LONDON.

1823.
HYDROGRAPHICAL CHARTS or MAPS, more usually called sea-charts, are projections of some part of the sea, or coast, for the use of navigation. These are laid down all the rhumbs or points of the compass, the meridians, parallels, &c. with the coasts, capes, islands, rocks, shoals, shallows, &c. in their proper places and proportions.

HYDROGRAPHY, the art of measuring and describing the sea, rivers, canals, lakes, &c.—With regard to the sea, it gives an account of its tides, counter-tides, soundings, bays, gulfs, creeks, &c.; as also of the rocks, shelves, sands, shallows, promontories, harbours; the distance and bearing of one port from another; with every thing that is remarkable, whether out at sea or on the coast.

HYDROLEA, a genus of plants belonging to the pentandria class, and in the natural method ranking with those of which the order is doubtful. See BOTANY INDEX.

HYDROMANCY, a method of divination by water, practised by the ancients. See DIVINATION, No. 7.

HYDROMEL, honey diluted in nearly an equal weight of water. When this liquor has not fermented, it is called simple hydromel; and when it has undergone the spirituous fermentation, it is called the vinous hydromel or mead.

Honey, like all saccharine substances, vegetable or animal, is susceptible of fermentation in general, and particularly of the spirituous fermentation. To induce this fermentation, nothing is necessary but to dilute it sufficiently in water, and to leave this liquor exposed to a convenient degree of heat. To make good vinous hydromel or mead, the whitest, purest, and best tasted honey must be chosen; and this must be put into a kettle with more than its weight of water: a part of this liquor must be evaporated by boiling, and the liquor scummed, till its consistence is such that a fresh egg shall be supported upon its surface without sinking more than half its thickness into the liquor; then the liquor is to be strained and poured through a funnel into a barrel: this barrel, which ought to be nearly full, must be exposed to a heat as equable as is possible, from 20 to 27 or 28 degrees of Mr. Reaumur's thermometer, taking care that the bung-hole be slightly covered, but not closed. The phenomena of the spirituous fermentation will appear in this liquor, and will subsist during two or three months, according to the degree of heat; after which they will diminish and cease. During this fermentation, the barrel must be filled up occasionally with more of the same kind of liquor of honey, some of which ought to be kept apart on purpose to replace the liquor which flows out of the barrel in froth. When the fermentation ceases, and the liquor has become very vinous, the barrel is then to be put in a cellar and well closed. A year afterwards the mead will be fit to be put into bottles.

The vinous hydromel or mead is an agreeable kind of wine; nevertheless it retains long a taste of honey, which is displeasing to some persons; but this taste it is said to lose entirely by being kept a very long time.

The spirituous fermentation of honey, as also that of sugar, and of the most of vinous liquors, when it is very saccharine, is generally effected with more difficulty, requires more heat, and continues longer, than that of ordinary wines made from the juice of grapes; and these vinous liquors always preserve a saccharine taste, which shows that a part only of them is become spirituous.

HYDROMETER, an instrument to measure the gravity, density, &c. of water and other fluids. For an account of different hydrometers, see HYDRODYNAMICS.

HYDROMPHALUS, in Medicine and Surgery, a tumor in the navel, arising from a collection of water.

HYDROPANES, or Oculus Mundi, a kind of precious stone, which becomes transparent in water, much esteemed by the ancients.

HYDROPHOBIA, an aversion or dread of water: a terrible symptom of the rabies canina; and which has likewise been found to take place in violent inflammations of the stomach and in hysterical fits. See MEDICINE INDEX.

HYDROPHYLACIA, a word used by Kircher and some others who have written in the same system, to express those great reservoirs of water which he places in the Alps and other mountains for the supply of rivers which run through the several lower countries. This he makes to be one of the great uses of mountains in the economy of the universe.

HYDROPHYLLAX, a genus of plants belonging to the tetrandria class. See BOTANY INDEX.

HYDROPHYLLUM, water-leaves, a genus of plants.
plants belonging to the pentandria class, and in the natural method ranking with those of which the order is doubtless. See Botany Index.

HYDROCOPE, an instrument anciently used for measuring time.

The hydroscope was a kind of water-clock, consisting of a cylindrical tube, conical at bottom: the cylinder was graduated, or marked out with divisions, to which the top of the water becoming successively continuous, as it trickled out at the vertex of the cone, pointed out the hour.

HYDROSTATICS, is that branch of physics which treats of the weight, pressure, and equilibrium of fluids. See Hydodynamics.

HYDROTHORAX, a collection of water in the breast. See Medicine Index.

HYDRUNTUM, in Ancient Geography, a noble and commodious port of Calabria, from which there was a shorter passage to Apollonia (Pilpol.) Famous for its antiquity, and for the fidelity and bravery of its inhabitants. Now Otranto, a city of Naples, at the entrance of the gulf of Venice. E. Long. 19. 15. N. Lat. 40. 12.

HYEMANTES, in the primitive church, offenders who had been guilty of such enormities, that they were not allowed to enter the porch of the churches with the other penitents, but were obliged to stand without, exposed to all the inclemency of the weather.

HYGEIA, in Mythology. See Health.

HYGEINE, ὑγεία (formed of ὑγεία, "sound, healthy"), that branch of medicine which considers health, and discovers proper means and remedies, with their use, in the preservation of that state.

The objects of this branch of medicine are, the non-natural. See Diet, Exercise, &c.

HYGEINE, more largely taken, is divided into three parts: prophylactic, which foresees and prevents diseases; syneretic, employed in preserving health; and analeptic, whose office is to cure diseases, and restore health.

HYGROMETER, an instrument for measuring the degrees of dryness or moisture of the atmosphere, in like manner as the barometer and thermometer measure their different degrees of gravity or warmth.

Though every substance which swells in moist, and shrinks in dry weather, is capable of becoming an hygrometer; yet this kind of instrument is far from being as yet arrived at such a degree of perfection as the barometers and thermometers. There are three general principles on which hygrometers have been constructed.

1. The lengthening and shortening of strings by dryness and moisture, or their twisting and untwisting by the same. 2. The swelling and shrinking of solid substances by moisture or dryness; and 3. By the increase or decrease of the weight of particular bodies whose nature is to absorb the humidity of the atmosphere.

SMESTON'S. 1. On the first of these principles Mr. Smeston constructed a hygrometer greatly superior to any that had appeared before; and of which the following account is given in the 62d volume of the Philosophical Transactions.

"Having some years ago attempted to make an accurate and sensible hygrometer by means of a hempen Hygrometer cord of a considerable length, I quickly found, that though it was more than sufficiently susceptible of every change in the humidity of the atmosphere, yet the cord was upon the whole in a continual state of lengthening. Though this change was the greatest at first, yet it did not appear probable that any given time would bring it to a certainty; and furthermore, it seemed, that as the cord grew more determinate in mean length, the alteration by certain differences of moisture grew less. Now, as on considering wood, catgut, paper, &c. there did not appear to be a likelihood of finding any substance sufficiently sensible of differences of moisture that would be unalterable under the same degrees thereof; this led me to consider of a construction which would readily admit of an adjustment; so that, though the cord whereby the instrument is actuated may be variable in itself, both as to absolute length, and difference of length under given degrees of moisture, yet that, on supposition of a material departure from its original scale, it might be readily restored thereto; and, in consequence, that any number of hygrometers, similarly constructed, might, like thermometers, be capable of speaking the same language.

"The two points of heat the more readily determinable in a thermometer, are the points of freezing and boiling water. In like manner, to construct hygrometers which shall be capable of agreement, it is necessary to establish two different degrees of a moisture which shall be as fixed in themselves, and to which we can have recourse as readily and as often as possible.

"One point is given by making the substance perfectly wet, which seems sufficiently determinable; the other is that of perfect dry, which I do not apprehend to be attainable with the same precision. A readiness to imbibe wet, so that the substance may be soon and fully saturated, and also a facility of parting with its moisture on being exposed to the fire to dry, at the same time, that neither immersion, nor a moderate exposition to the warmth of the fire, shall injure its texture, are properties requisite to the first mover of such an hygrometer, that is to say, the hygrometer must include all substances that I am acquainted with, besides hempoen and flaxen threads and cords, or substances compounded of them.

"Upon these ideas, in the year 1758, I constructed two hygrometers as nearly alike as possible, in order that I might have the means of examining their agreement or disagreement on similar or dissimilar treatment. The interval or scale between dry and wet I divided into 100 equal parts, which I call the degrees of this hygrometer. The point of 0 denotes perfect dry; and the numbers increase with the degrees of moisture to 100, which denotes perfect wet.

"On comparing them for some time, when hung up together in a passage or staircase, where they would be very little affected by fire, and where they would be exposed to as free an air as possible in the inside of the house, I found that they were generally within one degree, and very rarely differed two degrees; but as these comparisons necessarily took up some time, and were frequently interrupted by long avocations from home, it was some years before I could form a tolerable judgment of them. One thing I soon observed, not altogether
Hygrometers altogether to my liking, which was, that the flaxen cords made use of seemed to make so much resistance to the entry of small degrees of moisture (such as a commonly experienced within doors in the situation above mentioned), that all the changes were comprised within the first 30° of the scale; but yet, on exposing them to the warm steam of a wash-house, the index quickly mounted to 100. I was therefore desirous of impregnating the cords with something of a saline nature, which should dispose them more forcibly to attract moisture; in order that the index might, with the ordinary changes of the moisture in the atmosphere, travel over a greater part of the scale of 100. How to do this in a regular and fixed quantity, was the subject of many experiments and several years interrupted inquiry. At last I tried the one hereafter described, which seemed to answer my intention in a great measure; and though upon the whole it does not appear probable that ever this instrument will be made capable of such an accurate agreement as the mercurial thermometers are, yet if we can reduce all the disagreements of an hygrometer within 15th part of the whole scale, it will probably be of use in some philosophical inquiries, in lieu of instruments which have not yet been reduced to any common scale at all.

"Fig. 1. and 2. ABC is an orthographic delineation of the whole instrument seen in front in its true proportion. DE is that of the profile, or instrument seen edgewise. FG in both represents a flaxen card about 3½ inches long, suspended by a turning peg F, and attached to a loop of brass wire at A, which goes down into the box-cover H, and defends the index, &c. from injury; and by a glass exposes the scale to view.

"Fig. 3. shows the instrument to a larger scale, the upright part being shortened, and the box-cover removed; in which the same letters represent the same parts as in the preceding figures; GI are two loops or long links of brass wire, which lay hold of the index KL, moveable upon a small stud or centre K. The cord FG is kept moderately strained by a weight M of about half a pound avoidance. It is obvious, that, as the cord lengthens and shortens, the extremity of the index rises and falls, and successively passes over N 2 the scale disposed in the arch of a circle, and containing 100 equal divisions. This scale is attached to the brass sliding ruler QP, which moves upon the directing piece RR, fixed by screws to the board, which makes the frame or base of the whole; and the scale and ruler NOP is retained in any place nearer to or further from the centre K, as may be required by the screw S.

"Fig. 4. represents in profile the sliding piece and stud I (fig. 3.), which traverses upon that part of the index next the centre K; and which can, by the two screws of the stud, be retained upon any part of the index that is made parallel; and which is done for three or four inches from the centre, for that purpose. The stud is fixed to the edges, like the fulcrum of a scale-beam; one being formed on the under side, the other on the upper, and as near as may be to one another. A hook formed at the lower end of the wire-loops CI, retains the index, by the lowest end of the stud, while the weight M hangs by a small hook upon the upper edge; by these means the index is kept steady and the cords strained by the weight, Hygrometer with very little friction or burthen upon the central stud L.

"Fig. 5. is a parallelogram of plate-brass, to keep Fig. 5. out dust, which is attached to the upper edge of the box-cover H; and serves to shut the part of the box-cover necessarily cut away, to give leave for the wire GI to traverse with the sliding stud nearer to or further from the centre of the index K; and where, in

"fig. 6. a is a hole of about an inch diameter, for the wire GI to pass through in the rising and falling of the index freely without touching; b is a slit of a lesser size, sufficient to pass the wire, and admit the cover to come off without deranging the cord or index; c e are two small screws applied to two slits, by which the plate slides lengthwise, in order to adapt the hole C to the wire GI, at any place of the stud I upon the index KL.

"1. In this construction, the index KL being 12 inches long, 4 inches from the extreme end are filed so narrow in the direction in which it is seen by the eye, that any part of these four inches lying over the divisions of the scale, becomes an index thereto. The scale itself slides four inches, so as to be brought under any part of the four inches of the index attenuated as above mentioned.

"2. The position of the directing piece RR is so determined as to be parallel to a right line drawn through O upon the scale, and the centre K of the index; consequently, as the attenuated part of the index forms a part of a radius or right line from the same centre, it follows, that whenever the index points to O upon the scale, though the scale is moved nearer to or further from the centre of the index, yet it produces no change in the place to which the index points.

"When the divided arch of the scale is at 10 inches from the centre (that is, at its mean distance); then the centre of the arch and the centre of the index are coincident. At other distances, the extremities of which are eight or twelve inches, the centre of the divisions, and the centre of the index pointing thereto, not being coincident, the index cannot move over the spaces geometrically proportionable to one another in all situations of the scale; yet the whole scale not exceeding 30° of a circle, it will be found on computation, that the error can never be so great as 15th part of the scale, or 1° of the hygrometer; which in this instrument being considered as indivisible, the mechanical error will not be sensible.

"The cord here made use of is flax, and between 15th and 15th of an inch in diameter; which can be readily ascertained by measuring a number of turns made round a pencil or small stick. It is a sort of cord used in London for making nets, and is of that particular kind called by net-makers flaxen three-threads laid. A competent quantity of this cord was boiled in one pound avoidance of water; in which was put two pennyweights troy of common salt; the whole was reduced by boiling to six ounces avoidance, which was done in about half an hour. As this ascertains a given strength of the brine, on taking out the cord, it may be supposed that every fibre of the cord is equally impregnated with salt. The cord being dried, it will be proper to stretch it; which may be done so as to prevent it from untwisting, by tying A two three
untwisting of the string A by the different changes of hygrometric
the air, the lower card G, from the mechanical prin-
ciples of motion, will describe 10 revolutions for one
of the upper card F; or when the lower card G has
made one revolution, the upper card F will have de-
scribed but the 10th part, or one of its divisions.
From whence it appears, that by the assistance of the
upper card F, an index is thereby obtained of the num-
ber of revolutions the lower card G performs, which
are reckoned by the line E on the slip of wood.

Example. It must first be observed what division of
the card F the line E is against, suppose 3; and also
what division of the lower card G is cut by the same
line, suppose 10: it then appears, that the state of the
hygrometer is thus 3 degrees and 10 hundredths of
another. If the whole 10 divisions of the card have
passed the line E, the lower card G will have revolved
10 times, or 10 hundred parts, equal to 1000; the ac-
curacy to which the principle of this simple contrivance
answers. Before use, the hygrometer should be adjust-
ed; to do which, the cards F and G are first set to the
line E at the 0 of each, or commencement of the gra-
duations: whatever direction the cards afterwards take,
it must evidently be from the change to greater mois-
ture or dryness in the air; and they will accordingly
point it out.

On this principle, but with a degree of ingenuity
and pains perhaps never before employed, an hygrome-
ter has been constructed by M. de Saussure, professor
of philosophy at Geneva. In his Essais sur l’Hýgrome-
trie, in 1783, is an important detail on the sub-
ject of hygrometry; from which the following descrip-
tion of his hygrometer is taken. The author found by
repeated experiments, that the difference between
the greatest extension and contraction of a hair, properly
prepared, and having a weight of about three grains sus-
pended to it, is nearly 20 of its whole length; that is,
34, or 3½ lines in a foot. This circumstance suggested
the idea of a new hygrometer: and, in order to render
those small variations perceptible and useful, the follow-
ing apparatus was constructed.

Fig. 7 is a representation of the whole instrument, fig. 7,
with the hair and other appendages complete. The
lower extremity of the hair a b is held by the chaps
of the screw pincers β. These pincers are represented
aside at B: by a screw at its end, it fastens into the
nut of the bottom plate C. This nut of the plate turns
independently of the piece that supports it, and serves
to raise or depress the pincers B at pleasure.

The upper extremity of the hair is held by the
under chaps of the double pincers α, represented aside
at A. These pincers fasten the hair below, and above
fasten a very fine narrow slip of silver, carefully
annealed, which rolls round the arbor or cylinder d, a
separate figure of which is shown at DF. This arbor,
which carries the needle or index ec, or E in the sepa-
rate figure, is cut into the shape of a screw; and the
intervals of the threads of this screw have their bases
flat, and are cut squarely so as to receive the slip of
silver that is fastened to the pincers α, and joined in this
manner with the hair. M. Saussure observes, that hair
alone fixed immediately to the arbor would not do; for it
corral upon it, and acquired a stiffness the counter-
poise was not able to surmount. The arbor was cut in
a screw form, in order that the slip of silver in wind-
The dial keek, divided into 360 degrees, is supported by two arms ll; these are soldered to two tubes, which inclose the cylindrical columns mm mm. The setting screws n n move upon these tubes, and serve thereby to fix the dial and arbor to any height required. The two columns which support the dial are firmly fastened to the case of the hygrometer, which rest upon the four screws 0000; by the assistance of these screws, the instrument is adjusted, and placed in a vertical situation.

The square column pp, which rests upon the base of the hygrometer, carries a box q, to which is fixed a kind of port-crayon r, the aperture of which is equal to the diameter of the counterpoise g. When the hygrometer is to be moved from one place to another; to prevent a derangement of the instruments from the oscillations of the counterpoise, the box q and the port-crayon r must be raised up so as the counterpoise may fall into and be fixed in it, by tightening the screws s and the box and counterpoise together by the screw t. When the hygrometer is intended for use, the counterpoise must be disengaged by lowering the box, as may be conceived from the figure.

Lastly, at the top of the instrument is a curved piece of metal x, y, z, which is fastened to the three columns just described and keeps them together. It has a square hole at y, which serves to hang up the hygrometer by when required.

The variations of which this hygrometer is capable, are (all things besides equal) as much greater as the arbor round which the slip of silver winds is than a smaller diameter, and as the instrument is capable of receiving a longer hair. M. Sauussure has had hygrometers made with hairs 14 inches long, but he finds one foot sufficient. The arbor is three-fourths of a line in diameter at the base between the threads of the screw or the part on which the slip winds. The variations, when a hair properly prepared is applied to it, are more than an entire circumference, the index describing about 400 degrees in moving from extreme dryness to extreme humidity. M. Sauussure mentions an inconvenience attending this hygrometer, viz. its not returning to the same point when moved from one place to another; because the weight of three grains that keeps the silver slip extended, cannot play so exactly as to act always with the same precision against the
All the instrument should be made of brass: though the axis of the index and its tube work more pleasantly together if made of bell-metal.

The extent of this hygrometer’s variations is not more than the fourth or fifth part of the hygrometer with the arbor. It may be augmented by making the segment of the pulley to which the hair is fixed of a smaller diameter; but then the hair, in moving about it, would fret and contract a stiffness, which would cause it to adhere to the bottom of the neck. M. Sausure is of opinion, that the radius of this pulley should not be less than two lines, at least that there should be adapted a plate of silver or some other contrivance; but then the hygrometer would be too difficult to construct, and it would require too much attention and care on the part of those who use it; his object was, to make an instrument generally useful, and easy and convenient in its use. The hygrometer with the arbor may be used for observations which require an extreme sensibility.

The variations of this instrument may be augmented by making it higher, because in that case longer hairs might be adapted; but it would be then less portable. Besides, if the hair is too long, when observations are made in the open air, the wind has too great an effect upon it, and thus communicates to the index inconvenient vibrations. It is not proper therefore to make it more than a foot in height. When it is of this dimension, an hair properly prepared can be applied to it, and its variations from extreme dryness to extreme humidity are 80 or even 100 degrees; which on a circle of 3 inches radius is not sufficient for observations of this kind. M. Sausure has even made smaller instruments that may be carried conveniently in the pocket, and to make experiments with under small receivers: they were but seven inches high by two inches in breadth; which, notwithstanding their variations, were very sensible.

Thus much for the construction of the various parts of the instrument. The limits of this work will not admit of our inserting the whole of M. Sausure’s subsequent account of the preparation of the hair, the manner of determining the limits of extreme humidity and of extreme dryness, the pyrometrical variations of the hair, and the graduation of the hygrometer. The following extract must therefore suffice.

In the preparation of the hair, it was found necessary to free it of a certain unctuosity it always has in its natural state, which in a great measure deprives it of its hygrometrical sensibility. A number of hairs are boiled in a lea[y of vegetable alkali; and among these are to be chosen for use such as are most transparent, bright, and soft; particular precautions are necessary for preventing the straining of the hair, which renders it unfit for the intended purpose.

The two fixed points of the hygrometer are the extremes both of moisture and dryness. The former is obtained by exposing the instrument to air completely saturated with water, and this is effected by placing it in a glass receiver standing in water, the sides of which are kept continually moistened. The point on the dial, at which the hand after a certain interval remains stationary, is marked 100. The point of extreme dryness, not absolute dryness, for that does not exist,
exist, but the greatest degree of it that can be obtained, is produced by introducing repeatedly into the same receiver containing the instrument, and standing now up upon quicksilver, certain quantities of deliquescent alkaline salts, which absorb the moisture of the air. The highest point to which the hand can be brought by this operation, not only when it will rise no higher, but when it becomes retrograde from the dilatation occasioned by heat, is called Ω; and the arch between these two points is divided into 100 equal parts, being degrees of the hygrometer. The arch p Ω, upon which the scale is marked in the instrument (represented in fig. 2.) being part of a circle of three inches diameter; hence every degree measures about one-third of a line.

In the stationary hygrometer, fig. 1. the scale upon the complete circular dial is so much larger, that every degree measures about five lines; but this M. Saussure considers so far from being a perfection, that it is rather an inconvenience; since the instrument becomes thereby so very susceptible of the least impression, that there is even no approaching it without a sensible variation. The thermometer, adapted as before mentioned, serves to correct the changes of temperature: towards the extreme of dryness, $1^{\circ}$ of the thermometer produces on the hair an effect of half a degree of the hygrometer, but towards the extreme of moisture, the same difference of temperature causes an effect no less than 3$^{\circ}$ on the hygrometer. He constructed two tables, that gave the intermediate hygrometrical variations for single degrees of the thermometer at different parts of the scale.

The whole range of the atmospheric variations takes in about $75^{\circ}$ of this scale; a dryness of more than $25^{\circ}$ being always the effect of art. The sensibility of this instrument is so very great, that being exposed to the dew, he mentions that it varies above $40^{\circ}$ in about 20 minutes of time. Being removed from a very moist into a very dry air, it varied in one instance no less than $35^{\circ}$ in three minutes. He says that its variations were always found uniform in different instruments suspended in different parts of the same atmosphere.

This hygrometer is considered by the author as possessed of all the properties requisite in such an instrument. These are: 1. That the degrees in the scale be sufficiently large, and to point out even the least variation in the dryness or moisture of the atmosphere. 2. That it be quick in its indications. 3. That it be at all times consistent with itself; viz. that in the same state of the hair it always points to the same degree. 4. That several of them agree with one another. 5. That it be affected only by the aqueous vapours. 6. That its variations be ever proportionate to the changes in the air.

But after all it must be observed, that a considerable degree of trouble and delicacy is requisite in the preparation of the hair, and it is very fragile; circumstances which may prevent it from coming into general use among common observers, although probably it may be the best in principle of any yet made.

Instead of hairs or cat-gut, of which hygrometers of the first kind are commonly made, Cassebois, a Benedictine monk at Mentz, proposed to make such hygrometers of the gut of a silk-worm. When that insect is ready to spin, there are found in it two vessels proceeding from the head to the stomach, to which they adhere, and then bend towards the back, where they form a great many folds. The part of these vessels next the stomach is of a cylindrical form, and about a line in diameter. These vessels contain a gummy sort of matter from which the worm spins its silk; and, though they are exceedingly tender, means have been devised to extract them from the insect, and to prepare them for the above purpose. When the worm is about to spin, it is thrown into vinegar, and suffered to remain there twenty-four hours; during which time the vinegar is absorbed into the body of the insect, and coagulates its juices. The worm being then opened, both the vessels, which have now acquired strength, are extracted; and, on account of their pliability, are capable of considerable extension. That they may not, however, become too weak, they are stretched only to the length of about fifteen or twenty inches. It is obvious that they must be kept sufficiently extended till they are completely dry. Before they attain to that state, they must be freed, by means of the nail of the finger, from a slimy substance which adheres to them. Such a thread will sustain a weight of six pounds without breaking, and may be used for an hygrometer in the same manner as cat-gut; but we confess that we do not clearly perceive its superiority.

II. On the second general principle, namely, that of De Luc's, the swelling of solid bodies by moisture, and their contraction by dryness, M. de Luc's instrument is the best. He makes choice of ivory for the construction of his hygrometer, because he finds that, being once wetted, ivory regularly swells by moisture, and returns exactly to the same dimensions when the moisture is evaporated, which other bodies do not. This hygrometer is represented in fig. 9, where $a a b$ is an ivory tube open at the end $a$, and close at $b$. It is made of a piece of ivory taken at the distance of some inches from the top of a pretty large elephant's tooth, and likewise at the same distance from its surface and from the canal which reaches to that point. (This particular direction is given, that the texture of the ivory in all different hygrometers may be the same, which is of great importance.) This piece is to be bored exactly in the direction of its fibres; the hole must be very straight, its dimensions $2^{1/2}$ lines in diameter, and $2$ inches $8$ lines in depth from $a$ to $e$. Its bore is then to be exactly filled with a brass cylinder, which however, must project somewhat beyond the ivory tube; and thus it is to be turned on a proper machine, till the thickness of the ivory is exactly $1/2$ of a line, except at the two extremities. At the bottom $b$ the tube ends in a point; and at the top $a$ it must for about two lines be left a little thicker, to enable it to bear the pressure of another piece put upon it. Thus the thin or hygrometrical part of the tube will be reduced to $2^{1/2}$ French inches, including the concavity of the bottom. Before this piece is used, it must be put into water, so that the external part alone may be wetted by it; and here it is to remain till the water penetrates to the inside, and appears in the form of dew, which will happen in a few hours. The reason of this is, that the ivory tube remains somewhat larger ever after it is wetted the first time.

For this hygrometer, a glass tube must be provided about $4$ inches long, the lower end of which is shown in $d e$. Its internal diameter is about $1/2$ of a line.
If now the ivory tube is exactly filled with mercury, and the glass one affixed to it, as the capacity of the former decreases by being dried, the mercury will be forced up into the glass one.

The piece $f$ is intended to join the ivory with the glass tube. It is of brass, shaped as in the figure. A cylindrical hole is bored through it, which holds the glass tube as tight as possible without danger of breaking it; and its lower part is to enter with some degree of difficulty into the ivory pipe. To hinder that part of the tube which incloses the brass piece from being affected by the variations of the moisture, it is covered with a brass vessel represented in $A A B C$.

The pieces must be united together with gum-lac or mastich.

The introduction of the mercury is the next operation. For this purpose, a slip of paper three inches wide is first to be rolled over the glass tube, and tied fast to the extremity nearest the ivory pipe. A horse-hair is then to be introduced into the tube, long enough to enter the ivory pipe by an inch, and to reach three or four inches beyond the extremity of the glass one. The paper which has been shaped round the tube must now be raised, and used as a funnel to pour the mercury into the instrument, which is held upright. The purest quicksilver is to be used for this purpose, and it will therefore be proper to use that revived from cinnambar. It easily runs into the tube; and the air escapes by means of the horse-hair, assisted with some gentle shakes. Fresh mercury must from time to time be supplied, to prevent the mercurial tube from being totally emptied; in which case, the mercurial pellicle which always forms by the contact of the air, would run in along with it.

Some air-bubbles generally remain in the tube; they may be seen through the ivory pipe, which is thin enough to have some transparency. These being collected together by shaking, must be brought to the top of the tube, and expelled by means of the horse-hair. To facilitate this operation, some part of the mercury must be taken out of the tube, in order that the air may be less obstructed in getting out, and the horse-hair have a free motion to assist it. Air, however, cannot be entirely driven out in this manner. It is the weight of the mercury with which the tube is for that reason to be filled, which in time completes its expulsion, by making it pass through the pores of the ivory. To hasten this, the hygrometers are put into a proper box. This is fixed nearly in a vertical direction to the saddle of a horse, which is set a trotting for a few hours. The shakes sometimes divide the column of mercury in the glass tube, but it is easily re-united with the horse-hair. When upon shaking the hygrometer vertically, no small tremulous motion is any longer perceived in the upper part of the column, one may be sure that all the air is gone out.

The scale of this hygrometer may be adjusted, as soon as the air is gone out, in the following manner. The instrument is to be suspended in a vessel of water cooled with ice, fresh quantities of which are to be added as the former melts. Here it is to remain till it has sunk as low as it will sink by the enlargement of the capacity of the ivory tube, owing to the moisture it has imbibed. This usually happens in seven or eight hours, and it is to be carefully noted. In two or three hours the mercury begins to ascend, because the moisture passes into the cavity, and forces it up. The lowest station of the mercury is then to be marked; and for the more accurate marking the degrees on the scale, M. de Luc always chose to have his hygrometers made of one which had formerly belonged to a thermometer. The reason of this is, that in the thermometer the expansion of the mercury by heat had been already determined. The distance between the thermometrical points of melting ice and boiling water at 27 French inches of the barometer was found to be 1937 parts. The bulb of this preparatory thermometer was broke in a basin, in order to receive carefully all the mercury that it contained. This being weighed in nice scales amounted to 1428 grains. The hygrometer contained 460 grains of the same mercury. Now it is plain, that the extent of the degrees on the hygrometer, ought to be to that of the degrees on the preparatory thermometer as the different weights of the mercury contained in each; consequently 1428 : 460 : 1937 : 624 nearly; and therefore the corresponding intervals ought to follow the same proportion; and thus the length of a scale was obtained, which might be divided into as many parts as be pleased.

Fig. 10. is a representation of De Luc's hygrometer when fully constructed. In elegance it far exceeds Sméaton's or any other, and probably also in accuracy; for by means of a small thermometer fixed on the board along with it, the expansion of the mercury by heat may be known with great accuracy, and of consequence how much of the height of the mercury in the hygrometer is owing to that cause, and how much to the mere moisture of the atmosphere.

M. de Luc having continued his inquiries further into the modifications of the atmosphere, mentions in his *Idée sur la Météorologie* another hygrometer, which he finds to be the best adapted to the measure of local humidity. Of all the hygroscopic substances which he tried for this purpose, which that answers the best is a slip of whalebone cut transversely to the direction of the fibres, and made extremely thin; for on this depends its sensibility. A slip of 12 inches in length and a line in breadth, he has made so thin as to weigh only half a grain; and it may be made still thinner, but is then of too great sensibility, being affected even by the approach of the observer. This slip is kept extended by a small spring, and the variations in its length are measured by a vernier division, or by, which is perhaps better, an index on a dial plate: the whole variation from extreme dryness to extreme moisture is about ⅓ of its length.

In these hygrometers, which are made by the instrument-makers in London, the slip of whalebone is mounted in a frame very similar to that belonging to M. Saussure's hygrometer before described (see fig. 7.). The only material difference is, that a small concentric wire spring is used, instead of a counterpoise, to keep the slip of whalebone extended. M. Saussure had tried such a spring applied to his hairs; but the weakest spring be found too strong for the hair; and he was further apprehensive, that the variations which the cold, heat, and the weather insalubrily make, would suffer from the force of the springs.

M. de Luc, in the hygrometers he formerly made, as before described (made of ivory), had graduated them from
from one fixed point only, that of extreme moisture, which is obtained by soaking them in water. He has now very ingeniously contrived to fix the other extreme, that of dryness; but this being producible only by means of strong fires, such as hygrometers cannot support, he uses an intermediate body, quicklime; which after having been deprived, by force of fire, of all its own humidity, has the property of slowly imbibing humidity again from the bodies in its neighbourhood; and whose capacity is such that all the vapour that can be contained in a quantity of air equal to its own bulk, can give it no sensible humidity. These hygrometers, inclosed with a large quantity of fresh burnt lime in lumpes, acquire in three weeks the same degree of dryness with the lime, which cannot differ sensibly from extreme dryness.

M. de Saussure makes choice of hairs, prepared by maceration in alkaline lye. M. de Luc shows that hairs, and all other animal or vegetable substances, taken lengthwise, or in the direction of their fibres, undergo contrary changes from different variations of humidity: that, when immersed in water, they lengthen at first, and afterwards shorten; that when they are near the greatest degree of humidity, if the moisture is increased, they shorten themselves; if it is diminished, they lengthen themselves first before they contract again. These irregularities, which obviously render them incapable of being true measures of humidity, he shows to be the necessary consequence of their organic reticular structure.

M. de Saussure takes his point of extreme moisture from the vapours of water under a glass bell, keeping the sides of the bell continually moistened: and affirms, that the humidity is there constantly the same in all temperatures; the vapours even of boiling water having no more effect than those of cold. M. de Luc shows, on the contrary, that the differences of humidity under the bell are very great, though M. Saussure's hygrometer was capable of discovering them; and that the real undecomposed vapour of boiling water has the directly opposite effect to that of cold, the effect of extreme dryness: and on this point he mentions an interesting fact, communicated to him by Mr Watt, viz. that wood cannot be employed in the steam engine for any of those parts where the vapour of the boiling water is confined, because it dries so as to crack, just as if exposed to the fire. In M. de Luc's work above mentioned there are striking instances related, in which the imperfection of M. Saussure's hygrometer led him into false conclusions respecting phenomena, and into erroneous theories to account for them.

III. On the third principle, namely, the alteration of the weight of certain substances by their attracting the moisture of the air, few attempts have been made, nor do they seem to have been attended with much success. Sponges dipped in a solution of alkaline salts, and some kinds of paper, have been tried. These are suspended to one end of a very accurate balance, and counterpoised by weights at the other, and show the degrees of moisture or dryness by the ascent or descent of one of the ends. But, besides that such kinds of hygrometers are destitute of any fixed point from whence to begin their scale, they have another inconvenience (from which indeed Smeaton's is not free, and which has been found to render it erroneous), namely, the hygrometer, that all saline substances are destroyed by long continued exposure to the air in very small quantities, and therefore can only imbibe the moisture for a certain time. Sulphuric acid has therefore been recommended in preference to the alkaline and neutral salts, and, indeed, for such as do not choose to be at the trouble of constructing a hygrometer on the principles of Mr Smeaton or De Luc, this will probably be found the most easy and accurate. Fig. 11. represents an hygrometer of this kind. A is a small glass cup containing a small quantity of oil of vitriol, B an index counterpoising it, and C the scale; where it is plain, that as the oil of vitriol attracts the moisture of the air, the scale will descend, which will raise the index, and vice versa. This liquor is exceedingly sensible of the increase or decrease of moisture. A single grain, after its full increase, has varied its equilibrium so sensibly, that the tongue of a balance, only an inch and a half long, has described an arch one-third of an inch in compass (which arch would have been almost three inches if the tongue had been one foot), even with so small a quantity of liquor; consequently, if more liquor, expanded under a large surface, were used, a pair of scales might afford as nice an hygrometer as any kind yet invented. A great inconvenience, however, is, that as the air must have full access to the liquid, it is impossible to keep out the dust, which, by continually adding its weight, must render the hygrometer false; add to this, that even oil of vitriol itself is by time destroyed, and changes its nature, if a small quantity of it is continually exposed to the air.

The best hygrometer upon this principle, and for ascertaining the quantity as well as the degree of moisture in the variation of the hygrometer, is of the contrivance of Mr Coventry, Southwark, London. The account he has favoured us with is as follows. "Take two sheets of fine tissue paper, such as is used by hatters; dry them carefully at about two feet distance from a tolerably good fire, till after repeatedly weighing them in a good pair of scales no moisture remains. When the sheets are in this perfectly dry state, reduce them to exactly 50 grains; the hygrometer is then fit for use. The sheets must be kept free from dust, and exposed a few minutes in the open air; after which it may be always known by weighing them the exact quantity of moisture they have imbibed." For many years the hygrometer has (says Mr Coventry) engrossed a considerable share of my attention; and every advantage proposed by others, either as it respected the substances of which the instrument was composed, or the manner in which its operations were to be discerned, has been impartially examined. But (adds he) I have never seen an hygrometer so simple in itself, or that would act with such certainty or so equally alike, as the one I have now described. The materials of which it is composed being thin, are easily deprived wholly of their moisture; which is a circumstance essentially necessary in fixing a datum from which to reckon, and which, I think, cannot be said of any substance hitherto employed in the construction of hygrometers; with equal facility they imbibe or impart the humidity of the atmosphere, and show with the greatest exactness when the least alteration takes place."
When the paper is prepared, as already described, it will serve, without the trouble of drying, as a standard for any number of sheets intended for the same purpose. But then the sheets must be kept together in the open air for a few hours; because whatever alteration may take place by this exposure, the paper already weighed must have undergone the same; being consequently in the same state, they must be cut to the same weight.

For easier weighing the paper, take a piece of round tin or brass the size of a crown piece, through the centre of which drill a hole, and also three others round it at equal distances: then cut about one hundred papers; and after putting them under the tin or brass, drive through each hole a strong pin into a board, in order to round them to the shape of the plate: the papers must be then separated and exposed to the air a few hours with that already weighed, and so many of them taken as are equal to the weight already specified. This done, threadle them together through those holes made by the pins, putting between every paper, on each thread a small bead, in order to prevent the papers from touching each other, and also that the air may be more readily admitted. The top of the hygrometer is covered with a card cut to the same size; and which, by reason of its stiffness, supports all the papers, and keeps them in proper shape. Before the papers are threaded, the beads, silk, card, and a thin piece of brass about the size of a sixpence, which must be placed at the bottom, and through which the centre string passes, must be weighed with the greatest exactness, in order to bring them to a certain weight, suppose 50 grains; now the paper in its driest state being of equal weight, they will weigh together 100 grains, consequently what they weigh more at any time is moisture.

To obviate the trouble and difficulty of making experiments with weights and scales, Mr Coventry contrived a machine or scale by which to determine at one view the humidity or dryness of the atmosphere. This, with its case, is represented by fig. 12. The front and back of the case are glass; the sides fine gauze, which excludes the dust and admits the air; the case is about ten inches high, 8 inches broad, and 4 inches deep. A, a brass bracket in front, behind which, at about 3 inches distance is another; these support the axis of the index E, also of the beam D, and another which supports the stem B, to which the ivory scale of divisions C is fixed. C, a brass scale suspended in the usual manner to the end of a beam D, and weighing exactly 100 grains. This scale is an exact counterpoise to the papers I and the different apparatus. The particular manner of suspension in this balance is, from the construction, as follows: The axis of the beam G, which is made of brass, instead of hanging on pivots, as in common scales, turns with two steel edges H, fixed in the extremities of the brass axis: these edges are shaped like the edge of a knife, and act on two steel concave edges I, in order to render the friction as small as possible. D, is a fine scale beam fixed at right angles with the axis G. E, the steel index fixed to the under side of the same axis. F, a brass sliding weight: A is the axis that holds the stem B to which the scale of divisions C is fixed. AA, the brass brackets which support the whole by four screws, two of which are seen at I, that screw the hygrometer to the top of the case. The axis of the scale of divisions is hung on pivots, one of which is seen at u, that, should the case not stand level, the stem B may always be in a perpendicular situation.

The hygrometer, before use, should be adjusted as follows: To the end of the beam when the hygrometer is suspended, hang a weight of 100 grains, which is equal to the weight of the scale; then move the sliding weight F up or down the index E, till one grain will cause the index to traverse neither more nor less than the whole scale of divisions; then add half a grain to the scale, in order to bring the index to 0; and the instrument, after taking off the 100 grain weight and hanging on the papers, is fit for use; then put grain weights in the scale till the index is brought within compass of the scale of divisions. Example: H is 3 grains on the brass scale, and the index points at 10; consequently there is 3 grains and 10 hundredths of a grain of moisture in the papers. If four grain weights are kept, viz. 1, 2, 4, and 5, they will make any number from 1 to 9, which are as many as will be wanted. Sometimes the index will continue traversing within the scale of divisions for many days without shifting the weights; but if otherwise, they must be changed as occasion may require.

One great advantage of this hygrometer above all others that have attracted my notice is (says Mr Coventry), that it acts from a certain datum, namely, the dry extreme; from which all the variations towards moist are calculated with certainty; and if constructed with that precision represented by the drawing, it will afford pleasure to the curious in observing the almost perpetual alteration of the atmosphere, even in the most settled weather. In winter it will be constantly traversing from about eight in the morning till four or five in the afternoon, towards dry; and in summer, from about four in the morning till six or seven in the evening, when the weather is hot and gloomy, the hygrometer discovers a very great change towards moisture; and when clear and frosty, that it contains a much greater quantity of moisture than is generally imagined.

An improvement has been proposed of this kind of hygrometer, of which the following circumstance, it is said, suggested the first hint. While Mr Lowitz was at Dmitriewsk in Astracan, he found, on the banks of the Wolga, a thin bluish kind of slate which attracted moisture remarkably soon, but again suffered it as soon to escape. A plate of this slate weighed, when brought to a red heat, 175 grains, and, when saturated with water, 247: it had therefore imbied, between complete dryness and the point of complete moisture, 72 grains of water. Lowitz suspended a round thin plate of this slate at the end of a very delicate balance, fastened within a wooden frame, and suspended at the other arm a chain of silver wire, the end of which was made fast to a sliding nut that moved up and down in a small groove on the edge of one side of the frame. He determined, by trial, the position of the nut when the balance was in equilibrio and when it had ten degrees of over-weight, and divided the space between these two points into ten equal parts, adding such a number more of these parts as might be necessary. When the stone was suspended from the one arm of
of the balance, and at the other a weight equal to 175
grains, or the weight of the stone when perfectly dry,
the nut in the groove would the excess of weight in
grains when it and the chain were so adjusted that the
balance stood in equilibrio. A particular apparatus on
the same principles as a vernier, applied to the nut,
showed the excess of weight to ten parts of a grain.
Lowitz remarked that this hygrometer in continued
wet weather gave a moisture of more than 15 grains,
and in a continued heat of 113 degrees of Fahrenheit
only 14 degree of moisture.

The hygrometer thus invented by Lowitz was, how-
ever, attended with this fault, that it never threw off
the moisture in the same degree as the atmosphere
became drier. It was also sometimes very deceitful,
and announced moisture when it ought to have indicated
that dryness had again begun to take place in the at-
mosphere. To avoid these inconveniences, M. Hoch-
heimer proposes the following method:
1. Take a square bar of steel about two lines in
thickness, and from ten to twelve inches in length,
and form it into a kind of balance, one arm of which ends
in a spiral. On this spiral let there be screwed a lead-
en bullet of a proper weight, instead of the common
weights that are suspended. 2. Take a glass plate
about ten inches long, and seven inches in breadth; de-
stroy its polish on both sides, free it from all moisture
by rubbing it over with warm ashes, suspend it at the
other end of the balance, and bring the balance into
equilibrio by screwing up or down the leaden bullet.
3. Mark now the place to which the leaden bullet is
brought by the screw, as accurately as possible, for the
point of the greatest dryness. 4. Then take away the
glass plate from the balance, dip it completely in water,
give it a shake that the drops may run off from it,
and wipe them carefully from the edge. 5. Apply the
glass plate thus moistened again to the balance, and
bring the latter into equilibrio by screwing the leaden
bullet. Mark then the place at which the bullet stands
as the highest degree of moisture. 6. This apparatus
is to be suspended in a small box of well dried wood,
sufficiently large to suffer the glass plate to move up
and down. An opening must be made in the lid, ex-
actly of such a size as to allow the tongue of the ba-
lance to move freely. Parallel to the tongue apply a
graduated circle, divided into a number of degrees at
pleasure, from the highest point of dryness to the high-
est degree of moisture. The box must be pierced with
small holes on all the four sides, to give a free passage
to the air; and to prevent moisture from penetrating
into the wood by rain, when it may be requisite to ex-
pose it at a window, it must either be lacquered or
painted. To save it at all times from rain, it may be
furnished with a sort of roof.

For a description of Mr Leslie's Hygrometer, fig. 13,
and in a more portable form, fig. 14. see Meteorolo-

GYSCOPE. The same with Hygrometer.
HYLA, in Ancient Geography, a river of Myca Mi-
nor, famous for Hylas the favourite boy of Heracles,
who was carried down the stream and drowned. It is
said to run by Prusa; whence it seems to be the same
with the Rhynacus, which runs north-west into the
Proponentis.

HYLAS, in fabulous history, son of Theodamus,
was ravished by the nymphs of a fountain as he was ta-
k ing out some water for Hercules, by whom he was be-

loved.

HYLOZISTS, formed of Ὠλος, matter, and ζωή, life,
the name of a sect of atheists among the ancient Greek
philosophers, who held matter to be animated; main-
taining that matter had some natural perception, with-
out animal sensation, or reflection in itself considered;
but that this imperfect life occasioned that organiza-

tion whence sensation and reflection afterwards arose.
Of these, some held only one life, which they called a
PLASTIC nature, presiding regularly and invariably over
the whole corporeal universe, which they represented as
a kind of large plant or vegetable; these were called
the cosmoplastic and stoical atheists, because the Stoics
held such a nature, though many of them supposed it
to be the instrument of the Deity. Others thought
that every particle of matter was enlivened with life,
and made the mundane system to depend upon a cer-
tain mixture of chance and plastic or orderly nature
united together. These were called the Stratonic,
from Strato Lampanecus, a disciple of Theophrastus, called
also Physicus (Cicero de Nat. Deor. lib. i. cap. 13.),
who was first a celebrated Peripatetic, and afterwards
formed this new system of atheism for himself. Besides
these two forms of atheism, some of the ancient phi-
losophers were Hylopathians, or Anaximandrians, de-

driving all things from dead and stupid matter, in the
way of qualities and forms, generating and corruptible;
and others again adopted the Atonical or Demo-

critical system, who ascribe the production of the universe
to atoms and figures. See on this subject Cadw Bent's
Intelligent System, book i. chap. 3.

HYMEN, or Hymenus, a fabulous deity, the son of Bacchus and Venus Uranis, was supposed by the
ancestors to preside over marriages; and accord-
ingly was invoked in epithalamions, and other mu-
trimonial ceremonies, under the formula Hymen, or
Hymeneae!

The poets generally crown this deity with a chap-
let of roses; and represent him, as it were, dissolved
and evaporated with pleasures, dressed in a yellow
robe and shoes of the same colour, with a torch in his
hand.—Catullus, in one of his epigrams, addresses him
thus:

Cinga tempora floribus
Suavidentes amaraci.

It was for this reason, that the new married couple bore
garlands of flowers on the wedding day: which custom
also obtained among the Hebrews, and even among
Christians, during the first ages of the church, as ap-
pears from Tertullian, De corona militari, where he
says, Coronam et supris sponsos.—S. Chrysostom limits
likewise mentions these crowns of flowers; and to this
day the Greeks call marriage ἡμέρα, in respect of this
crown or garland.

HYMEN, Ἱμήν, in Anatomy, a thin membrane or skin,
sometimes circular, of different breadths, more or less
smooth, and sometimes semilunar, formed by the union
of the internal membrane of the great canal with that
on the inside of the ala, resembling a piece of fine
parchment. This membrane is supposed to be stretch-
ed in the neck of the wombs of virgins, below the
nymphs, leaving in some subjects a very small opening,
HYMEN

in others a larger, and in all rendering the external orifice narrower than the rest of the cavity, and to be broke when they are deflowered; an effusion of blood following the breach.

The membranous circle may likewise suffer some disorder by too great a flux of the menses, by imprudence, levity, and other particular accidents.

The hymen is generally looked upon as the test of virginity; and when broke, or withdrawn, shows that the person is not in a state of innocence. This notion is very ancient. Among the Hebrews, it was the custom for the parents to save the blood shed on this occasion as a token of the virginity of their daughter, and to send the sheets next day to the husband’s relations. And the like is said to be still practised in Portugal, and some other countries.

And yet authors are not agreed as to the existence of such a membrane. Nothing, Dr Drake observes, has employed the curiosity of anatomists, in dissecting the organs of generation in women, more than this part: they have differed not only as to its figure, substance, place, and perforation, but even its reality; some positively affirming, and others flatly denying it.

De Graaf himself, the most accurate inquirer into the structure of these organs, confesses he always sought it in vain, though in the most unsuspected subjects and ages: all he could find was, a different degree of stringiness or wideness, and different corrugations, which were greater or less according to the respective ages; the aperture being still the less, and the rugosities the greater, as the subject was younger and more untouched.

Dr Drake, on the other hand, declares, that in all the subjects he had opportunity to examine, he does not remember to have missed the hymen so much as once, where he had reason to depend on finding it. The fairest view he ever had of it was in a maid who died at thirty years of age; in this he found it a membrane of some strength, furnished with fleshy fibres, in figure round, and perforated in the middle with a small hole, capable of admitting the end of a woman’s little finger, and situated a little above the orifice of the urinary passage, at the entrance of the vagina of the womb.

In infants it is a fine thin membrane, not very conspicuous, because of the natural stringiness of the passage itself, which does not admit of any great expansion in so little room; which might lead De Graaf into a notion of its being no more than a corrugation.

This membrane, like most others, does probably grow more distinct, as well as firm, by age. That it not only exists, but is sometimes very strong and impervious, may be collected from the history of a case reported by Mr Cowper. In a married woman, twenty years of age, whose hymen was found altogether impervious, so as to detain the menses, and to be driven out by the pressure thereof beyond the labia of the pudendum, not unlike a prolapsus of the uterus; on dividing it, at least a gallon of grumous blood came forth. It seems the husband, being denied a passage that way, had found another through the meatus urinarius; which was found very open, and its sides extended like the anus of a cock.

Upon a rupture of the hymen, after the consummation of marriage, and especially delivery, its parts, shrinking up, are supposed to form those little fleshy knots, called carunculae myriformes.

HYMENEA, the BASTARD LOCUST TREE; a genus of plants, belonging to the decandria class; and in the natural method ranking under the 33rd order, Lomatoceae. See BOTANY Index.

HYMENEA, something belonging to marriage; so called from HYMEN.

HYMENOPTERA (derived from hymen, membrane, and pteron, wing), in the Linnaean system of natural history, is an order of insects, having four membranaceous wings, and the tails of the females are furnished with stings, which in some are used for instilling poison, and in others for merely piercing the bark and leaves of trees, and the bodies of other animals, in which they deposit their eggs. See ENTOMOLOGY Index.

HYMETTUS, in Ancient Geography, a mountain of Attica near Athens, famous for its marble quarries, and for its excellent honey. Hymettus is the epithet. Pliny says that the orator Ctesias was the first who had made columns from this place.

HYMN, a song or ode in honour of God; or a poem, proper to be sung, composed in honour of some deity. The word is Greek, ὕμνος, hymnos, formed of the verb ἔχω, celebro, “I celebrate.”—Isidore, on this word, remarks, that hymn is properly a song of joy, full of the praises of God; by which, according to him, it is distinguished from threnos, which is a mourning song, full of lamentation.

St Hilary, bishop of Poictiers, is said to have been the first that composed hymns to be sung in churches, and was followed by St Ambrose. Most of those in the Roman Breviary were composed by Prudentius. They have been translated into French verse by Messieurs de Port Royal.—In the Greek Liturgy there are four kinds of hymnus; but the word is not taken in the sense of a praise offered in verse, but simply of a litan or prayer. The angelic hymn, or Gloria in excelsis, makes the first kind; the triasigion the second; the Cherubic hymn, the third; and the hymn of victory and triumph, called simeons, the last.

The hymns or odes of the ancients generally consisted of three sorts of stanzas; one of which, called strophai, was sung by the band as they walked from east to west; another, called antistrophai, was performed as they returned from west to east; the third part, or epode, was sung before the altar. The Jewish hymns were accompanied with trumpets, drums, and cymbals, to assist the voices of the Levites and people.

HYOBANCHE, a genus of plants belonging to the didynamia class. See BOTANY Index.

HYOIDES, in Anatomy, a bone placed at the root of the tongue. See ANATOMY, No. 28.

HYOSCYAMUS, Henbane; a genus of plants belonging to the pentandria class, and in the natural method ranking under the 28th order, Lurideae. See BOTANY and MATERIA MEDICA Index.

HYOSERIS, a genus of plants belonging to the symgenia class, and in the natural method ranking under the 49th order, Composite. See BOTANY Index.

HYO-TYROIDES, in Anatomy, one of the muscles belonging to the 68 hyoides. See ANATOMY, Table of the Muscles.
While Hypatia thus reigned the brightest ornament of Alexandria, Orestes was governor of the same place for the emperor Theodosius, and Cyril was bishop or patriarch. Orestes having had a liberal education, could not but admire Hypatia; and as a wise governor frequently consulted her. This, together with an aversion which Cyril had against Orestes, proved fatal to the lady. About 500 monks assembling, attacked the governor one day, and would have killed him, had he not been rescued by the townspeople; and the respect which Orestes had for Hypatia causing her to be traduced among the Christian multitude, they dragged her from her chair, tore her in pieces, and burned her limbs. Cyril is not clear from a suspicion of fomenting this tragedy. Cave indeed endeavours to remove the imputation of such an horrid action from the patriarch; and lays it upon the Alexandrian mob in general, whom he calls levissimum hominum genus; "a very trifling inconstant people." But though Cyril should be allowed neither to have been the perpetrator, nor even the contriver of it, yet it is much to be suspected that he did not disapprove it in the manner he ought to have done: which suspicion must needs be greatly confirmed by reflecting, that he was so far from blaming the outrage committed by the monks upon Orestes, that he afterwards received the dead body of Ammonius, one of the most forward in that outrage, who had grievously wounded the governor, and who was justly punished with death. Upon this riotous roffian Cyril made a panegyric in the church where he was laid, in which he extolled his courage and constancy, as one that had contended for the truth; and changing his name to Thaumastus, or "the Admirable," ordered him to be considered as a martyr. "However, (continues Socrates), the wisest part of Christians did not approve the zeal which Cyril showed on this man's behalf, being convinced that Ammonius had justly suffered for his desperate attempt."

HYPECOM, WILD COMIN, a genus of plants belonging to the tetrandria class; and in the natural method ranking under the 24th order, Corydalis. See BOTANY INDEX.

HYPER, a Greek preposition frequently used in composition, where it denotes excess; its literal signification being above or beyond.

HYPERBATON, in Grammar, a figurative construction inverted the natural and proper order of words and sentences. The several species of the hyperbaton are, the anastrophe, the hysteron-proteron, the hypallage, synchysis, tmesis, parenthesis, and the hyperbaton strictly so called. See ANASTROPHE, &c.

HYPERBATON, strictly so called, is a long retention of the verb which completes the sentence, as in the following example from Virgil:

Interes Reges: ingenti moele Latinitas
Quadrijuge vestitur eburneum, cui tempora circum
Aurati bis sex radiis, fugit exiguita eburneum
Solis avit specimen: hie in Iturum in alsis
Bina manu lato crispans hastilla ferro:
Hinc Pater Æneas, Romanae stipita origo
Sidereum flagrans clypeo et celestibus armis:
Et justa Ascanium, magae spec altera Rome:
Procedant castra.

HYPERBOLE.
HYPERBOLA, a curve formed by cutting a cone in a direction parallel to its axis. See CONIC SECTIONS.

HYPERBOLA Deficient, is a curve having only one asymptote, though two hyperbolic legs running out infinitely by the side of the asymptote, but contrary ways.

HYPERBOLE, in Rhetoric, a figure, whereby the truth and reality of things are excessively enlarged or diminished. See ORATORY, No. 58.

An object uncommon with respect to size, either very great of its kind or very little, strikes us with surprise; and this emotion forces upon the mind a momentary conviction that the object is greater or less than it is in reality: the same effect precisely attends figurative grandeur or littleness: and hence the hyperbole, which expresses this momentary conviction. A writer, taking advantage of this natural delusion, enriches his description greatly by the hyperbole: and the reader, even in his coolest moments, relishes this figure, being sensible that it is the operation of nature upon a warm fancy.

It cannot have escaped observation that a writer is generally more successful in magnifying by a hyperbole than in diminishing. The reason is, that a minute object contracts the mind, and fetters its powers of imagination; but that the mind, dilated and inflamed with a grand object, moulds objects for its gratification with great facility. Longinus, with respect to a diminishing hyperbole, cites the following ludicrous thought from a comic poet: "He was owner of a bit of ground not larger than a Lacedaemonian letter." But, for the reason now given, the hyperbole has by far the greater force in magnifying objects; of which take the following example:

For all the land which thou seest, to thee will I give it; and to thy seed for ever. And I will make thy seed as the dust of the earth: so that if a man can number the dust of the earth, then shall thy seed also be numbered. Gen. xiii. 15, 16.

Ila cel intacta segetis per summum volaret
Gramina, nec teneras cursus laxisset undas.

—Ateque imo barathri ter gurgite vastos
Sorbet in abruptum fluctus, sursumque sub auras
Erigit altumos, et sidera verberat unda.

—Horrificis justa tanat Aetna ruinis,
Interdumque atrim prorumpit et aethera nubem,
Turbine fulmanem piceo et candidentia favilla:
Attollitque globos flammarum, et sidera lambit.

—Ipse arduus, altoque pulsat
Sidera.

—When he speaks,
The air, a charter'd libertine, is still.

Henry V. act i. sc. 1.

Now shield with shield, with helmet helmet clos'd,
To arm'our arm'our, lance to lance oppos'd,

Host against host with shadowy squadrons draw,
The sounding darts in iron tempests flew,
Victors and vanquish'd join promissuous cries,
And shrillings shouts and dying groans arise;
With streaming blood the slipp'ry fields are dy'd,
And slaughter'd heroes swell the dreadful tide.

Iliad, iv. 508.

Quintilian is sensible that this figure is natural: "For (says he), not contented with truth, we naturally incline to augment or diminish beyond it; and for that reason the hyperbole is familiar even among the vulgar and illiterate;" and he adds, very justly, "That the hyperbole is then proper, when the object of itself exceeds the common measure." From these premises, one would not expect the following inference, the only reason he can find for justifying this figure of speech, Concebi enim amplius dicere, quid dici quantum est, non potest: meliusque ultra quam estra stat oratio." (We are indulged to say more than enough, because we cannot say enough; and it is better to be above than under). In the name of wonder, why this slight and childish reasoning, when immediately before he had observed, that the hyperbole is founded on human nature? We could not resist this personal stroke of criticism; intended not against our author, for no human creature is exempt from error; but against the blind veneration that is paid to the ancient classic writers, without distinguishing their blemishes from their beauties.

Having examined the nature of this figure, and the principle on which it is erected, let us proceed to the rules by which it ought to be governed. And, in the first place, it is a capital fault to introduce an hyperbole in the description of an ordinary object or event; for in such a case, it is altogether unnatural, being destitute of surprise, its only foundation. Take the following instance, where the subject is extremely familiar, viz. swimming to gain the shore after a shipwreck.

I saw him beat the surges under him,
And ride upon their backs: he trade the water;
Whose enmity he flung aside, and breathed
The surge most swoln that met him: his bold head
Bove the contentious waves be kept, and oar'd
Himself with his good arms, in lusty strokes
To th' shore, that o'er his wave-born basis hov'd,
As stooping to relieve him. Tempest, act ii. sc. 1.

In the next place, it may be gathered from what is said, that an hyperbole can never suit the tone of any dispassionate passion: sorrow in particular will never prompt such a figure; and for that reason the following hyperboles must be condemned as unnatural:

K. Rich. Amnerle, thou weep'st, my tender-hearted cousin!
We'll make foul weather with despised tears:
Our sighs, and they, shall lodge the summer-corn,
And make a deafth in this revolving land.

Richard II. act iii. sc. 6.

Draw them to Tyber's bank, and weep your tears
Into the channel, till the lowest stream
Do kiss the most exalted shore of all.

Julius Caesar, act i. sc. 1.
HYPERBOLAE.

Thirdly, A writer, if he wish to succeed, ought always to have the reader in his eye: he ought, in particular, never to venture a bold thought or expression, till the reader be warmed and prepared. For this reason, an hyperbole in the beginning of a work can never be in its place.

Example:

Jām panca aratro jugera regiae

In the fourth place, The nicest point of all is, to ascertain the natural limits of an hyperbole, beyond which being overstrained, it has a bad effect. Longinius (chap. iii.) with great propriety of thought, enters a caveat against an hyperbole of this kind: he compares it to a bow-string, which relaxes by overstraining, and produceth an effect directly opposite to what is intended. To ascertain any precise boundary, would be difficult, if not impracticable. We shall therefore only give a specimen of what may be reckoned overstrained hyperboles. No fault is more common among writers of inferior rank; and instances are found even amongst those of the finest taste; witness the following hyperbole, too bold even for an Hotspur.

Hotspur talking of Mortimer:

In single opposition hand to hand,
He did confound the best part of an hour
In changing hardiment with great Glendower.

Three times they breath'd, and three times did they drink,
Agreement of swift Severn's flood:
Who then allrighted with their bloody looks,
Ran fearfully among the trembling reeds,
And hid his crept-head in the hollow bank,

Blood-stained with there valiant combats.

First Part Henry IV. act i. sc. 4.

Speaking of Henry V.

Eagland ne'er had a king until this time.
Virtue he had, deserving to command;
His brandish'd sword did blind men with its beams:
His arms spread wider than a dragon's wings:
His sparkling eyes, replete with awful fire,
More dazzled, and drove back his enemies,
Than mid-day sun fierce bent against their faces.

What should I say? his deeds exceed all speech.
He never lifted up his hand but conquer'd.

First Part Henry VI. act i. sc. 1.

Lastly, an hyperbole, after it is introduced with all advantages, ought to be comprehended within the fewest words possible: as it cannot be refus'd but in the hurry and swelling of the mind, a leisurely view dissolves the charm, and discovers the description to be extravagant at least, and perhaps also ridiculous. This fault is palpable in a sonnet which passes for one of the most complete in the French language: Phillis, in a long and florid description, is made as far to outshine the sun as he outshines the stars:

Le silence regnoit sur la terre et sur l'onde,
L'air devenoit lourd et l'Olym vermeil,
Et l'amoureux Zéphyr affranchi du sommeil,
Resserloit les fleurs d'une baleine feconde.

HYPERBOREAN, in the Ancient Geography.

The ancients denominated those people and places Hyperborean which were to the northward of the Scythians. They had but very little acquaintance with these Hyperborean regions; and all they tell us of them is very precarious, much of it false. Diodorus Siculus says, the Hyperboreans were thus called by reason they dwelt beyond the wind Boreas; the, signifying, "above or beyond," and Boreas, Boreas, the "north wind." This etymology is very natural and plausible; notwithstanding all that Rudbeck has said against it, who would have the word to be Gothic, and to signify mobility. Herodotus doubts whether or not there were any such nations as the Hyperborean. Strabo, who professes that he believes there are, does not take hyperborean to signify beyond Boreas or the north, as Herodotus understood it; the proposition is, in this case, he supposes only to help to form a superlative; so that hyperborean, on his principles, means no more than most northern; by which it appears the ancients scarce knew themselves what the name meant.—Most of our modern geographers, as Hoffman, Cellarius, &c. have placed the Hyperboreans in the northern parts of the European continent, among the Siberians and Samoieds: according to them, the Hyperboreans of the ancients were those in general who lived farthest to the north. The Hyperboreans of our days are those Russians who inhabit between the Volga and the White sea. According to Cluver, the name Celts was synonymous with that of Hyperboreans.

HYPERCATALECTIC, in the Greek and Latin poetry, is applied to a verse that has one or two syllables too much, or beyond the regular and just measure; as,

Muses sorores sunt Minerva:

Also,

Muses sorores Palladis lugent.

HYPERCRITIC, an over-rigid censor or critic: one who will let nothing pass, but animadverts severely on the slightest fault. See CRITICISM. The word is compounded of óver, super, "ever, above, beyond," and kritikos, of kritikos, judge, of a, judeo, "I judge."

HYPERDULIA,
HYPERDULIA, in the Roman theology, is the worship rendered to the holy virgin. The word is Greek, ἱππόδολος, composed of ἵππος, horse, and ὁδός, way, signifying service. The worship offered to saints is called dolia; and that to the mother of God, hyperdulia, as being superior to the former.

HYPERIA, in Ancient Geography, the seat of the Phœcians near the Cyclops, (Homer;) some commentators take it to be Camarina in Sicily; but, according to others, it is supposed to be an adjoining island, which they take to be Malta, lying in sight of Sicily. And this seems to be confirmed by Apollonius Rhodius. Whence the Phœcians afterwards removed to Coreya, called Scheria, Phœacia, and Macris; having been expelled by the Phœcians, who settled in Malta for commerce, and for commodious harbours, before the war of Troy, (Diodorus Siculus.)

HYPERICUM, St John's Wort, a genus of plants belonging to the polygalae class, and in the natural method ranking under the 20th order, Rosaceae. See Botany Index.

HYPERIDES, an orator of Greece, was the disciple of Plato and Isocrates, and governed the republic of Athens. He defended with great zeal and courage the liberties of Greece; but was put to death by Antipater's order, 352 B.C. He composed many orations, of which only one now remains. He was one of the ten celebrated Greek orators.

HYPERMESTRA, in fabulous history, one of the fifty daughters of Danaus king of Argos. She alone refused to obey the cruel order. Danaus had given to all his daughters, to murder their husbands the first night of their marriage; and therefore saved the life of Lynceus, after she had made him promise not to violate her virginity. Danaus, enraged at her disobedience, confined her closely in prison, whence Lynceus delivered her some time after.

HYPERSEARCOYSIS, in Medicine and Surgery, an excess of flesh, or rather a fleshy excrement, such as those generally rising upon the lips of wounds, &c.

HYPHEN, an accent or character in grammar, implying that two words are to be joined, or connected into one compound word, and marked thus: as pre-established, five-leaved, &c. Hyphens also serve to connect the syllables of such words as are divided by the end of the line.

HYPNOTIC, in the Materia Medica, such medicines as any way produce sleep, whether called narcotics, hypnoses, soporiferous, or soporifics.

HYPNOTICUS SERPENS, the Sleep-snake, in Zoology, the name of an East Indian species of serpent, called by the Ceylonese nintipolong, a word importing the same sense. It is of a deep blackish brown, variegated with spots of white, and is a very fatal kind in its poison: its bite is said brings on a sleep which ends in death; hence this trivial name.

HYPNUM, Feather-moss, a genus of plants of the natural order of musci, belonging to the cryptogamic class. See Botany Index.

HYPO, a Greek particle, retained in the composition of divers words borrowed from that language; literally denoting under, beneath.—In which sense it stands opposed to ὑπάρχω, supra, "above."

HYPOBOLIC, or Subjection, (from ὑπό, and βολή, I cast,) in Rhetoric, a figure, so called, when several things are mentioned, that seem to make for the contrary side, and each of them refuted in order. This figure, when complete, consists of three parts; a proposition, an enumeration of particulars with their answer, and a conclusion. Thus Cicero, upon his return from banishment, vindicates his conduct in withdrawing so quietly, and not opposing the fact that ejected him. See Oratory, No. 81.

HYPOCATARTHARIS (composed of ὑπό, under, and καθαρός, I purge), in Medicine, a too faint or feeble purgation.

HYPOCASTAUS, among the Greeks and Romans, a subterraneous place, where was a furnace to heat the baths. The word is Greek, formed of the preposition ὑπό, under; and the verb καθαρός, to burn. Another sort of hypocaustus was a kind of kiln to heat their winter parlours. The remains of a Roman hypocaustus, or sweating-room, were discovered under ground at Lincoln in 1739. We have an account of these remains in the Philosophical Transactions, No. 461. § 29.—Among the moderns, the hypocaustus is that place where the fire is kept which warms a stove or hot-house.

HYPOCAVÆRIS, Hawk's-eye, a genus of plants belonging to the syngeacia class, and in the natural method ranking under the 49th order, Compositae. See Botany Index.

HYPOCHONDRIA, in Anatomy, a space on each side the epigastria, or upper part of the abdomen. See Anatomy, No. 88.

HYPOCHONDRIAC PASSION, a disease in men, similar to the hysterical affection in women. See Medicine Index.

HYPOCISTIS, in the Materia Medica, an inspired juice obtained from the sessile asarum, much resembling the true Egyptian ascaris. They gather the fruit while unripe, and express the juice, which they evaporate over a very gentle fire, to the consistency of an extract, and then form into cakes, and expose them to the sun to dry. It is an astringent of considerable power; is good against diarrhoea and haemorrhages of all kinds; and may be used in repellent gargarisms in the manner of the true ascaris; but it is very rarely met with genuine in our shops, the German ascaris being usually sold under its name.

HYPOCRISY, ὑποκρισία, in Ethics, denotes dissimulation with regard to the moral or religious character. In other words, it signifies one who feigns to be what he is not; and is generally applied to those who assume the appearances of virtue or religion, without having anything in reality of either.

HYPOÆGÆ, ὑπόγεια, formed of ὑπό, under, and γῆ, earth, in the ancient architecture, is a name common to all the parts of a building that are underground; as the cellar, butteries, and the like places. The term hypogeum was used by the Greeks and Romans for subterraneous tombs in which they buried their dead.

HYPOÆGÆUM, in Astrology, is a name given to the celestial houses which are below the horizon: and especially the imum caeli, or bottom of heaven.

HYPOGASTRIC, an appellation given to the internal branch of the iliac artery.

HYPOGASTRIUM, in Anatomy, the middle part of
of the lower region of the belly. See Anatomy, 88.

HYPOGLOSSI EXTERNI, or MAJORES, in Anatomy, the ninth pair of nerves, called also linguales and gustatorii. See Anatomy.

HYPOGLOSSIS, or HYPOGLOSSIS, (composed of in, under, and glosa, tongue), in Anatomy, is a name given to two glands of the tongue. There are four large glands of the tongue; two of them called hypoglotides, situated under it, near the vein ranulana: one on each side of the tongue. They serve to secrete a kind of serous matter of the nature of saliva, which is discharged into the mouth by little ducts near the gums.

HYPOGLOSSIS, or Hypoglossis, in Medicine, denotes an inflammation or ulceration under the tongue; called also ranula.

HYPOPYON, in Medicine, a collection of purulent matter under the corner of the eye.

HYPOSCEMUM, in antiquity, a partition under the pulpit or logeum of the Greek theatre, appointed for the music.

HYPOSTASIS, a Greek term, literally signifying substance, or subsistence; used in theology for person.
The word is Greek, ἰδρύμα; compounded of ἴδε, sub, "under;" and ἔσχη, st, exist. "I stand, I exist." q. d. sub sistentia. Thus we hold, that there is but one nature or essence in God, but three hypostases or persons.

The term hypostasis is of a very ancient standing in the church. St Cyril repeats it several times, as also the phrase union according to hypostasis. The first time it occurs is in a letter from that father to Nestorius, where he uses it instead of συνοικία, the word we commonly render person, which did not seem expressive enough. "The philosophers (says St Cyril) have allowed three hypostases: They have extended the Divinity to three hypostases: They have even sometimes used the word trinity: And nothing was wanting but to have admitted the consubstantiality of the three hypostases, to show the unity of the divine nature, exclusive of all triplicity in respect of distinction of nature, and not to hold it necessary to conceive any respective inferiority of hypostases."

This term occasioned great dissensions in the ancient church; first among the Greeks, and afterwards also among the Latins. In the council of Nice, hypostasis was defined to denote the same with essence or substance; so that it was heresy to say that Jesus Christ was of a different hypostasis from the Father; but custom altered its meaning. In the necessity they were under of expressing themselves strongly against the Sabellians, the Greeks made choice of the word hypostasis, and the Latins of persona; which change proved the occasion of endless disagreement. The phrase ἰδρύμα, used by the Greeks, scandalized the Latins, whose usual way of rendering ἰδρύμα in their language was by substantia. The barrenness of the Latin tongue in theological phrases, allowed them but one word for the two Greek ones, ἰδρύμα and ἰδρύμα; and thus disabled them from distinguishing essence and hypostasis. For which reason they chose rather to use the term tres personae, and tres hypostases. — An end was put to logomachia, in a synod held at Alexandria, about the

Vol. XI. Part I. year 362, at which St Athanasius assisted; from which hypostasis time the Latins made no great scruple of saying tres hypostases, nor the Greeks of three persons.

HYPOTHETICA, in the Civil Law, an obligation, whereby the effects of a debtor are made over to his creditor, to secure his debt. The word comes from the Greek δόγμα, a thing subject to some obligation; of the verb δογμάζω, suppose, "I am rejected," of υπό, under, and ἄνα, ano, "I put."

As the hypotheca is an engagement procured on purpose for the security of the creditor, various means have been made use of to secure to him the benefit of the convention. The use of the pawn or pledge is the most ancient, which is almost the same thing with the hypotheca; all the difference consisting in this, that the pledge is put into the creditor’s hands; whereas, in a simple hypotheca, the thing remained in the possession of the debtor. It was found more easy and commodious to engage an estate by a civil covenant than by an actual delivery; accordingly the expedient was first practised among the Romans; and from them the Romans borrowed both the name and the thing: only the Greeks, the better to prevent frauds, used to fix some visible mark on the thing, that the public might know it was hypothecate or mortgaged by the proprietor; but the Romans, looking on such advertisements as injurious to the debtor, forbade the use of them.

The Roman lawyers distinguished four kinds of hypothecas: the conventional, which was with the will and consent of both parties; the legal, which was appointed by law, and for that reason called tacit; the prior’s pledge, when by the flight or non-appearing of the debtor, the creditor was put in possession of his effects; and the judiciary, when the creditor was put in possession by virtue of a sentence of the court.

The conventional hypotheca is subdivided into general and special. The hypotheca is general, when all the debtor’s effects, both present and future, are engaged to the creditor. It is special, when limited to one or more particular things.

For the tacit hypotheca, the civilians reckon no less than twenty-six different species thereof.

HYPOTHENOUSA, in Geometry, the longest side of a right-angled triangle, or that which subtends the right angle.

HYPOTHESIS, formed of ὑπό, "under," and σύν, posito, of συγκρίτω, ἑπονοο, "I put"); is a proposition or principle which we suppose, or take for granted, in order to draw conclusions for the proof of a point in question.

In disputation, they frequently make false hypotheses, in order to draw their antagonists into absurdities; and even in geometry truths are often deducible from such false hypotheses.

Every conditional or hypothetical proposition may be distinguished into hypothesis and thesis: the first rehearses the conditions under which any thing is affirmed or denied; and the latter is the thing itself affirmed or denied. Thus, in the proposition, a triangle is half of a parallelogram, if the bases and altitudes of the two be equal; the latter part is the hypothesis, "if the bases," &c. and the former a thesis, "a triangle is half a parallelogram."

In strict logic, we are never to pass from the hypo-
HYPOTHESIS thesis to the thesis; that is, the principle supposed must be proved to be true, before we require the consequence to be allowed.

HYPOTRACHELION, in Architecture, is used for a little frieze in the Tuscan and Doric capital, between the astragal and assaulets; called also the colerin and gogerin. The word is applied by some authors in a more general sense, to the neck of any column, or that part of its capital below the astragal.

HYPOXIS, a genus of plants belonging to the hexandria class, and in the natural method ranking under the 10th order, Coronarias. See Botany Index.

HYPSISTARIUS, (formed from ὑψίστας, "highest"), a sect of heretics in the fourth century; thus called from the profession they made of worshipping the most high God.

The doctrine of the Hypsistarians was an assemblage of Paganism, Judaism, and Christianity. They adored the most high God with the Christians; but they also revered fire and lamps with the heathens; and observed the sabbath, and the distinction of clean and unclean things with the Jews.

The Hypsistarii bore a near resemblance to the Faustites, or Mazzalians.

HYRCANIA, in Ancient Geography, a country of the farther Asia, lying to the south-east of the Morea Hyrcanum or Caspium; with Media on the west, Parthia on the south, and Margiana on the east. Famous for its tygers (Virgil); for its vines, figs, and olives, (Strabo).

HYRCANIA, in Ancient Geography, a town of Lydia, in the campus Hyrcanum, near Thyatira; so called from colonists brought from Hyrcania, a country lying to the south of the Caspian sea. The people called Hyrcani Macedones, because a mixed people (Pliny).—Another Hyrcania, the metropolis of the country called Hyrcania. Thought to be the Tape of Strabo, the Syninx of Polybius, the Zeudracaria of Arrian, and the Assae of Isidorus Characenus.—A third, a strong place of Judæa, built by Hyscanus.

HYSSOP. See Hyssopus.

Hedge Hyssop. See Gratiola.

HYSSOPUS, Hyssop, a genus of plants belonging to the didynamia class. See Botany and Materia Medica Index.

HYSTERIC AFFECTION, or Passion, (formed of ὑστερεσκόμενος, "womb"); a disease in women, called also suffocation of the womb, and vulgarly, fits of the mother. It is a spasmodico-convulsive affection of the nervous system, proceeding from the womb; for the symptoms and cure of which, see Medicinal.

HYSTERON PROTERON, in Grammar and Rhetoric, a species of the hyperbaton, wherein the proper order of construction is so inverted, that the part of any sentence which should naturally come first is placed last: as in this of Terence, Vaeat et ivivit, for ivivit et vaelet; and in the following of Virgil, Moriamur, et in media arma ruamus, et moriamur.

HYSTRIX, or Porcupine, a genus of quadrupeds belonging to the order of glires. See Mammalia Index.
or i, the ninth letter and third vowel of the alphabet, is pronounced by throwing the breath suddenly against the palate, as it comes out of the larynx with a small hollowing of the tongue, and nearly the same opening of the lips as in pronouncing a or e. Its sound varies: in some words it is long, as high, mind, &c.; in others short, as bid, hid, sin, &c.; in others, again, it is pronounced like y, as in collar, onion, &c.; and in a few, it sounds like ee, as in machine, magazine, &c. No English word ends in i, e being either added to it, or else the s turned into y.

But besides the vowel there is the jod consonant; which because of its different pronunciation, has likewise a different form, thus J. I. In English, it has the soft sound of g; nor is it used, but when g soft is required before vowels, where g is usually hard: thus we say, jack, jet, jain, &c. instead of gock, get, goun, &c. which would be contrary to the genius of the English language.

I, used as a numeral, signifies one, and stands for so many units as it is repeated times; thus I, one; II, two; III, three; &c. and when put before a higher numeral, it subtracts itself, as IV, four, IX, nine, &c. But, when set after it, so many are added to the higher numeral as there are I's added: thus VI is 5 + 1, or six; VII, 5 + 2, or seven; VIII, 5 + 3, or eight. The ancient Romans likewise used I for 100, CI for 1000, CCC for 3000, CCCC for 4000. Farther than this, as Pliny observes, they did not go in their notation; but when necessary repeated the last number, as CCCCCC CCCCCC for 500,000; CCCCCC CCCCCC for 600,000; CCCCCC CCCCCC for 700,000; and so on.

The ancients sometimes changed i into u; decimus for decimus; maximus for maximum, &c.

According to Plato, the vowel i is proper to express delicate but humble things, as in this verse in Virgil which abounds in i's; and is generally admired:

Accipiant inimicum imbrem, rimisque fatiscunt.

I, used as an abbreviation, is often substituted for the whole word Jesus, of which it is the first letter.

JABBOK, a brook on the other side of the Jordan, the spring whereof is in the mountains of Gilead. It falls into Jordan pretty near the sea of Tiberias, to the south of this sea. Near this brook the patriarch Jacob wrestled with the angel (Gen. xxxii. 22.). The Jabbok separated the land of the Ammonites from the Gabetenes, and the territories of Og king of Bashan.

JABESH, or Jabesh-Gilead, was the name of a city in the half tribe of Manasseh, beyond Jordan. The scripture calls it generally Jabesh-Gilead, because it lay in Gilead, at the foot of the mountains which go by this name. Eusebium places it six miles from Pella, towards Gerasa; and consequently it must be eastward of the sea of Tiberias.

JABIRU. See MYCTERIA, Ornithology Index.

JABLONSKI, Daniel Ernest, a learned Polish Protestant divine, born at Dantzick in 1660. He became successively minister of Magdeburg, Lisa, Koningberg, and Berlin; and was at length ecclesiastical counsellor, and president of the academy of sciences at Jablonski the latter. He took great pains to effect an union between the Lutherans and Calvinists; and wrote some works which are in good esteem, particularly Meditations on the origin of the Scriptures, &c. He died in 1741.

JABLONSKI, Theodore, counsellor of the court of Prussia, and secretary of the royal academy of sciences in Berlin, was also a man of distinguished merit. He loved the sciences, and did them honour, without that ambition which is generally seen in men of learning; it was owing to this modesty that the greatest part of his works were published without his name. He published, in 1715, a French and German Dictionary; a Course of Morality, in 1713; a Dictionary of Arts and Sciences, 1721; and translated Tacitus de moribus Germanorum into High Dutch, in 1724.

JABNE, in Ancient Geography, a town of Palestine, near Joppa; called Jamnia or Jamnial, by the Greeks and Romans. In Joshua xv. it seems to be called Jabneh; but in a Chron. xxi. Jabnae. It was taken from the Philistines by Uzziah, who demolished its fortifications. Its port, called Jammitars portus, lay between Joppa and Azotus.

JACAMAR. See ALCEO, Ornithology Index.

JACCA, an ancient town of Spain, in the kingdom of Aragon, with a bishop's see, and a port; seated on a river of the same name among the mountains of Jacca, which are part of the Pyrenees. W. Long. o. 19. N. Lat. 42. 26.

JACK, in Mechanics, a well-known instrument of common use for raising great weights of any kind.

The common kitchen-jack is a compound engine, where the weight is the power applied to overcome the friction of the parts and the weight with which the spit is charged; and a steady and uniform motion is obtained by means of the fly.

Jack, in the sea language, a sort of flag or colours, displayed from a mast erected on the outer end of a ship's bowsprit. In the British navy the jack is nothing more than a small union flag, composed of the intersection of the red and white crosses; but in merchant-ships this union is bordered with a red field. See the article Union.

Jack, used also for a horse or wooden frame to saw timber upon; for an instrument to pull off a pair of boots; for a great leathern pitcher to carry drink in; for a small bowl that serves as a mark at the exercise of bowling; and for a young pike.

Jack-Flag, in a ship, that which is hoisted up at the sprit-sail top-mast head.

Jack-Daw, the English name of a species of corvus. See CORVUS, Ornithology Index.

This bird is very mischievous to the farmer and gardener; and is of such a thievish disposition, that he will carry away much more than he can make use of. There is a method of destroying them by a kind of springes much used in England; and is so useful, that it ought to be made universal. A stake of about five feet long is to be driven firmly into the ground, and made so fast that it cannot move, and so sharp in the
JAC

the point that the bird cannot settle upon it. Within a foot of the top there must be a hole bored through it, of three quarters of an inch diameter; through this hole is to be put a stick of about eight inches long; then a horse-hair spring or noose is to be made fast to a thin hazel wand, and this brought up to the place where the short stick is placed, and carried with it through the hole, the remainder being left open under that stick. The other end of the hazel rod is to be put through a hole in the stake near the ground, and fastened there. The stake is to be planted among the jack-daw's food, and he will naturally be led to settle on it; but finding the point too sharp, he will descend to the little cross stick. This will sink with his weight, and the spring will receive his leg, and hold him fast.

JACKALL, in Zoology. See Canis, Mammalia Index.

JACOB, the son of Isaac and Rebekah, was born in the year of the world 2168, before Jesus Christ 1836. The history of this patriarch is given at large in the book of Genesis. He died in Egypt in the 147th year of his age. Joseph directed that the body should be embalmed, after the manner of the Egyptians; and there was a general mourning for him throughout Egypt for seventy days. After this, Joseph and his brethren, accompanied with the principal men of Egypt, carried him, with the king of Egypt's permission, to the burying-place of his fathers near Hebron, where his wife Leah had been interred. When they were come into the land of Canaan, they mourned for him again seven days; upon which occasion the place where they stood was called Abel-mizraim, or the mourning of the Egyptians.

JACOB, Ben Hajim, a rabbi famous for the collection of the Masorah in 1525; together with the text of the bible, the Chaldaic paraphrase, and Rabbinical commentaries.

JACOB, Ben Naphtali, a famous rabbi of the 5th century; he was one of the principal masseors, and bred at the school of Tiberias in Palestine with Ben Aser, another principal masseor. The invention of points in Hebrew to serve for vowels, and of accents to facilitate the reading of the language, are ascribed to these two rabbis; and said to be done in an assembly of the Jews held at Tiberias, A.D. 476.

JACOBINE MONKS, the same with Dominicans.

JACOBINES, the name assumed by a party or club at the beginning of the French revolution, composed of members of the national assembly. The club held its meetings in the hall belonging to the Jacobin friars, from which it derived its name. For an account of the views and influence of the Jacobin club in the French revolution, see France.

JACOBITES, a term of reproach bestowed on the persons who, vindicating the doctrines of passive obedience and non-resistance with respect to the arbitrary proceedings of princes, disavow the revolution in 1688, and assert the supposed rights, and adhere to the interests, of the late abdicated King James and his family.

JACOBITES, in church history, a sect of Christians in Syria and Mesopotamia; so called, either from Jacob a Syrian who lived in the reign of the emperor Mauritius, or from one Jacob a monk who flourished in the year 550.

The Jacobites are of two sects, some following the rites of the Latin church, and others continuing separated from the church of Rome. There is also a division among the latter, who have two rival patriarchs. As to their belief, they hold but one nature in Jesus Christ; with respect to purgatory and prayers for the dead, they are of the same opinion with the Greeks and other Eastern Christians; they consecrate unleavened bread at the eucharist, and are against confession, believing that it is not of divine institution.

JACOBUS, a gold coin, worth 25 shilling; so called from King James I. of England, in whose reign it was struck. See Coin.

We usually distinguish two kinds of Jacobus, the old and the new; the former valued at 23 shillings, weighing six penny-weights ten grains; the latter, called also Carolus, valued at 23 shillings, in weight five penny-weights twenty grains.

JAQUIN, a genus of plants belonging to the hexandria class, and in the natural method ranking with those of which the order is doubtful. See Botany Index.

JACULATOR, or Shooting-Fish. See Chato-don, Ichthyology Index.

JADDESSES is the name of an inferior order of priests in Ceylon, who have the care of the chapels appropriated to the genii, who form a third order of gods among these idolaters. These priests are applied to by the people in a time of disease or calamity, who offer a cock on their behalf to appease the anger of the demons.

JADE-STONE, or Lapis Nephriticus, a species of Mineral. See Mineralogy Index.

JAFFA, an ancient town of Asia in Palestine, formerly called Joppa. Its former grandeur is now greatly diminished. It is situated 40 miles north-west of Jerusalem. It has long been a favourite resort of pilgrims proceeding to Jerusalem. It was taken by the French under Bonaparte, in February 1799, but afterwards re-taken and fortified. E. Long. 35° 0′. N. Lat. 32° 16′.

JAFFATIEN ISLANDS, the name of four islands in the Red sea, visited by Mr Bruce in his travels. They are joined together by shoals or sunk rocks, are crooked, or bent like half a bow, and are dangerous for ships in the night-time, because there seems to be a passage between them, to which, while the pilots are paying attention, they neglect two small sunk rocks which lie almost in the middle of the entrance in deep water.

JAFNAPATAN, a sea-port town, seated at the north-east end of the island of Ceylon in the East Indies. The Dutch took it from the Portuguese in 1638, but it is now with the rest of the island in possession of the British. They export from thence great quantities of tobacco, and some elephants, which are accounted the most docile of any in the whole world. E. Long. 80° 25′. N. Lat. 9° 40′.

JAGENDORF, a town and castle of Silisia, capital of a province of the same name, seated on the river Opper. E. Long. 17° 47′. N. Lat. 50° 4′.

JAGGERNAUT, a black pyramidal stone worshipped by the Gentoos, who pretend that it fell from heaven, or was miraculously presented on the place where their temple stands. There are many other idols of this figure in India; which, however, are all but
JAGHIRE, an assignment made in Bengal by an imperial grant upon the revenue of any district, to defray civil or military charges, pensions, gratuities, &c.

JAGHIREDER, the holder of a jaghire.

JAGO, RICHARD, an ingenious poet, was vicar of Snitterfield in Warwickshire, and rector of Kincton in Leicestershire. He was the intimate friend and correspondent of Mr Shenstone, contemporary with him at Oxford, and, it is believed, his school-fellow; was of University college; took the degree of M. A. July 9, 1739; was author of several poems in the 4th and 5th volumes of Dodson's Poems: published a sermon, in 1755, on the Causes of Impenitence considered, preached May 4, 1755, at Harbury in Warwickshire, where he was vicar, on occasion of a conversation said to have passed between one of the inhabitants and an apparition in the church-yard there; wrote "Edge-hill," a poem, for which he obtained a large subscription in 1767; and was also author of "Labour and Genius," 1768, 4to, of "The Blackbirds," a beautiful elegy in the Adventurer; and of many other ingenious performances. He died May 28, 1778.

St Jago, a large town of South America, which rises in the province of Quito in Peru. It is navigable; and falls into the South sea, after having watered a fertile country abounding in cotton-terres, and inhabited by wild Americans.

61 Jago, the largest, most populous, and fertile of the Cape Verd islands, on the coast of Africa, and the residence of the Portuguese viceroy. It lies about 13 miles eastward from the island of Mayo, and abounds with high barren mountains; but the air, in the rainy season, is very wholesome to strangers. Its produce is sugar, cotton, wine, and some excellent fruits. The animals are black cattle, horses, asses, deer, goats, hogs, civet-cats, and some very pretty green monkeys with black faces.

Sir George Staunton, in the account which he gives of this island, observes, that it is liable to long and excessive droughts, for which it is perhaps impossible to assign any philosophical cause. It was in a state of absolute famine at the end of 1792, when visited by the embassy to China, and the waters of the rivers were almost dried up. The surface of the earth was devoid of herbage, the cattle had nearly all perished, as much from the want of food as from drought.

"What were the uncommon circumstances (says Sir George) that took place in the atmosphere of that part of Africa to which the Cape de Verd islands lie contiguous, or in the vast expanses of continent extending to the east behind it, and from which this direful effect must have proceeded (as they happened where no man of science existed to observe or to record them), will remain unknown, nor is theory bold enough to supply the place of observation. Whatever was the cause which thus arrested the bountiful hand of nature, by drawing away the sources of fertility, it was observable, that some few trees and plants preserved their luxuriance, indicating that they still could extract from the arid earth whatever portion of humidity it was necessary to derive from thence for the purpose of vegetable life, though it was denied to others."

Beside palm trees, frequently found verdant amidst burning sands, nothing could be more rich in flavour, or abound more with milky though corrosive juice, than the asclepias gigantea, growing plentifully without culture, but undisturbed. The physic nut tree appeared as if its perpetuity was not to be affected by any drought. Some species of mimosa, or sensitive plant, were most common, and did not appear to languish.

But the annual produce of agriculture had almost wholly disappeared, and the sugar canes had little resemblance to any thing like vegetation. Yet vegetation quickly revived whenever any moisture could be conveyed through the soil.

The residence of the viceroy is represented by Sir George as a hamlet, consisting of 100 small dwellings, only one story high, scattered nearly a mile in length, and one-third as much in breadth. Not being commanded by any eminence, it was a situation which admitted of defence, yet the fort was nearly in ruins, and the few guns mounted on it were mostly honey-combed. Amidst the ruins of St Jago, was found a Portuguese, to whom one of the party was recommended, by whom they were hospitably received, and treated with every species of tropical fruits from his garden.

St Jago, a handsome and considerable town of South America, the capital of Chili, with a good harbour, a bishop's see, and a royal audience. It is seated in a large and beautiful plain, abounding with all the necessaries of life, at the foot of the Cordilleras, on the river Mapocho, which runs across it from east to west.
Here are several canals and dykes, by means of which they water the gardens and cool the streets. It is very much subject to earthquakes. W. Long. 69° 35' S. Lat. 33° 40'.

St Jago de Cuba, a town situated on the southern coast of the island of Cuba, in the bottom of a bay, with a good harbour, and on a river of the same name. W. Long. 75° 44' N. Lat. 20° 0'.

Jago de los Cañoneros, a town of America, and one of the principal of the island of Hispaniola. It is seated on the river Yaque, in a fertile soil, but bad air. W. Long. 70° 5' N. Lat. 19° 40'.

St Jago del Entero, a town of South America, one of the most considerable of Tucuman, and the usual residence of the inquisitor of the province. It is seated on a large river, in a flat country, where there is game, tygers, guanacos, commonly called camel-sheep, &c.

Jago de la Vega, otherwise called Spanish-town, is the capital of the island of Jamaica, in the West Indies; and stands in 18° 1' north latitude, and 76° 45' west longitude. It is about a mile in length, and little more than a quarter of a mile in breadth, and contains about 6000 inhabitants of all colours and denominations. This town is situated in a delightful plain on the banks of the Rio Cobre, 13 miles from Kingston, and 10 from Port Royal. It is the residence of the commander in chief; and here the supreme court of judicature is held, four times in the year, viz. on the last Tuesdays of February, May, August, and November, and sits three weeks. St Jago de la Vega is the county-town of Middlesex, and belongs to the parish of St Catherine.

JAGUAR, or Jaugar, a name given to the Brasilian ounce, a species of Felis. See Felis, Mammalia Index.

JAGUEIR, in East India affairs, any pension from the Grand Mogul, or king of Delhi; generally such as are assigned for military services.

JAGUEIRDAR, the holder or possessor of a jaguer. It comes from three Persian words, Jo, "a place;" guerfistun, "to take;" and dastun, "to hold;" guna, "a place-holder or pensioner." In the times of the Mogul empire, all the great officers of the court, called omrads, were allowed jaguers, either in lands of which they collected the revenues, or assignments upon the revenues for specified sums, payable by the lord-lieutenant of a province: which sums were for their maintenance, and the support of such troops as they were necessitated to bring into the field when demanded by the emperor, as the condition of their jaguer, which were always revocable at pleasure.

JAIL-FEVER, a very dangerous distemper of the contagious kind, arising from the putrescent disposition of the blood and juices. See Medicine Index.

JAINS, a religious sect among the Hindoos. See Supplement.

JALAP, the root of a species of convolvulus or bind weed. See Convolvulus, Botany and Materia Medica Index.

JALEMUS, in antiquity, a kind of mournful song, used upon occasion of death, or any other affecting accident. Hence the Greek proverbs had their original, μετ' απαθήσεως, or φαγαθίας, i.e. more sad or colder than a jalemus, as the medical physicmen, worthy to be ranked among jalemeses.

JALOFFS, or YALOFFS, are a warlike people, inhabiting most of that part of Africa, lying between Senegal and the Mandoingo states on the Gambia. Their lips, according to Mr Park, are not so protuberant as those of the generality of Africans; and though their skin is of the deepest black, they are esteemed by the white traders as the most sightly of the negroes in that part of the continent. They are divided into several independent states, and more resemble the Mandoingo than any other nation in their manners and government but much exceed them in the manufacture of cotton cloth, spinning the wool to a finer thread, weaving it in a broader loom, and dying it of a better colour. They make excellent soap, by boiling ground nuts in water, and then adding a ley of wood ashes. They likewise manufacture very good iron, which they carry to Bandore to exchange for salt. Their language, it is said, is copious and significant, and is frequently learned by Europeans trading to Senegal.

A generous disposition, according to the testimony of Mr Park, is said to distinguish them above the generality of savages; they know how to return an act of kindness shown to them by others in distress, and their conduct towards their enemies, in many instances, is said to be worthy of imitation.

JAMADOR, an officer of horse or foot, in Hindostan. Also the head or superintendent of the Peons in the Sichwa or train of any great man.

JAMAICA, an island of the West Indies, the largest of the Antilles, lying between 17° and 19° N. Lat. and between 76° and 79° W. Long.; in length near 120 miles, and about 50 in breadth. It approaches in its figure to an oval. The windward passage right before it hath the island of Cuba on the west, and Hispaniola on the east, and is about 20 leagues in breadth.

This island was discovered by Admiral Christopher Columbus in his second voyage, who landed upon it May 5. 1494; and was so much charmed with it, as always to prefer it to the rest of the islands: in consequence of which, his son chose it for his dukedom. It was settled by Juan de Esquivel, A. D. 1509, who built the town, which, from the place of his birth, he called Seville, and 11 leagues farther to the east stood Melilla. Oriston was on the south side of the island, seated on what is now called Blue Fields River. All these are gone to decay; but St Jago, now Spanish-town, is still the capital. The Spaniards held this country 160 years, and, in their time the principal commodity was cacao; they had an immense stock of horses, asses, and mules, and prodigious quantities of cattle. The English landed here under Penn and Venables, May 11. 1654, and quickly reduced the island. Cacao was also their principal commodity till the old trees decayed, and the new ones did not thrive; and then the planters from Barbadoes introduced sugar-canes, which hath been the great staple ever since.

The prospect of this island from the sea, by reason of its constant verdure, and many fair and safe bays, is wonderfully pleasant. The coast, and for some miles within, the land is low; but removing farther, it rises and becomes hilly. The whole isle is divided by a ridge of mountains running east and west, some rising 3
Jamaica. [ 23 ]

Jamaica.

Jamaica. to a great height; and these are composed of rock and a very hard clay; through which, however, the rains that fall incessantly upon them have worn long and deep cavities, which they call gullies. These mountains, however, are far from being unpleasant, as they are crowned even to their summits with a variety of fine trees. There are also about a hundred rivers that issue from them on both sides: and, though none of them are navigable for any thing but canoes, are both pleasing and profitable in many other respects. The climate, like that of all countries between the tropics, is very warm towards the sea, and in marshy places unhealthy; but in more elevated situations cooler; and, where people live temperately, to the full as wholesome as in any part of the West Indies. The rains fall heavy for about a fortnight in the months of May and October; and, as they are the cause of fertility, are styled seasons. Thunder is frequently heard, and sometimes showers of hail: but ice and snow are never seen, although on the tops of the mountains, and at no very great height, the air is exceedingly cold.

The most eastern parts of this ridge are known under the name of the Blue Mountains, some of which exceed 5000 feet in height. This great chain of rugged rocks defends the south side of the island from those boisterous north-west winds, which might be fatal to their produce. The streams, though small, supply the inhabitants with good water, which is a great blessing, as their wells are generally brackish. The Spaniards were persuaded that these hills abounded with metals: but we do not find that they wrought any mines; or if they did, it was only copper, of which they said the bells in the church of St. Jago were made. They have several hot springs, which have performed great cures. The climate was certainly more temperate before the great earthquake; and the island was supposed to be out of the reach of hurricanes, which since that time it hath severely felt. The heat, however, is very much tempered by land and sea breezes; and it is asserted, that the hottest time of the day is about eight in the morning. In the night, the wind blows from the land on all sides, so that no ships can then enter their ports.

In an island so large as this, which contains above four millions of acres, it may be very reasonably conceived that there are great variety of soils. Some of these are deep, black, and rich, and mixed with a kind of potters earth; others shallow and sandy; and some of a middle nature. There are many savannahs, or wide plains, without stones, in which the native Indians had luxuriant crops of maize, which the Spaniards turned into meadows, and keep in them prodigious herds of cattle. Some of these savannahs are to be met with even amongst the mountains. All these different soils may be justly pronounced fertile, as they would certainly be found, if tolerably cultivated, and applied to proper purposes. A sufficient proof of this will arise from a very cursory review of the natural and artificial produce of this spacious country.

It abounds in maize, pulse, vegetables of all kinds, meadows of fine grass, a variety of beautiful flowers, and as great a variety of oranges, lemons, citrons, and other rich fruits. Useful animals there are of all sorts, horses, asses, mules, black cattle of a large size, and sheep, the flesh of which is well tasted, though their wool is hairy and bad. Here are also goats and hogs in great plenty; sea and river fish; wild, tame, and water fowl. Amongst other commodities of great value, they have the sugar cane, cacao, indigo, pimento, cotton, ginger, and coffee; trees for timber and other uses, such as mahogany, manchineel, white wood which no worm will touch, cedar, olives, and many more. Besides these, they have fustick, red wood, and various other materials for dyeing. To these we may add a multitude of valuable drugs, such as guaiacum, china, sarsaparilla, cassia, tamarind, vanilla, and the prickly-pear or opuntia, which produces the cochineal; with no inconsiderable number of odoriferous gums. Near the coast they have salt-ponds, from which at one time they supplied their own consumption, and might certainly make any quantity they pleased.

As this island abounds with rich commodities, it is happy likewise in having a number of fine and safe ports. Point Morant, the eastern extremity of the island, hath a fair and commodious bay. Old Harbour is also a convenient port, so is Maccary bay, and there are at least twelve more between this and the western extremity, which is Point Negrillo.

The town of Port Royal stood on a point of land running far out into the sea, narrow, sandy, and incapable of producing any thing. Yet the excellence of the port gradually attracted inhabitants, and there were near two thousand houses in the town in its most flourishing state, and which let at high rents. The earthquake by which it was overthrown happened on the 7th of June 1692, and numbers of people perished in it. This earthquake was followed by an epidemic disease, of which upwards of three thousand died: yet the place was rebuilt; but the greatest part was reduced to ashes by a fire that happened on the 9th of January 1703, and then the inhabitants removed mostly to Kingston. It was, however, rebuilt for the third time; and was rising towards its former grandeur, when it was overwhelmed by the sea, August 28. 1722. There is, notwithstanding, a small town there at this day. Hurricanes since that time have often happened, and occasioned terrible devastations.

The island is divided into three counties, Middlesex, Surry, and Cornwall; containing 20 parishes, over which presides a magistrate styled a cawto. The whole contain 36 towns and villages, and 18 churches and chapels. The population in 1787 was estimated at 25,000 negroes, 30,000 whites, 10,000 people of colour, and 1400 maroons; in all 291,400 inhabitants.

In 1812, the number of slaves was 319,912. The number of whites was not published; but estimating it at 40,000, the whole population would be 350,000.

The administration of public affairs is by a governor and council of royal appointment, and the representatives of the people in the lower house of assembly. They meet at Spanish-town, and things are conducted with great order and dignity. The lieutenant-governor and commander in chief has 5000l. currency, or 3571l. 8s. 6d. sterling, besides which, he has a house in Spanish-town, a pen or a farm adjoining, and a po-linl or mountain for provisions; a secretary, an under-secretary, and a domestic chaplain.

The honourable the council consists of a president and
Jamaica, and its members; with a clerk, a chaplain, usher of the black rod, and messenger.

The honourable the assembly consists of 43 members, one of whom is chosen speaker. To this assembly belong a clerk, with 1000l. salary; a chaplain, 150l.; messenger, 700l.; deputy, 140l.; and printer, 200l.

The number of members returned by each parish and county are, for Middlesex, 17, viz. St Catharine 3, St Dorothy 2, St John 2, St Thomas in the Vale 2, Clarence 2, Vere 2, St Mary 2, St Ann 2; For Surrey 16, viz. Kingston 3, Port Royal 3, St Andrew 2, St David 2, St Thomas in the East 2, Portland 2, St George 2; For Cornwall 10, viz. St Elizabeth 2, Westmoreland 2, Hanover 2, St James 2, Trelawney 2.

The high court of chancery consists of the chancellor (governor for the time being), 25 masters in ordinary, and 20 masters extraordinary; a registrar, and clerk of the patents; sergeant at arms, and mace-bearer. The court of vice-admiralty has a sole judge, judge surrogate, and commissary, king's advocate, principal registrar, marshal, and a deputy-marshal. The court of ordinary consists of the ordinary (governor for the time being); and a clerk. The supreme court of judicature has a chief justice, and 16 assistant judges; attorney-general; clerk of the court; clerk of the crown; solicitor for the crown: 33 commissioners for taking affidavits; a provost-marshal-general, and eight deputies; 18 barristers, besides the attorney general and advocate-general; and upward of 120 practising attorneys at law.

The commerce of Jamaica is very considerable, not only with all parts of Great Britain and Ireland, but with Africa, North and South America, the West India islands, and the Spanish main. The ships annually employed are upwards of 500 sail.

The average expense of the cultivation of sugar is 20s. 10d. per cwt. independent of the interest of capital and produce of rum. The works necessary for making 200,000 lbs. of sugar annually cost 10,000l. Jamaica currency; and an estate producing such a quantity requires 40,000l. to establish it, viz. 250 negroes, at 70l.

A comparative view between the years 1768 and 1786.

The revenues of the island amount to about 300,000 annually, Jamaica currency. They are derived from taxes, consisting chiefly of a duty on negroes imported, an excise on rum, &c. a poll tax on slaves and stock, and a rate on rents and wheel carriages.

There are nineteen beneficed clergy men in the island, each of whom receives 420. per annum, subject to a deduction of 10 per cent. for a widow's fund. Besides this stipend, there are surplus fees, which in Kingston, Spanish-town, and St Andrews, are very great. The last has also considerable glebe lands annexed to the living.

All white males, from fifteen to sixty, are obliged by law to provide themselves with arms, and to enter either into the cavalry or infantry of the militia.

JAMB, or JAMBIS, a sea-port town and small kingdom of Asia, on the eastern coast of the island of Sumatra. It is a trading place. The Dutch have a fort there; and export pepper from thence, with the best sort of canes. E. Long. 105. 53. S. Lat. 0. 30.

JAMBIA VICUS. See YAMBO.

JAMBIC, in ancient poetry, a sort of verse, so called from its consisting either wholly, or in great part, of iambs. See IAMBUS.

Buddiman makes two kinds of iambs, viz. dimeter and trimeter; the former containing four feet, and the latter six. And as to the variety of their feet, they consist wholly of iambs', as in the following two verses of Horace:

1 2 3 4 5 6
Dim. Inar|sit at usu|bus
Trim. Su|is|st ... pra|b|a|t|u|ria|ru|us.

Or, a dactylus, spondeus, anapestus, and sometimes troischlys, obtain in the odd places; and the troischlys also in the even places, excepting the last. Examples of all which may be seen in Horace; as,

1 2 3 4 5 6
Canid|ç|a tro|ci|ta|vi|si|dape|
Pide|re pro|ab|ra|na|ce| domi|

Trimeter.

Quod quod|e|ce|li|s ruit|tu|que|tati|...|c|c|e|sc|era|ea. Pria|que ca|si|as si et in ... Ar|ius|ma. Alt|t|bus a|lie|que ... hos|sic|di|... 

Pav|du|m|q|e|le|p|a aut ad|j|an|m... 

JAMBLICUS, the name of two celebrated Platonic philosophers, one of whom was of Colchis, and the other of Apsam in Syria. The first, whom Julian equals to Plato, was the disciple of Anatolius and 

Porphyry, and died under the reign of the emperor Jamblicus Constantine.—The second also enjoyed great reputation. Julian wrote several letters to him, and it is said he was poisoned under the reign of Valens.—It is not known to which of the two we ought to attribute the works we have in Greek under the name of Jamblicus, viz. 1. The history of the life of Pythagoras, and the sect of the Pythagoreans. 2. An exhortation to the study of philosophy. 3. A piece against Porphyry's letter on the mysteries of the Egyptians.

JAMBOLIFERA, a genus of plants, belonging to the cyathia class; and in the natural method ranking with those of which the order is doubtful. See BOTANY INDEX.

IAMBUS, in the Greek and Latin prosody, a poetical foot, consisting of a short syllable followed by a long one; as in

Ωμ λυμ, Δις μεσ.

Syllaba longa brevi subjecta vocatur iambus, as Horace expresses it; who also calls the iambus a swift, rapid foot, pes citus.

The word, according to some, took its rise from Iambus, the son of Pan and Echo, who invented this foot; or, perhaps, who only used sharp biting expressions to Ceres, when afflicted for the death of Proserpine. Others rather derive it from the Greek iwm, vemen, "poison;" or from μελανο, maledico, "I rail, or revile," because the verses composed of iambus's were at first only used in satire.

JAMES, St., called the Greater, the son of Zebedee, and the brother of John the Evangelist, was born at Bethsaida, in Galilee. He was called to be an apostle, together with St John, as they were mending their nets with their father Zebedee, who was a fisherman; when Christ gave them the name of Boanerges, or Sons of Thunder. They then followed Christ, were witnesses with St Peter of the transfiguration on Mount Tabor, and accompanied our Lord in the garden of olives. It is believed that St James first preached the gospel to the dispersed Jews; and afterwards returned to Judea, where he preached at Jerusalem, when the Jews raised up Herod Agrippa against him, who put him to a cruel death about the year 44. Thus St James was the first of the apostles who suffered martyrdom. St Clement of Alexandria relates, that his accuser was so struck with his constancy, that he became converted and suffered with him. There is a magnificent church at Jerusalem which bears the name of St James, and belongs to the Armenians. The Spaniards pretend, that they had St James for their apostle, and boast of possessing his body; but Baronius, in his Annals, refutes their pretensions.

JAMES, St., called the Less, an apostle, the brother of Jude, and the son of Cleophas and Mary the sister of the mother of our Lord, is called in Scripture the Just, and the brother of Jesus, who appeared to him in particular after his resurrection. He was the first bishop of Jerusalem, when Ananias II., high priest of the Jews, caused him to be condemned and delivered him into the hands of the people and the Pharisees, who threw him down from the steps of the temple, when a fuller dashed out his brains with a club, about the year 62. His life was so holy, that Josephus con-

Digitized by Google
James considered the ruin of Jerusalem as a punishment inflicted on that city for his death. He was the author of the epistle which bears his name.

*St James of the Sword,* (San Jago del Espada), a military order in Spain, instituted in 1170, under the reign of Ferdinand II, king of Leon and Galicia. Its end was to put a stop to the incursions of the Moors; three knights obliging themselves by a vow to secure the roads. An union was proposed and agreed to in 1170 between these and the canons of St Eloy; and the order was confirmed by the pope in 1175. The highest dignity in that order is that of grand master, which has been united to the crown of Spain. The knights are obliged to make proof of their descent from families that have been noble for four generations on both sides; they must also make it appear that their said ancestors have neither been Jews, Saracens, nor heretics; nor even to have been called in question by the the inquisition. The novices are obliged to serve six months in the galleys, and to live a month in a monastery. Hereofore they were truly religious, and took a vow of celibacy; but Alexander III. gave them a permission to marry. They now make no vows but of poverty, obedience, and conjugal fidelity; to which, since the year 1552, they have added that of defending the immaculate conception of the holy Virgin. Their habit is a white cloak, with a red cross on the breast. This is esteemed the most considerable of all the military orders in Spain: the king carefully preserves the office of grand master in his own family, on account of the rich revenues and offices, whereof it gives him the disposal. The number of knights is much greater now than formerly, all the grandees choosing rather to be received into this than into the order of the Golden Fleece; inasmuch as this puts them in a fair way of attaining to commands, and gives them many considerable privileges in all the provinces of Spain, but especially in Catalonia.

James, the name of several kings of Scotland and of Great Britain. See (Histories of) Scotland and Britain.

James I. king of Scotland in 1423, the first of the house of Stuart, was not only the most learned king, but the most learned man, of the age in which he flourished. This ingenious and amiable prince fell into the hands of the enemies of his country in his tender youth, when he was flying from the sores of his unnatural ambitious uncle, who governed his dominions, and was suspected of designs against his life. Having secretly embarked for France, the ship was taken by an English privateer off Falmouth-head; and the prince and his attendants (among whom was the earl of Orkney), were confined in a neighbouring castle until they were sent to London. See (History of) Scotland.

The king of England knew the value of the prize he had obtained, and kept it with the most anxious care. The prince was conducted to the Tower of London immediately after he was seized, April 12. A.D. 1405, in the 13th year of his age, and there kept a close prisoner till June 10. A.D. 1407, when he was removed to the castle of Nottingham; from whence he was brought back to the Tower, March 1. A.D. 1414, and there confined till August 5, in the same year, when he was conveyed to the castle of Windsor, where he was detained till the summer of A.D. 1417, when Henry V. for political reasons carried him with him into France in his second expedition. In all these fortresses his confinement, from his own account of it, was so severe and strict, that he was not so much as permitted to take the air. In this melancholy situation, so unsuitable to his age and rank, books were his chief companions, and study his greatest pleasure. He rose early in the morning, immediately applied to reading, to divert him from painful reflections on his misfortunes, and continued his studies, with little interruption, till late at night. James being naturally sensible, ingenious, and fond of knowledge, and having received a good education in his early youth, under the direction of Walter Wardlaw, bishop of St Andrews, by this close application to study, became an universal scholar, an excellent poet, and exquisite musician. That he wrote as well as read much we have his own testimony, and that of all our historians who lived near his time. Bowmaker, the continuator of Fordun, who was his contemporary, and personally acquainted with him, spends ten chapters in his praises, and in lamentations on his death; and, amongst other things, says, that his knowledge of the scriptures, of law, and philosophy, was incredible. Hector Bence tells us, that Henry IV. and V. furnished their royal prisoner with the best teachers in all the arts and sciences; and that, by their assistance, he made great proficiency in every part of learning and the fine arts; that he became a perfect master in grammar, rhetoric, poetry, music, and all the secrets of natural philosophy, and was inferior to none in divinity and law. He observes further, that the poems he composed in his native tongue were so beautiful, that you might easily perceive he was born a poet; but that his Latin poems were not so faultless; for though they abounded in the most sublime sentiments, their language was not so pure, owing to the rudeness of the times in which he lived. This prince's skill in music was remarkable. Walter Bower, abbot of Inchcolm, who was intimately acquainted with that prince, assures us, that he excelled all mankind in that art, both vocal and instrumental; and that he played on eight different instruments (which he names), and especially on the harp, with such exquisite skill, that he seemed to be inspired. King James was not only an excellent performer, but also a capital composer both of sacred and secular music; and his fame on that account was extensive, and of long duration. Above a century after his death, he was celebrated in Italy as the inventor of a new and pleasing kind of melody, which had been admired and imitated in that country. This appears from the following testimony of Alessandro Tassoni, a writer who was well informed, and of undoubted credit. "We may reckon among us moderns, James king of Scotland, who not only composed many sacred pieces of vocal music, but also of himself invented a new kind of music, plaintive and melancholy, different from all other; in which he hath been imitated by Carlo Gesualdo, prince of Venosa, who, in our age, hath improved music with new and admirable inventions." As the prince of Venosa imitated King James, the other musicians of Italy imitated the prince of Venosa. "The most noble Carlo Gesualdo,
do, the prince of musicians of our age, introduced such a style of modulation, that other musicians yielded the preference to him; and all singers and players on stringed instruments, laying aside that of others, every-where embraced his. All the lovers, therefore, of Italian or Scotch music, are much indebted to the admirable genius of King James I. who, in the gloom and solitude of a prison, invented a new kind of music, plaintive indeed, and suited to his situation; but at the same time so sweet and soothing, that it hath given pleasure to millions in every succeeding age.

As James I. of Scotland was one of the most accomplished princes that ever filled a throne, he was also one of the most unfortunate. After spending almost 20 years in captivity, and encountering many difficulties on his return into his native kingdom, he was murdered by barbarous assassins in the prime of life. In the monuments of his genius, he hath been almost equally unfortunate. No vestiges are now remaining of his skill in architecture, gardening, and painting; though we are assured by one who was well acquainted with him, that he excelled in all these arts.

Many of the productions of his pen have also perished; for he tells us himself that he wrote much; and we know of only three of his poems that are now extant, viz. Christ's Kirk on the Green; Peablas at the Play—and the King's Quair, which was lately discovered by Mr. Warton, and hath been published by another gentleman. But slandering as these remains are, and remembrance, they afford sufficient evidence, that the genius of this of James I. royal poet was not inferior to that of any of his contemporaries; and that it was equally fitted for the gayest or the gravest strains.

JAMES II. king of Scotland, 1437, succeeded his father, being then not seven years of age; and was killed at the siege of Roxburgh in 1460, aged 29.

JAMES III. king of Scotland, succeeded his father, in 1460, in the 7th year of his age. The most striking feature in the character of this prince, unjustly represented as tyrannical by several historians, was his fondness for the fine arts, and for those who excelled in them, on whom he bestowed more of his company, confidence, and favour, than became a king in his circumstances. This excited in his fierce and haughty nobles dislike and contempt of their sovereign, and indignation against the objects of his favour; which produced the most pernicious consequences, and ended in a rebellion that proved fatal to James, who was slain in 1488, aged 36.

JAMES IV. king of Scotland, succeeded his father in 1488. He was a pious and valiant prince; subdued his rebellious subjects; and afterwards, taking part with Louis XII. against Henry VIII. of England, he was slain in the battle of Floddon-field in 1513, aged 43. This king is acknowledged to have had great accomplishments both of mind and body. His Latin epistles are classical, compared with the barbarous style of the foreign princes with whom he corresponded. Like his father, he had a taste for the fine arts, particularly that of sculpture. The attention he paid to the civilization of his people, and his distribution of justice, merit the highest praise. After all, the virtues of James appear to have been more shining than solid; and his character was that of a fine gentleman and a brave knight, rather than a wise or a great monarch. At the time of his death, he was only in his forty-first year. Like all the princes of his family (to his great grandson James VI.) his person was handsome, vigorous, and active. From their coins, it does not appear that either he, or any of his predecessors of the Stuart race, wore their beards, as did all his successors, to the reign of Charles II.

JAMES V. king of Scotland, in 1513, was but 18 months old when his father lost his life. When of age, he assisted Francis I. king of France against the emperor Charles V. for which service Francis gave him his eldest daughter in marriage, in 1535. This princess died in two years; and James married Mary of Lorraine, daughter of Claud duke of Guise, and widow of Louis d'Orleans, by whom he had only one child, the unfortunate Mary queen of Scots, born only eight days before his death, which happened December 13, 1542, in the 33rd year of his age. This was the first prince of his family who died a natural death since its elevation to the throne. He died, however, of a broken heart, occasioned by differences with his barons. He was formed by nature to be the ornament of a throne and a blessing to his people; but his excellent endowments were rendered in a great measure ineffectual by an improper education. Like most of his predecessors, he was born with a vigorous, graceful person, which, in the early part of his reign, was improved by all the many exercises then in use. This prince was the author of a humorous composition in poetry, which goes by the name of the Gabinetum Man.

JAMES VI. king of Scotland in 1567, and of England in 1603, was son of Mary queen of Scots; whom he succeeded in Scotland, as he did Elizabeth in England. Strongly attached to the Protestant religion, he signalized himself in its support; which gave rise to the horrid conspiracy of the Papists to destroy him and all the English nobility by the Gunpowder Plot, discovered November 5, 1605. The following year, a political test of loyalty was required, which secured the king's person, by clearing the kingdom of those disaffected Roman Catholic subjects who would not submit to it. The chief glory of this king's reign consisted in the establishment of new colonies, and the introduction of some manufactures. The nation enjoyed peace, and commerce flourished during his reign. Yet his administration was despised both at home and abroad: for, being the head of the Protestant cause in Europe, he did not support it in that great crisis, the war of Bohemia; abandoning his son-in-law the elector Palatine; negotiating when he should have fought; deceived at the same time by the courts of Vienna and Madrid; continually sending illustrious ambassadors to foreign powers, but never making a single ally. He valued himself much upon his polemical writings; and so fond was he of theological disputations, that to keep them alive, he founded, for this express purpose, Chelsea-college; which was converted to a much better use by Charles II. His Basilicon Doron, Commentary on the Revelation, writings against Bellarmine, and his Daemonologia, or doctrine of witchcraft, are sufficiently known. There is a collection of his writings and speeches in one folio volume. Several other pieces of his are extant; some of them in the Cabala, others in manuscript in the British Museum,
James, and others in Howard's collection. He died in 1625, in the 59th year of his age, and 23rd of his reign.

James II. king of England, Scotland, &c. 1685, grandson of James I. succeeded by his brother Charles II.

It is remarkable, that this prince wanted neither courage nor political abilities whilst he was duke of York; on the contrary, he was eminent for both: but when he ascended the throne, he was no longer the same man. A bigot from his infancy to the Roman religion and to its hierarchy, he sacrificed everything to establish them, in direct contradiction to the experience he had acquired, during the long reign of his brother, of the genius and character of the people he was to govern. Guided by the Jesuit Peters his confessor, and the infamous chancellor Jeffries, he violated every law enacted for the security of the Protestant religion; and then, unable to face the resentment of his injured subjects, he fled like a coward, instead of disarming their rage by a discharge of his Popish ministers and priests. He rather chose to live and die a bigot, or, as he believed, a saint, than to support the dignity of his ancestors, or perish beneath the ruins of his throne. The consequence was the revolution of 1689. James II. died in France in 1712, aged 68.

He wrote Memoirs of his own life and campaigns to the Restoration; the original of which is preserved in the Scotch college at Paris. This piece is printed at the end of Ramsay's Life of Marshal Turenne. 2. Memoirs of the English affairs, chiefly naval, from the year 1660 to 1673. 3. The royal sufferer, King James II. consisting of meditations, soliloquies, vows, &c. said to be composed by his majesty at St. Germain's. 4. Three letters; which were published by William Fuller, gent. in 1702, with other papers relating to the court of St. Germain's, and are said in the title page to be printed by command.

James, Thomas, a learned English critic and divine, born about the year 1571. He recommended himself to the office of keeper of the public library at Oxford, by the prosperous undertaking of publishing a catalogue of the MSS. in each college library at both universities. He was elected to this office in 1602, and held it 18 years, when he resigned it to prosecute his studies with more freedom. In the convocation held with the parliament at Oxford in 1625, of which he was a member, he moved to have proper commissioners appointed to collate the MSS. of the fathers in all the libraries in England, with the Popish editions, in order to detect the forgeries in the latter; but this proposal not meeting with the desired encouragement, he engaged in the laborious task himself, which he continued until his death in 1629. He left behind him a great number of learned works.

James, Richard, nephew of the former, entered into orders in 1615; but, being a man of humour, of three sermons preached before the university, one concerning the observation of Lent was without a text, according to the most ancient manner; another against the text; and the third beside it. About the year 1619, he travelled through Wales, Scotland, Shetland, into Greenland and Russia, of which he wrote observations. He assisted Selden in composing his Mora novum Amundianum; and was very serviceable to Sir Robert Cotton, and his son Sir Thomas, in disposing and settling their noble library. He died in 1638; and has an extraordinary character given to him by Wood for learning and abilities.

James, Dr. Robert, an English physician of great eminence, and particularly distinguished by the preparation of a most excellent fever powder, was born in Kinverston in Staffordshire, A.D. 1703: his father major in the army, his mother a sister of Sir Robert Clarke. He was of St John's-college in Oxford where he took the degree of A.B. and afterwards practised physic at Sheffield, Lichfield, and Birmingham successfully. Then he removed to London, and became a licentiate in the college of physicians; but in what years is not known. At London he applied himself to writing as well as practising physic; and in 1743, published a Medical Dictionary, in 3 vols. folio. Soon after he published an English translation, with Supplement by himself, of Ramonassino de morbis arkhicis; to which he also prefixed a piece of Frederic Hoffman upon Endemical Distempers, 8vo. In 1746 The Practice of Physic, 2 vols 8vo; in 1760, On Cane Madness, 8vo; in 1764, A Dispensatory, 8vo; June 25, 1755, when the king was at Cambridge James was admitted by mandamus to the doctorship of physic. In 1788, were published, A Dissertation upon Fivers, and A Vindication of the Fever-powder 8vo; with A Short Treatise on the Disorders of Children, and a very good print of Dr James. This was the 8th edition of the Dissertation, of which the first was printed in 1751; and the purpose of it was, to set forth the success of this powder, as well as to describe more particularly the manner of administering it. The Vindication was posthumous and unfinished: for he died March 23, 1775, while he was employed upon it.—Dr James was married, and left several sons and daughters.

James's Powder, a medicine prepared by Robert James, which is known also by the name of James's fever powder. See Materia Medica Index.

James's Town, a borough and market city of Ireland, in the county of Laois, in the province of Connaught, situated five miles north-west of Carrick on Shannon, and 73 north-west of Dublin, in N. Lat. 53 44. W. Long. 8 15. It has a barracks for a company of foot, and returns two members to parliament; patronage in the family of King. It has three fairs.

St James's Day, a festival of the Christian church, observed on the 25th of July, in honour of St James the greater, son of Zebedee.

Epistle of St James, a canonical book of the New Testament, being the first of the catholic or general epistles; which are so called, as not being written to one but to several Christian churches.

This general epistle is addressed partly to the believing and partly to the infidel Jews; and is designed to correct the errors, soften the ungodly zeal, and reform the indecent behaviour of the latter; and to comfort the former under the great hardships they then did, or shortly were to suffer, for the sake of Christianity.

Jamesone, George, an excellent painter, justly termed the Vandack of Scotland, was the son of Andrew Jamesone, an architect; and was born at Aberdeen, in 1586. He studied under Rubens at Antwerp; and, after his return, applied with indomitable industry to portraits in oil, though he sometimes practiced
practised in miniature, and also in history and landscapes. His largest portraits were somewhat less than life. His earliest works are chiefly on board, afterwards on a fine linen cloth smoothly primed with a proper tone to help the harmony of his shadows. His excellence is said to consist in delicacy and softness, with a clear and beautiful colouring; his shades not charged, but helped by varnish, with little appearance of the pencil. When King Charles I. visited Scotland in 1633, the magistrates of Edinburgh, knowing his majesty’s taste, employed this artist to make drawings of the Scottish monarchs; with which the king was so pleased, that, enquiring for the painter, he sat to him, and rewarded him with a diamond ring from his own finger. It is observable, that Jamesone always drew himself with his hat on, either in imitation of his master Rubens, or on having been indulged in that liberty by the king when he sat to him. Many of Jamesone’s works are in both the colleges of Aberdeen; and the Sibyl there he is said to have drawn from living beauties in that city. His best works are from the year 1630 to his death, which happened at Edinburgh in 1644.

JAMYN, AMADIS, a celebrated French poet in the 16th century. He is esteemed the rival of Ronald, who was his contemporary and friend. He was secretary and chamber-reader in ordinary to Charles IX. and died about 1585. He wrote, 1. Pastoral works, two vols. 2. Philosophical discourses to Pasicharis and Rodanthe, with seven academical discourses. 3. A translation of the Iliad of Homer, begun by Hugh Sabel, and finished by Jamyn; with a translation into French verse of the first three books of the Odyssey.

JANE of FLANDERS, a remarkable lady, who seems to have possessed in her own person all the excellent qualities of both sexes, was the wife of John de Mountfort, a competitor for the dukedom of Brittany upon the death of John III. This duchy, dying without issue, left the dominions to his nice Jane, married to Charles de Blois, king of the king of France; but John de Mountfort, brother to the late duke though by a second marriage, claimed the duchy, and was received as successor by the people of Nantes. The greatest part of the nobility swore fealty to Charles de Blois, thinking him best supported. This dispute occasioned a civil war; in the course of which John was taken prisoner, and sent to Paris. This misfortune would have entirely ruined his party, had not his interest been supported by the extraordinary abilities of his wife, Jane of Flanders. Bold, daring, and intrepid, she fought like a warrior in the field; shrewd, sensible, and sagacious, she spoke like a politician in the council; and endowed with the most amiable manners and winning address, she was able to move the minds of her subjects by the force of her eloquence, and mould them exactly according to her pleasure. She happened to be at Rennes when she received the news of her husband’s captivity; but that disaster, instead of depressing her spirits, served only to rouse her native courage and fortitude. She forthwith assembled the citizens; and, holding in her arms her infant son, recommended him to their care and protection in the most pathetic terms, as the male heir of their ancient dukes, who had always governed them with lenity and indulgence, and to whom they had ever professed the most zealous attachment. She declared herself willing to run all hazards with them in so just a cause; pointed out the resources that still remained in the alliance of England; earnestly beseeching them to make one vigorous effort against an usurper, who being forced upon them by the intrigues of France, would, as a mark of his gratitude, sacrifice the liberties of Brittany to his protector. The people moved by the affecting appearance, and animated by the noble conduct of the princess, vowed to live and die with her in defending the rights of her family; and their example was followed by almost all the Bretons. The countess went from place to place, encouraging the garrisons of the several fortresses, and providing them with every thing necessary for their subsistence: after which she shot herself up with her son in Hennebon, where she resolved to wait for the succours which the king of England (Edward III.) had promised to send to her assistance. Charles de Blois, accompanied by the dukes of Burgundy and Bourbon, and many other noblemen, took the field with a numerous army, and having reduced Rennes, laid siege to Hennebon, which was defended by the countess in person. This heroine repulsed the assailants in all their attacks with the most undaunted courage; and observing one day that their whole army had left the camp to join in a general storm, she rushed forth at a postern-gate, with three hundred horse, set fire to their tents and baggage, killed their butlers and servants, and raised such a terror and consternation through all their quarters, that the enemy gave over their assault, and getting between her and the walls, endeavoured to cut off her retreat to the city. Thus intercepted, she put the spurs to her horse, and without halting, galloped directly to Brest, which lay at the distance of two-and-twenty miles from the scene of action. There being supplied with a body of five hundred horse, she immediately returned, and fighting her way through one part of the French camp, was received into Hennebon, amidst the acclamations of the people. Soon after this the English succours appeared, and obliged the enemy to raise the siege.

JANEIRO, or Rio JANEIRO, a river and province of Brazil in South America, seated between the tropic of Capricorn and 22° of S. Lat. See Rio-JANEIRO.

JANICULUM, or JANICULARIS, a hill of ancient Rome, added by Ancus Martius; the burial place of Numa, and of Statius Cassius, the poet; to the east and south, having the Tiber; to the west, the fields; to the north, a part of the Vatican. So called, either from an ancient city, (Virgil); or because it was a janas, or gate, from which to issue out and make incursions on the Tuscanians, (Verres Flaccus). Now called Mons Aureus, corruptly Montorius, from its sparkling sands. From this hill, on account of its height, is the most extensive prospect of Rome: but it is less inhabited, because of its gross air; neither is it reckoned among the seven hills. Hither the people retired, and were hence afterwards recalled by Q. Hæcstenius the dictator, (Pliny).

JANIZARIES, an order of infantry in the Turkish armies; reputed the grand seignior’s foot-guards. Yosius derives the word from geniziers, which in the Turkish language signifies nost homines or militis. D’Herbelot tells us, that Jenickers signifies a new band, or troop; and that the name was first given by Amurat,
Janizaries, rath I. called the Conqueror, who choosing out one-fifth part of the Christian prisoners whom he had taken from the Greeks, and instructing them in the discipline of war and the doctrines of their religion, sent them to Hagi Bektaşche (a person whose pretended piety rendered him extremely revered among the Turks), to the end that he might confer his blessing on them, and at the same time give them some mark to distinguish them from the rest of the troops.—Bektaşche, after blessing them in his manner, cut off one of the sleeves of the fur-gown which he had on, and put it on the head of the leader of this new military from which time, viz., the year of Christ 1361, they have still retained the name *jeniecheri*, and the fur-cap.

As, in the Turkish army, the European troops are distinguished from those of Asia; the Janizaries are also distinguished into janizaries of Constantinople, and of Damascus. Their pay is from two aspers to twelve *per diem*; for when they have a child, or do any signal piece of service, their pay is augmented.—Their dress consists of a dolman, or long gown, with short sleeves, which is given them annually by the grand seignior on the first day of Ramazan. They wear no turbeau; but, in lieu of that, a kind of cap, which they call *zarcola*, and a long hood of the same stuff hanging on their shoulders. On solemn days they are adorned with feathers, which are stuck in a little case on the fore part of the bonnet.—Their arms, in Europe, in time of war, are a sabre, a carabine or musket, and a cartouch-box hanging on the left side. At Constantinople, in time of peace, they wear only a long staff in their hand. In Asia, where powder and fire-arms are more uncommon, they wear a bow and arrows, with a piaignet, which they call *haniere*.—Though the janizaries are not prohibited marriage, yet they rarely marry, nor then but with the consent of their officers; as imagining a married man to make a worse soldier than a bachelor.—It was Osman, or Ottoman, or, as others will have it, Amurath, who first instituted the order of janizaries. They were at first called *faja*, that is, footmen, to distinguish them from the other Turks, the troops whereof consisted most of cavalry. The number of janizaries is generally above 40,000; divided into 162 companies or chambers called *odas*, in which they live together at Constantinople as in a convent. They are of a superior rank to all other soldiers, and are also more arrogant and factious, and it is by them that the public tranquillity is mostly disturbed. The government may therefore be said to be in the hands of the janizaries. They have, however, some good qualities: they are employed to escort travellers, and especially ambassadors and persons of high rank, on the road; in which case they behave with the utmost zeal and fidelity.

Janizaries, at Rome, are officers or pensioners of the pope, called *participantes*, on account of certain rights or duties which they enjoy in the annates, bulls, or expeditions, and the Roman chancery. Most authors are mistaken in the nature of their office: the truth is, they are officers of the third bench or college of the Roman chancery. The first bench consists of writers, the second of abbreviators, and the third of janizaries; who are a kind of correctors and revisors of the pope's bulls.

Jansen, Cornelius, bishop of Ypres, one of the most learned divines of the 17th century, and principal of the sect called from his name *Jansenists*. He was born in Holland of Catholic parents, and studied at Louvain. Being sent into Spain to transact some business of consequence relating to the university, the Catholic king, viewing with a jealous eye the intriguing policy of France, engaged him to write a book to expose the French to the pope as no good Catholics, since they made no scruple of forming alliances with Protestant states. Jansen performed this task in his *Marc Gallicus*, and was rewarded with a mitre, being promoted to the see of Ypres in 1655. He had, among other writings, before this, maintained a controversy against the Protestants upon the points of grace and predestination; but his *Augustinus* was the principal labour of his life, on which he spent above 20 years. See the next article.

Jansenists, in church history, a sect of the Roman Catholics in France, who followed the opinions of Jansenius, bishop of Ypres, and doctor of divinity of the universities of Louvain and Douay, in relation to grace and predestination.

In the year 1640, the two universities just mentioned, and particularly Father Molina and Father Leonard Celsus, thought fit to condemn the opinions of the Jesuits on grace and free-will. This having set the controversy on foot, Jansenius opposed to the doctrine of the Jesuits the sentiments of St Augustine; and wrote a treatise on grace, which he entitled *Augustinus*. This treatise was attacked by the Jesuits, who accused Jansenius of maintaining dangerous and heretical opinions; and afterwards, in 1642, obtained of Pope Urban VIII. a formal condemnation of the treatise written by Jansenius: when the partizans of Jansenius gave out that this bull was spurious, and composed by a person entirely devoted to the Jesuits. After the death of Urban VIII. the affair of Jansenism began to be more warmly controverted, and gave birth to an infinite number of polemical writings concerning grace. And what occasioned some mirth, was the titles which each party gave to their writings; one writer published *The torch of St Augustine*, another found *Seminares for St Augustine's torch*, and Father Vernon formed *A Gage for the Jansenists*, &c. In the year 1650, 68 bishops of France subscribed a letter to Pope Innocent X. to obtain an inquiry into and condemnation of the five following propositions, extracted from Jansenius's *Augustinus*: 1. Some of God's commandments are impossible to be observed by the righteous, even though they endeavour with all their power to accomplish them. 2. In the state of corrupted nature, we are incapable of resisting inward grace. 3. Merit and demerit, in a state of corrupted nature, do not depend on a liberty which excludes necessity, but on a liberty which excludes constraint. 4. The Semipelagians admitted the necessity of an inward preventing grace for the performance of each particular act, even for the beginning of faith: but they were heretics in maintaining that this grace was of such a nature, that the will of man was able either to resist or obey it. It is Semipelagian to say, that Jesus Christ died, or shed his blood, for all mankind in general.

In the year 1652, the pope appointed a congregation for examining into the dispute in relation to grace. In this congregation Jansenius was condemned; and
JAN

JAN, the bull of condemnation, published in May 1653, filled all the pulpits in Paris with violent outcries and alarms against the heresy of the Jansenists. In the year 1656, Pope Alexander VII. issued another bull, in which he condemned the five propositions of Jansenius. However, the Jansenists affirm, that these propositions are not to be found in this book; but that some of his enemies having caused them to be printed on a sheet, inserted them in the book, and thereby deceived the pope. At last Clement XI. put an end to the dispute by his constitution of July 17. 1705; in which, after having recited the constitutions of his predecessors in relation to this affair, he declares, "That in order to pay a proper obedience to the papal constitutions concerning the present question, it is necessary to receive them with a respectful silence." The clergy of Paris, the same year, approved and accepted this bull, and none dared to oppose it.

This is the famous bull Unigenitus, so called from its beginning with the words Unigenitus Dei Filius, &c. which has occasioned so much confusion in France.

JANSSENS, ABRAHAM, history-painter, was born at Antwerp in 1639. He was contemporary with Rubens, and also his competitor, and in many of the finest parts of the art was accounted not inferior to that celebrated master. It is reported, that having wasted his time and his substance by a life of dissipation and pleasure, and falling into necessitous circumstances, which he imputed more to ill fortune than to his own neglect of his business, he grew envious at the grandeur in which Rubens appeared, and impatient at his merit and success; and with peevish impatience challenged him to paint a picture with him only for fame, which he was willing to submit to impartial judges. But Rubens rejected the proposal, answering with modesty, that he freely submitted to him, and the world would certainly do justice to them both.

Sandart, who had seen several of his works, assures us, that he not only gave a fine roundness and relief to his figures, but also such a warmth and clearness to the carnations, that they had all the look of real flesh; and his colouring was as durable as it was beautiful, retaining its original lustre for a number of years. His most capital performance is said to be the resurrection of Lazarus, which is in the cabinet of the elector Palatine, and is an object of admiration to all who behold it.

JANSSENS, Victor Honorius, history-painter, was born at Brussels in 1654, and was a disciple of one Volders, under whose direction he continued for seven years; in which time he gave many proofs of a genius far superior to those who were instructed in the same school. He afterwards went to Rome, where he attended particularly the works of Raphael; he designed after the antiques, and sketched the beautiful scenes around that city; and in a short time his paintings rose in esteem, and the principal nobility of Rome were desirous to employ him. He associated with Tempesta, the celebrated landscape-painter, for several years, and painted the figures in the works of that great master as long as they resided together.

Janssens composed historical subjects, both in a small and a large size; but he found the demand for his small pictures so considerable, that he was induced to paint most frequently in that size. During 11 years Janssens, he continued at Rome, which barely sufficed for his Januaries, finishing those pictures for which he was engaged; nor could he have even then been at his liberty, had he not limited himself to a number, and determined not to undertake more.—Returning to Brussels, his performances were as much admired there as they had before been in Italy; but having married, and gradually become the father of 11 children, he was compelled to change his manner of painting in small, and to undertake only those of the large kind, as being more lucrative, more expeditious, and also more agreeable to his genius and inclination. He adorned most of the churches and palaces of his own country with his compositions.—The invention of this artist was fruitful; he designed correctly, his colouring is natural and pleasing, his pencil free, and the airs of his heads have beauty and elegance. As to the difference between his large and small paintings, it is observed, that in correctness and taste they had an equal degree of merit; but the colouring of the former appears more raw and cold than the colouring of the latter; and it is agreed, that for small historical pictures, he was preferable to all the painters of his time.

JANSEN, Cornelius, called Johnson, an eminent painter of portraits, was born at Amsterdam (though in the Chronological tables, and in Sandart, it is improperly asserted that he was born in London), and resided in England for several years; where he was engaged in the service of King James I. and painted several excellent portraits of that monarch, as also of his children and of the principal nobility of his court. He had not the freedom of hand, nor the grace of Van dyck; but in other respects he was accounted his equal, and in the finishing his pictures superior. His paintings are easily distinguished by their smooth, clear, and delicate tints, and by that character of truth and nature with which they are strongly marked. He generally painted on board; and, for the most part, his draperies are black; probably because the opposition of that tint made his flesh colours appear more beautifully bright, especially in his female figures. It is said that he used a quantity of ultramarine in the black colours, as well as in his carnations; which may be one great cause of their preserving their original lustre even to this day. Frequently he painted in a small size in oil, and often copied his own works in that manner. His fame began to be somewhat obscured, on the arrival of Vandyck in England; and the civil war breaking out some time after, induced him to return to his own country, where his paintings were in the highest esteem. He died in 1685.

St JANUARIUS, the patron saint of Naples, where his head is occasionally carried in procession, in order to stay the eruption of Vesuvius. The liquefaction of his blood is a famous miracle at Naples. The saint suffered martyrdom about the end of the third century. When he was beheaded, a pious lady of Naples caught about an ounce of his blood, which has been carefully preserved in a bottle ever since, without having lost a single grain of its weight. This of itself, were it equally demonstrable, might be considered as a greater miracle than the circumstance on which the Neapolitans lay the whole stress, viz. that the blood which has congealed, and acquired a solid form
January and February were introduced into the year by Numa Pompilius; Romulus's year beginning in the month of March. — The kalends, or first day of the month, was under the protection of Juno, and in a particular manner consecrated to Janus by an offering of cakes made of new meal and new salt, with new frank incense and new wine. On the first day of January beginning was made of every intended work, the consuls took possession of their office, who, with the flamens, offered sacrifices and prayers for the prosperity of the empire. On this day all animosities were suspended, and friends gave and received new year's gifts called Strenae. On this day too the Romans above all things took care to be merry and divert themselves, an oftentimes such a scene of drunkenness was exhibited that they might with propriety enough have distinguished it with the name of All-fools day.

The Christians heretofore fasted on the first day of January, by way of opposition to the superstitions and debaucheries of the heathens.

JANUS, in the heathen worship, the first king of Italy, who, it is said, received Saturn into his dominions, after his being driven from Arcadia by Jupiter. He tempered the manners of his subjects, and taught them civility; and from them learned to improve the wine, to sow corn, and to make bread. After his death, he was adored as a god.

This deity was thought to preside over all new undertakings. Hence, in all sacrifices, the first libations of wine and wheat were offered to Janus, all prayers prefigured a short address to him; and the first month of the year was dedicated to and named from him. See JANUARY.

Janus was represented with two faces, either to denote his prudence, or that he viewed at once the past and approaching years; he had a sceptre in his right hand, and a key in his left, to signify his extensive authority, and his invention of locks.

Though this is properly a Roman deity, the abbé la Pluche represents it as derived from the Egyptians, who made known the rising of the dog-star, which opened their solar year, with an image with a key in its hand, and two faces, one old and the other young, to typify the old and new year.

Temple of JANUS, in ancient history, a square building at Rome (as some say) of entire brass, erected by Romulus, and so large as to contain a statue of Janus five feet high, with brazen gates on each side, which were always kept open in time of war, and shut in time of peace. But the Romans were so much engaged in war, that this temple was shut only twice from the foundation of Rome till the reign of Augustus, and six times afterwards. It was first shut during the long reign of Numa, who instituted this ceremony.

1. In the year of the city 519, after the end of the first Punic war. 2. By Augustus after the battle of Actium, in the year of Rome 725. 3. On Augustus's return from the war which he had against the Cantabrians in Spain, in the year of Rome 729. 4. Under the same emperor, in 744, about five years before the birth of Christ, when there was a general peace throughout the whole Roman empire, which lasted 12 years. 6. Under Nero, 81. 7. Under Vespasian, 824. 8. Under Constantius, when, upon Magnentius's death, he was left sole possessor of the empire, 1105. Some dispute the author
which are commonly followed by hard frosts. The rains in summer are very violent, especially in the months of June and July, which on that account are called sat-suki, or water-months. The country is also much subject to dreadful thunders and lightnings, as well as storms and hurricanes, which frequently do a great deal of damage.

The soil, though naturally barren and mountainous, by the industry of the inhabitants, not only supplies them with every necessary of life, but also furnishes other countries with them; producing, besides corn, the finest and whitest rice and other grains, with a great variety of fruits, and vast numbers of cattle of all sorts. Besides rice, and a sort of wheat and barley, with two sorts of beans, they have Indian wheat, millet, and several other kinds in great abundance. Their seas, lakes, and rivers, abound with fish; and their mountains, woods, and forests, are well stocked with horses, elephants, deer, oxen, buffaloes, sheep, hogs, and other useful animals. Some of their mountains also are enriched with mines of gold, silver, and copper, exquisitely fine, besides tin, lead, iron, and various other minerals and fossils; whilst others abound with several sorts of marble and precious stones. Of these mountains, some may be justly ranked among the natural rarities of the country; one, in particular, in the great island of Niphon, is of such prodigious height as to be easily seen forty leagues off at sea, though its distance from the shore is about eighteen. Some authors think it exceeds the famous Peak of Tenerife; but it may rather be called a cluster or group of mountains, among which are no less than eight dreadful volcanoes, burning with incredible fury, and often laying waste the country round about them; but to make some amends, they afford great variety of medicinal waters, of different degrees of heat; one of these, mentioned by Varranius, is said to be as hot as burning oil, and to scorch and consume everything thrown into it.

The many brooks and rivers that have their sources among the mountains, form a great number of delightful cascades, as well as some dreadful cataracts. Among the great variety of trees in the forests here, the cedars exceed all of that kind through India, for strength, height, and beauty. They abound in most of the islands, especially the largest.

Their seas, besides fish, furnish them with great quantities of red and white coral, and some pearls of great value, besides a variety of sea plants and shells; which last are not inferior to those that are brought from Abyena, the Molucca and other easterly islands.

The vast quantity of sulphur with which most of the Japan islands abound, makes them subject to frequent and dreadful earthquakes. The inhabitants are so accustomed to them, that they are scarcely alarmed at any, unless they chance to be very terrible indeed, and lay whole towns in ruins, which very often proves the case. On these occasions, they have recourse to extraordinary sacrifices, and acts of worship, to their deities or demons, according to the different notions of each sect, and sometimes even proceed to offer human victims; but in this case they only take some of the vilest and most abandoned fellows they can meet with, because they are only sacrificed to the malevolent deities.

E The
The religion throughout Japan, it is well known, is
Pagans, split into several sects, who live together in
the greatest harmony. Every sect has its own temples and
priests. The spiritual emperor, the Dairi, is the chief
of their religion. They acknowledge and honour a
Supreme Being. The author of this relation (Dr
Thunberg) saw two temples of the God of gods of
a majestic height. The idol that represented this god
was of gilted wood, and on it were inscribed, on it,
that on his hands six persons might sit in the Japanese
fashion; his shoulders were five times broad. In the
other temple, the enormous power of this god was
represented by little gods to the number of 63333; all standing
round the great idol that represented God. The
priests, who are numerous in every temple, have nothing to
but to clean the pavement, light the lamps, and
dress the idol with flowers. The temples are open to
everybody, even to the Hollanders; and in case they are
in want of a lodging in the suburbs, when they go
to the court of Jesus, they are entertained with hospital-
ity in the temple. The service is finally con-
cluded by the masses at Simboda, about the year
1693. The reason of the emperor's proclamations,
making it death to embrace the religion, were as follow: 1. The new religion occasioned considerable
alterations in the Japanese church, and was prejudicial
in the highest degree to the heathen clergy. 2. It
was feared the innovation in religion might be attended
with fatal consequences even in regard to the state; but
what more immediately gave rise to them was, as the
Japanese of credit confessed to Dr Kemper, pride and
covetousness; pride among the great ones, and covet-
souls among the people of less note; the spiritual fathers
aiming not only at the salvation of their souls, but
having an eye also to their money and lands, and the mer-
chants disposing of their goods in the most unscrupulous
and unreasonable manner. To confine ourselves to the
clergy here: they thought it beneath their dignity to walk
on foot any longer; nothing would serve them but they
must be carried about in state chairs, mimicking the
pomp of the pope and his cardinals at Rome. They not
only put themselves on an equal footing with the greatest
men of the empire, but, swelling with ecclesiastical pride,
same that even a superior rank was nothing but their due.
If in one day happened, that a Portuguese bishop
went upon the road one of the commissioners of state on his
way to court. The haughty priest would not order his
chaise to be stopped, in order to alight and pay his
respects to the great man, as is usual in that country;
but without taking any notice of him, nay, indeed
without showing him so much as a common mark of civ-
ility, he very contumeliously bid his men carry him by.
The great man, exasperated at so signal a affront,
thenceforward bore a mortal hatred to the Portuguese,
and, in the height of his just resentment, made his com-
plaint to the emperor himself, with such an odious pic-
ture of the insolence, pride, and vanity of this nation,
as he expected could not but raise the emperor's utmost
indignation." This happened in 1666. The next year
the persecution began anew, and 26 persons, of the num-
ber whose were two foreign Jesuits, and several other
fathers of the Franciscan order, were executed on the
cross. The emperor Jirias had usurped the crown on
his pupil Tidajori, who, as likewise the greatest part of
his court and party, had been either Christians them-
selves,
selves, or at least very favourably inclined to that religion; so that reasons of state mightly co-operated to forward the persecution.

Some Franciscan friars, whom the governor of the Masilhas had sent as his ambassadors to the emperor of Japan, were guilty at this time of a most imprudent step: they, during the whole time of their abode in the country, preached openly in the street of Macao where they resided; and of their own accord built a church, contrary to the imperial commands, and contrary to the advice and earnest solicitations of the Jesuits.

Some time after, a discovery of a dangerous conspiracy, which the fathers, and the yet remaining adherents of their religion, entered into against the person of the emperor as a heathen prince, put a finishing stroke to the affair, and hastened the sentence which was pronounced soon after, that the Portuguese should for ever be banished the emperor's dominions; for till then the state seemed desirous to spare the merchants and secular persons, for the purpose of continuing trade and commerce with them, which was looked upon as an affair independent of religion. The affair of the conspiracy was as follows: the Dutch had had an eye to the trade of Japan before 1600, and in 1611 had liberty of a free commerce granted them by the imperial letters patent, and had actually a factory at Fijando. The Dutch were then at war with Spain, which was then sovereign of the Portuguese dominions; so that it was natural for them to be trying to supplant them. The Portuguese, on their parts, made use of all malicious inventions to blacken their characters, calling them rebels and pirates, whence it was natural for the Dutch to endeavour to clear, and even to revenge themselves. Now they took an homeward-bound Portuguese ship near the Cape of Good Hope, on board of which they found some treacherous letters to the king of Portugal, written by one Captain Mora, who was chief of the Portuguese in Japan, himself a Japanese by birth, and a great zealot for the Christian religion. The Dutch took special care of delivering said letters to the viceroy of Fijando, who communicated them without loss of time to the governor of Nagasaki, a great friend to the Portuguese. Captain Mora having been taken up, boldly, and with great assurance, denied the fact, and so did all the Portuguese then at Nagasaki.

However, neither the governor's favour, nor their constant denial, were able to clear them, and to keep off the cloud which was ready to break over their heads. Hand and seal convinced them; the letter was sent up to court, and Captain Mora sentenced to be burnt alive on a stake, which was executed accordingly. This letter laid open the whole plot which the Japanese Christians, in conjunction with the Portuguese, had laid against the emperor's life and throne; the want they stood in of ships and soldiers, which were promised them from Portugal; the names of the Japanese princes concerned in the conspiracy; and lastly, to crown all, the expectation of the papal blessing. This discovery made by the Dutch was afterwards confirmed by another letter written by the said Captain Mora to the Portuguese government at Macao, which was intercepted and brought to Japan by a Japanese ship."

Considering this, and the suspicions which the court had then already conceived against the Portuguese, it was no difficult matter thoroughly to ruin the little cre-
dit and favour they had as yet been able to preserve; and the rather, since the strict imperial orders notwithstanding, they did not leave off privately to bring over more ecclesiastics. Accordingly, in the year 1637, an imperial proclamation was sent to the governors of Nagasaki, with orders to see it put in execution. It was then that the empire of Japan was shut for ever both to foreigners and natives.

Now, although the governors of Nagasaki, on receipt of these commands, took care they should be obeyed, yet the directors of the Portuguese trade maintained themselves in Japan two years longer, hoping to obtain leave to stay in the island of Bussaco, and there to continue their trade. But they found themselves at last wholly disappointed; for the emperor was resolved to get rid of them; and on assurance given him by the Dutch East India company that they would supply for the future what commodities had been imported by the Portuguese, he declared the Portuguese and the Castilians, and whatsoever belonged to them, enemies of the empire, forbidding the importation of even the goods of their country, Spanish wines only excepted, for the use of the court. And thus the Portuguese lost their profitable trade and commerce with Japan, and were totally expelled the country before the latter end of the year 1639 or 1640: and thus ended the fruitless papal mission in this empire, for the Portuguese have never been able to restore themselves; and the Dutch have not in their power to do any one thing in favour of religion, were they so inclined; but, as it appears, they are very indifferant as to that, and are in little credit with the Japanese.

According to Dr Thunberg's researches, the Japanese have never been subdued by any foreign power, not even in the most remote periods; their chronicles contain such accounts of their valour, as one would rather incline to consider as fabulous inventions than actual occurrences, if later ages had not furnished equally striking proofs of it. When the Tartars, for the first time in 1200, had overrun part of Japan, and were, after a considerable time had elapsed, their fleet was destroyed by a violent storm in the course of a single night, the Japanese general attacked, and so totally defeated his numerous and brave enemies, that not a single person survived to return and carry the tidings of such an unparalleled defeat. In like manner, when the Japanese were again, in 1281, invaded by the warlike Tartars, to the number of 240,000 fighting them, they gained a victory equally complete. The extirpation of the Portuguese, and with them of the Christian religion, towards the beginning of the 17th century, as already mentioned, was so complete, that scarce a vestige can now be discerned of its ever having existed there.

With respect to the government of these islands, it is and has been for a long time monarchical; though formerly it seems to have been split into a great number of petty kingdoms, which were at length all swallowed by one. The imperial dignity had been enjoyed for a considerable time before the year 1500, by a regular succession of princes, under the title of daimio, a name supposed to have been derived from Dairo, the head of that family. Soon after that epoch, such a dreadful civil war broke out, and lasted so many years, that the empire was quite ruined. During these distractions and confusions, a common soldi,
dier, by name Tayckoy, a person of obscure birth, but of an enterprising genius, found means to raise himself to the imperial dignity; having, in little more than three years time, by an uncommon share of good fortune, subdued all his competitors and opponents, and reduced all their cities and castles. The dairo not being in a condition to obstruct or put a stop to his progress, was forced to submit to his terms; and might perhaps have been condemned to much harder, had not Tayckoy been apprehensive lest his soldiers, who still revered their ancient natural monarch, should have revolted in his favour. To prevent this, he granted him the supreme power in all religious matters, with great privileges, honours, and revenues annexed to it; whilst himself remained invested with the whole civil and military power, and was acknowledged and proclaimed king of Japan. This great revolution happened in 1517, and Tayckoy reigned several years with great wisdom and tranquility; during which he made many wholesome laws and regulations, which still subsist, and are much admired to this day. At his death, he left the crown to his son Tayckossama, then a minor; but the treacherous prince under whose guardianship he was left deprived him of his life before he came of age. By this murder, the crown passed to the family of Jejassama, in which it still continues. Tayckoy and his successors have contented themselves with the title of cubo, which, under the dairos, was that of prime minister, whose office is now suppressed; so that the cubo, in all secular concerns, is quite as absolute and despotic, and has as extensive a power over the lives and fortunes of all his subjects, from the petty kings down to the lowest persons, as ever the dairos had. The dairo resides constantly at Mexico, and the cubo at Jeddo.

The inhabitants of Japan are well-grown, agile, and active, and at the same time stout-limbed, though they do not equal in strength the northern inhabitants of Europe. The colour of the face is commonly yellow; which sometimes varies to brown, and sometimes to white. The inferior sort, who during their work in summer have often the upper parts of the body naked, are sun-burnt and browner; women of distinction, who never go uncovered into the open air, are perfectly white.

The national character consists in intelligence and prudence, frankness, obedience, and politeness, good-nature and civility, curiosity, industry, and dexterity, economy and sobriety, hardiness, cleanliness, justice and uprightness, honesty and fidelity; in being also mistrustful, superstitious, haughty, resentful, brave and invincible.

In all its transactions, the nation shows great intelligence, and can by no means be numbered among the savage and uncivilized, but rather is to be placed among the polished. The present mode of government, admirable skill in agriculture, sparing mode of life, way of trading with foreigners, manufactures, &c. afford convincing proofs of their cunning, firmness, and intrepid courage. Here there are no appearances of that vanity so common among the Asiaties and Africans, of adorning themselves with shells, glass-beads, and polished metal plates: neither are they fond of the useless European ornaments of gold and silver lace, jewels, &c. but are careful to provide themselves, from the productions of their own country, with neat clothes well-tasted food, and good weapons.

Their curiosity is excessive; nothing imported by the Europeans escapes it. They ask for information concerning every article, and their questions continue till they become wearisome. It is the physician, amongst the traders, that is alone regarded as learned, and particularly during the journey to court and the residence at Jeddo, the capital of the empire; that he is regarded as the oracle, which they trust can give responses in all things, whether in mathematics, geography, physics, chemistry, pharmacy, zoology, botany, medicine, &c.

Economy has its peculiar abode in Japan. It is a virtue admired as well in the emperor's palace as in the meanest cottage. It makes those of small possessions content with their little, and it prevents the abundance of the rich from overflowing in excess and voluptuousness. Hence it happens, that what in other countries is called scarcity and famine, is unknown here; and that, in so very populous a state, scarce a person in necessity, or a beggar, should be found.

The names of families, and of single persons, are under very different regulations from ours. The family name is never changed, but is never used in ordinary conversation, and only when they sign some writing; to which they also for the most part affix their seal. There is also this peculiarity, that the surname is always placed first; just as in botanical books the generic name is always placed before the specific name. The phenomenon is always used in addressing a person; and it is changed several times in the course of life. A child receives at birth from its parents a name, which is retained till it has itself's son arrived at maturity. A person again changes his name when he is invested with any office; as also when he is advanced to a higher trust: some, as emperors and princes, acquire a new name after death. The names of women are less variable; they are in general borrowed from the most beautiful flowers.

After marriage, the wife is confined to her own apartment, from whence she hardly ever stirs, except once a-year to the funeral-rites of her family; nor is she permitted to see any man, except perhaps some very near relation, and that as seldom as can be. The wives, as well as in China and other parts of the east, bring no portion with them, but are rather bought by the husband of their parents and relations. The bridegroom most commonly sees his bride for the first time upon her being brought to his house from the place of the nuptial ceremony: for in the temple where it is performed she is covered over with a veil, which reaches from the head to the feet. A husband can put his wives to a more or less severe death, if they give him the least cause of jealousy, by being seen barely to converse with another man, or suffering one to come into their apartment.

The dress of the Japanese deserves, more than that of any other people, the name of national; since they are not only different from that of any other man, but are also of the same figure in all ranks, from the monarch to his poorest subject, as well as in both sexes; and what exceeds all credibility, they are said not to have been altered for at least 2444 years. They universally consist of night-gowns, made long and wide, of which several
Japan.

veral are worn at once by all ranks and all ages. The more distinguished and the rich have them of the finest silk; the poorer sort of cotton. Those of the women reach down to the ground, and sometimes have a train; in the men, they reach down to the heels: travellers, soldiers, and labourers, either tuck them up, or wear them only down to the knees. The habit of the men is generally of one colour: the women have theirs variegated, and frequently with flowers of gold interwoven. In summer, they are either without lining, or have but a thin one; in winter they are stuffed to a great thickness with cotton or silk. The men seldom wear a great number; but the women thirty, fifty, or more, all so thin, that they scarce together amount to five pounds. The undermost serves for a shirt, and is therefore either white or blue, and for the most part thin and transparent. All these gowns are fastened round the waist with a belt, which in the men are about a hand's-breadth, in the women about a foot; of such a length that they go twice round the waist, and afterwards are tied in a knot with many ends and bows. The knot, particularly among the fair sex, is very conspicuous, and immediately informs the spectator whether they are married or not. The unmarried have it behind, on their back; the married before. In this belt the men fix their sabres, fans, pipe, tobacco, and medicine boxes. In the neck the gowns are always cut round, without a collar; they therefore leave the neck bare; nor is it covered with cravat, cloth, or any thing else. The sleeves are always ill made, and out of all proportion wide; at the opening before, they are half sewed up, so that they form a sack, in which the hands can be put in cold weather; they also serve for a pocket. Girls in particular have their sleeves so long that they reach down to the ground. Such is the simplicity of their habit, that they are soon dressed; and to undress, they need only open their girdle and draw in their arms.

As the gowns, from their length, keep the thighs and legs warm, there is no occasion for stockings; nor do they use them in all the empire. Among poorer persons on a journey, and among soldiers, who have not such long gowns, one sees buckins of cotton. Shirts, more properly speaking, slippers, are of all that is worn by the Japanese, the simplest, the meanest, and the most miserable, though in general use among high and low, rich and poor. They are made of interwoven rice-straw; and sometimes, for persons of distinction, of reeds split very thin. They consist only of a sole, without upper leathers or quarters. Before, there passes over, transversely, a bow of linen, of a finger's breadth: from the point of the shoe to this bow goes a thin round band, which running within the great toe, serves to keep the shoe fixed to the foot. The shoe being without quarters, slides, during walking, like a slipper. Travellers have three bands of twisted straw, by which they fasten the shoe to the foot and leg, to prevent its falling off. The Japanese never enter the houses with shoes, but put them off in the entrance. This precaution is taken for the sake of their next carpets. During the time the Dutch reside in Japan, as they have sometimes occasion to pay the natives visits in their houses, and as they have their own apartments at the factory covered with the same sort of carpets, they do not wear European shoes, but have in their stead red, green, or black slippers, which can easily be put off at entering in. They, however, wear stockings, with shoes of cotton, fastened by buckles. These shoes are made in Japan, and may be washed whenever they become dirty.

The way of dressing the hair is not less peculiar to this people, and less universally prevalent among them, than the use of their long gowns. The men shave the head from the forehead to the neck; and the hair remaining on the temples, and in the nape, is well smeared with oil, turned upwards, and then tied with a white paper thread, which is wrapped round several times. The ends of the hair beyond the head, are cut crossways, about a finger's length being left. This part, after being pasted together with oil, is bent in such a manner that the point is brought to the crown of the head; in which situation it is fixed by passing the same thread round it once. Women, except such as happen to be separated from their husbands, shave no part of their head.

The head is never covered with hat or bonnet in winter or in summer, except when they are on a journey; and then they use a conical hat, made of a sort of grass, and fixed with a ribband. Some travelling women, who are met with on the roads, have a bonnet like a shaving bason inverted on the head, which is made of cloth, in which gold is interwoven. On other occasions, their naked heads are preserved, both from rain and the sun, by umbrellas. Travellers, moreover, have a sort of riding-coat, made of thick paper oiled. They are worn by the upper servants of princes, and the suite of other travellers. Dr Thunberg and his fellow-travellers, during their journey to court, were obliged to provide such for their attendants when they passed through the place where they are made.

A Japanese always has his arms painted on one or more of his garments, especially on the long and short gowns, on the sleeves, or between the shoulders; so that nobody can steal them; which otherwise might easily happen in a country where the clothes are so much alike in stuff, shape, and size.

The weapons of the Japanese consist of a bow and arrows, sabre, halberd, and musket. The bows are very large, and the arrows long, as in China. When the bows are to be bent and discharged, the troop always rests on one knee, which hinders them making a speedy discharge. In the spring the troops assemble to practice shooting at a mark. Muskets are not general; Dr Thunberg only saw them in the hands of persons of distinction, in a separated and elevated part of the audience room. The barrel is of the common length; but the stock is very short, and there is a match in the lock. The sabre is their principal and best weapon, which is universally worn, except by the peasants. They are commonly a yard long, a little crooked, and thick in the back. The blades are of an incomparable goodness, and the old ones are in very high esteem. They are far superior to the Spanish blades so celebrated in Europe. A tolerably thick nail is easily cut in two without any damage to the edge; and a man, according to the account of the Japanese, may be clef saunder. A separate scabbard is never used, but the sword is stuck in the belt, on the left side, with the edge upwards, which to a European appears ridiculous. All persons in office wear two such sabres, one of their own, and
Japan. and the other the sword of office, as it is called; the latter is always the longer. Both are worn in the belt on the same side, and so disposed as to cross each other. When they are sitting, they have their sword of office laid on one side or before them.

The sciences are very far from having arrived at the same height in Japan as in Europe. The history of the country is, notwithstanding, more authentic, perhaps, than that of any other country; and it is studied, without distinction, by all. Agriculture, which is considered as the art most necessary, and most conducive to the support and prosperity of the kingdom, is nowhere in the world brought to such perfection as here; where neither civil nor foreign war, nor emigration, diminishes population; and where a thought is never entertained, either of getting possession of other countries, or to import the useless and often hurtful productions of foreign lands; but where the utmost care is taken that no turf lies uncultivated, and no produce of the earth unemployed. Astronomy is pursued and respected; but the natives are unable, without the aid of Chinese, and sometimes of Dutch almanacs, to form a true kalendr, or calculate an eclipse of the sun or moon within minutes and seconds. Medicine has neither arrived, nor is it likely to arrive, at any degree of perfection. Anatomy is totally unknown; the knowledge of diseases imperfect, intricate, and often fabulous. Botany, and the knowledge of medicines, constitute the whole of their skill. They use only simples; and these generally diuretic and diaphoretic deceptions. They are unacquainted with compound medicines. Their physicians always indeed feel the pulse; but they are very tedious, not quitting it for a quarter of an hour; besides, they examine first one, and then the other arm, as if the blood was not driven by the same heart to both pulses. Besides those diseases which they have in common with other countries, or peculiar to themselves, the venereal disease is very frequent, which they only understood how to alleviate by deceptions, thought to purify the blood. Salivation, which their physicians have heard mentioned by the Dutch surgeons, appears to them extremely formidable, both to conduct and to undergo; but they have lately learned the art of employing the sublimate with much success. — Jurisprudence is not an extensive study in Japan. No country has thinner law-books, or fewer judges. Explanations of the law, and advocates, are things altogether unknown; but nowhere, perhaps, are the laws more certainly put in force, without respect to persons, without impartiality or violence. They are very strict, and lawsuits very short. The Japanese know little more of physic or chemistry than what they have learned of late years of the Europeans.

Their computation of time takes its rise from Min-a, or 660 years before Christ. The year is divided according to the changes of the moon; so that some years consist of twelve, and others of thirteen, months; and the beginning of the year falls out in February or March. They have no weeks consisting of seven days, or of six working days, and a holiday; but the first and fifteenth days of the month serve for holidays. On these days no work is done. On new-year’s day they go round to wish one another a good new-year, with their whole families, clad in white and blue chequered, their holiday-dress; and they rest almost the whole of the first month. The day is divided only into twelve hours, and in this division they are directed the whole year by the rising and setting of the sun. They reckon six o'clock at the rising, and six likewise at the setting of the sun. Mid-day and mid-night are always at nine Time is not measured by clocks or hour-glasses, but with burning matches, which are twisted together like ropes, and divided by knots. When the match is burned to a knot, which indicates a certain portion of time elapsed, notice is given during the day, by striking the bells of the temples; and in the night, by the watchmen striking two boards against one another. A child is always reckoned a year old at the end of the year of his birth, whether this happen at the beginning or the close. A few days after the beginning of the year, is performed the horrid ceremony of trampling on images representing the cross and the Virgin Mary with her child. The images are of melted copper, and are said to be scarce a foot in height. This ceremony is intended to impress every individual with hatred of the Christian doctrine, and the Portuguese, who attempted to introduce it there; and also to discover whether there is any remnant of it left among the Japanese. It is performed in the places where the Christians chiefly resided. In Nagasaki it lasts four days; then the images are conveyed to the circumjacent places, and afterwards are laid aside against the next year. Every person, except the Japanese governor and his attendants, even the smallest child, must be present; but it is not true, as some have pretended, that the Dutch are also obliged to trample on the image. Overseers are appointed in every place, who assemble the people in companies in certain houses, call over the name of every one in his turn, and take care that every thing goes on properly. The children, not yet able to walk, have their feet placed upon it; older persons pass over it from one side of the room to the other.

The Japanese are much addicted to poetry, music, and painting: the first is said to be grand as to the style and imagery, softness, and cadence; but, like that of the Chinese, is not easily understood or relished by the Europeans. The same may be said of their music, both vocal and instrumental.

They pretend, like the Chinese, to have been the inventors of printing from time immemorial, and their method is the same with theirs on wooden blocks; but they excel them in the neatness of cutting them, as well as in the goodness of their ink and paper. Golowin found translations of some European works, among which was a geographical description of the Russian empire. They likewise lay claim to the invention of gunpowder; and are vastly superior to the Chinese in the use of all sorts of fire-arms, especially of artillery, as well as the curiousness of their fire-works.

Their manner of writing is much the same as that of the Chinese, viz. in columns from top to bottom, and the columns beginning at the right and ending at the left hand. Their characters were also originally the same, but now differ considerably.

Their language hath some affinity with the Chinese, though it appears from its various dialects to have been a kind of compound of that and other languages, derived from the various nations that first peopled those islands. It is not only very regular, polite, elegant, and copious, but abound with a great variety of synonyms,
The Japanese architecture is in much the same taste and style as that of the Chinese, especially as to their temples, palaces, and other public buildings; but in private ones they affect more plainness and neatness than show. These last are of wood and cement, consisting of two stories: they dwell only in the lower, the upper chamber serving for warehouses. The roofs are covered with rush-mats three or four inches thick. In every house there is a small court, ornamented with trees, shrubs, and flower-pots, as likewise with a place for bathing. Chimneys are unknown in this country, although fire is needed from the cold month of October till the end of March. They heat their rooms with charcoal contained in a copper stove, which they sit round. Their cities are generally spacious, having each a prince or governor residing in them. The capital of Jeddoo is 21 French leagues in circumference. Its streets are straight and large. There are gates at little distances, with an extremely high ladder, which they ascend to discover fires. Villages differ from cities in having but one street; which often extends several leagues. Some of them are situated so near each other that they are only separated by a river or a bridge.

The principal furniture of the Japanese consists in straw-mats, which serve for seats and beds; a small table for every one who chooses to eat the only movable. The Japanese sit always upon their knees. Before dinner begins, they make a profound bow and drink to the health of the guests. The women eat by themselves. During the course, they drink a glass of sakki, which is a kind of beer made of rice kept constantly warm, and they drink at each new morsel. Tea and sakki are the most favourite drinks of this people; wine and spirits are never used, not even accepted when offered by the Dutch. Sakki, or rice beer, is clean as wine, and of an agreeable taste: taken in quantity, it intoxicates for a few moments, and causes headach. Both men and women are fond of tobacco, which is in universal vogue and smoked continually. The gardens about their houses are adorned with a variety of flowers, trees, verdure, baths, terraces, and other embellishments. The furniture and decorations of the houses of persons of distinction consist in Japan-work of various colours, curious paintings, beds, couches, skreen, cabinets, tables, a variety of porcelain jars, vases, tea-equipage, and other vessels and figures, together with swords, guns, scimitars, and other arms. Their retainers are more or less numerous and splendid according to their rank; but there are few of the lords who have less than 30 or 60 men richly clad and armed, some on foot, but most on horseback. As for their petty kings and princes, they are seldom seen without 300 or 200 at lease, when they either wait on the emperor, which is one-half of the year or attend him abroad.

When a prince or great man dies, there are commonly about 10, 20, or more youths of his household, and such as were his greatest favourites, who put themselves to a voluntary death, at the place where the body is buried or burned; as soon as the funeral pile, consisting of odoriferous woods, gums, spices, oils, and other ingredients, is set on fire, the relations and friends of the deceased throw their presents into it, such as clothes, arms, victuals, money, sweet herbs, flowers, and other things which they imagine will be of use to him in the other world. Those of the middle or lower rank commonly bury their dead, without any other burning than that of some odoriferous woods, gums, &c. The sepulchres in which the bones and ashes of persons of rank are deposited, are generally very magnificent, and situated at some distance from the towns.

The Dutch and Chinese are the only nations allowed to trade in Japan. The Dutch at present send but two ships annually, which are fitted out at Batavia, and sail in June, and return at the end of the year. The chief merchandise is Japanese copper and raw camphor. The wares which the Dutch company import are, coarse sugar, ivory, a great quantity of tin and lead, a little cast iron, various kinds of fine chinzez, Dutch cloth of different colours and fineness, serge wood for dyeing, tortoise-shell, and costus arabicus. The little merchandise brought by the officers on their own account, consists of saffron, theria, sealing-wax, glass-balls, watches, &c. &c. About the time when the Dutch ships are expected, several outposts are stationed on the highest hills by the government; they are provided with telescopes, and long before their arrival give the governor of Nagasaki notice. As soon as they anchor in the harbour, the upper and under officers of the Japanese immediately betake themselves on board, together with interpreters; to whom is delivered a chest, in which all the sailors books, the muster-roll of the whole crew, six small barrels of powder, six barrels of balls, six muskets, six bayonets, six pistols, and six swords are deposited; this is supposed to be the whole remaining ammunition after the imperial garrison has been saluted. These things are conveyed on sloops, and preserved in a separate warehouse, nor are they returned before the day the ship quits the harbour.

Duties are quite unknown as well in the inland part as on the coast, nor are there any customs required either for exported or imported goods; an advantage enjoyed by few nations. But, to prevent the importation of any forbidden wares, the utmost vigilance is observed; then the men and things are examined with the eyes of Argus. When any European goes on shore, he is examined before he leaves the ship, and afterwards on his landing. This double search is exceedingly strict; so that not only the pockets and clothes are streaked with the hands, but the pudenda of the manner sort are pressed, and the hair of the slaves. All the Japanese who come on board are searched in like manner, except only their superior officers: so also are the wares either exported or imported, first or board, and then at the factory, except the great chests, which are opened at the factory, and so carefully examined that they.
they strike the very sides lest they should be hollow.

The bed-clothes are often opened, and the feathers examined: rods of iron are run into the pots of butter and confections: a square hole is made in the cheese, and a long pointed iron is thrust into it in all directions. Their suspicion is carried so far, that they take out and break one or two of the eggs brought from Batavia.

The interpreters are all natives; they speak Dutch in different degrees of purity. The government permits no foreigner to learn their language, lest they should by means of this acquire the knowledge of the manufactures of the country; but 40 or 50 interpreters are provided to serve the Dutch in their trade, or on any other occasion.

The interpreters are very inquisitive after European books, and generally provide themselves with some from the Dutch merchants. They persecute them with care, and remember what they learn. They besides endeavour to get instruction from the Europeans; for which purpose they ask numberless questions, particularly respecting medicine, physics, and natural history. Most of them apply to medicine, and are the only physicians of their nation who practice in the European manner of and with European medicines, which they procure from the Dutch physicians. Hence they are able to acquire money, and to make themselves respected.

Among the vegetable productions peculiar to Japan, we may take notice of the aelutis japonica, camellia japonica, and the volckmeria japonica. The trumpet-flower, or bignonia catalpa of Linnaeus, is very common, bearing a resemblance to the epidendrum vanilla, the berries of which are said to constitute an article of commerce. Here also we find the mimosa arborea, and tallow tree, together with the plantain, cocoa-nut tree, the chamaerops excelsa, and the cyanus circinalis, adorning the woods near the sea shore.

It is a singular circumstance, that in the whole empire of Japan, neither sheep nor goats are to be met with, the goats being deemed pernicious to cultivation; and the vast quantities of silk and cotton with which it abounds, are considered as an excellent substitute for wool. There are few quadrupeds of any kind, either swine, horses, or cattle, as the Japanese live upon fish, poultry, and vegetables. Some wolves are seen in the northern provinces; and foxes are considered as demons incarnate.

Gold and silver abound in Japan, and copper richly impregnated with gold, which constitutes the chief wealth of many provinces. Iron is said to be scarcer than any other metal, which of consequence they are not fond of exporting. Amber, sulphur, bit-coal, red agate, asbestos, porcelain clay, pomice and white marble, are also found in considerable quantities; but, according to Kempfer, neither antimony nor mercury. As Europeans have seldom visited the interior parts of the country, the natural curiosities of Japan are but very little known.

Japan Earth. See Mimosa and Terra Japonica, Materia Medica Index.

JAPANNING, the art of varnishing and drawing figures on wood, in the same manner as is done by the natives of Japan in the East Indies.

The substances which admit of being japanned are almost every kind that are dry and rigid, or not too flexible; as wood, metals, leather, and paper prepared.

Wood and metals do not require any other preparation, but to have their surface perfectly even and clean but leather should be securely strained either on frames or on boards; as its bending or forming would otherwise crack and force off the coats of varnish: an paper should be treated in the same manner, and have a previous strong coat of some kind of size; but it is rarely made the subject of japanning till it is converted into papier mache', or wrought by other means into such a form, that its original state, particularly with respect to flexibility, is lost.

One principal variation from the method formerly used in japanning is, the using or omitting any priming or undercoat on the work to be japanned. In the old practice, such priming was always used; and is at present retained in the French manner of japanning coaches and snuff-boxes of the papier mache'; but in the Birmingham manufacture here, it has been always rejected. The advantage of using such priming or undercoat is, that it makes a saving in the quantity of varnish used; because the matter of which the priming is composed fills up the imperfections of the body to be varnished; and makes it easy, by means of rubbing and water-polishing, to gain an even surface for the varnish: and this was therefore such a convenience in the case of wood, as the giving a hardness and firmness to the ground was also in the case of leather, that it became an established method; and is therefore retained even in the instance of the papier mache' by the French, who applied the received method of japanning to that kind of work on its introduction. There is nevertheless this inconvenience always attending the use of an undercoat of size, that the japan coats of varnish and colour will be constantly liable to be cracked and peeled off by any violence, and will not endure near so long as the bodies japanned in the same manner, but without any such priming; as may be easily observed in comparing the wear of the Paris and Birmingham snuff-boxes; which latter, when good of their kind, never peel or crack, or suffer any damage, unless by great violence, and such a continued rubbing as wastes away the substance of the varnish; while the japan coats of the Parisians crack and fly off in flakes, whenever any knock or fall, particularly near the edges, exposes them to be injured.

But the Birmingham manufacturers, who originally practised the japanning only on metals, to which the reason above given for the use of priming did not extend, and who took up this art of themselves as an invention, of course omitted at first the use of any such undercoat; and not finding it more necessary in the instance of papier mache' than on metals, continue still to reject it. On which account, the boxes of their manufacture are, with regard to wear, greatly better than the French.

The laying on the colour in gum-water, instead of varnish, is also another variation from the method of japanning formerly practised: but the much greater strength of the work, where they are laid on in varnish or oil, has occasioned this way to be exploded with the greatest reason in all regular manufactures; however, they who may practice japanning on cabinets, or other such pieces as are not exposed to much wear and
coarse seed-lac and resin each two ounces. Dissolve Japanese
the seed-lac and resin in the spirit; and then strain off
the varnish.

This varnish, as well as all others formed of spirit of
wine, must be laid on in a warm place; and if it can
be conveniently managed, the piece of work to be var-
ished should be made warm likewise: and for the
same reason all dampness should be avoided; for either
cold or moisture chills this kind of varnish, and pre-
vents it taking proper hold of the substance on which
it is laid.

When the work is so prepared, or by the priming
with the composition of size and whiting above de-
scribed, the proper japan ground must be laid on,
which is much the best formed of shell-lac varnish,
and the colour desired, if white be not in question,
which demands a peculiar treatment, or great bright-
ness be not required, when also other means must be
pursued.

The colours used with the shell-lac varnish may be
any pigments whatever which give the tint of the
ground desired; and they may be mixed together to
form browns or any compound colours.

As metals never require to be undercoated with
whiting, they may be treated in the same manner as
wood or leather, when the undercoat is omitted, except
in the instances particularly spoken of below.

White Japan Grounds.—The forming a ground per-
fecfly white, and of the first degree of hardness, re-
 mains hitherto a desideratum, or matter sought for, in
the art of japanning, as there are no substances which
form a very hard varnish but what have too much col-
our not to deprave the whiteness, when laid on of a
due thickness over the work.

The nearest approach, however, to a perfect white
varnish, already known, is made by the following com-
position.

"Take flake-white, or white lead, washed over and
ground up with a sixth of its weight of starch, and
then dried; and temper it properly for spreading with
the mastich varnish prepared as under the article
Varnish.

"Lay these on the body to be japanned, prepared
either with or without the undercoat of whiting, in
the manner as above ordered; and then varnish it
over with five or six coats of the following varnish:

"Provide any quantity of the best seed-lac; and
pick out of it all the clearest and whitest grains, re-
serving the more coloured and futiler parts for the
coarse varnishes, such as that used for priming or pre-
paring wood or leather. Take of this picked seed-lac
two ounces, and of gum-animi three ounces; and dis-
solve them, being previously reduced to a gross powder
in about a quart of spirit of wine; and strain off the
clear varnish."

The seed-lac will yet give a slight tinge to this
composition; but cannot be omitted where the varnish
is wanted to be hard; though, when a softer will an-
swer the end, the proportion may be diminished, and a
little crude turpentine added to the gum-animi to take
off the brittleness.

A very good varnish, free entirely from all brittle-
ness, may be formed by dissolving as much gum-animi
as the oil will take, in old rots or poppy oil, which must be
made to boil gently when the oil is put into it. The

JAPAN

Japanning. Ground of white colour itself may be laid on in this varnish, and then a coat or two of it may be put over the ground; but it must be well diluted with oil of turpentine when it is used. This, though free from brittleness, is nevertheless liable to suffer by being indented or bruised by any slight strokes; and it will not well bear any polish, but may be brought to a very smooth surface without, if it be judiciously managed in the laying on. It is likewise somewhat tedious in drying, and will require some time where several coats are laid on; as the last ought not to contain much oil of turpentine.

Blue JAPAN Grounds.—Blue japan grounds may be formed of bright Prussian blue, or of verditer glazed over by Prussian blue, or of smalt. The colour may be best mixed with shell-lac varnish, and brought to a polishing state by five or six coats of varnish of seed-lac: but the varnish, nevertheless, will somewhat injure the colour by giving to a true blue a cast of green, and foiling in a very small degree a warm blue by the yellow it contains; wherefore a bright blue is required, and a less degree of hardness can be dispensed with, the method before directed in the case of white grounds must be pursued.

Red JAPAN Grounds.—For a scarlet japan ground, vermillion may be used: but the vermillion has a glaring effect, that renders it much less beautiful than the crimson produced by glazing it over with carmine or fine lake; or even with rose pink, which has a very good effect used for this purpose. For a very bright crimson, nevertheless, instead of glazing with carmine, the Indian lake should be used, dissolved in the spirit of which the varnish is compounded, which readily admits of when good: and in this case, instead of glazing with the shell-lac varnish, the upper or polishing coats need only be used; as they will equally receive and convey the tinge of the Indian lake, which may be actually dissolved by spirit of wine: and this will be found a much cheaper method than the using carmine. If, nevertheless, the highest degree of brightness be required, the white varnishes must be used.

Yellow JAPAN Grounds.—For bright yellow grounds, the king's yellow, or the turpeth mineral, should be employed, either alone or mixed with fine Dutch pink: and the effect may be still more heightened by dissolving powdered turpeth in the spirit of wine of which the upper or polishing coat is made; which spirit of wine must be strained from off the dregs before the seed-lac is added to it to form the varnish.

The seed-lac varnish is not equally injurious here, with greens, as in the case of other colours; because being only tinged with a reddish yellow, it is little more than an addition to the force of the colours.

Yellow grounds may be likewise formed of the Dutch pink only; which, when good, will not be wanting in brightness, though extremely cheap.

Green JAPAN Grounds.—Green grounds may be produced by mixing the king's yellow, and bright Prussian blue, or rather the turpeth mineral and Prussian blue; and a cheap but fouler kind, by verdigris with a little of the above-mentioned yellows, or Dutch pink. But where a very bright green is wanted, the crystals of verdigris, called distilled verdigris, should be employed: and to heighten the effect, they should be laid on a ground of leaf-gold, which renders the colour extremely brilliant and pleasing.

They may any of them be used successfully with good seed-lac varnish, for the reason before given; but will be still brighter with white varnish.

Orange-coloured JAPAN Grounds.—Orange-coloured japan grounds may be formed by mixing vermillion or red-lead with king's yellow, or Dutch pink; or the orange-lac, which will make a brighter orange ground than can be produced by any mixture.

Purple JAPAN Grounds.—Purple japan grounds may be produced by the mixture of lake and Prussian blue; or a fouler kind, by vermillion and Prussian blue. They may be treated as the rest with respect to the varnish.

Black JAPAN Grounds to be produced with Heat.—Black grounds may be formed by either ivory-black or lamp-black; but the former is preferable where it is perfectly good.

These may be always laid on with shell-lac varnish; and have their upper or polishing coats of common seed-lac varnish, as the tinge of freshness of the varnish can be here no injury.

Common Black JAPAN Grounds on Iron or Copper, produced by means of Heat.—For forming the common black japan grounds by means of heat, the piece of work to be japanned must be painted over with drying oil; and, when it is of a moderate dryness, must be put into a stove of such degree of heat as will change the oil to black, without burning it so as to destroy or weaken its tenacity. The stove should not be too hot when the work is put into it, nor the heat increased too fast; either of which errors would make it blister: but the slower the heat is augmented, and the longer it is continued, provided it be restrained within the due degree, the harder will be the coat of japan.

This kind of varnish requires no polish, having received, when properly managed, a sufficient one from the heat.

The fine Tortoise-shell JAPAN Ground produced by means of Heat.—The best kind of tortoise-shell ground produced by heat is not less valuable for its great hardness, and enduring to be made hotter than boiling water without damage, than for its beautiful appearance. It is to be made by means of a varnish prepared in the following manner:

"Take of good linseed oil one gallon, and of amber half a pound; boil them together till the oil becomes very brown and thick: strain it then through a coarse cloth, and set it again to boil; in which state it must be continued till it acquire a pitchy consistence; when it will be fit for use."

Having prepared thus the varnish, clean well the iron or copper plate or other piece which is to be japanned; and then lay varnishing tempered with shell-lac varnish, or with drying oil diluted with oil of turpentine, very thinly, on the places intended to imitate the more transparent parts of the tortoise-shell. When the varnish is dry, brush over the whole with the black varnish, tempered to a due consistence with oil of turpentine; and when it is set and firm, put the work into a stove, where it may undergo a very strong heat, and must be continued a considerable time; if even three weeks or a month, it will be the better."

This
JAPAN

This was given amongst other receipts by Kunckel; but appears to have been neglected till it was revived with great success in the Birmingham manufactures, where it was not only the censer of snuff-boxes, dressing-boxes, and other such lesser pieces, but of those beautiful tea-wasters which have been so justly esteemed and admired in several parts of Europe where they have been sent. This ground may be decorated with painting and gilding, in the same manner as any other varnished surface, which had best be done after the ground has been duly hardened by the hot stove; but it is well to give a second annealing with a more gentle heat after it is finished.

Method of Painting Japan Work.—Japan work ought properly to be painted with colours in varnish, though, in order for the greater dispatch, and, in some very nice works in small, for the freer use of the pencil, the colours are sometimes tempered in oil; which should previously have a fourth part of its weight of gum animal dissolved in it; or, in default of that, of the gums sandarac or mastich. When the oil is thus used, it should be well diluted with spirit of turpentine, that the colours may be laid more evenly and thin; by which means, fewer of the polishing or upper coats of varnish become necessary.

In some instances, water-colours are laid on grounds of gold, in the manner of other paintings; and are best, when so used, in their proper appearance, without any varnish over them; and they are also sometimes so managed as to have the effect of embossed work. The colours employed in this way, for painting, are both prepared by means of isinglass size corrected with honey or sugarcandy. The body of which the embossed work is raised, need not, however, be tinged with the exterior colour; but may be best formed of very strong gum-water, thickened to a proper consistence by bore-sorbian and whiting in equal parts; which being laid on the proper figure, and repaired when dry, may be then painted with the proper colours tempered in the isinglass size, or in the general manner with shell-lac varnish.

Manner of Varnishing Japan Work.—The last and finishing part of japanning lies in the laying on and polishing the outer coats of varnish; which are necessary, as well in the pieces that have only one simple ground of colour, as with those that are painted. This is in general best done with common seed-lac varnish, except in the instances and on those occasions where we have already shown other methods to be more expeditious; and the same reasons which decide as to the fitness or impropriety of the varnishes, with respect to the colours of the ground, hold equally with regard to those of the painting: for where brightness is the most material point, and a tinge of yellow will injure it, seed-lac must give way to the whiter gums; but where hardness, and a greater tenacity, are most essential, it must be adhered to; and where both are so necessary, that it is proper one should give way to the other in a certain degree reciprocally, a mixed varnish must be adopted.

This mixed varnish, as we have already observed, should be made of the picked seed-lac. The common seed-lac varnish, which is the most useful preparation of the kind hitherto invented, may be thus made:

"Take of seed-lac three ounces, and put it into water to free it from the sticks and fibres that are frequently intermixed with it, and which must be done by stirring it about, and then pouring off the water, and adding fresh quantities in order to repeat the operation, till it be freed from all impurities, as it very effectually may be by this means. Dry it then, and powder it grossly, and put it, with a pint of rectified spirit of wine, into a bottle, of which it will not fill above two-thirds. Shake the mixture well together; and place the bottle in a gentle heat, till the seed appear to be dissolved; the shaking being in the mean time repeated as often as may be convenient: and then pour all that can be obtained clear by this method, and strain the remainder through a coarse cloth. The varnish thus prepared must be kept for use in a bottle well stopped."

When the spirit of wine is very strong, it will dissolve a greater proportion of the seed-lac: but this will saturate the common, which is seldom of a strength sufficient for making varnishes in perfection. As the chilling, which is the most inconvenient accident attending those of this kind, is prevented, or produced more frequently, according to the strength of the spirit; we shall therefore take this opportunity of showing a method by which weaker rectified spirits may with great ease, at any time, be freed from the phlegm, and rendered of the first degree of strength.

"Take a pint of the common rectified spirit of wine, and put it into a bottle, of which it will not fill above three parts. Add to it half an ounce of pearl-ashes, salt of tartar, or any other alkaline salt, heated red hot, and powdered, as well as it can be without much loss of its heat. Shake the mixture frequently for the space of half an hour; before which time, a great part of the phlegm will be separated from the spirit, and will appear, together with the undissolved part of the salts, in the bottom of the bottle. Let the spirit then be poured off, or freed from the phlegm and salts, by means of a triumvir or separating funnel; and let half an ounce of the pearl-ashes, heated and powdered as before, be added to it, and the same treatment repeated. This may be done a third time, if the quantity of phlegm separated by the addition of the pearl-ashes appear considerable. An ounce of alum reduced to powder and made hot, but not burnt, must then be put into the spirit, and suffered to remain some hours; the bottle being frequently shaken; after which, the spirit, being poured off from it, will be fit for use."

The addition of the alum is necessary, to neutralize the remains of the alkaline salts or pearl-ashes; which, otherwise, greatly deprave the spirit with respect to varnishes and lacquer, where vegetable colours are concerned; and must consequently render another distillation necessary.

The manner of using the seed-lac or white varnishes is the same, except with regard to the substance used in polishing; which, where a pure white or great clearness of other colours is in question, should be itself white: whereas the browner sorts of polishing dust, as being cheaper, and doing their business with greater dispatch, may be used in other cases. The pieces of work to be varnished should be placed near a fire, or in a room where there is a stove, and made perfectly dry;
JAP

Japanning, dry; and then the varnish may be rubbed over them Japheth. by the proper brushes made for that purpose, beginning in the middle, and passing the brush to one end; and then with another stroke from the middle, passing it to the other. But no part should be crossed or twice passed over, in forming one coat, where it can possibly be avoided. When one coat is dry, another must be laid over it; and this must be continued at least five or six times, or more, if on trial there be not sufficient thickness of varnish to bear the polish, without laying bare the painting or the ground colour underneath.

When a sufficient number of coats is thus laid on, the work is fit to be polished: which must be done, in common cases, by rubbing it with a rag dipped in Tripoli or pumice-stone, commonly called rotten stone, finely powdered: but towards the end of the rubbing, a little oil of any kind should be used along with the powder; and when the work appears sufficiently bright and glossy, it should be well rubbed with the oil alone, to clean it from the powder, and give it a still brighter lustre.

In the case of white grounds, instead of the Tripoli or pumice-stone, fine putty or whitewash must be used; both which should be washed over to prevent the danger of damaging the work from any sand or other gritty matter that may happen to be commixed with them.

It is a great improvement of all kinds of japan work, to harden the varnish by means of heat; which, in every degree that it can be applied, short of what would burn or calcine the matter, tends to give it a more firm and strong texture. Where metals form the body, therefore, a very hot stove may be used, and the pieces of work may be continued in it a considerable time; especially if the heat be gradually increased; but where wood is in question, heat must be sparingly used, as it would otherwise warp or shrink the body, so as to injure the general figure.

Japheth, the son of Noah. His descendants possessed all Europe and the isles in the Mediterranean, as well those which belong to Europe, as others which depend on Asia. They had all Asia Minor, and the northern parts of Asia above the sources of the Tigris and Euphrates. Noah, when he blessed Japheth, said to him, "God shall enlarge Japheth, and he shall dwell in the tents of Shem; and Canaan shall be his servant." This blessing of Noah was accomplished, when the Greeks, and after them the Romans, carried their conquests into Asia and Africa, which were the dwellings and dominions of Shem and Canaan.

