Mr. Grattan, whose patriotic efforts had never been slackened, now ventured to propose a second time in parliament the address which had been rejected before. On the