The sons of Japheth were Gomer, Magog, Madai, Javan, Tubal, Meshech, and Tiras. The scripture says, "that they peopled the isles of the Gentiles, and settled in different countries, each according to his language, family, and people." It is supposed, that Gomer was the father of the Cimbr, or Cimmerians; Magog of the Scythians; Madai of the Macedonians or Medes; Javan of the Ionians and Greeks; Tubal of the Tiberians; Meshech of the Muscovites or Russians; and Tiras of the Thracians. By the isles of the Gentiles, the Hebrews understand the isles of the Mediterranean, and all the countries separated by the sea from the continent of Palestine; whither also "the Hebrews could go by sea only, as Spain, Gaul, Italy, Greece, Asia Minor.

Japheth was known by profane authors under the name of Japetus. The poets make him the father of heaven and earth. The Greeks believe that he was the father of their race, and acknowledged nothing more ancient than him. Besides the seven sons of Japheth above mentioned, the Septuagint, Eusebius, the Alex andrian Chronicle, and St Austin, give him an eighth called Elisa, who is not mentioned either in the Hebrew or Chaldee, and the eastern peoples affirm that Japheth had eleven children.

Japydia, in Ancient Geography, a western district of Illyricum, anciently threefold; the first Japydite, extending from the springs of the Timavus to Istria; the second, from the river Arsia to the river Tedia; and the third, called Inaplinna, situated in Mount Alibus and the other Alps, which run out above Istria. Japodes, or Japades, the people. Now constituting the south part of Carniola, and the west of Austrian Croatia.

Japygia, Calabria, anciently so called by the Greeks. Japygae, the people.

Japygium, in Ancient Geography, a promontory of Calabria; called also Salentinum. Now Capo di S. Maria di Leuca.

Jaquelot, Isaac, a celebrated French Protestant divine, born in 1647, at Vassy in Champagne, where his father was minister. The revocation of the edict of Nantz obliging him to quit France, he took refuge first at Heidelberg, and then at the Hague, where he procured an appointment in the Wallyon church. Here he continued till that capital was taken by the king of Prussia, who, hearing him preach, made him his French minister in ordinary at Berlin; to which city he removed in 1702. While he lived at Berlin, he entered into a warm controversy with M. Bayle on the doctrine advanced in his dictionary flattering manichism, which continued until death imposed silence on both parties: and it was in this dispute that M. Jaquelot openly declared in favour of the Remonstrants. He wrote, among other works, 1. Dissertations sur l'existence de Dieu. 2. Dissertations sur le Messie. 3. Lettres à Messieurs les Prélats de l'Eglise Gallicaine. He was employed in finishing an important work upon the divine authority of the holy scriptures, when he died suddenly in 1708, aged 61.

JAR, or Jarr, an earthen pot or pitcher, with a big belly and two handles. —The word comes from the Spanish jarra or jarro, which signifies the same.

JAR is used for a sort of measure or fixed quantity of divers things. —The jar of oil is from 18 to 26 gallons; the jar of green ginger is about 100 pounds weight.

Jarchi, Solomon, otherwise Rashi, and Isakki Solomon, a famous rabbi, born at Troyes in Champagne, who flourished in the 12th century. He was a perfect master of the talmud and gemara; and he filled the postils of the bible with so many talmudical reveries, as totally extinguished both the literal and moral sense of it. A great part of his commentaries are printed in Hebrew, and some have been translated into
JAROSLOW, a handsome town of Poland, in the palatinate of Russia, with a strong citadel. It is remarkable for its great fair, its handsome buildings, and a battle gained by the Swedes in 1656, after which they took the town. It is seated on the river Saine, in E. Long. 22° 23'. N. Lat. 49° 58'.

JASHER, THE BOOK OF. This is a book which Joshua mentions, and refers to in the following passage: “And the sun stood still, and the moon stayed, until the people had avenged themselves upon their enemies: is not this written in the book of Jasher?”

It is difficult to determine what this book of Jasher, or “the upright,” is. St. Jerome and the Jews believed it to be Genesis, or some other book of the Pentateuch, wherein God foretold He would do wonderful things in favour of his people. Huetius supposes it was a book of morality, in which it was said that God would subvert the course of nature in favour of those who put their trust in Him. Others pretend, it was public annals, or records, which were styled justicia or upright, because they contained a faithful account of the history of the Israelites. Grotius believes, that this book was nothing else but a song, made to celebrate this miracle and this victory. This seems the most probable opinion, because the words cited by Joshua, as taken from this work, “Sun, stand thou still upon Gibeon, and thou moon in the valley of Ajalun,” are such poetical expressions as do not suit with historical memoirs; besides that in the 2d book of Samuel (i. 18.) mention is made of a book under the same title, on account of a song made on the death of Saul and Jonathan.

JASION, a genus of plants belonging to the syngenesia class; and in the natural method ranking under the 29th order, Campanaceae. See BOTANY Index.

JASMINE. See JASMINUM.

Arobian Jasmine. See NYCTANTHES, BOTANY Index.

JASMINUM, Jasmine, or Jessamine Tree, a genus of plants belonging to the diandrias class; and in the natural method ranking under the 44th order, Scipirae. See BOTANY Index.

JASON, the Greek hero who undertook the Argonautic expedition, the history of which is obscured by fabulous traditions, florished about 937 B.C. See ARGONAUTS.

JASPACHATES. See JADE-STONE, MINERALOGY Index.

JASPER, a species of mineral belonging to the siliceous genus of stones, and of which there are many varieties, some of which being extremely beautiful, are much sought after, and employed as trinkets and ornaments. See MINERALOGY Index.

JASPONYX, an old term in mineralogy, importing, as appears from the name, a compound of jasper and onyx.

JATROPHA, the Cassada Plant, a genus of plants belonging to the monoeia class; and in the natural method ranking under the 38th order, Tricoera. See BOTANY Index.

JAVA, a large island of the East Indies, lying between 105° and 115° E. Long, and from 6° to 8° S. Lat. extending in length 700 miles, and in breadth about 100. It is situated to the south of Borneo, and south-east.
Java. — south-east from the peninsula of Malacca, having Sumatra lying before it, from which it is separated by a narrow passage, now so famous in the world by the name of the Straits of Sunda. The country is mountainous and woody in the middle; but a flat coast, full of bogs and marshes, renders the air unhealthful. It produces pepper, indigo, sugar, tobacco, rice, coffee, cocoa-nuts, plantains, cardamoms, and other tropical fruits. Gold also, but in no great quantities, hath been found in it. It is diversified by many mountains, woods, and rivers; in all which nature has very bountifully bestowed her treasure. Many of the mountains are so high as to be seen at the distance of a number of leagues. That which is called the Blue Mountains is by far the highest of them all, and seen the farthest off at sea. They have frequent and very terrible earthquakes in this island, which shake the city of Batavia and places adjacent, to such a degree, that the fall of the houses is expected every moment. The waters in the road are excessively agitated, isomochon that their motion resembles that of a boiling pot, and in some places the earth opens, which affords a strange and terrible spectacle. The inhabitants are of opinion, that these earthquakes proceed from the mountain Parang, which is full of sulphur, saltpetre, and bitumen. The fruits and plants of this island are in their several kinds excellent, and almost out of number. There are abundance of forests scattered over it, in which are all kinds of wild beasts, such as buffaloes, tygers, rhinoceroses, and wild horses, with an infinite variety of serpents, some of them of an enormous size. Crocodiles are prodigiously large in Java, and are found chiefly about the mouths of rivers; for, being amphibious animals, they delight mostly in marshes and savannahs. This creature, like the tortoise, lays its eggs in the hot sands, without taking any further care of them; the sun hatches them at the proper season, when the young run instantly into the water. There is, in short, no kind of animal wanting here: birds they have of all sorts, and exquisitely good, especially peacocks, partridges, pheasants, wood-pigeons: and, for curiosity, they have the Indian bat, which differs little in form from ours; but its wings, when extended, measure a full yard, and the body of it is of the size of a rat. They have fish in great plenty, and very good; so that for the value of three-pence there may be enough bought to dine six or seven men. They have likewise a multitude of tortoises, the flesh of which is very little inferior to veal, and there are many who think it better.

Very extravagant ideas formerly prevailed respecting the number of inhabitants in Java. By a census taken in 1815, it was found to be 4,600,000. Of these, three millions are in the provinces directly subject to European authority; the rest are subject to the native princes. The principal European capitals, Batavia, Samarang, and Surabaya, contain respectively 60,000, 25,000, and 20,000 inhabitants: the chief native capitals, Surakarta, and Yogyukerta, about 105,000 each. The Chinese, amounting to 94,000, form the most active and industrious part of the population.

There are a great many princes in the island, of which the most considerable are, the emperor of Malacca, and the kings of Bantam and Japara. Upon first of these many of the petty princes are dependent, but the Dutch are absolute masters of the greatest; of the island, particularly of the north coast, and there are some of the princes beyond the mountains the south coast, who still maintain their independence. The natives of the country, who are established in neighbourhood of Batavia, and for a tract of about leagues along the mountains of the country of Bantam are immediately subject to the governor-general. The company send dressards, or commissaries, among the who administer justice and take charge of the public venues.

The city of Batavia is the capital not only of the island but of all the Dutch possessions in India, is an exceeding fine city, situated in the latitude 6° south, at the mouth of the river Jucatra, and the bosom of a large commodious bay, which may be considered not only as one of the safest harbours India, but in the world. The city is surrounded a rampart 21 feet thick, covered on the outside with fortifications, and fortified with 33 bastions. This rampart is environed by a ditch 45 yards wide, and full of water, so that the tides of water are high, in the spring. The avenues to the town are defended by several forts, each of which is well furnished with excellent brass cannon: no person is suffered to go beyond these for without a passport. The river Jucatra passes through the midst of the town, and forms 15 canals of running water, all faced with free-stone, and adorned with trees that are ever green: over these canals are 36 bridges, besides those which lie without the town. The streets are all perfectly straight, and each, generally speaking, thirty feet broad. The houses are built of stone, after the manner of those in Holland. The city is about a league and a half in circumference, and has five gates; but there are ten times the number of houses without that there are within it. There is a very fine town-house, four Calvinist churches, besides other places of worship for all sorts of religions: a spin-bury or house of correction, an orphan-house, a magazine of sea stores, several for spices, with wharfs and cord manufactories, and many other public buildings. The garrison consists commonly of between 2000 and 3000 men. Besides the forts mentioned above, there is the citadel of Batavia, a very fine regular fortification, situated at the mouth of the river, and flanked with four bastions; two of which command the sea, and the other two the town. It is in the citadel that the governor-general of the Indies has his palace; over against which is that of the director-general, who is the next person to the governor. The counsellors, and other principal officers of the company, have also their apartments there; as have likewise the physician, the surgeon, and the apothecary. There are in it, besides, arsenals and magazines furnished with ammunition for many years. The city of Batavia is not only inhabited by Dutch, French, Portuguese, and other Europeans, established here on account of trade; but also by a vast number of Indians of different nations, Javanese, Chinese, Malays, Negroes, Amboyneese, Armenians, natives of the isle of Bali, Mardykers or Topasses, Macassars, Timores, Buggis, &c. Of the Chinese, near 30,000 resided
JAY [ 47 ]

resided in the city till the year 1740, when the Dutch, pretending that they were in a plot against them, sent a body of troops into their quarter, and demanded their arms, which the Chinese readily delivered up; and the next day the governor sent another body, with orders to murder and massacre every one of the Chinese, men, women, and children. Some relate there were 20,000 others 30,000, that were put to death, without any manner of trial: and yet the barbarous governor, who was the instrument of this cruel proceeding, had the assurance to embark for Europe, imagining he had amassed wealth enough to secure him against any prosecution in Holland: but the Dutch, finding themselves detected and abhorred by all mankind for this piece of tyranny, endeavoured to throw the odium of it upon the governor, though he had the hands of all the council of Batavia, except one, to the order for the massacre. The states, therefore, dispatched a packet to the Cape of Good Hope, containing orders to apprehend the governor, and send him back to Batavia to be tried. He was accordingly apprehended at the Cape; but was never heard of afterwards. It is supposed he was thrown over-board in his passage to Batavia, that there might be no farther inquiries into the matter; and it is said, all the wealth this merciful gentleman had amassed, and sent over before him in four ships, was cast away in the passage.

As Holland after its annexation to France came into a state of hostility with Great Britain, a British force landed in the island in August 1811, and Batavia the capital was taken on the 10th August. The Dutch commander was afterwards pursued to the eastern extremity of the island, and compelled to capitulate. Under the government of Sir Stamford Raffles, many important improvements were made in the judicial system, the collection of the revenue, and the regulation of trade. Agreeably to the terms of the peace in 1815, this island was restored to the Dutch government in the following year. See JAVA, SUPPLEMENT.

JAVELIN, in antiquity, a sort of spear five feet and a half long; the shaft of which was of wood, with a steel point. Every soldier in the Roman armies had seven of these, which were very light and slender.

JAWER, a city of Selinc, capital of a province of the same name, with a citadel, and a large square, surrounded with piazzas. It is 12 miles south-east of Lignitz, 30 south-west of Breslaw, and 87 east of Praga. E. Long. 16° 29' N. Lat. 50° 56'.

JAUDICE (derived from the French jaunisse, "yellowness," of jaune, "yellow"), a disease consisting in a suffusion of the bile, and a rejection thereof to the surface of the body, whereby the whole exterior habit is discoloured. See MEDICINE Index.

JAWLS, a people of Hindostan. See SUPPLEMENT.

JAWS. See MAXILLE.

Jawed, a contraction of the lower jaw, commonly produced by some external injury affecting the tendons or ligaments. See MEDICINE Index.

JAY, seeing CORVUS, ORNITHOLOGY Index.

JAY, Guy Michael de, a French gentleman, who distinguished himself by causing a polyglot bible to be printed at his own expense in 10 vols folio; but he ruined himself by that impression, first because he would not suffer it to appear under the name of Cardinal Richelieu, who, after the example of Cardinal Ximenes, was ambitious of eternizing his name by this means; and next, because he made it too dear for the English market; on which Dr Walten undertook his polyglot bible, which, being more commodious, reduced the price of M. le Jay's. After the death of his wife, M. le Jay took orders, was made dean of Veszelay in the Nivernois, and Louis XIV. gave him the post of counsellor of state.

JAZER, or JASER, in Ancient Geography, a Levitical city in the territory of the Amorrites beyond Jordan, 10 miles to the west, or rather south-west, of Philadelphia, and 15 miles from Ezebon, and therefore situated between Philadelphia and Heshbon, on the east border of the tribe of Gad, supposed to be the Jasorum of Josephus. In Jeremiah xlviii. mention is made of the sea of Jazer, that is, a lake; taken either for an effusion or overflowing of the Arnon, a lake through which it passes, or from which it takes its rise.

IBERIA, Spain so called by the ancients, from the river Iberus. Iberus the people, from the nominative Iber. See HISPANIA.

IBERIA was also the name of an inland country of Asia, having Colchis to the west, with a part of Pontes; to the north Mount Caucasus; on the east Armenia Magna: Now the western part of Georgia (see GEORGIA). Iberia, according to Josephus, was first peopled by Tubal, the brother of Gomer and Magog. His opinion is confirmed by the Septuagint; for Meshech and Tubal are by these interpreters rendered Meschi and Iberiens. We know little of the history of the country till the reign of Mithridates, when their king, named Artaces, sided with that prince against Lucullus, and afterwards against Pompey, was defeated by the latter with great slaughter; but afterwards obtained a peace, upon delivering up his sons as hostages. Little notice is taken of the succeeding kings by the ancient historians. They were probably tributary to the Romans till that empire was overthrown, when this, with the other countries in Asia bordering on it, fell successively under the power of the Saracens and Turks.

IBERIS, SCATICA CRESS, or COMEDY-TAFF, a genus of plants belonging to the tetradynamia class, and in the natural method ranking under the 39th order, Siliqua. See BOTANY Index.

IBEX, a species of goat. See CAPRA, MAMMALIA Index.

IBEXUS, See TANTALUS, ORNITHOLOGY Index.

IBYcus, a Greek lyric poet, of whose works there are only a few fragments remaining, flourished 550 B.C. It is said, that he was assassinated by robbers; and that, when dying, he called upon some cranes he saw flying to bear witness. Some time after, one of the murderers seeing some cranes, said to his companions, "There are the witnesses of Ibycus's death!" which being reported to the magistrates, the assassins were put to the torture, and having confessed the fact, were hanged. Thence arose the proverb Ibyus Grues.
ICE, in Physiology, a solid, transparent, and brittle body, formed of some fluid, particularly water, by means of cold.

The young Lemery observes, that ice is only a re-establishment of the parts of water in their natural state; that the mere absence of fire is sufficient to account for this re-establishment; and that the fluidity of water is a solid fusion, like that of metals exposed to the fire; differing only in this, that a greater quantity of fire is necessary to the one than the other. Galileo was the first that observed ice to be lighter than the water which composed it: and hence it happens, that ice floats upon water, its specific gravity being to that of water as eight to nine. This rarefaction of ice seems to be owing to the air-bubbles produced in water by freezing; and which, being considerably large in proportion to the water frozen, render the body so much specifically lighter: these air-bubbles, during their production, acquire a great expansive power, so as to burst the containing vessels, though ever so strong.

M. Mairan, in a dissertation on ice, attributes the increase of its bulk chiefly to a different arrangement of the parts of the water from which it is formed; the icy skin on the water being composed of filaments, which, according to him, are found to be constantly and regularly joined at an angle of 60°; and which, by this angular disposition, occupy a greater volume than if they were parallel. He found the augmentation of the volume of water by freezing, in different trials, a 14th, an 18th, a 19th; and when the water was previously purged of air, only a 22d part; that ice, even after its formation, continues to expand by cold; for, after water had been frozen to some thickness, the fluid part being let out by a hole in the bottom of the vessel, a continuance of the cold made the ice convex; and a piece of ice, which was at first only a 14th part specifically lighter than water, on being exposed some days to the frost, became a 12th part lighter. To this cause he attributes the bursting of ice on ponds.

Wax, resins, and animal fats, made fluid by fire, instead of expanding like watery liquors, shrink in their return to solidity: for solid pieces of the same bodies sink to the bottom of their respective fluids; a proof that these bodies are more dense in their solid than in their fluid state. The oils which congeal by cold, as olive oil, and the essential oil of aniseeds, appear also to shrink in their congelation. Hence, the different dispositions of different kinds of trees to be burst by, or to resist, strong frosts, are by some attributed to the juices with which the tree abounds; being in the one case watery, and in the other resinous or oily.

Though it has been generally supposed that the natural crystals of ice are stars of six rays, forming angles of 60° with each other, yet this crystallization of water, as it may properly be called, seems to be as much affected by circumstances as that of salts. Hence we find a considerable difference in the accounts of those who have undertaken to describe these crystals. M. Mairan informs us, that they are stars with six radii; and his opinion is confirmed by observing the figure of frost on glass. M. Rome de L'Ile determines the form of the solid crystal to be an equilateral octaedron. M. Hassenfratz found it to be a prismatic hexaedron; but M. d'Antic found a method of reconciling these seemingly opposite opinions. In a violent hail-storm, where the hailstones were very large, he found they had sharp wedge-like angles of more than half an inch; and in these he supposed it impossible for two pyramidal tetrahedra joined laterally, and not to conclude that each grain was composed of octaedrons converging to a centre. Some had a cavity in the middle; and he saw the opposite extremities of two opposite pyramids, which constitute the octaedron; he likewise saw the octaedron entire united in the middle; all of them were therefore similar to the crystals formed upon a thread immersed in a saline solution. On these principles M. d'Antic constructed an artificial octaedron resembling one of the largest hailstones; and found that the angle at the summit of the pyramid was 45°, but that of the junction of the two pyramids 145°. It is not, however, easy to procure regular crystals in hailstones where the operation is conducted with such rapidity: in snow and hoar-frost, where the crystallization goes on more slowly, our author is of opinion that he sees the rudiments of octaedra.

Ice forms generally on the surface of the water: but this too, like the crystallization, may be varied by an alteration in the circumstances. In Germany, particularly the northern parts of that country, it has been observed that there are three kinds of ice. 1. That which forms on the surface. 2. Another kind formed in the middle of the water, resembling nuclei or small hail. 3. The ground ice which is produced at the bottom, especially where there is any fibrous substance to which it may adhere. This is full of cells like a wasp's nest, but less regular; and performs many strange effects in bringing up very heavy bodies from the bottom, by means of its inferiority in specific gravity to the water in which it is formed. The ice which forms in the middle of the water rises to the top, and there unites into large masses; but the formation both of this and the ground ice takes place only in violent and sudden colds, where the water is shallow, and the surface disturbed in such a manner that the congelation cannot take place. The ground ice is very destructive to dykes and other aquatic works. In the more temperate European climates these kinds of ice are not met with.

In many countries the warmth of the climate renders ice not only a desirable, but even a necessary article; so that it becomes an object of some consequence to fall upon a ready and cheap method of procuring it. We shall here take notice of some attempts made by Mr. Cavallo to discover a method of producing a sufficient degree of cold for this purpose by the evaporation of volatile liquids. He found, however, in the course of these experiments, that ether was incomparably superior to any other fluid in the degree of cold it produced. The price of the liquor naturally induced him to fall upon a method of using it with as little waste as possible. The thermometer be made use of had the ball quite detached from the ivory piece on which the scale was engraved. The various fluids were then thrown upon the ball through the capillary aperture of a small glass vessel shaped like a funnel; and care was taken to throw them upon it so slowly, that a drop might now and then fall from the under part, excepting when those fluids were used, which...
...which evaporate very slowly; in which case it was sufficient barely to keep the ball moist, without any drop falling from it. During the experiment, the thermometer was kept very gently turning round its axis, so that the fluid made use of might fall upon every part of its ball. He found the method preferable to that of dipping the ball of the thermometer into the fluid and taking it out again immediately, or even of anointing it constantly with a feather. The evaporation, and consequently the cold, produced by it, may be increased by blowing on the thermometer with a pair of bellows; though this was not used in the experiments now to be related, on account of the difficulty of its being performed by one person, and likewise because it occasions much uncertainty in the results.

The room in which the experiments were made was heated to 65° of Fahrenheit; and with water it was reduced to 56°, viz. 8° below that of the room or of the water employed. The effect took place in about two minutes; but though the operation was continued for a longer time, it did not sink lower. With spirit of wine it sunk to 48°. The cold was greater with highly rectified spirit than with the weaker sort; but the difference is less than would be expected by one who had never seen the experiment made. The pure spirit produces its effect much more quickly. On using various other fluids which were either compounded of water and spirituous liquors, or pure essences, he found that the cold produced by their evaporation was generally some intermediate degree between that produced by water and the spirit of wine. Oil of turpentine sunk the mercury three degrees; but olive oil and others, which evaporate very slowly, or not at all, did not sensibly affect the thermometer.

To observe how much the evaporation of spirit of wine, and consequently the cold produced by it, would be increased by electricity, he put the tube containing it into an insulating handle, and connected it with the conductor of an electrical machine, which was kept in action during the time of making the experiment; by which means one degree of cold seemed to be gained, as the mercury now sunk to 47° instead of 48°, at which it had stood formerly. On trying the three mineral acids, he found that they heated the thermometer instead of cooling it; which effect he attributes to the heat they themselves acquired by uniting with the moisture of the atmosphere. The vitriolic acid, which was very strong and transparent, raised the mercury to 102°, the smoking nitric acid to 72°, and the marine to 66°.

**Fig. 1.**

---

The apparatus for using the least possible quantity of ether for freezing water consists in a glass tube (fig. 1.) terminating in a capillary aperture, which is to be fixed upon the bottle containing the ether. Round the lower part of the neck at A some thread is wound, in order to let it fit the neck of the bottle. When the experiment is to be made, the stopper of the bottle containing the ether is to be removed, and the tube just mentioned put in its room. The thread round the tube ought also to be previously moistened with water or spittle before it is put into the neck of the bottle, in order the more effectually to prevent the escape of the ether between the neck of the phial and tube. Hold then the bottle by its bottom FG (fig. 2.)

In this manner, flowing the stream of ether upon the ball of a thermometer in such a quantity that a drop might now and then, every ten seconds for instance, fall from the bulb of the thermometer, Mr. Cavallo brought the mercury down to 2°, or 20° below the freezing point, when the atmosphere was somewhat hotter than temperate. When the ether is very good, i.e. capable of dissolving elastic gum, and has a small bulb, not above 20 drops of it are required to produce this effect, and about two minutes of time; but the common sort must be used in greater quantity, and for a longer time; though at last the thermometer is brought down by this nearly as low as by the best sort.

To freeze water by the evaporation of ether, Mr. Cavallo takes a thin glass tube about four inches long, and one-fifth of an inch diameter, hermetically sealed at one end, with a little water in it, so as to take up about half an inch of the cavity, as is shown at CB in fig. 3. Into this tube a slender wire H is also introduced, the lower extremity of which is twisted into a spiral, and serves to draw up the bit of ice which is formed. He then holds the glass tube by its upper part A with the fingers of the left hand, and keeps it continually and gently turning round its axis, first one way and then the other, whilst with the right hand he holds the phial containing the ether in such a manner as to direct the stream on the outside of the tube, and a little above the surface of the water contained in it. The capillary aperture D should be kept almost in contact with the surface of the tube containing the water; and by continuing the operation for two or three minutes, the water will be frozen as it were in an instant; and the opacity will ascend to C in less than half a second of time, which makes a beautiful appearance. This congelation, however, is only superficial: and in order to congeal the whole quantity of water, the operation must be continued a minute or two longer; after which the wire H will be found kept very tight by the ice. The hand must then be applied to the outside of the tube, in order to soften the surface of the ice; which would otherwise adhere very firmly to the glass; but when this is done, the wire H easily brings it out.

Sometimes our author was accustomed to put into the tube a small thermometer instead of the wire H; and thus he had an opportunity of observing a very curious phenomenon unnoticed by others, viz. that in the winter time water requires a smaller degree of cold to congeal it than in the summer. In the winter, for instance, the water in the tube AB will freeze when the thermometer stands about 30°; but in the summer, or even when the thermometer stands at 60°, the quicksilver must be brought down 10, 15, or even more degrees.
The proportion of ether requisite to congeal water seems to vary with the quantity of the latter; that is, a large quantity of water seems to require a proportionably less quantity of ether to freeze it than a smaller one. In the beginning of the spring (says Mr Cavallo), I froze a quarter of an ounce of water with about half an ounce of ether: the apparatus being larger, though similar to that described above. Now as the price of ether, sufficiently good for the purpose, is generally about 18d. or 2s. per ounce, it is plain, that with an expense under two shillings, a quarter of an ounce of ice, or ice-cream, may be made in every climate, and at any time, which may afford great satisfaction to those persons, who, living in those places where no natural ice is to be had, never saw or tasted any such delicious refreshment. When a small piece of ice, for instance, of about ten grains weight, is required, the necessary apparatus is very small, and the expense not worth mentioning. I have a small box four inches and a half long, two inches broad, and one and a half deep, containing all the apparatus necessary for this purpose; viz. a bottle capable of containing about one ounce of ether; two pointed tubes, in case one should break; a tube in which the water is to be frozen, and a wire. With the quantity of ether contained in this small and very portable apparatus, the experiment may be repeated about ten times. A person who wishes to perform such experiments in hot climates, and in places where ice is not easily procured, requires only a larger bottle of ether besides the whole apparatus described above. Electricity increases the cold produced by means of evaporating ether but very little, though the effect is perceptible. Having thrown the electrified and also the unelectricised stream of ether upon the bulb of a thermometer, the mercury was brought down two degrees lower in the former than in the latter case.

Our author observes, for the sake of those who may be inclined to repeat this experiment, that a cork confined this volatile fluid much better than a glass stopple, which it is almost impossible to grind with such exactness as to prevent entirely the evaporation of the ether. When a stopple, made very nicely out of an uniform and close piece of cork, which goes rather tight, is put upon a bottle of ether, the smell of that fluid cannot be perceived through it; but he never saw a glass stopple which could produce that effect. In this manner, ether, spirit of wine, or any other volatile fluid, may be preserved, which does not corrode cork by its fumes. When the stopple, however, is very often taken out, it becomes loose, as it will also be long keeping: in either of which cases it must change.

Blank of the Ice, is a name given by the pilto a bright appearance near the horizon, occasioned by the ice, and observed before the ice itself saw.

Ice-Boats, boats so constructed as to sail upon it and which are very common in Holland, particularly upon the river Maas and the lake Y. See Plate CCLXXVIII. They go with incredible swiftness sometimes so quick as to affect the breath, and are found very useful in conveying goods and passengers over lakes and great rivers in that country. Boats of different sizes are placed in a transverse form upon 2½ or 3 inch deal boards; at the extremity of each end are fixed iron screws, which turn up in the form of skillets upon this plank the boat rests, and the two ends serve as out-riggers to prevent oversetting; whence ropes are fastened that lead to the head of the mast in the nature of shrouds, and others passed through a bloc across the bowsprit: the rudder is made somewhat like a hatchet with the head placed downwards, which being pressed down, cuts the ice, and serves all the purpose of a rudder in the water, by enabling the helmsman to steer, tack, &c.

Method of making Ice-Cream. Take a sufficient quantity of cream, and, when it is to be mixed with raspberry, or currant, or pine, a quarter part as much of the juice or jam, as of the cream: after beating and straining the mixture through a cloth, put it with a little of the juice of lemon into the mould, which is a pewter vessel, and varying in size and shape at pleasure; cover the mould, and place it in a hail about two-thirds full of ice, into which two handfuls of salt have been thrown; turn the mould by the hand-held with a quick motion to and fro, in the manner used for milling chocolate, for eight or ten minutes; then let it rest as long, and turn it again for the same time; and having left it to stand half an hour, it is fit to be turned out of the mould and to be sent to table. Lemon juice and sugar, and the juices of various kinds of fruits, are frozen without cream; and when cream is used, it should be well mixed.

Ice-Hills, a sort of structure or contrivance common upon the river Neva at Petersburg, and which afford a perpetual fund of amusement to the populace. They are constructed in the following manner. A scaffolding is raised upon the river about 30 feet in height, with a landing place on the top, the ascent to which is by a ladder. From this summit a sloping plane of boards, about four yards broad and 30 long, descends to the superfluities of the river; it is supported by strong poles gradually decreasing in height, and its sides are defended by a parapet of planks. Upon these boards are laid square masses of ice about four inches thick, which being first smoothed with the axe and laid close to each other, are then sprinkled with water: by these means they coalesce, and adhering to the boards, immediately form an inclined plane of pure ice. From the bottom of this plane the snow is cleared away for the length of 200 yards, and the breadth of four, upon the level bed of the river; and the sides of this course, as well as the sides and top of the scaffolding, are ornamented with fires and pines. Each person, being provided with
a sledge, mounts the ladder; and having attained the summit, he seats himself upon his sledge at the upper extremity of the inclined plane, down which he suffers it to glide with considerable rapidity, poised as he goes down; when the velocity acquired by the descent carries it above 100 yards upon the level ice of the river. At the end of this course, there is usually a similar ice-hill, nearly parallel to the former, which begins where the other ends; so that the person immediately mounts again, and in the same manner glides down the other inclined plane of ice. This diversion he repeats as often as he pleases. The boys also are continually employed in skaiting down these hills: they glide chiefly upon one skait, as they are able to poised themselves better upon one leg than upon two. These ice-hills exhibit a pleasing appearance upon the river, as well from the trees with which they are ornamented, as from the moving objects which at particular times of the day are descending without intermission.

ICE-House, a repository for ice during the summer months. The aspect of ice-houses should be towards the east or south-east, for the advantage of the morning sun to expel the damp air, as that is more pernicious than warmth: for which reason trees in the vicinity of an ice-house tend to its disadvantage.

The best soil for an ice-house to be made in is chalk, as it conveys away the waste water without any artificial drain; next to that, loose stony earth or gravelly soil. Its situation should be on the side of a hill, for the advantage of entering the cell upon a level, as in the drawing, Plate CCLXXVIII.

To construct an ice-house, first choose a proper place at a convenient distance from the dwelling-house, or houses it is to serve: dig a cavity (if for one family, of the dimensions specified in the design) of the figure of an inverted cone, sinking the bottom concave, to form a reservoir for the waste water till it can drain off; if the soil requires it, cut a drain to a considerable distance, or so far as will come out at the side of the hill, or into a well, to make it communicate with the springs, and in that drain form a stink or air-trap, marked by sinking the drain so much lower in that place as it is high, and bring a partition from the top an inch or more into the water, which will consequently be in the trap; and will keep the well air-tight. Work up a sufficient number of brick piers to receive a cart-wheel, to be laid with its convex side upwards to receive the ice; lay hurdles and straw upon the wheel, which will let the melted ice drain through, and serve as a floor. The sides and dome of the cone are to be nine inches thick—the sides to be done in steened brickwork, £ c. without mortar, and wrought at right angles to the face of the work: the filling in behind should be with gravel, loose stones, or brick-bats, that the water which drains through the sides may the more easily escape into the well. The doors of the ice-house should be made as close as possible, and bundles of straw placed always before the inner door to keep out the air.

Description of the parts referred to by the letters—

- The line first dug out.
- The brick circumference of the cell.
- The diminution of the cell downwards.
- The lesser diameter of the cell.
- The cart wheel or joists and hurdles. The piers to receive the wheel or floor.
- The principal receptacle for straw.
- The outer entrance, k the outer door, passages having a separate door each.
- An air trap. m The well. n The profile of the piers.
- The ice filled in. p The height of the cell. q The dome worked in two half brick arches.
- The arched passage. r The door-ways inserted in the walls.
- The floor of the passage. s An aperture through which the ice may be put into the cell; this must be covered next the crown of the dome, and then filled in with earth.
- The sloping door, against which the straw should be laid.

The ice when to be put in should be collected during the frost, broken into small pieces, and rammed down hard in strata not of more than a foot, in order to make it one complete body; the care in putting it in, and ramming it, tends much to its preservation. In a season when ice is not to be had in sufficient quantities, snow may be substituted.

Ice may be preserved in a dry place under ground, by covering it well with chaff, straw, or reeds.

Great use is made of chaff in some places of Italy to preserve ice: the ice-house for this purpose need only be a deep hole dug in the ground on the side of a hill, from the bottom of which they can easily carry out a drain, to let out the water which is separated at any time from the ice, that it may not melt and spoil the rest. If the ground is tolerably dry, they do not line the sides with any thing, but leave them naked, and only make a covering of thatch over the top of the hole: this pit they fill either with pure snow, or else with ice taken from the purest and clearest water; because they do not use it as we do in England, to set the bottles in, but really mix it with the wine. They first cover the bottom of the hole with chaff, and then lay in the ice, not letting it anywhere touch the sides, but ramming in a large bed of chaff all the way between: they thus carry on the filling to the top, and then cover the surface with chaff; and in this manner it will keep as long as they please. When they take any of it out for use, they wrap the lump up in chaff, and it may then be carried to any distant place without waste or melting.

It appears from the investigation of Professor Bekman, in his History of Inventions, that the ancients from the earliest ages were acquainted with the method of preserving snow for the purpose of cooling liquors in summer. "This practice, (he observes), is mentioned by Solomons; and proofs of it are so numerous in Proverbs. the works of the Greeks and the Romans, that it is unnecessary for me to quote them, especially as they have been collected by others. Now the repositories for keeping it were constructed, we are not expressly told; but it is probable that the snow was preserved in pits or trenches."

"When Alexander the Great besieged the city of Petra, he caused 30 trenches to be dug, and filled with snow, which was covered with oak branches; and which kept in that manner for a long time. Plutarch says, that a covering of chaff and coarse cloth is sufficient; and at present a like method is pursued in Portugal. Where the snow has been collected in a deep gulf, some grass or green sods, covered with dung from the sheep"
ICE [ 52 ]

When the ancients, therefore, wished to have cooling liquors, they either drank the melted snow, or put some of it in their wine; or they placed jars filled with wine in the snow, and suffered it to cool there as long as they thought proper. That ice was also preserved for the like purpose, is probable from the testimony of various authors; but it appears not to have been used so much in warm countries as in the northern. Even at present snow is employed in Italy, Spain, and Portugal; but in Persia, ice. I have never anywhere found an account of Grecian or Roman ice-houses. By the writers on agriculture they are not mentioned.

Ice-Island, a name given by sailors to a great quantity of ice collected into one huge solid mass, and floating about upon the seas near or within the Polar circles.

Many of these fluctuating islands are met with on the coasts of Spitzbergen, to the great danger of the shipping employed in the Greenland fishery. In the midst of those tremendous masses navigators have been arrested and frozen to death. In this manner the brave Sir Hugh Willoughby perished with all his crew in 1553; and in the year 1772, Lord Mulgrave, after every effort which the most finished seaman could make to accomplish the end of his voyage, was caught in the ice, and was near experiencing the same unhappy fate. See the account at large in Phipps's Voyage to the North Pole. As there described, the scene, divested of the horror from the eventful expectation of change, was the most beautiful and picturesque:—Two large ships becalmed in a vast basin, surrounded on all sides by islands of various forms: the weather clear: the sun gleaming the circumbent ambient ice, which was low, smooth, and even; covered with snow, excepting where the pools of water on part of the surface appeared crystalline with the young ice: the small space of sea they were confined in perfectly smooth. After fruitless attempts to force a way through the fields of ice, their limits were perpetually contracted by its closing; till at length it bent each vessel till they became immovably fixed. The smooth extent of water was soon lost; the pressure of the pieces of ice, by the violence of the swell, caused them to pack: fragments rose upon fragment till they were in many places higher than the main-yard. The movements of the ships were tremendous and involuntary, in conjunction with the surrounding ice, actuated by the currents. The water shoaled to 14 fathoms. The grounding of the ice or of the ships would have been equally fatal: The force of the ice might have crushed them to atoms, or have lifted them out of the water and overset them, or have left them suspended on the summits of the pieces of ice at a tremendous height, exposed to the fury of the winds, or to the risk of being dashed to pieces by the failure of their frozen dock. An attempt was made to cut a passage through the ice; after a perseverance worthy of Britons, it proved fruitless. The commander, at all times master of himself, directed the boats to be made ready to be hauled over the ice, till they arrived at navigable water (a task alone of seven days), and in them to make their voyage to England. The boats were drawn progressively three whole days. At length a wind sprung up, the ice separated sufficiently to yield to the pressure of the full-sailed ships, and after labouring against the resisting fields of ice, on the 10th of August in the harbour of Smeerenburg, at the west end of Spitzbergen, between it and Illyt's Headland.

The forms assumed by the ice in this chilling mate are extremely pleasing to the most ingenious eye. The surface of that which is congealed from the sea water (for we must allow it two original is flat and even, hard, opaque, resembling white stone and incapable of being slid on, like the British ice. Greater pieces, or fields, are many leagues in length; the lesser are the meadows of the seas, on which the animals at times frolic by hundreds. The motion of the lesser pieces is as rapid as the currents: the great which are sometimes 200 leagues long, and 60 or broad, move slow and majestically; often fix for a time immovable by the power of the ocean, and then pounce near the horizon that bright white appearance led the blink. The approximation of two great ice fields produces a most singular phenomenon: it forces the lesser (if the term can be applied to pieces of several acres square) out of the water, and adds them to the surface; a second and often a third succeeds; so that the whole forms an aggregate of a tremendous higg. These float in the sea like so many rugged mountains, and are sometimes 500 or 600 yards thick; but the far greater part is concealed beneath the water. The air is continually increased in height by the freezing the spray of the sea, or of the melting of the snow which falls on them. Those which remain in this frozen state receive continual growth; others are gradually cut by the northern winds into southern latitudes, and melt by degrees, by the heat of the sun, they waste away, or disappear in the boundless elements.

The collision of the great fields of ice, in high latitudes, is often attended with a noise that for a time takes away the sense of hearing any thing else; and lesser with a grinding of unspeakable horror. The water which dashes against the mountainous ice freezes in to an infinite variety of forms; and gives the voyage ideal towns, streets of towers, bridges, sleeper, and every ship which imagination can frame.

Ice-Plant. See Mesembryanthemum, Botany.

Icebergs, are large bodies of ice filling the valleys between the high mountains in the northern latitudes. Among the most remarkable are those of the east coast of Spitzbergen (see Greenland, No. 10). They are seven in number, but at considerable distances from each other; each fills the valleys for tracts unknown in a region totally inaccessible in the interior parts. The glaciers of Switzerland seem contemptible to these; but present often a similar front into some lower valley. The last exhibits over the sea a front 300 feet high, emulating the emerald in colour; cataracts of melted snow precipitate down various parts, and black spiring mountains, streaked with white, bound the sides, and rise crag above crag, as far as eye can reach in the back ground. See Plate CCLXXVIII. At times immense fragments break off, and tumble into the water, with a most alarming dashing. A piece of this vivid green substance has fallen, and grounded in 24 fathoms water, and spired above the surface 30 feet.
ICEBERGS are frequent in all the Arctic regions; and to their lapse is owing the solid mountainous ice which inhabits those seas. Frost sports wonderfully with these icebergs, and gives them majesty as well as other most singular forms. Mists have been seen assuming the shape of a Gothic church, with arched windows and doors, and all the rich drapery of that style, composed of what an Arabian tale would scarcely dare to relate, of crystal of the richest sapphire blue; tables with one of more feet; and often immense flat-roofed temples, like those of Luxor on the Nile, supported by round transparent columns of celsian blue, float by the astouned spectator. These icebergs are the creation of ages, and receive annually additional height by the falling of snows and of rain, which often instantly freezes, and more than repairs the loss occasioned by the influence of the melting sun.

ICELAND, a large island lying in the northern part of the Atlantic ocean, between 63 and 67 degrees of north latitude, and between 16 and 24 degrees of west longitude; its greatest length being about 700 miles, and its breadth 300.

This country lying partly within the frigid zone, and being liable to be surrounded with vast quantities of ice which come from the polar seas, is, on account of the coldness of its climate, very inhospitable; but much more so for other reasons. It is exceedingly subject to earthquakes; and so full of volcanoes, that the little part of it which appears fit for the habitation of man seems almost totally laid waste by them. The best account that hath yet appeared of the island of Iceland is in a late publication, intitled "Letters on Iceland, &c. written by Uno Von Troil, D. D. first chaplain to his Swedish majesty." This gentleman sailed from London on the 12th of July 1772, in company with Mr Banks, Dr Solander, and Dr James Lind of Edinburgh, in a ship for which 100l. sterling was paid every month. After visiting the Western islands of Scotland, they arrived on the 28th of August at Iceland, where they cast anchor at Bessastreir or Bessastried, lying in about 64° 6' N. Lat. in the western part of the island. The country had to them the most dismal appearance that can be conceived. "Imagine to yourself (says Dr Troil) a country, which from one end to the other presents to your view only barren mountains, whose summits are covered with eternal snow, and between them fields divided by vitiulified cliffs, whose high and sharp points seem to vie with each other to deprive you of the sight of a little grass which scantly springs up among them. These same dreary rocks likewise conceal the few scattered habitations of the natives, and no where a single tree appears which might afford shelter to friendship and innocence. The prospect before us, though not pleasing, was uncommon and surprising. Whatever presented itself to our view bore the marks of devastation; and our eyes, accustomed to behold the pleasing coasts of England, now saw nothing but the vestiges of the operation of a fire, Heaven knows how ancient."

The climate of Iceland, however, is not unwholesome, or naturally subject to excessive colds, notwithstanding its northerly situation. There have been instances indeed of Fahrenheit’s thermometer sinking to 24° below the freezing point in winter, and rising to 104° in summer. Since the year 1749, observations have been made on the weather; and the result of these observations hath been unfavourable, as the coldness of the climate is thought to be on the increase, and as a consequence the country is in danger of becoming unfit for the habitation of the human race. Wood, which formerly grew in great quantities all over the island, cannot now be raised. Even the hardy firs of Norway cannot be reared in this island. They seemed indeed to thrive till they were about two feet high; but then their tops wither, and they ceased to grow. This is owing chiefly to the storms and hurricanes which frequently happen in the months of May and June, and which are very unfavourable to vegetation of every kind. In 1772, Governor Thudal sowed a little barley, which grew very briskly; but a short time before it was to be reaped, a violent storm so effectually destroyed it, that only a few grains were found scattered about. Besides these violent winds, this island lies under another disadvantage, owing to the floating ice already mentioned, with which the coasts are often beset. This ice comes on by degrees, always with an easterly wind, and frequently in such quantities as to fill up all the gulfs on the north-west side of the island, and even covers the sea as far as the eye can reach; it also sometimes drives to other shores. It generally comes in January, and goes away in March. Sometimes it only reaches the land in April; and, remaining there for a long time, does an incredible deal of mischief. It consists partly of mountains of ice, said to be sometimes 60 fathoms in height; and partly of field ice, which is neither so thick nor so much dreaded. Sometimes these enormous masses are grounded in shoal-water; and in these cases they remain for many months, nay years, undissolved, chilling the atmosphere for a great way round. When many such bulky and lofty ice-masses are floating together, the wood which is often found drifting between them, is so much chased, and pressed with such violence together, that it sometimes takes fire: which circumstance has occasioned fabulous accounts of the ice being in flames.

In 1753 and 1754, this ice occasioned such a violent cold, that horses and sheep dropped down dead by reason of it, as well as for want of food; horses were observed to feed upon dead cattle, and the sheep ate off each other’s wool. In 1755, towards the end of the month of May, the waters were frozen over in one night to the thickness of an inch and five lines. In 1756, on the 26th of June, snow fell to the depth of a yard, and continued falling through the months of July and August. In the year following it froze very hard towards the end of May and beginning of June, in the south part of the island, which occasioned a great scarcity of grass. These frosts are generally followed by a famine, many examples of which are to be found in the Icelandic chronicles. Besides these calamities, a number of bears annually arrive with the ice, which commit great ravages among the sheep. The Icelanders attempt to destroy these intruders as soon as they get sight of them. Sometimes they assemble together, and drive them back to the sea, with which they often float off again. For want of fire-arms, they are obliged to use spears on these occasions. The government also encourages the destruction of these animals,
ICE

by paying a premium of 10 dollars for every bear that is killed, and purchasing the skin of him who killed it.

Notwithstanding this dismal picture, however, taken from Von Troll's letters, some tracts of ground, in high cultivation, are mentioned as being covered by the great eruption of lava in 1783. It is possible, therefore, that the above may have been somewhat exaggerated.

Thunder and lightning are seldom heard in Iceland, except in the neighbourhood of volcanoes. Aurora Borealis is very frequent and strong. It most commonly appears in dry weather; though there are not wanting instances of its being seen before or after rain, or even during the time of it. The lunar halo, which prognosticates bad weather, is likewise very frequent here; as are also parhelia, which appear from one to nine in number at a time. These parhelia are observed chiefly at the approach of the Greenland ice, which an intense degree of frost has produced, and the frozen vapours fill the air. Fire-balls, sometimes round and sometimes oval, are observed, and a kind of ignis fatuus which attaches itself to men and beasts; and comets are also frequently mentioned in their chronicles. This last circumstance deserves the attention of astronomers.

Iceland, besides all the inconveniences already mentioned, has two very terrible ones, called by the natives skrida and smiðafoss: the name of the first imports large pieces of a mountain tumbling down and destroying the lands and houses which lie at the foot of it: this happened in 1554, when a whole farm was ruined, and thirteen people buried alive. The other word signifies the effects of a prodigious quantity of snow, which covers the top of the mountains, rolling down in immense masses, and doing a great deal of damage: of this there was an instance in 1690, during the night, when two farms were buried, with all their inhabitants and cattle. This last accident Iceland has in common with all very mountainous countries, particularly Switzerland.

Iceland abounds with hot and boiling springs, some of which spout up into the air to a surprising height. All the jets d'eau which have been contrived with so much art, and at such an enormous expense, cannot be compared with these wonders of nature in Iceland. The water-works at Herenthansen threw up a single column of water of half a quarter of a yard in circumference to a height of about 70 feet; those at the Winterkenste in Cassel throw it up, but in a much thinner column, 130 feet; and the jet d'eau at St Cloud, which is thought the greatest of all the French water-works, casts up a thin column 80 feet into the air; but some springs in Iceland pour forth columns of water several feet in thickness to the height of many fathoms; and many affirm of several hundred feet.

These springs are unequal in their degrees of heat; but we have observed none under 188 degrees of Fahrenheit's thermometer; in some it is 192, 193, 212, and in one small vein of water 213 degrees. From some the water flows gently, and the water being down the columns, and called liquid; from others it spouts with a great noise, and is then called huer, or ketel. It is very common for some of these spouting springs to close up, and others to appear in their stead. All these waters have an increasing quality, so that we very commonly find the exterior surface from whence it burst covered with a kind of mud, which almost resembles chaff in work, and which we at first took for lumps of coal, but which was afterwards found by Mr Bergmann to be of a silicious or flinty nature. In some places the water tastes of sulphur, in others not; but when drank soon as it is cold, tastes like condensed boiler-water. The inhabitants use it at particular times for dyeing; if they were to adopt proper regulations, it might be still greater use. Victuals may also be boiled in it, as milk held over its steam becomes sweet; owing, probably, to the excessive heat of the water, and a same effect is produced by boiling it a long time over the fire. They have begun to make salt by boiling salt water over it, which when it is refined, is very pure and good. The cows which drink this hot water yield a great deal of milk. Egbert Olafsen relates, that the water does not become turbid when alkali is thrown into it, nor does it change the colour of syrup of violets. Horrebow asserts, that if you fill a bottle at one of the spouting springs, the water will boil over two or three times while the spring throws forth its water; and corked too soon, the bottle will burst.

Among the many hot springs to be met with in Iceland, several bear the name of geyser: the following is a description of the most remarkable of that name and in the whole island. It is about two days journey from Hecla, near a farm called Haukadal. Here poet would have an opportunity of painting whatever nature has of beautiful and terrible, united in one picture, by delineating this surprising phenomenon. It presents to yourself a large field, where you see on one side, at a great distance, high mountains covered with ice, whose summits are generally wrapped in clouds, so that their sharp and unequal points become invisible. This loss, however, is compensated by a certain wind which causes the clouds to sink, and cover the mountain itself, when its summit appears as it were to rest on the cloud. On the other side of Hecla is seen, with its three points covered with ice, rising above the clouds, and with the smoke which ascends from it, forming other clouds at some distance from the real ones: and on the other side is a ridge of high rocks, at the foot of which boiling water from time to time issues forth; and further on extends a marsh of about three English miles in circumference, where are 40 or 50 boiling springs, from which a vapour ascends to a prodigious height.

In the midst of these is the greatest spring geyser, which deserves a more exact and particular account. In travelling to the place, about an English mile and a half from the heer, from which the ridge of rocks still divided us, we heard a loud roaring noise, like the rushing of a torrent precipitating itself from stupendous rocks. We asked our guide what it meant; he answered, it was geyser roaring; and we soon saw with our naked eyes what before seemed almost incredible.

The depth of the opening or pipe from which the water gushes cannot well be determined; for sometimes the water descends slowly, and at other times it descends faster, and many seconds passed before a stone which was thrown into the aperture reached the surface of the water. The opening itself was perfectly round, and 19 feet in diameter.
Both the pipe and the basin were covered with a rough stalactitic rind, which had been formed by the force of the water: the outermost border of the basin is nine feet and an inch higher than the pipe itself. The water here spouted several times a day, but always by starts, and after certain intervals. The people who lived in the neighborhood told us, that they rose higher in cold and bad weather than at other times; and Egbert Olafsen and several others affirm, that it has spouted to the height of 60 fathoms. Most probably they guessed only by the eye, and on that account their calculation may be a little extravagant; and indeed it is to be doubted whether the water was ever thrown up so high, though probably it sometimes mounts higher than when we observed it. The method we took to observe the height was as follows. Every one in company wrote down, at each time that the water spouted, how high it appeared to him to be thrown, and we afterwards chose the medium. The first column marks the spoutings of the water, in the order in which they followed one another; the second, the time when these effusions happened; the third, the height to which the water rose; and the last, how long each spouting of water continued.

The pipe was now for the first time full of water, which ran slowly into the basin.

9—IX 25
10—X 16

At 35 minutes after twelve we heard, as it were, three discharges of a gun under ground, which made it shake: the water flowed over immediately, but instantly sunk again. At eight minutes after two, the water flowed over the border of the basin. At 15 minutes after three, we again heard several subterranean noises, though not so strong as before. At 43 minutes after four, the water flowed over very strongly during the space of a minute. In six minutes after, we heard many loud subterraneous discharges, not only near the spring, but also from the neighbouring ridge of rocks, where the water spouted. At 51 minutes after six, the fountain spouted up to the height of 92 feet, and continued to do so for four minutes. After this great effort, it sunk down very low into the pipe, and was entirely quiet during several minutes; but soon began to bubble again: it was not, however, thrown up into the air, but only to the top of the pipe.

The force of the vapours which throw up these waters is excessive: it not only prevents the stones which are thrown into the opening from sinking, but even throws them up to a very great height, together with the water. When the basin was full, we placed ourselves before the sun in such a manner that we could see our shadows in the water; when every one observed round the shadow of his own head (though not round that of the heads of others), a circle of almost the same colours which compose the rainbow, and round this another bright circle: this most probably proceeded from the vapours exhaling from the water.

"Not far from this place, another spring at the foot of the neighbouring ridge of rocks spouted water to the height of one or two yards each time. The opening through which this water issued was not so wide as the other: we imagined it possible to stop up the hole entirely by throwing large stones into it, and even flattered ourselves that our attempts had succeeded: but, to our astonishment, the water gushed forth in a very violent manner. We hastened to the pipe, and found all the stones thrown aside, and the water playing freely through its former channel. In these large springs the waters were hot in the highest degree, and tasted a little of sulphur; but in other respects it was pure and clear. In the smaller springs of the neighbourhood the water was tainted: in some, it was as muddy as that of a clay-pit: in others, as white as milk; and in some few, as red as blood.

"Iceland abounds with pillars of basaltes which account for the lower sort of people imagine have been piled upon the basaltic each other by the giants, who made use of supernatural force to effect it. They have generally from three to seven sides; and are from four to six feet in thickness, and from 12 to 16 yards in length, without any horizontal divisions. But sometimes they are only from six inches to one foot in height, and they are then very regular, insomuch that they are sometimes made use of for windows and door-posts. In some places they only peep out here and there among the lava, or more frequently among the tufa; in other places they are quite overthrown, and pieces of broken pillars only make their appearance. Sometimes they extend without interruption for two or three miles in length. In one mountain they have a singular appearance: on the top the pillars lie horizontally, in the middle they are sloping; the lowest are perfectly perpendicular; and in some parts they are bent into a semicircular figure. The matter of the Iceland basaltes seems to be the same with that of Staffa; though in some it is more porous, and inclines to a gray. Some we observed which were of a blackish gray, and composed of several joints. Another time we observed a kind of porous glassy stone, consequently a lava, which was so indistinctly divided, that we were for some time at a loss to determine whether it was basaltes or not, though at last we all agreed that it was.

Iron ore is found in some parts of the island, and that beautiful copper ore called malachites. Horrobow speaks of native silver. A stratum of sulphur is found near Myvatno from nine inches to two feet in thickness; partly of a brown colour, and partly of a deep orange. Immediately over the sulphur is a blue earth; above that a vitriolic and aluminous one; and beneath the sulphur a reddish boulc.

At what time the island of Iceland was first peopled is uncertain. An English colony indeed is said to have been settled there in the beginning of the fifth century.
century; but of this there are not sufficient proofs. There is, however, reason to suppose that the English and Irish were acquainted with this country under another name, long before the arrival of the Norwegians; for the celebrated Bede gives a pretty accurate description of the island. But of the original inhabitants we cannot pretend to say anything, as the Iceland chronicles go no farther back than the arrival of the Norwegians. What they relate is to the following purpose.

Naddodr, a famous pirate, was driven on the coast of Iceland in 861, and named the country "Snow-land," on account of the great quantities of snow with which he perceived the mountains covered. He did not remain there long; but on his return extolled the country to such a degree, that one Gardar Sufjarson, an enterprising Swede, was encouraged by his account to go in search of it in 864. He sailed quite round the island, and gave it the name of Gardarsholmar, or Gardar's island. Having remained in Iceland during the winter, he returned in the spring to Norway, where he described the newly-discovered island as a pleasant well-wooded country. This excited a desire in Fiske, another Swede, reputed the greatest navigator of his time, to undertake a voyage thither. As the compass was then unknown, he took three ravens on board to employ them on the discovery. By the way he visited his friends at Ferro; and having sailed farther to the northward, he let fly one of his ravens, which returned to Ferro. Some time after, he dismissed the second, which returned to the ship again, as he could find no land. The last trial proved more successful; the third raven took his flight to Iceland, where the ship arrived a few days after. Fiske sailed here the whole winter with his company; and, because he found a great deal of floating ice on the north side, he gave the country the name of Iceland, which it has ever since retained.

When they returned to Norway in the following spring, Fiske, and those that had been with him, made a very different description of the country. Fiske described it as a wretched place; while one of his companions named Thorolf, praised it so highly, that he affirmed butter dropped from every plant; which extravagant commendation procured him the name of Thorolf-the-butter, or Butter-Thorolf.

From this time there are no accounts of voyages to Iceland, till Ingolf and his friend Leifr undertook one in 874. They spent the winter on the island, and determined to settle there for the future. Ingolf returned to Norway, to provide whatever might be necessary for the comfortable establishment of a colony, and Leifr in the mean time went to assist in the war in England. After an interval of four years, they again met in Iceland, the one bringing with him a considerable number of people, with the necessary tools and instruments for making the country habitable; and the other imported his acquired treasures. After this period many people went there to settle; and, in the space of 60 years, the whole island was inhabited. The tyranny of Harold King of Norway contributed not a little to the population of Iceland; and so great was the emigration of his subjects, that he was at last obliged to issue an order, that no one should sail from Norway to Iceland without paying four ounces of silver to the king.

Besides the Norwegians, new colonies arrived from different nations, between whom wars soon commenced; and the Icelandic histories are full of the account of their battles. To prevent these conflicts for the future, a kind of chief was chosen in 928, upon whom great powers were conferred. This man was the speaker all their public deliberations; pronounced sentence in difficult and intricate cases; decided all disputes; and published new laws, after they had been received as approved of by the people at large; but he had no power to make laws without the approbation and consent of the rest. He therefore assembled the chief whenever the circumstances seemed to require it; and after they had deliberated among themselves, he represented the opinion of the majority to the people, whom assent was necessary before it could be considered as law. His authority among the chiefs and leading men, however, was inconsiderable, as he was chosen by them and retained his place no longer than while he preserved their confidence.

This institution did not prove sufficient to restrain the turbulent spirit of the Icelanders. They openly waged war with each other; and, by their intestine conflicts, so weakened all parties, that the whole became at last a prey to a few arbitrary and enterprising men; who, as in too generally the case, wantonly abused their power to the oppression of their countrymen, and the disgrace of humanity. Notwithstanding these troubles, however, the Icelanders remained free from a foreign yoke till 1261, when the greatest part of them put themselves under the protection of Hakon, King of Norway, promising to pay him tribute upon certain conditions agreed on between them; and the rest followed their example in 1264. Afterwards, Iceland, together with Norway, became subject to Denmark. For a long time the care of the island was committed to a governor, who commonly went there once a year; though, according to his instructions, he ought to have resided in Iceland. As the country suffered incredibly through the absence of its governors, it was resolved a few years ago that they should reside there, and have their seat at Bessastaðir, one of the old royal domains. He has under him a bailiff, two laymen, a sheriff, and 21 eyaelmen, or magistrates who superintend small districts; and almost everything is decided according to the laws of Denmark.

At the first settlement of the Norwegians in Iceland, they lived in the same manner as they had done in their own country, namely, by war and piracy. Their situation with regard to the kings of Norway, however, soon obliged them to apply to other states, in order to learn as much of the knowledge of government and politics as was necessary to preserve their colony from subjugation to a foreign yoke. For this purpose they often sailed to Norway, Denmark, Sweden, England, and Scotland. The travellers, at their return were obliged to give an account to their chiefs of the state of those kingdoms through which they passed. For this reason, history, and what related to science, was held in high repute as long as the republican form of government lasted; and the great number of histories...
to be met with in the country, show at least the desire of the Icelanders to be instructed. To secure themselves, therefore, against their powerful neighbours, they were obliged to enlarge their historical knowledge. They likewise took great pains in studying perfectly their own laws, for the maintenance and protection of their internal security. Thus Iceland, at a time when ignorance and obscurity overwhelmed the rest of Europe, was enabled to produce a considerable number of poets and historians. When the Christian religion was introduced, about the end of the 10th century, more were found conversant in the law than could have been expected, considering the extent of the country, and the number of its inhabitants. Fishing was followed among them; but they devoted their attention considerably more to agriculture, which has since entirely ceased.

Two things have principally contributed towards producing a great change both in their character and way of life, viz. the progress of the Christian religion, and their subjection first to Norway, and afterwards to Denmark. For if religion, on one side, commanded them to desist from their ravages and warlike expeditions; the secular power, on the other, deprived them of the necessary forces for the execution of them: and, since this time, we find no farther traces of their heroic deeds, except those which are preserved in their histories.

The modern Icelanders apply themselves to fishing and breeding of cattle. They are middle-sized and well made, though not very strong; and the women are in general ill-featured. Vices are much less common among them, than in other parts where luxury and riches have corrupted the morals of the people. Though their poverty disables them from imitating the hospitality of their ancestors in all respects, yet they continue to show their inclination to it: they cheerfully give away the little they have to spare, and express the utmost joy and satisfaction if you are pleased with their gift. They are uncommonly obliging and faithful, and extremely attached to government. They are very zealous in their religion. An Iceland never passes a river or any other dangerous place, without previously taking off his hat, and imploring the divine protection; and he is always thankful for the protection of the Deity when he has passed the danger in safety. They have an inexpressible kindness to their native country, and are nowhere so happy. An Iceland is therefore rarely settled in Copenhagen, though ever such advantageous terms should be offered him. On the other hand, we cannot ascribe any great industry or ingenuity to these people. They work on in the way to which they have all along been accustomed, without thinking of improvements. They are not cheerful in conversation, but simple and credulous; and have no aversion against a bottle, if they can find an opportunity. When they meet together, their chief pastime consists in reading their history. The master of the house makes the beginning, and the rest continue in their turns when he is tired. Some of them know these stories by heart; others have them in print, and others in writing. Besides this, they are great players at chess and cards, but only for their amusement, since they never play for money; which, however, seems to have been formerly in use among them; since by one of their old laws, a fine is imposed upon those who play for money.

The modern Icelanders have made very little alteration in their dress from what was formerly in use. The men all wear a linen shirt next to the skin, with a short jacket, and a pair of wide breeches over it. When they travel, another short coat is put over all. The whole is made of coarse black cloth, called wadmal; but some wear clothes of a white colour. On their head they wear large three-cornered hats, and on the feet Iceland shoes and worsted stockings. Some of them indeed have shoes from Copenhagen; but, as they are rather too dear for them, they generally make their own shoes, sometimes of the hide of oxen, but more frequently of sheep's leather. They make them by cutting a square piece of leather, rather wider than the length of the foot; this they sew up at the toes and behind at the heel, and tie it on with leather thongs. These shoes are convenient enough where the country is level; but it would be very difficult for us who are not accustomed to walk with them amongst the rocks and stones, though the Icelanders do it with great ease.

The women are likewise dressed in black wadmal. They wear a bodice over their shifts, which are sewed up at the bosom; and above this a jacket laced before with long narrow sleeves reaching down to the wrists. In the opening on the side of the sleeve, they have buttons of chased silver, with a plate fixed to each button; on which the lover, who has bought them in order to present them to his mistress, takes care to have his name engraved along with hers. At the top of the jacket a little black collar is fixed, of about three inches broad, of velvet or silk, and frequently trimmed with gold cord. The petticoat is likewise of wadmal, and reaches down to the ankles. Round the top of it is a girdle of silver or some other metal, by which they fasten the apron, which is also of wadmal, and ornamented at top with buttons of chased silver. Over all this they wear an upper dress nearly resembling that of the Swedish peasants; with this difference, that it is wider at bottom: this is close at the neck and wrists, and a hand's-breadth shorter than the petticoat. It is adorned with a facing down to the bottom, which looks like cut velvet, and is generally woven by the Icelandic women. On their fingers they wear gold, silver, or brass rings. Their head-dress consists of several cloths wrapped round the head almost as high again as the face. It is tied fast with a handkerchief, and serves more for warmth than ornament. Girls are not allowed to wear this head-dress till they are marriageable. At their weddings they are adorned in a very particular manner; the bride wears, close to the face, round her head-dress, a crown of silver gilt. She has two chains round her neck, one of which hangs down very low before, and the other rests on her shoulders. Besides these, she wears a lesser chain, from whence generally hangs a little heart, which may be opened to put some kind of perfume in it. This dress is worn by all the Icelandic women without exception: only with this difference, that the poorer sort have it of coarse wadmal, with ornaments of brass; and those that are in easier circumstances have it of broad cloth, with silver ornaments gilt.

H The
THE HOUSES OF THE ICELANDERS ARE VERY INDIFFERENT, but the worst are said to be on the south side of the island. In some parts they are built of drift-wood, in others of lava, almost in the same manner as the stone-walls we make for inclosures, with moss stuffed between the pieces of lava. In some houses the walls are wainscoted on the inside. The roof is covered with sods, laid over rafting, or sometimes over the ribs of whales; the walls are about three yards high, and the entrance somewhat lower. Instead of glass, the windows are made of the chlobion and ammos of sheep, or the membranes which surround the womb of the ewe. These are stretched on a hoop, and laid over a hole in the roof. In the poorer sort of houses they employ for the windows the inner membrane of the stomach of animals, which is less transparent than the others.

As the island of Iceland produces no kind of grain, the inhabitants of consequence have no bread but what is imported; and which being too dear for common use, is reserved for weddings and other entertainments. The following list of their viands is taken from Troil's Letters:

1. Flour of fialgras, (lichen islandicus), or rockgrass. The plant is first washed, and then cut into small pieces by some; though the greater number dry it by fire or in the sun, then put it into a bag in which it is well beaten, and lastly work it into a flour by stamping.

2. Flour of komaygr, (polygynum bottris), is prepared in the same manner, as well as the two other sorts of wild corn melur (arundo arenaria, and arundo foliorum lateribus convolutis), by separating it from the chaff, pounding, and lastly grinding it.

3. Sort smor, (sour butter). The Icelanders seldom make use of fresh or salt butter, but let it grow sour before they eat it. In this manner it may be kept for 20 years, or even longer; and the Icelanders look upon it as more wholesome and palatable than the butter used among other nations. It is reckoned better the older it grows; and one pound of it then is valued as much as two of fresh butter.

4. Struig, or whey boiled to the consistence of sour milk, and preserved for the winter.

5. Fish of all kinds, both dried in the sun and in the air, and either salted or frozen. Those prepared in the last manner are preferred by many.

6. Meat, or whey boiled to cheese, which is very good. But the art of making other kinds of good cheese is lost, though some tolerably palatable is sold in the east quarter of Iceland.

7. Beina struig, bones and cartilages of beef and mutton, and likewise bones of cod, boiled in whey till they are quite dissolved: they are then left to ferment, and are eaten with milk.

8. Skyr. The curds from which the whey is squeezed are preserved in casks or other vessels; they are sometimes mixed with black crow-berries or juniper-berries, and are likewise eaten with new milk.

9. Syro, is sour whey kept in casks, and left to ferment; which, however, is not reckoned fit for use till a year old.

10. Blanda, is a liquor made of water, to which a twelfth part of syrup is added. In winter, it is mixed with the juice of thyme and of the black crow berries.

11. They likewise eat many vegetables, some which grow wild, and some are cultivated; also the fish and mushrooms.

The Icelanders in general eat three meals a-day, seven in the morning, two in the afternoon, and nine at night. In the morning and evening they commonly eat curds mixed with new milk, and sometimes with juniper or crow-berries. In some parts, they also have pottage made of rock-grass, which is very palatable or curdled milk boiled till it becomes of a red colour or new milk boiled a long time. At dinner, the food consists of dried fish, with plenty of sour butter; the also sometimes eat fresh fish, and, when possible, a little bread and cheese with them. It is reported by some, that they do not eat any fish till it is quite rotten; this report perhaps proceeds from their being fond of it when a little tainted: they however frequently eat fish which is quite fresh, though, in the same manner as the rest of their food, often without salt. The common beverage is milk, either warm from the cow or cold, and sometimes boiled: they likewise use butter-milk with or without water. On the coast they generally drink blandas and sour milk; which is sold after it is skimmed at two-fifths of a rixdollar per cask: some likewise send for beer from Copenhagen, and some brew their own. A few of the principal inhabitants also have claret and coffee. The common people sometimes drink a kind of tea, which they make from the leaves of the Dryas octopetala, and the Veronica officinalis.

On the coasts the men employ themselves in fishing, both summer and winter. On their return home, when they have drawn and cleaned their fish, they give them to their wives, whose care it is to dry them. In the winter, when the inclemency of the weather prevents them from fishing, they are obliged to take care of the cattle, and spin wool. In summer, they mow the grass, dig turf, provide fuel, go in search of sheep and goats that were gone astray, and kill cattle. They prepare leather with the Spirula Ulmaria instead of bark. Some few work in gold and silver; and others are instructed in mechanics, in which they are tolerable proficient. The women prepare the fish, take care of the cattle, manage the milk and wool, sew, spin, and gather eggs and down. When they work in the evening, they use, instead of an hour-glass, a lamp with a wick made of epitholium dpt in train oil, which is contrived to burn four, six, or eight hours.

Among the common people of Iceland, time is not reckoned by the course of the sun, but by the work they have done, and which is prescribed by law. According to this prescription, a man is to mow as much hay in one day as grows on 30 fathoms of manured soil, or 40 fathoms of land which has not been manured; or he is to dig 700 pieces of turf eight feet long and three broad. If as much snow falls as reaches to the horse bellies, a man is required daily to clear a piece of ground sufficient for 100 sheep. A woman is to rake together as much hay as three men can mow, or to weave three yards of wadmal a-day.

The
The wages of a man are fixed at four dollars and 12 yards of wadmal; and those of a woman at two dollars and five yards of wadmal. When men are sent a fishing out of the country, there is allowed to each man, by law, from the 25th of September to the 14th of May, six pounds of butter, and 18 pounds of dried fish every week. This may seem to be too great an allowance; but it must be remembered that they have nothing else to live upon. When they are at home, and can get milk, &c., every man receives only five pounds of dried fish and three quarters of a pound of butter a-week.

The food and manner of life of the Icelanders by no means contribute to their longevity. It is very rare indeed to see an inhabitant of Iceland exceed the age of 50 or 60; and the greater part are attacked by grievous diseases before middle age. Of these the scurvy and elephantiasis or leprosy are the worst. They are also subject to the gout in their hands, owing to their frequent employment in fishing, and handling the wet fishing-tackle in cold weather. St Anthony's fire, the jaundice, pleurisy, and lowness of spirits, are frequent complaints in this country. The small-pox also is exceedingly fatal, and not long ago destroyed 16,000 persons. By these diseases, and the frequent famines with which the country has been afflicted, the inhabitants are reduced to a much smaller number than they formerly were, insomuch that it is computed they do not in all exceed 60,000.

The exports of Iceland consist of dried fish, salted mutton and lamb, beef, butter, tallow, train oil, coarse woollen cloth, stockings, gloves, raw wool, sheep-skins, lamb-skins, fox-furs of various colours, eider down, feathers, and formerly sulphur; but there is no longer a demand for this mineral. On the other hand, the Icelanders import timber, fishing-lines and hooks, tobacco, bread, horse-shoes, brandy, wine, salt, linen, a little silk, and a few other necessaries, as well as superfluities for the better sort. The whole trade of Iceland is engrossed by a monopoly of Danes, indulged with an exclusive charter. This company maintains factories at all the harbours of Iceland, where they exchange their foreign goods for the merchandise of the country; and as the balance is in favour of the Icelanders, they pay the overplus in Danish money, which is the only current coin in this island. All their accounts and payments are adjusted according to the number of fish: two pounds of fish are worth two skillings in specie, and 48 fish amount to one rixdollar. A Danish crown is computed at 30 fish: what falls under the value of 12 fish cannot be paid in money; but must be bartered either for fish or roll-tobacco, an ell of which is equal to one fish.

The weights and measures of the Icelanders are nearly the same with those used in Denmark. The Icelanders being neither numerous nor warlike, and altogether unprovided with arms, ammunition, garrisons, or fleets, are in no condition to defend themselves from invasion, but depend entirely on the protection of his Danish majesty, to whom they are subject. The revenues which he draws from this island consist of the income of divers estates, as royal demesne, amounting to about 8000 dollars per annum; of the money paid by the company, for an exclusive trade, to the value of 20,000 dollars; and of a fixed proportion in the tythes of fish paid in some particular districts.

Iceland is noted for the volcanoes with which it abounds, as already mentioned, and which seem to be more furious than any yet discovered in the other parts of the globe. Indeed, from the latest accounts, it would seem that this miserable country were little other than one continued volcano. Mount Hecla has been commonly supposed to be the only burning mountain, or at least the principal one, in the island: (see Hecla). It has indeed been more taken notice of than many others of as great extent, partly from its having had more frequent eruptions than any single one, and partly from its situation, which exposes it to the sight of ships sailing to Greenland and North America. But in a list of eruptions published in the appendix to Pennant's Arctic Zoology, it appears, that out of 51 remarkable ones, only one-third have proceeded from Hecla, the other mountains it seems being no less active in the work of destruction than this celebrated one. These eruptions take place in the mountains covered with ice, which the inhabitants call Jokuls. Some of these, as appears from a large map of Iceland made by order of his Danish majesty in 1734, have been swallowed up. Probably the great lakes met with in this country may have been occasioned by the sinking of such mountains, as several instances of a similar nature are to be met with in other parts of the world. The great Icelandick lake called Myvatn may probably have been one. Its bottom is entirely formed of lava, divided by deep cracks, which shelter during winter the great quantity of trout which inhabit this lake. It is now only 30 feet deep, but originally was much deeper; being nearly filled up in the year 1718 by an eruption of the great mountain Krafla. The fiery stream took its course towards Myvatn, and ran into it with an horrid noise, which continued till the year 1730.

The mountains of Iceland (says Mr Pennant) are of two kinds, primitive and posterior. The former consist of strata usually regular, but sometimes confused. They are formed of different sorts of stone without the least appearance of fire. Some are composed of sand and free-stone, petrolix or chert, slaty or fissile stone, and various kinds of earth or bole, and stenites; different sorts of breccia or conglomerated stones; jaspers of different kinds, Iceland crystal; the common rhomboid epathon, chalcedony stratified, and botryoid; zeolites of the most elegant kinds; crystals, and various other substances that have no relation to volcanoes. These primitive mountains are those called Jokuls, and are higher than the others. One of them, called Eystian or Rias, is 6000 feet high. It seems to be composed of great and irregular rocks of a dark grey colour, piled on each other. Another, called Einahberg, is about 3000 feet high; the Snæfells Jökull, 2287 yards; the Snæfellsnes or promontory of Snæfells is from 300 to 400 fathoms. Harmann's or the coast by the north Cape Nord is very high, from 300 to 400 fathoms. The rocks of Drang are seven in number, of a pyramidal figure, rising out of the sea at a small distance from the cliffs, four of which are of a vast height, and have a most magnificent appearance.

Eastward from the Snæfells begins the Eiberge, soaring
soaring to a vast height; many parts of which have felt the effects of fire, and in some of the melted rocks are large cavities. Budir-leikur, a rock at one end of this mountain, is also volcanic, and has in it a great cavern hung with stalactites. The name of Selvahamur is given to a tremendous range of volcanic rocks, composed entirely of slag, and covered in the season with fowl. It would be endless, however, to mention all the places which bear the marks of fire in various forms, either by having been vitrified, changed into a fiery colour, ragged and black, or bear the marks of having run for miles in a sloping course towards the sea.

These volcanoes, though so dreadful in their effects, seldom begin to throw out fire without giving warning. A subterraneous rumbling noise, heard at a considerable distance, as in other volcanoes, precedes the eruption for several days, with a roaring and cracking in the place from whence the fire is about to burst forth; many fiery meteors are observed, but generally unattended with any violent concussion of the earth, though sometimes earthquakes, of which several instances are recorded, have accompanied these dreadful conflagrations. The drying up of small lakes, streams, and rivulets, is also considered as a sign of an impending eruption; and it is thought to hasten the eruption when a mountain is so covered with ice, that the holes are stopped up through which the exhalations formerly found a free passage. The immediate sign is the bursting of the mass of ice with a dreadful noise; flames then issue forth from the earth, and lighting and fire balls from the smoke; stones, ashes, &c. are thrown out to vast distances. Egbert Olafsen relates, that, in an eruption of Kettle gia in 1755, a stone weighing 200 pounds was thrown to the distance of 24 English miles. A quantity of white pumice stones is thrown up by the boiling waters: and it is conjectured with great probability, that the latter proceeds from the sea, as a quantity of salt, sufficient to load several horses, has frequently been found after the mountain has ceased to burn.

To enumerate the ravages of so many dreadful volcanoes, which from time immemorial have contributed to render this dreary country still less habitable than it is from the climate, would greatly exceed our limits. It will be sufficient to give an account of that which happened in 1783, and which from its violence seems to have been unparalleled in history.

Its first signs were observed on the 1st of June by a trembling of the earth in the western part of the province of Skagafjord. It increased gradually to the 11th, and became at last so great that the inhabitants quitted their houses, and lay at night in tents on the ground. A continual smoke or steam was perceived rising out of the earth in the northern and uninhabited parts of the country. Three fire-spouts, as they were called, broke out in different places, one in Úlfarsdal, a little to the east of the river Skæta; the other two were a little to the westward of the river called Itvarlefjot. The river Skæta takes its rise in the north east, and running first westward, it turns to the south, and falls into the sea in a south-east direction. Part of its channel is confined for about 24 English miles in length, and is in some places 200 fathoms deep, in others 100 or 150, and its breadth in some places 100, 50, or 40 fathoms. Along the whole of part of its course the river is very rapid, though there are no considerable cataracts or falls. There are several other such confined channels in the country, but it is the most considerable. The three fire-spouts, or streams of lava, which broke out, united into one, after having risen a considerable height into the air, arriving at last at such an amazing altitude as to be seen at the distance of more than 200 English miles; the whole country, for double that distance, being covered with a smoke or steam to be described.

On the 8th of June this fire first became visible. Vast quantities of sand, ashes, and other volca-
ICE

little to the eastward of a town called Orrebakka, and into which another river called Tuna, after having run through a large tract of barren and uncultivated land, emptied itself. But on the 11th of June the waters of the Skapta were lessened, and in less than 24 hours totally dried up. The day following, a prodigious stream of liquid and red-hot lava, which the fire-sputt had discharged, ran down the channel of the river. This burning torrent not only filled up the deep channel above mentioned, but, overflowing the banks of it, spread itself over the whole valley, covering all the low grounds in its neighbourhood; and not having any sufficient outlet to empty itself by, it rose to a vast height, so that the whole adjacent country was overflowed, insinuating itself between the hills, and covering some of the lower ones. The hills here are not continued in a long chain or series, but are separated from one another, and detached, and between them run little rivulets or brooks; so that, besides filling up the whole valley in which the river Skapta ran, the fiery stream spread itself for a considerable distance on each side, getting vent between the above-mentioned hills, and laying all the neighbouring country under fire.

The spouts still continuing to supply fresh quantities of inflated matter, the lava took its course up the channel of the river, overflowing all the grounds above, as it had done those below the place whence it issues. The river was dried up before it, until at last it was stopped by the hill whence the Skapta took its rise. Finding now no proper outlet, it rose to a prodigious height, and overflowed the village of Bulsand, consuming the houses, church, and every thing that stood in its way: though the high ground on which this village stood seemed to ensure it from any danger of this kind. The fiery lake still increasing, spread itself out in length and breadth for about 26 English miles; and having converted all this tract of land into a sea of fire, it stretched itself toward the south, and getting out again by the river Skapta, rushed down its channel with great impetuosity. It was still confined between the narrow banks of that river for about six miles (English); but coming at last into a more open place, it poured forth in prodigious torrents with amazing velocity and force; spreading itself now towards the south, tearing up the earth, and carrying on its surface flaming woods and whatsoever it met with. In its cours it laid waste another large district of land. The ground where it came was cracked, and sent forth great quantities of steam long before the fire reached it; and every thing near the lake was either burned up or reduced to a fluid state. In this situation matters remained from the 12th of June to the 13th of August; after which the fiery lake no longer spread itself; but nevertheless continued to burn; and when any part of the surface acquired a crust by cooling, it was quickly broken by the fire from below; and tumbling down among the melted substance, was rolled and tossed about with prodigious noise and cracking; and in many parts of its surface, small spouts or at least ebullitions, were formed, which continued for some length of time.

In other directions this dreadful inundation proved no less destructive. Having run through the narrow part of the channel of Skapta as early as the 12th of June, it stretched out itself towards the west and southwest, overflowing all the flat country, and its edge being no less than 70 fathoms high at the time it got out of the channel of the river. Continuing its destructive course, it overflowed a number of villages, running in every direction where it could find a vent.

In one place it came to a great cataract of the river Skapta, about 14 fathoms in height, over which it was precipitated with tremendous noise, and thrown in great quantities to a very considerable distance. In another place it stopped up the channel of a large river, filled a great valley, and destroyed two villages by approaching only within 100 fathoms of them. Others were overflowed by inundations of water proceeding from the rivers which had been stopped in their courses; until at last all the passages on the south, east, and west, being stopped, and the spouts still sending up incredible quantities of fresh lava, it burst out to the north and north-east, spreading over a tract of land 48 miles long and 36 broad. Here it dried up the rivers Tuna and Asadayri; but even this vast effusion being insufficient to exhaust the subterraneous resources of liquid fire, a new branch took its course for about eight miles down the channel of the river Ilverfsfjöll, when coming again to an open country, it formed what our author calls a small lake of fire, about twelve miles in length and six in breadth. At last, however, this branch also stopped on the 16th of August; the fiery mountains ceased to pour forth new supplies, and this most astonishing eruption came to a period.

The whole extent of ground covered by this dreadful inundation was computed at not less than 90 miles long and 42 in breadth; the depth of the lava being from 16 to 20 fathoms. Two rivers were dried up, 25 or 21 villages were destroyed, and 224 people lost their lives. The extent above mentioned, however, is that only on the south, east, and west; for that towards the north being over uninhabited land, where no body cared to venture themselves, was not exactly known. Some hills were covered by this lava: others were melted down by its heat; so that the whole had the appearance of a sea of red hot and melted metal.

After this eruption two new islands were thrown up from the bottom of the sea. One, about three miles in circumference, and about a mile in height, made its appearance in the month of February 1784, where there was formerly 100 fathoms of water. It was about 100 miles south-west from Iceland, and 48 from a cluster of small islands called Gierfugal. It continued for some time to burn with great violence, sending forth prodigious quantities of pumice-stones, sand, &c. like other volcanoes. The other lay to the north-west, between Iceland and Greenland. It burnt day and night without intermission for a considerable time; and was also very high, and larger than the former. Since that time, however, one or both of these islands have been swallowed up.

All the time of this great eruption, and for a considerable time after, the whole atmosphere was loaded with smoke, steam, and sulphureous vapours. The sun was sometimes wholly invisible; and when it could be seen was of a reddish colour. Most of the fishe-
ries were destroyed; the banks where the fish used to resort being so changed, that the fishermen could not know them again; and the smoke was so thick, that they could not go far out to sea. The rain water, falling through this smoke and steam, was so impregnated with salt and sulphureous matter, that the hair and even the skins of the cattle were destroyed; and the whole grass of the island was covered with soot and pitchy matter, that what had escaped the destructive effects of the fire became poisonous; so that the cattle died for want of food, or perished by eating those wholesome vegetables. Nor were the inhabitants in a much better situation; many of them having lost their lives by the poisonous qualities of the smoke and steam with which the whole atmosphere was filled; particularly old people, and such as had any complaint in the breast and lungs.

Before the fire broke out in Iceland, there is said to have been a very remarkable eruption in the uninhabited parts of Greenland; and that in the northern parts of Norway, opposite to Greenland, the fire was visible for a long time. It was also related, that when the wind was in the north, a great quantity of ashes, pumice, and brimstone, fell upon the north and west coasts of Iceland, which continued for the whole summer whenever the wind was in that quarter; and the air was always very much impregnated with a thick smoke and sulphureous smell.

During the fall of the sharp rain formerly mentioned, there was observed at Trondheim, and other places in Norway, and likewise at Faw, an uncommon fall of sharp and salt rain, which totally destroyed the leaves of the trees, and every vegetable it fell upon, by scourching them up, and causing them to wither. A considerable quantity of ashes, sand, and other volcanic matters, fell at Faro, which covered the whole surface of the ground whenever the wind blew from Iceland, though the distance between the two places is not less than 480 miles. Ships that were sailing between Copenhagen and Norway were frequently covered with ashes and sulphureous matter, which stuck to the masts, sails, and decks, besmearing them all over with a black and pitchy substance. In many parts of Holland, Germany, and other northern countries, a sulphureous vapour was observed in the air, accompanied with a thick smoke, and in some places a light grey-coloured substance fell upon the earth every night; which, by yielding a bluish flame when thrown into the fire, evidently showed its sulphureous nature. On those nights in which this substance fell in any quantity, there was little or no dew observed. These appearances continued, more or less, all the months of July, August, and September.

Some curious particulars relative to the ancient state of this island have lately been published by a Mr Vhorkey, a native of the country. From his work it appears that Iceland, for a very considerable space of time, viz. from the beginning of the 10th to the middle of the 13th century, was under a republican form of government. At first the father, or head of every family, was an absolute sovereign; but in the progress of population and improvement, it became necessary to form certain regulations for the settlement of disputes concerning the frontiers of different estates. For this purpose the heads of the families concerned as

sesembled themselves, and formed the outlines of public. In the mean time they carried on a prosperous trade to different parts; sending ships even to Levant, and to Constantinople, at that time celebrated as the only seat of literature and humanity in the world. Deputies were likewise sent from this island over land to that capital, for the improvement of the laws and civilization; and this a whole century before the first crusade. In these ancient Icelandic laws, therefore, we meet with evident traces of those of the Greeks and Romans. For example, besides a body of writ laws which were read every third year to the people, they had two men chosen annually by the heads of miles, with consular power, not only to enforce laws then in being, but when these proved deficient, act as necessary required. These laws do not appear to have inflicted capital punishments upon any person. Murderers were hanged to the wood; that is, to the interior and uncultivated parts of the island: where no person was allowed to approach them within a certain number of fathoms. In cases of banishment for lesser crimes, the friends of the offender were allowed to supply him with necessaries. The culprit, however, might be killed by another person who found him without his bounds; and he might even be hunted and destroyed in his sanctuary provided he did not withdraw himself from the island within a twelvemonth after his sentence, which it was supposed he might accomplish by means of the annual arrival and departure of ships. Every man's person was free until he had forfeited his rights by some crime against society; and so great was their respect for it independence, that great indulgence was allowed for the power of passion. If any provoking word or behaviour had been used, no punishment was inflicted on the party who resented it, even though he should have killed his adversary.

By the laws of Iceland, the poor were committed to the protection of their nearest kindred, who had a right to their labour as far as they were able to work; and afterwards to indemnification if the poor person should acquire any property. Children were obliged to maintain their parents in their old age; but if the latter had neglected to give them good education, they were absolved from this duty.

While the republic of Iceland continued free and independent, ships were sent from the island to all parts of the world. Till very lately, however, not a ship belonged to it, the little commerce it enjoyed being monopolized by a Danish company, until in 1786 it was laid open to all the subjects of Denmark. "There is at present (says Mr Pennant) a revival of the cod fishery on the coast of Iceland from our kingdom. About a dozen of vessels have of late sailed from the islands of Thaneet, and a few from other parts of Great Britain. They are either sloops or brigs of 50 to 80 tons burden. A lug-sail boat, such as is used in the herring fishery, sailed last season from Yarmouth thus equipped. The crew consisted of five men from the town, and five more taken in at the Orkneys. They had twelve lines of 520 fathoms each, and 200 or 300 hooks; six heading knives, twelve guttering and twelve splitting knives. They take in 18 tons of salt at Leith, at the rate of three tons to every thousand fish; of which six or seven thousand is a load for a vessel of this
this kind. They go to sea about the middle of April; return by the Orkneys to land the men; and get into their port in the latter end of August or beginning of September. Pytheas says, that Iceland lies six days sailing from Great Britain. A vessel from Yarmouth was, in the last year, exactly that time in its voyage from the Orkneys to Iceland. With a fair wind it might be performed in far less time; but the winds about the Ferroo isles are generally changeable.

**Iceland Agate.** A kind of precious stone met with in the islands of Iceland and Ascension, employed by the jewellers as an agate, though too soft for the purpose. It is supposed to be a volcanic product; being solid, black, and of a glossy texture. When held between the eye and the light, it is semitransparent and greenish like the glass bottles which contain much iron. In the islands which produce it, such large pieces are met with, that they cannot be equalled in any glasshouse.

**ICENI.** The ancient name of the people of Suffolk, Norfolk, Cambridgeshire, and Huntingdonshire, in England.

**ICH DIEN.** See HERALDRY, chap. iv. sect. 2.

**ICHNEUMON.** See ZOOLOGY. See VIVERRA, MAMMALIA Index.

**ICHNEUMON.** Also the name of a genus of flies of the hymenoptera order. See ENTOMOLOGY Index.

**ICHOGRAPHY.** In Perspective, the view of any thing cut off by a plane, parallel to the horizon, just as the base of it. The word is derived from the Greek *skeina*, footstep, and *skein*, I write, as being a description of the footsteps or traces of a work.

Among painters it signifies a description of images or of ancient statues of marble and copper, of busts and semi-busts, of paintings in fresco, mosaic works, and ancient pieces of miniature.

**ICHOGRAPHY.** In Architecture, is a traverse or horizontal section of a building, exhibiting the plot of the whole edifice, and of the several rooms and apartments in any story; together with the thickness of the walls and partitions; the dimensions of the doors, windows, and chimneys; the projections of the columns and piers, with every thing visible in such a section.

**ICHOGLANS, the grand signior's pages serving in the seraglio.** These are the children of Christian parents, either taken in war, purchased, or sent in presents from the viceroys and governors of distant provinces: they are the most sprightly, beautiful, and well-made that can be met with; and are always reviewed and approved of by the grand signior himself, before they are admitted into the seraglio of Persia, Constantinople, or Adrianople, being the three colleges, according to the opinion the court entertains of them.

---

(CHOR, properly signifies a thin watery humour like serum; but is sometimes used for a thicker kind flowing from ulcers, called also sordid.)

**ICHTHYOCOLLA, ISINGLASS.** A preparation from the fish known by the name of *Husoi*. See ACCEPER. The word is Greek, formed of *ichthys*, fish, and *siska*, glue.—The method of making isinglass was long a secret in the hands of the Russians; but hath lately been discovered, and the following account of it published by Humphrey Jackson, Esq. in the 63d volume of the Philosophical Transactions.

"All authors who have hitherto delivered processes for making ichtyocolla, fish-glue, or isinglass, have greatly mistaken both its constituent matter and preparation.

"To prove this assertion, it may not be improper to recite what Pomat says upon the subject, as he appears to be the principal author whom the rest have copied. After describing the fish, and referring to a cut engraved from an original in his custody, he says: "As to the manner of making the isinglass, the sinewy parts of the fish are boiled in water till all of them be dissolved that will dissolve; then the jelly liquor is strained, and set to cool. Being cold, the fat is carefully taken off, and the liquor itself boiled to a just consistency, then cut to pieces and made into a twist, bent in form of a crescent, as commonly sold; then hung upon a string, and carefully dried." "From this account, it might be rationally concluded, that every species of fish which contained gelatious principles would yield isinglass: and this parity of reasoning seems to have given rise to the hasty conclusions of those who strenuously vouch for the extraction of isinglass from sturgeon; but as that fish is easily procurable, the negligence of ascertaining the fact by experiment seems inexplicable.

"In my first attempt to discover the constituent parts and manufacture of isinglass, relying too much upon the authority of some chemical authors whose veracity I had experienced in many other instances, I found myself constantly disappointed. Glue, not isinglass, was the result of every process; and although, in the same view, a journey to Russia proved fruitless, yet a steady perseverance in the research proved not only successful as to this object, but in the pursuit to discover a reservoir matter plentifully procurable in the British fisheries, which has been found by ample experience to answer similar purposes. It is now no longer a secret that our (A) lakes and rivers in North America are stocked with immense quantities of fish, said to be the same species with those in Muscovy, and yielding the finest isinglass; the fisheries whereof, under due encouragement, would doubtless supply all Europe with this valuable article.

"No artificial heat is necessary to the production of isinglass; neither is the matter dissolved for this purpose; for,
A due consideration that an imperfect solution of isinglass, called 
fining by the brewers, possessed a peculiar property of clarifying malt liquors, induced me to
attempt its analysis in cold subacid menstrua. One
ounce and a half of good isinglass, steeped a few days
in a gallon of stale beer, was converted into good 
fining, of a remarkable thick consistence: the same quantity
of glue, under similar treatment, yielded only a mucilaginous 
liquor, resembling diluted gum-water, which, instead
of clarifying beer, increased both its tenacity and turbidness, and communicated other properties in no
respect corresponding with those of genuine fining. On
commincing three spoonfuls of the solution of isinglass
with a gallon of malt liquor, in a tall cylindrical glass,
a vast number of curdly masses became presently formed,
by the reciprocal attraction of the particles of isinglass
and the feculencies of the beer, which increasing in
magnitude and specific gravity, arranged themselves ac-
cordingly and fell in a combined state to the bottom,
through the well-known laws of gravitation; for, in this
case, there is no elective attraction, as some have imagi-
ned, which bears the least affinity with what frequently
occurs in chemical decompositions.

If what is commercially termed long or short stapled
isinglass be steeped a few hours in fair cold water, the
untwisted membranes will expand, and reassume their
original beautiful (a) hue, and, by a dexterous address,
may be perfectly unfolded. By this simple operation,
we find that isinglass is nothing more than certain mem-
branous parts of fishes, dewetted of their native mucosity,
rrolled and twisted into the forms above mentioned, and
dried in open air.

The sounds, or air-bladders, of fresh-water fish in
general, are preferred for this purpose, as being the most
transparent, flexible, delicate substances. These consti-
tute the finest sorts of isinglass; those called book and
ordinary staple are made of the intestines, and probably
of the peritoneum of the fish. The belluga yields the
greatest quantity, as being the largest and most plentiful
fish in the Volga rivers; but the sounds of all
fresh-water fish yield, more or less, fine isinglass, par-

cularly the smaller sorts, found in prodigious quan-
tities in the Caspian sea, and several hundred miles be-
don Astracan, in the Wolga, Yaik, Don, and even as
far as Siberia, where it is called kle or klo by the natives,
which implies a glutinous matter; it is the basis of the
Russian glue, which is preferred to all other kinds for
its strength.

The sounds, which yield the finer isinglass, consist of
parallel fibres, and are easily rent longitudinally; but the
ordinary sorts are found composed of double membrans, whose fibres cross each other obliquely, re-
sembling the coats of a bladder; hence the former a
more readily pervaded and divided, with subacid
liquors; but the latter, through a peculiar kind of intr-
trinsic texture, are with great difficulty torn asunder,
and long resist the power of the same menstruum; 3
when duly resolved, are found to act with equal ener
in clarifying liquors.

Isinglass receives its different shapes in the follo-
ing manner.

"The parts of which it is composed, particularis
the sound, are taken from the fish while sweet a
fresh, slit open, washed from their slimy sordes, dived
ed of every thin membrane which envelopes the soun
and then exposed to stiffen a little in the air. In th
state, they are formed into rolls about the thickness
a finger, and in length according to the intended si
of the staple: a thin membrane is generally selecte
for the centre of the roll, round which the rest a
folded alternately, and about half an inch of each e
tremity of the roll is turned inwards. The due d
mensions being thus obtained, the two ends of wh
is called short staple are pinned together with a sm
wooden peg; the middle of the roll is then pressed
little downwards, which gives it the semblance of
heart-shape; and thus it is laid on boards, or hung u
in the air to dry. The sounds, which compose ti
long-staple, are longer than the former; but the op-
erator lengthens this sort at pleasure, by interfoldin
the ends of one or more pieces of the sound with eac
other. The extremities are fastened with a peg, lik
the former; but the middle part of the roll is bet
more considerably downwards, and, in order to pre
serve the shape of the three obtuse angles thus formed
piece of round stick, about a quarter of an inch di
meter, is fastened in each angle with small wooden pegs,
in the same manner as the ends. In this state
it is permitted to dry long enough to retain its form
when the pegs and sticks are taken out, and the
drying completed; lastly, the pieces of isinglass are

colligated in rows, by running pack-thread through
the peg-holes, for convenience of package and exporta
tion.

The membranes of the book sort, being thick
and refractory, will not admit a similar formation with
the preceding; the pieces, therefore, after their sides
are folded inwardly, are bent in the centre, in such
manner that the opposite sides resemble the cover of a
book, from whence its name; a peg being run across
the middle, fastens the sides together, and thus it is
dried like the former. This sort is interleaved, and
the pegs run across the ends, the better to prevent its
unfolding.

That called cake-isinglass is formed of the bits
and fragments of the staple sorts, put into a flat me-
talline pan, with a very little water, and heated just
enough to make the parts coherent like a pancake when
it is dried; but frequently it is overheated, and such
pieces, as before observed, are useless in the business of
fining. Experience has taught the consumers to reject
them.

Isinglass
"Isinglass is best made in the summer, as frost gives it a disagreeable colour, deprives it of weight, and impairs its gelatinous principles; its fashionable forms are unnecessary, and frequently injurious to its native qualities. It is common to find oily putrid matter, and exuviae of insects, between the implicated membranes, which, through the inattention of the cellerman, often contaminate wines and malt liquors in the act of clarification. These peculiar shapes might probably be introduced originally with a view to conceal and disguise the real substance of isinglass, and preserve the monopoly; but, as the mask is now taken off, it cannot be doubted to answer every purpose more effectually in its native state, without any subsequent manufacture whatever, especially to the principal consumers, who hence will be enabled to procure sufficient supply from the British colonies. Until this laudable end can be fully accomplished, and as a species of isinglass, more easily producible from the marine fisheries, may probably be more immediately encouraged, it may be manufactured as follows:

The sounds of cod and ling bear great analogy with those of the accipiter genus of Linnaeus and Arredi; and are in general so well known as to require no particular description. The Newfoundland and Iceland fishermen split open the fish as soon as taken, and throw the back-bones with the sounds annexed in a heap; but previous to incipient putrefaction, the sounds are cut out, washed from their slimes, and salted for use. In cutting out the sounds, the intercostal parts are left behind, which are much the best; the Iceland fishermen are so sensible of this, that they beat the bone upon a block with a thick stick, till the pockets, as they term them, come out easily, and thus preserve the sound entire. If the sounds have been cured with salt, that must be dissolved by steeping them in water before they are prepared for isinglass; the fresh sound must then be laid upon a block of wood, whose surface is a little elliptical, to the end of which a small hair brush is nailed, and with a saw-knife the membranes on each side of the sound must be scraped off. The knife is rubbed upon the brush occasionally, to clear its teeth; the pockets are cut open with scissors, and perfectly cleansed of the mucous matter with a coarse cloth; the sounds are afterwards washed a few minutes in lime-water in order to absorb their oily principle, and lastly in clear water. They are then laid upon nets to dry in the air; but if intended to resemble the foreign isinglass, the sounds of cod will only admit of that called book, but those of ling both shapes. The thicker the sounds are, the better the isinglass, colour excepted; but this is immaterial to the brewer, who is its chief consumer.

This isinglass resolves into fining, like the other sorts, in subacid liquors, as stale beer, cyder, old hock, 

&c. and in equal quantities produces similar effects upon turbid liquors, except that it falls speedier and closer to the bottom of the vessel, as may be demonstrated in tall cylindrical glasses; but foreign isinglass retains the consistency of fining preferably in warm weather, owing to the greater tenacity of its native mucilage.

"Vegetable acids are, in every respect, best adapted to fining: the mineral acids are too corrosive, and even insalubrious, in common beverage.

"It is remarkable, that during the conversion of isinglass into fining, the acidity of the menstruum seems greatly diminished, at least to taste, not on account of any alkaline property in the isinglass, probably, but by its enveloping the acid particles. It is likewise reduced into jelly with alkaline liquors, which indeed are solvents of all animal matters; even cold lime-water dissolves it into a pulposa magnum. Notwithstanding this is inadmissible as fining, on account of the menstruum, it produces admirable effects in other respects: for, on commixture with compositions of plaster, lime, &c. for ornamenting walls exposed to vicissitudes of weather, it adds firmness and permanency to the cement; and if common brick-mortar be worked up with this jelly, it soon becomes almost as hard as the brick itself; but for this purpose, it is more commodiously prepared, by dissolving it in cold water, acidulated with vitriolic acid; in which case, the acid quits the jelly, and forms with the lime a selenitic mass, while, at the same time, the jelly being deprived in some measure of its moisture, through the formation of an indissoluble concrete amongst its parts, soon dries, and hardens into a firm body; whence its superior strength and durability are easily comprehended.

"It has long been a prevalent opinion, that sturgeon, on account of its cartilaginous nature, would yield great quantities of isinglass; but, on examination, no part of this fish, except the inner coat of the sound, promised the least success. This being full of ruggae, adheres so firmly to the external membrane, which is useless, that the labour of separating them superseded the advantage. The intestines, however, which in the larger fish extend several yards in length, being cleansed from their mucus, and dried, were found surprisingly strong and elastic, resembling cords made with the intestines of other animals, commonly called cat-gut, and, from some trials, promised superior advantages when applied to mechanic operations."

Isinglass is sometimes used in medicine; and may be given in a thin acrimonious state of the juices, after the same manner as the vegetable gums and mucilages, regard being had to their different disposition to putrescence.
ICHTHYLOGY (from the Greek ἰχθύς, "a fish," and θεωρεῖν, "discourse," ) is that part of zoology which treats of fishes.

Fishes are such animals as have a heart with one auricle and one ventricle, with cold red blood, which inhabit water, and breathe by means of gills. Most of the species are likewise distinguished by fins and scales.

The very element in which fishes live prevents us from following their motions with exactness, from studying their instincts, and from noting with fidelity their specific differences. Their colours often vary, according to the accidental circumstances of age, sex, climate, season, breeding, &c. and often vanish in the open air, or with the principle of life. On the same shores unknown kinds seldom occur; and when they do, they may pass unnoticed by the illiterate fishermen. Hence, the natural history of the fishy tribe has, in all ages, been involved in greater obscurity than that of land animals, which are more readily subjected to the investigation of the learned and the curious. Hence, Aristotle, Pliny, and Helian, in treating of fishes, have mingled much fable with some truths, and have even confounded classes which nature has distinctly separated. Such, too, is the ambiguity which now attaches to their vague and unscientific nomenclature, and such, we may add, is the indispensable limitation of our plan, that we should forbear enlarging on the ichthyological portions of their writings. The classical and inquisitive reader may, however, derive entertainment and some instruction from a careful perusal of their text, and of some of the most ingenious and judicious annotations of more recent scholars and naturalists. To the names just mentioned, we may add that of Athenaeus, who, in the seventh book of his Deipnosophistai, discourses of fishes. Ovid celebrates them in his Halieuticon; and his example has been followed, without success, by Oppian, a Greek poet, who flourished in the second century, under the reign of Caracalla. Ausonius, a native of Bourdeaux, who died towards the conclusion of the fourth century, in his admired poem on the Moselle, has not forgotten to sing of its inhabitants.

In the more downward periods of the dark and middle ages, no writer of eminence appears in this department of natural history. Indeed, the first who laid the foundation of ichthyological arrangement was Pierre Belon, a French physician, born in 1518, and advantageously known by his travels in Judæa, Greece, and Arabia, as well as by his writings in natural history. Some of his divisions of fishes, as the eleventh, which comprises the flat species that are not cartilaginous, the twelfth, those that are both flat and cartilaginous; the thirteenth, which includes the squaæ, &c. are deduced from natural resemblances; but others are more fanciful; and the wooden cuts are deficient in accuracy and neatness. Belon was an industrious, and rather an acute observer, who wrote with pleasing naïveté, who should rank high in the estimation of the learned world, when we reflect on the few resources of his wit he could avail himself of. His history of fishes appeared in 1551. That of his countryman, Rondelet, was published three years afterwards, and exhibited more accurate descriptions and figures, with many excellent marks, the result of his own observation. In point arrangement, however, Rondelet's work is extremely imperfect, and even puerile. He tells us, for example, that, after very mature deliberation, he resolved to begin with the gilt-head, because it was best known to ancients and moderns, and highly prized for its delicacy.

He had, however, the merit of exciting a general taste for the study of ichthyology; and Sallust, Boscow Conrad Gesner, Pison, &c. who followed him in rapid succession, contributed their share to the stock of scientific facts, though they made few advances to the construction of a natural order.

In 1603, Aldrovandus, who published a large compilation on natural history, distributed the fishes according to the nature of their residence; thus, his first book treats of those that frequent rocks; the second is devoted to the littoral; the third to the pelagic; &c. Several authors, whom we cannot stay to name, displayed their talents, with more or less felicity, on the same subject. But their labours were eclipsed by those of Willoughby, whose work, entitled De Historia Piscium, was printed at Oxford in 1686, and unfolds many new and accurate notions relative to the anatomy and physiology of fishes. His arrangement may be considered as an improved modification of that of Belon. The celebrated Ray, published, in 1707, his Synopsi Methodica Piscium, which may be regarded as an abridgment and corrected view of Willoughby's larger work, and as indicating, if not fixing, a series of genera. This valuable descriptive catalogue continued to be appealed to as a standard, till the combined genius of Artedi and Linnaeus effected an important reform in the science of ichthyology.

Artedi, the countryman and friend of the great Swedish naturalist, had adopted his principles, and was engaged in applying them to the systematic illustration of fishes, when death prematurely arrested the prosecution of his design. His illustrious friend put the finishing hand to his papers, and published them in the form of two octavo volumes, under the title of Bibliotheca Ichthyologica, and Philosophia Ichthiologica, which Walbaum re-edited, in four volumes, in 1792. Thus, then, to Artedi we may ascribe the merit of having first traced the outlines of that classification of fishes which has now become so popular in Europe; for he first instituted orders and genera, and defined the characters on which these divisions are founded. Independently of the cetaceous tribes, which are now generally classed with the mammalia, and of which we have treated in
ICHTHYOLOGY.

the article CETACEA, his method consisted of four great divisions or orders, namely, the Malacostracan, Echinodermata, Branchiostegata, and Chondrostea.

The first denoted those species which have soft fins, or fins with bony rays but without spines, and included twenty-one genera; the second, those with spiny fins, containing sixteen genera; the third, corresponding to the amphibia natae of Linnaeus which want the operculum or branchiostegous membrane; and the fourth, the Linnaean amphibia natae which have not true bones, but only cartilages, and the rays of whose fins hardly differ from a membrane. In his first edition of the System of Nature, Linnaeus wholly adopted the Artediian method. With regard to the changes which he afterwards introduced, it would be unnecessary to state them in this rapid historical sketch, especially as we purpose to follow his divisions in our systematic exposition.

Those ichthyologists who have proposed methods in opposition to that of Linnaeus, have usually fallen short in the latter part of simplicity. Thus Kner, who vainly attempted to rival the professor of Upsala, distributed fishes into three sections, according as they had lungs, and visible or invisible gills; but his subdivisions were so numerous and complex, that his scheme has never been adopted. That of Gronovius was, at least for a few years, much more favourably received. It is principally founded on the presence or absence, and the number or nature of the fins. The first class includes all the cetaceous animals, and the second all the fishes. The chondrostea, and the osseous or bony, form two great divisions; and the osseous are subdivided into branchiostegata and branchial. These last are grouped according to the Linnaean rules; but, in the formation of the genera, the number of dorsal fins is admitted as a character, which Linnaeus has, perhaps inconsiderably, overlooked, and which gives rise to several genera which are not to be found in the System of Nature. —Brunnich laboured, with much pains and considerable ingenuity, to combine the Linnaean and Artediian divisions; but his system remained without encouragement or support. —Scopoli boldly struck out a new path, and assumed the position of the genus as the basis of his three primary divisions. His secondary characters sometimes coincide with those of Gronovius, and sometimes with those of Linnaeus; while his third series of distinctions is sometimes drawn from the form of the body, and sometimes from the teeth. Gosse, the celebrated professor of botany at Montpelier, preserved the Linnaean genera, but formed his greater divisions from the union of those of Linnaeus and Artedi. His two principal sections are, of fishes with complete, and of those with incomplete, gills; and the last is divided into two others, viz. acanthopterygian, and osteichthygian, in each of which are ranged the apodal, jugular, thoracic, and abdominal species. The same process is followed in the second section, which includes the branchiostegata and the chondrostea.

All the authors who have just passed under our review, with the exception of Belas, Randelet, and Gronovius, published their works without any regular series of plates illustrative of their descriptions. Among those who embellished their volumes with valuable figures, we have to mention Scota, in his large collection of subjects belonging to natural history.—Catesby, in his Natural History of Carolina.—Broussonet, in his Ichthyologie, and Bloch, in his Natural History of Fishes, first published at Berlin in German, and in French in 1785, and recently republished in a small form, by Deterville, at Paris, forming part of the extensive work entitled Histoire Naturelle de Buffon, &c. Bloch's original work includes about 600 species of fishes, which are generally described with great accuracy, figured, as nearly as circumstances will admit, of the natural size, and beautifully coloured. The author enters with some minuteness into the history of those which afford food for man, or which suggest facts worthy of remark. He has followed the Linnaean method, and made considerable additions to the number of genera.

La Cépide, the friend and co-author of Buffon, has of La Cépide executed an elaborate and extensive undertaking on the natural history of fishes. He divides this class of animals into two secondary classes, viz. the cartilagineus and the osseous. Each of these subordinate classes consists of four divisions, taken from the combinations of the presence or absence of the operculum, and of the branchial membrane; thus, the first division of the cartilagineus includes those fishes which have neither operculum nor branchial membrane; the second, those which have an operculum, but no membrane; the third, those which have an operculum, but no membrane; and the fourth, those which have both. The same characters, stated in the inverse order, determine the divisions of the osseous species. Each of these divisions is again distributed into the Linnaean orders, and these, in turn, into the Linnaean genera. The conquests of the latter, however, do not always correspond with the enumerations in the System of Nature; for the French zoologist has withdrawn many species from their former categories, and ranged them under new genera. His innovations in this respect are, perhaps, not always improvements; and some of his generic appellations, as gobio, gobiasor, gobioïde, gobionemf, and gobionemorïde, pomacanthus, pomacentra, pomadagis, and pomatomes, &c. are too nearly allied in sound and orthography, to be readily discriminated by the memory. We have, moreover, to regret that the plates are not coloured, and that they are executed on too small a scale. Yet, after every deduction which even rigid criticism may require from the merits of this publication, enough will remain to attest the industry and the talents of its author, and to justify the high rank which he has obtained among the writers on ichthyology.

Before closing even these very condensed notices, it of Pen...
CHAP. II. ANATOMY OF FISHES.

The shape of the body of fishes is subject to considerable varieties. It is said to be compressed, when the diameter, from side to side, is less than from back to belly; and depressed, on the contrary, when the diameter, from side to side, is greater than from back to belly. It is cylindrical, when it is circular in the greater part of its length; ensiform, or sword-shaped, when the back and belly terminate in a sharp edge, or when the body gradually tapers from the head to the tail; conical, or knife-shaped, when the back is somewhat flat, and the angle below acute; carinated, or keel-shaped, when the back is rounded, and the under part of the belly acute, through its length; oblong, when the longitudinal diameter is much longer than the transverse; oval, when the longitudinal diameter not only exceeds the transverse, but the base is circular, and the apex more acute; orbicular, when the longitudinal and transverse diameters are nearly equal; lamellated, or scale-shaped, when oblong, and attenuated at both extremities; coniciform, or wedge-shaped, when the body gradually flattens towards the tail; conical, when it is cylindrical, and grows gradually more slender towards the tail; ventricose, when the belly is very prominent; gibbous, when the back presents one or more protuberances; annulated, when the body is surrounded by rings, or elevated lines; articulated, when it is covered with connected and bony plates; trigon, tetragon, pentagon, and hexagon, when the sides are plain, with three, four, or six longitudinal angles; if the number of these angles exceed six, it is termed a polygon.

The surface of the body of fishes is termed naked, when it is destitute of scales; scaly, when provided with them; smooth, when the scales are without angles, furrows, roughness, or inequalities; lubricous, or slippery, when invested with a mucous or slimy humour; tuberculated, or rough, when covered with prominent warts or tubercles; papillose, when covered with fleshy points; spinous, when the asperities are elongated, and pointed at their extremities; frillated, or frilled, or mailed, when the body is inclosed in a hard, callous, or bony integument, or in scales so closely united as to seem but one; fasciated, or banded, when marked with transverse zones from the back to the belly; striped, when marked with very narrow, scattered, and coloured streaks; vittated, when marked with longitudinal zones along the sides, from the head to the tail; reticulated, or chequered, when marked with lines forming the appearance of net-work; pointed, or dotted, when marked with points, either longitudinally disposed, or without order; and variegated, when of different colours.

The parts of the body are either external, or internal: the former include the head, trunk, and fins; the latter, the skeleton, muscles, and viscera.
Anatomy behind, within which, and the upper or under part of the mouth, the fish lays its tongue, or discharges water from its mouth; and moveable, when they can be thrust out or drawn in.

The lips are obvious only in a few fishes, and are either of a fleshy or bony consistence. They are also distinguished into plicated, or consisting of folds, and retractile, or capable of being drawn out or in, at the pleasure of the animal.

The teeth are acute, when their extremity terminates in a point; obtuse, when it is rounded; granular, when the teeth are of the size and shape of small grains; plane, when flat on the sides; semi-sagittate, when hooked on one side only; serrated, when toothed like a saw on the margin; emarginate, when the extremity is somewhat cleft; recurved, when inclined towards the gullet; parallel, when of the same direction, length, and figure; diverging, when the spine stand wide, or distant from each other; similar, when they are all of the same size and figure; dissimilar, when some are acute, and others obtuse; ordinatate, when disposed in one or more rows; confused, when crowded, and not disposed in any regular order.

The tongue is termed acute or obtuse, according as its extremity terminates in a point, or is rounded; it is emarginate, or bifid, when the extremity is divided into two lobes; carinated, when angulated on the upper or lower surface; dentated, when its surface is furnished with teeth; and papillous, when covered with fleshy points.

The palate is that part of the mouth which is included between the base of the jaws and the origin of the eosophagus. It is either smooth, when its surface is destitute of tubercles, teeth, and asperities; or denticated, when furnished with teeth.

The nostrils are orifices, almost always situated in the rostrum, before the eyes. They are anterior, when they occupy the fore part of the rostrum, and are somewhat distant from the eyes; posterior, when situated at the base of the rostrum, and very near the eyes; superior, when on the crown of the head, between the eyes, and close to them; cylindrical, when they form a tube; single, or solitary, when there is only one on each side of the head; and double, when there are two on each side.

The eyes are always two, and are composed of two principal parts, as they are visible from without belonging to the description of the external structure. These parts are the pupil and the iris. The first occupies the centre of the globe; and is usually spherical, but sometimes oval; and the second is the coloured circle which surrounds the pupil, and is often furnished with a distinct ring. It is, for the most part, black or gold-coloured, but sometimes it assumes a silvery hue.

The eyes are said to be covered, when they are enveloped in the skin, or in a nictitating membrane; semi-covered, when this membrane is arched, or lunulated, or perforated like a ring; naked, when destitute of nictitating membrane; vertical, when situated on the crown of the head; lateral, when placed on the sides of the head; binate, when they are both on the same side of the head; plane, or depressed, when the convexity of the ball does not exceed the surface of the head; convex, when the convexity projects beyond this surface; salient, when the eyes are very prominent.

The branchial opercles are scaly or bony processes, situated on both sides of the head, behind the eyes, closing the aperture of the gills, and sustaining the branchial membrane. They are termed simple, when composed of a single piece; diphyllous, triphyllous, or tetrphyllous, when consisting of two, three, or four pieces; flexile, or soft, when they can be easily bent; sub-arcuate, when the posterior margin is rounded; fistulous, when the branchial opening seems to be excuated out of the substance of the opercula; acuminated, when the hinder plate runs out into a sharp process; ciliated, when the posterior margin is fringed, or set with membraneous setaceous appendages; frenulated, or bridled, when connected with the body by means of a membrane; scabrous, when their surface is covered with asperities; striated, when marked with hollow and nearly parallel lines; radiated, when the lines run like rays, from the centre to the edge; graved, when the lines appear in no regular order; aculeated, when the posterior margin is terminated by one or more spines; serrated, when it is cut like the teeth of a saw; soaby, when the surface of the opercles is covered with scabs.

The branchial or branchiostegous membrane, is a true and membrane, lurking under the opercula, to which it adheres, and is capable of being folded or expanded, as necessity requires. This membrane is said to be patent, when it projects, beyond the margin of the opercula; retracted or latent, when it is concealed under them; covered, when concealed under them, yet so as to be visible without hurting them.

The aperture of the gills, is a cleft commonly lateral, which opens between the opercula and the trunk, by means of the gills. It is arcuated, or arched, when it represents a crescent; operculated, when quite covered by the operculum; pipe-shaped, when in the form of a tube. Its place, in some of the cartilaginous species, is supplied by vena, or spiracles, which are either round, arched, lateral, or inferior, i.e. placed underneath the body.

The nape is the hind and terminating part of the head, which is attached to the first vertebra of the trunk, in the region of the gills. It is carinated, when its surface is sharply angulated; plane, when flat, and on a level with the body; and sulcated, when ridged or furrowed.

2. The trunk is that part of the body, which ex. The trunk, tends from the nape and branchial-aperture, to the extremity of the tail. It comprehends the gills, throat, thorax, back, sides, abdomen, lateral line, anus, tail, and scales.

The gills, or branchia, consist, for the most part, of four crooked, parallel, unequal bones, furnished, on the outer or convex part, with small soft appendages, like the beards of a feather, and generally of a red colour. They are aculeated, when the concave or interior part has spines instead of tubercles; anomalous, when some are ciliated, others tabculated, or of a different structure: denuded, when wanting opercles, the branchiostegous membrane, or both; pustulated, when the convex or exterior part, towards the branchial aperture,
ICHTHYOLGY.

Anatomy of the body, the scales, the fins, and the gills, are usually described as: 1. The head; 2. The body; 3. The tail; 4. The fins; 5. The gills.

1. The head is the part of the body that is immediately above the gills.
2. The body is the part of the body that extends from the head to the tail.
3. The tail is the part of the body that is immediately below the fins.
4. The fins are the appendages on either side of the body that are used for swimming.
5. The gills are the organs that are used for respiration.

The fins of a fish are classified as: 1. The dorsal; 2. The pectoral; 3. The pelvic; 4. The anal; 5. The caudal.

The dorsal fin is located on the upper part of the body, between the head and the tail. The pectoral fin is located on the sides, between the head and the tail. The pelvic fin is located on the lower part of the body, behind the anal fin. The anal fin is located on the bottom of the body, behind the caudal fin. The caudal fin is located on the lower part of the body, behind the anal fin. The gills are located on the sides of the head, behind the eyes.

The scales of a fish are classified as: 1. The cycloid; 2. The ctenoid; 3. The cycloid and ctenoid; 4. The cycloid and ctenoid; 5. The cycloid and ctenoid.

The cycloid scale is a thin, flat scale that is joined to the body by a thin membrane. The ctenoid scale is a thin, flat scale that is joined to the body by a row of tiny hooks.

The fins of a fish are classified as: 1. The dorsal; 2. The pectoral; 3. The pelvic; 4. The anal; 5. The caudal.

The dorsal fin is located on the upper part of the body, between the head and the tail. The pectoral fin is located on the sides, between the head and the tail. The pelvic fin is located on the lower part of the body, behind the anal fin. The anal fin is located on the bottom of the body, behind the caudal fin. The caudal fin is located on the lower part of the body, behind the anal fin.

The scales of a fish are classified as: 1. The cycloid; 2. The ctenoid; 3. The cycloid and ctenoid; 4. The cycloid and ctenoid; 5. The cycloid and ctenoid.

The cycloid scale is a thin, flat scale that is joined to the body by a thin membrane. The ctenoid scale is a thin, flat scale that is joined to the body by a row of tiny hooks.

The fins of a fish are classified as: 1. The dorsal; 2. The pectoral; 3. The pelvic; 4. The anal; 5. The caudal.

The dorsal fin is located on the upper part of the body, between the head and the tail. The pectoral fin is located on the sides, between the head and the tail. The pelvic fin is located on the lower part of the body, behind the anal fin. The anal fin is located on the bottom of the body, behind the caudal fin. The caudal fin is located on the lower part of the body, behind the anal fin.
I CHTHYOLOGY.

Anatomy of Fishes.

Internal Parts.

1. The skeleton of a fish is the assemblage of bones which constitutes the frame-work of its body. The number of these bones is not uniform in each individual, but varies according to age and species. They may be conveniently divided into those of the head, thorax, abdomen, and fins.

The head contains a considerable number of bones; that of the perch, for example, has eighty. As the limit nature of our plan precludes minute specification, we shall indicate only a few of the most important. The skull covers the whole head, its sides forming the sockets of the eyes, the temples, and the cheeks. The upper and lower jaw-bones are placed on the fore part of the head. The upper is more or less of an arched form. In some fishes it is wanting, and its place is supplied by a portion of the skull. The lower jaw is usually arched or triangular, and its length regulates that of the snout, or rostrum. The bones of the palate are, for the most part, four, viz.: two on each side of the fauces, oval, and nearly plane, often crowned with teeth, or rough with tubercles, or furrowed transversely, the base of the ones connected with the apex of the other. The gills are attached to these ossicles on each side by a cartilage. The opercular bones are situated at the bind part of the jaws, on each side of the head, and behind the eyes. In some species, they form a part of the upper jaw. The hyoid bone is an ossicle situated between the two sides of the lower jaw, serving as a basis for the tongue, presenting the figure of a V, and occasionally furnished with a hook.

The thorax is a cavity principally formed by the vertebræ, the sternum, the clavicles, and the scapulae. The vertebræ form the back-bone, which reaches from the skull to the extremity of the tail. They are stronger and thicker towards the head, and grow weaker and more slender towards the tail. Each species has a determinate number of vertebræ, which grow with the body. They are furnished with transverse and spiny processes, the former of which are marked by transverse lines, by the number of which, it is supposed, the age of fishes may be known. The spinal marrow is contained in the canal which passes through the vertebræ. The sternum in fishes is not cartilaginous, as in other animals, but always bony. Its form varies considerably, being sometimes triangular, sometimes rounded before, and pointed behind, but most frequently of a rhomboidal figure. It occupies the part of the thorax, and closes that cavity. The clavicles are two bones situated transversely behind the opening of the gills; and are sometimes formed by two ossicles united. They are attached to the first vertebra. The scapulae are two flat, rhomboidal, or arched bones, situated on the lateral side of the body, under the posterior margin of the clavicles, and serving as a base to the pectoral fins. When the scapulae are wanting, the pectoral fins are attached to the sternum, or to the margin of the clavicles.

The abdomen forms a cavity always larger than that of the thorax, extending from the extremity of the latter to the anus. It is encompassed by the ribs and the osa pelvis. The ribs are bony arches, situated obliquely on the lateral parts of the abdomen, having their upper extremity articulated with the extremity of the transverse processes of the vertebrae. Their number is very variable. In those species which are without ribs, the absence of the latter is compensated by the length and direction of the transverse processes of the vertebrae. The osa pelvis are two bones which defend the viscera contained in the abdomen. The ventral fins are usually attached to their posterior margin. When these fins are wanting, or when they are attached under the throat, or on the thorax, the osa pelvis are also wanting. The tail is composed of certain bones, which terminate the vertebral column. The processes of each vertebra of the tail are incident to great variety in respect of number and dimensions.

The fins are formed of a certain number of ossicles, connected to one another by firm membranes. The dorsal and anal fins are supported by the inter-spinous bones (ossa interspinosa), which lie between the pointed processes of the vertebrae, and are connected with them by a ligament. The rays of the anal fin have nearly the same conformation as those of the dorsal.

2. The muscles are an assemblage of small bundles of muscles, of fleshy fibres, partly red, and partly whitish, enveloped in a common membrane. The first of these is called the fleshy portion of the muscle, the second, the tendon. Each muscle, thus composed, is susceptible of contraction and dilatation. The former is accompanied by a visible swelling, hardening, wrinkling, and shortening of the muscle, and the latter by its elongation, expansion, and recovery of its former softness and flexibility. Its force, in general, depends on the quantity of fibrous matter which enters into its composition, and its moving power on the length and size of the fibres. The muscles vary much in respect of number, size, and situation. There are two which proceed from the head to the tail, along the sides of the body, and thence denominated lateral muscles. Each of these seems to be composed of several transverse muscles, which are similar and parallel. There are four situated at the caudal fin, namely, three superior, and one inferior. Of the two former, one is straight, and two are oblique. The fourth occupies the half of the lower extremity of the tail. There are likewise four at each pectoral fin, namely, two erectors and two depressors; the two former situated on the external surface of the clavicles and scapulae, and the two latter under these parts. Each ventral fin has three muscles, one erector and two depressors; the first placed over the whole external surface of the os pelvis, and the two latter on the internal surface of the same part. The carinal muscles of the back and tail are slender, and closely united, occupying the space that is left between the lateral muscles. Their number is always proportioned to that of the dorsal fins. Fishes, for example, which have no dorsal fin, have but one pair of carinal muscles, those which have one dorsal fin, have two pairs, and those which have two dorsal fins, have three pairs, viz. one pair between the first and second fin, another between the two fins, and a third between the second dorsal and the caudal fin. The proper inter-spinous muscles are those whose office it is to raise or depress the dorsal and anal fins. Each inter-spinous ray is furnished with four, two erectors, and two depressors. The dilating muscle of the branchiostegous membrane is small, and attached by its anterior extremity, partly under the angle of the lower.
ICHTHYOLOGY.

3. ORGANS and VISCERA.—The brain of fishes is a very small organ, relative to the size of the head. It is divided into three equal lobes, of which the two anterior are contiguous; the third being placed behind, and forming the cerebellum. These three lobes are surrounded by a frothy matter, resembling saliva. In this region the optic and olfactory nerves are easily discovered.

The esophagus, or gut, begins at the bottom of the throat, and descends, in a straight line, to the upper orifice of the stomach. It is membranous, smooth, and lined with a mucous humour.

The stomach is a membranous sack, sometimes cylindrical or spherical, and sometimes divided into two lobes.

The swimming, or air-bladder, or sound, is an oblong, white, membranous bag, sometimes cylindrical, sometimes elliptical, and sometimes divided into two or three lobes, of different lengths. It is usually situated between the vertebrae and the stomach, and included within the peritoneum. In some fishes it communicates with the stomach, and in others, with the esophagus. The flat fishes are unprovided with this organ.

The intestines, which in man are placed transversely, have a longitudinal position in fishes, and are all connected with the substance of the liver. They are in general very short, making only three turns, the last of which terminates in a common outlet or vent. The appendices, or secondary intestines, are very numerous, composing a group of worm-like processes, all ultimately terminating in two large canals, opening into the first intestine, into which they discharge their peculiar fluid.

The liver is commonly of a yellowish colour. It is situated on the right or left side, or in the anterior region of the abdomen, of whose cavity it fills about two-thirds. It is sometimes simple, and sometimes divided into two, three, or more lobes. It usually contains a large portion of oil or fat.

The gall-bladder is oval or oblong, and lies under the right side of the liver. It communicates with the stomach or the intestines, by means of the cystic duct and the choledochal canal.

The spleen varies in form and position. Sometimes it is all of a piece; sometimes divided into many lobes, which adhere only by very slender filaments. In some individuals it is black, in others it has the reddish hue of clotted blood. It is placed near the backbone, and at a place where it is subject to an alternate constriction and dilatation, from the pressure of the air-bag, which is situated in its neighbourhood.

Almost all fishes are provided with the urinary bladder. Its form is nearly oval. It terminates under the tail, and has no communication with the rectum.

The kidneys are two flat bodies, of a pyramidal form, as long as the abdomen, and of a reddish colour. They are attached to the vertebrae, separated from the cavity of the abdomen by the peritoneum, and frequently prolonged from the diaphragm to the region of the urinary bladder.

The diaphragm is a white and shining membrane which separates the thorax from the abdomen. This partition is partly fleshy and partly tendinous.

The peritoneum, or membrane investing the contents of the abdomen, is thin and of a blackish colour.

The ovo, in the females, are disposed into two large oblong bodies, one on each side of the abdomen; and the milt or soft sac, in the male, appears in a similar form in the same part.

The pericardium is a small bag which contains the heart.

The heart is a viscous situated on the sternum, under the posterior gills. It varies considerably in form, being sometimes flat, frequently triangular or pyramidal, &c. Its position is not transverse, as Aristotle has alleged, but longitudinal, as in quadrupeds. It consists of one ventricle and one auricle. The sides of the former are rugose, and exhibit small cavities. The latter is a very slender muscular bag, with a larger cavity than that of the ventricle, and forming the communication between the heart and the venous sinus. The capacity of this last is still greater than that of the auricle. Its position is transverse, corresponding to that of the diaphragm. It communicates with the auricle by a large aperture, and receives at the other end three large trunks of veins.

The aorta is an artery attached to the apex of the heart, and sending out numerous branches to the gills, on which it is subdivided into ramifications so minute as to escape the eye unless assisted by a glass.

The blood of fishes is red, and the red particles are not round as in the mammals, but oval as in the amphibia.

Dr. Monroe's elaborate description of the absorbent system in fishes, is thus stated by Dr. Shaw in the fourth volume of his General Zoology.

"On the middle of the belly, immediately below the outer skin, a lymphatic vessel runs upwards from the vent, and receives branches from the sides of the belly and the fin below the vent; near the head this lymphatic passes between the two pectoral fins, and having got above them, receives their lymphatics: it then goes under the juncture of the two bones which form the thorax, where it opens into a network of very large lymphatics which lie close to the pericardium, and almost surrounds the heart: this network, besides that part of it behind the heart, has a large lymphatic on each side, which receives others from the kidney, runs upon the bone of the thorax backwards, and when it has got as far as the middle of that bone, sends off a large branch from its inside to join the thoracic duct; after detaching this branch, it is joined by the lymphatics of the thoracic fins, and soon after by a lymphatic which runs upon the side of the fish; it is formed of branches, which give it a beautiful penniform appearance. Besides these branches, there is another set lying deeper, which accompanies the ribs; after the large lymphatic has been joined by the above-mentioned vessels, it receives others from the gills, orbit, nose, and mouth: a little below the orbit another net-work appears, consisting in part of the vessels above described, and of the thoracic duct: this net-work is very complete, some of its vessels lying on each side the muscles of the gills, and from its internal part a trunk is sent out, which terminates in the jugular vein.

"The lacteals run on each side of the mesenteric arteries,

Chap. III.

Physiology and Habitudes of Fishes.

Physiology, anastomosing frequently across those vessels: the receptacle into which they enter is very large in proportion to them, and consists at its lower part of two branches, one of which lies between the duodenum and the stomach, and runs a little way upon the pancreas, receiving the lymphatics of the liver, pancreas, lower part of the stomach, and the lacteals from the greatest part of the small intestines: the other branch of the receptacle receives the lymphatics from the rest of the alimentary canal. The receptacle formed by these two branches lies on the right side of the upper part of the stomach, and is joined by some lymphatics in that part, and also by some from the sound and gall-bladder: the thoracic duct takes its rise from the receptacle, and lies on the right side of the oesophagus, receiving lymphatics from that part; and running up about half an inch, divides into two ducts, one of which passes over the oesophagus to the left side, and the other goes straight upon the right side, passing by the upper part of the kidney, from which it receives some small branches, and soon afterwards is joined by a branch from the large lymphatic that lies above the bone of the thorax, as formerly mentioned: near this part it likewise sends off a branch to join the duct of the opposite side; and then, a little higher, is joined by those large lymphatics from the upper part of the gills and from the fauces.

"The thoracic duct, after being joined by these vessels, communicates with the net-work near the orbit, where its lymph is mixed with that of the lymphatics from the posterior part of the gills, and from the superior fins, belly, &c. and then from this net-work a vessel goes into the jugular vein just below the orbit. This last vessel, which may be called the termination of the whole system, is very small in proportion to the net-work from which it rises; and indeed the lymphatics of the part are so large as to exceed by far the size of the sanguiferous vessels.

"The thoracic duct from the left side, having passed under the oesophagus from the right, runs on the inside of the vena cava of the left side, receives a branch from its fellow of the opposite side, and joins the large lymphatics which lie on the left side of the pericardium, and a part of those which lie behind the heart, and afterwards makes, together with the lymphatics from the gills, upper fins, and side of the fish, a net-work, from which a vessel passes into the jugular vein of this side: in a word, the lymphatics of the left side agree exactly with those of the right. Another part of the system is more deeply seated, lying between the roots of the spinal processes of the backbone. This part consists of a large trunk that begins from the lower part of the fish, and as it ascends receives branches from the dorsal fins and adjacent parts of the body: it goes up near the head, and sends a branch to each thoracic duct near its origin."

CHAP. III. PHYSIOLOGY AND HABITUDES OF FISHES.

MOST of the observations which belong to this section may be referred to the general topics of respiration, external senses, motion, nourishment, reproduction, and duration.

1. Respiration.

Respiration performed by gills.

This important animal function is performed, in fishes, by means of gills, which supply the place of lungs. Though all fishes live in water, the presence of air is not less necessary to their existence than to our own. If a carp, for example, be put into a large vessel of water, from which the air is extracted by the air-pump, a number of bubbles are observable on the surface of the fish's body; soon after, the animal breathes swifter and with greater difficulty; it then rises to the surface to get more air; the bubbles on its surface begin to disappear; next, the belly, which was swollen, will suddenly fall, and the fish sink to the bottom, convulsed and expiring. For the same reason, if the external air be excluded from a small pond by a sufficient and durable covering of ice, the fish within it will be killed: or if a hole be made in the ice, before it be too late, they will all come near it for a fresh supply of air. In ordinary cases, a fish in the water first receives a quantity of that element by the mouth, from which it is driven to the gills; these close and prevent the water so swallowed from returning by the mouth, at the same time that their bony covering prevents it from passing through them, until the proper quantity of air has been drawn from it. The covers then open, and give it a free passage: by which means the gills also are again opened, and admit a fresh body of water.

Vol. XI. Part I.

Should the free play of the gills be suspended, or their covers kept from moving, by a string tied round them, the fish would soon fall into convulsions, and die in a few minutes. Though the branchial apparatus be comprised in a small compass, its surface, if fully extended, would occupy a very considerable space, since that of the common skate is equal to the surface of the human body. This single fact may convince us of the numberless convolutions and ramifications in which the included water is elaborated and attenuated in the course of given out its air in the respiratory process. This process, in fishes, as in the human subject, is carried on during sleep, and is repeated about twenty-five times in a minute.

Atmospheric air, though in small quantities, is change thus imparted to the blood at the ramifications of the gills, without, however, depriving it of a large share of the hydrogenated and carbonized substances furnished by the alimenta; and, consequently, without communicating to it so much of the vermilion tinge as is observable in warm-blooded animals with lungs. Hence the oily quality of the blood of fishes, and the greasy congestions which take place in their livers, and in the abdominal regions of animals whose respiration is slow or scanty. The act of breathing is, in reality, a species of combustion; and the temperature of animals, in whose system this combustion is imperfectly performed, is necessarily low. As that of fishes is little elevated above the mean temperature of water, some species, as eels and gudgeons, are occasionally benumbed by the winter's cold, and remain concealed in the mud or sand, without motion, food, or breathing, till the warmth of spring rouses them from their torpor. At
and habits of different species. Those fishes which undertake long voyages, and traverse much space in a short time, as the trout, salmon, salvelin, &c. have the conformation of the eye like that of birds; whose sight is very acute. Were we, indeed, to form our judgment of the power of vision in fishes merely from the external appearance of their eyes, we should conclude, that it is far from perfect, and that the small convexity of the cornea would occasion very little refraction in the rays of light; but this defect is sufficiently compensated by the structure of the crystalline lens, which is almost spherical, and more dense than in terrestrial animals. In its natural state, it is transparent, and not much harder than a jelly; and it forms that little hard peal-like substance which is found in the eyes of fishes after boiling. As the rays fall on this convex humour, they undergo a powerful refraction, gradually approach one another, and unite at the axis of the eye, where they form their impressions. In most fishes the eyes are naked; but those of the skate tribe are distinguished by a digitated curtain, which hangs over the pupil, and which may exclude the light when the animal rests; and, in the genera Gadus and Blemnus, the eyes are covered with an internal nictitating membrane.

That fishes possess the sense of hearing, has been alternately maintained and denied by the most celebrated naturalists, since the days of Aristotle. Among the moderns, Artedi, Linnaeus, and Geoffroy have contended for the non-existence of this faculty, although some very ordinary facts naturally lead to an opposite conclusion. It is well known that fishes are affected by noise, and that they seem to be alarmed at loud explosions. On the coast of Brittany, they are frequently chased into nets by the sound of a drum; in China, by that of the tam-tam; and in ponds, they have been taught to assemble at the ringing of a bell. These sounds, however, it has been alleged, produce certain changes or vibrations in the water, which are seen by the animals, or which affect them in some way different from acting on the organ of hearing, an organ which naturalists and anatomists had long laboured in vain to discover. As the vibrations of water are sometimes felt at Malta, and an earthquake will sometimes visibly agitate the sea, at the distance of many leagues, it is supposed that smaller commotions in the atmosphere may communicate similar impressions to the finny tribes, independently of the medium of hearing. The laborious Klein spared no pains in searching for some hidden organ, by which he hoped to demonstrate that fishes are not more destitute of the faculty of hearing than other animals; but though his investigations proved fruitless, we are indebted to him for many curious observations on the number and figure of the small bones which are to be found in the head of various species. Geoffroy also made some important discoveries, but without arriving at decisive results. At length, the abbe Nollet proved, that water is a conductor of sound, and that even the tones and articulation of the human voice may be transmitted through its medium. All that now remained to set the question completely at rest, was to detect the parts of the auditory organ in fishes, and these the celebrated Camper has distinctly revealed in consequence of numerous dissections. For his particular description of the figure and mechanism of
of the whole apparatus, we must refer our readers to the seventh volume of the Haeckel Memoirs, and to a paper which he has inserted in one of the volumes of the Journal des Scavans Etrangers. Suffice it for the present to note, that this curious organ is contained in the cavity of the head, and that it consists of three semi-circular, cartilaginous canals, and an elastic bag, which includes one or two very moveable ossicles, floating in a jelly more or less thick, and slightly adhering to the contiguous parts. The moment that the vibration of the water, which is analogous to that of the air, is communicated to the fish's head, the impression is transmitted to the ossicles, which, acting in the ratio of their mass multiplied by the force of the impulse, impart their movement to the hole of the elastic bag and to the semi-circular canals. The sentient principle is more or less alive to the action of the ossicles on the nerves, that is to say, in Camper's own language, "that the fish perceives sound, but sound peculiar to the watery element." Hunter, who observed the same organs in the head of fishes, remarks that their structure varies in different species. His minute and ingenious observations on this subject are published in the 7th volume of the Philosophical Transactions. "Fishes, particularly of the skate kind, (says Dr Shaw) have a bag at some distance behind the eyes, which contains a fluid, and a soft crenaceous substance, and supplies the place of the vestibule and cochlea: there is a nerve distributed upon it, similar to the portio mollis in man: they have semi-circular canals, which are filled with a fluid, and communicate with the bag: they have likewise a meatus externus, which leads to the internal ear. The cod-fish, and others of the same shape, have an organ of hearing somewhat similar to the former; but instead of a soft substance contained in the bag, there is a hard crenaceous stone."

Touch.

The sense of touch is probably very imperfect in fishes, because it results from the contact and immediate application of the surface of some object to that of the animal, and all parts of the body are not equally fit to be applied to the surface of foreign substances. The hand alone, which is divided into several flexible and moveable parts, and is capable of being applied to different portions of the same surface, at the same time, seems peculiarly destined to convey the ideas of size and form; and even it would discharge such an office, if its contact with objects should be interrupted by any intermediate substance, as hair, feathers, shells, scales, &c. A rough and hard skin blunts the sense of touch, while a fine and delicate one renders it more lively and exquisite. Hence, we may presume, that fishes, which are destitute of palmed extremities, are incapable of recognizing the forms of bodies. Besides, as they are invested with a rough skin, which is frequently covered with tubercles, or numberless scales, they appear to be unsusceptible of that delicacy of feeling which nature has bestowed on many of the quadrupeds.

In the mouth of man, and of those animals which are endowed with sensibility of taste, there are numberless nervous papillae, large, porous, constantly supplied with an abundance of lymph, and covered with a delicate skin; or inserted in sheaths of very unequal lengths. The savourous matters are arrested by these aspersities, diluted by the lymph, and absorbed by the pores, which convey them to the nervous papillae, on which they act as stimulants. The tongue is the principal seat of this system of organs, and is extremely susceptible of impression, being composed of fleshy fibres, encompassed by a medullary tissue. In fishes, however, few pores have been discovered in the interior region of the mouth, the lymph is constantly carried off by the passage of the water, the tongue is sometimes imperfect and sometimes cartilaginous, and the palate is generally hard and bony. If to these circumstances we add the want of mastication, we may justly infer, that fishes are nearly destitute of the discriminating powers of taste. Accordingly, they are remarked for variety, rather than for particular relishes; and they will often swallow substances which can afford them no nourishment.

The organ of smelling, on the other hand, is large; Smelling, and the animals have a power of contracting and dilating the entry to it as they have occasion. All have one or more nostrils, and even those which have not the holes perceptible without, yet have the proper formations of the bones for smelling within. The olfactory nerves, which are extended over the nostrils, are probably the instruments by which they are enabled to distinguish their food. A fish will discover a worm that is thrown into the water, at a considerable distance; and that this is not done by the eyes, is manifest from the consideration, that after the same worm has remained for some time in the water, and lost its smell, no fishes will come near it; but if you make several little incisions into it, so as to let out more of the odoriferous effluvia, the creatures again approach it.

"We may frequently observe them (says the intelligent naturalist quoted above), allowing themselves to be carried down with the stream, that they may ascend again leisurely against the current of the water; thus the odoriferous particles swimming in that medium, being applied more forcibly to their organs of smell, produce a stronger sensation."

3. Motion.

Most fishes present us with the same external form. Motions of being sharp at either end, and swelling in the middle, fishes extremely rapid. Whereby they are enabled to traverse their native fluid with greater ease and celerity. We wisely endeavour to imitate this peculiar shape in the construction of vessels designed to sail with the greatest swiftness; yet, the progress of a machine moved forward in the water by human contrivance, is nothing to the rapidity of an animal formed to reside in that element. The large fishes are known to overtake a ship in full sail with the greatest ease, to play round it without effort, and to overstrip it at pleasure. The flight of an arrow is not more rapid than the darting of a tunny, a salmon, or a gill-headed, through the water. It has been calculated that a salmon will glide over 86,000 feet in an hour, and 24 feet in a second, that it will advance more than a degree of the meridian of the earth in a-day, and make the tour of the world in the course of some weeks. Every part of the body seems exerted in this dispatch; the fins, the tail, and the motion of the whole back-bone assist progression; and it is to that flexibility of body which mocks the efforts of art, that fishes owe their great velocity.

The chief instruments in a fish's motion are its fins, air-bladder, and tail. With at least two pair, and three means of
Physiology single fins, it will migrate with great rapidity, and take
voyages of a thousand leagues in a season, without in-
dicating any visible symptoms of languor or fatigue.

But it does not always happen, that fishes which have
the greatest number of fins, have also the swiftest mo-
tion: the shark, for example, which is reckoned one
of the swiftest swimmers, wants the ventral fins; while
the haddock, which has its full complement of fins, is
more tardy in its progress.

The fins serve not only to assist the animal in pro-
gression, but in rising or sinking, in turning, or even
in leaping out of the water. To answer these purposes,
the pectoral fins, like oars, serve to push the animal
forward, and have, therefore, not unaptly, been com-
pared to the wings of a bird. By their help and con-
tinued motion, the flying-fish is sometimes seen to dart
out of the water, and to fly above a hundred yards.
The pectoral fins likewise serve to balance the head,
when it is too large for the body, and prevent it from
tumbling prone to the bottom, as happens to large-head-
ed fishes, when the pectoral fins are cut off. The ven-
tral fins which lie flat in the water, in whatever situa-
tion the fish may be, serve rather to raise or depress
the body, than to assist its progressive motion. The
dorsal fin acts as a pivot, in preserving the animal's
equilibrium, at the same time that it aids the forward
movement. The anal is designed to maintain the ver-
tical or upright position of the body.

By means of the air-bladder, fishes can increase or
diminish the specific gravity of their body. When
they contract it, or press out the included air, by means
of the abdominal muscles, the bulk of the body is di-
minished, its weight in proportion to the water is in-
creased, and the fish swims easily at a great depth. On
relaxing the operation of the abdominal muscles, the
swimming-bladder again acquires its natural size, the
body increases in bulk, consequently becomes lighter,
and enables the fish to swim easily near the surface. So
fishes which have no air-bladder, or those whose blad-
er has been injured, keep always at the bottom.

Lastly, the tail may be regarded as the directing
instrument of motion, to which the fins are only sub-
servient. To illustrate all this by a simple experiment
—if we take a live carp, and put it into a large vessel,
the fish, when in a state of repose, will be seen to spread
all its fins, and to rest on the pectoral and ventral near
the bottom; and, if it fold up either of its pectoral fins,
it will incline to the side on which the folding takes
place. When it desires to have a retrograde motion,
striking with the pectoral fins, in a contrary direction,
effectually produces it. If it desires to turn, a blow
from the tail sends it about; but if the tail strike both
ways, the motion is progressive. If the dorsal and ven-
tral fins be cut off, the fish reels to the right and left,
and endeavors to supply its loss by keeping the rest of
its fins in constant exercise. If the right pectoral fin
be cut off, the fish leans to that side; and, if the ven-
tral fin on the same side be cut away, it loses its equi-
librium entirely. When the tail is removed, the fish
loses all motion, and abandons itself to the impulse of
the water.

The slimy glutinous matter which is secreted from
the pores of most fishes, not only defends their bodies
from the immediate contact of the surrounding fluid,
but facilitates their progressive motion.

The pelagic tribes of fishes, which traverse large
portions of the ocean, as the salmon, tunny, and several
species of Coryphena, Gadus, Sparus, Scaena, &c. are
furnished with large and strong fins, to enable them to
struggle against large waves and rapid currents; whereas
those which frequent the shores and fresh waters have
their fins smaller and weaker; while those with soft fins
seldom expose themselves to the fury of the storm, and
confine themselves to depths that are not affected by
the most impetuous winds. A more ample explanation
of these particulars will be found in Borelli's work De
Motu Animalium.

Notwithstanding the astonishing agility of their
movements, fishes often remain in a state of inactivity
and supineness, till roused by the calls of hunger or love,
or stimulated by the dread of an approaching enemy.
The periodical and extensive migrations of certain tribes
of fishes are not irreconcilable with this remark, since
the want of food, or the important occupation of breed-
ing, may induce them to change their station. But we
cannot give implicit credit to the relations of those
naturalists, who, copying from one another, affix on this
subject the language of wonder and mystery. In re-
Regard to the reputed migrations of immense shoals of migrations
herrings from the polar regions to the south of Europe,
doubted,
and which have been generally ascribed to the depreda-
tions of the cetaceous tribes, we may be allowed to
ask, why these small fishes proceed so many leagues
beyond the reach of their enemies, and why they re
turn in winter to the very haunts of their gigantic de
stroyers? If it be alleged, that those monstrous ani
mals drive them into bays, and inlets; why do they
equally abound in the North sea and the Baltic, which
are not frequented by whales? If mere want of food
compels the herrings to detach their crowded col
onies; how happens it that the migration always
takes place at the same time, and at the same season of
the year? It is difficult to conceive, that their stock
of provisions should regularly be exhausted at the year's
end? Besides, if the arctic pole be the native country
of the herrings, as has been usually supposed, they
should make their appearance, like birds of passage, in nu-
erous troops at certain seasons, and very few or none
should be seen during the rest of the year. Yet it is
well known, that great quantities of them are caught
in Norway, during the whole of summer; in the same
country, and in Swedish Pomerania, the fishery is very
productive from January to March; on the coast of
Gothland, from October to December; in the north of
Holland, in February, March, and April; and in
Sweden, in the middle of winter. That part of the
migrating shoal regularly directs its course to the coast
of Iceland, is an assertion unanswerable by respectable
testimony. Horbow, who passed some years on that
island, affirms, that a single herring will sometimes not
be seen for many years; and Olafsson, Ægidius, Otho
Fabricius, and others, corroborate his assertions.

To account, then, for the movements of the herring,
cod, tunny, anchovy, &c. it is in vain to have recourse
to the capacity of the whale, or to the certain pressure
of hunger; and least of all should we adopt the marvel-
ous tales of periodical voyages, performed with the ut-
most order and exactitude. M. Bloch explains in a much
more simple and natural manner the arrival and disap-
pearance of the respective shoals. According to him, herrings
herrings have the same propensity as other fishes, and usually live in the depths of the water, till stimulated by the desire of reproducing their species. They then quit their retreat, and suddenly appear in places where they were not formerly seen: and, as the spawning time occurs sometimes sooner, and sometimes later, according to the temperature of the water, and the age of the fishes, we can easily conceive why those species which are reputed migratory, should be observed at different times. Those sea fishes which ascend rivers in spring, only return to their several haunts in autumn. The herrings are, doubtless, guided by an analogous instinct; and if we may be allowed to suppose, that they sometimes spawn more than once in the course of the year, we shall be at no loss to account for the circumstances of their wandering.

5. Reproduction.

In most, if not in all fishes, there is a difference in sex, though Bloch and others make mention of individuals, which seem to unite the two sexes, and to be real hermaphrodites. The number of males, it has been remarked, is about double that of females; and were it not for this wise provision of nature, a large proportion of the extruded eggs would remain unfertilized. A few species, indeed, as the eel, benny, &c. are viviparous; but by far the greater number are pro-duced from eggs. These last compose the roe or ovarian eggs of the females, which lie along the abdomen. The milt of the males is disposed along the back-bone, in one or two bags, and consists of a whitish glandular substance, which secretes the spermatid fluid. Though the history of the generation of fishes be still involved in considerable obscurity, it seems to be ascertained, that no sexual union takes place among the oviparous kinds, and that the eggs are fructified after exclusion. They are of a spherical form, and consist of a yolk, a white part, and a bright crescent-like spot, or germ. The yolk, which is usually surrounded by the white, is round, and not placed in the middle, but towards one of the sides; and the clear spot, or embryo, is situated between the yolk and the white. In this spot there is observable, on the day after fecundation, a moveable point, of a somewhat dull appearance. On the third day, it assumes the appearance of a thickish mass, detached on one side, and on the other strongly adhering to the yolk, and presenting the contour of the heart, which, at this period, receives an increase of motion, while the disengaged extremity, which forms the rudiments of the tail, is perceived to move at intervals. On the fourth day, the pulsations of the heart and the movements of the whole body occur in quicker succession. On the fifth, the circulation of the humours in the vessels may be discerned, when the fish is in a particular position. On the sixth, the back-bone may be distinctly recognised. On the seventh, two black points, which are the eyes, and the whole form of the animal, are visible to the naked eye. Although the yolk gradually diminishes as the embryo enlarges, the included animal cannot yet stretch itself at length, and makes a curve with its tail. Its motions are then so brisk, that when it turns its body, the yolk turns with it; and these motions become more and more frequent, as the moment of birth, which happens between the seventh and ninth day, approaches. By repeated strokes of the tail, the covering of the egg at length

4. Nourishment.

Among fishes, as among quadrupeds and birds, some search for their food in the mud; others live on worms, insects, or marine plants. The former have their anterior extremity adapted to the extraction of peculiar juices from the earth; the latter have the conformation of their jaws or teeth suited to the capture and destruction of their appropriate prey. The greatest number of species, however, are carnivorous and extremely voracious, subsisting chiefly on other fishes, and frequently not sparing even their own offspring. When taken out of the water, and almost expiring, they will often greedily swallow the very bait which lured them to their ruin. In the sequel, we shall have occasion to adduce some striking instances of the violent and indiscriminate appetite of several fishes. The digestive power of their stomach is no less remarkable, and seems to increase with the quantity of food received into it. This food, though reduced to a gelatinous state, usually preserves its natural form; a circumstance which leads us to conclude, that the process of digestion is performed by the solvent power of some particular menstruum, and not by any trituration.

Fishes, in general, manifest a predilection for whatever they can swallow possessed of life. Some that have very small mouths, feed on worms and the spawn of other fish: others, whose mouths are larger, seek larger prey; it matters not of what kind, whether of another or their own. Those with the largest mouths, pursue almost everything that has life; and often meet each other in fierce opposition, and the victor devours his antagonist. Thus are they irritated by the continual desire of satisfying their hunger; and the life of a fish, from the smallest to the greatest, is but one scene of hostility, violence, and evasion. The smaller fry, which stand no chance in the unequal combat, resort to those shallows, where the greater are unable or too heavy to pursue. There they become invaders in turn, and live on the spawn of large fishes, which they find floating on the surface of the water, till they are imprisoned and leisurely devoured by the musel, oyster, or scallop, which lie in ambush at the bottom.

Notwithstanding the astonishing voracity of fishes, some of them are capable of suffering at least the apparent want of food for a long time. This is particularly the case with the gold and silver fishes which are kept in vases, and which seem to enjoy perfect health, though deprived of sustenance for months. But they may pro-
ICHTHYOLOGY.

Chap. III.

Physiology and Habitation of Fishes.

length gives way, and the fish comes forth, first by the tail, redoubling its efforts, till it detach its head; and then it moves nimbly, and at liberty, in its new element. Such, at least, are the results of some particular observations: but it is obvious, that they must vary considerably according to circumstances; particularly, that the spawn must continue in the egg state in some species longer than in others, and this in proportion to the animal's size. The embryo salmon, for instance, continues in the egg from the beginning of December to the beginning of April, and the carp not above three weeks.

Fishes have different seasons for depositing their spawn. Some which live in the depths of the ocean, are said to choose the winter months; but, in general, those with which we are acquainted, choose the hottest months in summer, and prefer such water as is somewhat tepid by the beams of the sun. They then leave the deepest parts of the ocean, which are the coldest, and shallot round the coasts, or swim up the fresh-water rivers, which are warm as they are comparatively shallow, depositing their eggs where the sun's influence can most easily reach them, and seeming to take no farther charge of their future progeny. Of the eggs thus deposited scarce one in a hundred brings forth an animal, as they are devoured by all the lesser fry which frequent the shores, by aquatic birds near the margin, and by the larger fish in deep water. Still, however, the sea is amply supplied with inhabitants; and, notwithstanding their own rapacity, and that of various tribes of fowls, the numbers that escape are sufficient to relieve the wants of a considerable portion of mankind. Indeed, when we consider the fecundity of a single fish, the amount will seem astonishing. If we should be told, for example, that a single being could in one season, produce as many of its kind as there are inhabitants in England, it would strike us with surprise; yet the cod annually spawns, according to Lewesnooock, above nine million of eggs contained in a single sea. The flounder is commonly known to produce above one million; and the mackerel above five hundred thousand; a herring of a moderate size will yield at least ten thousand; a carp, of 14 inches in length, contained, according to Petit, two hundred and sixty-two thousand, two hundred and twenty-four; and another, 16 inches long, contained three hundred and forty-two thousand, one hundred and forty-four; a perch deposited three hundred and eighty thousand, six hundred and forty; and a female sturgeon, seven million, six hundred and fifty-three thousand, two hundred—The viviparous species are by no means so fruitful; yet the eel brings forth two or three thousand at a time, all alive and playing round the parent together.

Some naturalists have suspected, that there are fishes which undergo certain metamorphoses in the early period of their existence, like the tadpoles of frogs. Madame novelle Merian, in her splendid work on the Insects of Surinam, even describes frogs, which are transformed into fishes. Speman makes mention of aquatic animals of an ambiguous nature, which he met with at all seasons of the year, and which he terms _proteus_; and Schranck and Laurentj have remarked in the Tyrolian lakes particular races of animals, which seem to form a gradation between tadpoles and branchioptegous.

Fishes. Perhaps they are larve, or imperfect animals, whose development is still obscure; yet it is not improbable that some fishes may undergo transformations analogous to those of young frogs and salamanders. The history of the _astrakos_ and _didon_ families will warrant such a supposition; and the _sirem lacertinae_ of Linnaeus seems to be alike connected with reptiles and fishes.

For several curious and interesting experiments relative to the artificial fertilization of the spawn of fishes, we must refer our readers to M. Jacob's Memoir, inserted in the Berlin Transactions for 1764. By pressing the contents of the milt of salmon and trout on the spawn of these fishes, he succeeded in rendering the ova fruitful, and obtained live fish. Among these were several monsters, such as trouts with two heads, others in the form of a cross, &c. none of which lived beyond six weeks, exhausting in that time the juices of their own stomach, and the yolks of the egg to which they were attached.

6. Duration.

It is extremely difficult to ascertain the precise term which nature has assigned to the existence of these creatures which inhabit the sea. It is said to be different from our own. It is probable, that the life of fishes which escape the numerous snares that are laid for them, is considerably longer than their mere size would seem to indicate. In the first stages of their existence, their growth is, no doubt, rapid; but their fishes quickly become hard, and less susceptible of extension. When newly excluded from its egg, the fish grows four lines in the short space of eight hours; but three weeks at least elapse, before it acquire an additional line. Nor is the rate of growth at all equal in different species. Thus a carp attains only to the length of six or seven inches in three years, and to the weight of 12 pounds in ten years. The growth of the tench is still more tardy, since twelve years are required to give it the length of twenty inches.

There have been two methods devised for determining the age of fishes, the one, by the circles of the scales, the other, by the transverse section of the backbone. When a fish's scale is examined through a microscope, it will be found to consist of a number of circles, one within another, in some measure resembling those which appear on the transverse section of a tree, and which are supposed to afford the same information. For, as in trees, we can tell their age by the number of their circles, so in fishes, we can tell theirs by the number of circles in every scale, reckoning one ring for every year of the animal's existence. By this method, the count de Buffon found a carp, whose scales he examined, to be not less than a hundred years old. Gesner adds an instance of one of the same age, and Albertus of one more than double that period.—The age of the skate and the ray, which are destitute of scales, may be known by the other method, which consists in separating the joints of the back-bone, and then minutely observing the number of rings which the surface where it was joined exhibits. But whatever degree of precision we may attach to such evidence, we have of some no reason to doubt the great age of some fishes. Those fishes, persons who have passed often know the oldest by their superior size and other indications. The carp which

---

Great age of some fishes.
were bred in the ditches of Pont-Chartrain, are quoted by Buffon, as exceeding a hundred and fifty years; and in the royal gardens of Charlottenburg, in Prussia, are said by Bloch to have their heads overgrown with moss. Ledebur alleges, that in some pools in Lusatia there are carp about 200 years old. At Mannheim, there is the skeleton of a pike, 15 feet in length, and which is said to have weighed, when alive, 350 pounds. It was caught at Kayserslautern, in 1497; and a Greek inscription on a bronze ring, inserted at the gills, announced that it had been put into the pond by the emperor Frederick II. that is to say, 267 years before it was taken. Some species, however, are known to have a much shorter existence; thus, the eel usually lives about 11 years; the bream and the tench, from 10 to 12, and the fifteen-spined stickle-back seldom survives two. The comparative simplicity of their structure, the flexibility of their frame, the strength of their digestive power, their want of sensibility, and the equal temperature of the element which they inhabit, probably all contribute to the longevity of fishes. The same causes may, perhaps, exempt them from many diseases which are incident to other races of animals. Yet we know for certain, that they are occasionally subject to indisposition and diseases. Before the spawning season, they undergo a change of their external covering, analogous to molting amongst the feathered tribes; their scales and skins are renewed, and the colours of the more beautiful kinds assume more fresh and vivid hues. But this annual change is not effected without evident symptoms of languor, decline, and suffering. Some kinds of salmon trout are liable to a leprous affection, the carp to smallpox, and the eruption of small tumours on the head and back, the perch to dropsy, eels to a cutaneous disorder which often proves fatal, and most species to ulcerated livers, or injured viscera, from the worms and insects of various descriptions which multiply within them.

CHAP. IV. SYSTEMATIC EXPOSITION OF FISHES.

THE Linnean orders of fishes have been instituted from the situation, presence, or absence of the ventral fins.
1. Such as are entirely destitute of these fins, are termed Piscis apodes, apodal or naked fishes.
2. The jugulares, or jugular, are those which have ventral fins, placed more forward than the pectoral fins, or under the throat.
3. The thoraci, or thoracic, include those whose ventral fins are placed immediately under the pectoral fins, or on the breast.
4. The abdominales, or abdominal, comprise those whose ventral fins are situated behind the pectoral fins, or on the abdomen.
5. There still remains a particular tribe, denominat ed Entelegynae, which, as their name imports, have a cartilaginous instead of a bony skeleton. This tribe was by Linnæus separated from the rest, on the mistaken idea, that the individuals which compose it were furnished both with lungs and gills, and should be ranked in the class of amphibious animals. The genera which pertain to the preceding orders are determined by the number of rays in the branchiostegous membrane, the condition of the teeth, the figure of the body, and of other remarkable parts.

The characters of the species are taken chiefly from the number of rays in the fins, which differs in the different species. But, as the precise enumeration of these rays is sometimes a matter of difficulty, and as they are likewise subject to variation, it is necessary to have recourse to other marks, and to adopt, as subsidiary characters, the form and situation of particular fins, the proportion of the head to the body, the condition of the lateral line, the number of the vertebrae and ribs, &c.

I. APODAL.

The fishes of this order approach very near to the amphibia, and some of them even resemble the serpent tribe. They have a smooth slippery skin, which is, in general, naked, or covered in some species only, with small, soft, and distant scales. Their body is long and slender; they have teeth in the jaws, and live in the sea; but some are found in rivers and standing waters. They feed on other animals.

Genus i. Muraena.
ICHTHYOLOGY.

Chap. IV

Apodis.

Perch; body olive-brown above, somewhat silvery beneath. The figure and appearance of this species are too well known to require a particular description. It is a native of almost all the waters of the ancient continent, frequenting not only rivers but stagnant pools, and occasionally salt marshes and lakes. In spring it is found even in the Baltic and other seas. In some places near the mouths of the Baltic, they are taken in such abundance that they cannot be used fresh, but are smoked and salted, and conveyed by waggon-loads into Saxony, Silesia, &c. We are told that 2000 have been taken in Jutland at a single sweep of the net, and 600,000 in the Garonne in one day, by a single net. It is generally alleged that the eel cannot bear the water of the Danube; and it is rarely found either in that river or the Wolga, though very common in the lakes and rivers of Upper Austria. Its ordinary size is from two to three feet, though it has been known to attain to the length of six feet, and to weigh fifteen pounds. Dale and others mention some of uncommon magnitude, but which were probably congers. Though impervious to heat and cold, the eel can live longer out of the water than any other fish, and is extremely tenacious of life, as its parts will move a considerable time after it has been skinned, and cut into pieces. It sometimes quits the water, and wanders about meadows and moist grounds in quest of particular food, as snails, worms, &c. It is also said to be fond of new-sown peas, and to have sometimes taken refuge from severe frosts in adjoining hay-ricks. Its usual food consists of water-insects, worms, and the spawn of fishes. It will also devour almost any decayed animal substance. It is vivacious, producing its young about the end of summer; though both eggs, and ready-formed young are occasionally observed in the same individual. Its skin, which is proverbially slippery, from the large proportion of mucus with which it is furnished, serves, in some countries, from its toughness and pellucidity, as tackle for carriages, &c. and glass for windows. Though we learn from Athenaeus, that the Sybarites exempted from every kind of tribute the vendors of eels, the Romans seem to have held this fish very cheap as an article of food. In modern times it is reckoned highly nutritious, though somewhat difficult of digestion, and hurtful when taken in excess.

Congers. — Two tentacula at the rostrum, the lateral line whitish and dotted. The first of these characters is not constant. But the conger may be distinguished from the common eel by other marks, such as its darker colour, larger eyes, its shorter lower jaw, and the greater size to which it usually attains. Specimens from the Mediterranean have sometimes been taken of the length of ten feet, and of the weight of more than a hundred pounds. It is likewise an inhabitant of the northern seas, and of those which surround some of the American islands. The conger is only an occasional visitant of fresh water, frequenting the mouths of rivers in spring. In the mouth of the Severn incredible quantities of the fry are taken in April, under the name of eefers. In its full-grown state the conger is also reckoned a useful article of food in many parts of Europe. The great quantities that are taken on the coast of Cornwall are chiefly exported to Spain and Portugal. Much of their abundant oil is drained away in the process of drying, the weight being reduced nearly eighty per cent. Congers are extremely voracious, preying on other fishes, and on various kinds of crustaceae, particularly on the small crabs during their soft state after they have cast their shell.

Southern muraena.—No pectoral fins; brown, with eelidius, black variegations; depressed head and very turgid neck. This species, which inhabits the southern ocean, has a repulsive appearance, grows to a very considerable size, and affords excellent food.

The siren.—Pectoral fins like hands with four siren. fingers, gill membrane with three pinnatifid bones. This is the siren lacertina of former editions of the System of Nature. It is peculiar to the muddy swamps of South Carolina, preys on serpents, which it seizes and holds with its strong and firm teeth. It is sometimes a foot and a half in length; its heart has but one ventricle; it has ribs and a bony tail; and is so fragile, that if cast on the ground, it breaks into three or four pieces.

The other species are, colubrina, serpens, myrus, guttata, caca, catenata, reticulata, africana, zebra, melagrus, and viridis.

Gen. 2. Synbranchus. Synbranch.

Body eel-shaped; no pectoral fins; spiracle single beneath the neck.

Marbled synbranchus.—Olive-brown, marbled with marmora-blackish spots; the body yellow beneath. Native of tus. the fresh waters of Surinam.

Plain synbranchus.—Of a plain unvariegated brown immaculatus. A native of Surinam.

Body eel-shaped; nostrils placed between the eyes; fin caudal.

Javan monopterus.—Livid brown or blackish, with javanicus. a very sharp-pointed tail. This fish, which has the appearance and habits of a muraena, is a native of the Indian seas, and very common about the coasts of Java, where it is considered as an excellent food.

Head with lateral opercula; two beards or tentacula on the upper lip; eyes covered by the common integument; gill-membrane five-rayed; body compressed, without dorsal fin (in most species), but carinated by a fin beneath.

Carapo gymnotus.—Brown, with the vent-fin of the carapo, length of the attenuated tail, and the upper jaw longer than the lower. This fish is a native of the American seas, and is said to be most frequent about the coast of Surinam. Its ordinary length is from one to two feet. It is reckoned excellent by the South Americans.

Electrical gymnotus, or cramp-fish.—Without scales, electricus. or dorsal fin; the caudal very obtuse, and joined to the anal fin. This fish bears a considerable resemblance to a large eel, though somewhat thicker, and commonly of an uniform blackish-brown. It was first announced to the philosophers of Europe on account of its remarkable electrical or galvanic properties, in 1677, by M. Richer, who was commissioned by the French Academy to make some mathematical observations in Cayenne.
ene. It would be tedious to recite all the remarks and experiments of succeeding observers, which conspire to prove the voluntary electricity of the gymnotus, which, however, occasionally exhibits some variations from the phenomena of common electricity. If a person touches the animal with one hand, in such a manner as to irritate it considerably, while the other is held at a small distance from it in the water, he will experience as strong a shock as from a charged Leyden phial. The shock is also readily communicated through a circle of eight or ten persons at once, the person at one extremity putting his hand in the water near the fish, while the other touches the animal. It is by this extraordinary faculty that the gymnotus supports its existence, the smaller fishes and other animals which happen to approach it being instantly stupefied, and then falling an easy prey. It is even capable of depriving those who approach it in its native waters, of sense and motion. It is a native of the warmer regions of Africa and America, in which last it inhabits the large rivers, particularly those of Surinam. In Africa, it is said to occur chiefly in the branches of the Senegal. In the 5th volume of the Philosophical Transactions, our readers will find an accurate description of the external form of the electrical gymnotus, by the late ingenious Dr Garden, and one equally accurate of its internal structure by the celebrated Mr John Hunter.

**Needle gymnotus.** Naked, with finless tail and belly, the anal fin of sixty rays, terminating before it reaches the tip of the tail. The only European species yet discovered, being a native of the Mediterranean, and described by Brunnic in his history of the fish of Marseilles.

To the same genus belong *fasciatus*, *albus*, *albifrons*, *rostratus*, *notoperus*, and *asiaticus*.

**Trichiurus.**

**Gen. 5. TRICHIURUS.**

Head stretched forwards, with lateral gill covers; teeth ensiform, semi-sagittated at the points, the fore teeth the largest; gill-membrane seven-rayed; body compressed and ensiform, with a subulate and finless tail.

**Lepturus.**

_Silvery trichiurus, or gymnogaster._—The lower jaw longer than the upper. This fish is distinguished by the singularity of its shape, and the silver brilliancy of its colour. It is from two to three feet long, very voracious, and a rapid swimmer. In the pursuit of its prey, it sometimes leaps into small vessels which happen to be sailing by. It frequents the rivers and larger lakes of South America, and is also said to occur in some parts of India and China.

**Indian or electrical trichiurus.**—Jaws of equal length. Inhabits the Indian seas, and is said to possess a degree of electrical power.

**Anarchichas.**

Head somewhat obtuse; fore teeth both above and below, conical, diverging, strong; six or more grinders in the under jaw, and palate rounded; gill-membrane six-rayed, body roundish, caudal fin distinct.

**Acipenser.**

_Wolf fish, sea wolf, or ravenous wolf fish._—Of a blackish gray colour, the sides, anal and caudal fins, and abdomen lighter. This is one of the few fishes which have fore teeth and grinders. Of three specimens examined by Dr Bloch, one had six rows of grinders in the upper jaw, and as many in the lower; another had six rows above, and four below; and a third had five above, and three below. The disposition and structure of all the teeth are excellently adapted for breaking and comminuting the crabs, lobsters, scallops, large whelks, &c., which this voracious animal grinds to pieces, and swallows with the shells. When caught, it fans itself on anything within its reach. Schonfeld relates, that it will seize on an anchor and leave the marks of its teeth behind; and we are informed by Steller, that one which he saw taken on the coast of Kamtschatka, seized with great violence a cutlass with which it was attempted to be killed, and broke it in pieces as if it had been made of glass. The fishermen, dreading its bite, endeavour as soon as possible to beat out its fore teeth, and then kill it by striking it on the head. Its flat and grinding teeth are often found in a fossil state, and known by the name of *bufonites*, or 'toad-stones', to which many superstitious virtues were formerly ascribed. The sea wolf grows to a very considerable size, being frequently four, and sometimes even seven feet in length. It has small scales and a lateral line, though described by most naturalists as destitute of both. It commonly frequents the deep parts of the sea, in the northern regions of the globe, and some parts of the British coasts, approaching the shores in spring, to deposit its spawn among the marine plants. It swims slowly, and with the serpentine motion of the eel. Owing to its forbidding appearance, it is not generally brought to market; but the fishermen, the Greenlanders, and the Scotch, find it excellent food. The latter call it the *sea cat*, and take off the head and skin before dressing it. The *strigosus* is now generally admitted to be only a variety of the preceding.

**Smaller wolf fish.**—With very sharp cartilaginous minor teeth. Inhabits the coast of Greenland.

**Panther Wolf fish.**—Yellow, or fulvous, spotted with panther brown. In other particulars it agrees with the common species. Native of the northern seas.

**Gen. 7. ODONTOGNATHUS.**

_Mouth furnished with a strong movable lamina or process on each side of the upper jaw; gill-membrane five-rayed._

**Odontognathus.**

Abeom odontognathus._—Abdomen aculeated. Native of the American seas, and common about the coasts of Cayenne, where it ranks among the edible fishes.

**Gen. 8. TRIURUS.**

_Snout cylindrical; one tooth in each jaw; dorsal and anal fin extended beyond the tail._

**Triurus.**

**Gen. 9. AMMODYTES.**

**Ammodytes.**

Head compressed, narrower than the body; upper lip doubled, the lower jaw narrow, and pointed; teeth small.
ICHTHYOLOGY.

Gen. 12. Xiphias.

Head with the upper jaw terminating in a sword-shaped snout; mouth without teeth; gill-membrane eight-rayed; body rounded, and scaleless.

Common or Sicilian sword-fish. - The dorsal fin at-gladius, tenuated at the hind part. The body of the sword-fish is long, round, and gradually tapers towards the tail; the head is flattish, and the mouth wide, both jaws terminating in a point, but the upper stretched to a great distance beyond the lower, forming what is commonly called the sword, by which it pierces and kills the smaller kinds of fishes. It sometimes measures twenty feet in length, and is of an active and ravenous disposition. The method of taking it, described by Strabo, exactly agrees with the modern practice. A man ascends one of the cliffs that overhang the sea, and as soon as he spies the fish, gives notice by voice or signal of the course it takes. Another person in a boat climbs up the mast, and on seeing the fish, directs the rowers to it. The moment that he thinks they have got within reach, he descends and taking his spear in his hand, strikes into the fish, which, after wearily itself with its agitations, is seized and dragged into the boat. Its flesh is much esteemed by the Sicilians, who cut it in pieces and salt it. The pieces from the belly and tail are most esteemed, and the salted fins are sold under the name of callo. The sword-fish is frequently found in the Mediterranean, especially on the coasts of Sicily, where the male and female usually appear in pairs. It also occasionally occurs in the northern seas, and sometimes in the Pacific ocean; but Albian erroneously asserts that it is at the same time a fresh-water fish, and an inhabitant of the Danube.

Broad-finned sword-fish. - Distinguished from the platyptere-preceding by a very broad back fin, and very long pectoral fins, pointed thoracic appendages. Found not only in the Brazilian and East Indian seas, but also in the Northern ocean. It is said to have frequent combats with whales. The bottom of an East Indiaman was pierced by a fish of this species, in such a manner, that the sword was driven through almost to its base, and the animal killed by the violence of the effort. The wood, together with the sword imbedded in it, is now in the British Museum. When this species does not exceed four feet, it is considered as an edible fish; but it is found of the length of twenty feet, and sometimes even much longer.

Short-snouted sword-fish. - Blackish; with snout of mokaira, middling length, and two bony tubercles on each side of the tail. Resembles the common sword-fish, except that the snout is much shorter and thicker.

Gen. 13. STERNOPTYX.

Head obtuse; mouth turning up; teeth very small; no gill-membrane; body compressed, without visible scales; breast carinated, and folded both ways; abdomen pellucid.

Transparent sternoptyx. - Silvery; with carinated diaphana breast, and pellucid abdomen; two or three inches long, broad, and compressed, the back rising into a sharp edge, and the abdomen terminating in a carina. Native of the American seas.

ICHTHYOLOGY.

The general colour of this fish is a rich silver, except on the delicate part belonging to the rostrum, which is of a deep brown, the fins and caudal processes are also brown, but not so deep as the part just mentioned. There is no appearance of scales on this fish. From the very singular figure and situation of the eyes, I have given it the generic name of *stylephorus*, and as the trivial name cannot be taken from any circumstance more properly than from the extraordinary thread-like process of the tail, I have applied to it the title of *chordatus*. It is a native of the West Indian seas, and was taken between Cuba and Martinico, near a small cluster of little islands about nine leagues from shore, where it was observed near the surface. The whole length of this uncommon animal, from the head to the extremity of the caudal process, is about 32 inches, of which the process itself measures 22."

II. JUGULAR.

The fishes of this order have their ventral fins situated before the pectoral fins, and, as it were, under the throat. They are mostly inhabitants of the sea. Their body is sometimes covered with scales, and sometimes not. With a very few exceptions, they have spines in the dorsal and anal fins; and their gills have bony rays.

**Gen. 1. Callionymus.**

The upper lip doubled; eyes near each other; the gill-membrane six-rayed; two breathing apertures in the hind part of the head; opercula close; body scaleless; ventral fins very distant.

**Gemmose dragont.**—The first ray of the first dorsal lyra. fin as long as the body. In this beautiful species, the pupils of the eyes are of a rich sapphire, the irides of a fine flame colour; the pectoral fins light brown, and the body yellow, blue, and white. "The blue," says Mr. Pennant, "is of an inexpressible splendour; the richest cerulean, glowing with a gemmous brilliancy; the throat black." Dr. Tyson has described it, in the 24th volume of the Philosophical Transactions, under the improper appellation of the yellow gurnard. It grows to the length of 10 or 12 inches; the body is slender, round, and smooth; and the membranes of all the fins extremely thin and delicate. It is found as far north as Norway and Spitzbergen, and as far south as the Mediterranean, and is not unfrequent on the Scurbrough coasts, where it is taken by the book in 30 or 40 fathoms water. It is often found in the stomach of the cod-fish. Its flesh is white and well flavoured. Rondelet compares it to that of the gudgeon. Pontoppidan, who never saw it, asserts, with his usual credulity, that it can fly in the air to the distance of several musket shot.

**Sordid dragont.**—The rays of the first dorsal fin dracuncul-shorter than the body. In most other respects it agrees *lus.* with the preceding.

This genus likewise comprises *indicus, baikalensis, ocellatus, sugittu*, and *japonicus.*

**Gen. 2. Uranoscopus.**

The general colour of this fish is a rich silver, except on the delicate part belonging to the rostrum, which is of a deep brown, the fins and caudal processes are also brown, but not so deep as the part just mentioned. There is no appearance of scales on this fish. From the very singular figure and situation of the eyes, I have given it the generic name of *stylephorus*, and as the trivial name cannot be taken from any circumstance more properly than from the extraordinary thread-like process of the tail, I have applied to it the title of *chordatus*. It is a native of the West Indian seas, and was taken between Cuba and Martinico, near a small cluster of little islands about nine leagues from shore, where it was observed near the surface. The whole length of this uncommon animal, from the head to the extremity of the caudal process, is about 32 inches, of which the process itself measures 22."

II. JUGULAR.

The fishes of this order have their ventral fins situated before the pectoral fins, and, as it were, under the throat. They are mostly inhabitants of the sea. Their body is sometimes covered with scales, and sometimes not. With a very few exceptions, they have spines in the dorsal and anal fins; and their gills have bony rays.

**Gen. 1. Callionymus.**

The upper lip doubled; eyes near each other; the gill-membrane six-rayed; two breathing apertures in the hind part of the head; opercula close; body scaleless; ventral fins very distant.

**Gemmose dragont.**—The first ray of the first dorsal lyra. fin as long as the body. In this beautiful species, the pupils of the eyes are of a rich sapphire, the irides of a fine flame colour; the pectoral fins light brown, and the body yellow, blue, and white. "The blue," says Mr. Pennant, "is of an inexpressible splendour; the richest cerulean, glowing with a gemmous brilliancy; the throat black." Dr. Tyson has described it, in the 24th volume of the Philosophical Transactions, under the improper appellation of the yellow gurnard. It grows to the length of 10 or 12 inches; the body is slender, round, and smooth; and the membranes of all the fins extremely thin and delicate. It is found as far north as Norway and Spitzbergen, and as far south as the Mediterranean, and is not unfrequent on the Scurbrough coasts, where it is taken by the book in 30 or 40 fathoms water. It is often found in the stomach of the cod-fish. Its flesh is white and well flavoured. Rondelet compares it to that of the gudgeon. Pontoppidan, who never saw it, asserts, with his usual credulity, that it can fly in the air to the distance of several musket shot.

**Sordid dragont.**—The rays of the first dorsal fin dracuncul-shorter than the body. In most other respects it agrees *lus.* with the preceding.

This genus likewise comprises *indicus, baikalensis, ocellatus, sugittu*, and *japonicus.*

**Gen. 2. Uranoscopus.**

Head depressed, rough and large; mouth turned up; the upper jaw shortest; gill-membrane papillary and...
ICHTHYLOGY.

Jugularis. 

Bearded star-gazer. — Back smooth; usual length about 12 inches. The head is large, squarish, and covered with a bony case. The mouth is wide, and opens in an almost vertical direction. The eyes are situated very near each other on the top of the head. A long cirrhus or beard extends beyond the lips, which are themselves edged with smaller ones; frequenting shallows near the shores; it is concealed in the mud, exposing only the tip of the head, and waving its beards in various directions, and thus decaying the smaller fishes and marine insects, which mistake these organs for worms. It is said to sleep during the day. It is found chiefly in the Mediterranean. Its flesh is white, but tough, coarse, and meagre.

Japonicus. 

Trachinus. 

Gen. 3. TRACHINUS.

Head slightly rough, compressed; gill-membrane six-rayed; inferior plate of the gill-covers serrated; went near the breast.

Draco. 

Dragon weever. Somewhat silvery hue, with transverse yellowish streaks; first anal fin black, and five-rayed; of a lengthened shape, much compressed, and covered with small deciduous scales. The mouth and eyes, in respect of position, resemble those of the star-gazer. The usual length of this fish is from 10 to 12 inches. It frequently imbeds itself in the sand, and if trodden on, endeavours to wound the aggressor with the spines of its first dorsal fin. The punctures are very troublesome and painful, though it does not appear that the spines contain any poisonous matter. It feeds principally on marine insects, worms, and small fishes, and is very tenacious of life, being capable of existing many hours out of the water. From this circumstance the French call it vive et ovier, which we have corrupted into weever. It frequents not only the Mediterranean, but the northern seas, and is found abundantly on the coasts of Holland and East Friesland. Its flesh is well flavoured, easy of digestion, and highly esteemed by the Dutch. The greater weever, described by Pennant, hardly deserves to be considered as a distinct species.

Osbeckii. 

Osbeckian weever. White, spotted with black; both jaws of equal length. Native of the Atlantic; found about the isle of Ascension, &c. and described by Osbeck in his voyage to China.

Gadus. 

Gen. 4. GADUS.

Head smooth; gill-membrane with seven round rays; body oblong, with deciduous scales; fins covered with a common skin; more dorsal and anal fins than one; the rays not prickly; the pectoral fins attenuated to a point.

* With three dorsal fins, cirrhi at the mouth.

Oeglefinus. 

Haddock. Whitish; the tail bilobated, the upper jaw the longest. Another distinguishing character may be deduced from the large black spot on each side above the pectoral fins. Superstition assigns this mark to the impression which St Peter left with his finger and thumb, when he took the tribute out of the mouth of a fish of this species, and which has been continued to the whole race. The haddock is usually of a moderate size, measuring about 18 inches or two feet in length, and the best for the table weighing from two to four pounds. It is found in the northern seas in prodigious shoals, visiting particular coasts at stated seasons, and for the most part attended by immense quantities of dog-fish, which, with seals, and other inhabitants of the ocean, are its constant devourers. Its food consists of small fishes, worms, crabs, and sea insects, and it fattens on herrings. In January, it deposits its spawn on the foci near the shore, and is out of season till May. Its flesh is white, firm, delicate, and easy of digestion.

Doice. Varied, with an even tail, and upper jaw collarienses.

Longest. Somewhat smaller than the haddock, seldom exceeding the weight of two pounds. Its colour is subject to vary with age and seasons. It inhabits the northern seas, the Baltic, and the Mediterranean. Otto Fabricius found in its stomach the sea-scorpion, sand-eel, crabs, and different species of sea-worms. It spawns in January and February, is taken both by the line and net, and is reckoned delicate eating.

Common cod. — Tail nearly equal, the first ray of the anal fin armed with a spine. This well-known and important species, which yields food and wealth to large districts of country, is found in immense shoals. It measures from two to three feet long, is of a cinereous colour with yellowish spots above and white below, and has larger scales than the other species of this genus. The young are sometimes reddish, with orange-coloured spots. It feeds on sepias, crabs, and fishes, not even sparing its own species, catching at any small body it perceives moved by the water, and throwing up what it does not digest. Its range of climate lies principally between the latitudes 50° and 66°. The great rendezvous of cod is on the banks of Newfoundland, and the other sand-banks that lie off the coasts of Cape Breton, Nova Scotia, and New England. The coast of Holland, &c. and is generally fattest and most numerous where the greatest sea runs. In our seas they begin to spawn in January; though some continue in roe till the beginning of April. As they recover sooner after spawning than most other fish, it is customary to take some good ones all the summer. When out of season they are thin-tailed and lousy; and the lice chiefly fix themselves on the inside of their mouths. Those most esteemed for the table are of a middling size, and are chosen by their plumpness and roundness, especially near the tail, by the depth of the furrow behind the head, and by the regular undulated appearance of the sides, as if they were ribbed. The glutinous parts about the head lose their delicate flavour after it has been four-and-twenty hours out of the water. The fish itself dies on being removed from salt-water, or put into fresh. The fishermen are well acquainted with the use of the air-bladder, and dexterously perforate the living fish with a needle, in order to let out the air; for without this operation the fish could not be kept under water in the well-boats, and brought fresh to market. The sounds, when salted, are reckoned a delicacy,
ICHTHYLOGY.

Jugularis.

Fishes.

delicacy, and are often brought in this state from New-
foundland. The Icelanders prepare from this part of
the fish a species of isinglass. Pennant makes men-
tion of a cod taken at Scarborough in 1755, which
was five feet eight inches in length, and weighed 78
pounds. But the general weight of these fish in the
Yorkshire seas is from 14 to 40 pounds.

Gobius.

Bib.—The first ray of the ventral fin setaceous;
about a foot long; body deep, and sides compressed;
eyes covered with a loose membrane, so as to be blown
up at the pleasure of the animal. The mouth is small,
and under the chin is a cirrhus about an inch long.
Native of the European seas, and prized as an article
of food.

Barbatas.

Whiting pout.—Seven punctures on each side of the
lower jaw. Much deeper in proportion to its length
than any of the genus, rarely exceeding a foot in
length; and one of that size being nearly four inches
in the broadest part. Inhabits the Mediterranean and
northern seas; burrows in the sand, and feeds on the
benny, salmon, and even young crabs. Its flesh is
white and delicate, but somewhat dry.

Minutus.

Poor.—Vent in the middle of the body. Little
more than six inches long; a small beard on the chin,
and the eyes covered with a loose membrane. The
abdomen is lined with a black peritonem. The poor
is supposed to feed chiefly on worms and insects, or
on the young and soft testaceous animals. It occurs in the
Baltic and Mediterranean, and in some parts of the
northern seas. It is reckoned a wholesome food, but is
not fit for being salted or dried.

Blenniidae.

Blennoid gador.—With didactyle ventral fins. Has
the habit of a whiting, and frequents the Mediterrane-

Saida.

Saida gador.—Bluish, with brown back, white abdo-
men, and the second ray of the ventral fins terminating
in a long bristle. Length about eight inches. Eatable,
but dry and juiceless. A native of the White sea.

Three dorsal fins, and no cirrhi.

Virens.

Green gador.—Greenish back and forked tail. Nearly
resembles the pollack. Abounds in the northern seas.

Merlangus.

Whiting.—White; the upper jaw longest. Usual
length about ten or twelve inches, and the largest sel-
dom exceeding twenty. Specimens from four to eight
pounds in weight have been taken in the deep water at
the edge of the Dogger bank. It is a fish of an
elegant make; the body rather long, and covered with
small round silvery scales, the head and back are of a
pale brown, and the sides are slightly streaked with
yellow. Though found in the Baltic, it is much more
numerous in the north seas, and appears in shoals on the
coasts of Holland, France, and England, during the
spring, keeping at the distance of from half a mile
to three miles from the shore. The whiting feeds on
small crabs, worms, and young fishes, and is particu-
larly fond of sprats and young herrings, with which the
fishermen generally bait for it, and in default of them,
with pieces of fresh herring. This species begins to
spawn at the end of the year, and continues to the
beginning of February. Its flesh is white, tender, and
delicate; but inalpud when the fish is out of season.
The chief time of the whiting fishery in France is in
January and February, though in England and Holland
it is practised at a much later period.

Coal-fish.—The under jaw longest, the lateral line
straight. When full grown, this species will frequent-
ly measure two feet and a half in length, and four or
five inches in breadth, and is distinguished from its
congeners by its very dark or black colour, though
the young are brown or olive. It is of an elegant
tapering shape, with a pretty large and forked tail.
It inhabits the Baltic, the northern, and Mediterranean
seas, and swarms round our rocky and deep coasts, par-
ticularly those of Scotland and the Orkneys, affording
by its fry, subsistence to numbers of the poor. In its
full grown state it is coarse food.

Pollack.—The under jaw longest, the lateral line pollachius.
curved. This species is broad, and of a brown colour;
feeds chiefly on small fishes, especially launcest, and
seldom grows to a very large size, though some have
been taken at Scarborough which weighed nearly 28
pounds. It is found in the Baltic and northern sea,
and is very common on many of our rocky coasts.
During summer it is seen frolicking on the surface of
the water, and will bite at any thing that appears on
the top of the waves. It is reckoned a good eating
fish.

With two dorsal fins.

Hake.—Beardless; the under jaw longest. Consider-
ably lengthened, measuring from one to two feet; the us.
body pale ash-colour on the back, and whitish on the
sides and abdomen. This fish, which is very voraci-
ous, frequents the Mediterranean and northern seas.
Its flesh is eatable and fatty, but little esteemed. It
is salted and dried as food for the lower orders of people.
One of the most considerable hake-fisheries is carried
on about the coasts of Brittany, both by the hook and
net. It is practised chiefly by night. The baits prin-
cipally used are launcest, sardines, and other small fishes.

Ling.—Bearded; the upper jaw longest. Long and
slender; the sides and back sometimes of an olive hue,
and sometimes cinereous; abdomen and ventral fins
white, and the tail marked near the end with a trans-
verse black bar, and tipped with white. Its ordinary
length is from three to four feet, but it will sometimes
grow to seven. It is an inhabitant of the northern
seas, chiefly frequenting deep water, living on small
fishes, shrimps, &c.; and depositing its spawn in June,
among the fuc in oazy bottoms. In the Yorkshire
seas, it is in perfection from the beginning of February
to the beginning of May, during which season the liver
is very white, and abounds with a fine flavoured oil.
In many places ling is salted both for exportation and
home consumption. An excellent isinglass is prepared
from its sound.

Levriani gador.—Somewhat cinereous, with oscilated levriani-
whitish spots. Supposed to be a native of the Southern us.
ocean.

Whitish gador.—Bearded; ventral fins didactyle and albidus.
elongated. Inhabits the Mediterranean.

Toad gador.—Bearded; gill-covers with three spines; tan.
the first dorsal fin with three rays. Native of the Amer-
ican and Indian seas.

Barbat.—Bearded; the jaws of equal length. Body kota.
much lengthened, somewhat cylindrical, of a brownish-
yellow
ICHTHYOLOGY.

... With one dorsal fin.

Mediterranean gadus.—Two cirri on the upper lip, and one on the lower. Native of the Mediterranean. Considered by La Cépée as a blennius.

Bosc. —Tors, or tusk.—Mouth bearded; tail oval and acute. About twenty inches in length; colour of the head dusky, of the back and sides yellow, of the belly white. Inhabits the northern seas, about the Shetland islands, and is not observed lower than the Orkneys. Bothbarrelled and dried, it forms a considerable article of commerce.

Blicarius. Gen. 5. BLENNIIUS.

Head sloping, and covered with scales; gill-membrane six-rayed; body lanceolate; ventral fins with two spineless processes; the anal fin detached.

With crested head.

Gabritia. Crested blenny.—Crest transverse, and skinny. Length about four or five inches; body long, compressed, and slippery. The crest erected or depressed at pleasure. Inhabits the European seas, and is sometimes found about the rocky coasts of Great Britain.

Cristatus. Pomara.—Longitudinal setaceous crest between the eyes. Native of the Indian seas.

Cornutus. Horned blenny.—Simple ray between the eyes, and single dorsal fin. Inhabits the Indian seas.

Ocellaris. Occluded blenny.—Blueish-green; subfasciatus with brown broad dorsal fin, marked by a black ocellated spot. Length about six or eight inches. Inhabits the Mediterranean, among the rocks and sea-plants near the shore. Its flesh is meagre and not much esteemed.

Fasciatus. Two simple cirri between the eyes; the vent fin with 19 rays. Native of the Indian seas.

Salient blenny.—Brown, streaked with black, with a saliens simple cirrus on the head, and very large pectoral fins. Observed by Commeron about some of the southern islands, particularly those of New Britain. It was seen swimming by hundreds; and, as it were, flying over the surface of the water, occasionally springing up and down with great rapidity among the rocks.

Gutturosum.—Small palmed fins on the eyebrows guttatorum and nape. Inhabits the Mediterranean and Atlantic; and is reckoned eatable.

Superciliosus. With palmed superciliary supercilium cirri, the lateral line curved. Grows to the length of sus. about twelve inches; is viviparous; and inhabits the Indian seas.

Tentaculatum. A simple cirrus over the eyes, tentacular and a large ocellated spot on the back fin. Nearly allied to the horned species; and is found in the Mediterranean.

Simus blenny.—With a very small cirrus over the simus eyes; dorsal fin united behind to the caudal fin, and crooked lateral line. Length about three inches and a half. Described by Swief, from a specimen in the museum of the Petersburg Academy.

Hake blenny, or forked hake.—Nostrils somewhat physica crested, a cirrus on the upper lip, and two dorsal fins. Grows to be eighteen inches long; inhabits the Mediterranean, and occurs on the coast of Cornwall. Improperly classed by Pennant among the gadi.

Head plain, or crestless.

Trifurcatus blenny, or trifurcated hake.—Brown trifurca with white lips, and three-rayed open ventral fins. Tus. Much allied to gadus tus; was first discovered by Mr Davies near Beaumaria, and described by Mr Pennant as a gadus.

Punctulata. Blenny.—White, scaly, with irregular punctato brown points, and elongated ventral fins. Head large; tus. about five inches. Described from a specimen in the Paris Museum.

Smooth blenny.—The lateral line curved, and sub-photis bifid. This species, which frequents the northern and Mediterranean seas, lying among stones and sea-weed, and occasionally entering the mouths of rivers, will grow to the length of seven or eight inches, but is usually much smaller. It bites fiercely, when first taken, and is so tenacious of life, that it may be kept 24 hours out of water. It feeds on smaller fishes and their spawn, as well as on shell-fish, sea-insects, &c. It is smooth, and covered with mucus. Being a coarse fish, it is principally used as a bait.

Boscian blenny.—Olivaeous, with brown and whitish boscianus clouds; vent in the middle of the body. Very much allied to the preceding. Native of the American seas, and very common in the bay of Charleston. It has its name from M. Bosc, by whom it was discovered.

Gunnell, spotted blenny, or butter fish.—The dorsal gennellus fin marked with ten ocellated black spots. About nine or ten inches in length; head small, body compressed,
ICHTHYIOLOGY.

Gen. 1. Cepola.

Cepola.

Head roundish and compressed; mouth turning up, a single row of curved teeth; gill-membrane six-rayed; body sword-shaped and scaleless; the abdomen scarcely so long as the head.

Common band fish, ribband-fish, or tape-fish. Cauc. salin. Head very obtuse. Very thin, and almost transparent, so that its vertebrae are visible. Grows to the length of four or five feet. It swims with rapidity, and haunts the muddy or weedy shores of the Mediterranean. Scarcely eatable, having little or no flesh.

Ribescent band-fish. Caudal fin attenuated, jaws rubescens. A rare species, and not very distinctly described by authors. It is said to inhabit the Mediterranean.

The other species are trochoptera and hermanniana.

Gen. 2. Gymneterus.

Body very long and compressed; teeth numerous and subulate; gill-membrane four or five-rayed; anal fin wanting.

Ascanian gymneterus. Silvery, speckled longitudinally, with brown points, and with the ventral cirri dilated at the tips. This singular fish, which is but imperfectly described in the Icones Rerum Naturalium of Professor Ascanius, is distinguished by the peculiar configuration of its ventral fins, which have more the appearance of long single rays or processes terminated by a small ovate and expanded tip. It is said either to precede or accompany the shoals of herrings in the northern seas, and is popularly denominated king of the herrings. That described by Dr. Shaw from a drawing and notes in the possession of Dr. Russel, is perhaps either a variety or sexual difference of the ascanium.

Hawkinnian or Blochian gymneterus. Bluish, silvery, haukemi, with oblique, linear, brown bands, and rounded spots, red fins, and four long ventral processes. Described by Dr. Bloch, from a drawing communicated by J. Hawksin., Esq. In general appearance, much allied to the other kinds of gymneterus; from which, however, it is readily distinguished by its two pair of ventral processes with their finny extremities, and large distant round spots on the body. A native of the Indian seas.

A specimen was thrown on the coast of Cornwall in February 1798.

Cepedian gymneterus. Described by La Cèpède, lanceolata, from a coloured Chinese drawing, therefore very imperfectly known.

Gen. 3. Vandellius.

Body very long and sword-shaped; gill-membrane five or six-rayed; teeth subulate, and those in front largest.

Lusitanian vandell. Silvery, with forked tail. Occ. lusitamia, though very rarely, in the Mediterranean and along the Atlantic seas. It has been sometimes taken near Lisbon.
ICHTHYLOGY.

Gen. 4. ECHENEIS.

Head oily, naked, and depressed, flat above, and emarginated, transversely sulcate, and the sulci serrate; gill-membrane ten-rayed; body scaleless.

Mediterranean remora, or sucking-fish.—Tail forked; head with sixteen spines or bars. This number, however, is subject to vary, and cannot be safely assumed as a certain character. Grows to the length of about eighteen inches, and is usually of an uniform brown colour. It is remarkable for the apparatus on its head, by which it firmly adheres to rocks, ships, or animals, being incapable of swimming easily to any considerable distance. From this adhesive property arose the marvellous account of the ancients, who alleged that the remora could arrest a ship under full sail in the midst of the ocean. They also pretended, that it completely subdued the passion of love. Five individuals of this species have been found fastened to the body of a single shark. The latter fish, it is said, will not swallow them. The Indians of Cuba and Jamaica formerly kept and fed sucking-fishes for the purpose of catching others. The owner, on a calm morning, would carry one or them out to sea, secured to his canoe by a small but strong line, many fathoms in length; the creature fastened on the first fish in its way. The Indian, meanwhile, loosened and let go the line, which was provided with a buoy to mark the course which the sucking-fish had taken; and he pursued it in his canoe, until he perceived his game to be nearly exhausted. He then gradually drew the line towards the shore, the remora still so inflexibly adhering to his prey, as not easily to be removed. Oviedo says, he has known turtle taken by this mode, of a weight that no single man could support. This species inhabits the ocean and the Mediterranean. Its flesh is said to taste like fried artichokes.

neerates. Indian remora, or longest sucking-fish.—Tail entire; 24 bars on the head. Occurs more frequently in the Indian and American seas than in those of Europe, and is very common about the Mozambique coast, where it is used in catching turtle. It is found of the length of two or three feet, or even of seven. The upper parts of the body are olive green, and the under parts are whitish. Its flesh is tough and meagre.

Lineated remora.—Tail wedge-shaped; head with ten bars, two longitudinal white lines on each side of the body. Inhabits the Pacific ocean.

Gen. 5. CORYPHAENA.

Head much sloping and truncated; gill membrane five-rayed; the dorsal fin of the length of the back.

Hippurus. Common Coryphena, or dolphin. Forked tail. Inhabits the Mediterranean, Indian, and Atlantic seas, often appearing in large shoals, playing round ships, and eagerly devouring any articles of food that happen to be thrown overboard. It will even swallow indigestible substances, such as iron nails, &c. Like its congeners, it exhibits splendid and vivid hues in the water, being of a bright and beautiful blue-green, accompanied by a golden gloss. When taken out of the water, this fine combination of colour gradually vanishes with the principle of life. Its ordinary length is about three feet; but it is often seen of four, or even five feet in length. It is strong and voracious, pursuing the smaller fishes, and especially persecuting the flying-fish. In spring and autumn it frequents shores, to deposit its spawn. As its flesh is much esteemed, it is taken both with the line and net. Though popularly called dolphin, it is not to be confounded with the delphinus of the ancients.

Of the following, which more or less resemble the preceding, the history is too obscure to detain us: equsiites, plumieri, carvelis, pentadactyle, novacula, chrysurus, pomilus, fasciolata, velifera, patracus, eobremoides, acuta, sima, sirens, hemiptera, branchiostegia, japonica, clypeata, lineata, and sinensis.

Gen. 6. MACROURUS.

Head and eyes large; body at the hind part attenuated into the tail.

Long-tailed imminet. Two dorsal fins, of which the rupestris first has the first ray toothed at the back. This is the coryphena rupestris of Linneus. It chiefly occurs about the coasts of Greenland and Iceland, where it is regarded as a dainty. The head is large and thick, and the body is covered with rounded scales, each of which is furnished with a toothed carina, ending in a pointed tip, so that the hand is wounded by drawing it over the fish from the tail towards the head. When taken, its body swells, as if with rage, and its eyes project in a hideous manner.

Gen. 7. GOBIIUS.

Head small, with two approximated pores between the eyes, one pore placed before the other; gill-membrane four-rayed; body small, compressed on both sides, covered with small scales, and furnished with a pimple behind the vent; the ventral fins coalescing into an oval shape; two dorsal fins.

Common, or black goby, sea gudgeon, or miller-s-niger. Thumb. Fourteen rays in the second dorsal fin. Grows to the length of six inches. The body is wedge-shaped, soft, and slippery, and overspread with small dusky or blackish specks. This species is said to affix itself to the rocks by the union of its ventral fins in the form of a funnel, from which circumstance it is sometimes called rock-fish. It is a native of the Mediterranean and southern seas, frequenting the shores in the beginning of summer, when it deposits its spawn. It is edible, but not held in particular estimation.

To this numerous genus also belong bicolor, cruentatus, paganelus, arabicus, nebulosus, electris, ophya, minius, joss, pettinnaeotis, schlosseri, melimorus, boddaerti, kogephalus, cyprinoides, lanceolatus, bosci, carvelis, brosonneti, plumieri, oceanis, eter, and anguilarius.

Gen. 8. GOMIOMORUS.

Habit as in the preceding genus; ventral fins distinct.

ICHTHYOLOGY.

Gen. 9. COTTUS.

Head broader than the body, and armed with spines; eyes vertical, furnished with a nictitating membrane; gill membrane six-rayed; body round, without scales, attenuated towards the tail; dorsal fins more than one.

cata-

Mailed or armed bull-head, or pogge.—Covered with a hard crust; two bifid warts on the rostrum; head furnished with cirri below. General length about five or six inches. The head large, bony, and rugged; the body octagonal, and covered with a number of strong bony crusts. Frequently the European seas, and is plentiful on our own coasts, living on worms and water insects, particularly young crabs, and spawning in the mouth of May. It is dressed for the table, but not esteemed a luxury.

squadriceps.

Four-horned bull-head, with four bony tubercles on the head.—Native of the Mediterranean, Baltic, and northern seas. Used chiefly as a bait.

grunniens.

Grunting bull-head.—Throat shagged with cirri; body naked.—When first taken, it utters, like some of the gurnards, a kind of abrupt grunting sound, by the sudden expulsion of air from the internal cavities, through the gill-covers and mouth. It is reckoned esculent; but the liver is said to be hurtful. Native of the Indian and American seas.

scorpius.

Lather bull-head, or father-lasher.—Several spines on the head; the upper jaw rather longer than the lower. Inhabits the Mediterranean, and the northern ocean of Europe and America.—It is very strong, swims with great rapidity, and is very voracious, preying on the bennies, cod, herrings, salmon, as well as on smaller fishes and insects. It is very frequent in Greenland, where it sometimes attains to the length of six feet, and where it is much relished as an article of food. It has said to be able to live a considerable time out of water, having the power of closing the gill-covers so as to exclude the effects of atmospheric air. Like the grunting bull-head, it utters a strong sound when first taken.

gobio.

River bull-head, or miller's thumb.—Smooth, with two spines on the head.—Inhabits the clear rivers and brooks of Europe and Siberia, generally lying on the gravel, or concealing itself beneath the stones, preying on worms, water insects, and very young fishes. It deposits its spawn in March or April. In this country its length seldom exceeds three inches and a half; but in other parts of Europe it seems to arrive at a superior size, and is even found of the length of seven inches. It is of a yellow olive colour, has a large head, slippery skin, and tapers to the tail. It is most readily caught during the night, and its flesh, which grows red by boiling, is esteemed good and wholesome.

insidious.

Insidious bull-head.—Head marked above by sharp lines, and on each side by two spines.—Native of the Arabian sea, in which it conceals itself under the sand, and springs up on such of the smaller fishes as happen to approach its haunts.

To this genus also appertain scaber, japonicus, massi-

bienae, monopterygius, madagascarianus, nigrip, and au-

crodon.

Gen. 10. SCORPENA.

Head large, aculeated, circrated, obtuse, scaleless, and Scorpenea. subcompressed; eyes approximated; teeth in the jaws, palate, and sauces; gill membrane seven-rayed; body fleshy; one dorsal fin, long; the first rays spinous.

Rufous scorpiena, or larger sea scorpion.—Two cirri scrofa, on the under lip. Larger than the preceding, being sometimes four feet in length. It preys not only on the smaller fishes, but, occasionally, on marine birds. Inhabits the Atlantic, Mediterranean, and northern seas.

Horrid scorpiena.—Scattered over with callous tu- horrida. bercles. Of a very uncouth and forbidding aspect. Measures from 12 to 15 inches in length, and inhabits the Indian seas.

Flying scorpiena.—Thirteen rays in the dorsal fin; volitans. Art. cirri, the pectoral fins longer than the body. Like fishes of the exocoetus and trigla genus, it uses its pec- toral fins for the purposes of occasional flight. Native of the rivers of Japan, Ambeynas, &c. where it is rec- koned excellent food.

Besides the preceding, naturalists reckon plumieri, commersonii, bicanillati, brachiata, aculeata, barbata, antennata, copenesi, spinosa, and americana.

Gen. 11. ZEUS.

Zeus.

Head compressed, and sloping; upper lip arched with a transverse membrane; tongue subulated; gill mem-

brane with seven perpendicular rays, the lowest trans-

verse; body compressed, thin, and shining; the rays of the first dorsal fin ending in filaments.

Brazilian dory.—The second ray of the dorsal and vomer.

anal fin very long. Of a bomboideal shape, about six or eight inches long, very thin, and scaleless. Native of the American seas, and sometimes seen in those of the north of Europe. Edible, but not much in re- quest.

Insidious dory.—With a narrow mouth. Native of insidiator.

the rivers and fresh waters of India.

Indian dory.—The tenth ray of the dorsal and the gallus.

second of the anal fin longer than the body. Native of the American and Indian seas.

Ciliated dory.—With some of the rays in the dorsal cititariis.

and anal fin very long. Native of the Indian seas.

Common dory.—The tail rounded; a brown central fisher.

spot on each side of the body; two anal fins. Grows to nearly 18 inches in length, and weighs from 10 to 12 pounds. The head is abrupt, the mouth wide, the back much arched, and furnished with a row of strong small prickles. The body is covered with very minute scales, dusky brown above, and of a shining greenish yellow on the sides. * We are indebted (says Mr Pennant) to that judicious actor and bon vivant, the late Mr Quin, for adding a most delicious fish to our table, who overcoming all the vulgar prejudices on account of its deformity, has effectually established its reputation.
The dory is extremely voracious, and, when first taken, makes the same kind of sound, as the gurnards and scorpions. It is a native of the Mediterranean, Atlantic, and northern seas. It is fished on the southern coasts of England; but the largest are found in the bay of Biscay.

**Red dory.**—Tail even; body reddish. Resembles the preceding, but is much smaller. Native of the Mediterranean.

**Opah dory.**—Tail somewhat lunated; body reddish, with white spots. This beautiful species measures from four to five feet in length; the general colour sometimes a brilliant silvery green, and sometimes a bright gold colour, variegated with pretty numerous, and moderately large, oval white spots; while the fins and tail are bright scarlet. It is the *Sciaena luna* of Linneus. Found, though rarely, in the Mediterranean and northern seas.

**Pleuronectes.**

Head small; eyes spherical, both on the same side of the head, and near each other; mouth arched; jaws with teeth, and unequal; gill-membrane, with four to seven rays; the gill-cover, in most of the species, consisting of three plates; body compressed, carinate; the one side somewhat convex, answering to the back; the other, of a paler colour, to the belly; the vent nearer the head than the tail.

The fishes of this genus are remarkable for having both eyes on one side of the head; and they are divided into two sections, according as they have the eyes towards the right, when the animal is laid with its coloured side upwards, with its abdomen towards the spectator; or to the left, when the fish is in the same direction.

* With eyes towards the right.

**Hippoglossus.**

Holibut.—The whole body smooth. Dusky above, pure white beneath. Narrow in respect to its length. Individuals have been taken on the English coast, which weighed from 200 to 500 pounds; and the Icelanders have caught some which weighed 400 pounds. Olafsen mentions, that he saw one which measured five ells, and we are told by the Norwegian fishermen, that a single holibut will sometimes cover a whole skiff. This species, then, is more entitled to the epithet *maximus*, than that to which it is applied. Though it inhabits the Mediterranean, it arrives at a larger size in the northern seas of Europe and America. It is so voracious, that it devours rays, crabs, haddock, and even lump-fish, of which it seems to be very fond. The part of the body nearest the fins, is fat and delicate, but surfeiting; the rest of the fish is regarded as coarse food. The Greenlanders cut it into thin slips, and dry them in the sun. This fish deposits its spawn in spring, among rocks near the shore.

**Cynoglossus.**

Smaller holibut.—Body smooth, oblong; teeth obtuse; tail roundish. Very like the preceding, but smaller, and more relished as an article of food. Native of the northern seas.

**Platessa.**

Ready to smooth, with six tubercles on the head. Readily distinguished by its very broad and flat shape, its pale brown colour above, and the orange-coloured spots with which it is marked. One of eight or nine pounds is reckoned a large fish, though instances occur of their weighing 15 pounds. They spawn in the beginning of May, and are common in the Baltic and northern seas. The best are said to be taken off Rey, on the Sussex coast, and near Holland. They are in considerable request in the fish-market, though far inferior to the sole and turbot.

**Flounder.**—With a rough lateral line, and a series of spines at the base of the fins. Easily distinguished from the rest of the genus by the specific character; and very generally known, as it inhabits every part of the British sea, and even frequents our rivers at a considerable distance from salt water. It likewise occurs in the northern, Baltic, and Mediterranean seas. In size, it is much inferior to the plaice; but it affords a light and wholesome food.

**Dab.**—Scales ciliated; small spines at the origin of *limanda*; the dorsal and anal fins; teeth obtuse. Of a very broad, ovate shape, yellowish brown above, and white beneath. Inhabits the same seas as the plaice and flounder; but is less common, of a smaller size, and more prized as an article of food.

**Smear-dab, or kit.**—Yellowish brown, with smooth scales; five dusky spots, white beneath. Caught on the Cornish coast.

**Long dab.**—Body oblong and rough, lateral line *limando*—straight and broad. Much longer than the dab. In *ides* habits the northern seas, and is esteemed at table.

**Rose-coloured flounder.**—Colour of a delicate rose; *roscus* and general proportions those of a flounder. Taken in the Thames, and preserved in the Leverian museum.

**Sole.**—Body oblong and rough; upper jaw longest. *Solea.* More narrow and oblong than any other of the genus. Sometimes grows to the length of more than two feet, and to the weight of eight pounds. Its general size, however, is much smaller. Those of moderate size are generally in most request for the table; and next to the turbot, are reckoned the most delicate of the genus. The sole is an inhabitant of the northern, Baltic, Mediterranean, and American seas. On the west coast of Great Britain it attains to a much larger size than on the east. The principal sole-fishery is at Brixham, in Torbay.

**Smooth sole.**—White, transparent, with small, thin, *diaphanus* deciduous scales. Found about the coasts of Cornwall, where it is called *lanterm-fish*.

* With eyes towards the left.

**Whiff.**—Body broad and rough. Native of the *punctatus* northern sea.

**Peel.**—Body smooth; pale brown above, marked *rhomus* by scattered yellowish, or rufous spots, and white beneath. Resembles the turbot, but is inferior in size. Native of the European seas.

**Turbot, or bret; pleuronectes maximus of Linneus.**—*Tuberculata.*

Body rough. This fish, which is reckoned such delicately eating, is found both in the Mediterranean and northern seas. It is broader and squarer than any of the genus, except the peel, and is of a dark brown above, marbled with blackish spots of different sizes, and white beneath. Like the rest of this genus, the turbot generally lies in deep water, preying on worms, shell-fish, small fishes, &c. It is taken in great quantities.
Chap. IV.

ICHTHYOLOGY.

Thoracic Fishes.

Thracian species about the northern coasts of England, as well as on those of France, Holland, &c. They are so extremely delicate in their choice of baits as not to touch a piece of berrong or haddock that has been 12 hours out of the sea. Though the turbort and holibut are often confounded in our markets, the former may be easily recognised by the large, unequal, and obtuse tubercles on its upper part.

In this numerous genus are also classed trichodactylus, sebra, plagius, ocellatus, rondlelit, linguatula, glacialis, platesoides, argenteus, barbatus, mortormorus, portorius, linearis, bilinaris, ornatus, dentatus, macroplepis, passer, papillosus, argus, stellatus, and japonicus.

Gen. 13. Chetodon.

Head small; mouth narrow, with retractile lips; teeth generally setaceous, flexible, moveable, equal, very numerous, and close; eyes round, small, vertical, and furnished with a nictitating membrane; gill-membrane from three to siix-rayed; body broad, thin, compressed, covered with hard scales, and coloured; dorsal and anal fins rigid, fleshy, scaly, and generally terminated with pickles.

To avoid much unnecessary repetition, we shall observe, in general, that upwards of 60 species of chetodonts have been distinctly ascertained; that they are mostly natives of the American and Indian seas; that they are distinguished by the great depth and highly compressed form of the body, which is often beautifully variegated by transverse, oblique, or longitudinal bands, and covered with strong scales, finely denticated on the margins; and that the dorsal and anal fins are remarkably broad, and, in many species, of an unusual length.

One of the most remarkable species of this genus is the rostratus, rostrated or beaked chetodon, with an entire tail, nine spines in the dorsal fin, an occluded spot on the sides, and the beak cylindrical. It is of a roundish-ovate shape, about six or eight inches in length, of a whitish colour, with a dusky tinge on the back, and marked by fine transverse and nearly equi-distant brown bands, with milk-white edges. It is a native of the western waters of India, and feeds principally on flies and other small winged insects which hover about the surface of its native waters. When it sees a fly at a distance, alighted on any of the plants in the shallow water, it approaches very slowly, and with the utmost caution, coming as much as possible perpendicularly under the object. Then putting its body in an oblique direction, with the mouth and eyes near the surface, it remains a moment immovable. Having fixed its eyes directly on the insect, it darts at it a drop of water from its tubular snout, but without shewing its mouth above the surface, from which only the drop seems to rise, and that with such effect, that, though at the distance of four, five, or six feet, it very seldom fails to bring its prey into the water. With the closest attention the mouth could never be discovered above the surface, although the fish has been seen to spout several drops successively, without leaving the place, or in the smallest apparent degree moving its body. This very singular mode of attacking its prey was reported to Mr. Homel, governor of the hospital at Batavia, and so far excited his curiosity, that he ordered a large tub to be filled with sea-water, and had some of the fishes caught and put into it. When they were reconciled to their confinement, he caused a slender stick, with a fly fastened at the end, to be placed in such a manner on the side of the vessel, as to enable the fish to strike it; and it was not without inexpressible delight, that he daily saw them exercising their skill in shooting at it, with amazing force, and seldom missing their mark. This faculty is possessed by a few other species belonging to very different genera. The flesh of the rostrated chetodon is white and well-tasted.

Angel chetodon, or angel-fish of Catesby, is of a fine catesbeii, gold-green colour, with the scales covered by smaller ones. The pectoral, ventral fins, and tail, are of a vivid orange; and the dorsal and anal, violet-blue at the base, and bright crimson towards the tips.—It is common off Carolina and the Bahama isles, where it is much esteemed for its delicacy.

Imperial chetodon, is a magnificent species, growing imperator to the length of a foot or more. Its ground colour is a golden-yellow, which is longitudinal, though somewhat obliquely, striped with very numerous bright blue parallel rays. It is a native of Japan, and said to be superior to the salmon in flavour.

Sea bat, or bat chetodon, surpasses all the other species in the great extent and breadth of the dorsal and anal fins, both which nearly equal the body itself in size, and are of a somewhat triangular shape. It is a native of Japan.

Red-striped chetodon, is distinguished by numerous setifer. red stripes on the body, and an eye-shaped spot and bristle on the dorsal fin.

Three-coloured chetodon, is golden-yellow on the fore-tricolor part, jet black behind, except the tail, which is yellow, and red near the end, while the edges of the gill-covers, and of all the fins, are bright red.

Acanthus.

Teeth small, and in most species lobated; tail aculeated on each side. This genus comprises such species of the Linnean chetodon as, in contradiction to the principal character of that genus, have moderately broad and strong teeth, rather than slender and setaceous ones.

Unicorn acanthurus.—Gray-brown; with a frontal unicornis horn projecting over the snout, and two spines on each side of the tail. Of the length of three feet or upwards. Its horn-shaped process is strong and conical, terminating rather obtusely.—It is a native of the Indian and Arabian seas, in the latter of which it is usually seen in shoals of two or four hundred, swimming with great strength, and feeding principally on the different kinds of sea-weed. It is singular that so remarkable a fish should have been entirely overlooked by Linnaeus, even in the twelfth edition of the Systema Naturae.

The other species are denominated nasus, teuthis, nigricans, militaris, triostegus, harpurus, sohal, nigrofuscus, achilles, lineatus, umbraeus, melacris, and velfifer.

Gen. 15. Eques.

Eques.

Teeth in several rows; body banded.

American knight-fish.—Chetodon lanceolatus, Lin.america—Body oblong; yellowish, with three black bands, the nux.
ICHTHYOLOGY.

Chap. IV.

Thoracic Fishes.

Trachurus.

Gen. 16. TRACHURUS.

Body compressed ; ventral fins, with a very long filament.

Goramy. Goramy trachurus.—Rufoesent, with a silvery cast on the sides; and the second ray of the ventral fins extremely long. Native of the fresh waters of China, where it is much prized as an article of food.

Pallasi. Pallasi trachurus. Labrus trachopterus, Lin.—Brown, with pale undulations, a black spot on each side of the body and tail, and long single-rayed ventral fins. Native of the Indian seas.

Monodactylus. Monodactylus trachurus.—Sultry, with brownish back, and short, single-rayed, rigid ventral fins. Native of the Indian seas.

Sparus.

Gen. 17. SPARUS.

Strong cutting or canine teeth, with obtuse and close-set grinders; lips double; gill membrane five-rayed, gill covers scaly; body compressed, lateral line curved behind; pectoral fins rounded.

Of this very extensive genus, most of the species are exotic; and their history is very imperfectly known. Considerable confusion takes place with respect to the characters by which they ought to be discriminated from the labri, a family to which they are much allied. We shall briefly notice only a few of the most striking and best known species.

Aratus. Gilthead, has a lunulate spot between the eyes. A more permanent character may be assumed from the six cutting teeth in each jaw. This species is about 15 inches long, but sometimes of a much larger size. It is of a silvery bluish cast, with gold-coloured brown, and sometimes with several brownish longitudinal stripes. The body is broad and thin, and the back elevated. The gill-head is a native of the Mediterranean, Atlantic, and Indian seas; frequenting deep water on cold rocky shores; and living chiefly on testaceous animals. It is said to sleep at stated times, and to be very susceptible of cold. The Greeks and Romans reckoned it a most delicate morsel, and the former held it to be consecrated to Venus.

ERYTHRUS. Rose sparke, is remarkable for its beautiful rose-red colour. In size and shape, it resembles the perch. It is a native of the Mediterranean and Indian seas, in the latter of which it is said to acquire noxious qualitics.

Fasciatus. Fasciated sparke, is of a squarish elongated shape; with transverse dusky bands, and the fins edged with black. It is a native of Japan.

CHLORUS. Green-tailed sparke, is a native of the American seas, and a highly elegant species; having its yellowish and large scales crossed by a green band, green fins, and rose-coloured gill-covers. The green tail is strongly lunulate, and marked by minute pale specks.

A striking disposition of colours likewise distinguishes the chrysiurus, or gold-tailed sparke, which is found in the seas of South America. Its general complexion is a bright rose-red, which is deepest on the back; a gold yellow stripe runs on each side from the gills to the tail, and a second on each side of the bottom of the abdomen.

Spined sparke, has the dorsal spines recumbent, and spinifer the five in the middle filiform and elongated. It is of a reddish silvery hue, with the back and the lines on the body dusky; shape ovate; and length, a foot and a half. It inhabits the Red sea; and is reckoned a delicious fish for the table.

Squirrel sparke, squirrel-fish, or grunt.—Gray-sciurus, brown, with large scales bordered with yellow, and head marked longitudinally by numerous blue and yellow lines. According to Bloch, these blue lines also run along the body. Native of the American seas. It is the perca fornosa of Linnaeus.

Insidious sparke, Red, yellowish on the sides; tail insidiator sub-fasciatus. Length about ten inches. Native of the Indian seas, where, through its long tubular snout, it shoots a drop of water at the insects on which it feeds, in the same manner as the rostrated chetodon.

Gallilean sparke, Greenish, with whitish abdomen, gallilea. Very common in the lake of Genesareth, and therefore supposed to have been the principal species in the miraculous draught of fishes recorded by St Luke.

Desfontaine's sparke, With 23 rays in the dorsal, desfontaini, 11 in the anal, and a black spot on the gill-covers, uii. Inhabits the warm waters of Cassa in Tunis, which, in January, are about 30 degrees of Reaumur's thermometer above the freezing point; but it is also found in the cold and brackish waters surrounding the date plantations at Tozzar.

Argus sparke. Of a silvery blue; with many ocel argus, lateral brown spots. A very elegant species, of which the native country is uncertain.

Climbing sparke, Olive-green, with yellowish abdo sancta, men, and gold-coloured eyes. Length about a span; skin covered by a blackish mucus. "This fish (says Dr Shaw) is remarkable for its power of climbing, which it performs by the assistance of the spines of its gill-covers, moving itself at pleasure up the stems of trees growing near the waters it frequents. In this situation it was observed in the month of November 1703, at Tranquebars, by Lieutenant Daldorff, who communicated its description to Sir Joseph Banks. It was seen ascending a fissure in the stem of the palm called borassus flabellifer, growing near a pool of water, and was observed to move itself forwards by alternately applying the spiny sides of the gill-covers to the sides of the fissure, assisting itself at the same time by the spines on each side of the tail, and had already ascended to the height of more than five feet above the water when it was first observed: it was found to be very tenacious of life, moving about on dry sand, many hours after it was taken."

Gen. 18. SCARUS.

SCARUS.

Instead of teeth, the jaws are eminent, crenated, and bony, with a toothed margin; gill-membrane five-rayed, gill-cover entire, lateral line generally branch.-ed.

Cretan
ICHTHYLOGY.

Chap. IV.

Cretan scorus.—Green, yellowish beneath, with very large scales, ramified lateral line, and sublimated tail. Native of the Mediterranean and Indian seas. Common about Crete.

Green scorus.—Yellowish green; with large scales, edged with green; lateral line interrupted towards the tail. Native of the Japanese seas.

Rivulatus scorus.—Bluish, spotted with black, and marked by longitudinal yellow undulations. Native of the Red sea.

Stellatus scorus.—Oval, blackish; variegated with subhexagonal pale rings. Native of the Arabian seas.

Red scorus.—Rose-red, with silvery abdomen. Native of the Indian seas.

Parrot scorus.—Greenish, marked with yellowish lines, and with the edges of the fins, abdominal band, and variegations of the head, blue. Native of the Arabian seas.

Purple scorus.—Dull-green, with three longitudinal serrated purple bands on each side, and blue abdomen. Native of the Arabian seas.

Black scorus.—Ovate-oblong; blackish brown, with red lips, and the margin of the fins greenish-blue. Native of the Arabian seas.

Blue-striped scorus.—Whitish, with the scales marked by transverse bluish bands, and double lateral line. Native of the Arabian seas.

Ferruginous scorus.—Brown-ferruginous, with the mouth and margins of the fins green, and tail even. Native of the Arabian seas.

Sordid scorus.—Brown-ferruginous, with darker-coloured fins, and rising, even tail. Native of the Arabian seas.

Scaly-tailed scorus.—Tail forked, the middle of its back beset with scales. Native of the Arabian seas.

Scioliurom scorus.—Gold-coloured, with five dusky spots on each side, brownish back, and nearly even tail. Native of Java.

Jaws lengthened into a tubular snout; teeth small, those in the front larger. This genus, instituted by La Cépée, contains two species, both natives of the Indian seas, and both agreeing in the remarkable form of the mouth, which consists of a tubular process, somewhat truncated at the tip.

Blue gomphus.—Entirely blue. About the size of a tench.

Variegated gomphus.—Variegated with red, yellow, and blue. Smaller than the preceding.

Labrus.

Teeth acute; lips not doubled; gill-membrane six rayed; gill-covers scaly; the rays of the dorsal fin furnished behind with a filiform process; the pectoral fins acuminate; and lateral line straight.

From this very numerous genus, the discrimination of which has never been accomplished with accuracy, we can afford to select only a few species.

Ceylonese labrus, or Ceylon scorus.—Green, purplish beneath, with blue head, and gill-covers variegated with purple. This beautiful fish is a native of Ceylon, where it is reckoned edible.

Faculatus, or shooting labrus.—Gray, clouded with yellow; five transverse dusky bands; and lower jaw longer than the upper. Darts water on its prey, like the rostrated chetodon and insidious asperus. Native of the Indian seas.

Scoro labrus.—Whitish, mixed with red; with trans-scorus longitudinal appendages on each side of the tail. Native of the Mediterranean; where it feeds principally on fucis, and swims in shoals. It was in high esteem with the ancients as a food, and considered by the Romans as one of the principal delicacies of the table.

Ballan labrus, or ballan scorus.—Yellow, with ful-ballanusvous spots, reflex lips, and ramentose dorsal fin. Weights about five pounds. Appears annually in great shoals off Filey-bridge, near Scarborough.

Ancient labrus, ancient scorus, or old wife.—Beak tinca, bent upwards; end of the tail circular. Size and habit of a tench. Native of the European seas, and usually found in deep waters, about rocky coasts. Liable to vary much in colour.

Parraceti labrus.—Green, with three longitudinal psittacene-red stripes on each side, and yellow dorsal fin marked luna by a longitudinal red band. A beautiful species, which inhabits the American seas.

Beautiful labrus.—Red, with longitudinal, interrupt-formose-red, flexuous, blue streaks; and fins edged with blue.

Juraca labrus.—Sides bluish, both marked by a long-julia-gitudinal, fulvous, and dentated band. Length about eight inches, and form somewhat lengthened. Occurs in shoals in the Mediterranean. The more ancient ichthyologists erroneously considered it as poisonous, and as the most beautiful of the finny tribes.

Ophicephalus.

Head coated with dissimilar scales; body elongated.

Punctated ophicephalus.—Dusky, paler beneath, with punctatus, the head pierced by pores, and the body speckled with black points. Length about ten inches. Frequent rivers and lakes in India; and is reckoned a delicate and wholesome food.

Striated ophicephalus.—Dusky, with the abdomen striatos and fins striated with dusky and whitish variegations. Length about twelve inches. Native of India; inhabiting lakes, and equally esteemed with the former as food.

Gen. 22. Lonchorus.

Lonchorus.

Head scaly; ventral fins separate; tail lanceolate.

Bearded lonchorus.—Ferruginous-brown; with slightly lengthened nose; two beards at the lower jaw; and the first ray of the ventral fins elongated into a bristle. Length about twelve inches. Native of Surinam.

Gen. 23. Sciaena.

Sciaena.

The whole head covered with scales; gill-membrane six-rayed; a furrow on the back, in which the dorsal fin is seared.

Most of the species of this genus are exotic, but obscurely known.
ICHTHYLOGY.

Chap. IV.

Thoracic fishes.

Cirrhose or bearded sciene, has the upper jaw longer than the lower, and a beard on the latter. It has the habit of a carp, and measures from one to two feet. Native of the Mediterranean. Was valued by the Greeks and Romans as an article of food.

Basac sciene, or basse. Percia labrou of Lin. Subargenteous, with brown back, yellowish-red fins, and dusky tail. Habitat of a salmon. Native of the Mediterranean and northern seas; frequently entering rivers. Known to the ancients by the names of labrou and dirus, and greatly prized, particularly by the Romans.

Percia.

Gen. 24. PERCA.

Jaws unequal, armed with sharp-pointed and incurred teeth; Gill-covers consisting of three plates, of which the uppermost is serrated; Gill-membrane seven-rayed, the lateral line following the arch of the back; the scales hard and rough; fins spiny; and vent nearer the tail than the head.

Fluviatilis. Common perch.—The second dorsal fin with 16 rays, of a brown olive, sometimes accompanied by a slight gilded tinge on the sides, and commonly marked by five or six broad, blackish, transverse bars. This well-known fish usually measures from 10 inches to two feet, and weighs from two to four pounds, though some have weighed eight, nine, or ten pounds. The perch inhabits clear rivers and lakes in most parts of Europe, haunts deep holes in gently flowing rivers, spawns early in spring, is of a gregarious disposition, very voracious, and so tenacious of life, that it may be carried to the distance of 60 miles in dry straw, and yet survive the journey. It feeds on aquatic insects and the smaller fishes, and is preyed on by the pike, eel, &c. Its flesh is firm and delicate, and was held in repute at the table of the ancient Romans. In some of the northern countries a sort of isinglass is prepared from the skin.

Lucioperca. Sandre perch.—The second dorsal fin with 23 rays; of a larger size, and more like a pike, than the preceding. Native of clear rivers and lakes in the middle parts of Europe.

Cernua. Ruffe perch, or ruffe.—Dorsal fin with 27 rays, of which 15 are spiny. Length from six to eight inches, and shape more slender than that of the common perch. Feeds on worms, insects, and young fishes, and is frequently preyed on by the pike, larger fishes, and aquatic fowls. Spawns in March and April; inhabits clear rivers in many parts of Europe, especially towards the north; and affords excellent food.

Marina. Sea perch.—The dorsal fin with 15 spiny rays, and 14 soft ones; the body variegated with dusky lines. Colour red, marked with dusky transverse lines on the sides. Inhabits the Northern, Mediterranean, and Atlantic seas, and is in high esteem for the table.

Holocentrus.

Habit of the genus perca; Gill-covers scaly, serrated, and aculeated; scales, in most species, hard and rough.

Sogo. Sogo holocentrus.—Silvery red, with longitudinal yellow lines on each side. A highly beautiful species, about a foot in length. Native of the Mediterranean, Indian, and American seas, and considered as an excellent fish for the table.

Sper-gilled holocentrus. Subargenteous, with brown-calcareous back, large scales, and spurred Gill-covers. Native of Japan.

Surinam holocentrus. Brownish; with yellowish surinae, clouds, red head, and anterior Gill-covers ciliated with mensiae spines. Native of Surinam, where it is reckoned one of the best fishes which the country produces.

Bodiana.

Habit of the genus perca; Gill-covers scaly, serrated and aculeated; scales in most species smooth.

Purple-backed bodian. Gold yellow, with purple bodiana. back. Shape like that of a trout; length about 14 inches. Native of the South American seas.

Fice-spined bodian. Rose-coloured, with silvery ab-pentacandemen, and dorsal fin yellow on the fore part. Native thus. of the Brazilian seas. Known good food.

Aya bodian. Red, with silvery abdomen, single-aya. spined Gill-covers, and lunate tail. This highly beautiful species is said to grow to the length of three feet. It is found in the Brazilian seas, and regarded as a delicacy.

Large-scaled bodian. Gray brown, with large round-macroiled scales denticulated at the edges. Length about 1/2pidotus. foot. Native of the East Indies.

Loui bodian. Oblong lanceolate, with smallish vio-loui. laceous spots, and fins edged with yellow. Native of the Arabian seas.

Polperbalbodian. Somewhat farruginous, with ochre-polpebra-coloured eyes, protected by a movable yellow valve. tuc. Shape nearly that of a perch. Native of the seas about Amboyina.

Silvery bodian. Silvery, with bluish back. Native argentus. of the Mediterranean.

Apau bodian. Red, with the back spotted, the body apus. speckled, and the fins edged with black. Native of the Brasilian seas.

Guttated bodian, fett-fish, or jacob riversten. Yel-guttata. lowish brown, with body and fins marked by small ocellated deep brown spots. Native of the Indian and American seas. Esteemed as an edible fish.

Zebra bodian. Yellowish, with the body marked by zebra. transverse, and the head by longitudinal, brown bands. Native of Japan.

Lunated bodian. Blackish farruginous, with black lunatulus. fins, whitish transparent towards the back part. Native of the Arabian seas.

Star-eyed bodian. Silvery, with yellowish back, and stellifer. orbit spiny beneath. Native of the seas about the Cape of Good Hope.

Gen. 27. Gasterosteus.

Gasterosteus.

Head oblong and smooth, the jaws armed with small teeth; tongue short and obtuse; palate smooth; eyes moderately sized, scarcely prominent, lateral; Gill-
ICHTHYOLOGY.

Common stickleback, banstickle, sharpling, &c. with three spines on the back. Length two inches, or three at most. In the early part of summer, the gills and abdomen are of a bright red, the back a fine olive green, and the sides silvery. Lives only two or three years, is very active and very voracious, devouring the young and spawn of other fishes, worms, insects, and their larve. The stronger inhabitants of the waters shun it on account of its spines; but it is infested by intestinal worms. In April and May it deposit its spawn in small quantities on aquatic plants, especially on the white and yellow water lily. It occurs very commonly in ponds, rivers, and marshes, and in some parts, as about Dantzic and the fens of Lincolnshire, in extreme profusion. At Spalding, according to Mr. Pennant, they appear in the Welland once in seven or eight years in such amazing shoals that they are used as manure, and a man has got for a considerable time four shillings a-day by selling them at the rate of a halfpenny per bushel.

Salatrir. Skupping stickleback.—Eight dorsal spines connected by a membrane. Native of the seas about Carolina, where it is often observed skupping out of the water.

Pungititus. Smaller or ten-spined stickleback.—Ten dorsal spines. The number of spines is sometimes only nine, and sometimes, though rarely, eleven. This is smaller than the common species, seldom exceeding an inch and three quarters. It is found both in seas and lakes, and enters the mouths of rivers in spring.

Spinachia. Fifteen-spined stickleback.—Fifteen dorsal spines. From five to seven inches long, of a slender form, with the head produced, and somewhat tubular. Frequent shallow places in the European seas, and preys on marine insects, and the spawn and fry of other fishes.

Spinarella Minute stickleback.—Four serrated spines at the hind part of the head: the lateral ones as long as the abdomen. Native of India.

To the same genus belong Japonicus, Carolinus, canadus.

Scomber.

Gen. 28. Scomber.

Head compressed and smooth; gill-membrane seven-rayed; body smooth, the lateral line carinated behind, often spurious fins towards the tail.

Spinous fins distinct.

Scomber. Common mackerel.—With five fins. Its ordinary length is from 12 to 18 inches, though it has sometimes been found of a much greater size. Its elegant shape and the beauty of its coloring are too well known to require particular description, and its qualities as an edible fish have been long duly appreciated. It dies very soon after it is taken out of the water, exhibits for a short time a phosphoric light, and partly loses the brilliancy of its hues. It is very voracious, and makes great havoc among the shoals of herrings. It dwells in the European and American seas, chiefly affecting the regions within the Arctic circle, and appearing at stated seasons about particular ranges of coast. Its alleged migrations, like those of the herring, begin to be questioned by some acute observers, and it is more probable that it resides at the bottom of the waters during winter at no great distance from the places where it visibly abounds in summer. A film grows over its eye in winter, when it probably conceals itself in muddy bottoms, and becomes torpid. It is very prolific, and deposits its spawn among the rocks about the month of June. The tenderness of its flesh renders it unfit for carriage in a fresh state; but in Cornwall, and several parts of the continent, it is preserved by salting and pickling. Caviar is prepared from the roes on the coasts of the Mediterranean, and the celebrated garum of the Romans is said to have been a condiment prepared from this fish.

Coly mackerel.—Bright green and azure. Somewhat higher, larger, smaller than the preceding, which it very much resembles. Found on the coasts of Sardinia.

Bonoito mackerel.—Seven inferior finlets; body mark-placem. ed on each side by four black lines. Resembles the tunny, but is more slender. Frequent the Atlantic and tropical seas, persecuting flying fishes and other species, and tormented in turn by internal worms.

Tunny.—Eight finlets above and below. Usually thynus, length about two feet, but sometimes grows to eight, or even ten. The upper part of the body is of a dusky blue, and the abdomen silvery. The tunny is gregarious, and inhabits the Mediterranean, Northern, Indian, and American seas, preying with fierceness on all kinds of smaller fish, and persecuting the mackerel and flying fish. The Greeks and Romans admired its flesh, though rather coarse, and established their tunny-fisheries on various parts of the Mediterranean coast, where this species is still taken in great quantities. The smaller fishes are chiefly sold fresh, and the larger cut in pieces and salted.

Spurious fins distinct.

Scord or Horse mackerel.—Dorsal fin recumbent, latracherus, lateral line marked. Length from 12 to 18 inches. Native of the European seas, and nearly equal to the common kind in point of flavour.

We forbear to enumerate several other species which have been recently defined, but whose history is still very incomplete, and shall terminate this abridged account of the genus by the

Pilot mackerel, or pilot fish; gasterosternus, auctor.

Linnaeus.—Silvery blueish, with four transverse blue bands; four dorsal spines, and tail barred with black. Length about 18 inches; general shape that of the tunny, but the head much shorter. Inhabits the American and Indian seas, and has its name from often swimming near or before sharks, which, it is said, it guides to their prey.

Gen. 29. Centrogaster.

Centeri.

Head compressed, smooth; gill-membrane generally seven-rayed; body depressed and smooth; fins spiny; ventral fins united by a membrane, which is furnished with four acute spines and six soft rays.

Brownish centrogaster.—Brownish, whitish beneath; fusescens tail somewhat forked. Native of the Japanese seas.

Silvery
ICHTHYLOGY.

Fishes.

Flying gurnard.—Sixtuple fingers, connected by a abdominal membrane. A highly singular and beautiful species, which inhabits the Mediterranean, Atlantic, and Indian seas, where it swims in shoals, and frequently flies out of the water to a considerable distance.

Voltans.

The carolina, alata, minutis, castillon, punctata, Adriatica, pinn, chabron, cucus, lucerna, lineata, asiatica, and exolans, also belong to this genus.

Gen. 32. Trachichthys.

Head rounded in front; eye large; mouth wide, toothless, descending; gill-membrane furnished with eight rays, of which the four lowest are rough on the edges; scales rough; abdomen mailed with large carinated scales.

Southern trachichthys.—Mailed abdomen. The whole of this curious fish is strongly coated, and of a bright pink ferruginous colour. It is a native of the coasts of New Holland, and is minutely described by Dr. Shaw, in his Naturalists Miscellany, and in the fourth volume of his General Zoology; a work from which we have derived much assistance in the compilation of the present article.

IV. ABDOMINAL.

The fishses of this order have the ventral situated behind the pectoral fins, or on the abdomen. They are mostly inhabitants of the fresh waters.

Gen. 1. Cobitis.

Head small, oblong, and scaleless; eye in the upper part of the head; nape flat; gill-membrane from four to six rayed; gill-covers formed of a single plate, shutting close below; body covered with mucous and small deciduous scales, and variegated with bands and spots, almost equal; the tail towards the caudal fin being a little narrowed; back straight, with a single fin; lateral line scarcely visible; vent near the tail, and the tail rounded.

Common or bearded loche.—Six beards; head smooth, barbata, and compressed. About three inches in length; mouth small, toothless, and placed beneath. Common in clear rivulets in many parts of Europe. Lives on aquatic insects, worms, &c. Swims in spring, is very prolific, dies very soon after being taken out of the water, and even when placed for any length of time in still water. It is very delicate eating, but quickly loses its fine flavour.

Spiny loche or the armed loche.—Six beards, a spine tania, below the eyes. Resembles the preceding, and is found in various parts of Europe, concealing itself below stones, feeding on worms, aquatic insects, and the spawn and fry of fishes. It is about five inches long, is tenacious of life, utters a hissing sound when handled, and is seldom eaten by man.

Great loche.—Eight beards; a spine above the eye, fossilis. The largest of the genus, inhabiting large lakes, and marshes in the midland countries of Europe. Restless on the approach of stormy weather.

The other known species are heteroclit and japonica.
ICHTHYLOGY:

Chap. IV.

Abdominal

Fishes.

Gen. 3. Anableps.

Anableps. Head somewhat depressed; mouth terminal; teeth small, and placed on the jaws; eyes protuberant, with double pupils; gill-membrane six-rayed.

Four-eyed anableps. Cobitis anableps of Linnaeus. - Yellowish-gray, with longitudinal black lines on each side. Length from six to eight or ten inches. Its general appearance like that of a loche; but its eyes differ from those of every known fish, each being apparently divided into two distinct eyes, united in a common receptacle; on dissection, however, this observation is found to apply only to the anterior half of the organ. This fish is a native of South America, principally frequenting the rivers of Surinam, near the sea-coasts.

Gen. 3. Amia.

Amia. Head bony, naked, rough, and furnished with sutures; teeth acute, and close in the jaws and palate; two beards at the nose; gill-membrane twelve-rayed; body scaly.

Calvus. Carolinaian amia. - With a black spot at the tail; small, of a roundish form, and seldom eaten. Inhabits Carolina.

Gen. 4. Silurus.

Silurus. Head naked, large, broad, and compressed; mouth furnished with beards; gape and throat wide; lips thick; jaws dentated; tongue thick, smooth, and very short; eyes small; gill-membrane furnished with from four to sixteen rays; body elongated, compressed, scaleless, covered with viscid slime; lateral line near the back; the first ray of the pectoral fins, or of the dorsal fin, spiny, and dentated backward.

Glanis. Glanis, or European silurus. - One soft dorsal fin; six beards. Grows to the length of eight, ten, or even fifteen feet, and to the weight of three hundred pounds; but its ordinary size is from two to three or four feet. It is sluggish, and usually lies half imbedded in the soft bottoms of the rivers which it frequents, with its mouth half-open, moving about its beards, which the smaller fishes mistaking for worms, lay hold of, and are entrapped. It inhabits the larger rivers of Europe, as well as some parts of Asia and Africa, but is in no high estimation as a food.

Electricus. Electricus silurus. - With one adipose dorsal fin, and six beards. About twenty inches long, very broad in the fore-part, depressed, and of a cinereous colour, with some blackish spots towards the tail. It is found in some rivers in Africa, and when struck, it gives a galvanic shock, though not so strong as that from the torpedo and gymnus. It is used as food.

Ascita. Ascitic silurus. - Brown, ash-coloured beneath, with beards longer than the body; forked tail, and eleven rays in the anal fin. The young of this species are excluded in the form of large ova, the integuments of which they soon break, but adhere to the parent till the yolk is consumed. Native of India.

Cat silurus. - The hinder dorsal fin adipose; twenty rays in the anal fin, and eight beards. Inhabits the sea and rivers of North America, preying on all kinds of smaller fishes, and not sparing even those of its own kind. Tastes like an eel, and is much relished by the Abdominal Americans.

The other species are denominated militaris, bagre, herwergrt, inermis, galeatus, nodosus, bimaculatus, fasciatus, claris, quadramacculus, erythrophorus, batrachus, fossilius, vitatus, atherinoide, asitus, mystus, anguillarius, undecimalis, cornitus, felis, coves, carinatus, docmac, chelone, and beyad.

Gen. 5. Platypterus.

Platypterus. Habitat of silurus; mouth beneath, bearded with cirrhi; body scaleless, depressed; tail long, compressed.

Acetabulatus platypterus. Silurus asperus of Linnaeus. cotylepho. Grows to the length of a foot or more, has a very un-rus, couth appearance, and is remarkable for the many small acetabular processes, or suckers, with which the body is beset. Native of the Indian seas and rivers.

Smooth platypterus. - Eight beards, and plain abdo-laeus. men. Very like the preceding, but wants the abdominal suckers.

Warted platypterus. - Brown, marked above by longitudi-guiridal warted lines, with short anal fin. Smaller, sus, and less elongated than the two preceding. Native of the Indian seas.

Eel-shaped platypterus. - Brown, with longitudinal anguilla-white stripes, and the second dorsal, anal, and caudal fins united. Length twelve or fifteen inches. Native of the Indian seas.

Loricaria. Habitat of silurus; mouth beneath, bearded with cirrhi; body scaleless, depressed; tail long, compressed.

Ribbed loricaria. Silurus costatus of Linnaeus. - Yel-lowish brown, mated with a single row of shields on each side; tail forked. This is a species of great strength and boldness, which inflicts very painful and dangerous wounds with its spines. It is a native of the Indian and American seas.

Armed loricaria. - One dorsal fin, two beards; length cata-about ten or twelve inches. Much allied to the pre-practica, preceding, but has a rounded tail. Native of the Ameri-can seas.

Soldier loricaria. Silurus callicthys of Linnaeus. - callic-thus. Brown, with depressed rounded head; double row of thy-scales on each side, and rounded tail. Native of South America, where it is in considerable esteem as a food.

Speckled loricaria. - Yellow, with brownish back; punctata, double row of scales on each side; fins speckled with black; and forked tail. Only five or six inches long, but very elegant. Native of the rivers of Surinam.

Toothed loricaria. - Lengthened; yellowish brown; dentata, with toothed, bearded mouth, and slightly pointed snout. Native of the Indian seas.

Yellow loricaria. Loricaria plecostomus of Linnaeus. - foluva. Yellow, spotted with brown; two dorsal fins; and tail marked by transverse bands. Native of the Indian seas.

Gen. 7. Salmo.

Salmo. Head smooth and compressed; mouth large; lips small; tongue white, cartilaginous, and moveable; eyes middle-sized; lateral teeth in the jaws and tongue; gill-membrane furnished with four to ten rays; gill-
ICHTHYLOGY.

Abdominal Fishes.

Most of the fishes of this genus frequent pure and rapid streams; a few of them inhabit the sea, but enter rivers for the purpose of depositing their spawn in spring, and return to the sea in autumn. They feed on insects and other fishes, and their flesh is much relished as a food. We shall confine our notices to a few of the most important and remarkable species.

Common salmon.—The upper jaw projecting beyond the under. The general length of the salmon is from two and a half to three feet; but it is said to be sometimes found the length of six feet, and Mr. Pennant mentions one of 74 pounds weight as the largest he ever heard of. The general colour of both sexes is a silvery gray, of a much darker cast on the back; the sides of the male are marked with many small, dusky and copper-coloured spots, while the markings on the female are larger, more distant, and roundish, or lunated. The male is also of a more slender form than the female. This fish, which is so highly esteemed for the delicacy of its flavour, and which forms such an important article of commerce, occurs chiefly in the salt and fresh waters of the northern regions, being unknown in the Mediterranean and other warm climates; but frequenting some of the rivers in France, which empty themselves into the ocean, and being found as far north as Greenland and the northern parts of North America. It quits the sea at certain periods to deposit its spawn in the gravelly beds of rivers, often ascending to a great distance from their mouths, forcing itself against the most rapid streams, and leaping with surprising agility over cataracts of a considerable height. On the river Liffey, the salmon are often observed to fall back before they surmount the cataract, which is 19 feet high; and baskets are placed near the edge of the stream to catch them as they fall. At the falls of Kilmore in Scotland, where the salmon are very numerous, the country people are accustomed to lay branches of trees on the edge of the rocks, and thus intercept such of the fish as miss their leap. Alongside one of these falls the late Lord Lovat ordered a kettle full of water to be placed over a fire, and many minutes had not elapsed before a large salmon made a false leap and fell into it. When the salmon enter the fresh water in winter, they are more or less infested with the salmon louse, (Lernaea salmonica Lin.), and are then reckoned to be in high season. These insects, however, soon die and drop off, and the fish becomes lean at spawning time. The male and female unite in forming a receptacle in the sand or gravel, about 18 inches deep, for the ova, and having covered up the latter, which are not hatched till the ensuing spring, hasten to the salt water much emaciated, and soon recover their plumpness. The fry appear about the end of March, and are five or six inches in length, in the beginning of May, when they are called salmon smelts or smolts. The first flood sweeps them in immense swarms into the sea. About the middle of June, the largest of these begin to return into the rivers. Towards the end of July, they are called gils, and weigh from six to nine pounds. Their food is other fish, insects, and worms; but no food is found in their stomach during spawning time, it is probable that they neglect it during that season. The fishery season commences in the Tweed on the 30th of November, and ends about old Michaelmas day. A particular account of this fishery occurs in the third volume of Pennant's British Zoology, to which we beg leave to refer our readers. "A person of the name of Graham (says Mr. Bingley), who farms the seacoast fishery at Whitehaven, has adopted a successful mode of taking salmon, which he has appropriately denominated salmon-hunting. When the tide is out, and the fish are left in shallow waters, intercepted by sand banks, near the mouth of the river; or when they are found in any inlets up the shore, where the water is not more than from one foot to four feet in depth, the place where they lie is to be discovered by their agitation of the pool. This man, armed with a three-pointed barbed spear, with a shaft of 15 feet in length, mounts his horse, and plunges, at a swift trot, or moderate gallop, belly deep, into the water. He makes ready his spear with both hands; when he overtakes the salmon, he lets go one hand, and with the other strikes the spear, with almost unerring aim, into the fish: this done, by a turn of the hand he raises the salmon to the surface of the water, turns his horse head to the shore, and runs the salmon on dry land without dismounting. This man says, that by the present mode he can kill from 40 to 50 in a day: ten are however no despicable day's work for a man and horse. His father was probably the first man that ever adopted this method of killing salmon on horseback."—In the intestinal canal of salmon is often found a species of fumicola, about three feet in length; and Dr. Bloch mentions, that in a specimen which had been three weeks dead, he found one of these worms still living.

Gray salmon, or gray.—With ash-coloured spots, the extra part of the tail equal. Weights from 13 to 20 pounds. The head is larger in proportion than in the preceding species; it is a strong fish, and does not ascend the fresh water till August, when it rushes up with great violence, and is seldom taken.

Salmon trout, sea trout, or bull trout.—Marked with black spotted spots, the middle brownish, six dots on the pectoral fins. The general appearance very like the common salmon, but seldom equal to it in size. Like the salmon it inhabits the European seas, passing into rivers to deposit its spawn. Its flesh, too, is of equal delicacy. The viscous mucus which covers the skin possesses the quality of exhibiting phosphoric light.

Common trout.—With red spots, the lower jaw broader than the upper. The general length of this species is from 12 to 15 or 16 inches; the ground colour yellowish grey, darker on the back, and marked on the sides by several straggling, round, bright-red spots, each surrounded by a tinge of pale blue grey. The colour however, is subject to considerable variety. The trout is a common inhabitant of European streams and lakes, preferring those that are clear and cold, living on worms, small fishes, and aquatic insects and their larvae. Like the salmon, it occasionally springs over obstacles in its course. It usually spawns in September or October. Those which are in most request for the table, are natives of the clearest waters.—The gillaroo trouts which are found in the lakes of Galway, in Ireland, are not specifically different from the common, but their stomachs acquire an extraordinary degree
gree of thickness and muscular force, a circumstance which is ascribed to their living much on shell-fish, and swallowing small steps.

Huso salmo.—Oblong, two rows of teeth in the palate, marked with slightly blackish spots. More slender than the common salmon, and its flesh not so firm. Inhabits the Danube, the Bavarian and Austrian lakes, and the rivers of Russia and Siberia.

Alpine trout, or charr.—Back black, sides bluish, belly reddish yellow. Length about a foot. In great request for the table. Native of the Alpine lakes and rivers, as well as of those of Germany, Lapland, Sweden, &c. Found in some of the lakes of Cumberland and Westmoreland, Loch-Leven in Scotland, &c.

Salvelinus.—Salvelinus trout, or red charr.—About a foot in length, the upper jaw longest. Inhabits nearly the same regions as the preceding, and is equally esteemed for the delicacy of its flavour.

Smelt salmon, or smelt; spilling or sparring of the Scotch.—Head transparent, 17 rays in the anal fin. Of an elegant, tapering form, and of a very peculiar flavour, which some compare to roushe, others to violets, and others to cucumbers. It varies in length, from six to 12 inches, inhabits the seas of Europe, and ascends rivers for the purpose of spawning, early in spring. In the Thames and the Dee, however, they are taken in great quantities in November, December, and January. There is a smaller variety which abounds in the north of Europe.

Gymnothorax, or guenaid.—The upper jaw longest, 14 rays in the dorsal fin. Resembles a trout, but is thicker in proportion. Inhabits the lakes of the Alpine parts of Europe, and those of Cumberland, Wales, and Ireland. It occurs also in Loch Lemond, in Scotland, where it is called pouvan. A fisherman at Ullswater is said to have taken between seven and eight thousand of this species at one draught. Its usual length is from 10 to 12 inches. According to Dr Bloch, the guenaid also inhabits the northern seas, and the Baltic.

Muraena salmon.—Jaws without teeth, the under one longest. Length about six inches; shape like that of a trout, but more slender. Native of several of the European lakes, and much esteemed as a food. At Lochmaben, the only place in Scotland where it occurs, it is called luranga. According to tradition, it was brought to Lochmaben, from England, in the time of Robert Bruce.

Thymus.—Graying salmon, or grayling.—Upper jaw the longest, 23 rays in the dorsal fin. About the length of 18 inches. Frequent in the clearer and colder rivers in many parts of Europe and Asia, particularly those which flow through mountainous countries. It is an elegant species, voracious, and of quick growth; spawns in April and May; has white, firm, and fine-flavored flesh, and is considered to be in highest season in the middle of winter.

To this genus also belong lernok, helias, taimen, erythrurus, phine, salmulus, sieffermulleri, gyaeni, salmarius, carpio, lepechini, lucustris, umbra, argentinus, arcticus, stagnalis, rivulis, stromi, saurus, tumbl, faten, granlandicus, denter, gibbosus, notatus, bimaculatus, immaeaculatus, crypsoidee, niloticus, aegyptus, pulvinulentus, anastomus, rhombeus, gasteropeleus, falsatus, fasciatus, friderici, unimaculatus, melanurus, fulvis, migratorius, autumnalis, wartmanni, rostrato-Abdominal

Gen. 8. Acanthoconus. Acantha-
notus.

Body elongated, without dorsal fin. Several spines on the back and abdomen.

Snouted acanthoconus.—Gray, with the back trans. nasus. Versely barred with brown. The only known species of this genus. The specimen described by Bloch measured two feet and a half. Native of the Indian seas.

Snout cylindrical, with jaws at the apex; gill membrane seven-rayed.

Slender fistularia, or tobacco-pipe-fish.—Tail bifid tabacaria, and setiferous. Length three or four feet, shape resembling that of an eel; the head about nine inches long, from the eyes to the tip of the mouth. From the middle of the forcurature of the tail, proceeds a very long and thickish bristle, like whalebone, which gradually tapers to a very fine point. The spine of this singular fish is also of a very peculiar structure, the first vertebra being of immoderate length, the three next much shorter, and the rest gradually decreasing as they approach the tail. It inserts its long snout into the hollows of rocks, under stones, &c. to lay hold on the smaller fishes, worms, and sea insects on which it chiefly feeds. Inhabits America and Japan, and is edible.

Chinese fistularia, or Chinese trumpet-fish.—Simple chinensis, rounded tail. Body thicker in proportion than in the preceding species. Native of the Indian seas, though its fossil impressions have been found under the volcanic strata of Monte Boka, near Verona.

Paradoxal fistularia.—Finely reticulated, with paradorea, slightly prominent lines, and lanceolate tail. Length from two to four inches, body angular, and the whole fish bearing a close resemblance to a Symphatus. Native of the Indian seas.

Head somewhat flat above; mouth and gullet wide; jaws dentated, unequal; the upper plane, under punctured; tongue broad and loose; palate smooth; eyes round, middle sized, and lateral; nostrils double; near the eyes rays; body elongated, covered with hard scales, convex above, compressed at the sides; lateral line straight, nearest the back, scarcely conspicuous; dorsal and anal fins very short and opposite.

Sea-pike, or spit-fish.—Two dorsal fins, the anterior spiny. Of a silvery bluish colour, dusky on the back, and slightly tinged with yellow on the head and about the gills. Grows to the length of nearly two feet. Inhabits the Mediterranean and Atlantic; and has something the flavour of the cod.

Bony-scaled pike.—Upper jaw the longest, scales osseus. Bony. This last character gives it a very singular appearance. It attains to the length of three to four feet, inhabits the American lakes and rivers, is very voracious, and is an excellent fish for the table.

Common pike, or pickerel.—Snout depressed, and near-lucius, ly equal. Head very flat; the teeth very sharp and numerous, being disposed not only in front of the upper

N. 2 jaw,
ICHTHYOLOGY.

Abdominal jaw, but in both sides of the lower, in the roof of the mouth, and often on the tongue, amounting to at least 7½. The ordinary colour of this fish is pale olive gray, deepest on the back, and marked on the sides by several yellowish spots; the abdomen is white, slightly spotted with black. According to Pennant, the largest specimen of English growth weighed 35 pounds. Those of Lapland sometimes measure eight feet. It is a proverbially voracious species. "We have known one, (says Mr Pennant), that was choked by attempting to swallow one of its own species—tht proved too large a morsel. Yet its jaws are very loosely connected, and have on each side an additional bone like the jaw of a viper, which renders them capable of greater distension when it swallows its prey. It does not seize itself to feed on fish and frogs; it will devour the water rat, and draw down the young ducks as they are swimming about. In a manuscript note, which we found, p. 244, of our copy of Plot's History of Staffordshire, is the following extraordinary fact: "At Lord Gower's canal at Trentham, a pike seized the head of a swan as she was feeding under water, and gorged so much of it as killed them both. The servants perceiving the swan with its head under water for a longer time than usual, took the boat, and found both swan and pike dead."—The smaller fish manifest the same uneasiness and horror at the presence of the pike, as little birds at the sight of the hawk or owl. If we may credit some naturalists of name, the longevity of the pike is not less remarkable than its voracity. Rzeczyński, in his Natural History of Poland, tells us of one that was 90 years old; but Gesner relates, that in the year 1497, one was taken near Haiburn, in Swabia, with a brazen ring affixed to it, on which were these words in Greek characters: "I am the fish which was first of all put into this lake by the hands of the Governor of the Universe, Frederick the Second, the 5th of October 1230."—The pike spawns in March and April, and is said to be of very quick growth.

Gar-pike, gar-fish, or horn-fish.—Both jaws sublunate. General length from two to three feet, the body slender, and the belly flat. The back is of a very fine green, beneath which is a rich changeable blue and purple cast, while the sides and belly are of a bright silver colour. The jaws are very long and slender, and the edges of both are armed with numerous short slender teeth. Native of the European seas, arriving in shoals on the British coasts, preceding the mackerel. The spine and bones acquire a green colour by boiling, notwithstanding which it is eaten with perfect safety.

The other species are barracuda, vulpes, malabaricus, synodus, hepetus, argenteus, gymnocephalus, brasiliensis, chiocenturus, chinensis, auroviridis, beccuna, saurus, cepedianus, chilenus, cirrhis, and stomias.

Gen. 11. POLYPETUS.

Gill-membrane single-rayed; dorsal fins numerous.

Nile Polypterus.—Green, with the abdomen spotted with black. Of a long and serpentine shape, the body being nearly cylindrical, and covered with strong and adhering scales. The pectoral and ventral fins are attached by a scaly base; and the dorsal, to the number of 16, 17, or 18, and of an ovate shape, run along the whole length of the back. Native of the Nile, and one of the best fishes which that river produces, but Abdominal Fishes.

Chap. IV.

Head smooth; numerous small teeth in the margin of the jaw and in the palate; gill-membrane with 32 rays, and armed in the middle externally with five teeth.

Savory elops, great saury, sein-fish, or sea gally-wasp. saurus.
—The tail armed above and below with a spine. About 14 inches long, and has some resemblance to a salmon, but wants the adipose fin. Native of the American seas.

Gen. 13. ARGENTINA.

Teeth in the jaws and tongue; gill-membrane eightrayed; vent near the tail; ventral fins with many rays.

Pearl-bladdered argentine.—Anal fin nine-rayed. A sphyraena. small brilliant fish, inhabiting the Mediterranean, and affording, by its air-bladder and scales, some of the best kind of silvery matter used in the preparation of artificial pearls.

The other species are glossodonta, carolina, and machnato.

Gen. 14. AHERENA.

The upper jaw somewhat flat; gill-membrane six-rayed, a silvery stripe along the side.

Mediterranean atherine.—About 12 rays in the anal hepsetus. fin. An elegant species, of the length of six or seven inches, and shaped like a scom. Native of the Mediterranean and Red seas. Also found on the coast of Southampton, where they are often called by the name of smelts.

To the same genus belong menidia, sithana, japonica, brownii, and pinguis.

Gen. 15. MUGIL.

Lips membraneous, the under one carinated within; no teeth, but a denticle above the opening of the mouth; gill-membrane 7-rayed; gill-covers smooth, rounded; body whitish.

Mullet, or common mullet.—Five rays in the first cephalus. dorsal fin.—Length from 12 to 16 inches; colour bluish gray, darker on the back, and silvery on the abdomen. Very common in the Mediterranean and northern seas, chiefly haunting the shallows near the shores, and feeding on marine worms, insects, and plants. It likewise occurs in the Indian and Atlantic oceans. In the spring and early summer months, it ascends rivers. The roe is often prepared into an inferior kind of caviar, called botargo; and the fish itself, though not fashionable in our own country, is reckoned excellent for the table. In plentiful seasons, it is dried and salted.

The other species are crenulatus, albula, malabaricus, tang, plumieri, carmimaculatus, chilenus, and chanos.

Gen. 16. EXOCETUS.

Head scaly, no teeth; jaws convex on both sides; gill-membrane ten-rayed; body whitish, belly angulated; pectoral fins very long, adapted to flying; the rays carinated before.

Oceanic
Oecistic flying fish.—Abdominal fins ciliated on both sides. Of a bright silver colour, gradually deepening into purplish brown on the back; the pectoral fins dusky, the dorsal and anal yellowish, and the ventral fins and tail reddish. It is a native of the American and Indian seas, but is occasionally observed in the Mediterranean; and Pennant mentions an instance of its being seen about the British coasts. The largeness of the air-bladder, and the peculiar structure of the mouth, which can be closed while the jaws are open, assist its power of flight.

Mediterranean flying fish.—The ventral fins reaching to the tail. The general length of this species is from 12 to 15 or 16 inches; and its general shape is not unlike that of a herring, to which it is also compared as an eatable fish. It is of a bright silvery cast, with a blue or dusky tinge on the upper part. It is frequently observed in the Mediterranean and Atlantic, sometimes singly, and sometimes in shoals. During the decline of its flight, it sometimes falls into ships; the height, however, at which it generally exercises its flight, is about three feet above the surface of the water. From the length and size of the pectoral fins, it is enabled to continue this motion through the air to the distance of 200 or 300 feet, when the fins becoming dry, it is again obliged to have recourse to the water. Here it is persecuted by the dorado, bonito, dolphin, and other predaceous fishes, while, in its aerial career, it is equally harassed by the gull and the albatross.

American flying fish.—Silvery bluish, with the ventral fins situated in the middle of the abdomen. Native of the Atlantic ocean.

Commersonian flying fish.—With a dark blue spot on the dorsal fin. Native of the Indian seas.

Gen. 17. Polynemus.

Head compressed and scaly; snout very obtuse and prominent; gill membranes with five or seven rays, separate finger-like processes at the pectoral fins.

Paradise polynemus, the fish of Paradise, or mango-fish.—Seven fingers, and forked tail. Grows to the length of about 12 or 15 inches, and the thoracic filaments are very long, the outer ones often extending beyond the tail, and the others gradually shortening. It inhabits the Indian seas, and is reckoned by much the most delicate fish at Calcutta.

Plebeius polynemus.—Five fingers, the first reaching beyond the vent, the others gradually shorter. Resembles a mullet, except that the head is much blunted. It sometimes measures upwards of four feet, is a native of the Indian and American seas, and is considered as an excellent fish for the table.

Quinquarius, niloticus, decadacontiulus, indicus, tetradacontius, virginicus, commersonii, and plumieri, compose the rest of the genus.

Gen. 18. Clupea.

Head compressed; mouth compressed, and denticulated within; jaws unequal, the upper furnished with serrated side plates; tongue short, rough, with teeth turned inwards; eyes middle-sized, round and marginal; gills internally seaceous, their covers consisting of three or four plates, the membranes eight-rayed; body compressed, elongated, covered with abdominal scales; lateral line straight, near and parallel to the back; under part of the abdomen forming a serrated ridge; ventral fins often with nine rays, caudal long and forked.

Herring.—Without spots; the under jaw the long-harengus. In size, this well-known fish is found to vary very considerably, though the general length may be reckoned from 10 to 12 or 13 inches. The back is of a dusky blue or greenish, and in the recent or living fish, the gill-covers are marked by a reddish or violet-coloured spot. The scales are rather large, and adhere slightly. The fins are rather small, and the tail is much forked. In most specimens, the anal fin has 17 rays. The herring inhabits the northern seas of Europe, and the Atlantic ocean, and is seldom found farther south than the coast of France. Its food principally consists of small fishes, sea worms, and a minute species of crab, Cancer holcium, which abounds in the Norwegian seas. When it has fed on this last, its intestines are filled with the red ova of the insect, and is unfit for being salted. At spawning time its stomach is always empty, which seems to indicate that, like the salmon, and some other fishes, it is, at that season, quite negligent of food. Herring spawn at different seasons, some in spring, some in summer, and some in autumn, when they approach our shores in immense shoals. But the reality of their long and periodical migrations is by no means ascertained. On the contrary, it is more probable, that, like the mackerel, they pass the winter in deep water, or in the soft mud at the bottom, at no very great distance from the shores. They are, in fact, found about some of the European coasts at almost every season of the year; and the alleged rapidity of their northern voyages greatly exceeds the swiftest progress of which they are capable. They are the ceaseless prey of several of the cetaceous tribe of animals, of various fishes, and of different sorts of sea fowl, particularly of the gannet, or sooty goose. Notwithstanding the great importance of this fish to the inhabitants of modern Europe, we find no certain description of it in any of the Greek or Roman writers. The Dutch engaged in the herring-fishery in 1164, and the discovery of the pickling process is ascribed to William Beukelen, of Bierviel, near Sylva. He died in 1597; and Charles V. in honour of his memory, paid a solemn visit to his tomb.

Pilchard.—Silvery, with dusky back, and large pilchard—strongly adherent scales. Very like the preceding, but dusier, smaller and thicker, with larger scales, and the dorsal fin placed exactly in the centre of gravity. Very frequent on some of the European coasts. Usually visits the shores of Cornwall in vast shoals, about the middle of July, and disappears on the commencement of winter. On the 5th of October, 1767, there were included in St Ives Bay 7000 hoghead, each of which contained 35,000 fish, in all 24 millions.

Sprat.—With 15 or 17 rays in the dorsal fin. A small species, like the fry of herring; but it has a strongly serrated abdomen, and only 48 vertebrae in the backbone, whereas the herring has 56. Inhabits the northern and Mediterranean seas, and approaches the shores in countless swarms, in autumn.

Shad.—Black spots on the sides, the snout bifid. In Asia, general appearance resembles the pilchard; but is much larger.
Abdominal larger, and much thinner in proportion. Native of the Mediterranean and northern seas. In spring, it ascends rivers for the purpose of depositing its spawn. Like the herring, it dies almost immediately on being taken out of the water. Though prepared for the table in many countries, it is rather coarse and insipid.

**Encrasico-locus.**

**Anchovy.**—The upper jaw longest. Usual length from three to four inches, of a somewhat lengthened form, and covered with large, thin, and easily deciduous scales. Native of the Mediterranean, northern, and Atlantic seas. Spawns from December to March. It is in great request as a pickle, the bones dissolving entirely in boiling. The principal anchovy fishery is about the small island of Gorgona, near Leghorn.

The remaining species are **malabarica, africana, sinensis, thraen, giganthes, atherinoides, setiostris, dorad, tuberculatus, chrysopera, fusiusa, nanus, macrocephalus**, and **tropicus**.

**Gen. 19. Cyprinus.**

**Cyprinus.**

Without teeth; mouth in the apex of the head, and bisulcated; gill-membrane three-rayed; body smooth and whitish; ventral fins generally nine-rayed.

Most of the cyprini inhabit the fresh waters, and are much esteemed as food. They live on clay, mould, worms, insects, and leguminous and aquatic plants, though some of them also prey on other fishes. Most of them spawn in April or May.

**Barb.**

**Barbel.**—Anal fin seven-rayed, four beards; second ray of the dorsal fin serrated on both sides. Has somewhat the habit of a pike, and is usually found in deep and rapid rivers in most of the middle and southern parts of Europe. It is easily distinguished by its two pair of long and unequal beards. Its ordinary length is from 18 inches to two feet. Though capable of swimming with strength and rapidity, it sometimes allows itself to be taken by the hand by divers employed for that purpose. It is a coarse fish; and the roe is said to operate as an emetic and cathartic.

**Cor.**

**Carpin.**—Anal fin nine-rayed, four beards, the second ray of the dorsal fin serrated behind. The most common colour of this species is a yellowish olive, much deeper on the back, with a gilded tint on the side. In our own country it measures from 12 to 16 inches in length; but in warmer climates attains to a much larger size, and sometimes weights from 20 to 40 pounds. It feeds chiefly on worms and water insects, and frequents the lakes and small rivers in the southern parts of Europe, usually decreasing in size the farther it is removed into a northern region. It is a very tenacious of life, and may be kept for a considerable time in any damp place, though not immersed in water; and well authenticated instances are quoted of its attaining to the age of more than a century. It is said to have been introduced into England about the year 1574. In Germany and Poland, it is cultivated as a considerable article of commerce. A carp of three pounds weight will produce 237,000 ova, and one of nine pounds, 621,650. A green pigment is obtained from its bile, and sizing from its air-bladder. It is reckoned one of the most delicate of fresh-water fishes. A variety occurs in some parts of Germany, with very large scales, and termed by Bloch **rex cypriniurn.**

**Gobio.**

**Gudgeon.**—Anal fin eleven-rayed, two beards. General length from four to five or six inches; the body thick and somewhat cylindrical, for the most part of a pale olive brown above, the sides silvery, and the abdomen white. This is a very prolific species, and deposits its spawn, at intervals, in the spring. Inhabits small lakes and gently flowing rivers in most parts of Europe, and is particularly abundant in some parts of Germany, especially in autumn. In request for the table.

**Tench.**—Anal fin with 25 rays; tail entire; body thin; slimy; two beards. The ordinary length of the tench is about 12 or 14 inches; but it varies considerably both in size and colour, according to its situation. It resides in stagnant waters with muddy bottoms, in most parts of the globe, deposits its minute greenish ova in May and June, is very prolific, of quick growth, and is supposed by some to hibernate in the mud of the waters which it inhabits. It is reputed a delicate fish for the table. In Mr Daniel's Rural Sports, we find the following remarkable passage. "A piece of water, at Thornville Royal, Yorkshire, which had been ordered to be filled up, and wherein wood, rubbish, &c. had been thrown for years, was, in November 1821, directed to be cleared out. Persons were accordingly employed; and, almost choked up by weeds and mud, so little water remained, that no person expected to see any fish, except a few eels; yet nearly 200 brace of tench, of all sizes, and as many perch, were found. After the pond was thought to be quite free, under some roots there seemed to be an animal, which was conjectured to be an otter; the place was surrounded, and on opening an entrance among the roots, a tench was found of a most singular form, having literally assumed the shape of the hole, in which he had of course for many years been confined. His length from fork to eye, was two feet nine inches; his circumference, almost to the tail, was two feet three inches; his weight 11 pounds, nine ounces and a quarter: the colour was also singular, his belly being that of a charr, or a vermillion. This extraordinary fish, after having been inspected by many gentlemen, was carefully put into a pond; but either from confinement, age, or both, it at first merely floated, and at last, with difficulty, swam gently away. It is not seen and well known."

**Cruicus.**—Anal fin ten-rayed, lateral line straight. **Carasius.** Length from eight to ten inches; shape very deep, with considerable thickness; colour deep olive yellow, with a silvery tint on the abdomen. Inhabits ponds and large stagnant waters in many parts of Europe. Grows slowly, and is much infested by the **lernat cyprinace.** Spawns but once in two years, and is in considerable esteem as an edible fish.

**Golden carp, or gold fish.** Two anal fins, the caudal transverse and forked. This favourite ornament of our houses and gardens, is a native of the southern parts of China, and exists in its natural state in a large lake in the province of Kiang, whence it has been diffused over the country, and cherished with fondness and attention. It is said to have been first introduced into England in 1691. In its domestic state, it is subject to very considerable variations in colour, form, and even number of fins. It may be fed with fine bread crumbs, small worms, water-snails, yolk of eggs dried and powdered, &c. and should be supplied with a frequent change of water.
Chap. IV.

ICHTHYOTOLOGY.

Abdominal Fin.

Minos.—Anal fin eight-rayed; a brown spot at the tail; body transparent. A small but elegant and familiar species, frequenting the small gravelly streams in many parts of Europe and Siberia. In our own country it appears first in March, and disappears about the beginning of October, when it sequesters itself in the mud. It is cgregarious, and fond of warmth, often swimming in shoals near the surface of the water, in clear hot weather. It feeds on herbs and worms, is very prolific, and of a delicate flavour, though seldom prepared for the table, on account of its smallness. It is more frequently used as bait for other fishes.

Dace, or Dace.—Eighteen rays in the anal, and nine in the dorsal fin. Length from six to eight or ten inches. In manners allied to the roach, and inhabits lakes and rivers in many parts of Europe. Little esteemed for the table.

Roach.—Anal fin with 12 rays; ventral rays of a blood-red colour. Silvery, with a cast of dull yellow, more dusky on the upper parts; fins red. Frequent deep, still, and clear rivers in most of the middle parts of Europe, often appearing in large shoals, preceded by one or more, apparently stationed as a kind of guard. It spawns about the middle of May, and is very prolific. It usually weighs about a pound, or a pound and a half. Its flesh is white, firm, and well tasted, but not held in any great repute.

Orf.—Thirteen rays in the anal fin. Length from 10 to 12 inches, or more. Resembles the gold-fish, and kept in small ponds on account of its beautiful appearance. Native of many parts of Germany, Russia, &c.

Rud.—Anal fin with 15 rays; fins red. About 8 or 10 inches long. Native of several parts of Europe, in lakes and rivers with a gravelly bottom. Reputed edible, and in season in summer.

Chub.—Fourteen rays in the anal fin; snout rounded. Resembles the tench, but has a more lengthened form, and a thicker head in proportion. Ordinary length from 14 to 18 inches. Native of many parts of Europe, and not uncommon in Great Britain, occurring chiefly in clear and rapid rivers. Rather coarse and unpalatable, and apt to acquire a yellow colour in boiling.

Bleak.—Twenty rays in the anal fin. Length five or six inches; shape slender; colour bright silvery. From its scales is prepared the silvery matter used in the manufacture of artificial pearls.

Bream.—Twenty-seven rays in the anal fin; the fins brown. Of a very broad or deep shape, and from two feet to two and a half long. Of an olive hue, with a pale or flesh-coloured tinge on the under parts. Inhabits the lakes and rivers of many parts of Europe. As an article of food, it is reckoned rather coarse and insipid.

Besides the above, this genus likewise comprehends the rondelet, gibele, bicea, bollerus, pomeranicas, fimbriatus, cirrhous, falcatus, americana, biorkna, forens, grisiagale, byni, bulatmai, capota, coccus, malchus, julis, buphthalmus, quadrilibus, tuncareus, fergusines, nigro-duras, viridio-volaceous, punctatus, annus, sericus, copia, candidus, cephalus, capitis, idius, masus, sora, doble, lancestratenis, murus, regius, labeo, leptochalas, cataracta, galus, chrysides, genus-hynchus, aphya, and rutilus.

Gen. 20. Mormyrus.

Mormyrus.

Mormyrus.—Snout produced; mouth terminal; teeth several, and emarginated; aperture without gill-cover; gill-membrane single-rayed; body scaly.

In consequence of Geoffroy’s recent investigations, this hitherto obscure genus is ranked in the abdominal order; and the number of species has been increased from three to nine. They are all natives of the Nile. Anguiliformis mormyrus, has a sharp snout, equal anguilliform jaws, 26 rays in the dorsal fin, and a bifid acute lunate tail.

The other species are kannume, oxyrhynchos, salamia, bebi, herter, cyprinoides, bate, and haseleuquus.

V. CARTILAGINOUS.

The fishes of this order have their fins furnished with cartilaginous rays. Their lungs are more similar to the gills of fishes than to the pulmonary system of the mammals and amphibians; and in some of the genera are found both lungs and gills.

Gen. I. Ostracion.

Ostracion.

Teeth pointing forward; body mailed by a bony covering.

Trigluitral or three-sided trunk-fish. — Body triangular, unarmoured. This species is of a trigonal shape, measures about 12 inches in length, and except to within a small distance from the tail, is completely enveloped in a bony covering, divided into hexagonal spaces. Its prevailing colour is brown, with a white spot in the centre of each hexagon, which is also marked by fine rays diverging from the centre to the edges. Native of the Indian and American seas, and highly esteemed as an edible fish among the East Indians.

The generic characters of the trunk-fishes are readily recognised; but the specific marks are not easily ascertained. Dr Shaw enumerates, in addition to the preceding, trigonies, bicaulacites, cornutus, tricornis, quadriformes, turritus, concenatus, nasus, cubicus, meleagris, auritus, striatus, tuberculatus, and gibbosus.

Gen. 2. Tetraodon.

Tetraodon.

Jaws bony, divided at the tip; body roughened beneath; no ventral fins.

The fishes of this genus, like the diodons, have the power of inflating their body at pleasure, by means of an internal membrane for that purpose; and during the time of inflation, the small spines dispersed over the sides and abdomen are raised in such a manner as to operate as a defence against their enemies. They are chiefly natives of the tropical seas, though sometimes seen in the higher northern and southern latitudes, and are supposed to live principally on the crustaceans and tectaceous animals.

Electric tetraodon.—Body brown above, yellow on the electricus. Sides, sea green beneath, and varied with red, green, and white spots. Length seven or eight inches. inhabits rocky places among the corals, in the Indian and American seas; and, when touched, affects the hand with a galvanic shock.

Oscillated.
Ichthyology.

Ocellated tetradon.—Dull green; whitish beneath, with a black crescent over the shoulders, and spot on the back, both edged with yellow. Inhabits the Indian seas, and sometimes the adjoining rivers, particularly those of China and Japan. It is of a very poisonous nature; and the emperor of Japan prohibits his soldiers, under very severe penalties, from eating it. The sceleratus is also reputed highly noxious.

The other species are logoccephalus, lineatus, hiripidus, testudineus, sphenilis, hongkoni, oblongus, lavigatus, stellatus, punctatus, megaloris, and rostratus.

Diodon.

Gen. 3. Diodon.

Jaws bony, undivided; body beset with moveable spines.

Hystrich.

Porcupine diodon.—Of a spherical form, with triangular spines. Of a considerable size, sometimes measuring two feet in length. It possesses the power of inflating and contracting itself at pleasure, remarkable instances of which property it is said to exhibit when taken with a line and hook. Its flesh is coarse, though sometimes eaten by the inhabitants of the West Indian islands.

Oblong diodon.—With round spines. Nearly allied to the preceding, and considered as poisonous.

The remaining species are denominated orbicularis, plumieri, and lituratus.

Cephalus.

Jaws bony; body terminating abruptly, so as to resemble the head of a fish.

Brevis.

Short sun-fish, or short diodon. Tetradon mola of Linneus.—Body suborbicular, very short and broad, terminating abruptly on the hind part, where it is edged by a shallow fin. The general colour brown, with a silvery cast on the sides and abdomen. Native of the northern seas, where it sometimes arrives at the length of eight or even ten feet, and to the weight of 500 pounds. Also a native of the Atlantic and Ethiopian sea. It is said to exhibit a strong phosphoric light during the night. The oblong is probably only a variety of this species, as La Cépède has observed intermediate gradations between the two. The corriged is distinguished by whitish undulations and spots; and the pallidus by its silvery hue, brownish back, and spiny carinate abdomen.

Syngnathus.

Gen. 5. Syngnathus.

Snout subcylindrical, with terminal mouth; body lengthened, jointed, and mailed; no ventral fins.

Great pipe-fish, or longer pipe-fish.—Caudal, anal, and pectoral fins radiated; body hexagonal. Generally from twelve to fifteen inches long, but sometimes from two to three feet; of a very slender form, and of a pale yellowish brown colour, with broad alternate zones of a deeper brown. In spring, as in others of this genus, the ovum appears in an appropriate channel at the lower part of the abdomen, and the young are excluded from them completely formed. Native of the European seas. The typule, or smaller pipe-fish, seems to be only a variety.

Hippocampus.

Diodon, or sea-horse pipe-fish.—Tail quadrangular, without a terminating fin; body heptangular and tuberculated. General length from six to ten inches; body much compressed; colour greenish brown, varied with darker and lighter specks. In its living state, the head and tail are carried nearly straight, but when dry or contracted, it resembles the skeleton of a horse. It is a native of the Mediterranean, northern, and Atlantic seas.

Foliated pipe-fish.—Blackish olive, with white specks, foliatus, and leaf-shaped appendages. These last are situated on very strong, rough, square spines or processes attached to the back, tail, and abdomen, and give the whole animal a very grotesque and anomalous appearance. This curious species is a native of the Indian seas; but nothing particular seems to be known relative to its habits or natural history.

The ophidion, biaculeatus, pelagicus, equoricus, and barbarus, require no particular description.

Pegasus.

Gen. 6. Pegasus.

Mouth beneath, with a retractive proboscis; upper jaw elongated, denticulated, ensiform under the snout and linear; gill-aperture simple, placed before the pectoral fins; body compressed, articulated with bony incisions, and covered with a hard crust; ventral fins placed behind the pectoral.

Little or dragon pegasus.—Snout conical. Only three or four inches long, with large pectoral fins, which enable it to support itself for some moments in the air, when it springs occasionally over the surface of the water. Native of the Indian seas.

Flying pegasus.—Snout ensiform and denticulated. Length three inches. Native of the Indian seas.

Swimming pegasus.—Snout ensiform and unarmed. Natans. Length three or four inches; more slender than the preceding. Native of the Indian seas.

Ceniris.

Gen. 7. Ceniris.

Head produced into a very narrow snout; no teeth; the lower jaw longest; gill-aperture waving; body compressed; abdomen carinated; ventral fins united.

Mailed or shielded trumpet-fish.—Back smooth, with scutatum, a hard shield, like a thin plate; eight inches long. Native of the Indian seas.

Snipe ceniris.—Body scaly and rough; tail straight scapan and extended. Smaller than the preceding. Native of the Mediterranean and Indian seas. Ranked among edible fishes.

Balistes.

Head compressed, and an apparent continuation of the trunk, in some species, armed with a spine between the eyes; mouth narrow; eight teeth in each jaw; the two foremost longer than the rest; three interior teeth on both sides, resting against as many lateral ones; gill-aperture narrow, above the pectoral fins; gill-covers wanting; gill-membrane two-rayed; body compressed, carinated on the sides, with scales growing on the skin, and rough with sharp prickles.
Most of the species of this genus are natives of the Indian and American seas. They can in some degree inflate their abdomen by means of a strong bone, rough with small prickle, which lies under the skin. They feed on other fishes. Some of them are very large, and some remarkable for the brilliancy and variegations of their colours. In general, they are reckoned poisonous.

Uniform file-fish.—A fin of one ray on the head; rays of the caudal fin carinated. The body is of an oval form, from one to two feet long, and covered all over with very minute spines. The general colour is gray, inclining to brown on the upper parts, and varied with irregular wavings and spots. Just above the eyes is a single spine of considerable length, a little recurved, and serrated on the bind part. Its food chiefly consists of crustaceous and testaceous animals.

capriscus. Mediterranean file-fish.—Violet-gray, with red or blue variegations, single ventral fin, and rounded tail. Length of the preceding, and shape ovate. Almost the only species found in the European seas. The rays of the first dorsal fin are so continued as to act in concert with considerable force in raising the fin at the pleasure of the animal.

cratula. Ancient file-fish, or old wife.—First dorsal fin three-rayed, ventral fin longitudinal; caudal bifid. Length from one to two feet, or more; general colour yellowish-olive, paler beneath. Several blue streaks on the front and cheek, and some transverse and longitudinal strips on the body. This species is supposed to have obtained its name from the mouth, when viewed in front, or from the slightly murmuring noise which it utters when first taken.

undulatus. Undulated file-fish.—Black, but waved by oblique red lines. Observed about the shores of Sumatra by Mr Mongo Park. The other sorts described by the most recent ichthyologists are, hispidus, tomentosus, papilleros, chinensis, ringens, lituratus, lavus, sonneratii, bicolor, virenses, fasciatus, unimaculatus, cinereus, maculatus, aculeatus, serruosus, bicolaeus, forciatus, signatus, punctatus, caprinatus, kleini, curassavicus, and assani.

Gen. 9. Cyclopterus.

Head obtuse; mouth standing forward; tongue short and thick; jaws armed with small sharp teeth; gill-membrane four-rayed; gill-cover of one plate; body short, thick, and scaleless; ventral fins united into an orbicular membrane.

lampus. Lump sucker, lump-fish, sea-owl or cock-paddle.—Body angulated, with bony tubercles; grows to the length of 19 inches, and the weight of seven pounds. It is of a deep and very thick shape, and swims edgeways; the back is sharp and elevated, and the belly flat. There are four rows of large tubercles, and the whole skin is rough with smaller ones. On the upper part of the back is a thick ridge, destitute of spines. Beneath the pectoral fins is an oval aperture, surrounded with a fleshy muscular substance, edged with small filiform processes, which act as claspers. By means of this organ it adheres very strongly to any thing it pleases. The belly is of a bright crimson colour. Inhabits the northern, American, and Indian seas. Deposits its orange-coloured eggs near the shore in April and May. The Greenlanders boil the roe, which is cartilaginous, very large, and eat both it and the fish. In England, young fishes. the latter is sometimes stewed, but is flabby and insipid.

The lump suckers are frequently devoured by seals, which leave the skin; numbers of which, thus emptied, may often be found in the spring, along those districts of shore which are frequented by this species. "It is easy, (adds Mr Pennant,) to distinguish the place where seals are devouring this or any unctuous fish, by a smoothness of the water immediately above the spot."
The pavo, pavo sucker, or pavo sucker, agrees with this species in all particulars, except size, and is, therefore, probably only a variety. The gibbo, Willoughby, or pyramidal sucker, seems also to belong to the same species, and to be distinguished only by the pyramidal elevation of the back.

Small sucker.—Body naked; snout marked above minutus. the mouth by three tubercles. A very small species, which inhabits the Atlantic ocean, and seems to be allied in habit to the common lump-fish. The body is compressed, of a whitish colour, and has two white unequal tubercles on each side.

Unguiculatus sucker.—Body naked; dorsal, anal, lipatus, and caudal fins united. The length varies from five to eighteen inches. The shape is elongated, thick, compressed; the skin thin and lax, and covered with a viscid humour, like a snail. It is brownish, with darker stripes above, white beneath, and slightly yellow on the head and sides. It inhabits the northern seas, and sometimes ascends rivers.

Cormus or jura sucker, or lesser sucking-fish.—Of a cornu-purple, brown colour, with lengthened front. About tucks, four inches long; skin without scales, and slippery. Native of the European seas. Found by Dr Borlase on the coast of Cornwall, and by Mr Pennant in the sound of Jura.

Bimaculatus sucker.—Body without scales; pectoral bimaculatus fins placed very high; a round black spot on each side of the ventral membrane. About an inch and a half long; the colour of the head and body fine pink. Inhabits the sea about Weymouth.

The remaining known species of this genus are, dent, gelatinous, ventricosus, lineatus, and binynus. 

Gen. 10. Cyclopterus.

Head depressed; many sharp-pointed teeth; tongue broad, and armed with teeth; eyes on the upper part of the head; nostrils small; gills three; one lateral aperture; pectoral fins placed on the long branchi; dorsal and anal fins opposite, and near the tail; body scaleless, covered with a thin and lax skin; vent in the middle; no lateral line.

The fishes of this genus are of a singularly uncouth appearance; the body being thick and shapeless; the head excessively large, and the fins short and broad.

European or common angler, frog-fish, toad-fish, piscato-fishing-frog, sea-devil, &c.—Depressed; head rounded. Rius.
ICHTHYOLOGY.

Chapter IV.

Cartilaginous Fishes.

Proceed from the upper part of the head, and some shorten ones from the back, while the edges of the body are fringed at intervals with shorter appendages of a somewhat similar nature. The upper surface is brown, with deeper or pale variegations, and the under surface whitish. The frog-fish inhabits the European seas; swims slowly; lies in ambush, in shallows, half-concealed by sea-plants or mud, and decoying its prey by moving its worm-like processes. It feeds on the dog-fish and smaller fishes. The cornuadius, cornish or long angler, or fishing-frog of Mount's bay, described by Borrow and Pennant, is so nearly allied to this that it may be regarded as only a variety.

Harlequin angler, or American toad-fish.—Compressed; exposed in a yellowish brown colour, with irregular blackish spots, and beards on the head and body. This, which is one of the most grotesque and singular of fishes, is a native of the Indian and American seas, growing to the length of ten or twelve inches, and in manners resembling the European angler.

Other species are, muricatus, vespertilio, striatus, pectoralis, marmoratus, and commersonii.

Acoipenser.

Gen. 11. ACIPENSER.

Head obtuse; mouth placed under the head; retractile; toothless; four beards under the snout and before the mouth.

The fishes of this genus are among the largest of the tribe. They are all inhabitants of the sea, though some occasionally ascend rivers in great shoals. All the species are large, seldom measuring, when full grown, less than three or four feet in length. Their flesh is reckoned delicate and nutritious; and they form a very considerable article of commerce on the banks of the Caspian sea, and many parts of Europe and America. They feed principally on worms and other fish.

Common sturgeon.—Snout obtuse; the transverse diameter of the mouth equal to the longitudinal; the beards on the snout near the end of it; lips bifid. Of a long, slender, and pentagonal form, attaining sometimes to eighteen feet in length, and weighing five hundred pounds. The whole length of the body is covered by five rows of large, strong, and bony tubercles, rounded at the base, radiated from the centre, and terminated above by a sharp curved point in a reversed direction. The whole skin, on the upper parts and sides, is also roughened with very small tubercles of a similar structure. The general colour is cincereous above, and whitish or yellowish below. Though generally a sluggish fish, it sometimes springs out of the water with great force. It feeds on fishes, particularly the herring, salmon, mackerel, and coal-fish. It spawns in spring, and is amazingly prolific. Lewenboeck having found in the roe of one of them 1,500,000,000,000 ova! It inhabits the ocean, the Mediterranean, and the Red, Black, and Caspian seas, especially such parts of them as are not remote from the estuaries of large rivers, which they occasionally ascend in great multitudes. In some of the rivers of Virginia they are so numerous that six hundred have been taken in twenty days merely by a pole, with a strong hook fixed to the end of it. The flesh is very delicate, white, and firm, and when roasted, is said to resemble veal. In this country it is usually served in a pickled state, being imported from America and the Baltic. It is sometimes, however, taken in our rivers in the salmon-net. The sturgeon was a fish in high repute with the Greeks and Romans, and, according to Pliny, was brought to table with much pomp, and ornamented with flowers, the slaves who carried it being also ornamented with garlands, and accompanied by music. Caviar is made of the dried and salted roe. The skin makes a good covering for carriages.

Sterlet sturgeon.—Brownish, with the sides spotted with red, and the body shielded above by a triple series of tubercles. The smallest and most delicate species of the genus. Native of the Caspian sea; found also in the Volga and Ural, and occasionally in the Baltic. In seasons when this fish happened to be unusually rare, Prince Potemkin paid three hundred rubles for a single tureen of sterlet soup, which formed the mere prelude to his repast.

Ishinglass sturgeon, or beluga.—Snout very obtuse, transverse diameter of the mouth less than the longitudinal; beards near the mouth; lips not cleft. Larger than the common species, and sometimes measuring 25 feet in length. The tubercles are smaller than those of the sturio, and seem to fall off with age. Inhabits the northern, Caspian, and Mediterranean seas. Ishinglass is prepared from its sound or air-bladder, and an inferior sort from the skin, tail, stomach, and intestines. See ICHTHYOCOLL.

To these may be added schypa, and stellatus; the first perhaps only a smaller variety of sturio, and the latter distinguished by the star-like marks on its head.

Gen. 12. CHIMERA.

Chimera.

Head sharp-pointed; spiracles solitary, in four divisions under the neck; mouth under the head; upper lip with five divisions; fore teeth like cutting teeth, two in each jaw; body long, with a single spine on the back; the tail ending in a bristle, and longer than the rest of the body.

Sea-monster, northern chimera.—Punctured folds below the snout. A singularly grotesque species, inhabiting the northern and Atlantic ocean; frequenting the deepest recesses, preying on smaller fishes and mollusca and testacea; and rarely approaching the shore, except during the breeding season. It is from three to four feet long, of a lengthened and compressed form, tapering to the tail, which is produced into a long and slender filament. The head and eyes are very large; and at the base of each ventral fin, in the male, is a lengthened process, rough with numerous sharp prominences in a reversed direction. The whole body is of a yellow-brown above the lateral line, and of a bright silvery colour beneath it, variegated with numerous irregular deep brown or blackish spots and patches. Its flesh is considered as coarse and unpalatable.

Elephant fish, or southern chimera.—Snout pro-calcise produced beneath into an infected lip. Native of the Clus. southern seas.

Gen. 13. SQUALUS.

Squalus.

Head obtuse, from four to seven semilunar spiracles on the sides of the neck; eyes oblong, half covered, placed before the temporal opening; mouth in the under part of the head, armed with several rows of serrated
ICHTHYOLOGY

Heart-headed shark.—Head very broad and heart-shaped. In other respects greatly allied to the preceding species, but is much more rare, and chiefly inhabits the South American seas.

Blue shark.—Sides of the tail smooth, a cavity on glaucus, the back of the tail. Of a more slender and elegant shape than the other species, measures from ten to fourteen feet, is of a blue-green above and white beneath. It is very bold and voracious; inhabits the European seas, and frequents several of the British coasts, especially those of Cornwall during the pilchard season.

Porbeagle shark.—A longitudinal fold on each side cornucipi of the tail. Length from three to eight feet; shapecute round, except near the tail, where it is depressed; colour deep on the back, and white or silvery beneath. Inhabits the sea about Cornwall. The monenesis, or Beaumen's shark of Pennant, is now regarded only as a variety of cornucipi.

Basking shark.—With conical teeth, not serrated. Body slender, and from three to twelve yards in length, of a deep lead colour above, and white below. The upper jaw is blunt at the end, and much longer than the lower. The mouth is furnished with a great multitude of small teeth, which those in front are much bent, and the remote ones conical and sharp pointed. It has two dorsal, two pectoral, two ventral fins, and one small anal fin. This species inhabits the northern seas, and derives its name from its propensity to lie on the surface of the water, as if to bask in the sun, generally on its belly, and sometimes on its back. It feeds on sea-plants and medusae, and betrays none of that ferocity of disposition which characterizes most of the shark tribe; on the contrary, it seems so little afraid of mankind, as often to suffer itself to be patted and stroked. These animals frequent our seas during the warm summer months, and appear in shoals on the Welsh and Scottish coasts, after intervals of a certain number of years. They are observed in the frith of Clyde and among the Hebrides in small troops of seven or eight, or more commonly in pairs, about midsummer, and disappear about the latter end of July. They swim very deliberately, and generally with their upper fins above water. Sometimes they may be seen sporting among the waves, and springing several feet above the surface. They are pursued and taken by the fishermen for the sake of the oil contained in the liver; that viscous sometimes weighing a thousand pounds, and yielding eight barrels of oil, and two of useless sediment. When pursued, they do not quicken their motion till the boat is almost in contact with them, when the harpooner strikes his weapon into the body, as near the gills as he can. Sometimes they remain in the same place till the united strength of two men is exerted to force the instrument deeper. Then they plunge headlong to the bottom, and frequently coil the rope round their bodies, and endeavour to get rid of the harpoon by rolling on the ground. Discovering that these efforts are vain, they swim with such strength and rapidity, that one instance has occurred of a basking shark towing to some distance a vessel of 70 tons burthen, against a fresh gale. They sometimes run off with 100 fathoms of line, and two harpoons in them, and will employ the men from 12 to 24 hours before they are subdued. A large fish has afforded the captors a pro-
ICHTHYOLOGY.

Carliana. 

fit of 20 pounds. " A male of this species (says Dr. 
Shaw) was taken in the year 1821, at Abbotshbury in 
Dorsetshire, entangled in a fishing seine, and after a 
vigorous resistance, was dragged ashore. It is said to 
have received 17 musket-balls before it expired; its 
length was 28 feet, and its circumference in the thick- 
est part about 20 feet; its tail, from point to point, 
near eight feet; the teeth, according to its propriétaire, 
who took the pains to count them, amounted to the 
number of four thousand." The skin makes excellent 
shagreen.

carcharias. 

White shark.—Triangular serrated teeth. This spe-
cies, so remarkable for its powers of destruction, is a 
native of most seas, but occurs more frequently in the 
warm than the cold latitudes. It arrives at the length 
of more than 30 feet, and is rather thicker and broader 
than most of its congeners. The mouth is very wide, 
and furnished on the margin of each jaw with from 
three to six rows of strong, flat, triangular, sharp-point-
ed, and finely serrated teeth, which can be raised or 
depressed at pleasure. The general colour of the ani-
mal is a pale ash, darker or browner on the upper 
parts. So great is the strength of the tail, that a young 
shark of six feet in length, is able by a stroke of this 
part to break a man's leg; hence it is usual for sailors 
to cut off the tail the instant they drag a shark on 
board. Gilius quotes a specimen which weighed four 
thousand pounds, and another in whose belly was found 
an entire human body; and Müller asserts, that in one 
taken at the Isle of St. Margaret, there was found a 
horse which had probably been thrown overboard from 
some ship. The size of the fossil teeth of this species, 
so often found in the Isle of Malta, &c. affords a con-
vincing proof of the enormous specimens which have 
not only once existed. Sharks are the dread of sailors in 
all hot climates, where they constantly attend the ships, in 
expectation of what may drop overboard; and a man 
who has that misfortune is almost instantly devoured. 
In the pearl-fisheries of South America, every negro, 
to defend himself against these animals, carries with him 
into the water a sharp knife, which, if the fish offers 
to assault him, he endeavours to strike into its belly, 
on which it generally swins off. The officers who are 
in the vessels keep a watchful eye on these voracious 
creatures, and on discovering them, shake the ropes 
fixed to the negroes, to put them on their guard. 
Many, when the divers have been in danger, have 
thrown themselves into the water, with knives in their 
hands, and hastened to their defence: but too often 
all their dexterity and precaution have been of no 
avail.

pristis. 

Saw-nouted shark, or saw fish.—With a long flat 
snout, set with teeth on both sides through its whole 
length. Inhabits the southern and northern oceans, 
grows to fifteen feet in length, and is readily distin-
guished by its produced and saw-like snout, which is 
often preserved in museums.

canthus. 

Picked shark, or picked dog fish.—Dorsal fin spinius; 
hody somewhat round. Length from three to four feet; 
colour brownish ash above and white beneath; rough, 
with minute prickles, hooked backwards. Common in 
the European seas, especially about the coasts of Scot-
land and Norway. When split and dried, it is eaten 
by the common people.

squalina. 

Angel-shark, or angel fish.—Pectoral fins very large 
and emarginated before. A deformed species, with 
large head and pectoral fins, and depressed body, attain-
ing to six or eight feet in length. It is a native of the 
European seas, and is extremely voracious, fierce, and 
dangerous. It produces twelve or thirteen young at a 
birth.

The other species of the genus are: _vulpes_, 
_stellaris_, _mustelus_, _spinax_, _centra-, _philippinus_, _cine-
_rus_, _spinosus_, _isabellus_, _cirrhatus_, _barbatus_, _africanus_, 
_ocellatus_, _griseus_, _americanus_, _squamous_, _denticulatus_, 
_punctatus_, _zebra_, _graciovus_, _tentaculatus_, and _semi-
sagittatus_.

Spatularia. 

Spiracles single on each side of the neck, concealed 
by a large Gill-cover; snout produced, and shaped like a 
spatula; mouth beneath the head, large, and fur-
nished with sharp serrated teeth.

Reticulated spatularia.—In habit and appearance this 
reticulated remarkable species is allied to the sharks, but 
distinguished by its thin snout, of the form of a spatula, 
and nearly equal in length to the whole remainder of 
the animal. Its history and manners are very imper-
fectly known.

Gen. 15. Raja.

Raja. 

Spiracles on the under part of the neck, ten on each 
side, oblique; mouth under the head, small, acum-
ninated, as if continuous with the breast, transverse 
and dentated; body thin, depressed, and of a rhomb-
oid figure.

The species of this genus are entirely confined to the 
sea, and, being destitute of an air bladder, live chiefly 
at the bottom, generally in deep water, covering them-
selves in winter in sand or mud. They live on shell-
fish, or other animal substances that fall in their way. 
Some of them become of a size so large as to weigh two 
hundred pounds and upwards. They seldom produce 
more than one young at a time, which, as in the sharks, 
is inclosed in a four-cornered capsule, ending in slender 
points, but not, as in the former, produced into long 
filaments. The liver is large, and often produces a 
great quantity of oil. They are mostly edible.

_Torpedo, torpedo ray, creamp ray, creamp fish, &c._—_torpedos._

Wholly smooth. The body of this species is of a some-
what circular form, slightly convex above, marked 
along each side of the spine by several small pores; about 
eighteen inches or two feet in length, and for the most 
part of a pale reddish brown on the upper surface, 
sometimes marked by five large circular dusky spots, and 
whitish or flesh-coloured beneath. It inhabits most seas, 
but seems to thrive best in the Mediterranean, usually 
living in water of about forty fathoms depth, in company 
with some of its congeners. It preys on smaller fish, which it is supposed to stoppage by 
it electric or galvanic faculty. This property, which 
has been so much exaggerated both by ancient and mo-
dern writers, is nevertheless, sufficiently remarkable.

From some experiments which were made by Mr. Walsh 
on a very stout and healthy fish, it appears that no spark 
could be discovered to proceed from it, and that pith-
balls were never found to be affected by it. When insu-
lated, it gave a shock to persons who were likewise 
insulated,
Chap. IV.

ICHTHYOLOGY.

Cartilaginous fishes. 

have to add squalene, clytanthera, acris, miga, picta, u.

cartilaginea, alba, marginata, clytanthera, aequa, guttata, fus.

Carus, lyoma, eucnus, sephera, tuberculata, pociulina,

diabola, manatia, gianna, fabroniana, banhiana, fimbriata, maculata, bicolor, sinensis, rhinobatus, thomini-

ana, idjifdenes, and cuvieri.

Gen. 16. Petromyzon.

Head more slender than the body; mouth larger above than below; teeth orange-coloured, hollow within, surrounded with a fleshy rim, curved within, broad below; seven spiracles at the sides of the neck; a fistulous opening at the back part of the head; no pectoral or ventral fins.

Lamprey, great lamprey, or sea lamprey.—Month marinus. 

within covered with papille; the hinder dorsal fin sep-

parate from the tail. In general appearance, approaches 

nearly to the eel tribe, especially to the moruece. 

Though it sometimes exceeds three feet in length, the 

British specimens are usually of inferior size. Its gen-

eral colour is a dull brownish olive, clouded with yel-

lowish white variegations; the fins are tinged with dull 

orange, and the tail with blue. On the top of the head 

is a small orifice for the discharge of the superfluous 

water taken in at the mouth and gills. Among the car-

tilaginous fishes, none is so destitute of all appearance 

of real bone as the lamprey, in which, the spine itself 

is no other than a mere soft cartilage, without any proc-

esses or protuberances. The heart, instead of being 

isolated in a soft pericardium, as in other animals, is 

guarded by a strong cartilaginous case; and the liver is 

of a fine greenish colour. It inhabits the ocean, and 

ascends rivers chiefly during the latter end of winter 

and the early months of spring. It is viviparous; and 

the young are of slow growth. Though capable of 

swimming with rapidity, it is more commonly seen at-

tached by the mouth to some large stone or other ob-

ject, and that with such power of adhesion, that a 

weight of more than twelve pounds may be raised with-

out forcing the fish to forsake its hold. It is supposed 

to live principally on worms and young fish. Like the 

eel, it is remarkably tenacious of life, the several parts, 

when cut in pieces, continuing to move, and the head 

strongly attaching itself for several hours to a stone, 

though by far the greater part of the body be cut away 

from it. "As an article of food, (observe Dr Shaw), 

the lamprey has for many ages maintained its credit as 

an exquisite delicacy; and has uniformly made its appear-

ance at the most splendid of our ancient entertainments. 

The death of King Henry I. it is well known, is at-

tributed to too luxurious indulgence in this his fa-

vourite dish. It still continues to be in high esteem; 

and we are told by Mr Pennant, that the city of Glo-

cester continues to send yearly, at Christmas, a present 
of a rich lamprey pie to the king. It sometimes hap-

pens that the lampreys at that season are so rare, that a 

grosino is demanded for the price of a single fish. They 

are most in season during March, April, and May, and 

are observed to be much more firm when fresh arrived 

from sea than when they have been a considerable time 

in fresh water. They are found in several of the Brit-

ish rivers, but that which is most celebrated for them 

is the Severn."

Lesser lamprey, or lampern.—The hinder dorsal fin angulatilis.
Before we conclude this article, it may be proper to direct the reader's attention to M. Nouel's paper relative to two methods of multiplying fishes. The first consists in conveying from the lakes to the rivers, and from the rivers to the lakes, fish found only in one of them; the second, in introducing into fresh water, as it were insensibly, and by means of artificial ponds, fish produced in salt water, giving the preference to those species, which, by their habits and manner of living, might be most adapted to this kind of naturalization.

The first of these methods has been successfully practised in Germany, with regard to the shad, in ponds and clear stagnant waters, with a bottom of sand or gravel. Perch and trout have, in like manner, been conveyed into lakes and rivers in Scotland, and have thriven remarkably well. The carp, which affects a warm temperature, has been successively introduced into the rivers and ponds of Prussia, Denmark, and England. M. Poivre first brought the 

**Gen. 17. GASTROBRANCHUS.**

**Body cale-shaped; mouth beneath, with numerous pectinate teeth; two spiracles beneath the abdomen.**

**Blind gastrobranchus. Myctes glutinosus, Lin.—Livid, paler beneath; with eight beads at the mouth. Removed to the class of fishes, in consequence of Dr Bloch's accurate examination of its external and internal structure. In general appearance, in the situation of the mouth, and in the orange colour of the teeth, it approaches very near to the lamprey. But it is remarkable for the total want of eyes, no vestige of any such organ being discoverable by the most attentive examination. The body is destitute of scales, lateral line, and fins, except that shallow one which forms the tail. Beneath the body, from head to tail, runs a double row of equidistant pores. The spiracles, which are a pair of oval apertures, are situated beneath the body, at some distance from the head. This singular species is said to enter into the bodies of such fishes as it happens to find on the fishermen's books, and which consequently have not the power of escaping its attack, and by gnawing its way through the skin, to devour all the internal parts, leaving only the bones and the skin remaining. Such is its uncommon glutinous nature, that, if put into a large vessel of sea water, it soon renders the whole so viscid, as easily to be drawn out into the form of threads. It inhabits the northern seas, and seems to occur in those of the southern hemisphere.**

**Dombevii.**

**Dombevian gastrobranchus.**—Head tumid. Much larger than the European species; the head rounded, and larger than the body; four bars on the upper lip, the number of those on the lower uncertain, the specimen being described in a dried state. Eyes and nostrils imperceptible. Native of the South American seas. Observed by M. Dombev, and described by La Cépède from the dried skin in the Paris museum.

Nature herself seems to point to the success of the second method. In many instances, salmon and sturgeon have habituated themselves to a fresh-water residence.
ICHTHYLOGY.

Pallas discovered the sea-dog in the lakes Baltic, and Liancourt found the herring in several of the rivers of North America. It likewise deserves to be remarked that the large fish, transported from the North sea to the ponds of East Friesland, have increased by myriads, and imparted great value to water which was formerly unproductive.

"In the year 1799, (continues M. Noupel,) I had the honour of reading, in one of the sitting of the National Institute, a memoir on the means and advantages of naturalizing the herring, a salt-water fish, in the waters of the Seine, near its mouth, &c. The account of the processes for accomplishing this end, which I there pointed out, are not susceptible of analysis, and cannot, therefore, be introduced into this essay; it will be sufficient for me to say, that the report of La Cépéde, Cuvier, and Tessier, was entirely in their favour. At present, I am still more convinced of the efficacy of the means which I then proposed; and I have no doubt that, if artificial ponds were formed on the edges of rivers, the experiment would be attended with complete success. "Every man, (says Dr Franklin,) who catches a fish, draws from the water a piece of money." Let not the maxims and example of this philosopher be lost to posterity; let them rather produce fruit, like strong and vigorous seed sown in a fertile soil. Having observed in New England, that the herrings ascended from the sea into one river of that country, while a single individual was never seen in another river, separated from the former by a narrow tongue of land, and which communicated also with the sea, this philosopher took the leaves of some plants on which the herrings had deposited their eggs, already fecundated, and conveyed them to the river which was deprived of the annual visit of these fish. The success of this experiment surpassed his expectations; the ova were completely productive; and the following year the river was peopled with a numerous shoal of herrings, which, since that time, have continued to frequent it.

"This fish is not the only one which I wish to see naturalized in fresh water; to the herring I would add several species of pleuronectes—also the mullet, goby, whiting, gar-fish, and perhaps, one or two species of the gurnard. I would pay the greatest attention possible to the nature of the water proper for each species. This happy choice is the principal condition, and that which could ensure success; but I would select in particular for this colonization, the fish found in lakes, which, though little known, are more numerous than is commonly supposed, and ought to be so."

By the adoption of this plan, which is susceptible of more ample development, society would gain an increased quantity of provision, and the naturalist would multiply his opportunities of observation.

For the modes of preserving fish in cabinets, see PRESERVING FISH, means of.

EXPLANATION OF PLATES.

Plate CCLXXXI.

Explanation of Terms.—a, (fig. 2.) pectoral fins; b, ventral fins; c, c, anal fins; d, caudal fin, or tail; e, e, dorsal fins; f, bony plates that cover the gills; g, branchiostegous rays and their membranes; h, lateral or side line.

Fig. 1. Anguilla Conger. Conger Eel.—Example of apodal fishes, in which the ventral fins are wanting. The lance or sand-eel, the wolf-fish, and sword-fish, belong to this order.

Fig. 2. The Haddock, an example of jugular fishes, in which the ventral fins b, are placed before the pectoral fins a. To this order belong the dragonet, the cod-fish, the blenny, &c.

Fig. 3. The Father-lasher, an example of thoracic fishes, in which the ventral fins a, are placed beneath the pectoral b; as in the bull's-head, the dory, the mackerel, the perch, &c.

Fig. 4. The Minnow, an example of abdominal fishes, having the ventral fins a, placed behind the pectoral fins b. To this order belong the salmon, the herring, the carp, &c.

Fig. 5. The Dog-fish, an example of cartilaginous fishes, in which the muscles are supported by cartilages instead of bones, and which breathe by means of apertures placed near the neck instead of gills; a the lateral apertures.

Fig. 6. Gymnatus Electricus, Electrical Gymnatus, or Cramp-fish.

ICHTHYOPHAGI, Fish-eaters, a name given to a people, or rather to several different people, who lived wholly on fishes; the word is Greek, compounded of ἰχθυς, piscis, "fish," and φαγεῖν, ἔπαγεῖν, "to eat." The Ichthyophagi spoken of by Ptolemy are placed by Saunon in the provinces of Nanquin and Kasteng. Agatharchides calls all the inhabitants between Carmania and Gedrosia by the name Ichthyophagi. From the accounts given of the Ichthyophagi by Herodotus, Strabo, Solinus, Plutarch, &c. it appears indeed that they fished, but that they made use of them, excepting to feed their fish withal. They made their houses of large fish-bones, the ribs of whales serving them for their beams. The jaws of these animals served them for doors; and the marts wherein they pounded their fish, and baked it at the sun, were nothing else but their vebrorets.

ICHTHYOPHAGIA, an old term in Natural History, which is applied by Dr. Shaw to the bony palates and mouths of fishes, usually met with either fossil, in single pieces, or in fragments. They are of the same substance with the bonefish; and are of very various figures, some broad and short, others longer and slender; some very gibbose, and others plainly arched. They are likewise of various sizes, from the tenth of an inch to two inches in length, and an inch in breadth.

ICKENLILL-BREAT, is that old Roman highway, demeasured from the Iceni, which extended from Yarmouth in Norfolk, the east part of the kingdom of the Iceni, to Barley in Hertfordshire, giving name in the way to several villages, as Hickworth, Icklingham, and Ickleton-in-that kingdom. From Barley to Royton it divides the counties of Cambridge and Hertford. From Icklesford it runs by Tring, crosses Bucks and Oxfordshire, passes the Thames at Goring, and extends to the west part of England.

ICOLMIL. See IONA.
ICONIUM, at present Cogni, formerly the capital city.
city of Lycaonia in Asia Minor. St Paul coming to Iconium (Acts xiii, 51, xiv. 1, &c.) in the year of Christ 45; converted many Jews and Gentiles there. It is believed, that in his first journey to this city, he converted St Thecla, so celebrated in the writings of the ancient fathers. But some incredulous Jews excited the Gentiles to rise against Paul and Barnabas, so that they were upon the point of offering violence to them, which obliged St Paul and St Barnabas to fly for security to the neighbouring cities. St Paul undertook a second journey to Iconium in the year 50, but we know no particulars of his journey, which relate peculiarly to Iconium.

ICONOCLASTES, or ICONOCRUSTAE, breakers of images; a name which the church of Rome gives to all who reject the use of images in religious matters.---The word is Greek, formed from ικον, image, and κλατειν, to break.

In this sense, not only the reformed, but some of the eastern churches, are called Iconoclastes, and esteemed by them heretics, as opposing the worship of the images of God and the saints, and breaking their figures and representations in churches.

The opposition to images began in Greece under the reign of Bardanes, who was created emperor of the Greeks a little after the commencement of the eighth century, when the worship of them became common. See Image. But the tumults occasioned by it were quelled by a revolution, which, in 713, deprived Bardanes of the imperial throne. The dispute, however, broke out with redoubled fury under Leo the Isaurian, who issued out an edict in the year 726, abrogating, as some say, the worship of images, and ordering all the images, except that of Christ’s crucifixion, to be removed out of the churches; but according to others, this edict only prohibited the paying to them any kind of adoration or worship. This edict occasioned a civil war, which broke out in the islands of the Archipelago, and by the suggestions of the priests and monks, ravaged a part of Asia, and afterwards reached Italy. The civil commotions and insurrections in Italy were chiefly promoted by the Roman pontiffs, Gregory I. and II. Leo was excommunicated, and his subjects in the Italian provinces violated their allegiance, and rising in arms either massacred or banished all the emperor’s deputies and officers. In consequence of these proceedings, Leo assembled a council at Constantinople in 730, which degraded Germanus, the bishop of that city, who was a patron of images; and he ordered all the images to be publicly burnt, and inflicted a variety of severe punishments upon such as were attached to that idolatrous worship. Hence arose two factions; one of which adopted the adoration and worship of images, and on that account were called iconoduli or iconoclastae; and the other maintained that such a worship was unlawful, and that nothing was more worthy the zeal of Christians than to demolish and destroy those statues and pictures which were the occasions of this gross idolatry; and hence they were distinguished by the titles of iconomachæ, (from ικον, image, and μαχαί, I contend,) and iconoclastæ. The zeal of Gregory II. in favour of image worship, was not only imitated, but even surpassed by his successor Gregory III. In consequence of which the Italian provinciates were torn from the Grecian empire.

Constantine, called Copronymus, from ωρναγε, ster-

...
"a man or husband"; the name of the 12th class in Linnæus's sexual method, consisting of plants with hermaphrodite flowers, which are furnished with 20 or more stamens, that are inserted into the inner side of the calyx or petals. See BOTANY, p. 192.

ICTINUS, a celebrated Greek architect who lived about 430 B.C. built several magnificent temples, and among others that of Minerva at Athens.

IDA, in Ancient Geography, a mountain situated in the heart of Crete where broadest; the highest of all the island; round, and in compass 60 stadia (Strabo); the nursing place of Jupiter, and where his tomb was visited in Varro's time.—Another Ida, a mountain of Mysia, or rather a chain of mountains (Homer, Virgil), extending from Zeleia on the south of the territory of Cyzicus to Lectum the utmost promontory of Tros. The abundance of its waters became the source of many rivers, and particularly of the Sinoes, Scamander, Eupos, Granicus, &c. It was covered with green wood, and the elevation of its top opened a fine extensive view of the Hellaspont and the adjacent countries; from which reason it was frequented by the gods during the Trojan war, according to Homer. The top was called Gargara (Homer, Strabo); and celebrated by the poets for the judgment of Paris on the beauty of the three goddesses, Minerva, Juno, and Venus; to the last of whom he gave the preference.

IDALIUM, in Ancient Geography, a promontory on the east side of Cyprus. Now Capo di Grigo; with a high rugged eminence rising over it, in the form of a table. It was sacred to Venus; and hence the epithet Idâlia given her by the poets. The eminence was covered by a grove; and in the grove was a little town, in Pliny's time extinct. Idâlia, according to Bochart, denotes the place or spot sacred to the goddess.

IDEA, the reflex perception of objects, after the original perception or impression has been felt by the mind. See METAPHYSICS, PASSIM; and LOGIC, PART I.

IDENTITY, denotes that by which a thing is itself, and not any thing else; in which sense identity differs from similitude, as well as from diversity. See METAPHYSICS.

IDES, in the ancient Roman calendar, were eight days in each month; the first of which fell on the 5th of March, May, July, and October; and on the 12th of the other months. The origin of the word is contested. Some will have it formed from dies, "to see"; by reason the full moon was commonly seen on the days of the ides; others from dies, "species, figure," on account of the image of the full moon then visible: others from iditum or ovis iditus, a name given by the Hetrurians to a victim offered on that day to Jupiter: others from the Hetrurian word idus, i.e. dividuo; by reason the ides divided the moon into two nearly equal parts.

The ides came between the Kalends, and the Nones; and were reckoned backwards. Thus they called the 14th day of March, May, July, and October, and the 12th of the other months, the pridie idus, or the day before the ides; the next preceding day they called the tertia idus; and so on, reckoning always backwards till they came to the Nones. This method of reckoning time is still retained in the calendar of Rome.
IDIOM. — The idiom of May was consecrated to Mercury: the idiom of March were ever esteemed unhappy, after Caesar's murder on that day: the time after the idiom of June was reckoned fortunate for those who entered into matrimony: the idiom of August were consecrated to Diana, and were observed as a feast day by the slave. On the idiom of September, auguries were taken for appointing the magistrates, who formerly entered into their offices on the idiom of May, afterwards on those of March.

IDIOTY, a defect of understanding. Both idiocy and lunacy excuse from the guilt of crimes; (see Crime, par. ult.) For the rule of law as to lunatics, which may also be easily adapted to idiots, is, that

...ratus, has a sufficient plea to void a man's own bond: and there is a writ in the register for the alienor himself to recover lands alienated by him during his insanity; dum fuit non compos mentis sue, ut dicit, &c.

But under Edward III. a scruple began to arise, whether a man should be permitted to blemish himself, by pleading his own insanity; and, afterwards, a defendant in assize having pleaded a release by the plaintiff since the last continuance, to which the plaintiff replied (ori tenuis, as the manner then was) that he was out of his mind when he gave it, the court adjourned the assize; doubting, whether as the plaintiff was sane both then and at the commencement of the suit, he should be permitted to plead an intermediate deprivation of reason; and the question was asked, how he came to remember to release, if out of his senses when he gave it? Under Henry VI. this way of reasoning (that a man should not be allowed to disable himself, by pleading his own incapacity, because he cannot know what he did under such a situation) was seriously adopted by the judges in argument; upon a question whether the heir was barred of his right of entry by the seisin of his insane ancestor? And from these loose authorities, which Fitzherbert does not scruple to reject as being contrary to reason, the maxim that a man shall not stultify himself, hath been handed down as settled law: though later opinions, feeling the inconvenience of the rule, have in many points endeavoured to restrain it. And, clearly, the next heir or other person interested, may, after the death of the idiot or non-compos, take advantage of his incapacity and avoid, the
the grant. And so, too, if he purchases under this
disability, and does not afterwards upon recovering his
senses agree to the purchase, his heir may either wave
or accept the estate at his option. In like manner, an
infant may wave such purchase or conveyance, when
he comes to full age; or, if he does not then actually
agree to it, his heir may wave it after him. Persons,
also, who purchase or convey under duress, may affirm
or avoid such transaction, whenever the duress is ceas-
ed. For all these are under the protection of the law;
which will not suffer them to be imposed upon through
the imbecility of their present condition; so that their
acts are only binding, in case they be afterwards agreed
to when such imbecility ceases. Yet the guardians
or committees of a lunatic, by the statute 11 Geo. III.
c. 20, are empowered to renew in his right, under the
directions of the court of chancery, any lease for lives
or years, and apply the profits of such renewal for the
benefit of such lunatic, his heirs, or executors. See
Lunacy.

IDIOM, among grammarians, properly signifies
the peculiar genius of each language, but is often used
in a synonymous sense with dialect. The word is
Greek, ἰδιός, "propriety;" formed of ἰδίος, "proper,
own."

IDIOPATHY, in Physic, a disorder peculiar to a
certain part of the body, and not arising from any pre-
ceding disease; in which sense it is opposed to sym-
pathy. Thus, an epilepsy is idiopathic when it hap-
pens merely through some fault in the brain; and
sympathetic when it is the consequence of some other
disorder.

IDIOSYNCRASY, among physicians, denotes a
peculiar temperament of body, whereby it is rendered
more liable to certain disorders than persons of a dif-
ferent constitution usually are.

IDIOT, or IDEOT, in our laws, denotes a natural
fool, or a fool from his birth. See IDIOCY.

The word is originally Greek, ἴδιος, which prima-
arily imports a private person, or one who leads a pri-
ivate life, without any share or concern in the govern-
ment of affairs.

A person who has understanding enough to measure
a yard of cloth, number twenty rightly, and tell the
days of the week, &c. is not an idiot in the eye of
the law. But a man who is born deaf, dumb, and
blind, is considered by the law in the same state as an
idiot.

Idiot is also used, by ancient writers, for a person
ignorant or unlearned: answering to illiteratus, or
imperius. In this sense, Victor tells us, in his Chroni-
cron, that in the consuls of Messalla, the Holy Gos-
pels, by command of the emperor Anastasius, were cor-
rected and amended, as having been written by idiot
evangelists: Tanquam ad idiotis evangelistics composita.

IDLENESS, a reluctance in people to be employed
in any kind of work.

Idleness in any person whatsoever is a high
offence against the public economy. In China it is a
maxim, that if there be a man who does not work, or
a woman that is idle, in the empire, somebody must
suffer cold or hunger; the produce of the lands not
being more than sufficient, with culture, to maintain the
inhabitants; and therefore, though the idle person
may shift off the want from himself, yet it must in the
and fall somewhere. The court also of Areopagus at
Athens punished idleness, and exercised a right of exami-
nining every citizen in what manner he spent his time;
the intention of which was, that the Athenians, know-
ing they were to give an account of their occupations,
should follow only such as were laudable, and that there
might be no room left for such as lived by unlawful
arts. The civil law expelled all sturdy vagrants from
the city; and, in our own law, all idle persons or va-
gabonds, whom our ancient statutes describe to be
such as wake on the night and sleep on the day,
haunts customable taverns and ale-houses, and routes
about; and no man went from whence they come, nor
whether they go, or such as are more particularly
described by statute 17 Geo. III. c. 5, and divided into
three classes, idle and disorderly persons, rogues and
gabond, and incorrigible rogues—all these are offend-
ers against the good order, and blemishes in the
government, of any kingdom. They are therefore all
punished, by the statute last mentioned; that is to
say, idle and disorderly persons with one month's im-
prisonment in the house of correction; rogues and
vagabonds with whipping, and imprisonment not exceed-
ing six months; and incorrigible rogues with the like
discipline, and confinement not exceeding two years;
the breach and escape from which confinement in one
of an inferior class, ranks him among incorrigible
rogues; and in a rogue (before incorrigible) makes
him a felon, and liable to be transported for seven
years. Persons harbouring vagrants are liable to a fine
of forty shillings, and to pay all expenses brought up-
on the parish thereby: in the same manner as, by our
ancient laws, whoever harboured any stranger for more
than two nights, was answerable to the public for any
offence that such his inmate might commit.

IDOL, in pagan theology, an image, or fancied
representation of any of the heathen gods. This
image, of whatever materials it consisted, was, by cer-
tain ceremonies, called consecration, converted into a
god. While under the artificers' hand, it was only a
mere statue. Three things were necessary to turn it
into a god: proper ornaments, consecration, and ora-
tion. The ornaments were various, and wholly design-
ed to blind the eyes of the ignorant and stupid multi-
tude, who are chiefly taken with show and pageantry.
Then followed the consecration and oration, which
were performed with great solemnity among the Ro-
mans. See Image.

IDOLATRY, or the worship of idols, may be di-
stinguished into two sorts. By the first, men adore
the works of God, the sun, the moon, the stars, angels,
demons, men, and animals: by the second, men wor-
ship the work of their own hands, as statues, pictures,
and the like: and to these may be added a third, that
by which men have worshipped the true God under
seemly figures and representations. This indeed may
have been the case with respect to each of the above
kinds of idolatry; and thus the Israelites adored God
under the figure of a calf.

The stars were the first objects of idolatrous wor-
ship, on account of their beauty, their influence on
the productions of the earth, and the regularity of
their motions, particularly the sun and moon, which are
considered as the most glorious and replentious images
of the Deity: afterwards, as their sentiments became
more
more corrupted, they began to form images, and to enthrone the opinion, that by virtue of consecration, the gods were called down to inhabit or dwell in their statues. Hence Arnobius takes occasion to rail against the Pagans for guarding so carefully the statues of their gods, who, if they were really present in their images, might save their worshippers from the trouble of securing them from thieves and robbers.

As to the adoration which the ancient Pagans paid to the statues of their gods, it is certain, that the wiser and more sensible heathens considered them only as simple representations or figures designed to recall to their minds the memory of their gods. This was the opinion of Varro and Seneca: and the same sentiment is clearly laid down in Plato, who maintains, that images are inanimate, and that all the honour paid to them has respect to the gods whom they represent. But as to the vulgar, they were stupid enough to believe the statues themselves to be gods, and to pay divine worship to stocks and stones.

Soon after the flood, idolatry seems to have been the prevailing religion of all the world: for wherever we cast our eyes at the time of Abraham, we scarcely see any thing but false worship and idolatry. And it appears from Scripture, that Abraham's forefathers, and even Abraham himself, were for a time idolaters.

The Hebrews were indeed expressly forbidden to make any representation of God: they were not to look upon an idol; and from the time of the Maccabees to the destruction of Jerusalem, the Jews extended this precept to the making of the image of any god: by the law of Moses, they were obliged to destroy all the images they found, and were forbidden to apply any of the gold or silver to their own use, that no one might receive the least profit from any thing belonging to an idol. Of this the Jews, after they hadsmarted for their idolatry, were so sensible, that they thought it unlawful to see any vessel that had been employed in sacrificing to a false god, to warm themselves with the wood of a grove after it was cut down, or to shelter themselves under its shade.

But the preaching of the Christian religion, wherever it prevailed, entirely rooted out idolatry; as did also that of Mahomet, which is built on the worship of one god. It must not, however, be forgotten, that the Protestant Christians charge those of the church of Rome with paying an idolatrous kind of worship to the pictures or images of saints and martyrs: before these they burn lamps and wax candles; before these, they burn incense, and, kneeling, offer up their vows and petitions; they, like the Pagans, believe that the saint to whom the image is dedicated, presides in a particular manner about its shrine, and works miracles by the intervention of its image; and that if the image was destroyed or taken away, the saint would no longer perform any miracle in that place.

IDOMENEUS, in fabulous history, succeeded his father Theseus on the throne of Crete. He accompanied the Greeks to the Trojan war with a fleet of 90 ships. During this celebrated war he rendered himself famous by his valor, and slaughtered many of the enemy. At his return from the Trojan war, he made a vow to Neptune in a dangerous tempest, that if he escaped from the fury of the seas and storms, he would offer to the god whatever living creature first presented itself to his eye on the Cretean shore. This was no other than his son, who came to congratulate his father upon his safe return. Idomeneus performed his promise to the god; and the inhumanity and rashness of this sacrifice rendered him so odious in the eyes of his subjects, that he left Crete, and migrated in quest of a settlement. He came to Italy, and founded a city on the coast of Calabria, which he called Salernum. He died in extreme old age, after he had had the satisfaction of seeing his new kingdom flourish and his subjects happy. According to the Greek scholar of Lycophron, v. 1217, Idomeneus, during his absence in the Trojan war, intrusted the management of his kingdom to Leucos, to whom he promised his daughter Cleithare in marriage at his return. Leucos at first governed with moderation, but he was persuaded by Nauplius king of Euboea to put to death Medea the wife of his master, with her daughter Cleithare, and to seize the kingdom. After these violent measures he strengthened himself on the throne of Crete, and Idomeneus at his return found it impossible to expel the usurper.

IDUMEA. See EDOM.

JEALOUSY, in Etymology, is that peculiar madness which arises from the fear that some rival may rob us of the affection of one whom we greatly love, or suspicion that he has already done it. The first sort of jealousy is inseparable from love, before it is in possession of its object; the latter is often unjust, generally mischievous, always troublesome.

Waters of JEALOUSY. See WATERS.

IDYLLION, in ancient poetry, is only a diminutive of the word EIDOS, and properly signifies any poem of moderate extent, without considering the subject. But as the collection of Theocritus's poems were called Idyllia, and the pastoral pieces being by far the best in that collection, the term Idyllion seems to be now appropriated to pastoral pieces.

JEARS, or GEEA, in the seaman's language, an assemblage of tackles, by which the lower yards of a ship are hoisted along the mast to their usual station, or lowered from thence as occasion requires: the former of which operations is called swaying, and the latter striking.

JEBUSAE, one of the seven ancient peoples of Canaan, descendants of Jebusi, Canaan's son; so warlike and brave, as to have stood their ground, especially in Jebus, afterwards called Jerusalem, down to the time of David, Judges i. 21. 1 Sam. v. 6.

JEDBURGH, a parliament town of Scotland, capital of Tweeddale or Roxburghshire, is situated nearly in the middle of the county, on the banks of the river Jed, whence it derives its name. It is well built and populous, and has a good market for corn and cattle. On the west side of the river, near its junction with the Teviot, stand the beautiful ruins of an abbey founded by David I. a part of which ancient pile serves for a parish church. —Jedburgh is the seat of the sheriff's court and of a presbytery. The population of this town in 1811 was 4454.

JEDDO, the capital town or city of the islands of Japan, where the emperor resides. It is open on all sides, having neither walls nor ramparts; and the houses
houses are built with earth, and boarded on the outside to prevent the rain from destroying the walls. In every street there is an iron gate, which is shut up in the night; and a kind of custom-house or magazine, to put merchandise in. It is a large place, and has been said to contain a million of inhabitants, but this is undoubtedly an exaggeration. A fire happened in 1658, which, in the space of 48 hours, burnt down many thousand houses, and in which a vast number of inhabitants perished. The emperor's palace and all the rest were reduced to ashes; but they are all rebuilt again. The royal palace is in the middle of the town; and is defended with walls, ditches, towers, and bastions. Where the emperor resides, there are three towers nine stories high, each covered with plates of gold; and the hall of audience is said to be supported by pillars of massy gold. Near the palace are several others, where the relations of the emperor live. The empress has a palace of her own, and there are 20 small ones for the concubines. Besides, all the vassal kings have each a palace in the city, with a handsome garden, and stables. The houses of the common sort are nothing but a ground floor, and the rooms are parted by folding screens; so that they can make the rooms larger or smaller at pleasure. It is seated in an agreeable plain, at the bottom of a fine bay; and the river which crosses it is divided into several canals. E. Long. 139. 40. N. Lat. 35. 45.

JEFFERSONIA, in Botany, a genus of plants belonging to the class pentandria, and order monogyne. The calyx is composed of five short oval imbricated leaves; the corolla is monophyllous and funnel-shaped; the margin hypocrioriform; the stigma is quadridif. One species only has been discovered, semprevivens, which is a shrub with round, polished, shining stems, which climb on bushes and small trees. This shrub is very abundant in the woods of Georgia in North America, where it was discovered by Dr Brickel, and it is covered with blossoms for many months of the year.

JEFFERY. See GEOFFREY.

JEFFREYS, Sir GEORGE, Baron Wem, commonly called Judge Jeffreys, was the sixth son of John Jeffreys, Esq. of Aston in Denbighshire; and was educated at Westminster school, whence he removed to the Inner Temple, where he applied himself to the study of the law. Alderman Jeffreys, who was probably related to him, introduced him among the citizens of London, and he being a merry bottle companion, soon came into great business, and was chosen their recorder. He was afterwards chosen solicitor to the duke of York; and in 1680 was knighted, and made chief-justice of Chester. At length, resigning the recordership, he obtained the post of chief-justice of the king's bench, and, soon after the accession of James II. the great seal. During the reign of King Charles II. he showed himself a bitter enemy to those dissenting ministers who, in that time of persecution, were tried by him: he was one of the greatest advisers and promoters of all the oppressions and arbitrary measures carried on in the reign of James II.; and his sanguinary and inhuman proceedings against Monmouth's unhappy adherents in the west will ever render his name infamous. Whenever the prisoner was of a different party, or he could please the court by condemning him, instead of appearing, according to the duty of his office, as his counsel, he would scarce allow him to speak for himself; but would load him with the greatest and most vulgar abuses, browbeat, insult, and turn to ridicule the witnesses that spoke in his behalf; and even threaten the jury with fines and imprisonment, if they made the least hesitation about bringing in the prisoner guilty. Yet it is said, that when he was in temper, and matters perfectly indifferent came before him, no one became a seat of justice better. Nay, it even appears, that when he was under no state-influence, he was sometimes inclined to protect the natural and civil rights of mankind, of which the following instance has been given:—The mayor and aldermen of Bristol had been used to transport convicted criminals to the American plantations, and sell them by way of trade. This turning to good account, when any pilferers or petty rogues were brought before them, they threatened them with hanging; and then some officers who attended, earnestly persuaded the ignorant intimidated creatures to beg for transportation, as the only way to save them; and in general their advice was followed. Then, without more form, each alderman in course took one, and sold him for his own benefit; and sometimes warm disputes arose between them about the next turn. This infamous trade, which had been carried on many years, coming to the knowledge of the lord chief justice, he made the mayor descend from the bench and stand at the bar, in his scarlet and fur, with his guilty brethren the aldermen, and plead as common criminals. He then obliged them to give securities to answer informations; but the proceedings were stopped by the revolution.—However, the brutality Jeffreys commonly showed on the bench, where his voice and visage were equally terrible, at length exposed him to a severe mortification. A scrivener of Wapping have a cause before him, one of the opponent's counsel said he was a strange fellow, and sometimes went to church, and sometimes to conventicles; and it was thought he was a trimmer. At this the chancellor fired: "A trimmer! (said he); I have heard much of that monster, but never saw one. Come forth Mr Trimmer, and let me see your shape." He then treated the poor fellow so roughly, that, on his leaving the hall, he declared he would not undergo the terrors of that man's face again to save his life, and he should certainly retain the frightful impressions of it as long as he lived. Soon after, the prince of Orange coming, the lord chancellor, dreading the public resentment, disguised himself in a seaman's dress, in order to leave the kingdom; and was drinking in a cellar, when this scrivener coming into the cellar, and seeing again the face which had filled him with such horror, started; on which Jeffreys, fearing he was known, feigned a cough, and turned to the wall with his pot of beer in his hand. But Mr Trimmer going out, gave notice that he was there; and the mob rushing in, seized him, and carried him before the lord mayor, who sent him with a strong guard to the lords of the council, by whom he was committed to the Tower, where he died in 1689.—It is remarkable, that the late countess of Pomfret met with very rude insults from the populace on the western road, only because she was granddaughter to the inhuman Jeffreys.
JEHOVAH, one of the Scripture names of God, signifying the Being who is self-existent and gives existence to others.

So great a veneration had the Jews for this name, that they left off the custom of pronouncing it, whereby its true pronunciation was forgotten. They called it tetragrammaton, or, "the name with four letters," and believe that whoever knows the true pronunciation of it cannot fail to be heard by God.

JEJUNE STYLE. See Style.

JEJUNUM, the second of the small guts; thus called from the Latin jejunus, "hungry," because always found empty. See Anatomy, No. 93.

JELLAL-EAN, or GELALEAN Calendar, Epocha, and Year. See Calendar, Epocha, and Year.

JELLY, a form of food, or medicine, prepared from the juices of ripe fruits, boiled to a proper consistency with sugar; or the strong decoctions of the bony, bones, or extremities of animals, boiled to such a height as to be stiff and firm when cold, without the addition of any sugar. The jellies of fruits are cooling, saponaceous, and acaceous, and therefore are good medicines in all disorders of the prime vice, arising from alkaline juices, especially when not given alone, but diluted with water. On the contrary, the jellies made from animal substances are all alkaline, and are therefore good in all cases in which an acidity of the humors prevails: the alkaline quality of these is, however, a measure taken off, by adding lemon juice and sugar to them. There were formerly a sort of jellies much in use, called compound jellies; these had the restorative medicinal drugs added to them, but they are now scarce ever heard of.

JELLY-OAT, a preparation of common oats, recommended by many of the German physicians in all hercatic disorders, to be taken with broth of snails or cray fish. It is made by boiling a large quantity of oats, with the husk taken off, with some harthorn shavings, and currants, together with a leg of veal cut to pieces, and with the bones all broken; these are to be set over the fire with a large quantity of water, till the whole is reduced to a sort of jelly; which when strained and cold is firm and hard. A few spoonfuls of this are to be taken every morning, diluted with a bun of either of the above-mentioned broths, or any other warming liquor.

JEMPTERLAND, a province of Sweden, bounded on the north by Angermania, on the east by Medelpad, on the south by Helsingland, and on the west by Norway. It is full of mountains; which afford ores of copper and iron, the latter of which is manufactured, and forms part of the trade with the Norwegians.

JENA, a strong town of Germany, in the circle of Upper Saxony, and in Saxo Weimar, with an university. It is seated on the river Saia, in E. Long. 11° 30'. N. Lat. 52° 54'.

JENCAPORE, a town of Asia, in the peninsula of Indostan, capital of a territory of the same name. It is seated on the river Chaul, in E. Long. 76° 25'. N. Lat. 30° 30'.

JENCOPING, a town of Sweden, in the province of Smoland, seated on the south side of the lake Werter, with a strong citadel. The houses are all built with wood. E. Long. 14° 20'. N. Lat. 57° 22'.

JENISA, a river of the Russian empire that runs from north to south through Siberia, and falls into the Frozen ocean.

JENSKOI, a town of the Russian empire, in Siberia, seated on the river Jenisa. It is large, populous, and pretty strong; and there are villages for several miles round it. It is subject to the Tungrians, who are Pagans, and live chiefly on the above river. They pay a tribute to the emperor for every bow, reckoning a man and a woman for one. The climate is extremely cold; and no other fruits grow there but black and red currants, strawberries, and gooseberries. Corn, butchers meat, and wild fowls, are very cheap. E. Long. 92° 35'. N. Lat. 57° 46'.

JENKINS, Henry. See Longevity.

JENKINS, Sir Lewis, a learned civilian and able statesman of the 17th century, born in Glamorganshire about the year 1523. Being rendered obnoxious to the parliament during the civil war by adhering to the king's cause, he consulted his safety by flight; but returning on the Restoration, he was admitted an advocate in the court of chancery, and succeeded Dr. Exton as judge. When the queen mother Henrietta died in 1669 at Paris, her whole estate, real and personal, was claimed by her nephew Louis XIV.: upon which Dr. Jenkins' opinion being called for and approved, he went to Paris, with three others joined with him in a commission, and recovered her effects; for which he received the honour of knighthood. He officiated as one of the mediators at the treaty of Nimoguen, in which tedious negotiation he was engaged about four years and a half; and was afterwards made a privy councillor and secretary of state. He died in 1685; and as he never married, bequeathed his whole estate to charitable uses: he was so great a benefactor to Jesus College, Oxford, that he is generally looked on as the second founder. All his letters and papers were collected and printed in 1724, in two vols. folio.

JENNY WREN, a name given by writers on song birds to the wren. See Wren, Ornithology Index.

JENTACULUM was, among the Romans, a morning refreshment like our breakfast. It was exceedingly simple, consisting, for the most part, of bread alone; labouring people indeed had something more substantial to enable them to support the fatigues of their employment. What has been here said may be observed of the Jews and Christians also. The Greeks distinguished this morning meal by the several names of aposis, anaplerosis, or anapleos, though aposis is generally applied to dinner. See Eating and Dinner.

JENYS, Soame, a distinguished English writer, was born in Great Ormond-street, London, in the year 1703-4. Sir Roger Jenys, his father, was descended from the family of the Jenys of Churchill in Somersetshire. The country residence of Sir Roger was at Ely, in the isle of the same name, where he turned his attention to such kinds of business as rendered him most beneficial to his neighbours, for which amiable deportment in particular the honour of knighthood was conferred upon him by William III. Our author's mother, a lady of rank, learning and piety, superintended his education till it was necessary to place him under a tutor, for which purpose a Mr Hill was taken into the family, by whom he was instructed in the first rudiments of language, with such other branches of knowledge as were suited to his years. At this time Mr Q Q Hill
Hill was called to a situation more advantageous, and a Mr. White succeeded him in the office of tutor to young Jenyns, a man eminent for his learning, taste, and ingenuity, by whom he was qualified for attending the university.

He was admitted into St. John’s College, Cambridge, in the year 1722, under Dr. Edmundson, who was at that time one of the leading tutors of the college. Here his diligence and regular deportment did him the greatest honour, and the strict discipline observed in the college was perfectly agreeable to his natural inclinations. After quitting the college, his winter residence was in London, and he lived in the country during the summer season, being chiefly employed in the prosecution of such studies as were of a literary nature. His first publication, a poetical essay on the art of dancing, appeared without his name in 1727; but he was very soon discovered, and it was considered as a presage of his future eminence.

Soon after the death of his father, he was chosen in 1742 one of the members of parliament for the county of Cambridge, and from this period he retained his seat in the house of commons till the year 1780. The high opinion entertained by his constituents of his parliamentary conduct, may be learned from the unanimity of their choice; for he never but once experienced any opposition. He was chosen one of the commissioners of the board of trade and plantations in 1755, which office he retained till an alteration was made in the constitution of it by authority of parliament. He was married, first to the only daughter of Colonel Soame, of Dereham in Norfolk, who died without issue, and afterwards to the daughter of Henry Gray, Esq. of Hackney, who survived him. He died himself of a fever, after a few days illness, on the 18th of December, 1787, leaving no issue.

His temper was mild, sweet, and gentle, which he manifested indiscriminately to all. It was his earnest wish never to give offence to any; yet he made such liberal allowances for diversities of temper, that he was very rarely offended with others. He was punctual in the discharge of the duties of religion both in public and private, professing to be better pleased with the government and discipline of the church of England than of any other in Christendom, which, however, he considered as capable of important alterations and amendments, if it were previously and deliberately determined what these alterations should be. He possessed an uncommon vein of the most lively and genuine wit, which he never made use of to wound the feelings of others, but was rather very much offended with those who did, being convinced that distinguished endowments of the mind are as much intended to promote the felicity of others, as of those who possess them.

No man was ever a mere genuine philanthropist, as he felt most sensibly for the miseries of others, and used every means in his power to render them as happy as possible. His indigent neighbours in the country he viewed as a part of his family, in which light he considered them as entitled to his care and protection. As an author, Soame Jenyns certainly deserves a place among those who have excelled, whether we view him as a poet, or a writer of prose, in which latter capacity he ranks with the purest and most correct writers of the English language. He reasons with closeness and preci-

JEHOFAILE, (compounded of three French words, Pay saillie, "I have failed"), a term in law, used for an oversight in pleading or other proceeding at law.

The showing of these defects or oversights was formerly often practised by the counsel; and when the jury came into court in order to try the issue, they said, This inquest you ought not to take; and after verdict they would say to the court, To judgment you ought not to go. But several statutes have been made to avoid the delays occasioned by such suggestions; and a judgment is not to be stayed after verdict for mistaking the Christian or surname of either of the parties, or in a sum of money, or in the day, month, year, &c. where the same are rightly named in any preceding record.

JEPHTHAH, judge of Israel, and successor to Jair in the government of the people, was a native of Mizpeh, and the son of one Gilead by a harlot. This Gilead having married a lawful wife, and had children by her, these children drove Jephthah from his father's house, saying that he should not be heir with them. Jephthah retired into the land of Tob, and there he became captain of a band of thieves and such other people as he had picked up together. At that time, the Israelites beyond Jordan, seeing themselves pressed by the Ammonites, came to desire assistance from Jephthah; and that he would take upon him the command of them. Jephthah at first reproached them with the injustice which they had done him, or at least which they had not prevented, when he was forced from his father's house. But as these people were very earnest in their request, he told them, that he would succour them, provided that at the end of the war they would acknowledge him for their prince. This they consented to, and promised with an oath.

Jephthah, in the year of the world 2817, having been acknowledged prince of the Israelites in an assembly of the people, was filled with the spirit of God, and began to get his troops together; to that end, he went over all the land which the children of Israel possessed beyond Jordan. At the same time he made a vow to the Lord, that if he were successful against the Ammonites, he would offer up for a burnt-offering whatever should first come out of his house to meet him. The battle being fought, Jephthah remained conqueror, and ravaged all the land of Ammon. But as he returned to his house, his only daughter came out to meet him with timbrels and with dances: whereupon Jephthah tore his clothes, and said, "Alas, my daughter, thou hast brought me very low, for I have made a vow unto the Lord, and cannot fail in the performance of it." His daughter answered, "My fa-

father,
JER

Jephthah, if thou hast made a vow unto the Lord, do with me as thou hast promised; grant me only the favour that I may be at liberty to go up to the mountains, and there for two months bewail my virginity with my companions." Jephthah granted her this liberty; and at the end of two months, he offered up his daughter, who died a virgin, a burnt-offering, agreeable to his vow; according to the opinion of most commentators.

In the mean time, the Ephraimites, jealous of the victory obtained by Jephthah over the Ammonites, passed the river Jordan in a tumultuous manner, came and complained to Jephthah that he had not invited them to this war, and threatened to set fire to his house. Jephthah answered them, that he had sent to desire their assistance; but observing that they did not come, be put his life in his hands and hazarded a battle. The Ephraimites not being satisfied with these reasons, Jephthah assembled the people of Gilead, gave them battle, and defeated them; so that there were two and forty thousand men of the tribe of Ephraim killed that day. We know nothing more in particular concerning the life of Jephthah, only that he judged Israel six years, and was buried in a city of Gilead.

St Paul (Heb. xi. 32.) places Jephthah among the saints of the Old Testament, the merit of whose faith distinguished them. But it must be observed, that there is something so extraordinary in Jephthah's vow, that notwithstanding the Scripture speaks of it in very plain and clear terms, yet such difficulties arise concerning it as perplex commentators. Some maintain, that this daughter of Jephthah was not sacrificed, as that would have been a violation of the law of Moses; and especially, when by the same law he might have redeemed his daughter for ten shekels of silver: therefore they contend, that it was something else Jephthah did to his daughter, such as devoting her to a state of celibacy, or dedicating her to the service of God. On the other hand, those who maintain the affirmative, or that Jephthah's daughter was actually sacrificed, urge, that the times wherein Jephthah lived were sadly addicted to idolatry; also the manner wherein he lived before he was called to the assistance of his country; but above all, the clear, evident, and express meaning of the text. They observe, that vows of perpetual virginity are institutions of a modern date; and had there been no more in it, there would have been little occasion for rending his clothes, and bemoaning himself as he did; besides the bitter lamentations made by herself, and by all the daughters of Israel in succeeding times. But if she was sacrificed, we may safely and confidently aver with Josephus, who says that she was, that this sacrifice was neither unlawful nor acceptable to God; but, on the contrary, an abominable crime, that might, notwithstanding, have proceeded from a mistaken principle of religion.

JERBOA, a species of quadruped belonging to the genus Dipsus, and resembling, in some of its characters, the mouse tribe. See Dipsus, Mammalia Index.

JEREMIAH, (the Prophecy of), a canonical book of the Old Testament. This divine writer was of the race of the priests, the son of Hilkiah of Amathoth, of the tribe of Benjamin. He was called to the prophetic office when very young, about the 13th year of Josiah, and continued in the discharge of it about 40 years. He was not carried captive to Babylon with the other Jews, but remained in Judea to lament the desolation of his country. He was afterwards a prisoner in Egypt with his disciple Baruch, where it is supposed he died in a very advanced age. Some of the Christian fathers tell us he was stoned to death by the Jews, for preaching against their idolatry; and some say he was put to death by Pharaoh Hophra, because of his prophecies against him. Part of the prophecy of Jeremiah relates to the time after the captivity of Israel, and before that of Judah, from the first chapter to the 54th; and part of it was in the time of the latter captivity, from the 44th chapter to the end. The prophet lays open the sins of Judah with great freedom and boldness, and reminds them of the severe judgments which had befallen the ten tribes for the same offences. He passionately laments their misfortune, and recommends a speedy reformation to them. Afterwards he predicts the grievous calamities that were approaching, particularly the 70 years captivity in Chaldea. He likewise foretells their deliverance and happy return, and the recompense which Babylon, Moab, and other enemies of the Jews, should meet with in due time. There are likewise several intimations in this prophecy concerning the kingdom of the Messiah; also several remarkable visions, and types, and historical passages relating to those times. The 52d chapter does not belong to the prophecy of Jeremiah, but probably was added by Ezra, and contains a narrative of the taking of Jerusalem, and of what happened during the captivity of the Jews, to the death of Jehoiachin. St Jerome has observed upon this prophet, that his style is more easy than that of Isaiah and Hosea; that he retains something of the rusticity of the village where he was born; but that he is very learned and majestic, and equal to those two prophets in the sense of his prophecy.

JERICO, or HIERICUS, in Ancient Geography, a city of Judea; situated between Jordan and Jerusalem, at the distance of 150 stadia from the latter, and 60 from the former. Josephus says, "the whole space from Jerusalem is desert and rocky, and equally barren and uncultivated from Jericho to the lake Asphaltites; yet the places near the town and above it are extremely fertile and delicious, so that it may be justly called a divine plain, surpassing the rest of the land of Canaan, no unfruitful country, and surrounded by hills in the manner of an amphitheatre. It produces opoponax, myrobolanum, and dates; from the last of which it is called the city of palm trees, by Moses. The place is now called Raba; and is situated, M. Volney informs us, "in a plain six or seven leagues long, by three wide, around which are a number of barren mountains, that render it extremely hot." Here formerly was cultivated the balm of Mecca. From the description of the Hadjje, this is a shrub similar to the pomegranate tree, with leaves like those of rue: it bears a pulpy nut, in which is contained a kernel that yields the reservoir juice we call basam or balsem. At present there is not a plant of it remaining at Raba; but another species is to be found there, called zakkoun, which produces a sweet oil, also celebrated for healing wounds. This zakkoun resembles a plum-tree; it has thorns four inches long, with leaves like those of the olive tree, but narrower and greener, and prickly at the end; its fruit is a kind of acorn, with-
out a calyx, under the bark of which is a pulp, and
then a nut, the kernel of which gives an oil that the
Arabs sell very dear; this is the sole commerce of Ra-
ba, which is no more than a ruinous village.

JERIMOTH. See Jarimuth.

JEROME, St., in Latin Hieronymus, a famous
director of the church, and the most learned of all the
Latin fathers, was the son of Eusebius; and was born
at Stridon, a city of the ancient Pannonia, about the
year 340. He studied at Rome under Donatus, the
learned grammarians. After having received baptism,
he went into Gaul, and there transcribed St Hilary's
book de Synodiis. He then went into Aquileia, where
he contracted a friendship with Heliodorus, who pre-
valued on him to travel with him thrice, Pontus,
Bithynia, Galatia, and Cappadocia. In 372 St Jerome
retired into a desert in Syria, where he was persecuted
by the orthodox of Melitius's party, for being a Sabell
ian, because he made use of the word hypostasis, which
had been used by the council of Rome in 360. This
obliged him to go to Jerusalem; where he applied him-
self to the study of the Hebrew language, in order to
receive a more perfect knowledge of the Holy Scrip-
tures; and about this time he consented to be ordained,
on condition that he should not be confined to any par-
ticular church. In 381, he went to Constantinople to
hear St Gregory of Nazianzen; and the following year
returned to Rome, where he was made secretary to Pope
Damasus. He then instructed many Roman ladies in
piety and the knowledge of the sciences, which exposed
him to the calumnies of those whom he zealously re-
proved for their irregularities; and Pope Siricius not
having all the esteem for him which his learning and
virtue justly entitled him to, this learned doctor left
Rome, and returned to the monastery of Bethlehem,
where he employed himself in writing against those
whom he called heretics, especially against Vigiliantius
and Jovinian. He had a quarrel with John of Jeru-
salem and Rufinus about the Origenists. He was the
first who wrote against Pelagius; and died on the 30th
of September 420, at about 80 years of age. There
have been several editions of his works; the last, which
is that of Verona, is in 11 vols. folio. His principal
works are, 1. A Latin version of the Holy Scriptures,
distinguished by the name of the Vulgate. 2. Commen-
taries on the Prophets, Ecclesiastes, St Matthew's Gos-
pel, and the Epistles to the Galatians, Ephesians, Titus,
and Philemon. 3. Polenical treatises against Montanus,
Helvidius, Jovinian, Vigiliantius, and Pelagius. 4. Se-
veral letters. 5. A treatise on the lives and writings of
the ecclesiastical authors who had flourished before his
time.—St Jerome's style is lively and animated, and
sometimes sublime.

JEROME OF PROVENCE, so called from the place of his
birth, in Bohemia. He was neither a monk nor
clergyman but had a learned education. Having em-
braced the opinions of John Huss, he began to pro-
pagate them in the year 1420. The mean time the
council of Nice kept a watchful eye over him, and
considering him as a dangerous person, cited him to
appear before them and give an account of his faith.
In obedience to this citation, he went to Constance;
but on his arrival, in 1415, finding Huss in prison, he
set out for his own country. Being seized, however,
on the way, imprisoned, and examined, he was so in-
timidated that he retracted, and pretended to appro
the condemnation of Wickliff's and Huss's opinions;
but on the 26th of May 1416, he condemned that
reputation in these terms: 'I am not ashamed to
confess here publicly my weakness. Yes, with horror
I confess my base cowardice. It was only the dread
of the punishment by fire which drew me to consent,
against my conscience, to the condemnation of the do-
trine of Wickliff and Huss.' Accordingly sentence
was passed on him; in pursuance of which he was de-
liberated to the secular arm, and burnt in 1416. He
was a person of great parts, sagacity, and audicion.

JERONYMITES, Hieronymitis, a denomina-
tion given to divers orders or congregations of religious;
otherwise called Hermits of St Jerome.

JERSEY, an island in the English channel, believed
to be the island called in the Itinerary Cassaro,
in succeeding times Augia, by us Gersey, more frequent-
ly Jersey. It is situated in the English channel, 18
miles to the west of Normandy, and to the south of
Portland in Dorsetshire, and in the time of the
Romans was called Cassaro. It is not over 12
miles in length, nor much above 6 where broadest,
which is at the two extremities. It is defended by
rocks and dangerous quicksands. On the north side
the cliffs rise 40 or 50 fathoms high, which render it
inaccessible on that side; but on the south the shore is
almost level with the water. In the west part of
the island is a large tract of land once cultivated and
very fertile, but now a barren desert, caused by the westerly
winds throwing up sand from the bottom to the top
of the highest cliffs. The higher lands are diversified
by gritty, gravely, stony, and fine mould; the lower
by a deep, rich, and heavy soil. The middle part of
the island is somewhat mountainous, and so thick
planted with trees, that at a distance it resembles one
entire forest, though in walking through it there is
hardly a thicket or any other thing to be seen but
hedge-rows and orchards of apple-trees. The valleys
under the hills, are finely watered by brooks, and have
plenty of cattle and small sheep, with very fine wool,
and very sweet meat, which is ascribed to the short-
ness of the grass. The horses are good for draught;
but few fit for the saddle. The island produces variety
of trees, roots, and herbs; but not corn enough for the
inhabitants, who therefore send for it to England and
France, and sometimes to Danzig. The fields are
inclosed by great mounds of earth, raised from 6 to 8
or 10 feet high, proportionally thick and solid, plant-
ed with quicksets and trees. As the air of this island
is very healthy, those of the inhabitants who are tem-
porate live to a great age: but the coast is very sub-
ject to storms by westerly winds, from which they have
no land to shelter them nearer than North America;
and there is a vast chain of rocks about the island,
among which the tides and currents are so strong and
rapid, that the navigation is dangerous to those who
are not perfectly acquainted with the coast. The
buildings of this island are generally of rag stone;
but some of the wealthy inhabitants have their houses
fronted with a reddish white stone, capable of being polished
like marble, and of which there is a rich quarry on a
hill called Montmado. The ordinary dwellings are
thatched. The churches are very plain buildings,
most of them with square steeples; and the com-
mon
JER [{125}]

Jersey. The monastic table is not at the east end, as in the English churches, but placed just under the pulpit. The staple manufacture is knit stockings and caps, many thousand pairs of which are weekly sold at St Helier to the merchants; also dyers, of which 25,000 hogsheads have been made in one year. Their principal foreign trade is to Newfoundland; whether, particularly in 1732, they sent 24 ships; these proceed from thence to the Mediterranean to dispose of their fish.

On the south of the island the sea seems to have encroached upon the land (which, as we have before observed, declines on that side), and to have swallowed upwards of six square miles, making a very beautiful bay of about three miles long, and near the same in breadth. In the east corner of this bay stands the town of St Helier, very happily situated. But the principal haven is in the western corner of the bay, which receives its name from it, being called St Aubin's. There are, besides these, several other havens of less note; as, St Brelade's bay, at the back of St Aubin's; the great bay of St Ouen, which takes in the greatest part of the west side of the island, where the largest ships may ride in 12 and 15 fathoms, safe from all but east winds. La Crevasse is a port only for boats; Greve de Leq and Port St John are also small havens on the north side, where is likewise Bonnemain. On the east there is the bay of St Catharine, and the harbour of Rosel. To the south-west lies the haven de la Chausée. The last we shall mention is the Port de Pas, a very little to the eastward of St Aubin's bay.

The towns of St Helier and St Aubin, which, as already mentioned, stand both in the same bay called St Aubin's bay, opening to the south, are about three miles sunder. St Helier took its name from Elerius or Helier, a holy man who lived in this island many centuries ago, and was slain by the Pagan Normans at their coming hither. He is mentioned among the martyrs in the martYROLOGY of Coutance. His little cell with the stone bed is still shown among the rocks; and in memory of him a noble abbey of canons regular was founded in the little island in this bay, and annexed to Cherbourg abbey in Normandy in the reign of Henry I. and suppressed as an alien priory. The town of St Helier stands at the foot of a long and high rocky hill at the east end. It is a well-built and populous place; greatly improved and enlarged within the last twenty years, and contained in 1806, 6,462 inhabitants. It has been greatly strengthened by fortifications. The market-place in the centre is spacious, surrounded with handsome houses, among which is the Cohue-Royal or court of justice. At the top of the market-place is a statue of George II. of bronze gilt. The market is held on Saturday, and much frequented.

St Aubin at the west end of the bay is principally inhabited by merchants and masters of ships, whom the neighbourhood of the port has invited hither. It is not more than half the size of the other town, though greatly increased within those 100 years; and has a good stone pier carried far into the sea, where ships of considerable burden lie safe under the guns of the adjoining fort.

The isle of St Helier, more to the east in the same bay, is in circuit near a mile, surrounded by the sea at about every half flood. On the site of the abbey before mentioned is now Elizabeth castle, one of the largest and strongest fortresses in Britain. Queen Elizabeth began it, and gave it her name. Charles I. enlarged, and Charles II. who was twice here, completed it. It was the last fortress that held out for the king. It is the residence of the governor and garrison, and occupies the whole isle, from whence at low water is a passage called the bridge, half a mile long, formed of sand and stones. A citadel was begun in the last war on a hill, whence the castle might be bombarded, but since the peace left off.

Mount Orgueil castle, called also Gourmay from the neighbouring village of that name, lies to the south of Rosel harbour in the bay of St Catharine. It was a place of strength before Henry V.'s time, and bid defiance to the attempts of the French under the comte de Guesclin, 1374, at the end of the reign of Edward III. It was repaired by Queen Elizabeth, but is now neglected, yet preserves an air of grandeur answering its name in ruins. The ascent to its top is by near 200 steps; and from thence by a telescope may be seen the two front towers of the cathedral of Coutance. The famous William Pryme was confined in it three years.

The island is divided into 12 parishes, which are so laid out that each has a communication with the sea; these are subdivided into 52 vintaines, so called from the number of 22 houses, which each is supposed to have formerly contained, just as in England 10 houses anciently made a tything. The whole number of inhabitants amounted to 22,355 in 1806, of which above 3,000 are able to bear arms, and are formed into regiments. Their general review is on the sandy bay between the two towns, when they are attended with a train of above 20 brass field pieces, and two small bodies of horse in the wings.

The chief officer is the governor, who has the custody of his majesty's castles, with the command of the garrisons and militia. The civil government is administered by a bailiff, assisted by 12 jurors. They have here also what they call an assembly of the states. These are convened by the governor or his deputy; the bailiff consists of himself and the jurors, the dean and clergy, and the 12 high constables.

There were formerly many druidical temples and altars in Jersey, some remains of which are still to be seen. The cromlechs are here called pouquelogs, and there are some tumuli and keeps. Roman coins have also been dug up in this island; and there are the remains of a Roman camp in the manor of Dilmant. Christianity was first planted here in the middle of the 6th century, and the island made part of the see of Dol in Bretegne, and it is now governed by a dean. Besides the abbey of St Helier, here were four priories, Noirmont, St Clement, Bonnemain, and le Leck, and above 20 chapels, now mostly ruined. During the last war this island, together with that of Guernsey, became an object of desire to France, whose vanity, no less than her interest, was concerned in depriving Britain of those last remains of her continental possessions. The first attempt to achieve this conquest took place in the year 1779. A force of 5,000 or 6,000 men was embarked in flat-bottomed boats, and endeavoured to land in the bay of St Ouen, on the first of May. In this
this attempt they were supported by five frigates and
other armed vessels; but met with such a vigorous
resistance from the militia of the island, assisted by a bod-
y of regulars, that they were compelled to retire
without having landed a single person. Much discon-
tent and mutual recrimination took place among the
French naval and military officers on this failure; and
though the expedition was represented by many as ill
concerted, and destitute of every hope of success, an-
other attempt was resolved on. Both the troops and
seamen that had been employed in the former expedi-
tion were equally desirous of retrieving their honour;
but they were for some time prevented from making
any attempt of this kind by bad weather; and, before
another opportunity offered, the squadron which was
designed to cover their descent was attacked by Sir
James Wallace, who drove them ashore on the coast of
Normandy, silencing a battery under whose guns they
had taken shelter, captured a frigate of 34 guns, with
two rich prizes, burnt two other large frigates, and a
considerable number of smaller vessels.

Thus the scheme of invading the island of Jersey
was totally disconcerted, and laid aside for that time,
but was resumed in the year 1781. The conduct of
this second expedition was given to the baron de Ru-
lucourt, who had been second in command when the
former attempt was made. He was a man of cour-
rage, but fierce and violent in his disposition, and seems
to have been very deficient in the prudence and conduct
necessary for bringing any military enterprise to a suc-
cessful issue. The force entrusted to him on the pre-

cent occasion consisted of 2000 men; with whom he
embarked in very tempestuous weather, hoping that
he might thus be able to surprise the garrison. Many
of his transports, however, were thus dispersed, and he
himself, with the remainder, obliged to take shelter in
some islands in the neighbourhood of Jersey. As soon
as the weather grew calmer, he seized the opportunity
of a dark night to effect landing at a place called Gre-
ville, where he made prisoners of a party of militia.
Hence he proceeded with the utmost expedition to
St Helier’s, the capital of the island, about three miles
distant. His arrival was so unexpected, that he seized
on a party of men who guarded it, together with the com-
manding officer, and the magistrates of the island.
Rulucourt then drew up a capitulation, the terms of
which were, that the island should be instantly surren-
dered to the French, and the garrison be sent to Eng-
land; threatening the town with immediate destruction
in case of non-compliance. It was in vain represented
to him that no act of the deputy-governor and magis-
trates could be valid while they remained in his power;
but, as Rulucourt still insisted, they were obliged to
comply, lest his menaces should have been carried into
execution. This point being gained, he advanced to
Elizabeth castle in the neighbourhood of the town,
suiming it to surrender in virtue of the capitulation
for the town and island just concluded. To this a pe-
remptory refusal was given, and followed by such a vi-
gorous discharge of artillery, that he was obliged to
retire into the town. In the mean time the British
troops stationed in the island began to assemble from
every quarter under the command of Major Pierson;
who, on being required by the French commander to
submit, replied, that if the French themselves did not,
within 20 minutes, lay down their arms, he would
attack them. This being refused, an attack was in-
stantly made with such impetuosity, that the French
were totally routed in less than half an hour, and driv-
en into the market-place, where they endeavoured to
make a stand. Their commander, exasperated at this
unexpected turn of affairs, endeavoured to wreak his
vengeance on the captive governor, whom he obliged
to stand by his side during the whole time of the con-
flict. This, however, was quickly over; the French
were broken on all sides, the baron himself mortally
wounded, and the next in command obliged to surren-
der himself and the whole party prisoners of war; while
the captive governor escaped without a wound. This
second disaster put an end to all hopes of the French
ministry of being able to reduce the island of Jersey,
and was indeed no small mortification to them; 800
troops having been landed at that time, of which not
one escaped. A monument was erected at the public
expense in the church of St Helier, to the memory of
Major Pierson, to whom the deliverance of the island
was owing; but who unhappily fell in the moment of
victory, when only 24 years of age.

All the landing places and creeks round the island
are now fortified with batteries, and 17 or 18 watch-
houses are erected on the headlands. These are round
towers with embrasures for small cannon and loop-holes
for musketry; the entrance by a door in the wall out
of the reach of man, and to be ascended by a ladder
afterwards drawn up. This island, with those of
Guernsey, Sark, Alderney, and their appendages, were
parcel of the duchy of Normandy, and were united to
the crown of England by the first princes of the Nor-
man line. The language of the pulpit, and the bar, is
the French, which is that generally spoken by the
people at large. They are governed by their own
laws, which are for the most part the ducal customs of
Normandy, being collected in an ancient book of cus-
toms intitled Le grand coutumier. The king’s writ,
or process from the courts of Westminster, is here of no
force; but his commission is. They are not bound by
any common acts of our parliaments, unless particularly
named. All causes are originally determined by their
own officers, the bailiff and jurats of the islands.
But an appeal lies from them to the king and council
in the last resort.—Jersey is an earldom in the Villiers
family.

NEW JERSEY, or, as it is commonly called, the Jer-
sey, (being two provinces united into one government,) one
of the united states of North America, lying from
39 to 41 degrees of north latitude, and from 73 to 75
degrees 30 minutes longitude west from London; in
length 160 miles, in breadth 52.

It is bounded on the east by Hudson’s river and the
sea; on the south by the sea; on the west by Dela-
ware bay and river, which divide it from the states of
Delaware and Pennsylvaniq; and on the north, by a
line drawn from the mouth of Mahakammak river, in
latitude 41° 24’; to a point on Hudson’s river, in lati-
date 41°; containing about 8320 square miles, equal
to 5,224,000 acres. New Jersey is divided into 13
counties, which are subdivided into 226 townships or pri-
cessions. In 1810, a census of the inhabitants was made
by order of the legislature, when they amounted to
245,563, of which 18,694 were blacks. Of these
blacks
Blacks 10,851 were slaves; so that the proportion of slaves to the whole of the inhabitants in the state is as one to 24. The population for every square mile is 37.

As to the face of the country, soil, and productions, the counties of Sussex, Morris, and the northern part Bergen, are mountainous. As much as five-eighths of most of the southern counties, or one-fourth of the whole state, is sandy and barren, unfit for cultivation. The land on the sea coast in this, like that in the most southern states, has every appearance of made ground. The soil is generally a light sand; and by digging, on an average, about 50 feet below the surface (which can be done, even at the distance of 20 or 30 miles from the sea, without any impediment from rocks or stones), you come to salt marsh. This state has all the varieties of soil from the worst to the best kind. It has a greater proportion of barrens than any of the states. The barrens produce little else but shrub oaks and white and yellow pines. In the hilly and mountainous parts of the state, which are not too rocky for cultivation, the soil is of a stronger kind, and covered in its natural state with stately oaks, hickories, chestnuts, &c. &c. and, when cultivated, produces wheat, rye, Indian corn, buck wheat, oats, barley, flax, and fruits of all kinds common to the climate. The land in this hilly country is good for grazing, and the farmers feed great numbers of cattle for New York and Philadelphia markets, and many of them keep large dairies.

The markets of New York and Philadelphia receive a very considerable proportion of their supplies from the contiguous parts of New Jersey. And it is worthy of remark that these contiguous parts are exceedingly well calculated, as to the nature and fertility of their soils, to afford these supplies; and the intervention of a great number of navigable rivers and creeks renders it very convenient to market their produce. These supplies consist of vegetables of many kinds, apples, pears, peaches, plums, strawberries, cherries, and other fruits; cod in large quantities and of the best quality; butter, cheese, beef, pork, mutton, and the lesser meats.

The trade of this state is carried on almost solely with and from those two great commercial cities, New York on one side, and Philadelphia on the other; though it wants not good ports of its own. The articles exported, besides those already mentioned, are wheat, flour, horses, live cattle, hams, which are celebrated as being the best in the world, lumber, flaxseed, leather, and iron in great quantities in pigs and bars. Formerly copper ore was reckoned among their most valuable exports; but the mines have not been worked since the commencement of the late war. The iron manufacture is the greatest source of wealth to the state. Iron works are erected in Gloucester, Burlington, Morris, and other counties. The mountains in the county of Morris give rise to a number of streams necessary and convenient for these works, and at the same time furnish a copious supply of wood and ore of a superior quality. In this county alone are no less than seven rich iron mines, from which might be taken ore sufficient to supply the United States; and to work it into iron are two furnaces, two rolling and slitting mills, and about thirty forges, containing from two to four fires each. These works produce annually about 540 tons of bar iron, 800 tons of pigs, besides large quantities of hollow ware, sheet iron, and nail rods. In the whole state, it is supposed there is yearly made about 7200 tons of bar iron, 1200 do. of pigs, 80 do. of nail rods, exclusive of hollow ware, and various other castings, of which vast quantities are made.

The character, manners, and customs of the people are various in different parts of the state. The inhabitants are a collection of Low Dutch, German, English, Scotch, Irish, and New Englanders, or their descendants. National attachment and mutual convenience have generally induced those several kinds of people to settle together in a body; and in this way their peculiar national manners, customs, and character, are still preserved, especially among the lower class of people, who have little intercourse with any but those of their own nation. Religion, although its tendency is to unite people in those things that are essential to happiness, occasions wide differences as to manners, customs, and even character. The Presbyterian, the Quaker, the Episcopalian, the Baptist, the German and Low Dutch Calvinist, the Methodist, and the Moravian, have each their distinguishing characteristics, either in their worship, their discipline, or their dress. There is still another very perceptible characteristic difference, distinct from either of the others, which arises from the intercourse of the inhabitants with different states. The people in West Jersey trade to Philadelphia, and of course imitate their fashions, and imitate their manners. The inhabitants of East Jersey trade to New York, and regulate their fashions and manners according to those of New York. So that the difference in regard to fashions and manners between East and West Jersey, is nearly as great as between New York and Philadelphia.

The people of New Jersey are generally industrious, frugal, and hospitable. There are, comparatively, but few men of learning in the state, nor can it be said that the people in general have a taste for the sciences. The lower class, in which may be included three-fifths of the inhabitants of the whole state, are ignorant, and are criminally neglectful in the education of their children. There are, in this state, sixty-four Presbyterian congregations, subject to the care of three presbyteries, viz. that of New York, of New Brunswick, and Philadelphia; 40 congregations of the Friends; 24 of the Bapists; 25 of Episcopalians; 33 of the Dutch, besides a few Moravians and Methodists.

There are two colleges in New Jersey; one at Princeton, called Nassau Hall; and the other at Brunswick, called Queen’s-college. The college at Princeton was first founded about the year 1746, and enlarged by Governor Belcher in 1747. It has an annual income of about 1000l. sterling, exclusive of certain funds for the education of poor and pious youth destined for the church. There is a grammar-school of about 30 scholars, connected with the college, under the superintendence of the president, and taught by two masters. Before the late revolution this college was furnished with a philosophical apparatus worth 500l. which (except the elegant orrery constructed by Mr. Rittenhouse) was almost entirely destroyed during the war, as was also the library, which now consists of between 2000 and 3000 volumes. The charter for Queen’s-college at Brunswick was granted just before the war, in consequence of an application from a body of the Dutch church,
church. Its funds, raised wholly by free donations, amounted soon after its establishment to 4000; but they were considerably diminished by the war. The students are under the care of a president. This college has lately increased both in numbers and reputation. There are also a number of flourishing academies in this state; one at Trenton, another in Hackettsak, others at Orangevale, Freehold, Elizabeth-town, Burlington, Newark, Springfield, Morristown, Bordentown, and Amboy; but there are no regular establishments for common schools. The usual mode of education is for the inhabitants of a village or neighbourhood to join in affording a temporary support for a schoolmaster, upon such terms as is mutually agreeable. But the encouragement which these occasional teachers meet with, is generally such as that no person of abilities adequate to the business will undertake it, and of course little advantage is derived from these schools.

There are a number of towns in this state, nearly of equal size and importance.—Trenton is the largest town in New Jersey. This town, with Lambertown, which joins it on the south, contained 6312 inhabitants in 1813. Here the legislature meets, the supreme court sits, and the public offices are all kept, except the secretary's, which is at Burlington. On these accounts it is considered as the capital of the state.—Burlington stands on the east side of the Delaware, 20 miles from Philadelphia by water, and 17 by land. The island, which is the most populous part of the city, is a mile and a quarter in length, and three quarters of a mile in breadth. Burlington contained 2419 inhabitants in 1810. There are two houses for public worship in the town, one for the Friends and Quakers, who are the most numerous, and one for the Episcopalians. The other public buildings are two market-houses, a court-house, and the best gaol in the state. Besides these, there is an academy, a free school, a nail manufacturer, and an excellent distillery, if that can be called excellent which produces a poison both of health and morals.—Perth Amboy stands on a neck of land included between Raritan river and Arthur Kull sound. It lies open to Sandy Hook, and has one of the best harbours on the continent. Vessels from sea may enter it in one tide, in almost any weather.—Brunswick was incorporated in 1784, and is situated on the southwest side of Raritan river, 12 miles above Amboy. It contains about 200 houses and 1600 inhabitants, one-half of which are Dutch. Its situation is low and unpleasant, being on the bank of the river, and under a high hill which rises back of the town.—Princeton is a pleasant healthy village, 52 miles from New York, and 43 from Philadelphia.—Elizabeth town and Newark are pleasant towns; the former is 15, and the latter nine miles from New York. Newark is famed for its good cider.

The government of this state is vested in a governor, legislative council, and general assembly. The governor is chosen annually by the council and assembly jointly. The legislative council is composed of one member from each county, chosen annually by the people. The general assembly is composed of three members from each county, chosen by the freemen. The council choose one of their members to be vice-president, who, when the governor is absent from the state, possesses the supreme executive power. The council may originate any bills, excepting preparing and altering any money bill, which is the sole prerogative of the assembly.

The first settlers of New Jersey were a number of Dutch emigrants from New York, who came over between the years 1614 and 1620, and settled in the county of Bergen. Next after these, in 1627, came over a colony of Swedes and Finns, and settled on the river Delaware. The Dutch and Swedes, though not in harmony with each other, kept possession of the country many years. In March 1664, Charles II. granted all the territory called by the Dutch New Netherlands, to his brother the duke of York. And in June 1664, the duke granted that part now called New Jersey to Lord Berkeley of Stratton, and Sir George Carteret, jointly; who, in 1665, agreed upon certain concessions with the people for the government of the province, and appointed Philip Carteret, Esq. their governor.—The Dutch reduced the country in 1672; but it was restored by the peace of Westminster, February 9, 1674.

This state was the seat of war for several years, during the bloody contest between Great Britain and America; and her losses, both of men and property, in proportion to the population and wealth of the state, were greater than of any other of the thirteen states.

Jersey, among wool-combers, denotes the finest wool, taken from the rest by dressing it with a Jersey comb.

Jerusalem, a very famous and ancient city, capital of Judea or Palestine, now a province of Turkey in Asia. According to Manetho, an Egyptian historian, it was founded by the shepherds who invaded Egypt in an unknown period of antiquity. According to Josephus, it was the capital of Melechisedek's kingdom, called Sisera in the book of Genesis: and the Arabsians assert, that it was built in honour of Melechisedek by 12 neighbouring kings; which, when they had done, he called Jerusalem. We know nothing of it with certainty, however, till the time of King David, who took it from the Jebusites, and made it the capital of his kingdom, which it ever after continued to be. It was first taken in the days of Jehoshaphat, by Hazael the king of Syria, who slew all the nobility, but did not destroy their city. It was afterwards taken by Nebuchadnezzar king of Babylon, who destroyed it, and carried away the inhabitants. Seventy years after, permission was granted by Cyrus king of Persia to the Jews to rebuild their city, which was done; and it continued the capital of Judea (though frequently suffering much from the Grecian monarchs of Syria and Egypt), till the time of Vespasian emperor of Rome, by whose son Titus it was totally destroyed. It was, however, rebuilt by Adrian; and seemed likely to have recovered its former grandeur, being surrounded with walls, and adorned with several noble buildings; the Christians also being permitted to settle in it. But this was a short-lived change; so that when the empress Helena, mother of Constantine the Great, came to visit this city, she found it in the most forlorn and ruinous situation. Having formed a design of restoring it to its ancient lustre, she caused, with a great deal
Jerusalem, deal of cost and labour, all the rubbish that had been thrown upon those places where our Saviour had suffered, been buried, &c. to be removed. In doing this, they found the cross on which he died, as well as those of the two malefactors who suffered with him; and, as the writers of those times relate, discovered by a miracle that which had borne the Saviour of mankind. She then caused a magnificent church to be built, which enclosed as many of the scenes of our Saviour’s sufferings as could conveniently be done, and adorned the city with several other buildings. The emperor Julian is said to have formed a design of rebuilding the temple of Jerusalem, and of restoring the Jewish worship. This scheme was contrived on purpose to give the lie to our Saviour’s prophecy concerning the temple and city of Jerusalem; namely, that the first should be totally destroyed, without one stone being left upon another; and that Jerusalem should be trodden down of the Gentiles till the times of the Gentiles were fulfilled. In this attempt, however, according to the accounts of the Christian writers of that age, the emperor was frustrated by an earthquake and fiery eruption from the earth, which totally destroyed the work, consumed the materials which had been collected, and killed a great number of the workmen.

This event hath been the subject of much dispute. Mr Warrington, who hath published a treatise expressly on the truth of this fact, hath collected the following testimonies in favour of it. The first is that of Ammianus Marcellinus, who tells us, “Julian, having been already thrice consul, taking Sallust, prefect of the several Gauls, for his colleague, entered a fourth time on this high magistracy; and although his sensibility of the many and great events which this year was likely to produce made him very anxious for the future, yet be both pushed on the various and complicated preparatives for this expedition with the utmost application, and, having an eye in every quarter, and being desirous to eternize his reign by the greatness of his achievements, he projected to rebuild at an immense expense the proud and magnificent temple of Jerusalem; which (after many combats, attended with much bloodshed on both sides, during the siege by Vespasian) was with great difficulty taken and destroyed by Titus. He committed the conduct of this affair to Alypius of Antioch, who had formerly been lieutenant in Britain. When therefore this Alypius had set himself to the vigorous execution of his charge, in which he had all the assistance that the governor of the province could afford him, horrible balls of fire breaking out near the foundations, with frequent and reiterated attacks, rendered the place from time to time inaccessible to the scorched and blasted workmen; and the victorious element continuing, in this manner, obstinately and resolutely bent, as it were, to drive them to a distance, Alypius thought best to give over the enterprise.”

The next testimony is that of Gregory Nazianzen. Speaking of the emperor Julian, he says, “After having run through a course of every other tyrannical experiment against the faith, and upon trial despising all of them as trifling and contemptible, he at last brought down the whole body of the Jews upon us; whom, for their ancient turn to seditious novelties, and an inveterate hatred of the Christian name, he chose as the fittest instrument for his machinations. Jerusalem. These, under a show of great good-will, which hid his secret purpose, he endeavoured to convince from their sacred books and traditions, which he took upon him to interpret, that now was come the time foretold when they should return to their own land, rebuild their temple, and restore the law to its ancient force and splendour. When these things had been thoroughly insinuated, and heartily entertained (for deceit finds easy admittance when it flatters our passions), the Jews set upon the work of rebuilding with great attention, and pushed on the project with the utmost labour and application. But when, now driven from their work by a violent whirlwind and a sudden earthquake, they fled together for refuge to a certain neighbouring church (same to depreciate the impending mischief; others, as is natural in such cases, to catch at any help that presents itself; and others again, enveloped in the crowd, were carried along with the body of those who fled); there are who say, the church refused them entrance; and that when they came to the doors, which were wide open but a moment before, they found them on a sudden closed by a secret and invisible hand; a hand accustomed to work these wonders by the terror and confusion of the impious, and for the security and comfort of godly men. This, however, is now invariably affirmed and believed by all, that, as they strove to force their way in by violence, the fire which burst from the foundations of the temple, met and stopped them. One part it burnt and destroyed, and another it desperately maimed, leaving them a living monument of God’s comination and wrath against sinners. Thus the affair passed; and let no man continue incredulous concerning this or the other miraculous works of God. But still the thing most wonderful and illustrious was, a light which appeared in the heavens, of a cross within a circle. That name and figure which impious men before esteemed so dishonourable upon earth, was now raised on high, and equally objected to the common view of all men; advanced by God himself as the trophy of his victory over unbelievers; of all trophies the most exalted and sublime. Nay further, they who were present, and partakers of the miracle we are now about to speak of, shew to this very day the sign or figure of the cross which was then marked or impressed upon their garments. For at that time, as these men (whether such as were of us or strangers) were showing these marks, or attending to others who showed them, each present observed the wonder, either on himself or his neighbour; having a radiant mark on his body or on his garment, in which there is something that, in art and elegance, exceeded all painting or embroidery.”

Notwithstanding these testimonies, however, this fact hath been strenuously contested by others; and indeed it must be owned that the testimonies above mentioned are by no means unexceptionable. In the last, particularly, the propensity to the marvellous is so exceedingly great, that every one must at first sight be struck with it. It is true indeed, the most miraculous part of it, as it seemed to be to Gregory, namely, the appearance of crosses upon the garments and bodies of some of the people who were struck, may be explained upon a natural principle; since we
Jerusalem are assured that lightning will sometimes produce effects of this kind: but even this is no decisive proof of the authenticity of the relation; though it cannot by any means discredit it, as some think. On the whole, however, it is not a matter of any consequence whether this event happened with the circumstances above mentioned or not. If Julian did make any attempt to rebuild the temple, it is certain that something obstructed the attempt, because the temple was never actually rebuilt. If he made no such attempt, the prophecy of our Saviour still holds good; and it surely cannot be thought to detract from the merit of a prophecy, that no body ever attempted to undue it, or prove it to be a falsehood.

Jerusalem continued in the hands of the eastern emperors till the reign of the caliph Omar, who reduced it under his subjection. The Saracens continued in possession of it till the year 1099, when it was taken by the Crusaders. They founded a new kingdom, of which Jerusalem was the capital, which lasted 58 years under some kings. At last this kingdom was utterly ruined by Saladin; and though the Christians once more got possession of the city, they were again obliged to relinquish it. In 1217, the Saracens were expelled by the Turks, who have ever since continued in possession of it.

The city of Jerusalem, in its most flourishing state, was divided into four parts, each enclosed with its own walls; viz. 1. The old city of Jebus, which stood on Mount Zion, where the prophets dwelt, and where David built a magnificent castle and palace, which became the residence both of himself and successors; on which account it was emphatically called the City of David. 2. The lower city, called also the Daughter of Zion, being built after it; on which stood the two magnificent palaces which Solomon built for himself and his queen; that of the Maccabean princes; and the stately amphitheatre built by Herod, capable of containing 80,000 spectators; the strong citadel, built by Antiochus, to command and overtop the temple, but afterwards razed by Simon the Maccabees, who recovered the city from the Syrians; and lastly, a second citadel, built by Herod, upon a high and craggy rock, and called by him Antonia. 3. The new city, mostly inhabited by traders, artificers, and merchants; and 4. Mount Moriah, on which was built the so famed temple of Solomon, described in the sixth and seventh chapters of the second book of Kings; and, since then, that rebuilt by the Jews on their return from Babylon, and afterwards built almost anew and greatly adorned and enriched by Herod.

Some idea of the magnificence of this temple may be had from the following considerations. 1. That there were no less than 163,300 men employed in the work. 2. That notwithstanding that prodigious number of hands, it took up seven whole years in building. 3. That the height of this building was 120 cubits, or 83 yards, rather more than half; and the courts round it about half as high. 4. That the front on the east side, was sustained by ramparts of square stone, of vast bulk, and built up from the valley below, which last was 300 cubits high, and being added to that of the edifice amounted to 430 cubits; to which, if we add, 5. The height of the principal tower above all the rest, viz. 60, will bring it to 480 cubits, which reckoning at two feet to a cubit, will amount to 960 feet; but according to the length of that measure, as others reckon it, viz. at two feet and a half, it will amount to 1200 feet; a prodigious height from the ground, and such as might well make Josephus say, that the very design of it was sufficient to have turned the brain of any but Solomon. 6. These ramparts, which were raised in this manner, to fill up the prodigious chasm made by the deep valley below, and to make the area of a sufficient breadth and length for the edifice, were 1000 cubits in length at the bottom, and 800 at the top, and the breadth of them 100 more. 7. The huge buttresses which supported the ramparts were of the same height, square at the top, and 50 cubits broad, and jutted out 150 cubits at the bottom. 8. The stones, of which they were built, were, according to Josephus, 40 cubits long, 12 thick, and 8 high, all of marble, and so exquisitely joined, that they seemed one continued piece, or rather polished rock. 9. According to the same Jewish historian, there were 1453 columns of Parian marble, and twice that number of pilasters; and of such thickness, that three men could hardly embrace them, and their height and capitals proportionable, and of the Corinthian order. But it is likely Josephus hath given us these two last articles from the temple of Herod, there being nothing like them mentioned by the sacred historians, but a great deal about the prodigious cedars of Lebanon used in that noble edifice, the excellent workmanship of them adapted to their several ends and designs, together with their gildings and other curious ornaments. The only thing more we shall venture to add is, what is affirmed in Scripture, that all the materials of this stupendous fabric were finished and adapted to their several ends before they were brought to Jerusalem, that is, the stones in their quarries, and the cedars in Lebanon; so that there was no noise of axe, hammer, or any tool, heard in the rearing of it.

At present Jerusalem is called by the Turks Cudsemburie, and Constaburie; and is reduced to a poor thinly inhabited town, about three miles in circumference, situated on a rocky mountain, surrounded on all sides, except the north, with deep valleys and deep valleys; and these again environed with other hills at some distance from them. In the neighbourhood of the city there grew some corn, vines, olives, &c. The stately church erected by the empress Helena, on Mount Calvary, is still standing. It is called the church of the sepulchre; and is kept in good repair by the generous offerings of a constant concourse of pilgrims, who annually resort to it, as well as by the contributions of several Christian princes. The walls of this church are of stone, and the roof of cedar; the east end inlays Mount Calvary, and the west the holy sepulchre: the former is covered with a noble cupola, open at top, and supported by 16 massive columns. Over the high altar, at the east end, is another stately dome. The nave of the church constitutes the choir; and in the inside aisle are shown the places where the most remarkable circumstances of our Saviour's passion were transacted, together with the tombs of Geoffrey and Baldwin, the two first Christian kings of Jerusalem. In the chapel of the crucifixion is shown the very hole in the rock in which the cross is said to
Jerusalem have been fixed. The altar in this chapel has three crosses on it; and is richly adorned, particularly with four lamps of immense value that hang before it, and are kept constantly burning. At the west end is that of the sepulchre, which is hewn in that form out of the solid rock, and hath a small dome supported by pillars of porphyry. The cloister round the sepulchre is divided into sundry chapels, appropriated to the several sorts of Christians who reside there; as Greeks, Armenians, Maronites, Jacobites, Copts, Abyssines, Georgians, &c. and on the north-west side of it are the apartments of the Latins, who have the care of the church, and are forced to reside constantly in it; the Turks keeping the keys of it, and not suffering any of them to go out, but obliging them to receive their provisions in at a wicket. At Easter there are some grand ceremonies performed in the church, representing our Lord's passion, crucifixion, death, and resurrection, at which a vast concourse of pilgrims commonly assist. For a particular account of them, we refer the reader to Doctors Shaw and Pococke.

On Mount Moriah, on the south-east part of the city, is an edifice called Solomon's Temple, standing on or near the same spot as the ancient; but when or by whom erected is uncertain. In the midst of it is a Turkish mosque, where the Jewish sanctuary sanctum sanctorum is supposed to have stood. The building, which Dr Pococke thinks must have been formerly a Christian church, is held in the utmost veneration by the Turks.

The city is now under the government of a sanguis, who resides in a house said to have been that of Pontius Pilate, over against the castle of Antonia built by Herod the Great. Many of the churches erected in memory of some remarkable gospel transactions, have since been converted into mosques; and some, in which money will procure admittance, but not into others. Both the friars and other Christians are kept so poor by the tyranny of the government, that the chief support and trade of the place consists in providing strangers with food and other accommodations, and selling them beads, relics, and other trinkets, for which they are obliged to pay considerable sums to the sanguis, as well as to his officers; and those are seldom so well contented with their usual duties, but they frequently extort some fresh ones, especially from the Franciscans, whose convent is the common receptacle for all pilgrims, and for which they have considerable allowances from the pope, and other crowned heads, besides the presents which strangers generally make them at their departure. The most remarkable antiquities in the neighbourhood of Jerusalem are, 1. The pools of Bethesda and Gihon; the former 120 paces long, 40 broad, and at least eight deep, but now without water; and the old arches, which it still discovers at the west end, are quite dammed up; the other, which is about a quarter of a mile without Bethlehem gate, is a very stately relic, 106 paces long, and 60 broad, lined with a wall and plaster, and still well stored with water. 2. The tomb of the Virgin Mary, in the valley of Jehoshaphat, into which one descends by a magnificent flight of 47 steps. On the right hand, as one goes down is also the sepulchre of St Ann, the mother, and on the left that of Joseph the husband, of the virgin mother; some add likewise that of Jehoia-Jerusalem, kin her father. In all these are erected altars for priests of all sorts to say mass, and the whole is cut into the solid rock. 3. The tomb of King Jehoshaphat, cut likewise into the rock, and divided into several apartments; in one of which is his tomb, which is adorned with a stately portico and entablature over it. 4. That commonly called Absalom's pillar or place, as being generally supposed to be that which he is said to have erected in his lifetime to perpetuate his memory, as he had no male issue. The place, however, both within and without, hath more the resemblance of a sepulchre than any thing else; though we do not read that he was buried there, neither do the people here affirm that he was. There is a great heap of stones about it, which is continually increasing; the superstitious Jews and Turks always throwing some as they pass, in token of their abhorrence of Absalom's unnatural rebellion against so good and holy a parent. The structure itself is about 20 cubits square, and 60 high, rising in a lofty square, adorned below with four columns of the Ionic order, with their capitals, entablatures, &c. to each front. From the height of 20 to 40 cubits, it is somewhat less, and quite plain, excepting a small fillet at the upper end; and from 40 to the top it changes into a round, which grows gradually into a point, the whole cut out of the solid rock. There is a room within, considerably higher than the level of the ground without, on the sides of which are niches, probably to receive coffins. 5. A little eastward of this is that called the tomb of Zechariah, the son of Barachiah, whom the Jews believe to have been buried between the temple and the altar, as is commonly supposed. This fabric is all cut out of the natural rock, 18 feet high, and as many square; and adorned with Ionic columns on each front, cut likewise out of the same rock, and supporting a cornice. The whole ends in a pointed top, like a diamond. But the most curious, grand, and elaborate pieces, in this kind, are the grottoes without the walls of Jerusalem, styled the royal sepulchres; but of what kings is not agreed on. They consist of a great number of apartments, some of them spacious, all cut out of the solid marble rock; and may justly be pronounced a royal work, and one of the most noble, surprising, and magnificent. For a particular account of them we must refer the reader, for want of room, to Pococke's Travels. In the neighbourhood of Jerusalem is a spot of ground, about 30 yards long, and 35 broad, now the burying place of the Armenians, which is shown as the Acediana, or Field of Blood, formerly the Potters Field, and since styled Campo Santo, or the Holy Field, purchased with the price of Judas's treason, for the burial of strangers. It is walled round, to prevent the Turks abusing the bones of Christians; and one half of it is taken up by a building in the nature of a charnel house. Besides the above, a great many other antiquities in the city and its environs are shown to strangers; there being scarce any place or transaction mentioned either in the Old or New Testament, but they show the very spot of ground where the one stood, and the other was done; not only here, but all over Judea.

JESI, an ancient town of Italy, in the territory of the church, and in the marca or march of Ancona, with
with a bishop’s see. It is seated on a mountain, near a river of the same name, in E. Long. 12. 20. N. Lat. 43. CO.

JESSO, Jedi, or Yadso, a large island of Asla, to the north of Nippon, and said to be governed by a prince tributary to the empire of Japan; but is not very little known to the Europeans, so that nothing can be said with certainty concerning it.

JESSES, ribbons that hang down from garlands or crowns in falconry; also short straps of leather fastened to the hawks’ legs, and so to vessels.

JESTING, or concise wit, as distinguished from continued wit or humour, lies either in the thought, or the language, or both. In the first case it does not depend upon any particular words or turn of the expression. But the greatest fund of jest lies in the language, i.e. in tropes or verbal figures; those afforded by tropes consist in the metaphorical sense of the words, and those of verbal figures principally turn upon a double sense of the same word, or a similitude of sound in different words. The third kind of jokes, which lie both in the sense and language, arise from figures of sentences, where the figure itself consists in the sense, but the wit turns upon the choice of the words.

JESUITS, or the Society of Jesus, a famous religious order of the Romish church, founded by Ignatius Loyola. See Ignatius. — The plan which this fanatic formed of its constitution and laws was suggested, as he gave out, and as his followers still teach, by the immediate inspiration of heaven. But notwithstanding this high pretension, his design met at first with violent opposition. The pope, to whom Loyola had applied for the sanction of his authority to confirm the institution, referred his petition to a committee of cardinals. They represented the establishment to be unnecessary as well as dangerous, and Paul refused to grant his approbation of it. At last, Loyola removed all his scruples by an offer which it was impossible for any pope to resist. He promised, that besides the three vows of poverty, chastity, and of monastic obedience, which are common to all the orders of regulars, the members of his society should take a fourth vow of obedience to the pope, binding themselves to go whithersoever he should command for the service of religion, and without requiring any thing from the holy see for their support. At a time when the papal authority had received such a shock by the revolt of so many nations from the Roman church; at a time when every part of the papish system was attacked with so much violence and success, the acquisition of a body of men, thus peculiarly devoted to the see of Rome, and whom it might set in opposition to all its enemies, was an object of the highest consequence. Paul instantly perceiving this, confirmed the institution of the Jesuits by his bull, granted the most ancient privileges to the members of the society, and appointed Loyola to be the first general of the order. The event hath fully justified Paul’s discernment, in expecting such beneficial consequences to the see of Rome from this institution. In less than half a century, the society obtained establishments in every country that adhered to the Roman Catholic church: its power and wealth increased amazingly; the number of its members became great: their character as well as accomplishments were still greater; and the Jesuits were celebrated by the friends and dreaded by the enemies of the Romish faith as the most able and enterprising order in the church.

The constitution and laws of the society were perfected by Laynez and Aquaviva, the two generals who succeeded Loyola; men far superior to their master in abilities and in the science of government. They framed that system of profound and artful policy which distinguishes the order. The large infusion of fanaticism mingled with its regulations should be imputed to Loyola its founder. Many circumstances concur in giving a peculiarity of character to the order of Jesuits, and in forming the members of it not only to take greater part in the affairs of the world than any other body of monks, but to acquire superior influence in the conduct of them.

The primary object of almost all the monastic orders is to separate men from the world, and from any concern in its affairs. In the solitude and silence of the cloister, the monk is called to work out his own salvation by extraordinary acts of mortification and piety. He is dead to the world, and ought not to mingle in its transactions. He can be of no benefit to mankind but by his example and by his prayers. On the contrary, the Jesuits are taught to consider themselves as formed for action. They are chosen soldiers, bound to exert themselves continually in the service of God, and of the pope his vicar on earth. Whatever tends to instruct the ignorant, whatever can be of use to reclaim or to oppose the enemies of the holy see, is their proper object. That they may have full leisure for this active service, they are totally exempted from those functions the performance of which is the chief business of other monks. They appear in no processes; they practise no rigorous austerities; they do not consume one half of their time in the repetition of tedious offices: but they are required to attend to all the transactions of the world, on account of the influence which these may have upon religion; they are directed to study the dispositions of persons in high rank, and to cultivate their friendship; and by the very constitution as well as genius of the order, a spirit of action and intrigue is infused into all its members.

As the object of the society of Jesuits differed from that of the other monastic orders, the diversity was less in the form of its government. The other orders are to be considered as voluntary associations, in which whatever affects the whole body is regulated by the common suffrage of all its members. The executive power is vested in the persons placed at the head of each convent or of the whole society; the legislative authority resides in the community. Affairs of moment, relating to particular convents, are determined in conventual chapters; such as respect the whole order are considered in general congregations. But Loyola, full of the ideas of implicit obedience, which he had derived from his military profession, appointed that the government of his order should be purely monarchical. A general, chosen for life by deputies from the several provinces, possessed power that was supreme and independent, extending to every person and to every case. He, by his sole authority, nominated provincials, rectors, and every other officer employed in the government of the society, and could remove them.
them at pleasure. In him was vested the sovereign administration of the revenues and funds of the order. Every member belonging to it was at his disposal; and by his uncontrollable mandate he could impose on them any task, or employ them in what service soever he pleased. To his commands they were required to yield not only outward obedience, but to resign up to him the inclinations of their own wills and the sentiments of their own understandings. They were to listen to his injunctions as if they had been uttered by Christ himself. Under his direction they were to be mere passive instruments, like clay in the hands of the potter, or like dead carcasses incapable of resistance. Such a singular form of policy could not fail to impress its character on all the members of the order, and to give a peculiar force to all its operations. There is not in the annals of mankind any example of such a perfect despotism, exercised not over monks shut up in the cells of a convent, but over men dispersed among all the nations of the earth.

As the constitutions of the order vest in the general such absolute dominion over all its members, they carefully provide for his being perfectly informed with respect to the character and abilities of his subjects. Every novice who offers himself as a candidate for entering into the order is obliged to manifest his con-science to the superior, or a person appointed by him; and is required to confess not only his sins and defects, but to discover the inclinations, the passions, and the bent of his soul. This manifestation must be renewed every six months. The society, not satisfied with penetrating in this manner into the innermost recesses of the heart, directs each member to observe the words and actions of the novices: they are constituted spies upon their conduct, and are bound to disclose every thing of importance concerning them to the superior. In order that this scrutiny into their character may be as complete as possible, a long noviciate must expire, during which they pass through the several gradations of ranks in the society; and they must have attained the full age of thirty-three years before they can be admitted to take the final vows, by which they become professed members. By these various methods, the superiors, under whose immediate inspection the novices are placed, acquire a thorough knowledge of their dispositions and talents. In order that the general, who is the soul that animates and moves the whole society, may have under his eye everything necessary to inform or direct him, the provincial and heads of the several houses are obliged to transmit to him regular and frequent reports concerning the members under their inspection. In these they descend into minute details with respect to the character of each person, his abilities natural or acquired, his temper, his experience in affairs, and the particular department for which he is best fitted. These reports, when digested and arranged, are entered into registers kept of purpose, that the general may, at one comprehensive view, survey the state of the society in every corner of the earth; observe the qualifications and talents of its members; and thus choose, with perfect information, the instruments which his absolute power can employ in any service for which he thinks meet to destine them.

As it was the professed intention of the order of Jesuits to labour with unwearied zeal in promoting the salvation of men, this engaged them of course in many active functions. From their first institution, they considered the education of youth as their peculiar province; they aimed at being spiritual guides and confessors; they preached frequently in order to in-sinstruct the people; they set out as missionaries to con-vince of the vert unbelieving nations. The novelty of the institu-tion, as well as the singularity of its objects, procured the order many admirers and patrons. The governors of the society had the address to avail themselves of every circumstance in its favour; and in a short time the number as well as influence of its members in-creased wonderfully. Before the expiration of the sixteenth century, the Jesuits had obtained the chief direction of the education of youth in every catholic country in Europe. They had become the confessors of almost all its monarchs; a function of no small im-portance in any reign, but, under a weak prince, superior even to that of minister. They were the spir-ritual guides of almost every person eminent for rank or power. They possessed the highest degree of con-fidence and interest with the papal court, as the most zealous and able champions for its authority. The advantages which an active and enterprising body of men might derive from all these circumstances are ob-vious. They formed the minds of men in their youth. They retained an ascendant over them in their advanced years. They possessed, at different periods, the di-rection of the most considerable courts in Europe. They mingled in all affairs. They took part in every intrigue and revolution. The general, by means of the extensive intelligence which he received, could regulate the operations of the order with the most per-fect discernment; and, by means of his absolute power, could carry them on with the utmost vigour and ef-fect.

Together with the power of the order, its wealth con-tinued to increase. Various expedients were devised wealth for eluding the obligation of the vow of poverty. The order acquired ample possessions in every catholic country; and by the number as well as magnificence of its public buildings, together with the value of its property, moveable or real, it vied with the most opulent of the monastic fraternities. Besides the sources of wealth common to all the regular clergy, the Jesuits possessed one which was peculiar to themselves. Under pretext of promoting the success of their missions, and of facili-tating the support of their missionaries, they obtained a special license from the court of Rome to trade with the nations which they laboured to convert. In consequence of this, they engaged in an extensive and lucrative commerce both in the East and West Indies. They opened warehouses in different parts of Europe, in which they vended their commodities. Not satisfied with trade alone, they imitated the example of other commercial societies, and aimed at obtaining settle-ments. They acquired possession accordingly of a large and fertile province in the southern continent of Amer-ica, and reigned as sovereigns over some hundred thousand subjects.

Unhappily for mankind, the vast influence which the order of Jesuits acquired by all these different means, has been often exerted with the most pernicious civil so-cial effect. Such was the tendency of that discipline ob-served by the society in forming its members, and such the
the fundamental maxims in its constitution, that every Jesuit was taught to regard the interest of the order as the capital object to which every consideration was to be sacrificed. This spirit of attachment to their order, the most ardent perhaps that ever influenced any body of men, is the characteristic principle of the Jesuits, and serves as a key to the genius of their policy as well as the peculiarities in their sentiments and conduct.

As it was for the honour and advantage of the society that its members should possess an ascendant over persons in high rank or of great power; the desire of acquiring and preserving such a direction of their conduct with greater facility has led the Jesuits to propagate a system of relaxed and pious morality, which accommodates itself to the passions of men, which justifies their vices, which tolerates their imperfections, which authorises almost every action that the most audacious or crafty politician would wish to perpetrate.

As the prosperity of the order was intimately connected with the preservation of the papal authority, the Jesuits, influenced by the same principle of attachment to the interests of their society, have been the most zealous patrons of those doctrines which tend to exalt ecclesiastical power over the ruins of civil government. They have attributed to the court of Rome a jurisdiction as extensive and absolute as was claimed by the most presumptuous pontiffs in the dark ages. They have contended for the entire independence of ecclesiastics on the civil magistrates. They have published such tenets concerning the duty of opposing princes who were enemies of the Catholic faith, as countenanced the most atrocious crimes, and tended to dissolve all the ties which connect subjects with their rulers.

As the order derived both reputation and authority from the zeal with which it stood forth in defence of the Roman church against the attacks of the reformers, its members, proud of this distinction, have considered it as their peculiar function to combat the opinions and to check the progress of the Protestants. They have made use of every art, and have employed every weapon against them. They have set themselves in opposition to every gentle or tolerating measure in their favour. They have incessantly stirred up against them all the rage of ecclesiastical and civil persecution.

Monks of other denominations have indeed ventured to teach the same pernicious doctrines, and have held opinions equally inconsistent with the order and happiness of civil society. But they, from reasons which are obvious, have either delivered such opinions with greater reserve, or have propagated them with less success. Whoever recollects the events which have happened in Europe during two centuries, will find that the Jesuits may justly be considered as responsible for most of the pernicious effects arising from that corrupt and dangerous casuistry, from those extravagant tenets concerning ecclesiastical power, and from that intolerant spirit, which have been the disgrace of the church of Rome throughout that period, and which have brought so many calamities upon civil society.

But, amidst many bad consequences flowing from the institution of this order, mankind, it must be acknowledged, have derived from it some considerable advantages. As the Jesuits made the education of youth one of their capital objects, and as their first attempts to establish colleges for the reception of students were violently opposed by the universities in different countries, it became necessary for them, as the most effectual method of acquiring the public favour, to surpass their rivals in science and industry. This prompted them to cultivate the study of ancient literature with extraordinary ardour. This put them upon various methods for facilitating the instruction of youth; and by the improvements which they made in it, they have contributed so much towards the progress of polite learning, that on this account they have merited well of society. Nor has the order of Jesuits been successful only in teaching the elements of literature; it has produced likewise eminent masters in many branches in science, and can alone boast of a greater number of ingenious authors than all the other religious fraternities taken together.

But it is in the new world that the Jesuits have exhibited the most wonderful display of their abilities, and have contributed most effectually to the benefit of the human species. The conquerors of that unfortunate quarter of the globe had nothing in view but to plunder, to enslave, and to exterminate its inhabitants. The Jesuits alone have made humanity the object of their settling there. About the beginning of the 17th century, they obtained admission into the fertile province of Paraguay, which stretches across the southern continent of America, from the bottom of the mountains of Potosi to the confines of the Spanish and Portuguese settlements on the banks of the river De la Plata. They found the inhabitants in a state little different from that which takes place among men when they first begin to unite together; strangers to the arts, subsisting precariously by hunting or fishing, and hardly acquainted with the first principles of subordination and government. The Jesuits set themselves to instruct and to civilize these savages. They taught them to cultivate the ground, to rear tame animals, and to build houses. They brought them to live together in villages. They trained them to arts and manufactures. They made them taste the sweets of society, and accustomed them to the blessings of security and order. These people became the subjects of their benefactors, who have governed them with a tender attention, remembering that with which a father directs his children. Respected and beloved almost to adoration, a few Jesuits presided over some hundred thousand Indians. They maintained a perfect equality among all the members of the community. Each of them was obliged to labour, not for himself alone, but for the public. The produce of their fields, together with the fruits of their industry of every species, were deposited in common storehouses, from which each individual received every thing necessary for the supply of his wants. By this institution, almost all the passions which disturb the peace of society, and render the members of it unhappy, were extinguished. A few magistrates, chosen by the Indians themselves, watched over the public tranquillity, and secured obedience to the laws. The sanguinary punishments frequent under other governments were unknown. An admonition
admonition from a Jesuit, a slight mark of infamy, or, on some singular occasion, a few lashes with a whip, were sufficient to maintain good order among these innocent and happy people.

But even in this meritorious effort of the Jesuits for the good of mankind, the genius and spirit of their order have mingled and are discernible. They plainly aimed at establishing in Paraguay an independent empire, subject to the society alone, and which, by the superior excellence of its constitution and police, could scarcely have failed to extend its dominion over all the southern continent of America. With this view, in order to prevent the Spaniards or Portuguese in the adjacent settlements from acquiring any dangerous influence over the people within the limits of the province subject to the society, the Jesuits endeavoured to inspire the Indians with hatred and contempt of these nations. They cut off all intercourse between their subjects and the Spanish or Portuguese settlements. They prohibited any private trader of either nation from entering their territories. When they were obliged to admit any person in a public character from the neighbouring governments, they did not permit him to have any conversation with their subjects; and no Indian was allowed even to enter the houses where these strangers resided unless in the presence of a Jesuit. In order to render any communication between them as difficult as possible, they industriously avoided giving the Indians any knowledge of the Spanish or of any other European language; but encouraged the different tribes which they had civilized to acquire a certain dialect of the Indian tongue, and laboured to make that the universal language throughout their dominions. As all these precautions, without military force, would have been insufficient to have rendered their empire secure and permanent, they instructed their subjects in the European arts of war. They formed them into bodies of cavalry and infantry, completely armed and regularly disciplined. They provided a great train of artillery, as well as magazines stored with all the implements of war. Thus they established an army so numerous and well-appointed, as to be formidable in a country where a few sickly and ill-disciplined battalions composed all the military force kept on foot by the Spaniards or Portuguese.

Such were the laws, the policy, and the genius of this formidable order; of which, however, a perfect knowledge has only been attainable of late. Europe had observed, for two centuries, the ambition and power of the order. But while it felt many fatal effects of these, it could not fully discern the causes to which they were to be imputed. It was unacquainted with many of the singular regulations in the political constitution or government of the Jesuits, which formed the enterprising spirit of intrigue that distinguished its members, and elevated the body itself to such a height of power. It was a fundamental maxim with the Jesuits, from their first institution, not to publish the rules of their order. They kept them concealed as an impenetrable mystery. They never communicated them to strangers, nor even to the greater part of their own members. They refused to produce them when required by courts of justice; and, by a strange solemnity in policy, the civil power in different countries authorized or connived at the establishment of an order of men, whose constitution and laws were concealed with a solicitude which alone was a good reason for having excluded them. During the prosecutions lately carried on against them in Portugal and France, the Jesuits have been so inconsiderate as to produce the mysterious volumes of their institute. By the aid of these authentic records, the principles of their government may be delineated, and the sources of their power investigated, with a degree of certainty and precision, which, previous to that event, it was impossible to attain.

The pernicious effects, however, of the spirit and constitution of this order, rendered it early obnoxious to some of the principal powers in Europe, and gradually brought on its downfall. The emperor Charles V. saw it expedient to check its progress in his dominions; it was expelled England, by proclamation of James I. in 1604; Venice, in 1606; Portugal, in 1799; France, in 1764; Spain and Sicily, in 1767; and totally suppressed and abolished by Pope Clement XIV. in 1773.

JESUITS BANK. See CINCHONA, BOTANY INDEX; and for its history and properties, see CINCHONA and MATERIA MEDICA INDEX.

JESUS, the Son of STRACT, a native of Jerusalem, composed about 200 B.C. the Book of Ecclesiasticus, called by the Greeks Nsmples, "replenished with virtue," who also quote it under the title of the Wisdom of Jesus the son of Sirach. His grandson, who was also of the same name, and a native of Jerusalem, translated it from the Hebrew into Greek about 121 B.C. We have the Greek version, but the Hebrew text is lost.

JESUS CHRIST, the Son of God; and Saviour of mankind, descended from heaven, and took upon him the human nature in Judæa, towards the conclusion of the reign of Herod the Great, king of that country. The place of his birth was Bethlehem, a flourishing city of Judah; but the year in which he was born is not properly ascertained. The most general opinion is that it happened about the year of Rome 748 or 749, and about 18 months before the death of Herod. Four inspired writers have transmitted to us an account of the life of Jesus Christ. They mention particularly his birth, lineage, family, and parents; but say very little concerning his infancy and earlier youth. Herod being informed that the Messiah, or king of the Jews, so much spoken of by the prophets, was now born, being afraid that his kingdom should now be taken away, contrived how to destroy his supposed rival: but Christ, being carried, while very young, into Egypt, escaped the cruelty of the tyrant; who, being determined to make sure work, made a general massacre of the infants about Bethlehem, from the age of two years and under.

After the death of Herod, our Saviour was brought back to Judæa; but we are totally ignorant of what his employment was during the interval between his return thither and the time of his entering upon the ministry. We know only, that when he was but 12 years of age, he disputed in the temple with the most learned of the Jewish doctors; whom, he surprised with his knowledge, and the answers he gave to their questions. After this, as the scripture tells us, he continued,
continued with his parents, and was subject to them, till he entered upon his ministry. It is said, indeed, though upon no sure foundation, that during this period he followed the trade of his father, who was a carpenter. In the thirty year of his age, he began his public ministry; to which the attention of the people was drawn by the preaching of John, a prophet miraculously inspired of God to proclaim the existence of the Saviour, as now descended upon earth, and visible to the eyes of all; and by this prophet Christ himself was baptized in the waters of Jordan, that he might not, in any point, neglect to answer the demands of the Jewish law.

It is not necessary here to enter into a particular detail of the life and actions of Jesus Christ. Every one knows, that his life was one continued scene of the most perfect sanctity, and the purest and most active virtue; not only without spot, but also beyond the reach of suspicion. And it is also well known, that by miracles of the most stupendous kind, and not more stupendous than salutary and beneficent, he displayed to the universe the truth of that religion which he brought with him from above, and demonstrated the reality of his divine commission in the most illustrious manner. For the propagation of his religion through the country of Judea, our Saviour chose 12 apostles; whom, however, he sent out only once, and after their return kept them constantly about his person. But, besides these, he chose other 70, whom he dispersed throughout the country.

There have been many conjectures concerning the reason why the number of apostles was fixed at 12, and that of the other teachers at 70. The first, however, was, according to our Saviour's own words (Matt. xix. 28.), an allusion to the 12 tribes of Israel, thereby intimating that he was the king of these 12 tribes; and as the number of his other messengers answers evidently to that of the senators who composed the Sanhedrim, there is a high degree of probability in the conjectures of those who think that Christ by this number designed to admonish the Jews, that the authority of their Sanhedrim was now at an end, and that all power with respect to religious matters was vested in him alone. His ministry, however, was confined to the Jews; nor, while he remained upon earth, did he permit his apostles or disciples to extend their labours beyond this favoured nation. At the same time, if we consider the illustrious acts of mercy and benevolence that were performed by Christ, it will be natural to conclude, that his fame must soon have spread abroad in other countries. Indeed this seems probable from a passage in scripture, where we are told that some Greeks applied to the apostle Philip in order to see Jesus. We learn also from authors of no small note, than Abgarus, king of Edessa, being seized with a severe and dangerous illness, wrote to our Lord, imploring his assistance; and that Jesus not only sent him a gracious answer, but also accompanied it with his picture, as a mark of his esteem for that pious prince. These letters are still extant; but by the judicious part of mankind are universally looked upon as spurious; and indeed the late Mr. Jones, in his treatise entitled *A new and full method of settling the canonical authority of the New Testament, hath offered reasons which seem almost unanswerable against the authenticity of the whole transaction."

The preaching of our Saviour, and the numberless miracles he performed, made such an impression on the body of the Jewish nation, that the chief priests and leading men, jealous of his authority, and provoked with his reproaching them with their wicked lives, formed a conspiracy against him. For a considerable time their designs proved abortive; but at last Jesus, knowing that he had fulfilled every purpose for which he came into the world, suffered himself to be taken through the treachery of one of his disciples, named Judas Iscariot, and was brought before the Sanhedrim. In this assembly he was accused of blasphemy; and being afterwards brought before Pilate the Roman governor, where he was accused of sedition, Pilate was no sooner set down to judge in this cause, than he received a message from his wife, desiring him to have nothing to do with the affair, having that very day had a frightful dream on account of our Saviour, whom she called that just man. The governor, intimidated by this message, and still more by the majesty of our Saviour himself, and the evident falsehood of the accusations brought against him, was determined if possible to save him. But the clamours of an enraged populace, who at last threatened to accuse Pilate himself as a traitor to the Roman emperor, got the better of his love of justice, which indeed on other occasions was not very fervent.

Our Saviour was now condemned by his judge, through contrary to the plainest dictates of reason and justice; was executed on a cross between two thieves, and very soon expired. Having continued three days in a state of death, he rose from the dead, and made himself visible to his disciples as formerly. He conversed with them 40 days after his resurrection, and employed himself during that time in instructing them more fully concerning the nature of his kingdom; and having manifested the certainty of his resurrection to as many witnesses as thought proper, he was, in the presence of many of his disciples, taken up into heaven, there to remain till the end of the world. See CHRISTIANITY.

JET, a black inflammable substance of the bituminous kind, harder than asphaltum, and susceptible of a good polish. It becomes electrical by rubbing, attracting light bodies like yellow amber. It swims on water, so that its specific gravity must be less than 1000; notwithstanding which it has been frequently confused with the lapis obstdactus, the specific gravity of which, according to Kirwan, is no less than 1744. It also resembles cannel-coal extremely in its hardness, receiving a polish, not soiling the fingers, &c. so that it has also been confused with this. The distinction, however, is easily made betwixt the two; for cannel-coal wants the electrical properties of jet, and is likewise so heavy as to sink in water; its specific gravity being no less than 1273; whereas that of jet, as has already been said, is less than 1000.

M. Magellan is of opinion that jet is a true amber, differing from the yellow kind only in the mere circumstance of colour, and being lighter on account of the great quantity of bituminous matter which enters into its composition. When burning it emits...
a bituminous smell. It is never found in strata or continued masses like fossil stones; but always in separate and unconnected heaps like the true amber. Great quantities of it have been dug up in the Pyrenean mountains; also near Batalka, a small town of Portugal; and in Galicia in Spain. It is found also in Ireland, Sweden, Prussia, Germany, and Italy. It is used in making small boxes, buttons, bracelets, mourning jewels, &c. Sometimes also it is employed in conjunction with proper oils in making varnishes. When mixed with lime in powder, it is said to make very hard and durable cement.

Jet d'Eau, a French term, frequently also used with us, for a fountain that casts up water to a considerable height in the air.

JETTE, the border made round the stilts under a pier, in certain old bridges, being the same with starling; consisting of a strong framing of timber filled with stones, chalk, &c. to preserve the foundations of the piers from injury.

JETTY-HEAD, a name usually given in the royal dock-yards to that part of a wharf which projects beyond the rest; but more particularly the front of a wharf, whose side forms one of the checks of a dry or wet dock.

JEWEL, any precious stone, or ornament beset with them. See DIAMOND, RUBY, &c.

JEWELS made a part of the ornaments with which the Jews, Greeks, and Romans, especially their ladies of distinction, adorned themselves. So prodigious was the extravagance of the Roman ladies, in particular, that Pliny the elder says he saw Lollio Paulina with an equipage of this kind amounting, according to Dr Arbuthnot's calculation, to 323,916l. 134. 4d. of our money. It is worthy of observation, that precious stones among the Romans and all the ancients were much scarcer, and consequently in higher esteem, than they are amongst us, since a commerce has been opened with the Indies.—The ancients did not know how to cut and polish them to much perfection; but coloured stones were not scarce, and they cut them very well either hollow or in relief.—When luxury had gained ground amongst them, the Romans hung pendants and pearls in their ears; and for this purpose the ears of both sexes were frequently bored. See EARS.

JEWEL, John, a learned English writer and bishop, was born in 1522, and educated at Oxford. In 1540 he proceeded A. B. became a noted tutor, and was soon after chosen rhetoric lecturer in his college. In February 1544, he commenced A. M. He had early imbibed Protestant principles, and inculcated the same to his pupils; but this was carried on privately till the accession of King Edward VI. in 1546, when he made a public declaration of his faith, and entered into a close friendship with Peter Martyr, who was made professor of divinity at Oxford. In 1550, he took the degree of B. D. and frequently preached before the university with great applause. At the same time he preached and catechised every other Sunday at Sunningwell in Berkshire, of which church he was rector. Upon the accession of Queen Mary to the crown, in 1553, he was one of the first who felt the rage of the storm then raised against the reformation; for before any law was made, or order given by the queen, he was expelled Corpus Christi college by the fellows, by their own private authority; but he continued in Oxford till he was called upon to subscribe to some of the Popish doctrines, under the severest penalties, which he submitted to. However, this did not procure his safety; for he was obliged to fly, and after encountering many difficulties, arrived at Frankfort, in the 2d year of Queen Mary's reign, where he made a public recantation of his subscription to the Popish doctrines. Thence he went to Strasburg, and afterwards to Zurich, where he attended Peter Martyr, in whose house he resided. He returned to England in 1558, after Queen Mary's death; and in 1559, was consecrated bishop of Salisbury. This promotion was given him as a reward for his great merit and learning; and another attestation of these was given him by the university of Oxford, who, in 1565, conferred on him in his absence the degree of D. D. In this character he attended the queen to Oxford the following year, and presided at the divinity disputations held before her majesty on that occasion. He had before greatly distinguished himself by a sermon preached at St Paul's cross, presently after he was made a bishop, wherein he gave a public challenge to all the Roman Catholics in the world, to produce but one clear and evident testimony out of any father or famous writer, who flourished within six hundred years after Christ, for any one of the articles which the Romanists maintain against the church of England. And two years afterwards, he published his famous apology for this church. In the mean time, he gave a particular attention to his diocese; where he began in his first visitation, and perfected in his last, such a reformation, not only in his cathedral and parochial churches, but in all the churches of his jurisdiction, as procured him and the whole order of bishops due reverence and esteem. For he was a careful overlooker and strict observer, not only of all the flocks, but also of the pastors, in his diocese: and he watched so narrowly upon the proceedings of his chancellor and archdeacons, and of his stewards and receivers, that they had no opportunities of being guilty of oppression, injustice, or extortion, nor of being a burden to the people, or a scandal to himself. To prevent these and the like abuses, for which the ecclesiastical courts are often unjustly censured, he sat often in his consistory-court, and saw that all things were carried rightly there: he also sat often as assistant on the bench of civil justice, being himself a justice of the peace. Amidst these employments, however, the care of his health was too much neglected; to which, indeed, his general course of life was totally unfavourable. He rose at four o'clock in the morning; and, after prayers with his family at five, and in the cathedral about six, he was so fixed to his studies all the morning, that he could not without great violence be drawn from them: After dinner, his doors and ears were open to all suitors; and it was observed of him, as of Titus, that he never sent any sad from him. Suitors being thus dismissed, he heard, with great impartiality and patience, such causes debated before him, as either devoted to him as a judge, or were referred to him as an arbitrator; and if he could spare any time from these, he reckoned it as clear gain to his study. About nine at night he called all his servants to an account how they had spent the day, and he went to prayers with them. From
the chapel he withdrew again to his study till near midnight, and from thence to his bed; in which, when he was laid, the gentleman of his bed-chamber read to him till he fell asleep. This watchful and laborious life, without any recreation at all, except what his necessary refreshment at meals and a very few hours of rest afforded him, wasted his life too fast. He died at Monkton-Farley, in 1571, in the 50th year of his age. He wrote, 1. A view of a seditionous bull sent into England by Pope Pius V. in 1569. 2. A treatise on the Holy Scriptures. 3. An exposition of St. Paul’s two epistles to the Thessalonians. 4. A treatise on the sacrament. 5. An apology for the national church. 6. Several sermons, controversial treatises, and other works.

This excellent prelate (says the Rev. Mr Granger) was one of the greatest champions of the reformed religion, as he was to the church of England what Bel-larmine was to that of Rome. His admirable Apology was translated from the Latin by Anne, the second of the four learned daughters of Sir Anthony Coke, and mother of Sir Francis Bacon. It was published, as it came from her pen, in 1564, with the approbation of the queen and the prelates. The same Apology was printed in Greek at Constantinople, under the direction of St Cyril the patriarch. His Defence of his Apology, against Harding and other Popish divines, was in such esteem, that Queen Elizabeth, King James I. King Charles I. and four successive archbishops, ordered it to be kept chained in all parish-churches for public use.

JEWEL Blocks, in the sea language, a name given to two small blocks which are suspended at the extremity of the main and fore top-sail yards, by means of an eye-bolt driven from without into the middle of the yard-arm, parallel to its axis. The use of these blocks is, to retain the upper part of the top-mast slooping-sails beyond the skirts of the top-sails, so that each of those sails may have its full force of action, which would be diminished by the encroachment of the other over its surface. The haliards, by which those slooping-sails are hoisted, are accordingly passed through the jewel-blocks; whence, communicating with a block on the top-mast head, they lead downwards to the top or decks, where they may be conveniently hoisted. See SAIL.

JEWS, a name derived from the patriarch Judah, and given to the descendants of Abraham by his eldest son Isaac, who for a long time possessed the land of Palestine in Asia, and are now dispersed through all nations in the world. The history of this people, as it is the most singular, so is it also the most ancient in the world; and the greatest part being before the beginning of profane history, depends entirely on the authenticity of the Old Testament, where it is only to be found.—To repeat here what is said in the sacred writings would both be superfluous and tedious, as those writings are in every person’s hands, and may be consulted at pleasure. It seems most proper therefore to commence the history of the Jews from their return to Jerusalem from Babylon, and the rebuilding of their city and temple under Ezra and Nehemiah, when the scripture leaves off any farther accounts, and profane historians begin to take notice of them. We shall, however, premise a chronological list of their judges and kings down to the captivity.

The Israelites had no king of their nation till Saul. Before him, they were governed, at first by elders, as in Egypt; then by princes of God’s appointment, as Moses and Joshua; then by judges, such as Othniel, Ehud, Shamgar, Gideon, Jephthah, Samson, Eli, Samuel; and last of all by kings, as Saul, David, Solomon, Rehoboam, &c.

A List of the Judges of Israel in a Chronological Order. The Numbers prefixed denote the Years of the World.

2570. The death of Joshua.
2575. The government of the elders for about 15 years.
2592. An anarchy of about 7 years. The history of Micah, the conquest of the city of Laish by part of the tribe of Dan, and the war undertaken by the 11 tribes against Benjamin, are all referred to this time.
2591. The first servitude under Cushan-rishathaim king of Mesopotamia began in 2591, and lasted eight years to 2599.
2599. Othniel delivered Israel in the 40th year after peace established in the land by Joshua.
2662. A peace of about 62 years, from the deliverance procured by Othniel, in 2599, to 2662, when the second servitude under Eglon king of the Moabites happened. It lasted 18 years.
2679. Ehud delivers Israel. After him Shamgar governed, and the land was in peace till the 80th year after the first deliverance procured by Othniel.
2699. The third servitude under the Canaanites, which lasted 20 years, from 2699 to 2719.
2719. Deborah and Barak deliver the Israelites: from the deliverance procured by Ehud to the end of Deborah and Barak’s government, were 40 years.
2768. Abimelech the natural son of Gideon is acknowledged king by the Shechemites.
2771. He died at the siege of Thebez in Palestine.
2772. Tola after Abimelech governs for 23 years, from 2772 to 2795.
2795. Jair succeeds Tola, and governs 22 years, from 2795 to 2816.
2799. The fifth servitude under the Philistines, which lasted 18 years, from 2799 to 2817.
2817. The death of Jair.
2817. Jephthah is chosen head of the Israelites beyond Jordan; he defeated the Ammonites, who oppressed them. Jephthah governed six years, from 2817 to 2823.
2823. The death of Jephthah.
2830. Ibzan governs seven years, from 2823 to 2830.
2840. Elon succeeds Ibzan. He governs from 2830 to 2840. Abdon judges Israel eight years, from 2840 to 2848.
2848. The sixth servitude, under the Philistines, which lasted 40 years, from 2848 to 2888.
2848. Eli the high-priest, of the race of Ithamar, governed 40 years, the whole time of the servitude under the Philistines.
2849. The birth of Samson.
The death of Samson, who was judge of Israel during the judicature of Eli the high-priest.

The death of Eli, and the beginning of Samuel's government, who succeeded him.

The election and anointing of Saul, first king of the Hebrews.

A Chronological List of the Kings of the Hebrews.

Saul, the first king of the Israelites, reigned 40 years, from the year of the world 2959 to 2999.

Ishbosheth the son of Saul succeeded him, and reigned six or seven years over part of Israel, from 2949 to 2936.

David was anointed king by Samuel in the year of the world 2934; but did not enjoy the regal power till the death of Saul in 2949, and was not acknowledged king of all Israel till after the death of Ishbosheth in 2956. He died in 2990 at the age of 70.

Solomon his son succeeded him; he received the royal anointing in the year 2999. He reigned alone after the death of David in 2990. He died in 3029, after a reign of 40 years.

After his death the kingdom was divided; and the ten tribes having chosen Jeroboam for their king, Rehoboam, the son of Solomon, reigned only over the tribes of Judah and Benjamin.

The Kings of Judah.

Rehoboam, the son and successor of Solomon, reigned 17 years; from the year 3029 to 3046.

Abijam, three years, from 3046 to 3049.

Asa, 41 years, from 3049 to 3090.

Jehoshaphat, 25 years, from 3090 to 3115.

Jehoram, four years, from 3115 to 3119.

Ahaziah, one year, from 3119 to 3120.

Athaliah, his mother, reigned six years, from 3120 to 3126.

Joash was set upon the throne by Jehoiada the high-priest, in 3126. He reigned 40 years, to the year 3165.

Amaziah, 20 years, from 3165 to 3194.

Uzziah, otherwise called Azariah, reigned 27 years, to the year 3221. Then attempting to offer incense in the temple, he was struck with a leprosy, and obliged to quit the government. He lived after this 26 years, and died in 3446.

Jotham, his son, took upon him the government in the year of the world 3221. He reigned alone in 3446, and died in 3462.

Ahaz succeeded Jotham in the year of the world 3462. He reigned 16 years, to 3278.

Hezekiah, 28 years, from 3278 to 3306.

Manasseh, 55 years, from the year of the world 3306 to 3361.

Amon 2 years, from 3361 to 3363.

Josiah, 31 years, from 3363 to 3394.

Jehoahaz, 3 months.

Eliakim, or Jehoiakim, 11 years, from the year 3394 to 3405.

Jehoachin, or Jehoniah, reigned three months and ten days, in the year 3405.

Mattaniah, or Zedekiah, reigned 11 years, from 3405 to 3416. In the last year of his reign Jerusalem was taken, the temple burnt, and Judah carried into captivity beyond the Euphrates.

Kings of Israel.

Jeroboam reigned 22 years, from 3029 to 3051. Nadab, one year. He died in 3051.

Baasha, 22 years, from 3052 to 3074.

Elah, two years. He died in 3075.

Zimri, seven days.

Omri, 11 years, from 3075 to 3086. He had a competitor Tibni, who succeeded, and died in what year we know not.

Ahab, 21 years, from 3086 to 3107.

Ahaziah, two years, from 3106 to 3108.

Jehoram, the son of Ahab, succeeded him in 3108.

He reigned 12 years, and died in 3120.

Jehu usurped the kingdom in 3120, reigned 28 years, and died in 3148.

Jehoash reigned 17 years, from 3148 to 3165.

Johah reigned 14 years, from 3165 to 3179.

Jeroboam II. reigned 41 years, from 3179 to 3220.

Zachariah, 12 years, from 3220 to 3232.

Shallum reigned a month. He was killed in 3233.

Menahem, 10 years, from 3233 to 3243.

Pekahiah, two years, from 3243 to 3245.

Pekah 20 years, from 3245 to 3265.

Hoshea, 18 years, from 3265 to 3283. Here the kingdom of Israel had an end after a duration of 233 years.

Cyrus the Great, king of Persia, having conquered Cyrus pub:
Babylon and almost all the western parts of Asia, perceiving the desolate and ruinous condition in which the province of Palestine lay, formed a design of restoring the Jews to their native country, and permitting them to rebuild Jerusalem and re-establish their worship. For this purpose he issued out a decree in the first year of his reign, about 536 B.C. by which they were allowed not only to return and rebuild their city, but to carry along with them all the sacred vessels which Nebuchadnezzar had carried off, and engaged to defray the expense of building the temple itself. This offer was gladly embraced by the more zealous Jews of the tribes of Judah, Benjamin, and Levi; but many more, being no doubt less sanguine about their religion, chose to stay where they were.

In 534 B.C. the foundations of the temple were laid, and matters seemed to go on prosperously, when the undertaking was suddenly obstructed by the Samaritans. These came at first, expressing an earnest desire to assist in the work, as they worshipped the same God with the Jews: but the latter refused their assistance, as they knew they were not true Israelites, but the descendants of those heathens who had been transplanted into the country of the ten tribes after their captivity by Shalmanezer. This refusal proved the source of all that bitter enmity which afterwards took place between the Jews and Samaritans; and the immediate consequence was, that the latter made all the opposition in their power to the going on of the work. At last, however, all obstacles were sur-

The temple mounted, and the temple finished as related in the books of Ezra and Nehemiah. The last of these chief ed-
died about 409 B.C. after having restored the Jewish worship to its original purity, and reformed a number of abuses which took place immediately on its commence
cement.

But though the Jews were now restored to the free exercise of religion, they were neither a free nor a powerful people as they had formerly been. They were few in number, and their country only a province of Syria, subject to the kings of Persia. The
JEW [ 140 ]

Jews.

Syrian governors conferred the administration of affairs upon the high-priests; and their accepting this office, and thus deviating from the law of Moses, must be considered as one of the chief causes of the misfortunes which immediately befell the people, because it made room for a sort of men, who seized the high office merely through ambition or avarice, without either zeal for religion or love for their country. It besides made the high-priesthood capable of being disposed of at the pleasure of the governors, whereas the Mosaic institution had fixed it unalienably in the family of Aaron.—Of the bad effects of this practice a fatal instance happened in 373 B.C. Bagoas, governor of Syria, having contracted an intimate friendship with Jeshua the brother of Johnan the high-priest, promised to raise him to the pontifical office a few years after his brother was invested with it. Jeshua came immediately to Jerusalem, and acquainted his brother with it. Their interview happened in the inner court of the temple; and a scuffle ensuing, Jeshua was killed by his brother, and the temple thus polluted in the most scandalous manner. The consequence to the Jews was, that a heavy fine was laid on the temple, which was not taken off till seven years after.

The first public calamity which befell the Jewish nation after their restoration from Babylon, happened in the year 351 B.C.: for having some how or other displeased Darius Ochus, king of Persia, he besieged and took Jericho, and carried off all the inhabitants captives. From this time they continued faithful to the Persians, insomuch that they had almost drawn upon themselves the displeasure of Alexander the Great. That monarch having resolved upon the siege of Tyre, and being informed that the city was wholly supplied with provisions from Judea, Samaria, and Galilee, sent to Jaddua, then high-priest, to demand of him that supply which he had been accustomed to pay to the Persians. The Jewish pontiff excused himself on account of his oath of fidelity to Darius; which so provoked Alexander, that he had no sooner completed the reduction of Tyre than he marched against Jerusalem. The inhabitants, then, being with good reason thrown into the utmost consternation, had recourse to prayers; and Jaddua is said, by a divine revelation, to have been commanded to go and meet Alexander. He obeyed accordingly, and set out on his journey, dressed in his pontifical robes, at the head of all his priests in their proper habits, and attended by the rest of the people dressed in white garments. Alexander is said to have been seized with such awful respect on seeing this venerable procession, that he embraced the high-priest, and paid a kind of religious adoration to the name of God engraven on the front of his mitre. His followers being surprised at this unexpected behaviour, the Macedonian monarch informed them, that he paid that respect not to the priest, but to his God, as an acknowledgment for a vision which he had been favoured with at Diah; where he had been promised the conquest of Persia, and encouraged in his expedition, by a person of much the same aspect and dressed in the same habit with the pontiff before him. He afterwards accompanied Jaddua into Jerusalem, where he offered sacrifices in the temple. The high priest showed him also the prophecies of Daniel, wherein the destruction of the Persian empire by himself is plainly set forth; in consequence of which the king went away highly satisfied, and at his departure asked the high-priest if there was nothing in which he could gratify himself or his people? Jaddua then told him, that, according to the Mosaic law, they neither sowed nor ploughed on the seventh year; therefore would esteem it a high favour if the king would be pleased to remit their tribute in that year. To this request the king readily yielded; and having confirmed them in the enjoyment of all their privileges, particularly that of living under their own laws, he departed.

Whether this story deserves credit or not (for the whole transaction is not without reason called in question by some), it is certain that the Jews were much favoured by Alexander; but with him their good fortune seemed also to expire. The country of Judea miserable being situated between Syria and Egypt, became subject to all the revolutions and wars which the ambitious successors of Alexander waged against each other.

At first it was given, together with Syria and Phcenicia, to Leomedon the Mitylenian, one of Alexander's generals; but he being soon after stripped of the other two by Ptolemy, Judea was next summoned to yield to the conqueror. The Jews scrupled to break their oath of fidelity to Leomedon; and were of consequence invaded by Ptolemy at the head of a powerful army. The open country was easily reduced; but the city being strongly fortified both by art and nature, threatened a strong resistance. A superstitious fear for breaking the sabbath, however, prevented the besieged from making any defence on that day; of which Ptolemy being informed, he caused an assault to be made on the sabbath, and easily carried the place. At first he treated them with great severity, and carried 100,000 men of them into captivity; but reflecting soon after on their known fidelity to their conquerors, he restored them to all the privileges they had enjoyed under the Macedonians. Of the captives he put some into garrisons, and others he settled in the countries of Libya and Cyrene. From those who settled in the latter of these countries descended the Cyrenian Jews mentioned by the writers of the New Testament.

Five years after Ptolemy had subdued Judea, he was forced to yield it to Antigonus, reserving to himself only the cities of Ace, Samaria, Joppa, and Gaza; and carrying off an immense booty, together with a great number of captives, whom he settled at Alexandria, and endowed with considerable privileges and immunities.—Antigonus believed in such a tyrannical manner, that great numbers of his Jewish subjects fled into Egypt, and others put themselves under the protection of Seleucus, who also granted them considerable privileges. Hence this nation came gradually to spread over Syria and Asia Minor; while Judea seemed to be in danger of being depopulated till it was recovered by Ptolemy in 292. The affairs of the Jews then took a more prosperous turn, and continued in a thriving way till the reign of Ptolemy Philopater, when they were grievously oppressed by the incursions of the Samaritans, at the same time that Antiochus Theos king of Syria invaded Galilee. Ptolemy, however, marched against Antiochus, and defeated him;
Jason's next step was to purchase liberty, at the price of 150 talents more, to build a gymnasion at Jerusalem, similar to those which were used in the Grecian cities, and to make as many Jews as he pleased free citizens of Antioch. By means of these powers, he became very soon able to form a strong party in Judea; for his countrymen were exceedingly fond of the Grecian customs, and the freedom of the city of Antioch was a very valuable privilege. From this time there—a general for a general apostasy took place; the service of the temple was neglected, and Jason abandoned himself without remorse to all the impieties and absurdities of Paganism.

He did not, however, long enjoy his ill-acquired dignity. Having sent his brother Menelaus with the usual tribute to Antiochus, the former took the opportunity of supplanting Jason in the same manner that he had supplanted Onias. Having offered for the high priesthood 300 talents more than his brother had given, he easily obtained it, and returned with his new commission to Jerusalem. He soon got himself a strong party: but Jason proving too powerful, forced Menelaus and his adherents to retire to Antioch. Here, the better to gain their point, they acquitted Antiochus that they were determined to renounce their old religion, and wholly conform themselves to that of the Greeks: which so pleased the tyrant, that he immediately gave them a force sufficient to drive Jason out of Jerusalem; who thereupon took refuge among the Ammonites.

Menelaus being thus freed from his rival, took care to fulfill his promise to the king with regard to the apostasy, but forgot to pay the money he had promised. At last he was summoned to Antioch; and finding nothing but the payment of the promised sum would do, sent orders to his brother Lysimachus to convey to him as many of the sacred utensils belonging to the temple as could be spared. As these were all of gold, the apostate soon raised a sufficient sum from them, not only to satisfy the king, but also to bribe the courtiers in his favor. But his brother Onias, who had been all this time confined at Antioch, getting intelligence of the sacrifice, made such bitter complaints, that an insurrection was ready to take place among the Jews at Antioch. Menelaus, in order to avoid the impending danger, bribed Andronicus, governor of the city, to murder Onias. This produced the most vehement complaints as soon as Antiochus returned to the capital (he having been absent for some time in order to quell an insurrection in Cilicia; which at last ended in the death of Andronicus, who was executed by the king's order. By dint of money, however, Menelaus still found means to keep up his credit; but was obliged to draw such large sums from Jerusalem, that the inhabitants at last massacred his brother Lysimachus, whom he had left governor of the city in his absence. Antiochus soon after took a journey to Tyre; upon which the Jews sent deputies to him, both to justify the death of Lysimachus, and to accuse Menelaus of being the author of all the troubles which had happened. The apostate, however, was not at a loss what he could procure money. By means of this powerful argument, he pleaded his cause so effectually, that the deputies were not only cast, but put to death; and this unjust sentence gave the traitors such a complete victory.

Over.
Jew. over all his enemies, that from thenceforth he commenced a downright tyrant. Jerusalem was destitute of protectors; and the sanhedrim, if there were any zealous men left among them, were so much terrified, that they durst not oppose him, though they evidently saw that his design was finally to eradicate the religion and liberties of his country.

In the mean time, Antiochus was taken up with the conquest of Egypt, and a report was somehow or other spread that he had been killed at the siege of Alexandria. At this news the Jews imprudently showed some signs of joy, and Jason thinking this a proper opportunity to regain his lost dignity, appeared before Jerusalem at the head of about 10,000 resolute men. The gates were quickly opened to him by some of his friends in the city; upon which Menelaus retired into the citadel, and Jason, minding nothing but his resentment, committed the most horrid butcheries. At last he was obliged to leave both the city and country, on the news that Antiochus was coming with a powerful army against him; for that prince, highly provoked at this rebellion, and especially at the rejocings the Jews had made on the report of his death, had actually resolved to punish the city in the severest manner. Accordingly, about 170 B.C. having made himself master of the city, he behaved with such cruelty, that within three days they reckoned no fewer than 40,000 killed, and as many sold for slaves. In the midst of this dreadful calamity, the apostate Menelaus found means not only to preserve himself from the general slaughter, but even to regain the good graces of the king, who having by his means plundered the temple of every thing valuable, returned to Antioch in a kind of triumph. Before he departed, however, he put Judea under the government of one Philip, a barbarous Phrygian; Samaria under that of Andronicus, a person of a similar disposition; and left Menelaus, the most hateful of all the three, in possession of the high-priesthood.

Though the Jews suffered exceedingly under these tyrannical governors, they were still reserved for greater calamities. About 168 B.C. Antiochus having been most severely mortified by the Romans, took it into his head to wreak his vengeance on the unhappy Jews. For this purpose he dispatched Apollonius to the head of 22,000 men, with orders to plunder all the cities of Judea, to murder all the men, and sell the women and children for slaves. Apollonius accordingly came with his army, and to outward appearance with a peaceable intention; neither was he suspected by the Jews, as he was superintendent of the tribute in Palestine. He kept himself inactive till the next sabbath, when they were all in a profound quiet; and then, on a sudden, commanded his men to arms. Some of them he sent to the temple and synagogues, with orders to cut in pieces all whom they found there; whilst the rest going through the streets of the city massacred all that came in their way; the superstitious Jews not attempting to make the least resistance for fear of breaking the sabbath. He next ordered the city to be plundered and set on fire, pulled down all their stately buildings, caused the walls to be demolished, and carried away captive about 10,000 of those who had escaped the slaughter. From that time the service of the temple was totally abandoned; that place having been quite polluted, both with the blood of multitudes who had been killed, and in various other ways. The Syrian troops built a large fortress on an eminence in the city of David; fortified it with a strong wall and stately towers, and put a garrison in it to command the temple, over against which it was built, so that the soldiers could easily see and sally out upon all those who attempted to come into the temple; so many of whom were continually plundered and murdered by them, that the rest, not daring to stay any longer in Jerusalem, fled for refuge to the neighbouring nations.

Antiochus, not yet satiated with the blood of the Jews, resolved either totally to abolish their religion, or destroy their whole race. He therefore issued out a decree that all nations within his dominions should forsake their old religion and gods, and worship those of the king under the most severe penalties. To make his orders more effectual, he sent overseers into every province to see them strictly put in execution; and as he knew the Jews were the only people who would disobey them, special directions were given to have them treated with the utmost severity. Athens, an old and cruel minister, well versed in all the pagan rites, was sent into Judea. He began by dedicating the temple to Jupiter Olympius, and setting up his statue on the altar of burnt-offerings. Another lesser altar was raised before it, on which they offered sacrifices to that false deity. All who refused to come and worship this idol were either massacred or put to some cruel torturestill they either complied or expired under the hands of the executioners. At the same time, altars, groves, and statues, were raised everywhere through the country, and the inhabitants compelled to worship them under the same severe penalties; while it was instant death to observe the sabbath, circumcision, or any other institution of Moses.

At last, when vast numbers had been put to cruel deaths, and many more had saved their lives by their apostasy, an eminent priest, named Mattathias, began to signalize himself by his bravery and zeal for religion. He had for some time been obliged to retire to Modin his native place, in order to avoid the persecution which raged at Jerusalem. During his recess there, Apelles, one of the king’s officers, came to oblige the inhabitants to comply with the above-mentioned orders. By him Mattathias and his sons were addressed in the most earnest manner, and had the most ample promises made them of the king’s favour and protection, if they would renounce their religion. But Mattathias answered, that though the whole Jewish nation, and the whole world, were to conform to the king’s edict, yet both he and his sons would continue faithful to their God to the last minute of their lives. At the same time perceiving one of his countrymen just going to offer sacrifices to an idol, he fell upon him and instantly killed him, agreeable to the law of Moses in such cases. Upon this his sons, fired with the same zeal, killed the officer and his men; overthrew the altar and idol; and running about the city, cried out, that those who were zealous for the law of God should follow them; by which means they quickly saw themselves at the head of a numerous troop, with whom they soon after withdrew into some of the deserts of Judea. They were followed by many others, so that in a short time they found themselves in a condition to resist their enemies;
and having considered the danger to which they were exposed by their scrupulous observance of the sabbath, they resolved to defend themselves, in case of an attack, upon that day as well as upon any other.

In the year 167 B.C. Mattathias finding that his followers daily increased in number, began to try his strength by attacking the Syrians and apostate Jews. As many of these as he took he put to death, but forced a much greater number to fly for refuge into foreign countries; and having soon struck his enemies with terror, he marched from city to city, overturned the idolatrous altars, opened the Jewish synagogues, made a diligent search after all the sacred books, and caused fresh copies of them to be written; he also caused the reading of the Scriptures to be resumed, and all the males born since the persecution to be circumscribed. In all this he was attended with such success, that he had extended his reformation through a considerable part of Judea within the space of one year: and would probably have completed it, had he not been prevented by death.

Mattathias was succeeded by his son Judas, surnamed Maccabeus, the greatest uninspired hero of whom the Jews can boast. His troops amounted to not more than 6000 men; yet with these he quickly made himself master of some of the strongest fortresses of Judea, and became terrible to the Syrians, Samaritans, and apostate Jews. In one year he defeated the Syrians in five pitched battles, and drove them quite out of the country; after which he purified the temple, and restored the true worship, which had been interrupted for three years and a half. Only one obstacle now remained, viz. the Syrian garrison above-mentioned, which had been placed over against the temple, and which Judas could not at present reduce. In order to prevent them from interrupting the worship, however, he fortified the mount on which the temple stood, with a high wall and strong towers round about, leaving a garrison to defend it, making some additional fortifications at the same time to Bethzur, a fortress at about 70 miles distance.

In the mean time Antiochus being on his return from an unsuccessful expedition into Persia, received the disagreeable news that the Jews had all to a man revolted, defeated his generals, driven their armies out of Judea, and restored their ancient worship. This threw him into such a fury, that he commanded his charioteer to drive with the utmost speed, threatening utterely to extirpate the Jewish race, without leaving a single person alive. These words were scarcely uttered, when he was seized with a violent pain in his bowels, which no remedy could cure or abate. But notwithstanding this violent shock, suffering himself to be hurried away by the transports of his fury, he gave orders for proceeding with the same precipitation in his journey. But while he was thus hastening forward, he fell from his chariot, and was so bruised by the fall, that his attendants were forced to put him into a litter. Not being able to bear even the motion of the litter, he was forced to halt at a town called Tabor on the confines of Persia and Babylonia. Here he kept bed, suffering inexpressible tortures, occasioned chiefly by the worms which bred in his body, and the stench, which made him insupportable even to himself. But the torments of his mind, caused by his reflecting on the former actions of his life, surpassed by many degrees those of his body. Polybius, who in his account of this prince's death agrees with the Jewish historians, tells us, that the uneasiness of his mind grew at last to a constant delirium or state of madness, by reason of several spectres and apparitions of evil genii or spirits, which he imagined were continually reproaching him with the many wicked actions of which he had been guilty. At last, having languished for some time in this miserable condition, he expired, and by his death freed the Jews from the most inimical enemy they had ever known.

Notwithstanding the death of Antiochus, however, the war was still carried on against the Jews; but through the valor and good conduct of Judas, the Syrians were constantly defeated, and in 163 B.C. a peace was concluded upon terms very advantageous to the Jewish nation. This tranquillity, however, was of no long continuance; the Syrian generals renewed their hostilities, and were attended with the same ill success as before. Judas defeated them in five engagements; but in the sixth was abandoned by all his men except 800, who, together with their chief, were slain in the year 161 B.C.

The news of the death of Judas threw his countrymen into the utmost consternation, and seemed to give new life to all their enemies. He was succeeded, however, by his brother Jonathan; who conducted matters with no less prudence and success than Judas had done, till he was treacherously seized and put to death by Tryphon, a Syrian usurper, who shortly after murdered his own sovereign. The traitor immediately prepared to invade Judea; but found all his projects frustrated by Simon, Jonathan's brother. This pontiff repaired all the fortresses of Judea, and furnished them with fresh garrisons, took Joppa and Gaza, and drove out the Syrian garrison from the fortress of Jerusalem; but was at last treacherously murdered by a son-in-law named Polemy, about 155 B.C.

Simon was succeeded by his son Hycran; who not only shook off the yoke of Syria, but conquered the Samaritans, demolished their capital city, and became master of all Palestine, to which he added the provinces of Samaria and Galilee; all which he enjoyed till within a year of his death, without the least disturbance from without, or any internal discord. His reign was no less remarkable on the account of his great wisdom and piety at home than his conquests abroad. He was the first since the captivity who had assumed the royal title; and he raised the Jewish nation to a greater degree of splendour than it had ever enjoyed since that time. The author of the fourth book of the Maccabees also informs us, that in him three dignities were centered which never met in any other person, namely, the royal dignity, the high priesthood, and the gift of prophecy. But the instances given of this last are very equivocal and suspicious. The last year of his reign, however, was embittered by a quarrel with the Pharisees; and which proceeded such a length as was thought to have shortened his days. Hycran had always been a great friend to that sect, and they had hitherto enjoyed the most honorable employments in the state; but at length one of them, named Eleazar, took it into his head to question Hycran's legitimacy, alleging, that his mother had formerly been a slave,
slave, and consequently that he was incapable of enjoying the high-priesthood. This report was credited, or pretended to be so, by the whole sect; which irritated the high-priest to such a degree, that he joined the Sadducees, and could never afterwards be reconciled to the Pharisees, who therefore raised all the troubles and seditions they could during the short time he lived.

Hyrcan died in 107 B.C. and was succeeded by his eldest son Aristobulus, who conquered Iturea, but proved a most cruel and barbarous tyrant, polluting his hands with the blood even of his mother and one of his brothers, keeping the rest closely confined during his reign, which, however, was but short. He was succeeded in 105 by Alexander Janneus, the greatest conqueror, next to King David, that ever sat on the Jewish throne. He was hated, however, by the Pharisees, and once in danger of being killed in a tumult excited by them; but having caused his guards to fall upon the mutinous mob, they killed 6000 of them, and dispersed the rest. After this, finding it impossible to remain in quiet in his own kingdom, he left Jerusalem, with a design to apply himself wholly to the extending of his conquests; but while he was busy in subduing his foreign enemies, the Pharisees raised a rebellion at home. This was quelled in the year 86 B.C. and the rebels were treated in the most inhuman manner. The faction, however, was by this means so thoroughly quelled, that they never dared to lift up their heads as long as he lived; and Alexander having made several conquests in Syria, died about 79 B.C.

The king left two sons, Hyrcanus and Aristobulus; but bequeathed the government to his wife Alexandra as long as she lived: but as he saw her greatly afraid, and not without reason, of the resentment of the Pharisees, he desired his queen, just before his death, to send for the principal leaders of that party, and pretend to be entirely devoted to them; in which case, he assured her, that they would support her and her sons after her in the peaceable possession of the government. With this advice the queen complied; but found herself much embarrassed by the turbulent Pharisees, who, after several exorbitant demands, would at last be contented with nothing less than the total extermination of their adversaries the Sadducees. As the queen was unable to resist the strength of the pharisaic faction, a most cruel persecution immediately took place against the Sadducees, which continued for four years; until at last, upon their earnest petition, they were dispersed among the several garrisons of the kingdom, in order to secure them from the violence of their enemies. A few years after this, being seized with a dangerous sickness, her youngest son Aristobulus collected a strong party in order to secure the crown to himself; but the queen being displeased with his conduct, appointed her other son Hyrcanus, whom she had before made high-priest, to succeed her also in the royal dignity. Soon after this she expired, and left her two sons competitors for the crown. The Pharisees raised an army against Aristobulus, which almost instantly deserted to him, so that Hyrcanus found himself obliged to accept of peace upon any terms; which, however, was not granted, till the latter had abandoned all title both to the royal and pontifical dignity, and contented himself with the enjoyment of his peculiar patrimony as a private person.

But this deposition did not extinguish the party of Hyrcanus. A new cabal was raised by Antipater an Idumean proselyte, and father of Herod the Great; who carried off Hyrcanus into Arabia, under pretence that his life was in danger if he remained in Judea. Here he applied to Aretas king of that country, who undertook to restore the deposed monarch; and for that purpose invaded Judea, defeated Aristobulus, and kept him closely besieged in Jerusalem. The latter The Romans called the Romans, and having bribed Scærus, one of their generals, he defeated Aretas with the loss of 7000 of his men, and drove him quite out of the country. The two brothers next sent presents to Pompey, at that time commander in chief of all the Roman forces in the east, and whom they made the arbiter of their differences. But he, fearing that Aristobulus, against whom he intended to declare, might obstruct his intended expedition against the Nabateans, dismissed them with a promise, that as soon as he had subdued Aretas, he would come into Judea and decide their controversy.

This delay gave such offence to Aristobulus, that he suddenly departed for Judea without even taking leave of the Roman general, who on his part was no less offended at this want of respect. The consequence was, that Pompey entered Judea with those troops with which he had designed to act against the Nabateans, and summoned Aristobulus to appear before him. The Jewish prince would gladly have been excused; but was forced by his own people to comply with Pompey's summons, to avoid a war with that general. He came accordingly more than once or twice to him, and was dismissed with great promises and marks of friendship. But at last Pompey insisted, that he should deliver into his hands all the fortified places he possessed; which let Aristobulus plainly see that he was in the interest of his brother, and upon this he fled to Jerusalem with a design to oppose the Romans to the utmost of his power. He was quickly followed by Pompey; and to prevent hostilities was at last forced to go and throw himself at the feet of the haughty Roman, and to promise him a considerable sum of money as the reward of his forbearance. This submission was accepted; but Gabinius, being sent with some troops to receive the stipulated sum, was repulsed by the garrison of Jerusalem, who shut the gates against him, and refused to fulfill the agreement. This disappointment so exasperated Pompey, that he immediately marched with his whole army against the city.

The Roman general first sent proposals of peace; but finding the Jews resolved to stand out to the last, he began the siege in form. As the place was strongly fortified both by nature and art, he might have found it very difficult to accomplish his design, had not the Jews been suddenly seized with a qualm of conscience respecting the observance of the sabbath-day. From the time of the Maccabees they had made no scruple of taking up arms against an offending enemy on the sabbath; but now they discovered, that though it was lawful on that day to stand on their defence in case they were actually attacked, yet it was unlawful to do any thing towards the preventing of those pre-

Digitized by Google
paratives which the enemy made towards such future assaults. As therefore they never moved an hand to hinder the erection of mounds and batteries, or the making of breaches in the walls, on the sabbath, the besiegers at last made such a considerable breach on that day, that the garrison could no longer resist them. The city was therefore taken in the year 63 B.C. 12,000 of the inhabitants were slaughtered, and many more died by their own hands; while the priests, who were offering up the usual prayers and sacrifices in the temple, chose rather to be butchered along with their brethren, than suffer divine service to be one moment interrupted. At last, after the Romans had satiated their cruelty with the death of a vast number of the inhabitants, Hyrcanus was restored to the pontifical dignity with the title of prince; but forbid to assume the title of king, to wear a diadem, or to extend his territories beyond the limits of Judea. To prevent future revolts, the walls were pulled down; and Scævus was left governor with a sufficient force. But before he departed, the Roman general gave the Jews a still greater offence than almost any thing he had hitherto done; and that was by entering into the most sacred recesses of the temple, where he took a view of the golden table, candlestick, censers, lamps, and all the other sacred vessels; but, out of respect to the Deity, forbore to touch any of them, and when he came out commanded the priests immediately to purify the temple according to custom.

Pompey having thus subdued the Jewish nation, set out for Rome, carrying along with him Aristobulus and his two sons Alexander and Antigonus, as captives, to adorn his future triumph. Aristobulus himself and his son Antigonus were led in triumph; but Alexander found means to escape into Judea, where he raised an army of 10,000 foot and 1,500 horse, and began to fortify several strong-holds, from whence he made incursions into the neighbouring country. As for Hyrcanus, he had no sooner found himself freed from his rival brother, than he relapsed into his former inindolence, leaving care of all his affairs to Antipater, who, like a true politician, failed not to turn the weakness of the prince to his own advantage and the aggravating of his family. He foresaw, however, that he could not easily compass his ends, unless he ingratiated himself with the Romans; and therefore spared neither pains nor cost to gain their favour. Scævus soon after received from him a supply of corn and other provisions, without which his army, which he had led against the metropolis of Arabia, would have been in danger of perishing; and after this, he prevailed on the king to pay 300 talents to the Romans, to prevent them from ravaging his country. Hyrcanus was now in no condition to face his enemy Alexander; and therefore again had recourse to the Romans, Antipater at the same time sending as many troops as he could spare to join them. Alexander ventured a battle; but was defeated with considerable loss, and besieged in a strong fortress named Alexandrión. Here he would have been forced to surrender; but his mother, partly by her address, and partly by the services she found means to do the Roman general, prevailed upon him to grant her son a pardon for what was past. The fortresses were then demolished, that they might not give occasion to fresh revolts; Hyrcanus was again restored to the pontifical dignity; and the province was divided into five several districts, in each of which a separate court of judicature was erected. The first of these was at Jerusalem, the second at Gadara, the third at Amath, the fourth at Jericho, and the fifth at Sebottis in Galilee. Thus was the changed government changed from a monarchy to an aristocracy; and, the Jews now fell under a set of domineering lords.

Soon after this, Aristobulus found means to escape from his confinement at Rome, and raised new troubles in Judea, but was again defeated and taken prisoner: his son also renewed his attempts; but was in like manner defeated, with the loss of near 10,000 of his followers; after which Gabinius, having settled the affairs of Judea to Antipater's mind, resigned the government of his province to Crassus. The only transaction during his government was his plundering the temple of all its money and sacred utensils, amounting in the whole to 10,000 Attic talents, i.e. above two millions of our money. After this sacrilege, Crassus set out on his expedition against Parthia, where he perished; and his death was by the Jews interpreted as a divine judgment for his impiety.

The war between Caesar and Pompey afforded the Jews some respite, and likewise an opportunity of ingratiating themselves with the former, which the artful Antipater readily embraced. His services were rewarded by the emperor. He confirmed Hyrcanus in his priesthood, added to it the principality of Judea, to be entailed on his posterity for ever, and restored the Jewish nation to their ancient rights and privileges; ordering at the same time a pillar to be erected, whereon all these grants, and his own decree, should be engraved, which was accordingly done; and soon after, when Caesar himself came into Judea, he granted liberty also to fortify the city, and rebuild the wall which had been demolished by Pompey.

During the lifetime of Caesar, the Jews were so highly favoured, that they could scarcely be said to feel the Roman yoke. After his death, however, the nation fell into great disorders; which were not finally quelled till Herod, who was created king of Judea by Mark Antony in 40 B.C. was fully established on the throne, and by the taking of Jerusalem by his allies the Romans in 37 B.C. The immediate consequence of this was another cruel pillage and massacre: then followed the death of Antigonus the son of Aristobulus, who had for three years maintained his ground against Herod, put to death his brother Phasael, and cut off Hyrcanus's ears, in order the more effectually to incapacitate him for the high-priesthood.

The Jews gained but little by this change of masters. The new king proved one of the greatest tyrants and cruelty mentioned in history. He began his reign with a cruel persecution of those who had sided with his rival Antigonus; great numbers of whom he put to death, seizing and confiscating their effects for his own use. Nay, such was his jealousy in this last respect, that he caused guards to be placed at the city gates, in order to watch the bodies of those of the Antigonian faction who were carried out to be buried, lest some of their riches should be carried along with them. His jealousy next prompted him to decoy Hyrcanus, the banished pontiff, from Parthia, where he had taken refuge,
JEW [146] JEW

refuge, that he might put him to death, though contrary to his most solemn promises. His cruelty then fell upon his own family. He had married Mariamne, the daughter of Hyrcanus; whose brother, Aristobulus, a young prince of great hopes, was made high priest at the intercession of his mother Alexandra. But the tyrant, conscious that Aristobulus had a better right to the kingdom than himself, caused him soon after to be drowned in a bath. The next victim was his beloved queen Mariamne herself. Herod had been summoned to appear first before Mark Antony, and then before Augustus, in order to clear himself from some crimes laid to his charge. As he was, however, doubtful of the event, he left orders that in case he was condemned, Mariamne should be put to death. This, together with the death of her father and brother, gave her such an aversion for him, that she showed it on all occasions. By this conduct the tyrant’s resentment was at last so much inflamed, that having got her falsely accused of infidelity, she was condemned to die, and executed accordingly. She suffered with great resolution; but with her ended all the happiness of her husband. His love for Mariamne increased so much after her death, that for some time he appeared like one quite distracted. His remorse, however, did not get the better of his cruelty. The death of Mariamne was soon followed by that of her mother Alexandra, and this by the execution of several other persons who had joined with her in an attempt to secure the kingdom to the sons of the deceased queen.

Herod, having now freed himself from the greatest part of his supposed enemies, began to show a greater contempt for the Jewish ceremonies than formerly; and introduced a number of heathenish games, which made him odious to his subjects. Ten bold fellows at last took it into their heads to enter the theatre where the tyrant was celebrating some games, with daggers concealed under their cloths, in order to stab him or some of his retinue. In case they should miscarry in the attempt, they had the desperate satisfaction to think, that, if they perished, the tyrant would be rendered still more odious by the punishment inflicted on them. They were not mistaken: for Herod being informed of their design by one of his spies, and causing the assassins to be put to a most excruciating death, the people were so much exasperated against the informer, that they cut and tore him to pieces, and cast his flesh to the dogs. Herod tried in vain to discover the authors of this affront; but at last having caused some women to be put to the rack, he extorted from them the names of the principal persons concerned, whom he caused immediately to be put to death, with their families. This produced such disturbances, that, apprehending nothing less than a general revolt, he set about fortifying Jerusalem with several additional works, rebuilding Samaria, and putting garrisons into several fortresses in Judea. Notwithstanding this, however, Herod had shortly after an opportunity of regaining the affections of his subjects in some measure, by his generosity to them during a famine; but as he soon relapsed into his former cruelty, their love was again turned into hatred, which continued till his death.

Rebuilds Herod now, about 23 B.C. began to adorn the temple cities with many stately buildings. The most remarkable and magnificent of them all, however, was the temple at Jerusalem, which he is said to have raised to a higher pitch of grandeur than even Solomon himself had done. Ten thousand artists were immediately set to work, under the direction of 1000 priests, the best skilful in building, masonry, &c. all of whom were kept in constant pay. A large and carts were employed in fetching materials; and such a number of other hands were employed, that every thing was got ready within the space of two years. After this, they set about pulling down the old building, and rearing up the new one with the same expedition: so that the holy place, or temple properly so called, was finished in a year and a half, during which we are told that it never rained in the day time, but only in the night. The remainder was finished in somewhat more than eight years. The temple, properly so called, or holy place, was but 60 cubits high, and as many in breadth; but in the front he added two wings or shoulders, which projected 20 cubits more on each side, and which in all made a front of 120 cubits in length, and as many in height; with a gate 70 cubits high and 20 in breadth, but open and without any doors. The stones were white marble, 35 cubits in length, 12 in height, and 5 in breadth, all wrought and polished with exquisite beauty; the whole resembling a stately palace, whose middle being considerably raised above the extremities of each face, made it afford a beautiful vista at a great distance, to those who came to the metropolis. Instead of doors, the gates closed with very costly veils, enriched with a variety of flowerings of gold, silver, purple, and every thing that was rich and curious; and on each side of the gates were planted two stately columns, from whose cornices hung golden festoons and vines, with their clusters of grapes, leaves, &c. curiously wrought. The superstructure, however, which was improperly reared on the old foundation, without sufficient additions, proved too heavy, and sunk down about 20 cubits; so that its height was reduced to 100. This foundation was of an astonishing strength and height, of which an account is given under the article JERUSALEM. The platform was a regular square of a stadium or furlong on each side. Each front of the square had a spacious gate or entrance, enriched with suitable ornaments; but that on the west had four gates, one of which led to the palace, another to the city, and the two others to the suburbs and fields. This inclosure was surrounded on the outside with a strong and high wall of large stones, well cemented, and on the inside had on each front a stately piazza or gallery, supported by columns of such a bigness, that three men could not just embrace them, their circumference being about 17 feet. There were in all 162 of them, which supported a cedar cieling of excellent workmanship, and formed three galleries, the middlemost of which was the largest and highest, it being 45 feet in breadth and 100 in height, whereas those on each side were but 30 feet wide, and 50 in height.

The piazzas and court were paved with marble of various colours; and at a small distance from the galleries was a second inclosure, surrounded with a flight of beautiful marble rails, with stately columns at proper distances, on which were engraved certain admonitions in Greek and Latin, to forbid strangers, and those
those Jews that were not purified, to proceed farther under pain of death. This enclosure had but one gate on the east side; none on the west; but on the north and south it had three, placed at equal distances from each other.

A third enclosure surrounded the temple, properly so called, and the altars of burnt offerings; and made what they called the court of the Hebrews or Israelites. It was square like the rest; but the wall on the outside was surrounded by a flight of 14 steps, which hid a considerable part of it; and on the top was a terrace, of about 12 cubits in breadth, which went quite round the whole circumference. The east side had but one gate; the west none; and the north and south four, at equal distances. Each gate was ascended by five steps more before one could reach the level of the inward court; so that the wall which enclosed it appeared within to be but 25 cubits high, though considerably higher on the outside. On the inside of each of these gates were raised a couple of spacious square chambers, in form of a pavilion, 30 cubits wide, and 40 in height, each supported by columns of 12 cubits in circumference.

This enclosure had likewise a double flight of galleries on the inside, supported by a double row of columns; but the western side was only one continued wall, without gates or galleries. The women likewise had their particular court separate from that of the men, and one of the gates on the north and south leading to it.

The altar of burnt-offerings was likewise high and spacious, with 40 cubits in breadth, and 15 in height. The ascent to it was, according to the Mosaic law, smooth, and without steps; and the altar of unhewn stones. It was surrounded at a convenient distance, with a low wall or rail, which divided the court of the priests from that of the laity Israelites; so that these last were allowed to come thus far to bring their offerings and sacrifices; though none but the priests were allowed to come within that inclosure.

Herod caused a new dedication of this temple to be performed with the utmost magnificence, and presented to it many rich trophies of his former victories, after the custom of the Jewish monarchs.

This, and many other magnificent works, however, did not divert the king's attention from his usual jealousies and cruelty. His sister Salome, and one of his sons named Antipater, taking advantage of this disposition, prompted him to murder his two sons by Mariamne, named Alexander and Aristobulus, who had been educated at the court of Augustus in Italy, and were justly admired by all who saw them. His cruelty soon afterwards broke out in an impotent attempt to destroy the Saviour of the world, but which was attended with no other consequence than the destruction of 3000 innocent children of his own subjects. His misery was almost brought to its summit by the discovery of Antipater's designs against himself; who was accordingly tried and condemned for treason. Something still more dreadful, however, yet awaited him; he was seized with a most loathsome and incurable disease, in which he was tormented with intolerable pains, so that his life became a burden. At last he died to the great joy of the Jews, five days after he had put Antipater to death, and after having divided his kingdom among his sons in the following manner.—Archelaus had Judea; Antipas, or Herod, was tetrarch of Galilee and Perea; and Philip had the regions of Trachonitis, Gaulon, Batanæa, and Taras, which he erected likewise into a tetrarchy. To his sister Salome he gave 50,000 pieces of money, together with the cities of Jamnia, Azotus, and Phasaelis; besides some considerable legacies to his other relations.

The cruelty of this monster accompanied him to his grave; nay, he in a manner carried it beyond the grave. Being well apprised that the Jews would rejoice at being freed from such a tyrant, he thought himself of the following infernal stratagem to damp their mirth. A few days before his death, he summoned all the heads of the Jews to repair to Jericho under pain of death; and, on their arrival, ordered them all to be shut up in the circus, giving at the same time strict orders to his sister Salome and her husband to have all the prisoners butchered as soon as his breath was gone out. "By this means (said he), I shall not only damp the people's joy, but secure a real mourning at my death." These cruel orders, however, were not put in execution. Immediately after the king's death, Salome went to the Hippodrome, where the heads of the Jews were detained, caused the gates to be flung open, and declared to them, that now the king had no further occasion for their attendance, and that they might depart to their respective homes; after which, and not till then, the news of the king's death was published. Tumults, seditions, and insurrections, quickly followed. Archelaus was on New Year's and his brethren, and obliged to appear at Rome on the 16th of Augustus, to whom many complaints were brought against him. After hearing both parties, the emperor made the following division of the kingdom: Archelaus had one half, under the title of ethnarch, or governor of a nation; together with a promise that he should have the title of king, as soon as he showed himself worthy of it. This ethnarchy contained Judea Propria, Idumea, and Samaria: but this last was exempted from one-fourth of the taxes paid by the rest, on account of the peaceable behaviour of the inhabitants during the late tumults. The remainder was divided between Philip and Herod; the former of whom had Trachonitis, Batanæa, and Auranitis, together with a small part of Galilee; the latter had the rest of Galilee and the countries beyond the Jordan. Salome had half a million of silver, together with the cities of Jamnia, Azotus, Phasaelis, and Ascalon.

For some years Archelaus enjoyed his government in peace; but at last, both Jews and Samaritans, tired out with his tyrannical behaviour, joined in a petition to Augustus against him. The emperor immediately summoned him to Rome, where, having heard his accusation and defence, he banished him to the city of Archelaus in Dauphiny, and confiscated all his estates. Judea being by this sentence reduced to a Roman province, was ordered to be taxed: and Cyrenius the governor of Syria, a man of consular dignity, was sent thither to see it put in execution; which having ever Judea done, and sold the palaces of Archelaus, and seized upon all his treasure, he returned to Antioch, leaving the Jews in no small ferment on account of this new tax.
Thus were the seeds of dissension sown between the Jews and Romans, which ended in the most lamentable catastrophe of the former. The Jews, always impatient of a foreign yoke, knew from their prophecies, that the time was now come when the Messiah should appear. Of consequence, as they expected him to be a great and powerful warrior, their rebellious and seditious spirit was heightened to the greatest degree; and they imagined they had nothing to do but take up arms, and victory would immediately declare on their side. From this time, therefore, the country was never quiet; and the infatuated people, while they rejected the true Messiah, gave themselves up to the direction of every impostor who chose to lead them to their own destruction. The governors appointed by the Romans were also frequently changed, but seldom for the better. About the 16th year of Christ, Pontius Pilate was appointed governor; the whole of whose administration, according to Josephus, was one continued scene of venality, rapine, tyranny, and every wicked action; of racking and putting innocent men to death, untried and uncondemned; and of every kind of savage cruelty. Such a governor was but ill calculated to appease the ferments occasioned by the late tax. Indeed Pilate was so far from attempting this, that he greatly inflamed them by taking every occasion of introducing his standards with images and pictures, consecrated shields, &c. into their city; and at last attempting to drain the treasury of the temple, under pretence of bringing an aqueduct into Jerusalem. The most remarkable transaction of his government, however, was his condemnation of JESUS CHRIST; seven years after which he was removed from Judea; and in a short time Agrippa, the grandson of Herod the Great, was promoted by Caius to the regal dignity. He did not, however, long enjoy this honour; for, on his coming into Judea, having raised a persecution against the Christians, and blasphemously suffering himself to be styled a God by some deputies from Tyre and Sidon, he was miraculously struck with a disease, which soon put an end to his life. The sacred historian tells us, that he was eaten of worms; and Josephus, that he was seized with most violent pains in his heart and bowels; so that he could not but reflect on the baseness of those flatterers, who had but lately complimented him with a kind of divine immortality, that was now about to expire in all the torments and agonies of a miserable mortal.

On the death of Agrippa, Judea was once more reduced to a province of the Roman empire, and had new governors appointed over it. These were Venti- dius, Felix, Festus Albinus, and Gessius Florus. Under their government the Jewish affairs went on from bad to worse; the country swarmed with robbers and assassins; the latter committing everywhere the most unheard-of cruelties under the pretence of religion; and about 64 A. C. were joined by 18,000 workmen, who had been employed in further repairing and beautifying the temple. About this time also, Gessius Florus, the last and worst governor the Jews ever had, was sent into the country. Josephus seems at a loss for words to describe him by or a monster to compare him to. His rapes, cruelties, conning for large sums with the banditti, and in a word, his whole behaviour, was so open and barefaced, that he was looked upon by the Jews more like a bloody executioner, sent to butcher, than a magistrate to govern them. In this distracted state of the country, many of the inhabitants forsook it to seek for an asylum somewhere else; while those who remained applied themselves to Festus Gallus, governor of Syria, who was at Jerusalem at the passover; beseeching him to pity their unhappy state, and free them from the tyranny of a man who had totally ruined their country. Florus, who was present when these complaints were brought against him, made a mere jest of them; and Cestius, instead of making a strict inquiry into his conduct, dismissed the Jews with a general promise that the governor should behave better for the future; and set himself about computing the number of Jews at that time in Jerusalem, by the number of lambs offered at that festival, that he might send an account of the whole to Nero. By his computation, there were at that time in Jerusalem 2,556,000; though Josephus thinks they rather amounted to 3,000,000.

In the year 67 began the fatal war with the Romans, cause of which was ended only by the destruction of Jerusalem. The immediate cause was the decision of a contest with the Syrians concerning the city of Caesarea. The Jews maintained that this city belonged to them, because it had been built by Herod; and the Syrians pretended that it had always been reckoned a Greek city, since even that monarch had reared temples and statues in it. The contest at last came to such an height, that both parties took up arms against each other. Felix put an end to it for a time, by sending some of the chiefs of each nation to Rome, to plead their cause before the emperor, where it hung in suspense till this time, when Nero decided it against the Jews. No sooner was this decision made public, than the Jews in all parts of the country flew to arms; and though they were everywhere the sufferers, yet, from this fatal period, their rage never abated. Nothing was now to be heard of but robberies, murders, and every kind of cruelty. Cities and villages were filled with dead bodies of all ages, even sucking babes. The Jews, on their part, spared neither Syrians nor Jews; where they got the better of them; and this instantly proved the destruction of great numbers of their peaceable, skilful brethren; 20,000 were massacred at Caesarea, 50,000 at Alexandria, 2000 at Ptolemais, and 3500 at Jerusalem.

A great number of assassins, in the mean time, having joined the factions Jews in Jerusalem, they beat the Romans out of Antonia, a fortress adjoining to the temple, and another called Massada; and likewise out of the towers called Phasael and Mariamme, killing all who opposed them. The Romans were at last reduced to such straits, that they capitulated on the single condition that their lives should be spared; notwithstanding which, they were all massacred by the furious zealots; and this treachery was soon revenged on the faithful Jews of Scythopolis. These had offered to assist in reducing their factions brethren; but their sincerity being suspected by the townspeople, they obliged them to retire into a neighbouring wood, where, on the third night, they were massacred to the number of 13,000, and all their wealth carried off. The rebels, in the mean time, crossed the Jordan, and took the fortresses of Machera and
and Cyprus; which last they razed to the ground, after having put all the Romans to the sword.—This brought Ceasius Gallus, the Syrian governor, into Judea with all his forces; but the Jews, partly by treachery and partly by force, got the better of him, and drove him out of the country with the loss of 5,000 men.

All this time such dreadful dissensions reigned among the Jews, that great numbers of the better sort, foreseeing the sad effects of the resentment of the Romans, left the city as men do a sinking vessel; and the Christians, mindful of their Saviour’s prediction, retired to Pella, a city on the other side of Jordan, whither the war did not reach. Miserable was the fate of such as either could not, or would not, leave that devoted city. Vespasian was now ordered to leave Greece, where he was at that time, and to march with all speed into Judea. He did so accordingly at the head of a powerful army, ordering his son Titus in the mean time to bring two more legions from Alexandria; but before he could reach that country, the Jews had twice attempted to take the city of Ascalon, and were each time repulsed with the loss of 10,000 of their number. In the beginning of the year 68, Vespasian entered Galilee at the head of an army of 63,000 men, all completely armed and excellently disciplined. He first took and burnt Gadara; then he laid siege to Jotapata, and took it after a stout resistance; at which he was so provoked, that he caused every one of the Jews to be massacred or carried into captivity, not one being left to carry the dreadful news to their brethren. Forty thousand perished on this occasion: only 1200 were made prisoners, among whom was Josephus the Jewish historian. Japha next shared the same fate, after an obstinate siege; all the men being massacred, and the women and children carried into captivity. A week after this, the Samaritans, who had assembled on Mount Gerizim, were almost all put to the sword, or perished. Joppa fell the next victim to the Roman vengeance. It had been formerly laid waste by Ceasius; but was now repopulated and fortified by the seditious Jews who infested the country. It was taken by storm, and shared the same fate with the rest. Four thousand Jews attempted to escape by taking to their ships; but were driven back by a sudden tempest, and all of them were drowned or put to the sword. Tarichea and Tibérias were next taken, but part of their inhabitants were spared on account of their peaceable dispositions. Then followed the sieges of Gamala, Gischala, and Itabyr. The first was taken by storm, with a dreadful slaughter of the Jews; the last by stratagem. The inhabitants of Gischala were inclined to surrender: but a seditious Jew of that town, named John, the son of Levi, head of the faction, and a vile fellow, opposed it; and, having the mob at his back, overawed the whole city. On the sabbath he begged of Titus to forbear hostilities till to-morrow, and then he would accept his offer; but instead of that, he fled to Jerusalem with as many as would follow him. The Romans, as soon as they were informed of his flight, pursued, and killed 6,000 of his followers on the road, and brought back near 3,000 women and children prisoners. The inhabitants then surrendered to Titus; and only the factious were punished; and this completed the reduction of Galilee.

The Jewish nation by this time was divided into two very opposite parties: the one foreseeing that this war, if continued, must end in the total ruin of their country, were for putting an end to it by surrendering to the Romans; the other, which was the remains of the faction of Judas Gauvionites, breathed nothing but war and confusion, and opposed all peaceable measures with invincible obstinacy. This last, which was by far the most numerous and powerful, consisted of men of the vilest and most profligate characters that can be paralleled in history. They were proud, ambitious, cruel, rapacious, and committed the most horrid and unnatural crimes under the mask of religion. They affirmed everywhere, that it was offering the greatest dishonour to God to submit to any earthly potentate; much less to Romans and to heathens. This, they said, was the only motive that induced them to take up arms, and to bind themselves under the strictest obligations not to lay them down till they had either totally extirpated all foreign authority, or perished in the attempt.—This dreadful dissension was not confined to Jerusalem, but had infected all the cities, towns, and villages, of Palestine. Even houses and families were so divided against each other, that, as our Saviour had expressly foretold, a man’s greatest enemies were often those of his own family and household. In short, if we may believe Josephus, the zealots acted more like incarnate devils than like men who had any sense of humanity left them.—This obliged the contrary party likewise to rise up in arms in their own defence against those miscreants; from whom, however, they suffered much more than they did even from the exasperated Romans.—The zealots began their outrages by murder. Cruelty of ing all that opposed them in the countries round about, the zealots. Then they entered Jerusalem; but met with a stout opposition from the other party headed by Ananus, who had lately been high-priest. A fierce engagement ensued between them; and the zealots were driven into the inner cincture of the temple, where they were closely besieged. John of Gischala above-mentioned, who had pretended to side with the peaceable party, was then sent with terms of accommodation; but, instead of advising the besieged to accept of them, he persuaded them still to hold out, and call the Idumeans to their assistance. They did so, and procured 20,000 of them to come to their relief; but these new allies were refused admittance into the city. On that night, however, there happened such a violent storm, accompanied with thunder, lightning, and an earthquake, that the zealots from within the inner court threw the bolts and hinges of the temple-gates without being heard, forced the guards of the besiegers, sallied into the city, and led in the Idumeans. The city was instantly filled with butcheries of the most horrid kind. Barely to put any of the opposite party to death was thought too mild a punishment; they must have the pleasure of murdering them by inches: so that they made it now their diversion to put them to the most exquisite tortures that could be invented; nor could they be prevailed upon to dispatch them till the violence of their torments had rendered them quite
JEW [150]  JEW

quite incapable of feeling them. In this manner perished 12,000 persons of noble extraction, and in the flower of their age; till at last the Idumeans complained so much against the putting such numbers to death, that the zealots thought proper to erect a kind of tribunal, which, however, was intended not for judgment but condemnation: for the judges having once acquitted a person who was manifestly innocent, the zealots not only murdered him in the temple, but deposed the new-created judges as persons unfit for their office.

The zealots, after having exterminated all those of any character or distinction, began next to wreak their vengeance on the common people. This obliged many of the Jews to forsake Jerusalem, and take refuge with the Romans, though the attempt was very hazardous; for the zealots had all the avenues well guarded, and failed not to put to death such as fell into their hands. Vespasian in the mean time staid at Cesarea an inspec-
tor of their outrages; well knowing that the zealots were fighting for him, and that the strength of the Jewish nation was gradually wasting away. Every thing succeeded to his wish. The zealots, after having mas-sacred or driven away the opposite party, turned their arms against each other. A party was formed against John, under one Simon who had his head-quarters at the fortress of Massada. This new insurrection plundered, burned, and massacred, wherever he came, carrying the spoil into the fortress above-mentioned. To increase his party, he caused a proclamation to be published, by which he promised liberty to the slaves, and proportionable encouragement to the freemen who joined him. This stratagem had the desired effect, and he soon saw himself at the head of a considerable army. Not thinking himself, however, as yet master of force sufficient to besiege Jerusalem, he invaded Idumea with 20,000 men. The Idumeans opposed him with 25,000; and a sharp engagement ensued, in which neither party was victorious. But Simon, soon after, having corrupted the Idumenean general, got their army delivered up to him. By this means he easily became master of the country; where he committed such cruelties, that the miserable inhabitants abandoned it to seek for shelter in Jerusalem.

In the city, matters went in the same way. John tyrannized in such a manner, that the Idumeneans revolted, killed a great number of his men, plundered his palace, and forced him to retire into the temple. In the mean time the people, having taken a notion that he would sally out in the night and set fire to the city, called a council, in which it was resolved to admit Simon with his troops, in order to oppose John and his zealots. Simon’s first attempt against his rival, however, was ineffectual, and he was obliged to content himself with besieging the zealots in the temple. In the mean time, the miseries of the city were increased by the starting up of a third party headed by one Eleazar, who seized on the court of the priests, and kept John confined within that of the Israelites. Eleazar kept the avenues so well guarded, that none were admitted to come into that part of the temple but those who came thither to offer sacrifices; and it was by these offerings chiefly that he maintained himself and his men. John by this means found himself hemmed in between two powerful enemies, Simon be-

low, and Eleazar above. He defended himself, how-

ever, against them both with great resolution; and when the city was invested by the Romans, having pretended to come to an agreement with his rivals, he found means totally to cut off or force Eleazar’s men to submit to him, so that the factions were again reduced to two.

The Romans, in the year 72, began to advance to-wards the capital. In their way they destroyed many thousands, wasting the country as they went along; and in the year 73 arrived before the walls of Jerusa-
lem, under Titus afterwards emperor. As he was a man of an exceedingly merciful disposition, and greatly desired to spare the city, he immediately sent offers of peace; but these were rejected with contempt, and he himself put in great danger of his life, so that he re-

solved to begin the siege in form. In the mean time, Simon and John renewed their hostilities with greater fury than ever. John now held the whole temple, some of the out-parts of it, and the valley of Cedron. Simon had the whole city to range in; in some parts of which John had made such devastations, that they served them for a field of battle, from which they saluted unanimously against the common enemy whenever occasion served; after which they returned to their usual hostilities, turning their arms against each other, as if they had sworn to make their reign more easy to the Romans. These drew still nearer to the walls, having with great labour and pains levelled all the ground between Scopas and them; by pulling down all the houses and hedges, cutting down the trees, and even clearing the rocks that stood in their way, from Scopas to the tomb of Herod, and Bethana or the pool of serpents; in which work so many hands were employed, that they finished it in four days.

Whilst this was doing, Titus sent the besieged some offers of peace; and Josephus was pitched upon to be the messenger of them: but they were rejected with indignation. He sent a second time Nicanor and Josephus with fresh offers, and the former received a wound in his shoulder; upon which Titus resolved to begin the assault in good earnest, and ordered his men to raze the suburbs, cut down all the trees, and use the materials to raise platforms against the wall. Every thing was now carried on with invincible ardour; the Romans began to play their engines against the city carried on with all their might. The Jews had likewise their vi-

machines upon the walls, which they plied with un-gov-

common fury; they had taken them lately from Ce-
stius; but were so ignorant in their use, that they did little execution with them, till they were better in-

structed by some Roman deserters: till then, their chief success was rather owing to their frequent sallies; but the Roman legionaries, who had all their towers and machines before them, made terrible havoc. The least stones they threw were near 100 weight; and these they could throw the length of a quarter of a mile against the city, and with such a force, that they could do mischief on those that stood at some distance be-

hind them. Titus had reared three towers 50 cubits high; one of which happening to fall in the middle of the night, greatly alarmed the Roman camp, who im-

mediately ran to arms at the noise of it; but Titus, upon knowing the cause, dismissed them, and caused it.
it to be set up again. These towers, being plated with iron, the Jews tried in vain to set fire to them, but were at length forced to retire out of the reach of their shot: by which the battering-rams were now at full liberty to play against the wall. A breach was soon made in it, at which the Romans entered; and the Jews, abandoning this last inclosure, retired behind the next. This happened about the 28th of April, a fortnight after the beginning of the siege.

John defended the temple and the castle of Antonia, and Simon the rest of the city. Titus marched close to the second wall, and plied his battering-rams so furiously, that one of the towers, which looked towards the north, gave a prodigious shake. The men who were in it, made a signal to the Romans, as if they would surrender; and at the same time, sent Simon word to be ready to give them a warm reception. Titus, having discovered their stratagem, plied his work more furiously, whilst the Jews that were in the tower set it on fire, and flung themselves into the flames. The tower being fallen, gave them an entrance into the second enclosure, five days after gaining the first; and Titus, who was bent on saving the city, would not suffer any part of the wall or streets to be demolished; which left the breach and lanes so narrow, that when his men were furiously repulsed by Simon, they had not room enough to make a quick retreat, so that there was a number of them killed in it. This oversight was quickly rectified; and the attack renewed with such vigour, that the place was carried four days after their first repulse.

The famine, raging in a terrible manner in the city, was soon followed by a pestilence; and as these two dreadful judgments increased, so did the rage of the factious, who by their intestine feuds, had destroyed such quantities of provisions, that they were forced to prey upon the people with the most unhallowed cruelty. They forced their houses; and, if they found any victuals in them, they butchered them for not apprising them of it; and, if they found nothing but bare walls, which was almost everywhere the case, they put them to the most severe tortures, under pretence that they had some provision concealed. "I should (says Josephus) undertake an impossible task, were I to enter into a detail of all the cruelties of those impious wretches; it will be sufficient to say, that I do not think, that since the creation any city ever suffered such dreadful calamities, or abounded with men so fertile in all kinds of wickedness."

Titus, who knew their miserable condition, and was still willing to spare them, gave them four days to cool; during which he caused his army to be mustered, and provisions to be distributed to them in sight of the Jews, who flocked upon the walls to see it. Josephus was sent to speak to them affably, and to exhort them not to run themselves into an inevitable ruin by obstinately persisting in the defence of a place which could hold out but a very little while, and which the Romans looked upon already as their own. But this stubborn people, after many bitter invectives, began to dart their arrows at him; at which, not at all discouraged, he went on with greater vehemence: but all the effect it wrought on them was, that it prevailed on great numbers to steal away privately to the Romans, whilst the rest became only the more desperate and resolute to hold out to the last, in spite of Titus's merciful offers.

To hasten therefore their destined ruin, he caused the city to be surrounded with a strong wall, to prevent either their receiving any supplies or provision from abroad, or their escaping his resentment by flight. This wall, which was near 40 stadia or five miles in circuit, was yet carried on with such speed, and by so many hands, that it was finished in three days; by which one may guess at the ardour of the besiegers to make themselves masters of the city.

There was now nothing to be seen through the streets of Jerusalem but heaps of dead bodies rotting above ground, walking skeletons, and dying wretches. As many as were caught by the Romans in their sallies, Titus caused to be sacrificed in sight of the town, to strike terror among the rest: but the zealots gave it out, that they were those who fled to him for protection; which when Titus understood, he sent a prisoner with his hands cut off to undecive, and assure them, that he spared all that voluntarily came over to him; which encouraged great numbers to accept his offers, though the avenues were closely guarded by the factious, who put all to death who were caught going on that errand. A greater mischief than that was, that even those who escaped safe to the Roman camp were miserably butchered by the soldiers, from a notion which these had taken that they had swallowed great quantities of gold; so that two thousand of them were ripped up in one night, to come at their supposed treasure. When Titus was apprised of this barbarity, he would have condemned all those butchering wretches to death; but they proved so numerous, that he was forced to spare them, and contented himself with sending a proclamation through his camp, that as many as should be suspected thenceforward of that horrid villany should be put to immediate death; yet did this not deter many of them from it, only they did it more privately than before; so greedy were they of that bewitching metal. All this while the defection increased still more through the inhumanity of the faction within, who made the miseries and dying groans of their starving brethren the subject of their cruel mirth, and carried their barbarity even to the sheathing of their swords in sport in those poor wretches, under pretence of trying their sharpsites.

When they found therefore that neither their guards nor severities could prevent the people's flight, they had recourse to another stratagem equally impious and cruel: which was, to hire a pack of vile pretenders to prophecy, to go about and encourage the despairing remains of the people to expect a speedy and miraculous deliverance; and this imposture proved a greater expedient with that infatuated nation than their other precautions.

Nothing could be more dreadful than the famished miserable condition to which they were now reduced. The poor, having nothing to trust to but the Roman's mercy or a speedy death, ran all hazards to get out of the city; and if in their flight, and wandering out for herbs or any other sustenance, they fell into the hands of any of Titus's parties sent about to guard the avenues, they were unmercifully scourged, and crucified if they made the least resistance. The rich within the walls were now
Jewsm. now forced, though in the most private manner, to give half, or all they were worth, for a measure of wheat, and the middling sort for one of barley. This they were forced to convey into some private places in their houses, and to feed upon it as it was, without daring to pound or grind it, much less to boil or bake it, lest the noise or smell should draw the rapacious zealots to come and tear it from them. Not that these were reduced to any real want of provisions: but they had a double end in this barbarous plunder; to wit, the starving what they cruelly styled all useless persons, and the keeping their own stores in reserve. It was upon this sad and pinching juncture, that an unhappy mother was reduced to the extremity of butchering and eating her own child.

When this news was spread through the city, the horror and consternation were as universal as they were inexpressible. It was then that they began to think themselves forsaken by the Divine Providence, and to expect the most terrible effects of his anger against the poor remains of their nation; insomuch that they began to envy those that had perished before them, and to wish their turn might come before the sad expected catastrophe. Their fears were but too just; since Titus, at the very first hearing of this inhuman deed, swore the total extirpation of city and people. "Since (said he) they have so often refused my proffers of pardon, and have preferred war to peace, rebellion to obedience, and famine, such a dreadful one especially, to plenty, I am determined to bury that accursed metropolis under its ruins, that the sun may never shoot his beams on a city where the mothers feed on the flesh of their children, and the fathers, no less guilty than they, choose to drive to such extremities, rather than lay down their arms."

The dreadful action happened about the end of July, by which time the Romans, having pursued their attacks with fresh vigour, made themselves masters of the fortress Antonia; which obliged the Jews to set fire to those stately galleries which joined it to the temple, lest they should afford an easy passage to the besiegers into this last. About the same time Titus, with much difficulty, got materials for raising new mounds and terraces, in order to hasten the siege, and save, if possible, the sad remains of that once glorious structure; but his pity proved still worse and worse bestowed on those obstinate wretches, who only became the more furious and desperate by it. Titus at length caused fire to be set to the gates, after having had a very bloody encounter, in which his men were repulsed with loss. The Jews were so terrified at it, that they suffered themselves to be devoured by the flames, without attempting either to extinguish them or save themselves. All this while Josephus did not cease exhorting the infatuated people to surrender, to represent to them the dreadful consequences of an obstinate resistance, and to assure them that it was out of mere compassion to them that he thus hazarded his own life to save theirs: he received one day such a wound in his head by a stone from the battlements, as laid him for dead on the ground. The Jews sallied out immediately, to have seized on his body: but the Romans proved too quick and strong for them, and carried him off.

By this time the two factions within, but especially that of John, having plundered rich and poor of all they had, fell also on the treasury of the temple, whence John took a great quantity of golden utensils, together with those magnificent gifts which had been presented to that sacred place by the Jewish kings, by Augustus, Livia, and many other foreign princes, and melted them all to his own use. The repositories of the sacred oil which was to maintain the lamps, and of the wine which was reserved to accompany the usual sacrifices, were likewise seized upon, and turned into common use; and the last of this to such excess, as to make himself and his party drunk with it. All this while, not only the zealots, but many of the people, were still under such an infatuation, that though the fortress Antonia was lost, and nothing left but the temple, which the Romans were preparing to batter down, yet they could not persuade themselves that God would suffer that holy place to be taken by beasts, and were still expecting some sudden and miraculous deliverance. Even that vile monster John, who commanded there, either seemed confident of it, or else endeavoured to make them think him so. For, when Josephus was sent for the last time to upbraid his obstinately exposing that sacred building, and the miserable remains of God's people, to sudden and sure destruction, he only answered him with the bitterest invectives; adding, that he was defending the Lord's vineyard, which he was sure could not be taken by any human force. Josephus in vain reminded him of the many ways by which he had polluted both city and temple; and in particular of the seas of blood which he caused to be shed in both those sacred places, and which, he assured him from the old prophecies, were a certain sign and forerunner of their speedy surrender and destruction. John remained as inflexible as if all the prophets had assured him of a deliverance, till at length Titus, foreseeing the inevitable ruin of that stately edifice, which he was still extremely desirous to save, unshackled even himself to speak to them, and to persuade them to surrender. But the factious, looking upon this condescension as the effects of his fear rather than generosity, only grew the more furious upon it, and forced him at last to come to those extremities which he had hitherto endeavoured to avoid. That his army, which was to attack the temple, might have the freer passage towards it through the castle Antonia, he caused a considerable part of the wall to be pulled down and levelled; which proved so very strong, that it took him up seven whole days, by which time they were far advanced in the month of July.

It was on the 17th day of that month, as all Josephus's copies have it, that the daily sacrifice ceased for the first time since its restoration by the brave Judas Maccabeus, there being no proper person left in the temple to offer it up. Titus caused the factious to be severely upbraided for it; exhorted John to set up whom he would to perform that office, rather than suffer the service of God to be set aside; and then challenged him and his party to come out of the temple, and fight on a more proper ground, and thereby save that sacred edifice from the fury of the Roman troops. When nothing could prevail on them, they began to set fire again to the gallery which formed a communication between the temple and the castle Antonia. The Jew...
Jews. Jews had already burnt about 20 cubits of it in length; but this second blaze, which was likewise encouraged by the besieged, consumed about 14 more; after which, they beat down what remained standing. On the 27th of July, the Jews, having filled part of the western portico with combustible matter, made a kind of flight; upon which, some of the forwardest of the Romans having scaled up to the top, the Jews set fire to it, which flamed with such sudden fury, that many of the former were consumed in it, and the rest, venturing to jump down from the battlements, were, all but one, crushed to death.

On the very next day, Titus having set fire to the north gallery, which inclosed the outer court of the temple, from Fort Antonia to the valley of Cedron, got an easy admittance into it, and forced the besieged into that of the priests. He tried in vain six days to batter down one of the galleries of that precinct with an helepolis: he was forced to mount his battering-rams on the terrace, which was raised by this time; and yet the strength of this wall was such, that it eluded the force of these also, though others of his troops were busy in sapping it. When they found that neither rams nor sapping could gain ground, they betook themselves of scaling; but were vigorously repulsed in the attempt, with the loss of some standards, and a number of men. When Titus therefore found that his desire of saving that building was like to cost so many lives, he set fire to the gates, which, being plated with silver, burnt all that night, whilst the metal dropped down in the melting. The flame soon communicated itself to the porticoes and galleries, which the besieged beheld without offering to stop it, but contented themselves with sending whole volleys of impotent curses against the Romans. This was done on the 8th of August; and, on the next day, Titus, having given orders to extinguish the fire, called a council, to determine whether the remainder of the temple should be saved or demolished. That general was still for the former, and most of the rest declared for the latter; alleging, that it was no longer a temple, but a scene of war and slaughter, and that the Jews would never be at rest as long as any part of it was left standing; but when they found Titus stiffly bent on preserving so noble an edifice, against which he told them he could have no quarrel, they all came over to his mind. The next day, August the 10th, was therefore determined for a general assault: and the night before the Jews made two desperate sallies on the Romans; in the last of which, these, being timely succoured by Titus, beat them back into their inclosure.

But whether this last Jewish effort exasperated the besiegers, or, which is more likely, as Josephus thinks, pushed by the land of Providence, one of the Roman soldiers, of his own accord, took up a blazing fire-brand, and, getting on his comrade's shoulders, threw it into one of the apartments that surrounded the sanctuary, through a window. This immediately set the whole north side in a flame up to the third story, on the same fatal day and month in which it had been formerly burnt by Nebuchadnezzar. Titus, who was gone to rest himself while his pavilion, was awaked at the noise, and ran immediately to give orders to have the fire extinguished. He called, prayed, threat-
The city to the fury of the soldiers, who fell forthwith on plundering, setting fire everywhere, and murdering all that fell into their hands; whilst the factious, who were left, went and fortified themselves in the royal palace, where they killed 8000 Jews who had taken refuge there.

In the meantime, great preparations were making for a vigorous attack on the upper city, especially on the royal palace; and this took them up from the 20th of August to the 7th of September, during which time great numbers came and made their submission to Titus. The warlike engines then played so ferociously on the factious, that they were taken with a sudden panic; and instead of fleeing to the towers of Hippicus, Phasael, or Mariamne, which were yet untaken, they ran like madmen towards Siloah, with a design to have attacked the wall of circumvallation, and to have escaped out of the city; but, being there repulsed, they were forced to go and hide themselves in the public sinks and common sewers, some one way and some another. All whom the Romans could find were put to the sword, and the city was set on fire. This was on the eighth of September, when the city was taken and entered by Titus. He would have put an end to the massacre; but his men killed all, except the most vigorous, whom they shut up in the porches of the women just mentioned. Fronton, who had the care of them, reserved the youngest and most beautiful for Titus's triumph; and sent all that were above seventeen years of age into Egypt, to be employed in some public works there; and a great number of others were sent into several cities of Syria, and other provinces, to be exposed on the public theatre, to exhibit fights, or be devoured by wild beasts. The number of those prisoners amounted to 97,000, besides about 11,000 more, who were either starved through neglect, or starved themselves through sullenness and despair.—The whole number of Jews who perished in this war is computed at upwards of 1,400,000.

Besides these, however, a vast number perished in caves, woods, wildernesses, common-ways, &c. of whom no computation could be made. Whole soldiers were still busy in burning the remains of the city, and visiting all the hiding-places, where they killed numbers of poor creatures who had endeavoured to evade their cruelty, the two grand rebels Simon and John were found, and reserved for the triumph of the conqueror. John, being pinched with hunger, soon came out; and having begged his life, obtained it; but was condemned to perpetual imprisonment. Simon, whose retreat had been better stored, held out till the end of October. The two chiefs, with 700 of the handsomest Jewish captives, were made to attend the triumphal chariot; after which Simon was dragged through the streets with a rope about his neck, severely scourged, and then put to death; and John was sent into perpetual imprisonment.—Three castles still remained untaken, namely, Herodion, Macheron, and Massada. The two former capitulated; but Massada held out. The place was exceedingly strong both by nature and art, well stored with all kinds of provisions, and defended by a numerous garrison of zealots, at the head of whom was one Eleazar, the grandson of Judas Gammoneus, formerly mentioned. The Roman general having in vain tried his engines and battering-rams against it, betook himself of surrounding it with a high and strong wall, and then ordered the gates to be set on fire. The wind pushed the flames so fiercely against the Jews, that Eleazar in despair persuaded them first to kill their wives and children, and then to choose ten men by lot, who should kill all the rest; and lastly one out of the surviving ten to dispatch them and himself: only this last man was ordered to set fire to the place before he put an end to his own life. All this was accordingly done; and on the morrow, when the Romans were preparing to scale the walls, they were greatly surprised neither to see nor hear any thing more. On this they made such an hideous outcry, that two women, who had concealed themselves in an aqueduct, came forth and acquainted them with the desperate catastrophe of the besieged.

Thus ended the Jewish nation and worship; nor have they ever since been able to regain the smallest footing in the country of Judea, nor indeed in any other country on earth, though there is scarce any part of the globe where they are not to be found. They continue their vain expectations of a Messiah to deliver them from the low estate into which they are fallen; and, notwithstanding their repeated disappointments, there are few who can ever be persuaded to embrace Christianity. Their ceremonies and religious worship ought to be taken from the law of Moses; but they have added a multitude of absurdities not worth the inquiring after. In many countries, and in different ages, they have been terribly massacred, and in general have been better treated by the Mahometans and Pagans than by Christians. Since the revival of arts and learning, however, they have felt the benefit of that increase of humanity which has diffused itself almost over the globe. It is said, that in this country the life of a Jew was formerly at the disposal of the chief lord where he lived, and likewise all his goods. So strong also were popular prejudices and suspicions against them, that in the year 1348, a fatal enmity and interregnum raging in a great part of Europe, it was said that they had poisoned the springs and wells; in consequence of which a million and a half of them were cruelly massacred. In 1492, half a million of them were driven out of Spain, and 150,000 from Portugal. Edward I. did the same. In short, they were everywhere persecuted, oppressed, and most rigorously treated.

In this enlightened period a more generous system is followed. France has allowed them the rights of citizens which induce numbers of the most wealthy Jews to fix their residence in that country. Poland granted them very great privileges and immunities; England, Holland, and Prussia tolerate and protect them; and the emperor has revoked some restrictions, for which an edict was passed: Spain, Portugal, and some of the Italian states, are still, however, it is said, averse to their dwelling among them.

JEZIDES, among the Mahometans; a term of similar import with heretics among Christians.

The Jezides are a numerous sect inhabiting Turkey and...
and Persia, so called from their head Jezid, an Arabian prince, who slew the sons of Ali, Mahomet's father in law; for which reason he is reckoned a paricide, and his followers heretics. There are about 20,000 Jezides in Turkey and Persia; who are of two sorts, black and white. The white are clad like Turks; and distinguished only by their shirts, which are not slit at the neck like those of others, but have only a round hole to thrust their heads through. This is in memory of a golden ring, or circle of light, which descend from heaven upon the neck of their chieftain, the head of their religion, after his undergoing a fast of forty days. The black Jezides, though married, are the monks or religious of the order; and these are called Fudirs.

The Turks exact excessive taxes from the Jezides, who hate the Turks as their mortal enemies; and when, in their wrath, they curse any creature, they call it musawwiman: but they are great lovers of the Christians, being more fond of Jesus Christ than of Mahomet, and are never circumcised but when they are forced to it. They are extremely ignorant, and believe both the Bible and the Koran without reading either of them: they make vows and pilgrimages, but have no places of religious worship.

All the adoration they pay to God consists of some songs in honour of Jesus Christ, the virgin, Moses, and sometimes Mahomet; and it is a principal point of their religion never to speak ill of the devil, lest he should resent the injury, if ever he should come to be in favour with God again, which they think possible; whenever they speak of him, they call him the angel Anacot. They bury their dead in the first place they come at, rejoicing as at a festival, and celebrating the entry of the deceased into heaven. They go in companies like the Arabians, and change their habitations every 15 days. When they get wine, they drink it to excess; and it is said, that they sometimes do this with a religious purpose, calling it the blood of Christ. They buy their wives; and the market-price is 200 crowns for all women, handsome or not, without distinction.

JEZRAEL, or JEREE, a town in the north of Samaria, towards Mount Carmel, where stood a palace of the kings of Israel, (1 Kings xxii. 18.) On the borders of Galilee (Joshua xix.) said to be one of the towns of Issachar. The valley of Jezreel (Judges vi. 17.) was situated on the north of the town, running from west to east for ten miles, between two mountains; the one to the north, commonly called Hermon, near Mount Tabor; the other Gilboa: in breadth two miles.

IF, an island of France, in Provence, and the most eastern of the three before the harbour of Marseilles. It is very well fortified, and its port one of the best in the Mediterranean.

IGIS, a town of the country of the Goisons, in Cades, with a magnificent castle, in which is a cabinet of curiosities, and a handsome library; 30 miles south-west of Cheras, and 23 south of Claces. E. Long. 9°. 0. N. Lat. 49°. 10'.

IGLAW, a considerable and populous town of Germay, in Moravia, where they have a manufactury of good cloth, and excellent beer. It is seated on the river Iglia, 40 miles west of Brin, and 62 south-east of Prague. E. Long. 15°. 42'. N. Lat. 47°. 8'.

IGNATIA, a genus of plants, belonging to the pentandria class. See botany index.

IGNATIUS LOYOLA, (canonized), the founder of the well-known order of the Jesuits, was born at the castle of Loyola, in Biscay, 1491; and became first page to Ferdinand V. King of Spain, and then an officer in his army. In this last capacity, he signalized himself by his valour; and was wounded in both legs at the siege of Pamplona, in 1521. To this circumstance the Jesuits owe their origin; for, while he was under care of his wound, a Life of the Saints was put into his hands, which determined him to forsake the military for the ecclesiastical profession. His first devout exercise was to dedicate himself to the blessed virgin as her knight: he then went a pilgrimage to the Holy Land; and on his return to Europe, he continued his theological studies in the universities of Spain, though he was then 33 years of age. After this he went to Paris; and in France laid the foundation of this new order, the institutes of which he presented to Pope Paul III. who made many objections to them, but at last in 1540 confirmed the institution. The founder died in 1555, and left his disciples two famous books: 1. Spiritual exercises; 2. Constitutions or rules of the order. But it must be remembered, that though these aforesaid institutes contain many privileges obnoxious to the welfare of society, the most diabolical are contained in the private rules, intitled Memoria secreta, which were not discovered till towards the close of the last century; and most writers attribute these, and even the Constitutions, to Laynez, the second general of the order.

IGNATIUS, St., surnamed Theophrastus, one of the apostolical fathers of the church, was born in Syria, and educated under the apostle and evangelist St John, and intimately acquainted with some other of the apostles, especially St Peter and St Paul. Being fully instructed in the doctrines of Christianity, he was, for his eminent parts and piety, ordained by St John, and confirmed about the year 67 bishop of Antioch, by these two apostles, who first planted Christianity in that city, where the disciples also were first called Christians. Antioch was then not only the metropolis of Syria, but a city the most famous and renowned of any in the east, and the ancient seat of the Roman emperors, as well as of the viceroys and governors. In this important seat he continued to sit somewhat above 40 years, both an honour and safeguard of the Christian religion, till the year 107, when Trajan the emperor, flushed with a victory which he had lately obtained over the Sceytians and Dasi, about the ninth year of his reign, came to Antioch to make preparations for a war against the Parthians and Armenians. He entered the city with the pomp and solemnities of a triumph; and, as his first care usually was about the conciliations of religion, he began presently to inquire into that affair. Christianity had by this time made such a progress, that the Romans grew jealous and uneasy at it. This prince, therefore, had already commenced a persecution against the Christians in other parts of the empire, which he now resolved to carry on here. However, as he was naturally of a
mild disposition, though he ordered the laws to be put
in force against them if convicted, yet he forbade them
to be sought after.

In this state of affairs, Ignatius, thinking it more
prudent to go himself than stay to be sent for, of his
own accord presented himself to the emperor; and, as
it is said, there passed a long and particular discourse
between them, wherein the emperor expressing a surprise
how he dared to transgress the laws, the bishop took
the opportunity to assert his own innocence, and to
explain and vindicate his faith and freedom. The is-
sure of this was, that he was cast into prison, and his
sentence passed upon him. That, being incurably over-
run with superstition, he should be carried bound by
soldiers to Rome, and there thrown as a prey to wild
beasts.

He was first conducted to Seleucia, a port of Syria,
about 16 miles distance, the place where Paul and
Barnabas set sail for Cyprus. Arriving at Smyrna in
Ionia, he went to visit Polycarp bishop of that place,
and was himself visited by the clergy of the Asian
churches round the country. In return for that kind-
ness, he wrote letters to several churches, as the Epe-
hesians, Magnesians, and Trallians, besides the Romans,
for their instruction and establishment in the faith; one
of these was addressed to the Christians at Rome, to
acquaint them with his present state, and passionate de-
sire not to be hindered in the course of martyrdom
which he was now hastening to accomplish.

His guard, a little impatient of their stay, set sail
with him for Troas, a noted city of the lesser Phry-
gia, not far from the ruins of old Troy; where, at
his arrival, he was much refreshed with the news he
received of the persecution ceasing in the church of
Antioch: bither also several churches sent their mes-
sengers to pay their respects to him; and hence too he
dispatched two epistles, one to the church of Phila-
delphia, and the other to that of Smyrna; and, to-
gether with this last, as Eusebius relates, he wrote pri-
vate to Polycarp, recommending to him the care and
inspection of the church of Antioch.

From Troas they sailed to Neapolis, a maritime
town in Macedonia; thence to Philippoi, a Roman col-
ony, where they were entertained with all imaginable
kindness and courtesy, and conducted forwards on their
journey, passing on foot through Macedonia and Epi-
rus, till they came to Epidamnium, a city of Dalma-
tia: where again taking shipping, they sailed through
the Adriatic, and arrived at Rhegium, a port-town in
Italy; directing their course thence through the Ty-
rrhenian sea to Puteoli, whence Ignatius desired to
proceed by land, ambitious to trace the same way by
which St Paul went to Rome: but this wish was not
accomplished with; and, after a stay of 24 hours, a pros-
perous wind quickly carried them to the Roman port,
the great harbour and station for their navy, built
near Ostia, at the mouth of the Tyber, about 16 miles
from Rome; whither the martyr longed to come, as
much desire to be at the end of his race, as his
keen desire ofany of their voyage, were to be at the end
of their journey.

The Christians at Rome, daily expecting his arrival,
came out to meet and entertain him, and accord-
ingly received him with a mixture of joy and sorrow;
but when some of them intimated, that, possibly the
populace might be taken off from desiring his death,
he expressed a pious indignation, interreating them to
cast no rocks in his way, nor do any thing that might
hinder him, now he was hastening to his crown. There
are many such expressions as this in his epistle to the
Romans, which plainly show that he was highly amb-
bitious of the crown of martyrdom. Yet it does not
appear that he rashly sought or provoked danger.
Among other expressions of his ardour for suffering,
he said, that the wild beasts had feared and refused to
touch some that had been thrown to them, which he
hoped would not happen to him. Being conducted to
Rome, he was presented to the prefect, and the
emperor's letters probably delivered concerning him.

The interval before his martyrdom was spent in pray-
ers for the peace and prosperity of the church. That
his punishment might be the more pompous and pub-
ic, one of their solemn festivals, the time of their Sa-
turnalia, and that part of it when they celebrated their
Sigillaria, was pitched on for his execution; at which
time it was their custom to entertain the people with
the bloody conflicts of gladiators, and the hunting and
fighting with wild beasts. Accordingly, on the 13th kal.
January, i.e. December 20, he was brought out
into the amphitheatere, and the lions being let loose
upon him, quickly dispatched their meal, leaving no-
thing but a few of the hardest of his bones. These
remains were gathered up by two deacons who had
been the companions of his journey; and being trans-
ported to Antioch, were interred in the cemetery,
without the gate that leads to Daphne; whence, by
the command of the emperor Theodosius, they were
removed with great pomp and solemnity to the Ty-
cheon, a temple within the city, dedicated to the pub-
lic genius of it, but now consecrated to the memory of
the martyr.

St Ignatius stands at the head of those Antinianic
fathers, who have occasionally delivered their opinions
in defence of the true divinity of Christ, whom he calls
the Son of God, and his eternal word. He is also reck-
oned the great champion of the doctrine of the episco-
pal order, as distinct and superior to that of priest
and deacon. And one, the most important, use of his
writings respects the authenticity of the Holy Scrip-
tures, which he frequently alludes to, in the very ex-
pressions as they stand at this day.—Archbishop Ush-
er's edition of his works, printed in 1647, is thought
the best: yet there is a fresher edition extant at Am-
sterdam, where, besides the best notes, there are the
dissertations of Usher and Pearson.

St Ignatius's Bean, the fruit of a plant. See Igna-
tia, Botany Index.

IGNIS-FATUUS, a kind of light, supposed to be of
an electric nature, appearing frequently in mines,
marshy places, and near stagnating waters. It was
formerly thought, and is still by the superstitious
believed, to have something ominous in its nature,
and to presage death and other misfortunes. There
have been instances of people being deceived by these
lights into marshy places, where they have perished;
whence the names of Ignis-fatuus, Will-with-a-noise,
and Jack-with-a-lanthorn, as if this appearance were
an evil spirit which took delight in doing mischief
of that kind. The general opinion is, that this light is
owing to the decomposition of animal or vegetable mat-
ters,
IGNOBLES, amongst the Romans, was the designation of such persons as had no right of using pictures and statues. See Jos Imaginis.

IGNOMINIA, a species of punishment amongst the Romans, whereby the offender suffered public shame, either by virtue of the praetor's edict, or by order of the censor. This punishment, besides the scandal, deprived the party of the privilege of bearing any offices, and almost all other liberties of a Roman citizen.

IGNORAMUS, in Law, is a word properly used by the grand inquest empanelled in the inquisition of causes criminal and public, and written upon the bill, whereby any crime is offered to their consideration, when, as they dislike their evidence as defective or too weak to make good the presentment; the effect of which word so written is, that all farther inquiry upon that party for that fault is thereby stopped, and he delivered without farther answer. It hath a resemblance with that custom of the ancient Romans, where the judges, when they absolved a person accused, did write A. upon a little tablet provided for that purpose, i. e. absolvimus; if they judged him guilty, they wrote C. i. e. condemnamus; if they found the cause difficult and doubtful, they wrote N. L. i. e. non liquet.

IGNORANCE, the privation or absence of knowledge. The causes of ignorance, according to Locke, are chiefly these three. 1. Want of ideas. 2. Want of a discoverable connexion between the ideas we have. 3. Want of tracing and examining our ideas. See Metaphysics.

IGNORANCE, in a more particular sense, is used to denote illiteracy. Previously to the taking of Rome by the Gauls, such gross ignorance prevailed among the Romans that few of the citizens could read or write, and the alphabet was almost unknown. During three ages there were no public schools, but the little learning their children had was taught them by their parents; and how little that was may be partly concluded from this circumstance, that a nail was annually driven into the wall of the temple of Jupiter Capitolinus, on the 15th of September, to assist the ignorance of the people in reckoning the years, because they were unacquainted with letters or figures. The driving of the nail was afterwards converted into a religious ceremony, and performed by the dictator, to aver public calamities.

IGNORANCE, or mistake, in Law, a defect of will, whereby a person is excused from the guilt of a crime, when, intending to do a lawful act, he does that which is unlawful. For here the deed and the will acting separately, there is not that conjunction between them which is necessary to form a criminal act. But this must be an ignorance or mistake of fact, and not an error in point of law. As if a man intending to kill a thief or house-breaker in his own house, by mistake kills one of his own family, this is no criminal action: but if a man thinks he has a right to kill a person excommunicated or outlawed wherever he meets him, and does so; this is wilful murder. For a mistake in point of law, which every person of discretion not only may, but is bound and presumed to know, is, in criminal cases, no sort of defence. Ignorantia juris quidem nullam scire, neminem excusat, is as well the maxim of our own law as it was of the Roman.

IGUANA, a species of Lacerta. See Herpetology Index.

Mud Iguana, a species of fish. See Murzna.

Ichthyology Index.

IHOR, Johor, or Jor, a town of Asia, in Malacca, and capital of a province of the same name in the peninsula beyond the Ganges. It was taken by the Portuguese in 1603, who destroyed it, and carried off the cannon; but it has since been rebuilt, and was afterwards in possession of the Dutch. E. Long. 93° 55' N. Lat. 1° 15'.

JIB, the foremost sail of a ship, being a large staysail extended from the outer end of the bowsprit prolonged by the jib-boom, towards the fore-top mast head. See Sail.

The jib is a sail of great command with any side-wind, but especially when the ship is close hauled, or has the wind upon her beam; and its effort in casting the ship, or turning her head to leeward, is very powerful and of great utility, particularly when the ship is working through a narrow channel.

Jib-Booms, a boom run out from the extremity of the bowsprit, parallel to its length, and serving to extend the bottom of the jib, and the stay of the foremost mast. This boom, which is nothing more than a continuation of the bowsprit forward, to which it may be considered as a top-mast, is usually attached to the bowsprit, by means of two large boom-irons, or by one boom-iron, and a cap on the outer end of the bowsprit; or, finally, by the cap without and a strong lashing within, instead of a boom-iron, which is generally the method of securing it in small merchant ships. It may therefore be drawn in upon the bowsprit as occasion requires; which is usually practised when the ship enters a harbour, where it might very soon be broken or carried away, by the vessels which are moored therein, or passing by under sail.
maintain their independence, and are of a savage disposition, so that our traveller found it difficult to approach them with safety. They are called Noradis; and each of them has a Greek cross in the middle between the eyes, marked with antimony. They are divided into tribes, unlike the other Arabs; have huts in the mountains built of mud and straw; and are, by our author, supposed to be a remnant of the Vandals. He even thinks that they may be descended from the remnant of an army of Vandals mentioned by Præcopius, which was defeated among these mountains. They live in perpetual war with the Moors, and boast that their ancestors were Christians. They pay no taxes.

JIDDA, a town of Arabia, situated, according to Mr Bruce, is N. Lat. 28° 4′ 1″, E. Long. 39° 16′ 55″, while others make it 21° 28′, and E. Long. 39° 22′. It is situated in a very unhealthy, barren, and desert part of the country. Immediately without the gate to the eastward is a desert plain filled with the huts of the Bedowees or country Arabs, built of long bundles of artemisia or bent-grass put together like fascines. These people supply the town with milk and butter.

"There is no stirring out of the town (says Mr Bruce) even for a walk, unless for about half a mile on the south side by the sea, where there is a number of stagnant pools of stagnant water, which contributes to make the town very unhealthy."

From the disagreeable and inconvenient situation of this port, it is probable, that it would have been long ago abandoned, had it not been for its vicinity to Mecca, and the vast annual influx of wealth occasioned by the India trade; which, however, does not continue, but passes on to Mecca, whence it is dispersed all over the east. The town of Jidda itself receives but little advantage, for all the customs are immediately sent to the needy and rapacious sheriff of Mecca and his dependents. "The gold (says Mr Bruce) is returned in bags and boxes, and passes on as rapidly to the ships as the goods do to the market, and leaves as little profit behind. In the mean time provisions rise, to a prodigious price, and this falls upon the townsmen, while all the profit of the traffic is in the hands of strangers; most of whom, after the market is over (which does not last six weeks) retire to Yemen and other neighbouring countries, which abound in every sort of provision."

From this scarcity, Mr Bruce supposes it is, that polygamy is less common here than in any other part of Arabia. "Few of the inhabitants of Jidda (says our author) can avail themselves of the privilege granted by Mahomet; he cannot marry more than one wife, because he cannot maintain more; and from this cause arises the want of people and the number of unmarried women."

The trade at Jidda is carried on in a manner which appeared very strange to our traveller. "Nine ships (says he) were there from India; some of them worth I suppose 300,000. One merchant, a Turk, living at Mecca, 30 hours journey off, where no Christian dares go, whilst the continent is open to the Turk for escape, offers to purchase the cargoes of four out of these nine ships himself; another of the same cast comes and says he will buy some unless he has them all. The samples are shown, and the cargoes of the whole nine ships are carried into the wilds parts of Arabia by men with whom one would not wish to trust himself alone in the field. This is not all; two India brokers come into the room to settle the price; one of the part of the India captain, the other on that of the buyer the Turk. They are neither Mahometans nor Christians, but have credit with both. They sit down on the carpet, and take an India shawl which they carry on their shoulder like a napkin, and spread it over their hands. They talk in the mean time indifferent conversation, as if they were employed in no serious business whatever. After about 20 minutes spent in handling each others fingers below the shawl, the bargain is concluded, say for nine ships, without one word ever having been spoken on the subject, or pen or ink used in any shape whatever. There never was one instance of a dispute happening in these sales. But this is not all; the money is yet to be paid. A private Moor, who has nothing to support him but his character, becomes responsible for the payment of these cargoes. This man delivers a number of coarse hempen bags full of what is supposed to be money. He marks the contents upon the bag, and puts his seal upon the string that ties the mouth of it. This is received for what is marked upon it without any one ever having opened one of the bags; and in India it is current for the value marked upon it as long as the bag lasts."

The port of Jidda is very extensive, and contains numberless shoals, small islands, and sunk rocks, with deep channels, however, between them; but in the harbour itself ships may ride secure, whatever wind blows. The only danger is in the coming in or going out; but as the pilots are very skilful, accidents are never known to happen. The charts of this harbour, as Mr Bruce informs us, are exceedingly erroneous. While he stood here, he was desired by Captain Thornhill to make a new chart of the harbour; but finding that it had been undertaken by another gentleman, Captain Newland, he dropped it. He argues in the strongest terms against the old maps, which he says can be of no use, but the contrary; and he gives it as a characteristic of the Red sea, "scarce to have soundings in any part of the channel, and often on both sides; whilst soundings are hardly found a boat length from the main. To this, says he, I will add, that there is scarce one island on which I ever was, where the bow-sprit was not over the land, while there were no soundings by a line heaved over the stern. Of all the vessels in Jidda, only two had their log-lines properly divided, and yet all were as fond of their supposed accuracy, as to aver they had kept their course within five leagues between India and Babelmandel. Yet they had made no estimation of the currents without the straits, nor the different very strong ones soon after passing Soocora; their half-minute glasses, upon a medium, ran 57 seconds; they had made no observations on the tides or currents in the Red sea, either in the channel or in the inward passage; yet there is delineated in this map a course of Captain Newland's, which he kept in the middle of the channel, full of sharp angles and short stretches; you would think every yard was measured and sounded."

JIG. See Music, N° 252.

JILLIFREE,
JILLIFREE, a town on the northern bank of the river Gambia, opposite to James's island, where the English had formerly a small port. The kingdom of Barra, in which it is situated, produces abundance of the necessaries of life; but the chief trade of the inhabitants is in salt, which they carry up the river in canoes; and, in return, bring down Indian corn, cotton-cloths, elephants teeth, small quantities of gold dust, &c. The number of canoes and people continually employed in this trade, make the king of Barra, according to Mr Park, more formidable to Europeans, than any other chieftain on the river, and have encouraged him to establish these extravagant duties, which traders of all nations are obliged to pay at entry, amounting almost to 20l. on each vessel, great and small. These duties are commonly collected in person by the governor of Jillifree, who is attended by a troublesome train of dependants, who have some knowledge of the English language, in consequence of their intercourse with them, and beg with such importunity, that traders are often under the necessity of complying with their demands, in order to get rid of them. N. Lat. 15° 16'. W. Long. 16° 10'. from Greenwich.

JIN. See GEMII.

IKENILD STREET, one of the four famous ways which the Romans made in England, called Stremon Xecomum, because it began in the country of the Iceni, who inhabited Northfolk, Suffolk, and Cambridgeshire.

ILA, ILAY, or ILA, one of the chief of the Hebrides, or Western isles of Scotland, lying to the west of Jura, from which it is separated by a narrow channel. It extends 24 miles in length from north to south, and is 18 in breadth from east to west. On the east side there are many lofty sterile mountains; but in the interior, and to the southward and westward, the land is in good cultivation. A great body of limestone of a bluish colour, lying in the middle part of the island, stretches almost through its whole length, and is now extensively employed for the purposes of manure. Marl, which is also abundant, is applied to the same use. Lead-ore has been dug out in several places, and at so early a period as the time of the Danes. The principal harbour in the isle is at Lochindal, but there are several others which are safe and commodious. Here are several rivers and lakes well stored with trout, eels and salmon. In the centre is Loch Finlaggan, about three miles in circuit, with the little isle of that name in the middle. Here the great lord of the Isles once resided in all the pomp of royalty; but his palaces and offices are now in ruins. Instead of a throne, Macdonald stood on a stone seven feet square, in which there was an impression made to receive his feet; here he was crowned and anointed by the bishop of Argyll and seven inferior priests, in presence of the chieftains. This stone still exists. The ceremony (after the new lord had collected his kindred and vassals) was truly patriarchal. After putting on his armour, his helmet and his sword, he took an oath to rule as his ancestor had done; that is, to govern as a father would his children: his people in return swore that they would pay the same obedience to him as children would to their parent. The dominions of this potentate, about the year 1586, consisted only of Ilay, Jura, Knapdale, and Cantyre; so reduc'd were they from what they had been before the deprivation of the great Earl of Ross in the reign of James III. Near this is another little isle, where he assembled his council, Dava-ness Corle, or "the island of counsel" where 13 judges constantly sat to decide differences among his subjects; and received for their trouble the 11th part of the value of the affair tried before them. In the first island were buried the wives and children of the lords of the Isles; but their own persons were deposited in the more sacred ground of Iona. On the shores of the lake are some marks of the quarters of his Cornovici and Gallow-glasses, "the military of the isles," the first signifying a strong man, the last a grim-looking fellow. The first were light-armed, and fought with darts and daggers; the last with sharp hatchets. These are the troopes that Shakespeare alludes to, when he speaks of a Donald, who

From the Western isles
Of Kernes and Gallow-glasses was supplied.

Besides those already mentioned, the lords had a house and chapel at Lagan, on the south side of Lochindal: a strong castle on a rock in the sea, at Dunsway, at the south-east end of the country; for they made this island their residence after their expulsion from that of Man in 1504. There was a tradition, that while the isle of Man was part of the kingdom of the Isles, the rents were for a time paid in this country: those in silver were paid on a rock, still called Creg-a-niaig, or "the rock of silver rent," the other, Creg-a-naigrid, or "the rock of rents in kind." These lie opposite to each other, at the mouth of a harbour on the south side of this island. There are several forts built on the isles in fresh water lakes, and divers caverns in different parts of the island, which have been used occasionally as places of strength. The island is divided into four parishes, viz. Kishalton, Kilarow, Klachomar, and Kilmenie. The produce is corn of different kinds; such as barley, which sometimes yields eleven fold; and oats six fold. Much flax is raised here, and about 2000l. worth sold out of the island in yarn, which might better be manufactured on the spot, to give employ to the poor natives. Notwithstanding the excellence of the land, above 1000l. worth of meal is annually imported (a). Ale is frequently made in this island of the young tops of heath, mixing two-thirds of that plant with one of malt, sometimes adding hops. Both is relates, that this liquor was much used among the Picts; but when that nation was extirpated by the Scots, the secret of making it perished with them. Numbers of cattle are bred here, and about 1700 are annually exported at the

(a) This might have been the case in the time of Pennant, from whom the above account is taken. It is not so now, although the population has increased to nearly 12,000. Isla indeed enjoys the peculiar advantages of being not only a grazing but a corn country, and can thus afford a very considerable exportation of both species of produce. The number of cattle now exported far exceeds that stated above by Pennant.
the price of 50 shillings each. The island is often overstocked, and numbers die in March for want of fodder. None but milch-cows are housed: cattle of all other kinds, except the saddle-horses, run out during winter.

The number of inhabitants, when Ilay was visited by Pennant, is computed to have been between seven and eight thousand. About 700, says he, are employed in the mines and in the fishery: the rest are gentleman-farmers, and tenants or servants. The women spin. The servants are paid in kind; the sixth part of the crop. They have houses gratis; the master gives them the seed for the first year, and lends them horses to plough annually the land annexed.

The quadrupeds of this island, as enumerated by Mr. Pennant, are stots, weesels, otters, and hares: the last small, dark-coloured, and bad runners. The birds are eagles, peregrine falcons, black and red game, and a very few ptarmigans. Red-breasted goosanders breed on the shore among the loose stones, wild geese in the moors, and herons in the island Loch-guirn. The fish are plaice, smearable, large dace, mullets, haliot, lump-fish, black goby, greater dragonet, and that rare fish the legadopaster of M. Gouan. Vipers swarm in the heath: the natives retain the vulgar error of their stinging with their forked tongues (8); that a sword on which the poison has fallen will heirs in water like a red-hot iron; and that a poultece of human exude is an infallible cure for the bite.

In this island, Mr. Pennant informs us, several ancient diversions and superstitions are still preserved: the last indeed are almost extinct, or at most lurk only amongst the very meanest of the people. The late wakes or funerals, like those of the Romans, were attended with sports, and dramatic entertainments composed of many parts, and the actors often changed their dresses suitably to their characters. The subject of the drama was historical, and preserved by memory.—The power of fascination is as strongly believed here as it was by the shepherds of Italy in times of old.

Nescio quis teneros oculis mihi fascinat agnos 2

But here the power of the evil eye affects more the milch-cows than lambs. If the good housewife perceives the effect of the malicious on any of her kine, she takes as much milk as she can draw from the enchanted herd (for the witch commonly leaves very little). She then boils it with certain herbs, and adds to them flints and untempered steel; after that she secures the door, and invokes the three sacred persons. This puts the witch into such an agony, that she comes niling-willing to the house, begs to be admitted, to obtain relief by touching the powerful pot: the good woman then makes her terms; the witch restores the milk to the cattle, and in return is freed from her pains. But sometimes, to save the trouble of those charms (for it may happen that the disorder may arise from other causes than an evil-eye), the trial is made by immersing in milk a certain herb, and if the cows are supernaturally affected, it instantly distils blood. The unsuccessful lover revenges himself on his happy rival by charms potent as those of the shepherd Alpheus, and exactly similar:

Necte tribus nodis termos, Amaryllis, coloris:
Necte, Amaryllis, modo.

Donald takes three threads of different hues, and ties three knots on each, three times imprinting the most cruel disappointments on the nuptial bed: but the bridegroom, to avert the harm, stands at the altar with an untied shoe, and puts a sixpence beneath his foot.

History furnishes very few materials for the great events or revolutions of Ilay. It seems to have been long a seat of empire, probably jointly with the isle of Man, as being most conveniently situated for the government of the rest of the Hebrides; for Crovan the Norwegian, after his conquest of that island in 1066, retired and finished his days in Ilay. There are more Danish or Norwegian names of places in this island than any other: almost all the present farms derive their titles from them; such as Persibus, Torridale, Torribole, and the like. On the retreat of the Danes it became the seat of their successors the lords of the isles; and continued, after their power was broken, in the reign of James III. in the descendants the Macdonalds, who held or ought to have held it from the crown. It was in the possession of a Sir James Macdonald, in the year 1598, the same who won the battle of Traill-duirnald. His power gave umbrage to James VI. who directed the lord of Macleod, Cameron of Lochiel, and the Masseilles of Barr, to support the Macleans in another invasion. The rival parties met near the hill of Benbigger, east of Killarow; a fierce engagement ensued, and the Macdonalds were defeated and almost entirely cut off. Sir James escaped to Spain; but returned in 1620, was pardoned, received a pension, and died the same year at Glasgow; and in him expired the last of the great Macdonalds. But the king, irritated by the disturbances raised by private wars waged between these and other clans, resumed the grant made by his predecessor, and transferred it to Sir John Campbell of Calder, who held it on paying an annual feu-duty of five hundred pounds sterling, which is paid to this day. The island was granted to Sir John as a reward for his undertaking the conquest: but the family considered it as a dear acquisition, by the loss of many galloway followers, and by the expenses incurred in support of it.

ILCHESTER, a town of Somersetshire in England, seated on the river Yeo-lil, 129 miles from London, is so called, because it once had a castle, and stands on the river Ivel. It is a place of great antiquity, as appears by the Roman coins which are sometimes dug up. It is likewise evident, from the ruins and from two towers on the bridge, that it was once a large place, and encompassed with a double wall. It also had several parish-churches, though now but one. It is governed by two bailiffs, who with the twelve burgesses are lords of the manor. In the reign of Edward III., the assizes for the county were fixed here, which have since been

(8) This vulgar error is by no means limited to the natives of Ilay.
The knights of the shire are always chosen here, and it is the place for the county courts and jail. On the latter is its chief dependence, and therefore it cannot be very polite. It is noted for being the birthplace of Roger the famous Friar Bacon. Ilchester is an earldom in the Fox family.

ILDEFONSO, St., a celebrated royal residence of Spain, distant about two miles from Segovia. It was erected by Philip V. in the midst of a solitary wood, and in the bosom of steep mountains. It is chiefly remarkable for its gardens. There is nothing magnificent in the palace, particularly in its exterior appearance. The front on the side of the garden is of the Corinthian order, and not destitute of elegance. Here are the king's apartments, which look upon a parterre surrounded with vases and marble statues, and a cascade which, for the richness of its decorations, may be compared with the finest of the kind.

The purity and clearness of the water is indeed incomparable. Philip V. could not, in this respect, be better served by nature. From the mountains which shade the palace descend several rivulets, which supply the reservoirs. These waters answer the double purpose of supplying numerous fountains, and of diffusing life and verdure through the magnificent gardens, the sight of which alone is a sufficient remuneration for a journey into Spain. They are on the inside a league in circumference. The inequality of the ground affords every moment new points of view. The principal alleys answer to different summits of neighbouring mountains; and one in particular produces the most agreeable effect. It is terminated at one end by the grand front of the palace. From this point are seen, at one view, five fountains, ornamented with elegant groups, rising into an amphitheatre, above which appear the summits of lofty mountains. The most elevated of these groups is that of Andromeda fastened to a rock. When seen at a little distance it is perhaps defective, because the rock appears too diminutive by the side of the monster which threatens Andromeda, and of Perseus, by whom it is attacked; but the whole contributes to the beauty of the view. The most remarkable of the five groups is that of Neptune.

Genius (saw M. Bourguinne) presided at the composition and in the choice of the situation; the deity of the ocean appears erect, surrounded by the marine court. His attitude, his threatening countenance, and the manner of holding his trident, announce that he has just imposed silence on the tumultuous waves; and the calm which reigns in the basin, defended from every wind by the triple wall of verdure by which it is surrounded, seems to indicate that he has not issued his commands in vain. Often have I seated myself, with Virgil in my hand, by the side of this silent water, under the shade of the verdant foliage, nor ever did I fail to recollect the famous Quos Ego!

There are other fountains worthy of the attention of the curious; such as that of Latona, where the limpid sheaves, some perpendicularly, and others in every direction, fall from the hoarse throats of the Lycian peasants, half transformed into frogs, and spouting them forth in such abundance, that the statue of the goddess disappears under the wide mantle of liquid crystal; that also of Diana in the bath, surrounded by her nymphs; in the twinkling of an eye Ildefonso.

All the chaste court is hidden beneath the waters; the spectator imagines he hears the whistling of aquatic birds, and the roaring of lions, from the place whence this momentary deluge escapes by a hundred canals. The fountain of Fame is formed by a single jet-d'eau, which rises 130 feet, exhibiting to the distance of several leagues round the triumph of art over nature, and falls in a gentle shower upon the gazing spectators. There are some situations in the gardens of St. Ildefonso, whence the eye takes in the whole or the greater part of these fountains, and where the ear is delighted with the harmony of their murmurs. The traveller, who wishes to charm all his senses at once, must take his station on the high flat ground in front of the king's apartment. In the thick part of the foliage are contrived two large arbours, from the top of which are seen twenty crystal columns rising into the air to the height of the surrounding trees, mixing their resplendent whiteness with the verdure of the foliage, uniting their confused noise to the rustling of the branches, and refreshing and embalming the air: if the traveller here experience no pleasing sensations, let him return home: he is utterly incapable of feeling either the beauties of art or nature.

"The reader may here imagine (continues our author) my enthusiasm too extravagant. He is mistaken; let him follow me to the great reservoir of abundant and limpid waters. He will have to climb for some minutes, but will not regret the trouble he has taken. Let us suppose ourselves arrived at the long and narrow alley which takes up the whole of the upper part of the gardens; proceed to the middle, and turn your face towards the castle. To the vast horizon around you, no other boundaries are discovered but those which limit the human sight; these alone prevent you from discovering the Pyrenees. Observe the steeple, which seems but a point in the immense extent: you will perhaps imagine it to be that of the parish church of St. Ildefonso, but, in reality, it is the cathedral of Segovia, at two leagues distance. The gardens, through which you have passed, become narrower to the eye. You suppose yourself close to the royal habitation; the alleys, fountains, and parterres, have all disappeared; you see but one road, which, in the form of a vessel, upon the prow of which you seem to stand, has its stern on the top of the palace. Afterward turn and take a view of the little lake behind you, of which the irregular borders do not, like what we call our English gardens, merely ape the disorder of nature. Nature herself has traced them, except on the side where you stand. This straight alley is united at each end to the curve which surrounds the reservoir. The waters, which stream in abundance from the sides of the mountain in front, meet in this reservoir, and then descend by a thousand invisible tubes to other reservoirs, whence they are spouted in columns or sheets upon the flowery soil to which they were strangers. The birds, drawn by their clearness, come to skim and agitate their crystal. The image of the tufted woods which surround them is reflected from their immovable surface, as is also that of some simple and rural houses, thrown as by accident into this delightful picture, which Lorraine would have imitated, but perhaps could not have imagined. The opposite bank is ob

Vol. XL, Part L.
The finances of Spain, so deranged under the princes of the house of Austria, (thanks to the wise calculations of Orry, to the subsidies of France, and still more to the courageous efforts of the faithful Castilians) would have been sufficient for three long and ruinous wars, and for all the operations of a monarchy which Philip V. had conquered and formed anew, as well as to have resisted the shocks of ambition and political intrigue; but they sunk beneath the expensive efforts of magnificence.

It is singular that the castle and gardens of St Idefonso should have cost about 45,000,000 of piastres, precisely the sum in which Philip died indebted. This enormous expense will appear credible, when it is known that the situation of the royal palace was at the beginning of this century the sloping top of a pile of rocks: it was necessary to dig and hew out the stones, and in several places to level the rock; to cut out of its sides a passage for a hundred different canals, to carry vegetative earth to every place in which it was intended to substitute cultivation for sterility, and to work a mine to clear a passage to the roots of the numerous trees which were there planted. All these efforts were crowned with success. In the orchards, kitchen-gardens, and parterres, there are but few flowers, espaliers, or plants, which do not thrive; but the trees, naturally of a lofty growth, and which consequently must strike their roots deep into the earth, already prove the insufficiency of art when it attempts to struggle against nature. Many of them languish with withered trunks, and with difficulty keep life in their almost naked branches. Every year it is necessary to call in the aid of gunpowder to make new beds for those which are to supply their place; and none of them are covered with that tufted foliage which belongs only to those that grow in a natural soil. In a word, there are in the groves of St Idefonso, marble statues, basins, cascades, limpid waters, verdure, and delightful prospects, everything but that which would be more charming than all the rest, thick shades.

The court of Spain comes hither annually during the heat of the dog days. It arrives towards the end of July, and returns at the beginning of October. The situation of St Idefonso, upon the declivity of the mountains which separate the two Castiles, and fronting a vast plain where there is no obstacle to the passage of the north wind, renders this abode delightful in summer. The mornings and evenings of the hottest days are agreeably cool. Yet as this palace is upwards of 20 leagues from Madrid, and half of the road which leads to it crosses the broad tops of mountains, extremely steep in many places, it is much more agreeable to the lovers of the chase and solitude than to others.

IELERA, in Ancient Geography, the capital of the Iblerges; situated on an eminence between the rivers Sicoris and Cinga: An unhappy city, often besieged, and often taken, because lying exposed to the incursions from Gaul; and under Gallienus it was destroyed by the Germans. Now IERIDA, in Catalonia, on the River Segre.

ILEX, the Holm or Holly-Tree; a genus of plants belonging to the tetrandria class; and in the natural method ranking under the 43d order, Dumas. See BOTANY INDEX.
ILLFRACOMB, a town of Devonshire, seated on the Severn Sea, almost opposite to Swansea in Glamorganshire, 181 miles from London. It has a considerable trade, especially in herrings, which are caught in the Bristol Channel. It is noted for maintaining constant lights to direct the sailors; for its convenience of building and repairing ships; and for the safe shelter ships from Ireland find here, when it is extremely dangerous for them to run into the mouth of the Taw. It had a quay or pier 850 feet long; but by time and the violence of the sea all went to decay; to remedy which, the parliament passed an act in 1731, and in 1762 it was partly rebuilt, lengthened and enlarged. It is governed by a mayor, bailiffs, &c. and consists chiefly of one street of scattered houses almost a mile long. The number of inhabitants in 1811 is stated at 1934. W. Long. 3. 10. N. Lat. 51. 11.

ILIAC PASSION, a violent and dangerous kind of colic; called also volcustus, miserei mei, and chordopausus. It takes its name from the intestine ilion, on account of its being usually affected in this distemper; or perhaps from the Greek verb αὐλάν, “to wind or twist,” whence also it is the Latins call it volcustus. See Medicine Index.

ILIAD, the name of an ancient epic poem, the first and finest of those composed by Homer.

The poet’s design in the Iliad was to show the Greeks, who were divided into several little states, how much it was their interest to preserve a harmony and good understanding among themselves; for which end he sets before them the calamities that befell their ancestors from the wrath of Achilles, and his misunderstanding with Agamemnon; and the advantages that afterwards accrued to them from their union. The Iliad is divided into 24 books or rhapsodies, which are marked with the letters of the alphabet.

ILLISSUS, a river running to the east of Athens; which, with the Eridanus running on the west side, falls below the city into the sea. Sacred to the muses, called lillaicides; on whose bank their altar stood, and where the lustration in the lesser mysteries was usually performed.

ILLIUM, Ilion, or Illos, in Ancient Geography, a name for the city of Troy, but most commonly used by the poets, and distinguished by the epithet Vetus. According to Strabo, the ancient city was 30 stadia farther east than New Ilium. The position of the latter was discovered by Dr Clarke. It is upon a low eminence, about three miles from the promontory Sigenum, now called Jenithere. New or modern Ilium was a village which Alexander, after the battle of Granicus, called a city, and ordered to be enlarged. His orders were executed by Lycurgus, who encompassed it with a wall of 40 stadia. It was afterwards adored by the Romans, who granted it immunities as to their mother-city. From this city the Ilium of Homer takes its name. The various disasters of the Greeks and Trojans, as described by the poet, gave rise to the proverb Ilius Maborum.

ILKUCH, a town of Poland, in the palatinate of Cracow, remarkable for its mines of silver and lead. It is seated in a barren and mountainous country, in E. Long. 20. 0. N. Lat. 50. 26.

ILLECEBRUM, a genus of plants belonging to the pentandria class; and in the natural method ranking under the 12th order, Holocaraceae. See Botany Index.

ILLE AND VILLEIN, a department in the north-west of France, comprising part of the ancient Brit- tany. It has some good pastures, but abounds in forests and heaths. Rennes is the chief town.

ILLINOIS, one of the United States of the North American republic. It is bounded by the Mississippi on the west, the Ohio on the south, the Wabash on the east, and by a line passing along the parallel of 41° 30’ on the north. It contains about 58,000 square miles. The surface of the country is in general low and wooded, but fertile and well watered. The principal river entirely in the state is the Illinois, which rises near Lake Michigan, and after a course of 500 miles joins the Mississippi. The population in 1810 amounted only to 12,262; but it increased so rapidly, that in 1818 it was admitted into the union as an independent state.

ILLICUM, a genus of plants belonging to the dodecandria class; and in the natural method ranking with those of which the order is doubtful. See Botany Index.

ILLUMINATI, the name of a secret society, or order in Germany and other countries of Europe, whose professed object, it is said, was to propagate the purest principles of virtue; but whose real views were to subvert every established government and religion, and delivering mankind from the necessary and salutary restraints of civil society, to bring them to an imaginary state of freedom and independence. Of this order much has been said, much has been written; but that a society has existed, regularly organized in the way this has been represented, working in secret, and, at the same time, possessing such extensive power and influence, no proof whatever has been adduced. The thing indeed seems impossible. See Masonry, Free.

ILLUMINATING, a kind of miniature painting, anciently much practised for illustrating and adorning books. Besides the writers of books, there were artists whose profession was to ornament and paint manuscripts, who were called illuminators; the writers of books first finished their part, and the illuminators embellished them with ornamented letters and paintings. We frequently find blanks left in manuscripts for the illuminators, which were never filled up. Some of the ancient manuscripts are gilt and burnished in a style superior to later times. Their colours were excellent, and their skill in preparing them must have been very great.

The practice of introducing ornaments, drawings, emblematical figures, and even portraits, into manuscripts, is of great antiquity. Varro wrote the lives of 700 illustrious Romans, which he enriched with their portraits, as Pliny attests in his Natural History (lib. xxxiv. chap. 2). Pomponius Atticus, the friend of Cicer, was the author of a work on the actions of the great men amongst the Romans, which he ornamented with their portraits, as appears in his life by Cornelius Nepos (chap. 18.). But these works have not been transmitted to posterity. There are, however, many precious documents remaining, which exhibit the advancement and decline of the arts in different ages and countries. These inestimable paintings and illuminations display the manners, customs, habits ecclesiastical, civil, and military, weapons and instruments of war, utensils and architecture of the ancients; they are of the greatest use in illustrating many important facts re-
works much inferior to ours at that period. The copy illuminated of the Apocalypse in the same library (No. 209.), contains a curious example of the manner of painting in the 14th century.—The beautiful paintings in the history of the latter part of the reign of King Richard II. in the Harleian library (No. 1319.), afford curious specimens of manners and customs, both civil and military, at the close of the 14th and in the beginning of the 15th century; as does No. 2275. in the same library.—Many other instances might be produced; but those who desire further information may consult Strutt's Regal and Ecclesiastical Antiquities, 4to., and his Harlie Anglian, lately published in 3 vols.

This art was much practised by the clergy, and even by some in the highest stations in the church. "The famous Osmond (says Bromton), who was consecrated bishop of Salisbury, A. D. 1076, did not disdain to spend some part of his time in writing, binding, and illuminating books." Mr. Strutt, as already noticed, has given the public an opportunity of forming some judgment of the degree of delicacy and art with which these illuminations were executed, by publishing prints of a prodigious number of them, in his "Regal and Ecclesiastical Antiquities of England," and "View of the Customs, &c. of England." In the first of these works we are presented with the genuine portraits, in miniature, of all the kings, and several of the queens of England, from Edward the Confessor to Henry VII., mostly in their crowns and royal robes, together with the portraits of many other eminent persons of both sexes.

The illuminators and painters of this period seem to have been in possession of a considerable number of colouring materials, and to have known the arts of preparing and mixing them, so as to form a great variety of colours; for in the specimens of their miniature-paintings that are still extant, we perceive not only the five primary colours, but also various combinations of them. Though Strutt's prints do not exhibit the bright and vivid colours of the originals, they give us equally a view, not only of the persons and dresses of our ancestors, but also of their customs, manners, arts, and employments, their arms, ships, houses, furniture, &c. and enable us to judge of their skill in drawing. The figures in those paintings are often stiff and formal; but the ornaments are in general fine and delicate, and the colours clear and bright, particularly the gold and azure. In some of these illuminations the passions are strongly painted. How strongly, for example, is terror painted in the faces of the earl of Warwick's sailors, when they were threatened with a shipwreck, and grief in the countenances of those who were present at the death of that hero? After the introduction of printing, this elegant art of illuminating gradually declined, and at length was quite neglected.

Before concluding, it may not be improper to observe, that from the 15th to the 16th century, the miniature paintings which we meet with in Greek manuscripts are generally good, as are some which we find among those of Italy, England, and France. From the 10th to the middle of the 14th century they are commonly very bad, and may be considered as so many monuments of the barbarity of those ages; towards the latter end of the 14th, the paintings in manuscripts were much improved; and in the two succeeding centuries
ILLUMINATORS. See ILLUMINATING.

ILLUMINED, Illuminati, a church term, anciently applied to such persons as had received baptism. This name was occasioned by a ceremony in the baptism of adults; which consisted in putting a lighted taper in the hand of the person baptized, as a symbol of the faith and grace he had received in the sacrament.

ILLUMINED, Illuminati, is also the name of a sect of heretics, who sprung up in Spain about the year 1575, and were called by the Spaniards Alembrados. Their principal doctrines were, that by means of a sublime manner of prayer, which they had attained to, they entered into so perfect a state that they had no occasion for ordinances, sacraments, nor good works; and that they could give way even to the vilest actions, without sin. The sect of Illumined was revived in France in the year 1634, and were soon after joined by the Guerins, or disciples of Peter Guerin, who together made but one body, called also Illuminated; but they were so hotly pursued by Louis XIII. that they were soon destroyed. The brothers of the Rosy Cross are sometimes also called Illumined. See Rosicrucian.

ILLUSTRIUS, Illustris, was heretofore, in the Roman empire, a title of honour peculiar to people of a certain rank. It was first given to the most distinguished among the knights, who had a right to bear the latus clavus: afterwards, those were intitled illustrious who held the first rank among those called honorati; that is, the prefectur praetorii, prefects urbis, treasurers, comites, &c.

There were, however, different degrees among the illustrius; as in Spain they have grandees of the first and second class, so in Rome they had their illustres, whom they called great, maiores; and others less, called illustriores. For instance, the prefectus praetorii was a degree below the master of the offices, though they were both illustrius.

The Novels of Valentinian distinguish as far as five kinds of illustres; among whom, the illustres administratores bear the first rank.

ILLYRICUM, (Solum perhaps understood) Livy, Herodian, St Paul; called Illyris by the Greeks, and sometimes Illyria; the country extending from the Adriatic to Pannonia thus called. Its boundaries are variously assigned. Pliny makes it extend in length from the river Aris to the Drinhus, thus including Liburnia to the west, and Dalmatia to the east: which is also the opinion of Ptolemy; who settles its limits from Mount Scardus and the Upper Moesia on the east, to Istria in the west. A Roman province, divided by Augustus into the Superior and Inferior, but of which the limits are left undetermined both by ancient historians and geographers. Illyria the people; called Illyres by the Greeks. The country is now called Slavonia.

ILLYRIUS, Mathias, Flaccus, or Francowitz, one of the most learned divines of the Augsburg confession, born in Istria, anciently called Illyrica, in 1520. He is said to have been a man of vast genius, extensive learning, of great zeal against Popery; but of such a restless and passionate temper, as overbalanced all his good qualities, and occasioned much disturbance in the Protestant church. He published a great number of books, and died in 1575.

IMAGE, in a religious sense, is an artificial representation or similitude of some person or thing, used either by way of decoration and ornament, or as an object of religious worship and adoration: in which last sense it is used indifferently with the word Idol.

The noble Romans preserved the images of their ancestors with a great deal of care and concern, and had them carried in procession at their funerals and triumphs: these were commonly made of wax, or wood, though sometimes of marble or brass. They placed them in the vestibules of their houses; and they were to stay there, even if the houses happened to be sold, it being accounted impious to displace them. Appius Claudius was the first who brought them into the temples, in the year of Rome 259, and he added inscriptions to them, showing the origin of the persons represented, and their brave and virtuous achievements. It was not, however, allowed for all, who had the images of their ancestors in their houses, to have them carried at their funerals; this was a thing only granted to such as had honourably discharged themselves of their offices; for those who failed in this respect forfeited that privilege; and in case they had been guilty of any great crime, their images were broken in pieces. See IGNOMINES and JUS.

The Jews absolutely condemn all images, and do not so much as suffer any statues or figures in their houses, much less in their synagogues or places of worship.

The use and adoration of images are things that have been a long time controverted in the world.

It is plain, from the practice of the primitive church, recorded by the earlier fathers, that Christians, for the first three centuries after Christ, and the greater part of the fourth, neither worshipped images nor read them in their worship. However, the greater part of the Popish divines maintain, that the use and worship of images were as ancient as the Christian religion itself: to prove this, they allege a decree, said to have been made in a council held by the Apostles at Antioch, commanding the faithful that they may not err about the object of their worship, to make images of Christ and worship them. Baron. ad Ann. 102. But no notice is taken of this decree, till 700 years after the Apostolic times, after the dispute about images had commenced. The first instance that occurs in any credible author of images among Christians, is that recorded by Tertullian de Pudicit. c. 10. of certain cups, or chalices, as Bellarmine pretends, on which was represented the parable of the good shepherd carrying the lost sheep on his shoulders: but this instance only proves, that the church, at that time, did not think emblematical figures unlawful ornaments of cups or chalices. Another instance is taken from Eusebius, Hist. Ecel. lib. vii. cap. 18. who says, that in his time there were to be seen two brass statues in the city of Panaes or Cassarea Philippi; the one of a woman on her knees, with her arms stretched out, the other of a man over against her, with his hand extended to receive her; these statues were said to be the images of our Saviour and
and the woman whom he cured of an issue of blood. From the foot of the statue representing our Saviour, says the historian, sprang up an exotic plant, which, as soon as it grew to touch the border of his garment, was said to cure all sorts of distempers. Eusebius, however, vouches none of these things: nay, he supposes that the woman who erected this statue of our Saviour was a pagan, and ascribes it to a pagan custom. Farther, Philostorgius, Eccl. Hist. lib. vii. c. 3, expressly says, that this statue was carefully preserved by the Christians, but that they paid no kind of worship to it, because it is not lawful for Christians to worship brass, or any other matter. The primitive Christians abstained from the worship of images, not, as the Papists pretend, from tenderness to heathen idolaters, but because they thought it unlawful in itself to make any images of the Deity.

Justin Mart. Apol. ii. p. 44. Clem. Alex. Strom. 5. Strom. 1. and Protr. p. 45. Aug. de Civit. Delib. vii. c. 5. and lib. iv. c. 32. Id. de Fide et Symb. c. 7. Lactant. lib. ii. c. 3. Tertull. Apol. c. 12. Arnob. lib. vi. p. 202. Some of the fathers, as Tertullian, Clemens Alexanderius, and Origen, were of opinion, that the second commandment, the arts of painting and engraving were rendered unlawful to a Christian, styling them evil and wicked arts. Tert. de Idol. cap. 3. Clem. Alex. Admon. ad. Gent. p. 41. Orig. contra Celsum. lib. vi. p. 182. The use of images in churches, as ornaments, was first introduced by some Christians in Spain, in the beginning of the fourth century; but the practice was condemned as a dangerous innovation, in a council held at Eliberis in 305. Epiphanius, in a letter preserved by Jerome, tom. ii. ep. 6. bears strong testimony against images, and may be considered as one of the first ICONOCLASTS. The custom of adorning pictures of saints and martyrs into the churches (for this was the first source of image-worship) was rare in the latter end of the fourth century; but became common in the fifth: however, they were still considered only as ornaments; and even in this view, they met with very considerable opposition. In the following century the custom of thus adorning churches became almost universal, both in the east and west. Petavius expressly says (de Incar. lib. xv. cap. 14.), that no statues were yet allowed in the churches; because they bore too near a resemblance to the idols of the Gentiles. Towards the close of the fourth or beginning of the fifth century, images, which were introduced by way of ornament, and then used as an aid to devotion, began to be actually worshipped. However, it continued to be the doctrine of the church in the sixth and in the beginning of the seventh century, that images were to be used only as helps to devotion, and not as objects of worship. The worship of them was condemned in the strongest terms by Pope Gregory the Great; as appears by two letters of his written in 601. From this time to the beginning of the eighth century, there occurs no single instance of any worship given or allowed to be given to images by any council or assembly of bishops whatever. But they were commonly worshipped by the monks and populace in the beginning of the eighth century; insomuch, that in the year 726, when Leo published his famous edict, it had already spread into all the provinces subject to the empire.

The Lutherans condemn the Calvinists for breaking the images in the churches of the Catholics, looking on it as a kind of sacrilege; and yet they condemn the Romanists (who are professes image-worshippers) as idolaters: nor can these last keep pace with the Greeks, who go far beyond them in this point; which has occasioned abundance of disputes among them. See ICONOCLASTS.

The Mahometans have a perfect aversion to images; which was what led them to destroy most of the beautiful monuments of antiquity, both sacred and profane, at Constantinople. The images, in Rhetoric, also signifies a lively description of any thing in discourse.

Images, in discourse are defined by Longinus, to be, in general, any thoughts proper to produce expressions, and which present a kind of picture to the mind.

But, in the more limited sense, he says, images are such discourses as come from us, when, by a kind of enthusiasm, or an extraordinary emotion of the soul, we seem to see the things whereof we speak, and present them before the eyes of those who hear us.

Images, in Rhetoric, have a very different use from what they have among the poets: the end principally proposed in poetry is, astonishment and surprise; whereas the thing chiefly aimed at in prose, is to paint things naturally, and to show them clearly. They have this, however, in common, that they both tend to move, each in its kind.

These images, or pictures, are of vast use, to give weight, magnificence, and strength, to a discourse. They warm and animate it; and when managed with art, according to Longinus, seem, as it were, to tame and subdue the hearer, and put him in the power of the speaker.

Image, in Optics, a figure in the form of any object, made by the rays of light issuing from the several points of it, and meeting in so many other points, either at the bottom of the eye, or on any other ground, or on any transparent medium, where there is no surface to reflect them. Thus we are said to see all objects by means of their images formed in the eye.

IMAGINARY Quantities, or Impossible Quantities, in Algebra, are the even roots of negative quantities; which expressions are imaginary, or impossible, or opposed to real quantities; as $\sqrt{-a}$, or $\sqrt{-a^2}$, &c. For as every even power of any quantity whatever, whether positive or negative, is necessarily positive, or having the sign +, because + by +, or by -, gives equally +; hence it follows that every even power, as the square for instance, which is negative, or having the sign -, has no possible root; and therefore the even roots of such powers or quantities are said to be impossible or imaginary. The mixed expressions arising from imaginary quantities joined to real ones, are also imaginary. As $a+\sqrt{-a}$, or $b-\sqrt{-a}$.

IMAGINARY Roots of an equation, are those roots or values of the unknown quantity, which contain some imaginary quantity. Thus, the roots of the equation $x^2+a=x+2$ are the two imaginary quantities $-\sqrt{-a}$ and $\sqrt{-a}$. a, or $\pm\sqrt{-1}$ and $-a\pm\sqrt{-1}$.

IMAGINATION, a power or faculty of the mind, whereby it conceives and forms ideas of things communicated to it by the outward organs of sense. See METAPHYSICS.

Force of IMAGINATION. See MONSTER.

IMAGO, in Natural History, is a name given by Linneus.
The capital, where Prince David resides, is called Curtays. The remains of a church announce that Curtays was formerly a large city; but at present it can scarcely be accounted a village.

Solomon, the father of the present sovereign, ordered the city to be destroyed, as well as the ramparts of the city; for he thought, and very wisely, that Caucaus was the only fortification capable of being defended by an army of 6000 men undisciplined and destitute of artillery.

The number of the inhabitants of Imeretta is reckoned to be 20,000 families; but the greater part of them live neither in towns nor villages, but are dispersed throughout the level country, each of them possessing a small hut or cottage. These people have fewer strangers among them, and they are more engaging in their appearance, than the Georgians. They are of a milder and less pusillanimous character; and the principal branch of their commerce consists in wines, a considerable quantity of which they export in skins as far as the confines of Georgia. They are acquainted with no other trade; for they are poor and miserable, and greatly oppressed by their lords.

The ordinary revenues of Imeretta, like those of Georgia, arise from a tythe which vassals are obliged to pay in wines, cattle, and corn, and some subsidies furnished annually by neighbouring princes. The extraordinary revenues for the most part arise from confiscations of every kind; but notwithstanding this, the finances of the princes are so limited, that he is often under the necessity of going from house to house, to live at the expense of his vassals, never quitting their habitations until the pressing wants of his hosts absolutely compel him. It is therefore probable, that the court of the sovereign of Imeretta is as deficient in brilliancy as his table is in splendour when he dines at home. His principal dishes consist of a certain food called gom, which is a kind of millet boiled, and a piece of roast meat, with some high-seasoned sauce. He never eats but with his fingers, for forks and spoons are unknown in Imeretta. At table he generally gives audiences respecting affairs of the first consequence, which he determines as he thinks proper; for in every country subject to his dominions there is no other law but his will.

On Friday, which is the market day, all his new edicts are published by a kind of herald, who climbs up into some tree, in order to proclaim the will of his sovereign. The Imerettans profess the religion of the Greek church. Their patriarch must be of the royal family; but it is seldom that he can either read or write; the priests who compose the rest of the clergy are not much more enlightened. The greater part of their churches are pitiful edifices, which can scarcely be distinguished from the common huts of the inhabitants but by a pasteboard crucifix, and a few coarse paintings of the Virgin, which are seen in them.

IMITATION, derived from the Latin imitare, to "represent or repeat," a sound or action, either exactly or nearly in the same manner as they were originally exhibited.

IMITATION, in Music, admits of two different senses. Sound and motion are either capable of imitating themselves by a repetition of their own particular modes, or of imitating other objects of a nobler and more abstracted
It is hoped, however, that in our article of Melody, imitation, we have shown upon what principle musical imitation may be compatible with harmony; though we admit, that from melody it derives its most powerful energy, and its most attractive graces. Yet we must either be deceived beyond all possibility of cure, or we have felt the power of imitative harmony in a high degree. We are certain that the fury, the impetuosity, the rapid vicissitudes, of a battle, may be successfully and vividly represented in harmony. We have participated the exultation and triumph of a conquest, inspired by the sound of a full chorus. We have felt all the solemnity and grandeur of devotion from the slow movement, the deep chords, the swelling harmony, of a sentimental composition played upon the organ. Nor do we imagine harmony less capable of presenting the tender depression, the fluctuating and tremulous agitation, of grief. As this kind of imitation is the noblest effort of music, it is astonishing that it should have been overlooked by M. d'Alembert. He has indeed apologized, by informing us, that his treatise is merely elementary: but we are uncertain how far this apology ought to be regarded as sufficient, when it is at the same time considered, that he has given an account of imitation in its mechanical, or what Rousseau calls its technical, sense; which, however, to prevent ambiguity, we should rather choose to call mynesia or anachephalosis. To Rousseau's account of the word in this acceptance, we return.

"Imitation (says he) in its technical sense, is a reiteration of the same air; or of one which is similar, in several parts where it is repeated by one after the other, either in unison, or at the distance of a fourth, a fifth, a third, or any other interval whatever. The imitation may be happily enough pursued even though several notes should be changed; provided the same air may always be recognised, and that the composer does not deviate from the laws of proper modulation. Frequently, in order to render the imitation more sensible, it is preceded by a general rest, or by long notes which seem to obliterate the impression formerly made by the air till it is renewed with greater force and vivacity by the commencement of the imitation. The imitation may be treated as the composer chooses; it may be abandoned, resumed, or another begun, at pleasure; in a word, its rules are as much relaxed as those of the fugue are severe; for this reason, it is despised by the most eminent masters; and every imitation of this kind, too much affected, almost always betrays a novice in composition."

Imitation, in Oratory, is an endeavour to resemble a speaker or writer in those qualities with regard to which we propose them to ourselves as patterns. The first historians among the Romans, says Cicero, were very dry and jejune, till they began to imitate the Greeks, and then they became their rivals. It is well known how closely Virgil has imitated Homer in his Æneid, Hesiod in his Georgics, and Theocritus in his Eclogues. Terence copied after Menander; and Kriamoteus after Epicurus. After Horace, liv. ii. ep. ad August., who himself owed many of his beauties to the Greek lyric poets. Cicero appears, from many passages in his writings, to have imitated the Greek orators. Thus Quintilian says of him, that he has expressed the strength and sublimity of Demosthenes,
IMITATION, the copiousness of Plato, and the delicacy of Isocrates.

IMMACULATE, something without stain, chiefly applied to the conception of the holy Virgin. See Conception, immaculate.

IMMATERIAL, something devoid of matter, or that is pure spirit. See Metaphysics.

IMMEDIATE, whatever is capable of producing an effect without the intervention of external means; thus we say, an immediate cause, in opposition to a mediate or remote one.

IMMEMORIAL, an epithet given to the time or duration of anything whose beginning we know nothing of.

In a legal sense, a thing is said to be of time immemorial, or time out of mind, that was before the reign of our king Edward II.

IMMENSITY, an unlimited extension, or which no finite and determinate space, repeated ever so often, can equal.

IMMER, the most easterly island of all the New Hebrides in the South sea. It lies about four leagues from Tan, and seems to be about five leagues in circumference; it is of a considerable height, with a flat top.

IMMERETTA, or IMERETIA. See Immeretia.

IMMERSION, that act by which any thing is plunged into water or other fluid. It is used in chemistry for a species of calcination, when any body is immersed in a fluid to be corroded; or it is a species of potion; as when a substance is plunged into any fluid, in order to deprive it of a bad quality, or communicate to it a good one.

IMMERSION, in Astronomy, is when a star or planet is so near the sun with regard to our observations, that we cannot see it; being, as it were, enveloped and hid in the rays of that luminary. It also denotes the beginning of an eclipse of the moon, or that moment when the moon begins to be darkened, and to enter into the shadow of the earth.

IMMOLATION, a ceremony used in the Roman sacrifices; it consisted in throwing upon the head of the victim a sort of corn and frankincense, together with the molia or salt cake, and a little wine.

IMMORTAL, that which will last to all eternity, as having in it no principle of alteration or corruption.

IMMUNITY, a privilege or exemption from some office, duty, or imposition; as an exemption from tolls, &c.

Immunity is more particularly understood of the liberties granted to cities and communities.

IMMUTABILITY, the condition of a thing that cannot change. Immutability is one of the divine attributes. See God.

IMOLA, a town of Italy, in the territory of the church, and in Romagna, with a bishop's see. It is a very handsome populous place; and is seated on the river Santerno, in E. Long. 11. 43. N. Lat. 44. 28.

IMPACT, the simple or single action of one body upon another to put it in motion. Point of impact is the place or point where a body acts.

IMPAL, in Heraldry, is to conjoin two coats of arms pale-wise. Women impale their coats of arms with those of their husbands. See Heraldry.

To impale cities, camps, fortifications, &c. is to enclose them with pallasades.

To Impale, or Empele, signifies also to put to death by spitting on a stake fixed upright.

IMPALABLE, that whose parts are so extremely minute, that they cannot be distinguished by the senses, particularly by that of feeling.

IMPACTION, a term used by divines to signify the opinion of the Lutherans with regard to the eucharist, who believe that the species of bread and wine remain together with the body of our Saviour after consecration.

IMPANNELLING, in Law, signifies the writing down or entering into a parchment, list, or schedule, the names of a jury summoned by the sheriff to appear for such public services as juries are employed in.

IMPARLANCE, in Law, a petition in court for a day to consider or advise what answer the defendant shall make to the plaintiff's action; and is the continuance of the cause till another day, or a longer time given by the court.

IMPASSIBLE, that which is exempt from suffering; or which cannot undergo pain or alteration. The Stoics place the soul of their wise men in an impassible, imperishable state. See Apathy.

IMPASTATION, the mixture of various materials in different colours and consistencies, baked or bound together with some cement, and hardened either by the air or by fire.

IMPATIENS, TOUCH-ME-NOT, and Balsamina; a genus of plants belonging to the syngenesia class; and in the natural method ranking under the 24th order, Corydalla. See Botany Index.

IMPEACHMENT, an accusation and prosecution for treason and other crimes and misdemeanours. Any member of the lower house of parliament may impeach any one belonging either to that body, or to the house of lords. The method of proceeding is to exhibit articles on the behalf of the commons, by whom managers are appointed to make good their charge. These articles are carried to the lords, by whom every person impeached by the commons is always tried; and if they find him guilty, no pardon under the great seal can be pleaded to such an impeachment. 12 Will. III. cap. ii.

IMPECCABLES, in church history, a name given to those heretics who boasted that they were impeccable, and that there was no need of repentance: such were the Gnostics, Priscillianists, &c.

IMPECCABILITY, the state of a person who cannot sin; or a grace, privilege, or princeple, which puts him out of a possibility of sinning.

The schoolmen distinguish several kinds and degrees of impeccability: that of God belongs to him by nature; that of Jesus Christ, considered as man, belongs to him by the hypostatical union; that of the blessed is a consequence of their condition: that of men is the effect of a confirmation in grace, and is rather called impeccance than impeccability: accordingly divines distinguish between these two: this distinction is found necessary in the disputes against the Pelagians, in order to explain certain terms in the Greek and Latin fathers,
IMPEDIMENTS, in Law, are such hinderances as put a stop or stay to a person's seeking for his right by a due course of law. Persons under impediments are those under age or coverture, non compos mentis, in prison, beyond sea, &c. who, by a saving in our laws, have time to claim and prosecute their rights, after the impediments are removed, in case of fines levied, &c.

IMPENETRABILITY, in Philosophy, that property of body, whereby it cannot be pierced by another: Thus, a body which so fills a space as to exclude all others, is said to be impenetrable.

IMPÉRATIVE, one of the moods of a verb, used when we would command, intreat, or advise: thus, go read, take pity, be advised, are imperatives in our language. But in the learned languages, this mood has a peculiar termination to distinguish it from others, as is, or lo, go: let, or let, "read," &c. and not only so, but the termination varies, according to what you address one or more persons, as aed.: for I audite: audite: audile, audile, audile: audiens, &c.

IMPÉROR, in Roman antiquity, a title of honour conferred on victorious generals by their armies, and afterwards confirmed by the senate. IMPÉRATOR was also the title adopted by the Roman emperors.

IMPÉRATORIA, MASTERWORT, a genus of plants belonging to the pentandria class; and in the natural method ranking under the 45th order, Umbelliferae. See Botany Index.

IMPERFECT, something that is defective, or that wants some of the properties found in other beings of the same kind.

IMPERFECT NUMBER, is that whose aliquot parts, taken all together, do not make a sum that is equal to the number itself, but either exceed it, or fall short of it; being an abundant number in the former case, and a defective number in the latter. Thus 12 is an abundant imperfect number, because the sum of all its aliquot parts, 1, 2, 3, 4, 6, makes 16, which exceeds the number 12. And 10 is a defective imperfect number, because its aliquot parts, 1, 2, 5, taken all together, make only 8, which is less than the number 10 itself.

IMPERFECT TENSE, in Grammar, a tense that denotes some protére case, or denotes the thing to be at that time present, and not quite finished; as scribemus, "I was writing." See Grammar.

IMPERIAL, something belonging to an emperor, or empire. See Emperor and Empire. Thus we say, his imperial majesty, the imperial crown, imperial arms, &c.

IMPERIAL CROWN. See Heraldry.

IMPERIAL CHAMBER, is a sovereign court, established for the affairs of the immediate states of the empire. See Chamber, and Germany.

IMPERIAL CITIES, in Germany, are those which own no other head but the emperor. These are a kind of little commonwealths; the chief magistrate whereof does homage to the emperor; but in other respects, and in the administration of justice, is sovereign. Imperial cities have a right of coinage money, and of keeping forces and fortified places. Their deputies assisted at the imperial diets, where they are divided into two branches, that of the Rhine and that of Silesia. There were formerly 22 in the former and 37 in the latter; but since 1815 there are only four, Hamburg, Bremen, Lubeck, and Frankfort.

IMPERIAL Diet, is an assembly or convention of all the states of the empire. See Diet and Germany.

IMPERSONAL VERB, in Grammar, a verb to which the nominative of any certain person cannot be prefixed; or, as others define it, a verb destitute of the two first and primary persons, as dect, operat, &c. the impersonal verbs of the active voice end in t, and those of the passive in tur; they are conjugated through the third person singular of almost all the tenses and moods: they want the imperative, instead of which we use the present of the subjunctive; as pensilest, pugnetur, &c. nor, but a few excepted, are they to be met with in the supines, participles or gerunds.

IMPÉRIUS, a thing not to be pervaded or passed through, either by reason of the closeness of its pores, or the particular configuration of its parts.

IMPETICO, in Medicine, an extreme roughness and foulness of the skin, attended with an itching and plentiful scurf.

The impetigo is a species of dry puriginous itch, wherein scales or scurf succeed space; arising from saline corrosive humours thrown out upon the exterior parts of the body, by which means the internal parts are usually relieved.

IMPETRATION, the act of obtaining any thing by request or prayer.

IMPETRATION was more particularly used in our statutes for the pre-obtaining of bounties and church-offices in England from the court of Rome, which did belong to the disposal of the king and other lay patrons of the realm; the penalty whereof is the same with that of provisors, 25 Ed. III.

IMPETUS, in Mechanics, the force with which one body strikes or impels another.

IMPLICATION, in Law, is where something is implied that is not expressed by the parties themselves in their deeds, contracts, or agreements.

To IMPLY, or CARRY, in Music. These we have used as synonymous terms in that article. They are intended to signify those sounds which ought to be the proper concomitants of any note, whether by its own nature, or by its position in artificial harmony. Thus every note, considered as an independent sound, may be said to carry or imply its natural harmonics, that is to say, its octave, its twelfth, and its seventeenth; or, when reduced, its eighth, its fifth, and its third. But the same sound, when considered as constituting any part of harmony, is subjected to other laws and different limitations. It can then only be said to carry or imply such simple sounds, or complications of sound, as the preceding and subsequent chords admit or require. For these the laws of melody and harmony must be consulted. See MELODY and HARMONY.

IMPORTATION, in Commerce, the bringing merchandise into a kingdom from foreign countries; in contradistinction to exportation. See Exportation.

For the principal laws relating to importation, see Customhouse Laws.

IMPOSITION of hands, an ecclesiastical action by which
IMPOST, in a general sense, denotes a person who cheats by a fictitious character.

Religious Impostors, are such as falsely pretend to an extraordinary commission from heaven; and who terrify and abuse the people with false denunciations of judgments. These are punishable in the temporal courts with fine, imprisonment, and infamous corporal punishment.

IMPOTENCY, or IMPOTENCY, in general, denotes want of strength, power, or means, to perform any thing.

Divines and philosophers distinguish two sorts of impotency; natural and moral. The first is a want of some physical principle, necessary to an action; or where a being is absolutely defective, or not free and at liberty to act: The second only imports a great difficulty; as a strong habit to the contrary, a violent passion, or the like.

IMPOsTEN'TY is a term more particularly used for a natural inability to coition. Impotence with respect to men is the same as sterility in women; that is, an inability of propagating the species. There are many causes of impotence; as, a natural defect in the organs of generation, which seldom admits of a cure: accidents or diseases; and in such cases the impotence may or may not be remedied, according as these are curable or otherwise.—The most common causes are, early and immoderate venery, or the venereal disease. We have instances, however, of unfitness for generation in men, by an impediment to the ejection of the semen in coition, from a wrong direction which the orifice at the vermiformum got, whereby the seed was thrown up into the bladder. M. Petit cured one patient under such a difficulty of emission, by making an incision like to that commonly made in the great operation for the stone.

On this subject we have some curious and original observations by the late Mr John Hunter in his Treatise on the Venereal Disease. He considers impo- tency as depending upon two causes. One he refers to the mind; the other to the organs.

1. As to impotency depending upon the mind, he observes, that as the " parts of generation are not necessary for the existence or support of the individual, but have a reference to something else in which the mind has a principal concern; so a complete action in those parts cannot take place without a perfect harmony of body and of mind; that is, there must be both a power of body and disposition of mind; for the mind is subject to a thousand caprices, which affect the actions of these parts.

"Copulation is an act of the body, the spring of which is in the mind; but it is not volition: and according to the state of the mind, so is the act performed. To perform this act well, the body should be in health, and the mind should be perfectly confident of the powers of the body; the mind should be in a state entirely disengaged from every thing else: it should have no difficulties, no fears, no apprehensions, not even an anxiety to perform the act well: for even this anxiety is a state of mind different from what should prevail; there should not be even a fear that the mind itself may find a difficulty at the time the act should be performed. Perhaps no function of
Impotency, the machine depends so much upon the state of the mind as this.

"The will and reasoning faculty have nothing to do with this power; they are only employed in the act, so far as voluntary parts are made use of; and if they ever interfere, which they sometimes do, it often produces another state of mind which destroys that which is proper for the performance of the act; it produces a desire, a wish, a hope, which are all only diffidence and uncertainty, and create in the mind the idea of a possibility of the want of success, which destroys the proper state of mind or necessary confidence.

"There is perhaps no act in which a man feels himself more interested, or is more anxious to perform well; his pride being engaged in some degree, which if within certain bounds would produce a degree of perfection in an act depending upon the will, or an act in voluntary parts; but when it produces a state of mind contrary to that state on which the perfection of the act depends, a failure must be the consequence.

"The body is not only rendered incapable of performing this act by the mind being under the above influence, but also by the mind being, though perfectly confident of its power, yet conscious of an impropriety in performing it; this, in many cases, produces a state of mind which shall take away all power. The state of a man's mind respecting his sister takes away all power.

A conscientious man has been known to lose his powers on finding the woman he was going to be connected with unexpectedly a virgin.

"Sheddimg tears arises entirely from the state of the mind, although not so much a compound action as the act in question; for none are so weak in body that they cannot shed tears; it is not so much a compound action of the mind and strength of body joined, as the other act is; yet if we are afraid of shedding tears, or are desirous of doing it, and that anxiety is kept up through the whole of an affecting scene, we certainly shall not shed tears, or at least not so freely as would have happened from our natural feelings.

"From this account of the necessity of having the mind independent respecting the act, we must see that it may very often happen that the state of mind will be such as not to allow the animal to exert its natural powers; and every failure increases the evil. We must also see from this state of the case, that this act must be often interrupted; and the true cause of this interruption not being known, it will be laid to the charge of the body or want of powers. As these cases do not arise from real inability, they are to be carefully distinguished from such as do; and perhaps the only way to distinguish them is, to examine into the state of mind respecting this act. So trifling often is the circumstance which shall produce this inability depending on the mind, that the very desire to please shall have that effect, as in making the woman the sole object to be gratified.

"Cases of this kind we see every day; one of which I shall relate as an illustration of this subject, and also of the method of cure.—A gentleman told me, that he had lost his virility. After above an hour's investigation of the case, I made out the following facts: that he had at unnecessary times strong erections, which showed that he had naturally this power; that the erections were accompanied with desire, which are all the natural powers wanted; but that there was still a defect somewhere, which I supposed to be from the mind. I inquired if all women were alike to him? his answer was, No; some women he could have connection with as well as ever. This brought the defect, whatever it was, into a smaller compass: and it appeared that there was but one woman that produced this inability, and that it arose from a desire to perform the act with this woman well; which desire produced in the mind a doubt or fear of the want of success, which was the cause of the inability of performing the act. As this arose entirely from the state of the mind produced by a particular circumstance, the mind was to be applied to for the cure; and I told him that he might be cured, if he could perfectly rely on his own power of self-denial. When I explained what I meant, he told me that he could depend upon every act of his will or resolution. I then told him, that, if he had a perfect confidence in himself in that respect, he was to go to bed to this woman, but first promise to himself that he would not have any connection with her for six nights, let his inclinations and powers be what they would; which he engaged to do, and also to let me know the result. About a fortnight after, he told me, that his resolution had produced such a total alteration in the state of his mind, that the power soon took place; for instead of going to bed with the fear of inability, he went with fears that he should be possessed with too much desire, too much power, so as to become uneasy to him; which really happened; for he would have been happy to have shortened the time; and when he had once broke the spell, the mind and powers went on together, and his mind never returned to its former state."

2. Of impotency from a want of proper correspondence between the actions of the different organs. Our author, in a former part of his Treatise, when considering the diseases of the urethra and bladder, had remarked, that every organ in an animal body, without exception, was made of different parts, whose functions or actions were totally different from one another, although all tending to produce one ultimate effect. In all such organs, when perfect (he observes), there is a succession of motions, one naturally arising out of the other, which in the end produces the ultimate effect; and an irregularity alone in these actions will constitute disease, at least will produce very disagreeable effects, and often totally frustrate the intention of the organ. This principle Mr Hunter, on the present occasion, applies to the "actions of the testicles and penis: for we find that an irregularity in the actions of these parts sometimes happens in men, producing impotence; and something similar probably may be one cause of barrenness in women.

"In men, the parts subservient to generation may be divided into two; the essential and the accessory. The testicles are the essential; the penis, &c. the accessory. As this division arises from their use, and actions in health, which exactly correspond with one another, a want of exactness in the correspondence or susceptibility of those actions may also be divided into two: where the actions are reversed, the accessory taking place without the first or essential, as in erections of the penis, where neither the mind nor the testicles are stimulated to action; and the second is where the testicles perform the
Impotence, the action of secretion too readily for the penis, which has not a corresponding erection. The first is called priapism; and the second is what ought to be called seminal weakness.

"The mind has considerable effect on the correspondence of the actions of these two parts: but it would appear in many instances, that erections of the penis depend more on the state of the mind than the secretion of the semen does; for many have the secretion, but not the erection; but in such, the want of erection appears to be owing to the mind only.

"Priapism often arises spontaneously, and is felt from visible irritation of the penis, as in the venereal gonorrhoeae, especially when violent. The sensation of such erections is rather uneasy than pleasant; nor is the sensation of the glans at the time similar to that arising from the erections of desire, but more like to the sensation of the parts immediately after coition. Such as arise spontaneously are of more serious consequence than those from inflammation, as they proceed probably from causes not curable in themselves or by any known methods. The priapism arising from inflammation of the parts, as in a gonorrhoea, is attended with nearly the same symptoms; but generally the sensation is that of pain, proceeding from the inflammation of the parts. It may be observed, that what is said of priapism is only applicable to it when a disease in itself, and not when a symptom of other diseases, which is frequently the case.

"The common practice in the cure of this complaint is to order all the nervous and strengthening medicines, such as bark, valerian, musk, camphor, and also the cold bath. I have seen good effects from the cold bath; but sometimes it does not agree with the constitution, in which case I have found the warm bath of service. Opium appears to be a specific in many cases; from which circumstance I should be apt, upon the whole, to try a soothing plan.

"Seminal weakness, or a secretion and emission of the semen without erections, is the reverse of a priapism, and is by much the worse disease of the two. There is great variety in the degrees of this disease, there being all the gradations from the exact correspondence of the actions of all the parts to the testicles acting alone; in every case of the disease, there is too quick a secretion and evacuation of the semen. Like to the priapism, it does not arise from desires and abilities; although when mild it is attended with both, but not in a due proportion; a very slight desire often producing the full effect. The secretion of the semen shall be so quick, that simple thought, or even toying, shall make it flow.

"Dreams have produced this evacuation repeatedly in the same night; and even when the dreams have been so slight, that there has been no consciousness of them when the sleep has been broken by the act of emission. I have known cases where the testicles have been so ready to secrete, that the least friction on the glans has produced an emission: I have known the simple action of walking or riding produce this effect, and that repeatedly, in a very short space of time.

"A young man, about four or five and twenty years of age, not so much given to venery as most young men, had these last mentioned complaints upon him. Three or four times in the night he would emit; and if he walked fast, or rode on horseback, the same thing would happen. He could scarcely have connection with a woman before he emitted, and in the emission there was hardly any spasm. He tried every supposed strengthening medicine, as also the cold bath and sea-bathing, but with no effect. By taking 20 drops of laudanum on going to bed, he prevented the night emissions; and by taking the same quantity in the morning, he could walk or ride without the before-mentioned inconvenience. I directed this practice to be continued for some time, although the disease did not return, that the parts might be accustomed to this healthy state of action; and I have reason to believe the gentleman is now well. It was found necessary, as the constitution became more habituated to the opiate, to increase the dose of it.

"The spasms, upon the evacuation of the semen in such cases are extremely slight, and a repetition of them soon takes place; the first emission not preventing a second; the constitution being all the time but little affected (A). When the testicles act alone, without the accessory parts taking up the necessary and natural consequent action, it is still a more melancholy disease; for the secretion arises from no visible or sensible cause, and does not give any visible or sensible effect, but runs off similar to involuntary stools or urine. It has been observed that the semen is more fluid than natural in some of these cases.

"There is great variety in the diseased actions of these parts; of which the following case may be considered as an example. A gentleman has had a stricture in the urethra for many years, for which he has frequently used a bougie, but has of late neglected it. He has had no connection with women for a considerable time, being afraid of the consequences. He has often in his sleep involuntary emissions, which generally awake him at the paroxysm; but what surprises him most is, that often he has such without any semen passing forwards through the penis, which makes him think that at those times it goes backward into the bladder. This is not always the case, for at other times the semen passes forwards. At the time the semen seems to pass into the bladder, he has the erection, the dream; and is awakened with the same mode of action, the same sensation, and the same pleasure, as when it passes through the urethra, whether dreaming or waking. My opinion is, that the same irritation takes place in the bulb of the urethra without the semen that takes place there when the semen enters, in consequence of all the natural preparatory steps, whereby the very same actions are excited as if it came into the

(A) "It is to be considered, that the constitution is commonly affected by the spasms only, and in proportion to their violence, independent of the secretion and evacuation of the semen. But in some cases even the erection going off without the spasms on the emission, shall produce the same debility as if they had taken place."
Impotency is a canonical disability, to avoid marriage in the spiritual court. The marriage is not void ab initio, but voidable only by sentence of separation during the life of the parties.

Impregnation, the getting a female with child. See Conception.

The term impregnation is also used, in pharmacy, for communicating the virtues of one medicine to another, whether by mixture, coction, digestion, &c. Impressing seamen. The power of impressing sea-faring men for the sea-service by the king's commission, has been a matter of some dispute, and submitted to with great reluctance; though it hath very clearly and learnedly been shown by Sir Michael Foster, that the practice of impressing, and granting powers to the admiralty for that purpose, is of a very ancient date, and hath been uniformly continued by a regular series of precedents to the present time: whence he concludes it to be part of the common law. The difficulty arises from hence, that no statute has expressly declared this power to be in the crown, though many of them very strongly imply it. The statute 2 Rich. II. c. 4, speaks of mariners being arrested and retained for the king's service, as of a thing well known, and practised without dispute; and provides a remedy against their running away. By a later statute, if any waterman, who uses the river Thames, shall hide himself during the execution of any commission of pressing for the king's service, he is liable to heavy penalties. By another (5 Eliz. c. 5.) no fisherman shall be taken by the queen's commission to serve as a mariner; but the commission shall be first brought to two justices of the peace, inhabiting near the sea coast where the mariners are to be taken, to the intent that the justices may choose out and return such a number of able-bodied men, as in the commission are contained, to serve her majesty. And by others, especial protections are allowed to seamen in particular circumstances, to prevent them from being impressed. Ferrymen are also said to be privileged from being impressed, at common law. All which do most evidently imply a power of impressing to reside somewhere; and if anywhere, it must, from the spirit of our constitution, as well as from the frequent mention of the king's commission, reside in the crown alone.—After all, however, this method of manning the navy is to be considered as only defensible from public necessity, to which all private considerations must give way.

The following persons are exempted from being impressed: Apprentices for three years; the master, mate, and carpenter, and one man for every 100 tons, of vessels employed in the coal trade; all under 18 years of age, and above 55; foreigners in merchantships and privateers; landmen betaking themselves to sea for two years; seamen in the Greenland fishery, and harpooneers, employed, during the interval of the fishing seasons, in the coal-trade, and giving security to go to the fishing next season.

Impression is applied to the species of objects which are supposed to make some mark or impression on the senses, the mind, and the memory. The Peripatetics assert, that bodies emit species resembling them, which are conveyed to the common sensibilities, and they are rendered intelligible by the active intellect; and, when thus spiritualized, are called expressions, or express species, as being expressed from the others.

Impression also denotes the edition of a book, regarding the mechanical part only; whereas edition, besides this, taken in the care of the editor, who corrected or augmented the copy, adding notes, &c. to render the work more useful.

Imprisonment, the state of a person restrained of his liberty, and detained under the custody of another.

No person is to be imprisoned but as the law directs, either by the command or order of a court of record, or by lawful warrant; or the king's process, on which one may be lawfully detained. And at common law, a person could not be imprisoned unless he were guilty of some force and violence for which his body was subject to imprisonment, as one of the highest executions. Where the law gives power to imprison, in such case it is justifiable, provided he that does it in pursuance of a statute exactly persues the statute in the manner of doing it; for otherwise it will be deemed false imprisonment, and of consequence it is unjustifiable. Every warrant of commitment for imprisoning a person ought to run, "till delivered by due course of law," and "not until farther order;" which has been held ill: and thus it also is, where one is imprisoned on a warrant not mentioning any cause for which he is committed. See Arrest and Commitment.

False imprisonment. Every confinement of the person is an imprisonment, whether it be in a common prison, or in a private house, or in the stocks, or even
these impurities were involuntary; as when any one inadvertently touched a box, or a sepulchre, or any thing polluted; or fell into such diseases as pollute, as the leprosy, &c.

The beds, clothes, and moveables, which had touched any thing unclean, contracted also a kind of impurity, and in some cases communicated it to others.

These legal pollutions were generally removed by bathing, and lasted no longer than the evening. The person polluted plunged over head in the water, and either had his clothes on when he did so, or washed himself and his clothes separately. Other pollutions continued seven days, as that which was contracted by touching a dead body. That of women in their monthly courses lasted till this was over with them. Other impurities lasted 40 or 50 days; as that of women who were lately delivered, who were unclean 40 days after the birth of a boy, and 50 after the birth of a girl. Others again lasted till the person was cured.

Many of these pollutions were expiated by sacrifices; and others by a certain water or ley made with the ashes of a red heifer, sacrificed on the great day of expiation. When the leper was cured, he went to the temple, and offered a sacrifice of two birds, one of which was killed and the other set at liberty. He who had touched a dead body, or had been present at a funeral, was to be purified with the water of expiation, and this upon pain of death. The woman who had been delivered, offered a turtle and a lamb for her expiation; or if she was poor, two turtles or two young pigeons.

These impurities, which the law of Moses has expressed with the greatest accuracy and care, were only figures of other more important impurities, such as the sins and iniquities committed against God, or faults committed against our neighbour. The saints and prophets of the Old Testament were sensible of this; and our Saviour, in the gospel, has strongly inculcated, that they are not outward and corporeal pollutions which render us unacceptable to God, but such inward pollutions as infect the soul, and are violations of justice, truth, and charity.

IMPUTATION, in general, the charging something to the account of one which belonged to another: thus, the asserters of original sin maintain, that Adam's sin is imputed to all his posterity.

In the same sense, the righteousness and merits of Christ are imputed to true believers.

INACCESSIBLE, something that cannot be approached, by reason of intervening obstacles, as a river, rock, &c. It is chiefly used in speaking of heights and distances. See Mensuration.

INACHUS, founder of the kingdom of Argos, 1895 B.C. See Argos.

INALIENABLE, that which cannot be legally alienated or made over to another: thus the dominions of the king, the revenues of the church, the estates of a minor, &c. are inalienable, otherwise than with a reserve of the right of redemption.

INANIMATE, a body that hath either lost its soul, or that is not of a nature capable of having any.

INANITION; among physicians, denotes the state of the stomach when empty, in opposition to repletion.

INANITY, the school term for emptiness or absolute
In France, and several other countries, they also reckon from the incarnation: but then they differ from each other in the day of the incarnation, fixing it, after the primitive manner, not to the day of the birth, but the conception of our Saviour; though the Florentines retain the day of the birth, and begin their year from Christmas.

Inca, or Inca, a name given by the natives of Peru to their kings and the princes of the blood. Pedro de Cieza, in his Chronicles of Peru, gives the origin of the inca, and says, that that country was, for a long time, the theatre of all manner of crimes, of war, dissension, and the most dreadful disorders, till at last two brothers appeared, one of whom was called Mancocapac; of this person the Peruvians relate many wonderful stories. He built the city of Cusco, made laws, established order and harmony by his wise regulations; and he and his descendants took the name of inca, which signifies king or great lord. These inca became so powerful, that they rendered themselves masters of all the country from Passo to Chili, and from the river Mauco on the south to the river Ayamsagno on the north; these two rivers forming the bounds of their empire, which extended above thirteen hundred leagues in length. This they enjoyed till the divisions between Inca Gucscar and Atabalipa: which the Spaniards laying hold of, made themselves masters of the country, and destroyed the empire of the inca. See Peru.

Incameration, a term used in the chancery of Rome, for the uniting of lands, revenues, or other rights, to the pope’s domain.

Incantation, denotes certain ceremonies, accompanied with a formula of words, and supposed to be capable of raising devils, spirits, &c. See Charm, &c.

Incapacity, in the canon-law, is of two kinds: 1. The want of a dispensation for age in a minor, for legitimation in a bastard, and the like: this renders the provision of a benefice void in its original. 2. Crimes and heinous offences, which annul provisions at first valid.

Incarnation, in Theology, signifies the act whereby the Son of God assumed the human nature; or the mystery by which Jesus Christ, the eternal word, was made man, in order to accomplish the work of our salvation. The era used among Christians, whence they number their years, is the time of the incarnation, that is, of Christ’s conception in the virgin’s womb.

This era was first established by Dionysius Exiguus, about the beginning of the sixth century, till which time the era of Dioclesian had been in use.

Some time after this, it was considered, that the years of a man’s life were not numbered from the time of his conception, but from that of his birth: which occasioned them to postpone the beginning of this era for the space of one year, retaining the cycle of Dionysius entire in every thing else.

At Rome they reckon their years from the incarnation or birth of Christ, that is, from the 25th of December, which custom has obtained from the year 431.
all the time in prayer. The quantity of incense offered each day was half a pound in the morning and as much at night.

One reason of this continual burning of incense might be, that the multitude of victims that were continually offered up, would have made the temple smell like a slaughter-house, and consequently have inspired the comers rather with disgust and aversion, than awe and reverence, had not it been overpowered by the agreeable fragrance of those perfumes.

INCEPTIVE, a word used by Dr. Wallis to express such moments, or first principles, which, though of no magnitude themselves, are yet capable of producing such as are. Thus a point has no magnitude itself, but is inceptive of a line which it produces by its motion. So a line, though it have no breadth, is yet inceptive of breadth; that is, it is capable, by its motion, of producing a surface which has breadth, &c.

INCEST, the crime of venereal commerce between persons who are related in a degree wherein marriage is prohibited by the laws of the country.

Some are of opinion, that marriage ought to be permitted between kinsfolks, to the end that the affection so necessary in marriage might be heightened by this double tie: yet the rules of the church have formerly extended this prohibition even to the seventh degree; but time has now brought it down to the third or fourth degree.

Most nations look on incest with horror; Persia and Egypt alone excepted. In the history of the ancient kings of those countries we meet with instances of the brother's marrying the sister; the reason was, because they thought it too mean to join in alliance with their own subjects, and still more so to have married into any foreign family.

INCERT, Spiritual, a crime committed in like manner between persons who have a spiritual alliance by means of baptism or confirmation.

Spiritual incest is also understood of a vicar, or other beneficiary, who enjoys both the mother and daughter; that is, holds two benefices, the one whereof depends upon the collateral of the other.

Such a spiritual incest renders both the one and the other of these benefices vacant.

INCH, a well-known measure of length; being the twelfth part of a foot, and equal to three barley-corns in length.

INCH (contracted from the Gaelic "sinne," "an island"), a word prefixed to the names of different places in Scotland and Ireland.

INCH Colm, or Columba, the isle of Columba, an island situated in the Frith of Forth in Scotland, and famous for its monastery. See Forth.

This monastery was founded about 1123, by Alexander I. on the following occasion. In passing the frith of Forth he was overtaken by a violent storm, which drove him to this island, where he met with the most hospitable reception from a poor hermit, then residing here in the chapel of St. Columba, who, for the three days that the king remained there tempest-bound, entertained him with the milk of his cow, and a few shelly-fish. His majesty, from the sense of the danger he had escaped, and in gratitude to the saint to whom he attributed his safety, vowed some token of respect; Inch Colm accordingly founded here a monastery of Augustines, and dedicated it to St. Columba. Allan de Mor, Incbative, a name of the earl, lord of Aberdour, who attended Edward III. in his Scotch expedition, bestowed half of those lands on the monks of this island, for the privilege of a family burial-place in their church. The buildings made in consequence of the piety of Alexander were very considerable. There are still to be seen a large square tower belonging to the church, the ruins of the church, and of several other buildings. The wealth of this place in the time of Edward III. proved so strong a temptation to his fleet, then lying in the Forth, as to suppress all the horror of sacrilege and respect to the sanctity of the inhabitants. The English landed, and spared not even the furniture more immediately consecrated to divine worship. But due vengeance overtook them; for in a storm which instantly followed, many of them perished; those who escaped, struck with the justice of the judgment, vowed to make ample recompense to the injured saint. The tempest ceased; and they made the promised atonement.—The Danish monument, figured by Sir Robert Sibbald, lies on the south-east side of the building, on a rising ground. It is of a rigid form, and the surface ornamented with scale-like figures. At each end is the representation of a human head.

Inch Keith, a small island situated in the same frith, midway between the port of Leith and Kinghorn on the opposite shore. See Forth.

This island is said to derive its name from the gallant Keith, who so greatly signalized himself by his valour in 1015, in the battle of Barry, in Angus, against the Danes; after which he received in reward the barony of Keith, in Lothian, and this little isle. In 1540 the English fleet, sent by Edward VI. to assist the lords of the congregation against the queen-dowager, landed, and began to fortify this island, of the importance of which they grew sensible after their neglect of securing the port of Leith, so lately in their power. They left here five companies to cover the workmen under the command of Cotterel; but their operations were soon interrupted by M. Desse, general of the French auxiliaries, who took the place, after a gallant defence on the part of the English. The Scots kept possession for some years; but at last the fortifications were destroyed by act of parliament, to prevent it from being of any use to the former. The French gave it the name of L'isle des chevaux, from its property of soon fattening horses.

—In 1497, by order of council, all venereal patients in the neighbourhood of the capital were transported there, to prevent their disease from spreading, ne quid detrimenti recompensa caperet. A lighthouse, which must prove highly beneficial to the shipping which frequents the Forth, was erected in 1855.

INCH Garvie, a small island, also lying in the frith of Forth, near Queensferry. See Forth.

INCHANTMENT. See Witchcraft.

INCHOATIVE, a term signifying the beginning of a thing or action; the same with what is otherwise called inceptive.

INCHOATIVE verbs, denote, according to Priscian and other grammarians, verbs that are characterised by the termination
INC

INCENDIBLE, something that cannot be burnt or consumed by fire. See Asbestos.

INCOMMENSURABLE, a term in Geometry, used where two lines, when compared to each other, have no common measure, how small soever, that will exactly measure them both. And in general, two quantities are said to be incommensurable, when no third quantity can be found that is an aliquot part of both.

INCOMMENSURABLE Numbers, are such as have no common divisor that will divide them both equally.

INCOMPATIBLE, that which cannot subsist without destroying itself: thus cold and heat are incompatible in the same subject, the strongest overcoming and expelling the weakest.

INCONTINENCE, inordinate exercise of the sexual appetite; lust. It is the opposite of chaste. See Chastity and Continence.

INCONSCIENCE, in the eye of the law, is of diverse kinds; as in cases of bigamy, rapes, sodomy, or buggery, getting bastards; all which are punished by statute. See 25 Hen. VIII. cap. 6. 18 Eliz. cap. 7. 1 Jac. I. cap. 11. Incontinency of priests is punishable by the ordinary, by imprisonment, &c. 1 Hen. VII. cap. 4.

INCONCEIVE, in Medicine, signifies an inability in any of the organs to retain what should not be discharged without the concurrence of the will. It is most frequently applied to an involuntary discharge of urine. See Medicine Index.

INCORPORATION, in Pharmacy, is the reduction of dry substances to the consistence of a paste, by the admixture of some fluid: thus pills, bulla, &c. are made by incorporation.

INCORPORATION, or Body-Corporate. See Corporation.

INCORPOREAL, spiritual; a thing, or substance, which has no body. Thus the soul of man is incorporeal, and may subsist independent of the body. See Metaphysics.

INCORRUPTIBLE, that which cannot be corrupted. Thus spiritual substances, as angels, human souls, &c. and thus also, glass, gold, mercury, &c. may be called incorruptible.

INCORRUPTIBLES, INCORRUPTIBLES, the name of a sect which sprung out of the Eutychians.—Their distinguishing tenet was, that the body of Jesus Christ was incorruptible; by which they meant, that after and from the time wherein he was formed in the womb of his holy mother, he was not susceptible of any change or alteration; not even of any natural and innocent passions, as of hunger, thirst, &c. so that he was
INDEPENDENTS, a sect of Protestants, so called from their maintaining that each congregation of Christians, which meets in one house for public worship, is a complete church, has sufficient power to act and perform every thing relating to religious government within itself, and is in no respect subject or accountable to other churches.

The Independents, like every other Christian sect, derive their own origin from the practice of the first apostles in planting the first churches; but they were unknown in modern times till they arose in England during the reign of Elizabeth. The hierarchy established by that princess in the churches of her dominions, the vestments worn by the clergy in the celebration of divine worship, the book of common prayer, and above all the sign of the cross used in the administration of baptism, were very offensive to many of her subjects, who during the persecution of the former reign had taken refuge among the Protestants of Germany and Geneva. Those men thought that the church of England resembled, in too many particulars, the antichristian church of Rome; and they called perpetually for a more thorough reformation and a purer worship. From this circumstance they were stigmatized by their adversaries with the general name of Puritans, as the followers of Novatian, (A) had been in the ancient church. Elizabeth was not disposed to comply with their demands; and it is difficult to say what might have been the issue of the contest, had the Puritans been united among themselves in sentiments, views, and measures. But the case was quite otherwise. That large body, composed of persons of different ranks, characters, opinions, and intentions, and unanimous in nothing but in their antipathy to the forms of doctrine and discipline that were established by law, was all of a sudden divided into a variety of sects. Of these the most famous was that which was formed about the year 1581 by Robert Brown, a man insinuating in his manners, but unsteady and inconsistent in his views and notions of men and things. See Brown.

This innovator differed not in point of doctrine either from the church of England, or from the rest of the Puritans; but he had formed notions, then new and singular, concerning the nature of the church and the rules of ecclesiastical government. He was for dividing the whole body of the faithful into separate societies or congregations; and maintained, that such a number of persons as could be contained in an ordinary place of worship ought to be considered as a church, and enjoy all the rights and privileges that are competent to an ecclesiastical community. These small societies he pronounced independent, jure divino, and entirely exempt from the jurisdiction of the bishops, in whose hands the court had placed the reins of spiritual government; and also from that of presbyteries.

(A) The followers of Novatian were called Puritans, because they would not communicate with the Catholic church, under pretence that her communion was polluted by admitting those to the sacred mysteries who through infirmity had sacrificed to idols in times of persecution. These unhappy men were not received by the church till after a long course of penance. The Novatians would not receive them at all, however long their penance, or however sincere their sorrow, for their sin. In other respects, the ancient Puritans were, like the English, orthodox in the faith, and of irreprehensible morals.
and synods, which the Puritans regarded as the supreme visible sources of ecclesiastical authority. He also main-
tained, that the power of governing each congrega-
tion resided in the people; and that each member had an equal share in this government, and an equal right to order matters for the good of the whole so-
ciety. Hence all points both of doctrine and disci-
pline were submitted to the discussion of the whole con-
gregation; and whatever was supported by a majority of voices passed into a law. It was the congregation also that elected certain of the brethren to the office of pastors, to perform the duty of public instruc-
tion, and the several branches of divine worship; re-
serving, however, to themselves the power of dismissing these ministers, and reducing them to the condition of private members, whenever they should think such a change conducive to the spiritual advantage of the community. It is likewise to be observed, that the right of the pastors to preach was by no means of an exclu-
sive nature, or peculiar to them alone; since any mem-
ber that thought proper to exhort or instruct the bre-
thren, was abundantly indulged in the liberty of pro-
phesying to the whole assembly. Accordingly, when the ordinary teacher or pastor had finished his discourse, all the other brethren were permitted to communicate in public their sentiments and illustrations upon any useful or edifying subject.

The zeal with which Brown and his associates main-
tained and propagated these notions was in a high degree intemperate and extravagant. He affirmed, that all communion was to be broken off with those religious societies that were founded upon a different plan from his; and treated, more especially, the church of England, as a spurious church, whose ministers were unlawfully ordained, whose discipline was popish and antichristian, and whose sacraments and institutions were destitute of all efficacy and virtue. The sect of this hot-headed innovator, not being able to endure the severe treatment which their own violence had brought upon them from an administration that was not distin-
guished by its mildness and indulgence, retired into the Netherlands, and founded churches at Middleburg in Zeeland, and at Amsterdam and Leyden in the pro-
vince of Holland; but their establishments were nei-
ther solid nor lasting. Their founder returned into England; and having renounced his principles of separa-
tion, took orders in the established church, and ob-
tained a benefice. The Puritan exiles, whom he thus abandoned, disagreed among themselves, were split into parties, and their affairs declined from day to day. This engaged the wiser part of them to mitigate the severity of their founder's plan, and to soften the rigour of his uncharitable decisions.

The person who had the chief merit of bringing about this reformation was one of their pastors called John Robinson, a man who had much of the solemn piety of the times, and no inconsiderable portion of learning. This well-meaning reformer, perceiving the defects that reigned in the discipline of Brown, and in the spirit and temper of his followers, employed his zeal and diligence in correcting them, and in new-
modelling the society in such a manner as to render it less obious to its adversaries, and less liable to the just censure of those true Christians, who looked upon char-
ity as the end of the commandments. Hitherto the

...had been called Brownists; but Robinson having,
in his Apology, affirmed, Catum quemlibet particulae-
rem, esse totam, integram, et perfectam ecclesiam ex
sub partibus constantem immediatet et indepentem
(quoad alias ecclesias) sub ipsa Christi...—the sect was
henceforth called Independents, of which the apologist
was considered as the founder.

The Independents were much more commendable
than the Brownists. They surpassed them both in the
moderation of their sentiments, and in the order of their discipline. They did not, like Brown, pour forth
bitter and uncharitable invectives against the churches
which were governed by rules entirely different from
their, nor pronounce them on that account unworthy
of the Christian name. On the contrary, though they
considered their own form of ecclesiastical government
as of divine institution, and as originally introduced
by the authority of the apostles, nay by the apostles them-
selves; they had yet candour and charity enough to
acknowledge, that true religion and solid piety might
flourish in those communities which were under the jurisdic-
tion of bishops or the government of synods and presbyters. This is put beyond all doubt by
Robinson himself, who expresses his own private senti-
ments and those of his community in the following clear and precise words: “Protestan
corun Dei et
honinibus, ador nobis convenerit cum ecclesias reforma-
tis Belgicis in re religionis, ut omnibus et singulis ear-
undem ecclesiarum fidei ariticul, prout habentur in
harmonia confessionum fidei, parati simus subscribere.
Ecclesias reformatus pro veris et genuinis habemus,
cum uisum in sacris Dei communionem profetemur, et,
quum in nobis est, colimus. They were also much
more attentive than the Brownists, in keeping on foot a
regular ministry in their communities: for while the
latter allowed promiscuously all ranks and orders of men
to teach in public, the Independents had, and still have, a
certain number of ministers, chosen respectively by the
congregations where they are fixed; nor is any
person among them permitted to speak in public, before he has submitted to a proper examination of his capaci-
ty and talents, and been approved of by the heads of the congregation.

This religious society still subsists, and has produced
divines as eminent for learning, piety, and virtue, as
any church in Christendom. It is now distinguished
from the other Protestant communities chiefly by the
two following circumstances.

1. The Independents reject the use of all creeds and in what
confessions drawn up by fallible men, requiring of their
they are
now dis-

1. They attribute no virtue whatever to the rite of
ordination, upon which some other churches lay so
much stress; for the Independents declare, that the
qualifications which constitute a regular minister of the
New Testament, are, a firm belief in the gospel, a
principle of sincere and unaffected piety, a competent
stock of knowledge, a capacity for leading devotion and
communicating instruction, a serious inclination to
engage in the important employment of promoting the
everlasting salvation of mankind, and ordinarily an in-
vitation to the pastoral office from some particular so-

...
ciety of Christians. Where these things concur, they consider a person as fitted and authorised for the discharge of every duty which belongs to the ministerial function; and they believe that the imposition of the hands of bishops or presbyters would convey to him no powers or prerogatives of which he was not before possessed.

When the reformers, separated from the church of Rome, they drew up public confessions of faith or articles of religion, to which they demanded subscription from their respective followers. Their purpose in this was to guard against dangerous heresies, to ascertain the meaning of Scripture-language, and, we doubt not, to promote the unity of the spirit in the bond of peace. These were laudable ends; but of the means chosen for attaining them, the late Dr Taylor of Norwich, the glory of the Independent churches, and whose learning would have done honour to any church, expresses his opinion in the following indignant language: "How much so ever the Christian world values these creeds and confessions, I confess, for my own part, that I have no opinion of them. But we are told that they were generally drawn up by the ablest divines. But what evidence is there of this? are divines in vogue and power commonly the most knowing and upright? But granting that the reformers were in those days the ablest divines; the ablest divines educated in popish schools, notwithstanding any pretended learning, might comparatively be very weak and defective in scripture knowledge, which was a thing in a manner new to them. In times of great ignorance they might be men of eminence; and yet far short of being qualified to draw up and decide the true and precise rules of faith for all Christians. Yet, their very attempting to draw up, decide, and establish, such rules of faith, is an incontestable evidence of their surprising ignorance and weakness. How could they be able divines, when they imposed upon the consciences of Christians their own decisions concerning gospel-faith and doctrine? Was not this in fact to teach and constrain Christians to depart from the most fundamental principle of their religion, submission and allegiance to Christ, the only teacher and legislator? But if they were able men, were they infallible? Nay they publicly affirmed their own infallibility; and yet they acted as if they had been infallible, and could not be mistaken in prescribing faith and doctrine.

But even if they were infallible, who gave them commission to do what the Spirit of God had done already? Could the first reformers hope to deliver the truths of religion more fully and more clearly than the Spirit of God? Had they found out more apt expressions than had occurred to the Holy Spirit? The Son of God spake not of himself; but as the Father said unto him, so he spake; (John xii. 50.) The Spirit of truth spake not of himself; but whatsoever he heard, that he spake; (John xvi. 13.) 'The things of God the apostles spake, not in the words which man's wisdom teacheth, but which the Holy Ghost teacheth.' (1 Cor. ii. 13.) If the Christian revelation was thus handed down to us from the Fountain of Light with so much care and exactness, both as to matter and words, by the Son of God, by the Spirit, and by the apostles; who were the ancient doctors and bishops? or who were the first reformers? or who were any synods or assemblies of divines, that they dared to model Christian faith into their own invented forms, and impose it upon the minds of men in their own devised terms and expressions?

"Hath Christ given authority to all his ministers to the end of the world, to new-mould his doctrines by the rules of human learning whenever they think fit? or hath he delegated his power to any particular persons? Neither the one nor the other. His doctrines are not of such a ductile nature; but stand fixed, both as to matter and words, in the Scripture. And it is at any man's peril, who pretends to put them, as they are rules of faith, into any new dress or shape. I conclude, therefore, that the first reformers, and all councils, synods, and assemblies, who have met together to collect, determine, and decide, to prescribe and impose matters pertaining to Christian faith, have acted without any warrant from Christ, and therefore have invaded the prerogative of him who is the sole Prophet and Lawgiver to the church. Peace and unity, I know, is the pretended good design of those creeds and confessions. But as God never sanctified them for these ends, so all the world knows they have produced the contrary effect; discord, division, and the spilling of whole seas of Christian blood for 1400 years together.'"

Such sentiments as these are now maintained by Christians of various denominations; but they were first avowed by the Independents, to whom therefore the merit or demerit of bringing them to light properly belongs. Our readers will think differently of them according to their preconceived opinions; but it is not our province either to confirm or to confute them. They rise almost necessarily out of the independent scheme of congregational churches; and we could not suppress them without deviating from our fixed resolution of doing justice to all religious parties, as well those from whom we differ as those with whom we agree. It ought not, however, to be rashly concluded, that the Independents of the present age, merely because they reject the use of all creeds of human composition, doubt or disbelieve the doctrines deemed orthodox in other churches. Their predecessors in the last century were thought to be more rigid Calvinists than the Presbyterians themselves; as many of those may likewise be who in the present century admit not the confessions and formulas of the Calvinistic churches. They acknowledge as divine truth every not there-doctrine contained in the Scriptures; but they think fore necessary that scripture-doctrines are most properly expressed in scripture-language; and the same spirit of religious liberty, which makes them reject the authority of bishops and synods in matters of discipline, makes them reject the same authority in matters of faith. In either case, to call any man or body of men their masters, would, in their opinion, be a violation of the divine law, since, "one is their master, even Christ, and they are all brethren.)

6 In support of their scheme of congregational churches, their argument is, that the word ekklēsia, which we translate church, is always used in Scripture to signify either a single congregation, or the place where a single congregation meets. Thus that unlawful assembly at Ephesus, brought together against Paul by the craftsmen, is called ekklēsia, a church, (Acts xix. 32, 39, 41.) The word, however, is generally applied to a more sacred use, ,
The evidence upon which this is said by Mr Glass (for the whole of this reasoning is extracted from his works) is probably the following passage in the epistle of Ignatius to the Ephesians: 

Ex: γεγονὼς ὁ διδάσκαλος Ἠλίας ἐπιβαίνει πρὸς τὸν Θεόν ἐν τῇ αἰείων ἡμέρᾳ. 

"For if the prayer of one or two be of such force as we are told, how much more prevalent must that be which is made by the bishop and the whole church? He then that does not come together into the same place with it, is proud, and hath condemned himself; for it is written, God resisteth the proud. Let us not therefore resist the bishop, that we may be the servants of God." The sentence, as it thus stands by itself, certainly countenances Mr Glass's scheme; but the reader who thinks any regard due to the testimony of Ignatius, will do well to peruse the whole epistle as published by Vossius.
Independent

as it has been called, was by our Saviour conformed not upon a particular order of disciples, but upon the church; "If thy brother shall trespass against thee, go and tell him his fault between thee and him alone: if he shall hear thee, thou hast gained thy brother. But if he will not hear thee, then take with thee one or two more, that in the mouth of one or two witnesses every word may be established. And if he shall neglect to hear them, tell it unto the church: but if he neglect to hear the church, let him be unto thee as an heathen man and a publican. Verily I say unto you, whatsoever ye shall bind on earth, shall be bound," 
&c. (St Mat. xviii. 15, 16, 17, 18.) It is not said, if he shall neglect to hear the one or two, tell it to the elders of the church; far less can it be meant that the offended person should tell the cause of his offence to all the disciples in a presbytery or diocese consisting of many congregations; but he is required to tell it to that particular church or congregation to which they both belong, and the sentence of that assembly proclaimed by its elders, is in a very solemn manner declared to be final, from which there lies no appeal to any jurisdiction on earth.

With respect to the constituting elders in any church or congregation, the Independent reasons in the following manner: The officers of Christ's appointment are either ordinary and permanent in the church, or they were extraordinary and peculiar to the planting of Christianity. The extraordinary were those who were employed in laying the plan of the gospel churches, and in publishing the New Testament revelation. Such were the apostles, the chosen witnesses of our Saviour's resurrection, such were the prophets inspired by the Holy Ghost far explaining infallibly the Old Testament by the things written in the New; and such were the evangelists, the apostles ministers. These can be succeeded by none in that which was peculiar to them, because their work was completed by themselves. But they are succeeded in all that was not peculiar to them by elders and deacons, the only two ordinary and permanent orders of ministers in the church. We have already seen that it belongs to the office of the elder to feed the flock of Christ: and the only question to be settled is, how men are ordinarily called to that office? for about the office of the deacon there is little, or no dispute. No man now can pretend to be so called of God to the ministry of the word as the apostles and other inspired elders were, whom he chose to be the publishers of his revealed truth, and to whose mission he bore witness in an extraordinary manner. But what the apostles were to those who had the divine oracles from their mouths, that their writings are to us; and therefore as no man can lawfully pretend a call from God to make any addition to those writings, so neither can any man pretend to be lawfully called to the ministry of the word already written but in the manner which that word directs. Now there is nothing of which the New Testament speaks more clearly than of the characters of those who should exercise the office of elders in the church, and of the actual exercise of that office. The former are graphically drawn in the apostles to Timothy and Titus; and the latter is minutely described in Paul's discourse to the Ephesians elders, in Peter's exhortation to elders, and our Lord's commission to those ministers, with whom he promised to be always present even unto the end of the world. It is not competent for any man or body of men to add to, or diminish from, the description of a gospel minister given in these places, so as to insist upon the necessity of any qualification which is not there mentioned, or to dispense with any qualification as needless which is there required. Neither has Jesus Christ given the only legislator to the church, given to any ministers or people any power or right whatsoever to call this or that, send, elect, or ordain, to that office, any person who is not qualified according to the description given in his own law; nor has he given any power or right to reject the least of them who are so qualified, and who desire the office of a bishop or elder. Let a man have hands laid upon him by such as could prove an uninterrupted descent by imposition of hands from the apostles; let him be set apart to that office by a company of ministers themselves, the most conformable to the scripture character, and let him be chosen by the most holy people on earth; yet if he answer not the New Testament description of a minister, is he not called of God to that office, and is no minister of Christ, but is indeed running amiss. No form of ordination can pretend to such a clear foundation in the New Testament as the description of the persons who should be elders of the church, and who are called to that office, whether by bishops or presbyters, is of no more importance in the mission of a minister of Christ, than the waving of one's hand in the air, or the putting of it into his bosom; for now when the power of miracles has ceased, it is obvious that such a rite, by whomsoever performed, can convey no powers, whether ordinary or extraordinary. Indeed it appears to have been sometimes used, even in the apostolic age, without any such intention. When Paul and Barnabas were separated to the particular employment of going out to the Gentiles, the prophets and teachers at Antioch "prayed and laid their hands on them": but did this ceremony confer upon the two apostles any new power or authority to act as ministers of Christ? Did the imposition of hands make those shining lights of the gospel one whit more qualified than they were before to convert and baptize the nations, to feed the flock of God to teach, rebuke, or exhort, with all long-suffering and doctrine? It cannot be pretended. Paul and Barnabas had undoubtedly received the Holy Ghost before they came to Antioch; and as they were apostles, they were of course authorized to discharge all the functions of the inferior and ordinary ministers of the gospel. In a word, whoever in his life and conversation is conformable to the character which the inspired writers give of a bishop or elder, and is likewise qualified by his "rightness in the scripture" to discharge the duties of that office, is fully authorized to administer the sacraments of baptism and the Lord's supper, to teach, exhort, and rebuke, with all long-suffering and doctrine, and has all the call and mission which the Lord now gives to any man; whilst he who wants the quas-calling, and such as are despised the popular justifications, has not God's call, whatever he may have, nor any authority to preach the gospel of Christ, or to dispense the ordinances of his religion.

From this view of the Independent principles, which is faithfully taken from their own writers, it appears, that according to them, even the election of a congregation,
In the ancient understanding, the name "India" referred to the western peninsula, the Ganges, and the territories beyond it, having little or no knowledge of the countries which lie farther to the eastward. However, there are records and accounts that provide insights into the way the ancients perceived India.

There is a strong belief that the ancients understood the name "India" to refer to the western peninsula, the Ganges, and the territories beyond it. This understanding is supported by various accounts and records that provide insights into the way the ancients perceived India.

In the ancient understanding, the name "India" referred to the western peninsula, the Ganges, and the territories beyond it, having little or no knowledge of the countries which lie farther to the eastward. However, there are records and accounts that provide insights into the way the ancients perceived India.
ed themselves by their application to navigation and commerce, and who were of consequence likely to discover these distant nations, were the Egyptians and Phoenicians. The former, however, soon lost their inclination for naval affairs, and held all seafaring people in detestation as profane persons; though the extensive conquests of Sesostris, if we can believe them, must have in a great measure supplied this defect. Without regard to the prejudice of his people against maritime affairs, he is said to have fitted out a fleet of 400 sail in the Arabian gulf or Red sea, which conquered all the countries lying along the Erythrean sea (A) to India; while the army led by himself marched through Asia, and subdued all the countries to the Ganges; after which he crossed that river, and advanced to the eastern ocean.

Great disputes have been carried on with respect to this conqueror, and the famous expedition just now related; but the learned Dr Robertson, in his Disquisition concerning ancient India, declares himself in doubt whether any such expedition ever was made, for the following reasons. Few historical facts seem to be better established than that of the aforesaid the Egyptians entreated to seafaring people and naval affairs; and the Doctor considers it as impossible even for the most powerful monarch to change in a few years a national habit confirmed by time and sanctified by religion. The very magnitude of the armaments is an argument against their existence; for besides the 400 ships of war, he had another fleet in the Mediterranean, and such a mighty navy could not have been constructed in any nation unaccustomed to maritime affairs, in a few years. 2. Herodotus makes no mention of the conquests of India by Sesostris, though he relates his history at some length. Our author is of opinion that the story was fabricated betwixt the time of Herodotus and that of Diodorus Siculus, from whom we have the first account of this expedition. Diodorus himself informs us that he had it from the Egyptian priests; and gives it as his opinion, that "many things they related flawed rather from a desire to promote the honour of their country than from attention to truth," and he takes notice that both the Egyptian priests and Greek writers differ widely from one another in the accounts which they give of the actions of Sesostris. 3. Though Diodorus declares that he has selected the most probable parts of the Egyptian narrative, yet there are still so many improbabilities, or rather impossibilities, contained in his relation, that we cannot by any means give credit to it. 4. For the reason just mentioned, the judicious geographer Strabo rejected the account altogether, and ranks the exploits of Sesostris in India with the fabulous ones of Bacchus and Hercules.

But whatever may be determined with regard to the Egyptians, it is certain that the Tyrians kept up a constant intercourse with some parts of India by navigating the Arabian gulf, now the Red sea. Of this navigation they became masters by taking from the Idumeans some maritime places on the coast of the Red sea: but as the distance betwixt the nearest place of that sea and Tyre was still considerable, the land-carriage would have been very tedious and expensive; for which reason it was necessary to become masters of a port on the eastern coast of the Mediterranean, nearer to the Red sea than Tyre, so that the goods might be shipped from thence to Tyre itself. With this view they took possession of Rhinocolura, the nearest port on the Mediterranean to the Arabian gulf; and to that port all the goods from India were conveyed by a much shorter and less expensive route than over land.—This is the first authentic account of any intercourse betwixt India and the western part of the world; and to this we are without doubt in a great measure to ascribe the vast wealth and power for which the city of Tyre was anciently renowned; for in other respects the whole territory of Phenicia was but of little consequence. Notwithstanding the frequency of these voyages, however, the ancients are able to give little or no account of them. The most particular description we have of the wealth, power, and commerce of ancient Tyre, is in the prophecies of Ezekiel; so that if the Tyrians themselves kept any journals of their voyages, it is probable that they were entirely lost when the city was destroyed by Alexander the Great.

Though the Jews, under the reigns of David and Solomon, carried on an extensive and lucrative commerce, yet our author is of opinion that they did not trade to any part of India. There are only two places mentioned to which their ships sailed, viz. Ophir and Tarshish; both of which are now supposed to have been situated on the eastern coast of Africa: the ancient Tarshish, according to Mr Bruce, was the present Mocha; and Ophir, the kingdom of Sofala, so remarkable in former times for its mines, that it was called by Oriental writers the golden Sofala.

Thus the Indians continued for a long time unknown to the western nations, and undisturbed by them; probably in subjection to the mighty empire of Babylon, from which the country was originally peopled, or in alliance with it; and the possession of this vast region will easily account for the immense and otherwise almost incredible wealth and power of the ancient Babylonian monarchs. Soon after the destruction of that conquests by the Persians, however, we find their monarch Darius Hystaspes undertaking an expedition against the Indians. His conquests were not extensive, as they did not reach beyond the territory watered by the Indus; nevertheless, such as they were, the acquisition seems to have been very important, as the revenue derived from the conquered territory, according to Herodotus, was near a third of that of the whole Persian empire. According to his account, however, we must form a much more diminutive opinion of the riches of the Persian monarch than has commonly been done; since Herodotus tells us, that the empire was divided into 20 satrapies or governments; all of which

---

(A) This must not be confounded with the Red sea, notwithstanding the similarity of names. The Erythrean sea was that part of the ocean which is interposed betwixt the straits of Babelmandel and the Malabar coast, now called the Indian sea or ocean.
yielded a revenue of 14,560 Euboic talents, amounting in the whole to 2,837,437l. sterling. The amount of the revenue from the conquered provinces of India, therefore, must have been considerably short of a million. Very little knowledge of the country was diffused by the expedition of Darius, or the voyage of Scylax whom he employed to explore the coast; for the Greeks paid no regard to the transactions of those whom they called Barbarians; and as for Scylax himself, he told so many incredible stories in the account he gave of his voyage, that he had the misfortune to be disbelieved in almost every thing, whether true or false.

The expedition of Alexander is so fully taken notice of under the article HINDOSTAN, that nothing more remains to be said upon it in this place, than that he went no farther into the country than the present territory of the Panjab, all of which he did not traverse. Its south-west boundary is formed by a river anciently called the Hymusus, now the Sutlej. The breadth of the district from Indusana on the Sutlej, to Attock on the Indus, is computed to be 250 geographical miles in a straight line; and Alexander’s march, computed in the same manner, did not exceed 200; nevertheless, by the spreading of his numerous army over the country, and the exact measurement and delineation of all his movements by men of science whom he employed, a very extensive knowledge of the western part of India was obtained. It is, however, surprising that having marched through so many countries in the neighbourhood of India, where the people must have been well acquainted with the nature of the climate, the Macedonian conqueror did not receive any information concerning the difficulties he would meet with from the rains which fell periodically at a certain season of the year. It was the extreme distress occasioned by them which made his soldiers finally resolve to proceed no farther; and no wonder indeed that they did adopt this resolution, since Diodorus informs us, that it had rained incessantly for 70 days before their departure. These rains, however, according to the testimony both of ancient and modern writers, fall only in the mountainous parts, little or none being ever seen in the plains. Aristobulus informs us, that in the country through which Alexander marched, though heavy rains fell along the mountains, not a shower was seen in the plains below. The district is now seldom visited by Europeans; but Major Rennel was informed by a person of credit, who had resided in the Panjab, that during great part of the S. W. monsoon, or at least in the months July, August, and part of September, which is the rainy season in most other parts of India, very little rain falls in the Delta of the Indus, except very near the sea, though the atmosphere is generally clouded, and very few showers fall throughout the whole season. Captain Hamilton relates, that when he visited Tatta, no rain had fallen there for three years before. We may have some idea of what the Macedonians suffered, by what happened afterwards to Nadir Shah, who, though possessed of vast wealth and power, as well as great experience in military affairs, yet lost a great part of his army, in crossing the mountains and rivers of the Panjab, and in battles with the savage inhabitants who inhabite the countries between the Oxus and the frontiers of Persia. He marched through the same countries, and nearly in the same direction, that Alexander did.

By his voyage down the river Indus, Alexander contributed much more to enlarge our geographical knowledge of India than by all his marches and conquests by land. According to Major Rennel, the space of country through which he sailed on the Indus, from the Hypasis to the ocean, was not less than 1000 miles; and as, during the whole of that navigation, he obliged the nations on both sides the river to submit to him, we may be very certain that the country on each side was explored to some distance. An exact account not only of his military operations, but of everything worthy of notice relating to the countries through which he passed, was preserved in the journals of his three officers, Lagus, Nearcatus, and Aristobulus; and these journals, Arrian informs us, he followed in the composition of his history. From these authors we learn, that in the time of Alexander, the western India in the part of that vast tract named India was possessed by several very powerful monarchs. The territory of King Porus, which Alexander first conquered, and that restored to him, is said to have contained no fewer than 2000 towns; and the king of the Prasi had assembled an army of 20,000 cavalry, 2000 armed chariots, and a great number of elephants, to oppose the Macedonian monarch on the banks of the Ganges. The navigable rivers with which the Panjab country abounds, afforded then, and still continue to afford, an intercourse from one part to another by water: and as at that time these rivers had probably many ships on them for the purposes of commerce, Alexander might easily collect all the number he is said to have had, viz. 2000; since it is reported that Semiramis was opposed by double the number on the Indus when she invaded India. When Mahmud Gazi also invaded this country, a fleet was collected upon the Indus to oppose him, consisting of the same number of vessels. From the Ayeen Akbery, also, we learn that the inhabitants of this part of India still continue to carry on all their communication with each other by water; and the inhabitants of the cities of Tatta alone have 40,000 vessels of various constructions.

Under the article HINDOSTAN we have mentioned why Major Rennel’s opinion concerning the silence of Alexander’s historians about the expedition of Scylax; but it is not necessary to Dr Robertson accounts for it in another manner. “It is remarkable (says he), that neither Nearcatus, nor Ptolemy, nor Aristobulus, nor even Arrian, once mention the voyage of Scylax. This could not proceed from their being unacquainted with it, for Herodotus was a favourite author in the hands of every Greek who had any pretensions to literature. It was probably occasioned by the reasons they had to distrust the veracity of Scylax, of which I have already taken notice. Accordingly, in a speech which Arrian puts in the mouth of Alexander, he asserts, that, except Bacchus, he was the first who had passed the Indus; which implies that he disbelieved what is related concerning Scylax, and was not acquainted with what Darius Hystaspes is said to have done in order to subject that part of India to the Persian crown. This opinion is confirmed by Megasthenes, who resided a considerable time in India. He asserts that, except Bacchus and Hercules (to whose fabulous expeditions Strabo is astonished,
INDIA.

Indi. astonished that he should have given any credit), Alexander was the first who had invaded India. Arrian informs us that the Assaceni, and other people who inhabited the country now called Candahar, had been tributary first to the Assyrians and then to the Medes and Persians. As all the fertile provinces on the north-west of the Indus were anciently reckoned to be part of India, it is probable that what was levied from them is the sum mentioned in the tribute-roll from which Herodotus drew his account of the annual revenue of the Persian empire, and that none of the provinces to the south of the Indus were ever subject to the kings of Persia."—The Doctor differs from Mr. Kennel with respect to the surprise which Alexander and his army expressed when they saw the high tides at the mouth of the Indus. This he thinks might very naturally have been the case, notwithstanding what Herodotus had written concerning the flux and reflux observable in the Red sea. All that has been mentioned by Herodotus concerning this phenomenon is, that "in the Red sea there is a regular ebb and flow of the tide every day." No wonder, therefore, that the Macedonians should be surprised and terrified at the very high tides which presented themselves in the Indian ocean, which the few words of Herodotus above-mentioned had by no means led them to expect. In the like manner the Romans were surprised at the tides in the Atlantic, when they had conquered some of the countries bordering upon that ocean. Caesar describes the astonishment of his soldiers at a spring tide in Britain which greatly damaged his fleet; and, indeed, considering the very little rise of the tide in the Mediterranean, to which alone the Greeks and Romans had access, we may reckon the account given us by Arrian highly probable.

The country on each side the Indus was found, in the time of Alexander, to be in no degree inferior in population to the kingdom of Porus already mentioned. The climate, soil, and productions of India, as well as the manners and customs of the inhabitants, are exactly described, and the descriptions found to correspond in a surprising manner with modern accounts. The stated change of seasons now known by the name of monsoons, the periodical rains, the swellings and inundations of the rivers, with the appearance of the country during the time they continue, are particularly described. The descriptions of the inhabitants are equally particular; their living entirely upon vegetable food, their division into tribes or castes, with many of the particularities related under the article Hindoo, are to be met with in the accounts of Alexander's expedition. His military operations, however, extended but a very little way into India properly so called; no further indeed than the modern province of Lahore, and the countries on the banks of the Indus from Multan to the sea; though, had he lived to undertake another expedition as he intended, it is very probable that he would have subdued a vastly greater tract of country; nor indeed could any thing probably have set bounds to his conquests but death or revolt in distant provinces of his empire. In order to secure the obedience of those countries he subdued, Alexander found it necessary to build a number of fortified cities; and the farther eastward he extended his conquests, the more necessary did he find this task. Three he built in India itself; two on the banks of the Hydaspes, and a third on the Acenines, both navigable rivers, falling into the Indus after they have united their streams. By means of these cities he intended not only to keep the adjacent countries in awe, but to promote a commercial intercourse betwixt different parts both by land and water. With this view, also, on his return to Susa, he surveyed in person the course of the Euphrates and Tigris, causing the cataracts or dams to be removed which the Persian monarchs had built to obstruct the navigation of those rivers, in conformity to a maxim of their superstition, that it was unlawful to defile any of the elements, which they imagined was done by navigators. After the navigation was opened in this manner, he proposed that the valuable commodities of India should be imported into the other parts of his dominions by means of the Persian gulf; while through the Red sea they were conveyed to Alexandria in Egypt, and thence dispersed all over Europe.

The death of Alexander having put an end to all his great schemes, the eastern part of his dominions devolved first on Pytho the son of Agenor, and afterwards on Seleucus. The latter was very sensible of the advantages to be derived from keeping India in subjection. With this view he undertook an expedition into that country, partly to establish his authority more perfectly, and partly to defend the Macedonian territories against Sandracottus king of the Prasii, who threatened to attack them. The particulars of his expedition are very little known; Justin being the only author that mentions them, and his authority is but of little weight, unless corroborated by the testimony of other historians. Plutarch, who tells us that Seleucus carried his arms farther into India than Alexander, is subject to an imputation of the same kind; but Pliny, whose authority is of considerably greater weight, corroborates the testimony of Plutarch in this instance, though his words are so obscure, that learned men differ in opinion concerning their meaning. Bayer thinks they imply that Seleucus marched from the Hyphasis, the boundary of Alexander's conquests, to the Hydaspes, thence to Palibostra, and then to the mouth of the Ganges; the distances of the principal stations being marked, and amounting in all to 2244 Roman miles. Notwithstanding this authority, however, Dr. Robertson thinks it very improbable that the expedition of Seleucus should have continued so long, as in that case "the ancients would have had a more accurate knowledge of that part of the country than they seem ever to have possessed."

The career of Seleucus in the east was stopped by Antigonus, who prepared to invade the western part of his dominions. The former was therefore obliged to conclude a treaty with Sandracottus, whom he allowed to remain in quiet possession of his territories; but Dr. Robertson is of opinion, that during the lifetime of Seleucus, which continued 42 years after the death of Alexander, no diminution of the Macedonian territories took place. With a view of keeping up a friendly intercourse with the Indian prince, Seleucus sent Megasthenes, one of Alexander's officers, to Palibostra, capital of the kingdom of the Prasii, thence situated on the banks of the Ganges. This city is by Dr. Robertson supposed to be the modern Allahabad, situated at the conflux of the Jumna and Ganges, con-
IN\DI\A.

As Megasthenes resided in this city for a considerable space of time, he had an opportunity of making many observations on the country of India in general; and these observations he was induced afterwards to publish. Unhappily, however, he mingled with his relations the most extravagant fables. To him may be traced the ridiculous accounts of men with ears so large that they could wrap themselves up in them; of tribes with one eye, without mouths or noses, &c. whence the extracts from his book given by Arrian, Diodorus, and other ancient writers, can scarcely be credited, unless confirmed by other evidence.

After the embassy of Megasthenes to Sandracottus, and that of his son Damaclus to Allectus, the successor of Sandracottus, we hear no more of the affairs of India with regard to the Macedonians, until the time of Antiochus the Great, who made a short incursion into India about 197 years after the death of Seleucus. All that we know of this expedition is, that the Syrian monarch, after finishing a war he carried on against the two revolted provinces of Parthia and Bactria, entered India, where he obliged Sophaganesus, king of the country which he invaded, to pay a sum of money, and give him a number of elephants. It is probable that the successors of Seleucus were obliged soon after his death to abandon all their Indian territories.

After the loss of India by the Syrians, an intercourse was kept up for some time betwixt it and the Greek kingdom of Bactria. This last became an independent state about 69 years after the death of Alexander; and, according to the few hints we have concerning it in ancient authors, carried on a great traffic with India. Nay, the Bactrian monarchs are said to have conquered more extensive tracts in that region than Alexander himself had done. Six princes reigned over this new kingdom in succession; some of whom, elated with the conquests they had made and the power they had acquired, assumed the title of Great King, by which the Persian monarchs were distinguished in their highest splendour. Strabo informs us, that the Bactrian princes were deprived of their territories by the Scythian Nomades, who came from the country beyond the Jaxartes, and were known by the names of Asii, Pasiani, Tachari, and Sacrauli. This is confirmed by the testimony of some Chinese historians quoted by M. de Guignes. According to them, about 1162 years before the Christian era, a powerful horde of Tartars, pushed from their native seats on the confines of China, and obliged to move farther to the west, passed the Jaxartes, and, pouring in upon Bactria like an irresistible torrent, overwhelmed that kingdom, and put an end to the dominion of the Greeks after it had lasted near 135 years.

From this time to the close of the 15th century, all thoughts of establishing any dominion in India were totally abandoned by the Europeans. The only object now was to promote a commercial intercourse with that country; and Egypt was the medium by which that intercourse was to be promoted. Ptolemy the son of Lagus, and first king of Egypt, first raised the power and splendour of Alexandria, which he knew had been built by Alexander with a view to carry on a trade to India; and in order to make the navigation more secure, he built the celebrated light-house at Pharos; a work so magnificent as to be reckoned one of the wonders of the world. His son Ptolemy Philadelphus prosecuted the same plan very vigorously. In his time the Indian commerce once more began to centre in Tyre; but to remove it effectually from thence, he formed a canal between Aristeu on the Red sea, not far from the place where Suez now stands, and the Pelusiac or eastern branch of the Nile. This canal was 100 cubits broad and 30 deep; so that by means of it the productions of India might have been conveyed to Alexandria entirely by water. We know not whether this work was ever finished, or whether it was found useless on account of the dangerous navigation towards the northern extremity of the Red sea; but whatever was the cause, it is certain that no use was made of it, and a new city named Berenice, situated almost under the tropic, upon the western shore of the Red sea, became the staple of Indian commerce. From thence the goods were transported by land to Coptos, a city distant only three miles from the Nile, to which it was joined by a navigable canal. Thus, however, there was a very tedious land carriage of no less than 258 Roman miles through the barren desert of Thebias; but Ptolemy caused diligent search to be made everywhere for springs, and wherever these were found, he built inns or caravanseras for the accommodation of travellers; and thus the commerce with India was carried on till Egypt became subject to the Romans. The ships during this period set sail from Berenice, and coasting along the Arabian shore to the promontory of Syagrus, now Cape Rasalgeti, held their course along the coast of Persia till they arrived at the mouth of the western branch of the river Indus. They either sailed up this branch till they came to Datta, now Tatta, situated at the upper part of the Delta, or continued their course to some other emporium on the western part of the Indian coast. A more convenient course was afterwards found by sailing directly to Zizona, a place concerning which there is now some dispute. Montesquieu will have it to be the kingdom of Sigetis, on the coast adjacent to the Indus, and which was conquered by the Bactrian monarchs; but Major Renne is of opinion that it was a port on the Malabar coast. Dr Robertson does not pretend to decide this dispute; but is of opinion, that during the time of the Ptolemies very little progress was made in the discovery of India. He contests the opinion of Major Renne, that "under the Ptolemics the Egyptians extended their navigation to the extreme point of the Indian continent, and even sailed up the Ganges to Palibothra, now Patna." In this case he thinks that the interior parts of India must have been much better known to the ancients than we have any reason to believe they were. He owns indeed that Strabo mentions the sailing up the Ganges, but then it is only cursorily and in a single sentence: "whereas if such a considerable inland voyage of above 450 miles, through a populous and rich country, had been customary, or even if it had been even performed by the Roman, Greek, or Egyptian traders, it must have merited a particular description, and must have been mentioned by Pliny, and other writers, as there was nothing similar to it in the practice of navigation among the ancients."—The extreme danger of navigating
gating the Red sea in ancient times (which even in the present improved state of navigation is not entirely got over) seems to have been the principal reason which induced Ptolemy to remove the communication with India from Arinthe to Berenice, as there were other harbours on the same coast considerably nearer to the Nile. After the ruin of Coptos by the emperor Dioclesian, the Indian commodities were conveyed from the Red sea to the Nile from Cosser, supposed by Dr Robertson to be the Philibersus Portus of Ptolemy, to Cusa, the Vicus Apollionis, a journey of four days. Hence Cusa from a small village became an opulent city; but in process of time, the trade from India removed from Cusa to Keret, farther down the river. In modern times such Indian goods as are brought by the Red sea come from Gidda to Suez, and are carried across the isthmus on camels, or brought by the caravan returning from the pilgrimage to Mecca.

Why the Syrian monarchs did not attempt to rival the Egyptians.

It was to this monopoly of Indian commerce that Egypt owed its vast wealth and power during the time of its Macedonian monarchs; but it appears surprising that no attempt was made by the Syrian monarchs to rival them in it, especially as the latter were in possession of the Persian gulf, from whence they might have imported the Indian commodities by a much shorter navigation than could be done by the Egyptians. For this neglect several reasons are assigned by our learned author. 1. The Egyptians, under their Greek monarchs, applied themselves to maritime affairs; and were in possession of such a powerful fleet as gave them a decided superiority at sea. 2. No intercourse by sea was ever kept up between Persia and India, on account of the aversion which the Persians had to maritime affairs. All the Indian commodities were then conveyed in the most tedious and difficult manner over land, and dispersed throughout the various provinces, partly by means of navigable rivers and partly by means of the Caspian sea. 3. Many of the ancients, by an unaccountable error in geography, imagined the Caspian sea to be a part of the great northern ocean; and thus the kings of Syria might hope to convey the Indian commodities to the European countries without attempting to navigate those seas which the Egyptian monarchs deemed their own property. Seleucus Nicator, the first and greatest of the Syro-Macedonian monarchs, formed a project of joining the Euxine and Caspian seas by a navigable canal, which would have effectually answered the purpose, but was assassinated before he could put it in execution, and none of his successors had abilities to execute such an undertaking. 4. Alexander the Great had given orders, a little before his death, to fit out a squadron on the Caspian sea, in order to discover whether it had any communication with the northern ocean, the Euxine sea, or Indian ocean; but Dr Robertson justly thinks it surprising that such errors concerning this sea should have existed among the ancients, as Herodotus had long before described it properly in the following words: The Caspian is a sea by itself, unconnected with any other. Its length is as much as a vessel with oars can sail in 15 days; and its greatest breadth as much as it can sail in eight days. Aristotle describes it in like manner, and insists that it ought to be called a great lake, and not a sea.

On the conquest of Egypt by the Romans, the Indian commodities continued as usual to be imported to Alexandria in Egypt, and from thence to Rome; but besides this, the most ancient communication between the eastern and western parts of Asia seems never to have been entirely given up. Syria and Palestine are India. Germany was separated from Mesopotamia by a desert; but the passage through it was much facilitated by its affording a station which abounded in water. Hence the possession of this station became an object of such consequence, that Solomon built upon it the city called in Syria Tellimor, and in Greek Palmyra. Both these names are expressive of its situation in a spot adorned with palm-trees. Though its situation for trade may to us seem very unfavourable (being 60 miles from the Euphrates, by which alone it could receive the Indian commodities, and 203 from the nearest coast of the Mediterranean), yet the value and small bulk of the goods in question rendered the conveyance of them by a long carriage over land not only practicable but lucrative and advantageous. Hence the inhabitants became opulent and powerful, and long maintained their independence even after the Syrian empire became subject to Rome. After the reduction of Palmyra by the emperor Aurelian, however, it did not any more recover its splendour; the trade gradually turned into other channels, and the city was reduced to ruins, which still exist, and manifest its former grandeur. See PALMYRA.

The excessive eagerness of the Romans for Asiatic luxuries of all kinds kept up an unceasing intercourse with India during the whole time that the empire continued in its power; and even after the destruction of the western part, it was kept up between Constantinople and those parts of India which had been visited formerly by merchants from the western empire. Long before this period, however, a much better method of sailing to India had been discovered by one Hippalus, the commander of an Indian ship, who lived about 80 years after Egypt had been annexed to the Roman empire. This man having observed the periodical shifting of the monsoons, and how steadily they blew from the east or west during some months, ventured to leave the coast, and sail boldly across the Indian ocean from the mouth of the Arabian gulf to Musiris, a port on the Malabar coast; which discovery was reckoned a matter of such importance, that the name of Hippalus was given to the wind by which he performed the voyage. Pliny gives a very particular account of the manner in which the Indian traffic was now carried on, mentioning the particular stages, and the distances between them, which are as follow. From Alexandria to Jutropolis was two miles; and there the cargo destined for India was shipped on the Nile, and carried to Coptos, distant 325 miles, the voyage being usually performed in twelve days. From Coptos they were conveyed by land to Berenice, distant 258 miles, and halting at different stations as occasion required. The journey was finished on the 12th day; but by reason of the heat the caravan travelled only in the night. The ships left Berenice about midsummer, and in 30 days reached Oeacrit, now Gella, at the mouth of the Arabian gulf, or Cane (now Cape Farquar) on the coast of Arabia Felix: from whence they sailed in 40 days to Musiris already mentioned. Their homeward voyage began early in the month of December; when setting sail with
with a north-east wind, and meeting with a south or south-west one when they entered the Arabian gulf, the voyage was completed in less than a year. With regard to the situation of Musiria, as well as of Barace, another Indian port to which the ancients traded, Major Rennel is of opinion, and Dr Robertson agrees with him, that they stood somewhere between Goa and Tellicherry; and that probably the modern Meerzaw or Marjee is the Musiria, and Barcolere the Barace of the ancients.

Ptolemy, who flourished about 200 years after the commencement of the Christian era, having the advantage of so many previous discoveries, gives a more particular description of India than what is to be met with in any of the ancient writers; notwithstanding which, his accounts are frequently inconsistent not only with modern discoveries, but with those of more ancient geographers than himself. A most capital error in his geography is, that he makes the peninsula of India stretch from the Sinus Barygazeus, or gulf of Cambay, from west to east, instead of extending, according to its real direction, from north to south; and this error must appear the more extraordinary, when we consider that Megasthenes had published a measurement of this peninsula nearly consonant to truth, which had been adopted with some variations by Eratosthenes, Strabo, Diodorus Siculus, and Pliny. His information concerning the situation of places, however, was much more accurate. With respect to some districts on the eastern part of the peninsula, as far as the Ganges, he comes nearer the truth than in his descriptions of any of the rest. These are particularly pointed out by M. D’Anville, who has determined the modern names of many of Ptolemy’s stations, as Kilkare, Negapatum, the mouth of the river Cauveri, Masulipatam, &c. The river Cauveri is the Chaboris of Ptolemy; the kingdom of Arcot, Arcati Regio; and probably, says Dr Robertson, the whole coast has received its present name of Coromandel from Sor Mandulum, or the kingdom of Sorn, which is situated upon it. Ptolemy had likewise acquired so much knowledge concerning the river Ganges, that he describes six of its mouths, though his delineation of that part of India which lies beyond the Ganges is hardly less erroneous than that of the nearer peninsula. M. D’Anville, however, has thus great pains to elucidate those matters, and to illustrate those parts of the writings of Ptolemy which appear to be best founded. According to him, the Golden Chersonesus of Ptolemy is the peninsula of Malacca; he supposes the gulf of Siam to be the great bay of Ptolemy; and the Sinne Metropolis of the same writer he looks upon to be Sin-hoa in the western part of the kingdom of Cochín-China, though Ptolemy has erred in its situation no less than 50 degrees of longitude and 20 of latitude. M. Gosseelin, however, differs from his countryman M. D’Anville, in a late work intitled ‘The Geography of the Greeks analysed; or the systems of Eratosthenes, Strabo, and Ptolemy, compared with each other, and with the knowledge which the moderns have acquired.’ In the opinion of M. Gosselein, the Magnum Pronomitorium of Ptolemy is not Cape Romanis at the southern extremity of the peninsula of Malacca, as M. D’Anville supposed, but the point Brugu, at the mouth of the river Ava. The great bay of Ptolemy he supposes not to be the gulf of Siam, but of Martaban.

He endeavours to prove that the position of Cattipara, as laid down by Ptolemy, corresponds with that of Mergui, a sea-port on the west of Siam; and that Thina, or Sine Metropolis, is not Sin-hoa, but Tan-sseriam, a city on the same river with Mergui; and he contends, that the Ibbadii insula of Ptolemy is not Sumatra, as D’Anville would have it, but one of the small islands which lie in a cluster off this coast. M. Gosselein is of opinion that the ancients never sailed through the straits of Malacca, nor had any knowledge of the island of Sumatra, or of the eastern ocean.

The errors of Ptolemy have given occasion to a mistake of more modern date; viz. that the ancients were acquainted with China. This arose from the resemblance betwixt the name of that empire and the Sine of the ancients. The Ayeen Akbery informs us, that Chen was an ancient name of Pegu; whence, says Dr Robertson, ‘as that country borders upon Ava, where M. Gosselein places the great promontory, this near resemblance of names may appear perhaps to confirm his opinion that Sine Metropolis was situated on this coast, and not so far east as M. D’Anville has placed it.’

Thus we see that the peninsula of Malacca was in all Boundary probability the boundary of the ancient discoveries by the sea; but by land they had correspondence with countries still farther distant. Whilest the Selucide continent continued to enjoy the empire of Syria, the trade with India continued to be carried on by land in the way already mentioned. The Romans having extended their dominions as far as the river Euphrates, found this method of conveyance still established, and the trade was by them encouraged and protected. The progress of the caravans being frequently interrupted by the Parthians, particularly when they travelled towards those countries where silk and other of the most valuable manufactures were procured, it thence became an object to the Romans to conciliate the friendship of the sovereigns of those distant countries. That such an attempt was actually made, we know from the Chinese historians, who tell us, that Antow, by whom they mean the emperor Marcus Antonius, the king of the people of the western ocean, sent an embassy to Ounti, who reigned in China in the 166th year of the Christian era; but though the fact is mentioned, we are left entirely in the dark as to the issue of the negotiations. It is certain, however, that during the times of the Romans such a trade was carried on; and as we cannot suppose all those who visited that distant region to be entirely destitute of science, we may reasonably enough conclude, that by means of some of these adventurers, Ptolemy was enabled to determine the situation of many places which he laid down in his geography, and which correspond very nearly with the observations of modern times.

With regard to the Indian islands, considering the little way they extended their navigation, they could islands not be acquainted with many of them. The principal covered by the ancients was that of Ceylon, called by the ancients Taprobene. The name was entirely unknown in Europe before the time of Alexander the Great; but that conqueror, though he did not visit, had some how or other heard of it; with regard to any particulars, however, he seems to have been very slidersly informed; and the accounts of ancient geographers concerning it are confused.
confused and contradictory. Strabo says, it is as large as Britain, and situated at the distance of seven days according to some reports, or 20 days sailing according to others, from the southern extremity of the peninsula. Pomponius Mela is uncertain whether to consider Taprobane as an island, or the beginning of another world; but inclines to the latter opinion, as nobody had ever sailed round it. The account of Pliny is still more obscure; and by this description he would make us believe, that it was seated in the southern hemisphere beyond the tropic of Capricorn. Ptolemy places it opposite to Cape Comorin, at no great distance from the continent; but was greatly with regard to its magnitude, making it no less than 15 degrees in length from north to south. And Agathemerus, who wrote after Ptolemy, makes Taprobane the largest island in the world, assigning the second place to Britain. From these discordant accounts, some learned men have supposed that the Taprobane of the ancients is not Ceylon, as is generally believed, but the island of Sumatra; though the description of it by Ptolemy, with the figure delineated in his maps, seems to put it beyond a doubt, that Ceylon, and not Sumatra, is the island to which Ptolemy applies the designation of Taprobane. The other islands described by that geographer to the eastward of Taprobane, are, according to Dr Robertson, those called Andaman and Nicobar in the gulf of Bengal.

From the time of Ptolemy to that of the emperor Justinian, we have no account of any intercourse of the Europeans with India, or of any progress made in the geographical knowledge of the country. Under that emperor one Cosmas, an Egyptian merchant, made some voyages to India, whence he acquired the surname of Indicopolitana. Having afterwards turned monk, he published several works; one of which, named Christian Topography, has reached us. In this, though mixed with many strange reveries, he relates with great simplicity and appearance of truth what he had seen in his travels or had learned from others. He describes several places on the western coast of the hither peninsula, which he calls the chief seat of the pepper-trade; and from one of the ports on that coast, named Male, Dr Robertson thinks that the name Malabar may probably be derived, as well as that of Maldives given to a cluster of islands lying at no great distance. Cosmas informs us also, that in his time the island of Taprobane had become a great staple of trade. He supposed it to lie about half way betwixt the Persian gulf and the country of the Sinae; in consequence of which commodious situation it received the silk of the Sinae, and the precious spices of the remote regions of the east, which were from thence conveyed to all parts of India, Persia, and the Arabian gulf. He calls it not Taprobane, but Sitalbida, derived from Selendib, or Serendib, the name by which it is still known all over the east. From him also we learn, that the Persians having overthrown the empire of the Parthians, applied themselves with great diligence and success to maritime affairs; in consequence of which they became formidable rivals to the Romans in the Indian trade. The latter finding themselves thus in danger of losing entirely that lucrative branch, partly by reason of the rivalships just mentioned, and partly by reason of the frequent hostilities which took place between the two empires, formed a scheme of preserving some share of the trade by means of his ally the emperor of Abyssinia. In this he was disappointed, though afterwards he obtained his end in a way entirely unexpected. This was by means of two monks who had been employed as missionaries in different parts of the east, and had penetrated as far as the country of the Serae or Chins. From thence, induced by the liberal promises of Justinian, they brought a quantity of the eggs of the silk-worms in a hollow cane. They were then hatched by the heat of a dagheli; and being fed with the leaves of the mulberry, worked and multiplied as well as in those countries of which they are natives. Vest numbers were soon reared in Greece; from whence they were exported to Sicily, and from thence to Italy; in all which countries silk manufactures have since been established.

On the conquest of Egypt by the Saracens in the Intercessionary year 640, the India trade was of course transferred to the Saracens with much more vigour than the Romans had done. The city of Bassora was built by the caliph Omar upon the western banks of the great river formed by the union of the Euphrates with the Tigris. Thus the command of both rivers was secured, and the new city soon became a place of such consequence as scarce to yield to Alexandria itself. Here Dr Robertson takes notice, that from the evidence of an Arabian merchant who wrote in the year 851, it appears, that not only the Saracens, but the Chinese also, were destitute of the use of the instrument was known in the east long before it made its appearance in Europe. From this relation, as well as much concurring evidence, says our author, "it is manifest, that not only the Arabs but the Chinese were destitute of this faithful guide, and that their mode of navigation was not more adventurous than that of the Greeks and Romans. They steered servily along the coast, seldom stretched out to sea so far as to lose sight of land, and as they shaped their course in this timid manner, their mode of reckoning was defective, and liable to the same errors with that of the Greeks and Romans." Notwithstanding this disadvantage, however, they penetrated far beyond Siam, which had set bounds to the navigation of the Europeans. They became acquainted with Sumatra and other Indian islands; extending their navigation as far as the city of Canton in China. A regular commerce was now carried on from the Persian gulf to all the countries lying betwixt it and China, and even with China itself. Many Saracens settled in India properly so called, and in the countries beyond it. In the city of Canton particularly, they were so numerous, that the emperor permitted them to have a cadi or judge of their own religion; the Arabian language was understood and spoken in every place of consequence; and ships from China are even said to have visited the Persian gulf.

According to the Arabian accounts of these days, the peninsula of India was at that time divided into four kingdoms. The first was composed of the provinces situated on the Indus and its branches, the capital of which was Moulava. The second had the city of Canoge, which, from the ruins of it remaining at this day, appears to have been a very large place. The Indian...
Indian historians relate, that it contained 30,000 shops in which betel nut was sold, and 60,000 sets of musicians and singers who paid a tax to government. The third kingdom was that of Cachimere, first mentioned by Massoudi, who gives a short description of it. The fourth kingdom, Gozerat, is represented by the same author as the most powerful of the whole. Another Arab writer, who flourished about the middle of the 24th century, divides India into three parts; the northern, comprehending all the provinces on the Indus; the middle, extending from Gozerat to the Ganges; and the southern, which he denominates Comar, from Cape Comorin.

From the relation of the Arabian merchant above mentioned, explained by the commentary of another Arabian who had likewise visited the eastern parts of Asia, we learn many particulars concerning the inhabitants of these distant regions at that time, which correspond with what is observed among them at this day. They take notice of the general use of silk among the Chinese; and the manufacture of porcelain, which they compare to glass. They also describe the tea plant, with the manner of using its leaves; whence it appears, that in the ninth century the use of this plant in China was as common as it is at present. They mention likewise the great progress which the Indians had made in astronomy; a circumstance which seems to have been unknown to the Greeks and Romans: they assert, that in this branch of science the Indians were far superior to the most enlightened nations of the west, on which account their sovereign was called the "King of wisdom." The superstitions, extravagant penances, &c. known to exist at this day among the Indians, are also mentioned by those writers; all which particulars manifest that the Arabs had a knowledge of India far superior to that of the Greeks or Romans. The zeal and industry of the Mohammedans in exploring the most distant regions of the east was rivalled by the Christians of Persia, who sent missionaries all over India and the countries adjoining, as far as China itself. But while the western Asiatics thus kept up a constant intercourse with these parts, the Europeans had in a manner lost all knowledge of them. The port of Alexandria, from which they had formerly been supplied with the Indian goods, was now shut against them; and the Arabs, satisfied with supplying the demands of their own subjects, neglected to send any by the usual channels to the towns on the Mediterranean. The inhabitants of Constantinople, and some other great towns, were supplied with Chinese commodities by the most tedious and difficult passage imaginable. The silk of that country was purchased in the most westerly province named Cherau; from whence it was conveyed by a caravan, which marched 80 or 100 days, to the banks of the Oxus. Here it was embarked, and carried down the river to the Caspian sea; whence, after a dangerous voyage across that sea, it was carried up the river Cyrus as far as that river is navigable; after which it was conducted by a land carriage of five days to the river Phasis, then down that stream into the Euxine, and thence to Constantinople. The passage of goods from Hindostan was less tedious; they being carried either directly to the Caspian or to the river Oxus, but by a passage much shorter than that from China; after which they were conveyed down the Phasis to the Exune, and thus to Constantinople.

It is evident that a commerce thus carried on must have been liable to a thousand disadvantages. The goods conveyed over such vast tracts of land could not be sold but at a very high price, even supposing the journey had been attended with no danger; but as the caravans were continually exposed to the assaults of barbarians, it is evident that the price must on that account have been greatly enhanced. In spite of every difficulty, however, even this commerce flourished, and Constantinople became a considerable mart for East Indian commodities; and from it all the rest of Europe was chiefly supplied with them for more than two centuries. The perpetual course of hostilities in which the Christians and Mohammedans were during this period engaged, contributed still to increase the difficulty; and it is remarkable, that the more this difficulty increased, the more desirous the Europeans seemed to be of possessing the luxuries of Asia.

About this time the cities of Amsph and Venice, with some others in Italy, having acquired a greater degree of independence than they formerly possessed, began first to exert themselves in promoting domestic manufactures, and then to import the productions of India in much larger quantities than formerly. Some traces of this revival of a commercial spirit, according to Dr Robertson, may be observed from the end of the seventh century. The circumstances which led to this revival, however, are entirely unnoticed by historians; but during the seventh and eighth centuries, it is very probable that no commercial intercourse whatever took place between Italy and Alexandria; for, prior to the period we speak of, all the public deeds of the Italian and other cities of Europe had been written upon paper made of the Egyptian papyrus, but after that upon parchment.

The mutual antipathy which the Christians and Mohammedans bore against each other, would no doubt for a long time retard the progress of commerce between them; but at last the caliphs, perceiving the advantage which such a traffic would be of to their subjects, were induced to allow it, while the eagerness with which the Christians coveted the Indian products and manufactures, prompted them to carry it on. But the effect of the crusades on the commerce of being totally interrupted by the crusades. Notwithstanding the enthusiastic zeal of these adventurers, however, there were many to whom commerce was a greater object than religion. This had always been the case with numbers of the pilgrims who visited the holy places at Jerusalem, even before the commencement of the crusades; but these, after they took place, instead of retarding the progress of this kind of commerce, proved the means of promoting it to a great degree. Various circumstances (says Dr Robertson) concurred towards this. Great armies, conducted by the most illustrious nobles of Europe, and composed of men of the most enterprising spirit in all the kingdoms of it, marched towards Palestine, through countries far advanced beyond those which they left in every species of improvement. They beheld the dawn of prosperity in the republics of Italy, which had begun to vie with each other in the arts of industry, and in their efforts to engage the lucrative commerce with the
the east. They next admired the more advanced state of opulence and splendour in Constantinople, raised to a pre-eminence above all cities then known by its extensive trade, particularly that which it carried on with India and the countries beyond it. They afterwards served in those provinces of Asia through which the commodities of the east were usually conveyed, and became masters of several cities which had been staples of that trade. They established the kingdom of Jerusalem, which subsisted near 200 years. They took possession of the throne of the Greek empire, and governed it about half a century. Amidst such a variety of events and operations, the ideas of the fierce warriors of Europe gradually opened and improved; they became acquainted with the policy and arts of the people whom they subdued: they observed the sources of their wealth, and availed themselves of all this knowledge. Antioch and Tyre, when conquered by the crusaders, were flourishing cities, inhabited by opulent merchants, who supplied all the nations trading in the Mediterranean with the productions of the east; and, as far as can be gathered from incidental occurrences mentioned by the historians of the holy war, who being mostly priests and monks, had their attention directed to objects very different from those relating to commerce, there is reason to believe, that both in Constantinople while subject to the Franks, and in the ports of Syria acquired by the Christians, the long-established trade with the east continued to be protected and encouraged."

Our author next goes on to show in what manner the commerce of the Italian states was promoted by the crusades, until at last, having entirely engaged the East India trade, they strove with such eagerness to find new markets for their commodities, that they extended a taste for them to many parts of Europe where they had formerly been little known. The rivalship of the Italian states terminated at last in a treaty with the sultan of Egypt in 1425, by which the port of Alexandria and others in Egypt were opened to the Florentines as well as the Venetians; and soon after, that people began to obtain a share in the trade to India which the Genoese of that state in the commerce we speak of, and they had possessed themselves of many important places on the coast of Greece, as well as of the port of Caffa on the Black sea. Nay, they had even established themselves at Constantinople, in the suburb of Pera, in such a manner as almost entirely to exclude the Greeks themselves from any share in this commerce; but by the destruction of Constantinople they were at once driven out of all these possessions, and so thoroughly humbled, that they could no longer contend with the Venetians and Genoese; but that, during the latter part of the 15th century, that republics held the greatest part of Europe with the productions of the east, and carried on trade to an extent far beyond what had been known in former times. The mode in which they now carried on this trade was somewhat different from what had been practiced by ancient nations. The Tyrians, Greeks, and Romans, had sailed directly to India in quest of the commodities they wanted; and their example has been imitated by the navigators of modern Europe. In both periods the Indian commodities have been paid for in gold and silver; and great complaints have been made on account of the drain of those precious metals, which were thus buried as it were in India, never to return again. The Venetians, however, were exempted from this loss; for in exchange of no direct intercourse with India, they supplied the Venetians themselves from the warehouses they found in Egypt, Syria, and Persia, ready filled with the precious commodities they wanted; and these they purchased more frequently by barter than with ready money. Thus, mercantile commerce began only the republics of Venice, but all the cities which had the good fortune to become emporia for the Indian goods imported by it, were raised to such a pitch of power.

Vol. XI. Part I.
INDIA.

The discovery of the passage to India by the Cape of Good Hope, however, was the most effectual and speedy in humbling the Venetians. After a tedious course of voyages along the western coast of Africa, continued for near half a century, Vasco de Gama, an active and enterprising Portuguese officer, doubled the Cape of Good Hope, and, coasting along the eastern shore of the continent, sailed next across the Indian ocean, and landed at Calicut on the coast of Malabar, on the 22d of May 1498, ten months and two days after leaving the port of Lisbon. On his arrival in India he was at first received with great kindness by the sovereign of that country, styled the Samorin; but afterwards, from what causes we cannot now well determine, the Indian prince suddenly changed his kindness into mortal enmity, and attempted to cut off Gama with his whole party. The Portuguese admiral, however, found means to escape every plot that was laid against him; and loaded his ships not only with the products of that part of the country, but with many of the valuable products of the more remote regions.

On his return to Portugal, De Gama was received with all imaginable demonstrations of kindness. The Portuguese nation, nay all the nations in Europe, the Venetians alone excepted, rejoiced at the discovery which had been made. The latter beheld in it the certain and unavoidable downfall of their own power, while the Portuguese, presuming upon their right of prior discovery, which they took care to have confirmed by a papal grant, plumed themselves on the thoughts of having the whole Indian commerce centre in their nation. The expectations of the one, and the apprehensions of the other, seemed at first to be well-founded. A succession of gallant officers sent into the east from Portugal accomplished the greatest and most arduous undertakings. In 24 years after the voyage of De Gama, they had made themselves masters of many important places in India; and among the rest of the city of Malacca, where the great staple of trade throughout the whole East Indies was established. As this city stands nearly at an equal distance from the eastern and western extremities of all the countries comprehended under the name of Indies, it was frequented by the merchants of China, Japan, of all the kingdoms on the continent, the Moluccas and other islands in that quarter, as well as by those of Malabar, Ceylon, Coromandel, and Bengal. Thus the Portuguese acquired a most extensive influence over the internal commerce of India; while, by the settlements they had formed at Goa and Diu, they were enabled to engross the trade on the Malabar coast, and greatly to obstruct the long established intercourse of Egypt with India by the way of the Red sea. Their ships now frequented every port in the east where any valuable commodities were to be had, from the Cape of Good Hope to the river of Canton in China; and all lying at that immense extent of more than 4000 leagues, they had a chain of forts and factories established for the convenience of protecting their trade. They had likewise made themselves masters of several stations favourable to commerce along the southern coast of Africa, and in many islands lying between Madagascar and the Moluccas. In all places where they came, their arms had struck such terror, that they not only carried on their trade without any rival or controul, but even prescribed
India.

The natives set the terms of their mutual intercourse; nay, sometimes they set what price they pleased upon the commodities they purchased, and thus were enabled to import into Europe the Indian commodities in greater abundance and at a lower rate than had ever been done before. Not satisfied with this, they formed a scheme of excluding all other nations from any share of the trade they enjoyed; and for that purpose determined to make themselves masters of such stations on the Red Sea and Persian Gulf as might put them in possession of the navigation of both these seas, and enable them not only to obstruct the ancient commerce between Egypt and India, but to command the mouths of the great rivers which we have formerly mentioned as the means of conveying the Indian goods through the internal parts of Asia. The conduct of these enterprises was committed to Alphonso Albuquerque, the most distinguished officer at that time in the Portuguese service. By reason of the vast number of the enemies he had to contend with, however, and the scanty supplies which could be derived from Portugal, he could not fully accomplish what was expected from him. However, he took from the petty princes who were tributaries to the kings of Persia the small island of Ormus, which commanded the mouth of the Persian Gulf; and thus secured to Portugal the possession of that extensive trade with the east which the Persians had carried on for several centuries. On this barren island, almost entirely covered with salt, and so hot that the climate can scarcely be borne, destitute of a drop of fresh water, except what was brought from the continent, a city was erected by the Portuguese, which soon became one of the chief seats of splendour, and luxury, in the eastern world. In the Red sea the Arabian princes made a much more formidable resistance; and this, together with the damage his fleet sustained in that sea, the navigation of which is always difficult and dangerous, obliged Albuquerque to retire without effecting any thing of importance. Thus the ancient channel of conveyance still remained open to the Egyptians; but their commerce was greatly circumscribed and obstructed by the powerful interest of the Portuguese in every port to which they had been accustomed to resort.

The Venetians now began to feel those effects of De Gama’s discovery which they had dreaded from the beginning. To preserve the remains of their commerce, they applied to the sultan of the Mameluks in Egypt, who was no less alarmed than themselves at the loss of such a capital branch of his revenue as he had been accustomed to derive from the India trade. By them this fierce and barbarous prince was easily persuaded to send a furious manifesto to Pope Julius II. and Emmanuel king of Portugal. In this, after stating his exclusive right to the Indian trade, he informed them, that if the Portuguese did not relinquish that new course of navigation by which they had penetrated into the Indian ocean, and cease from encroaching on that commerce which from time immemorial had been carried on between the east of Asia and his dominions, he would put to death all the Christians in Egypt, Syria, and Palestine, and demolish the holy sepulchre itself. To this threat, which some centuries before would have alarmed all Christendom, so regard was paid; so that the Venetians, as their last resource, were obliged to have recourse to a different expedient. This was to excite the sultan to fit out a fleet in the Red sea to attack the Portuguese, and drive them from all their settlements in the east; nay, in order to assist him in the enterprise, he was allowed to cut down their forests in Dalmatia, to supply the deficiency of Egypt in timber for ship-building. The timber was conveyed from Dalmatia to Alexandria; and from thence, partly by water and partly by land, to Suez; where twelve men of war were built, on board of which a body of Mameluks were ordered to serve under the command of an experienced officer. Thus the Portuguese were assaulted by a new enemy, far more formidable than any they had yet encountered; yet such was the valour and conduct of the admiral, that after several severe engagements, the fleet of the infidels was entirely ruined, and the Portuguese became absolute masters of the Indian ocean.

This disaster was followed in no long time by the total overthrow of the dominion of the Mameluks in Egypt by Selim the Turkish sultan; who thus also became master of Syria and Palestine. As his interest was now the same with that of the Venetians, a league was quickly formed betwixt them for the ruin of the power of the Portuguese in India. With this view Selim confirmed to the Venetians the extensive commercial privileges they enjoyed under the government of the Mameluks; publishing at the same time an edict, by which he permitted the free entry of all the productions of the east imported directly from Alexandria into any part of his dominions, but imposed heavy taxes upon such as were imported from Lisbon. All this, however, was insufficient to counteract the great advantages which the Portuguese had obtained by the new passage to India, and the settlements they had established in that country; at the same time that the power of the Venetians being entirely broken by the league of Cambray, they were no longer able to contribute any assistance. They were therefore reduced to the necessity of making an offer to the king of Portugal to purchase all the spices imported into Lisbon, over and above what might be requisite for the consumption of his own subjects. This offer being rejected, the Portuguese for some time remained uncontrolled masters of the Indian trade, and all Europe was supplied by them, excepting some very inconsiderable quantity which was imported by the Venetians through the usual channels.

The Portuguese continued to enjoy this valuable branch of commerce undisturbed almost for a whole century; for which, however, they were indebted more to the political situation of the different European nations than to their own prowess. After the accession of Charles V. to the throne of Spain, that kingdom was either so much engaged in a multiplicity of operations, owing to the ambition of that monarch and his son Philip II. or so intent on prosecuting their discoveries and conquests in the new world, that no effort was made to interfere with the East Indian trade of the Portuguese, even though an opportunity offered by the discovery of a second passage by sea to the East Indies through the straits of Magellan. By the acquisition of the crown of Portugal in 1580, Spain, instead of becoming the rival, became the protector and guardian of the Portuguese trade. The resources of France all...
this time were so much exhausted by a continuance of long and desolating wars, that it could bestow neither much attention on objects at such a distance, nor engage in any expensive scheme. England was desolated by the ruinous wars between the houses of York and Lancaster, and afterwards its enterprising spirit was restrained by the cautious and covetous Henry VII. His son Henry VIII, in the former part of his reign, by engaging in the continental quarrels of the European princes, and in the latter part by his quarrel with the pope and contests about religion, left no time for commercial schemes. It was not, therefore, till the reign of Queen Elizabeth that any attention was paid to the affairs of the east by that kingdom. The first who shook the power of the Portuguese in India were the Dutch; and in this they were gladly seconded by the natives, whom the Portuguese had most grievously oppressed. The English soon followed their example; and in a few years the Portuguese were expelled from their most valuable settlements, while the most lucrative branches of their trade have continued ever since in the hands of those two nations.

It is not to be supposed that the other European nations would sit still and quietly see these two engross the whole of this lucrative commerce without attempting to put in for a share. East India companies were therefore set up in different countries: but it was only between France and Britain that the great rivalry commenced; nor did this fully display itself till after the peace of Aix-la-Chapelle. Both nations had by this time made themselves masters of considerable settlements in India. The principal of those belonging to Britain were, 1. Surat, situated on the western side of the peninsula within the Ganges, between the 21st and 22nd degrees of N. Lat. This peninsula comprehended the kingdoms of Malabar, Decan, Colocca, and Binsegar, with the principalities of Ginji, Tanjow, and Madura; the western coast being distinguished by the name of Malabar, and the eastern by that of Coromandel. 2. Bombay, a small town in the kingdom of Deon, about 45 leagues to the south of Surat. 3. Dubol, about 40 leagues farther to the south, in the province of Cuncan. 4. Carvar, in N. Lat. 15°, where there was a small fort and factory. 5. Tillicherry, to which place the English trade was removed from Calicut, a large town 15 leagues to the southward. 6. Anjengo, between eight and nine degrees of latitude, the most southerly settlement on the western coast of the peninsula. 7. On the Coromandel coast they possessed Fort St. David's, formerly called Tegapatan, situated in the kingdom of Ginji, in 11° 40' N. Lat. 8. Madras, the principal settlement on this coast, between 13° and 14° N. Lat. not far from the diamond mines of Colocca. 9. Visigapatan, farther to the north. 10. Balasore, in latitude 22°, a factory of small consequence. 11. Calcutta, the capital of all the British settlements in the East Indies. These were the principal places belonging to Britain which we shall have occasion to mention in the account of the contests which now took place; those of the French were chiefly Pondicherry and Chandernagore.

The war is said to have been first occasioned by the intrigues of the French commandant M. Duplex; who immediately after the peace of Aix-la-Chapelle, began to sow dissension among the nabobs, who had by this time usurped the sovereignty of the country. Nizam Almulk, viceroy of Deon, and nabob of Arcot, had, as officer for the Mogul, nominated Anaverdy Khan to be governor of the Carnatic, in the year 1745. On the death of Nizam, his second son Nazir-zing was appointed to succeed him in his viceroyalty, and his nomination was confirmed by the Mogul. He was opposed by his cousin Musazer-zing, who applied to Duplex for assistance. By him he was supplied with a body of Europeans and some artillery; after which, being also joined by Chunda Saib, an active Indian prince, he took the field against Nazir-zing. The latter was supported by a body of British troops under Colonel Lamarose; and the French, dreading the event of an engagement, retired in the night; so that their ally was obliged to throw himself on the clemency of Nazir-zing. His life was spared, though he himself was detained as a state prisoner; but the traitor, forgetting the kindness shown him on this occasion, entered into a conspiracy against the life of Nazir-zing, and murdered him in his camp; in which infamous transaction he was encouraged by Duplex and Chunda Saib, who had retired to Pondicherry. Immense riches were found in the tents of Nazir-zing, great part of which fell to the share of Duplex, whom Musazer-zing now associated with himself in the government. By virtue of this association, the Frenchman assumed the state and formalities of an eastern prince; and he and his colleague Musazer-zing appointed Chunda Saib nabob of Arcot. In 1749, Anaverdy Khan had been defeated and killed by Musazer-zing and Chunda Saib, assisted by the French; after which his son Mohammed Ali Khan had put himself under the protection of the English at Madras, and was confirmed by Nazir-zing as his father's successor in the nabobship or government of Arcot. This government, therefore, was disputed between Mohammad Ali Khan, appointed by the legal viceroy Nazir-zing, and supported by the English company, and Chunda Saib nominated by the usurper Musazer-zing, and supported by Duplex, who commanded at Pondicherry. Musazer-zing, however, did not long enjoy his ill-got authority; for in the year 1751, the nabobs who had been the means of raising him to the power he enjoyed, thinking themselves ill rewarded for their services, fell upon him suddenly, defeated his forces, and put him to death; proclaiming Salabat-zing next day viceroy of the Deon. On the other hand, the Mogul appointed Gauzody Khan, the elder brother of Salabat-zing, who was confirmed by Mohammad Ali Khan in the government of Arcot; but the affairs of the Mogul were at that time in such disorder, that he could not with an army support the nomination he had made. Chunda Saib in the mean time determined to recover by force the nabobship of Arcot, from which he had been deprived by the Mogul, who had placed Anaverdy Khan in his room. With this view he had recourse to Duplex at Pondicherry, who reinforced him with 2000 French, 60 Caftrees, and 420 French; upon condition that if he succeeded, he should cede to the French the town of Velar in the neighborhood of Pondicherry, with its dependencies, consisting of 45 villages. Thus reinforced, he defeated Anaverdy Khan, who lost his life in the engagement, reestablished the government of Arcot,
India.

All this time Mohammed Ali Khan had been supported by the English, to whom he fled after his father's death. By them he was supplied with a reinforcement of men, money, and ammunition, under the conduct of Major Lawrence, a brave and experienced officer. By means of this supply he gained some advantages over the enemy; and repairing afterwards to Fort St. David's, he obtained a further reinforcement. With all this assistance, however, he accomplished nothing of any moment; and the English auxiliaries having retired, he was defeated by his enemies. Thus he was obliged to enter into a more close alliance with the English, and cede to them some commercial points which had been long in dispute; after which, Captain Cape was dispatched to put Trinchinopoly in a state of defence, while Captain de Gisgis, a Swiss officer, marched at the head of 400 Europeans to the assistance of the nabob. On this occasion Mr. Clive first appeared, offered his services in a military capacity. He had been employed before as a writer, but appeared very little qualified for that or any other department in civil life. He now marched towards Arcot at the head of 210 Europeans and 500 Seys. In the first expedition he displayed at once the qualities of a great commander. His movements were conducted with such celerity and dispatch, that he made himself master of the enemy's capital before they knew of his march; and gained the affection of the people by his generosity, in affording protection without ransom. In a short time, however, he found himself invested in Fort St. David's by Rajah Saib, son to Chanda Saib, nabob of Arcot; and afterwards produced forged commissions from the Great Mogul, appointing him governor of all the Carnatic from the river Krisitso to the sea. The better state of the prince came on this deception, a messenger pretended to carry from Delhi, and was received with all the pomp of an ambassador from the Great Mogul. Duplexi, mounted on an elephant, and preceded by music and dancing women, after the oriental fashion, received his commission from the hands of this impostor; after which he affected the state of an eastern prince, kept his durbar or court, appeared sitting cross-legged on a sofa, and received presents as sovereign of the country, from his own council as well as from the natives.

Thus the forces of the English and French East India companies were engaged in a course of hostilities at a time when no war existed between the two nations; and while they thus continued to make war on each other under the title of auxiliaries to the contending parties, Gauzedy Khan took possession of the dignity appointed him by the Mogul; but had not been in possession of it above 14 days when he was poisoned by his own sister. His son Scab Abadian Khan was appointed to succeed him by the Mogul; but the latter being unable to give him proper assistance, Salbat-xing remained without any rival, and made a present to the French commander of all the English possessions to the northward.

Thus concluded the campaign of 1752. Next year reinforcements were received considerable reinforcements; the English, by the arrival of Admiral Watson with a fleet of ships of war, having on board a regiment commanded by Colonel Alderson; and the French by M. Gadeau, commissary and governor-general of all their settlements, on whose arrival M. Duplexi departed.
parted for Europe. The new governor made the most friendly proposals; and desired a cessation of arms until the disputes could be adjusted in Europe. These proposals being readily listened to on the part of the English, deputees were sent to Pondicherry, and a provisional treaty and truce were concluded, on condition that neither of the two companies should for the future interfere in any of the differences that might take place in the country. The other articles related to the places or settlements that should be retained or possessed by the respective companies, until fresh orders should arrive from the courts of London and Versailles; and till then it was stipulated, that neither of the two nations should be allowed to procure any new grant or cession, or to build forts in defence of any new establishment; nor should they proceed to any new settlement, retraction, or evacuation, of what they then possessed; but every thing should remain on the same footing as formerly.

The treaty was published on the 11th of January 1755; at the end of which month Admiral Watson returned with his squadron from Bombay, and M. Gadeau returned to France in the beginning of February, leaving M. Léry his successor at Pondicherry. M. Bussy, with the Soubahdar Salabat-zing, commanded in the north; and M. de Saussay was left to command the troops at Syringham. Matters, however, did not long continue in a state of tranquility. Early in the year it appeared that the French were endeavouring to get possession of all the provinces of the Deccan. M. Bussy demanded the fortress of Colombo from Salabat-zing; and M. Léry encouraged the phusder or governor who rented Velur to take up arms against the nabob. He even sent 300 French and as many Sepoys from Pondicherry to support this rebel, and oppose the English employed by the nabob to collect his revenues from the tributary princes. In this office they had been employed ever since the cessation of hostilities; one half of the revenue being paid to the nabob, and the other to the company, which now involved them in a kind of military expedition into the country of the Polgars, who had been previously summoned to send agents to settle accounts with the nabob, four of them obeyed the summons; Lachenal refused, and it was therefore resolved to attack him. The country was very strong, being almost entirely fortified by nature or art; for it was surrounded by craggy hills detached from one another, and covered with bushes so as to be impassable for any but the natives, who had thrown up works from hill to hill. These works were indeed very rude, being formed of large stones laid upon one another without any cement, and flanked at proper distances by round earthen towers; before the wall was a deep and broad ditch, with a large hedge of bamboos in front, so thick that it could not be penetrated but by the hatchet or by the fire. This was forced, though not without some loss; after which another work of the same kind, but stronger, made its appearance; but this being likewise forced, Lachenal was obliged to submit and pay his tribute.

Madr a reduced. The English army now marched to Madura, a strong Indian town about 60 miles south of Trincinopolis. On their approach it submitted without any opposition, and the inhabitants seemed pleased with their change of government. Here a deputation was received from a neighbouring Polygar, desiring an alliance, and as a proof of his sincerity making an offer of two settlements on the sea-coast of his country opposite to the island of Ceylon, which would greatly facilitate their present future commerce with Timnevelly. Before this time they could not have reached that city but by a circuitous march of 400 or 500 miles; but from the new settlements the distance to Timnevelly was no more than 50 miles, and reinforcements or supplies of any kind might be sent them from Madras or Fort St. David in four or five days. The offer being accepted, Colonel Heron, the English commander, marched to attack the governor of Madura, who had fled to a place called Coilgoody; on the approach of the English he fled from this place also, leaving the greatest part of his troops to defend the place. The road was so rugged, that the carriages of the cannon broke down; and as the troops were not furnished with scaling ladders, there seemed to be little hope of gaining the place, which was very strong. The colonel, however, determined to make an assault after the Indian manner, by burning down the gates with bundles of straw; and to encourage his men in this new method of attack, he himself carried the first torch, being followed by Mohamed Issouf, who bore the second. The place was taken and plundered, not sparing even the temples, which inspired the inhabitants with the utmost abhorrence of the victors, on account of their contempt of their religion.

After this exploit the army removed to Madura; and a garrison being left in the place, they proceeded to Timnevelly, which submitted without opposition, and owned the jurisdiction of the nabob; though some of the Polygars still evaded payment, and therefore hostilities were commenced against them.

The new expedition was marked by an act of the Cutchi most disgraceful cruelty at a fort named Nettootah, 40 miles south of Timnevelly. It was fortified by a mud wall with round towers. The assault was made with great resolution, and the troops gained possession of the parapet without being repulsed. On this the garrison called out for quarter, but it was barbarously refused; a general massacre of men, women, and children ensued, only six persons out of 450 being suffered to escape with life.

It now appeared that the revenues collected in this expedition had not been sufficient to defray the expenses of the army; and a report being spread that Salabat-zing was advancing into the Carnatic at the head of his army, along with M. Bussy the French commander, to demand the Mogul's tribute, it was thought proper to recall Colonel Heron to Trinchinopoli. Before this, he had been prevailed on by the Indian chief who accompanied him, to convey to him (Mazuphe Cawn) an investiture of the countries of Madura and Timnevelly for an annual rent of 185,500 sterling. In his way he was likewise induced by the same chief to make an attempt on a strong fort named Nelliyangaur, situated about 30 miles west of Timnevelly; and belonging to a refractory Polygar. This attempt, however, proving unsuccessful for want of battering cannon, the colonel returned with Mazuphe Cawn to Trinchinopoli, where he arrived on the 22d of May 1755.
The last expedition of this commander was against a mud fort named Polignam, situated near the entrance of the woods belonging to the Colleries. These people were highly incensed at the plundering of Collandery, and particularly at the loss of the several images, which the rapacious conquerors had carried off.

In consequence of this they had already slaughtered a party of Sepoys whom the commanding officer at Madura had sent out to collect cattle. In their march the English army had to go through the pass of Natam, one of the most dangerous in the peninsula. It begins about 20 miles north of Trinchinopoly, and continues for six miles through a wood impassable to Europeans. The road which lay through it was barely sufficient to admit a single carriage at a time, at the same time that a bank running along each side rendered it impossible to widen it. In most places the wood was quite contiguous to the road; and even where part of it had been felled, the eye could not penetrate above 20 yards.—A detachment of Europeans, pioneers, and sepoys, were sent to clear the woods before the main body ventured to pass through such a dangerous defile. The former met with no opposition, nor did any enemy appear against the latter for a long time. At last the march was stopped by one of the heaviest turbulents sticking in a slough, out of which the oxen were not able to draw it. The officers of artillery suffered the troops marching before to proceed; and the officer who commanded in the rear of the battalion, not suspecting what had happened, continued his march, while most of the Sepoys who marched behind the rear division of the artillery were likewise suffered to pass the carriage in the slough, which choked up the road, and prevented the other turbulents from moving forward, as well as three field pieces that formed the rear division of artillery, and the whole line of baggage that followed. In this divided and defenceless state the rear division of the baggage was attacked by the Indians; and the whole would certainly have been destroyed, had it not been for the courage and activity of Capt. Smith, who here commanded 40 Cañares and 200 Sepoys, with one six-pounder. Considerable damage, however, was done, and the Indians recovered their gods; which certainly were not worth the carrying off, being only made of brass, and of a diminutive size. Colonel Heron was tried by a court-martial for misconduct in this expedition; and being found guilty, was declared incapable of serving the company any longer; soon after which he returned to Europe, and died in Holland.

In the mean time Nandereuz, an Indian prince, formed a scheme to get possession of Trinchinopoly; and in order to compass his end with greater facility, communicated his design to M. de Saussay the commander of the French troops. But this gentleman having communicated intelligence to the English commander, the enterprise miscarried, and no difference betwixt these two rival nations as yet took place. It does not, however, appear that the English were in the least more solicitous to avoid hostilities than the French; for as soon as the company were informed of the acquisitions made by M. Bussy in the Deccan, it was determined to encourage the Maharratts to attack Salabat-zing, in order to oblige him to dismiss the French auxiliaries from his service. In order to succeed in this enterprise, it was necessary to have a commander well experienced in the political systems of the country, as well as in military affairs; and for this purpose Mr Grieve, now governor of Fort St. David's, and invested with a lieutenant-colonel's commission in the king's troops, offered his service. Three companies of the king's artillery, consisting of 100 men each, and 300 recruits were sent from England on this expedition, who arrived at Bombay on the 27th of November; when on a sudden the presidency of Madras took it into consideration that this expedition could not be prosecuted without infringing the convention made with the French commander. "This (says Mr Grieve) was acting with too much caution; for every thing relating to Salabat-zing and the French troops in his service seemed to have been studiously avoided. The court of directors had explained their whole plan to the presidency of Madras; but the ship which had the letters on board was unfortunately wrecked on a rock about 800 miles east of the Cape of Good Hope."

The whole expedition was therefore laid aside, and the presidency of Madras directed all their force for the present against Tulugee Angria, who had long been a formidable enemy to the English commerce in those parts.

The dominions of this pirate consisted of several islands near Bombay, and an extent of land on the continent about 150 miles in length, and from 30 to 60 in breadth. He possessed also several forts that had been taken from the Europeans by his ancestors; the trade of piracy having, it seems, been hereditary in the family, and indeed followed by most of the inhabitants of this coast. This was the more dangerous for trading vessels, as the land breezes do not here extend more than 40 miles out at sea, so that the ships are obliged to keep within sight of land; and there was not a creek, harbour, bay, or mouth of a river, along the whole coast of his dominions, where Angria had not erected fortifications, both as stations of discovery and places of refuge to his vessels. His fleet consisted of two kinds of vessels peculiar to this country, named gratts and gallivats. The former have generally two description masts, though some have three; the latter being about 150 tons burthen, and the former 150. They are built to draw little water, being very broad in proportion to their height; but narrowing from the middle to the end, where, instead of bows, they have a prow projecting like a Mediterranean galley, and covered with a strong deck level with the main deck of the vessel, from which it is separated by a bulk-head that terminates the forecastle. As this construction subjects the grab to pitch violently when sailing against a head sea, the deck of the prow is not inclosed with sides as the rest of the vessel, but remains bare, that the water which comes upon it may pass off without interruption. Two pieces of cannon are mounted on the main deck under the forecastle, carrying balls of nine or twelve pounds, which point forwards through port-holes cut in the bulk-head, and fire over the prow; those of the broad side are from six to nine pounders. The gallivats are large row-boats built like the grab, but smaller, the largest scarce exceeding 40 tons burthen. They have two masts, the mizen slightly made, and the main-mast bearing one large and triangular sail. In general they are covered with a spar deck made of split
The commodore, provoked at this pusillanimous behaviour, determined, for the honour of the British arms, to extend the orders he had got. Running within 100 yards of a fort named Severndroog, he in a few hours ruined the walls, and set it on fire; a powder magazine also blowing up, the people, to the number of about 1000, abandoning the place, and embarking on board of eight large boats, attempted to make their escape to another fort named Cox, but were all intercepted and made prisoners by the English. The whole force of the attack being then turned upon Cox, a white flag was soon hung out as a signal to surrender. The governor, however, did not think proper to wait the event of a capitulation, but without delay passed over to Severndroog, where he hoped to be able to maintain his ground notwithstanding the ruinous state of the fortifications. The fire was now renewed against this fortress; and the seamen having cut a passage through one of the gates with their axes, the garrison soon surrendered, at the same time that two other forts besieged by the Maharrats hung out flags of truce and capitulated: and thus were four of Angria's forts, for so many years deemed impregnable, subdued in one day.

These successes were followed by the surrender of the pirate Bancote, a strong fortified island, now called Fortsnayl, by the English East India Company. The ship Victoria, in which the English retained in possession, was burnt by the other forts were delivered up to the Maharrats. On the arrival of Admiral Watson in the beginning of November 1755, it was determined to root out the pirate at once, by attacking Geriah the capital of his dominions; but it was so long since any Englishman had seen this place, and the reports of its strength had been so much exaggerated, that it was thought proper to reconnoitre it before any attack was made. This was done by Commodore James; who having reported that the fort, though strong, was far from being inaccessible or impregnable, it was resolved to prosecute the enterprise with the utmost expedition and vigour. It was therefore attacked by such a formidable fleet, that Angria, losing courage at their approach, fled to the Maharrats, leaving Geriah to be defended by his brother. The fort, however, was soon obliged to surrender, with no more loss on the part of the English than 10 men killed and wounded: but it was afterwards acknowledged, that this success was owing principally to the terror of the garrison, occasioned by such a violent cannonade; for their fortifications appeared to have been proof against the utmost efforts of an enemy. All the ramparts of this fort were either cut out of the solid rock, or built of stones at least ten feet long laid edgeways.

In this fortress were found 200 pieces of brass cannon with six brass mortars, and a great quantity of ammunition and military stores, besides money and effects to the value of 125,000l. Angria's fleet was entirely destroyed, one of the ships having been set on fire by a shell from the English fleet, and the flames having spread from thence to all the rest. About 2000 people were made prisoners; among whom were the wife, children, mother, brother, and admiral of the pirate: but they were treated with the greatest clemency; and his family, at their own request, continued under the protection of the English at Geriah. All the
thought proper to interfere, the English were obliged to stand alone in the quarrel.

Surajah Dowla took the field on the 30th of May 1756, with an army of 40,000 foot, 30,000 horse, and 400 elephants; and on the 2d of June detached 20,000 men to invest the English fort at Cassumbugzar, a large town situated on an island formed by the western branch of the Ganges. The fort was regularly built, with 60 cannon, and defended by 300 men, but principally Sepoys. The nabob pretending a desire to treat, Mr. Watts the chief of the factory, was persuaded to put himself in his power; which he had no sooner done, than he was made a close prisoner, along with Mr. Batson a surgeon who accompanied him. The two prisoners were treated with great indignity, and threatened with death; but two of the council who had been sent for by the tyrant’s command were sent back again, with orders to persuade the people of the factory to surrender it at discretion. This proposal met with great opposition in the council; but was at last complied with, though very little to the advantage of the prisoners; for they were not only deprived of every thing they possessed, but stripped almost naked, and sent to Hooghly, where they were closely confined.

The nabob, encouraged by this success, marched directly to Calcutta, which he invested on the 15th. Though he now threatened to drive the English entirely out of his dominions, yet he proposed an accommodation with Mr. Drake, provided he would pay him his duty upon the trade for 15 years, defray the expenses of his army, and deliver up the Indian merchants who were in the fort. This being refused, a siege commenced, and the place was taken in three days, through the treachery of the Dutch guard who had the charge of a gate. The nabob promised on the word of a soldier, that no harm should be done to the English; nevertheless they were shut up in a prison so strictly, that out of 146 all perished in a single night for want of air but 22. It was not, however, supposed that any massacre at this time was intended; and it is probable that he only gave orders to confine the prisoners closely for the night, without taking into consideration whether the place they were confined in was large or small.

The news of this disaster put an end to the expedition projected against M. Bussy; and Colonel Clive was instantly dispatched to Bengal with 400 European and 1000 Sepoys, on board of the fleet commanded by Admiral Watson. They did not arrive till the 15th of December, at a village called Futte, situated on a branch of the Ganges, where the inhabitants of Calcutta had taken refuge after their misfortune. Their first operations were against the forts Bushudanga, Tanna, Fort-William, and Calcutta, now in the hands of the enemy. All these were reduced almost as soon as they could approach them. An expedition was then proposed against Hooghly, a large town about 60 miles above Calcutta, and the place of rendezvous for all nations who traded to Bengal; its warehouses and shops were always filled with the richest merchandise of the country. This was likewise easily reduced; and the city was destroyed, with the granaries and storehouses of salt seated on each side the river; which proved
proved very detrimental to the nabob, as depriving him of the means of subsistence for his army.

Surajah Dowla, enraged at this success of the English, now seemed determined to crush them at once by a general engagement. From this, however, he was intimidated by a successful attack on his camp, which soon induced him to conclude a treaty. This took place on the 9th of February 1757, on the following conditions. 1. That the privileges and immunities granted to the English by the king (Mogul) should not be disputed. 2. That all goods with English orders should pass, by land or water, free of any tax, fee, or imposition. 3. All the Company's factories which had been seized by the nabob should be restored; and the goods, money, and effects, which had been plundered, should be accounted for. 4. That the English should have permission to fortify Calcutta as they thought proper. 5. They should also have the liberty to coin their own import of bullion and gold.

As certain intelligence was now received of a war between France and England, the first object that naturally occurred, after the conclusion of this treaty, was the reduction of the French power in the east; in consequence of which it was represented to Admiral Watson, by a committee of the council of Bengal, that this was the only opportunity he perhaps might ever have of acting offensively against them. An attack would therefore immediately have been made on Chandernagore, had not a deputation arrived from that place, requesting a neutrality in this part of the world until matters should be finally decided in Europe. The negotiation, however, was broken off on a suggestion that the government of Chandernagore, being subordinate to that of Pondicherry, could not render any transaction of this kind valid. It remained, therefore, only to obtain the consent of the nabob to make an attack upon this place: but this seemed not likely to be got; for in ten days after the conclusion of the treaty, he sent a letter to the admiral, complaining of

his intention. "It appears (says he) that you have a design to besiege the French factory near Hooghly, and to commence hostilities against that nation. This is contrary to all rule and custom, that you should bring your animosities and differences into my country; for it has never been known, since the days of Timur, that the Europeans made war upon one another in the king's dominions. If you are determined to besiege the French factories, I shall be necessitated, in honour and duty to my king, to assist them with my troops. You are certainly bound to abide by your part of the treaty strictly, and never to attempt or be the occasion of any troubles or disturbances in future within the province under my jurisdiction, &c." To this Admiral Watson replied, that "he was ready to desist from his intended enterprize if the French would agree to a solid treaty of neutrality; or if the nabob, as sowadhur (viceroy) of Bengal, would, under his hand, guarantee this treaty, and promise to protect the English from any attempts made by the French against their settlements in his absence." This letter did not prove satisfactory; the nabob having been informed by the French agent, that the English designed to turn their arms against him as soon as they had made themselves masters of Chandernagore. This was strenuously denied by the admiral; and a number of letters passed between him and the nabob, in one of which the latter made use of the following expressions, which were supposed to imply a tacit consent that Chandernagore should be attacked. "My forbidding war on my borders was because the French were my tenants, and upon this affair desired my protection: on this I wrote to you to make peace, and no intention had I of favouring or assisting them. You have understanding and generosity: if your enemy with an upright heart claims your protection, you will give him his life; but then you must be well satisfied of the innocence of his intentions; if not, then whatsoever you think right, that do." Having thus, as was supposed, obtained the consent of the nabob, an attack was made on Chandernagore, which was soon reduced to the necessity of capitulating; though the French made a gallant defence, and, as Mr. Ives informs us, "stood to their guns as long as they had any to fire." A messenger was dispatched with the news to Surajah Dowla three days after the place had surrendered, intimating also that the French had been pursued some way up the country. This intelligence, however, seemed to be by no means agreeable, as he could scarce be induced to return an answer. At last he pretended displeasure on account of the design of the English to infringe the treaties, and complained that they had ravaged some parts of his dominions. This was denied on the part of the admiral; who in his turn accused the nabob of breach of promise, and neglect in fulfilling his engagements. The last letter sent by Admiral Watson to the nabob, of date 19th April 1757, concludes in this manner. "Let me again repeat to you, that I have no other views than that of peace. The gathering together of riches is what I despise; and I call on God, who sees and knows the spring of all our actions, and to whom you and I must one day answer, to witness to the truth of what I now write: therefore, if you would have me believe that you wish for peace as much as I do, no longer let it be the subject of our correspondence for me to ask the fulfilment of our treaty, and you to promise and not perform it; but immediately fulfill all your engagements: thus let peace flourish and spread throughout all your country, and make your people happy in the re-establishment of their trade, which has suffered by a ruinous and destructive war." From this time both parties made preparations for war. The nabob returned no answer till the 13th of June, when he sent the following declaration of war. "According to my promises, and the agreement made between us, I have duly rendered every thing to Mr. Watts, except a very small remainder: Notwithstanding this, Mr. Watts, and the rest of the council of the factory at Casembazar, under the pretence of going to take the air in their gardens, fled away in the night. This is an evident mark of deceit, and of an intention to break the treaty. I am convinced it could not have happened without your knowledge, nor without your advice. I all along expected something of this kind, and for that reason I would not recall my forces from Plassey, expecting some treachery. I praise God, that the breach of the treaty has not been on my part," &c.

Nothing less was now resolved on in the English council at Calcutta than the deposition of the nabob; on which
which at this time appeared practicable, by supporting the pretensions of Meer Jaffier Ali Cawo, who had with other noblemen entered into a conspiracy against him. Meer Jaffier had married the sister of Aliverdy Cawo, the predecessor of Surajah Dowla; and was now supported in his pretensions by the general of the horse, and by Jogget Sett the nabob’s banker, who was reckoned the richest merchant in all India. By these three leading men the design was communicated to Mr Watts the English resident at the nabob’s court, and by him to Colonel Clive and the secret committee at Calcutta. The management of the affair being left to Mr Watts and Mr Clive, it was thought proper to communicate the secret to Omichund, through whom the necessary correspondence might be carried on with Meer Jaffier. This agent proved so avaricious, that it was resolved to serve him in his own way; and by a piece of treachery to him also, to gain their point with both parties. Two treaties were therefore written; in one of which it was promised to comply with Omichund’s demand, but in the other his name was not even mentioned; and both these treaties were signed by all the principal persons concerned, Admiral Watson alone excepted, whom no political motives could influence to sign an agreement which he did not mean to keep. These treaties, the same in every respect excepting as to Omichund’s affair, were to the following purpose: 1. All the effects and factories belonging to the provinces of Bengal, Bahar, and Ooriza, shall remain in possession of the English, nor should any more French ever be allowed to settle in these provinces. 2. In consideration of the losses sustained by the English company by the capture and plunder of Calcutta, he agreed to pay one crore of rupees, or 1,230,000l. sterling. 3. For the effects plundered from the English at Calcutta, he engaged to pay 50 lacks of rupees, or 625,000l. 4. For the effects plundered from the Gentoo, Moors, and others inhabitants of Calcutta, 20 lacks, or 250,000l. 5. For the effects plundered from the Armenian merchants, inhabitants of Calcutta, seven lacks, or 87,500l. 6. The distribution of all these sums to be left to Admiral Watson, Colonel Clive, Roger Drake, William Watts, James Kilpatrick, and Richard Becher, Esquires, to be disposed of by them to whom they think proper.

All things being now in readiness, Colonel Clive began his march against Surajah Dowla on the 13th of June, the very day on which Surajah Dowla sent off his last letter for Admiral Watson. Before any act of hostility was committed, however, Colonel Clive wrote the nabob a letter, upbraiding him with his conduct, and telling him at last, that “the rains being so near, and it requiring many days to receive an answer, he had found it necessary to wait upon him immediately.” This was followed by the decisive action at Plassey; in which the treachery of Meer Jaffier, who commanded part of the nabob’s troops, and stood neutrality during the engagement, undoubtedly rendered the victory more easily acquired than it would otherwise have been. The unfortunate nabob fled to his capital with a few that continued faithful to him. He reached the city in a few hours; but not thinking himself safe there, left it the following evening disguised like a faqir, with only two attendants. By these he appears to have been abandoned and even robbed; for on the 3d of July he was found wandering forlorn and almost naked on the road to Patna. Next day he was brought back to Muxadabad; and a few hours after privately beheaded by Meer Jaffier’s eldest son, to whose care he had been committed. The usurper took possession of the capital in triumph; and on the 29th of June Colonel Clive went to the palace, and in presence of the rajahs and grandees of the court solemnly handed him the munsud or carpet and throne of state, where he was nabob of unanimously saluted soudbadur or nabob, and received Bengal.

While these transactions were going forward with the nabob, the utmost efforts were used to expel the French entirely from Bengal. By the articles of capitulation at Chandernagore, the whole of that garrison under Mr Law were to continue prisoners of war; but about the time of signing the treaty, Mr Law with a small body of troops made his escape out of Casemmbuzar, and joined his march towards Patna. There he had been protected by the late nabob; and on the commencement of fresh hostilities, had collected about 200 French, the only remains of that nation in Bengal, to make an attempt to succour him. With these he was within two hours’ march of Surajah Dowla’s camp when the battle of Plassey was fought; on hearing the news of which he stopped: but afterwards being informed of the nabob’s escape, he marched again to his assistance, and was within a few hours of joining him when he was taken. Three days after he was pursued by Major Eyre Cooe at the head of 233 Europeans, three companies of Sepoys, 50 Lascars or Indian sailors, and 2 Marmutty men or pioneers to clear the roads, together with two pieces of cannon, six pounders. On this expedition the major exerted his utmost diligence to overtake his antagonist, and spent a very considerable space of time in the pursuit; for though he set out on the 6th of July, he did not return to Muxadabad till the 1st of September. Mr Law, however, had the good fortune to escape; but though the major did not succeed in what was proposed as the principal end of his expedition, he was, nevertheless, says Mr Ives, of considerable service to the company and to his country in general. He had obliged Ramnraain, the most powerful rajah in the country, to swear allegiance to Meer Jaffier; he laid open the interior state of the northern provinces; and, in conjunction with Mr Johnston, gave the company some insight into the saltpetre business, from which such advantages have since been derived to the public.

Before the return of Major Cooe, Admiral Pocock had succeeded to the command of the fleet, in consequence of the decease of Admiral Watson, who died on the 16th of August. The joy of the British was considerably damped by the loss of this gentleman, who had gained a great and deserved reputation both in the military line and every other. News were also received, that the French had been very successful on the coast of Coromandel. Salabat-zung, as has already been observed, had applied to the English for assistance against the French; but as they were prevented from performing their agreement by the disaster at Calcutta, he found himself under a necessity of accommodating the differences with his former friends, and to admit them again into his service. M. Bussy was now reinforced by the troops under Mr Law; who

Death of Admiral Watson.
had collected as many Europeans in his journey as made up 500 with those he had at first. With these
be undertook to reduce the English factories of Inge-
ram, Bandermalanka, and Vizagapatnam. As none of
the two former places were in any state of defence,
the greatest part of the company’s effects were put on
shipboard on the first alarm; but as Vizagapatnam
was garrisoned by 140 Europeans and 420 Sepoys, it
was supposed that it would make some defence. If
any was made, however, it appears to have been very
trifling; and by the conquest of this the French be-
came masters of all the coasts from Ganjam to Massul-
patnam. In the southern provinces the like good
success attended the British cause. The rebel Polyg-
ars having united their forces against Mazuphe Cawn,
obtained a complete victory over him; after which the
English Sepoys, being prevailed upon to quit Ma-
dura, the conqueror seized upon that city for him-
self.
In the beginning of 1758, the French made an at-
tempt on Trinchiopolpy. The command was given to
M. d’Auvergn, who invested the place with 500
men in battalion, with 4000 Sepoys, 1000 horse,
and a great body of Indian horse. Trinchiopolpy was then
in no condition to withstand such a formidable power,
as most of the garrison had gone to besiege Madura
under Captain Caillaud; but this commander having
received intelligence of the danger, marched back with
all his forces, and entered the town by a difficult road
which the enemy had neglected to guard; and the
French general, disconcerted by this successful man-
œuvre, drew off his forces, and returned to Pondi-
cherry.
This fortunate transaction was succeeded by the
siege of Madura, in which the English were so vigo-
rously repulsed, that Captain Caillaud was obliged to
turn the siege into a blockade in order to reduce the
place by famine. But before any progress could be
made in this way, Mazuphe Cawn was prevailed upon
to give it up for the sum of 170,000 rupees. A large
garrison of Sepoys was again put into the place, and
Captain Caillaud returned to Trinchiopolpy.
An unsuccessful attempt was now made by Colonel
Ford on Nellore, a large town surrounded by a thick
sand wall, with a dry ditch on all sides but one, where
there is the bed of a river always dry but in the rainy
season. The enterprise is said to have proved unsuccess-
ful through the unheared-of cowardice of a body of
Sepoys, who having sheltered themselves in a ditch,
absolutely refused to stir a step farther, and rather chose
to allow the rest of the army to march over them to the
assault, than to expose themselves to danger. Several
other enterprises of no great moment were undertaken;
but the event was on the whole unfavourable to the
English, whose force by the end of the campaign was
reduced to 1718 men, while that of the French amount-
ed to 3400 Europeans, of whom 1000 were sent to
Pondicherry.
Both parties now received considerable reinforce-
ments from Europe; Admiral Pocock being joined on the
14th of March by Commodore Stephens with a squadron
of five men of war, and the French by nine men of war
and two frigates, having on board General Lally with a
large body of troops. The English admiral no sooner
found himself in a condition to cope with the enemy
than he went in quest of them; and an engagement
took place, in which the French were defeated with the
loss of 600 killed, and a great many wounded, while
the English had only 29 killed and 89 wounded. The
former returned to Pondicherry, where they landed
their men, money, and troops. After the battle three
of the British captains were tried for misbehaviour,
and two of them dismissed from the command of their ships.
As soon as his vessels were refitted, the admiral sailed
again in quest of the enemy, but could not bring them
They are
to an action before the 3d of August, when the French were
defeated a second time, with the loss of 251 kill-
ed, and 652 wounded.
Notwithstanding this success at sea, the English were
greatly deficient in land forces; the re-establishment of
their affairs in Bengal having almost entirely drained
the settlements on the coast of Coromandel; the troops
necessary for their defence. The consequence of this
was the loss of Fort St. David, which General Lally
Take Fort
St. David.
reduced, destroying the fortifications, demolishing also
the adjacent villages, and ravaging the country in such a
manner as filled the natives with indignation, and in the
end proved very prejudicial to his affairs. He pro-
vided successful, however, in the reduction of Devic-
tah, but was obliged to retire with loss from before
Tanjore, his army being greatly distressed for want of
provisions; and money in particular being so deficient,
that on the 7th of August the French seized and car-
ried into Pondicherry a large Dutch ship from Bata-
via, bound to Negapatnam, and took out of her about
5000l. in specie.
From this time the affairs of the French daily declin-
ed. On their retreat from Tanjore, they abandoned
the island of Seringham; however, they took Tripas-
sore, but were defeated in their designs on the impor-
tant post of Chinglapet, situated about 45 miles south-
west of Madras. Their next enterprises on Fort St.
George and Madras were equally unsuccessful. The
latter was besieged from the 12th of December 1758 to
the 17th of February 1759, when they were obliged to
abandon it with great loss; which disaster greatly con-
tributed to depress their spirits, and abate those san-
guine hopes they had entertained of becoming masters
in this part of the world.
The remainder of the year 1759 proved entirely fa-
vourable to the British arms. M. d’Ache the French
admiral, who had been very roughly handled by Ad-
miral Pocock on the 3d of August 1758, having refit-
ted his fleet, and being reinforced by three men of war
at the islands of Mauritius and Bourbon, now ventured
once more to face his antagonist, who on his part did
not at all decline the combat. A third battle ensued French de-

by laying siege to Wandewash, which had lately been taken by Colonel Coote. The advantage in numbers was entirely in favour of the French general; the English army consisting only of 1700 Europeans, including artillery and cavalry, while the French amounted to 2200 Europeans. The auxiliaries on the English side were 3000 black troops, while those of the French amounted to 10,000 black troops and 300 Caillers; nor was the odds less in proportion in the artillery, the English bringing into the field only 14 pieces of cannon and one howitzer, while the French had 23 pieces in the field, and five on their batteries against the fort. The battle began about 11 o'clock on the 22d of January 1765, and in three hours the whole French army gave way and fled towards their camp; but quitted it on finding themselves pursued by the English, who took all their cannon except three small pieces. They collected themselves under the walls of Cheltpat, about 18 miles from the field of battle, and soon after retired to Pondicherry. Colonel Coote caused the country to be wasted to the very gates of this fortress, by way of retaliation for what the French had done in the neighbourhood of Madras. He then set about the siege of Cheltpat, which surrendered in one day; a considerable detachment of the enemy was intercepted by Captain Smith; the fort of Timmery was reduced by Major Monson, and the city of Arcot by Captain Wood. This last conquest enabled the English to restore the nabob to his dominions, of which he had been deprived by the French; and it greatly weakened both the French force and interest in India. M. Lally, in the mean time, had recalled his forces from Seringham, by which means he augmented his army with 300 Europeans. All these were now shut up in Pondicherry, which became the last hope of the French in India. To complete their misfortunes, Admiral Cornwallis arrived at Madras with six men of war; and as the French had now no fleet in these parts, the admiral readily engaged to cooperate with the land forces. The consequence was the reduction of Carical, Chellamborn, and Verachemullam, by a strong detachment under Major Monson; while Colonel Coote reduced Pernum, Alamperta, and Wodull. Thus he was last enabled to lay siege to Pondicherry itself. Previous to this, however, it had been blockaded by sea and land, which reduced the place to great straits for want of provisions, and induced a mutinous disposition among the garrison. The batteries were not opened till the beginning of December 1760; and the place capitulated on the 15th of January 1761, by which an end was put to the power of the French in this part of the world.

While the English were thus employed in effectually reducing the power of their rivals in every part of India, Meer Jaffier, the nabob of Bengal, who had been raised to that dignity by the ruin of Surajah Dowlah, found himself in a very disagreeable situation. The treachery of the late nabob had been valued at no less than 64 crores of rupees, about 80 millions sterling; and in expectation of such a vast sum, Meer Jaffier had no doubt thoughtlessly submitted to the enormous exactions of the English already mentioned. On his accession to the government, however, the treasure of which he became master fell so much short of expectation, that he could by no means fulfill his engagements to them and supply the expenses of government at the same time. This soon reduced him to the necessity of mortgaging his revenues to supply present demands; and by this ruinous expedient he put it out of his own power ever to extricate himself. In this dilemma his grandees became factious and discontented, his army mutinous for want of pay, and he rendered himself odious to his subjects by the exactions he was necessitated to lay upon them. The English, who for their own interest had raised him to the supreme power, no sooner found that he was incapable of answering their purposes any longer, than they began to scheme against him; and in order to have some colour of reason for pulling down the man whom they had just set up, they either invented or gave ear to the most malicious calumnies against him. The charges brought against him were shortly these: 1. That soon after his advancement he had resolved to reduce that power which raised him to the dignity. 2. That, to effect this, he assassinated or banished every person of importance whom he suspected of being in the English interest. 3. That he negotiated with the Dutch to introduce an armament for the expulsion of the English. 4. That he had in different instances been guilty of the deepest deceit and treachery towards the English, his best benefactors and allies. 5. That at three different periods the English commander in chief had been basely deserted both by the nabob and his son, when he and the troops were hazarding their lives for them. 6. That he meditated a secret and separate treaty with Shah Zadah, the Mogul's son, and had intended to betray the English to him. 7. That the whole term of his government had been one uninterrupted chain of cruelty, tyranny, and oppression. 8. That he meditated, and was near carrying into execution, an infamous secret treaty with the Maharrattas, which would have proved the total destruction of the country if it had taken place. 9. That he threw every possible obstruction in the way of the collection of the English tankas or assignments upon lands. 10. That he encouraged the obstructions given to the free currency of the English secaus; by which the company suffered heavy losses. 11. That by his cruelties he had rendered it scandalous for the English to support his government any longer; and, 12. That by his misconduct, he had brought the affairs of the company as well as his own into the utmost danger of ruin.

In what manner these charges were supported it is difficult to know, nor perhaps were the accusers very solicitous about the strength of their evidence. This seems the more probable, as the accusations of cruelty were, in some instances at least, void of foundation. On the 13th of June 1760, Mr Hawle wrote from Calcutta to Mr Warren Hastings, that by express he had received intelligence of the murder of the princess of Alverady Khan and Shah Amet, in a most inhuman manner, by Meer Jaffier's orders. He was said to have sent a jemmadar with 100 horses to Jessaruth Khan to carry this bloody scheme into execution; with separate orders to the jemmadar to put an end to their lives. He refused acting any part in the tragedy, and left it to the other; who carried them out by night in a boat, tied weights to their legs, and threw them overboard. They struggled for some time, and held by the gunwale of the boat; but by strokes on their heads,
and cutting off their hands, they were at last forced off and drowned. In like manner we were told that many others of Surajah Dowla's relations had perished; yet when it was thought proper to replace Meer Jaffer in 1762, all these dead persons were found alive excepting two.

It must also be remembered, in behalf of the unfortunate nabob, that besides the same exacted of him by the English at his accession, he had ceded to them a large extent of territory, and granted them so many immunities in trade, that he had in a manner deprived himself of all his resources; and it was impossible for him to defray the necessary expenses without either extorting money from his subjects, or infringing the privileges he had so inconsiderately granted.

There were two accounts of this remarkable revolution published, materially differing from one another. The first was given in a memorial drawn up at a consultation at Fort William, November 10, 1760, where were present Henry Vansittart, Esq., president; William Ellis, B. Sumner, William Mc'Guire, Henry Verelst, and Henry Smyth, Esqs. We resolved (says the governor) to give the nabob the next day (October 19, 1762) to reflect upon the letters I had delivered him, proposing some measures for regulating these abuses. I heard nothing from him all that day; but finding by my intelligence that he had been in council at his old residence, whose advice, I was sure, would be contrary to the welfare of the country and of the company. I therefore determined to act immediately on the nabob's fear. There could not be a better opportunity than the night of the 16th offered, it being the conclusion of the Gentoos feast, when all the principal people of that caste would be pretty well fatigued with their ceremonies. Accordingly I agreed with Colonel Caillaud, that he should cross the river with the detachment between three and four in the morning; and having joined Cosim Ali Khan and his people, march to the nabob's palace, and surround it just at daybreak. Being extremely desirous to prevent disturbance or bloodshed, I wrote a letter to the nabob, telling him, I had been waiting all the day in expectation that he would have settled the urgent affairs upon which I conferred with him yesterday; but his having favoured me with no answer, plainly showed that all I could represent to him for the good of his country would have no effect, as long as his evil counsellors were about his person, who would in the end deprive him of his government and ruin the company's affairs. For this reason I had sent Colonel Caillaud with forces to wait upon him, and to expel those bad counsellors, and place his affairs in a proper state, and I would shortly follow. This letter I gave to the colonel, to send to the nabob at such a time as he should think most expedient. Measures were taken at the same time for seizing his three unworthy ministers, and to place Cosim Ali Khan in the full management of all the affairs, in quality of deputy and successor to the nabob.

The necessary preparations being made with all care and secrecy possible, the colonel embarked with the troops, joined Cosim Ali Khan without the least alarm, and marched into the court-yard of the palace just at the proper instant. The gates of the inner court being shut, the colonel formed his men without, and sent the letter to the nabob, who was at first in a great rage, and long threatened that he would make what resistance he could, and take his fate. The colonel forbore hostilities, and several messages passed between him and the nabob. The affair remained in this doubtful state for two hours, when the nabob, finding his persisting was to no purpose, sent a message to Cosim Ali Khan, informing him that he was ready to send the seals and all the ensigns of dignity, provided he would agree to take the whole charge of the government upon him, to discharge all arrears due to the troops, to pay the usual revenue to the king, to save his life and honour, and to give him an allowance sufficient for his maintenance. All these conditions being agreed to, Cosim Ali was proclaimed; and the old nabob came out to the colonel, declaring that he depended on him for his life. The troops then took possession of all the gates; and the old nabob was told, that not only his person was safe, but his government too if he pleased, of which it was never intended to deprive him. He answered, that he had now no more business in the city, where he should be in continual danger from Cosim Ali Khan; and if he was permitted to go and live at Calcutta, he should be contented. Cosim Ali Khan was now placed on the musnad, and the people in general seemed much pleased with the revolution. The old nabob did not think himself safe even for one night in the city. Cosim Ali Khan supplied him with boats, and permitted him to take away about 60 of his family, with a reasonable quantity of jewels. He begged that he might sleep in his boat that night; which he accordingly did, and on the morning of the 22d of October he set out for Calcutta, and arrived there on the 29th. He was met by a deputation from the council, and treated with every mark of respect due to his former dignity.

The second account of this affair was not published till the 11th of March 1762, and was signed Eyre Coote, P. Amyatt, John Cavnac, W. Ellis, S. Batson, H. Verelst. In September 1760 (say they), when there was not the least appearance of a rupture or disgust between us and the nabob, but friendship and harmony subsisting, Meer Cosim Khan his son-in-law came down to Calcutta, and having staid a short time returned to Moundsabad. A few days after, Mr Vansittart went up to that city on the pretence of a visit to the nabob Meer Jaffer. Colonel Caillaud, with 200 Europeans and some Sepoys, attended him; who, it was pretended, were going to join the army at Patna. When Mr Vansittart arrived at Moradshong, the nabob paid him two visits; at the last of which Mr Vansittart gave him three letters, proposing the reformation of the abuses in his government, insisted on naming some person among his relations to take charge of the subahship, and particularly recommended Cosim Ali Khan, who was sent for, and the nabob desired to stay till he came: But the nabob being greatly fatigued, was suffered to depart to his palace. The night and following day passed in conciliating measures with Cosim Ali how to put in execution the plan before agreed on in Calcutta, where a treaty was signed for this purpose. In consequence of these deliberations, our troops crossed the river next night, and being joined by Cosim and his party, surrounded the nabob's palace. A letter from Mr Vansittart was sent in to the nabob, demanding his compliance with what had been proposed to him. To this the nabob returned for answer, that he

never
never expected such usage from the English; that while a force was at his gates, he would enter into no terms. A message was sent in, that if he did not directly comply, they should be obliged to storm the palace. Astonished and terrified at this menace, he opened the gates, exclaiming, that "he was betrayed; that the English were guilty of perjury and breach of faith; that he perceived their designs against his government; that he had friends enough to hazard at least one battle in his defence; but although no oaths were sacred enough to bind the English, yet as he had sworn to be his faithful friend, he would never swerve from his engagement, and rather suffer death than draw his sword against them." So suspicious was he of being sold, that he desired to know what sum of money Cossim Ali Khan was to give for the subahship, and he would give half as much more to be continued. He hoped, however, if they intended to dethrone him, that they would not leave him to the mercy of his son-in-law, from whom he feared the worst; but wished they would carry him from the city, and give him a place of safety in Calcutta. "This last request of the nabob was permitted in the light of a voluntary resignation. Our troops took possession of the palace; Meer Cossim was raised to the musnud; and the old nabob hurried into a boat with a few of his domestics and successors, and sent away to Calcutta in a manner wholly unworthy of the high rank he so lately held, as was also the scanty subsistence allowed him for his maintenance at Calcutta by his son-in-law. Thus was Jaffier Ali Khan deposed, in breach of a treaty founded on the most solemn oaths, and in violation of the national faith."

According to this account, the servants of the company, who were the projectors of the revolution, made no secret that there was a present promised them of 20 lakhs of rupees from Cossim, who was desirous of making the first act of his power the assassination of Jaffier, and was very much displeased when he found that the English intended giving him protection at Calcutta.

It could scarce be supposed that Meer Cossim, raised to the nabobship in the manner we have related, could be more faithful to the English than Meer Jaffier had been. Nothing advantageous to the interests of the company could indeed be reasonably expected from such a revolution. No successor of Meer Jaffier could be more entirely in subjection than the late nabob, from his natural imbecility, had been. This last consideration had induced many of the council at first to oppose the revolution; and indeed the only plausible pretext for it was, that the administration of Meer Jaffier was so very weak, that, unless he was aided and even controlled by some person of ability, he himself must soon be ruined, and very probably the interests of the company along with him. Meer Cossim, however, was a man of a very different disposition from his father-in-law. As he knew that he had not been served by the English out of friendship, so he did not think of making any return of gratitude; but instead of this, considered only how he could most easily get rid of such troublesome allies. For a while, however, it was necessary for him to dissemble, and to take all the advantage he could of the power of his allies whilst it could be serviceable to him. By their assistance he cleared his dominions of invaders, and strengthened his frontiers against them; he reduced, by means of the same assistance, the rajahs or independent Indian chiefs who had rebelled in the time of his predecessor, obliging them to pay the usual tribute; by which means he repaired his finances, and thereby secured the discipline and fidelity of his troops. Having thus, by the assistance of the English forces, brought his government into subjection, he took the most effectual means of securing himself against their power. As the vicinity of his capital, Muxadabad, to Calcutta, gave the English factory there an opportunity of inspecting his actions, and interrupting his designs when they thought proper, he took up his residence at Mongheer, a place 200 miles farther up the Ganges, which he fortified in the best and most expeditious manner he could. Being very sensible of the advantages of the European discipline, he resolved to form his army on a new model. For this purpose he collected all the Armenian, Persian, Tartar, and other soldiers of fortune, whose military characters he supposed might serve to raise the spirits of his Indian forces, and abate their natural timidity. He also carefully collected every wandering European who had borne arms, all the Sepoys who had been thrown from the English service, distributing them among his troops in order to teach them the English exercise. He changed the fashion of the Indian muskets from matchlocks to firelocks; and as their cannon were almost as deficient as their small arms, he procured a pattern of one from the English, by which he soon formed a train of artillery; and having thus done every thing in his power to enable himself to withstand the English by force of arms, he resolved also to free his court from their emissaries, by imprisoning or putting to death every person of any consequence in his dominions who had shown any attachment to their interest.

His next step was to free himself from some of those restraints which his predecessor Meer Jaffier, and even he himself, had been obliged to lay upon the trade of the country, in order to gratify the avarice of his European allies. At his accession indeed he had ordered to the company a tract of land worth no less than 700,000 annually, besides 70,000 a year on other accounts. All this, however, was only grace; the immunities granted them in trade were of still worse consequences than even those vast concessions. He knew by experience the distress which those immunities had brought upon his predecessor, and therefore determined to put an end to them. In pursuance of this resolution, he began, in the year 1762, every duties on where to subject the English traders to the payment of certain duties throughout his dominions, and required that their disputes, if beyond the limits of their own jurisdiction, should be decided by his magistrates. This gave such an alarm at Calcutta, that, in November 1762, the governor Mr Vansittart waited on him in person at Mongheer, in order to expostulate with him upon the subject. The nabob answered his remonstrances in the following manner. "If (said he) the servants of the English company were permitted to trade in all parts, and in all commodities, custom free, as many of them now pretend, they must of course draw all the trade into their own hands, and my customs would be of so little value, that it would be much more for my interest to lay trade entirely open, and collect no customs from any person whatever upon
any kind of merchandise. This would draw a number of merchants into the country, and increase my revenues by encouraging the cultivation and manufacture of a large quantity of goods for sale, at the same time that it would effectually cut off the principal subject of disputes which had disturbed the good understanding between us, an object which I have more than any other at heart.”

By these intimations Mr Vansittart was very much discouraged; nor indeed was it in any person’s power to devise a plausible answer. What the nabob had threatened was evidently in his power; and though he had laid the trade entirely open, no reasonable fault could have been found with him. The proceeding, however, tended evidently to destroy the private trade carried on by the gentlemen of the factory; and even to prejudice, as they said, that of the company itself. Mr Vansittart therefore thought proper to submit to certain regulations, by which the trade of the English was put under certain restrictions.

This new agreement being instantly put in execution on the part of the nabob, excited the utmost indignation at Calcutta. On the 17th of January 1763, the council passed a resolution, disavowing the treaty made by the governor, and affirmed that he assumed a right to which he was by no means authorized; that the regulations proposed were dishonourable to them as Englishmen, and tended to the ruin of all public and private trade; and that the president’s issuing out regulations independent of the council was an absolute breach of their privileges. They sent orders therefore to all the factories, that no part of the agreement between the governor and nabob should be submitted to. Application was again made to Meer Cossim to persuade him to a third agreement; but before the success of this negociation could be known, hostilities commenced on the part of the English.

There was at that time in the city of Patna (situated on the Ganges, about 300 miles above Calcutta), a force, under the command of Major Adams, who had 32 pieces of cannon. By this factory the city was suddenly attacked on the 25th of June 1763, and instantly taken, though it was defended by a strong garrison, and the fortifications had been newly repaired. The governor and garrison fled out into the country on the first appearance of danger; but perceiving that the victors took no care to prevent a surprise, he suddenly returned with a reinforcement from the country, retook the city, and either cut in pieces or drove into their forts all the English who were in it, after having been only four hours in possession of the place. The English, disheartened by this disaster, did not now think themselves able to defend their fort against the Indians; for which reason they left it, with a design to retreat into the territories of a neighbouring nabob; but being pursued by a superior force, they were all either killed or taken.

This piece of perfidy, for such it certainly was, the nabob repaid by another, viz. slaughtering the deputies who had been sent him by the council of Calcutta to treat about a new agreement with regard to commercial affairs. They set out from Mongbeer on the 24th of June, having been unable to bring Meer Cossim to any terms; and though he furnished them with the usual passports, yet, as they were passing the city of Muzsadabad, they found themselves attacked by a number of troops assembled for that purpose on both sides of the river, whose fire killed several gentlemen in the boats. Mr Amyatt, the chief of the embassy, landed with a few Sepoys, whom he forbade to fire, and endeavoured to make the enemy’s troops understand that he was furnished with the nabob’s passports, and had no design of committing any hostilities; but the enemy’s horse advancing, some of the Sepoys fired notwithstanding Mr Amyatt’s orders to the contrary. On this a general confusion ensued, and Mr Amyatt, with most of the small party who attended him, were cut in pieces.

These acts of treacherous hostility were soon followed by Meer Jaffer, not师兄 again withstanding the crimes formerly alleged against him, proclaiming himself nabob. He immediately took the field under the command of Major Adams. The whole force, however, at first consisted only of one regiment of the king’s troops, a few of the march companies, two troops of European cavalry, ten companies of Sepoys, and 12 pieces of cannon. These very soon came to action with the enemy; and having got the better in two skirmishes, cleared the country of them as far as Cossimbazar river, a branch of the Ganges, which lay between Calcutta and Muzsadabad, or Mooreshabad, the capital of the province.

This war was now carried on with uninterrupted success on the part of the English; nor does it appear that all the pains taken by Meer Cossim to discipline his troops had made them in the least more able to cope with the Europeans. The English were suffered to pass the river without opposition; but an army of 10,000 Indians was advantageously posted between the river and the city. These were entirely defeated, and Major Adams pushed on directly for the capital. In his way he found the Indians again strongly posted with intrenchments 15 feet high, and defended by a numerous artillery. This strong post was taken by stratagem; a feint being made with a small body of troops against that part where the enemy had collected their greatest strength. Thus the attention of the Indians was drawn entirely to that place, without regarding others where no attack was apprehended. The greatest part of the English army, however, had in the night-marched round the Indian fortification, and by day-break made a furious assault on a place where there was only a slight guard. These instantly fled; the intrenchments were abandoned; and the city, which was protected only by them, fell of course into the hands of the conquerors.

This success of the English served only to make them redouble their diligence. They now penetrated into the heart of the province, crossed the numerous branches of the Ganges, and traversed morasses and forests in quest of their enemy. Meer Cossim, on the other hand, was not wanting in his defence; but the utmost efforts he could use were totally insufficient to stop the career of an enemy so powerful and now flushed with victory. The two armies met on the banks of a river called Numa Nullas, on the 2nd of August 1765. The Indians were entirely defeated; they had chosen their post with great judgment, and had by defeating much more the appearance of an European army than ever was observed before, not only in their arms and
INDIA.

eight days this great city was taken by storm. Thus the nabob was deprived of all his fortified places, his army reduced to a small body, and himself obliged to fly to Sujah Dowla nabob of Oudh, for the protection and viceroy to the Mogul. Here he was kindly received, and an asylum promised for his person, but admittance was refused to his army, nor would this prince consent at any rate to make his country a seat of war.

The English were now entire masters of Bengal: for though Meer Jaffier was proclaimed nabob, it is not to be supposed that he had now any authority farther than what they pleased to give him. Major Adams did not long survive the conquest of Patna, which was taken on the 6th of November 1763; he died in the month of March 1764.

Meer Cossim being thus driven out, an agent was sent from Calcutta to Sujah Dowla, proposing an alliance with him and the Mogul, who was along with him, and offering to assist him against Meer Cossim or any other enemy who should attempt an invasion of their proposed dominions; in return for which, it was expected that they should declare themselves open enemies to Meer Cossim, and use their utmost endeavours to seize and deliver him up with all his effects. This design was communicated to Major Adams on the 8th of December 1763; but as he was next day to resign the command of the army, Major Carnac was desired to take the command upon him, and to watch the motions of Meer Cossim, as well as to guard the dominions of Meer Jaffier against any hostilities which might be attempted. It was also resolved, that in case Meer Cossim should prevail upon the Mogul and Sujah Dowla to assist him, Major Carnac was desired to advance to the banks of the river Goomnass, and there oppose the entrance of any hostile army.

It soon appeared that the friendship of the English was not what Sujah Dowla desired. He considered them as rapacious usurpers, who having got a footing in the country under pretence of commerce, could be satisfied with nothing less than the entire possession of it, to the ruin of the natural inhabitants. The council on this wrote him, that though they heard such a report, they could not believe it, considering the former connections subsisting between him and the chiefs of the company, and were persuaded he would not act in such an unjust manner: but if it really was his intention to espouse the cause of Meer Cossim, they informed him that they were resolved to keep Bengal free from troubles, and carry the war into the dominions of Sujah Dowla himself. To this the nabob replied by enumerating the many favours conferred on the English by the Mogul. "Notwithstanding these (says he) you have interfered in the king's country, possessed yourselves of districts belonging to the government, and turned out and established nabobs at pleasure, without the consent of the imperial court. Since you have imprisoned dependants on the court, and exposed the government of the king of kings to contempt and dishonour; since you have ruined the trade of the merchants of the country, granted protection to the king's servants, injured the revenues of the imperial court, and crushed the inhabitants by your acts of violence; and
since you are continually sending fresh people from Calcutta, and invading different parts of the royal dominions; to what can all those wrong proceedings be attributed, but to an absolute disregard to the court, and a wicked design of seizing the country to yourselves? If these disturbances have arisen from your own improper desires, desist from such behaviour in future; interfere not in the affairs of government; withdraw your people from every part, and send them to their own country; carry on the company’s trade as formerly, and confine yourselves to commercial affairs.”

Another letter, much to the same purpose, was sent to Major Carnac; but the president and council of Calcutta, instead of paying any regard to the remonstrances of the nabob, determined to commence an immediate and offensive war against him.

Notwithstanding this resolution, several difficulties occurred in carrying on a war at this time. The principal were the death of Major Adams, whose name had become formidable to the Indians, and the mutinous disposition of the army. The former was obviated by the appointment of Colonel Hector Munro, who, in military skill, appeared nothing inferior to his predecessor; and the mutinous disposition of the soldiers was got the better of by a most severe example of the muzzineers, 24 of whom were blown away from the mouths of cannon. Hostilities were commenced on the part of Meer Cossim, who cut off a small party of English troops, and sent their heads to the Mogul and Sujah Dowla. An army of 50,000 men was collected, with a most formidable train of artillery, such as might be supposed to follow an European army of equal numbers. This prodigious armament seemed to have aspired all the caution of Meer Cossim; for though he had formerly experienced the bad effects of engaging the English in a pitched battle, yet he now thought proper to try his fortune a second time in the same way. The two armies met on the 22d of October 1764, at a place called Buxard, on the river Carnunass, about 100 miles above the city of Patna. The event was similar to that of other engagements with the English, to whom it never was possible for any advantages either in situation or number to make the Indians equal. The allied army was defeated with the loss of 5000 killed on the spot, 130 pieces of cannon, a proportionable quantity of military stores, and all their tents ready pitched; while, on the side of the conquerors, only 32 Europeans and 239 Indians were killed, and 37 Europeans and 473 Indians wounded.

The only place of strength now belonging to the allies on this side the river was a fort named Chanda Geer. The reduction of this place, however, might well have been deemed impracticable, as it stood on the top of a high hill, or rather rock, situated on the very brink of the Ganges, by which it could be constantly supplied with provisions; and as to military stores, it could not stand in need of any as long as stones could be found to pour down on the assailants. Notwithstanding all these difficulties, however, Colonel Munro caused his soldiers advance to the attack; but they were received with such volleys of stones, which the Indians threw both with hands and feet, that they were repulsed in a very short time; and though the attack was renewed the next day, it was attended with no better success; on which the English commander encamped with his army under the walls of Benares.

Soon after this, Colonel Munro being recalled, the command of the army devolved on Sir Robert Fletcher, a major in the company’s troops. The nabob, in the mean time, instead of attacking the English army at once, contented himself with sending out parties of light horse to skirmish with their advanced posts, while the main body lay at the distance of about 15 miles from Benares, which rendered it very dangerous for them to move from their place. On the 14th of January 1765, however, Sir Robert ventured at midnight to break up his camp under the walls of Benares, and to march off towards the enemy, leaving a party to protect that place against any attempt during his absence. In three days he came up with the main body of Indians, who retreated before him; on which Chanda Geer, being taken by Sir Robert before which the late commander had been foiled, by Sir Robert. His success would in all probability have been no better than that of his predecessor, had not the garrison maintained for want of pay, and obliged the commander to surrender the place.

The reduction of Chanda Geer was followed by that of Elabba, the capital of the enemy’s country, a large city on the Ganges, between 20 and 30 miles above Chanda Geer, defended by thick and high walls and a strong fort; soon after which Sir Robert was superseded in the command of the army by Major Carnac. Sujah Dowla in the mean time had been abandoned by the Mogul, who concluded a treaty with the English soon after the battle of Buxard. He did not, however, give himself up to despair, but gathered together, with great assiduity, the remains of his routed armies; and seeing that his own territories could not supply him with the requisite number of troops, he now applied to the Maharattas for assistance. But these people, though very formidable to the other nations of Hindostan, were far from being able to cope with the English. On the 26th of May 1765, General Carnac having assembled his troops, marched immediately to attack them; and having gained a complete victory at a place called Calpi, obliged them to retreat with precipitation across the Yumna into their own country.

Sujah Dowla, now destitute of every resource, determined to throw himself on the clemency of the English. Previous to this, however, he allowed Meer Cossim and the assassin Somers to escape; nor could any consideration ever prevail upon him to deliver them up. Three days after the battle of Calpi, the nabob surrendered himself to General Carnac, without stipulating any thing in his own favour, farther than that he should await the determination of Lord Clive concerning him.

In the beginning of February this year died Meer Jaffier Ali Cawn, nominal nabob of Bengal. The succession was disputed between his eldest surviving son Najemul Doula, a youth of about 18 years of age, and a grandson by his eldest son Miran, at that time only seven years old. As the English were in reality absolute sovereigns of the country, it was debated in the council of Calcutta whether Meer Jaffier’s son should be allowed to succeed, according to the custom of the country,
gentlemen a plan of reformation was instantly set about; by which, however, violent disputes were occasioned: but the committee, disregarding these impotent efforts, exerted their authority to the full extent, seldom even acquainting the council with their transactions, and never allowing them to give their opinion on any occasion.

On taking the affairs of Bengal into thorough consider-ation, Lord Clive found that the success of the company. British arms could be productive of nothing but war; that to ruin Sujah Dowla was to break down the strongest barrier which the Bengal provinces could have against the incursions of the Mahrattas and other barbarous people to the westward, who had long desola-
ted the northern provinces; and the Mogul, with whom the company had concluded a treaty, was utterly unable to support himself, and would require the whole English power in the east to secure him in his dignity. His lordship therefore found it necessary to conclude a treaty with Sujah Dowla. The Mogul was satisfied by obtaining a mere ample revenue than he had for some time enjoyed; by which means he might be ena-bled to march an army to Delhi to take possession of his empire. For the company his lordship obtained the office of duan or collector of revenues for the province of Bengal and its dependencies. Thus Sujah Dowla was again put in possession of his dominions, excepting a small territory which was reserved to the Mogul, and estimated at 20 lacks of rupees, or 250,000l. annually. The company were to pay 26 lacks of rupees, amounting to 325,000l. sterling.

They engaged also to pay to the nabob of Bengal an annual sum of 50 lacks, or 662,500l. for the expenses of government, and the support of his dignity. The remainder of the revenues of Bengal were allotted to the company, who on their part guaranteed the territories at that time in possession of Sujah Dowla and the Mogul.

Thus the East India company acquired the sovereignty of a territory equal in extent to the most flourishing kingdom in Europe. By all this, however, they were so far from being enriched, that the disorder of their affairs attracted the attention of government, and gave the British ministry an opportunity at least of depriving them of their territorial possessions, and subjecting the province of Bengal to the authority of the crown. New misfortunes also speedily occurred, and the company found a most formidable enemy in Hyder. This man, from the rank of a Sepoy, had raised himself to be one of the most considerable princes in the empire of Hindostan. Being sensible that the power of the English was an insuperable bar to his ambitious designs, he practised on the nizam of the Deccan, and partly by promises, partly by threats, engaged him to renounce his alliance with the company, and even to enter into a war against them. As he had been at great pains to introduce the European discipline among his troops, and had many renegades in his service, he imagined, that with the advantage of numbers he should certainly be able to cope with his antagonists in the open field. In this, however, he was deceived; for on the 26th of September, his army was entirely defeated by Colo- nel Smith at a place called Erreur near Trinomalle; after which the nizam thought it advisable to desert his
new ally, and conclude another treaty with the English.

From the latter, however, he did not obtain peace but at the expense of ceding to them the dominions of the Bageat Carnatic, which includes the dominions of Hyder Ali and some petty princes.

Hyder, thus deserted by his ally, transferred the seat of war to a mountainous country, where, during the year 1767, nothing decisive could be effected; while the Indian cavalry was sometimes enabled to cut off the supplies, and interrupt the communications of their antagonists. During these operations some ships were fitted out at Bombay, which conveyed 400 European soldiers, and about 800 Sepoys, to attack Mangalore, one of Hyder Ali’s principal sea-ports, where all his ships lay. This enterprise proved successful, and nine ships were brought away; but too small a garrison having been left in the place, it was almost immediately after retaken, and all who were in it made prisoners by Hyder Ali.

In the mean time, an injudicious measure, adopted by the English in their method of managing the army, proved not only of the utmost detriment to their cause, but occasioned disgrace hitherto unheard of in the history of the nation, viz. the desertion of officers from the service of Britain to that of a barbarous prince, and the giving up of forts in such a shameful manner as could not but suggest a suspicion that they had been betrayed. The original cause of all this mischief was the appointment of field deputies to attend the army, and to control and superintend the conduct of the commander in chief; and these, in the present instance, being deeply concerned in the contracts for the army, took care to regulate its motions in such a manner as best suited their private interest or convenience. Hyder Ali did not fail to improve the errors consequent upon this kind of management to his own advantage. General Smith had penetrated far into his country, taken several of his fortresses, and was in a fair way of becoming master of his capital, when all his operations were checked at once by the field deputies. His antagonist being thus allowed some respite, suddenly entered the Carnatic with a numerous army of horse, ravaging and destroying every thing at pleasure. Thus the English were obliged to relinquish all their conquests in order to defend their own territories; while this reverse of fortune not only discouraged the allies of the English, but even produced in them an inclination to desert their cause, and go over to Hyder Ali, while those who remained faithful paid dearly for their attachment. The nabob of Arcot, the most faithful ally the English ever had, suffered extremely on this occasion. Hyder Ali had long entertained a violent enmity against this prince, most probably on account of his inviolable attachment to the English. His dominions were therefore ravaged without mercy; and, thus while Hyder gratified his personal resentment against him, he cut off from the English one of the principal resources they had for carrying on the war.

On the return of the company’s forces to the defence of the Carnatic, they found themselves very little able to cope with their adversary; for, besides the continuance of the same causes which had formerly contributed to their want of success, they had been very much weakened in their expedition. Hyder Ali had also the prudence to avoid a general engagement, but frequently intercepted the convoys of the English, cut off their detached parties, and wearied them out with long and continual marches. The news of his success against an enemy hitherto invincible by all the powers of India, so raised his reputation, that adventurers flocked to him from all parts; by which means his cavalry were soon increased to upwards of 90,000; to which, however, his infantry bore no proportion.

Notwithstanding all this success, it appears that the forces of Hyder Ali were altogether unable to cope with those of Britain, even when there was the greatest imaginable disparity of numbers. A detachment of the company’s forces had made an assault upon a fort called Mulluggul, in which they were repulsed with some loss. This, with the small number of the detachment, encouraged Hyder Ali to march at the head of a great part of his army to the protection of the fort. The commanding officer, however, Colonel Wood, did not hesitate, with only 460 Europeans and 2300 Sepoys, to attack his army, consisting of 14,000 horse, 12,000 men armed with matchlock guns, and six battalions of Sepoys. The engagement lasted six hours; when at last Hyder Ali, notwithstanding his numbers, was obliged to retreat, leaving the field covered with dead bodies; the loss of the British being upwards of 300 killed and wounded. This engagement, however, was attended with no consequences affecting the war in general, which went on for some time in the same manner, and greatly to the disadvantage of the company. The divisions and discontent among the officers and council daily increased, the soldiers deserted, and every thing went to ruin. The revenues of the establishment of Madras being at last unequal to the expenses of the war, large remittances were made from Bengal to answer that purpose; and as these were made in a kind of base gold coin, the company is said by that means alone to have lost 40,000l. in the difference of exchange only. At last Hyder Ali having given the English army the slip, suddenly appeared within a few miles of Madras; which occasioned such an alarm, that the presidency there were induced to enter into a negotiation with him. The Indian prince, on his part, was very ready to hearken to proposals of peace upon any reasonable terms. An offensive and defensive treaty was therefore concluded on the 30th of April 1769, on the simple condition that the forts and places taken on both sides should be restored, and each party sit down contented with their own possessions.

By this treaty it was particularly stipulated, that in case of either party being attacked by their enemies, the English should give them assistance; and in this case even the number of troops to be supplied by each was specified. It soon after appeared, however, that the presidency of Madras were resolved to pay very little regard to their engagements. Hyder Ali having in a little time been involved in a war with the Mahrattas, applied for assistance, according to agreement; but was refused by the presidency, who pretended to fear a quarrel with the Mahrattas themselves. As the latter are a very powerful and warlike nation, Hyder Ali found himself overmatched, and therefore applied several times to the English for the assistance he had a right to expect; but was constantly refused on various pretences: which convinced him at last that he could place no...

war between the English and Mahrattas.

121

no dependence on the friendship of the English, and filled him with an implacable hatred against them. As soon, therefore, as he could make up his differences with the Mahrattas, he resolved to recover his losses, and revenge himself on those faithless allies. With this view he applied himself to their rivals the French; whom no Indian nation ever found backward in supplying them with the means of defence against the English. By their means he obtained military stores in the greatest abundance, a number of experienced officers and soldiers; and the European discipline was brought to much greater perfection than even he himself had ever been able to bring it before this period. Thus, in a short time, imagining himself a match for the Mahrattas, he renewed the war; and gained such decisive advantages, as quickly obliged them to conclude an advantageous treaty with him.

It now appeared that the English, notwithstanding their pretended ill-will to quarrel with the Mahrattas, had not the least hesitation at doing so when their interest was concerned. In order to understand the subsequent transactions, however, we must observe, that the Mahrattas, like other nations of Indostan, were originally governed by princes called rajahs, who resided at Satherah; and though in process of time they came to be divided into a number of petty states, yet they paid a nominal respect to the ram-rajah, who had a right to assemble their chiefs, and order out their troops on any necessary occasion. By degrees this dignity of ram-rajah or sou-rajah (as he was also called), became merely titular, the administration being entirely possessed by the paishwa or chancellor. This office being usurped by one particular family, Nana-row, the reigning paishwa, seized the ram-rajah and confined him in a fortress near Satherah. At his death he left two sons Mada-row and Narain-row; of whom the former, as being the elder, succeeded him in the paishwa-pship. Mongee Boosal, or Bounccella, the immediate predecessor of Moodjagee Boosla, rajah of Berar, was one of the pretenders to the dignity of ram-rajah, as being the nearest of kin; at the same time that Roganaut-row, called also Ragogab, uncle to Mada-row himself, pretended to the paishwa-pship. On this account the latter was confined by Mada-row, but who imprudently released him a little before his death, and even recommended to him in the most affectionate manner the care of his brother Narain-row, who was to succeed to the paishwa-pship. The care he took in consequence of this recommendation was such as might easily have been imagined; the unhappy Narain-row was murdered, and Roganaut-row the assassin fled to Bombay; where, on promising a cession of territory, he was protected and encouraged in his pretensions. The Mahrattas remonstrated against this behaviour; but the English had determined at all events to profit by the civil disensions of the Indians, and therefore paid no regard to the justice or injustice of their cause. The Mahrattas therefore not only made up their differences with Hyder Aly, as has been already mentioned, but became determined enemies to the English, at the same time that a dangerous confederacy was formed among the most powerful princes of India to expel from that part of the world those intruders, whose avarice could be satisfied with no concessions, and whom no treaties could bind when it served their turn to break them.

The resentment of Hyder Aly was particularly directed against the presidency of Madras for the reasons already given; he had also received fresh provocation by their causing a body of troops march through his dominions without his leave, and that to the assistance of a prince for whom he had no great friendship; also by the capture of the French settlement of Mah Lee, on the coast of Malabar, which he said was within his dominions, and consequently that the French were under his protection. His troops were therefore assembled from every quarter, and the greatest preparations made for a powerful invasion. The presidency of Madras in the mean time spent their time in mutual altercation, neglecting even to secure the passes of the mountains, through which only an invasion could be made, until their active antagonist, having seized and guarded those passes, suddenly poured out through them at the head of 100,000 men, among whom was a large body of European troops under French officers, and commanded by Colonel Lally, a man of great bravery and experience in war.

The alarm was given on the 24th of July 1780 that Hyder Aly's horse were only nine miles distant from Madras. The inhabitants instantly deserted their houses and fled into the fort; while the unresisted barbarian burnt the villages, reduced the inferior forts, and prepared to lay siege to the capital. It being now absolutely necessary to make some resistance, measures were taken for assembling the troops; in doing which an express was sent to Colonel Baillie, at that time at Gunapore, about 28 miles from Madras, to proceed from thence directly to Conjeveram with the corps under his command, where the main body was to meet him. But when the latter was under marching orders, the first regiment of cavalry positively refused to move without money; and as they persisted in their intention of resolution, were at last made prisoners and sent to Madras. The main body, then, consisting of 1500 Europeans and 4200 Sepoys, under Sir Hector Munro, with their train of artillery, proceeded towards Conjeveram: and such were the fatigues of their march, that 200 men belonging to the 73d regiment were left lying on the road. On their arrival at Conjeveram, they found the town in flames, great bodies of the enemy's cavalry advancing on both flanks, and no appearance of Colonel Baillie's detachment. The march of this body had been impeded by a small river swelled by a sudden fall of rain. On this occasion, the officer who gives the account of this disaster makes the following observation. "In this incident we have a most remarkable proof and example of the danger of procrastination, and on what minute circumstances and sudden springs of the mind the fortune and the general issue of war may depend. Had Colonel Baillie passed over the Tripassore without halting, as some advised, and encamped on its southern instead of its northern bank, the disaster that soon followed would have been prevented, and an order of affairs wholly different from that which took place would have succeeded."
campaigned, and in the course of several days, at different times, offered battle. On the 6th of September, he detached his son Tippoo Saib with the flower of his army to cut off the detachment under Colonel Baillie, who was now at Perambakum, a small village distant from the main body about 15 miles, he himself remaining in the neighbourhood of Conjeevaram, in order to watch the motions of Sir Hector Munro.

The detachment under Tippoo Saib consisted of 30,000 horse, 8000 foot, with 12 pieces of cannon. Notwithstanding this superiority in number, however, they were bravely resisted by Colonel Baillie’s handful of troops; and a junction was effected with a detachment under Sir Robert Fletcher, sent by Sir Hector Munro on first hearing the noise of the engagement.

This junction was effected on the 6th of September, and next morning orders were given for the whole army to march; Colonel Fletcher’s detachment being dispersed in different parts of the line. From the moment they began to march, the enemy played off their rockets, which, however, did but little execution; but about ten at night several guns began to open on the rear of the English. Colonel Baillie, therefore, after some proper manoeuvres, caused his troops form a line, while the enemy cannonaded them incessantly with great execution. On this Colonel Baillie detached Captain Rumley with five companies of Sepoy grenadiers to storm their guns; which service they would have undoubtedly accomplished, had not their march been interrupted by a torrent of water which at that time happened to be of undressable. Captain Rumley therefore returned about half an hour after eleven, when the guns of the enemy were heard drawing off towards the English front, and a general alarm was perceived throughout their camp; owing, as was supposed, to having received intelligence of the party that had been sent to storm their guns.

From their noise, confusion, and irregular firing (says our author), one would have imagined that a detachment of our men had fallen upon them with fixed bayonets. At that critical moment, had a party of grenadiers been sent against them, they would have routed without difficulty the whole of Tippoo’s army. Having about ten o’clock in the evening advanced a few hundred yards into an avenue, the detachment remained there in perfect silence till the morning.

"Colonel Fletcher being asked by some officers, why Colonel Baillie halted? modestly answered, that Colonel Baillie was an officer of established reputation, and that he no doubt had reasons for his conduct. It cannot, however, be concealed, that this halt afforded an opportunity for Tippo Saib to draw off his cannon to a very strong post by which the English were obliged to pass; and at the same time of informing Hyder of their situation, and suggesting to him the expedition of advancing for the improvement of so favourable a conjuncture.

On the 10th of September, at five o’clock in the morning, our little army marched off by the right in subdivisions, having their baggage on their right flank and the enemy on their left. A few minutes after six two guns opened on their rear, on which the line halted a few minutes. Large bodies of the enemy’s cavalry now appeared on their right flank; and just at the moment when the pagoda of Conjeevaram appeared in view, and our men had begun to indulge the hopes of a respite from toils and dangers, a rocket-boy was taken prisoner, who informed them, that Hyder’s whole army was marching to the assistance of Tippoo. Your guns now opened on their left with great effect. So hot was the fire they sustained, and so heavy the loss, that Colonel Baillie ordered the whole line to quit the avenue, and present a front to the enemy; and at the same time dispatched Captain Rumley with ten companies of Sepoy grenadiers to storm the enemy’s guns.

"Within a few minutes after Captain Rumley had left the line, Tippoo’s guns were silenced. Rumley’s little detachment immediately took possession of four of the enemy’s guns, and completely routed the party attached to them. Captain Rumley, overcome with fatigue, ordered Captain Cowdie, the officer next in command, to lead on the party, and take possession of some more guns placed a few hundred yards in their front. But in a few minutes after, as they were advancing for this purpose, a sudden cry was heard among the Sepoys, of horse! horse! The camp followers, whose numbers were nearly five to one of the troops under arms, were driven on a part of our line by the numerous and surrounding forces of Hyder Ali; who being informed of the embarrassing situation of Colonel Baillie, had left his camp without striking his tents, with a view to conceal his march from the English. A great confusion among our troops was the unavoidable consequence of this sudden onset. The Europeans were suddenly left on the field of action alone; and at that critical moment a detachment from the advanced guard of Hyder’s army pressed on with great celerity between our line and Captain Rumley’s party. The commanding officer, therefore, apprehensive of being cut off from our little army, judged it most prudent to retreat.

"Colonel Baillie, when he was informed that an immense body of horse and infantry was marching towards him, and that this was supposed to be Hyder’s main army, said, “Very well, we shall be prepared to receive them.” Hyder’s whole forces now appeared uncontested in view; and this barbarian chief, who, as was observed of the Roman general by Pyrrhus, had nothing barbarous in his discipline, after dividing his guns agreeably to a preconcerted plan, opened from 60 to 70 pieces of cannon, with an innumerable quantity of rockets.

"Hyder’s numerous cavalry, supported by his regular infantry and European troops, driven on by threats, encouraged by promises, and led on by his most distinguished officers, bore on our little army in different quarters without making the least impression. Our men, both Europeans and Sepoys, repeatedly presented and recovered their fire-arms as if they had been manœuvring on a parade. The enemy were repulsed in every attack; numbers of their best cavalry were killed, and many more were wounded; even the English infantry were forced to give way: and Hyder would have ordered a retreat, had it not been for the advice of General Lally, who informed him that it was now too late, as General Munro was most proba..."
India: 

Endearingly advancing on their rear from Conjeevaram; for which reason nothing remained but to break the detachment by their artillery and cavalry.

"Tippero Saib had by this time collected his party together, and renewed the cannonade; and at the same time that the English were under the necessity of sustaining an attack both from the father and son, two of their tumults were blown up by Hyder's guns, and a large opening made in both lines. They had now no other ammunition than grape; their guns discontinued firing; and in this dreadful situation, under a terrible fire not only of guns but rockets, losing great numbers of officers and men, they remained from half past seven till nine o'clock.

"On this Hyder Aly, perceiving that the guns were quite silenced, came with his whole army round their right flank. The cavalry charged them in distinct columns, and in the intervals between these the infantry poured in volleyes of musquetry with dreadful effect. Mihir Saib, with the Mogul and Sanoor cavalry, made the first impression. These were followed by the elephants and the Mysorean cavalry, which completed the overthrow of the detachment. Colonel Baillie, though grievously wounded, rallied the Europeans, and once more formed them into a square; and with this handful of men he gained an entrance, where, without ammunition, and most of the people wounded, he resisted and repulsed 13 separate attacks; but fresh bodies of cavalry continually pouring in, they were broken without giving way. Many of our men, desperately wounded, raising themselves from the ground received the enemy on their bayonets.

"Captain Lucas's battle of Sepoys, at the time when our men moved up to a rising ground, was stationed to the right of the European grenadiers; but that corps, seeing the Europeans in motion, and misunderstanding perhaps this evolution for a retreat, broke in the utmost confusion. The Europeans, however, sustaining their reputation for intrepid valour, remained in this extremity of distress steady and undaunted, though surrounded by the French troops, and by Hyder's cavalry to the number of 40,000. They even expressed a desire, though their number did not exceed 400, of being led on to the attack. A party of Toppers, who lay at the distance of about 30 yards in our front, kept up an incessant fire of small arms with great effect. Many attempts were made by the enemy's cavalry to break this small body of men; but by the steady conduct of our officers and men they were repulsed.

"Colonel Baillie, finding that there was now no prospect of being relieved by General Munro, held up a flag of truce to one of the chiefs of Hyder's army. But this was treated with contempt, and the surdard endeavoured at the same time to cut off the colonel. The reason the enemy assigned for this was, that the Sepoys had fired after the signal was hoisted.

A few minutes after this, our men received orders to throw down their arms, with intimation that quarter would be given. This order was scarcely compiled with, when the enemy rushed in upon them with the most savage and brutal manner, sparing neither age nor infancy nor any condition of life; and, but for the humane interposition of the French commanders Lally and Pimoran, who implored and insisted with the conqueror to show mercy, the gallant remains of our little army must have fallen a sacrifice to that savage thirst of blood with which the tyrant disgraced his victory (A).

In this unfortunate action near 700 Europeans were killed.

(A) In a narrative of the sufferings of the English who survived this fatal day, said to be published by an officer in Colonel Baillie's detachment, we find it related, that "Hyder Aly, seated in a chair in his tent, enjoyed the sight of the heads of the slain, as well as of his prisoners. Colonel Baillie, who was himself very much wounded, was brought to his camp on a cannon, and with several other gentlemen in the same situation laid at the tyrant's feet on the ground and in the open air. In this situation they saw many of the heads of their countrymen presented to the conqueror, some of them even by English officers, who were forced to perform that horrid task; in a little time, however, Hyder ordered no more heads to be brought to him while the English gentlemen were present. A tent was fitted up for Colonel Baillie and his officers, but without straw or any thing else to lie upon, though many of them were dangerously wounded; and as the tent could only contain 10 persons, the rest were obliged to lie in the open air. When the prisoners were removed from place to place, they were wantonly insulted, and even beaten by those who had the charge of them. If the latter halted to refresh themselves under a tree, they would be at the trouble of carrying their prisoners to the side next to the sun, lest they should enjoy the benefit of shade. Sometimes they were tormented with thirst, at others the people allowed them to drink water out of the palms of their hands, it being reckoned a profanation to allow an European to drink out of a vessel belonging to an Indian."

In this narrative are likewise mentioned some examples of a recovery from wounds, which, if we can depend on their authenticity, must undoubtedly show a restorative power in the human body altogether unknown in this climate.

"Lieutenant Thomas Bowser received a musket ball in his leg, and after that sight desperate wounds with a scimitar. He lay for seven hours on the spot, deprived of all sensation; but, towards evening, awakened from his trance, stripped of all his clothes, except a pair of under drawers and part of his shirt, with an intense thirst, calling out, and imploring a little water from the enemy. Some were moved with compassion, while others answered his intreaties only with insults and threats of immediate death. Some water, however, was brought from a pool in the field of battle, about 50 or 60 yards from the place where he lay. It was deeply tinged with blood; nevertheless, Mr Bowser being furnished by one of Hyder's soldiers with an earthen chatly, or pot containing about a pint, and directed to the place, crawled thither as well as he could. Though struck with horror at the sight of the dead and wounded with which it was filled, he quenched his thirst with the liquid; and having
killed on the spot; the loss on Hyder Ayl’s part was
so great that he industriously concealed it, being en-
rag ed that the conquest of such an inconsiderable body
should cost him so many of his bravest troops. He
seemed ever after to consider the English with an ex-
treme degree of terror; insomuch that, notwithstanding
his pretended exultation on account of the present vic-
tory, he never heard a word of Sir Hector Munro’s
march to attack him, than he left his camp in the ut-
most confusion, abandoning great part of his tents and
baggage, as well as the vast numbers that had been
wounded in the late action.

On the news of Colonel Bailie’s disaster, the supreme
council of Bengal requested Sir Eyre Coote to take
upon him the management of the war; for the carrying
on of which a large supply of men and money was in-
stantly decreed. This was readily undertaken by the
illustrious officer just mentioned, notwithstanding his
very precarious state of health at that time; and from
the moment he took upon him the management of af-
fairs, the fortune of the war was changed.

The spirit of dissension, which for a long time had
infected the presidency of Madras, was indeed the true
cause of all the misfortunes that had happened. This
was found by Sir Eyre Coote to be even greater than
he had heard by report: the respect and confidence of
the natives was wholly lost; the complaints of the of-
cfers and soldiers were loud and acrimonious; an in-
activity prevailed in all the councils and operations,
while the enemy carried every thing before them. Sir
Hector Munro had been greatly harassed on his march
to Madras, whither he had retreated after Bailie’s disas-
ter; the forces of Hyder Ayl had invest ed all the places in
that neighbourhood in such a manner as in a great measure to cut off all supplies;
and Arcot, the capital city of the most faithful ally
the British ever had, was taken by storm, together with
an adjoining fort, by which means an immense quan-
tity of ammunition and military stores fell into the
hands of the enemy.

No sooner had Sir Eyre Coote taken upon him the
command of the British forces, than his antagonist
thought proper to change his plan of operations en-
tirely. He now detached large parties of his numer-
ous forces to lay siege to the principal fortresses be-
longing to the company; while, with the bravest and
best disciplined part, he kept the field against the Bri-
tish commander in person. On the very first appear-
ance of the British army, however, his resolution fail-
ed, and he abandoned the siege of every place he had
invested, retreating to a considerable distance, on the
other side of the river Palar, without even disputing
the passage of it, as it was expected he would have
done.

A respite being thus obtained from the incursions
Pondicherry
of this formidable enemy, the next operation was to try revolts,
secure Pondicherry, whose inhabitants had revolted, but in
They were, however, easily disarmed, their magazines
seized, and all the boats in their possession destroy-
ed; in consequence of which precaution, a French
squadron that soon after appeared off Pondicherry
was obliged to depart without being furnished with any
necessaries. But in the mean time Hyder Ayl having
drawn large reinforcements from all parts of his domi-
nions, resolved to try his fortune in a pitched battle.
His army amounted to 200,000 men, 40,000 of whom
were cavalry, and 15,000 well disciplined Sepoys. Still,
however, he durst not openly attack the British army
in the field, but took a strong post from whence he
might harass them in their march. Sir Eyre Coote,
however, was not on his part backward to make the
attack; and on the other hand Hyder Ayl prepared
to engage him with all possible advantage. The battle
was fought on the 1st of July 1781; and notwith-
standing the vast superiority of Hyder Ayl’s army, he
was routed with great slaughter. The Indians, how-
ever, made a much more obstinate resistance than usual;
Hyder Ayl’s engagement lasted from nine in the morning till
four in the afternoon, and the deficiency of the English
in cavalry prevented them from pursuing the advantage
that they had gained.

Notwithstanding the loss of this battle, Hyder Ayl was soon encouraged to venture another. This was cond ve-
fought on the 27th of August the same year, on the toy
very spot where Colonel Bailie had been defeated. It
was more obstinately contested than even the former,
being continued with great fury from eight in the
morning to near dusk. A number of brave officers
and soldiers fell on the part of the British, owing chief-
ly to the terrible fire of the enemy’s artillery and the
advantageous position of their troops. At last, how-
ever, the Indian army was totally defeated, and driven
from every post it had occupied; though from the
obstinate resistance made at this time, Hyder began
to entertain hopes that his forces might, by a suc-
cession of such battles, be at last enabled to cope with
the English. He therefore ventured a third battle in Hyder in
some weeks after, but was now defeated with greater loss a
third time.

having filled his chatty, endeavoured to proceed towards Conje veram. He had not, however, moved from his
place above 300 or 400 yards, when, being quite overcome, he was obliged to lie all night in the open air, du-
ring which time there fell two heavy showers of rain. Next morning he proceeded to Conje veram; but after
walking about a mile, was met by some of the enemy’s horsemen, by whom he was brought back prisoner, and
obliged to walk without any assistance. When delivered up to the enemy’s Sepoys, he was so stiff with his
wounds, that he could not stoop or even bend his body in the smallest degree.

44 The quarter-master sergeant of artillery received so deep a cut across the back part of his neck, that he
was obliged to support his head with his hands in order to keep it from falling to a side all the journey. The
least shake or unevenness of the ground made him cry out with pain. He once again ceased from all at-
ttempts to proceed; but being encouraged and conjured by his companions to renew his efforts, he did so,
reached the camp, and at last, as well as Mr Bowser, recovered."—It is also remarkable, that, according to
our author, out of 32 wounded persons only six died; though one would be apt to think that the excessively
severe usage they met with would have killed every one.
India.

loss than before. Undiscouraged by this bad success, however, he laid siege to Vellore; and expecting that the relief of it would be attempted, seized a strong pass through which he knew the British army must direct their march. The British commander accordingly advanced, and found the enemy in possession of some very strong grounds on both sides of a marsh through which he was obliged to pass. Here he was attacked on all sides, but principally in the rear, the enemy directing their force principally against the baggage and convey of provisions designed for the garrison. Their utmost efforts, however, were unsuccessful, and Sir Eyre Coote forced his way to Vellore in spite of all opposition. Hoysayy did not fail to wait his return through the same pass; and having exerted his utmost skill in posting his troops, attacked him with the utmost vigour: but though the English were assaulted front and on both flanks at once, and a heavy cannonade kept up during the whole time of the engagement, the Indians were at last defeated with great slaughter.

By these successes the presidency of Madras were now allowed so much repose, that an enterprise was planned against the Dutch settlement of Negapatam, situated to the south of Madras, and in the neighbourhood of Tanjore. A very inconceivable force, however, could yet be spared for this purpose, as Hoysayy, though so often defeated, was still extremely formidable. Sir Hector Munro had the management of the expedition: and so furious was the attack of the British sailors, that the troops left to guard the avenues to the place were defeated at the very first onset. A regular siege ensued: which, however, was of very short duration, a breach being soon made and the garrison surrendering prisoners of war.

The loss of Negapatam was quickly followed by that of Trincomalee in Ceylon. Admiral Hughes, who had conveyed Sir Hector Munro with the land forces to that place, and assisted him with his sailors, immediately after its surrender set sail for Trincomalee, where he arrived about the middle of January 1782. The fort of that name was quickly reduced; but the main strength of the settlement consisted of a fort named Ostenburgh, the principal place on the island, and by the capture of which the whole settlement would be reduced. This fort stands on a hill which commands the harbour, but is itself overlooked by another hill at the distance of no more than 200 yards. Though the gaining of this post was undoubtedly attended with the loss of the fort, it does not appear that the governor even attempted to defend it. A British detachment of sailors and marines therefore took possession of it, when the admiral sent a summons of surrender, representing the inutility of making any further defence after the loss of such a post; and being extremely desirous of avoiding an effusion of blood, repeated his arguments at several different times. The governor, however, proving obstinate, the place was taken by storm, with the loss of about 60 on the side of the British, and very little on that of the Dutch, the victors giving quarter the moment it was asked.

Four hundred Europeans were taken prisoners; a large quantity of ammunition and military stores, with a numerous artillery, were found in the place; and two Indiamen richly laden, with a number of small trading vessels, were taken in the harbour.

A more formidable enemy, however, now made his appearance on the coast of Coromandel. This was Suffren the French admiral; who setting out from Toulon with his native country with 11 ships of the line and several powerful stout frigates, had fallen in with the Hannibal of 50 guns, and taken her when separated from her consorts.

This ship, along with three others, a 74, a 64, and a 50, had been sent out to the assistance of Sir Edward; and the three last had the good fortune to join him before the arrival of M. de Suffren. The latter, supposing that he had not yet received this reinforcement, bore down upon the English squadron at Madras, to which place they had sailed immediately after the capture of Trincomalee. Perceiving his mistake, however, he instantly bore away. The English admiral pursued, took six vessels, five of them English prizes, and the sixth a valuable transport laden with gunpowder and other military stores, besides having on board a number of land-officers and about 300 regular troops. This brought on an engagement, in which M. Suffren, perceiving the rear division of the British fleet unable to keep up with the rest, directed his force principally against it. The ships of Admiral Hughes himself and Commodore King sustained the most violent and relentless efforts of the French, having mostly two, and sometimes three, vessels to contend with. Thus the Edward commodore's ship was reduced almost to a wreck; but at six in the evening, the wind becoming more favourable to the English, the squadron of the enemy were obliged to draw off. The loss of men on the part of the British amounted to little more than 130 killed and wounded, but that of the French exceeded 250.

After the battle Sir Edward returned to Madras; but meeting with no intelligence of Suffren at that place, he made the best of his way for Trincomalee, being apprehensive of an attack upon that place, or of the intercepting of a convoy of stores and reinforcements at that time expected from England. Suffren had indeed got intelligence of this convoy, and was at that time on his way to intercept it. This brought the hostile fleets again in sight of each other: and as the British admiral had been reinforced by two ships of the line, he was now better able to encounter his adversary. A desperate battle ensued, which continued till towards night, when the ships on both sides were so much shattered, that neither could renew the engagement next day.

Though these engagements produced nothing decisive, they were nevertheless of the utmost prejudice to the affairs of Hoysayy, who was thus prevented from receiving the succours he had been promised from France; and he was still farther mortified by the defeat of his forces before Tellicherry, which place he had blocked up since the commencement of hostilities. This last misfortune was the more sensibly felt, as an Tellicherry. This place was now left for the English into those countries best affected to Hoysayy. His bad success elsewhere, however, was in some measure compensated by waite's defeat, the entire destruction of a detachment of about 2000 English infantry and 3000 cavalry under Colonel Braithwaite, by waite, a brave and experienced officer. This detachment,
ment, consisting of chosen troops from Sir Eyre Coote's army, lay encamped on the banks of the Coleroon, which forms the northern boundary of Tanjore. Tippoo Saib having procured exact intelligence of the situation of this party, formed a design of attacking it while no danger was suspected on account of the distance of Hyder Ayl's army. He set out on his design with an army of 15,000 horse and 5000 foot, accompanied by a body of French regulars; and having crossed the Coleroon, suddenly surrounded the British forces on all sides. The colonel, perceiving his danger, formed his men into a square, distributing the artillery to the several fronts, and keeping his cavalry in the centre. In this situation he resisted for three days the utmost efforts of his numerous enemies, always compelling them to retreat with great loss. At last General Lally, rightly conjecturing that the strength of the English must be exhausted and their numbers thinned by such desperate service, proposed that the French infantry, which was fresh and entire, should attack one of the fronts of the square, while the forces of Tippoo should do the same with the other three. This last attack proved successful; the British forces were broken with great slaughter, which however was stopped by the humanity of the French commander; who even obtained from Tippoo Saib the care of the prisoners, and treated them with a tenderness and humanity they certainly would not otherwise have experienced. A number of British officers, however, perished in the engagement, and only one remained unwounded.

In the meantime, the succours from France, so long expected by Hyder, made their appearance. As soon as a junction was formed, they proceeded, under the command of M. Duchemin, to invest Cuddalore; which not being in any situation to stand a siege, was surrendered on capitulation. In like manner some other places of smaller consequence were reduced, until at last being joined by Hyder's numerous forces, they determined to lay siege to Vavandavas, a place of great importance, and the loss of which would have been extremely detrimental to the English. This quickly brought Sir Eyre Coote with his army to its relief; but Hyder Ayl, notwithstanding his being reinforced by the French, durst not yet venture a battle in the open field. On this the British commander proceeded to attack Arnee, the principal depositary of Hyder's warlike stores and necessaries. Thus the latter was obliged to quit his advantageous ground; but he did so with such secrecy and speed, that he came upon the British army unawares while preparing for its last march to Arnee, now only five miles distant. Perceiving that the march of the British troops was through low grounds, encompassed on most parts with high hills, he planted his cannon upon the latter; from which he kept a continual and heavy fire on the troops below, while his numerous cavalry attacked them on every side. Notwithstanding all disadvantages, the British commander at last closed in with the enemy; and after an obstinate dispute completely routed them. Neither this, however, nor any other engagement with Hyder Ayl, ever proved decisive; for as the want of cavalry prevented the British general from pursuing his advantage, so that of his antagonist was so numerous, that by it he always covered his retreats in such an effectual manner as to lose but few men, and in a short time to be in a condition to act again on the offensive. This was remarkably the case at present; for notwithstanding this defeat, which happened on the 2d of June 1782, he cut off an advanced body of the British army five days after; and harassed the whole in such a manner, that Sir Eyre Coote, notwithstanding his success, was obliged to move nearer Madras; soon after which, he was obliged, on account of his bad state of health, to relinquish the command of the army to General Stuart.

Hyder Ayl now perceiving that he was likely to be attended with no success by land, began to rest his hopes on the success of the French by sea. He therefore earnestly requested M. Suffrene, who possessed at that time a decisive superiority in the number of ships, to lose no time in attacking the British squadron before it could be joined by a reinforcement which was then on its way, and was reported to be very formidable. As the French commander was by no means deficient in courage, a third engagement took place on the 5th of July 1782. At this time the British had the advantage of the wind, the battle was much more close, and the victory more plainly on their side. It is said indeed, that had not the wind fortunately shifted in such a manner as to enable the French to disengage their ships, a total and ruinous defeat would have ensued. After the engagement, the French admiral proceeded to Cuddalore, having received intelligence that a large body of French troops in transports had arrived off the island of Ceylon, in company with three ships of the line. As this seemed to afford hopes of retaliation, he used such diligence in refitting his ships, that the fleet was able to put to sea in the beginning of August. His intention was to make an attempt on Trincomalee; and so well were his designs conducted, that Sir Edward received no intelligence of the danger, till a French frigate chasing a French one, which took shelter with the squadron at Trincomalee, discovered it by this accident, and hastened back with the news to Madras. It was now, however, too late; the place was not in a condition to resist a siege; and besides the French batteries had silenced those of the British fort in two days, a capitulation took place on the last day of August.

Sir Edward Hughes having been detained by contrary winds, did not arrive at Trincomalee before the 2d of September, when he had the mortification to see the forts in the hands of the French, and that Suffrene was in the harbour with 15 sail of the line, while he had only 12. He did not hesitate at venturing an engagement with this inferiority, nor did M. Suffrene battle to decline the combat. The event of the battle was between the French and no other than shattering the fleets and killing and wounding a number of men on both sides. In these fleets, however, as well as in the other engagements, the superiority of the English was very manifest; and in entering the harbour of Trincomalee the French lost a 74 gun ship.

The loss of Trincomalee was severely felt by the English; for while the French lay safely in the harbour refitting their squadron, the English were obliged to sail for Madras. Here the fleet was destined to be assailed by one of the most dreadful tempests ever known on that coast. Trading vessels to the number of
of near 100 were wrecked, as well as those for Madras laden with rice, of which there was an extreme scarcity at that place. Thus the scarcity was augmented to a famine, which carried off vast numbers of the inhabitants before supplies could arrive from Bengal. The continuation of the bad weather obliged Sir Edward with his whole squadron to sail to Bombay; and there he did not arrive till towards the end of the year, when his squadron was so much shattered, that, in order to repair it with proper expedition, he was obliged to distribute it between the dock-yards of Bombay and the Portuguese settlement at Goa.

In the meantime Sir Richard Bickerton arrived at Bombay from England with five men of war, having on board 5000 troops, after a very favourable passage; having neither seen nor heard of the bad weather which had desolated the coasts of India. It was likewise the intention of France to signalize the campaign of this year by an immense force both by sea and land in India. Exclusive of the forces already on the coast of Coromandel, they were to be joined by 2000 more, all regulars, from their islands on the African coast. Suffrein was to be reinforced by several ships of the line, when it was hoped that a decided superiority at sea would be obtained over the English; while their superior numbers and artillery on shore would render them invincible by any force that could be brought against them. To oppose these designs, it was deemed necessary by the presidency of Bombay to make a powerful diversion on the coast of Malabar. Here was situated the kingdom of Mysore, the sovereignty of which had been usurped by Hyder Ali under the title of Dyaua, as that of the Marathas was by a person styled Peishtwa. This kingdom is nearly in the same parallel with Arcot. To the northward is the kingdom of Canara, which is said to have been the favourite possession of Hyder Ali; the name of its capital is Biddore, which also gives name to an extensive territory, and was by Hyder changed to that of Hydernagar.

The expedition had been set on foot as early as the end of the year 1781; a strong body of forces under the command of Colonel Humberstone had taken the two cities of Calicut and Panyan, besides others of lesser note, and penetrated into the inland country, which is there difficult and dangerous. Having here made himself master of a place called Mongayry Cotta, of which the situation commanded the entrance into the inner parts of the country, he proceeded to attack Palatasherry, a considerable town at some miles distance; but being suddenly environed with a numerous and hostile army, instead of making himself master of the place, it was not without the utmost difficulty that he made his escape after losing all his provisions and baggage. A great army, consisting of 28,000 foot and 10,000 horse, under Tippoo Saib, also advanced against him with such celerity, that the colonel had only time to retreat to Panyan, where he was superseded in the command by Colonel Macleod; and soon after the place was invested by the forces of the enemy, among whom was General Lally with a considerable body of French. Two British frigates, however, having come to the assistance of the place, rendered all the attempts of the enemy to reduce it abortive. At last Tippoo Saib, impatient of delay, made a vigorous effort against the British lines; but though both the Indian and French commanders behaved with great bravery, the attack not only proved unsuccessful, but they were repulsed with such loss as determined Tippoo to abandon the siege of the place, and retire beyond the river of Panian.

As soon as the presidency of Bombay were acquainted with the success of Colonel Humberstone, General Matthews was dispatched to his assistance with a powerful reinforcement. This expedition, which began the campaign of 1783 in the kingdom of Canara, has been related with circumstances so disgraceful, and so exceedingly contrary to the behaviour for which the British troops are remarkable, that we are totally at a loss to account for them. On the one hand, it seems surprising how the national character could be forfeited by a particular body, and not by any other part of the army; and on the other, it seems equally surprising why such calumnies (if we suppose them to be so) should have arisen against this particular body and no other part of the army. Such accounts of it, however, the army were published as raised the indignation of the military gentlemen, who thought proper to publish a vindication of themselves. In the Annual Register, from this expedition, next to the gazettes and newspapers, the general receive what they look upon to be authentic intelligence, the character of this army is treated with the highest asperity. "In the story of the conquest and recovery of Canara (says the New Annual Register), the Spaniards may be said to be brought a second time upon the scene, but not to sit down in sullen and insolent prosperity after all their crimes. The Spaniards of Britain were overtaken in the midst of their career; and he who is more of a man than an Englishman, will rejoice in the irregular and unmeasured, but at the same time the just and merited, vengeance that was inflicted upon them by the prince whose dominions they were ravaging!" In support of this dreadful exclamation the following account is given of the expedition. It began with the putting in execution a design formed by General Matthews of carrying the war into the heart of Hyder Ali's dominions. For this purpose the English invested the city of Onore, situated about 300 miles to the south of Bombay, and one of the principal places in the country of Canara. "It was taken by assault (says Dr Andrews) with great slaughter, and plundered with circumstances of arrogance and rapine that disgraced the victors; among whom, at the same time, great contents arose concerning the division of the spoil." "No quarter (says the Annual Register) was given by the victorious English; every man they met was put to the sword. Upon this occasion we beg leave to transcribe three lines from the private letter of one of the officers concerned in the expedition. 'The carnage (says he) was great: we trampled thick on the bodies that were strewn in the way. It was rather shocking to humanity; but such are the only secondary considerations, and to a soldier, whose bosom glows with heroic glory, they are thought only accidents of course; his zeal makes him aspire after farther victory.' This part of the peninsula had hitherto been untouched by the barbarous and unsparing hands of Europeans, and of consequence was full of riches and splendour. In the fortress of Onore were found sums of money to an unknown amount, besides jewels and diamonds.
diamonds. A considerable part of this appears to have been secured as private plunder by General Matthews. The complaints of the military were loud; they thought, and naturally, that the acquisition of riches was the fair and reasonable consequence of the perpetration of bloodshed. But their commander turned a deaf ear to their representations; and hastened, by adding new laurels to his fame, to hide the slander that might otherwise rest upon him."

From Onore the army proceeded to the nearest fortresses on the sea-coast, Inore and Cundapour. Here they were joined by a reinforcement from Bombay, under the command of Colonels Macleod and Humberstone, with positive orders to proceed for Bidnore or Hydermugur the capital of Canara. On this General Matthews marched for the mountains called the Ghauts, where there is a pass three miles in length, though only eight feet wide, and which was then strongly fortified, and defended by a vast number of the natives. "The English (say our authors), however, had already obtained a considerable reputation by their executions; ang the use of the bayonet, the most fatal instrument of war, and which was employed by them on all occasions, created such an extreme terror in the enemy, as to enable them to surmount this otherwise impregnable defile."

The gaining of this pass laid open the way to Bidnore the capital, to which a summons was now sent. An answer was returned, that the place was ready to submit, provided the inhabitants were not molested, and the governor was permitted to secure his property. The wealth of this city was undoubtedly great, but the estimates of its amount are very different. By the accounts of Bombay it was stated only at 175,000l; while the officers concerned in the expedition say that it was not less than 1,200,000l, or even 1,920,000l; and even this was only public property; that seized upon by the soldiers, and which belonged to private persons, was undoubtedly very considerable also.

This treasure was at first shown by the general to his officers, and declared to belong to the army; but he afterwards told them that it was all the property of the Mohammedan governor, and had been secured to him by the terms of the surrender. It was therefore sent to Cundapour, under the convoy of Lieutenant Matthews, brother to the general, to be thence transmitted to Bombay; but whether any part of it ever reached that settlement or not was never known. The discontent of the army were now carried to the utmost height; and the contest became so serious, that Colonels Macleod, Humberstone, and Shaw, quitted the service all together, and returned to Bombay. The officers charged their general with the most instable and shameful avarice; while he, in return, accused his whole army of doing every thing disrespectful and injurious to him; of paying no regard to order and discipline, and of becoming loose and unfeeling as the most licentious freethinkers.

From Bidnore detachments were sent to reduce several fortresses, the principal of which was Aanapour or Anantapore. Here orders were issued for a storm and no quarter. Every man in the place was put to death, except one horseman, who made his escape after being wounded in three places. "The women, unwilling to be separated from their relations, or exposed to the brutal licentiousness of the soldiery, threw themselves in multitudes into the moats with which the fort was surrounded. Four hundred beautiful women pierced with the bayonet, and expiring in one another's arms, were in this situation treated by the British with every kind of outrage."

This exploit was succeeded by the reduction of Carwa and Mangalore, which completed the reduction of Canara, when General Matthews put his army in cantonments for the rainy season.

This rapid success was owing to the death of Hyder Ali, which happened in the end of the year 1782. His son Tippoo Saib, however, having taken possession of the government, and settled his affairs as well as time would allow, instantly resumed his military operations. On the 7th of April 1783 he made his appearance before Bidnore, so that General Matthews had scarce time to collect a force of 2000 men, and to write to Bombay for a reinforcement. But, however necessary the latter must have been in his circumstances, the presidency were so much inclined against him by the unfavourable reports of his officers, that they suspended him from his commission, appointing Colonel Macleod to succeed to the command of the army.

Tippoo Saib now advanced with a vast army, supposed not to be fewer than 150,000 men, covering the hills on each side of the metropolis as far as the eye could reach. The army of General Matthews, altogether unable to cope with such a force, was quickly driven from the town, and forced to take refuge in the citadel. Tippoo having cut off their retreat by gaining possession of the Ghauts, laid close siege to the fortress; which in less than a fortnight was obliged to capitulate. The terms proposed were, that all public property should remain in the fort; that the English should engage not to act against Tippoo for a stipulated time; that they should march out with the honours of war; that they should pile their arms, and have full liberty to proceed unmolested with their private property to the sea-coast, from thence to embark for Bombay; and in this capitulation the garrisons of Aanapour, and other inland fortresses, were also included.

All these terms were broken by Tippoo, who said that they had forfeited their title to liberty by a breach of the articles of capitulation, in embezzeing and secreting the public money, which was all in good faith to be delivered up. That this was really the case seems to be universally acknowledged. In the Annual Register we are told, that "to prevent too much money being found in the possession of one man, the general ordered his officers to draw on the paymaster-general for whatever sums they wanted. When the fort was surrendered to the sultan, there was not a single rupee found in it." By this circumstance the fate of the garrison was decided. General Matthews was sent for next morning to a conference. He was not, however, admitted to his presence, but immediately thrown into chains. Most of the other principal officers were, on various pretences, separated from the army. The general and his companions were conducted to Seringapatam the capital of Mysore; and after having experienced a variety of severities, were at last put to death by poison. In this manner the general and 20 officers perished.
The poison administered was the milk of the cocoa-tree, which is said to be very deadly.

The above account was repeatedly complained of as partial, and at last openly contradicted in a pamphlet entitled "A Vindication of the Conduct of the English Forces" employed in that expedition, and published by order of the East India Company. In this pamphlet the circumstance most found fault with was that regarding the women at Anantpore, which was positively contradicted. On this account, therefore, the publishers of the above-mentioned work retract that part of their narrative, as being founded in misrepresentation. Notwithstanding this vindication, however, they still draw the following conclusions. "It is already sufficiently evident, how little has been effected by this vindication of the Bombay officers. The great outlines of the expedition remain unaltered. It is still true that a remarkable degree of severity was employed in the field; that, in the capture of the fortresses of Canara, the principle of a storm and no quarter was very frequently applied; and that the acquisition of money was too much the governing object in every stage of the undertaking. The vindication of the officers has therefore done them little service; and it happens here, as it generally does in the case of an imperfect reply, that the majority of the facts are rather strengthened and demonstrated by the attempt to refute them. With respect to the conclusion of the story, the treasurers of Hydernagar, and the charge brought against them by Tippoo, that they had broken the terms of the capitulation, and that when the fort was surrendered not a rupee was to be found in it; these circumstances are passed over by the officers in the profoundest silence. It was this that roused the sultan to vengeance; and it is to this that he appeals for his justification in disregarding a capitulation which had been first dissolved by the vanquished English."

The vindication above alluded to was signed by one major and 52 subaltern officers. It seems not, however, to have given entire satisfaction to the military gentlemen themselves, as other vindications have appeared, said to be written by officers; but these being anonymous, can be supposed to add very little weight to that already mentioned, where such a respectable body have signed their names. We shall therefore drop a subject so disagreeable, and the investigation of which at the same time is entirely foreign to the plan of this work.

It now remains to give some account of the war with the Mahrattas, begun, as was formerly hinted, on account of the protection afforded to the assassin Raghobat-row. This man had formerly obliged the Mogul to take shelter in the English factory at Bengal; but being unable to keep up his credit among his countrymen, was expelled as already related. On his arrival at Bombay, an alliance was formed between him and the English government; by which the latter engaged to replace him in the Mahratta regency in consideration of some valuable cessions of territory. The supreme council of Bengal, however, disowned this treaty, and concluded one with the Mahrattas in the month of March 1776; by which it was agreed that they should provide for Raghob's subsistence according to his rank, on condition of his residing in their country. This being not at all agreeable to Raghob, he fled once more to Bombay, where a new confederacy was entered into for his restoration. The council of Bengal approved of this on account of the approaching rupture with France; and in consequence of this, a detachment was, in February 1778, ordered to march across the continent of India. By some mismanagement in this expedition, the whole army was obliged to capitulate with the Mahratta general on the 9th of January 1779. One of the terms of the capitulation was, that a body of troops which were advancing on the other side should be obliged to return to Bengal. But General Goddard, the commander of these forces, denying the right of the council of Bengal to remand him, proceeded on his march, and arrived on the 18th of February. Here he received orders to conclude a new treaty, if it could be obtained on easier terms than that of the capitulation, by which it had been engaged to cede all our acquisitions in the country of the Mahrattas.

Such extreme disregard to any stipulations that could be made, undoubtedly provoked the Mahrattas, and induced them to join in the confederacy with Hyder Aly already mentioned. The war, however, was successfully begun by General Goddard in January 1782. In three months he reduced the whole province of Gujarat. Madaji Scindia the Mahratta general advanced to oppose him; but as he did not choose to venture a battle, the English general stormed his camp, and totally routed him. Other exploits were performed in the course of this campaign; during which the governor-general (Mr Hastings) seeing no hopes of an accommodation, entered into a treaty with the raja of Gothis, and with his consent Major Popham reduced a fortress in his dominions named Gujtol, garrisoned by the Mahrattas, and lighthouse reckoned impregnable.

These successes were followed by the dreadful incursions of Hyder Aly already related, which put a stop to the conquests of General Goddard; all the forces he could spare being required to assist the army under Sir Eyre Coote. The last exploit of General Goddard was the reduction of the island of Salsette, and of a strong fortress named Bassee in its neighbourhood. The army of Scindia, consisting of 30,000 men, was also defeated this year by Colonel Carnac; and the Mahrattas, disheartened by their losses, consented to a separate peace with the English, leaving Hyder Aly to manage the war as he thought proper.

In the mean time, however, the expenses incurred by these wars were so high, that Mr Hastings, who was obliged to furnish them some how or other, was reduced to the greatest difficulties. For this purpose not only all the treasure of Bengal was exhausted, but it was found necessary to draw extraordinary contributions from the British allies, which was productive of many disagreeable circumstances. One of the most remarkable of these was the revolt of Benares. The raja of this town had formerly put himself under the protection of the English, who on their part agreed to secure his dominions to him on condition of his paying an annual subsidy to the nabob of Oude. In 1770 the raja died, and was succeeded by his son Cheit Sing, who held the sovereignty at the time we speak of. On the death of the nabob in 1775, a new treaty was made with his successors.
successor, by which the sovereignty of Benares was transferred to the East India Company, an acquisition equivalent to 240,000 per annum; at the same time that the subsidy paid by Sujah Dowla, and which, by Lord Clive, had been fixed at 56,000, and afterwards raised to 252,000, was now augmented to 312,000 per annum.

On receiving intelligence in July 1778, that war had actually commenced between France and England, Cheit Sing was required to pay 50,000 as his share of the public burdens. Such a demand was paid with extreme reluctance on the part of a prince who already contributed 240,000, and probably thought that an abundant equivalent for the protection enjoyed. The same requisition, however, was made in the two succeeding years, but with a promise that the demand should cease when peace was restored. Instead of any present alleviation, however, a body of troops was also quartered upon him, and he was likewise obliged to pay for their maintenance, lest he should not voluntarily pay the additional 50,000. In November 1780, in addition to all these demands, he was also required to send into the field such a body of horse as he could spare; but this requisition, owing to some misunderstanding, was never complied with.

In July 1781 Mr Hastings having, it is said, received some intelligence that the oppressed rajah mediated rebellion, set out on a visit to the nabob of Oude, and in his way proposed to clear up the misunderstanding with him. The method by which he intended to clear up this misunderstanding was to lay a fine upon the poor prince of 400,000 or 500,000; and as a reason for doing so, it was alleged that the late rajah had left a million sterling in his treasury; a sum which was continually increasing. Cheit Sing advanced to the borders of his territories to meet the governor-general, behaved with all imaginable submission; and having got private intelligence of what was meditated against him, offered to pay down 200,000. This was refused; and the governor-general having reached the capital, forbade the rajah his presence, and by a letter acquainted him with his causes of complaint. Cheit Sing sent a very submissive answer; but as he endeavoured to exculpate himself, Mr Hastings was so far from being satisfied, that he put the prince under an arrest.

Such an unheard-of proceeding excited the utmost surprise and resentment in subjects accustomed to regard their sovereignty with a degree of reverence little short of adoration. On the very day of the arrest they assembled tumultuously, cut in pieces the guard which had been set on the palace, and carried off their prince in triumph. It does not appear, however, that this was any other than a transitory tumult: for though they could easily have cut off the governor-general, they made no attempt against him. Cheit Sing protested his innocence, and made the most unlimited offers of submission, but all in vain. His government was declared vacant, and the zemindary bestowed on the next heir; the annual subsidy to the government of Bengal was augmented from 240,000 to 400,000 annually. The miserable rajah was forced to fly his country; and his mother, though promised leave to retire upon conditions, was attacked in her retreat and plundered by the soldiers. After all his endeavours to procure money, however, Mr Hastings found this adventure turn out much less profitable than he had expected; for the treasury of the fugitive prince was seized and retained by the soldiery.

As to the nabob of Oude, a new treaty was concluded with him; the design of which was evidently to ease him of some of the burdens to which he was at that time subjected. Part of the British troops were therefore withdrawn from his dominions. As Fizullah Khan, the most prosperous of his dependents, had been called upon to furnish a body of 5000 horse to join the nabob's army, and had not complied with the requisition, the guarantee of his treaty with the nabob, formerly executed, was withdrawn; but it being afterwards discovered that his territory was not equivalent to the claims of the governor, the treaty was renewed on payment of a slight fine. As the widow of Sujah Dowla was suspected of favouring the late rajah Cheit Sing, the reigning prince was allowed to reclaim the treasures of his father in her possession, on condition of paying him a certain stipulated allowance annually. The treasures were seized as payment of the debts of the prince to the company.

Hostilities continued in India between the French and English till the year 1783 was far advanced, and long after tranquillity had been restored to other parts of the world. In the beginning of the season for action the governor and council of Bengal determined to send an ample supply to the presidency of Madras, that they might be enabled to put an end to the war, which Tipoo seemed willing to prosecute with even more vigour than his father had done. For this purpose Sir Eyre Coote, who, for his health, had gone to Bengal by sea, set sail once more for Madras, being intrusted with a large sum of money for the necessary expenses of the war. In his passage he was chased for forty-eight hours by two French men of war. The solicitude and fatigue he underwent during this time, being almost constantly upon deck, occasioned a relapse, so that he died in two days after his arrival at Madras. His death was greatly lamented, as the greatest expectations had been formed of a happy conclusion being put to the war by his extraordinary military talents, for which he had already acquired such a great reputation in England.

The invasion of Tipoo's dominions having called him off from the Carnatic, General Stuart took the opportunity of attacking him in another quarter. Colonel Fullarton was despatched with a large body of troops to invade the province of Coimbatour. This he executed with great success; overrunning the country, taking several fortresses, and making a very alarming diversion on this side of Tipoo's dominions. General Stuart, however, having still greater designs in view, was obliged to recall this gentleman in the midst of his success. The siege of the strong fortress of Cuddalore was the operation which now engaged his attention. It was now become the principal place of arms chiefly belonging to the French; was strongly fortified, and garrisoned by a numerous body of the best troops in France, as well as a considerable number of Tipoo's choicest forces. The siege therefore proved so difficult, that though the English displayed the utmost valour and military skill, they were not able to reduce the place until hostilities were interrupted by the news of a general pacification having taken place in Europe. In this
this siege a remarkable circumstance took place, viz. that of a corps of Sepoy grenadiers encountering and overcoming the French troops opposed to them with fixed bayonets. For this remarkable instance of valour, they not only received the highest applause at the time, but provision was made for themselves and families by the presidencies to which they belonged.

After the reduction of Hyderabaud, and the destruction of the army under General Matthews, the English possessed only three places of consequence in the kingdom of Canara. These were Mangalore, Onore, and Carwa. The siege of all these places was undertaken at once. Mangalore, the principal port in the country, was defended by a very numerous garrison under Major Campbell. Tippoo sat down before it on the 10th of May; and the attack and defence were both conducted with the greatest spirit and activity. Notwithstanding the utmost efforts of the besiegers, however, and that the garrison were reduced to the last extremity for want of provisions, they held out in spite of every difficulty, until the general pacification being concluded, the place was afterwards delivered up. In other parts nothing more happened than an indecisive engagement between M. Suffren and Admiral Hughes; so that the British empire in Bengal was for that time fully established, and continued un molested by foreign enemies, till the ambition of Tippoo Saib again prompted him to invade the territories of the nabob, an ally of Britain. This again brought on a war with that restless, but able prince; in this war the British were joined by the Mahrattas, and the conduct of it was entrusted to Lord Cornwallis.

Among the various usurpers who suddenly rose to the rank of sovereign princes on the fall of the Mogul empire, Hyder Ali was the most successful. A master in dissimulation and treachery, he laboured, while in a humble station, to acquire the confidence of his superiors, that he might the more completely betray them. "The qualities, so necessary to a successful usurper, were in the accompanied with considerable military skill, and great talents for government. Hence the power which he at first so treacherously obtained, was soon augmented by fresh acquisitions; and the territories which he conquered were governed with a systematic arrangement and vigorous justice, which speedily augmented their population, and increased his own resources.

His son, Tippoo Sultan, though far inferior to his father in the art of government, in moderation, and in the general steadiness of his character, was, however, distinguished in India as an excellent officer and intrepid warrior; qualities which effectually secured him the confidence of his troops. The operation of the system established by his father, and the warlike complexion of his own character, continued to support the general prosperity of his dominions, which were enlarged on all sides by conquests from his neighbours, and were strengthened by a great number of the most impregnable fortresses in the peninsula.

Hence the power of the Mysorean kings, which in its rise had been often combated, and sometimes defeated by the Mahrattas, at last acquired a decided ascendency in the south of India. The discipline and fidelity of their troops, till their late aggressions on the British, had constantly been increasing in reputation; and fully evinced the excellent regulations which had been established for the army. The government of the princes was strict; that of the last, violent and arbitrary. It was still, however, the despotism of an able and warlike sovereign, who may rigorously check, but does not destroy those subjects which must form the means of his future aggrandisement.

From these causes the extensive territory of the Mysore and its dependencies had not, in the course of many years, suffered materially, either from insurrection or external invasion;—a felicity but rarely experienced in any quarter of India. When they were invaded by the British and their allies, under the conduct of Lord Cornwallis, the whole country was found in a high state of cultivation, and filled with inhabitants. The regular army consisted of 70,000 men; and the troops employed in the garrisons, in the police, and in the collection of revenue, amounted, by the most authentic accounts, to twice that number. This vast establishment was so completely furnished with artillery in the numerous forts, and in the field, that upwards of 450 cannon were found in the outworks of the capital itself. The most frequent bar to the efficiency of native armies, is the want of regular pay: an obstacle the provident sultan had removed by gradually amassing vast treasures, which he secured in the forts, or in the capital; and by improving his revenue, which amounted annually to upwards of three millions sterling.

The power and resources of the Mysorean dominions, thus formidable in themselves, cannot be fairly estimated, unless we take into account their advantageous position and the character of the sovereign. Lying in the heart of the Deccan, and strengthened by innumerable forts, they command the adjoining frontiers of all their neighbours; while the restless and enterprising spirit of the prince has long obliged all around him to keep in a state of constant military preparation, to them nearly as expensive as that of actual war. Few years were suffered to elapse, in which their territories were not either menaced or actually invaded. The open and defenceless frontier of the Carnatic was frequently the object of these incursions; and the territory of our ally, the nabob of Arcot, had often suffered devastations that are still remembered with horror. The British, who were bound by treaty to be the protectors of this prince, had their own territories plundered extensively; and, on one occasion, had been forced to submit to an ignominious peace, which was dictated to them at the gates of Madras.

The French officers in India, many of whom had influence long been entertained in the service of Tippoo, had communicated to his policy that marked hostility against the British nation, by which it was so peculiarly distinguished. A splendid embassy, which had been dispatched to France, returned previous to 1799, before the breaking out of the late war; which must be regarded as the commencement of a regular system of hostility for the entire overthrow of the British power in the east.

Although the events of the French revolution operated to divert their attention from prosecuting the objects of this new alliance, the power of Tippoo had become so formidable to the British government, that the revenues of Madras and Bombay were inadequate to support the forces necessary for their defence. Large supplies...
supplies both of troops and money were required from Europe; and experience had fully proved, that unless the power of the kings of Mysore was reduced, the British possessions in the east could not be retained without incurring an annual loss to the state.

Happily the power, talents, and ambition of the present sultan were fully known to the whole of India. His views of universal conquest had alarmed all the native powers of the peninsula; and both the Nizam and the Mahrattas were roused to combine for their own defence. Tipoo was the first Mohammedan prince, since the establishment of the Mogul empire, who openly disclaimed the authority of the king of Delhi, or Great Mogul. He was the first also to impress coin with his own titles; a mark of disrespect which none of the native governments had ever shewn. The great seal which he adopted soon after his father's death, and which he affixed to all his public deeds, declared him to be "the messenger of the true faith," and announced his ambition to appear as a prophet as well as conqueror. In the spirit of eastern vanity, he not only declared himself the greatest king on earth, but announced himself to be the restorer of the Mohammedan faith; and to avail himself of the enthusiasm of his sect, he invites all true Mussulmans to join his standard, and not only drive the European infidels out of India, but to establish the empire of Mohammed over the world.

An ambition so openly avowed, and to an extent so inordinate, created immediate alarm among the native powers of India. It rendered an union peculiarly necessary between the Nizam and the Mahrattas; states who differed in religion, in government, and in every point of interest, except that fear, which combined them against this powerful adversary, who was ever ready to attack them, and whom, in fact, already commanded their southern frontier.

The policy of the British, who had earlier foreseen the danger, led them to adopt a still more vigorous preparation than the native powers. Four additional regiments had been raised in Europe, and sent to India under General Abercromby and Colonel Mosgrave; and as early as 1788, there were in that country thirteen European battalions, consisting of 8000 men, besides the troops in the company's establishment. Earl Cornwallis, and several of the first officers in the British service, were appointed to command them, under a new system, by which the powers of the governor-general and commander in chief were united in the same person. Thus the counteraction of different authorities was avoided, and every advantage secured which might give efficiency to the operations of warfare.

Happily for the execution of those views of defence, the climate of the Mysore, like all the central parts of the peninsula of India, is temperate and healthy, in a degree superior to that of any other region of the globe lying within the tropics. The monsoons which deluge the coasts of Malabar and Coromandel, have their force broken as they approach the high mountains of the interior, where they fall out in showers, which, though heavy, are not commonly of long continuance. The verdure of the country is thus preserved; and the temperature of the climate is moderated throughout almost the whole year. The British army was therefore able to remain constantly in the field, during the whole war; and although they did not enter into cantonments, or leave their tents, yet the health of the troops did not materially suffer.

The military operations against Tipoo may there Operations of the British against Tipoo.

The first campaign commenced in the month of June 1790, and was directed to the southern part of the peninsula, with a view to relieve the rajah of Travancore, whose country had already been attacked by the sultan. During it, the main army was commanded by General Meadows; and before the end of the year, it effected the reduction of his rich provinces below the mountains; while the Bombay troops, under General Abercromby, conquered the valuable districts below the Ghauts on the west and north, as far as the river Balispatam.

The second campaign was carried on by Earl Cornwallis in the heart of Tipoo's dominions. Though unsuccessful in effecting its ultimate object, it was distinguished by the capture of the important fortress of Bangalore in the interior of the country; an event which fixed the seat of war in the enemies' territory, and was decisive of its final success. A successful battle was also fought in the vicinity of Seringapatam; and a demonstration made against that capital, which, from the advanced season and the swelling of the Cavery, proved abortive.

The last failure, which must in part be ascribed to the delay of the Mahratta armies, and the want of provisions, was speedily followed by the arrival of these allies, and by preparations for a fresh campaign. As these new efforts completely humbled the sultan, and produced a successful termination of hostilities, it is necessary to detail them more particularly.

The season of the year, which, after the battle in 1791, prevented an immediate attack on Seringapatam, was also unfavourable to the numerous draught cattle belonging to the army. They were infected with an epidemic disorder, which was aggravated by famine, and killed them in vast numbers; while the remainder, from disease and hunger, became unfit for service. Meanwhile the scarcity of grain, of arrack, and every article of subsistence, daily increased; this scarcity became at last so urgent that the camp followers, which in India are four times as numerous as the fighting men, were reduced to the necessity of devouring the putrid flesh of the dead bullocks; and to add to all these calamities, the smallpox unfortunately raged in the camp.

Similar distresses were suffered by the Bombay army, who, with infinite labour, had dragged their artillery for 50 miles through the most steep and difficult passes, in order to co-operate with Lord Cornwallis. Unable to form a junction, from the swelling of the Cavery, and the badness of the roads, they were compelled to retrace their steps over those vast woody mountains, which form the immense and impregnable barrier between the kingdom of Mysore and the Malabar coast. In this perilous retreat, the battering train of both armies was unavoidably lost, being too unwieldy to be moved by the small portion of draught cattle which now survived; upwards of 40,000 had already perished since the commencement of the campaign.
Disappointed of the relief and assistance which the junction of the Bombay troops might have afforded, the position of the main army became a scene of the greatest distress. The tents and clothing of the troops, as well as their provisions, were nearly worn out. Great part of the horses of the cavalry were so far reduced by want and fatigue, that they were unable to carry their riders. The ground at Canimabbad, where it had camped for a few days to favour the junction, or to protect the retreat of General Abercromby, was covered to an extent of several miles, with the carcasses of the cattle and horses; and the last sight of the gun carriages, carts, and stores of the battering train, left in flames, was the melancholy spectacle which the troops beheld, as they passed along, on quitting this deadly camp.

Fortunately for them in this dreadful situation, they were met, before they had finished the first day’s march, by the allied force of the Marathras, under Purseram Bow and Hurry Punt. Every despatch sent to these chiefs had been intercepted by the vigilance of the enemy. They were astonished when they learned the disasters which had been occasioned by their delay: their arrival, which evinced their sincerity in the cause, produced general satisfaction in the British camp, and a conviction, that the ruin of the sultan, though delayed, must now become certain and inevitable. Tippoo himself, on seeing his enemies firm and active in their union, was not insensible to the dangers that awaited him. Before the allied armies left the vicinity of his capital to forward their preparations for a new campaign, he made overtures to Lord Cornwallis for the conclusion of a peace; but that nobleman would listen to no terms of accommodation in which his allies were not included, and which were not preceded by the release of all the prisoners that had been detained during the present and former wars.

The arrival of the Mahrastra troops, amounting to 32,000 cavalry, however fortunate it might be deemed at the critical moment in which it happened, brought little additional effective strength to the allied army. Their battalions were unwieldy, irregular, and ill-disciplined: their force had declined as much as Tippoo’s had advanced in improvement; and they were at present far inferior to those troops who, under Madha Row, had defeated Hyder Ali in 1772. Their chiefs were, however, overjoyed that they had effected a junction nearly on the spot where that signal victory had been obtained. They were pleased at having met the British army without having occasion to try their strength singly with Tippoo, of whose discipline and abilities in the field they entertained a deep apprehension.

To avoid confusion and interference, they were encamped at a distance from the British troops. Their ground, from the number of followers, and their families, had the appearance of a large town, or of a whole nation emigrating from its territory. The tents of the chiefs are placed around their general’s, without any regularity or order. They are of all dimensions, and of every variety of colour, resembling houses rather than canvases. The streets, winding and crossing in every direction, present the appearance of a great fair; in which smiths, jewellers, merchants, and mechanics, are displaying their wares, and as busily employed in their trades, as if they lived in their own capital, and enjoyed a profound peace.

The state of their artillery, upon which modern warfare so much depends, will at once demonstrate the perfection of the military system among the Mahrastra in states. In the construction of their gun carriages, they make little use of iron, but for their strength they trust to the bulk and solidity of the timber: Hence they are unwieldy from their weight, and clumsy beyond all belief; the wheels, in particular, are heavy and low, being formed of large solid pieces of wood united together. The guns themselves are ponderous in the extreme, and of the most irregular dimensions; each is painted in a fantastic manner, and bears the name of some one of their gods. Not a few are dragged after the army long after they have ceased to be serviceable, from the great estimation they are held in, on account of past achievements which they are supposed to have performed for the state. Some of these useless impediments of a march are dragged along at the immense expense of 100, and sometimes 150 draught cattle yoked in pairs. The most insurmountable obstacle to the efficiency of the Mahrastra artillery, was the scarcity of ammunition with which they were provided at this period; subsequent improvements have enlarged this supply, and rendered them far more formidable to their enemies.

The infantry of this nation holds a rank, if possible, still more contemptible than their artillery. Its officers are half-cast Portuguese or French; and the privates consist of outcasts of every description, who are uniform in nothing but in the wretched condition of their muskets, ammunition, and accoutrements. The Mahrastra themselves hold them in contempt, ride through them on the march, without ceremony, or even the appearance of respect. If there happen to be a few Europeans among the officers and men, which in these times was but seldom the case, they execute the service, and till they find an opportunity of escape, continue to deplore their fate.

The cavalry is the favourite portion of a Mahrastra army; and it is to his horses, and the bazaars, that the attention of every chief is almost solely directed. On marching days, the baggage and infantry move off at daybreak, while the chiefs and their principal followers remain upon the ground smoking their hookahs till they have advanced some miles; their men follow, each pursuing his own route, attended by his principal people; while the inferior ranks disperse over the country to plunder and forage in every direction.

The troops of the Nizam at this period joined Lord Cornwallis and the Marathras; their state of equipments and discipline was almost in every respect as wretched as that of the Mahrastra. Their forces, when united, amounted to about 80,000 men; and if to these be added four times the number of camp-followers, baggage, and accoutrements, and the carriage department, the number of strangers to be subsisted in the Mysore alone, cannot be much less than half a million. That no distrust, jealousy, or counteraction, should have disturbed the combined operations of such an immense multitude, must be ascribed to the unexampled moderation and vigilant conduct of the commander in chief. Such a vast army had never taken the field in India in the British
cause; yet no murmurs, or even the slightest appearance of distrust, were ever manifested by the allies towards the British commander. They submitted with implicit confidence not only to his arrangements in carrying on the war; but, which was little to be expected among allies so much alive to their particular interests, they acquiesced in his distribution of the conquered territories with a deference which evinced the most perfect confidence in his liberality and justice.

The steady co-operation, however, of any native power with the British army in the field, is a circumstance hardly to be looked for, and must therefore prove a resource on which no commander would choose to rely. His patience will often be severely tried by their irregularities and delays; and in the most critical emergencies his views may be frustrated by their want of punctuality, or by a total failure in their engagements. Even in the article of provisions, the presence of the native armies, bating the temporary relief at their first junction, proved a much greater annoyance than a benefit; for it increased the number of mouths to be supplied, in a country desolated by its friends as well as by the hostile armies.

With these conditons, Lord Cornwallis set out in the month of June, towards Bangalore. He determined on a new and circuitous route, northward by Naggemungulum, that he might accomplish some of the important objects necessary to enable the Confederates to commence another campaign. He had to enable the Malwatta to withdraw the posts which they had left on their march, when they advanced from Poona towards Seringapatam. He had to confide the sultan to as small a portion of his territory as practicable, and thus to oblige him to consume the provisions which he had laid up for the defence of his capital: and, lastly, he had to gain time for collecting and bringing forward the vast stores of camp equipage, provisions, and supplies, which he had ordered for the succeeding campaign.

In order to facilitate the communication between the Mysore and the Carnatic, from which the supplies were chiefly to be drawn; the various hill forts, which command the different passes, were to be reduced. Many of these fortresses, from their situation upon high and precipitous rocks, are of such strength that they have always been deemed impregnable by the native armies of India. In ancient times they formed the inaccessible retreats of the rajahs who still retained their independence; and it was not till the vigorous administration of Tipoo and his father, that they were brought into subjection and garrisoned by the Mysorean troops.

Among these forts, Savandroog, Chitlledroog, and Kistnaughrury, are the most remarkable in point of natural strength. The first of these consists of a vast mountainous rock, which rises above half a mile in perpendicular height above its own base, which covers a space of eight or ten miles in circumference. This rock is surrounded by walls on every side, and defended by crenellations wherever it was deemed accessible. Towards the upper part, the immense pile is almost precipitous, and has the farther advantage of being divided on the top into two hills, which have each their defences, and are capable of being maintained independent of the garrison in the lower works.

To the siege of this tremendous fortress, Lieutenant-colonel Stewart commanding the right wing of the main army was appointed. The attempt commenced on the 10th of December, when this officer pitched his camp within three miles of the north side of the rock.

The formidable appearance of the place itself, had Savandroog withdrawn the attention of the troops from a circum-balanced stance which proved on trial the chief obstacle to the execution of their arduous attempt. It consisted in the formation of a gun road from the camp to the foot of the mountain. This was found a work of incredible labour, since it led through a long tract of rocky hills, thickly planted with bamboo; and after every effort, the battering guns were still to be dragged over rocks of considerable height, and of an ascent almost perpendicular.

This celebrated rock, so difficult of approach, and of such immense strength, is no less famed for a noxious atmosphere, occasioned by the hills and immense tracts of wood by which it is surrounded; the appellation of Savandroog, or Rock of death, is said to have been given it from the noxious and fatal nature of its climate. Tipoo Sultan, sensible of all its advantages, congratulated his army on the infatuation of the British, which had at last led them to an enterprise which would speedily operate their disgrace, and terminate in their ruin. One half of the Europeans, he asserted, would be destroyed by disease, and the other half he was confident would be killed in the assault. The garrison which Tipoo had selected for the station of Savandroog were of the same sentiments with their master: regarding the attempt to reduce it as madness, they fortunately trusted more to its strength, than to their own exertions for its defence; and hence, little or no opposition was made to the erection of our batteries. On the contrary, the batteries were far more simple in their construction than the ill-directed fire of their artillery produced.

In three days, during which it was found necessary to advance the batteries nearer to the wall, a practicable breach was effected, and a lodgment made for the troops within twenty yards of the breach. The storming party, which consisted chiefly of Europeans, was led by Lieutenant-colonel Nisbet, and was divided into four different parties of attack, in order to secure both hills into which the mountain was divided, and to distract the attention of the enemy. Each party succeeded in gaining its object; for a large body of the enemy who were seen in the morning coming down for the defence of the breach, on observing the Europeans advancing to the storm, was seized with a panic, and fled. The eastern hill immediately above the breach, was carried by Captain Gage, without meeting, or even overtaking, the enemy; the main body of which, not hearing the explosion on the western hill, and, had they attacked the object, the siege must have recommenced. Happily, however, the pathway leading from the breach to this hill is so steep and narrow that the fugitives impeded each other, and the assailants pressed them so hard that they entered the different batteries along with the enemy. In these numbers were killed, among whom was the second killadar; and the citadel on the summit of the hill was at last gained, where the first killadar was made prisoner. So close and critical was the pursuit
on this fortunate occasion, that a sergeant of the 71st regiment, when at some distance, shot the man who was in the act of shutting the first gate; and upon this occurrence, almost accidental, the fate of the citadel hinged. It was instantly taken, without the loss of a single man; although a hundred of the enemy had been killed during the advance, and many had perished by falling from the precipices in endeavouring to escape. Only one privy soldier was wounded in this remarkable assault of the impregnable fortress of Seringapatam: it formed a display of successful prowess, fortunate almost beyond example; and it exhibited before the enemy, in open day, an instance of intrepidity, of brilliant value to the reputation of the army and the interests of the India government.

The beneficial consequences of this important capture, were sensibly felt at the different forts, almost impregnable, by which this part of the country is so remarkably strengthened. Colonel Stewart's detachment, which had been so much distinguished by this achievement, marched in two days against Outradroog, another fortress strengthened by five different walls, and so steep as to prove tenable by a handful of men against the largest army. After the refusal of a summons to surrender, the lower fort was escaladed with such rapidity, that the killadar requested a parley. While this was in agitation, an appearance of treachery was discovered in the upper fort, where the garrison were seen moving and pointing their guns against the assailants. Fired at this sight, Lieutenant M'Innes led on the storming party with impetuosity; some of the gates were instantly broken, others were escaladed, till five or six different walls on the face of the steep rock were passed, when the troops gained the summit, and put the garrison to the sword. So panic-struck were the enemy, when they saw a single European above the walls, that they could make no resistance. The killadar was made prisoner, a number of the garrison was killed, and not a few, terrified at the approach of Europeans with their bayonets, are said to have precipitated themselves from the rocks.

The assault of these fortresses, which had hitherto been deemed impregnable, made so serious an impression on the enemy, that in none of the hill forts, however inaccessible, did they afterwards make an attempt to resist the British troops. Hence, the strong mountainous country between Bangalore and Seringapatam, which, studded with forts, had so much checked all communication, now afforded security to the convoys. These now reached the army without opposition, and the supplies of warlike stores of every description were as completely re-established as they had been at the beginning of the last campaign.

To prevent any future scarcity of the great article of grain, the commander in chief encouraged the native brinjaries, a class of men whose employment is purchasing grain where it is cheap, and selling it to the army. By constantly affording regular payment and a good price to these native merchants, they supplied the camp to an extent far exceeding what could ever be furnished by the most extensive carriage establishments. The grain-dealers had at this time places for no less than 50,000 bullock, whose rice was instantly paid for, as soon as it reached the camp, and orders given for purchasing more from whatever quarter it could be procured. This brought forth the resources of the enemy country as well as our own; for several of Tipoo's brinjaries, tempted by the certainty of payment and a high price, sold their rice in the British camp.

Supplies being thus provided to an extent far exceeding every former example, the allied armies, and the different detachments, were ordered to assemble for another campaign. The Bombay troops, destined again to act from the same quarter as last season, marched from Cananore, and arrived at the foot of the Poondicherry Ghaut in the month of December. Several weeks of hard labour were necessary to drag the artillery through woods extending nearly 60 miles, and over mountains of immense height. These mountains, which on the west command a view of the Malabar coast, and on the east of the country of the Mysore, form an elevated ridge towering into the clouds, on which the rivers are seen taking their rise, and flowing in different directions, till they reach the eastern and western shores of the peninsula. The friendly territory of the Coorga rajah surrounds the interior of this formidable pass, where a small opposition might bid defiance to a whole army. This circumstance enabled the Bombay troops, consisting of 8,400 men, with all their baggage and artillery, and a supply of rice for 40 days, to penetrate with safety into the Mysore frontier, which they reached on the 22d of January 1792. To facilitate the return of our army, batteries were constructed, and the defence of this pass committed to Lieutenant-colonel Peché with 300 men, a precaution which had not the sultan overlooked, he would have suffered no invasion on this quarter of his dominions.

The Maharatta forces, which had separated from the main army at Bangalore, had spent the season of the monsoon in a train of exploits which seemed to imply more than their usual share of activity. With the assistance of the Bombay detachment of three native battalions, they took the important post of Simoga, after defeating Reza Saib and near 10,000 of the sultan's cavalry. This brilliant success encouraged Purseram Bow to engage in an enterprise against Bednore, which had nearly frustrated the whole plan of the campaign, by protruding his junction with General Abercromby beyond the stipulated time. From this attempt, however, he was diverted by the arrival of Cummer ud Deen Khan, one of Tipoo's best generals, who had been dispatched against him. This chieftain retook the fort of Simoga; but being too weak to encounter the Bow in the field, the Maharattas effected their junction with the Bombay army, though somewhat later than the appointed season. The main army under Lord Cornwallis, which had been so actively employed during the rains in subduing the hill forts, and in collecting the necessary stores and reinforcements, was ordered ultimately to assemble at Outradroog, one of the strongest of Tipoo's forts, which was situated within 50 miles of his capital. This place being equally spacious and strong, was fitted up as a general hospital, and formed into a magazine for the grain and public stores that were not immediately needed for the army. The battering train under Colonel Duff, and the last convoys under Colonel Floyd, having safely joined, the main army was at last fully prepared to resume its enterprises against
against the sultan, who, in imitation of his father, when formerly attacked in 1767, had encamped with the whole of his force in a strong position under the walls of his capital.

One junction more was still expected; that of the Nizam or Soubah from Gurramcondah, the lower fort of which he had captured. This prince having left a strong force to garrison the place, marched again to meet Lord Cornwallis, who was detained in expectation of this event for several days beyond the time he had appointed for leaving Outre droog. On the 25th of January, the young prince at last arrived with his army; his youth and inexperience were put under the guidance of a minister 60 years of age, a man of great talents and established reputation. The confederacy, which thus united the chief powers in the peninsula for the overthrow of a formidable and ambitious enemy, was attended also by an ambassador, who arrived at this time, from Madajee Boonsla the rajah of Barar. The Peshwa and the Nizam were themselves in the field on their respective frontiers, and all India looked with anxious expectation to the event of this important campaign.

On the 1st of February the allied armies marched from Hooleadroog, the last hill fort of which they had taken possession, lying at the distance of only 40 miles from Seringapatam. Tipoo's cavalry, which had been sent out to harass them on the march, made little impression, and were therefore chiefly occupied in burning the intermediate villages, and in laying waste the country. The last march, of the 5th of February, stretched across a range of barren hills lying six miles north-east of Seringapatam. From these heights, a view of the whole city was presented to the army, and the encampment of the sultan under its walls. Every circumstance was eagerly viewed by our troops; and, from the sultan's position, it was evident he meant to defend the place in person, and to make it the grand concluding scene of the war.

The camp of the allies was pitched on the north side of the island. The British formed the front line, and extended its whole length on both sides of the Lockany, a small river which at this place flows into the Cavery. The reserve was placed a mile in the rear, to afford space for the baggage and stores; and the Nizam and Mahrattas were stationed still farther in the rear, to prevent interference with the British camp.

Opposite to Seringapatam, on both sides of the river, a large space is inclosed by a bound hedge, which marks the limits of the capital, and affords a refuge to the peasants during the incursions of cavalry. Tipoo's front line, or fortified camp, lay immediately behind this hedge, where it was defended by heavy cannon in the redoubts, and by a large field train advantageously placed. In this line there were 100 pieces of artillery, and in the fort and island which formed his second line there were above thrice that number. The redoubts on his left were entrusted to two of his best officers, and a corps of Europeans commanded by Monsieur Vigie; Sheik Anzar, a general of established reputation, was stationed on the right, and the Carighaut hill; while Tipoo himself commanded the centre, having his tent pitched in the sultan's redoubt. The fort and island, where there was the greatest number of guns, were entrusted to Syed Sab and other commanders. The whole army of the sultan, thus stationed, consisted of about 50,000 men.

Ever since the junction of the allied armies, Tipoo finding he could not keep the field, employed his chief attention, and the labours of his main army, in fortifying this camp, and in strengthening his defences in the fort and island. The country had already been laid waste in the former campaign; and the sultan seemed to rest his hopes, that the strength of his works and the value of his army would protract the siege, till the want of supplies, or the approach of the monsoon, would again force his enemies to abandon their enterprise, as they had been compelled to do on former occasions.

Impressed with these ideas, Tipoo made no attempt to interrupt our reconnoitring parties, who had been busily employed on the first day after their arrival in examining his camp. The distance of our position, and the absence of the armies under General Abercromby and Purseram Bow, increased his security: for he did not imagine that Lord Cornwallis would venture to attack him without their assistance; far less could he believe that a fortified camp, defended by the guns of his capital and a powerful army, would be attempted by infantry alone, without guns, and in the uncertainty of night.

The promptitude and spirit of Lord Cornwallis had suggested far different ideas, and a plan of attack which was bold beyond even the expectations of his own army. On the evening of the sixth of February, just after the troops had left the parade, orders were issued for an assault at 7 o'clock of the enemies camp and lines in three divisions. The British camp was left to be defended by the artillery and cavalry; while the assailants who were instantly furnished with guides and scaling ladders, marched in perfect confidence that muskets alone would prove the fittest instruments for opening their way into the enemy's camp.

No part in the execution of this bold enterprise was assigned to the troops of the allies; nor was the intended assault even communicated to them, till after the columns had marched. It was perhaps good policy to Tipoo's conceal from them a measure so repugnant to all their maxims of war, and in which they could not possibly concur. This opinion seems justified by the surprise and consternation which they displayed, on learning that Lord Cornwallis, like a common soldier, was personally to lead the attack on the enemies fortified camp. They not only deemed his success impossible, but they dreaded that the ruin of the allied armies would be involved in the attempt.

The three columns into which the assailants had been divided, marched with equal intrepidity to execute the different objects that had been allotted them: many obstacles intervened; various conflicts ensued in different quarters of the enemies camp; each party was uncertain of the fate of the rest, and each individual of his associate. The return of day at last removed their fears and uncertainty, by disclosing the complete success which had crowned their exertions throughout the whole line of attack.

The right column commanded by General Meadows had met with more impediments than the rest; it attacked and carried the ad gah, a redoubt on the enemies
The centre column about 11 o'clock forced through the bound hedges, amidst a heavy fire from the sultan's redoubt and Tipoo's lines. These, however, were also forced. The troops were now enabled to cross the river, and penetrate into the island. So closely did they press upon the fugitives, that they would have entered the citadel along with them, but for the precaution of raising the drawbridge, which they had drawn up at the moment of entering the place. So precipitately had Tipoo been forced to abandon his tent in the sultan's redoubt, that his silver sticks, pikes, and mathematical instruments, were found scattered in the place. The fort being inaccessible from the removal of the bridge, the advanced party forced into the town or pettab, which had been almost abandoned for the defence of the batteries. Here they found 27 half-starved Europeans, loaded with iron, and confined in a dungeon. Some of these unhappy men, who were now relieved, had been cruelly given up to Tipoo by Admiral Suffrin; others were deserters, whom Tipoo, however, had treated with equal severity.

The left division of the attack, which was commanded by Lieut. Col. Maxwell, was destined to take possession of the Carighart hill, and from thence to descend and penetrate into the island on the right flank of the enemy. These objects were effected with rapidity, and but little loss, except in crossing the Cavery, which was deep and rapid, and at the same time strongly defended by the enemy's batteries. In crossing the stream, which at this place was neck deep, the ammunition was unavoidably damaged; but the troops pressed forward with the bayonet, and at last joined the other divisions who were now assembled at the pettab.

The enemy having lost all their positions on the north side of the river, where the siege was commenced, and almost the whole of the island, every material object of the assault was secured. On the side of the British, the loss, though considerable, was small in proportion to the importance of the victory, and the disasters of the enemy; of whom, it afterwards appeared, that no less than 20,000 had either deserted, or been slain in the various conflicts during this night of enterprise, danger, and death.

On the 7th, the enemy, as if ashamed of the rapidity with which their different posts had been abandoned, made several attempts to recover them. Their efforts were directed chiefly to the sultan's redoubt, commanded by Major Sibbald. Exposed to the guns of the fort, and the batteries on the island, the major's little party defended the place for the whole day; and having successfully repulsed the different assaults of the enemy, they at last, weary of the attempt, desisted from the enterprise. The endeavour which the sultan's troops made to regain the pettab, met with a similar check; and the night of the 7th would have afforded some respite to the army, had not the rumour of an intended attack by Tipoo during the night, kept them on the alert. That such an attack had been meditated, there was full evidence; but both the chiefs and the soldiery were so much dispirited by the late defeat of so small a body of troops that had so rapidly taken place during the last twenty-four hours, that they could not be induced to second the zeal of their sovereign. During the various conflicts of the 6th and 7th, the fatigues and dangers of the British army were severe; and its loss in killed, wounded, and missing, was far from being inconsiderable (536 men). The extent and importance of the acquisitions gained by this brilliant contest seemed, however, to compensate every sacrifice that had been made. It now occupied the lines and posts from which the enemy had been driven; and the works which had been so completely fortified for the defence of the capital, now became lines of circumvallation for its attack. The troops on the one side were broken and dispirited; on the other they were in perfect order, and animated with their recent success. The Europeans in the service of Tipoo, after the disastrous events of the last two days, now despairing of his fortunes, deserted to our army; and many of them enlisted with the Mahrattas; others retired to the French settlements. After their departure, the sultan's army never encamped in order, or assumed a formidable appearance.

The British army, now in possession of the island and Serina town of Seringapatam, was immediately employed in making the necessary preparations for the siege of the fortress or citadel. This enchanting island being plentifully watered by the Cavery, and a vast number of intersecting canals, maintains a perpetual verdure: on the east, it is decorated by the buildings of the fort, which occupies a mile square; on the west, by the Laurel Bangi, containing the mausoleum of Hyder Ali, adorned by tall cypresses, shaded walks, with a variety of trees, whose foliage and perennial verdure announce an everlasting spring. The mosques and religious buildings were converted into hospitals for the wounded and sick; and the trees, now for the first time assailed by the axe, furnished materials for fascines and gabions for the approaching siege.

The proud mind of the sultan could not remain tranquil, on seeing his beautiful gardens and all his improvements threatened with destruction, by an enemy who was also preparing to deprive him of his citadel and all that remained of his power. His indignation was expressed by a continual discharge of cannon from the fort, directed against the island, the redoubts, and every party of ours that seemed within his reach. Some of his shot ranged as far as the camp, aimed apparently at head quarters: but the distance of the several posts was too great; and his ineffectual cannonade served rather to proclaim the wrath of the sovereign, than materially to annoy his enemies.

Tired by these repeated efforts, which he saw were vain, and worn out by the ebullitions of his own anger, Tipoo at last began to meditate seriously on the necessity of a peace, the only means by which he could extricate himself from his perilous state. In order to smooth the way for his overtures, he previously liberated two British officers, who had been detained contrary to capitulation in Coimbatore; these officers, till now the victims of his cruelty, he loaded with presents, and made them
them the bearers of a letter to Lord Cornwallis suing for peace. Another expedition, more daring, but far less honourable, was nearly at this time practised to attain his deliverance. A small party of horsemen were despatched to the British camp in the night, for the purpose of assassinating the commander in chief: as straggling parties of the Nizam’s horse were near, the troopers, mistaken for friends, had little difficulty in entering the camp; and, but for an accident, might have effected their purpose. Detected, however, by their inquiries for his lordship’s tent, they were fired at by a party of recruits; and such was the speed with which they made off, that they suffered little damage in this disgraceful enterprise, which is so often resorted to by the princes of India. This was the second attempt against the commander’s life during the present war: that both were unsuccessful, must be ascribed to that intoxication in which the natives are plunged, before they can be induced to venture upon such hazardous deeds.

Though Tippoo had recourse to these vile projects, which he knew were countenanced by the practice of his country, he did not trust to them solely for his defence. The Bombay army which was at this time approaching, the combated and harassed by every effort of honourable war; its junction, however, with the main army was effected on the 16th; and on the second night after this event, the trenches were opened, and a parallel formed within 800 yards of the north face of the fort. General Abercromby, stationed on the south quarter with a strong detachment, was ordered to cannonade it from the heights. This attack being directed against the weakest part of the fort, occasioned the greatest alarm. Tippoo himself, therefore, at the head of his troops, marched to dislodge the general: being supported by the guns of the fort, he maintained the action for the whole day; but towards evening, he was forced to retreat.

This desperate effort was the last that Tippoo made for his defence. His affairs hastened to a crisis; cabals were formed by the chiefs, and his troops deserted in multitudes during the night. Plenipotentiaries from the allies, since that, had been treating with his vakeels; his haughty spirit, hitherto untractable, was now forced to yield to their demands. He saw his capital blockaded on every side by a powerful army, plentifully supplied with provisions, which must infallibly reduce his troops by famine, should they even prove successful in repelling its assaults; even his last hopes of relief from the monsoon, and the swelling of the river, were thus finally cut off.

On the 23d of February, therefore, the preliminaries of peace were signed by Tippoo, amidst the conflicting emotions of pride, resentment, and fear; and orders were issued to the troops on both sides to cease from farther hostilities; a stipulation, of which the dread of an immediate assault alone enforced the observance.

By the terms of this treaty, Tippoo was compelled to pay, as an indemnification for the expenses of the war, three crore and 50 lakhs of rupees at two instalments, the first to be advanced immediately, and the second at the end of four months. Other articles of this instrument provided farther, that the whole prisoners taken from the allied powers from the time of Hyder Ali, should be unconditionally restored; that no less than one-half of his territories should be ceded to the allies; and that two of Tippoo Sultân’s three eldest sons should be given as hostages, for the due performance of the treaty.

The candid and upright conduct of Lord Cornwallis had gained the full confidence of all the allies. So complete was the ascendency he possessed over their councils, that they submitted without a murmur to all the arrangements which he proposed; a circumstance (considering the deep interests which were at stake) that must be regarded as not the least extraordinary in this campaign.

The terms of this agreement, which resembled a capitulation more than a treaty, were hard, and Tippoo with great difficulty was prevailed on to subscribe to them. Another struggle, perhaps still greater, yet remained for his family. This arose from the distress in his seraglio, on parting with his children. The sultan was entreated to request another day for making preparations for their departure; and Lord Cornwallis, though he had already dispensed with their accompanying the treaty, as first agreed, had the humanity to grant this request.

About noon day on the 26th the princes mounted their elephants richly caparisoned, and attended with a splendid retinue left the fort, the walls and ramparts of which were crowded with multitudes of spectators. Amidst the vast multitudes whom curiosity or affection had drawn out to witness this scene, Tippoo himself was beheld standing above a high gateway through which, as they passed, the princes were saluted by the guns of the fort; a compliment which they again received as they approached the British camp. They were seated in silver howdahs, attended by their father’s minister, and a numerous retinue. The procession which they thus formed, was equally grand and interesting. It was led by several camel harcarras and standard-bearers, carrying green flags suspended from rockets, followed by one hundred pikemen with spears inlaid with silver. Their guard of two hundred Sepoys, and a party of horse, brought up the rear (c.)

In this order the princes proceeded till they approached the tent of Lord Cornwallis, who had ordered a battalion of Sepoys for their reception; where the commander in chief embraced them with a cordiality and tenderness that resembled parental affection. The manners, dress, and appearance of the young princes themselves, formed an interesting spectacle to their European hosts. Bred up from their infancy with infinite care, and instructed to imitate in their manners the reserve and politeness of more advanced age, all present were astonished to observe the correctness and propriety of their conduct. Abdul Kalic, the eldest, was of a dark complexion, even among the natives of India; but his countenance was marked by thoughtfulness and intelligence.

(c) For the substance of this account we are indebted to an eye witness, Major-general Dirou; who has favoured the public with an excellent narrative of this campaign.
The younger, Moza ud Deen, was remarkably fair; a regular set of features, with an open appearance, rendered him the general favourite, and more admired than his brother. Clothed in red turbans and long white muslin gowns, every where sparkling with emeralds, rubies, and pearls, their external decorations displayed a brilliancy far surpassing every European idea of dress, and seemed to realize those laboured descriptions of splendour, which are in the western world only seen in the pages of romance. Thus attired, the young princes, immediately after their reception, were seated on each side of Lord Cornwallis, when Gulam Aly, the head vakeel of Tippoo, thus addressed the British general: "These children were this morning the sons of the sultan my master: Their situation is now changed: They must look up to your lordship as their father."

The conduct of the commander in chief had perhaps suggested this address: he had in fact received the boys, as if they had been his own sons; and be again anxiously assured the vakeels, and the young princes themselves, that every possible attention would be shown them, and the greatest care taken of their persons. The scene became more interesting; the faces of the children brightened up; and not only their attendants, but all the spectators, were delighted to observe, that any fears they might have harboured were removed, and that they would soon be reconciled to their change of situation. With regard to the youngest, this desirable object was likely to be first attained. He was the favourite son, and was said to be the sultan’s destined heir: his mother, a beautiful and delicate woman, had lost her brother in a late action; and she herself had died of grief a few days before the attack of the lines. These circumstances, together with his own captivating appearance, drew to the youngest boy the greatest share of attention, and rendered his situation doubly interesting.

After being regaled, in the eastern manner, with 60 per and betel nut; the princes were presented each with a gold watch from Lord Cornwallis, a gift from which they seemed to receive great delight. On this occasion the ministers of the Nizam and the Maharrattas attended with their suits; and when the ceremony of their reception was ended, the princes were led back to the tents furnished by the sultan, which were of a green colour, an emblem of majesty which Tippoo always had carried with him into the field.

The detaining of Tippoo’s sons as hostages, may be deemed a rigorous condition imposed on that prince; the event, however, soon proved, that with this precaution, he could never have been induced, unless by a renewal of hostilities, to fulfill the terms of the treaty. The value of the money to be received, as well as the rents of the different districts to be ceded, were keenly disputed. When the territory of the Coraga rajah, in particular, was required, the demand seemed unexpected both by the sultan and his ministers, and was at first received with astonishment and disdain. The rajah was considered as a chief cause of the war, and Tippoo, therefore, wished to crush him. Lord Cornwallis seemed equally resolute in his defence; for he again maasned the works, and threatened to recommence the attack. Happily, his stock of provisions was ample; and although upwards of 400,000 strangers and half a million of cattle were daily to be fed, the supply was sufficient for the whole; while one million sterling of the fine imposed on Tippoo, had already been paid. The firm determination of the commander in chief, aided by these circumstances, which were not unknown to the sultan, damped his resolution. His resentment cooled, and he finally implemented the terms agreed upon, copies of which were delivered to the confederate power.

The war against Tippoo, which was now happily terminated, placed the dominions of the India Company and of their allies in a state of safety and tranquility, which they had never enjoyed since the aggrandisement of his ambitious family. In the former campaigns against the Mysore, the civil and military powers were placed in separate hands; measures were planned without either energy or uniformity of system; and their execution being trusted to other hands, seldom displayed the promptitude or vigour necessary to their success. They had often ended in the accumulation of debt, without adequate advantage; sometimes they produced the devastation of the company’s possessions; and hitherto they had uniformly increased the power and pretensions of the formidable adversary whom they were meant to subdue.

This war, just concluded, was followed by effects suited to the energy and perseverance with which it had been conducted. The one half of his dominions was at once wrested from the hands of the common enemy; and while his power was thus diminished, an additional strength and security was conferred on his neighbours, by that impregnable barrier which was added to their territories. In the three different campaigns the sultan’s loss had been great; in the last, it seemed almost irredeemable, not less than 60,000 were taken, 800 cannon fell into the hands of the allies; and the killed, wounded, and missing of Tippoo’s troops amounted to 40,000 men. At the conclusion of the treaty very few places of strength were left in his possession; his treasury was drained, and the strength and spirit of his army completely broken. To the moderation of the British commander alone it was owing that he still remained a sovereign; for he was at last completely in the power of the victors. This moderation, but little merited by a cruel and vindictive enemy, he easily forgot when his power was afterwards revived, and he permitted his French counsellors to persuade him that he was again able to contend against the British government.

In the mean time, however, the India Company’s annual territories sensibly felt the advantages of the treaty of Seringapatam. The presidency of Madras, which this treaty to the was most exposed to inroads from the Mysore, has by company, that event secured a chain of forts along its frontiers, which has ever since effectually freed it from the evil of invasion. The Carnatic, recovered from its former calamities, most improve its revenue, while it is defended at a less expense. The Malabar coast and presidency of Bombay have experienced, ever since the victory, at Seringapatam, a state of still greater security than the Carnatic. It contains a country the most varied, and perhaps the most fertile in India, which under a regular government may be improved to an extent at present.
present almost inconceivable. Hitherto, from being a scene of constant war and bloodshed, it has not been suffered to develop its resources.

While the relative situation of the British and the sultan were thus improved by the pacification, the interests of our allies were perhaps still more essentially benefited. The Marhattas have gained an addition of strength as well as territory, by enlarging their frontier from Dwarar to the Tumbadar, and the Nizam has gained a similar advantage, being strengthened on the one side by the same river, and on the other by the saner and Gungacota. Both powers are by their position placed nearer the aid of the British, to whom they must in future look up for their defence against all their enemies, as well as the aggressions of the Mysorean armies. During the seven years tranquillity that succeeded this memorable campaign, the armies of both these powers, having no external enemy to call forth their exertions, gradually relaxed in discipline, and assumed a still more tumultuary and unmilitary appearance.

On the other hand, the troops of Tipoo, from his unconquerable hostility to the British power, and from the secret instigations of the French, were kept in a state of constant preparation, by which their discipline was improved. The influence of time, and the resources of a vigorous government, gradually repaired the vast losses which had been sustained during the three last campaigns. The power of the Mysorean court had indeed been much impaired, but it had lost none of that antipathy and hatred against the neighbouring states by which it had always been distinguished.

Of all the confederated powers engaged in this war, the British derived, perhaps, the smallest share of the direct and immediate advantages which resulted from it. The prize-money shared by the army, although increased by the renunciation of the shares of Earl Cornwallis and General Meadows, was not great; and the territories that were ceded to the India Company being undisputed and at a distance, seem to have been demanded rather with a view to weaken the common enemy than to add to their resources. Prior to the year 1799, the period of the final conquest of Seringapatam and the Mysore, more than two-thirds of the ancient territory of the Mogul empire still remained in the hands of populous and independent states, professing either the Hindoo or Mohammedan faith. Among the latter, the Nizam and the king of Mysore still held the chief rank; while five powerful Mahattta chiefs, the adherents of Brahmanism, occupied the first station in the former class.

Some of these princes, during the former wars in Hindostan, had individually arranged themselves on the side of the monarchy of France, against that of Britain. These rival and leading powers in Europe, had for near a century occupied a similar position in the east, which decided in some measure the fate of Asia. The republican councils, however, by which the French government had been lately subverted, embraced a much wider range in their foreign policy.

They attempted to form at once all these different princes collectively into a combination, which they hoped might become the instrument of their own ambition. Hence proceeded their warm professions of philanthropy to the natives, and their new-born zeal for improving their condition, and for rescuing them from the rapacity and tyranny of the British. The same unceasing thirst after external conquest and universal domination which instigated that nation to attempt these momentous changes, which were lately beheld in Europe, began to display their violence in the east, and to characterize the whole of the French policy in Asia. Confidential agents had already been sent over the territories of these princes; officers of the French the ambition of from France had been secretly sent out and appointed to their armies. For several years these agents had been sedulously employed not only in disciplining their troops, but in promoting among the native princes a combination for the purpose of subverting the British government, and for annihilating throughout the peninsula every power that might be deemed hostile to their own.

These schemes of ambition, wild and romantic as they may seem, have not been executed with complete success over almost one half of Europe; and it must be confessed, that the power of the mighty confederacy which was projected in the east, was more than sufficient to subjugate the whole of India, had it been possible to effect the steady co-operation of its members in any common system of policy. A closer view of it will evince its power and efficiency for the execution of the most extensive plans even of French ambition.

The Mahratta empire, by being properly consolidated, must of itself command an immense force. Stretching throughout the whole length of the peninsula, from the bay of Bengal to the banks of the Indus, its population has been estimated at no less than forty millions of souls; while its known revenue has been found to amount to seventeen millions sterling. These resources, however ample, it must be noticed, are far more efficient in India than in Europe; they have been found by actual experiment, adequate to the establishment and constant maintenance of an army of upwards of 300,000 men. Nor has the progress of the French emissaries in communicating European tactics to this immense force, been at all inadequate to the vast schemes of their policy, or to the magnitude of the undertaking; many battalions in the service of the Peshwa and of Holkar, but more especially in the establishment of Scindia, have been found in a state of discipline that might have been deemed creditable in most European armies. Among the troops of this latter prince, the brigade of General Perron has long been distinguished by a system of tactics hardly inferior to that of the British Sepoys; it consists of about 40,000 men, who are regularly regimented and brigaded, and are completely clothed and accoutred as the British troops. The pay of this force is regularly issued, a rare occurrence in India; and while in the field, its operations are sustained by a well appointed artillery, consisting of upwards of 40 pieces of ordnance.

To the charge of this favourite portion of his army Scindia has for some time past committed the capital of the empire, and the custody of the venerable but unfortunate Shah Alum; a monarch who, it is said, has reached the uncommon period of 90 years; and who, it would appear, is more wasted and broken down by an unexampled load of calamity, than by either the weight or feebleness of his singular age. The forcible restraints to which this unhappy prince has for many
years been subjected, easily enabled the French party among Scindiah's troops to wrest from him the sanction of the imperial name, and the semblance at least of legitimate authority; a matter of some moment, as it served to screen the progress of usurpation. It was accordingly in the vicinity of the capital, and almost in the presence of the deposed emperor, that the projects of French ambition seemed to tend to maturity with the most steady and rapid course. Considerable advances had already been made towards the formal cession of the important provinces of Agra and Delhi to the French government, and towards their final union with that distant kingdom.

Fortunately for the independence of the neighbouring states, and the safety of the British empire, that nobleman who at this critical period had been appointed to the government of India possessed a complete knowledge of the character and views of the French nation. Soon after the arrival of the marquis of Wellesley in the east, his innate penetration, and unwearied industry in acquiring the knowledge of Indian politics, enabled him to discover the whole range and extent of those plans of hostility which the French had meditated in Asia. He was fully apprised of the dangerous situation of the British empire in that quarter of the globe; and with equal promptitude and energy he employed the whole resources of its power in order to avert or repel the danger.

It was, however, at Hyderabad in the Deccan that the impatience and activity of French intrigue first compelled him to meet actual hostility in the field: an insurrection of the French officers there had wrested from the Nizam the whole authority over his army, and in fact, had already converted that faithful and peaceable ally of the British into an open enemy. By a sudden and unexpected movement of a small part of our army, that had been prepared for this purpose, these officers were all suddenly apprehended, and the allegiance of the Nizam, and the subordination of his army, were almost instantaneously restored. This first act of the marquis Wellesley, though scarcely heard of in Europe, certainly augured favourably of his government; for it not only paved the way to his subsequent success against the Mysore, but from its promptitude and decision it deserved to be ranked among the most meritorious measures of his whole administration.

The vengeance of the king of Mysore, for his former losses and defeats, had not suffered him to enjoy a moment of tranquillity after the late pacification (s). He had in fact been raising up a Mohammedan confederacy, which was to consist of the grand seignior, the Persian chiefs, the nabob of Oude, and the Nizam; and was intended for a purpose, no less splendid in the eyes of the faithful, than the extermination, not only of the British, but of all the enemies of Islamism throughout Hindostan. The army of this prince was fully prepared to take the field, but the fortunate event that has just been related, had deprived him of the co-operation of the Nizam, his nearest, and therefore his most efficient ally.

The native princes of India are in general far more prompt in imbibing resentment, and in learning maxims of hostility against their neighbours, than cautious or prudent in their application. Their French instructors were also, at this period, so much intoxicated with the new form which their own government in Europe had assumed, that they had instituted a society, in the capital of Mysore, for the romantic purpose of spreading the doctrine of liberty and equality among the despots and slaves of Asia. The sovereign of Mysore himself was easily persuaded to become an honorary member of this institution, where he appeared among its associates under the name of Citizen Tippoo, an appellation perhaps the most awkward and incongruous that had ever been assumed by an eastern despot. The wild and frantic orisons that were daily poured forth in this club, in favour of an imaginary liberty, were constantly accompanied with sentiments of detestation, and vows of eternal hostility, against the British government; its forces were therefore instantly prepared and marched into the field to meet an aggression, which there had been so little care taken to conceal. Past experience had taught the British officers to avoid the pursuit of a native army in its rapid and discursive evolutions in the field; the British, therefore, marched directly towards the capital of the enemy, which fell, but not till two decided victories had been obtained without its walls, and also an obstinate defence had been made in the interior of the city. In this last conflict (r), which fall of Tippoo, with his capital, and with the lives of many brave men were lost, among the rest that of Tippoo Sultan, whose body was found, after long search, among heaps of the slain, where he had fallen nobly defending the last bulwark of his kingdom, and where, however unfortunate he may be deemed in other respects, he at last met with a fate not unworthy of his bravery.

By the pacification at Hyderabad, the fall of Seringapatam, and the death of Tippoo Sultan, the Mohammedan branch of the grand confederacy, which the French had raised against the British power in India, was completely broken and finally destroyed. For although the few remaining adherents of the deceased monarch made some desperate efforts for the restoration of his family, these were rendered abortive by the activity and vigilance of those British officers who had been left in charge of the conquered country (f). The campaign against the Mysore was, therefore, completed by a signal act of justice, as creditable to the government of India, as the late brilliant successes had been honourable to the British arms. The greater part of the vanquished territory was restored to the rajah of Mysore, and his ancient family again mounted that throne,

(p) Effected by Marquis Cornwallis.
(q) This memorable attack was led by General Baird, who had been for three years confined in a dungeon by the tyrant.
(r) Particularly by Sir Arthur Wellesly, who signalized himself by the defeat of Doondee Waugh, the most steady adherent of Tippoo.
from which they had been driven by the treachery and
surpassation of Tipoo and his father: nor did the venge-
gance of the British, though hurried with such de-
structive rapidity against the most formidable and in-
veterate of all their enemies, prevent them from afford-
ing sympathy and relief to the surviving family of the
Mysorean kings; ample endowments were set apart for
their support, which they still continue to enjoy, with
perhaps equal comfort, and certainly with greater se-
curity, than in the most prosperous days of the fortunes
of their house.

This train of important and successful events took
place during the short space of only a few months after
the arrival of the marquis of Wellesly, and they cer-
tainly entitled his administration to rank with the most
active and brilliant that had ever been displayed by any
governor of India; according, however, to his views
of the state of that country, he must have regarded his
labours as scarcely half finished. He saw the immense
power of the Mahratta empire still remaining not only
unbroken, but daily increasing, and consolidating under
the active and unceasing operation of French influence.
A French state, as already noticed, of large extent
and formidable power, had been framed by the succes-
sive labours of Generals de Boyne and Perron, around
the capital of India. This nascent power the all-de-
vouring ambition of the new emperor had already
grasped as a rich prize, and its destruction became
therefore absolutely necessary to the safety of our empire
in India, since amidst all the multiplied aggressions of
his neighbours, the usurper had uniformly distinguished
the British nation as the marked though perhaps not
the ultimate object of his hostility.

The reduction of a hostile power so immediately in
the vicinity of our possessions, might certainly have
justified a war; but as no actual aggression had yet been
committed in that quarter, it was on the other side of
the peninsula that the marquis of Wellesly was again
first called upon for the active support of the interests
of his government: the danger became at once pressing
and immediate by the usurpation of the whole Mahrat-
ta power by a single chief; and the cause of the fugitive
was identified with our own.

The politics of India were never so refined, or con-
siderate, as to admit of a balancing system, by which
the overgrown power of any individual state might be
prevented from endangering the independence of the
rest. Hardly any circumstance of common danger has ever been deemed sufficiently urgent, to unite the
native princes in the defence of the country even against
foreign invasions. During the contest between the Bri-
tish and the king of Mysore, the Mahrattas observed a
suspicious neutrality: they grazed on the combatants with
an indifference that bordered on fatuity; and which
strongly forebode the dissolution of their state. After
the fall of that kingdom, their empire actually fell into
a state of anarchy that demanded the most prompt
measures of precaution for the safety of the British ter-
ritories, and those of its allies, which lay around its
frontiers. The constitution of their empire, originally
ill constructed and undefined, had lately been radically
changed. The ancient raja of Satarah, who had
originally laid the foundation of its power, and ex-
tended its influence over the peninsula with such un-
examined rapidity, had gradually sunk from the rank
of sovereigns to imbecility, and, owing to the per-
sonal ambition of their servants, fell into a station, if
not of absolute privacy, at least of complete insigni-
cance.

Their ministers, already become hereditary in their
offices, and too powerful for control, had sufficient
influence to remove the seat of government from Sa-
tarah, and to constitute the town of Poona the capital
of the empire. There, removed from the eyes of the
princes, they no longer desired to preserve further al-
legiance, than the semblance of delegated power; they
accordingly retained the appellation of Peshawa, but
compelled the subordinate members of the confedera-
cy to acknowledge them as the legitimate organ of the
whole executive power of the state, whether civil or
military. It is, however, scarcely possible, accurately
to define either the rights or the power attached to
the Peshawa, after his being acknowledged representa-
tive of the supreme head of the empire. The ex-
tent of his prerogatives seems to have varied at dif-
f erent times, according to the personal talents and am-
bition of each incumbent in the exercise of this recent
power.

Bajee Rao, the present Peshawa, from that imbecility
and indolence which in Asia is so often attached to
high stations, had devolved upon inferior agents almost
the whole of the active duties of his office. His
power had frequently been disputed or controlled;
he had at different times nearly become a prey to the
ambition of the subordinate chieftains; and, at the period
now under review, though defended by Scindiah, he
had been completely defeated by Holkar's troops,
and obliged to fly for security beyond the limits of his
own dominions.

The danger to the British possessions, and those of
their allies, became pressing and immediate, from this
usurpation of almost the whole Mahratta power by the
hands of a single chief; and the cause of the Peshawa
thus became identified with that of our India govern-
ment.

A treaty of defensive alliance between the India
Company and the Peshawa, was therefore drawn up at
the earnest solicitation of that prince, and was finally
ratified at Basscin, where he had fled from the aggres-
sions of Holkar for protection. By this instrument, it
was stipulated, that he should be restored to his domin-
ions, and to the exercise of his legitimate authority, on
condition of his maintaining for the defence of his ter-
ritories, and at his own expense, a brigade of British
troops; which it was at first agreed should consist of
6000, but afterwards the number was increased to
10,000 men.

The terms of this convention were no sooner arranged,
than the British army, under Sir Arthur Wellesly,
marshaled towards Poona with that promptitude and de-
cision which have always distinguished the services of this
valuable officer. The rapidity of his movements, and Poona to
his unexpected advance, saved the capital from destruc-
tion; for the troops of Holkar, who had continued to
pillage the city, since it fell into their possession, had at
last resolved to finish the catastrophe, by setting it on
fire. Alarmed, however, by the sudden approach of
the British army, they fled from the place with the ut-
most precipitation, and soon after abandoned the ter-
ritory of Poona. Room was thus made for the peace-
able
able restoration of the deposed sovereign; and the Peshwa, when he afterwards arrived, was received by his subjects, not merely with submission and quietness, but with every mark of the sincerest joy and satisfaction. During his absence the inhabitants had been subjected to the severest forms of military execution; and forced to submit to the various exactions of a chief the most needy, desperate, and rapacious, of all the leaders of the predatory bands of his countrymen. When, therefore, they again beheld their lawful sovereign, they greeted his return by salutes from all the forts in his kingdom, and testified their joy, by illuminations on the tops and activities of the hills throughout the whole vicinity of Poona.

Thus far the measures of the governor of India were an aspect of consistency and vigour, which augured well in favour of their ultimate success. The justice of his interference at this time, to check the overgrown power of an aspiring adversary, and to succour the distress of a fallen prince, will hardly be questioned by such as are versant in the politics of India: Nor will it be denied, since all the Maratha princes exercised the right of making treaties themselves, that the same privilege belonged to the head of the empire.

According to these views, the defensive treaty of Bassein was not only授owed by the parties, but freely communicated to the rest of the chiefs, who explicitly declared, that it contained no stipulations injurious either to the principles of their constitution, or to the just rights of any member of the Maratha confederacy. On the other hand, its advantages were sufficiently obvious. It had the immediate effect of restoring a deposed prince to his throne, and to the exercise of his acknowledged rights, as well as of checking a dangerous usurpation. It detached from the influence of French counsels a very important branch of the Maratha confederacy, and therefore coincided with the general tendency and spirit of the British policy in the east.

But the power of the Peshwa, and the predominant rights which, by the constitution of the empire, were attached to his office, had, as was already noticed, become a grand object of ambition among the more considerable chiefs. Scindiah had for many years laboured to gain an ascendency at the court of Poona, and on some occasions actually possessed a powerful influence on its councils. Ragooee Boomsla had, from family connection, some grounds for the advancement of his own claims to this office; while Holkar had lately, by the fortune of war, had the whole authority placed within his grasp, and in the name of Amrut Rao, brother to the Peshwa, had actually begun to exercise its different prerogatives.

The final deprivation of these chiefs, of so fair an object of ambition as the general control of the whole Maratha empire, seemed to reproach their indolence and want of ambition; and the nearer they considered its attainment, the stronger the jealousy and disappointment which its loss occasioned. The deep resentment thus excited among these chiefs, though acknowledged by themselves, was the true cause of that open hostility which they were now about to commence against the British power. Thus impelled by the strong emotions of disappointed ambition, Scindiah and the rajah of Nagpore entered into a close engagement to frustrate the arrangements lately stipulated by the treaty of Bassein. In order to execute this purpose,

each chief set on foot a large army, which was marched from different quarters to a point of union, bordering on the territories of the Nizam, an ally of the Indian company.

This menacing position they maintained for a considerable time, in order to complete their own preparations, and the more effectually to urge Holkar to join their confederacy; nor could they be persuaded to abandon it by the strongest remonstrances of our government against military preparations so unnecessary for their own defence, and in a situation so incompatible with the peace and safety of the British allies. However unwilling the marquis of Wellesley might be to hazard the tranquillity and safety of the British empire in the east by entering into a contest with these powerful chiefs, whose dominions actually stretched over more than one-half of the peninsula of India, he had however no alternative left him. The full and positive information which he had from various sources obtained, of the nature and extent of the hostilities that had for some time past been meditated, was now confirmed by the menaces of the enemy, and the actual preparations that he had made to carry them into execution. He foresaw the dangerous crisis which was now so near at hand; and the hollow professions of friendship which were constantly sent in reply to his remonstrances, did not for a moment prevent him from bringing forward the whole resources of his government to defeat their enterprises.

A combination of the Maratha empire, so extensive armies sent and powerful as that now formed by the confederates, against had never hitherto been brought into action against the British power; and it must be acknowledged also, that a system of defence, equally prompt, vigorous, and comprehensive, was never planned by any former governor of British India. Five different armies, each of considerable force, were speedily prepared, brought into the field, and ready to invade the vast territory of the enemy, nearly at the same period of time. The value of the previous arrangements that had been formed with the Nizam and the Peshwa, particularly the subsidiary treaties, was now distinctly felt. By them the British army was enabled to proceed through the friendly territories of allied chiefs, to the very boundary of the Maratha dominions, where it was joined by a large subsidiary force both from Hyderabad and Poona, which materially promoted the success of the campaign. The marquis thus was enabled to attack the extensive dominions of the enemy, from almost every assailable point, by an effort almost simultaneous.

On the south they were invaded by a powerful division of the Madras army under Sir Arthur Wellesley; in Guzerat, on the west, by Colonel Murray, and a strong detachment of the Bombay troops; a similar effort was also made by General Lake on the northern extremity of Scindiah's dominions, where the main strength of his army was stationed in conjunction with the celebrated brigade of General Perron. On the east, in Bundelcund, the same system of attack was pursued, where the adherents of the confederacy, Ali Mohammed and Himnut Bahlaurd, were overpowered and dispersed. During the execution of all these operations, the provinces of Balasore and Cuttack were wrested from the rajah of Nagpore, by the immediate direction and under the auspices of the governor-gene-
Their immediate consequences were the defeat of the combined armies of the confederate chiefs; and, from the loss of their artillery, an irreparable blow to their strength and resources throughout the whole of the Deccan. These prosperous results were, no doubt, aided and accelerated by the auspicious progress of the army at all the different points from which it invaded the Mahatta empire. Soon after these successes, the French officers attached to Scindiah's army, after having quarrelled with the native siardas and with each other, abandoned the service of that chief; after the example of Perron their principal partizan, they submitted to the protection of the British commander, who suffered them to retire with whatever property they had acquired, and had been able to bring away.

Thus the grand fabric of French power which that nation had been anxiously raising up, with the assumed sanction of the imperial authority, and the more efficient support of the Mahatta power, was at last broken down, and completely destroyed throughout the whole of India. The conquest of Balasore and Cuttack by Colonel Harcourt seemed well calculated to prevent its future renovation; for it connected the two presidencies of Bengal and Madras, and united the British territories along the whole extent of the Coromandel coast, where they now present an unbroken and hostile frontier against every inroad from the shore, and form a barrier against the introduction of French supplies, and officers to discipline the armies of every inimical power.

The strong detachment of the Bombay army under Colonel Murray, though engaged in enterprises apparently less splendid, were equally serviceable in promoting the important results of the campaign. This officer not only defended the coast and British territory in that quarter, and those of our ally the Guiccar rajah; but he also reduced the fortresses of Broach, Powanghor, and other posts of importance. Thus, in every quarter of this extended warfare, was the British cause triumphant;—on the shores of Guzerat and Balasore, on the mountains of the Deccan, and in the plains of Delhi, her banners were supported with equal energy and spirit: and victory everywhere continued steadily to follow them.

In the space of a few months, a rapid succession of events had taken place, of sufficient importance to change completely the relative condition of the British empire, and the different powers of India. Its power was enlarged; and its ascendency among the neighbouring states was without control. Seven hundred pieces of cannon had been taken from the enemy; their armies routed and dispersed. Eight fortresses had been reduced, either by siege or by escalade. The mighty strength of the French and Mahatta confederacy had been suddenly crushed throughout a territory extending over 1000 miles square. What seemed, however, of no less importance, in these warlike times, and in the critical situation of the British empire, then attacked and threatened with invasion, by its most powerful and inveterate enemy in Europe; her military reputation was heightened; the laurels she had lately gathered in Syria and Egypt were refreshed; and she enjoyed a satisfactory proof, that amidst increasing luxury and imminent danger, no portion of the enterprise and valour of her armies had been lost. Nor is it to be forgotten...
India.

gotten that all her late victories in the east, had been obtained over troops not in the ordinary circumstances of Indian armies. They had been disciplined by European officers, and led with intrepidity and skill. The proficiency they had made in European tactics was so great, that during the action at Assaye, the Mahrattas made no less than five different changes of position, and sustained on the same day an equal number of assaults, before they yielded the contest. It was by the point of the bayonet alone, that they were at last compelled to relinquish their guns; 100 of which were taken on the field of battle, by an army scarce amounting to a tenth part of the number of that which they had, with such singular bravery, driven from the field.

The Mahratta confederacy being finally subdued, a peace was concluded between the India Company, Dowlut Rao Scindiah, and the Berar rajah, in January 1804. The short period of tranquility that succeeded this event was speedily interrupted by Holkar, another powerful chief, whose expulsion of the Peshwa had originally occasioned the war. This prince, though he kept aloof from the confederacy of his countrymen, with an indifference which seemed to argue at once a deficiency of patriotism and a want of sound policy, was, nevertheless, found to maintain the contest for his independence with far greater skill and bravery than any prince whom the British arms had opposed in India.

The power and resources of Holkar had gradually been increased, like that of the other chiefs, by the introduction of European officers into his army, and by an improved system of discipline which was thus established. Thus formidable itself, his power was rendered almost insusceptible, from the nature of his country, which is uncommonly mountainous, and, during the rains, impassable from jungles and morasses. His skill in maintaining the predatory warfare, so congenial to a Mahratta army, was far superior to that of the other chiefs; whose experience had so fully taught him the danger of risking any regular engagement with European troops. Thus, although his territories were invaded on all sides by detachments of the company's forces, he constantly eluded their attacks; and by the singular rapidity of his movements, he was enabled suddenly to assemble almost his whole force, and overpower whatever detachments he might find at a distance from support. In this situation, the troops under Colonel Monson were surprised. This officer had marched against his capital Indoor, in concert with Colonel Murray, who had reached the place from Bombay, and captured it without much opposition. His less fortunate coadjutor, however, after being betrayed by his guides and deserted by a part of his troops, was attacked by a superior force under Holkar himself, before which he was forced to retreat towards Agra, through a country impassable from the rains, and destitute of provisions. After several disastrous conflicts, during a retreat of seven weeks, which degenerated into a flight, the greater part of his guns, and the whole of the baggage and military stores, were lost. A few only of the troops reached Agra at midnight, in a state of extreme distress; the greater part had been overtaken in their flight, and were either massacred, or cruelly mutilated, by their ferocious pursuers.

Colonel Willot of the Bengal artillery was almost equally unsuccessful in an attack which he had planned against a strong post in the interior: he failed in the attempt, and soon after died of the wounds he had received. It was in Bundelcund, and the country of the Rohillas, that Holkar received the most considerable checks, which produced a reverse of fortune. From both these territories he was completely driven by Lieutenant-colonel Fawcett and General Smith.

Parts of his cavalry had been repeatedly defeated by Lord Lake; but the rapidity of their movements as often saved them from destruction; and it was not till the decisive battle of Deeg, on the 13th of November, that the main strength of this enterprising chief was completely broken. At this place his army, trusting to the great strength of its position, behind successive ranges of batteries, was induced to hazard a general action. From these different batteries, which extended to the depth of two miles, they were successively driven by the gallant General Frazer, who had the credit of forcing a post which had been deemed impregnable; and which at this period was defended by 24 battalions of infantry, and 150 pieces of cannon.

In this brilliant achievement the general was wounded in the leg, and soon after was obliged to be carried off the field. The completion of the victory thus fell to Colonel Monson, who now saw complete vengeance inflicted for his past disasters, and for the unexampled cruelty of his enemy; 2000 of whom were killed, either in the battle or during the retreat. An immense number was wounded, and among those many considerable chiefs; while 87 pieces of cannon fell into his hands, which partly consisted of the same guns which he had himself lost during his disastrous retreat to Agra.

Had Holkar confined merely to his effective force in the field, his cause might have now been regarded as desperate. His boldness, however, and his unexampled success, had gained him the support of several of the native princes. Among these he had seduced the rajah of Bhurtore, an ally of the British, and the chief of the celebrated cast of the Jauts, the most warlike tribe in upper India. General Lake was therefore obliged to concentrate his army, and to employ it in the reduction of Bhurtore, a fortress which experience has proved to have been the strongest and most impregnable in the whole peninsula. While thus employed, the dispersed troops of Holkar had time to rendezvous in distant quarters; and were successful in cutting off his supplies of provisions, and in plundering the surrounding districts, by that predatory mode of warfare, for which the Mahrattas have always been celebrated.

The reduction of Bhurtore, thus defended by the indefatigable efforts of Holkar, by its intrepid garrison, and its own natural strength, proved the most arduous enterprise which the British troops had ever undertaken in Asia. The success of the besieged in repelling four different assaults, animated them with fresh courage and intrepidity. The rajah and his whole tribe were united by the tides of blood, as well as of civil authority. They had claim to a high rank among the natives, which they knew must be forfeited forever by unconditional submission: Unfortunately these were the only terms which General Lake, in the peremptory instructions which were given for its reduction, was permitted to accept. The rajah, therefore, having collected in
INDIA.

The loss of the British army in this last assault, and that of the 20th, amounted to 300 killed, and 1564 wounded; its whole loss during the different attacks, amounted to upwards of 3000 of the bravest of our troops; while the unconditional surrender of the place, though the ultimate object of all these perilous attempts, was never attained.

The rajah, however, again proposed the terms he had formerly offered; and consented to pay three lacks of rupees to the army, and the expenses of the war. Hostages were given for the regular discharge of these sums, at different instalments. Thus the last prince in India who resisted the British arms, was found to have made the most glorious defence of his independence, and to have secured for himself the most honourable terms. Holkar himself, after having been often beaten, was at last deserted by almost the whole of his troops, and was obliged to escape with a retinue so scanty, as was hardly sufficient for the protection of his person. Nor did this daring and magnificent prince design to render submission, or to sue for peace, till the marquis of Wellesley had returned to Europe; till he had beheld the downfall of all the leading men of his nation; and till, like another Galgacus, he had secured to himself the honour of being the last prince who had dared to uphold the standard of independence in his native country. Thus ended the contest between the British government and the Mahratta states—a combination of military chiefs who had suddenly emerged from obscurity, and risen to the highest rank among the native powers. For the more recent history of the British empire in Hindostan, see the article INDIA, in the SUPPLEMENT.

INDICATION, in Physic, whatever serves to direct the physician how to act.

INDICATIVE, in Grammar, the first mood or manner of conjugating a verb, by which we simply affirm, deny, or ask something: as, amant, "they love;" non amant, "they do not love;" amant ne? "do they love?" See GRAMMAR.

INDICITION, in Chronology, a cycle of 15 years. See CYCLE.

INDICTMENT, in Law, one of the modes of prosecuting an offender. See PROSECUTION.

In English law, it is a written accusation of one or more persons of a crime or misdemeanor, preferred to, indictment and presented upon oath by, a grand jury. To this end, the sheriff of every county is bound to return to every session of the peace, and every commission of oyer and terminer, and of general gaol-delivery, twenty-four good and lawful men of the county, some out of every hundred, to inquire, present, do, and execute all those things, which on the part of our lord the king shall then and there be commanded them. They ought to be freeholders; but to what amount is uncertain: which seems to be come omisitus, and as proper to be supplied by the legislature as the qualifications of the petty jury; which were formerly equally vague and uncertain, but are now settled by several acts of parliament. However, they are usually gentlemen of the best figure in the county. As many as appear upon this pannel, are sworn upon the grand jury, to the amount of twelve at the least, and not more than twenty-three; that twelve may be a majority. Which number, as well as the constitution itself, we find ex-Wilk. L.L. accurately described so early as the laws of King Ethelred: Ann. Lk.

Excitent seniores duodecim thani, et prefectus cum eis, ut 117. jurent
red of and tried by the king's special commission in any indictment shire or place in the kingdom. By statute 10 and 11 W. III. c. 25: all robberies, and other capital crimes, committed in Newfoundland, may be inquired of and tried in any county in England. Offences against the black act, 9 Geo. I. c. 22, may be inquired of and tried in any county of England, at the option of the prosecutor. So felonies, in destroying turnpikes, or works upon navigable rivers, erected by authority of parliament, may, by statutes 8 Geo. II. c. 20 and 13 Geo. III. c. 84. be inquired of and tried in any adjacent county. By statute 26 Geo. II. c. 19: plundering or stealing from any vessel in distress or wrecked, or breaking any ship contrary to 11 Ann. statute 2 c. 18. may be prosecuted either in the county where the fact is committed, or in any county next adjoining; and if committed in Wales, then in the next adjoining English county: by which is understood to be meant, such English county as, by the statute 26 Hen. VIII. above mentioned, had before a concurrent jurisdiction of felonies committed in Wales. Felonies committed out of the realm, in burning or destroying the king's ships, magazines, or stores, may, by statute 12 Geo. III. c. 24. be inquired of and tried in any county of England, or in the place where the offence was committed. By statute 13 Geo. III. c. 63, misdemeanors committed in India may be tried upon information or indictment in the court of king's bench in England; and a mode is marked out for examining witnesses by commission, and transmitting their deposition to the court. But, in general, all offences must be inquired into, as well as tried, in the county where the fact is committed. Yet if larceny be committed in one county, and the goods carried into another, the offender may be indicted in either: for the offence is complete in both. Or he may be indicted in England for larceny in Scotland, and carrying the goods with him into England, or vice versa; or for receiving in one part of the united kingdom goods that have been stolen in another. But for robbery, burglary, and the like, he can only be indicted where the fact was actually committed: for though the carrying away and keeping of the goods is a continuation of the original taking, and is therefore larceny in the second county, yet it is not a robbery or burglary in that jurisdiction. And if a person be indicted in one county for larceny of goods originally taken in another, and he thereof convicted, or stands mute, he shall not be admitted to his clergy; provided the original taking be attended with such circumstances as would have ousted him of his clergy by virtue of any statute made previous to the year 1691.

When the grand jury have heard the evidence, if they think it a groundless accusation, they used formerly to endorse on the back of the bill, Ignoramus; or, We know nothing of it: intimating, that though the facts might possibly be true, that truth did not appear to them. But now they assent in English more absolutely, Not a true bill; or (which is the better way) Not found; and then the party is discharged without farther answer. But a fresh bill may afterwards be preferred to a subsequent grand jury. If they are satisfied of the truth of the accusation, they then indorse upon it, A true bill; and the anciently, Billa vera. The indictment is then said to be found, and the party stands indicted. But to find a bill, there must at least
Indictment twelve of the jury agree: for so tender is the law
of England of the lives of the subjects, that no man
may be convicted at the suit of the king of any capi-
tal offence, unless by the unanimous voice of twenty-
four of his equals and neighbours; that is, by twelve
at least of the grand jury, in the first place, assent-
ing to the accusation; and afterwards by the whole pe-
tit jury of twelve more, finding him guilty upon his
trial. But if twelve of the grand jury assent, it is a
good presentment, though some of the rest disagree.
And the indictment, when so found, is publicly deli-
ered into court.

Indictments must have a precise and sufficient cer-
tainty. By statute 2 Hen. V. c. 5. all indictments
must set forth the Christian name, surname, and addi-
tion of the state and degree, mystery, town, or place,
and the county of the offender; and all this to identify
his person. The time and place are also to be ascer-
tained, by naming the day and township in which the
fact was committed: though a mistake in these points
is in general not held to be material, provided the
time be laid previous to the finding of the indictment;
and the place to be within the jurisdiction of the court;
unless where the place is laid, not merely as a name,
but as part of the description of the fact. But some-
times the time may be very material, where there is
no limitation in point of time assigned for the pro-
secution of offenders; as by the statute 7 Will. III.
c. 3. which enacted, that no prosecution shall be bad
for any of the treasons or misprisions therein mention-
ed (except an assassination designed or attempted
on the person of the king), unless the bill of indictment
be found within three years after the offence commit-
ted: and, in case of murder, the time of the death
must be laid within a year and a day after the mortal
stroke was given. The offence itself must also be set
forth with clearness and certainty; and in some crimes
particular words of art must be used, which are so
appropriated by the law to express the precise idea which
it entertains of the offence, that no other words, how-
ever synonymous they may seem, are capable of doing
it. Thus, in treason, the facts must be laid to be done
"treasonably, and against his allegiance;" anciently,
"proditior et contra legem sui debuit;" else the in-
dictment is void. In indictments for murder, it is
necessary to say that the party indicted "murdered," not
"killed" or "slew" the other; which, till the late statute,
was expressed in Latin by the word mur-
dravit. In all indictments for felonies, the adverb
"feloniously," "feloniae," must be used; and for burgla-
ries also, "burglariously," in English, "burglariously;"
and all these to ascertain the intent. In rapes, the
word rapuit, or "ravished," is necessary, and must
not be expressed by any paraphrase, in order to render
the crime certain. So in larcenies also, the words fe-
lonicae cepit et asportavit, "feloniously took or car-
ried away," are necessary to every indictment; for these
only can express the very offence. Also, in indictments
for murder, the length and depth of the wound should
in general be expressed, in order that it may appear to
the court to have been of a mortal nature: but if it
goes through the body, then its dimensions are imma-
terial, for that is apparently sufficient to have been
the cause of the death. Also, where a limb, or the
like, is absolutely cut off, there such description is need-
less. Lastly, in indictments, the value of the thing
which is the subject or instrument of the offence must
sometimes be expressed. In indictments for larcenies
this is necessary, that it may appear whether it be grand
or petit larceny; and whether entitled or not to the be-

Indigofera

Indigofera in Scotia Law, the name of the sum-
mons, or libel, upon which criminals are cited before
the court of justiciary to stand trial. See Law
Index.

Plea to Indictment. See Plea.

Indies, East and West. See India and Amer-
ica.

Indigenous, of indigena, denotes a native of a
country, or that which was originally born or pro-
duced in the country where it is found. In this sense,
particular species of animals and plants are said to be
indigenous in the country where they are native, in op-
position to exotic.

Indigestion, a crudity or want of due coction
of the food in the stomach. See Digestion.

Indigetes, a name which the ancients gave to
some of their gods.

There are various opinions about the origin and sig-
nification of this word. Some pretend it was given
to all the gods in general; and others, only to the de-
migods, or great men deified. Others say, it was gi-
ven to such gods as were originally of the country, or
rather such as were the gods of the country that bore
this name; and others again held it was ascribed to
such gods as were patrons and protectors of particular
cities. Lastly, others hold indigetes to be derived from
inde genitus or in loco degens, or from inde and ago, for
dego, "I live, I inhabit;" which last opinion seems the
most probable.

In effect it appears, 1. That these indigetes were also
called local gods (dii locales), or topical gods, which is
the same thing. 2. The indigetes were ordinarily men
deified, who indeed were in effect local gods, being
esteemed the protectors of those places where they were
deified; so that the second and third opinions are very
consistent. 3. Virgil joins patrii with indigetes, as be-
ing the same thing, Georg. i. ver. 498. "Dii patrii,
indigetes." 4. The gods to whom the Romans gave the
name indigetes were, Faunus, Vesta, Aeneas, Romulus,
all the gods of Italy; and at Athens, Minerva, says
Servius; and at Carthage, Dido. It is true, we meet
with Jupiter indiges: but that Jupiter indiges is Aeneas,
not the great Jupiter; as we may see in Livy, lib. i.
cap. 3. in which last sense Servius assures us, indiges
comes from the Latin in dio ago, "I am among the
gods."

Among these indigetes gods, there is none more ce-
lebrated, or more extensively worshipped, than Her-
cules.

Indigo, a dye prepared from the leaves and small
branches of the Indigofera Tinctoria. See the next
article.

Indigofera, the Indigo Plant, a genus of
plants belonging to the diadelphus class; and in the
natural method ranking under the 32d order, Papilionaceae.
See Botany Index.

This
This plant requires a smooth rich soil, well tilled, and not too dry. The seed of it, which, as to figure and colour, resembles gunpowder, is sown in little furrows that are about the breadth of the hoe, two or three inches deep, at a foot's distance from each other, and in as straight a line as possible. Continual attention is required to pluck up the weeds, which would soon choke the plant. Though it may be sown in all seasons, the spring is commonly preferred. Moisture causes this plant to shoot above the surface in three or four days. It is ripe at the end of two months. When it begins to flower, it is cut with pruning-knives; and cut again at the end of every six weeks, if the weather is a little rainy. It lasts about two years, after which term it degenerates; it is then plucked up, and planted afresh. As this plant soon exhausts the soil, because it does not absorb a sufficient quantity of air and dew to moisten the earth, it is of advantage to the planter to have a vast space which may remain covered with trees, till it becomes necessary to fell them in order to make room for the indigo.

Indigo is distinguished into two kinds, the true and the bastard. Though the first is sold at a higher price on account of its superiority, it is usually advantageous to cultivate the other, because it is heavier. The first will grow in many different soils; the second succeeds best in those which are most exposed to the rain. Both are liable to great accidents. Sometimes the plant becomes dry, and is destroyed by an insect frequently found on it; at other times, the leaves, which are the valuable part of the plant, are devoured in the space of 24 hours by caterpillars. This last misfortune, which is but too common, has given occasion to the saying, "that the planters of indigo go to bed rich, and rise in the morning totally ruined."

This production ought to be gathered in with great precaution, for fear of making the farina that lies on the leaves, and is very valuable, fall off by shaking it. When gathered, it is thrown into the steeping-vat, which is a large tub filled with water. Here it undergoes a fermentation, which in 24 hours at furthest is completed. A cock is then turned to let the water run into the second tub, called the mortar or pounding-tub. The steeping-vat is then cleaned out, that fresh plants may be thrown in; and thus the work is continued without interruption.

The water which has run into the pounding-tub is found impregnated with a very subtle earth, which alone constitutes the dregs or blue substance that is the object of this process, and which must be separated from the useless salt of the plant, because this makes the dregs swim on the surface. To effect this, the water is forcibly agitated with wooden buckets, that are full of holes and fixed to a long handle. This part of the process requires the greatest precautions. If the agitation be discontinued too soon, the part that is used in dyeing, not being sufficiently separated from the salt, would be lost. If, on the other hand, the dye were to be agitated too long after the complete separation, the parts would be brought together again, and form a new combination; and the salt reacting on the dregs would excite a second fermentation, that would alter the dye, spoil its colour, and make what is called burnt indigo. These accidents are prevented by a close attention to the least alterations that the dye undergoes, and by the precaution which the workmen take to draw out a little of it from time to time in a clean vessel. When they perceive that the coloured particles collect by separating from the rest of the liquor, they leave off shaking the buckets, in order to allow time to the blue dregs to precipitate to the bottom of the tub, where they are left to settle till the water is quite clear.—Holes made in the tub at different heights, are then opened one after another, and this useless water is let out.

The blue dregs remaining at the bottom having acquired the consistency of a thick muddy liquid, cocks are then opened, which draw it off into the settler. After it is still more cleared of much superfluous water in this third and last tub, it is drained into sacks; from whence, when water no longer filters through the cloth, this matter, now become of a thicker consistency, is put into chests, where it entirely loses its moisture. At the end of three months the indigo is fit for sale.

It is used, in washing, to give a bluish colour to linen; painters also employ it in their water-colours; and dyers cannot make fine blue without indigo. The ancients procured it from the East Indies; in modern times, it has been transplanted into America. The cultivation of it, successively attempted at different places, appears to be fixed at Carolina, St Domingo, and Mexico. That which is known under the name of Guatimala indigo, from whence it comes, is the most perfect of all.

There are two kinds of indigo prepared in the East Indies, particularly on the coast of Coromandel, at Pondicherry, &c. Of these the worst kind is used for giving the body of colour to the dyed substance, the other being employed only to give it a gloss afterwards. The finest is prepared on the coast of Agra, Masulipatam, and Ayanoo, but especially in the island of Java; but this last, being extremely dear, is very little used by the dyers. The best ought to float on the surface of water; its colour ought to be a very dark blue inclining to violet, bright and sparkling, especially when broken. It may be tried by dissolving a little in a glass of water; if pure, it will mix equally with the liquor; but if otherwise, will separate and fall to the bottom. Another method of trying the goodness of this substance is by fire; for the pure indigo will be entirely consumed, while the extraneous particles will remain. The pounded indigo is much more subject to adulteration than such as is sold in cakes or tablets; as well as all or dirt with which it is mixed are very apt to separate from the pale colouring substance when standing in a liquid state, as it must always do before the moisture is evaporated: whence, on breaking a bit of indigo so adulterated, the extraneous matter will be perceived in strata of a different colour.

INDIVIDUAL, a particular being of any species, or that which cannot be divided into two or more beings equal or alike.

The usual division in logic is made into genera, or into genera; those genera into species; and those species into individuals.
INDIVISIBLE, among metaphysicians. A thing is said to be absolutely indivisible that is a simple being, and consists of no parts into which it may be divided. Thus, God is indivisible in all respects; as is also the human mind; not having extension, or other properties of body.

INDIVISIBLES, in Geometry, the elements or principles into which any body or figure may be ultimately resolved; which elements are supposed to be infinitely small: thus, a line may be said to consist of points, a surface of parallel lines, and a solid of parallel and similar surfaces.

INDORSEMENT, in Law, any thing written on the back of a deed; as a receipt for money received.

There is likewise an indorsement, by way of assignment, on bills of exchange and notes of hand; which is done by writing a person’s name on the back thereof.

INDOSTAN, or HINDOSTAN, PROPER INDIA, or the Empire of the Great Mogul. See HINDOSTAN.

INDUCTION, in Logic and Rhetoric, a consequence drawn from several propositions or principles first laid down. See LOGIC; and ORATORY, No. 32.

INDUCTION, in Law, is putting a clerk or clergyman in possession of a benefice or living to which he is collated or presented. See the article PARSON.

Induction is performed by a mandate from the bishop to the archdeacon, who usually issues out a precept to other clergymen to perform it for him. It is done by giving the clerk corporal possession of the church, as by holding the ring of the door, tolling a bell, or the like; and is a form required by law, with intent to give all the parishioners due notice and sufficient certainty of their new minister, to whom their tithes are to be paid. This therefore is the investiture of the temporal part of the benefice, as institution is of the spiritual. And when a clerk is thus presented, instituted, and inducted into a rectory, he is then, and not before, in full and complete possession; and is called in law persona impersonata, or parson impersonans.

INDULGENCES, in the Romish church, are a remission of the punishment due to sins, granted by the church, and supposed to save the sinner from purgatory.

According to the doctrine of the Romish church, all the good works of the saints over and above those which were necessary towards their own justification, are deposited, together with the infinite merits of Jesus Christ, in one inexhaustible treasury. The keys of this were committed to St Peter, and to his successors the popes, who may open it at pleasure, and by transferring a portion of this superabundant merit to any particular person, for a sum of money, may convey to him either the pardon of his own sins, or a release for any one in whom he is interested, from the pains of purgatory. Such indulgences were first invented in the 11th century, by Urban II, as a recompense for those who went in person, upon the glorious enterprise of conquering the Holy Land. They were afterwards granted to those who hired a soldier for that purpose; and in process of time were bestowed on such as gave money for accomplishing any pious work enjoined by the pope.

The power of granting indulgences has been greatly abused in the church of Rome. Pope Leo X. in order to carry on the magnificent structure of St Peter’s at Rome, published indulgences, and a plenary remission, to all such as should contribute money towards it. Finding the project take, he granted to Albert elector of Mentz, and archbishop of Magdeburg, the benefit of the indulgences of Saxony and the neighbouring parts, and farmed out those of other countries to the highest bidders; who, to make the best of their bargain, promised the absent preachers to cry up the value of the ware. The form of these indulgences was as follows: ‘May our Lord Jesus Christ, according to the merits of St. Charles V. of his most holy passion. And I by his authority, vol. ii. sp. that of his blessed apostles Peter and Paul, and of the most holy Pope, granted and committed to me in these parts, do absolve thee, first from all ecclesiastical censures, in whatever manner they have been incurred; then from all thy sins, transgressions, and excesses, how enormous soever they may be, even from such as are reserved for the cognizance of the holy see, and as far as the keys of the holy church extend: I remit to you all punishment which you deserve in purgatory on your account; and I restore you to the holy sacraments of the church, to the unity of the faithful, and to that innocence and purity which you possessed at baptism; so that when you die, the gates of punishment shall be shut, and the gates of the paradise of delight shall be opened: and if you shall not die at present, this grace shall remain in full force when you are at the point of death. In the name of the Father, and of the Son, and of the Holy Ghost.”

The terms in which the retailers of indulgences described their benefits and the necessity of purchasing them, are so extravagant, that they appear almost incredible. If any man (say they) purchases letters of indulgence, his soul may rest secure with respect to its salvation. The souls confined in purgatory, for whose redemption indulgences are purchased, as soon as the money tinkle in the chest, instantly escape from that place of torment, and ascend into heaven. That the efficacy of indulgences was so great, that the most heinous sins, even if one should violate (which was impossible) the mother of God, would be remitted and expiated by them, and the person be freed both from punishment and guilt. That this was the unspeakable gift of God, in order to reconcile man to himself. That the cross erected by the preachers of indulgences was equally efficacious with the cross of Christ itself. “Lo! the heavens are open; if you enter not now, when will you enter? For twelve pence you may redeem the soul of your father out of purgatory; and are you so ungrateful, that you will not rescue your parent from torment? If you had but one coat, you ought to strip yourself instantly, and sell it, in order to purchase such benefits, &c.

It was this great abuse of indulgences that contributed not a little to the first reformation of religion in Germany, where Martin Luther began first to declare against the preachers of indulgences, and afterwards against indulgences themselves: but since that time the popes have been more sparing in the exercise of this power: however, they still carry on a great trade
Indulgences trade with them to the Indies, where they are purchased at two rials a-piece, and sometimes more.

The pope likewise grants indulgences to persons at the point of death; that is, he grants them, by a brief, power to choose what confessors they please, who is authorised thereby to absolve them from all their sins in general.

INDULT, in the church of Rome, the power of presenting to benefices granted to certain persons by the pope. Of this kind is the indult of kings and sovereign princes in the Romish communion, and that of the parliament of Paris granted by several popes. By the concordat for the abolition of the pragmatic sanction, made between Francis I. and Leo X. in 1516, the French king has the power of nominating to bishoprics, and other consistorial benefices, within his realm. At the same time, by a particular bull, the pope granted him the privilege of nominating to the churches of Brittany and Provence. In 1648 Pope Alexander VIII. and in 1668 Clement IX. granted the king an indult for the bishopric of Metz, Toul, and Verdun, which had been yielded to him by the treaty of Munster; and in 1668 the same Pope Clement IX. granted him an indult for the benefices in the counties of Rouillon, Artois, and the Netherlands. The cardinals likewise have an indult granted them by agreement between Pope Paul IV. and the sacred college in 1555, which is always confirmed by the popes at the time of their election. By this treaty the cardinals have the free disposal of all the benefices depending on them, and are empowered likewise to bestow a benefice in commendam.

INDULTO, a duty, tax, or custom, paid to the king of Spain for all such commodities as are imported from the West Indies in the galleons.

INDUS, a large river of Asia, which rises in the mountains which separate Tartary from India, and discharges itself into the Indian ocean. See HINDOSTAN.

INEBRIANTS, are defined to be such things as affect the nerves in a particular and agreeable manner, and through them alter and disturb the functions of the mind. They are properly divided into native and artificial; the former chiefly in use among the oriental and other nations, the latter principally throughout Europe.

Natural Inebriants, are, 1. Opium; in use all over the east, and of which the Turks, through custom, swallow a draught. 2. Peganum harmala, Syrian rue. The seeds are sold in Turkey for this purpose; and with these, as Bellonius relates, the Turkish emperor Solymann kept himself intoxicated. 3. Maslac of the Turks, or bongue of the Persians; prepared from the dust of the male-flower of hemp, or from the leaves. 4. Bangue of the Indians, from the leaves of the hibiscus sabdariffa. 5. Seeds of various species of the datura, or thorny apple. 6. Pinang, or betel of the Indians. 7. Roots of black benzene. 8. The hyoscyamus physaloides. 9. Berries of the deadly nightshade. 10. Leaves of millfoil, are used by the Dalekarlians to render their beer intoxicating. 11. Tobacco, and several others less material are mentioned; such as clary, saffron, and derv.)

Artificial Inebriants, are fermented liquors from farinaceous seeds; wines, and spirits drawn by distillation. Inebriants With these is ranked the nectar of the gods, and the anodyne medicine of Homer, commonly called nepenthes; and the spells by which Medea and Circe produced their enchantments.

INERTIA OF MATTER, in Philosophy, is defined by Sir Isaac Newton to be a passive principle by which bodies persist in their motion or rest, receive motion in proportion to the force impressing it, and resist as much as they are resisted. It is also defined by the same author to be a power implanted in all matter, whereby it resists any change endeavoured to be made in its state. See MECHANICS.

INESSE is applied to things which are actually existing.

Authors make a difference between a thing in esse, and a thing in posse: a thing that is not, but may be, they say is in posse, or potentia; but a thing apparent and visible, they say is in esse, that is, has a real being co instanti; whereas the other is casual, and at best but a possibility.

INFALISTACIO, an ancient punishment of felons, by throwing them among the rocks and sands, customarily used in port-towns. It is the opinion of some writers, that infalilitatus did imply some capital punishment, by exposing the malefactor upon the sand till the next tide carried him away; of which custom, it is said, there is an old tradition. However, the penalty seems to take its name from the Norman fæles, or fælesia, which signified not the sands, but the rocks and cliffs adjoining, or impeding on the sea-shore. Committit feloniam ob quam fuit suspensus, uteligatus, vel alio modo morti damnatus, &c. vel apud Dover infalilitatus, apud Southampton submerus, &c.

INFAILIBLE, something that cannot err, or be deceived.

One of the great controversies between the Protestants and Papists, is the infallibility which the latter attribute to the pope; though, in fact, they themselves are not agreed on that head, some placing this pretended infallibility in the pope and a general council.

INFAMY, in Law, is a term which extends to forgeries, perjury, gross cheats, &c. by which a person is rendered incapable of being a witness or juror, even though he is pardoned for his crimes.

INFANCY, the first part of life.—Fred. Hoffman says, that the human species are infants until they begin to talk, and children to the age of puberty.—Anatomy discovers to us, that during infancy there is much imperfection in the human frame; e. g. its parts are disproportioned, and its organs incapable of those functions which in future life they are designed to perform. The head is larger in proportion to the bulk of the body than that of an adult. The liver and pancreas are much larger in proportion than in advanced life; their secretions are more in quantity also. The bile is very inert; the heart is stronger and larger than in future life; the quantity of blood sent through the heart of an infant, in a given time, is also more in proportion than in adults. Though these circumstances have their important usefulness, yet the imperfection attending them subjects this age to many injuries and dangers from which a more perfect state is exempted.
INFANCY, exempted. Dr Percival observes, in his Essays Med. and Exp. that of all the children who are born alive, two-thirds do not live to be two years old.

Infants have a larger proportion of brain than adults, hence are most subject to nervous disorders; and hence the diagnosticks of diseases are in many respects obscure or uncertain, as particularly those taken from the pulse, which, from the irritability of the tender bodies of infants, is suddenly affected by a variety of accidents too numerous, and seemingly too trivial, to gain our attention. However, no very great embarrassment arises to the practitioner from hence: for the disorders in this state are generally acute, less complicated than those in adults, and are more easily discovered than is generally apprehended.

INFANT, denotes a young child. See INFANCY.

INFANTS, among the Jews, Greeks, and Romans, were swaddled as soon as they were born, in a manner similar to that practised by the moderns. The Jews circumcised and named their infant children on the eighth day from the birth. Upon the birth of a son, the Grecians crowned their doors with olives—of a daughter, with wool. The infant was washed in warm water, and anointed with oil—by the Spartans with wine; it was then dressed, and laid in a basket, or on a shelf if the father was a warrior, particularly amongst the Spartans. At five days old they ran with it round the fire, and the mother's relations sent presents. The Greeks named their children on the tenth day, the Romans on the ninth: Their naming was attended with sacrifices and other demonstrations of joy. The maternal office of suckling their own children was never declined, when circumstances would permit. How much different is this from the unnatural delicacy observed by modern mothers, a delicacy which to the child is cruelty! The 40th day was a day of solemnity for the mother. The names of children were registered both by the Greeks and Romans. See Register.

For an account of the custom of exposing infants, see EXPOSING.

Infants were kept from crying in the streets by means of a sponge soaked in honey. Nurses had also their bugbears and terrible names to frighten the children into peace:—The figure with which they were principally intimidated was Megaloceros, a sort of rawhead and bloody bones.

INFANT; in Law, is a person under 21 years of age; whose capacities; incapacities, and privileges, are various.

1. In criminal matters. The law of England does in some cases privilege an infant under the age of 21, as to common misdemeanors; so as to escape fine, imprisonment, and the like; and particularly in the cases of omission, as not repairing a bridge, or a high way, and other similar offences; for, not having the command of his fortune till the age of 21, he wants the capacity to do those things which the law requires. But where there is any notorious breach of the peace, a riot, battery, or the like, (which infants when full-grown are at least as liable as others to commit) for those, an infant above the age of 14 is equally liable to suffer as a person of the full age of 21.

With regard to capital crimes, the law is still more minute and circumspect; distinguishing with greater nicety the several degrees of age and discretion. By the ancient Saxon law, the age of twelve years was established for the age of possible discretion, when first the understanding might open; and from hence till the offender was 14, it was eunte ubertatis proximae, in which he might, or might not, be guilty of a crime, according to his natural capacity or incapacity. This was the dubious stage of discretion; but, under twelve, it was held, that he could not be guilty in will, neither after fourteen could be supposed innocent, of any capital crime which he in fact committed. But by the law, as it now stands, and has stood at least ever since the time of Edward III. the capacity of doing ill, or contracting guilt, is not so much measured by years and days, as by the strength of the delinquent's understanding and judgment. For one lad of 11 years old may have as much cunning as another of 14; and in these cases our maxim is, that multa supplet etatem. Under seven years of age, indeed, an infant cannot be guilty of felony; for then a felonious discretion is almost an impossibility in nature: but at eight years old, he may be guilty of felony. Also, under 14, though an infant shall be prima facie adjudged to be doli incapax, yet if it appear to the court and jury that he was doli copax, and could discern between good and evil, he may be convicted and suffer death. Thus a girl of 13 has been burnt for killing her mistress; and one boy of ten, and another of nine years old, who had killed their companions, have been sentenced to death, and he of ten years actually hanged; because it appeared upon their trials, that the one bid himself, and the other hid the body he had killed; which hiding manifested a consciousness of guilt, and a discretion to discern between good and evil. And there was an instance in the last century, where a boy of eight years old was tried at Abington for firing two barns; and it appearing that he had malice, revenge, and cunning, he was found guilty, condemned, and hanged accordingly. Thus also, in very modern times, a boy of ten years was convicted on his own confession of murdering his bedfellow; there appearing in his whole behaviour plain tokens of a mischievous disposition; and, as the sparing this boy merely on account of his tender years might be of dangerous consequence to the public, by propagating a notion that children might commit such atrocious crimes with impunity, it was unanimously agreed by all the judges, that he was a proper subject of capital punishment. But, in all such cases, the evidence of that malice, which is to supply age, ought to be strong and clear beyond all doubt and contradiction.

2. In civil matters. The ages of male and female are different for different purposes. A male at 12 years old may take the oath of allegiance; at 14 is at the years of discretion, and therefore may consent or disagree to marriage, may choose his guardian, and, if his discretion be actually proved, may make his testament of his personal estate; at 17 may be an executor; and at 21 is at his own disposal, and may alienate his land, goods, and chattels. A female also at seven years of age may be betrothed or given in marriage; at nine is entitled to dower; at 12 is at years of maturity, and therefore may consent or disagree to marriage, and, if proved to have sufficient discretion, may bequeath her personal estate; at 14 is at years of legal discretion, and may choose a guardian; at 17 may be executrix; and at 21 may
may dispose of herself and her lands. So that full age in male or female is 21 years, which age is completed on the day preceding the anniversary of a person’s birth; who till that time is an infant, and so styled in law. Among the ancient Greeks and Romans, women were never of age, but subject to perpetual guardianship, unless when married, nisi conveniens in manum vivit; and when that perpetual tutelage were away in process of time, we find that, in females as well as males, full age was not till 25 years. Thus by the constitution of different kingdoms, this period, which is merely arbitrary, and juris position, is fixed at different times. Scotland agrees with England in this point; (both probably copying from the old Saxon constitutions on the continent, which extended the age of minority ad annum vigesimum primum, et ex usu juvenes sub tutelam reposunt); but in Naples persons are of full age at 18; and in France, with regard to marriage, not till 30; and in Holland at 25.

The very disabilities of infants are privileges; in order to secure them from hurting themselves by their own improvisid acts. An infant cannot be sued but under the protection, and joining the name, of his guardian; for he is to defend him against all attacks as well by law as otherwise: but he may sue either by his guardian, or prochein amy, his next friend who is not his guardian. This prochein amy may be any person who will undertake the infant’s cause; and it frequently happens, that an infant, by his prochein amy, institutes a suit in equity against a fraudulent guardian.

With regard to estates and civil property, an infant hath many privileges. In general, an infant shall lose nothing by nonclaim, or neglect of demanding his right; nor shall any other laches or negligence be imputed to an infant, except in some very particular cases.

It is generally true, that an infant can neither alienate his lands, nor do any legal act, nor make a deed, nor indeed any manner of contract, that will bind him. But still to all these rules there are some exceptions: part of which were just now mentioned in reckoning up the different capacities which they assume at different ages: and there are others, a few of which it may not be improper to recite, as a general specimen of the whole. And, first, it is true, that infants cannot alienate their estates; but infant trustees, or mortgagees, are enabled to convey, under the direction of the court of chancery or exchequer or other courts of equity, the estates they hold in trust or mortgage, to such person as the court shall appoint. Also it is generally true, that an infant can do no legal act: yet an infant, who has an advowson, may present to the benefice when it becomes void.

For the law in this case dispenses with one rule, in order to maintain others of far greater consequence: it permits an infant to present a clerk (who, if unfit, may be rejected by the bishop), rather than either suffer the church to be unserved till he come of age, or permit the infant to be debarred of his right by lapse to the bishop. An infant may also purchase lands, but his purchase is incomplete; for, when he comes to age, he may either agree or disagree to it, as he thinks prudent or proper, without alleging any reason; and so may his heirs after him, if he dies without having completed his agreement. It is, farther, generally true, that an infant, under 21, can make no deed but what is afterwards voidable; yet in some cases he may bind himself apprentice by deed indented or indentures, for seven years; and he may by deed or will appoint a guardian to his children, if he has any. Lastly, it is generally true, that an infant can make no other contract that will bind him: yet he may bind himself to pay for his necessary meat, drink, apparel, physic, and such other necessaries; and likewise for his good teaching and instruction, whereby he may profit himself afterwards.

INFANTE, and INFANTA, all the sons and daughters of the kings of Spain and Portugal, except the eldest: the princes being called infants, and the princesses infantes.

INFANTRY, in military affairs, the whole body of foot soldiers, whether independent companies or regiments.—The word takes its origin from one of the infantes of Spain, who, finding that the army commanded by the king her father had been defeated by the Moors, assembled a body of foot-soldiers, and with them engaged and totally routed the enemy. In memory of this event, and to distinguish the foot-soldiers, who were not before held in much consideration, they received the name of infantry.

Heavy-armed Infantry, among the ancients, were such as wore a complete suit of armour, and engaged with broad shields and long spears. They were the flower and strength of the Grecian armies, and had the highest rank of military honour.

Light-armed Infantry, among the ancients, were designed for skirmishes, and for fighting at a distance. Their weapons were arrows, darts, or slings.

Light Infantry, among the moderns, have only been in use since the year 1656. They have no camp equipage to carry, and their arms and accoutrements are much lighter than those of the infantry. Light infantry are the eyes of a general, and the givers of sleep and safety to an army. Wherever there is found light cavalry, there should be light infantry. They should be accustomed to the pace of four miles an hour, as their usual marching pace, and to be able to march at five miles an hour upon all particular occasions. Most of the powers on the continent have light infantry. It is only of late years that light infantry came to be used in the British army: But now every regiment has a company of light infantry, whose station is on the left of the regiment, the right being occupied by the grenadiers.

INFATUATE, to prepossess any one in favour of some person or thing that does not deserve it, so far as that he cannot easily be dispossessed.—The word infatuat comes from the Latin fatuus, “fool”; of fari, “to speak out,” which is borrowed from the Greek φαω, whence φωνη, which signifies the same with vox in Latin, or prophet in English; and the reason is, because their prophets or priests used to be seized with a kind of madness or folly, when they began to make their predictions, or deliver oracles.

The Romans called those persons infatuati, who fancied they had seen visions, or imagined the god Faunus, whom they called Fatuus, had appeared to them. This word is more generally applied by the moderns to persons who are what the vulgar call bewitched, or under
same peculiar destiny which it appears impossible for them to shun.

INFECTION, among physicians. See CONTAGION.

INFECTION, in Scots Law, the solemnity of the delivery of an heritable subject to the purchaser.

INFERNAL, sacrifices offered by the Romans to the Dii Manns, or the souls of deceased heroes or other illustrious persons, or even any relation or person whose memory was held in veneration. These sacrifices consisted of honey, water, wine, milk, the blood of victims, variety of balsamic unguents, chaplets, and loose flowers. The victims upon these occasions were generally of the smaller cattle, though in ancient times they sacrificed slaves or captives: But what a shocking view does this give us of their sentiments of human nature, as if nothing but murder, cruelty, and human blood, could satisfy or prove acceptable to a human soul! The sacrifices were usually black and barren. The altars on which they were offered were holes dug in the ground.

The honey, water, wine, &c. were used as libations, and were poured on the tombs of children by children, on those of virgins by virgins, and on those of married men by women. The infernal were offered on the 9th and 30th days after interment amongst the Greeks, and repeated in the month Anthesterion. The whole of this article applies equally to the Greeks and the Romans.

INFIBULATION, in antiquity. It was a custom among the Romans to infibulate their singing boys, in order to preserve their voices: for this operation, which prevented their retracting the prepuce over the glans, and is the very reverse to circumcision, kept them from injuring their voices by premature and preposterous venery; serving as a kind of padlock, if not to their inclinations, at least to their abilities. It appears by some passages in Martial, that a less decent use was made of infibulation among the luxurious Romans: for some ladies of distinction, it seems, took this method of confining their paramours to their own embraces. Juvenal also hints at some such practice. Celsius, a chaste author, says infibulation was sometimes practised for the sake of health, and that nothing destroys it more than the ill practice of this operation. It was intended to prevent. This practice is not perhaps likely to be revived; if, however, any one who has suffered in his constitution by preposterous venery, should be able to get children, and should be inclined to prevent the same misfortune in them by infibulation, the method of doing it is thus: The skin which is above the glans is to be extended, and marked on both sides with ink, where it is perforated, and then suffered to retract itself. If the marks recur upon the glans, too much of the skin has been taken up, and we must make the marks farther; if the glans remain free from them, they show the proper place for affixing a fibula: then pass a needle and thread through the skin where the marks are, and tie the threads together; taking care to move it every day, until the parts about the perforation are cicatrisèd: this being effected, take out the thread, and put in the fibula; which the lighter it is the better.

Authors have not determined what the fibula of the ancient surgeons was, though no doubt it was for different purposes. In the present case, the fibula seems to mean a ring of metal, not unlike what the country people put through the noses of swine.

INFIDEL, a term applied to such persons as are not baptized, and that do not believe the truths of the Christian religion. See DETRACT.

INFIDELITY, in a general sense, denotes want of faith or belief in regard to any subject or transaction.

Religious INFIDELITY signifies a disbelief of Christianity.

Of all the methods (says an elegant modern essayist*) which the vanity of man has devised with a view to acquire distinction, there is none easier than that of professing a disbelief of the established religion. That which shocks the feelings of those with whom we converse, cannot fail of attracting notice; and as the vain are usually confident, they utter their doubts with an air so oracular and decisive, as induces the simple to think them profoundly wise. Audacity, with little ingenuity, will attract the eyes of spectators, and he who will sufficiently answer the purpose of many among the professed unbelievers. One might be diverted, if one were not hurt, at seeing a circle of silly admirers, gaping and fixing their eyes on some half-learned and impudent prater, who throws out oblique insinuations against the Bible, the clergy, or the sacrament. These are fertile topics of wit and ingenuity; but it might mortify the vanity of some very vain writers and talkers, if they were to recollect, what is undoubtedly true, that it is a species of wit and ingenuity which not only the vilest, but the most stupid and illiterate of mankind, have frequently displayed in all its possible perfection.

There is indeed no doubt, but that vanity is one of the principal causes of infidelity. It must be the sole cause of communicating it to others, by writing or conversation. For let us suppose the case of a very humane, judicious, and learned man, entertaining doubts of the truth of Christianity: if he cannot clear his doubts by examination, he will yet recollect that doubts are no certainties; and, before he endeavours to propagate his scepticism, he will ask himself these questions: "Am I quite convinced that what I doubt of cannot possibly be true? If I am convinced of it, am I sure that the publication of my opinions will not do more harm than good? Is not the disturbing of any long-established civil constitution attended with confusion, rebellion, bloodshed, and ruin: And are not the majority of men more strongly attached to the religion than the government of their forefathers? Will it serve my country to introduce discontentment of any species? May not those innovations in religion, which discontent may introduce, lead to all the evils which are caused by frenzy and fanaticism? Granting that I were able to make a party formidable enough to crush opposition and to exterminate Christianity, still am I certain that I act, in this instance, like a good member of society? For is not this system, whether well or ill founded, friendly to society? I must confess it; its greatest enemies have acknowledged it. What motive then can induce me to divulge my doubts of its authenticity? Not the good of mankind; for it is already allowed by unbelievers, that the good of mankind is interested in the belief of its divine original. Is it for
I will not deceive myself; my motive, I suspect, is of another kind; for do I read those books which have been already written to satisfy similar doubts? Nothing but the vanity of appearing wiser than my credulous neighbours can induce me to interrupt the happiness of their belief. But vanity of this sort, which tends to disturb society, to injure the national morals, and to rob many thousand individuals of a copious source of sweet and solid comfort, must be pronounced extreme wickedness, even according to the obvious dictates of natural religion. I shall act the part of a good citizen and a good man, by conforming to a system whose beneficial influence I feel and confess, and by endeavouring to acquire a belief in that, which has for so many centuries been established, and which promises to soothe me in distress with the sweetest consolations, and to brighten the dismal hour of death, by the hope of a more glorious and happy state of existence. At all events, I shall have the satisfaction of having commanded myself so far, as not to have run the hazard of endangering the welfare of my fellow-creatures, either here or hereafter, by indulging a degree of vanity, which, in a creature so weak and so short-lived as myself, is a folly very inconsistent with the superior wisdom which I seem to arrogate.

I will venture to repeat (continues our author), that all writers against Christianity, however they may affect even the extremes of benevolence, honour, philosophy, and enlargement of mind, are actuated by vanity and wickedness of heart. Their motives are as mean, selfish, narrow, and in every respect unjustifiable, as the tendency of their writings is mischievous. Their malice is often importunate, through the foolish sophistry of their arguments; but, if ever it be successful, it is highly injurious: and indeed, considering their motives and the probable consequences of their endeavours, the infidel writer is a greater enemy to society, and consequently guiltier, according to all the principles of social union, than the thief or the traitor. Persecution would, however, only promote his cause, and his proper punishment is contemp.

It is certainly no derogation from the character of a man of sense, to conform, even while he is so unfortunate as to doubt their truth, to the opinions of his country. His conformity will probably lead him to a train of actions and of thought, which, in due time, will induce him to believe. But, if that should not happen, yet he will not, as very wise and very great men have acted, in paying a respectful deference to the avowed conviction of others. The most intelligent and powerful men of ancient Rome, not only appeared to believe a very absurd and hurtful system, but assisted in all its ceremonies as priests. Even Socrates, who evidently entertained some notions adequate to the dignity of the one great and supreme Being, yet thought it was a duty which he owed to his country, so far to conform to the wretched establishment, as to order in his dying words a sacrifice to Æsculapius. This external conformity to the national religion ought not to be confounded with hypocrisy. If indeed it is carried to extremes, or zealously affected, it certainly is very blameable and contemptible deceit; but while it keeps within the bounds of reason and moderation, it ought to be called a decent deference to the opinions of the majority, arising from humility, and from a desire to maintain the tranquillity of the state, and to continue an innocent and useful system, which has, and will always greatly contribute to lessen the quantity and degree both of moral and of natural evil.

The easiest, after all, or at least the most effectual method of appearing in any character, is really to be what we wish to appear. But belief, you will say, is not in our power, and how can we believe what appears to us incredible? Certainly you cannot while it appears incredible. But let me ask you, whether you have taken any pains to believe, or have at once and at a glance persuaded yourself, that the Christian religion is totally false? It is probable that a great number of sceptical writers never gave themselves the trouble to read those Scriptures which they warmly oppose. They hear objections, they read objections, and they find, that from men of reputed wit and ingenuity the objections often originate. They also wish to be reputed men of wit and ingenuity, and therefore eagerly adopt the language and sentiments of the order. Perhaps the vanity and pride of this class of men will render all attempts to convince them abortive; but to modest doubters, and to those whose good sense and good dispositions lead them to wish to adopt the religion of their country, it may not be useless to suggest advice, with a view to facilitate their conviction.

The chief thing required is to free themselves from the pride of human reason. Humility (and surely our blindness and imperfections are sufficient to render us humble, if we would be reasonable), humility will open our hearts, and belief will find admission. Sincere endeavours, seconded by prayers, will never fail to help our unbelief. But, alas! a fine, gay, spirited, liberal, and enlarged modern philosopher, would be ashamed to be found on his knees, or with a Testament in his possession. There is scarcely any vicious act, or any vicious book, which would put him so much to the blush.

A modest well-meaning man might, however, one should think, divest himself of those prejudices which prevent the possibility of belief, by the following soliloquy: I find myself placed in a world abounding with evil and misery. Under the immediate pressure of it, I feel my heart inclining, like the needle to the north, by its natural tendency, to the Deity for support. Man, of all animals, is the only one who has the sense of religion. Feeling this distinctive propensity of my nature, I look around to discover to what object, and in what manner, that part of my fellow creatures, who live in the same society with myself, pay their adoration. I find a system of religion already established, and which has been established in the most enlightened countries of the earth near 2000 years. I resolve to examine it. It claims that respect from its antiquity and universality. Many difficulties appear on the first inspection. My reason is often startled, and my belief wavers. But I will not yet give up a point of so serious importance, without further and closer attention to it. I reflect, that 2000 years is a vast space in the age of the world. How many myriads of men like myself have lived and died in the faith during that time! And were all of them fools or hypocrites?
INFINITY. It could not have been. Can the understanding of a poor individual, just come into the world, and hardly knowing where he is, comprehend an object of such magnitude, and make the mighty discovery which has escaped millions of the wisest and most learned of mortals? Or, supposing that they did perceive the deception, am I then at last the only honest man who will confess it? I am ashamed to avow such an idea to myself. But yet, if I reject what they received, surely I owe it in the more expressive language of my conduct. Praise, I fear, is the foundation of my skepticism; and humility must form the basis of my belief. I will check my own presumption, and reject the cavils of vain and foolish philosophy. Shall a poor weak creature, who cometh up like a flower, and is cut down, who fleeth as a shadow, and never continueth in one stay, presume to pronounce decisively in that little period, in which he has scarcely time to look about him before he dies, against a system which has strong internal and external evidence of divine original, which is most useful and comfortable, and which has been admitted among a great portion of mankind during almost 20 centuries? No, it is the first wisdom to be humble. Humility will be followed by grace, and grace by faith, and faith by salvation. It plainly appears, that I can lose nothing by belief, but some of those excessive and irregular enjoyments, which would destroy my health and life; but I may possibly gain a glory and a happiness which shall continue to all eternity.’’

INFINITE, that which has neither beginning nor end: in which sense God alone is infinite.

INFINITY is also used to signify that which has had a beginning, but will have no end, as angels and human souls. This makes what the schoolmen call infinitum à parte post; as, on the contrary, by infinitum à parte ante, they mean that which has an end, but had no beginning.

INFINITE Quantities. The very idea of magnitudes infinitely great, or such as exceed any assignable quantities, does include a negation of limits; yet if we nearly examine this notion, we shall find that such magnitudes are not equal among themselves, but that there are really, besides infinite length and infinite area, three several sorts of infinite solidity; all of which are quantitates sui generis, and that those of each species are in given proportions.

Infinite length, or a line infinitely long, is to be considered either as beginning at a point, and so infinitely extended one way, or else both ways from the same point; in which case the one, which is a beginning infinity, is the one half of the whole, which is the sum of the beginning and ceasing infinity; or, as may be said, of infinity à parte ante and à parte post, which is analogous to eternity in time and duration, in which there is always as much to follow as is past, from any point or moment of time; nor doth the addition or subtraction of finite length, or space of time, alter the case either in infinity or eternity, since both the one or the other cannot be any part of the whole.

INFINITESIMALS, among mathematicians, are defined to be infinitely small quantities.

In the method of infinitesimals, the element, by which any quantity increases or decreases, is supposed to be infinitely small; and is generally expressed by two or more terms, some of which are infinitely less than the rest; which being neglected as of no importance, the remaining terms form what is called the difference of the proposed quantity. The terms that are neglected in this manner, as infinitely less than the other terms of the element, are the very same which arise in consequence of the acceleration or retardation of the generating motion, during the infinitely small time in which the element is generated; so that the remaining terms express the elements that would have been produced in that time, if the generating motion had continued uniform: therefore those differences are accurately in the same ratio to each other as the generating motions or fluxions. And hence, though in this method infinitesimal parts of the elements are neglected, the conclusions are accurately true without even an infinitely small error, and agree precisely with those that are deduced by the method by fluxions. See Fluxions.

INFINITIVE, in Grammar, the name of one of the moods, which serve for the conjugating of verbs. See Grammar.

INFINITY, the quality which denominates a thing infinite. See Metaphysics.

INFIRMARY, a kind of hospital, where the weak and sick are properly taken care of.

INFLAMMABILITY, that property of bodies which disposes them to kindle or catch fire. See Chemistry. No 326. p. 400.

INFLAMMATION, in Medicine and Surgery, a redness and swelling of any part of the body, attended with heat, pain, &c. See Medicine Index.

INFLATION, formed from in and status; of, io, “I blow;” blowing up, the act of stretching or filling any fluidic or distensible body with a flatulent or windy substance.

INFLATED BATS. See Inflected Bats.

INFECTION, called also distillation, and diffusion, in Optics, is a property of light, by reason of which, when it comes within a certain distance of any body, it will either be bent from it, or towards it; which is a kind of imperfect reflection or refraction. See Optics.

INFLATION, or Point of Inflation, in the higher geometry, is a point where a curve begins to bend in a contrary way.

INFECTION, in Grammar, the variation of nouns and verbs, by declension and conjugation.

INFLUENCE, a quality supposed to flow from the heavenly bodies, either with their light or heat; to which astrologers idly ascribe all sublunary events. Alchemists also, who to this ascribe the philosophers stone, tells us, that everything in nature is produced by the influence of the stars, which, in their passage through the atmosphere, imbibe many of its moist parts, the grossest whereof they deposit in the sands and earths where they fall; that these, filtering through the pores of the earth, descend even to the centre, whence they are driven, by the central fire, back again to the surface; and in their ascent, by a natural kind of sublimation, as they find earths duly disposed, they form natural bodies, as metals, minerals, and vegetables, &c. Thus, it is pretended, that chemistry, consisting
Informers were very common both in Greece and Rome. Every corner of the streets was pestered with swarms of turbulent rascals, who made it their constant business to pick up stories, and catch at every occasion to accuse persons of credit and reputation; these by the Greeks were called ἠμυντες; for a more particular account of whom, see the article SYCOPHANT.

Amongst the Romans, informers were of two sorts, mandatores and delatores. These played into each other's hands; the former marking down such persons as they pretended to have found guilty of any misdemeanor, and the other prosecuting them. What tended to increase the number of these pestilent fellows was, that the informers were entitled to a fourth part of the effects of the person convicted. Wicked princes rewarded and countenanced this mischievous tribe; but Titus set on foot a most diligent search after them, and punished such as he found with death or banishment. Trajan also is praised by Pliny for a similar conduct.

Infraction (formed from in, and the supine of frango, "I break") a rupture or violation of a treaty, law, ordinance, or the like.

INFRALAPSIUM, the name of a sect of predecinarians, who maintain, that God has created a certain number of men only to be damned, without allowing them the means necessary to save themselves, if they would; and they are thus called, because they hold that God's decree was formed infra lapsum, after his knowledge of the fall, and in consequence thereof; in contradistinction to the SUPERALAPSARIANS.

INFRA-SCAPULARIS, in Anatomy. See Anatomy, Table of the Muscles.

INFRA-SPINATUS, in Anatomy. See Anatomy ibid.

INFULA, in antiquity, was a mitre worn by the Roman and Grecian priests upon the head, from which on each side hung a riband. The covering the head with a mitre was rather a Roman than a Grecian custom, introduced into Italy by Æneas, who covered his head and face at the performance of sacrifice, lest any ill-boding omen should disturb the rites.

The infusor were commonly made of wool, and were not only worn by the priests, but were put upon the horns of the victims, upon the altar and the temple. The infusor were also called victae.

INFUNDIBULIFORM, in Botany, an appellation given to such monopetalous or one-leaved flowers as resemble a funnel in shape.

Infusion, in Pharmacy, an operation, whereby the virtues of plants are drawn out, by steeping them in some convenient fluid without boiling.

INGELSHIEM, a town of Germany, in the palatinate of the Rhine, remarkable for having been the residence of the emperor; seated on the river Salva, on an eminence, from whence there is a charming prospect. E. Long. 8. 5. N. Lat. 49° 58'.

INGENIOUS, John, a late eminent natural philosopher. See Supplement.

INGENIOUS, in a general sense, signifies open, fair, and candid.

INGENIOUS (ingenius), in Roman antiquity, an appellation given to persons born of free parents, who had never been slaves: for the children of the liberti, or
ING

INGESTA, is used by some authors to express all sorts of aliment taken into the body.

INGLUVIES, the crop or caw of granivorous birds, serving for the immediate reception of the food, where it is macerated for some time before it is transmitted to the true stomachs.

INGOLSTADT, a handsome town of Germany, and the strongest in Bavaria, with a handsome church. The university formerly seated here was transferred to Landsbut in 1800. It is situated on the Danube, in E. Long. 11. 10. N. Lat. 48. 42.

INGOT, a mass of gold or silver melted down, and cast in a mould, but not coined or wrought.

INGRAFTING, in Gardening. See GRAFTING, Gardening Index.

INGRATITUDE, the opposite of gratitude. See GRATITUDE.

Ingratitude is a crime so shameful, that there never was a man found who would own himself guilty of it; and, though too frequently practiced, it is so abhorred by the general voice, that to an ungrateful person is imputed the guilt or the capability of all other crimes.

The ungrateful are neither fit to serve their Maker, their country, nor their friends.

Ingratitude perverts all the measures of religion and society, by making it dangerous to be charitable and good natured. (See GRATITUDE). However, it is better to expose ourselves to ingratitude than to be wanting in charity and benevolence.

Great minds, like Heav’n, are pleas’d with doing good; Though the ungrateful subjects of their favour Are barren in return.

1. In a little work intitled Friendly Cautions to Officers, the following atrocious instance of ingratitude is related. An opulent city in the west of England, little used to have troops with them, had a regiment sent to be quartered there: the principal inhabitants and wealthiest merchants, glad to show their hospitality and attachment to their sovereign, took the first opportunity to get acquainted with the officers, inviting them to their house, and showing them every civility in their power. This was truly a desirable situation. A merchant, extremely easy in his circumstances, took so prodigious a liking to one officer in particular, that he gave him an apartment in his own house, and made him in a manner absolute master of it, the officer’s friends being always welcome to his table. The merchant was a widower, and had only two favourite daughters; the officer is so comfortable a station cast his wanton eyes upon them; and too fatally succeeding, ruined them both. Dreadful return to the merchant’s misplaced friendship! The consequence of this ungenerous action was, that all officers ever after were shunned as a public nuisance, as a pest to society: nor have the inhabitants perhaps yet conquered their aversion to a red-coat.

2. We read in Rapin’s History, that during Monmouth’s rebellion, in the reign of James II. a certain person knowing the humane disposition of one Mas Gaunt, whose life was one continued exercise of benevolence, fled to his house, where he was concealed and maintained for some time. Hearing, however, of the proclamation, which promised an indemnity and reward to those who discovered such as harboured the rebels, he betrayed his benefactress; and such was the spirit of justice and equity which prevailed among the ministers, that he was pardoned and recompensed for his treachery, while she was burnt alive for her charity!

3. The following instance is also to be found in the same history. Humphry Bannister and his father were both servants to and raised by the duke of Buckingham; who being driven to abscond, by an unfortunate accident befalling the army he had raised against the usurper Richard III., he without footman or page retired to Bannister’s house near Shrewsbury, as to a place where he had all the reason in the world to expect security. Bannister, however, upon the king’s proclamation promising 1000l. reward to him that should apprehend the duke, betrayed his master to John Merton high sheriff of Shropshire, who sent him under a strong guard to Salisbury, where the king then was, and there in the market-place the duke was beheaded. But Divine vengeance pursued the traitor Bannister; for demanding the 1000l. that was the price of his master’s blood, King Richard refused to pay it him, saying, “He that would be false to so good a master, ought not to be encouraged.” He was afterwards hanged for manslaughter, his eldest son run mad and died in a hag-stye, his second became deformed and lame, and his third son was drowned in a small paddle of water. His eldest daughter was got with child by one of his carters, and his second was seized with a leprous whereof she died. Hist. of Eng. 8vo. vol. i. p. 304.

The following barbarous instances are from ancient History.

4. When Xerxes king of Persia was at Celeno, a city in the west of Persia, the Lydian city of Phrygia, Pythius, a Lydian, who had been a slave, and next to Xerxes was the most opulent of those times, entertained him and his whole army with an incredible magnificence, and made him an offer of all his wealth towards defraying the expenses of his expedition. Xerxes, surprised and charmed at so generous an offer, had the curiosity to inquire to what a sum his riches amounted. Pythius made answer, that having the design of offering them to his service, he had taken an exact account of them, and that the silver he had by him amounted to 2000 talents (about 255,000l. sterling), and the gold to 4,000,000 of drachmae (about 1,700,000l. sterling), wanting 7000. All this money he offered him, telling him, that his revenue was sufficient for the support of this household. Xerxes made him very hearty acknowledgments, and entered into a particular friendship with him, but declined accepting his present. The same prince who had made such obliging offers to Xerxes, having desired a favour of him some time after, that out of his five sons who served in his army, he would be pleased to leave him the eldest, in order to be a comfort to him in his old age: the king was so enraged at the proposal, though so reasonable in itself, that he caused the eldest son to be killed before the eyes of his father, giving the latter to understand,
that it was a favour he spared him and the rest of his children. Yet this is the same Xerxes who is so much admired for his humane reflection at the head of his enormous army. "That of so many thousand men, in 100 years time there would not be one remaining; on which account he could not forbear weeping at the uncertainty and instability of human things." He might have found another subject of reflection, which would have more justly merited his tears and affliction, had he turned his thoughts upon himself, and considered the reproaches he deserved for being the instrument of hastening the fatal term to millions of people, whom his cruel ambition was going to sacrifice in an unjust and unnecessary war.

5. Basilius Macedo the emperor, exercising himself in hunting; a sport he took great delight in, a great stag running furiously against him, fastened one of the branches of his horns in the emperor's girdle, and pulling him from his horse, dragged him a good distance, to the imminent danger of his life; which a gentleman of his retinue perceiving, drew his sword and cut the emperor's girdle asunder, which disengaged him from the beast, with little or no hurt to his person. But about what reward he had for his pains: "He was sentenced to lose his head for putting his sword so near the body of the emperor;" and suffered death accordingly.

INGRESS, in Astronomy, signifies the sun's entering the first sculp of one of the four cardinal signs, especially Aries.

INGRIA, a province of the Russian empire, lying on the gulf of Finland, being about 130 miles in length, and 40 in breadth. It abounds in game and fish; and here are a great number of elks, which come in troops from Finland in the spring and autumn. It was conquered by the Czar Peter the Great, and Petersburgh is the capital town. It is bounded by the river Neva, and the gulf of Finland, on the north; by Great Novgorod, on the east and south; and by Livonia, on the west.

INGROSSER, or ENGROSSER, in common law, is one wise buys up corn growing, or any provisions by wholesale, before the market, to sell again. See FOREST.

It also signifies a clerk who writes records or instruments of law on skins of parchment. See ENGROSSING.

INGUEN, in Anatomy, the same with what is otherwise called groin.

INGULPHUS, abbot of Croyland, and author of the history of that abbey, was born in London about A.D. 1030. He received the first part of his education at Westminster; and when he visited his father, who belonged to the court of Edward the Confessor, he was so fortunate as to engage the attention of Queen Edgitha. That amiable and learned princess took a pleasure in examining our young scholar on his progress in grammar, and in disputing with him in logic; nor did she ever dismiss him without some present as a mark of her approbation. From Westminster he went to Oxford, where he applied to the study of rhetoric, and of the Aristotelian philosophy, in which he made greater proficiency than many of his contemporaries. When he was about 27 years of age, he was introduced to William duke of Normandy (who visited the court of England, A.D. 1051), and made himself so Ingrulphus, agreeable to that prince, that he appointed him his secretary, and carried with him into his own dominions. In a little time he became the prime favourite of his prince, and the dispenser of all presents, humbling some, and exalting others, at his pleasure; in which difficult station, he confessed, he did not behave with a proper degree of modesty and prudence. This excited the envy and hatred of many of the courtiers; to avoid the effects of which, he obtained leave from the duke to go in pilgrimage to the Holy Land. With a company of 30 horsemen, he joined Sigfrid duke of Mentz, who, with many German nobles, bishops, clergy, and others, was preparing for a pilgrimage to Jerusalem. When they were all united, they formed a company of no fewer than 7000 pilgrims. In their way they spent some time at Constantinople, performing their devotions in the several churches. In their passage through Lycaia, they were attacked by a tribe of Arabs, who killed and wounded many of them, and plundered them of a prodigious mass of money. Those who escaped from this disaster, at length reached Jerusalem, visited all the holy places, and dreaded to leave the land of promise, with their tears, giving money for their repARATION. They intended to have hasted in Jordan; but being prevented by the roving Arabs, they embarked on board a Genoese fleet at Joppa, and landed at Brundius, from whence they travelled through Apulia to Rome. Having gone through a long course of devotions in this city, at the several places distinguished for sanctity, they separated, and every one made the best of his way into his own country. When Ingrulph and his company reached Normandy, they were reduced to 20 half-starved wretches, without money, clothes, or horses: A faithful picture of the disastrous journeys into the Holy Land, so common in those times. Ingrulph was now so much disgusted with the world, that he resolved to forsake it, and became a monk in the abbey of Fontenelle in Normandy; in which, after some years, he was advanced to the office of prior. When his old master was preparing for his expedition into England, A.D. 1066, he was sent by his abbott, with letters in money, and 10 men armed and completely armed, as a present from their abbey. Ingrulph having found a favourable opportunity, presented his men and money to his prince, who received him very graciously; some part of the former affection for him reviving in his bosom. In consequence of this he raised him to the government of the rich abbey of Croyland in Lincolnshire, A.D. 1076, in which he spent the last 34 years of his life, governing that society with great prudence, and protecting their possessions from the rapacity of the neighboring barons by the favour of his royal master. The lovers of English history and antiquities are much indebted to this learned abbot, for his excellent history of the abbey of Croyland, from its foundation, A.D. 664, to A.D. 1051, into which he hath introduced much of the general history of the kingdom, with a variety of curious anecdotes that are nowhere else to be found. Ingrulph died of the gout, at his abbey, A.D. 1109, in the 79th year of his age.

INHALER, in Medicine, a machine for breathing in warm steams into the lungs, recommended by Mr Mudge.
Mudge in the cure of the catarrhous cough. The body of the instrument holds about a pint; and the handle, which is fixed to the side of it, is hollow. In the lower part of the vessel, where it is soldered to the handle, is a hole, by means of which, and three others on the upper part of the handle, the water, when it is poured into the inhaler, will rise to the same level in both. To the middle of the cover a flexible tube about five or six inches long is fixed, with a mouth-piece of wood or ivory. Underneath the cover there is a valve fixed, which opens and shuts the communication between the upper and internal part of the inhaler and the external air. When the mouth is applied to the end of the tube in the act of inspiration, the air rushes into the handle, and up through the body of warm water, and the lungs become, consequently, filled with hot vapours. In expiration, the mouth being still fixed to the tube, the breath, together with the steam on the surface of the water in the inhaler, is forced up through the valve in the cover. In this manner, therefore, the whole act of respiration is performed through the inhaler, without the necessity, in the act of expiration, of either breathing through the nose, or removing the pipe from the mouth.

INHERITANCE, a perpetual right or interest in lands, invested in a person and his heirs. See DESCENT.

INHIBITION, a writ to inhibit or forbid a judge from further proceeding in a cause depending before him.

Sometimes prohibition and inhibition are put together, as of the same import; but inhibition is most commonly a writ issuing out of a higher court-christian to a lower; and prohibition out of the king's court to an inferior court.

INHIBITION, in Scots Law, a diligence obtained at the suit of a creditor against his debtor, prohibiting him from selling or contracting debts upon his estate to the creditor's prejudice.

INJECTION, the forcibly throwing certain liquid medicines into the body by means of a syringe, tube, or the like.

INJECTION, in Surgery, the throwing in some liquor or medicine into a vein opened by incision. This practice, and that of transfusion, or the conveying the arterial blood of one man, or other animal, into another, were once greatly practised, but are now laid aside.

Anatomical INJECTION, the filling the vessels of a human, or other animal body, with some coloured substance, in order to make their figures and ramifications visible.

1. The best account of the method of injecting the sanguiferous vessels of animals, is that by the late Dr Monro, published in the Medical Essays, vol. i. p. 79.

"The instrument with which the liquor is commonly thrown into the vessels is a tight, easy-going syringe of brass, to which several short pipes are fitted, and can be fixed by screws; the other extremities of these pipes being of different diameters without any screw, that they may slide into other pipes, which are so exactly adapted to them at one end, that when they are pressed a little together, nothing can pass between them: and because their cohesion is not so great as to resist the pushing force of the injection, which would drive off this second pipe, and spoil the whole operation; therefore the extremity of this second sort of pipes, which receives the first kind, is formed on the outside into a square, bounded behind and before by a rising circle, which hinders the key that closely grasps the square part from sliding backwards or forwards; or a bar of brass must stand out from each side of it to be held with the fingers. The other extremity of each of these second sort of pipes is of different diameter; and near it a circular notch, capable of allowing a thread to be sunk into it, is formed; by this, the thread tying the vessel at which the injection is to be made, will not be allowed to slide off.

"Besides this form described, common to all this second sort of pipes, we ought to have some of the larger ones, with an additional mechanism, for particular purposes; as, for instance, when the larger vessels are injected, the pipe fastened into the vessel ought either to have a valve or a stopcock, that may be turned at pleasure, to hinder any thing to get out from the vessel by the pipe; otherwise, as the injection, in such a case, takes time to coagulate, the people employed in making the injection must either continue all that while in the same posture; or, if the syringe is too soon taken off, the injected liquor runs out and the larger vessels are emptied. When the syringe is not large enough to hold at once all the liquor necessary to fill the vessels, there is a necessity of filling it again. If, in order to do this, the syringe was to be taken off from the pipe fixed in the vessel, some of the injection would be lost, and what was exposed to the air would cool and harden; therefore some of the pipes ought to have a reflected curve tube coming out of their side, with a valve so disposed, that no liquor can come from the straight pipe into the crooked one, but, on the contrary, may be allowed to pass from the crooked to the straight one; the injector then, taking care to keep the extremity of the reflected pipe immersed in the liquor to be injected, may, as soon as he has pushed out the first syringeful, fill it again by only drawing back the sucker; and, repeating this quickly, will be able to throw several syringefuls into the vessels.

"All these different sorts of pipes are commonly made of brass.

The liquor so thrown into the vessels, with a design to fill the small capillary tubes, are either such as will incorporate with water, or such as are oily: both kinds have their advantages and inconveniences; which I shall mention in treating of each, and shall conclude with that which I have found by experience to succeed best.

"All the different kinds of glue, or ichthyocola, syths, common glue, &c. dissolved and pretty much diluted, mix easily with the animal fluids, which is of great advantage, and will pass into very small vessels of a well-chosen and prepared subject, and often answer the intention sufficiently, where the design is only to prepare some very fine membrane, on which no vessels can be expected to be seen so large as the eye can discover whether the transverse sections of the vessels would be circular, or if their sides are collapsed. But when the larger vessels are also to be prepared, there
there is a manifest disadvantage to the usefulness and beauty of the preparation; for if nothing but the glutinous liquor is injected, one cannot keep a subject so long as the glue takes of becoming firm; and therefore, in dissecting the injected part, several vessels will probably be cut and emptied. To prevent this, one may indeed either soak the part well in alcohol, which coagulates the glue; but then it becomes so brittle, that the least handling makes it crack; and if the preparation is to be kept, the larger vessels appear quite shrivelled, when the watery part of the injection is evaporated: or the efflux of the injection may be prevented, by carefully tying every vessel before we are obliged to cut it; still, however, that does not hinder the vessels to contract when the glue is drying. If, to obviate these difficulties, the glutinous liquor should first be injected in such quantity as the capillary vessels will contain, and the common oily or waxy injection is pushed in afterwards to keep the larger vessels distended, the wax is very apt to harden before it has run far enough; and two sorts of liquors never mix irregularly, and the whole appear interrupted and broken by their soon separating from each other; which is still more remarkable afterwards, when the watery particles are evaporated.

Spirits of wine coloured mixes with water and oils, and so far is proper to fill the very small vessels with: but, on the other hand, it coagulates any of our liquor it meets, which sometimes blocks up the vessels so much, that no more injection will pass; then it scarse will suspend some of the powders that prove the most durable colours; and as it entirely evaporates, the vessels must become very small; and the small quantity of powder left, having nothing to serve for connecting its particles together, generally is seen so interrupted, that the small ramifications of vessels rather have the appearances of random scratchings of a pencil, than of regular continued canals.

Melted tallow, with a little mixture of oil of turpentine, may sometimes be made to fill very small vessels, and keeps the larger ones at a full stretch; but where any quantity of the animal liquors are still in the vessels, it is liable to stop too soon, and never can be introduced into numbers of vessels, while other liquors enter; and it is so brittle, that very little handling makes it crack, and thereby renders the preparation very ugly (A).

The method I have always succeeded best with, in making what may be called subtle or fine injections, is, first throw in coloured oil of turpentine, in such a quantity as might fill the very small vessels; and, immediately after, to push the common coarse injection into the larger ones. The oil is subtle enough to enter rather smaller capillary tubes than any colouring can; its resinous parts, which remain after the spirituous are evaporated, give a sufficient adhesion to the particles of the substance with which it is coloured, to keep them from separating, and it intimately incorporates with the coarser injection; by which, if the injection is rightly managed, it is impossible for the sharpest eye to discover that two sorts have been made use of (B).

"All the liquors with which the vessels of animals are artificially filled, having very faint, and near the same colours, would not all appear in the very small vessels, because of their becoming entirely diaphanous, without a mixture of some substance to impart its colour to them; and where several sorts of even the largest vessels of any part were filled, one sort could not be distinguished from another, unless the colour of each was different; which has likewise a good effect in making preparations more beautiful. Wherefore anatomists have made use of a variety of such substances, according to their different fancies or intentions; such as gamboge, saffron, ink, burnt iver, &c. which can be easily procured from painters. My design being only to consider those that are fit to be mixed with the injecting liquors proposed to fill capillary vessels, which is scarce ever to be done in any other, except the branches of the arteries and of some veins, I shall confine myself to the common colours employed to these last-named two sorts of vessels, which colours are red, green, and sometimes blue, without mentioning the others, which require very little choice.

"Anatomists have, I imagine, proposed to imitate the natural colours of the arteries and veins in a living creature, by filling the arteries with a red substance, and the veins with a blue or green: from which, however, there are other advantages, such as the strong reflection which such bodies make of the rays of light, and the unaptness most such bodies have to transmit these same rays, without at least a considerable reflection of the rays peculiar to themselves; or, in other words, their unfitness to become completely pellucid; without which, the very fine vessels, after being injected, would still be imperceptible. The animal or vegetable substances made use of for colouring injections, such as cochineal, lacque, rad. anchoas, brazilwood, indigo, &c. have all one general fault of being liable to run into little knots which stop some of the vessels: their colour fades sooner when kept dry; they more easily yield their tincture when the parts are preserved in a liquor; and rats, mice, and insects, will take them for food: for which reasons, though I have frequently succeeded in injecting them, I rather prefer the mineral kind, such as minium or vermillion for red; of which this last is, in my opinion, the best, because it gives the brightest colour, and is commonly to be bought finely levigated. The green-coloured powder generally

(A) Riglerus (Introduct. in notitium rerum natur. &c. 4to. Hage, 1743, titul. Balsamum) gives Ruyssch's method of injecting and preserving animals, which, he says, Mr Blumentrost, president of the Petersburg academy, assured him was copied from the receipt given in Ruyssch's own hand-writing to the Czar. According to this receipt, melted tallow, coloured with vermillion, to which, in the summer, a little white wax was added, was Ruyssch's injecting cerea materiae.

(B) Mr Bauboy's injecting matter, as published by Dr Hales, (Herbarist. Ex. 21.) is white rosin and tallow, of each two ounces, melted and strained through linen; to which was added three ounces of vermillion, or finely ground indigo, which was first well rubbed with eight ounces of turpentine varnish.
The method of preparing the injection composed of these materials, is to take for the fine one, a pound of clear oil of turpentine, which is gradually poured on three ounces of vermillion, or distilled verdigrise finely powdered, or rather well levigated by grinding on marble; stir them well with a small wooden spatula till they are exactly mixed, then strain all through a fine linen rag. The separation of the grosser particles is, however, rather better made, by pouring some ounces of the file upon the powder, and after stirring them together strongly, stop rubbing with the spatula for a second or so, and pour off into a clean vessel the oil with the vermillion or verdigrise suspended in it; and continue this sort of operation till you observe no more of the powder come off; and all that remains is granulated. The coarser injection is thus prepared: Take tallow, 1 pound; wax, bleached white, 5 ounces; salad oil, 3 ounces; melt them in a skillet put over a lamp; then add Venice turpentine, 2 ounces; and as soon as this is dissolved, gradually sprinkle in of vermillion or verdigrise prepared, 3 ounces; then pass all through a clean, dry, warmed linen-cloth, to separate all the grosser particles; and, when you design to make it run far into the vessels, some oil of turpentine may be added immediately before it is used.

The next thing to be considered, and indeed what chiefly contributes to the success of injections, is the choice and preparation of the subject whose vessels are to be conducted. In choosing a fit subject, take these few general rules: The younger the creature to be injected is, the injection will, ceteris paribus, go farthest, and vice versa. 2. The more the creature's fluids have been dissolved and exhausted in life, the success of the operation will be greater. 3. The less solid the part designed to be injected is, the more vessels will be filled. 4. The more membranous and transparent parts are, the injection shows better; whereas, in the solid very hard parts of a rigid old creature, that has died with its vessels full of thick strong blood, it is scarcely possible to inject great numbers of small vessels.

Therefore, in preparing a subject for injecting, the principal things to be aimed at are, To dissolve the fluids, empty the vessels of them, relax the solids, and prevent the injection's coagulating too soon. To answer all these intentions, authors have proposed to inject tepid or warm water by the arteries, till it returns clear and untinged by the veins, and the vessels are thereby so emptied of blood, that all the parts appear white; after which, they push out the water by forcing in air; and lastly by pressing with their hands, they squeeze the air also out. After this preparation, one can indeed inject very subtilly; but generally there are inconveniences attend it. For in all the parts where there is a remarkable tunic a cellulosæ, it never misses to be full of the water, which is apt to spoil any parts designed to be preserved either wet or dry; and some particles of the water seldom miss to be mixed in the larger as well as smaller vessels with the oily injection, and make it appear discontinued and broken; wherefore it is much better to let this injection of water alone, if it can be possibly avoided, and rather to macerate the body or part to be injected a considerable time in water, made so warm (c) as one can hold his hand easily in it; taking care to keep it of an equal warmth all the time, by taking out some of the water as it cools, and pouring in hot water in its place; by which the vessels will be sufficiently softened and relaxed, the blood will be melted down, and the injection can be in no danger of hardening too soon; whereas, if the water is too hot, the vessels shrink, and the blood coagulates. From time to time we squeeze out the liquids as much as possible at the cut vessel by which the injection is to be thrown in (d). The time this maceration is to be continued, is always in proportion to the age of the subject, the bulk and thickness of what we design to inject, and the quantity of blood we observe in the vessels, which can only be learned by experience; at least, however, care ought to be taken, that the whole subject, or part macerated, is perfectly well warmed all through; and that we continue the pressure with our hands till no more blood can be brought away, whatever position we put the subject in.

When the syringe, injections, and subjects, are all in readiness, one of the second sort of pipes as is chosen near to the disordered part; by which the injection is to be thrown as possible; for if the pipe is too large, it is almost needless to tell it cannot be introduced. If the pipe is much smaller than the vessel, it is scarce possible to tie them so firmly together; but, by the wrinkling of the coats of the vessel, some small passage will be left, by which part of the injection will spring back on the injector in the time of the operation, and the nearest vessels remain afterwards undistended, by the loss of the quantity that oozes out. Having chosen a fit pipe, it is introduced at the cut orifice of the vessel, or at an incision made in the side of it; and then a waxed thread being brought round the vessel, as near to its coats as possible, by the help of a needle, or a flexible eyed probe, the surgeon's knot is made with the thread, and it is drawn as firmly as the thread can allow; taking care that it shall be sunk into the circular notch of the pipe all around, otherwise it will very easily slide off, and the pipe will be brought out probably in the time of the operation, which ruins it.

If there have been large vessels cut, which communicate with the vessels you design to inject, or if there are any others proceeding from the same trunk which

(c) Ruysch orders a previous maceration for a day or two in cold water; which must have a better effect in melting the blood than warm water has.

(d) When Ruysch intended to inject the whole body, he put one pipe upwards, and another downwards, in the descending aorta.
Injection, which you do not resolve to fill, let them be all carefully now tied up, to save the injected liquor, and make the operation succeed better in the view you then have.

When all this is done, both sorts of injections are to be warmed over a lamp, taking care to stir them constantly, lest the colouring powder fall to the bottom and burn (x). The oil of turpentine needs be made no warmer than will allow the finger to remain in it, if the subject has been previously well warmed in water; when the maceration has not been made, the oil ought to be scalding hot, that it may warm all the parts which are designed to be injected. The coarse injection ought to be brought near to a boiling. In the mean time, having wrapped several folds of linen round the parts of the syringe which the operator is to grip, and secured the linen with thread, the syringe is to be made very hot by sucking boiling water several times up (y), and the pipe within the vessel is to be warmed by applying a sponge dipped in boiling water to it (z).

After all is ready, the syringe being cleared of the water, the injector fills it with the finer injection; and then introducing the pipe of the syringe into that in the vessel, he presses them together, and either with one hand holds this last pipe firm, with the other-gripes the syringe, and with his breast pushes the sucker; or, giving the pipe in the vessel to be held by an assistant, in any of the ways mentioned in the description of these sorts of pipes, he grips the syringe with one hand, and pushes the sucker with the other, and consequently throws in the injection, which ought to be done slowly, and with no great force, but proportioned to the length and bulk of the part to be injected and strength of the vessels. The quantity of this fine injection to be thrown in is so much to be learned by use. The only rule I could ever fix to myself in this matter was to continue pushing till I was sensible of a stop which would require a considerable force to overcome. But this will not hold where all the branches of any vessel are not injected; as for instance, when the vessels of the thorax are only to be injected: for the sorts bear too great a proportion to the branches sent from it, and therefore less fine injection is requisite here. As soon as that stop is felt, the sucker of the syringe is to be drawn back, that the nearest large vessels may be emptied. Then the syringe is taken off, emptied of the fine injection, and filled with the coarser, which is to be pushed into the vessels quickly and forcibly, having always regard to the strength and firmness of the vessels, bulk, &c. of the part. Continue to thrust the sucker, till a full stop or a sort of push backwards, is felt, when you must beware of thrusting any more, otherwise some of the vessels will be burst, and the whole, or a considerable share of the preparation you designed, will be spoiled by the extravasation; but rather immediately stop the pipe by the turn-cook, and take out the syringe to clean it, and allow sufficient time for the coarse injection to coagulate fully before any part is dissected. Ruyssch, immediately after throwing in the injection, put the body into cold water, and stirred it continually for some time to prevent the vermilion to separate from the tallow.

II. The injection of the lymphatic system is much more difficult than that of the sanguiferous, on account of the extreme smallness of the vessels; so that till very lately it was almost quite impracticable. Methods indeed had been attempted for this purpose; but by reason of the improper form of the instruments, and the inferior skill of anatomists in former times, we may justly look upon this as one of the most modern improvements in anatomy.

The first thing to be considered, when the lymphatics are to be injected, is a proper method of discovering them; for this is by no means an easy matter, on account of their smallness and transparency. To find out these vessels, the subject must be viewed in a proper place, where the light is neither very strong nor very weak. Mr. Sheldon, who has written a treatise upon this subject, recommends a winter afternoon from two to four; it being chiefly in the winter season that anatomical preparations are made, and because at that time of the day, the light is more clear and steady. He says also, from his own experience, that the light passing through the glass of a window is better for this purpose than the open air, as the vessels are more distinctly seen. The injecting of the vessels is likewise rendered more difficult in the open air by the case with which the humidity is evaporated from them. It will likewise be necessary to incline the part in various ways to the light, as some of the vessels are most easily discoverable in one position and some in another. The lateral trunks under the peritoneal coats of the intestines, and the lymphatics on the external surface of the liver, &c. particularly require this method. He recommends the use of magnifying glasses. "I am persuaded," says he, "that those who attempt to find them through this medium will not acquire that visus cruditatis which is obtained to a surprising degree by those who have been much experienced in injecting lymphatic vessels. A lateral light is likewise preferable to a horizontal, or even to an oblique sky-light.

The subjects must be laid upon a table of sufficient height, which might be conversed with a ledge fixed to the table as in such a manner as to be water-proof, which would be useful for preventing the quicksilver, which is almost always necessary for injecting these vessels, from being lost. The surface of the table should likewise be hollowed, so that the mercury which falls may be collected in the middle, where a hole with a stopper may be made to take out occasionally the quicksilver which collects. Such a table would also be convenient for holding water for the purpose of steeping membraneous parts which are frequently to be injected; and

(x) Ruyssch melts his tallow by the heat of warm water, into which he puts the vessel containing the injection.
(y) He warms his syringe by laying it on hot coals.
(z) He warms his pipe, by putting the body, after the pipe is fixed in the vessel, into hot water. When this is to be done, a cork ought to be put into the pipe, to prevent the water getting into the vessel that is to be injected.
Injection.

and which, from being exposed to the air, become dry; which also it is inconvenient and hazardous to move into water during the time of operation. Even a common table with a hole cut in the middle may answer the purpose: the hole may be round or square according to the fancy of the anatomist; but the table must be constructed of such materials as are not liable to warp in warm water. Should the anatomist not be provided with either of these tables, the parts must be laid in a tray or earthen dish, that the quicksilver may be saved.

The materials for injecting these vessels are only quicksilver, and the ceraceous or coarse injection of anatomists; the former being always used in injecting the lymphatics and lacteals, it being almost impossible to fill them with another fluid in the dead body. The ceraceous injection is chiefly used for the thoracic duct; and in some particular instances, where the lymphatic trunks have been found larger than the ordinary size, a coarse injection has been made use of.

Injections of the lymphatics may be made even while the animal is alive, and that without any great cruelty, by feeding it with milk previous to its being strangled. Of all the barbarous methods of opening the animal while alive, the most useful seems to be that of Mr Hunter, who directs to perforate the small intestines, and throw in starch-water with solutions of musk, or indigo and starch-water. "In a word (says Mr Sheldon), any gelatinous fluids rendered opaque with such colours as will be absorbed, are extremely useful for experiments of this kind; for much more may be seen by examining the vessels distended with a coloured fluid from natural absorption, than by anatomical injection practised in the dead body." Lieberkuhn first discovered the ampullae by feeding children in whom the lacteal glands were obstructed previous to their death with milk; by which means not only the lacteal trunks became distended with chyle, but likewise the ampullae. Thus absorbing mouths of the lacteal vessels were discovered by Lieberkuhn; and in a similar manner Asellius discovered the lacteals themselves. Thus also Eustachius discovered the thoracic duct in a horse; and Mr Hewson traced the lacteal vessels, lymphatics, and thoracic duct, in birds, by making ligatures on the root of the mesentery, and other parts, which had been previously fed with barley. Mr Hunter likewise was enabled to observe the lacteals of a crocodile when distended with chyle.

The coarse injection for the lymphatics is made of mutton suet and yellow resin, in the proportion of two-thirds of resin to one of suet. If required of a thicker consistence, we may add a small quantity of pure wax: if of a softer quality, we may augment the quantity of suet: Orpiment or king's yellow is generally made use of; though others are equally proper, provided they be fine enough.

The instruments necessary for injecting the lymphatic vessels are the injecting tube and pipe, lancets, blow-pipes, knives, scissors, forceps, needles, and thread. The old injecting tube has been found in a manner entirely useless, the pipe being fixed in a glass tube two or three feet long; which is one of the reasons why, before the time of Hewson, so little of the lymphatic system could be injected. Tubes of such a length are entirely unmanageable by one person, and it is impossible to perform the operation properly with two. To perform it in the best manner, the instrument should be held in the hand like a pencil or pen. The instruments used by our author are tubes made either of glass or of brass; which, when filled with mercury, may be held in the hand like a pen; a glass tube, however, is preferable to the metallic one. It is somewhat in the shape of a trumpet; six inches and a half in length, an inch and a half broad where broadest, and three-eighths of an inch where narrowest. A collar of steel half an inch broad and three quarters of an inch long is cemented to this pipe, and a smaller tube of the same metal is screwed upon the end of the collar; the whole terminating in a capillary tube about an inch in length. This last is the most difficult part of the whole work to execute; it should be drilled out of a solid piece of metal, and not made of a thin bit of plate soldered, as these are apt to turn ragged in the edges, and the solder is also liable to be destroyed by the mercury. Those used by Mr Sheldon were made by drilling a small hole lengthwise through a bit of well-tempered wire. It is closed by means of a very small piece of steel wire capable of passing through the bore of the tube. This ought to be annealed lest it should break; in which case the broken bit could not easily be got out. Very small tubes may be made of glass drawn out as fine as we choose; and thought very apt to break, they are easily repaired. They ought to be very thin, that they may be easily melted. Sometimes it has been found convenient to fit the collar with a stop-cock.

The brass tube represented by our author is about nine inches and a half in length, and half an inch wide where widest. The collar is a full quarter of an inch broad, and three quarters of an inch long; a steel piece and capillary tube being screwed to it as in the other.

The lancets are to be exquisitely sharp, in order to cut into the lymphatic vessels. The latter are easily inflated by the small silver blow-pipes usually put up in the dissecting cases by the London mathematical instrument makers: dissecting knives, fine-pointed scissors, accurately made dissecting forceps, with straight or crooked needles, are likewise substituted with advantage, as not being affected by the quicksilver.

We must next consider the proper subjects for injection. Mr Sheldon recommends, that they should be as free from fat as possible: he has always found in the human subject those who died universally dropical, or of an ascites or anasarca, to be the best, for the following reasons, viz. in such there is little or no animal oil, and but a very small quantity of red blood; both of which, when they occur in great abundance, very much impede the discovery of the lymphatic vessels; but when the cellular vessels are loaded with water, the absorbents are more readily traced, and with less risk of wounding them in dissection: the preparations also, particularly the dried ones, are more lasting. This circumstance is found to be of most consequence in preparing the absorbent vessels of the trunk and extremities of the human subject. Of all the viscera in young subjects, only the liver and lungs can be injected with success; and these may be successfully injected even in the fetus. It will be most proper to begin the opera-
In these it is useful to stroke up the parts with the finger, by which means the small quantity of lymph remaining in the vessels will be forced upwards, and stopped by the ligature; after which the vessels may be easily injected with quicksilver, as already mentioned.

To inject the vessels, we must open one or more of them, directing the point of the lancet almost always towards the trunk or trunks of the vessels, and taking care not to carry the incision through the opposite side. If the vessels happen to lie under the peritoneum as the lacteals, or under the pleura as the lymphatics of the lungs, we may cut into their cavity through these membranes. In injecting those of the extremities, however, and in many other parts of the body, it is absolutely necessary to dissect the vessels we design to fill away from the fat and reticular substance before we attempt to open them with the lancet. The tube with the pipe affixed to it is previously to be filled with mercury: the anatomist then inflates the vessel by means of the blowpipe, takes the tube from the assistant, and introduces the small tube into the puncture. In this operation it will be found necessary not to carry the tube farther into the vessel than is sufficient to give the mercury a free passage; for, if we introduce it farther, the passage of the mercury will be impeded by the pipe being pushed against the side of the vessel. Should not the fluid be able to effect a passage, it will then be necessary to press upon the surface of it in the tube with our fingers. If it descend freely, and without any of it passing between the side of the vessel and small pipe, we have only to fill up the tube with mercury as the latter descends; but if it gets out, we must then tie the vessel. This, however, should always be avoided if possible; because, if not very dexterously performed, the operator will be apt to separate the tube from the vessel; and on this account the puncture ought always to be very small, no larger indeed than is necessary to allow the pipe to get in with difficulty. As the injection proceeds, the pressure upon the surface of the quicksilver must be carried on higher and higher in the course of the lymphatic, till we come near the gland or glands into which the vessels terminate; otherwise we shall seldom get the cells of the glands, or the vessels emerging from the side of the glands, well injected. In injecting the lymphatic vessels of the extremities, it will be useful to raise the part where the pipe is inserted higher than the other end of the limb, and to make the assistant press with his hands along the skin in the course of the vessels, which will favour the progress of the injection. When the vessels are sufficiently filled, which may be known by the swelling of them, and by the resistance the mercury meets with, the assistant passes a ligature about the vessel, and ties it above the puncture before the anatomist withdraws the injection-pipe.

The method of injecting the larger trunks or thoracic duct with the coarse injection is exactly similar to that already described for the sanguineous vessels. Mr Sheldon, however, recommends the use of some pipes of a particular construction invented by himself. The improvement consists in shaping the ends of the pipes like a pen; taking care to make the edges and point blunt, to avoid cutting the vessels when we introduce them. Thus much larger tubes than those commonly
Injection. 

... any bulb or rising near the extremity of these small pipes to prevent the thread from slipping off: for this will certainly hinder us from inserting pipes of such diameter as might otherwise be done.

Having thus shown the method of injecting the lymphatics, our author next proceeds to describe the method of dissecting and preparing them either for immediate demonstration, or for preservation for any length of time. In the dissection, great care is requisite, on account of the exquisite thinness of their coats: but if this should happen by accident, it will then be necessary to introduce the pipe at the ruptured part; and having secured it above and below with ligatures, to fill it again as before directed. Our author recommends, for the purpose of dissection, such knives as are made use of by the Germans and French in tracing the nerves. They must be made thin in the blade like lancets, and not much larger. A variety of different shaped blades, some single and others double edged, will be necessary for various parts of the body; the fault of the common dissecting knives being that they are too thick in the blade, which makes them soon blunt, and occasions the trouble of perpetual grinding, which is not the case with those just recommended. A sharp-pointed forceps is necessary, in order to lay fast hold of the smallest portion of cellular substance; but they ought not to be so sharp as to endanger the puncturing of the vessels; nor should they by any means be bowed or stiff in the spring, to prevent the fingers of the operator from being wearied in the operation. They should also be made in such a manner as to hold large as well as small portions of reticular substance. For dissections of this kind, fine-pointed scissors and lancets fixed in handles are sometimes necessary; and it is frequently of use to plunge the parts into water, in order to loosen the reticular membrane connected with the outside of the coats of the vessels; by which means they may be dissected more easily, and with less danger of wounding them. The blood may be extracted by frequently changing the water. After being injected with quicksilver, the parts should not be allowed to remain long in the water, because the volatile alkalies forming the purfuration is apt to change the colour of the mercury.

The dissection being performed, the preparation is then to be preserved either in a wet or dry state, according to its nature. Preparations of the larger parts, as the trunk or extremities, should be preserved dry; and to dry them effectually, they should be exposed to a free current of air, but not to the rays of the sun; and the vessels should be displayed in their natural situation. When fully dried, they ought then to be varnished over with transparent spirit or copal varnish: which will not only preserve them from insects, but render them more beautiful, and the vessels more conspicuous. They should then be inclosed in glass cases, where they are to be placed in a horizontal position, and handled as little as possible.

To make preparations of the thoracic duct, we must in the first place fill the aorta, vena cava superior, and vena azygos or intercostalis, with coarse injection; then fill, with the same, the vessels below the right crus or little muscle of the diaphragm. The duct is sometimes prepared with quicksilver; but Mr Sheldon recommends to anatomists to make drawings of any thing new or remarkable in their preparations of the lymphatic vessels with quicksilver; as most of those specimens, particularly such as are dried, become at last totally useless, by reason of the drying of the vessels and the escape or blackening of the mercury; or from the varnish growing more and more opaque with age. The quicksilver injection, however, in some cases is very useful. Thus, for instance, if we wish to demonstrate the valves in the thoracic duct, or any other large absorbent vessel, we need only inject the vessels with quicksilver, dissect and dry them, then cut them open, and let the mercury run out: after which the valves will appear by making sections in the coats of the vessels. This may be done still better by varnishing the vessels three or four times before the sections are made; because the varnish will strengthen the sides of the vessel. In wet preparations, the valves in the cavities of these parts may likewise be demonstrated by opening them, or by inverting the vessels and suspending them in proof malt-spirits. Thus the valves that cover the terminations of the thoracic duct on the inside of the angle formed between the jugular and subclavian veins on the left side, and those which terminate the lymphatics on the right side of the neck, arm, and lungs, may be beautifully demonstrated. Specimens of the actual vessels, of the absorbents of the heart, lungs, liver, spleen, diaphragm, kidneys, &c may be kept wet or dry, according to the particular nature of the preparation or view of the anatomist. Some preparations are the better for being dried and afterwards immersed in phials full of oil of turpentine; by which means the flesh will be rendered transparent, the vessels distinctly seen, and the vessels appear extremely beautiful. The only disadvantage of this method is, that the parts on which the vessels pass, do not at all preserve their natural bulk by reason of their shrinking up; and as the wet preparations are free from this inconvenience, Mr Sheldon does not hesitate at assigning them a decided superiority over the dry ones.—Sometimes it is necessary to fix the preparations upon stiff paper or pasteboard, on account of their weight after being injected with mercury. The paper or pasteboard on which they are fastened ought to be of some colours, according to the nature of the preparation, in order to form a proper ground for showing the lymphatic vessels. Such small preparations as are preserved in spirits, or oil of turpentine, may be kept in bottles well closed with stoppers; and the larger in common preparation glasses. Our author describes a simple method of stopping the mouths of these preparation glasses, by which means the stopper is rendered nearly as durable as the glass itself. "In order to execute it, let the anatomist take care to have the upper surface of his bottles made plain, by desiring the workmen at the glass-house to flatten them in the making. This they will easily do in forming the round ones, but the flat bottles are attended with considerable difficulty. The right way to make them, I believe, would be to blow them in moulds of various sizes; the workman should likewise form the bottoms of the bottles perfectly flat, that they may stand upright and steady. Bottles of this form being provided for the larger preparations, we grind the upper surface of them on a plain plate of lead, about a quarter of an inch thick, and two feet in diameter; first with fine emery and wa,
Injection, then with powdered rotten stone, or putty first wet with water and at last dry; so that the surface may be reduced to an exact horizontal plane, and of as fine a point as plate-glass. This will soon be done, as the operation requires but little dexterity; and the anatomist should be provided with a considerable number of these glasses prepared as above directed. To the top of each bottle a piece of plate-glass, cut by a diamond, is to be adapted so as completely to cover, but not project over, the edge of the bottle. When these two smooth surfaces are put upon each other, with a drop of water between, the attraction of cohesion is so considerable, that it requires great force to separate them.

Many preparations of the lymphatics, and other parts preserved in bottles, do not require any strings to suspend them; particularly when fixed on pasteboard or paper; such as require suspension should be tied to strings fixed to the preparation below, and to small holes drilled in the substance of the glass at the bottom of the neck; or to small bits of glass, that may be fixed on the inside of the same part. The preparation is thus suspended in limpid proof malt-spirit, the bottle being almost completely filled; the upper and polished surface of the bottle, and the plate of glass, are to be wiped clean and dry; a drop of solution of gum arabic is to be put on the polished surface of the bottle, the top strongly and steadily pressed upon it, so as to bring the two surfaces into as close contact as possible; after which the bottle is to be placed in a cool airy place to dry. A piece of wet ox-bladder, freed from fat, and soaked in water till it becomes mucilагinous, is then to be placed over the top, the air pressed out from between it and the glass; after which it must be tied with a packthread dipped in the solution of gum arabic. The bladder being cut off neatly under the last turn of the thread, it is then to be dried, the string taken cautiously off, and the top and neck painted with a composition of lamp-black mixed with japanners gold size; this soon dries, and leaves a fine smooth glossy surface, from which the dirt can at any time be as readily wiped off as from a mirror. By this method large bottles are as easily and effectually secured as small ones; and it is found to answer as well as the hermetic sealing of glasses, which in large vessels is altogether impracticable. If the bottoms have any inequalities which prevent them from standing steady, they may be easily made perfectly flat by grinding them with emery on the plate above mentioned. The tops, if well gummed, will even remain perfectly fixed on the glasses without the bladder; though in the common way upright ones it may be advisable to put it on as a defence. Our author informs us, that since his making this discovery, he has used glass saucers; with flat tops gummed on. In these vessels the preparations, by reason of their horizontal posture, appear to great advantage. Thus he has exhibited very early abortions in their membranes, and some other preparations that cannot be suspended or viewed conveniently in the perpendicular direction. Some very delicate preparations, particularly those intended to be viewed with the microscope, those of the amphiuta lactae Lieberkuhn, and of the valves of the absorbents, may be preserved either in spirits or dry in tubes closed in the manner just mentioned, and will appear to great advantage. Some of the dry ones may also be advantageously placed in square oblong boxes, made of pieces of plate or white glass neatly gummed together, with narrow slips of white or coloured paper, and the objects may be conveniently viewed in this manner. With respect to the stopper bottles, which are very convenient for holding small preparations, our author advises the stoppers to be perfectly well ground; that they pass rather lower down than the neck of the bottle, for the convenience of drilling two holes obliquely through the inferior edge of the substance of the stopper, opposite to each other, for the convenience of fixing threads to hold the subject: for if the threads pass between the neck and stopper, a space will be left; or if the stopper be well ground, the neck of the bottle will be broken in endeavouring to press it down. On the other hand, if any space be left, the thread, by its capillary attraction, will act from capillary attraction, raise the spirits from the bottle, and cause evaporation, which will likewise take place from the chink between the stopper and neck.

INISTIOGE, a post town of Kilkenny, in the province of Leinster; 63 miles from Dublin. It is also a borough, and returns two members to parliament; patronage in the representative of Sir William Fownes.—It has two fairs.

INITIATED, a term properly used in speaking of the religion of the ancient heathens; where it signifies being admitted to the participation of the sacred mysteries. The word comes from the Latin initium, iniri; which properly signifies to begin sacrificing, or to receive or admit a person to the beginning of the mysteries, or of ceremonies of less importance.

The ancients never discovered the deeper mysteries of their religion, nor ever permitted some of their temples to be open, to any but those who had been initiated. See MYSTERY.

INJUNCTION, in Law, a writ generally grounded upon an interlocutory order or decree out of the court of chancery or exchequer, sometimes to give possession to the plaintiff, for want of the defendant's appearance; sometimes to the king's ordinary court, and sometimes to the court-christian, to stop proceedings in a cause, upon suggestion made, that the rigour of the law, if it take place, is against equity and conscience in that case, that the complainant is not able to make his defence in these courts, for want of witnesses, &c. or that they act erroneously, denying him some just advantage. The writ of injunction is directed not only to the party himself, but to all and singular his counsel, attorneys, and solicitors; and if any attorney, after having been served with an injunction, proceeds afterward contrary to it, the court of chancery will commit the attorney to the Fleet for contempt. But if an injunction be granted by the court of chancery in a criminal matter, the court of king's bench may break it, and protect any that proceed in contempt of it.

INJURY, any wrong done to a man's person, reputation, or goods. See ASSAULT.

INK, a black liquor used, in writing, generally made of an infusion of galls, coppers, and gum-arabic.

The properties which this liquor ought to have, are,
Ink. 1. To flow freely from the pen, and sink a little into
the paper, that the writing be not easily discharged. 2. A very deep black colour, which should be as deep
at first as at any time afterwards. 3. Durability, so
that the writing may not be subject to decay by age.
4. Ink should be destitute of any corrosive quality,
that it may not destroy the paper, or go through it
in such a manner as to render the writing illegible.
No kind of ink, however, hath yet appeared which is
possessed of all these qualities. The ink used by
the ancients was possessed of the second, third, and fourth
qualities above mentioned, but wanted the first. Dr
Lewis hath discovered its composition from some pas-
sages in ancient authors. "Pliny and Vitruvius (says
he) expressly mention the preparation of soot, or what
we now call lamp-black, and the composition of writing-
ink from lamp-black and gum. Dioscorides is more
particular, setting down the proportions of the two in-
gredients, viz. three ounces of the soot to one of the
gum. It seems the mixture was formed into cakes or
rolls; which being dried in the sun, were occasionally
tempered with water, as the cakes of Indian ink are
among us for painting."

In Mr Delaval's Treatise on Colours, p. 37. he ac-
quaints us, that with an infusion of galls and iron filings,
he had not only made an exceedingly black and dura-
ble ink, but by its means, without the addition of any
acid, dyed silk and woollen cloth of a good and lasting
black. This kind of ink, however, though the colour
is far superior to that of any other, has the inconve-
nience of being very easily discharged, either by the
smallest quantity of any acid, or even by simple water;
because it does not penetrate the paper in such a man-
ner as is necessary to preserve it from the instantaneous
action of the acid or of the water. During the action
of the infusion of galls upon the iron in making this
kind of ink, a very considerable effervescence takes
place, and a quantity of air is discharged, the nature of
which has not yet been examined.

The materials usually employed for the making of
ink are, common green vitriol, or coppers and galls;
but almost all of them are deficient in durability, which
is a property of such importance, that Dr Lewis hath
thought the subject of ink-making not unworthy of his
attention. From experiments made by that author,
he infers, that the decay of inks is chiefly owing to a
deficiency of galls; that the galls are the most peris-
gradable ingredient, the quantity of these, which gives
the greatest blackness at first (which is about equal
parts with the vitriol), being insufficient to maintain the
colour: that, for a durable ink, the quantity of galls
cannot be much less than three times that of the vitriol;
that it cannot be much greater without lessening the
blackness of the ink: that by diminishing the quantity
of water, the ink is rendered blacker and more durable;
that distilled water, rain-water, and hard spring-water,
have the same effects: that white wine produces a deeper
black colour than water: that the colour produced
by vinegar is deeper than that by wine: that proof-
spirit extracts only a reddish brown tinge: that the
last-mentioned tincture sinks into, and spreads upon
the paper; and hence the impropriety of adding spi-
xit of wine to ink, as is frequently directed, to prevent
mouldiness or freezing: that other astringents, as oak-
bark, bistort, sloe-bark, &c. are not so effectual as
galls, nor give so good a black, the colour produced
by most of these, excepting oak-bark, being greenish:
that the juice of sloes does not produce a black colour
with martial vitriol; but that, nevertheless, the writ-
ing made with it becomes black, and is found to be
more durable than common ink: that inks made with
saturated solutions of iron, in nitrous, marine, or acetous
acids, in tartar, or in lemon juice, were much inferior
to the ink made with martial vitriol: that the col-
our of ink is deprived by adding quicklince, which
is done with an intention of destroying any supera-
bundant acid which may be supposed to be the cause
of the loss of the colour of ink: that the best meth-
ods of preventing the effects of this superabundant acid
is probably by adding pieces of iron to engage it; and
that this conjecture is confirmed by an instance the
author had heard, of the great durability of the colour
of an ink in which pieces of iron had been long im-
mersed: and lastly, that a decoction of logwood used
instead of water, sensibly improves both the beauty
and depthness of the black, without disposing it to fade.
The same author observes, that the addition of gum-arabic
is not only useful, by keeping the colouring matter sus-
pended in the fluid, but also by preventing the ink
from spreading, by which means a greater quantity of
it is collected on each stroke of the pen. Sugar, which
is sometimes added to ink, is found to be much less ef-
fectual than gums, and to have the inconvenience of
preventing the drying of the ink. The colour of ink
is found to be greatly injured by keeping the ink in
vessels made of copper or of lead, and probably of any
other metal, excepting iron, which the vitriolic acid
can dissolve.

The foregoing experiments point out for the best
proportions of the ingredients for ink, one part of
green vitriol, one part of powdered logwood, and
three parts of powdered galls. The best menstruum
appears to be vinegar or white wine, though for com-
mon use water is sufficient. If the ink be required to
be of a full colour, a quart, or at most three pints, of
liquor, may be allowed to three ounces of galls, and to
one ounce of each of the other two ingredients. Half
a ounce of gum may be added to each pint of the
liquor. The ingredients may be all put together at
once in a convenient vessel, and well shaken four or
five times each day. In 10 or 12 days the ink will be
fit for use, though it will improve by remaining long-
er on the ingredients. Or it may be made more ex-
peditiously, by adding the gum and vitriol to a deco-
ction of galls and logwood in the menstruum. To the
ink, after it has been separated from the feculencies,
some coarse powder of galls, from which the fine dust
has been sifted, together with one or two pieces of
iron, may be added, by which its durability will be se-
cured.

In some attempts made by the Doctor to endow writ-
ing ink with the great durability of that of the an-
cients, as well as the properties which it has at pre-
sent; he first thought of using animal glues, and then
of oily matters. "I mixed both lamp-black (says he)
and ivory-black with solutions of gum-arabic, made of
such consistence as just to flow sufficiently from the
pen. The liquors wrote of a fine black colour; but
when
INK

Jnt.

"All the inks, however, made on the principle we are now speaking of, can be discharged by washing, unless the paper admits them to sink into its substance. The ancients were not insensible of this imperfection; and sometimes endeavoured to obviate it, according to Pliny, by using vinegar, instead of water, for tempering the mixture of lamp-black and gum. I tried vinegar, and found it to be of some advantage, not as giving any improvement to the cement, but by promoting the sinking of the matter into the paper. As this washing out of the ink may be prevented by using a kind of paper easy enough to be procured, it is scarce to be considered as an imperfection; and indeed, on other kinds of paper, it is an imperfection only so far as it may give occasion to fraud, for none of these inks are in danger of being otherwise discharged than by design. The vitriolic inks themselves, and those of printed books and copperplates, are all dischargeable; nor can it be expected of the ink-maker to render writings secure from frauds.

But a further improvement may yet be made, namely, that of uniting the ancient and modern inks together; or using the common vitriolic ink instead of water, for tempering the ancient mixture of gum and lamp-black. By this method it should seem that the writings would have all the durability of those of former times, with all the advantage that results from the vitriolic ink fixing itself in the paper. Even where the common vitriolic mixture is depended on for the ink, it may in many cases be improved by a small addition of the ancient composition, or of the common Indian ink which answers the same purpose: when the vitriolic ink is dilute, and flows so pale from the pen, that the fine strokes, on first writing, are scarcely visible, the addition of a little Indian ink is the readiest means of giving it the due blackness. By this admixture it may be presumed also that the vitriolic ink will be made more durable, the Indian ink in some measure covering it, and defending it from the action of the air. In all cases, where Indian ink or other similar compositions are employed, cotton should be used in the inkstand, as already mentioned, to prevent the settling of the black powder."

Since the invention of printing much less attention has been paid to the making of ink, so that now the art seems to be in a great measure lost. This will appear from a comparison of some ancient manuscripts with the writings of modern times. It being of the utmost importance, however, that public records, wills, and other valuable papers, which cannot admit of being printed, should be written with ink of a durable quality, this inattention seems to have been very culpable, and a restoration of the method of making writing ink a very valuable acquisition. "The necessity (says Mr. Astle *) of paying greater attention to this matter may readily be seen, by comparing the rolls and records that have been written from the 15th century to the end of the 17th, with the writings we have remaining of various dates from the 5th to the 12th centuries. Notwithstanding the superior antiquity of the latter, they are in excellent preservation; but we frequently find the former, though of more modern date, so much defaced, that they are scarcely legible."

Our author agrees with Dr Lewis in the opinion that
that the ancient inks were composed of soot or ivory black instead of the galls, coppers, and gums, which form the composition of ours. Besides their black inks, however, the ancients used various other colours, as red, gold and silver, purple, &c. Green ink was frequently used in Latin manuscripts, especially in the latter ages; and it was frequently employed in signatures by the guardians of the Greek emperors till their wards were of age. Blue or yellow ink was seldom used except in manuscripts; but (says Mr Astle) "the yellow has not been much in use, as far as we can learn, these 500 years." Some kinds of characters, particularly the metallic, were burnished. Wax was used by the Latins and Greeks as a varnish, but especially by the former, and particularly in the 9th century. It continued a long time in vogue.

A treatise upon inks was published by Peter Campanius professor of medicine at Venice; of which an edition was printed at London in 1660. It is divided into six parts. The first five of the six parts made from pyrites, stones, and metals; the second part is composed of minerals and calcines. The third from soots and vitriols; the fourth of the different kinds of inks used by the libraries or book-writers, by printers, and engravers; likewise of staining or writing upon marble, stucco, or scagliola, and of encrusting modes of writing; also of liquids for painting or colouring leather and linen or woollen cloth; restoring inks that had been decayed by time; together with many methods of effacing writing, restoring decayed paper, and different modes of secret writing. The fifth treat of writing inks made in different countries from gums, woods, the juices of plants, &c. as well as of different kinds of varnishes. The sixth treat of the different methods of extracting viigiol, and the chemical uses of it.

Weckerus de Secretis, a treatise printed at Basel in 1612, contains a number of curious particulars concerning ink. He gives also receipts for making gold and silver inks, composed both with these metals and without them; directions for making inks for secret writing, and for defacing them; though in this last part there are many particulars bordering too much on the marvellous.

In the Philosophical Transactions for 1787, Dr Blagden gives some account of a method of restoring decayed inks so as to render them legible. His experiments originated from a conversation with Mr Astle already quoted, on the question whether the inks made eight or ten centuries ago, and which are found to have preserved their colour very well, were made of the same materials now employed or not. In order to decide the question, Mr Astle furnished the doctor with several manuscripts on parchment and vellum from the 9th to the 15th centuries inclusive. Some of these were very black; others of different shades, from a deep yellowish brown to a very pale yellow, in some parts so faint that it could scarcely be seen. This was tried with simple and phlogisticated alkalies, the mineral acids, and infusion of galls. From these experiments it appeared that the ink anciently employed was of the same nature as at present: the letters turned of a reddish or yellowish brown with alkalies became pale, and were at length obliterated by the dillute mineral acids. The drop of acid liquor, which had been put upon a letter, changed to a deep blue or green on the addition of phlogisticated alkalies; with an infusion of galls, in some cases the letters acquired a deep tinge, in others a slight one. "Hence (says the doctor) it is evident, that one of the ingredients was iron, which there is no reason to doubt was joined with the vitriolic acid; and the colour of the more perfect MSS. which in some was a deep black, and in others a purplish black, together with the restitutio of that colour in those which had lost it by the infusion of galls, sufficiently proved that another of the ingredients was astringent matter, which from history appears to have been that of galls. No trace of a black pigment of any sort was discovered; the drop of acid, which had completely extracted a letter, appearing of an uniform pale and ferruginous colour, without an atom of black powder, or other extraneous matter floating in it."

As this account differs very materially from the former extracted from Mr Astle's writings, so the reason given for the continuance of the colour differs no less. This, according to Dr Blagden, "seems to depend very much on a better preparation of the material upon which the writing was made, namely the parchment or vellum; the blackest letters being generally those which had sunk into it the deepest. Some degree of effervescence was commonly to be perceived when acids were in contact with the surface of these old vellums."

I was led, however, to suspect, that the ancient inks contained rather a less proportion of iron than the more modern; for, in general, the tinge of colour produced by the phlogisticated alkali in the acid laid upon them, seemed less deep; which, however, might depend in part upon the length of time they have been kept: and perhaps more gum was used in them, or they were washed over with some kind of varnish, though not such as gave any gloss."

Among the specimens with which our author was favoured by Mr Astle, there was one which differed very materially from the rest. It was said to be a manuscript of the 15th century: the letters were of a full engrossing hand, angular without any fine strokes, breadth, and very black. None of the chemical solvents above mentioned seemed to produce any effect. Most of them seemed rather to make the letters blacker, probably by cleaning the surface; and the acids, after having been rubbed strongly upon the letters, did not strike any deeper tinge with the phlogisticated alkali. Nothing could obliterate these but what took off part of the vellum; when small rolls of a dirty matter were to be perceived. "It is therefore unquestionable (says the doctor) that no iron was used in this ink; and, from its resistance to the chemical solvents, as well as a certain clotted appearance in the letters when examined closely, and in some places a slight degree of gloss, I have little doubt that they were formed of a sooty or carbonaceous powder and oil, probably something like our present printers ink; and am not without suspicion that they were actually printed."

On examining this MS. more fully, our author was convinced that it was really a part of a very ancient printed book. In considering the methods of restoring the legibility of decayed writings, our author observes, that perhaps one of the best may be to join phlogisticated alkali with the calx of iron which remains; be-
cause the precipitate formed by these two substances greatly exceeds that of the iron alone. On this subject Dr. Blagden disagrees with Mr. Bergmann; but to bring the matter to a test, the following experiments were made.

1. The phlogisticated alkali was rubbed in different quantities upon the bare writing. This, in general, produced little effect; though, in a few instances, it gave a bluish tinge to the letters, and increased their intensity; "probably (says the doctor) where something of an acid nature had contributed to the diminution of their colour." 2. By adding, besides the alkali, a dilute mineral acid to the writing, our author found his expectations fully answered; the letters then changing quickly to a very deep and beautiful blue. It is but of little consequence whether the acid or phlogisticated alkali be first added; though upon further consideration the doctor inclined to begin with the alkali. The reason is, that when the alkali is first put on, the colour seems to spread less, and thus not to hurt the legibility of the writing so much as would otherwise be done. His method is to spread the alkali thin over the writing with a feather, then to touch it as gently as possible upon or nearly over the letters with the diluted acid by means of a feather or bit of stick cut to a blunt point. The moment that the acid liquor is applied, the letters turn to a fine blue, beyond comparison stronger than the original trace of the letter; and by applying a bit of blotting-paper to suck up the superfluous liquid, we may in a great measure avoid the staining of the parchment: for it is this superfluous liquor which, absorbing part of the colouring matter from the letters, becomes a dye to whatever it touches. Care ought, however, to be taken not to allow the blotting paper to come in contact with the letters, because the colouring matter may easily be rubbed off while soft and wet. Any one of the three mineral acids will answer the purpose effectually. Dr. Blagden commonly uses the marine. But whichever of the three is used, it ought to be diluted so far as not to be in danger of corroding the parchment; after which the degree of strength seems not to be a matter of great nicety.

Another method of restoring the legibility of old writings is by wetting them with an infusion of galls in white wine: but this is subject to the same inconvenience with the former, and is besides less efficacious. The doctor is of opinion that the acid of the galls by itself would be better for the purpose than the infusion of the whole substance of them; and he thinks also that a preferable kind of phlogisticated alkali might be prepared either by purifying the common kind from iron as much as possible, or by making use of the volatile alkali instead of the fixed. Mr. Astle mentions a method of restoring the legibility of decayed writings; but says that it ought not to be hazarded lest a suspicion of deceit should arise.

A method has been proposed of preventing ink from decaying by washing over the paper to be written upon with the colouring matter of Prussian blue, which will not deprave it in colour, or any other respect. By writing upon it with common ink afterwards, a ground of Prussian blue is formed under every stroke; and this remains strong after the black has been decayed by the weather or destroyed by the acids. Thus the ink will bear a larger proportion of vitriol at first, and will have the advantage of looking blacker when first written.

Indian Ink, a valuable black for water-colours, brought from China and other parts of the East Indies, sometimes in large rolls, but more commonly in small quadrangular cakes, and generally marked with Chinese characters. Dr. Lewis, from experiments made on this substance, hath shown that it is composed of fine lamp-black and animal glue; and accordingly, for the preparation of it, he desires us to mix the lamp-black with as much melted glue as is sufficient to give it a tenacity proper for being made into cakes; and these when dry, he tells us, an dire as well as those imported from the East Indies, both with regard to the colour and the freedom of working. Ivory black, and other charcoal blacks, levediged to a great degree of fineness, answered as well as the lamp-black; but in the state in which ivory-black is commonly sold, it received much too gritty, and separated too hastily from the water.

Printing Ink, is totally different from Indian ink, or that made use of in writing. It is an oily composition, of the consistence of an ointment: the method of preparing it was long kept a secret by those whose employment it was to make it, and who were interested in concealing it; and even yet is but imperfectly known. The properties of good printing ink are, to work clean and easily, without daubing the types, or tearing the paper; to have a fine black colour; to wash easily off the types; to dry soon; and to preserve its colour, without turning brown. This last, which is a most necessary property, is effectually obtained by setting fire to the oil with which the printing ink is made for a few moments, and then extinguishing it by covering the vessel (A). It is made to wash easily off the types, by using soap as an ingredient; and its working clean depends on its having a proper degree of strength, which is given by a certain addition of resin. A good deal, however, depends on the proportion of the ingredients to each other; for if too much soap is added, the ink will work very foul, and daub the types to a greater degree. The same thing will happen from using too much black, at the same time that both the soap and black hinder the ink from drying; while too much oil and resin tear the paper, and hinder it from washing off. The following receipt has been found to make printing ink of a tolerable good quality. "Take a Scots pint of linseed oil, and set it over a pretty brisk fire in an iron or copper vessel capable of holding three or four times as much. When it boils strongly, and emits a thick smoke, kindle it with a piece of paper, and immediately take the vessel off the fire. Let the oil burn for about a minute; then extinguish it by covering the vessel; after it has grown (A) This is mentioned by Dr. Lewis in his Philosophical Commerce of Arts; but he seems not to have been acquainted with the method of giving it the other necessary properties.
INK

I N K

Ink.
grown pretty cool, add two pounds of black rosin, and
one pound of hard soap cut into thin slices. If the
oil is very hot when the soap is added, almost the whole
mixture will run over the vessel. The mixture is then
to be set again over the fire; and when the ingredients
are thoroughly melted, a pound of lamp-black, previously
put through a lawn sieve, is to be stirred into it.
The whole ought then to be ground on a marble stone,
or in a levigating mill.

Though the above receipt is greatly superior to any
that hath been hitherto published, all of which are
capitally deficient in not mentioning the necessary
ingredients of rosin and soap; yet it must be ac-
knowledged that ink made in this manner is inferior
in point of colour, and is likewise more apt to daub
the types and make an indistinct impression, than such
as is prepared by some of those who make the ma-
machine of this commodity their employment; so
that either a variation in the proportion of the ingre-
dients, a nicety in the mixture, or some additional ingre-
dient, seems necessary to bring it to the requisite
perfection.

INK for the rolling Press, is made of linseed oil
burnt in the same manner as that for common printing
ink, and then mixed with Francfort-black, and finely
ground. There are no certain proportions which can
be determined in this kind of ink; every workman
adding oil or black to his ink as he thinks proper,
in order to make it suit his own taste.—Some, how-
ever, mix a portion of common boiled oil, which has
never been burnt: but this must necessarily be a bad
practice, as such oil is apt to go through the paper;
a fault very common in prints, especially if the paper
is not very thick. No soap is added; because the
ink is not cleared off from the copperplates with alkali
ley as in common printing, but with a brush dipped
in oil.

INK is also an appellation given to any coloured li-
quor used in writing. Different kinds of these inks
may be prepared by the directions given under the
article COLOUR-Making.

Sympathetic Ink, a liquor with which a person may
write, and yet nothing appear on the paper after it is
dry; till some means are used, as holding the paper to
the fire, rubbing it over with some other liquor, &c.

These kinds of ink may be divided into seven classes,
with respect to the means used to make them visible;
viz. 1. Such as become visible by passing another li-
quor over them, or by exposing them to the vapour of
that liquor. 2. Those that do not appear so long as
they are kept close, but soon become visible on being
exposed to the air. 3. Such as appear by steaming or
sifting some very fine powder of any colour over them.
4. Those which become visible by being exposed to
the fire. 5. Such as become visible by heat, but dis-
appear again by cold or the moisture of the air. 6.
Those which become visible by being wetted with wa-
ter. 7. Such as appear of various colours.

I. The first class contains four kinds of ink, viz.
solutions of lead, bismuth, gold, and green vitriol, or
sulphate of iron. The two first become visible by the
contact of sulphurous liquids or fumes. For the first,
a solution of common sugar of lead in water answers
very well. With this solution write with a clean pen,
and the writing when dry will be totally invisible; but
if it be wetted with a solution of sulphur, or
of orpiment, dissolved by means of quicklime; or ex-
posed to the strong vapours of these solutions, the writ-
ing will appear of a brown colour, more or less deep
according to the strength of the sulphurous fume. By
the same means the solution of nitrate of bismuth will
appear of a deep black.

The sympathetic ink prepared from gold depends on
the property by which that metal precipitates from its
solvent on the addition of a solution of tin. Write
with a solution of gold in nitro-muriatic acid, and let
the paper dry gently in the shade; nothing will appear
for the first seven or eight hours. Dip a pencil in the
solution of tin, and draw it lightly over the invisible
characters, they will immediately appear, of a purple
colour.

Characters written with a solution of green vitriol,
will likewise be invisible when the paper is dry; but if
wetted with an infusion of galls, they will immediately
appear as if written with common ink. If, instead of
this infusion, a solution of an alkaline prussiate be used,
the writing will appear of a deep blue.

II. To the second class belong the solutions of all
those metals which are apt to attract oxygen from the
air, such as lead, bismuth, silver, &c. The sympa-
thetic ink of gold already mentioned belongs also to
this class; for if the characters written with it are long
exposed to the air, they become of a deep violet
colour, nearly approaching to black. In like
manner, characters written with a solution of nitrate of
silver are invisible when newly dried, but being ex-
posed to the air, appear of a grey colour like slate.
To this class also belong solutions of sugar of lead, nitrates
of copper and of mercury, acetate of iron, and murate
of tin. Each of these has a particular colour when ex-
posed to the air; but they corrode the paper.

III. The third class of sympathetic inks contains
such liquids as have some kind of glutinous viscosi-
ty, and at the same time are long in drying; by which
means, though the eye cannot discern the characters
written with them upon paper, the powders strewn up-
on them immediately adhere, and thus make the writ-
ing become visible. Of this kind are urine, milk, the
juices of some vegetables, weak solutions of the deli-
quescent salts, &c.

IV. This class, comprehending all those that be-
come visible by being exposed to the fire, is very ex-
tensive, as it contains all those colourless liquids in
which the matter dissolved is capable of being reduced,
or of reducing the paper, into a sort of charcoal by a
small heat. Sulphuric acid diluted with as much water
as will prevent it from corroding the paper makes a
good ink of this kind. Letters written with this fluid
are invisible when dry, but instantly on being held near
the fire appear as black as if written with the finest ink.
Juice of lemons or onions, a solution of sal-ammoniac,
green vitriol, &c. answer the same purpose.

V. The fifth class comprehends only a solution of
muricate of cobalt; for the properties of which, see
CHEMISTRY, No. 1608, p. 627.

VI. This class comprehends such inks as become
visible when characters written with them are wetted
with water. They are made of all such substances as
deposite a copious sediment when mixed with water,
dissolving only imperfectly in that fluid. Of this kind

ar
are dried alum, sugar of lead, vitriol, &c. We have therefore only to write with a strong solution of these salts upon paper, and the characters will be invisible when dry; but when we apply water, the small portion of dried salt cannot again be dissolved in the water. Hence the insoluble part becomes visible on the paper, and shows the characters written in white, gray, brown, or any other colour which the precipitate assumes.

VII. Characters may be made to appear of a fine crimson, purple, or yellow, by writing on paper with solution of muriate of tin, and then passing over it a pencil dipst in a decoction of cochineal, Brazil-wood, log-wood, yellow wood, &c.

Ink Stones, a kind of small round stones, of a white, red, gray, yellow, or black colour, containing a quantity of native martial vitriol, whence they derive the property of making ink, and from thence their name. They are almost entirely soluble in water, and besides their other ingredients, contain also a portion of copper and zinc.

INLAND, a name for any part of a country at a distance from the sea.

Inland Trade, that kind of trade carried on between the different parts of the same kingdom, whether over land, or by means of inland navigation.

INLAYING. See Veneering, Mosaic, and Marquetry.

INLEASED, in our old writers, signifies entangled or ensnared. It is used in the champion's oath.

INLISTING, in a military sense. See Listing.

INMATES, such persons as are admitted for their money, to live in the same house or cottage with another man, in different rooms, but going in at the same door; being usually supposed to be poor, and not able to maintain a whole house themselves. These are inquirers in a court-leet.—No owner or occupier of a cottage shall suffer any inmates therein, or more families than one to inhabit there, on pain of forfeiting ictus per month to the lord of the leet.

INN, a place appointed for the entertainment and relief of travellers.

Inns are licensed and regulated by justices of the peace, who oblige the landlord to enter into recognizances for keeping good order. If a person who keeps a common inn, refuses to receive a traveller into his house as a guest, or to find him victuals and lodging on his tendering a reasonable price for them, he is liable to an acción of damages, and may be indicted and fined at the king's suit. The rates of all commodities sold by innkeepers, according to our ancient laws, may be assessed: and innkeepers not selling their hay, oats, beans, &c. and all manner of victuals, at reasonable prices, without taking any thing for litter, may be fined and imprisoned, &c. by 21 Jac. I. c. 21.

Where an innkeeper harbours thieves, persons of infamous characters, or suffers any disorders in his house, or sets up a new inn where there is no need of one, to the hinderance of ancient and well-governed inns, he is indictable and finable; and by statute, such inn may be suppressed. Action upon the case lies against any innkeeper, if a theft be committed on his guest by a servant of the inn, or any other person not belonging to the guest; though it is otherwise where the guest is not a traveller, but one of the same town or village, for there the innkeeper is not chargeable; nor is the master of a private tavern answerable for a robbery committed on his guest: it is said, that even though the travelling guest does not deliver his goods, or into the innkeeper's possession, yet if they are stolen, he is chargeable. An innkeeper is not answerable for any thing out of his inn, but only for such as are within it; yet, where he of his own accord puts the guest's horse to grass, and the horse is stolen, he is answerable, he not having the guest's orders for putting such horse to grass. The innkeeper may justify the stopping of the horse, or other thing of his guest, for his reckoning, and may retain the same till it be paid. Where a person brings his horse to an inn, and leaves him in the stable, the innkeeper may detain him till such time as the owner pays for his keeping: and if the horse eats out as much as he is worth, after a reasonable appraisement made, he may sell the horse and pay himself: but when a guest brings several horses to an inn, and afterwards takes them all away except one, this horse so left may not be sold for payment of the debt for the others; for every horse is to be sold, only to make satisfaction for what is due for his own meat.

INNS. Our colleges of municipal or common law professors and students, are called inns: the old English word for houses of noblemen, bishops, and others of extraordinary note, being of the same signification with the French word hotels.

INNS of Court are so called, as some think, because the students there are to serve and attend the courts of judicature; or else, because anciently these colleges received none but the sons of noblemen, and better sort of gentlemen, who were here to be qualified to serve the king in his court; as Fortescue affirms. And, in his time, he says, there were about 2000 students in the inns of court and chancery, all of whom were filii nobilium, or gentlemen born. But this custom has gradually fallen into disuse; so that in the reign of Queen Elizabeth, Sir Edward Coke does not reckon above 1000 students, and the number at present is very considerably less; for which Judge Blackstone assigns the following reasons. 1. Because the inns of chancery, being now almost totally filled by the inferior branches of the profession, are neither commodious nor proper for the resort of gentlemen of any rank or figure; so that there are very rarely any young students entered at the inns of chancery. 2. Because in the inns of court all sorts of regiments and academical superintendence, either with regard to morals or studies, are found impracticable, and therefore entirely neglected. Lastly, because persons of birth and fortune, after having finished their usual courses at the universities, have seldom leisure or resolution sufficient to enter upon a new scheme of study at a new place of instruction; wherefore few gentlemen now resort to the inns of court, but such for whom the knowledge of practice is absolutely necessary in such as are intended for the profession.

Our inns of court, justly famed for the production of men of learning in the law, are governed by masters, principals, benchers, stewards, and other officers: and have public halls for exercises, readings, &c.
The remains of this abbey are very extensive; its situation is inland and retired. Upon the dissolution of religious houses, the possessions of this abbey were granted to Captain Robert Collan. The island contains about 12 acres, is agreeably wooded, and has a number of fruit-trees. St Finian flourished about the middle of the 6th century; he was named in Irish Locha, his father's name was Coan or the son of Echvedi; descended from Clan the son of Aidh, king of Munster. There was formerly a chronicler kept in this abbey, which is frequently cited by Sir J. Ware and other antiquaries under the title of the Annals of Innisfallen. They contain a sketch of universal history, from the creation of the world to the year 430 or thereabouts, but from thence the annalist has amply enough prosecuted the affairs of Ireland down to his own times. He lived to the year 1215. Sir J. Ware had a copy of them, whereof there is an imperfect transcript among the MSS. of the library of Trinity-college, Dublin. They were continued by another hand to the year 1320. Bishop Nicholson, in his Irish historical library, informs us, that the duke of Chandos had a complete copy of them down in 1320 in his possession. These annals tell us, that in the year 1180, the abbey, which had at that time all the gold and silver and richest goods of the whole country deposited in it, and the place of greatest security, was plundered by Midwine son of Daniel O'Donoghue, as was also the church of Ardfer, and many persons were slain in the very cemetery by the M'Carty; but God, as it is said in this chronicle, punished this impiety by the untimely end of some of the authors of it.

INNISNANNON, a town in the county of Cork and province of Munster, 134 miles from Dublin; situated on the river Bandon, and six miles from Minsale. The river is navigable to Collier's quay, about half a mile below the place. On the west side of the town is a strong bridge. This place was formerly walled, and of some note, as appears by the foundations of several castles and large buildings discovered in it. The town of Innisnannon, together with its ferry, were granted to Philip de Barry by Henry V. by letters patent, anno 1412.

INNISHIRKAN, an island situated between Cape Clear island and Baltimore bay, in the county of Cork and province of Munster. In this island stood the castle of Dunelog, possessed by the O'Driscolls, which was surrendered after the defeat of the Spaniards to Captain Harvey on 23rd Feb. 1602. There was afterwards a regular fortification erected on part of the island, which was garrisoned in Queen Anne's time, but it has been for several years dismantled; about a mile to the south are the remains of an ancient abbey, founded 1460, for Franciscans, by Florence O'Driscoll. This island has very good land, and is vastly preferable to that of Cape Clear island. To the north-west of Innishirkan island lies Hare island, a large fruitful spot; and near it are four small islands called the Schemes: also along the coast, in the following order from east to west, are Horse island, containing 100 acres; Castle island, containing 125 acres; Long island, containing 316 acres; and west of all these is a small spot called Goat island. All these islands, together with the adjacent coast, produce large crops of fine English barley.

INNISKILLING,
INNISKILLEN, a borough town of Ireland, in the county of Fermanagh and province of Ulster, lying between three lakes. It is about 24 miles east of Ballybannon, and 79 north-west of Dublin, this place giving title of viscount to the family of Clan. Its inhabitants distinguished themselves in several considerable engagements in the wars of Ireland at the revolution, out of which a regiment of dragoons, bearing the title of the Inniskilleners, was mostly formed. They form the 6th regiment of dragoons in the British army.

INNOCENTS DAY, a festival of the Christian church, observed on December 28., in memory of the massacre of the innocent children by the command of Herod king of Judea. See Jesus Christ; and Jews, No. 24 par. ult. The Greek church in their calendar, and the Abyssinians of Ethiopia in their offices, commemorate 14,000 infants on this occasion.

INUENDO (of inuovo, "I nod or beckon"), is a word frequently used in writs, declarations, and pleadings, to asertain a person or thing which was named, but left doubtful, before: as, he (inquendo the plaintiff) did so and so: mention being before made of another person. In common conversation or writing, an innuendo denotes an obscure hint or distant reference, in contradistinction to a direct and positive charge.

INO, in fabulous history, a daughter of Cadmus and Harmonia, who nursed Bacchus. She married Athamas king of Thebes, after he had divorced Nephele, by whom he had two children Phryxus and Helle. Ino became mother of Melicerta and Leachrus; and soon conceived an implacable hatred against the children of Nephele, because they were to ascend the throne in preference to her own. Phryxus and Helle were informed of Ino's machinations, and they escaped to Colchis on a golden ram. Juno, jealousy of Ino's prosperity, resolved to disturb her peace; and more particularly because she was of the descendants of her greatest enemy, Venus. Tiphophone was sent by order of Juno to the house of Athamas, and she filled the whole palace with such fury, that Athamas taking Ino to be a lioness and her children whales, pursued her and dashed her son Leachrus against a wall. Ino escaped from the fury of her husband; and from a high rock she threw herself into the sea with Melicerta in her arms. The gods pitied her fate; and Neptune made her a sea deity, which was afterwards called Leucothoe. Melicerta became also a sea god, known by the name of Palémon.

INO, festivals in memory of Ino, celebrated yearly with sports and sacrifices at Corinth. An anniversary sacrifice was also offered to Ino at Megara, where she was first worshipped under the name of Leucothoe. — Another in Lacedonia, in honour of the same. It was usual at the celebration to throw cakes of flour into a pond, which if they sunk were presages of prosperity, but if they swam on the surface of the waters they were insipid and very unlucky.

INOCARUS, a genus of plants belonging to the decandria class. See Botany Index.

INOCULATION, or Budding, in Gardening, is commonly practised upon all sorts of stone fruit; as nectarines, peaches, apricots, plums, cherries, as also upon oranges and jasmine: and indeed this is preferable to any sort of grafting for most sorts of fruit. For the method of performing it, see Gardening Index.
surgery in the same place, says, that buying the smallpox is both a common practice, and of long standing in that neighbourhood. He says, that in Pembroke-There are two large villages near the harbour of Milford, more famous for this custom than any other, viz. St Jhmsel's and Marloes. The old inhabitants of these villages say, that it had been a common practice; and that one William Allen of St Jhmsel's, who in 1722 was 90 years of age, declared to some persons of good sense and integrity, that this practice was used all his time; that he well remembered his mother telling him, that it was a common practice all her time, and that she got the smallpox that way; so that at least we go back 160 years or more.

In the Highlands of Scotland and some of the adjacent isles, Dr Alexander Monro senior informs us, that the custom through ages past hath been, to put their children to bed with those who laboured under a favourable smallpox, and to tie worsted threads about their children's wrists, after having drawn them through various pustules.

According to the result of Dr Russell's inquiries, the Arabians assert, that the inoculation of the smallpox has been the common custom of their ancestors, and that they have no doubt of its being as ancient as the disease itself. It is remarkable, that buying the smallpox is the name universally applied in all countries to the method of procuring the disease: it is true that there are other terms; but in Wales and Arabia, as well as many other countries, this is the usual appellation. From the sameness of the name, and the little diversity observable in the manner of performing the operation, it is probable that the practice of inoculation in these countries was originally derived from the same source. From its extensive spread, it is probably of great antiquity too.

In the year 1717, Lady Mary Wortley Montague, wife of the English ambassador at Constantinople, had her son inoculated there at the age of six years; he had but few pustules, and soon recovered. In April 1721, inoculation was successfully tried on seven condemned criminals in London, by permission of his majesty. In 1722, Lady Mary Wortley Montague had a daughter of six years old inoculated in this island; soon after which, the children of the royal family that had not had the smallpox were inoculated with success; then followed some of the nobility, and the practice soon prevailed. And here we date the commencement of inoculation under the direction of art.

From the example of the royal family in England, the practice was adopted in Germany, particularly in Hanover, and its adjacent countries.

After Mr Maitland had succeeded with those he had inoculated in and about London, he introduced the practice into Scotland in the year 1726.

Sweden soon followed the example of the British. Russia lately engaged one of our, principal promoters and improvers of this art. And now there are not many countries that do not more or less practise it.

Different Modes of Inoculation. The practice of inoculation having obtained in every part of the world, it may be grateful, at least to curiosity, to have a general account of the different modes that are and have been adopted in that practice.

Inoculation with the blood of various patients hath been tried without effect; the variolous matter only produces the variolous disease.

The application of the variolous matter takes place in a sensible part only; the activity of the virus is such, that the smallest atom, though imperceptible to any of our senses, conveys the disease as well as the largest quantity. Hence the most obvious method is the prick of a needle or the point of a lancet dipped in the matter of a variolous pustule.

Cotton or thread is used, that is previously rubbed with powdered variolous sebæ; this thread is drawn with a needle through the cutis, but not left in. This is the method in some parts of the East Indies. The Indians pass the thread on the outside of the hand, between any of the fingers, or between the fore finger and thumb. The Thessalian women inoculate in the forehead and chin.

Some abrade the scarf-skin, and rub in the powdered dry sebæ which fall from the pustules of patients with the smallpox.

Many of the Greek women make an oblique puncture with a needle, on the middle of the top of the forehead, on each cheek, the chin, each metacarpus, and each metatarsus; then drop in each a little of the pus just taken warm from a patient, and brought in a servant's bosom. Others in Greece make several little wounds with a needle in one, two, or more places, in the skin, till some drops of blood ensue; then the operator pours a drop of warm pus fresh from a pustule, and mixes it with the blood as it issues out; then the wound is covered by some with a bandage, by others with half a walnut shell placed with its concave side over each orifice.

The Chinese convey a pellet of variolatus cotton, with the addition of a little musk, into the nostrils of the patient; they collect dry pustules, and keep them in a porcelain bottle well corked; and when they inoculate, they mix a grain of musk with three or four grains of the dry scales, and roll them in cotton. This method may be called inoculation.

About Bengal, in the East Indies, the person who intends to be inoculated, having found a house where there is a good sort of the smallpox, goes to the bed of the sick person, if he is old enough; or if a child, to one of his relations, and speaks to him as follows: "I am come to buy the smallpox." The answer is, "Buy if you please." A sum of money is accordingly given, and one, three, or five pustules, for the number must always be odd, and not exceeding five, extracted whole, and full of matter. These are immediately rubbed on the skin of the outside of the hand between the forefinger and the thumb; and this suffices to produce the disease. The same custom obtains in Algiers, Tossa, Tripoli, and other countries.

Very similar to the custom among the people about Bengal, &c. is that in Arabia, where on some fleshly part they make several punctures with a needle imbrued in variolous matter, taken from a pustule of a favourable kind. Here they buy the smallpox too, as follows: the child to be inoculated carries a few raisins, dates, sugar-plums, or such like; and showing them to the child from whom the matter is to be taken, asks how many pecks he will give in exchange? The bargain being made, they proceed to the operation; but this buying, though still continued, is not thought necessary.
necessary to the success of the operation. The Arabs say that any fleshly part is proper; but generally they insert the matter between the fore-finger and thumb on the outside of the arm.

The Georgians insert the matter on the fore-arm.

The Armenians introduce the matter on the two thighs. In Wales the practice may be termed infliction of the smallpox. There some of the dry pustules are procured by purchase, and are rubbed hard upon the naked arm or leg.

The practice in some places is to prick the skin between some of the fingers by means of two small needles, joined to one another; and after having rubbed a little of the matter on the spot, a circle is made by means of several punctures of the point of a common pustule, and matter is again rubbed over it. The operation is finished by dressing the wound with lint. Another custom is to mix a little of the variolous matter with sugar, and give it to be drunk in any agreeable liquors.

Inoculations have been made in the arms and legs, and thread, cotton, or lint, previously dipped in the variolous matter, was lodged in them. The practice of some is to bathe the feet in warm water, and then secure lint dipped in the variolous matter on the instep, or other part of the foot, where the skin is thin. Others apply a small blistering plaster; and when the skin is elevated and slipped off, the variolous matter is applied to the surface of the true skin, and confined there by a little lint or plaster. Scratching the skin with a pin or needle, and then rubbing the part with lint previously dipped in variolous matter, is the custom in some places.

In the Highlands of Scotland they rub some part of the skin with fresh matter, or dip worsted in variolous matter, and tie it about the children’s wrists. They observe, that if fresh matter is applied a few days successively, the infection is more certain than by one application.

We have thus given the history of inoculation for the smallpox, which not many years ago was justly regarded as one of the greatest discoveries which had been made for the benefit of mankind, and would still be regarded as such had it not given place to one still more valuable and important, the vaccine inoculation or cowpox, which now promises to banish the smallpox from the world. For an account of this, see Vaccination.

It would be quite unnecessary to enter into the detail of the advantages to be derived from inoculation for the smallpox, and the methods of performing or preparing for it formerly practised. But, as a curious part of the history of this practice, we shall just barely mention some of the objections which have been urged against it.

It has been said that inoculation for the smallpox is unlawful; that it is bringing a distemper on ourselves, and thus usurping the sacred prerogative of God; that the decrees of God have fixed the commission of every disease, and our precautions cannot prevent what he hath determined; that we should not do evil that good may come; that the patient may die, and then his last moments are distressed, and the future reflections of his friends are grievous; that fear is a dangerous passion in the smallpox, but inoculation increases the causes of fear, by lessening our faith and trust in God; that inoculation does not exempt from future infection; that other diseases are communicated with the matter of the smallpox by inoculating it; that perhaps the disease may never attack in the natural way; that it requires much thought to know what we should do with regard to inoculation; that it endangers others, and that the practice of inoculation comes from the devil.

INORDINATE PROPORTION. See Proportion, Inordinate.

INOSCULATION, in Anatomy, the same with Anastomosis.

INPROMPTU, or IMPROMPTU. See Impromptu.

INQUEST, in Scots law, the same with Jury.

INQUISITION, in the church of Rome, a tribunal in several Roman Catholic countries, erected by the popes for the examination and punishment of heretics.

This court was founded in the 12th century by Father Dominic and his followers, who were sent by Pope Innocent III, with orders to excite the Catholic princes and people to extirpate heretics, to search into their number and quality, and to transmit a faithful account thereof to Rome. Hence they were called inquisitors; and this gave birth to the formidable tribunal of the inquisition, which was received in all Italy and the dominions of Spain, except the kingdom of Naples and the Low Countries.

This diabolical tribunal takes cognizance of heresy, Judaism, Mahometanism, sodomy, and polygamy; and the people stand in so much fear of it, that parents deliver up their children, husbands their wives, and masters their servants, to its officers, without daring in the least to murmur. The prisoners are kept for a long time, till they themselves turn their own accusers, and declare the cause of their imprisonment; for they are neither told their crime nor confronted with witnesses. As soon as they are imprisoned, their friends go into mourning, and speak of them as dead, not daring to solicit their pardon, lest they should be brought in as accomplices. When there is no shadow of proof against the pretended criminal, he is discharged, after suffering the most cruel tortures, a tedious and dreadful imprisonment, and the loss of the greatest part of his effects. The sentence against the prisoners is pronounced publicly, and with extraordinary solemnity. In Portugal, they erect a theatre capable of holding 3000 persons; in which they place a rich altar, and raise seats on each side in the form of an amphitheatre. There the prisoners are placed; and over against them is a high chair, whither they are called, one by one, to hear their doom, from one of the inquisitors.

The unhappy people know what they are to suffer by the clothes they wear that day. Those who appear in their own clothes are discharged upon payment of a fine; those who have a santo benito, or striped yellow coat without sleeves, charged with St. Andrew’s cross, have their lives, but forfeit all their effects; those who have the resemblance of flames made of red serge, sewed upon their santo benito, without any cross, are pardoned, but threatened to be burnt if ever they relapse; but those who, besides these flames, have on their santo benito their own picture, surrounded with figures of devils, are condemned to expire in the flames. The inquisitors, who are ecclesiastics, do not pronounce the sentence of death;
but form and read an act, in which they say, that the criminal being convicted of such a crime, by his own confession, is with much reluctance delivered to the secular power to be punished according to his demerits: and this writing they give to the seven judges who attend at the right side of the altar, who immediately pass sentence. For the conclusion of this horrid scene, see Act of Faith.

INSCRIBED, in Geometry. A figure is said to be inscribed in another, when all its angles touch the side or planes of the other figure.

INSCRIPTION, a title or writing affixed to any thing, to give some farther knowledge of it, or to transmit some important truth to posterity.

Antiquaries are very curious in examining ancient inscriptions found on stones and other monuments of antiquity. Sanchoniathon, contemporary, as it is said, with Gideon, drew most of the memoirs whereof his history is composed from inscriptions which he found in temples and on columns, both among the Heathens and the Hebrews.

It appears, indeed, that the ancients engraved upon pillars the principles of sciences, as well as the history of the world. Those mentioned by Herodotus show, that this was the first way of instructing people, and of transmitting histories and sciences to posterity. This is confirmed by Plato in his Hippias; wherein he says, that Pisistratus engraved on stone pillars precepts useful for husbandmen. Pliny assures us, that the first public monuments were made of plates of lead; and that the treaties of confederacy concluded between the Romans and the Jews were written upon plates of brass; that (says he) the Jews might have something to put them in mind of the peace and confederacy concluded with the Romans. The Greeks and Romans were great dealers in inscriptions, and were extremely fond of being mentioned in them; and hence it is that we find so many in those countries of ancient learning, that large volumes have been composed, as the collection of Gruter, &c. Since Gruter's collection, Th. Reinesius has compiled another huge volume of inscriptions. N. Fabrety published another volume at Rome in 1699, wherein he has corrected abundance of errors which had escaped Gruter, Reinesius, and other antiquaries, &c. and added a great number of inscriptions omitted by them. Since all these, Grevius has published a complete collection of inscriptions, in three vols. folio.

INSCRUTABLE, Unsearchable, in Theology, is usually understood of the secrets of Providence, and the judgments of God, into which human reason cannot penetrate.

Academy of Inscriptions. See Academy.

INSECTS, INSECTA, in Natural History, a smaller sort of animals, commonly supposed to be exiguous; and distinguished by certain incisions, cuttings, or indentings in their bodies. The word is originally Latin, formed of in, and secare, "I cut;" the reason of which is, that in some of this tribe, as ants, the body seems to be cut or divided into two; or because the bodies of many, as worms, caterpillars, &c. are composed of different circles, or rings, which are a sort of incision. See Entomology. See also the article INSECTA, in the Supplement.

Noxious Insects; Means of destroying them, or pre-
may perhaps have that effect; but it scarcely will in this. He also employed sulphur in the following manner to drive insects from small trees. He split the end of a pole, and put in the slit some matches, set them on fire, and held them under the parts of the trees chiefly affected. A pole thus armed, he found, would answer for three or four trees. Brimstone thus mixed with damp straw, and set on fire, for instance, in hop-ground infested with the fly, might be of use to drive away the fly.

The itch is supposed to proceed from a very small insect which nestles under the skin, and proceeds no farther into the habit; and is therefore attended with no dangerous consequences. Brimstone made into an ointment with hog's-lard is a sure remedy.

Sheep are liable to an eruption on the skin, known by the name of the scab. The brimstone, when added to the mercurial ointment recommended for that disorder in the Transactions of the Society for the Encouragement of Arts, vol. vi. p. 90. might perhaps render the application more efficacious and less dangerous.

3. The natives of hot countries are taught by experience, that an astringent covering on their bodies prevents the bites of mosquitoes and all gnats. The white inhabitants in such countries are not sufficiently careful in preventing the least stagnant water near their dwellings, in which the mosquitoes are bred; seen in the waste water thrown out they are produced. Dr Franklin, by a careful attention to this circumstance, guarded his family in Philadelphia from such insects: one day seeing a number of mosquitoes in his library, he found on inquiry, that one of his servants had taken the cover off a tub placed near his window for receiving rain-water. On such an occasion this remedy is easy, viz. shutting the room up for the day, so that the mosquitoes cannot come at any water, in which time they die. Though this caution may seem trifling to us who live in a mild climate, it is far otherwise in hot countries.

Oil being known to be most efficacious in destroying insects, may not the use of it be extended to the destruction of worms in the bowels of horses, where they may occasion the violent pain they seem sometimes to suffer? If the horse was for some time kept fasting, and a large quantity of oil, suppose a pint, was given, if worms are the cause, the oil may in that case kill them.

Flowers, leaves, and fruits, on plants, are known to be devoured by caterpillars. These are destroyed by oils, which close the lateral pores by which they breathe. For this purpose it is advised that, on the approach of spring, a cloth dipped in train oil be laid on such parts of the tree in which there is the least appearance of them.

We are informed in the Memoirs of the Society of Agriculture at Paris, that oil of turpentine, when applied to animals which were covered with insects, destroyed the insects without hurting the animal. The author tried it on several trees, mixed with fine earth so as to incorporate them well, then adding water, still stirring them carefully till the whole was brought to some degree of fluidity. In this mixture he dipped branches of fruit trees on which there were insects, and thereby destroyed not only the eggs but also the insects, without hurting the leaves. This composition may be get off by washing, or the first heavy shower. From these experiments the author thinks, that oil of turpentine may with equal efficacy be employed for killing various kinds of lice on domestic animals.

We are informed, in the Transactions of the Society for the Encouragement of Arts, vol. v. p. 45. that Mr Winter, among other experiments on turnip-seed, steeped the seed 24 hours in a sufficient quantity of train oil. He then drained the oil from the seed, which he mixed with a quantity of fine sifted earth, and immediately sowed it in drills. When the plants began to appear on the surface, the ground was sown with soil. He found that seed steeped in linseed oil answered equally well. The turnips the least injured by the fly were those that grew from seed steeped as above, which grew so luxuriantly as to produce rough leaves several days prior to the most flourishing of any of his other experiments, and were the better enabled to withstand the fly's attack. The leaves of these turnips were of a darker green, and appeared twice as thick in bulk and luxuriance as the other turnips, and were a considerable deal larger. The seed was drilled an inch and a half deep, and at a foot distance in the rows. Train oil is apt to kill the leaves of plants which have been injured by insects, but linseed oil has not that effect, though equally destructive to the insects. The train oil seems to act both as an oil, and by its disagreeable smell it prevents insects approaching it. In this respect it may be successfully used to prevent field mice or other vermin preying on asparagus, beans, or other seeds steeped in it before they are sown.

When thus giving directions for preventing the fly on turnips, a late experiment should be mentioned, by the disclosure of which a person gained a considerable reward. His secret was, running a roller over the ground early in the morning, while the dew remained on the ground, on the first appearance of the fly. The dew entangled the flies so much, that they could not make their escape, and were therefore crushed to death. As the roller may leave the surface of the earth too hard, some very properly advise, to fix some boughs of elder in a gate or hurdle, to be drawn over the field; and if the boughs had been before imbibed with the smoke of tobacco, or tincture of ananis, the success would be the surer. The most certain method of preventing the hurt done by the fly is to raise the plants in a nursery, and at a proper age to transplant them, being carried to the ground in a wheel-barrow filled with manure softened with water, so as to admit the plants. This method will secure their more speedy growth. In the nursery the attack of the fly may be prevented by sprinkling sot or quicklime on the ground. The utility of transplanting turnips is evident by the practice of transplanting the turnip-rooted cabbage. They who are discouraged from this practice by the expense attending it, do not reflect that the hoicing is prevented, and the plants grow the better, being set in fresh earth.

4. Before proceeding to direct the use of the last means mentioned, viz. tobacco, for destroying insects in turnips, it may be proper to mention an experiment made by Mr Green, of her majesty's flower-garden at Kew. He contrived a pair of bellows similar to that employed in recovering people seemingly drowned. It:
Insects have a cavity in the nozzle, in which some tobacco is put, with a live coal over it. The bellows being then worked, the tobacco is set on fire, and the smoke is directed to any particular spot. A lady was fond of having the maskrose in her dressing-room, but was prevented having it on account of the green insects which constantly adhere to that plant. To remedy this inconvenience, Mr Green had a box made large enough to contain a pot in which a plant of the maskrose grew. In one end of the box was a hole, to admit the nozzle of the bellows; the bellows was worked, and the smoke was received into the box. When the tobacco was consumed, the nozzle was withdrawn, and a cork being put into the hole, the box thus remained till morning, when the insects were all laid dead on the earth. Being swept off, the plant was in a state fit for a dressing-room. Many plants thus infested with insects may be too large, or otherwise so placed as not to be put into a box. In this case it occurred to the writer of these observations, that being sprinkled with an infusion of tobacco in water might in some degree answer the same purpose. On trial he found it answer, and be thus freed other plants of their insects. He also used it on trees of easy access with advantage. Train oil is so inimical to tender plants or leaves, that it destroys them if insects have in the least hurt them; whereas the infusion, instead of killing the leaves, promoted a fresh vegetation.

Fruit trees often become the prey of insects. Those against a wall, or in espaliers, being easily come at, much of the mischief may be prevented by cutting off the leaves so soon as they are observed to be curled; for then fresh eggs are laid on them, probably by butterflies. If sprinkled with the infusion of tobacco, it will prevent their coming to life. After the fruit is formed, the infusion must not be used, lest the taste and smell may remain. The scissors are then the proper remedies, which ladies may employ as amusement, and may thereby present fruit to their friends of their own preserving. A lyce of the ash of plants sprinkled on the leaves may have a good effect, as also on other pot-herbs, which are often the prey of caterpillars. As many insects, besides those bred on the leaves or in the walls, may destroy the fruit, the sugar with the corrosive sublimate, as already described, may be laid in the way of other insects, to all which it will prove a speedy death. Diligent inspection into their retreats is the most certain means of preventing the loss sustained by snails. Ants are prevented rising up the trees, by laying round the roots powdered chalk, or any other substance which by entangling their feet prevents their crossing it. Care should be taken to destroy their nests everywhere near the garden.

Hops are now become an article of so great consequence, that it deserves our particular attention. Early in its growth, when the vines begin to ascend the poles, a black fly preys on its leaves, frequently in such numbers as, by destroying the leaves, to interrupt the vegetation, much of the food of plants being absorbed by the leaves. The infusion of tobacco destroys them, or at least drives them away so effectually, that a plant almost totally stripped of its leaves has put out fresh leaves after the use of it. If care be not taken, they will again fall on the fresh leaves. As the flies lodge on the lower side of the leaves, they are protected from storms of rain, and therefore the infusion must be driven upwards by a forcing pump. As it is said that the expanse of tobacco is too great, perhaps lime-water, or even water by itself, driven strongly against the leaves, might drive them away. The labour attending such experiments in a large plantation discourages others, without reflecting, that, if such means are used early, the flies may more easily be got rid of. Free ventilation is undoubtedly beneficial to all plants; and hence perhaps the particular advantages of drilling corns in rows a little distant. If alleys somewhat larger than common were made in the plantations of hops, there might be sufficient spaces left where the alleys cross one another to admit of setting damp straw, or other materials mixed with brimstone, soot, &c. on fire. Smoke itself is said to prevent the fly; and if so, it will still not more powerfully when mixed with such materials. It has been observed in Sweden, that the hops grow naturally among heaps of stones or fragments of rocks. They therefore advise to cover the ground round their roots with stones, which will prevent the insects laying their eggs near the roots in the ground, where they lay them to be protected during the winter. The stones will also preserve moisture at the roots during the summer. A rope cannot be drawn across a plantation of hops, as it can across a field of corn, in case of mildew. Here water to wash off the clammy juice that catises and feeds insects seems to be the only remedy. The plantation being well ventilated, may at least prevent the frequency of it. The forcing pump will most effectually wash off this exudation.

Cruelty to Insects. It does not appear upon what principle of reason and justice it is, that mankind have founded their right over the lives of every creature that is placed in a subordinate rank of being to themselves. Whatever claim they may have in right of food and self-defence (to which ought we to add the purposes of the naturalist, explained above?) did they extend their privileges no farther than those articles would reasonably carry them, numberless beings might enjoy their lives in peace, who are now hurried out of them by the most wanton and unnecessary carelessness. It is surely difficult to discover why it should be thought less inhuman to crush to death a harmless insect, whose single offence is that he eats that food which nature has prepared for his sustenance, than it would be were we to kill any bulky creature for the same reason. There are few temper so hardened to the impressions of humanity, as not to shudder at the thought of the latter; and yet the former is universally practised without the least check of compassion. This seems to arise from the gross error of supposing, that every creature is really in itself contemptible, which happens to be clothed with a body infinitely disproportionate to our own, not considering that great and little are merely relative terms. But the inimitable Shakespeare would teach us, that

——— the poor beetle that we tread upon,
In corp'ral suffrage, feels a pang as great
As when a giant dies———

And indeed there is every reason to believe that the sensations of many insects are as exquisite as those of creatures of far more enlarged dimensions, perhaps even more
have not wherewithal to pay their just debts. A person dying, and not leaving estate sufficient to discharge these, is said to die insolvent.

Trial by INSPECTION, or Examination, is when, for the greater expedition of a cause, in some point or issue, being either the principal question, or arising collateral out of it, but being evidently the object of sense, the judges of the court, upon the testimony of their own senses, shall decide the point in dispute. For, when the affirmative or negative of a question is matter of such obvious determination, it is not thought necessary to summon a jury to decide it; who are properly called in to inform the conscience of the court of dubious facts; and therefore, when the fact, from its nature, must be evident to the court either from ocular demonstration or other irrefrangible proof, there the law departs from its usual resort, the verdict of 12 men, and relies on the judgment of the court alone. As in case of a suit to reserve a fine for non-age of the cognizor, or to set aside a statute or recognizance entered into by an infant; here, and in other cases of the like sort, a writ shall issue to the sheriff, commanding him that he constrain the said party to appear, that it may be ascertained by the view of his body by the king's justices, whether he be of full age or not: Ut per aspetum corporis sui constaret poterit justiciarius nostris, si predictus an sit plene acutis neces. If however, the court has, upon inspection, any doubt of the age of the party (as may frequently be the case), it may proceed to take proofs of the part; and, particularly, may examine the infant himself upon an oath of sua dire, certatam flere; that is, to make true answers to such questions as the court shall demand of him; or the court may examine his mother, his god-father, or the like.

INSPECTOR, a person to whom the care and conduct of any work is committed.

INSPECTORS, in the Roman law, were such persons as examined the quality and value of lands and effects, in order to the adjusting or proportioning taxes and impositions to every man's estate.

The Jews also have an officer, in their synagogue, whom they call inspector, hahesen. His business consists principally in inspecting or overlooking the prayers and lessons, in preparing and showing them to the reader, and in standing by him to see he reads right: and, if he makes mistakes, he is to correct him.

INSPIRATION, among divines, &c. implies the conveying of certain extraordinary and supernatural notices or motions into the soul; or it denotes any supernatural influence of God upon the mind of a rational creature, whereby he is formed to any degree of intellectual improvements, to which he could not, or would not, in fact have attained in his present circumstances, in a natural way. Thus the prophets are said to have spoken by divine inspiration.

Some authors reduce the inspiration of the sacred writers to a particular care of Providence, which prevented any thing they had said from failing or coming to nought; maintaining, that they never were really inspired either with knowledge or expression. According to M. Simon, inspiration is no more than a direction of the Holy Spirit, which never permitted the sacred writers to be mistaken.

It is a common opinion, that the inspiration of the Holy Spirit, which never permitted the sacred writers to be mistaken.
Inspiration. Holy Spirit regards only the matter, not the style or words; and this seems to fall in with M. Simon's doctrine of direction.

Theologians have enumerated several kinds of inspiration; such as an inspiration of superintendence, in which God does so influence and direct the mind of any person, as to keep him more secure from error in some various and complex discourse, than he would have been merely by the use of his natural faculties; plenary superintendence inspiration, which excludes any mixture of error at all from the performance so superintended; inspiration of elevation, where the faculties act in a regular, and, as it seems, in a common manner, yet are raised to an extraordinary degree, so that the composer shall, upon the whole, have more of the true sublime or pathetic, than natural genius could have given; and inspiration of suggestion, when the use of the faculties is superseded, and God does, as it were, speak directly to the mind, making such discoveries to it as it could not otherwise have obtained, and dictating the very words in which such discoveries are to be communicated, if they are designed as a message to others. It is generally allowed that the New Testament was written by a superintendence inspiration; for without this the discourses and doctrines of Christ could not have been faithfully recorded by the evangelists and apostles; nor could they have assumed the authority of speaking the words of Christ, and evinced this authority by the actual exercise of miraculous powers: and besides, the sacred writings bear many obvious internal marks of their divine original, in the excellence of their doctrines, the spirituality and elevation of their design, the majesty and simplicity of their style, the agreement of their various parts, and their efficacy on mankind; to which may be added, that there has been in the Christian church, from its earliest ages, a constant tradition, that the sacred books were written by the extraordinary assistance of the Spirit, which must at least amount to superintendence inspiration. But it has been controverted whether this inspiration extended to every minute circumstance in their writings, so as to be in the most absolute sense plenary. Jerome, Grotius, Erasmus, Episcopalius, and many others, maintain that it was not; whilst others contend, that the emphatic manner in which our Lord speaks of the agency of the Spirit upon them, and in which they themselves speak of their own writings, will justify our believing that their inspiration was plenary, unless there be very convincing evidence brought on the other side to prove that it was not: and if we allow, it is said, that there were some errors in the New Testament, as it came from the hands of the apostles, there may be great danger of subverting the main purpose and design of it; since there will be endless room to debate the importance both of facts and doctrines.

Among the Heathens, the priests and priestesses were said to be divinely inspired, when they gave oracles. — The poets also laid claim to it; and to this end they always invoked Apollo and the Muses at the beginning of any great work.

Inspiration, in Physic, is understood of that action of the breast, by which the air is admitted within the lungs, in which sense, inspiration is a branch of respiration, and stands opposed to expiration.

This admission of the air depends immediately on its spring or elasticity, at the time when the caviety of the breast is enlarged by the elevation of the thorax and abdomen, and particularly by the motion of the diaphragm downwards, so that the air does not enter the lungs, because they are dilated; but these dilate, because the air enters within them. Nor is it the dilatation of the breast which draws in the air, as is commonly thought, though this is a condition absolutely necessary to inspiration; but an actual intrusion of the air into the lungs. See Respiration.

Inspirating, in Pharmacy, an operation whereby a liquor is brought to a thicker consistence, by evaporating the thinner parts.

Inspruck, a city of Germany, in the circle of Austria, and capital of the county of Tyrol, received its name from the river Inn, which runs by it. It has a noble castle or palace, formerly the residence of the archdukes of the house of Austria, with a cathedral where they are buried. The houses, though built in the German taste, are rather handsomer; and the streets, though narrow, are remarkably well paved. For the defence of this city the inhabitants can place but little confidence in their fortifications, which are very trifling. They seem rather to depend on the natural fastnesses of their country, which appear indeed to form a barrier, so perfectly inaccessible to any enemy, that even the great Gustavus Adolphus, after having overrun with his victorious arms the other parts of Germany, could never make any impression upon this. It has about 12,000 inhabitants, and it is seated in a pleasant valley. L. Long. 11. 30. N. Lat. 47. 16.

Installation, the act of giving visible possession of an order, rank, or office, by placing in the proper seat. See Installment.

Installment, a settling or instating any person in a dignity. The word is derived from the Latin in, and stollum, a term used for a seat in church, in the choir, or a seat or bench in a court of justice, &c.; though Vossius is of opinion the word is of German origin. Installment is chiefly used for the induction of a dean, prebendary, or other ecclesiastical dignitary, into the possession of his stall, or proper seat, in the cathedral church to which he belongs. This is sometimes also called installation.

Installment is likewise used for the ceremony whereby the knights of the Garter are placed in their rank, in the chapel of St. George at Windsor.

Instant, a part of duration in which we perceive no succession; or it is that which takes up the time only of one idea in our minds.

Instauration, the re-establishment, or restoration of a religion, a church, or the like, to its former state. The word is by some derived from the old Latin instaurum, which signified the "stock" of things necessary for the tillage and managing of grounds; as cattle, tools, harness, &c. But the word instaurum is only of the middle age: instauratio is of much greater antiquity, and by some derived from instar, "like," as importing a thing's being brought
In our opinion, great part of the Essay on Human Understanding has been very generally misunderstood. Much of its merit, however, was soon discovered, and mankind, finding philosophy disencumbered of the barbarous jargon of the schools, and built upon a few self-evident principles, implicitly embraced every opinion advanced, or which they supposed to be advanced, by the illustrious author; especially if that opinion was contrary to any part of the scholastic system which had so long been employed to perplex the understanding and to veil absurdity. Hence arose many philosophers of eminence both at home and abroad, who maintained, as they imagined, upon the principles of Locke, that in the human mind there are no instincts, but that every thing which had been usually called by that name is resolvable into association and habit. This doctrine was attacked by Lord Shaftesbury, who introduced into the theory of mind, as faculties derived from nature, a sense of beauty, a sense of honour, and a sense of ridicule; and these he considered as the tests of speculative truth and moral rectitude. His lordship's principles were in part adopted by Mr. Hutchison of Glasgow, who published a system of moral philosophy, founded upon a sense or instinct, to which he gave the name of the moral sense; and the undoubtedly merit of his work procured him many followers.

Men generally run from one extreme to another. It being now discovered, or at least supposed, that the human mind is endowed with instinctive principles of action, a sect of philosophers soon afterwards arose, who maintained with much vehemence that it is likewise endowed with instinctive principles of belief; and who built a system of metaphysics, if such it may be called, upon a number of innate, distinct, and independent senses. The rise of this sect is well known. Berkeley and Hume had adopted Locke's doctrine respecting the origin of our ideas; and had thence deduced consequences supposed to be dangerous in themselves, but which, it was thought, could not be denied without refusing the principles from which they were inferred. The foundation of the instinctive system being thus laid, the system itself was rapidly carried to a height far beyond what seems to have been the intention of its excellent author; and reason was well nigh banished from the regions of philosophy. For such a proceeding it is not difficult to assign the cause. The instinctive scheme requires much less labour of investigation than the systems of Locke and the ancients; for upon the principles of it, when carried to its utmost extent, every phenomenon in human nature is thought to be sufficiently accounted for, by supposing

(A) As nothing is of greater importance in the philosophy of mind than accurate definitions, it may not be improper to observe, that through the whole of this article the word spontaneous is to be taken in the sense in which it is used in the following extracts from Hale's Origin of Mankind: "Many analogical motions in animals, though I call them voluntary, yet I see them spontaneous: I have reason to conclude, that these are not simply mechanical." "The sagacities and instincts of brutes, the spontaneousness of many of their motions, are not explicable, without supposing some active determinate power connected to and inherent in their spirits, of a higher extraction than the bare natural modification of matter." If this be attended to, our definition of instinct will be found perfectly consonant to that which has been given by the author of Ancient Metaphysics. "Instinct (he says) is a determination given by Almighty Wisdom to the mind of the brute, to act in such or such a way, upon such or such an occasion, without intelligence, without knowledge of good or ill, and without knowing for what end or purpose he acts."
it the effect of a particular instinct implanted in the mind for that very purpose. Hence in some popular works of philosophy we have a detail of so many distinct internal senses, that it requires no small strength of memory to retain their very names: besides the moral sense, we have the sense of beauty, the sense of deformity, the sense of honour, the hoarding sense, and a thousand others which it is needless here to mention.

This new system, which converts the philosophy of mind into mere history, or rather into a collection of facts and anecdotes, though it has made a rapid progress, is not yet universally received. It has been opposed by many speculative men, and by none with greater skill than Dr Priestley; who maintains, with the earliest admirers of Locke, that we have from nature no innate sense of truth, nor any instinctive principle of action; that even the action of sucking in new-born infants is to be accounted for upon principles of mechanism; and that the desire of the sexes is merely association.

Whilst men, eminent for candour as well as for science, have thus been disputing the limits between instinct and reason in the human mind, and endeavouring to ascertain the actions which result from each, two writers of name, treating of that subject, have lately advanced opinions, which, if admitted as just, must render the dispute henceforth ridiculous, and put an end for ever to all moral enquiries. Mr Smelle, in a work which he calls The Philosophy of Natural History, affirms, that between instinctive and rational motives no distinction exists, but that the reasoning faculty itself is the necessary result of instinct; and Dr Reid, in his Essays on the Active Powers of Man, by attributing to instinct the action of breathing, seems to confound that principle with mere mechanism.

These three principles accurately distinguished from each other.

That reason, instinct, and mechanism, are all essentially different from one another, has hitherto been universally allowed; and it appears not to be a task of much difficulty to point out in what respect each of them differs from the other two. Actions performed with a view to accomplish a certain end are called rational actions, and the end in view is the motive to their performance. Instinctive actions have a cause, viz. the internal impulse by which they are spontaneously performed; but they cannot be said to have a motive, because they are not done with any view to consequences. Actions automatic have likewise a cause; but that cause is not internal impulse, but mere mechanism, by which they are performed without any spontaneity of the agent. Thus, a man gives charity in order to relieve a person from want; he performs a grateful action as a duty incumbent on him; and he fights for his country in order to repel its enemies. Each of these actions is performed from a motive, and therefore they are all rational actions. An infant is impelled to suck the breast, but he knows not that it is necessary for his preservation; a couple of young savages go together, for the first time, without any view to offspring or any determinate idea of enjoyment. These actions have no motive, and therefore are not rational: but as they are performed by a spontaneous exertion of the agents, they are not to be attributed to mere mechanism; they are therefore instinctive actions. A man breathes without any motive, without any spontaneous exertion of his own, and that as well when he is asleep as when he is awake. The action of breathing therefore is neither rational nor instinctive, but merely automatic or mechanical. All this seems to be very plain. To talk of the motives of actions performed by instinct, in an argument intended to prove that between reason and instinct there is no difference, is either to beg the question or to pervert language. If the author of the Philosophy of Natural History chooses to call the impulse which prompts the infant to suck by the name of motive, he only uses an English word improperly; if he be his intention to affirm that such a motive is not totally and essentially different from that which prompts a man to give charity or to fight for his country, he affirms what all mankind know to be false (E).

Having thus ascertained what we mean by instinct, we shall now proceed to inquire, whether or not there be any instinctive principles in man? But in order to proceed upon sure grounds, it will be proper to consider, in the first place, such actions of the inferior animals as are generally allowed to be instinctive: for an attempt has lately been made to prove, that even these actions are the offspring influenced by motives; and that instinct, as we have defined it, is a mere imaginary principle, which has no existence either in man or brute.

(b) The author of Ancient Metaphysics, whose learned work contains more good sense on this subject than any other book which we have seen, thus distinguishes between reason and instinct: "With respect to the mere animal, it is evident, that he pursues nothing but what is conducive either to the preservation of the animal life or to the continuation of the kind. On the other hand, the object which the intellectual mind pursues, is the fair and the handsome; and its happiness consists in the contemplation of these. And though it pursue also what is useful and profitable for the being and well-being of the animal life, yet it is for the sake, not of the animal life itself, but of the  \textit{e\textit{kale}}, or beautiful; which therefore is the ultimate object of its pursuit in all things.

"Another material difference in practice betwixt the animal and intellectual mind is, that every action of intellect proceeds from an opinion formed concerning what is good or ill, beautiful or the contrary, in the action. When we do so, we are said to act from \textit{will}, which is always determined by some opinion formed of the kind I have mentioned: whereas, when we act from mere appetite or inclination, without deliberation or opinion formed, we act as the brute does always; for he has no \textit{will}, but is prompted to action by natural impulse, or \textit{dun}, as the Greeks call it.

"A third very material difference is, that intellect, in all its operations, proposes ends, and devises means to accomplish these ends; whereas the instinct of the brute proceeds without consideration either of ends or means."
It has been said that caterpillars, when shaken off a tree in every direction, instantly turn round towards the trunk and climb up, though they have never formerly been on the surface of the ground. This is a striking instance of instinct. On the tree, and not upon the ground, the caterpillar finds its food. If therefore it did not turn and climb up the trunk it would inevitably perish; but surely the caterpillar knows not that such an exertion is necessary to its preservation; and therefore it acts not from motives, but from blind impulse. The bee and the beaver are endowed with an instinct which has the appearance of foresight. They build magazines, and fill them with provisions; but the foresight is not theirs. Neither bees nor beavers know any thing of futurity. The solitary wasp digs holes in the sand, in each of which she deposits an egg. Though she certainly knows not that an animal is to proceed from that egg, and still less, if possible, that this animal must be nourished with other animals, she collects a few small green worms, which she rolls up in a circular form, and fixes in the hole in such a manner that they cannot move. When the wasp-worm is hatched, it is simply stored with the food which nature has destined for its support. The green worms are devoured in succession; and the number deposited is exactly proportioned to the time necessary for the growth and transformation of the wasp-worm into a fly; when it issues from the hole, and is capable of procuring its own nourishment. This instinct of the parent-wasp is the more remarkable, that she feeds not upon flesh herself. Birds of the same species, unless when restrained by peculiar circumstances, uniformly build their nests of the same materials, and in the same form and situation, though they inhabit very different climates; and the form and situation are always exactly suited to their nature, and calculated to afford them shelter and protection. When danger, or any other circumstance peculiar to certain countries, renders a deviation from the common form or situation of nests necessary, that deviation is made in an equal degree, and in the very same manner, by all the birds of one species; and it is never found to extend beyond the limits of the country where alone it can serve any good purpose. When removed by necessity from their eggs, birds return to them with haste and anxiety, and shift them so as to heat them equally; and it is worthy of observation, that their haste to return is always in proportion to the cold of the climate. But do birds reason, and all of the same species reason equally well, upon the nature and extent of danger, and upon the means by which it can best be avoided? Have birds any notion of equality, or do they know that heat is necessary for incubation? No; in all these operations men recognise the intentions of nature; but they are hid from the animals themselves, and therefore cannot operate upon them as motives.

Of the instinct of animals we shall give one instance more in the elegant and perspicuous language of Dr Reid. “Every manufacturing art among men (says that able writer) was invented by some man, improved by others, and brought to perfection by time and experience. Men learn to work in it by long practice, which produces a habit. The arts of men vary in every age and in every nation, and are found only in those men who have been taught them. The manufactures of animals differ from those of men in many striking particulars. No animal of the species can claim the invention; no animal ever introduced any new improvement, or any variation from the former practice; every one of the species has equal skill from the beginning, without teaching, without experience, and without habit; every one has its art by a kind of inspiration. I do not mean that it is inspired with the principles or rules of the art, but with the ability of working in it to perfection, without any knowledge of its principles, rules, or end. The work of every animal is indeed like the works of nature, perfect in its kind, and can bear the most critical examination of the mechanic or the mathematician; of which a honeycomb is a striking instance.

“Bees, it is well known, construct their combs with remarkable small cells on both sides, fit both for holding the storeable in- stances in honey and for rearing their young. There are all three possible figures of the cells, which can make them all equal and similar, without any useless interstices. These are the equilateral triangle, the square, and the regular hexagon. Of the three, the hexagon is most proper, both for convenience and strength. Bees, as if they knew this, make their cells regular hexagons. As the combs have cells on both sides, the cells may either be exactly opposite, having partition against partition, or the bottom of a cell may rest upon the partitions between the cells on the other side, which will serve as a buttress to strengthen it. The last way is the best for strength; accordingly the bottom of each cell rests against the point where three partitions meet on the other side, which gives it all the strength possible. The bottom of a cell may either be one plane, perpendicular to the side partitions; or it may be composed of several planes, meeting in a solid angle in the middle point. It is only in one of these two ways that all the cells can be similar without losing room. And, for the same intention, the planes, of which the bottom is composed, if there be more than one, must be three in number, and neither more nor fewer. It has been demonstrated, that by making the bottoms of the cells to consist of three planes meeting in a point, there is a saving of material and labour no way inconsiderable. The bees, as if acquainted with these principles of solid geometry, follow them most accurately: the bottom of each cell being composed of three planes, which make obtuse angles with the side partitions, and with one another, and meet in a point in the middle of the bottom; the three angles of this bottom being supported by three partitions on the other side of the comb, and the point of it by the common intersection of these three partitions. One instance more of the mathematical skill displayed in the structure of a honey-comb deserves to be mentioned. It is a curious mathematical problem, at what precise angle the three planes which compose the bottom of a cell ought to meet, in order to make the greatest possible saving of material and labour. This is one of those problems belonging to the higher parts of mathematics, which are called problems of maxima and minima. The celebrated Mr. Laurin resolved it by a fluxional calculation, which is to be found in the Transactions of the Royal Society of London, and determined precisely the angle required. Upon the most exact measurement which the subject could admit, he
 Instinct. he afterwards found, that it is the very angle in which the three planes in the bottom of the cell of a honeycomb do actually meet.

"Shall we ask here, Who taught the bees the properties of solids, and to reduce problems of maxima and minima? If a honeycomb were a work of human art, every man of common sense would conclude, without hesitation, that he who invented the construction must have understood the principles on which it was constructed. We need not say that bees know none of these things. They work most geometrically without any knowledge of geometry; somewhat like a child, who, by turning the handle of an organ makes good music without any knowledge of music. The art is not in the child, but in him who made the organ. In like manner, when a bee makes its combs so geometrically, the geometry is not in the bee, but in that great Geometrician who made the bee, and made all things in number, weight, and measure."

We have given a full detail of the structure of a honeycomb, because it is an effect of instinct which cannot be confounded with the operations of reason. The author of The Natural History of Animals, justly offended with that theory which treats of instinctive motives, which represents the human mind as a bundle of instincts, and of which the object seems to be to degrade mankind to the level of brutish, has very laudably exerted his endeavours to detect its weakness, and to expose it to contempt. But in avoiding one extreme, he seems to have run into the other; and whilst he maintains the rights of his own species, he almost raises the brutish to the rank of men. "It is better he says, to share our rights with others than to be entirely deprived of them." This is certainly true; and no good man will hesitate to prefer his theory to that of his antagonist; but we see no necessity for adopting either; the phenomena may be accounted for without degrading reason to the level of instinct, or elevating instinct to the dignity of reason.

We shall readily allow to Locke, that some of the inferior animals seem to have perceptions of particular truths, and within very narrow limits the faculty of reason: but we see no ground to suppose that their reason; natural operations are performed with a view to consequences, and therefore cannot persuade ourselves with this historian of theirs, that these operations are the result of a train of reasoning in the mind of the animal.

He acknowledges indeed, that their reasoning is to them, their thinking powers are remarkably deficient when compared with those of men; that they cannot take so full a

(c) "For if they have any ideas at all, and are not mere machines, as some would have them, we cannot deny them to have some reason. It seems as evident to me, that some of them do, in certain instances, reason, as that they have sense; but it is only in particular ideas, just as they received them from the senses. They are the best of them tied up within those narrow bounds, and have not, as I think, the faculty to enlarge them by any kind of abstraction." Essay on Human Understanding, book ii. chap. xi.

This is in part a just observation, and serves to account for many phenomena which later writers have derived from instinct. The author of The Philosophy of Natural History had "a cat that frequented a closet, the door of which was fastened by a common iron latch. A window was situated near the door. When the door was shut, the cat gave herself no uneasiness. As soon as she tired of her confinement, she mounted on the sole of the window, and with her paw dexterously lifted the latch and came out." This practice, which we are told continued for years, must have been the consequence of what Locke calls reasoning in particular ideas. It could not be the effect of instinct; for instinct is adapted only to a state of nature, in which cats have neither latches to lift nor doors to open; and as it is not said that the animal attempted to lift the latches of other doors, we are not authorised to infer that this particular action was the consequence of reasoning in ideas enlarged by abstraction: the cat had repeatedly seen one door opened by an exertion which she was capable of imitating. Yet that animals have no power of enlarging their ideas, is a position, of the truth of which, though it is advanced by Locke, we are by no means confident. It is well known that crows feed upon several kinds of shell fish when within their reach; and that they contrive to break the shell by raising the fish to a great height, and letting it drop upon a stone or a rock. This may perhaps be considered as pure instinct directing the animal to the proper means of acquiring its food. But what is to be thought of the following fact, which was communicated to us by a gentleman whose veracity is unquestioned, and who, being totally unacquainted with the theories of philosophers, has of course no favourite hypothesis to support?

In the spring of the year 1791, a pair of crows made their nest in a tree, of which there are several planted round his garden; and in his morning walks he had often been amused by witnessing furious combats between them and a cat. One morning the battle raged more fiercely than usual, till at last the cat gave way and took shelter under a hedge, as if to wait a more favourable opportunity of retreating to the house. The crows continued for a short time to make a threatening noise; but perceiving that on the ground they could do nothing more than threaten, one of them lifted a stone from the middle of the garden, and perched with it on a tree planted in the hedge, where she sat watching the motions of the enemy of her young. As the cat, except along under the hedge, the crow accompanied her by flying from branch to branch and from tree to tree; and when at last she ventured to quit her hiding-place, the crow, leaving the tree, and hovering over her in the air, let the stone drop from on high on her back. That the crow on this occasion reasoned, is self-evident; and it seems to be less evident, that the ideas employed in her reasoning were enlarged beyond those which she had received from her senses. By her senses, she may have perceived, that the shell of a fish is broken by a fall; but could her senses inform her, that a cat would be wounded or driven off the field by the fall of a stone? No; from the effect of the one fall preserved in her memory, she must have inferred the other by her power of reasoning.
a review of the past, nor look forward with so penetrating an eye to the future; that they do not accumulate observation upon observation, or add the experience of one generation to that of another: that their manners do not vary nor their customs fluctuate like ours; and that their arts always remain the same, without degeneracy and without improvement. "The crow (he observes) always builds its nest in the same way; every hen treats her young with the same measure of affection; even the dog, the horse, and the egregious animal, seem to act rather mechanically than with design. From such hasty observations as these, it has been inferred (he says), that the brutes are directed in their actions by some mysterious influence, which impels them to employ their powers un-intentionally in performing actions beneficial to themselves, and suitable to their nature and circumstances."

And are these observations indeed hasty? and is this inference ill founded? To us the matter appears quite otherwise. If the acts of brutes and other animals have always remained the same without degeneracy, and without improvement; and if they be at the same time the result of reasoning, they must either be so perfect that they cannot be improved, or so imperfect that they cannot degenerate. That the structure of a honey-comb is imperfect no man has ever imagined. We have seen, that as far as we are capable of discerning the end which it is intended to serve, it is the most perfect structure possible: and therefore, if it be the result of the reasoning of the bee, the author must retract his assertion respecting the extent of the reasoning and thinking powers of inferior animals; and instead of saying that they are remarkably deficient when compared with those of men, affirm that they are infinitely more perfect. No human art has yet arrived at such perfection as that it might not be improved; no architect has ever built a town, or constructed a magazine, which he could mathematically demonstrate to be of the very best possible form for the end intended, and so absolutely perfect as to be incapable of improvement.

But the same author proceeds to affirm, that "the laws of analogical reasoning do not justify the idea that the brutes act, on any occasion, absolutely without design." Nay, he says, it seems more probable, that the inferior animals, even in those instances in which we cannot distinguish the motives which actuate them, or the views with which they proceed, yet act with design, and extend their views, if not a great way, yet at least a certain length forward; than that they can be upon any occasion, such as in rearing of their young, building nests, &c. actuated merely by feeling, or overruled by some mysterious influence, under which they are nothing but insensible instruments." This last phrase is ambiguous. If by insensible instruments it be meant that the brutes are considered by the advocates for instinct as mere machines without the faculties of sensation and spontaneity, the author is combating a phantom of his own creation; for we believe an opinion so absurd is not now maintained by any man, (see BRUTE). But if by insensible instruments be meant such instruments as act spontaneously without being conscious of the end to which their actions lead, he appears not only to be egregiously mistaken in his conjecture respecting the design of brutes, but also to have advanced an hypothesis contradictory and inconsistent.

If it be true, that the inferior animals act with Mainland's design, even in those instances in which we cannot discern and distinguish their motives, their views may indeed extend but a little way when compared with infinity; but certainly they extend farther than ours; for there is no useful work of man constructed with such skill, but that, after it is finished, another man of equal education will be able to distinguish the general design of the artist. But if the inferior animals, on all occasions, act with design, we should be glad to know the design of the bees in forming the cells of their combs in the manner which we have so largely described. Do these little animals indeed know that a comb, consisting on both sides of hexagonal cells, with the bottom of each composed of several planes meeting in a certain solid angle, and so formed as that the bottom of a cell on the one side shall rest upon the partitions between the cells on the other side, is in all respects the most proper both for holding their stores of honey and for rearing their young? And do they likewise know, that its excellence arises from the precise figure and position of the cells, by which there is a very considerable saving of labour and materials, whilst the comb at the same time has the greatest possible strength, and the greatest possible capaciousness? If they know all this, and act with a view to these ends, it must indeed be confessed that bees are rational creatures, and that their thinking and reasoning powers far surpass those of men; for they have from the earliest ages made discoveries in the higher mathematics, which there is reason to believe were altogether unknown to the human race till the beginning of the present century, and which at this moment are beyond the comprehension of nine-tenths of mankind in the most enlightened nation on earth. If this be a conclusion too absurd to be admitted, there is no other alternative but either to suppose that by this artificial structure of their cells the bees have some other end in view, which we cannot distinguish; or to acknowledge that they are overruled by some mysterious influence, under which they are nothing but spontaneous agents, unconscious of the end to which their operations tend. Which of these conclusions is the most rational, we will not offer such an insult to the understanding of our readers, as to suppose the meanest of them capable of entertaining a doubt. That a honey-comb is constructed with design, we must readily admit; but the design is not in the bees, but in the Creator of the bees, who directs their operations to their own good, by what the author with great propriety terms a mysterious influence (D).

But he thinks it an unanswerable argument in support of his opinion, that "the laws of analogical reasoning do not justify the idea that the brutes act, on any occasion, absolutely without design."
Instinct, part of his theory, that in the performance of those actions, in which animals are said to be guided by unerring instinct, different individuals display different modes of conduct; and in his opinion, to talk of instinctive principles which admit of improvement, and accommodate themselves to circumstances, is merely to introduce new terms into the language of philosophy; for he affirms, that no such improvement or accommodation to circumstances can ever take place without a comparison of ideas and a deduction of inferences. It is probable that the author here alludes to those animals which, in their most important operations, are known to act differently in different countries. Thus the ostrich in Senegal, where the heat is excessive, neglects her eggs during the day, but sits upon them in the night. At the Cape of Good Hope, however, where the degree of heat is less, the ostrich, like other birds, sits upon her eggs both day and night. In countries infested with monkeys, many birds, which in other climates build in bushes and crevices of trees, suspend their nests upon slender twigs, and thus elude the rapacity of their enemies.

It may be thought, that a determination of the mind of the brute to act so variously upon different occasions, can hardly be conceived without judgment or intelligence. But before our author had so confidently affirmed that such accommodation to circumstances can never take place without a comparison of ideas and a deduction of inferences, he would have done well to consider how nature acts in other organized bodies, such as the vegetable. We see that a vegetable, reared in the corner of a dark cellar, will bend itself towards the light which comes in at the window; and if it be made to grow in a flower-pot, with its head downwards, it will turn itself into the natural position of a plant. Can it be supposed, that the plant, in either case, does what it does from any judgment or opinion that it is best, and not from a necessary determination of its nature? But, further, to take the case of bodies unorganized, how shall we account for the phenomena which chemistry exhibits to us? When one body unites with another, and then, upon a third being presented to it, quits the first, and unites itself with it, shall we suppose that this preference proceeds from any predilection or opinion that it is better to cleave to the one than to the other, from any comparison of ideas or deduction of inferences? Or shall we not rather say, that it proceeds from an original law of nature impressed upon it by that Being who mediately or immediately directs every motion of every minutest atom in the universe? And if so, why may not instinct be an original determination of the mind of the animal, of which it is part of the nature or essence to accommodate itself to certain circumstances, on which depends the preservation of the individual, or the continuation of the kind? Indeed it cannot be otherwise, if we have defined instinct properly; for no man ever supposed, that when animals work instinctively, they act for no purpose. It is only affirmed that the purpose is not known to them. It is known, however, to the Author of instinct; who knows likewise that the same purpose must in different climates be promoted by different means, and who accordingly determines the operations of animals of the same species to be different under different circumstances.

But though we cannot agree with this author when he affirms that no accommodation to circumstances can ever take place without a comparison of ideas, we readily admit that no faculty which is capable of improvement by observation and experience can in propriety of speech be termed instinct. Instinct being a positive determination given to the minds of animals by the Author of nature for certain purposes, must necessarily be perfect when viewed in connection with those purposes: and therefore to talk, as Mr. Smellich does, of the improvement of instinct, is to perplex the understanding by a perversion of language. There is not, however, a doubt, but that reason may copy the works of instinct, and so far alter or improve them as to render them subservient to other purposes than those for which they were originally and instinctively performed. It was thus in all probability that man at first learned many of the most useful arts of life.

"Thy arts of building from the bee receive;"
"Learn of the mole to plough, the worm to weave;"
"Learn of the little nautilus to sail;"
"Spread the thin ear, and catch the driving gale."

But the arts thus adopted by men are no longer the works of instinct, but the operations of reason influenced by motives. This is so obviously and undeniable true, that it has compelled the author last mentioned to confess, in that very section which treats of instincts, improvable by experience, that "what men or brutes learn by experience, though this experience be founded on instinct, cannot with propriety be called instinctive knowledge, but knowledge derived from experience and observation. Instinct (he says) should be limited to such actions as every individual of a species exerts without the aid either of experience or imitation." This is a very just distinction between instinct and experience; but how to reconcile it with the fundamental principle of the author's theory we know not. It would certainly be a very arduous task; but it is a task from which we are happily relieved, as his theory and ours have little resemblance.

Having thus proved, we hope to the satisfaction of our readers, that there is such a principle as instinct in the inferior animals, and that it is essentially different from human reason; let us return to our own species and inquire whether there be any occasions upon which man acts instinctively, and what these occasions are. Man acts instinctively, a question of some difficulty, to which a complete and satisfactory answer will perhaps never be given, and to which we have not the vanity to think that such an answer will be given by us. The principle of association (to be explained afterwards under the article Metaphysics) operates so powerfully in man, and at so early a period of life, that in many cases it seems to be impossible to distinguish the effects of either; and indeed, in my opinion, by far the greater part of mankind are destined by God and nature to be governed in that way."

of habit from the operations of nature. Yet there
are a few cases immediately connected with the preser-
vation of the individual and the propagation of the
kind, in which by a little attention these things may
be distinguished. We have already given an instance
in the sucking of a child, which we believe to be an
operation performed by instinct. Dr Priestley, how-
ever, thinks differently. "The action of sucking
(says he), I am confident, from my own observations,
is not natural, but acquired." What observations they
were which led him to this conclusion he has not told
us, and we cannot imagine; but every observation
which we ourselves have made, compels us to believe
that an attempt to suck is natural to children. It has
been observed by the author of the Philosophy of Na-
tural History, that the instinct of sucking is not excited
by any smell peculiar to the mother, to milk, or to
any other substance; for that infants suck indiscrimi-
nately every thing brought into contact with their
mouths. He therefore infers, that the desire of suck-
ing is innate, and coeval with the appetite for air. The
observation is certainly just: but a disciple of Dr
Priestley's may object to the inference; for "in sucking
and swallowing our food, and in many such instances,
it is exceedingly probable (says the doctor), that the
actions of the muscles are originally automatic, having
been so placed by our Maker, that at first they are sti-
mulated and contract mechanically whenever their ac-
tion is requisite." This is certainly the case with re-
spect to the motion of the muscles in the action of
breathing; and if that action be of the same kind and
proceed from the very same cause with the action of
sucking, and if a child never show a desire to suck but
when something is brought into contact with its mouth,
Dr Priestley's account of this operation appears to us
much more satisfactory than that of the authors who
attribute it to instinct.

But the actions of breathing and sucking seem to
differ essentially in several particulars. They are in-
deed both performed by means of air; but in the for-
mour, a child for many months exerts no spontaneous
 effort, whilst a spontaneous effort seems to be absolutely
necessary for the performance of the latter. Of this
indeed we could not be certain, were it true that infants
never exhibit symptoms of a wish to suck but when
something is exactly in contact with their mouths;
for the mere act of sucking them might well be sup-
posed to be automatic and the effect of irritation: But
this is not the case. A healthy and vigorous infant,
within ten minutes of its birth, gives the plainest and
most unequivocal evidence of a desire to suck, before
any thing be brought into actual contact with its
mouth. It stretches out its neck, and turns its head
from side to side apparently in quest of something: and
that the object of its pursuit is something which it may
suck, every man may satisfy himself by a very convincing
experiment. When an infant is thus stretching out its
neck and turning its head, if anything be made to
touch any part of its face, the little creature will in-
stantly turn to the object, and endeavour by quick
alternate motions from side to side to seize it with
its mouth, in the very same manner in which it always
seizes the breast of its nurse, till taught by experience
to distinguish objects by the sense of sight, when these
alternate motions, being no longer useful, are no longer
employed. If this be not an instance of pure instinct,
we know not what it is. It cannot be the result of
association or mechanism; for when the stretching of
the neck takes place, nothing is in contact with the
child's mouth, and no association which includes the
act of sucking can have been formed. Associations
of ideas are the consequences of simultaneous impressions
frequently repeated; but when the child first declares,
as plainly as it could do were it possessed of language,
its wish to suck, it has not received a single impression
with which that wish can possibly be associated.

Were Dr Priestley to weigh these facts, of the truth
of which we are certain, we doubt not that his well-
known candour would make him retract the assertion,
that all the actions which Dr Reid and others refer to
instinct, are either automatic or acquired. The greater
part of those actions, as well as of the apparently in-
 instinctive principles of belief, we have no doubt are
 acquired: but we are persuaded that a child sucks its
nurse, as a bee builds its cell, by instinct; our other
hypothesis can account for the spontaneous efforts exerted in both these operations: and we think it
no disgrace to our species, that in some few cases we
should act from the same principle with the inferior
creation, as nothing seems more true than that,

---Reason raise o'er instinct as we can;
In this 'tis God that works, in that 'tis man.

We have said, that, in the savage state, the sexes go
together for the first time by instinct, without any
view to offspring, and perhaps with no determinate idea
of enjoyment. This opinion, we believe, has been
generally maintained; but it is controverted by Dr
Hartley. "Here (says he) we are to observe, first,
that when a general pleasurable state is introduced,
either by direct impressions or by associated influences,
the organs of generation must sympathize with this
general state, for the same reasons as the other parts
do. They must therefore be affected with vibrations
in their nerves, which rise above indifference, into the
limits of pleasure, from youth, health, grateful aima-
ment, the pleasures of imagination, ambition, and sym-
pathy, or any other cause which diffuses grateful vi-
brotions over the whole system. ---Secondly, as these
organs are enuned with a greater degree of sensibility
than the other parts, from their make, and the peculiar
structure and disposition of the nerves, whatever these
be, we may expect that they should be more affected by
those general pleasurable states of the nervous system
than the other parts. ---Thirdly, the distension of the
cells of the vesicular seminales and of the sinuses of the
stirrus, which take place about the time of puberty,
must make these organs more particularly irritable
then." His fourth observation respects a state widely
different from that of nature, and therefore is nothing
to the purpose: but his fifth is, that "the particular
shame which regards the organs of generation, may,
when considered as an associated circumstance, like
other pains, be so far diminished as to fall within the
limits of pleasure, and add considerably to the sum
total."

To this excellent and able writer may allow the
truth of these observations (though some of them
might certainly be controverted); and yet deny his
conclusion, that "they are sufficient to account for the
N a
Instinct. general desires which are observable in young persons, and that those desires are of a factitious nature." For supposing every thing which he mentions to take place by mere mechanism and association; that the organs of generation are irritated, and certain cells and sinuses distended; the only inference which can be fairly drawn from such premises is, that at the age of puberty young men and women must from these causes experience certain feelings and wants which they knew not before; but surely mechanism and association cannot teach them the use of the organs of generation, or point out the only means by which their new feelings can be gratified: and therefore, as we see these means invariably pursued by all animals rational and irrational, without experience and without instruction, we must refer the mutual desire of the sexes to a higher principle than mere mechanism and association; and that principle can be nothing but instinct.

Besides these, we think the action of eating may be attributed to instinct. It is certainly performed by a spontaneous exertion of the proper organs; and that exertion is first made at a time of life when we have no conception of the end which it serves to accomplish, and therefore cannot be influenced by motives. It must indeed be confessed, that the first act of chewing is performed by a child, not for the purpose of masticating food, but to quicken the operation of nature in the cutting of teeth: and perhaps it may be said, that the pleasing sensation of taste, which is then first experienced, and afterwards remembered, prompts the child to continue at intervals the exertion of chewing after all his teeth are cut; so that though the act of eating is not performed with a view to the mastication of food or the nourishment of the body, it may yet be performed, not from any instinctive impulse, but merely from an early and deep-rooted association. But in answer to this it is sufficient to ask, Who taught the infant that the act of chewing will quicken the operation of nature in the cutting of teeth? Not reason, surely, nor experience; for an infant knows nothing of teeth or the manner in which they grow; and if it be granted, that for this purpose it was originally impelled by some internal and mysterious influence to perform the action of chewing, we are not inclined to deny that the operation may be continued for other purposes by means of association.

In human works, though laboured on with pain, A thousand movements scarce one purpose gain; In God’s, one single can its end produce, Yet serves to second too some other use.

This is sound philosophy confirmed by observation and daily experience: but though in the works of God, one principle produces many consequences, and though perhaps there is not a principle which falls under our cognizance more fruitful than that of association, yet if it be not sufficient to account for the first act of chewing, we cannot refer to it alone as to the source of that operation. Should it be said, that the gums of an infant are at the period of cutting teeth so irritating, that the moment any thing is applied to them the jaws perform a motion merely automatic, which we mistake for the spontaneous effect of instinct; still we would ask, What prompts the child to apply every thing to its mouth? Does the irritation of the gums contract the muscles of the arm? By a bigot for mechanism this might be said, were it true that the arm of an infant, like a piece of clock-work, is always so regularly moved as to bring its hand directly into contact with its gums: but this is far from being the case; an infant makes many unsuccessful efforts to reach its mouth, and does not accomplish its purpose till after repeated trials. Perhaps it may be alleged (for when men adopt a favourite hypothesis they will allege any thing in its support), that infants are taught to carry things to their mouths by the pleasing sensation received from the application of their nurses breasts, and continue the practice from habit and association. But it is certain that they do not begin this practice till teeth are forming in their gums; and then they use such things as they themselves carry to their mouths very differently from the breasts of their nurse: they constantly chew and bite their rattles, though they very seldom bite their nurses. As this practice cannot be begun from a principle of association, so it appears to us that it cannot be continued upon such a principle. Were the sensation experienced by an infant when chewing a hard substance a pleasing sensation, the remembrance of the pleasure might as a motive prompt it to repeat the operation: but it is obvious, that by pressing a gum, through which a tooth is making its way, against any thing hard, the infant must experience a painful sensation; and therefore the influence which impels it to continue this operation, must be something more powerful than pleasure or pain.

These three actions, then, by which infants suck, by which they chew their food, and by which mankind motions in are propagated, have undeniably their origin in instinctive instinct. There may be many other human actions which it is which derive their origin from the same source; but impossible to distinguish from the effects of early habit.

Such, however, is the present impatience of that labour without which effects cannot be traced to their causes, that every phenomenon in human nature, which to former philosophers would have occasioned difficulty, is now thought to be sufficiently accounted for by referring it to some instinct as its particular cause; and he who can provide himself with sufficient number of these instincts, for the reality of which he offers no proof, seats himself in the philosopher’s chair, and dreams that he is dictating a system of science, whilst he is only retailing a collection of anecdotes. A philosopher of this school has lately carried the doctrine of instinctive principles so far, as to attribute the superiority of man over the other animals, chiefly to the great number of instincts with which his mind is endowed; and among these he reckons (not, we believe, as characteristic of our species in contradistinction to other animals, but as part of the instinctive bundle in the largeness of which our superiority consists) the voiding of urine and excrement, the moving of the eyelids and other parts of the body. These (he says) are effects of original instincts, and essential to the existence of young animals. With this writer instinct is sometimes represented as looking into futurity, and acting upon motives which have hitherto been considered as the province of reason and the characteristic of man:
Here the same instinct is confounded with irritation and mechanism; and if this mode of philosophizing continue in fashion, we shall not be surprised to find men, beasts, birds, and vegetables, considered by some other writer as nothing more than different species of the same genus of beings, that are all actuated by the great and universal principle of instinct. If sneezing and the retraction of the muscles upon the application of any painful stimulus be actions of instinct, there cannot be a doubt, upon the received principles of philosophy, but that the contraction of the least sensitive plant upon the application of any stimulus proceeds likewise from instinct: may, a piece of leather must be endowed with instinct; for it too retracts upon the application of the painful stimulus of fire. All these are evidently similar effects produced by the same or similar causes; for in the operations of sneezing and retracting the muscles upon any painful application, there is not the least spontaneous exertion on our part, no co-operation of mind more than in the contraction of the leather and the plant. With respect to the voiding of urine and excrement, it is obvious, that at first these operations are performed without any effort of spontaneity; and that a voluntary power over the muscles which are subservient to them is very gradually acquired. Urine and excrement irritate the bladder and gut, which are supplied with branches of the same nerves that supply the abdominal muscles. But it is well known that the irritation of one branch of a nerve brings on a contraction of the muscles which are supplied by the other branches. Urine and excrement therefore are evidently felt by the mechanical contraction of the organs of excretion; and to attribute these evacuations to instinct, is equally absurd as to say, that water or any other soft substance pent up in a vessel, and pressed equally on all sides, makes its escape by instinct through the easiest passage. It is difficult to guess what the author means by the instinctive motion of the eyelids and other parts of the body. There is a motion of the eyelids which is voluntary, and another which is involuntary. The former proceeds from some motive, to exclude too great a glare of light, or to guard the eye against a foreseen mischief, and is therefore the result of reason as distinguished from instinct: the latter is obviously the effect of association, which took place in early infancy and produced a habit. Infants for several days after birth do not wink with their eyes upon the approach of one’s hand or any other substance; but after having experienced pain from too much light or any other thing which hurts the eye, and that pain having at first produced an automatic motion of the eyelids, the association comes next to be so closely associated with its cause, that the very appearance of the latter produces the former. In all this there is no instinct, nor any thing which resembles instinct: in the one case, the motion of the eyelids is in the strictest sense voluntary and rational; and in the other, it is either automatic or the effect of habit.

"The love of light (says the same writer) is exhibited by infants at a very early period. I have remarked evident symptoms of this attachment on the third day after birth. When children are farther advanced, marks of the various passions generally appear. The passion of fear is discoverable at the age of two months. It is called forth by approaching the hand to the child’s eye, and by any sudden motion or unusual noise." It has likewise been said, that "an infant may be put into a fright by an angry countenance, and soothed again by smiles and blandishments;" and "that all these are cases of pure instinct." In reply to which, we scruple not to assert with Dr. Priestley, that an infant (unless by an infant be meant a child who has a good deal of experience, and of course has made many observations on the connections of things) "is absolutely incapable of terror. I am positive (says he) that no child never showed the least symptom of fear or apprehension till he had actually received hurts and had felt pain; and that children have no fear of any particular person or thing, but in consequence of some connection between that person or thing and the pain they have felt. If any instinct of this kind were more necessary than another, it would be the dread of fire. But every body must have observed, that infants show no sign of any such thing; for they will as readily put their finger to the flame of a candle as to any thing else, till they have been burned. But after some painful experience of this kind, their dread of fire, though undeniably the effect of association, becomes as quick and as effectual in its operations as if it were an original instinctive principle." We moreover do not hesitate to say, with the same great philosopher, that if it were possible always to beat and terrify a child with a placid countenance, so as never to assume that appearance but in those circumstances, and always to assure him with what we call an angry countenance, this connection of ideas would be reversed, and we should see the child frightened with a smile and delighted with a frown. In fact, there is no more reason to believe that a child is naturally afraid of a frown, than that he is afraid of being in the dark; and of this children certainly discover no sign, till they have either found something disagreeable to them in the dark, or have been told that there is something dreadful in it.

The truth of these observations is so obvious, that we doubt not but they will carry conviction to the mind of every reader. For though it should be granted, that so early as on the third day after birth children exhibit symptoms of uneasiness upon the sudden exclusion of light, it would by no means follow that the love of light is in them instinctive. Light operates upon the eye by contact, and communicates to the infant a sensation of touch. If that sensation be pleasant, the child must necessarily feel some degree of uneasiness upon its removal, just as a full grown man must feel uneasiness upon being deprived of any positive pleasure. But is sensation, or pleasure, or the removal of pleasure, pure instinct? No, surely.

Thus difficult is it to say in many cases what actions have their origin in instinct; and what are merely the effects of early association. But we think it may be safely affirmed, that no action, whether of man or brute, which is deliberately performed with a view to consequences, can with any propriety be said to proceed from instinct; for such actions are the effect of reason influenced by motives. Deliberation and instinct are obviously incompatible. To say with the author of the Philosophy of Natural History, "that, when we are stimu-
Instinct. {284] Instinct. 

Insulated by a particular instinct, instead of instantly obeying the impulse, another instinct arises in opposition, creates hesitation, and often totally extinguishes the original motive to action; "is either to affirm what is apparently not true, or it is a gross perversion of language. Motives opposed to each other may create hesitation, and a powerful motive may counterbalance a feeble instinct; but of two or more instincts operating at the same time, and opposing each other, we have no conception. Instinct, if we choose to speak a language that is intelligible, means a certain impulse under the direction of Supreme Wisdom; and it is very little probable that such wisdom should give opposite impulses at the same instant. In the natural works of animals, which are confessedly under the influence of instinct, we perceive no symptoms of deliberation; but every one, when not interrupted by external violence, proceeds without hesitation in the direct road, to an end of which the animal itself knows nothing. The same would be the case with man were he under the guidance of instinct: and it is vain to say that the instinct of fear is daily counteracted by ambition and resentment, till it be proved that fear, ambition, and resentment, are really instincts. Of this, however, the author seems to have no doubt. Indeed his work is so liberally stored with those principles of universal utility to man, that he wishes us to procure the name of a philosopher without the labour of investigation, that not only fear, ambition, and resentment, but even superstition, devotion, respect for eminent characters, avarice, hope, envy, benevolence, and sympathy, are all, in his opinion, instincts simple or modified. The origin of fear we have already seen when examining the instincts said to exhibit themselves in early infancy: let us try if we cannot trace some other individuals of this numerous family to the same source of early associations.

Source of this error. 

The case then seems to be as follows. We first perceive or suppose some real good, i.e. some fitness to promote our happiness, in those things which we love or desire. Hence we annex to those things the idea of pleasure; with which they come, in time, to be so closely associated in our minds, that they cannot ever after present themselves without bringing that idea along with them. This association likewise often remains even after that which first gave rise to it is quite forgotten, or perhaps does not exist. An instance or two will make this very clear. No man can be borne a lover of money; for in a state of nature money exists not: no man therefore can be born with our author's instinct of avarice, directed in the manner which the most common acceptation of that word denotes. Yet how many men are there in the world, who have as strong a desire for money as if that desire were innate and instinctive; who account so much money so much happiness; and who make the mere possession of gold and silver, without any thought or design of using them, the ultimate end of all their actions? This is not because the love of money is born with them, for that is impossible; but because they first perceive a great many advantages from the possession of money, whence they conceive a pleasure in having it. Hence they desire it, endeavour to obtain it, and feel an actual pleasure in obtaining and possessing it. Then, by dropping the intermediate steps between money and happiness, they join money and happiness immediately together, and content themselves with the fantastic pleasure of having it; making that which was at first pursued only as means, be to them an ultimate end, in which consists their happiness or misery. The same might be observed concerning the thirst after knowledge, fame, ambition, and most of the various pursuits of life. These are at first entered upon with a view to some farther end, but at length become habitual exercises; with which the idea of pleasure is so closely associated, that we continue the pursuit after the reason from which it was at first begun has entirely vanished from our minds. Hence also we may account for another of our author's modified instincts, the almost diabolical feeling of envy. Mr Locke observes, that there are some men entirely unacquainted with this passion. His observation we believe to be a just one; for most men that are used to reflection, remember the time when they were first under its influence; and though they did not, it is a thing very little likely that the beneficent Author of nature should have implanted in the human mind even the seeds of an instinct, which, in the emphatic language of The Rambler, "is mere unmixed and genuine evil." Envy is that pain which arises in the mind upon observing the success or prosperity of others; not however of all others indefinitely, but only of those with whom, upon some account or other, the envious person has once had a rivalship. But of such a feeling the origin is obvious: for when two or more persons are competitors for the same thing, the success of the one necessarily tends to the detriment of the other: hence the success of the one rival is in the mind of the other closely associated with pain or misery; and this association remaining after the rivalship which occasioned it has ceased, the person in whose mind envy is thus generated, always feels pain at the success of his rival even in affairs which have no relation to the original competition. Thus it is, that we are apt to envy those persons who refuse to be guided by our judgments, or persuaded by our arguments: For this is nothing else than a rivalship about the superiority of judgment; and we take a secret pride, both to let the world see, and in imagining ourselves, that in perspicuity and strength of judgment we have no superior.

Though the principle of association will be more fully explained in another place, there is one observation which must not be omitted here; it is, that we do not always, nor perhaps for the most part, make these associations ourselves, but learn them from others in very early life. We annex happiness or misery to certain things or actions, because we see it done by our parents or companions; and acquire principles of action by imitating those whom we esteem, or by being told, by those in whom we have been taught to place confidence, that such conduct will promote our happiness, and that the reverse will involve us in misery. Hence the son too often inherits both the vices and the virtues of his father as well as his estate; hence national virtues and vices, dispositions and opinions; and hence too it is, that habits formed before the period of distinct remembrance are so generally mistaken for natural instincts.

From the whole then of this investigation, we think ourselves warranted to conclude, that there is an essential difference between mechanism and instinct, and between both and reason; that mankind perform actions instinctively.
The primary schools, one of which is established in every district, where children are taught the arts of reading and writing, the elements of French grammar, of arithmetic and geometry, &c. 2. The central schools, situated in the capital of every department, and one is allowed for every 300,000 inhabitants. 3. The schools of health, which are three in number, where medicine and surgery are studied. 4. Two schools for oriental languages. 5. The polytechnic school in Paris for the direction of public works, an establishment which is generally admired. 6. The national institute, of which we have already given some account.

The Institute was new modelled by Bonaparte in 1806, and again on the return of the Bourbons. By a decree of 21st March 1816, it was ordered that the Institute should be composed of four academies, viz. the French academy, the Royal Academy of Inscriptions and Belles Lettres, the Royal Academy of Sciences, and the Royal Academy of Fine Arts. Some alterations were at the same time made in the number of members, and in other particulars.

By means of a permanent committee of instruction, under the authority of government, many improvements of a literary and scientific nature have been made, such as the National Bibliography, or complete catalogue of books of all descriptions; the annihilation of all dialects, which were incredibly numerous in France; the establishment of the Conservatoire des Arts et Métiers; of the board of longitude, the general school of the oriental languages, the national museum of antiquities, the new-modelling of the grand national library, the augmentation of the museum of natural history, the école des mines, and the society of natural history.

INSTITUTION, in general, signifies the establishing or founding something.—In the canon and common law, it signifies the investing a clerk with the spiritualities of a rectory, &c. which is done by the bishop, who uses the following formula: “I institute you rector of such a church with the cure of souls, and receive your care and mine.”

Institutions, in literary matters, denote a system of the elements or rules of any art or science.

Thus physical or medical institutions are such as teach the necessary precognita to the practice of medicine, or the cure of diseases.

INSTRUMENT, in general, whatever is subservient to a cause in producing any effect.

Mathematical, Philosophical, &c. INSTRUMENTS: See Astronomy, Electricity, Geometry, Levelling, Mechanics, Optics, Pneumatics, &c. &c.

Instrument, is also used in law, to signify some public act, or authentic deed, by means whereof any truth is made apparent, or any right or title established, in a court of justice.

Notarial INSTRUMENT, in Scots Law, any fact certified in writing, under the hand of a notary-public.

INSUBRIUM AGER, in Ancient Geography, a district of the Transpadana; situated between the Ticinus to the west, the Addua to the east, the Padus to the south, and the Orobi to the north. The people called Insubes by Livy, Insubri by Ptolemy, and Isombres by Strabo. Now the duchy of Milan.

INSULAR, any thing belonging to an island.—Insular situations are productive of many happy consequences to the inhabitants, both with respect to the climate,
The parties who engage to pay the damage are called the insurers or underwriters; the parties for whose security they engage are called the insured; and the premium is understood to be paid when the insurance is made.

On this subject, we shall consider, What is necessary to render an insurance valid:—When the risk commences, and when it terminates:—What constitutes a total or a partial loss:—What proof of loss is necessary:—and, How the loss is adjusted.

First, In order to render an insurance valid, the insured must have property really at stake; the voyage must take place under the circumstances agreed on; the dangers insured against must not be contrary to law; and a candid account must be given of circumstances which enhance the danger.

1. The condition of possessing property was required by 19 Geo. II. c. 37, to prevent ships from being fraudulently destroyed when insured above their value; and to discourage a practice which had become common, of converting policies to the purpose of mere wagers. In transactions of this kind, as the insured had no property, and could claim no indemnification for partial damage, so the insurers, having lost their wager by the ship's being lost, could claim no substantial, though part was saved: accordingly, the policies contained clauses of interest or no interest, free from average, and without benefit of salvage. All such policies are declared invalid.

This restriction does not extend to privateers, nor to ships trading to the Spanish or Portuguese plantations.

Insurances are commonly made as interest shall appear; and it is incumbent on the insured to prove the value of his property. The value of the goods may be proved by the invoices; and the coquet must be produced, if required, to inculpate that the goods were actually shipped. It is admitted to value the ship at prime cost and charges, deducting the freights that have been drawn since purchased, if the proprietors choose to stand to that rule; but they are not restricted to it. Sometimes the value of the ship or goods is expressed in the policy; and this value must be admitted, although it be higher than the true one: but it is incumbent on the insured to prove that he had property at stake; and, if the property be trifling in comparison of the sum insured, the insurance will be set aside, as an evasion of the statute.

Expected profits, and bounty on the whale fishery, if specified in the policy, may be insured.

When the value is less than the sum insured, the owners may claim a return of premium for the excess.

If there be several policies on the same subject, of different dates, the earliest one is valid, and the others must be vacated. If they be of the same date, they must be vacated in equal proportions.

When a policy is vacated, in whole or in part, the underwriters have a right to retain ¼ per cent. for their trouble.

In the case of a cargo intended for A, but afterwards sent to B, both expected it, and insured, and B claimed for the value on its being lost. The underwriters answered, that it was a double insurance, and they ought only to pay their proportion. Judgment was
was given, finding them liable for the whole, and receiving to them any demand competent against the underwriters who insured for A.

Fraudulently to cast away or destroy a ship insured above its value, is felony.

2. If the ship does not proceed on the voyage, or if, being warranted to depart with convoy, it departs without convoy, the insurance must be vacated.

If the extent of a trading voyage be uncertain, the longest one in contemplation is described in the policy, and it is agreed that part of the premium shall be returned, if the voyage be shortened. In like manner, in time of war, when insurance is made without condition of convoy, it is agreed that part of the premium be returned in case it sail with convoy.

When a ship is warranted to depart with convoy, it is understood from the usual place of convoy (e.g. the Downs), and it is insured till it arrive there.

The common proof of sailing with convoy is the production of sailing orders; but, if a ship be prevented by the weather from receiving the sailing orders, other proof may be admitted.

A ship was insured from the Thames to Halifax, warranted to sail from Portsmouth with convoy. The convoy had sailed before the ship arrived there, and the underwriters declined to insure it, without convoy, for the rest of the voyage. They were found liable to return part of the premium, retaining only in proportion to the accustomed rate from London to Portsmouth. This decision seems to establish the following principle, that, when the voyage performed is only part of that described in the policy, and when the risk can be proportioned, the underwriters are bound to return part of the premium, though there be no agreement for that purpose.

But, if a ship, insured only against the hazards of the sea, be taken by the enemy, the insured have no right to claim a return of premium, though the capture happen soon, under pretence that little sea-hazard was incurred.

If a ship deviates from the voyage described in the policy, without necessity, it sets aside the insurance. An intention to deviate is not sufficient to set it aside; there must be an actual deviation; and, even in that case, the insurers are liable for damages sustained before deviation.

It is no deviation to go out of the way to the accustomed place of convoy, nor to the nearest place where necessary repairs may be had. Deviation, for the purpose of smuggling, if without the knowledge of the owners, does not set aside the insurance, nor when the master is forced by the crew to return.

In insurance to the East Indies, and home, the insurers are understood to take the risk of detention in the country, and of country voyages.

3. Insurance of prohibited goods, against the risk of seizure by the government, is unlawful and invalid. The insurers, insured, brokers, and all accessories, are liable to the fine of 500l.

4. If the insured have any information of more than common danger, they must reveal every such circumstance to the insurers; otherwise the policy is set aside.

This rule is established for the preservation of good faith; and there are several strong decisions in support of it. If a ship be spoke to leaky at sea, or if there be a report of its being lost, these circumstances must be communicated to the insurers. Even the concealment of a false report of loss vitiates the insurance; and, if the ship be afterwards lost, though in a different manner, the insurer will recover nothing. In a voyage from Carolina to London, another ship had sailed ten days after that which was insured, and arrived seven days before the insurance was made; and the concealment of this circumstance, though the fact was not proved to the satisfaction of the jury, was considered as sufficient to set it aside. Also, during the continuance of the American war, a ship being insured from Portugal, by the month, without condensing on the voyage, sailed for North America, and was taken by a provincial privateer. The insurers refused to pay, because the hazardous destination was concealed; and it was only upon proof of the insured being equally ignorant of it that they were found liable.

But the insurers are not obliged to take notice of general perils, which the insurers are understood to have in contemplation; dangerous navigation, West Indian hurricanes, enterprises of the enemy, and the like.

Insurance is not set aside by a mistake in the name of the ship or master, or the like.

Insurance may be made on an uncertain ship; on any ship that the goods may be loaded on; on any ship that A shall sail from Virginia. In this last case, the policy is not transferred to a ship which A goes on board during the voyage.

Secondly, If a ship be insured at and from a port, the insurance commences immediately if the ship be there, or at its arrival there. If it be damaged when preparing for a voyage, the insurers are liable; but not if the voyage be laid aside for several years, with consent of the owners. Insurance from a port commences when the ship breaks ground; and, if it set sail, and be driven back and lost in the port, the insurers are liable.

Insurance on goods generally continues till they be landed; but if they be sold after the ship's arrival, and freight contracted to another port, the insurance is suspended. Goods sent on board another ship or lighter are not at the risk of the insurers; but goods sent ashore in the long boat are.

Insurance on freight commences when the goods are put on board.

Goods from the East Indies, insured to Gibraltar, and to be reshipped from thence to Britain, were put on board a store-ship at Gibraltar, to wait an opportunity of reshipping, and were lost: The custom of putting goods aboard a store-ship being proved, the insurers were found liable.

Loss of sails ashore, when the ship is repairing, is comprehended within the insurance. What is necessarily understood, is insured, as well as what is expressed; the essential means, and intermediate steps, as well as the end. Ships performing quarantine are at the risk of the insurers.

Thirdly, The insurers are liable for a total loss when the subject perishes through any of the perils insured against. Barratry, though it properly signifies running away with the ship, extends to any kind of fraud in
If damage is sustained, the extent is proved by an insurance examination of the subject damaged, at the ship’s arrival; and the cause by the evidence of the crew.

If the ship be stranded, evidence must be taken at the place where stranded.

Documents of loss must be laid before the underwriters, with all convenient speed; and, if these be sufficiently clear, the loss should be immediately settled.

The underwriters generally grant their notes at a month or six weeks date for their proportions.

If a ship be not heard of for a certain time, it is presumed lost; and the underwriters are liable to pay the sums insured, the property being abandoned to them in the event of the ship’s return. Six months are allowed for a voyage to any part of Europe, a year to America, and two years to the East Indies.

By the ordinance of Hamburg, if a ship be three months beyond the usual time of performing a voyage, the underwriters may be desired to pay 92 per cent. on an abandon. If they decline it, they are allowed 14 months more, and then they must pay the full value.

A ship insured against the hazards of the sea, but not against the enemy, if never heard of, is presumed lost at sea.

Fifthly, In order that the manner of settling losses may be understood, we must explain what is meant by covering property. We mentioned already, that insurances for greater sums than the insured had really at stake, were contrary to law: but some latitude is allowed in that respect; for if the owner were to insure no more than the exact value of his property, he would lose the premium of insurance, and the abatement, if any was agreed on.

For example, if he has goods on board to the value of 100l. and insures the same at 5 per cent. to abide 2 per cent. in case of loss; then, if a total loss happen, he recovers 98l. from the insurers, of which 98l. being applied to re-place the premium, the nett sum saved is only 93l.; but, if the value on board be only 93l. and the sum insured 100l. he would be fully indemnified for the loss; and his property, in that case, is said to be covered.

To find how much should be insured to cover any sum, subtract the amount of the premium and abatement (if any) from 100l. As the remainder is to 100l. so is the value to the sum which covers it.

In case of a total loss, if the sum insured be not greater than that which covers the property, the insurers must pay it all. If greater, they pay what covers the property, and return the premium on the overplus.

Partial losses are regulated by this principle, that whereas the owner is not fully indemnified, in case of a total loss, unless he covers his property, therefore he should only be indemnified for a partial loss in the same proportion; and, if it be not fully insured, he is considered as insurer himself, for the part not covered, and must bear a suitable proportion of the loss. Therefore the value of the property is proved, and the sum required to cover it computed. If that sum be all insured, the underwriters pay the whole damage; if only part be insured, they pay their share, which is computed by the following rule: As the sum which covers the property is to the sum insured, so is the whole damage to the
the part for which the insurers are liable.

For example, if the value of the property be 350l. the sum insured 300l. the premium 5 per cent. and abatement 2 per cent. then the sum which should be insured to cover the property is 400l.; and, if damage be sustained to the extent of 200l. the owners will recover 150l.

If a voyage is insured out and home, the premium outward must be considered as part of the value on the homeward property, and the sum necessary to cover it computed accordingly. For example, to insure 100l. out and home, at 5 per cent. each voyage, abatement 2 per cent. we compute thus:

\[ 93 : 100 :: L. 100 : L. 109 : 10 : 6, \]

93:100 is the proportion of the premium on 100l. at 5 per cent., to the premium on 109l. at 6 per cent. Then the premium on which is

\[ L. 5 : 13 : 6 \]

and, if the ship be lost on the homeward voyage,

From the sum insured home

L. 113 6 0

Subtract the discount, 2 per cent.

Insurance home L. 5 13 3 II — 9

Covered property L. 100 — —

II. Insurance against Fire.

There are several offices in Britain for this purpose, of which the Sun fire-office is the most considerable. Insurances are divided into common, hazardous, and doubly hazardous, according to the nature of the subject insured. When the sum insured is high, there is a higher premium per cent. demanded; and money, papers, jewels, pictures, and gun-powder, are not comprehended. If a subject be wrongly described, in order that it may be insured at a lower premium, the policy is void. The benefit of a policy is transferred, by indorsement, to the representatives of the person in whose favour it was made; and it may be transferred to other houses when the insured changes his habitation. If insurance be made on the same subject in different offices, it must be specified, by indorsement, on the policy; and, in case of loss, the offices pay proportionally. The insurers pay all expenses in attempting to extinguish fire, or to save goods, though not successful. If the value of a subject be insured in part, and damage be sustained, the insurers pay the whole, if it does not exceed the sum insured.

III. Insurance of Debts. See Bottomry.

IV. In virtue of Insurance for Lives, when the person dies, a sum of money becomes payable to the person on whose behalf the policy of insurance was granted. One of the principal insurance-offices of this kind is that of the Amicable Society for a perpetual insurance, kept in Serjeant’s-inn, Fleet street, London.

This society at Serjeant’s-inn requires an annual payment of 5l. from every member during life, payable quarterly. The whole annual income hence arising is equally divided among the nominees, or heirs, of such members as die every year; and this renders the dividends among the nominees in different years, more or less, according to the number of members who have happened to die in those years. But this society engages that the dividends shall not be less than Insurance. 150l. to each claimant, though they may be more.

None are admitted whose ages are greater than 45, or less than 12; nor is there any difference of contribution allowed on account of difference of age. This society has subsisted ever since 1706, and its credit and usefulness are well established. Its plan, however, is liable to several objections. First, it is evident, that regulating the dividends among the nominees, by the number of members who die every year, is not equitable; because it makes the benefit which a member is to receive to depend, not on the value of his contribution, but on a contingency; that is, the number of members that shall happen to die the same year with him. Secondly, its requiring the same payments from all persons under 45, is also not equitable; for the payment of a person admitted at 12 ought not to be more than half the payment of a person admitted at 45. Thirdly, its plan is so narrow, as to confine its usefulness too much. It can be of no service to any person whose age exceeds 45. It is likewise by no means properly adapted to the circumstances of persons who want to make assurances on their lives for only one year, or a short term of years. For example: the true value of the assurance of 150l. for five years, on the life of a person whose age is 35, may be found, by the first rule, to be nearly three guineas per annum, supposing interest at 3 per cent. and the probabilities of the duration of human life, as they are given in Dr Hanmer’s Tables of Observation. But such an assurance could not be made in this society without an annual payment of 5l. Neither is the plan of this society at all adapted to the circumstances of persons who want to make assurances on particular survivorships. For example: a person possessed of an estate or salary, which must be lost with his life, has a person dependent upon him, for whom he desires to secure a sum of money payable at his death. But he desires this only as a security against the danger of his dying first, and leaving a wife, or a parent, without support. In these circumstances he enters himself into this society; and, by an annual payment of 5l. entitles his nominee at his death to 150l. In a few years, perhaps, his nominee happens to die; and having then lost the advantages he had in view, he determines to forfeit his former payments, and to withdraw from the society. The right method, in this case, would have been to have taken from such a person the true value of the sum assured, “on the supposition of non-payment of the annuity, provided he should survive.” In this way he would have chosen to contract with the society: and had he done this, he would have paid for the assurance (supposing interest at 3 per cent. his age 30, the age of his nominee 30, and the values of lives as given by M. de Moivre) 3l. 8s. in annual payments, to begin immediately, and to be continued during the joint duration of his own life, and the life of his nominee.

The Equitable Society for Assurances on Lives and Survivorships, which meets at Blackfriars Bridge, is one of the most important of the kind. It was established in the year 1762, in consequence of proposals made, and lectures recommending the design, which had been read by Mr Dodson, author of the Mathematical Repository. It assures any sums, or reversionary annuities, on any life or lives, for any number of years, as well as for the whole continuance of the lives; and

O o
The other offices in London for the assurances of lives are:

The Royal Exchange Assurance, which was empowered to assure lives by virtue of its second charter, bearing date the 20th of April 1721; the Westminster Society was established in 1727, for assuring lives and annuities; and the Pelican Life Office was instituted in 1797, which makes a new species of assurance, by way of endowment for daughters, when they have attained the age of 21 years.

Re-Insurance is a second contract, made by any insurer, to transfer the risk he has engaged for to another. It is in general forbidden by 19 Geo. II. c. 37, but is permitted to the representatives of an insurer in case of his death, or his assignees in case of his bankruptcy; and it must be mentioned in the policy that it is a re-insurance.

INTAGLIOES, precious stones, on which are engraved the heads of great men, inscriptions, and the like; such as we frequently see set in rings, seals, &c.

INTEGRER, in Arithmetic, a whole number, in contradistinction to a fraction.

INTEGRAL, or INTEGRANT, in Philosophy, appellations given to parts of bodies which are of a similar nature with the whole; thus filings of iron have the same nature and properties as bars of iron.

Bodies may be reduced to their integrant parts by trituration or grinding, limination or filing, solution, amalgamation, &c., See GRINDING.

INTEGRAL Calculus, in the new analysis, is the reverse of the differential calculus, and is the finding of the integral from a given differential; being similar to the inverse method of fluxions. See FLUXIONS.

INTEGREMENTS, in Anatomy, denote the common coverings which invest the body; as the cuticle, epidermis, &c. See ANATOMY.

INTEGUMENT is also extended to the particular membranes which invest certain parts of the body; as the coats or tunics of the eye.

INTELLIGENT, a term used among philosophers, to signify that faculty of the soul usually called the understanding. See LOGIC and METAPHYSICS.

INTENDANT, one who has the conduct, inspection, and management of any thing. See SUPERINTENDANT.

This is a title frequent among the French; they have INTENDANTS OF THE MARINE, who are officers in the sea-ports.
Intendant, whose business it is to take care the ordinances and regulations relating to sea affairs be observed; intendantes of the finances, who have the direction of the revenues; intendantes of provinces, who are appointed by the king to take care of the administration of justice, policy, and finances in the province; also intendantes of buildings, of houses, &c.

Intendment, in Law, is the intention, design, or true meaning, of a person or thing, which frequently supplies what is not fully expressed; but though the intent of parties in deeds and contracts is much regarded by the law, yet it cannot take place against the rules of law.

Intendment of Crimes; this, in case of treason where the intention is proved by circumstances, is punishable in the same manner as if it was put in execution. So, if a person enter a house in the night-time, with an intent to commit burglary, it is felony; also, an assault, with an intent to commit a robbery on the highway is made felony, and punished with transportation. 7 Geo. II. c. 21.

Intent, in the civil law, signifies to begin, or commence, an action or process.

Intention, in Medicine, that judgment or method of cure which a physician forms to himself from a due examination of symptoms.

Intention, in Physics, the increase of the power or energy of any quality; as heat, cold, &c. by which it is opposed to remission, which signifies its decrease or diminution.

Intention, in Metaphysics, denotes an exertion of the intellectual faculties with more than ordinary vigour; when the mind with earnestness fixes its view on any idea, considers it on all sides, and will not be called off by any solicitation.

Interamnus, in Ancient Geography, so called from its situation between rivers, or in an island in the river Nisus; a town of the Cisapennine Umbria. Interamnenses, the people; surnamed Narates by Pliny, to distinguish them from the people of other Interamnus. Now Termes: a town in the pope's territory in Umbria; E. Long. 13° 38'. N. Lat. 42° 40'.

Interamnus, a town and colony of the Volsci in Latium, on the confines of Samnium, at the confluence of the rivers Liris and Melis; and for distinction sake called Lirisus. The town is now in ruins.

Interamnum, or Interamnium Pratisianorum (Ptolemy); a town in the territory of the Pistoritani, a part of the Picenum. Now Termo, in the Abruzzo of Napels; E. Long. 15° 5'. N. Lat. 42° 40'.

Intercalary, an appellation given to the odd day inserted in leap-year; which was so called from calo, calere, "to proclaim," it being proclaimed by the priests with a loud voice.

Intercatia, in Ancient Geography, a town of the Vaccei in the Iberian Spain. Here Scipio Aemilianus slew a champion of the barbarians in single combat; and was the first who mounted the wall in taking the town. It was situated to the south-east of Asturia; now said to be in ruins.

Intercession (intercessio), was used in ancient Rome, for the act of a tribune of the people, or other magistrate, by which he inhibited the acts of other magistrates; or even, in case of the tribunes, the decree of the senate. Veto was the solemn word used by the tribunes when they inhibited any decree of the senate or law proposed to the people. The general law of these intercessions was, that any magistrate might inhibit the acts of his equal or inferior; but the tribunes had the sole prerogative of controlling the acts of every other magistrate, yet could not be controlled themselves by any.

Intercessor (from inter and cedo, "I go between"), a person who prays, expostulates, or intercedes, in behalf of another. In the Roman law, intercessor was the name of an officer, whom the governors of provinces appointed principally to raise taxes and other duties.

Intercessor, is also a term heretofore applied to such bishops as, during the vacancy of a see, administered the bishoprick, till a successor to the deceased bishop had been elected. The third council of Carthage calls these interventores.

Intercolumniation, in Architecture, denotes the space between two columns, which is always to be proportioned to the height and bulk of the column.

Intercostal, in Anatomy, an appellation given to such muscles, nerves, arteries, and veins, as lie between the ribs.

Interdict, an ecclesiastical censure, by which the church of Rome forbids the performance of divine service in a kingdom, province, town, &c. This censure has been frequently executed in France, Italy, and Germany; and in the year 1170, Pope Alexander III. put all England under an interdict, forbidding the clergy to perform any part of divine service, except baptizing of infants, taking confessions, and giving absolution to dying penitents. But this censure being liable to the ill consequences of promoting libertinism and a neglect of religion, the succeeding popes have very seldom made use of it.

There was also an interdict of persons, who were deprived of the benefit of attending on divine service. Particular persons were also anciently interdicted of fire and water, which signified a banishment for some particular offence; by their censure no person was allowed to receive them, or allow them fire or water; and being thus wholly deprived of the two necessary elements of life, they were doubtless under a kind of civil death.

Interest, is the premium or money paid for the loan or use of other money.

Many good and learned men have in former times very much perplexed themselves and other people by raising doubts about the legality of interest in force conscientiae. It may not be amiss here to inquire upon what grounds this matter does really stand.

The enemies to interest in general make no distinction between that and usury, holding any increase of money to be indispensably notorious. And this they ground as well on the prohibition of it by the law of Moses among the Jews, as also upon what is laid down by Aristotle, That money is naturally barren; and to make it breed money is preposterous, and a perversion of the end of its institution, which was only to serve the purposes of exchange, and not of increase. Hence the school-divines have branded the practice of taking interest, as being contrary to the divine law both natural and revealed; and the canon law has proscribed...
Interest. the taking any the least increase for the loan of money as a mortal sin.

But, in such a case, it may be observed, that the Mosaical precept was clearly a political, and not a moral, precept. It only prohibited the Jews from taking usury from their brethren the Jews; but in express words permitted them to take it of a stranger: which proves that the taking of moderate usury, or a reward for the use, for so the word signifies, is not malum in se, since it was allowed wherever any but an Israelite was concerned. And as to Aristotle's reason, deduced from the natural barrenness of money, the same may with equal force be alleged of houses, which never breed houses; and twenty other things, which nobody doubts it is lawful to make profit of, by letting them to hire. And though money was originally used only for the purposes of exchange, yet the laws of any state may be well justified in permitting it to be turned to the purposes of profit, if the convenience of society (the great end for which money was invented) shall require it. And that the allowance of moderate interest tends greatly to the benefit of the public, especially in a trading country, will appear from that generally acknowledged principle, that commerce cannot subsist without mutual and extensive credit. Unless money therefore can be borrowed, trade cannot be carried on: and if no premium were allowed for the hire of money, few persons would care to lend it; or at least the case of borrowing at a short warning (which is the life of commerce) would be entirely at an end. Thus, in the dark ages of monkish superstition and civil tyranny, when interest was laid under a total interdict, commerce was also at its lowest ebb, and fell entirely into the hands of the Jews and Lombards: but when men's minds began to be more enlarged, when true religion and real liberty revived, commerce grew again into credit; and again introduced with itself its inseparable companion, the doctrine of loans upon interest.

And, really, considered abstractedly from this use, since all other conveniences of life may be either bought or hired, but money can only be hired, there seems no greater impropriety in taking a recompense or price for the hire of this, than of any other convenience. If one borrow 100l. to employ in a beneficial trade, it is but equitable that the lender should have a proportion of the gains. To demand an exorbitant price is equally contrary to conscience, for the loan of a horse, or the loan of a sum of money: but a reasonable equivalent for the temporary inconvenience which the owner may feel by the want of it, and for the hazard of his losing it entirely, is not more immoral in one case than it is in the other. And indeed the absolute prohibition of lending upon any, even moderate interest, introduces the very inconvenience which it seems meant to remedy. The necessity of individuals will make borrowing unavoidable. Without some profit by law, there will be but few lenders: and those principally bad men, who will break through the law, and take a profit; and then will endeavour to indemnify themselves from the danger of the penalty, by making that profit exorbitant. Thus, while all degrees of profit were discomted, we find more complaints of usury, and more flagrant instances of oppression, than in modern times when money may be easily had at a low interest. A capital distinction must therefore be made between a moderate and exorbitant profit; to the former of which we usually give the name of interest, to the latter the truly odious appellation of usury: the former is necessary in every civil state: if it were but to exclude the latter, which ought never to be tolerated in any well regulated society. For, as the whole of this matter is well summed up by Grotius, "if the compensation allowed by law does not exceed the proportion of the hazard run, or the want felt, by the loan, its allowance is neither repugnant to the revealed nor to the natural law: but if it exceeds these bounds, it is then oppressive usury; and though the municipal laws may give it impunity, they never can make it just."

We see, that the exorbitance or moderation of interest, for the money lent, depends upon two circumstances; the inconvenience of parting with it for the present, and the hazard of losing it entirely. The inconvenience to individual lenders can never be estimated by laws; the rate therefore of general interest must depend upon the usual or general inconvenience. This results entirely from the quantity of specie or current money in the kingdom: for, the more specie there is circulating in any nation, the greater superfluity there will be, beyond what is necessary to carry on the business of exchange and the common concerns of life. In every nation, or public community, there is a certain quantity of money thus necessary: which a person well skilled in political arithmetic might perhaps calculate as exactly as a private banker can the demand for running cash in his own shop: all above this necessary quantity may be spared, or lent, without much inconvenience to the respective lenders; and the greater this national superfluity is, the more numerous will be the lenders, and the lower ought the rate of the national interest to be; but where there is not enough, or barely enough, circulating cash to answer the ordinary uses of the public, interest will be proportionably high; for lenders will be but few, as few can submit to the inconvenience of lending.

So also the hazard of an entire loss has its weight in the regulation of interest: hence, the better the security, the lower will the interest be; the rate of interest being generally in a compound ratio, formed out of the inconvenience and the hazard. And as, if there were no inconvenience, there should be no interest but what is equivalent to the hazard; so, if there were no hazard, there ought to be no interest, save only what arises from the mere inconvenience of lending. Thus, if the quantity of specie in a nation be such, that the general inconvenience of lending for a year is computed to amount to three per cent. a man that has money by him will perhaps lend it upon good personal security at five per cent. allowing two for the hazard run; he will lend it upon landed security, or mortgage, at four per cent. the hazard being proportionably less; but he will lend it to the state, on the maintenance of which all his property depends, at three per cent. the hazard being none at all.

But sometimes the hazard may be greater than the rate of interest allowed by law will compensate. And this gives rise to the practice, 1. Of bottomry, or respondentia. 2. Of policies of insurance. See Bottomry, and Insurance.

Upon
Upon the two principles of inconvenience and hazard, compared together, different nations have at different times established different rates of interest. The Romans at one time allowed centesimae, one per cent. monthly, or twelve per cent. per annum, to be taken for common loans: but Justinian reduced it to trienties, or one-third of the as or centesimae, that is four per cent.; but allowed higher interest to be taken of merchants, because there the hazard was greater. So too Croton informs us, that in Holland the rate of interest was then eight per cent. in common loans, but twelve to merchants. Our law establishes one standard for all alike, where the pledge or security itself is not put in jeopardy; lest, under the general pretense of vague and indeterminate hazards, a door should be opened to fraud and usury; leaving specific hazards to be provided against by specific insurances, or by loans upon respondendia or bottomry. But as to the rate of legal interest, it has varied and decreased for 200 years past, according as the quantity of specie in the kingdom has increased by accessions of trade, and other circumstances. The statute 37 Hep. VIII. c. 9. confined interest to ten per cent. and so did the statute 13 Eliz. c. 8. But, as through the encouragements given in her reign to commerce, the nation grew more wealthy; so, under her successor, the statute 21 Jac. I. c. 17. reduced it to eight per cent.; as did the statute 12 Car. II. c. 13. to six; and lastly, by the statute 12 Ann. stat. 2. c. 15. it was brought down to five per cent. yearly, which is now the extremity of legal interest that can be taken. But yet, if a contract which carries interest be made in a foreign country, our courts will direct the payment of interest according to the law of that country in which the contract was made. Thus Irish, American, Turkish, and Indian interest, have been allowed in our courts to the amount of even 13 per cent. For the moderation or exorbitance of interest depends upon local circumstances; and the refusal to enforce such contracts would put a stop to all foreign trade. And, by stat. 14 Geo. III. c. 79. all mortgages and other securities upon estates or other property in Ireland or the plantations, bearing interest not exceeding six per cent. shall be legal; though executed in the kingdom of Great Britain: unless the money lent shall be known at the time to exceed the value of the thing in pledge; in which case also, to prevent usurious contracts at home under colour of such foreign securities, the borrower shall forfeit treble the sum so borrowed. See the article Interest in the Supplement; and for the method of computing interest, see Arithmetic, sect. iv. p. 640, and Algebra, sect. xx. p. 658.

INTERJECTION, in Grammar, an inexpressible part of speech, signifying some passion or emotion of the mind. See Grammar.

INTERIM, a name given to a formulary, or kind of confession of the articles of faith, obtruded upon the Protestants after Luther's death by the emperor Charles V. when he had defeated their forces; so called because it was only to take place in the interim (mean time) till a general council should have decided all points in dispute between the Protestants and Romanists. It retained most of the doctrines and ceremonies of the Romanists, excepting that of marriage, which was allowed to the clergy, and communion to the laity under both kinds. Most of the Protestants rejected it. There were two other interims; one of Leipzig, the other of Franconia.

INTERLOCUTOR, in Scots Law, is the decision or judgment of a court before the final decree is passed and extracted.

INTERLOCUTORY DECREES, in English Law. In a suit in equity, if any matter of fact be strongly controverted, the fact is usually directed to be tried at the bar of the court of king's bench, or at the assizes, upon a feigned issue. If a question of mere law arises in the course of a cause, it is the practice of the court of chancery to refer it to the opinion of the judges of the court of king's bench, upon a case stated for that purpose. In such cases, interlocutory decrees or orders are made.

INTERLOCUTORY JUDGMENTS are such as are given in the middle of a cause, upon some plea, proceeding on default, which is not intermediate, and does not finally determine or complete the suit. But the interlocutory judgments most usually spoken of, are those incomplete judgments, whereby the right of the plaintiff is established, but the quantum of damages sustained by him is not ascertained, which is the province of a jury. In such a case a writ of inquiry issues to the sheriff, who summons a jury, inquires of the damages, and returns to the court the inquisition so taken, whereupon the plaintiff's attorney taxes costs, and signs final judgment.

INTERLOCUTORY ORDER, that which decides not the cause, but only settles some intervening matter relating to the cause. As where an order is made in chancery, for the plaintiff to have an injunction, to quit possession till the hearing of the cause; this order, not being final, is called interlocutory.

INTERLOPERS, are properly those who, without due authority, hinder the trade of a company or corporation lawfully established, by dealing in the same way.

INTERLUDE, an entertainment exhibited on the theatre between the acts of a play, to amuse the spectators while the actors take breath and shift their dress, or to give time for changing the scenes and decorations.

In the ancient tragedy, the chorus sung the interludes, to show the intervals between the acts.

Interludes, among us, usually consist of songs, dances, feats of activity, concerts of music, &c.

Aristotle and Horace give it for a rule, that the interludes should consist of songs built on the principal parts of the drama: but since the chorus has been laid down, dancers, buffoons, &c. ordinarily furnish the interludes.

INTERMENT, the act of interring, i.e. burying or laying a deceased person in the ground.

Aristotle asserted, that it was more just to assist the dead than the living. Plato, in his Republic, does not forget amongst other parts of justice, that which concerns the dead. Cicero establishes three kinds of justice; the first respects the gods, the second the manes or dead, and the third men. These principles seem to be drawn from nature; and they appear at least to be necessary for the support of society, since at all times civilized nations have taken care to bury their
We find in history several traces of the respect which the Indians, the Egyptians, and the Syrians entertained for the dead. The Syrians embalmed their bodies with myrrh, aloe, honey, salt, wax, bitumen, and resinsous gums; they dried them also with the smoke of the fir and the pine tree. The Egyptians preserved theirs with the resin of the cedar, with aromatic spices, and with salt. These people often kept such mummys in their houses; and at grand entertainments they were introduced, that by reciting the great actions of their ancestors they might be better excited to virtue. See *Funeral Rites*.

The Greeks, at first, had probably not the same veneration for the dead as the Egyptians. Empedocles, therefore, in the eighty-fourth Olympiad, restored to life Pothia, a woman of Agrigentum, who was about to be interred. But this people, in proportion as they grew civilized, becoming more enlightened, perceived the necessity of establishing laws for the protection of the dead.

At Athens the law required that no person should be interred before the third day; and in the greater part of the cities of Greece a funeral did not take place till the sixth or seventh. When a man appeared to have breathed his last, his body was generally washed by his nearest relations, with warm water mixed with wine. They afterwards anointed it with oil; and covered it with a dress commonly made of fine linen, according to the custom of the Egyptians. This dress was white or Emerson, Athens, and in the greater part of the cities of Greece, where the dead body was crowned with flowers. At Sparta it was of a purple colour, and the body was surrounded with olive leaves. The body was afterwards laid upon a couch in the entry of the house, where it remained till the time of the funeral. At the magnificent obsequies with which Alexander honoured Hephestion, the body was not burned until the tenth day.

The Romans, in the infancy of their empire, paid as little attention to their dead as the Greeks had done. Accius Aviola having fallen into a lethargic fit, was supposed to be dead; he was therefore carried to the funeral pile; the fire was lighted up; and though he cried out he was still alive, he perished for want of speedy assistance. The pretor Lamia met with the same fate. Tuberno, who had been pretor, was saved from the funeral pile. Asclepiades a physician, who lived in the time of Pompey the Great, about one hundred and twenty years before the Christian era, returning from his country-house, observed near the walls of Rome a great convoy and a crowd of people, who were in mourning assisting at a funeral, and showing every exterior sign of the deepest grief. Having asked what was the occasion of this concourse, no one made any reply. He therefore approached the pretended dead body; and imagining that he perceived signs of life in it, he ordered the bystanders to take away the flambeaux, to extinguish the fire, and to pull down the funeral pile. A kind of murmur on this arose throughout the whole company. Some said that they ought to believe the physician, while others turned both him and his profession into ridicule. The relations, however, yielded at length to the remonstrances of Asclepiades; they consented to defer the obsequies for a little; and the consequence was, the restoration of the pretended dead person to life. It appears that these examples, and several others of the like nature, induced the Romans to delay funerals longer, and to enact laws to prevent precipitate interments.

At Rome, after allowing a sufficient time for mourning, the nearest relation generally closed the eyes of the deceased; and the body was bathed with warm water, either to render it fitter for being anointed with oil, or to reanimate the principle of life, which might remain suspended without manifesting itself. Prizes were afterwards made, to discover whether the person was really dead, which were often repeated during the time that the body remained exposed; for there were persons appointed to visit the dead, and to prove their situation. On the second day, after the body had been washed a second time, it was anointed with oil and balm. Luxury increased to such a pitch in the choice of foreign perfumes for this purpose, that under the consuls of Licinius Crassus and Julius Cæsar, the Senate forbade any perfumes to be used except such as were the production of Italy. On the third day the body was clothed according to its dignity and condition. The robe called the praetexta was put upon magistrates, and a purple robe upon consuls; for conquerors, who had merited triumphal honours, this robe was of gold tissue. For other Romans it was white, and black for the lower classes of the people. These dresses were often prepared at a distance, by the mothers and wives of persons still in life. On the fourth day the body was placed on a couch, and exposed in the vestibule of the house, with the visage turned towards the entrance, and the feet near the door; in this situation it remained till the end of the week. Near the couch were lighted wax-tapers, a small box in which perfumes were burnt, and a vessel full of water for purification, with which those who approached the body besprinkled themselves. An old man, belonging to those who furnished every thing necessary for funerals, sat near the deceased, with some domestics clothed in black. On the eighth day the funeral rites were performed; but to prevent the body from corrupting before that time, salt, wax, the resinosous gum of the cedar, myrrh, honey, balm, gum-sum, lime, asphaltes or bitumen of Judæa, and several other substances, were employed. The body was carried to the pile with the face uncovered, unless wounds or the nature of the disease had rendered it loathsome and disgusting. In such a case a mask was used, made of a kind of plaster; which has given rise to the expression of *furna larvata*, used in some of the ancient authors. This was the last method of concealment which Nero made use of, after having caused Germanicus to be poisoned: for the effect of the poison had become very sensible by livid spots and the blackness of the body; but a shower of rain happening to fall, it washed the plaster entirely away, and thus the horrid crime of fratricide was discovered.

The Turks, at all times, have been accustomed to wash the bodies of their dead before interment; and as their ablutions are complete, and no part of the body escapes the attention of those who assist at such melancholy ceremonies, they can easily perceive whether
The difference between the end of a weak life and intermeat, the commencement of death, is so small, and the uncertainty of the signs of the latter is so well established both by ancient and modern authors who have turned their attention to that important object, that we can scarcely suppose undertakers capable of distinguishing an apparent from a real death. Animals which sleep during winter show no signs of life; in this case, circulation is only suspended: but were it annihilated, the vital spirit does not so easily lose its action as the other fluids of the body; and the principle of life, which long survives the appearance of death, may re-animate a body in which the action of all the organs seems to be at an end. But how difficult is it to determine whether this principle may not be revived? It has been found impossible to recall to life some animals suffocated by mephitic vapours, though they appeared less affected than others who have revived. Coldness, heaviness of the body, a leaden livid colour, with a yellowness in the visage, are all very uncertain signs: Mr. Zimmerman observed them all upon the body of a criminal, who fainted through the dread of that punishment which he had merited. He was shaken, dragged about, and turned in the same manner as dead bodies are, without the least signs of resistance; and yet at the end of 24 hours he was recalled to life by means of volatile alkali.

A director of the coach-office at Dijon, named Coquet, was supposed to be dead, and the news of this event was spread through the whole city. One of his friends, who was desirous of seeing him at the moment when he was about to be buried, having looked at him for a considerable time, thought he perceived some remains of sensibility in the muscles of the face. He therefore made an attempt to bring him to life by spirituous liquors, in which he succeeded; and this director enjoyed afterwards for a long time that life which he owed to his friend. This remarkable circumstance was much like those of Empedocles and Aesopides. These instances would perhaps be more frequent, were men of skill and abilities called in cases of sudden death, in which people of ordinary knowledge are often deceived by false appearances.

A man may fall into a syncope, and may remain in that condition three or even eight days. People in this situation have been known to come to life when deposited among the dead. A boy belonging to the hospital at Cassel appeared to have breathed his last; he was carried into the hall where the dead were exposed, and was wrapped up in a piece of canvas. Some time after, recovering from his lethargy, he recollected the place in which he had been deposited, and crawling towards the door knocked against it with his foot. This noise was luckily heard by the centinel, who soon perceiving the motion of the canvas called for assistance. The youth was immediately conveyed to a warm bed, and soon perfectly recovered. Had his body been confined by close bandages or ligatures, he would not have been able, in all probability, to make himself heard: his unavailing efforts would have made him again fall into a syncope; and he would have been thus buried alive.

We must not be astonished that the servants of an hospital should take a syncope for a real death, since even the most enlightened people have fallen into errors of
Intem. of the same kind. Dr. John Schmid relates, that a young girl, seven years of age, after being afflicted for some weeks with a violent cough, was all of a sudden freed from this troublesome malady, and appeared to be in perfect health. But some days after, while playing with her companions, this child fell down in an instant as if struck by lightning. A death-like paleness was diffused over her face and arms; she had no apparent pulse, her temples were sunk, and she showed no signs of sensation when shaken or pinched. A physician, who was called, and who believed her to be dead, in compliance with the repeated and pressing request of her parents, attempted, though without any hopes, to recall her to life; and at length, after several vain efforts, he made the soles of her feet be smartly rubbed with a brush dipped in strong pickle. At the end of three quarters of an hour she was observed to sigh: she was then made to swallow some spirituous liquor; and she was soon after restored to life, much to the joy of her disconsolate parents.—A certain man having undertaken a journey, in order to see his brother, on his arrival at his house found him dead. This news affected him so much, that it brought on a most dreadful syncope, and he himself was supposed to be in the like situation. After the usual means had been employed to recall him to life, it was agreed that his body should be dissected, to discover the cause of so sudden a death; but the supposed dead person over-hearing this proposal, opened his eyes, started up, and immediately betook himself to his heels.—Cardinal Espinola, prime minister to Philip II. was not so fortunate; for we read in the Memoirs of Amelot de la Houssai, that he put his hand to the knife with which he was opened in order to be embalmed. In short, almost every one knows that Vesalius, the father of anatomy, having been sent for to open a woman subject to hysteries, who was supposed to be dead, he perceived on making the first incision, by her motion and cries, that she was still alive; that this circumstance rendered him so ardently, that he was obliged to fly; and that he was so much astounded by it, that he died soon after.—On this occasion, we cannot forbear to add an event more recent, but no less melancholy. The abbé Prevost, so well known by his writings and the singularities of his life, was seized with a fit of the apoplexy, in the forest of Chantilly, on the 23d of October, 1763. His body was carried to the nearest village, and the officers of justice were proceeding to open it, when a cry which he sent forth affrighted all the assistants, and convinced the surgeon that the abbé was not dead; but it was too late to save him, as he had already received the mortal wound.

Even in old age, when life seems to have been gradually drawing to a close, the appearances of death are often fallacious. A lady in Cornwall, more than 80 years of age, who had been a considerable time declining, took to her bed, and in a few days seemingly expired in the morning. As she had often desired not to be buried till she had been two days dead, her request was to have been regularly complied with by her relations. All that saw her looked upon her as dead, and the report was current through the whole place; nay, a gentleman of the town actually wrote to his friend in the island of Scilly that she was deceased. But one of those who were paying the last kind office of humanity to her remains, perceived some warmth about the middle of the back; and acquainting her friends with it, they applied a mirror to her mouth: but, after repeated trials, could not observe it in the least stained; her under jaw was likewise fallen, as the common phrase is; and, in short, she had every appearance of a dead person. All this time she had not been stripped or dressed; but the windows were opened, as is usual in the chambers of the deceased. In the evening the heat seemed to increase, and at length she was perceived to breathe.

In short, not only the ordinary signs are very uncertain, but we may say the same of the stiffness of the limbs, which may be convulsive; of the dilation of the pupil of the eye, which may proceed from the same cause; of putrefaction, which may equally attack some parts of a living body; and of several others. Haller, convinced of the uncertainty of all these signs, propose a new one, which he considers as infallible. "If the person (says he) be still in life, the mouth will immediately shut of itself, because the contraction of the muscles of the jaw will awaken their irritability." The jaw, however, may be deprived of its irritability though a man may not be dead. Life is preserved a long time in the passage of the intestines. The sign pointed out by Dr. Fothergill appears to deserve more attention: "If the air blown into the mouth (says this physician) passes freely through all the alimentary channel, it affords a strong presumption that the irritability of the internal sphincters is destroyed, and consequently that life is at an end." These signs, which deserve to be confirmed by new experiments, are doubtless not known to undertakers.

The difficulty of distinguishing a person apparently dead from one who is really so, has, in all countries where bodies have been interred too precipitately, rendered it necessary for the law to assist humanity. Of several regulations made on this subject, we shall quote only a few of the most recent; such as those of Arras in 1772; of Mantua in 1774 of the grand duke of Tuscany in 1775; of the stateskamed of Savoy, Poiton, in 1777; and of the parliament of Metz in the same year. To give an idea of the rest, it will be sufficient to relate only that of Tuscany. By this edict, the grand duke forbids the precipitate interment of persons who die suddenly. He orders the magistrates of health to be informed, that physicians and surgeons may examine the body; that they may use every endeavour to recall it to life, if possible, or to discover the cause of its death; and that they shall make a report of their procedure to a certain tribunal. On this occasion, the magistrate of health orders the dead not to be covered until the moment they are about to be buried, except so far as decency requires; observing always that the body be not closely confined, and that nothing may compress the jugular veins and the carotid arteries. He forbids people to be interred according to the ancient method; and requires that the arms and the hands should be left extended, and that they should not be folded or placed cross-wise upon the breast. He forbids, above all, to press the jaws one against the other; or to fill the mouth with wadding, cotton, or other stuffing. Lastly, he recommends not to cover the visage with any kind of cloth until the body is deposited in its coffin.
INTERPOULATION, in the modern algebra, is used for finding an intermediate term of a series, its place in the series being given. This method was first invented by Mr. Briggs, and applied by him to the calculation of logarithms, etc. See ALGEBRA.

INTERPOSITION, the situation of a body between two others, so as to hide them, or prevent their action.

The eclipse of the sun is occasioned by an interposition of the moon between the sun and us; and that of the moon by the interposition of the earth between the sun and moon. See ECLIPSE.

INTERPRETER, a person who explains the thoughts, words, or writings, of some other, which before were unintelligible.—The word *interpretari* is, according to Isidore, composed of the preposition *inter* and *partes*, as signifying a person in the middle between two parties, to make them mutually understand each other's thoughts: others derive it from *inter* and *prae*, i.e. *fidejussor*; q.d. a person who serves as security between two others who do not understand one another.

There have been great debates about interpreting Scripture. The Romanists contend, that it belongs absolutely to the church: adding, that where she is silent, reason may be consulted; but when she speaks, reason is to be disregarded. The Protestants generally allow reason to the sovereign judge or interpreter; though some among them have a strong regard to synode, and others to the authority of the primitive fathers. Lastly, others have recourse to the Spirit within every person to interpret for them; which is what Bochart calls *sacramentum interpretationis*.

INTERREGNUM, the time during which the throne is vacant in elective kingdoms; for in such cases are hereditary, like ours, there is no such thing as an interregnwm.

INTERFEX, the magistrate who governs during an interregnwm.

This magistrate was established in old Rome, and was almost as ancient as the city itself: after the death of Romulus there was an interregnwm of a year, during which the senators were each interfex in turn, five days a-piece.

After the establishment of consuls and a commonwealth, though there were no kings, yet the name and function of interfex was still preserved: for, when the magistrates were absent, or there was any irregularity in their election, or they had abdicated, so that the comitia could not be held; provided they were unwilling to create a dictator, they made an interfex, whose office and authority was to last five days; after which they made another. To the interfex was delegated all the regal and consular authority, and he performed all their functions. He assembled the senate, held comitia or courts, and took care that the election of magistrates was according to rules. Indeed at first it was not the custom of the interfex to hold comitia, at least we have no instance of it in the Roman history. The patricians alone laid the right of selecting an interfex; but this office fell with the republic, when the emperors made themselves masters of every thing.

INTERROGATION, *erōtēs*, a figure of rhetoric, in which the passion of the speaker introduces a thing
thing by way of question, to make its truth more conspicuous.

The interrogation is a kind of apostrophe which the speaker makes to himself; and it must be owned, that this figure is suited to express most passions and emotions of the mind; it serves also to press and bear down an adversary, and generally adds an uncommon briskness, action, force, and variety, to discourse.

Interrogation, in Grammar, is a point which serves to distinguish such parts of a discourse, where the author speaks as if he was asking questions. Its form is this (?).

Interrogatories, in Law, are particular questions demanded of witnesses brought in to be examined in a cause, especially in the court of chancery. And these interrogatories must be exhibited by the parties in suit on each side; which are either direct for the party that produces them, or counter, on behalf of the adverse party; and generally both plaintiff and defendant may exhibit direct, and counter or cross interrogatories. They are to be pertinent, and only to the points necessary; and either drawn or perused by counsel, and to be signed by them.

Interscendent, in Algebra, is applied to quantities, when the exponents of their powers are radical quantities. Thus, \( x^{\sqrt{a}}, \sqrt{x^{a}}, \&c. \) are interscendent quantities.

Intersection, in Mathematics, the cutting of one line, or plane, by another; or the point or line wherein two lines, or two planes, cut each other.

The mutual intersection of two planes is a right line. The centre of a circle is in the intersection of two diameters. The central point of a regular or irregular figure of four sides, is the point of intersection of the two diagonals.

The equinoxes happen when the sun is in the intersections of the equator and ecliptic.

Interspinales. See Anatomy, Table of the Muscles.

Interval, the distance or space between two extremes, either in time or place. The word comes from the Latin intervalum, which according to Isidore, signifies the space \( \text{inter fossam et murum}, \) "between the ditch and the wall;" others note, that the stakes or piles, driven into the ground in the ancient Roman bulwarks, were called \( \text{colli}, \) and the interstices or vacancy between them, \( \text{intervala}. \)

Interval, in Music. The distance between any given sound and another, strictly speaking, is neither measured by any common standard of extension nor duration; but either by immediate sensation, or by computing the difference between the numbers of vibrations produced by two or more sonorous bodies, in the act of sounding, during the same given time. As the vibrations are slower and fewer during the same instant, for example, the sound is proportionally lower or graver; on the contrary, as during the same period, the vibrations increase in number and velocity, the sounds are proportionally higher or more acute. An interval in music, therefore, is properly the difference between the number of vibrations produced by one sonorous body of a certain magnitude and texture, and of those produced by another of a different magnitude and texture, in the same time.

Intervals are divided into consonant and dissonant.

A consonant interval is that whose extremes, or whose highest and lowest sounds, when simultaneously heard, coalesce in the ear, and produce an agreeable sensation called by Lord Kames a tertium quid. A dissonant interval, on the contrary, is that whose extremes, simultaneously heard, far from coalescing in the ear, and producing one agreeable sensation, are each of them plainly distinguished from the other, produce a grating effect upon the sense, and repel each other with an irreconcilable hostility. In proportion as the vibrations of different sonorous bodies, or of the same sonorous body in different modes, more or less frequently coincide during the same given time, the chords are more or less consonant. When these vibrations never coincide at all in the same given time, the discord is consummate, and consequently the interval absolutely dissonant. But for a full account of these, see Music.

Intestate, in Law, a person that dies without making a will.

Intestina, in the Linnaean System, one of the orders of worms. See Helminthology Index.

Intestines, Intestina, in Anatomy, the guts or bowels; those hollow, membranous, cylindrical parts, extended from the right orifice of the stomach to the anus; by which the chyle is conveyed to the lacteals, and the excrements are voided. See Anatomy, No. 93.

Intonation, in Music, the action of sounding the notes in the scale with the voice, or any other given order of musical tones. Intonation may be either true or false, either too high or too low, either too sharp or too flat; and then this word intonation, attended with an epithet, must be understood concerning the manner of performing the notes.

In executing an air, to form the sounds, and preserve the intervals as they are marked with justness and accuracy, is no inconsiderable difficulty, and scarcely practicable, but by the assistance of one common idea, to which, as to their ultimate test, these sounds and intervals must be referred: these common ideas are those of the key, and the mode in which the performer is engaged; and from the word tone, which is sometimes used in a sense almost identical with that of the key, the word intonate may perhaps be derived. It may also be deduced from the word diatonic, as in that scale it is most frequently conversant; a scale which appears most convenient and most natural to the voice. We feel more difficulty in our intonation of such intervals as are greater or lesser than those of the diatonic order; because, in the first case, the glottis and vocal organs are modified by gradations too large; or too complex, in the second.

Intrenchment, in the military art, any work that fortifies a post against an enemy who attacks. It is generally taken for a ditch or trench with a parapet. Intrenchments are sometimes made of fascines with earth thrown over them, of gabions, boghead, or bags filled with earth, to cover the men from the enemy's fire.

Intrigue, an assemblage of events or circumstances, occurring in an affair, and perplexing the persons concerned in it. In this sense, it is used to signify the nodus or plot of a play or romance; or that point wherein the principal characters are most embarrassed through
through the artifice and opposition of certain persons, or the unfortunate falling out of certain accidents and circumstances.

In tragedy, comedy, or an epic poem, there are always two designs. The first and principal is that of the hero of the piece: the second contains the designs of all those who oppose him. These opposite causes produce opposite effects, to wit, the efforts of the hero for the execution of his design, and the efforts of those who thwart it. As these causes and designs are the beginning of the action, so these efforts are the middle, and there form a knot or difficulty which we call the *intrigue*, that makes the greatest part of the poem. It lasts as long as the mind of the reader or hearer is suspended about the event of those opposite efforts: the solution or catastrophe commences when the knot begins to unravel, and the difficulties and doubts begin to clear up.

The intrigue of the *Iliad* is twofold. The first comprehends three days fighting in Achilles's absence, and consists on the one side in the resistance of Agamemnon and the Greeks, and on the other in the inexorable temper of Achilles. The death of Patroclus unravels this intrigue, and makes the beginning of a second. Achilles resolves to be revenged, but Hector opposes his design; and this forms the second intrigue, which is the last day's battle.

In the *Odyssey* there are also two intrigues. The first is taken up in the voyage and landing of *Odysseus* in Italy; the second is his establishment there: the opposition he meets with from Juno in both these undertakings forms the intrigue.

As to the choice of the intrigue, and the manner of unravelling it, it is certain they ought both to spring naturally from the ground and subject of the poem. Bossu gives us three manners of forming the intrigue of a poem: the first is that already mentioned; the second is taken from the fable and design of the poet; in the third the intrigue is so laid, as that the solution follows from it of course.

**INTRINSIC**, a term applied to the real and genuine values and properties, &c. of any thing, in opposition to their extrinsic or apparent values.

**INTRODUCTION**, in general, signifies any thing which tends to make another in some measure known before we have leisure to examine it thoroughly; and hence it is used on a great variety of occasions. Thus we speak of the introduction of one person to another; the introduction to a book, &c. It is also used to signify the actual motion of any body out of one place into another, when that motion has been occasioned by some other body.

**INTUITION**, among logicians, the act whereby the mind perceives the agreement or disagreement of two ideas, immediately by themselves, without the intervention of any other; in which case the mind perceives the truth as the eye does the light, only by being directed towards it. See LOGIC, No 25, 27.

**INTUITIVE EVIDENCE**, is that which results from **Intuition**. Dr Campbell distinguishes different sorts of intuitive evidence; one resulting purely from intellecution, or that faculty which others have called intuicion; another kind arising from consciousness; and a third sort from that new-named faculty *Common Sense*, which this ingenious writer, as well as several others, contends to be a distinct original source of knowledge; whilst others refer its supposed office to the intuitive power of the understanding.

**INVALID**, a person wounded, maimed, or disabled for action by age.

At Chelsea and Greenwich are magnificent hospitals, or rather colleges, built for the reception and accommodation of invalids, or soldiers and seamen worn out in the service.

We have also twenty independent companies of invalids, dispersed in the several forts and garrisons.

At Paris is a college of the same kind, called *Les Invalides*, which is accounted one of the finest buildings in that city.

**INVECTED**, in Heraldry, denotes a thing fluted or furrowed. See HERALDRY.

**INVECTIVE**, in Rhetoric, differs from reproof, as the latter proceeds from a friend, and is intended for the good of the person reproved; whereas the invidive is the work of an enemy, and entirely designed to vex and give uneasiness to the person against whom it is directed.

**INVENTION**, denotes the act of finding any thing new, or even the thing thus found. Thus we say, the invention of gunpowder, of printing, &c. The alcove is a modern invention owing to the Moors.

The Doric, Ionic, and Corinthian orders, are of Greek invention; the Tuscan and Composite of Latin invention. Janson ab Almeloveen has written an Onomasticon of inventions; wherein are shown, in an alphabetical order, the names of the inventors, and the time, place, &c. where they are made. Pandecritius has a treatise of old inventions that are lost, and new ones that have been made; Polydore Virgil has also published eight books of the inventors of things, De Inventoribus Rerum.

**INVENTION** is also used for the finding of a thing hidden. The Romish church celebrates a feast on the 4th of May, under the title of **Invention of the Holy Cross**.

**INVENTION** is also used for subtilty of mind, or somewhat peculiar to a man's genius, which leads him to a discovery of things new; in which sense we say, a man of invention.

**INVENTION**, in Painting, is the choice which the painter makes of the objects that are to enter the composition of his piece. See PAINTING.

**INVENTION**, in Poetry, is applied to whatever the poet adds to the history of the subject he has chosen; as well as to the new turn he gives it. See POETRY.

**INVENTION**, in Rhetoric, signifies the finding out and choosing of certain arguments which the orator is to use for the proving or illustrating his point, moving the passions or conciliating the minds of his hearers. Invention, according to Cicero, is the principal part of oratory: he wrote four books De Inventiones, whereof we have but two remaining. See ORATORY.

**INVENTORY**, in Law, a catalogue or schedule orderly made, of all the deceased person's goods and chattels at the time of his death, with their value appraised by different persons, which every executor or administrator is obliged to exhibit to the ordinary at such time as he shall appoint.

By 21 Hen. VIII. c. v. executors and administrators are
are to deliver in upon oath to the ordinary, indented inventories, one part of which is to remain with the ordinary, and the other part with the executor or administrator; this is required for the benefit of the creditors and legatees, that the executor or administrator may not conceal any part of the personal estate from them. The statute ordains, that the inventory shall be exhibited within three months after the person's decease; yet it may be done afterwards; for the ordinary may dispense with the time, and even with its being over exhibited, as in cases where the creditors are paid, and the will is executed.

INVERARY, the county town of Argyleshire, in Scotland, pleasantly situated on a small bay formed by the junction of the river Airy with Loch Fine, where the latter is a mile in width and 50 fathoms in depth. Here is a castle, the principal seat of the dukes of Argyle, chief of the Campbells. It is a modern building of quadrangular form, with a round tower at each corner; and in the middle rises a square one glazed on every side to give light to the staircase and galleries, which has from without rather a heavy appearance. This castle is built of a coarse lope stone brought from the other side of Loch Fine; and is of the same kind with that found in Norway, of which the king of Denmark's palace is built. The founder of the castle, the late Duke Archibald, also formed the design of an entire new town, upon a commodious elegant plan, becoming the dignity of the capital of Argyleshire, a country most admirably situated for fisheries and navigation. The town has been rebuilt agreeable to the original design; and the inhabitants are well lodged in houses of stone, lime, and slate. They are fully employed in arts and manufactures.—The planting around Inverary is extensive beyond conception, and admirably variegated; every crevice, glen, and mountain, displaying taste and good sense.—The population of the town and parish in 1811 was 1134.

The value of the immense wood at this place, for the various purposes of bark, charcoal, forges, paving, furniture, house and ship building, is thus estimated by Mr. Knox: "Some of the beech are from 9 to 12 feet in circumference, and the pines from 6 to 9; but these being comparatively few, we shall state the medium girth of 2,000,000 trees planted within these last hundred years, 3 feet, and the medium value at 4s., which produces 400,000l.; and this, for the most part, upon grounds unfit for the plough, being chiefly composed of hills and rock." One of these hills rises immediately from the house a great height, in the form of a pyramid, and is clothed to the summit with a thick wood of vigorous ornamental trees. On this summit or point Archibald duke of Argyile built a Gothic tower, or observatory, where he sometimes amused himself. The ascent by the road seems to be half a mile, and the perpendicular height about 800 feet.

INVERBERVIE, or Bervie, a town of Scotland, in Kincardineshire or the Meares, and a royal borough, 13 miles north-east from Montrose. It lies between two small hills, which terminate in high cliffs towards the sea; it is but a small place, the inhabitants of which are chiefly employed in making thread.

INVERKEITHING, a town of Scotland, in the county of Fife, situated on the northern shore of the Firth of Forth, in W. Long. 3° 15'. N. Lat. 56° 5'. It was much favoured by William, who granted its first charter. He extended its liberties considerably, and in the time of David I. it became a royal residence. The Franciscans had a convent in this town; and, according to Sir Robert Sibbald, the Dominicans had another. The population of the town and parish in 1811 amounted to 2400; and they are employed in the herrings, fishery, the coal, and coaling trade. It has a considerable trade in coal and other articles.

INVERLOCHY, an ancient castle in the neighbourhood of Fort-Wilhelm in Inverness-shire. It is adorned with large round towers; and, by the mode of building, seems to have been the work of the English in the time of Edward I. who laid large fountains on the Scotch barons for the purpose of erecting new castles. The largest of these towers is called Cambin's. But long prior to these ruins, Inverlochloy, according to Boece, had been a place of great note, a most opulent city, remarkable for the vast resort of French and Spaniards, probably on account of trade. It was also a seat of the kings of Scotland, for here Achaus in the year 1174 is reported (as is repeated) the league offensive and defensive between himself and Charlemagne. In after-times it was utterly destroyed by the Danes, and never again restored.

In the neighbourhood of this place were fought two fierce battles, one between Donald Balloch brother to Alexander lord of the Isles, who with a great power ravaged Lochaber in the year 1427: he was met by the earls of Mar and Caithness; the last was slain, and their forces totally defeated. Balloch returned to the isles with vast booty. Here also the Campbells under the marquis of Argyile, were in February 1645, defeated by Montrose. Fifteen hundred fell in the action and in the pursuit, with the loss only of three to the royalists.

INVERNESS, capital of a county of the same name in Scotland, is a parliament-town, finely seated on the river Ness, over which there is a stone bridge of seven arches, in W. Long. 4°. N. Lat. 57° 30'. It is large, well built, and very populous, being the most northerly town of any note in Britain. As there are always regular troops in its neighbourhood, there is a great air of politeness, a plentiful market, and more money and business stirring than could have been expected in such a remote part of the island. The country in the neighbourhood is remarkably well cultivated; and its produce clearly shows that the soil and climate are not despicable. The salmon-fishery in the Ness is very considerable, and is let to London fishmongers. Some branches both of the woollen, linen, and hemp manufacture, are also carried on here; and, in consequence of the excellent military roads, there is a great proportion of inland trade. But besides all this, Inverness is a port with 20 creeks dependent upon it, part on the Murray; six to the east, and part on the north of the town, reaching even the south border of the county of Caithness. Inverness has several good schools; and an academy was erected some years ago on an extensive and liberal plan. The inhabitants speak the Erse and English language promiscuously. On an eminence near the town are the remains of a castle, where, according to some historians, the famous Macbeth murdered Duncan his royal guest. Population 11,353 in 1811.

Inverness-shire.
Inverness-Shire, a county of Scotland, bounded on the north by Ross-shire; on the east by the shires of Nairn, Moray, and Aberdeen; on the south, by those of Perth and Argyle; and on the west by the Atlantic ocean. Its extent from north to south is above 50 miles; from east to west about 80. —The northern part of this county is very mountainous and barren. In the district of Gleneg is seen the ruins of several ancient circular buildings, similar to those in the Western Isles, Sutherland, and Ross-shire; concerning the uses of which antiquaries are not agreed. In their outward appearance they are round and tapering like glass-houses. In the heart of the wall, which is perpendicular within, there are horizontal galleries going quite round and connected by stairs. These ascend toward the top, which is open. They are all built of stone, without lime or mortar of any kind. They have no opening outward, except the doors and the top; but there are several in the inside, as windows to the galleries. From Bernera barracks, in this district, proceeds the military road to Inverness.

This county is nearly divided by water, so that by means of the Caledonian canal unifying Loch Ness, Loch Oich, Loch Loychy, and Lochbuie or Loch Eil, a communication will be opened between the eastern and western seas. This great undertaking, it is expected, will be completed in 1822. In this tract, Fort George, Fort Augustus, and Fort William, form what is called the Chain of Forts across the island. By means of Fort George on the east, all entrance up the frith towards Inverness is prevented; Fort Augustus curbs the inhabitants midway; and Fort William is a check to any attempts in the west. Detachments are made from all these garrisons to Inverness. Bernera barracks opposite to the Isle of Skye, and Castle Duard in the Isle of Mull. The river Ness, upon which the capital of the shire is situated, is the outlet of the great lake called Loch Ness. This beautiful lake is 22 miles in length, and for the most part one in breadth. It is skreened on the north-west by the lofty mountains of Urquhart and Meallfourvany, and bordered with coppices of birch and oak. The adjacent hills are adorned with many extensive forests of pine; which afford shelter to the cattle, and are the retreat of stags and deer. There is much cultivation and improvements on the banks of Loch Ness; and the pasture-grounds in the neighboring valleys are excellent. From the south, the river Fyers descends towards this lake. Over this river there is built a stupendous bridge, on two opposite rocks; the top of the arch is above 100 feet from the level of the water. A little below the bridge is the celebrated Fall of Fyers, where a great body of water darts through a narrow gap between two rocks, then falls over a vast precipice into the bottom of the chasm, where the foam rises and fills the air like a great cloud of smoke.

Loch Oich is a narrow lake, stretching about four miles from east to west. It is adorned with some small wooded islands, and is surrounded with ancient trees. Near this is the family seat of Glengary, surrounded by natural woods of full growth, which extend nine or ten miles along the banks of the river Gary. The waters of Loch Oich flow through Loch Ness into the eastern sea. —Loch Loychy transmits its waters in an opposite direction, this being the highest part of the vast flat tract that here stretches from sea to sea. This extensive lake is above ten miles in length, and from one to two in breadth. From the west, the waters of Loch Arkaig descend into this lake. Out of it runs the river Lochar, which about a mile below its issue from the lake receives the Spean, a considerable river, over which there is a magnificent bridge, built by General Wade, about two miles above the place where it falls into the Lochar. These united streams traversing the plains of Lochaber, after a course of five or six miles, fall into Loch Eil.

A few miles to the south-east of Loch Loychy is Glensport or King's Vale. The north-east end of this valley opens on Loch Spey. A small river passes along the bottom of the vale, accompanied by a modern road. On the declivity of the mountains, about a mile from the river, on either hand, are seen several parallel roads of great antiquity. On the north-west side, five of these roads run parallel and close by each other. On the opposite side there are three other roads exactly similar. These roads are 30 feet broad, all perfectly horizontal, and extend eight or nine miles in length. Their destination or use has baffled the conjectures of antiquaries. —Not far from Fort Augustus rises the pointed summit of Ben Nevis, which is esteemed the highest mountain in Britain, rising more than 4300 feet above the level of the sea. —In the districts of Moydart, Arisaig, Morar, and Knoydart, there are numerous bays and creeks, along the coast, many of which might be excellent fishing stations.

The southern part of this county is very mountainous, and is supposed to be the most elevated ground in Scotland. From its numerous lakes many streams descend toward both seas. In the extensive district called Badnoch lies Loch Spey, the source of the great river Spey, which proceeding eastward with an increasing stream, enters the shire of Moray at Rothiemurchus, after having expanded into a fine lake. Not far from this is seen the lofty top of Cairngorm; a mountain celebrated for its beautiful rock-crystals of various tints. These are much esteemed by lapidaries; and some of them, having the lustre of fine gems, bring a very high price. Limestone, iron-ore, and some traces of different minerals, are found in the county; but no mines have yet been worked with much success. Its rivers and lakes afford abundance of salmon and trout. The extensive plains which surround the lakes are in general fertile; and the high grounds feed many sheep and black cattle, the rearing and selling of which form the chief trade of the inhabitants. —By the present spirited exertions of the gentlemen in this populous county, the commerce and the industry of the inhabitants have of late been greatly increased; and to facilitate the communication with other parts, application has been made to parliament for leave to levy a tax on the proprietors of land for improving the roads and erecting bridges in this extensive shire. The commonalty in the high parts of the county, and on the western shore speak Gaelic; but the people of fashion in Inverness and its vicinity use the English language, and pronounce it with remarkable propriety.
The following is a view of the population of the different parishes in the county at two different periods.*

INVERSE, is applied to a manner of working the rule of three. See ARITHMETIC, No. 13.

INVERSION, the act whereby any thing is inverted or turned backwards. Problems in geometry and arithmetic are often proved by inversion; that is, by a contrary rule or operation.

INVERSION, in Grammar, is where the words of a phrase are ranged in a manner not so natural as they might be. For instance: "Of all vices, the most abominable, and that which least becomes a man, is impurity." Here is an inversion; the natural order being this: Impurity is the most abominable of all vices, and that which least becomes a man.—An inversion is not always disagreeable, but sometimes has a good effect.

INVESTMENT, a Place, is when a general, having an intention to besiege it, detaches a body of horse to possess all the avenues; blocking up the garrison, and preventing relief from getting into the place, till the army and artillery are got up to form the siege.

INVESTITURE, in Law, a giving livery of seisin or possession. There was an ancient great variety of ceremonies used upon investitures; as at first they were made by a certain form of words, and afterwards by such things as had the greatest resemblance to the thing to be transferred: thus, where lands were intended to pass, a turfi, &c. was delivered by the granter to the grantee. In the church, it was customary for princes to make investiture of ecclesiastical benefices, by delivering to the person they had chosen a pastoral staff and a ring.

INVISIBLE LADY, an amusing experiment in Acoustics, which was exhibited in this country, first by a Frenchman, and afterwards by others; in which, from the construction of the apparatus, a lady who conversed, sung and played on musical instruments, seemed to be enclosed in a hollow metallic globe, of about a foot in diameter. See SCIENCE, Amusements of.

INULA, Elecampane; a genus of plants belonging to the syngenesia class; and in the natural method ranking under the 49th order, Compositae. See BOTANY Index.

INUNDATION, a sudden overflowing of the dry land by the waters of the ocean, rivers, lakes, springs, or rains. See BOTANY, p. 209.

INVOCATION, in Theology, the act of adoring God, and especially of addressing him in prayer for his assistance and protection. See the articles ADORATION and PRAYER.

The difference between the invocation of God and of the saints, as practised by the Papists, is thus explained in the catechism of the council of Trent. "We beg of God (says the catechism), to give us good things, and to deliver us from evil; but we pray to the saints, to intercede with God and obtain those things which we stand in need of. Hence we use different forms in praying to God and to the saints: to the former we say,
JOACIMITES, in Church-History, the disciples of Joachim a Cistercian monk, who was an abbot of Flora in Calabria, and a great Pretender to inspiration.

The Joachimites were particularly fond of certain ternaries: The Father, the Son, and the Holy Spirit: The first ternary was that of men; of whom the first class was that of married men, which had lasted during the whole period of the Father; the second was clerks, which had lasted during the time of the Son; and the last was that of the monks, in which there was to be an uncommon effusion of grace by the Holy Spirit: The second ternary was that of doctrine, viz. the Old Testament, the New, and the everlasting Gospel; the first they ascribed to the Father, the second to the Son, and the third to the Holy Spirit: A third ternary consisted in the manner of living, viz. under the Father, men lived according to the flesh; under the Son, they lived according to the spirit; and under the Holy Ghost, they were to live according to the spirit only.

JOAN, POPE, called by Platina John VIII. is said to have held the holy see between Leo IV. who died in 885, and Benedict III. who died in 896. Marianus Scotus says, she sat two years five months and four days. Numberless have been the controversies, fables, and conjectures, relating to this pope. It is said that a German girl, pretending to be a man, went to Athens, where she made great progress in the sciences; and afterward came to Rome in the same habit. As she had a quick genius, and spoke with a good grace in the public disputations and lectures, her great learning was admired, and every one loved her extremely; so that after the death of Leo, she was chosen pope, and performed all offices as such. Whilst she was in possession of this high dignity, she was got with child; and as she was going in a solemn procession to the Lateran church, she was delivered of that child, between the Colosseum and St. Clement's church, in a most public street, before a crowd of people, and died on the spot, in 897. By way of embellishing this story, may be added the precaution reported to have been afterward taken to avoid such another accident. After the election of a pope, he was placed on a chair with an open seat, called the poping chair, when a deacon came most devoutly behind and satisfied himself of the pontiff's sex by feeling. This precaution, however, has been long deemed unnecessary, because the cardinals, it is alleged, take care to become fathers before they arrive at the pontificate.

JOAN d'Arc, or the Maid of Orleans, whose heroic behaviour in reanimating the expiring value of the French nation, through the most superstitious means, (pretending
JOANNA, St., or HINZUAN, one of the Comora islands in the Indian ocean. E. Long. 44° 15'. S. Lat. 12° 47'. See HINZUAN.

JOB, or Book of Job, a canonical book of the Old Testament, containing a narrative of a series of misfortunes which happened to a man whose name was Job, as a trial of his virtue and patience; together with the conferences he had with his cruel friends on the subject of his misfortunes, and the manner in which he was restored to ease and happiness. This book is filled with those noble, bold, and figurative expressions, which constitute the very soul of poetry.

Many of the Jewish rabbins pretend that this relation is altogether a fiction; others think it a simple narrative of a matter of fact just as it happened: while a third sort of critics acknowledge, that the groundwork of the story is true, but that it is written in a poetical strain, and decorated with peculiar circumstances, to render the narration more profitable and entertaining.

The time is not set down in which Job lived. Some have thought that he was much anciester than Moses, because the law is never cited by Job or his friends, and because it is related that Job himself offered sacrifices. Some imagine that this book was written by himself; others say, that Job wrote it originally in Syriac or Arabic, and that Moses translated it into Hebrew: but the rabbins generally pronounce Moses to be the author of it; and many Christian writers are of the same opinion.

JOBBER, a person who undertakes jobs, or small pieces of work.

In some statutes, jobber is used for a person who buys and sells for others. See BROKER.

JOBING, the business of a jobber.

Stock-JOBING, denotes the practice of trafficking in the public funds, or of buying and selling stock with a view to its rise or fall. The term is commonly applied to the illegal practice of buying and selling stock for time, or of accounting for the differences in the rise or fall of any particular stock for a stipulated time, whether the buyer or seller be possessed of any such real stock or not. See Stock-Broker.

JOCASTA, in fabulous history, a daughter of Menoeceus, who married Laius king of Thebes, by whom she had Oedipus. She afterwards married her son Oedipus, without knowing who he was, and had by him Eteocles, Polyneices, etc. When she discovered that she had married her own son and been guilty of incest, she hanged herself in despair. She is called Epicasta by some mythologists.

JOCKEY, in the management of horses; the person who trims up, and rides about horses for sale.

JOEL, or the Prophecy of Joel, a canonical book of the Old Testament. Joel was the son of Pethuel, and the second of the twelve lesser prophets. The style of this prophet is figurative, strong, and expressive. He upbraids the Israelites for their idolatry, and foretells the calamities they should suffer as the punishment of that sin: but he endeavours to support them with the comfort that their miseries should have an end upon their reformation and repentance. Some writers, inferring the order of time in which the minor prophets lived from the order in which they are placed in the Hebrew copies, conclude that Joel prophesied before Amos, who was contemporary with Uzziah, king of Judah. Archbishop Usher makes this inference from Joel's foretelling that drought, chap. iv. 7, 8, 9. If we consider the main design of Joel's prophecy, we shall be apt to conclude, that it was uttered after the captivity of the ten tribes; for he directs his discourse only to Judah, and speaks distinctly of the sacrifices and oblations that were daily made in the temple.

JOGHIS, a sect of heathen religious in the East Indies, who never marry, nor hold anything in private property; but live on alms, and practise strange serevities on themselves.

They are subject to a general, who sends them from one country to another to preach. They are, properly, a kind of penitent pilgrims; and are supposed to be a branch of the ancient Gymnosophists.

They frequent, principally, such places as are consecrated by the devotion of the people, and pretend to live several days together without eating or drinking. After having gone through a course of discipline for a certain time, they look on themselves as impeccable, and privileged to do any thing; upon which they give a loose to their passions, and run into all manner of debauchery.

JOGUÉS, or YOGGS, certain ages, eras, or periods, of extraordinary length, in the chronology of the Hindoos. They are four in number; of which the following is an account, extracted from Halhed’s Preface to the Code of Gentoo Laws, p. xxxvi.

1. The Sutter Jogus (or age of purity) is said to have lasted three million two hundred thousand years; and they hold that the life of man was extended in that age to one hundred thousand years, and that his stature was 21 cubits.

2. The Tirthah Jogus (in which one-third of mankind was corrupted) they suppose to have consisted of two million four hundred thousand years, and men lived to the age of ten thousand years.

3. The Dvapour Jogus (in which half of the human race became depraved) endured one million six hundred thousand years, and the life of man was then reduced to a thousand years.

4. The Colles Jogus (in which all mankind are corrupted, or rather lessened, for that is the true meaning of Colles) is the present era, which they suppose ordained to subsist four hundred thousand years, of which near five thousand are already past; and the life of man in that period is limited to one hundred years.

Concerning the Indian chronology, we have already had occasion to be pretty copious; see HINDOOS, N° 19. 22. We shall here, however, subjoin Dr Robertson’s observations on the above periods, from the Notes to his Historical Disquisition concerning India.

"If (says he *) we suppose the computation of time in the Indian chronology to be made by solar or lunar years, nothing can be more extravagant in itself, or more repugnant to our mode of calculating the duration of the world, founded on sacred and infallible authority. From one circumstance, however, which merits attention, we may conclude, that the information
was his beloved disciple. He was witness to the actions and miracles of his Master; was present at his transfiguration on Mount Tabor; and was with him in the garden of olives. He was the only apostle who followed him to the cross; and to him Jesus left the care of his mother. He was also the first apostle who knew him again after his resurrection. He preached the faith in Asia; and principally resided at Ephesus, where he maintained the mother of our Lord. He is said to have founded the churches of Smyrna, Pergamum, Thyatira, Sardis, Philadelphia, and Laodicea. He is also said to have preached the gospel among the Parthians, and to have addressed his first epistle to that people. It is related, that, when at Rome, the emperor Domitian caused him to be thrown into a cauldron of boiling oil, when he came out unhurt; on which he was banished to the isle of Patmos, where he wrote his Apocalypse. After the death of Domitian he returned to Ephesus, where he composed his Gospel, about the year 96; and died there, in the reign of Trajan, about the year 100, aged 94.

Gospel of St John, a canonical book of the New Testament, containing a recital of the life, actions, doctrine, and death, of our Saviour Jesus Christ, written by St John the apostle and evangelist.

St John wrote his Gospel at Ephesus, after his return from the isle of Patmos, at the desire of the Christians of Asia. St Jerome says he would not undertake it, but on condition that they should appoint a public fast, to implore the assistance of God; and, that the fast being ended, St John, filled with the Holy Ghost, broke out into these words: “In the beginning was the Word,” &c. The ancients assign two reasons for this undertaking: the first is, because, in the other three Gospels, there was wanting the history of the beginning of Jesus Christ’s preaching till the imprisonment of John the Baptist, which therefore he applied himself particularly to relate. The second reason was, in order to remove the errors of the Cerinthians, Ebionites, and other sects. But Mr Lampe and Dr Lardner have urged several reasons to show that St John did not write against Cerinthus or any other heretics in his Gospel.

Revelation of St John. See Apocalypse.

John of Salisbury, bishop of Chartres in France, was born at Salisbury in Wiltshire, in the beginning of the 12th century. Where he imbibed the rudiments of his education is unknown: but we learn that in the year 1136, being then a youth, he was sent to Paris, where he studied under several eminent professors, and acquired considerable fame for his application and proficiency in rhetoric, poetry, divinity, and particularly in the learned languages. Thence he travelled to Italy: and, during his residence at Rome was in high favour with Pope Eugenius III. and his successor, Adrian IV. After his return to England, he became the intimate friend and companion of the famous Thomas Becket, archbishop of Canterbury, whom he attended in his exile, and is said to have been present when that haughty prelate was murdered in his cathedral. What preferment he had in the church during this time does not appear; but in 1176 he was promoted by King Henry II. to the bishopric of Chartres in France, where he died in 1182. This John of Salisbury was really a phenomenon. He was one of the first

JOHN of Leyden, otherwise called Bucold. See ANABAPTISTS.

JOHN Sobieski of Poland, one of the greatest warriors in the 17th century, was, in 1665, made grand-marshal of the crown; and, in 1669, grand-general of the kingdom. His victories obtained over the Tartars and the Turks procured him the crown, to which he was elected in 1674. He was an encourager of arts and sciences, and the protector of learned men. He died in 1696, aged 72.

St John’s Day, the name of two Christian festivals; one observed on June 24th, kept in commemoration of the wonderful circumstances attending the birth of John the Baptist; and the other on December 27th, in honour of St John the Evangelist.

St John’s Wort. See HYPERICUM, BOTANY INDEX.

John’s, St, an island of the East Indies, and one of the Philippines, east of Mindanao, from which it is separated by a narrow strait. E. Long. 125° 25’ N. Lat. 7° 0’.

John’s, St, an island of North America, in the bay of St Lawrence, having New Scotland on the south and west, and Cape Breton on the east. The British got possession of it when Louisbourg was surrendered to them, on July 26, 1758.

JOHNSON, Ben, one of the most considerable dramatic poets of the last age, whether we consider the number or the merit of his productions. He was born at Westminster in 1574, and was educated at the public school there under the great Camden. He was descended from a Scottish family; and his father, who lost his estate under Queen Mary, dying before our poet was born, and his mother marrying a bricklayer for her second husband, Ben was taken from school to work at his father-in-law’s trade. Not being captivated with this employment, he went into the Low Countries, and distinguished himself in a military capacity. On his return to England, he entered himself at St John’s college, Cambridge; and having killed a person in a duel, was condemned, and narrowly escaped execution. After this he turned actor; and Shakespeare is said to have first introduced him to the world, by recommending a play of his to the stage, after it had been rejected. His alchemist gained him some reputation, that in 1619 he was, at the death of Mr Daniel, made post-laureate to King James I. and master of arts at Oxford. As we do not find Johnson’s economical virtues anywhere recorded, it is the less to be wondered at, that after this we find him petitioning King Charles, on his accession, to enlarge his father’s allowance of 100 marks into pounds; and quickly after we learn that he was very poor and sick, lodging in an obscure alley; on which occasion it was, that Charles, being prevailed on in his favour, sent him ten guineas; which Ben receiving said, “His majesty has sent me ten guineas, because I am poor, and live in an alley; go and tell him, that his soul lives in an alley.” He died in August 1657, aged 63 years, and was buried in Westminster Abbey.—The most complete edition of his works was printed in 1756, in 7 vols 8vo.

JOHNSON, Dr Samuel, who has been styled the brightest ornament of the 18th century, was born in the city of Litchfield in Staffordshire, on the 18th of September N. S. 1709. His father Michael was a bookseller; and must have had some reputation in the city, as he more than once bore the office of chief magistrate. By what casuistical reasoning he reconciled his conscience to the oaths required to be taken by all who occupy such stations, cannot now be known; but it is certain that he was zealously attached to the exiled family, and instilled the same principles into the youthful mind of his son. So much was he in earnest in this work, and at so early a period did he commence it, that when Dr Sacheverel, in his memorable tour through England, came to Litchfield, Mr Johnson carried his son, not then quite three years old, to the cathedral, and placed him on his shoulders, that he might see as well as hear the far-famed preacher.

But political prejudices were not the only bad things which young Sam inherited from his father: he derived from the same source a morbid melancholy, which, though it neither depressed his imagination, nor clouded his perspicuity, filled him with dreadful apprehensions of insanity, and rendered him wretched through life.
JOHN [307]

John adds, that "meeting with another source, the bounty, as it is supposed, of some one or more of the members of the cathedral of Litchfield, he returned to college, and made up the whole of his residence in the university about three years." Mr Boswell has told us nothing but that Johnson, though his father was unable to support him, continued three years in college, and was then driven from it by extreme poverty.

These gentlemen differ likewise in their accounts of Johnson's tutors. Sir John Hawkins says that he had two, Mr Jordan and Dr Adams. Mr Boswell affirms that Dr Adams could not be his tutor, because Jordan did not quit the college till 1731; the year in the autumn of which Johnson himself was compelled to leave Oxford. Yet the same author represents Dr Adams as saying, "I was Johnson's nominal tutor, but he was above my mark:" a speech of which it is not easy to discover the meaning, if it was not Johnson's duty to attend Adams's lectures. In most colleges we believe there are two tutors in different departments of education; and therefore it is not improbable that Jordan and Adams may have been tutors to Johnson at the same time, the one in languages, the other in science. Jordan was a man of such mean abilities, that though his pupil loved him for the goodness of his heart, he would often risk the payment of a small fine, rather than attend his lectures; nor was he studious to conceal the reason of his absence. Upon occasion of one such imposition, he said, "Sir, you have concealed me twopenny for non-attendance at a lecture not worth a penny." For some transgression or absence, his tutor imposed upon him as a Christmas exercise the task of translating into Latin verse Pope's Messiah, which being shown to the author of the original, was read and returned with this encomium, "The writer of this poem will leave it a question for posterity, whether his or mine be the original." The particular course of his reading while in college, and during the vacation which he passed at home, cannot be traced. That at this period he read much, we have his own evidence in what he afterwards told the king; but his mode of study was never regular, and at all times he thought more than he read. He informed Mr Boswell, that what he read solidly at Oxford was Greek, and that the study of which he was most fond was metaphysics.

It was in the year 1731 that Johnson left the university without a degree; and as his father, who died in the month of December of that year, had suffered great misfortunes in trade, he was driven out a commoner of nature, and excluded from the regular modes of profit and prosperity. Having therefore not only a profession but the means of subsistence to seek, he accepted, in the month of March 1732, an invitation to the office of under-master of a free school at Market Bosworth in Leicestershire: but not knowing, as he said, whether it was more disagreeable for him to teach or for the boys to learn the grammar-rules, and being likewise disgusted at the treatment which he received from the patron of the school, he relinquished in a few months a situation which he ever afterwards recollected with horror. Being thus again without any fixed employment, and with very little money in his pocket, he translated Lobo's voyage to Abyssinia, for the trifling sum, it is said, of five guineas, which he received from a bookseller in Q 2 Birmingham.
When the complaints of the nation against the administra-
tion of Sir Robert Walpole became loud, and a mo-
tion was made, February 13, 1740-1, to remove him
from his majesty's council for ever, Johnson was pitch-
ed upon by Cave to write what he did in the Magazine
intitled Debates in the Senate of Lilliput, but was under-
stood to be the speeches of the most eminent members
in both houses of parliament. These orations, which
induced Voltaire to compare British with ancient elo-
cuence, were hastily sketched by Johnson while he was
not yet 32 years old, while he was little acquainted
with life, while he was struggling, not for distinction
but for existence. Perhaps in none of his writings has
he given a more conspicuous proof of a mind prompt
and vigorous almost beyond conception: for they were
composed from scanty notes taken by illiterate persons
employed to attend in both houses; and sometimes he
had nothing communicated to him but the names of
the several speakers, and the part which they took in
the debate.

His separate publications which at this time attracted
the greatest notice were, "London, a Poem in imitation
of Juvenal's third Satire;" "Marmor Norfolciense,
or an Essay on an ancient prophetical Inscription in
Monkish Rhyme, lately discovered near Lynn in Nor-
folk;" and "A complete Vindication of the Licen-
sers of the Stage from the malicious and scandalous as-
sertions of Mr Brook author of Gustavos Vasa." The
poem, which was published in 1738 by Dobbsley, is uni-
versally known and admired as the most spirited instance
adapted to modern topics. Pope, who then filled the poetical
throne without a rival, being informed that the author's
name was Johnson, and that he was an obscure person,
replied, "he will soon be ditérré." The other two
pamphlets, which were published in 1739, are filled
with keen satire on the government; and though Sir
John Hawkins has thought fit to declare that they dis-
play neither learning nor wit, Pope was of a different
opinion; for in a note of his preserved by Mr Boswell,
he says, that "the whole of the Norfolk prophecy is
very humorous."

Mrs Johnson, who went to London soon after her
husband, now lived sometimes in one place and some-
times in another, sometimes in the city and sometimes
at Greenwich: but Johnson himself was oftener to be
found at St John's Gate, where the Gentleman's Ma-
gazine was published, than in his own lodgings. It was
there that he became acquainted with Savage, with
whom he was induced, probably by the similarity of
their circumstances, to contract a very close friend-
ship; and such were their extreme necessities, that they
have often wandered whole nights in the street for
want of money to procure them a lodging. In one
of these nocturnal rambles, when their distress was al-
most incredible, so far were they from being depressed
by their situation, that in high spirits, and full of
patriotism, they traversed St James's Square for se-
veral hours; inveighed against the minister; and, as
Johnson said in ridicule of himself, his companion, and
all such patriots, "resolved that they would stand by
their country." In 1744, he published the life of his
unfortunate companion; a work which, had he never
written any thing else, would have placed him very
high
JOH [ 309 ]

HIGH in the rank of authors (a). His narrative is remarkably smooth and well disposed, his observations are just, and his reflections disclose the inmost recesses of the human heart.

In 1749, when Drury-lane theatre was opened under the management of Garrick, Johnson wrote a prologue for the occasion; which for just dramatic criticism on the whole range of the English stage, as well as for poetical excellence, is confessedly unrivalled. But this year is, in his life, distinguished as the epoch when his arduous and important work, the Dictionary of the English Language, was announced to the world by the publication of its plan or prospectus, addressed to the earl of Chesterfield. From that nobleman Johnson was certainly led to expect patronage and encouragement; and it seems to be equally certain that his lordship expected, when the book should be published, to be honoured with the dedication. The expectations of both were disappointed. Lord Chesterfield, after seeing the lexicographer once or twice, suffered him to be repulsed from his door: but afterwards thinking to conciliate him when the work was upon the eve of publication, he wrote two papers in “The World,” warmly recommending it to the public. This article was seen through; and Johnson, in very polite language, rejected his lordship’s advances, letting him know, that he was unwilling the public should consider him as owing to a patron that which Providence had enabled him to do for himself. This great and laborious work its author expected to complete in three years: but he was certainly employed upon it seven; for we know that it was begun in 1747, and the last sheet was sent to the press in the end of the year 1754. When we consider the nature of the undertaking, it is indeed astonishing that it was finished so soon, since it was written, as he says, “with little assistance of the learned, and without any patronage of the great; not in the soft obscurities of retirement, or under the shelter of academic bowers, but amidst inconvenience and distraction, in sickness and in sorrow.” The sorrow, to which he here alludes, is probably that which he felt for the loss of his wife, who died on the 17th of March O. S. 1752, the loss of whom he continued to lament as long as he lived.

The Dictionary did not occupy his whole time: for while he was pushing it forward, he fitted his tragedy for the stage; wrote the lives of several eminent men for the Gentleman’s Magazine; published an imitation of the 10th Satire of Juvenal, entitled “The Vanity of Human Wishes;” and began and finished “The Rambler.” This last work is so well known, that it is hardly necessary to say that it was a periodical paper, published twice a-week, from the 20th of March 1750 to the 14th of March 1752 inclusive; but to give our readers some notion of the vigour and promptitude of the author’s mind, it may not be improper to observe, that notwithstanding the severity of his other labours, all the assistance which he received does not amount to five papers; and that many of the most masterly of those unequalled essays were written on the spur of the occasion, and never seen entire by the author till they returned to him from the press.

Soon after the Rambler was concluded, Dr Hawkesworth projected “The Adventurer” upon a similar plan; and by the assistance of friends he was enabled to carry it on with almost equal merit. For a short time, indeed, it was the most popular work of the two; and the papers with the signature T, which are confessedly the most splendid in the whole collection, are now known to have been communicated by Johnson, who received for each the sum of two guineas. This was double the price for which he sold sermons to such clergymen as either would not or could not compose their own discourses; and of sermon-writing he seems to have made a kind of trade.

Though he had exhausted, during the time that he was employed on the Dictionary, more than the sum for which the booksellers had bargained for the copy; yet by means of the Rambler, Adventurer, sermons, and other productions of his pen, he now found himself in greater affluence than he had ever been before; and as the powers of his mind, distended by long and severe exercise, required relaxation, he restore them to their proper tone; he appears to have done little or nothing from the closing of the Adventurer till the year 1756, when he submitted to the office of reviewer in the Literary Magazine. Of his reviews by far the most valuable is that of Soame Jenyns’s “Free Inquiry into the Nature and Origin of Evil.” Never were wit and metaphysical acuteness more closely united than in that criticism, which exposes the weakness and holds up to contempt the reasons of those vain mortals, who presumptuously attempt to grasp the scale of existence, and to form plans of conduct for the Creator of the universe. But the furnishing of magazines, reviews, and even newspapers with literary intelligence, and authors of books with dedications and prefaces, was considered as an employment unworthy of Johnson. It was therefore proposed by the booksellers that he should give a new edition of the dramas of Shakespeare; a work which he had projected many years before, and of which he had published a specimen which was commended by Warburton. When one of his friends expressed a hope that this employment would furnish him with amusement and add to his fame, he replied, “I look upon it as I did upon the Dictionary; it is all work; and my inducement to it is not love or desire of fame, but the want of money, which is the only motive to writing that I know of.” He issued proposals, however, of considerable length; in which he showed that he knew perfectly what a variety of research such an undertaking required; but his indolence prevented him from pursuing it with diligence, and it was not published till many years afterwards.

On the 15th of April 1785 he began a new periodical paper entitled “The Idler,” which came out every Saturday.

(a) From the merit of this work Mr Boswell has endeavoured to detract, by insinuating, that the person called Richard Savage was an impostor, and not the son of the earl of Rivers and the countess of Macclesfield. The moral character of Savage was undoubtedly unworthy of such a biographer; and it may be fairly questioned whether his intellectual or poetical character at all entitled him to such respectable notice.
JOHN. [ 310 ]

Johnson. Saturday in a weekly newspaper, called "the Universal
sal Chronicle, or Weekly Gazette," published by New-
berry. Of these essays, which were continued till the
5th of April 1760, many were written as hastily as an
ordinary letter; and one in particular composed at
Oxford was begun only half an hour before the de-
parture of the post which carried it to London.
About this time he had the offer of a living, of which
he might have rendered himself capable by entering
into orders. It was a rectory in a pleasant country,
of such yearly value as would have been an object to one
in much better circumstances; but sensible, as it is
supposed, of the aspersity of his temper, he declined it,
saying, "I have not the requisites for the office, and I
cannot in my conscience shear the flock which I am
unable to feed.”

In the month of January 1759 his mother died at
the great age of 90; an event which deeply affected
him, and gave birth to the 41st Idler, in which he la-
mens, that "the life which made his own life pleasant
was at an end, and that the gate of death was shut up
on his prospects.” Soon afterwards he wrote his "Ras-
selas Prince of Abyssinia; that with the profits he might
defray the expense of his mother's funeral, and pay
some debts which she had left. He told a friend, that
he received for the copy 100l. and 25l. more when it
came to a second edition; that he wrote it in the
evenings of one week, sent it to the press in par-
tions as it was written, and had never since read it
over.

Hitherto, notwithstanding his various publications,
he was poor, and obliged to provide by his labour for
the wants of the day that was passing over him; but
having been early in 1762 represented to the king as
a very learned and good man without any certain pro-
vision, his majesty was pleased to grant him a pension,
which Lord Bute, then first minister, assured him "was
not given for any thing which he was to do, but for
what he had already done.” A fixed annuity of three
hundred pounds, if it diminished his distress, increas-
ed his indolence; for as he constantly avowed that he had
no other motive for writing than to gain money, as he
had now was abundantly sufficient for all his pur-
pose, as he delighted in conversation, and was visited
and admired by the witty, the elegant, and the learn-
ed, very little of his time was past in solitary study.
Solitude was indeed his aversion; and that he might
avoid it as much as possible, Sir Joshua Reynolds and
he, in 1764, instituted a club, which existed long with-
out a name, but was afterwards known by the title of
the Literary Club. It consisted of some of the most en-
lighted men of the age, who met at the Turk's Head
in Gerard-street, Soho, one evening in every week at
seven, and till a late hour enjoyed "the feast of reason
and the flow of soul.”

In 1765, when Johnson was more than usually op-
pressed with constitutional melancholy, he was fortu-
nately introduced into the family of Mr Thrale, one
of the most eminent brewers in England, and member
of parliament for the borough of Southwark: and it
is but justice to acknowledge, that to the assistance
which Mr and Mrs Thrale gave him, to the shelter
which their house afforded him for 16 or 17 years,
and to the pains which they took to soothe or express
his uneasy fancies, the public is probably indebted for
some of the most masterly as well as the most popular
works which he ever produced. At length, in the
October of this year, he gave to the world his edition
of Shakespeare, which is chiefly valuable for the pre-
face, where the excellencies and defects of that immor-
tal bard are displayed with such judgment, as must
please every man whose taste is not regulated by the
standard of fashion or national prejudice. In 1767 he
was honoured by a private conversation with the king
in the library at the queen's house: and two years af-
wards, upon the establishment of the royal academy of
painting, sculpture, &c. he was nominated professor
of ancient literature; an office merely honorary, and
conferred on him, as is supposed, at the recommen-
dation of his friend the president.

In the variety of subjects on which he had hitherto
exercised his pen, he had forborne, since the admini-
stration of Sir Robert Walpole, to meddle with the dis-
putes of contending factions; but having seen with in-
dignation the methods which, in the business of Mr
Wilkes, were taken to work upon the populace, he
published in 1770 a pamphlet, entitled "The False
Alarm," in which he asserts, and labours to prove by
a variety of arguments founded on precedents, that the
expulsion of a member of the house of commons is equi-
valent to exclusion, and that no such calamity as the
subversion of the constitution was to be feared from an
act warranted by usage, which is the law of parliament.
Whatever may be thought of the principles main-
tained in this publication, it unquestionably contains much
wit and much argument, expressed in the author’s best
style of composition; and yet it is known to have been
written between eight o'clock on Wednesday night and
twelve o'clock on the Thursday night, when it was
read to Mr Thrale upon his coming from the house of
commons. In 1771 he published another political
pamphlet, entitled, "Thoughts on the late transactions
respecting Falkland's islands;" in which he attacked
Jarius: and he ever afterwards delighted himself with
the thought of having destroyed the able writer, whom
he certainly surpassed in nervous language and pointed
ridicule.

In 1773 he visited with Mr Boswell some of the
most considerable of the Hebrides or Western Islands
of Scotland, and published an account of his journey
in a volume which abounds in extensive philosophical
views of society, ingenious sentiments, and lively
description, but which offended many persons by the
violent attack which it made on the authenticity of the
poems attributed to Ossian. For the degree of
offence that was taken, the book can hardly be thought
to contain a sufficient reason: if the antiquity of these
poems be yet doubted, it is owing more to the con-
duct of their editor than to the violence of Johnson.
In 1774, the parliament being dissolved, he addressed
to the electors of Great Britain a pamphlet, entitled
"The Patriot;" of which the design was to guard
them from imposition, and teach them to distinguish
true from false patriotism. In 1775 he published
"Taxation no tyranny; in answer to the resolutions
and address of the American Congress." In this
performance his admirer Mr Boswell cannot," he says,
perceive that ability of argument or that felicity of ex-
pression for which on other occasions Johnson was so
eminent. This is a singular criticism. To the assumed
principle
principle upon which the reasoning of the pamphlet rests many have objected, and perhaps their objections are well founded; but if it be admitted that "the supreme power of every community has the right of requiring from all its subjects such contributions as are necessary to the public safety or public prosperity," it will be found a very difficult task to break the chain of arguments by which it is proved that the British parliament had a right to tax the Americans. As to the expression of the pamphlet, the reader, who adopts the maxim recorded in the "Journal of a tour to the Hebrides," that a controversialist "ought not to strike soft in battle," must acknowledge that it is uncommonly happy, and that the whole performance is one of the most brilliant as well as most correct pieces of composition that ever fell from the pen of its author. These essays drew upon him numerous attacks, all of which he heartily despised; for though it has been supposed that "A letter addressed to Dr Samuel Johnson occasioned by his public publications," gave him great uneasiness, the contrary is manifest, from his having, after the appearance of that letter, collected them into a volume with the title of "Political Tracts by the author of the Rambler." In 1765 Trinity College Dublin had created him LL. D. by diploma, and he now received the same honour from the university of Oxford; an honour with which, though he did not boast of it, he was highly gratified. In 1777 he was induced, by a case of a very extraordinary nature, to exercise that humanity which in him was obedient to every call. Dr William Dodd, a clergyman, under sentence of death for the crime of forgery, found means to interest Johnson in his behalf, and procured from him two of the most energetic compositions of the kind ever seen; the one a petition from himself to the king, the other a like address from his wife to the queen. These petitions failed of success.

The principal booksellers in London having determined to publish a body of English poetry, Johnson was prevailed upon to write the lives of the poets, and give a character of the works of each. This task he undertook with alacrity, and executed it in such a manner as must convince every competent reader, that as a biographer and a critic, no nation can produce his equal. The work was published in ten small volumes, of which the first four came abroad 1778, and the others in 1781. While the world in general was filled with admiration of the stupendous powers of that man who at the age of seventy-two, and labouring under a complication of diseases, could produce a work which displays so much genius and so much learning, there were narrow circles in which prejudice and resentment were fostered, and whence attacks of different sorts issued against him. These gave him not the smallest disturbance. When told of the feeble, though shrill, outcry that had been raised, he said,—"Sir, I considered myself as intrusted with a certain portion of truth. I have given my opinion sincerely; let them show where they think me wrong."

He had hardly begun to reap the laurels gained by this performance, when death deprived him of Mr. Thrale, in whose house he had enjoyed the most comfortable hours of his life; but it abated not in Johnson that care for the interests of those whom his friend had left behind him, which he thought himself bound to cherish, both in duty as one of the executors of his will, and from the nobler principle of gratitude. On this account, his visits to Streatham, Mr. Thrale's villa, were for some time after his death regularly made on Monday and protracted till Saturday, as they had been during his life; but they soon became less and less frequent, and he studiously avoided the mention of the place or the family. Mrs. Thrale, now Mrs. Poizzi, says indeed, that "it grew extremely perplexing and difficult to live in the house with him when the master of it was no more; because his dislikes grew capricious, and he could scarce bear to have any body come to the house where it was absolutely necessary for her to see."

The person whom she thought it most necessary for her to see may perhaps be guessed at without any superior share of sagacity; and if these were the visits which Johnson could not bear, we are as far from thinking his dislikes capricious, though they may have been perplexing, that if he had acted otherwise, we should have blamed him for want of gratitude to the friend whose "face for fifteen years had never been turned upon him but with respect or benignity."

About the middle of June 1783 his constitution sustained a severer shock than it had ever before felt, by a stroke of the palsy; so sudden and so violent, that it awakened him out of a sound sleep, and rendered him for a short time speechless. As usual, his recourse under this affliction was to piety, which in him was constant, sincere, and fervent. He tried to repeat the Lord's prayer first in English, then in Latin, and afterwards in Greek; but succeeded only in the last attempt; immediately after which he was again deprived of the power of articulation. From this alarming attack he recovered with wonderful quickness, but it left behind it some premonstrances of an hydroptic affection; and he was soon afterwards seized with a spasmodic asthma of such violence that he was confined to the house in great pain, while his dropsy increased, notwithstanding all the efforts of the most eminent physicians in London and Edinburgh. He had, however, such an interval of ease as enabled him in the summer 1784 to visit his friends at Oxford, Litchfield, and Ashbourne in Derbyshire. The Roman religion being introduced one day as the topic of conversation when he was in the house of Dr. Adams, Johnson said, "If you join the Papists externally, they will not interrogate you strictly as to your belief in their tenets. No reasoning Papist believes every article of their faith. There is one side on which a good man might be persuaded to embrace it. A good man of a timorous disposition, in great doubt of his acceptance with God, and pretty credulous, might be glad of a church where there are so many helps to go to heaven. I would be a Papist if I could. I have fear enough; but an obstinate rationality prevents me. I should never be a Papist unless on the near approach of death, of which I have very great terror."

His constant dread of death was indeed so great, that it astonished all who had access to know the piety of his mind and the virtues of his life. Attempts have been made to account for it in various ways; but doubtless that is the true account which is given in the Olla Podrida, by an elegant and pious writer, who now adorns a high station in the church of England. "That he should..."
JOHN

should not be conscious of the abilities with which Pro-
vidence had blessed him was impossible. He felt his
own powers: he felt what he was capable of having
performed; and he saw how little, comparatively speak-
ing, he had performed. Hence his apprehension on
the near prospect of the account to be made, viewed through
the medium of constitutional and morbid melancholy,
which often excluded from his sight the bright beams
of divine mercy." This, however, was the case only
while death was approaching from some distance. From
the time that he was certain it was near, all his fears
were calmed; and he died on the 13th of December
1784, full of resignation, strengthened by faith, and
joyful in hope.

For a just character of this great man our limits af-
ford not room: we must therefore content ourselves
with laying before our readers a very short sketch. His
stature was tall, his limbs were large, his strength was
more than common, and his activity in early life had
been greater than such a form gave reason to expect:
but he was subject to an infirmity of the convulsive
kind, resembling the distemper called St Vitus's dance;
and he had the seeds of so many diseases sown in his
constitution, that a short time before his death he de-
clared that he hardly remembered to have passed one
day wholly free from pain. He possessed very extra-
ordinary powers of understanding; which were much
cultivated by reading, and still more by meditation
and reflection. His memory was remarkably retentive,
his imagination uncommonly vigorous, and his judg-
ment keen and penetrating. He read with great rap-
idity, retained with wonder, the exactness what he so
easily collected, and possessed the power of reducing
to order and system the scattered hints on any subject
which he had gathered from different books. It would
not perhaps be safe to claim for him the highest place,
among his contemporaries, in any single department
of literature; but, to use one of his own expressions,
he brought more mind to every subject, and had a
greater variety of knowledge ready for all occasions,
than any other man that could be easily named.—
Though prone to superstition, he was in all other re-
spects so remarkably incredulous, that Hogarth said
while Johnson firmly believed the Bible, he seemed de-
termined to believe nothing but the Bible. Of the
importance of religion he had a strong sense, and his
zeal for its interests was always awake, so that pro-
fusion of every kind was abashed in his presence.—
The same energy which was displayed in his literary
productions, was exhibited also in his conversation,
which was various, striking, and instructive: like the
sage in Rasselas, he spoke, and attention watched his
lips; he reasoned, and conviction closed his periods:
when he pleased, he could be the greatest sophist that
ever contended in the lists of declamation; and per-
haps no man ever equalled him in nervous and pointed
repartees. His veracity, from the most trivial to the
most solemn occasions, was strict even to severity: he
scorned to embellish a story with fictitious circum-
stances; for what is not a representation of reality, he
used to say, is not worthy of our attention. As his
pursue and his house were ever open to the indigent, so
was his heart tender to those who wanted relief, and
his soul was susceptible of gratitude and every kind
impression. He had a roughness in his manner which
subdued the saucy and terrified the meek: but it was
only in his manner; for no man was more loved than
Johnson was by those who knew him; and his works
will be read with veneration for their author as long as
the language in which they are written shall be under-
stood.

JOHNSTON, DR. ARTHUR, was born at Caskie-
ben, near Aberdeen, the seat of his ancestors, and
probably was educated at Aberdeen, as he was afterwards
advanced to the highest dignity in that university.
The study he chiefly applied himself to was that of
physic; and to improve himself in that science, he trave-
elled into foreign parts. He was twice at Rome;
but the chief place of his residence was Padua, in
which university the degree of M. D. was conferred
on him in 1610, as appears by a MS. copy of verses
in the advocate's library in Edinburgh. After leav-
ing Padua, he travelled through the rest of Italy,
and over Germany, Denmark, England, Holland, and
other countries; and at length settled in France; where
he met with great applause as a Latin poet. He lived
there 20 years, and by two wives had 13 children.
After 24 years' absence, he returned into Scotland in
1632. It appears by the council books at Edinburgh,
that the doctor had a suit at law before that court
about that time. In the year following, it is very well
known that Charles I. went into Scotland, and made
Bishop Laud, then with him, a member of that coun-
cil: and by this accident, it is probable, that acquaint-
ance began between the doctor and that Prelate, which
produced his "Psalmorum Davidis paraphrasis poeti-
tica," for we find that, in the same year, the doctor
printed a specimen of his Psalms at London, and dedi-
cated them to this lordship.

He proceeded to perfect the whole, which took him
up four years; and the first edition complete was pub-
lished at Aberdeen in 1637, and at London the same
year. In 1641, Dr Johnston being at Oxford, on a
visit to one of his daughters who was married to a di-
vine of the church of England in that place, was seized
with a violent diarrhoea, of which he died in a few
days, in the 54th year of his age, not without having
seen the beginning of those troubles that proved too
fateful to his patron. He was buried in the place where
he died; which gave occasion to the following lines of
his learned friend Wedderburn in his Susperia on the
doctor's death:

Socia maxia, dule, tanti vehuta sepulchro
Vatis: is Anglicen is contigis altus honos.

In what year Dr Johnston was made physician to
the king does not appear: it is most likely that the
archbishop procured him that honour at his coming in-
to England in 1633, at which time he translated So-
lon's Song into Latin elegiac verse, and dedicated
it to his majesty. His Psalms were reprinted at
Middleburgh, 1642; London, 1647; Cambridge,....;
Amsterdam, 1706; Edinburgh, by William Lauder,
1729; and last on the plan of the Delphic classics,
at London, 1741, 8vo, at the expense of Auditor Bun-
son, who dedicated them to his late majesty, and pre-
fixed to this edition memoirs of Dr Johnston, with
the testimonies of various learned persons. A laboured
comparison between the two translations of Bucha-
nan and Johnston was printed the same year in English,
IOLAS or Iolau, in Fabulous History, a son of Iphiclus king of Thessaly, who assisted Hercules in conquering the hydra, and burnt with a hot iron the place where the heads had been cut off, to prevent the growth of others. He was restored to his youth and vigour by Hebe, at the request of his friend Hercules. Some time afterwards Iolas assisted the Heraclidæ against Eurytheus, and killed the tyrant with his own hand. According to Plutarch, Iolas had a monument in Boeotia and Phocis, where lovers used to go and bind themselves by the most solemn oaths of fidelity, considering the place as sacred to love and friendship. According to Diodorus and Pausanias, Iolas died and was buried in Sardinia, where he had gone to make a settlement at the head of the sons of Hercules by the 50 daughters of Theseus.

Jolloxochitl, an Indian word, signifying flower of the heart, is the name of a plant which bears a large beautiful flower, growing in Mexico, where it is much esteemed for its beauty and odour; which latter is so powerful, that a single flower is sufficient to fill a whole house with the most pleasing fragrance.

ION, in Fabulous History, a son of Xuthus and Creusa daughter of Erechtheus, who married Helice, the daughter of Selinus king of Ægiale. He succeeded to the throne of his father-in-law; and built a city, which he called Helice on account of his wife. His subjects from him received the name of Ioniotes, and the country that of Ionia. See Ionia.

ION, a tragic poet of Chios, who flourished about the 8th Olympiad. His tragedies were represented at Athens, where they met with universal applause. He is mentioned and greatly recommended by Aristophanes and Athenæus, &c.

IONA, Jona, or Icolmkill, one of the Hebrides; a small, but celebrated island, "once the luminary of the Caledonian regions (as Dr. Johnson expresses it), whence savage clans and roving barbarians derived the benefits of knowledge and the blessings of religion." The name Iona is derived from a Hebrew word signifying a dove, in allusion to his patron Columba, who landed here in 565. See COLUMBA.—It is said to have been a seat of the druids before his arrival, when its name in Irish was Inis Drúinsh, or the "Druid Island." The druids being expelled or converted, he founded here a cell of canons regular, who till 1716 differed from the church of Rome, in the observance of Easter and in the tonsure. After his death, the island retained his name, and was called Yeolumb cell or "Columb's cell," now Icolmkill. The Danes dislodged the monks in the 7th century, and Cluniacs were the next order that settled here.

This island, which belongs to the parish of Ross in Mull, is three miles long, and one broad: the east side is mostly flat: the middle rises into small hills; and the west side is very rude and rocky: the whole forming a singular mixture of rock and fertility.—There is in the island only one town, or rather village, consisting of about 60 mean houses. The population in 1798 amounted to about 330. Near the town is the bay of Martyrs slain by the Danes. An oblong inclosure, bounded by a stone dyke, and called Clachnan Drúinach, in which bones have been found, is supposed to have been a burial-place of the Druids or rather the common cemetery of the towns-people. Beyond the
the town are the ruins of the nunnery of Austin cano-
nesses, dedicated to St Oran, and said to be founded
by Columba: the church was 58 feet by 20, and the
east roof is entire. On the floor, covered deep with
cow-dung, is the tomb of the first prioress, with her
figure praying to the Virgin Mary, and this inscrip-
tion on the ledge: Hic jacet domina Anna Donaldi
Perleti filia, quondam prioresse de Iona, quae obtit an'o
mè do ximo εξε animom Altissimo commendamus;
and another inscribed, Hic jacet Mariota filia Johan: Lauch-
lain domini de..... A broad paved way leads hence to
the cathedral; and on this way is a large handsome cross
called Maclean's, the only one that remains of 360,
which were demolished here after the Reformation.
Re-
lig Ouran, or the burying-place of Oran, is the large
inclosure where the kings of Scotland, Ireland,
and of the isles, and their descendants, were buried
in
three several chapels. The dean of the isles, who
travelled over them 1549, and whose account has been
copied by Buchanan, and published at Edinburgh
1784, says, that in his time on one of these chapels
( or " tombs of stain fornit like little chapels with one
braid gray marble or quin on staw on the gawt of lik
ane of the tombs," containing, as the chronicle says,
the remains of 48 Scotch monachs, from Ferguson to
Macbeth, 30 of whom were pretended to be of the
race of Alpin) was inscribed, Tumulus regum Scotiae.
The next was inscribed, Tumulus regum Hibernia,
and contained four Irish monachs: and the third, inscribed
Tumulus regum Norwegia, containing eight Norwegian
princes, or viceroys of the Hebrides while they
were subject to the crown of Norway. Boetius says,
that Ferguson founded this abbey for the burial-place of
his successors, and caused an office to be composed for
the funeral ceremony. All that Mr Pennant could
discover here were only certain slant remains, built
in a ridged form and arched within, but the inscrip-
tions lost. These were called Jornaire nan righ, or
" the ridge of the kings." Among these stones are
to be seen only these two inscriptions in the Gaelic or
Erse language and ancient Irish characters: Cros
Domhail fat'asих, i.e. " the cross of Donald Long-
shanks," and that of Urcheoine o Guin; and another
inscribed Hic jacet prioresse de Hy, Johannes, Hug-
nius, Patricius, in defretis obis baculatorius, qui obit
an. Dom. milesio quaingestesimo. About 300 inscrip-
tions were collected here by Mr Sacherer in 1688
and given to the earl of Argyll, but afterwards lost in
the troubles of the family. The place is in a man-
ner filled with grave-stones, but so overgrown with
weeds, that few or none are at present to be seen, far
less any inscriptions read. Here also stands the chapel
of St Oran, the first building begun by Columba, which
the evil spirits would not suffer to stand till some hu-
man victim was buried alive; for which service Oran
offered himself, and his red grave-stone is near the
door. In this chapel are tombs of several chiefs, &c.
A little north-west of the door is the pedestal of a
cross: on it are certain stones that seem to have been
the supports of a tomb. Numbers who visit this island
think it incumbent on them to turn each of these
thrice round, according to the course of the sun.
They are called Clacha-brath; for it is thought that the
brath, end of the world, will not arrive till the
pedestal on which they stand is worn through. Origi-
nally (says Mr Sacherer) here were three noble
gloves of white marble, placed on three stone basons,
and these were turned round; but the synod ordered
them and 60 crosses to be thrown into the sea.
The present stones are probably substituted in place of
these gloves. The precinct of these tombs was held sacred,
and enjoyed the privileges of a girth or sanctuary.
These places of retreat were by the ancient Scotch law,
not to shelter indiscriminately every offender, as was
the case in more bigotted times in Catholic countries;
for here all atrocious criminals were excluded; and
only the unfortunate delinquent, or the penitent sinner,
was shielded from the instant stroke of rigorous justice.
A little to the north of this inclosure stands the
cathedral, built in form of a cross, 115 feet long
by 23, the transept 70 feet: the pillars of the choir
have their capitals charged with scripture and other
histories; and near the altar are the tombs of two ab-
bots and a knight. A fragment remains of the alter-
stone of white marble veined with gray. This church
is ascribed to Maldwin in the seventh century; but the
present structure is far too magnificent for that age.
Most of the walls are built of red granite from the
Nun's island in the sound. Two parallel walls of a con-
vent way about 12 feet high and 10 wide, reach from
the south-east corner to the sea. In the churchyard
is a fine cross of a single piece of red granite, 14 feet high,
22 inches broad, and 10 inches thick. Near the south-
east end is Mary's chapel. The monastery is behind
the chapel; of which only a piece of the cloisters re-
 mains, and some sacred black stones in a corner, on
which contracts and alliances were made and oaths
sworn. East of it was the abbot's gardens and offices.
North of this was the palace of the bishop of the isles
after the separation of Man from them. This see was
endowed with 13 islands; several of which were fre-
cently taken away by the chieftains. The title of
Soder, which some explained Soter, Zeleg, " the name
of Christ, or Soder, an imaginary town," is really de-
uced from the distinction of the diocese into the nor-
thern islands or Norderays (i.e. all to the north of Ard-
namurchan point), and the Southern or Sudereys;
which last being the most important, the isle of Man
retained both titles.

Other ruins of monastic buildings and offices may be
traced, as well as some Druidical sepulchral remains.
Several abbey were derived from this, which with
the island was governed by an abbot-presbyter, who had
rule even over bishops. The place where Columba
landed was a pebbly beach, where a heap of earth repres-
ents the form of his ship. Near it is a hill with a cir-
cle of stones called Cooc-nan eingeal, or " the hill of
angels," with whom the saint held conference; and on
Michaelmas day the inhabitants course their horses
round it, a remain of the custom of bringing them there
to be blessed. In former times, this island was
the place where the archives of Scotland and many valu-
able old manuscripts were kept. Of these most are sup-
posed to have been destroyed at the Reformation; but
many, it is said, were carried to the Scotch college at
Douay in France, and it is hoped some of them may
still be recovered. In the island of Iona a schoolmaster
is established; but there is no temple for worship, no
instructor in religion, excepting the schoolmaster, unless
it is visited by the parish minister from another island,
JONAH, or Prophecy of JONAH, a canonical book of the Old Testament; in which it is related, that Jonah (about 771 B.C.) was ordered to go and prophesy the destruction of the Ninevites, on account of their wickedness. But the prophet, instead of obeying the divine command, embarked for Tarshish; when, a tempest arising, the mariners threw him into the sea, he was swallowed by a great fish; and after being three days and nights in his belly, was cast upon the land. Hereupon, being sensible of his past danger and surprising deliverance, he betook himself to the journey and embassy to which he was appointed; and arriving at Nineveh the metropolis of Assyria, he, according to his commission, boldly laid open their sins and miscarriages, and proclaimed their sudden overthrow: upon which the whole city, by prayer and fasting, and a speedy repentance, happily averted the divine vengeance, and escaped the threatened rain. Jonah upon this, fearing to pass for a false prophet, retired to a hill at some distance from the city; where God, by a miracle, condescended to show him the unreasonableness of his discontent.

JONATHAN, the son of Saul, celebrated in sacred history for his valour, and his friendship for David against the interest of his own house. slain in battle 1055 B.C.

Jonathan Maccabæus, brother of Judas, a renowned general of the Jews. He forced Bacchides the Syrian general, who made war with the Jews, to accept a peace; conquered Demetrius Soter, and afterwards Apollo, that prince's general; but, being ensnared by Tryphon, was put to death 144 B.C.

JONES, Inigo, a celebrated English architect, was the son of a cloth-worker of London, and was born in 1572. He was at first put apprentice to a joiner; but early distinguished himself by his inclination to drawing or designing, and was particularly taken notice of for his skill in landscape painting. This afterwards recommended him to the favour of William earl of Pembroke, who sent him abroad with a handsome allowance in order to perfect himself in that branch. He was no sooner at Rome, than he found himself in his proper sphere: he felt that nature had not formed him to decorate cabinets, but to design palaces. He dropped the pencil and conceived Whitehall. In the state of Venice he saw the works of Palladio, and learned how beautiful taste may be exerted on a less theatre than the capital of an empire. How his abilities distinguished themselves in a spot where they certainly had no opportunity to act, we are not told, though it would not be the least curious part of his history; certain it is, that, on the strength of his reputation at Venice, Christian IV. invited him to Denmark, and appointed him his architect; but on what buildings he was employed in that country, we are yet to learn. James I. found him at Copenhagen, and Queen Anne took him in the quality of her architect to Scotland. He served Prince Henry in the same capacity, and the place of surveyor-general of the works was granted to him in reversion. On the death of that prince, with whom at least all his lamented qualities did not die, Jones travelled once more into Italy, and, assisted by ripeness of judgment, perfected his taste. To the interval between these voyages Mr Walpole is inclined to assign those buildings of Inigo, which are less pure, and border too much upon the bastard style, which one may call King James's Gothic. Inigo's designs of that period are not Gothic, but have a littleness of parts, and a weight of ornaments, with which the revival of the Grecian taste was encouraged, and which he shook off in his grander designs. The surveyor's place fell, and he returned to England; and, as if architecture was not all he had learned at Rome, with an air of Roman disinterestedness he gave up the profits of his office, which he found extremely in debt, and prevailed upon the comptroller and paymaster to imitate his example, till the whole arrears were cleared.

In 1620, he was employed in a manner very unworthy of his genius: King James set him upon discovering, that is, robbing, who were the founders of Stonehenge. His ideas were all Romanised; consequently, his partiality to his favourite people, which ought rather to have prevented him from charging them with that mass of barbarous clumsiness, made him conclude it a Roman temple.

In the same year Jones was appointed one of the commissioners for the repair of St Paul's; but which was not commenced till the year 1633, when Laud, then bishop of London, laid the first stone, and Inigo the fourth. In the restoration of that cathedral, he made two capital faults. He first renewed the sides with very bad Gothic; and then added a Roman portico, magnificent and beautiful indeed, but which had no affinity with the ancient parts that remained, and made his own Gothic appear ten times heavier. He committed the same error at Winchester, thrusting a screen in the Roman or Grecian taste into the middle of that cathedral. Jones indeed was by no means successful when he attempted Gothic. The chapel of Lincoln's-Inn has none of the characteristics of that architecture. The cloister beneath seems oppressed by the weight of the building above.

The authors of the life of Jones place the erecting of the Banqueting-house in the reign of King Charles; but it appears, from the accounts of Nicholas Stone, that it was begun in 1619, and finished in two years—a small part of the pile designed for the palace of our kings; but so complete in itself, that it stands a model of the most pure and beautiful taste. Several plates of the intended palace at Whitehall have been given; but Mr Walpole thinks, from no finished design. The four great sheets are evidently made up from general hints; nor could such a source of invention and taste as the mind of Inigo ever produce so much sameness. The whole fabric, however, was so glorious an idea, that one forgets for a moment (says Mr Walpole), in the regret for its not being executed, the confirmation of our liberties, obtained by a melancholy scene that passed before the windows of that very Banqueting-house.

In 1623 he was employed at Somerset-house, where a chapel was to be fitted up for the Infanta, the intended bride of the prince. The chapel is still in being. The front to the river, part only of what was designed, and the water-gate, were erected afterwards on the designs of Inigo, as was the gate at York-stairs.

On the accession of Charles, Jones was continued in
his pastas under both king and queen. His fee as surveyor was 8s. 4d. a day, with an allowance of 46l. a year for house-rent, besides a clerk, and incidental expenses. What greater rewards he had, are not upon record.

During the prosperous state of the king's affairs, the pleasures of the court were carried on with much taste and magnificence. Poetry, painting, music, and architecture, were all called in to make them rational amusements. Mr Walpole is of opinion, that the celebrated festivals of Louis XIV. were copied from the shows exhibited at Whitehall, in his time the most polite court in Europe. Ben Johnson was the laureat; Inigo Jones the inventor of the decorations; Laniere and Farenbosco composed the symphonies; the king, the queen, and the young nobility, danced in the interludes. We have accounts of many of those entertainments, called masques; they had been introduced by Anne of Denmark.

Lord Burlington had a folio of the designs for these solemnities, by Inigo's own hand, consisting of habits, masks, scenes, &c. The harmony of these masks was a little interrupted by a war that broke out between the composers, Inigo and Ben, in which whoever was the aggressor, the turbulent temper of Johnson took care to be most in the wrong.

The works of Inigo Jones are not scarce; Surgeon's hall is one of his best works. One of the most admired is the arcade of Covent-garden, and the church: "Two structures (says Mr Walpole), of which I want taste to see the beauty. In the arcade there is nothing remarkable: the pilasters are ar- rant and homely stripes as any plasterer would make. The barn-roof over the portico of the church strikes my eyes with as little idea of dignity and beauty, as it could do if it covered nothing but a barn. It must be owned, that the defect is not in the architect, but in the order.—Who ever saw a beautiful Tuscan building? Would the Romans have chosen that order for a temple?" The expense of building that church was 4520l.

Ambresbury in Wiltshire was designed by Jones, but executed by his scholar Webb. Jones was one of the first that observed the same diminution of pilasters as in pilars. Lindsay-house in Lincoln's-Inn Fields, which he built, owes its chief grace to this singularity. In 1618, a special commission was issued to the lord-chancellor, the earls of Worcester, Pembroke, Arundel, and others, to plant and reduce to uniformity, Lincoln's-Inn Fields, as it shall be drawn by way of map or ground-plot, by Inigo Jones, surveyor-general of the works. That square is laid out with a regard to so trifling a singularity, as to be of the exact dimensions of one of the pyramids: this would have been admired in those ages when the keep at Ken- nelworth Castle was erected in the form of a horse-futter, and the Escurial in the shape of St Lawrence's gridiron.

Coleshill in Berkshire, the seat of Sir Matthew Pleydell, built in 1650, and Cobham-hall in Kent, were Jones's. He was employed to rebuild Castle Ashby, and finished one front: but the civil war interrupted his progress there and at Stoke-park in Northamptonshire. Shafsbury-house, now the London Lying-in hospital, on the east side of Aldersgate-street, is a beautiful front. The Grange, the seat of the lord chancellor Henley in Hampshire, is entirely of this master. It is not a large house, but by far one of the best proofs of his taste. The hall, which opens to a small vestibule with a cupola, and the staircase adjoining, are beautiful models of the purest and most classic antiquity. The gate of Beauchamp-garden at Chelsea, designed by Jones, was purchased by Lord Burlington, and transported to Chiswick. He drew a plan for a palace at Newmarket; but not that wretched hovel that stands there at present. One of the most beautiful of his works is the queen's house at Greenwich. The first idea of the hospital is said to have been taken from his papers by his scholar Webb. Heriot's hospital in Edinburgh, and the improvements made in his time on Glamis Castle in Forfarshire in Scotland, are specimens of the designs of Inigo Jones.

Inigo tasted early the misfortunes of his master. He was not only a favourite, but a Roman Catholic; in 1645 he paid 153l. for his delinquency and sequestration. Whether it was before or after this time, it is uncertain, that he and Stone the mason buried their joint stock in Scotland yard; but an order being published to encourage the informers of such concealments, and four persons being privy to the spot where the money was hid, it was taken up, and reburied in Lambeth-marsh. Grief, misfortunes, and age, put an end to his life at Somerset-house, July 21. 1651. Several of his designs have been published by Mr Kent, Mr Colin Campbell, and Mr Isaac Ware. He left in MS. some curious notes on Palladio's architecture, which are inserted in an edition of Palladio published in 1714.

Jones, Sir William, the son of William Jones, Esq., an eminent mathematician, contemporary with the great Newton, was born in London on the 28th of September 1746, and received the rudiments of his education at Harrow school, under the tuition of Dr Robert Sumner, whom he has celebrated in an eulogium which will probably be coeval with time. From Harrow school he went to University college, Oxford, where the rapidity of his literary acquisitions excited the admiration of all.

He travelled through France at the age of 23, taking up his residence for some time at Nice, where man, and the various forms of government, became the favourite objects of his investigation. A wish to relieve his mother from the burden of his education, made him long for a fellowship in his college, but having no immediate prospect of obtaining it, he in 1765 became tutor to young Lord Althorpe, afterwards Earl Spencer, in which situation he was introduced to the best of company, and had also leisure to prosecute the acquisition of knowledge, and the farther cultivation of his intellectual powers, which were objects ever dear to him.

He obtained next year, the fellowship he expected, and was thus raised to a state which he could not help viewing as independent. Being at Spas with his pupil in the year 1757, he employed much of his time in making himself acquainted with the German language; and in the following year he was requested by the duke of Grafton's under-secretary, to undertake a translation of a Persian MS. of the life of Nadir Shah, into the French language, of which the king of Denmark was anxious.
JON (317) JON

anxious to have a version. This, his first publication, appeared in 1770, with the addition of a treatise on oriental poetry, which was very much admired, on account of the elegance of the French style and the accuracy of the translation. For this excellent publication it appears that he received nothing more than a diploma from his Danish majesty, constituting him a member of the Royal Society of Copenhagen, with a warm recommendation to the notice of his own sovereign.

That he might be enabled to gratify his commendable ambition, he now began to think seriously of some profession through life; and, as he had conceived an early predilection for the law, he made that the object of his choice; and in the month of September 1770, he entered at the Temple. Yet the studies of his profession did not prevent him from making those literary advances, in which he so much delighted, and oriental literature still continued a favourite object. When the life of Zoroaster by Anquetil du Perron made its appearance, in the preliminary discourse to which the University of Oxford had been attacked, our author defended it in a pamphlet written with severity and with elegance. In 1772, he published a small volume of poems, being translations from the Asiatic poets, remarkable for the grace and brilliancy of their style; and in 1774 appeared his work "De Poeti Asiatico," the beauty and purity of the Latin in which it is composed, exciting the admiration of men of literature both at home and abroad. He was called to the bar in the beginning of 1774, but declined to act in that capacity without a previous knowledge of the actual business of the profession. He was appointed a commissioner of bankrupts in 1776, about which period he addressed a letter to Lord Althorp, in which he beautifully expresses his ardent wish to have constitutional liberty established by constitutional means.

His translation of the speech of Jesus, on account of his elegant style, his profound critical and historical knowledge, commanded the admiration of every competent judge. Soon after this his practice at the bar increased with rapidity; but he had little reason to flatter himself with the prospect of advancement in professional rank and dignity, because he was known to be convinced of the injustice of the British cause respecting the American war, which he was at no pains to conceal; and therefore an opposer of the measures of those who had the direction of public affairs, had little preference to look for. In 1780 he became a candidate to succeed to Sir Roger Newdigate as representative in parliament for the university of Oxford, in which he was respectably supported; but his political sentiments were ill suited to secure him a majority, which made him decline the contest prior to the election. He soon after published a pamphlet entitled "An Inquiry into the Legal Mode of Suppressing Riots, with a Constitutional Plan of Future Defense," recommending the propriety of making every citizen a soldier in cases of imminent danger. He next published a translation of seven ancient poems of the highest reputation in Arabia, which, with an ode on the marriage of Lord Althorp, procured for him the highest reputation. His essay on the laws of bailments was also much admired, as was his speech at the London tavern in defence of a parliamentary reform in 1782. At Paris he drew up a dialogue between a farmer and a country gentleman on the principles of government, published in Wales by the dean of St. Asaph, for which a bill of indictment was preferred against the clergyman. In a letter to Lord Kenyon, Mr. Jones avowed himself to be the author, and asserted the principles it contained to be perfectly agreeable to the British constitution; but it appears that he afterwards relaxed considerably in his political ardour.

After the resignation of Lord North, and appointment of Lord Shelburne, Mr. Jones was nominated one of the judges in the British territories of India, an appointment which he had long wished for, as it would afford him an opportunity of prosecuting his favourite researches into oriental literature. He was chosen a judge in March 1783, and on the 20th of that month the honour of knighthood was conferred upon him. He arrived at Calcutta in September, and entered upon his office in December, opening the sessions with a very elegant charge to the grand jury. Here he planned the institution of a society similar to the Royal Society of London, many valuable labours and researches of which are already in the hands of the public. He collected materials for a complete digest of the Hindu and Mahometan laws, which interesting work he did not live to bring to a conclusion. The publication of the "Asiatic Researches" occupied much of his attention. In 1780 he translated an ancient Indian drama called "Sacentara," which has been considered as an interesting curiosity. In 1794 he gave the world his "Ordinances of Mino," a famous Indian legislator, containing a system of duties both civil and religious.

The climate of India proving unfavourable to the health of Lady Jones, obliged her to return to England, whither Sir William soon designed to follow her. On the 20th of April 1794, he was seized at Calcutta with an inflammation of the liver, which set the powers of medicine at defiance, and on the 27th of the same month put an period to his existence without pain or struggle.

It may be fairly asserted that few men have died more respected or regretted, as few have passed a more useful and irreproachable life. The uncommon extent of his erudition has been displayed in all his writings, and scarcely any subject of human research escaped his notice. He has scarcely ever been equalled as a linguist, for he is said to have been more or less acquainted with about 28 different languages. Taste and elegance marked all his exertions, and he might have risen as a poet to the very first rank. Great as his knowledge was, his virtue and religion were not inferior. In whatever light we think proper to view him, as standing in relation to society, he was undoubtedly a pattern worthy of imitation.

As a permanent monument to his memory, his affectionate lady published his whole finished works in six quarto volumes, in the year 1799; and a marble monument to his memory by the same endearing friend, is placed in the antechamber of University college, Oxford. The East India Company also voted a monument to his memory in St. Paul's cathedral, and a statue of him to be sent out to Bengal. Memoirs of his life were published by Lord Teignmouth, and a
society of gentlemen in Bengal who had been educated at Oxford, subscribed a sum for a prize dissertation on his character and merits, by students in that university.

IONIA, a country of Asia Minor, bounded on the north by Æolia, on the west by the Ægean and Ionic seas, on the south by Caria, and on the east by Lydia and part of Caria. It was founded by colonies from Greece, and particularly Attica, by the Ionians or subjects of Ion. Ionia was divided into 12 small states, which formed a celebrated confederacy often mentioned by the ancients. These 12 states were Priene, Miletus, Colophon, Clazomenes, Ephesus, Leonidas, Teos, Phocaia, Eretria, Smyrna, and the capitals of Samos and Chios. The inhabitants of Ionia built a temple which they called Pan Ioniaeum from the concourse of people that flocked there from every part of Ionia. After they had enjoyed for some time their freedom and independence, they were made tributary to the power of Lydia by Creusus. The Athenians assisted them to shake off the slavery of the Asiatic monarchs; but they soon forgot their duty and relation to their mother-country, and joined Xerxes when he invaded Greece. They were delivered from the Persian yoke by Alexander, and restored to their original independence. They were reduced by the Romans under the dictator Sulla.

IONIAN ISLANDS, seven islands on the western coast of Greece, which were erected into a republic in 1800, and are now under the protection of Great Britain. See Ionian Islands, Supplement.

IONIC ORDER. See Architecture, No. 45.

IONIC Dialect, in Grammar, a manner of speaking peculiar to the people of Ionia.

IONIC Sect was the first of the ancient sects of philosophers; the others were the Ionic and Eleatic. The founder of this sect was Thales, who being a native of Miletus in Ionia, occasioned his followers to assume the appellation of Ionia: Thales was succeeded by Anaximander, and he by Anaximenes, both of Miletus: Anaxagoras Clazomenian succeeded them, and removed his school from Asia to Athens, where Socrates was his scholar. It was the distinguishing tenet of this sect, that water was the principle of all natural things.

IONIUM, a part of the Mediterranean sea, at the bottom of the Adriatic. It lies between Sicily and Greece. That part of the Ægean sea which lies on the coasts of Ionia in Asia, is called the Sea of Ionia, and not the Ionian sea. According to some authors, the Ionian sea receives its name from Io, who swam across there after she had been metamorphosed into a heifer.

JONK, or JONQUE, in naval affairs, is a kind of small ship, very common in the East Indies. These vessels are about the bigness of our fly-boats; and differ in the form of their building, according to the different methods of naval architecture used by the nations to which they belong. Their sails are frequently made of mats, and their anchors are made of wood.

JOPPA, a sea-port town in Palestine, lying south of Cæsarea; and anciently the only port to Jerusalem, whence all the materials sent from Tyre towards the building of Solomon's temple were brought hither and landed, (2 Chron. ii. 16.) It is said to have been built by Japhet, and from him to have taken its name Jopha, afterwards moulded into Joppa; and the very heathen geographers speak of it as built before the flood. It is now called Jaffa, somewhat nearer to its first appellation, and is but in a poor and mean condition.

JOR, the Hebrew for a river, which, joined with Dan, concurs to form the term Jordan. See Dan.

JORDANO, LUCCA, an eminent Italian painter, was born at Naples in 1632. He became very early a disciple of Joseph Ribera; but going afterwards to Rome, he attached himself to the manner of Pietro da Cortona, whom he assisted in his great works. Some of his pictures being seen by Charles II. king of Spain, he engaged him in painting the Escorial; in which task he acquitted himself as a great painter. The king showed him a picture of Bassani, expressing his concern that he had not a companion: Lucca painted one so exactly in Bassani's manner, that it was taken for a performance of that master; and for this service he was knighted, and gratified with several honourable and valuable employments. The great works he executed in Spain gave him still greater reputation when he returned to Naples; so that though he was a very quick workman, he could not supply the eager demands of the citizens. No one, not even Tintoret, ever painted so much as Jordano; and his generosity carried him so far as to present altar-pieces to churches that were not able to purchase them. His labours were rewarded with great riches, which he left to his family, when he died, in 1705.

JOSEPH, the son of Jacob; memorable for his chastity, and the honours conferred on him at the court of Egypt, &c. He died in 1635 B.C. aged 110.

JOSEPHUS, the celebrated historian of the Jews, was of noble birth, by his father Matthias descended from the high-priests, and by his mother of the blood-royal of the Maccabees; he was born A.D. 37, under Caligula, and lived under Domitian. At 16 years of age he betook himself to the sect of the Essenes, and then to the Pharisees; and having been successful in a journey to Rome, upon his return to Judea he was made captain-general of the Galileans. Being taken prisoner by Vespasian, he foretold his coming to the empire, and his own deliverance by his means. He accompanied Titus at the siege of Jerusalem, and wrote his "Wars of the Jews," which Titus ordered to be put in the public library. He afterwards lived at Rome, where he enjoyed the privileges of a Roman citizen, and where the emperors loaded him with favours, and granted him large pensions. Besides the above work, he wrote, 1. Twenty books of Jewish antiquities, which he finished under Domitian. 2. Two books against Apion. 3. An elegant discourse on the martyrdom of the Maccabees. 4. His own life. These works are excellently written in Greek.

JOSHUA, the renowned general of the Jews, who conducted them through the wilderness, &c. died in 1424 B.C. aged 110.

JOSHUA, a canonical book of the Old Testament, containing a history of the wars and transactions of the person whose name it bears. This book may be divided into three parts: the first of which is a history of the conquest of the land of Canaan; the second, which begins at the 12th chapter, is a description of that country, and the division of it among the tribes; and
and the third, comprised in the two last chapters, contains the renewal of the covenant he caused the Israelites to make, and the death of their victorious leader and governor. The whole comprehends a term of 17, or, according to others, of 27 years.

Josiah, king of Judah, the destroyer of idolatry, and the restorer of the true worship, an excellent magistrate, and a valiant general, was slain in battle, 609 B.C.

Jotapata, in Ancient Geography, a town of the Lower Galilee, distant 40 stadia from Gabara; a very strong place, situated on a rock, walled round, and encompassed on all hands with mountains, so as not to be seen but by those who came very near. It was with great difficulty taken by Vespasian, being defended by Josephus, who commanded in it; when taken, it was ordered to be rased.

Jovian, the Roman emperor, elected by the army, after the death of Julian the apostate, in 363. He at first refused, saying he would not command idolatrous soldiers; but, upon an assurance that they would embrace Christianity, he accepted the throne, and immediately shut all the Pagan temples, and forbade their sacrifices. But he did not long enjoy the dignity to which his merit had raised him; being suffocated in his bed by the fumes of a fire that had been made to dry the chamber, in 364, the 33d of his age, and the eighth month of his reign. See Constantinople, No. 67.

Jovius, Paul, in Italian Giovio, a celebrated historian, was born at Como in Italy, in the year 1483. As his father died in his infancy, he was educated by his eldest brother Benedict Jovius, under whom he became well skilled in classical learning; and then went to Rome, for the sake of enjoying the benefit of the Vatican library. He there wrote his first piece, De piscibus Romanus, which he dedicated to Cardinal Lewis of Bourbon. He received a pension of 500 crowns for many years from Francis I. king of France, whose favour he secured by his writings. But, in the following reign, having disputed the constable Montmorency, his name was struck out of the list of pensioners. Jovius did not suffer his spirits to sink under his misfortune: he had obtained a high reputation in the learned world by his writings; and having always showed great respect to the house of Medicis, on whose praises he had expatiated in his works, he applied to Clement VII. and obtained the bishoprick of Nocera. His principal piece is his history, which is that of his own time throughout the world, beginning with 1494, and extending to the year 1544. This was the chief business of his life. For he formed the plan of it in the year 1515; and continued upon it till his death, which happened at Florence in 1552. It is printed in three volumes folio. He is allowed to have been a man of wit as well as learning: he was master of a bright and polished style, and has many curious observations: but being a venal writer, his histories are not much credited.

Journal, a day-book, register, or account of what passes daily. See Diary.

Journal, in merchants' accounts, is a book into which every particular article is posted out of the warehouse, and made debtor. This is to be very clearly worded, and fairly engrossed. See Book-Keeping.

Journal, in Navigation, a sort of diary, or daily register of the ship's course, winds, and weather; together with a general account of whatever is material to be remarked in the period of a sea-voyage.

In all sea-journals, the day, or what is called the 24 hours, terminate at noon, because the errors of the dead-reckoning are at that period generally corrected by a solar observation. The daily compact usually contains the state of the weather; the variation, increase, or diminution of the wind; the suitable shifting, reducing, or enlarging the quantity of sail extended; as also the most material incidents of the voyage, and the condition of the ship and her crew; together with the discovery of other ships or fields, land, shoals, breakers, soundings, &c.

Journal, is also a name common for weekly essays, newspapers, &c. as the Gray's Inn Journal, the Westminster Journal, &c.

Journal, is also used for the titles of several books which come out at stated times, and give abstracts, accounts, &c. of the new books that are published, and the new improvements daily made in arts and sciences; as the Journal de Scavans, Journal de Physique, &c.

Journey, a tract of ground passed over in travelling by land; properly as much as may be passed over in one day.

Management of a Horse on a Journey. See Horse.

Journeyman, properly one who works by the day only; but the word is now used for any one who works under a master, either by the day, the year, or the piece.

Joy, in Ethics, is that passion which is produced by love, regarding its object as present, either immediately or in prospect, in reality or imagination. The operation of joy sometimes affects the functions of the body, by increasing the secretion of perspiration and some others.

Joyner, See Joinery.

Ipecacuanha, the root of a plant which is well known by its use as an emetic. See Materia Medica Index.

Iphicrates, general of the Athenians, had that command conferred upon him at 20 years of age, and became famous for the exactness of his military discipline. He made war on the Thracians; restored Seuthes, who was an ally of the Athenians; attacked the Lacedemonians, and, on many other occasions, gave signal proofs of his conduct and courage. Many ingenious repartees have been mentioned of this general: a man of good family, with no other merit than his nobility, reproaching him one day for the meanness of his birth, he replied, "I shall be the first of my race, and thou the last of thine." He died 380 B.C.

Iphigenia, a daughter of Agamemnon and Clytemnestra. When the Greeks going to the Trojan war were detained by contrary winds at Aulis, they were informed by one of the soothsayers, that to appease the gods they must sacrifice Iphigenia, Agamemnon's daughter to Diana. The father, who had provoked the goddess by killing her favourite stag, heard this with the greatest horror and indignation; and rather than to shed the blood of his daughter, he commanded one of his heralds, as chief of the Grecian forces, to order all the assembly to depart each to his respective home. Ulysses and the other generals interfered, and
Ipswich. Iphigenia. Aegamemnon consented to immolate his daughter for the common cause of Greece. As Iphigenia was tenderly loved by her mother, the Greeks sent for her on pretence of giving her in marriage to Achilles. Clytemnestra gladly permitted her departure, and Iphigenia came to Aulis. Here she saw the bloody preparations for the sacrifice. She implored the forgiveness and protection of her father; but tears and entreaties were unavailing. Calchas took the knife in his hand; and as he was going to strike the fatal blow, Iphigenia suddenly disappeared, and a goat of uncommon size and beauty was found in her place for the sacrifice. This supernatural change animated the Greeks, and the wind suddenly became favourable, and the combined fleet set sail from Aulis.

Ipomea, Quamoclit, or Scarlet Convulvulus; a genus of plants, belonging to the pentandria class, and in the natural method ranking under the 29th order, Campanaceae. See Botany Index.

Ipswich, the capital of the county of Suffolk, in England, seated in E. Long. 1. 6. N. Lat. 52. 12. The name comes from the Saxon Cyperwell, that is, a town situated upon the Gypen, now called Orwell. It had once 21 churches, but now has only 12. It was plundered by the Danes in 991, and afterwards besieged by King Stephen. It had charters and a mint in the reign of King John, but its last charter was from Charles II. The remains of a wall and six or seven religious houses are still to be seen. Though it is not in so flourishing a state as formerly when the harbour was more commodious, yet it is still a large well-built town. Besides the churches already mentioned, it has several meeting-houses, two chapels, a town-hall, council chamber, a large market place with a cross in the middle of it, a shire-hall for the county sessions, a library, several hospitals, a free-school, a handsome stone-bridge over the river, stately shambles in the market place built by Cardinal Wolsey, who was a native of the town and a butcher's son, and who also began to build a college here on the ruins of a small college of black canons, which still bears his name, though it was never finished. Here are several alms-houses, three charity-schools, and a convenient key and custom-house. By virtue of Charles II.'s charter, the town is governed by two bailiffs, a recorder, 12 portmen, of whom the bailiffs are two, a town-clerk, two coroners, and 24 common-council. The bailiffs and 4 of the portmen are justices of the peace. The town enjoys many privileges, as passing fines and recoveries, trying criminals, and even crown and capital causes among themselves, settling the assize of bread, wine, and beer. No freeman is obliged to serve on juries out of the town, or bear any office for the king, except that of the sheriff, or to pay tolls or duties in any other part of the kingdom. They have an admiralty jurisdiction beyond Harwich on the Essex coast, and on both sides the Suffolk coast, by which they are entitled to all goods cast on shore. The bailiffs even hold an admiralty-court beyond Landguard-fort. By a trial in King Edward III.'s time, it appears that the town had a right to the customs duties for all goods coming into Harwich-haven. The population in 1811 was 13,670, of whom nearly 2000 are employed in manufactures, which are chiefly woollen and linen cloth. It has still a considerable foreign-trade. The tide rises 12 feet, and ships come within a small distance of the town. They export a great deal of corn to London, and in former times to Holland. Formerly, they had a great trade in ship-building; but that having declined, they now send great quantities of timber to the king's yard at Chatham. It has several great fairs for cattle, cheese, and butter; and is admirably situated for the trade to Greenland, because the same wind that carries them out of the river will carry them to Greenland. It is worth remarking, that it is one of the best places in England for persons in narrow circumstances, house- rent being easy, provisions cheap and plentiful, the passage by land or water to London, &c. convenient, and the company of the place good. It gives title of viscount, as well as Thetford, to the duke of Grafton; and sends two members to parliament.

Irascible, in the old philosophy, a term applied to an appetite or a part of the soul, where anger and the other passions, which animate us against things difficult or odious, were supposed to reside.

Of the eleven kinds of passions attributed to the soul, philosophers ascribe five to the irascible appetite; viz. wrath, boldness, fear, hope, and desire; the other six are charged on the concupiscible appetite, viz. pleasure, pain, desire, aversion, love, and hatred.

IRELAND.

Ireland, one of the Britannic islands, situated between the 4th and 10th degrees of west longitude, and between the 51st and 56th of north latitude, extending in length about 280 miles, and about 170 in breadth.

The ancient history of this island is involved in so much obscurity, that it has been the object of contention among the antiquarians for upwards of a century and a half. The Irish historians pretend to very great antiquity. According to them, the island was first inhabited about 322 years after the flood. At that time Partholus, the son of Scara landed in Munster on the 14th of May with 1000 soldiers, and some women, from Greece. This voyage he had undertaken on account of his having killed his father and mother in his native country. The same historians inform us, that a great number of lakes broke out in Ireland during the reign of Partholus, which had no existence when he came into the island, with many other particulars not worth mentioning; but the most surprising circumstance is, that about 300 years after the arrival of this Grecian colony, all of them perished by a plague, not a single person remaining to tell the fate of the rest; in which case, it is wonderful how the catastrophe should have been known.

After the extinction of this first colony, Ireland remained a perfect wilderness for 30 years; when another colony arrived from the east, under the direction of one Nemedia. He set sail from the Euxine sea with 30 transports, each manned with 40 heroes; and at
IRELAND.

Ireland. at last arrived on the coasts of Ireland, after a very tedious and strange navigation. During his reign also many lakes were formed in the country, which had no existence before; the most material circumstance, however, was an unsuccessful war in which he was engaged with some African pirates, who in the end enslaved his people. The victors proved such intractable tyrants, that the Irish found themselves under a necessity of quitting the island altogether. They embarked on board a fleet of 1130 ships, under the command of three grandsons of Nemedius, viz. Simon Brec, To Chath, and Briatan Maol. The first returned to Greece, the second sailed to the northern parts of Europe, and the third landed in the north of Scotland, and from him the island of Britain is said to have taken its name, and the Welsh their origin.

About 216 years after the death of Nemedius, the descendents of Simon Brec returned from Greece into Ireland. They were conducted by five princes of great reputation, who divided the island into five kingdoms, nearly equal in size. These kingdoms were called Munster, Leinster, Connaught, Meath, and Ulster; and the subjects of these kings are called by the Irish historians Firbolges.

The Firbolgs were in process of time expelled or totally subdued, after the loss of 100,000 men in one battle, by the Tuatha de Danann, a nation of necromancers, who came from Attica, Boetia, and Achaea, into Denmark, from Denmark to Scotland, and from Scotland to Ireland. These necromancers were so completely skilled in their art, that they could even restore the dead to life, and bring again into the field those warriors who had been slain the day before. They had also some curiosities which possessed a wonderful virtue. These were a sword, a spear, a cauldron, and a marble chair; on which last were crowned first the kings of Ireland, and afterwards those of Scotland. But neither the powerful virtues of these Danish curiosities, nor the more powerful spells of the magic art, were able to preserve the Tuatha de Danann from being subdued by the Gadelians when they invaded Ireland.

The Gadelians were descended from one Cathalus, from whom they derived their name. He was a man of great consequence in Egypt, and intimately acquainted with Moses the Jewish legislator. His mother was Scotia the daughter of Pharaoh, by Nioil the son of a Scythian monarch contemporary with Nimrod. The Gadelians, called also Scotia, from Scotia above-mentioned, conquered Ireland about 1300 B.C. under Heber and Heremon, two sons of Milesius king of Spain, from whom were descended all the kings of Ireland down to the English conquest, and who are therefore styled by the Irish historians princes of the Milesian race.

From this period the Irish historians trace a gradual refinement of their countrymen from a state of the grossest barbarity, until a monarch, named Ollam Fodhla, established a regular form of government, erected a grand seminary of learning, and instituted the Feis, or triennial distribution of provincial kings, priests, and poets, at Rian or Tarab in Meath, for the establishment of laws and the regulation of government. But whatever were the institutions of this monarch, it is acknowledged that they proved insufficient to withstand the wildness and disorder of the times. To Kimniath, one of his successors, the annalists give the honour of reviving them, besides that of regulating Ulster, his family province, and adorning it with a stately palace at Eamannia near Armagh. His immediate successor, called Hugony, is still more celebrated for advancing the work of reformation. It seems, that, from the earliest origin of the Irish nation, the island had been divided into the five provincial kingdoms above mentioned, and four of these had been subject to the fifth, who was nominal monarch of the whole island. These four, however, proved such obstinate disturbers of the peace, that Hugony, to break their power, parcelled out the country into 25 dynasties, binding them by oath to accept no other monarch but one of his own family. This precaution proved ineffectual. Hugony himself died a violent death, and all his successors for a series of ages were assassinated, scarcely with one exception.

About 100 B.C. the pentarchal government was restored, and is said to have been succeeded by a considerable revolution in politics. The Irish had for many ages dispensed the laws, and the whole nation submitted to their decisions; but as their laws were exceedingly obscure, and could be interpreted only by themselves, they took occasion from thence to oppress the people, until at last they were in danger of being totally exterminated by a general insurrection. In this emergency they fled to Convocar-Mac-Nessa, the reigning monarch, who promised them his protection in case they reformed; but, at the same time, in order to quiet the just complaints of his people, he employed the most eminent among them to compile an intelligible, equitable, and distinct body of laws, which were received with the greatest joy, and dignified with the name of celestial decisions. These decisions seem to have produced but very little reformation among the people in general. We are now presented with a new series of barbarities, murders, factions, and anarchy; and in this disordered situation of affairs it was, according to the Irish historians, that the chieftain mentioned by Tacitus addressed himself to Agricola, and encouraged him to make a descent on Ireland. This scheme happened not to suit the views of the Roman general at that time, and therefore was not adopted; and so confident are these historians of the strength of their country, even in its then distracted state, that they treat the notion of its being subdued by a Roman legion and some auxiliaries (the force proposed to Agricola) as utterly extravagant; acquainting us at the same time, that the Irish were so far from dreading a Roman invasion, that they sailed to the assistance of the Picts, and having made a successful incursion into South Britain, returned home with a considerable booty.

In the same state of barbarity and confusion the kingdom of Ireland continued till the introduction of Christianity by St Patrick, about the middle of the fifth century. This missionary, according to the advocates of the Irish antiquity, had introduced letters into Ireland, and thus laid the foundations of a future civilization. On the other hand, the advocates for that antiquity maintain, that the Irish had the knowledge of letters, and had made considerable progress in the arts, before the time of St Patrick; though they allow
IRELAND.

322

that he introduced the Roman character, in which his copies of the Scripture and liturgies were written. To enter into the dispute would be contrary to our plan. It is sufficient to observe, that, excepting by some of the Irish themselves, the history already given is generally reckoned entirely fabulous, and thought to have been invented after the introduction of Christianity. An origin of the Irish nation has been found out much nearer than Asia, Greece, or Egypt; namely, the island of Britain, from whence it is now thought that Ireland was first peopled. A dispute hath arisen concerning the place from whence the first emigrants from Britain set sail for Ireland. The honour of being the mother-country of the Irish hath been disputed between the North and South Britons. Mr Macpherson has argued strenuously for the former, and Mr Whitaker for the latter. For an account of their dispute, however, we must refer to the works of these gentlemen. Mr Whitaker claims the victory, and challenges to himself the honour of being the first who clearly and truly demonstrated the origin of the Irish.

The name of Ireland, according to Mr Whitaker, is obviously derived from the word *Jer* or *Eir*, which in the Celtic language signifies "west." This word was sometimes pronounced *Iver* and *Iver*; whence the names of *Iris*, *Ierna*, *Iuverna*, *Iverna*, *Hibernia*, and *Ireland*; by all of which it hath at some time or other been known.

About 350 B.C. according to the same author, the Belgæ crossed the channel, invaded Britain, and seized the whole extended line of the southern coast, from Kent to Devonshire. Numbers of the former inhabitants, who had gradually retired before the enemy, were obliged at last to take shipping on the western coast of England, and passed over into the uninhabited isle of Ireland. These were afterwards joined by another body of Britons driven out by the Belgæ under Divitiacus, about 100 B.C. For two centuries and a half afterwards, these colonies were continually reinforced with fresh swarms from Britain; as the populousness of this island, and the vicinity of that, invited them to settle in the one, or the bloody and successive wars in Britain during this period naturally induced them to relinquish the other: and the whole circuit of Ireland appears to have been completely peopled about 150 years after Christ: and as the inhabitants had all fled equally from the dominion of the Belgæ, or for some other cause left their native country, they were distinguished among the Britons by one general and very apposite name, viz. that of Scutæ or Scottæ, "the wanderers, or refugees."

Mr Whitaker also informs us, "that in the times of the Romans Ireland was inhabited by 18 tribes; by one upon the northern and three on the southern shore, seven upon the western, six on the eastern, and one in the centre."

"Along the eastern coast, and the Verginia or internal ocean, were ranged the Danmii, the Voluntii, and the Eblani, the Caucii, the Menapii, and the Coriosiddii. The first inhabited a part of the two counties of Antrim and Down, extending from Fairhead, the most north-easterly extremity of the island, to Isamnum Promontorium, or the point of Ardglass haven, in the county of Down; and, having the Logia or Logan,
IRELAND.

Clare: Malcolim near the Shannon, perhaps Feakle or Melle, being their principal town; a headland in the bay of Galway, near Glaninny, being denominated Bovisumum Fomentorum; and the adjoining isles of Arran called Imnulh Conganas. The Antiri were settled in the county of Galway; wading along the deep recess in the Sinus Autea or bay of Galway; stretching towards the north as far as the Libnius, or the river that bounds the shire in that part; and possessing the small portion of Mayo which lies to the south of it. And these were subject to Auteriens, anciently Atherin, and new Atheniens; and have left their name to the division of Athineer. The Nagnate occupied the rest of the large county of Mayo, all Sligo and all Roscommon, all Leitrim as far as Lough Allen on the south-east, and all Fermanagh, to Ballyshannon and Lough Erne; being bounded by the Rhetiurn or river of Ballyshannon, and the lake Rheinius or Lough Erne; having a deep bay, called Magnus Sinus, that curves along Mayo, Sligo, and Leitrim counties; and acknowledging Nagnat, Nacumh, or Almechait, the town of the Nagnate, for their capital. And the Hardinii and Venicii were confederated together under the title of the Veniciem Nations, extended from Ballyshannon to the North Cape, and possessed all Donegalle, except the two whole divisions of Raphe and Bizis-Owen, and the eastern part of Killirosen. The Venicii lay along the immediate margin of the shore, giving name to the Fomentorum Venicien or Cape Horn, and to the Insula Venicia or North Arran Island. And their metropolis Rheba was seated upon the lake Rheinius, and in the country of the Hardinii on the south-east.

"Upon the northern shore and along the margin of the Deucaladian ocean, were only the Bobogidi, inhabiting the rest of Donegalle, all Derry, and all Antrim to the Fair-Head, and the Damni; and giving their own name to the former and the division of Raphe. And they had the rivers Vidua or Shiphare, Ariga or Lough Swilly, Daraboua or Lough Foile, and Bann, or Ban, in their territories; and acknowledged Robobgium, Robog, or Raphe, for their chief city.

"The central regions of the island, all Tyrone, the remainder of Fermanagh and Leitrim, all Monaghan, and the rest of Armagh; all Cavan, all Longford, and all West-Meath; all the King’s and Queen’s county, all Kilkenny, and all Tipperary; were planted by the Scots. The Shannon, Lough Allen, and Lough Erne, were their great boundaries on the west; the Barrow, Boyne, and Lough Neagh, on the east; the Swane and Blackwater on the south; and a chain of mountains on the north. And the two greatest of their towns were Rheba, a city seated, like the Rheba of the Venicians, upon the lake and river Rheinius, but on a different part of them, and somewhere in the north of Cavan; and Ibernia, a town placed a little to the east of the Shannon, and somewhere in the county of Tipperary."

But whether we are to receive as a truth the accounts given by Mr Whitaker, those of the Irish annalists, or any other, it is certain, that, till little more than a century ago, Ireland was a scene of confusion and slaughter. The Irish historians acknowledge this, as we have already seen. Very few of their monarchs escaped a violent death. The histories of their kings indeed amount to no more than this, viz. that they began to reign in such a year, reigned a certain number of years, and were slain in battle by the valiant prince who succeeded to the throne. The introduction of Christianity seems to have mended the matter very little, or rather not at all. The same wars between the chiefs continued; and the same murders and treacheries took place among the inhabitants, till they were invaded by the Danes or Normans, about the invasion of the end of the eighth century. At this time, we are told, the Danes, that the monarchical power was weak, by reason of the factious and assuming disposition of the inferior dynasties; but that the evils of the political constitution had considerably subsided by the respect paid to religion and learning. The first invasions of the Danes were made in small parties for the sake of plunder, and were repelled by the chief whose dominions were invaded. Other parties appeared in different parts of the island, and terrified the inhabitants by the havoc they committed. These were in like manner put to flight, but never failed to return in a short time; and in this manner was Ireland harassed for the space of 20 years, before the inhabitants thought of putting an end to their intestine contests, and uniting against the common enemy. The northern pirates, either by force or treaty, gradually obtained some small settlements on the island; till at length Turgesius, or Turgesius, a warlike Norwegian, landed with a powerful armament in the year 815. He divided his fleet and army, in order to strike terror in different quarters. His followers plundered, burned, and massacred, without mercy, and persecuted the clergy in a dreadful manner on account of their religion. The Danes already settled in Ireland, flocked to the standard of Turgesius, who thus was enabled to seat himself in Armagh, from which he expelled the clergy, and seized their lands. The Irish, in the mean time, were infatuated by their private quarrels; till at last, after some ill-conducted and unsuccessful efforts, they sunk into a state of object submission, and Turgesius was proclaimed monarch of the whole island in 845.

The new king proved such a tyrant, that he soon became intolerable. A conspiracy was formed against him; and he was seized by Melachline prince of Meath, in a time of apparent peace. An universal insurrection ensued; the Danes were massacred or dispersed; their leader condemned to death for his cruelties, and drowned in a lake. The foreigners, however, were not exterminated, but the remains of them were allowed to continue on the island as subjects or tributaries to some particular chieftains. A new colony soon arrived, but under the pretence of peaceable intentions, and a design of enriching the country by commerce. The Irish, through an infatuated policy, suffered them to become masters of Dublin, Limerick, Waterford, and other maritime places, which they enlarged and fortified with such works as had till then been unknown in Ireland. The Danes did not fail to make use of every opportunity of enlarging their territories, and new wars quickly ensued. The Irish were sometimes victorious, and sometimes not; but were never able to drive out their enemies, so that they continued to be a very distinguished and powerful sect, or tribe, in Ireland. The wars with the Danes were no sooner at
IRELAND.

The state of Ireland, as we have already observed, was at this time extremely favourable for an invasion. The monarch enjoyed little more than a titular dignity, being harassed by a faction, and opposed by powerful rivals. A number of chieftains who assumed the title and rights of royalty, paid a perquisite tribute to their superior, and united, if they were disposed to unite, with him, rather as his allies than his subjects. In Ulster, the family of the northern Hi-Nial, as it was called, exercised a hereditary jurisdiction over the counties now called Tyrone, Derry, and Downagel. They also claimed a right of supremacy over the lords of Fermanagh, Antrim, and Argial, which included the counties of Armagh, Monaghan, Louth, and some adjacent districts; while Dunleve, prince of Uladh (now Down), disputed the superiority of this family, and affected an independent state. In Munster reigned the descendants of Brien, a famous sovereign of former times, impatient to recover the honours of their family; but at last, being confined by powerful rivals to the territory of North Munster, they were obliged to leave the family of Mac Arthy sovereigns of Desmond, the southern division. In Connaught, the princes known by the name of O'Connor were acknowledged sovereigns of the eastern territory. Tierman O'Ruaro, an active and restless military chief, had the supremacy in Breffney, containing the modern county of Leitrim, and some adjacent districts. Meath, or the southern Hi-Nial, was subject to the family of Clan-Colman, Murchard O'Malachy, and his successors. Leinster, divided into several principalities, was subject to Dermod, a fierce, haughty, and oppressive tyrant. His father had governed with great cruelty. Seventeen of his vassal lords had been either put to death, or had their eyes put out, by his order, in one year; and Dermod seemed to inherit too great a portion of the same temper. His stature and bodily strength made him admired by the inferior orders of his subjects; and these he was careful to protect and favour. His donations and endowments of religious houses recommended him to the clergy; but his tributary chieftains felt the weight of his pride and tyranny, and to them his government was extremely odious.

The chief competitors for the rank of monarch of Ireland, in the mean time, were, the heirs of the two houses of O'Connor, and the northern Hi-Nial. Torlogh O'Connor was in possession; but he was not generally recognised, and was opposed by his rival O'Lochlan: notwithstanding which, he maintained his dignity with magnificence and vigour, till a decisive victory gained by him over O'Brien raised O'Lochlan's jealousy so much, that he obliged him in a convention of the states to allow him the sovereignty of the northern division. In consequence of this partition, it was resolved to transfer the territory of O'Ruaro to a person more inclined to the interests of the two sovereigns. An expedition was accordingly undertaken; O'Ruaro was surprised, defeated, and driven from his dominions. Dermod, who had conceived an unlawful passion for Dervorgal, the wife of O'Ruaro, took the opportunity of her husband's distresses to carry her off in triumph. O'Ruaro conceived the most implacable resentment against Dermod; and therefore applying himself to Torlogh, promised an inviolable attachment to his interest; and prevailed on him not only to reinstate...
as it was formerly called, Strigul, a nobleman of considerable influence in Wales, but of broken fortune, to assist him with a considerable force to be transported next spring into Ireland. Overjoyed at this first instance of success, he advanced into South Wales, where, by the influence of the bishop of St David’s, he procured many other friends. Robert Fitz-Stephen, a brave and experienced officer, covenanted with him to engage in his service with all his followers, and Maurice Fitz-Gerald his maternal brother; while Dermod on his part, promised to cede to the two principal leaders, Fitz-Stephen and Fitz-Gerald, the entire dominion of the town of Wexford, with a large adjoining territory, as soon as by their assistance he should be reinstated in his rights.

The Irish prince having now accomplished his purpose, set sail for Ireland in the winter of 1169, and recovered a small part of his dominions even before the arrival of his new allies; but being attacked with a superior force by his old enemies Roderic and O’Ruarc, he found himself obliged to feign submission till the English allies came to his assistance. The expected succours arrived in the month of May 1170, in a creek called the Bann, near the city of Wexford. Robert Fitz-Stephen commanded 30 knights, 60 men in armour, and 300 archers. With these came Harvey of Mountmorris, nephew to Earl Richard. He had no military force along with him; but came solely with a view of discovering the nature of the country, and reporting it to his uncle. Maurice of Pendergast commanded 10 knights and 200 archers: and thus the English force, which was to contend with the whole strength of Ireland, amounted to no more than 600 men.

Trilling as this assistance may seem, it nevertheless took place; for the absence of arms almost instantly destroyed Dermod’s subjects who had abandoned him in his distress, now flocked to his standard. Wexford was immediately attacked, and surrendered in a few days; Fitz-Stephen and Fitz-Gerald were jointly invested with the lordship of this city and its domain; and Harvey of Mountmorris was declared lord of two considerable districts on the coast. After three or four weeks spent in feasting and rejoicing, a new expedition was undertaken against the prince of Osorio (a district of Leinster), who had not only revolted from Dermod, but put out the eyes of one of his sons, and that with such cruelty, that the unhappy youth expired under the operation. The allied army was now increased to 3000 men, who were opposed by the prince of Osorio at the head of 5000, strongly entrenched among woods and morasses. By the superior conduct of the English troops, however, the Irish were decoyed from their advantageous situation, and thus were entirely defeated. The English were for keeping the field till they had totally reduced their enemies: but Dermod, accustomed only to ravage and plunder, contended himself with destroying the country: and a sudden reverse of fortune seemed ready to take place. The prince of Osorio, though defeated, still appeared in arms, and only waited for an opportunity of again opposing the enemy in the field. Maurice Pendergast also joined him with his whole troop, being provoked by Dermod, who had refused him leave to return to Wales. This defection, however, was in part supplied by the arrival of
Ireland. arrival of Fitz-Gerald with 10 knights, 50 horsemen, and 100 archers. Fendigast in a short time repented of his new alliance, and retired into Wales; so that the prince was obliged to make his submission to Dermod, which the latter with some reluctance accepted.

In the mean time, Roderic, having settled all his other affairs, advanced against the allies with a powerful army. Dermod was thrown into despair; but encouraged by Fitz-Stephen, he encamped in a very strong situation, where he was soon besieged by Roderic. The latter, however, dreading the valour of the English, condescended to treat first with them, and then with Dermod, in order to detach them from the interests of each other: but as this proceeded evidently from fear, his offers were rejected by both parties; upon which he began to prepare for battle: but at the very time when the engagement should have commenced, either through the suggestions of his clergy, or of his own fears, Roderic entered into a new negotiation; which at last terminated in a peace. The terms were, that Dermod should acknowledge the supremacy of Roderic, and pay him such service as the monarchs of Ireland had usually received from inferior princes; and as a security for his faithful performance of this article, be delivered up his favourite son as an hostage to Roderic; but in order to establish this accommodation on the firmest basis, the latter obliged himself to give his daughter in marriage to the young prince as soon as Leinster should be reduced, and the peace of the island effectually restored. By a secret article, Dermod engaged to dismiss the British forces immediately after the settlement of his own province, and in the mean time not to bring over any further reinforcements from England.

Thus ended the first British expedition into Ireland; the consequences of which were so little dreaded at that time by the natives, that their historians, though they dwell upon the principal wars and contests in other parts of the island, speak of the settlement of the Welshmen in Leinster with a careless indifferenc. But though the settlement of this colony seemed very little alarming to the generality, it could not escape the observation of discerning persons, that a man of Dermod's character would not long keep his treaties; and that on the first emergency he would have recourse to his former allies, who would thus establish themselves more and more, till at last they would reduce the country entirely under their subjection. These reflections, if any such were then made, were in a short time verified. Dermod was scarce settled in his own dominions, when he began to aspire at the sovereignty, and form schemes for dethroning Roderic. He applied to Fitz-Stephen and Fitz-Gerald; by whom he was again directed to apply to Richard earl of Chester, more commonly known by the name of Strongbow, on account of his feats of archery. Richard was very much inclined to accept of his invitation; but thought it incumbent upon him first to obtain the consent of King Henry. The king, however, did not incline that his subjects should make conquests for themselves in any other country, and therefore dismissed Richard with an equivocal answer; but the latter being willing to understand his sovereign's words in the most favourable sense, immediately set about the necessary preparations for his expedition. In May 1171, Raymond le Gros, Richard's domestic friend, and the near relation of Fitz-Stephen and Fitz-Gerald, landed at a place called Dyeudenough, near Waterford, with 10 knights and 70 of England archers; and along with them came Harvey of Mount-lishe,{1} attended by a small train. The English immediately intrenched themselves, and erected a temporary fort for themselves: which proved a very necessary precaution; for the natives, justly attributing this new debarkation to the practices of Dermod, instantly formed a tumultuous army, and marched to expel the invaders. The English prepared to meet them; but when they perceived the great superiority of the enemy, they thought proper to retire to the fort. Here, however, they must have been totally cut off, had they not luckily collected a numerous herd of cattle from the neighbouring country for their subsistence. These their scene they drove with fury among the Irish, who were thus put into the utmost confusion. The invaders seized the favourable moment; and, falling upon their disordered enemies, put them to flight, and drove great numbers of them into the sea, where they perished. Seventy prisoners were taken, all of them principal citizens of Waterford; who, though they offered large sums for their ransom, and even that the city should be delivered up to the English, were all barbarously put to death. This success and cruelty so intimidated the Irish, that they suffered these merciless invaders to maintain their station unmolested, and wait for the arrival of their associates.

Richard in the mean time having assembled his vassals, led them through Wales, where he was joined by great numbers of other adventurers: but, when just on the point of embarking, was surprised by a positive command by the king, to desist from his intended enterprise, on pain of forfeiture of his lands and honours. He was now, however, too much interested in his scheme to retract; and therefore pretended to disbelieve the authenticity of the royal mandate. On Earl Rich's being about to land, he divided his army into two, Waterford with 200 knights and 1200 infantry, all with a powerful chosen and well appointed soldiers. They were immediately joined by Raymond and his troop; and the next day it was resolved to make an attempt upon Waterford. The city was taken by storm, and a dreadful massacre ensued; to which the cruel Dermod had the merit of putting an end. The marriage of Richard with Eva, the daughter of Dermod, was solemnized without delay, and a scene of joy and festivity succeeded the calamities of war.

A new expedition was now undertaken against Dublin; the inhabitants of which had either manifested some recent disaffection to Dermod, or had never been thoroughly forgiven for their old defection. Roderic advanced against the allied army with a formidable body, consisting, as is said, of 30,000 men; but, fearing to come to a general engagement, he contented himself with some slight skirmishes; after which, great part of his vassals forced him to dismiss them, and Dublin was left to its fate. The inhabitants were treated very severely; however, a considerable body of them, with Hesculph their governor, had the good fortune to gain some vessels lying in the harbour, and made their escape to the northern islands. Earl Richard was now invested with the lordship of Dublin;
IRELAND.

Dublin; and appointed Milo de Cogan, a brave English knight, his governor; while he himself, in conjunction with the forces of Dermot, oversaw the country of Meath, committing everywhere the most horrid cruelties. Roderic, in the mean time, unable to oppose them in the field, sent deputies to Dermot, commanding him to retire, and putting him in mind that his son was in his bands, and must answer with his life for the breach of those treaties which his father made so little scruple to violate. Natural affection, however, had very little place in the breast of Dermot. He expressed the utmost indifference about his son; and, with the greatest arrogance, claimed the sovereignty of all Ireland; Roderic, provoked at this answer, cut off the young prince's head.

This piece of impotent cruelty served only to make the king odious to his own subjects, while Dermot and his English allies committed everywhere the greatest devastations, and threatened to subdue the whole island. This indeed they would have accomplished, had not the extraordinary success of Strongbow alarmed King Henry; who, hearing that he might render himself totally independent on the crown of Britain, issued his royal edict, strictly forbidding any English vessel from passing into Ireland with men, arms, or provisions; and commanding all his subjects at that time resident in Ireland, of whatever rank or degree, to return to their country before the ensuing feast of Easter, on pain of forfeiting their lands, and being declared traitors.

Our adventurers were plunged into the greatest distress by this peremptory edict. They now found themselves cut off from all supplies in the midst of their enraged enemies, and in danger of being forsaken by those who had attached themselves to them during their success. Raymond was dispatched with a most submissive message to the offended monarch; but before he received any favourable answer, everything was thrown into confusion by the death of Becket, so that the king had neither leisure nor inclination to attend to the affairs of Ireland. About the same time the death of Dermot their great ally seemed almost to give a finishing stroke to the English affairs. An universal defection took place among their associates; and before they had time to concert any proper measures, Hesulph, who had formerly escaped from Dublin, appeared before that city with a formidable body of troops armed after the Danish manner. A furious attack ensued; which, at last ended in the defeat and captivity of Hesulph, who was immediately put to death. This danger, however, was soon followed by one still greater. Roderic had formed a powerful confederacy with many of the Irish chieftains, and the kings of the northern isles, in order to extirpate the English totally from the island. The harbour of Dublin was blockaded by a fleet of 30 ships from the northern isles; while the confederated Irish took their stations in such a manner as to surround the city, and totally cut off all supplies of provisions. In two months the English were reduced to great straits. On the first alarm, Richard had sent for assistance to Fitz-Stephen; who, having weakened his own force, in order to serve the earl, the people of Wexford had risen and besieged Fitz-Stephen in his fort called Carrig, near that city. A messenger now arrived, informing Strongbow that his friend was in the utmost danger, and must fall into the hands of his enemies if not assisted within three days; upon which a council of war was called, in order to deliberate on the measures necessary to be pursued in this desperate emergency. It was soon resolved to enter into a treaty with Roderic upon some terms that were not totally servile or oppressive. Laurence prelate of Dublin was appointed to carry the terms; which were, that Richard proposed to acknowledge Roderic as his sovereign, and to hold the province of Leinster as his vassal, provided he would raise the siege. Laurence soon returned with an answer, probably of his own framing; namely, that Dublin, Waterford, Wexford, and all the forts possessed by the British, should be immediately given up; and that the earl and his associates should depart with all their forces by a certain day, leaving every part of the island free from their usurpations, and absolutely renouncing all their pretended claims. On these conditions they were to be spared; but the least reluctance or delay would determine the besiegers to storm the city.

These terms, though they contained nothing insolent or unreasonable, considering the present situation of the English, were yet intolerable to our ingenious adventurers. After some time spent in silence, Milo de Cogan, suddenly starting up, declared his resolution to die bravely rather than submit to the mercy of barbarians. The spirit of desperate valor was instantly caught by the whole assembly; and it was resolved to risk their whole fortune on one desperate effort, by sallying out against the enemy, and to make their attack upon that quarter where Roderic himself commanded. Accordingly, having persuaded a body of the townsmen to take part in this desperate enterprise, they marched out against their enemies, who expected nothing less than such a sudden attack. The besiegers were secure and careless, without discipline or order; in consequence of which, they were unable to sustain the furious assault of the English. A terrible slaughter ensued, and the Irish instantly fled in the greatest confusion; their monarch himself escaping only by mixing half naked with the crowd. The other chieftains who were not attacked caught the panic, and broke up their camps with precipitation; while the victor returned from the pursuit to plunder, and among other advantages, gained as much provision as was sufficient to support them for a whole year.

Strongbow being thus relieved from his distress, committed the government of Dublin to Milo de Cogan, while he proceeded immediately to Wexford, in order to relieve Fitz-Stephen; but in this he was disappointed; for that brave officer, having often repulsed his enemies, was at last treacherously deceived into submission and laid in irons. Strongbow, however, continued to advance; and was again attacked by the Irish, whom he once more defeated. On his arrival at Wexford, he found it burnt to the ground; the enemy having retired with Fitz-Stephen and the rest of the prisoners to Holy Island, a small island in the middle of the harbour, from whence they sent a deputation, threatening to put all the prisoners to death if the least attempt was made to molest them in their present situation. The earl then proceeded to Waterford, and from thence to Ferm; where he for some time exercised a regal authority, rewarding his friends and punishing his enemies.
IRELAND.

A more important object, however, soon engaged his attention. The king of England, having settled his affairs as well as he could, now determined to conquer Ireland for himself. A summons was instantly dispatched to Earl Richard, expressing the greatest displeasure at his presumption and disobedience, and requiring his immediate presence in England. The earl found himself under the necessity of obeying; and having made the best dispositions the time would permit for the security of his Irish possessions, embarked for England, and met the king at Newham, near Cuckeston. Henry at first affected great displeasure, but soon allowed himself to be pacified by a surrender of the city of Dublin, and a large territory adjacent, together with all the maritime towns and forts acquired by Strongbow: while on his part he consented that the earl should have all his other possessions granted in perpetuity, to be held of the king and his heirs. The other adventurers made their peace in a similar manner; while the Irish chieftains, instead of uniting in the defence of their country, only thought how to make the most of the approaching invasion, or at least how to avert the threatened evils from their own particular districts. They saw the power of their own sovereign on the point of total dissolution; and they saw it with indifference, if not with an envious and malignant satisfaction. Some were even ready to prevent their invader, and to submit before he appeared on the coast. The men of Wexford, who had possessed themselves of Fitz-Stephen, resolved to avert the consequences of their late perfidy and cruelty, by the forwardness of their zeal for the service of the king of England, and the readiness of their submissions. Their deputies cast themselves at Henry's feet; and, with the most passionate expressions of obedience, humbly intreated that he would accept them as his faithful vassals, ready to resign themselves, their lands, and possessions, to his absolute disposal. "They had already (they said) endeavoured to approve their zeal by seizing Robert Fitz-Stephen, a traitor to his sovereign, who had lately entered their territory by force of arms, without any due warrant or fair pretence, had slaughtered their people, seized their lands, and attempted to establish himself independent of his liege lord. They kept him in chains, and were ready to deliver him to the disposal of his sovereign." The king received them with expressions of the utmost grace and favour; commended their zeal in repressing the unwarrantable attempts of Fitz-Stephen; declared that he should soon inquire into his crimes, and the wrongs they had sustained, and inflict condign punishment for every offence committed by his undutiful subjects.

Thus were the Irishmen dismissed in the utmost joy and exultation; and the artifice of Henry, while it inspired these men with dispositions favourable to his interests, proved also the most effectual means of saving Fitz-Stephen from their cruelty.

Henry, having completed the preparations necessary for his expedition, embarked at Milford with several of his barons, 400 knights, and about 4000 soldiers, on board a fleet of 240 sail. He landed at Waterford on the feast of St. Luke in October 1272, with a professed design not to conquer, but to take possession of a kingdom already his own, as being granted him by the pope. Most of the Irish indeed seemed to be of the same opinion, and therefore submitted without Ireland the least resistance. Strongbow set them an example, by making a formal surrender of Waterford, and doing homage to the king for the territory of Leinster. Fitz-Stephen was delivered over, with many accusations of tyranny and injustice. He was at first sent to prison; but soon purchased his liberty, by surrendering Wexford, and doing homage for the rest of his possessions to the king. The prince of Desmond was the first Irish chieftain who submitted. On the very day after the king's arrival, he attended his court, resigned his submission to the city of Corke, did him homage, and stipulated to pay a tribute for the rest of his territory. An English governor and garrison were immediately appointed to take possession of his capital; and the king displayed his power and magnificence by marching to Lismore, where he chose a situation and gave the necessary orders for building a fort. The prince of Thomond next submitted and did homage. He was followed by the princes of Ossory, Deceys, and all the inferior chiefs of Munster.

The king, after having provided for the security of all his newly acquired territories, and put garrisons in the cities of Limerick, Corke, Waterford, and Wexford, proceeded to take possession of Dublin, which had been surrendered by Strongbow. The neighbouring lords took the opportunity of submitting as he advanced. O'Carroll of Argiel, a chieftain of great consequence, repaired to his camp, and engaged to become his tributary; and even O'Ruare, whom Roderic had made lord of a considerable part of Meath, voluntarily submitted to the new sovereign.

Roderic, though surprised at the defection of so many of his allies, still determined to maintain his own still hold dignity, and at least preserve his province of Connaught, seeing he could no longer call himself monarch of the whole island. With this design he entrenched himself on the banks of the Shannon; and now, when disencumbered from a crowd of faithless and discontented followers, he appears to have acted with a spirit and dignity becoming his station. Hugh de Lacey and William Fitz-Andelem were commissioned by the king to reduce him; but Roderic was too strong to be attacked with any probability of success by a detachment from the English army; and he at least affected to believe, that his situation was not yet so totally desperate as to reduce him to the necessity of resigning his dignity and authority, while his own territory remained inviolate, and the brave and powerful chiefs of Ulster still kept retired in their own districts without any thoughts of submission. Henry in the mean time attempted to attach the Irish lords to his interest by elegant and magnificent entertainments, such as to them appeared quite astonishing. Some historians pretend that he established the English laws in all those parts which had submitted to his jurisdiction; but this must appear extremely improbable, when we consider how tenacious a rude and barbarous people are of their ancient laws and customs. The Irish lords had been accustomed to do homage to a superior; and they had made no submission to Henry which they had not formerly done to Roderic, and probably thought their submission to the king of England more honourable than that to their Irish monarchs; and it cannot be supposed, that a wise and politic monarch, such as
IRELAND.

Henry undoubtedly was, should form at once such an extravagant scheme as altering the laws of a great number of communities, none of which he had subdued by force of arms. By his transactions both with the natives and adventurers, however, Henry had attained the absolute dominion of several maritime cities and their dependencies; so that he had both a considerable number of real subjects, and a large extent of territory, in the island. To these subjects indeed Henry granted the English laws; and gave the city of Dublin by charter to the inhabitants of Bristol, to be held of him and his heirs, with the same liberties and free customs which they enjoyed at Bristol, and throughout all his land. And, by another charter, executed soon after, he confirmed to his burgesses of Dublin all manner of rights and immunities throughout his whole land of England, Normandy, Wales, and Ireland, wherever they and their effects shall be, to be fully and honourably enjoyed by them as his free and faithful subjects. And as it was not easy to induce his English subjects immediately to settle in these maritime towns, he permitted the Ostmen to take possession of Waterford; and to them he granted a particular right of denization, whereby they were invested with the rights and privileges of free subjects, and free future to be governed by the laws of his realms. For the better execution of these new laws, the king also made a division of the districts now subject to him into shires or counties; which was afterwards improved and enlarged, as the extension of the English settlements and the circumstances of the country required. Sheriffs were appointed both for the counties and cities, with itinerant judges, and other ministers of justice, and officers of state, and every appendage of English government and law. To complete the whole system, a chief governor, or representative of the king, was appointed. His business was to exercise the royal authority, or such parts of it as might be committed to him in the king’s absence; and, as the present state of Ireland, and the apprehensions of war or insurrections, made it necessary to guard against sudden accidents, it was provided, That in case of the death of any chief governor, the chancellor, treasurer, chief justice, and chief baron, keeper of the rolls, and king’s sergeant at law, should be empowered, with consent of the nobles of the land, to elect a successor, who was to exercise the full power and authority of this office, until the royal pleasure should be further known.

But while Henry was thus regulating the government of his new dominions, he received the unwelcome news, that two cardinals, Albert and Theodine, delegated by the pope, had arrived in Normandy the year before, to make inquisition into the death of Becket; that having waited the king’s arrival until their patience was exhausted, they now summoned him to appear without delay, as he would avert the dreadful sentence of excommunication, and preserve his dominions from a general interdict. Such denunciations were of too great consequence to admit of his longer stay in Ireland; he therefore ordered his forces and the officers of his household to embark without delay, reserving three ships for the conveyance of himself and his immediate attendants. Having therefore but a short time to secure his Irish interests, he addressed himself to the original English adventurers, and by grants and promises laboured to detach them from Strongbow, and to bind them firmly to himself. To make amends for what he had taken from Fitz-Stephen, he granted him a considerable district in the neighbourhood of Dublin, to be held by knight’s service; at the same time entrusting the maritime towns to his own immediate dependants. Waterford was committed to Humphrey de Bohun, Robert Fitz-Bernard, and Hugh de Gunderville, with a train of 20 knights. In Wexford were stationed William Fitz-Andelm, Philip of Hastings, and Philip de Brose, with a like number of attendants. Hugh de Lacey had a grant of all the territory of Meath, where there was no fortified place, and where of consequence no particular reservation was necessary, to be held of the king and his heirs, by the service of 50 knights, in as full a manner as it had been enjoyed by any of the Irish princes. He also constituted him lord governor of Dublin, with a guard of 20 knights. Robert Fitz-Stephen and Maurice Fitz Gerald were appointed his lieutenants, with an equal train; and these, with others of the first adventurers, were thus obliged, under the pretence of an honourable employment, to reside at Dublin, subject to the immediate inspection of De Lacey, in whom Henry seems to have placed his chief confidence. Lands were assigned in the neighbourhood of each city for the maintenance of the knights; soldiers. Orders were given to build a castle in Dublin, and fortresses in other convenient places; and to John de Courcy, a baron distinguished by his enterprising genius and abilities for war, was granted the whole province of Ulster, provided he could reduce it by force of arms.

Henry was no sooner gone, than his barons began to contrive how they might best strengthen their own causes on the interests, and the Irish how they might best shake off the yoke to which they had so readily submitted. De Lacey parcelled out the lands of Meath to his friends and adherents, and began to erect forts to keep the old inhabitants in awe. This gave offence to O’Rourke, who still enjoyed the eastern part of this territory as a tributary prince. He repaired to Dublin, in order to obtain redress from Lacey for some injuries real or pretended; but, as the parties could not come to an agreement, another conference was appointed on a hill called Tiragha. Both parties came with a considerable train of armed followers; and the event was a scuffle, in which O’Rourke and several of his followers were killed, and which served to render the English not a little odious to the natives.

The spirit of disaffection had soon after an opportunity of showing itself on the rebellion of King Henry’s sons, of which an account is given under the article ENGLAND, No. 121, et seq. The king had been obliged to weaken his forces in Ireland, by withdrawing several of his garrisons. The soldiers who remained were also discontented with their general Henry of Mountmorris, on account of his severity in discipline, and restraining them from plunder, to which they imagined themselves entitled in account of the deficiencies of their pay. Raymond le Gros, the second in command, was much more beloved by the soldiery; and to such a height had the jealousies between the commanders arisen, that all effectual op-
IRELAND.

The very next morning, the bridegroom was obliged to take the field against Roderic, who had committed great devastations in Meath. By the vigorous conduct of the English commander, however, he was not only prevented from doing further mischief, but at last convinced of the folly of resistance; and Roderic therefore determined to make a final submission. Yet, conscious of his dignity, he disdained to submit to a subject; and therefore, instead of treating with Earl Richard, he sent deputies directly to the king. The deputies were, Catholic bishop of Tuam, the abbot of St. Brendan, and Master Lawrence as he is styled, chancellor to the king of Connaught.

The terms of this submission, by which Henry be

Tarms of came sole monarch of Ireland, were as follow: Roderic consented to do homage, and pay tribute, as

liege-groom to the king of England, on which condition he was allowed to hold the kingdom of Con

naught, as well as his other lands and sovereignties, in as ample a manner as he had enjoyed them before the arrival of Henry in Ireland. His vassals were to hold under him in peace, as long as they paid their tribute and continued faithful to the king of England; in which Roderic was to exercise his own discretion, and for this purpose to call to his assistance the Englis

government, if necessary. The annual tribute to be paid was every tenth merchantable hide, as well from Connaught as from the rest of the island; excepting those parts under the immediate dominion of the king of England and his barons, viz. Dublin and Meath with their appurtenances, Wexford and all Leinster, and Waterford with its lands as far as Dun

garvan inclusive; in all which districts Roderic was not to interfere, nor claim any power or authority.

The Irish who had fled from these districts were to return, and either pay their tribute, or perform the services required by their tenures, at the option of their immediate lords; and, if refractory, Roderic, at the requisition of their lords, was to compel them to retu

He was to take hostages from his vassals, such as he and his liege-lord should think proper; and on his part to deliver either these or others to the king, according to the royal pleasure. His vassals were to furnish hawks and hounds annually to the English monarch; and were not to detain any tenant of his immediate demesnes in Ireland, contrary to his royal pleasure and command. This treaty was solemnly ratified in a grand council of prelates and temporal barons, among whom we find the archbishop of Dub

lin one of the subscribing witnesses. As metropolitan of Leinster, he was now become an English subject, and was probably summoned on this occasion as one obliged to attend, and who had a right to assist in the king's great council. It is also observable, that Henry now treated with Roderic not merely as a provincial prince, but as a monarch of Ireland. This is evidently implied and supposed in the articles; although his monarchical powers and privileges were little more than nominal, frequently disregarded and opposed by the Irish toparchs. Even by their submissions to Henry, many of them in effect disavowed and renounced the sovereignty of Roderic; but now his supremacy seems to be industriously acknowledged, that the present submission might appear virtually the submission of all the subordinate princes, and thus the

The earl replied, with an affected air of regard and confidence, that he had his free consent to employ Raymond in any service he should deem necessary, not as a colleague, but as an assistant; but that he relied entirely on the earl himself, and implicitly trusted everything to his direction. To reward his services, he granted him the city of Wexford, together with a fort erected at Wicklow, and then dismissed him with the most gracious expressions of favour.

The earl landed at Dublin, where he was received with all the respect due to the royal commission. He signified the king's pleasure, that Robert Fitz-Bernard, with the garrison of Waterford, should instantly embark and repair to Normandy; that Robert Fitz-Stephen and Maurice Pendergast should attend the service of their sovereign in England; and, agreeably to the king's instructions, took on him the custody of the cities of Dublin, Waterford, and Wexford. Hugh de Lacey and Milo de Cogan were, with the other lords, commanded to repair to England for the service of the king; by which the earl's forces were considerably weakened, and he soon found himself under the necessity of appointing Raymond to the chief command.

The new general proved successful in some enterprises against the rebellious Irish; but having presumed upon his merits to demand in marriage Basilia the earl's sister, Richard refused his consent, and Raymond retired into Wales.

Thus the supreme command again devolved upon Hervey of Mountmorris; who, being sensible that his character had suffered much from a comparison with that of Raymond, determined to emulate his successes by some bold attempt against the rebels. A detachment of 400 of his men, however, had the misfortune to be surprised and cut off by the enemy; and this success served as a signal for a general revolt. Several of the Leinster chieftains, who had lately made their submissions, and bound themselves to the service of King Henry, now openly disclaimed all engagements. Even Donald Keavanagh, son to the late king Dermot, who had hitherto adhered to the English in their greatest difficulties, now declared against them, and claimed a right to the kingdom of Leinster; while Roderic, on his part, was active in uniting the princes of Ulster, the native lords of Meath, and other chiefs, against their common enemy. This produced the immediate recall of Raymond; and Richard no longer refused his consent to the marriage with his sister, which was solemnized immediately on Raymond's arrival.
IRELAND.

Ireland. king of England be invested with the sovereignty of the whole island. The marks of sovereignty, however, were no more than homage and tribute; in every other particular the regal rights of Roderic were left inviolate. The English laws were only to be enforced on the English pale: and, even there, the Irish might live in peace, as the subject of the Irish monarch; bound only to pay his quota of tribute, and not to take arms against the king of England.

But though the whole island of Ireland thus became subject to the king of England, it was far from being settled in tranquillity, or indeed from having the situation of its inhabitants mended almost in any degree. One great occasion of disturbance was, that the English laws were confined only to those parts which had been subdued by force of arms: while the chieftains that had only submitted to pay tribute, were allowed to retain the ancient Irish laws within the limits of their own jurisdictions. By these old Irish laws, many crimes accounted capital with us, such as robbery, murder, &c. might be compensated by a sum of money. Hence it happened, that very unequal punishments were inflicted for the same offence. If one Englishman killed another, he was punished with death; but if he killed an Irishman, he was punished only by a fine. If an Irishman, on the other hand, killed an Englishman, he was certainly punished with death: and as in times of violence and outrage, the crime of murder was very frequent, the circumstance just mentioned tended to produce an impossible hatred between the original inhabitants and the English. As the Irish laws were thus more favourable to the barbarity natural to the tempers of some individuals, many of the English were also tempted to lay aside the manners and customs of their countrymen altogether, and to associate themselves with the Irish, that, by becoming subject to their laws, they might thus have an opportunity of gratifying their brutal inclinations with less controul than formerly; and in process of time, these degenerate English, as they were called, proved more bitter enemies to their countrymen than even the Irish themselves.

Another cause of the distresses of Ireland was, the great power of the English barons, among whom Henry had divided the greatest part of his Irish dominions. The extent of their authority only inflamed them with a desire for more; and, instead of contributing their endeavours to increase the power of their sovereign, or to civilize the barbarous people over whom they were placed, they did every thing in their power to counteract and destroy each other. Henry himself, indeed, seems to have been infected with a very fatal jealousy in this respect; for, though the abilities and fidelity of Raymond had abundantly manifested themselves, the king never could allow himself to continue him in the government of the island: and the consequence of degrading him never failed to be a scene of uproar and confusion. To these two reasons we must likewise add another: namely, that in these parts of the kingdom where the Irish chieftains enjoyed the sovereignty, they were at full liberty to make war upon each other as formerly, without the least restraint. This likewise induced many of the English to degenerate, that they might have an opportunity of sharing the plunder got by these petty wars; so that, on the whole, the island was a perpetual scene of horror, almost unequalled in the history of any country.

After the death of Earl Richard, Raymond was immediately elected to succeed him; but was superseded by the king, who appointed William Fitz-Andelm, a nobleman allied to Raymond, to succeed in his place. The new governor had neither inclination nor abilities to perform the task assigned to him. He was of a rapacious temper, sensual and corrupt in his manners; and therefore only studied to enrich himself. The native Irish, provoked by some depredations of the English, commenced hostilities; but Fitz-Andelm, instead of repressing these with vigour in the beginning, treated the chieftains with affected courtesy and flattery. This they had sufficient discernment to see, and to despise; while the original adventurers had the burden of the whole defence of the English pale, as the English territories were called, thrown upon them, at the same time that the bad conduct of the governor was the cause of perpetual disorders. The consequence of this was, that the lords avowed their hatred of Fitz-Andelm: the soldiers were mutinous, ill-appointed, and unpaid: and the Irish came in crowds to the governor with perpetual complaints against the old adventurers, which were always decided against the latter; and this decision increased their confidence, without lessening their disaffection.

In this unfavourable state of affairs, John de Courcy, a bold adventurer, who had as yet reaped some of the benefits he expected, resolved to undertake an expedition against the natives, in order to enrich himself with their spoils. The Irish at that time were giving no offence; and therefore pleaded the treaty lately concluded with King Henry: but treaties were of little avail, when put in competition with the necessities of an indigent and rapacious adventurer. The consequence was, that the flame of war was kindled through the whole island. The chieftains took advantage of the war with the English, to commence hostilities against each other. Desmond and Thomond, in the southern province, were distracted by the jealousies of contending chiefs, and the whole land was wasted by unnatural and bloody quarrels. Treachery and murder were revenged by practices of the same kind, in such a manner as to perpetuate a succession of outrages the most horrid and the most disgraceful to humanity. The northern province was a scene of the like enormities; though the new English settlers, who were considered as a common enemy, ought to have united the natives among themselves. All were equally strangers to the virtues of humanity; nor was religion, in the form it then assumed, capable of restraining these violations in the least.

Ireland was thus in a short time reduced to such a state, that Henry perceived the necessity of recalling Fitz-Andelm, and appointing another governor. He was recalled accordingly; and Hugh de Lacey appointed to succeed him. He left his government without being regretted, and is said by the historians of those times to have done only one good action during the whole course of his administration. This action was nothing more important, than the removing of a reliquary, called the Staff of Jesus, from the cathedral of Armagh to that of Dublin; probably that it might be...
be in greater safety, as the war raged violently in Ulster. De Lacy, however, was a man of a quite different disposition, and every way qualified for the difficult government with which he was invested: but at the same time, the king, by investing his son John with the lordship of Ireland, gave occasion to greater disturbances than even those which had already happened. The nature of this lordship had been much disputed; but the most probable opinion is, that the king’s son was now to be invested with all the rights and powers which had formerly belonged to Roderic, who was allowed the title of king of Ireland. It doth not appear, indeed, that Henry had any right to deprive Roderic of these powers, and still less bad he to dispose of any of the territories of those chief-tains who had agreed to become his tributaries; which nevertheless he certainly did, and which failed not to be productive of an immediate war with these chief-tains.

The new governor entered on his office with all that spirit and vigour which was necessary; but being misrepresented to the king by some factious barons, he was in a short time recalled, and two others, totally unfit for the government, appointed in his room. This error was soon corrected, and Lacey was replaced in three months. The same jealousy which produced his first degradation, soon produced a second; and Philip de Braose, or Philip of Worcester as he is called, a man of a most avaricious disposition, was appointed to succeed him. This governor behaved in such a manner, that his superstitious subjects expected every moment that the vengeance of heaven would fall upon him, and deliver them from his tyranny. His power, however, was of short duration; for now Prince John prepared to exercise the authority with which his father had invested him in Ireland. He was attended by a considerable military force: his train was formed of a company of gallant Normans in the pride of youth; but luxurious, insolent, and followed by a number of Englishmen, strangers to the country they were to visit, desperate in their fortunes, accustomed to a life of profligacy, and filled with great expectations of advantage from their present service. The whole assembly embarked in a fleet of 60 ships; and arrived at Waterford after a prosperous voyage, filling the whole country with the greatest surprise and expectation.

The young prince had not arrived at the years of discretion; nor indeed, from his subsequent conduct, doth it appear that his disposition was such as qualified him in the least for the high dignity to which he was raised. The hardy Welshmen, who first migrated into Ireland, immediately waited upon him to do him homage; but they were disagreeable to the gay courtiers, and to the prince himself, who minded nothing but his pleasures. The Irish lords were at first terrified by the magnificent representation of the force of the English army; and being reconciled to submission by the dignity of the prince’s station, hastened in crowds to Waterford to do him homage. They exhibited a spectacle to the Norman courtiers, which the latter did not fail to treat with contempt and ridicule. The Irish lords, with uncouth attire, thick bushy beards, and hair standing on end, advanced with very little ceremony; and, according to their own notions of respect, offered to kiss the young prince. His attendants stepped in, and prevented this horrid violation of decorum by thrusting away the Irishmen. The whole assembly burst into peals of laughter, pulled the beards, and committed several other indignities on the persons of their guests, which were immediately and severely resented. The chief-tains left the court, boiling with indignation; and meeting others of their countrymen hastening to do homage to the prince, they informed them of the reception they themselves had met with. A league was instantly formed to extirpate the English, and the whole nation flew to arms; while John and his courtiers, instead of opposing the enemy, employed themselves in harassing and oppressing those who were under their immediate jurisdiction. The country was therefore overrun by the barbarians, agriculture entirely neglected, and a dreadful famine threatened to follow the calamities of war.

This terrible devastation had continued for eight months before the king was fully acquainted with it. He then determined to recall his son; but was at a loss whom he should name for his successor. Lacey had been murdered by an Irish peasant, and the king was at last obliged to have recourse to John de Courcy, whose boisterous valour seemed now to be absolutely necessary to prevent the English from being totally exterminated. The new governor was obliged at first to act on the defensive; but as the enemies soon forgot the league, and began their usual hostilities against each other, he was at last enabled to maintain the authority of the English government, and to support their acquisitions in Ireland, though not to extend them.

In this situation were the affairs of Ireland when Henry II. died, and was succeeded by his son Richard I. The new king was determined on an expedition to the holy land, which left him no leisure to attend to the affairs of Ireland. John, by virtue of the powers granted him by his father, took upon him the management of Irish affairs; and immediately degraded De Courcy from his government, appointing in his place Hugh de Lacey the younger. De Courcy, provoked at this indignity, retired into Ulster, where he was immediately engaged in a furious war with the natives, and at last almost entirely detached himself from the English government. The greatest confusion ensued: Hugh de Lacey was recalled from his government, and William Petit earl marshal of England appointed in his place. Petit’s administration proved more unfortunate than that of any of his predecessors. Confederacies everywhere took place against the English; the latter were everywhere defeated, their towns taken; and their power would certainly have been annihilated, had not the Irish, as usual, turned their arms against each other.

In this desperate situation matters continued during the whole reign of King Richard, and part of the reign of John, while the distresses of the country were increased by the dissensions and disaffection of the English lords, who aspired at independency, and made war upon each other like Irish chief-tains. The prudent conduct of a governor named Meiler Fitz-Henry, however, at last put an end to these terrible commotions; and about the year 1208, the kingdom was more quiet than it had been for a long time before. In 1210, John came over to Ireland in person with an army,
IRELAND.

army, with a design, as he said, to reduce his refractory nobles to a sense of their duty. More than 20 Irish chiefs waited upon him immediately to do him homage; while three of the English barons, Hugh and Walter de Lacy and William de Braose, fled to France. The king, at the desire of his Irish subjects, granted them, for their information, a regular code and charter of laws, to be deposited in the exchequer of Dublin, under the king's seal. For the regular and effectual execution of these laws, besides the establishment of the king's courts of judicature in Dublin, there was now made a new and more ample division of the king's lands of Ireland into counties, where sheriffs, and many other officers, were appointed. These counties were, Dublin, Meath, Kildare, Argial, now called Louth; Kilkenny, Wickford, Waterford, Cork, Kerry, Limerick, Tipperary; which marks the extent of the English dominions at this time as confined to a part of Leinster and Munster, and to those parts of Meath and Argial which lie in the province of Ulster as now defined. Before his departure, the king gave liberty to John de Grey, bishop of Norwich, whom he appointed governor, to coin money of the same weight with that of England; and which, by royal proclamation, was made current in England as well as Ireland.

This ecclesiastical governor is said to have managed affairs so happily, that during the violent contests between John and his barons, Ireland enjoyed an unusual degree of tranquillity. We are not to imagine, however, that this unhappy country was at this or indeed any other period, till the end of Queen Elizabeth's reign, perfectly free from disorders, only they were confined to those districts most remote from the English government. In 1219, the commotions were renewed, through the immeasurable ambition and contentions of the English barons, who despised all control, and oppressed the inhabitants in a terrible manner. The disorders in England during the reign of Henry III. encouraged them to despise the royal authority; they were over the secret enemies, and sometimes the avowed adversaries, of each other; and in many places where they had obtained settlements, the natives were first driven into insurrections by their cruelty, and then punished with double cruelty for their resistance. The English laws, which tended to punish the authors of these outrages, were scorned by an imperious aristocratic faction, who, in the frenzy of rapine and ambition, trampled on the most salutary institutions. In 1228, a remonstrance was presented to the king against this dangerous neglect and suspension of the laws; which, he answered by a mandate to the chief governor, directing that the whole body of nobility, knights, free tenants, and bailiffs of the several counties, should be convened; that the charter of English laws and customs received from King John, and to which they were bound by oath, should be read over in their presence; that they should be directed for the future strictly to observe and adhere to these; and that proclamation should be made in every county of Ireland, strictly enjoining obedience, on pain of forfeiture of lands and tenements. How little effect was produced by this order, we may learn from another, dated in 1246; where the barons are commanded, for the peace and tranquillity of the land, to permit it to be governed by the laws of England.

Nothing indeed can be conceived more terrible than the state of Ireland during the reign of Henry III. People of all ranks appear to have been sunk in the lowest degree of depravity. The powerful English manners, lords not only subdued the peace and security of the people, by refusing to admit the salutary laws of their own country, but behaved with the utmost injustice and violence to the natives who did not enjoy the benefits of the English constitution. The clergy appear to have been equally abandoned with the rest: nor indeed could it be otherwise; for through the partialities of Henry himself, the neglected, the worthless, and the depressed among the English clergy, found refuge in the church of Ireland. What were the manners of these clergy, will appear from the following petition of a widow to King Edward I.

Margaret le Blunde, of Cashel, petitions our lord the king's grace, that she may have her inheritance which she recovered at Clonmel before the king's judges, &c. against David Mucmackerwayt bishop of Cashel.

Item, the said Margaret petitions redress on account that her father was killed by the said bishop.

Item, for the imprisonment of her grandmother and mother, whom be shut up and detained in prison until they perished by famine, because they attempted to seek redress for the death of their son, father of your petitioner, who be had been killed by the said bishop.

Item, for the death of her six brothers and sisters, who were starved to death by the said bishop, because he had their inheritance in his hands at the time be killed their father.

And it is to be noted, that the said bishop had built an abbey in the city of Cashel, on the king's lands granted for this purpose, which he hath filled with robbers, who murder the English, and depopulate the country; and that when the council of our lord the king attempts to take cognizance of the offence, he repudiates the sentence of excommunication against them.

It is to be noted also, that the said Margaret has five times crossed the Irish sea. Wherefore, she petitions for God's sake, that the king's grace will have compassion, and that she may be admitted to take possession of her inheritance.

It is further to be noted, that the aforesaid bishop hath been guilty of the death of many other Englishmen besides that of her father; and that the aforesaid Margaret hath many times obtained writs of our lord the king, but to no effect, by reason of the influence and bribery of the said bishop.

She further petition, for God's sake, that she may have costs and damages," &c.

Matters continued in the same deplorable state during the reign of Edward I. with this additional grievance, that the kingdom was infested by invasions of the Scots. The English monarch indeed possessed all that prudence and valour which were necessary to have reduced the island to a state of tranquillity; but his project of conquering Scotland left him but little leisure to attend to the distracted state of Ireland. Certain it
IRELAND.

is, however, that the grievous distress of that country gave him great uneasiness; so that he transmitted his mandate to the prelates of Ireland, requiring them to interpose their spiritual authority for composing the public disorders. About the same time, the Irish who lay contiguous to the English, and who dwelt among them, presented a petition to the king, offering to pay him 8000 merks, upon condition that they were admitted to the privileges of English subjects. To this petition he returned a favourable answer; but his good intentions were defeated by the licentious nobility, who knew that these laws would have circumscribed their rapacious views, and controlled their violence and oppression. Petitions of the same kind were several times repeated during this reign, but as often defeated; though some means were used for the peace of the kingdom, such as the frequent calling of parliaments, appointing sheriffs in some new counties, &c.

These means were not altogether without effect. They served to give some check to the disorders of the realm, though by no means to terminate or subdue them. The incursions of the natives were repressed, and the English lords began to live on better terms with each other; and, in 1311, under Edward II., the most powerful of them were reconciled by the marriage of Maurice and Thomas Fitz-John, afterwards the heads of the illustrious houses of Desmond and Kildare, to two daughters of the earl of Ulster. But just at this happy period, when the nation seemed to have some prospect of tranquillity, more dreadful calamities than any hitherto related were about to take place. The Scots had just recovered their liberty under Robert Bruce, and were now in no danger of being again enslaved by a foreign power. Edward, the king's brother, as a recompense for his services, demanded a share of the royal authority. This was refused by Robert, and Edward was for the present satisfied by being declared heir apparent to the crown. But the king, wisely considering the necessity of finding some employment for a youth of such an aspiring and ambitious disposition, pointed out to his brother the island of Ireland, the conquest of which would be easy on account of the distracted state in which it almost always was, and which would make him an independent sovereign. This proposal was eagerly embraced by Edward, and every thing necessary for the expedition immediately got ready. On the 25th of May 1315, he landed on the north-eastern coast of Ireland with 6000 men, to assert his claim to the sovereignty of this kingdom. The Irish lords of Ulster, who had invited and encouraged him to this enterprise, were now prepared to receive their new monarch, flocked with eagerness to his standard, and prepared to wreak their vengeance on the common enemy. Their progress was marked by desolation and carnage. The English settlers were slaughtered, or driven from their possessions, their castles levelled with the ground, and their towns set on fire. The English lords were neither prepared to resist the invasion, nor sufficiently united among themselves. The consequence was, that the enemy for some time met with no interruption. An intolerable scarcity of provisions, however, prevented Bruce from pursuing his advantages; and though his brother landed in Ireland with a powerful army, the famine prevented him from being of any essential service. The forces which he left behind him, however, proved of considerable advantage; and by means of this reinforcement, he was enabled to take the city of Carrickfergus.

The terrible devastations committed by Bruce and his associates, now induced some English lords to enter into an association to defend their possessions, and repel these invaders. For this purpose they raised a considerable body of forces; which coming to an engagement with Fadlim, prince of Connaught, one of Bruce's principal allies, entirely defeated and killed him with 8000 of his men. This defeat, however, had very little effect on the operations of Bruce himself. He ravaged the country to the walls of Dublin, traversed the district of Osory, and penetrated into Munster, destroying every thing with fire and sword. The English continued to augment their army, till at last it amounted to 30,000 men; and then Bruce, no longer able to oppose such a force, found it necessary to retire into the province of Ulster. His retreat was effected with great difficulty; and during the time of his inactivity, the distresses of his army increased to such a degree, that they are said to have fed upon the bodies of their dead companions. At last an end was put to the sufferings and the life of this adventurer in the battle of Dundalk, in 1318, where he was defeated and killed by the English under Sir Robert Birming. A brave English knight, named Maupeus, had feasted. He was rushed forward to encounter Bruce himself, and both antagonists had killed each other; the body of Maupeus being found, after the battle, stretched upon that of Bruce. The king of Scotland had been advancing with powerful succours to his brother; but Edward, confident of victory, refused to wait his arrival; and Robert, on hearing of his brother's death, instantly retired.

The defeat of the Scottish invaders did not put an end to the disturbances of this unhappy country. The contentions of the English with one another, of the Irish with the English, and among themselves, still kept the island in a state of the utmost barbarity and confusion. An attempt was made indeed, in the reign of Edward II. to establish an university in Dublin; but for want of proper encouragement the institution for some time languished, and then expired amidst the confusion and anarchy of the country. The reign of Edward III. proved not much more favourable than preceding times had been. He was too much taken up with the idea of conquering France, to pay much regard to the interests of Ireland. The unhappy under Ed-people, indeed, sensible of their own miseries, peti-ward III. tioned the king to admit all his subjects in Ireland to a participation of the English laws; but the petition being delivered as usual to the chief governor, and laid before the parliament, it was either clandestinely defeated, or openly rejected. A new scene of tumult and bloodshed immediately ensued; which at last produced an order from the king, prohibiting all Irishmen, or Englishmen married and having estates in Ireland, from bearing any public office whatever. This, instead of having a tendency to promote peace, made the disorder much greater than before; and at last produced a remonstrance from the states met at Kilkenny, in which they grievously complain not only of
IRELAND.

During the whole of this reign, therefore, the state of the Irish government continued to be greatly disordered and embroiled. The English interest gradually declined; and the connections of the king's subjects with the original inhabitants, occasioned by their vicinity and necessary intercourse, in despite of all legal injunctions, obliged the king to relax the severity of the statutes of Kilkenny, in cases where they proved impracticable, or oppressive in the execution. The perpetual hostility, however, in which the different parties lived, proved an effectual bar to the introduction of those arts which contribute to the comfort and refinement of mankind. Even foreign merchants could not venture into such a dangerous country without particular letters of protection from the throne. The perpetual succession of new adventurers from England, led by interest or necessity, served only to inflame dissension, instead of introducing any essential improvement. Lawyers sent from England were notoriously insufficient, if not corrupt; and, as such, had frequently been the objects of complaint. The clergy were a mean grovelling race, totally influenced by the crown. Even prelates were commonly made the inferior agents of government in collecting forces, and raising war against the Irish enemy; but were not to be enticed into this service, except by remittances from the exchequer. Attendance in parliament they dreaded as the greatest hardship; and either recurred to mean excuses to avert the penalty of absence, or sued to the king to be exempted by patent from contributing or assenting to those laws by which they were to be governed.

In this deplorable situation the kingdom continued till the time of Henry VII. who laid the foundation of the future civilization of the Irish, as he also did of the English nation. This he effected by enacting some salutary laws, and appointing faithful and active governors to see them put in execution. Of these governors Sir Edward Poyning contributed more than any other to the tranquillity of the state. During his administration was enacted the law known by the name of Poyning's law, and which hath since been the subject of much political debate. The purport of it was, that no parliament should be held in that island without first giving notice to the king of England, and acquainting him with the acts to be passed in that parliament: neither should any act passed, or any parliament held, without the approbation of the king and council, be deemed valid. Thus was the power of the turbulent barons greatly broken; and the governor, not having it in his power to assemble parliaments when he pleased, became a person of much less consequence. The whole Irish legislation also became dependent on that of England, and hath ever since continued to be so.

From this time we may date the revival of the English power in Ireland; which from the Scottish war in the time of Edward II. had gradually declined into a miserable and precarious state of weakness. The authority of the crown, which had at last been defied, insulted, and rejected, even in the English territory, was restored and confirmed, and the rebellious vigorously opposed and suppressed. The sway of the British crown over the whole body of the Irish, which
IRELAND.

England in this island, after a continued contest for 440 years, was reserved for the arms of Elizabeth. The ghastliness of famine and desolation was now somewhat enlivened by the restoration of tranquility. Indeed, from the most authentic accounts, the prices of provisions were so high, that considering the value of money at that time, it is surprising how the inhabitants could subsist. From an account of the rates of provisions taken by the mayor of Dublin in 1602, it appears, That wheat had risen from 36s. to 9l. the quarter; barley-malt from 10s. to 43s. the barrel; oat-meal from 5s. to 22s. the barrel; pease from 3s. to 40s. the peck; oats from 3s. 4d. to 20s. the barrel; beef from 26s. 8d. to 8l. the carcass; mutton from 3s. to 26s. the carcass; veal from 10s. to 20s. the carcass; a lamb from 12d. to 6s.; a pork from 8s. to 20s. Under James I. Ireland began to assume a quite different appearance. That monarch valued himself upon promoting the arts of peace, and made it his study to civilize his barbarous Irish subjects. By repeated conspiracies and rebellions, a vast tract of land had been taken to the crown in six northern counties: Tyrconnel, now called Downey, Tyrone, Derry, Fermoy, Nub, Cavan, and Armagh, amounting to about 500,000 acres; a tract of country covered with woods, where rebels and banditti found a secure refuge, and which was destined to lie waste without the timely interposition of government. James resolved to dispose of these lands in such a manner as might introduce all the happy consequences of peace and cultivation. He caused surveys to be taken of the several counties where the new settlements were to be established; described particularly the state of each; pointed out the situations proper for the erection of towns and castles; delineated the characters of the Irish chieftains, the manner in which they should be treated, the temper and circumstances of the old inhabitants, the rights of the new purchasers, and the claims of both; together with the impediments to former plantations, and the methods of removing them.

At his instance it was resolved, that the persons to whom lands were assigned should be either new undertakers from Great Britain, especially from Scotland, or serfs, as they were called; that is, men who had for some time served in Ireland, either in civil or military offices; or old Irish chieftains or captains. Among the last were included even those Irish who had engaged in the rebellion of Tyrone, and still harboured their secret discontents. To gain them, if possible, by favour and lenity, they were treated with particular indulgence. Their under-tenants and servants were allowed to be of their own religion; and, while all the other planters were obliged to take the oath of allegiance, they were tacitly excepted. The servants were allowed to take their tenants either from Ireland or Britain, provided no Papish recusants were admitted. The British undertakers were confined to their own countrymen.

In the plantations which had been formerly attempted, the Irish and English had been mixed together, from a fond imagination that the one would have learned civility and industry from the other. But experience had now discovered, that this intercourse served only to make the Irish envy the superior comforts of their
IRELAND.

their English neighbours, and to take the advantage of a free access to their houses to steal their goods and plot against their lives. It was therefore deemed necessary to plant them in separate quarters; and in the choice of these situations, the errors of former times were carefully corrected. The original English adventurers, on their first settlement in Ireland, were capitivated by the fair appearance of the plain and open districts. Here they erected their castles and habitations; and forced the old natives into the woods and mountains, their natural fortresses. There they kept themselves unknown, living by the milk of their kine, without husbandry or tillage; there they increased to incredible numbers by promissory generation; and there they held their assemblies, and formed their conspiracies without discovery. But now the northern Irish were placed in the most open and accessible parts of the country, where they might lie under the close inspection of their neighbours, and be gradually habituated to agriculture and the mechanic arts. To the British adventurers were assigned places of the greatest strength and command; to the servitors stations of the greatest danger and greatest advantage to the crown: but as this appeared a peculiar hardship, they were allowed guards and entertainment, until the country should be quietly and completely planted.

The experience of ages had shown the inconvenience of enormous grants to particular lords, attended with such privileges as obstructed the administration of civil government; and even in the late reign, favourite undertakers had been gratified with such portions of land as they were by no means able to plant. But, by the present scheme, the lands to be planted were divided in three different proportions; the greatest to consist of 2000 English acres, the least of 1000, and the middle of 1500. One half of the escheated lands in each county was assigned to the smallest, the other moiety divided between the other proportions; and the general distributions being thus ascertained, to prevent all disputes between the undertakers, their settlements in the respective districts were to be determined by lot. Estates were assigned to all, to be held of them and their heirs. The undertakers of 2000 acres were to hold of the king in capite; those of 1500, by knight's service; those of 1000 in common socage. The first were to build a castle, and enclose a strong court-yard, or baun, as it was called, within four years; the second, to finish a house and baun within two years; and the third, to enclose a baun; for even this rude species of fortification was accounted no inconsiderable defence against an Irish enemy. The first were to plant upon their lands, within three years, 48 able men of English or Scottish birth, to be reduced to 20 families; to keep a demesne of 600 acres in their own hands; to have four fee farmers on 120 acres each; six lease-holders, each on 100 acres; and on the rest, eight families of husbandmen, artificers, and cottagers. The others were under the like obligations proportionally. All were, for five years after the date of their patents, to reside upon their lands, either in person, or by such agents as should be approved by the state, and to keep a sufficient quantity of arms for their defence. The British and servitors were not to alienate their lands to mere Irish, or to demy any portions of them to such persons as should refuse to take the oaths to government; they were to let them at determined rents, and for no shorter term than 21 years, or three lives. The houses of their tenants were to be built after the English fashion, and united together in towns or villages. They had power to erect manors, to hold courts-baron, and to create tenures. The old natives, whose tenures were granted in fee simple, to be held in socage, were allowed the like privileges. They were enjoined to let their lands at certain rents, and for the like terms as the other undertakers; to take no Irish exactions from their inferior tenants, and to oblige them to forsake their old Scythian custom of wandering with their cattle from place to place for pasture, or crogghing as they called it; to dwell in towns, and conform to the English manner of tillage and husbandry. An annual rent from all the lands was reserved to the crown for every 60 English acres, six shillings and eightpence from the undertakers, ten shillings from servants, and 2 shillings and fourpence from Irish natives. But for two years they were exempt from such payments, except the natives who were not subject to the charge of transportation. What gave particular credit to this undertaking, was the capital part which the city of London was persuaded to take in it. The corporation accepted of large grants in the county of Derry; they engaged to expend 20,000l. on the plantation, to build the cities of Derry and Coleraine, and stipulated for such privileges as might make their settlements convenient and respectable. As a competent force was necessary to protect this infant plantation, the king, to support the charge, instituted the order of baronets, an hereditary dignity, to be conferred on a number not exceeding 200; each of whom, on passing his patent, was to pay into the exchequer such a sum as would maintain 30 men in Ulster, for three years, at 8d. daily pay.

But scarcely had the lands been allotted to the different patentees, when considerable portions were reclaimed by the clergy as their rightful property. And so far had the estates of the northern bishoprics been embarrassed, both by the usurpations of the Irish hidage, and the claims of patentees, that they scarcely afford ed a competent, much less an honourable, provision for men of worth and learning, while the state of the parochial clergy was still more deplorable. Most of the northern churches had been either destroyed in the late wars or had fallen to ruin: the benefices were small, and either shamefully kept by the bishops in the way of commendam or sequestration; or filled with ministers as scandalous as their income. The wretched flock was totally abandoned; and for many years divine service had not been used in any parish-church of Ulster, except in cities and great towns. To remedy these abuses, and to make some proper provision for the instruction of a people immersed in lamentable ignorance, the king ordained, that all ecclesiastical lands should be restored to their respective sees and churches, and that all lands should be deemed ecclesiastical from which bishops had in former times received rents or pensions; that compositions should be made with the patentees for the site of cathedral churches, the residences of bishops and dignitaries, and other church-lands which were not intended to be conveyed to them; who were to receive equivalents if they compounded freely.
IRELAND.

freely, or else to be deprived of their patents as the king was deceived in his grant, and the possessions restored to the church. To provide for the inferior clergy, the bishops were obliged to resign all their impropriations, and relinquish the tythes paid them out of parishes, to the respective incumens; for which ample recompense was made out of the king’s lands. Every proportion allotted to undertakers was made a parish, with a parochial church to each. The incumens, besides their tythes and duties, had glebe-lands assigned to them of 60, 90, or 120 acres, according to the extent of their parishes. To provide for a succession of worthy pastors, free-schools were endowed in the principal towns, and considerable grants of lands conferred on the university of Dublin, which had been re-established by Queen Elizabeth, together with the advowson of six parochial churches, three of the largest, and three of the middle proportion in each county.

Such was the general scheme of this famous northern plantation, so honourable to the king, and of such consequence to the realm of Ireland. Its happy effects were immediately perceived, although the execution by no means corresponded with the original idea. Buildings were slowly erected; British tenants were difficult to be procured in sufficient numbers; the old natives were at hand, offered higher rents, and were received into those districts from which it was intended to exclude them. In this particular, the Londoners were accused of being notoriously delinquent. They acted entirely by agents; their agents were interested and indolent, and therefore readily countenanced this dangerous intrusion of the natives: an error of which sufficient cause was afterwards found to repent. For the present, however, a number of loyal and industrious inhabitants was poured into the northern counties, considerable improvements made by the planters, and many towns erected. To encourage their industry, and advance his own project, the king was pleased to incorporate several of these towns, so that they had a right of representation in the Irish parliament.

The only disturbance that now ensued was from the Popish party, who never could bear to see the Protestant religion established in preference to their own, while they had power to resist. After numberless ineffectual machinations and complaints, their fury broke out in a terrible massacre of the new English settlers in the year 1641. The affairs of Britain were at that time in such confusion, that the rebellion could not be quelled in less than ten years; during which time the country was reduced to a most deplorable situation. It recovered again under Cromwell, Charles II. and the short reign of James II. On the accession of William III. matters were once more thrown into confusion by an attempt made in favour of the exiled monarch, who came over thither in person, and whose bad success is related under the article Britannia, No. 309—323. Since that time, Ireland hath recovered from the miserable situation to which it was so long reduced. As yet, however, it is far from being in such a flourishing state as either Scotch or North Britain. One great obstacle to the improvement of the kingdom is the extreme poverty and oppression of the common people. The produce of the kingdom, either in corn or cattle, is not above two-thirds at most of what by good cultivation it might yield. The high roads throughout the southern and western parts are lined with beggars, who live in huts or cabins without chimneys, or any covering capable of defending the wretched inhabitants from the cold, wind, and rain. It is a scandal (says a judicious traveler, who lately visited Ireland) to the proprietors of this fertile country, that there is not the greatest plenty of good corn and hay in it; but some of the best land in the king’s dominions is suffered to be torn in pieces, and cultivated in the vilest manner, by a set of abject miserable occupiers: who are absolutely no better than slaves to the despicable, lazy, and oppressive subordinate landlords.

Another cause consisted in the various restrictions (origin of which it had been thought proper to lay upon the Irish trade; and the constant and great preference given by government to the English manufacturers, at last produced the most grievous discontent and distresses. State of On the part of England it was supposed, that as Ireland had been subdued by force of arms, the inhabitants ought in every respect to be subject to the victorious state; and that the interest of the English ought on all occasions to be consulted, without regarding the inconveniences which might ensue to the Irish. A very different idea, however, was entertained by the Irish themselves, or at least by the patriots among them. They rejected all notions of dependence upon the British ministry and parliament; and though they did not scruple to acknowledge the king’s right of conquest, they most positively denied that the British parliament had any authority whatever over them; and therefore looked upon the restrictions laid upon their trade as the most grievous and intolerable oppression.

In the year 1719, according to Mr Crawford, the cause of oppression and grievances of Ireland became altogether insupportable. A cause relative to an estate, between Hester Sherlock and Maurice Annesley in 1719, before the court of exchequer in Ireland. Here the latter obtained a decree in his favour; but, on an appeal, the sentence was reversed by the lords. Annesley appealed from them to the English peers; who having reversed the judgment of those of Ireland, he was put in possession of the subject in dispute. Sherlock appealed again to the Irish lords, and the matter became very serious. It was proposed to the consideration of the judges, Whether by the laws of the land an appeal lies from a decree of the court of exchequer in Ireland to the king in parliament in Britain? This question being determined in the negative, Sherlock was again put in possession of the estate. A petition was some time after presented to the house by Alexander Burrows sheriff of Kildare, setting forth, That his predecessor in office had put Sherlock in possession of the premises: that, upon his entering into office, the injunction, agreeable to the order of the English peers, issued from the exchequer, requiring him to restore Maurice Annesley to the possession of the above-mentioned lands; and that, not daring to act in contradiction to the order of the house, he was fined. In consequence of this, being afraid lest he should be taken into custody, he durst not come in to pass his accounts; and for this he was fined 1200l. His conduct was applauded by the Irish and English lords, who commanded the fines imposed upon him to be
IRELAND.

The same was set forth in an application made to his majesty by the privy council. In short, the whole nation seemed to unite their efforts in order to remedy an evil of such dangerous tendency, the effects of which already began to be felt.

Among the controversial pieces which appeared on Dr Swift this occasion, those of Dr Swift were particularly distinguished. His Draper's letters are to this day held in grateful remembrance by his countrymen; but he was in danger of suffering deeply in the cause. He had been at particular pains to explain an argument used by the Irish on this occasion, viz. that brass money, being illegal, could not be forced upon the nation by the king, without exceeding the limits of his prerogative. Hence the opposite party took occasion to charge the Irish with a design of casting off their dependence on Britain altogether; but Swift having examined the accusation with freedom, pointed out the encroachments made by the British parliament on the liberties of Ireland; and asserted, that any dependence on England, except that of being subjects to the same king, was contrary to the law of reason, nature, and nations, as well as to the law of the land. This publication was so disagreeable to government, that they offered a reward of 300l. for the discovery of the author; but as nobody could be found who would give him up, the printer was prosecuted in his stead: however, he was unaniomously acquitted by a jury of his countrymen.

The Irish continued to be jealous of their liberties, while the British ministry seemed to watch every opportunity of encroaching upon them as far as possible. Apprehensions being entertained of a design upon Ireland by the partisans of the pretender in 1715, a vote of credit to government was passed by the house of commons to a considerable amount. This laid the foundation of the national debt of that kingdom, which dispute was quickly augmented to several hundred thousand with government; for discharge of which a fund had been provided by administration. An attempt was made during the administration of Lord Carteret (who governed Ireland till 1730) to vest this fund in the hands of his majesty and of his heirs for ever, redeemable by parliament. This was opposed by the patriotic party, who insisted that it was inconsistent with the public safety, and unconstitutional, to grant it longer than from session to session. In 1731 another attempt was made to vest the same in the crown for 21 years; but when the affair came to be debated, the strength of both parties was found to be equally balanced. Immediately before the vote, however, Colonel Thortingham having rode post on the occasion, arrived in the house, and determined the question against government.

The behaviour of Lord Chesterfield, who was made Excellent governor of Ireland in 1745, is highly extolled, on account of his moderation, and the favour he showed to the liberties of the people. As the apprehensions of government were then very considerable, on account of the rebellion which raged in Scotland, his lordship was advised to augment the military force of Ireland by 4000 men. Instead of this, however, he sent four battalions to the duke of Cumberland, and encouraged the volunteer associations which formed in different parts for the defence of their country. These battalions...
IRELAND.

be replaced by additional companies to the regiments
already on the establishment; by which means he saved
a considerable expense to the nation, without augmenting
the influence of the crown. The supplies asked
by him were small, and raised in the most easy and
agreeable manner to the people, expending the money
at the same time with the utmost economy. There
was even a saving which he applied to the use of the
public. It had been a custom with many of the lieu-
tenant-governors of Ireland to bestow reversionary
grants, in order to purchase the assistance of friends in
support of their measures. Lord Chesterfield, however,
being convinced that this practice was prejudicial to
the interest of the nation, put a stop to it; but the most
remarkable part of his administration was, the
humanity with which he treated the Roman Catho-
licals. Before his arrival, the Romish chapels in Dub-
lin had been shut up; their priests were command-
ated by proclamation to leave the kingdom; and such
as disobeyed had been subjected to imprisonment and
other penalties. Lord Chesterfield, however, con-
vinced that the affection is to be engaged by gentle
usage, permitted them to exercise their religion with-
out disturbance. The accusations brought against
them of forming plots against government were disre-
garded; and so much was his moderation and upright-
ness in this respect applauded by all parties, that, dur-
ing the whole time of his administration, the na-
tional tranquillity was not once interrupted by the
smaller internal commotion. On his leaving the island, his
bust was placed at the public expense in the castle of
Dublin.

Lord Chesterfield having left Ireland in the spring
of 1746, the island continued to be governed by lords
justices until the 13th of September, when William
earl of Harrington came over with the powers of lord-
lieutenant. A contest in the election of representa-
tives for the city of Dublin this year called forth the
abilities of Mr Charles Lucas, so much celebrated for
his patriotic virtues. Having some years before been
admitted a member of the common council, he re-
solved to exert himself in behalf of the privileges of
his fellow-citizens. The powers of this city-corpora-
tion, as well as of others, had been changed by author-
ity derived from an act in the time of Charles II.;
and among other innovations, for the purpose of aug-
menting the influence of the crown, they deprived the
commons of the power of choosing the city magistrates.
This was now vested in the board of aldermen; which
being subject in the exercise of its jurisdiction to the
approbation of the privy-council, was consequently de-
pendent on government. Mr Lucas complained loudly
of the injury; but as this law could not be altered, he
set himself to inquire, whether encroachments, which
could not be justified by law, had not been made on
the rights of the citizens? Having satisfied himself, by
searching diligently into ancient records, that his ap-
prehensions were well founded, he published his disco-
veries, explained the nature of the evidence resulting
from them, and encouraged the people to take the
proper steps for obtaining redress.

The consequence of this was a contest between the
commons and aldermen, which lasted two years. The
former struggled in vain to recover their lost privileges;
but the exertions of Lucas in every stage of the dis-
pute had rendered him so respectable among his coun-
trymen, that on the death of Sir James Somerville he
was encouraged to declare himself a candidate for a
seat in parliament. This being highly agreeable to
his wishes, he was elected accordingly; and distin-
guished himself not only by the boldness and energy of his
speeches, but more especially by a number of addresses
to his countrymen. In some of these he particularly
considered the several branches of the constitution, and
pointed out the encroachments of the British legisla-
ture. Government, alarmed at his boldness, determi-
ned to crush him by the hand of power; for which
reason the most obnoxious paragraphs were extracted
from his works, and made the foundation of a charge
before parliament. The commons voted him an ene-
my to his country; and addressed the lord-lieutenant
for an order to prosecute him by the attorney-general.
The universal esteem in which he was held could not
screen him from ministerial vengeance: he was driven
from Ireland; but having spent some years in banish-
ment, he was once more enabled, through the exert-
ions of his friends, to present himself as a candidate
for the city of Dublin. Being again elected, he con-
tinued to distinguish himself by the same virtuous prin-
ciples for which he had been from the beginning so
remarkable, and died with the character which he had
preserved through life, of the incorruptible Lucas.

In the year 1753, a remarkable contest took place Dispute
betwixt government and the Irish parliament relative to
government previous consent. As the taxes for defraying state
expenses are imposed by the representatives of the
people, it thence naturally follows, that they have a consent
right to superintend the expenditure of them; and by
an inspection of the journals of the house of commons,
it appeared, that from the year 1692 they had exer-
cised a right of calling for and examining the public
accounts. When any surplus remained in the treasury,
it was also customary to dispose of it by bill for the
good of the public. In the year 1749, however, a
considerable sum having remained in the treasury, the
disposal of this money in future became an object of
ministry. In 1751, it was intimated to parliament by
the lord-lieutenant, the duke of Dorset, that his
majesty would graciously consent and recommend it to
them, that such part of the money as then remained in
the treasury should be applied to the reduction of the
national debt. As this implied a right inherent in his
majesty to dispose of the money as he thought
proper, the proposal was accounted an invasion of the
privileges of the house of commons. No notice was
therefore taken of the directions given by Dorset; but
the bill was sent over to England as usual without any
notice taken of his majesty's consent. In England,
however, this very material alteration was made, and
their word consent introduced into it. The commons at
this time did not take any notice of such an essential
alteration; but next year, on its being repeated, the
bill was rejected. Government were now at the utmost
pains to defend the measure they had adopted, and
pamphlets were published in which it was justified on
various grounds. The event at last, however, was,
that his majesty by letter took the money which had
been the subject of dispute out of the treasury.

In the year 1760 Ireland sustained an inconsiderable
Invasion by
hostile invasion, the first that had been experienced in
the
IRELAND.

Ireland, the kingdom for 75 years. The armament consisted originally of five ships; one of 48 guns, two of 36, and two of 24; having on board 1270 land forces. They were commanded by the celebrated Thurot, whose reputation, as captain of a privateer, had advanced him to this dignity. His squadron, however, was driven by adverse winds to Gottenburgh; where having continued a few days, they set sail for the place of their destination. On their arrival at the coast of Ireland, they were obliged to shelter themselves in Lough Foyle from a violent storm which again overtook them. The wind, however, having shifted, and continuing to blow tempestuously, they were obliged to keep out to sea. Two of the ships were thus separated from the rest by the violence of the storm, and returned to France; but the remaining three directed their course to the island of Islay, where they anchored; and having repaired their damages, took in a supply of provisions, and thence sailed to Carrickfergus.

In the mean time, an officer belonging to the small number of troops at that time in Carrickfergus took post on a rising ground, with an advanced party, to observe the motions of the enemy. A skirmish ensued betwixt this party and Thurot's men, until the former, having expended all their ammunition, were obliged to retire into the town. Having in vain attempted to prevent the enemy from taking possession of it, the British troops shut themselves up in the castle, where they were soon obliged to capitulate, after having killed about 100 of their enemies, with the loss of only three on their own part. The French having plundered the town, set sail on the 26th of February; and three days after were all taken by Captain Elliot, Thurot himself being killed in the engagement.

Soon after the accession of George III. Ireland first began to be disturbed by a banditti who styled themselves White Boys; and as these were generally of the Romish persuasion, the prejudices against that sect broke forth in the usual manner. A plot was alleged to have been formed against government; French and Spanish emissaries to have been sent over to Ireland, and actually to be employed to assist in carrying it into execution. The real cause of this commotion, however, was as follows: About the year 1739 the murrain broke out among the horned cattle in the duchy of Holstein, from whence it soon after spread through the other parts of Germany. From Germany it reached Holland, from whence it was carried over to England, where it raged with great violence for a number of years. The mitigation of the penal laws against the Papists about this time encouraged the natives of the south of Ireland to turn their thoughts towards agriculture, and the poor began to enjoy the necessaries of life in a comfortable manner. A foreign demand for beef and butter, however, having become uncommonly great, by reason of the cattle distemper just mentioned, ground appropriated to grazing became more valuable than that employed in tillage. The cottars were everywhere dispossessed of their little possessions, which the landlords let to monopolizers who could afford a higher rent. Whole baronies were now laid open to pasturage, while the former inhabi- tants were driven desperate by want of subsistence. Numbers of them fled to the large cities, or emigrated to foreign countries, while those who remained took small spots of land, about an acre each, at an exorbitant price, where they endeavoured if possible to procure the means of protracting a miserable existence for themselves and families. For some time these poor creatures were allowed by the more humane landlords the liberty of commons; but afterwards this was taken away, in despite of justice and a positive agreement; at the same time, the payment of tythes, and the low price of labour, not exceeding the wages in the days of Queen Elizabeth, aggravated the distresses of the unhappy sufferers beyond measure.

In such a situation, it is no wonder that illegal methods were pursued in expectation of redress. The people, covered with white shirts, assembled in parties at night, turned up the ground, destroyed bullocks, levelled the inclosures of the commons, and committed other acts of violence. These unavailing efforts were construed into a plot against the government; numbers of the rioters were apprehended in the counties of Limerick, Cork, and Tipperary, and some of them condemned and executed. In different places these unhappy wretches, instead of being looked upon as objects of compassion, were prosecuted with the utmost severity. Judge Aston, however, who was sent over to try them, executed his office with such humanity as did him the highest honour. A most extraordinary and affecting instance of this was, that on his return from Dublin, for above ten miles from Clonmel, both sides of the road were lined with men, women, and children; who, as he passed along, kneeled down and implored the blessing of heaven upon him as their guardian and protector.

In the mean time, the violences of the White Boys continued, notwithstanding that many examples were made. The idea of rebellion was still kept up; and, without the smallest foundation, gentlemen of the first rank were publicly charged with being concerned in it; insomuch that some of them were obliged to enter bail, in order to protect themselves from injury. The Catholics of Waterford gave in a petition to Lord Hertford, the governor in 1765, in behalf of themselves and brethren, protesting their loyalty and obedience to government; but no effectual step was taken either to remove or even to investigate the cause of the disturbances.

About two years after the appearance of the White Boys, a similar commotion arose in Ulster; which, however, proceeded in part from a different cause, and was of much shorter duration. By an act of parliament, the making and repairing of highways in Ireland was formerly a grievous oppression on the lower ranks of people. An housekeeper who had no horse was obliged to work at them six days in the year; and if he had a horse, the labour of both was required for the same space of time. Besides this oppression, the poor complained that they were frequently obliged to work at roads made for the convenience of individuals, and which were of no service to the public. Nor were these the only grievances of which the insurgents at this time complained: the tythes exacted by the clergy were said to be unreasonable, and the rent of lands was more than they could bear. In 1763, therefore, being exasperated by a road proposed to be made through a part of the county of Armagh, the inhabitants most immediately affected by it rose in a body, and decla-
IRELAND.

red that they would make no more highways of the kind. As a mark of distinction, they were oak-branches in their hats, from which circumstance they called themselves Oak-boys. The number of their partizans soon increased, and the insurrection became general through the counties of Armagh, Tyrone, Derry, and Fermangh. In a few weeks, however, they were dispersed by parties of the military; and the public tranquility was restored with the loss of only two or three lives. The road-act, which had been so justly found fault with, was repealed next session; and it was determined, that for the future the roads should be made and repaired by a tax to be equally assessed on the lands of the rich and poor.

Of the Steel-boys. Besides these, another set of insurgents called Steel-boys soon made their appearance, on the following account. The estate of an absentee nobleman happening to be out of lease, he proposed, instead of an additional rent, to take fines from his tenants. Many of those, who at that time possessed his lands, were unable to comply with his terms; while others, who could afford to do so, insisted upon a greater rent from the immediate tenants than they were able to pay. The usual consequence of this kind of oppression instantly took place. Numbers being dispossessed and thrown destitute, were forced into acts of outrage similar to those already mentioned. One of these charged with felony was carried to Belfast, in order to be committed to the county gaol; but his associates, provoked by the usage they had received, determined to relieve him. The design was eagerly entered into by great numbers all over the country; and several thousands, having provided themselves with offensive weapons, proceeded to Belfast in order to rescue the prisoner. To prevent this, he was removed to the barrack and put under the guard of a party of soldiers quartered there; but the Steel-boys pressed forward with a determination to accomplish their purpose by force, and some shots were actually exchanged between them and the soldiers. The consequences would undoubtedly have been fatal, had it not been for a physician of highly respectable character, who interposed at the risk of his life, and prevailed on those concerned to set the prisoner at liberty. The tumult, however, was not thus quelled. The reception of the commons in a very material point. A money-bill, which had not originated in Ireland, was sent over from Britain, but was rejected in a spirited manner. Its rejection gave great offense to the lord-lieutenant, who repeatedly procrastinated them till the year 1771.

The affairs of Ireland began now to draw towards that crisis which effected the late remarkable revolution in favour of the liberties of the people. The passing of the occetinal bill had diminished, but not taken away, the influence of the crown; and the situation of affairs between Britain and America had inclined ministry to make the most of this influence they could. In 1773 Lord Harcourt, at that time governor of Ireland, exicted himself so powerfully in favour of administration, that the voice of opposition in parliament was almost entirely silenced. The difficulties, Distressed however, under which the whole nation laboured began state of Ireland last before the was presented by the commons to his excellence. In lord-lieutenant this they told him, that they hoped he would lay before nation the king the state of Ireland, restricted in its commerce from the short-sighted policy of former times, to the great injury of the kingdom, and the advantage of its rivals, if not of the interests of Great Britain. These hardships, they said, were not only impolitic, but unjust; and they told his excellence plainly, that they expected to be restored to some, if not to all their rights, which alone could justify them to their constituents for laying upon them so many burdens during the course of this session.

This representation to the lord-lieutenant produced no effect; and Ireland for some years longer continued to groan under the burden of intolerable restrictions. These had principally taken place in the reign of Charles II. At this time it was enacted, that beef or live cattle should not be exported to England; the restrictions neither were the commodities of Ireland to be exported to the American colonies, nor American goods to be imported to any port in Ireland without first unloading them in some part of England or Wales. All trade with Asia was excluded by charters granted to particular companies; and restrictions were imposed upon almost every valuable article of commerce sent to the different ports of Europe. Towards the end of

King
IRELAND.

King William's reign an absolute prohibition was laid on the exportation of Irish wool. This restriction proved disadvantageous not only to Ireland, but to Great Britain herself. The French were now plentifully supplied by smuggling with Irish wool; and not only enabled to furnish woollen stuffs sufficient for their own consumption, but even to vie with the British in foreign markets. Other restrictions conspired to augment the national calamity; but that which was most sensibly felt took place in 1776. There had hitherto (says Mr. Crawford) been exported annually to America large quantities of Irish linens; this very considerable source of national advantage was now shut up, under pretence of rendering it more difficult for the enemy to be supplied with the means of subsistence; but in reality, to enable a few rapacious English contractors to fulfil their engagements, an embargo, which continued, was in 1776 laid upon the exportation of provisions from Ireland, by an unconstitutional stretch of prerogative. Remittances to England, on various accounts, particularly for the payment of our forces abroad, were more than usually considerable. These immediate causes being combined with those which were invariable and permanent, produced in this country very calamitous effects. Black cattle fell very considerably in their value; notwithstanding that, customers could not be had. The price of wool was reduced in a still greater proportion. Rents everywhere fell; nor, in many places, was it possible to collect them. An universal stagnation of business ensued. Credit was very much injured. Farmers were pressed by extreme necessity, and many of them failed. Numbers of manufacturers were reduced to extreme necessity, and would have perished, had they not been supported by public charity. Those of every rank and condition were deeply affected by the calamity of the times. Had the state of the exchequer permitted, grants might have been made to promote industry, and to alleviate the national distress; but it was exhausted to a very uncommon degree. Almost every branch of the revenue had failed. From want of money the militia law could not be carried into execution. We could not pay our forces abroad; and, to enable us to pay those at home, there was a necessity for borrowing 50,000l. from England. The money which parliament was forced to raise, it was obliged to borrow at an exorbitant interest. England, in its present state, was affected with the wretched condition to which our affairs were reduced. Individuals there, who had estates in Ireland, were sharers of the common calamity; and the attention of individuals in the British parliament was turned to our situation, who had even no personal interest in this country.

Irish affairs taken into consideration by the British parliament.

While things were in this deplorable situation, Earl Nugent, in the year 1778, undertook the cause of the Irish, by moving in parliament, that their affairs should be taken into consideration by a committee of the whole house. This motion being agreed to almost unanimously, it was followed by several others, viz. That the Irish might be permitted to export directly to the British plantations, or to the settlements on the coasts of Africa, all goods being the produce and manufacture of the kingdom, excepting only wool, or woollen manufactories, &c. That all goods, being the produce of any of the British plantations, or of the settlements on the coast of Africa, tobacco excepted, be allowed to be imported directly from Ireland to all places, Britain excepted. That cotton yarn, the manufacture of Ireland, be allowed to be imported into Great Britain. That glass manufactured in Ireland be permitted to be exported to all places, Britain excepted. With respect to the Irish sail cloth and cordage, it was moved, that they should have the same privilege as for the cotton yarn.

These motions having passed unanimously, bills for Petitions of relief of Ireland were framed upon them accordingly. The trading and manufacturing towns of England, however, now took the alarm, and petitions against the Irish indulgence were brought forward from many different quarters, and numbers instructed to oppose it. In consequence of this a warm contest took place on the second reading of the bills. Mr. Burke supported them with all the strength of his eloquence; and as the minister seemed to favour them, they were committed, though the violent opposition to them still continued, which induced many of their friends at that time to desert their cause.

Though the efforts of those who favoured the cause of Ireland thus proved unsuccessful for the present, they renewed their endeavours before the Christmas vacancy. They now urged, that, independent of all claims from justice and humanity, the relief of Ireland was enforced by necessity. The trade with British America was now lost for ever; and it was indispensable requisite to unite the remaining parts of the empire in one common interest and affection. Ireland had hitherto been passive; but there was danger that, by driving her to extremities, she would cast off the yoke altogether; or, even if this should not happen, the tyranny of Britain would be of little advantage; as, on the event of a peace, the people would desert a country in which they had experienced such oppression, and emigrate to America, where they had a greater prospect of liberty. On the other hand, they insisted, that very considerable advantages must ensue to Britain by the emancipation of Ireland; and every benefit extended to that country would be returned with accumulated interest. The business was at last summed up in a motion made by Lord Newhaven, in February 1769, that liberty should be granted to the Irish to import sugars from the West Indies. This was carried; but the new petitions against them.

Irish merchants of Glasgow and Manchester having petitioned against it, it was again lost through the interference of the minister, who now exerted his influence against the relief he had formerly declared in favour of. Various other efforts, however, were made to effect the intended purpose; but nothing more could be obtained than a kind of compromise, by which Lord Gower pledged himself, as far as he could answer for the conduct of others, that, during the recess, some plan should be fallen upon for accommodating the affairs of Ireland to the satisfaction of all parties.

In the mean time the affairs of this country hastened to a crisis; which forced the British ministry to give that relief so long solicited, and which they so often promised without any intention of performing their promises. As long as the affairs of the country were under consideration of the British parliament, the in-
IRELAND.

habitants preserved some degree of patience; but when they found themselves deserted by the minister, 
their discontent was inflamed beyond measure. The 
laws he had passed in their favour, viz. an allowance 
to plant tobacco, and a bill for encouraging the growth 
of hemp, were considered as mockery instead of relief, 
and it was now resolved to take such measures as should 
effectually convince the ministry that it was not their 
interest to tyrannize any longer. With this view, associ-
atons against the importation of British commodities, 
which had been entered into in some places before, now 
became universal throughout the kingdom; and such 
as presumed to oppose the voice of the people in this 
respect, had the mortification to find themselves ex-
posed to public obloquy and contempt on that ac-
count. Thus the Irish manufactures began to re-
 vive; and the people of Britain found themselves 
obliged seriously to take into consideration the relief 
of that country, and to look upon it as a matter very 
necessary to their own interest. To this also they were 
still more seriously disposed by the military associa-
tions, which had taken place some time before, and now 
assumed a most formidable appearance. These at first 
were formed by accidental causes. The situation of 
Britain, for some time, had not admitted of any effect-
tual method being taken for the defence of Ireland. 
Its coasts had been insulted, and the trading ships 
taken by the French and American privateers; nor was 
it at all improbable that an invasion might soon follow. 
"The minister (says Mr Crawford) told us, that the 
situation of Britain was such as rendered her incapable 
of protecting us. The weakness of government, from 
the following circumstance, was strikingly obvious. 
The mayor of Belfast having transmitted a memorial 
to the lord-lieutenant, setting forth the unprotected 
state of the coast, and requesting a body of the 
military for its defence, received for answer, that he could 
not afford him any other assistance than half a troop 
of dismounted horse and half a company of invalids." 
In this dilemma, a number of the inhabitants of the 
town associated for the purpose of self-defence; and, 
on the same principle, a few volunteer companies were 
defined in different parts of the kingdom. These chose 
their own officers, purchased their own uniforms and 
arms, and, with the assistance of persons properly quali-
fied, assembled regularly on the parade to acquire a 
knowledge in the military art. Their respectable 
appearance, and the zeal they showed in the service of 
their country, soon excited curiosity and attracted 
respect. Their number increased every day; and people 
of the first consequence became ambitious of being 
enrolled among them. As no foreign enemy appeared, 
against whom they might exercise their military prowess, 
these patriotic bands soon began to turn their thoughts 
towards a deliverance from domestic oppression. No 
sooner was this idea made known, than it gave new 
vigour to the spirit of volunteering; insomuch that, 
by the end of 1778, the military associations were 
thought to amount at least to 30,000 men. But, 
while thus formidable from their numbers, and openly 
avowing their intention to demand a restitution of their 
rights from the British ministry, they professed the 
utmost loyalty and affection to the king; and with re-
gard to sobriety and decent demeanor, they were not 
only exceptionable, but exemplary. Instead of ex-
citing disorders themselves, they restrained every kind 
of irregularity, and exerted themselves with unanimity 
and vigour for the execution of the laws.

That such a body of armed men, acting without any 
command or support from government, should be an 
object of apprehension to ministry, is not to be won-
dered at. In the infancy of their associations, indeed, 
they might have been suppressed; but matters had been 
suffered to proceed too far; and, as they stood at pres-
ent, all resistance was vain. As the volunteers could 
not be controlled, some attempts were made to bring 
them under the influence of the crown: but this being 
found impossible, ministry thought proper to treat them 
with arms and with an appearance of confidence; and, accordingly, by the mi-
 ordered were issued for supplying them with 16,000 
stand of arms.

The Irish parliament, thus encouraged by the spirit 
The parliament of the nation, and pressed by the difficulties arising 
from the diminished value of their estates, resolved 
to bring them in a becoming manner, in order to 
relief. At their meeting in 
October 1779, an address to his majesty was drawn 
up; in which it was expressly declared, that "it was 
not by temporary expedients, but by a free trade alone, 
that Ireland was now to be saved from impending 
rain." When this address was carried up to the lord 
lieutenant, the streets of Dublin were lined with vol-
uunteers, commanded by the duke of Leinster, in 
their arms and uniform. But, though a general 
expectation of relief was now diffused, an anxious 
fear of disappointment still continued. If the usual 
supply was granted for two years, there was danger of 
the distresses continuing for all that time; and after it 
was granted, the prorogation of parliament might put 
a stop to the expected relief altogether. The people, 
however, were not now to be trifled with. As the 
court party showed an aversion to comply with the 
popular measures, a mob rose in Dublin, who, among risi-

g other acts of violence, pulled down the house of the Dubh 
attorney-general, and did their utmost to compel the 
members to promise their contentment to the matter 
in hand. When the point therefore came to be de-
bated, some espoused the popular side from principle, 
others from necessity; so that on the whole a majority 
appeared in favour of it. A short money-bill was passed 
and transmitted to England; where, though very 
mortifying to the minister, it passed also.

On the meeting of the British parliament in Decem-

ber, the affairs of Ireland were first taken into conside-
ration in the house of peers. The necessity of granting 
relief to that kingdom was strongly set forth by the 
British lord who introduced them. He said, the Irish, now parliament 
conscious of possessing a force and consequence to 
which they had hitherto been strangers, had resolved 
to apply it to obtain the advantages of which the na-
tion, by this spirited exertion, now showed themselves 
worthy. Had they for some time before been grati-
fied in lesser matters, they would now have received 
with gratitude, what they would, as affairs stood at 
present, consider only as a matter of right. He then 
moved for a vote of censure on his majesty's ministers 
for their neglect of Ireland. This motion was re-
jected; but Earl Gower, who had now deserted the 
cause of ministry, declared, that there did not exist in 
his mind a single doubt that the vote of censure was
IRELAND.

not well founded. He added, in his own vindication, that early in the summer he had promised that relief should be given to Ireland, and had done every thing in his power to keep his word; but that all his efforts had proved fruitless.

In the house of commons the minister found himself so hard pressed by the arguments of the minority, and the short money-bill from Ireland, that he was obliged to declare, that in less than a week he intended to move for a committee of the whole house to take the affairs of Ireland into consideration. On the 13th of December he accordingly brought forward his propositions in favour of this kingdom. The design of these was to repeal the laws prohibiting the exportation of Irish manufactures made of wool or woollen flocks; to repeal as much of the act of 19th Geo. II. as prohibited the importation of glass into Ireland, except of British manufacture, or the exportation of glass from Ireland; and to permit the Irish to export and import commodities to and from the West Indies and the British settlements on the coast of Africa, subject to such regulations and restrictions as should be imposed by the Irish parliament.

On these propositions his lordship made several remarks by way of explanation. One object of them, he said, was to restore to Ireland the wool export and woollen manufacture. In 1692, from jealousy or some other motive, an address had been presented by the English parliament, recommending a kind of compact between the two kingdoms; the terms of which were, that England should enjoy the woollen manufacture, and Ireland the linen, exclusively. But notwithstanding this agreement, it was certain, that England carried on the linen manufacture to as great extent as Ireland, while at the same time the former retained the monopoly of woollens. The first step taken, in consequence of this agreement, was to lay a heavy duty, equal to a prohibition, upon all wool and woollen exports; and when this act, which was but a temporary one by way of experiment, expired, the English parliament passed a similar one, and made it perpetual; by means of which and some others a total end was put to the woollen trade of Ireland.

With regard to the trade of Ireland, his lordship observed, that, upon an average of the six years from 1766 to 1772, the export to Ireland was somewhat more than two millions; and, in the succeeding six years, from 1772 to 1778, about as much more: nearly one-half being British manufacture and produce; the other half certified articles, of which this country was the medium of conveyance. The native produce, on an average, was somewhat more than 900,000l. but of this only 200,000l. were woollens. The woollen manufacture of Ireland therefore would long continue in a state of infamy; and though cloths had been manufactured sufficient for home consumption, yet it could hardly be expected that Ireland would rival Great Britain at the foreign markets, when, after the expense of land-carriage, freight, insurance, and factorage, the latter was able to undersell Ireland in her own market on the very spot, even though aided by the low wages and taxes paid in the country.

With regard to the linen, his lordship observed, that however prosperous it might appear, yet still it was capable of great improvement. The idea of extend-
taxes; and this was the only proper ground on which
the benefits expected by the Irish nation could be
either granted or desired.

Having made some other observations on the pro-
propriety of these measures, they were regularly formed
into motions, and passed unanimously. In Ireland
they were received with the utmost joy and gratitude
by both houses of parliament. On the 20th of De-
December the following resolutions were passed; viz.
That the exportation of woollen and other manufac-
tures from Ireland to all foreign places will materially
tend to relieve its distresses, increase its wealth, pro-
mote its prosperity, and thereby advance the welfare
of Britain, and the common strength, wealth, and com-
merce of the British empire; that a liberty to trade
with the British colonies in America and the West
Indies, and the settlements on the coast of Africa, will
be productive of very great commercial benefits; will
be a most affectionate mark of the regard and attention
of Great Britain to the distresses of the kingdom; and
will give new vigour to the zeal of his majesty's brave
and loyal people of Ireland, to stand forth in support
of his majesty's person and government, and the in-
terest, the honour, and dignity of the British empire."

The same resolutions were, next day, passed in the
house of peers.

The highest encomiums were now passed on Lord
North. His exertions in favour of Ireland were de-
clared to have been great and noble; he was styled
"the great advocate of Ireland;" and it was foretold,
that he would be of glorious and immortal memory in
that kingdom. But while these panegyrics were so
lavishly made on the minister, the members in opposi-
tion, in the British parliament, were spoken of in very
indifferent terms. It was said, that while they
thought the minister did not mean to go into the busi-
ness of Ireland, they called loudly for censure against
him for not doing it; but when it was found that he
meant seriously to take their affairs into consideration,
they had then basely deserted, and wholly forsaken
the interest of the kingdom. These censures were so loud,
that a member of the British house of commons wrote
a letter to be communicated to his friends in Ireland,
in which he represented, that however politic it might
be to compliment the minister on the present occasion,
itis neither very wise nor generous in the members
of the Irish parliament to be so ready in bestowing in-
vectives against their old friends in England. With
regard to the minister, it was alleged, that until he was
driven to it by the measures adopted in Ireland, his
conduct had been extremely equivocal, dilatory, and
indecisive. The minority had been justly incensed
against him for having so grossly sacrificed the honour
of the nation and the dignity of parliament as to re-
fuse any substantial relief to the Irish, until their own
exertions had made it appear that every thing which
could be done for them by the British parliament was
not a matter of choice but of necessity. The minority,
it was said, had earnestly and repeatedly laboured to
procure relief for the people of Ireland; and if they
had now contested themselves with silent acquiescence
in the minister's propositions, it was only until they
should know whether they would be satisfactory to the
people of Ireland; and because what was now done,
appeared to be more an act of state than of mere par-
liamentary deliberation and discussion.

To the propositions already mentioned, Lord North
added three others. 1. For repealing the prohibitions
of exporting gold coin from Great Britain to Ireland.
  2. For removing the prohibition to import foreign
hops into Ireland, and the drawback on the exporta-
tion of foreign hops. 3. For enabling his majesty's
Irish subjects to become members of the Turkey com-
pany, and to export woollens in British or Irish bot-
toms to the Levant. In support of this last resolution
his lordship urged, that it was necessary, because the
exportation of woollens having been granted to Ire-
land, the Irish would naturally expect a share in the
Turkey trade, which, as matters stood, was not pos-
sible, it having hitherto been a received opinion, that
no Irishman could be elected a member of the Turkey
company. Notwithstanding all the satisfaction, how-
ever, with which the news of these bills were received
in Ireland, it was not long before thoughts of a dif-
f erent kind began to take place. It was suggested
that a free trade could be but of little use, if held over
for a precarious tenure. The repeal of the obnoxious laws
was represented as an act of necessity, not of choice,
on the part of the British parliament. When that ne-
necessity, therefore, no longer existed, the same parliament
might recall the benefits it had granted, and again set-
ter the Irish trade by restrictions perhaps more oppres-
sive than before. To secure the advantages they now
possessed it was necessary that the kingdom should en-
joy the benefits of a free constitution. For this the
people looked up to the volunteer companies; and the
idea of having such a glorious object in their power,
augmented the numbers of those which had also been
increased from other causes. They had now received
the thanks of both houses of parliament, and thus had
obtained the sanction of the legislature. Thus many
hunters in-
Numbers, who had formerly scrupled to connect themselves with
a lawless body, made no scruple to enter their lists.
Government also engaged several of their friends in
the volunteer cause. New companies were therefore
raised; but whatever might be the political sentiments
of the officers, the private men were universally at-
tached to the popular cause. The national spirit was
likewise kept up by several patriotic publications par-
ticularly the letters signed Owen Roe O'Neil, which
in an especial manner attracted the public attention;
or was the pulpit backward in contributing its part
in the same cause.

To give the greater weight to their determinations,
the volunteers now began to form themselves into batta-
talions; and in a very short time they were all united into batta-
in this manner, excepting a small number of compa-
nies, which, from accidental causes, continued separate.
The newspapers were filled with resolutions from the
several corps, declaring Ireland to be an independent
kingdom, entitled by reason, nature, and compact, to claim
all the privileges of a free constitution; that no power indepen-
dent kingdom, with the lords and commons of Ireland, had or ought to have power to
make laws for binding the Irish; and that, in support
of these rights and privileges, they were determined to
sacrifice their lives and property.

Notwithstanding all this zeal, however, the represen-
IRELAND.

sentatives of the people in Ireland seem yet to have behaved in a very supine and careless manner, and to have been entirely obedient to the dictates of government. One of the house of commons declared in the month of April 1780, that “no power on earth, excepting the king, lords, and commons of Ireland, had a right to make laws to bind the people.” “Every member in the house (says Mr. Crawford), one excepted, acknowledged the truth of the proposition, either in express terms, or by not opposing it; and yet, however astonishing it may appear, it was evident, that had the question been put, it would have been carried in the negative.” The matter was compromised. The question was not put; and nothing relating to it was entered on the journals.

This inattention, or rather unwillingness, of the majority to serve their country, was more fully manifested in the case of a mutiny bill, which they allowed to be made perpetual in Ireland, though that in England had always been cautiously passed only from year to year. After it was passed, however, some of the zealous patriots, particularly Mr. Grattan, took great pains to set forth the bad tendency of that act. He observed, that standing armies in the time of peace were contrary to the principles of the constitution and the safety of public liberty; they had subverted the liberty of all nations, excepting in those cases where their number was small, or the power of the sovereign over them limited in some respect or other; but it was in vain to think of setting bounds to the power of the chief magistrate, if the people chose by a statute to give themselves to give them a perpetual and irresistible force. The mutiny bill, or martial law methodised, was directly opposite to the common law of the land. It set aside the trial by jury and all the ordinary steps of law; establishing in their stead a summary proceeding, arbitrary crimes and punishments, a secret sentence, and sudden execution. The object of this was to bring those who were subject to it to a state of implicit subordination, and render the authority of the sovereign absolute. The people of England, therefore, from a laudable jealousy on all subjects in which their liberty was concerned, had in the matter of martial law exceeded their usual caution. In the preamble to the mutiny act, they recited part of the declaration of right, “that standing armies and martial law in time of peace, without the consent of parliament, are illegal.” Having then stated the purity and simplicity of their ancient constitution, and set forth the great principle of magna charta, they admitted a partial and temporary repeal of it: they admitted an army, and a law for its regulation, but at the same time they limited the number of the former, and the duration of both; confusing the existence of the troops themselves, the law that regulated them, and the power that commanded them, to one year. Thus were the standing forces of England rendered a parliamentary army, and the military rendered effectually subordinate to the civil magistrate, because dependent on parliament. Yet the people of England considered the army, even thus limited, only as a necessary evil, and would not admit even of barracks, lest the soldier should be still more alienated from the state of a subject; and in this state of alienation have a post of strength, which would augment the danger arising from his situation. When the parliament of Ireland proceeded to regulate the army, therefore, they ought to have adopted the maxims of the British constitution, as well as the rules of British discipline. But they had totally departed from the maxims and example of the English, and that in the most important concern, the government of the sword. They had omitted the preamble which declared the great charter of liberty; they had left the number of forces in the breast of the king, and under these circumstances they had made the bill perpetual.

It is probable that the bulk of the Irish nation did not at first perceive the dangerous tendency of the bill in question. The representations of Mr. Grattan and others, however, soon opened their eyes, and a general dissatisfaction took place. This was much increased by two unsuccessful attempts in the house of commons; one to obtain an act for modifying Poyning’s law; and the other for securing the independency of the judges. An universal disgust against the spiritless conduct of parliament now took place; and the hopes of the people were once more set on the volunteers.

As it became now somewhat probable that these companies might at last be obliged to assert the rights of their countrymen by force of arms, reviews were judged necessary to teach them how to act in larger bodies, and to give them a more exact knowledge of the use of arms. Several of these reviews took place in the course of summer 1780. The spectators in general were struck with the novelty and grandeur of the sight; the volunteers became more than ever the objects of esteem and admiration, and their numbers increased accordingly. The reviews in 1781 exceeded those of the former year; and the dexterity of the corps who had associated more early was now observed to be greater than that of the rest. More than 5000 men were reviewed at Belfast, whose performances were set off to peculiar advantage by the display of 13 pieces of cannon. They showed their alacrity to serve their country in the field, on a report having arisen that the kingdom was to be invaded by the combined fleets of France and Spain; and for their spirited behaviour on this occasion they received a second time the thanks of both houses of parliament.

Such prodigious military preparations could not but alarm the British ministry in the highest degree; and it was not to be doubted that the Irish volunteers would come to the same extremities the Americans had done, unless their wishes were speedily complied with. Still, however, it was imagined possible to suppress them, and it was supposed to be the duty of the lord-lieutenant to do so. It was during the administration of the duke of Buckingham that the volunteers had grown into such consequence; he was therefore recalled, and the earl of Carlisle appointed in his place.

Though it was impossible for the new governor to suppress the spirit of the nation, he found it no difficult matter to obtain a majority in parliament. Thus every redress was for the present effectually denied. Neither the modification of Poyning’s law, nor the repeal of the obnoxious parts of the mutiny bill, could be obtained. The volunteers, exasperated at this behaviour, resolved at once to show that they were resolved to do themselves justice, and were convinced they had power to do so. At a meeting of the officers of the southern battalion of the Armagh regiment, com-
IRELAND.

manded by the earl of Charlemont, the following resolutions were entered into, December 28, 1781. 1. That the most vigorous and effectual methods ought to be pursued for rooting corruption out from the legislative body. 2. For this purpose a meeting of delegates from all the volunteer associations was necessary; and Dungannon, as the most central town in the province of Ulster, seemed to be the most proper for holding such a meeting. 3. That as many and lasting advantages might attend the holding such a meeting before the present session of parliament was much farther advanced, the 15th of February next should be appointed for it.

These resolutions proved highly offensive to the friends of government, and every method was taken to discourage it. On the appointed day, however, the representatives of 143 volunteer corps attended at Dungannon; and the results of their deliberation were as follows. 1. It having been asserted, that volunteers, as such, cannot with propriety debate or publish their opinions on political subjects, or on the conduct of parliament, or public men, it was resolved unanimously, that a citizen, by learning the use of arms, does not abandon any of his civil rights. 2. That claim from any body of men, other than the king, lords, and commons of Ireland, to make laws to bind the people, is illegal, unconstitutional, and a grievance. 3. Resolved, with one dissenting voice only, that the powers exercised by the privy council of both kingdoms, under colour or pretence of the law of Poyning, are unconstitutional and a grievance. 4. Resolved unanimously, that the ports of this country are by right open to all foreign countries not at war with the king; and that any burden thereon, or obstruction thereto, excepting only by the parliament of Ireland, are unconstitutional and a grievance. 5. Resolved, with one dissenting voice only, that a mutiny bill, not limited in point of duration from session to session, is unconstitutional and a grievance. 6. Resolved unanimously, that the independence of judges is equally essential to the impartial administration of justice in Ireland as in England, and that the refusal or delay of this right is in itself unconstitutional and a grievance. 7. Resolved, with 11 dissenting voices only, that it is the decided and unalterable determination of the volunteer companies to seek a redress of these grievances; and they pledged themselves to their country, and to each other, as freeholders, fellow-citizens, and men of Honour, that they would, at every ensuing election, support only those who had supported them, and would support them therein, and that they would use all constitutional means to make such pursuit of redress speedy and effectual. 8. Resolved, with only one dissenting voice, that the minority in parliament, who had supported those constitutional rights, are entitled to the most grateful thanks of the volunteer companies, and that an address to the purpose be signed by the chairman, and published with the resolutions of the present meeting. 9. Resolved unanimously, that four members from each county of the province of Ulster, eleven to be a quorum, be appointed a committee till the next general meeting, to act for the volunteer corps, and to call general meetings of the province as occasion requires. 10. The committee being appointed, and the time of general meetings, and some other affairs of a similar nature settled, it was resolved unanimously, that the court of Portugal having unjustly refused entry to certain Irish commodities, the delegates would not consume any wine of the growth of Portugal, and that they would use all their influence to prevent the use of the said wine, excepting what was then in the kingdom, until such time as the Irish exports should be received in the kingdom of Portugal. 11. Resolved, with only two dissenting voices, that they hold the right of private judgment in matters of religion equally sacred in others as in themselves; and that they rejoiced in the relaxation of the penal laws against the Papists, as a measure fraught with the happiest consequences to the union and prosperity of the inhabitants of Ireland.

While these proceedings took place at Dungannon, Ministerial the ministry carried all before them in parliament. In a debate concerning the exclusive legislative privileges of Ireland, a law member, speaking of the arbitrary acts of England, asserted, that "power constituted right," and a motion that the commons should be declared the representatives of the people was carried in the negative. These scandalous proceedings could not but hasten the ruin of their cause. These resolutions entered into at the Dungannon meeting were received throughout the kingdom with the utmost applause. A Mr Grant, few days after, Mr Grattan, whose patriotism has been tan's already taken notice of, moved in the house of commons for an address, long and spirited address to his majesty, declaring the rights of the kingdom, and asserting the principle the inde which now began to prevail, that Ireland could legally be bound by no power but that of the king, lords, and commons of the country; though the British parliament had assumed such a power. This motion was at present rejected by a large majority; but their eyes were soon enlightened by the volunteers.

These having now appointed their committees of correspondence, were enabled to communicate their sentiments to one another with the utmost facility and quickness. An association was formed in the name of the nobility, representatives, freeholders, and inhabitants of the county of Armagh, wherein they set forth the necessity of declaring their sentiments openly re- 103 specting the fundamental and undoubted rights of the nation. They declared, that, in every situation in life, and with all the means in their power, they would maintain the constitutional right of the kingdom to be governed only by the king and parliament of Ireland, and that they would, in every instance, uniformly and strenuously oppose the execution of any statutes, except such as derived their authority from the parliament just mentioned; and they pledged themselves, in the usual manner, to support what they now declared with their lives and fortunes.

This declaration was quickly adopted by all the other counties, and similar sentiments became universally avowed throughout the kingdom. The change in the British ministry in the spring of 1782 facilitated the wishes of the people. The duke of Portland, who came over as lord-lieutenant in April that year, sent a most welcome message to parliament. He informed them, that "his majesty, being concerned to find that the duke of Portland loyal subjects in Ireland, upon matters of great weight and importance, he recommended it to parliament to take
IRELAND.

Mr. Grattan's second attempt in favour of Ireland.
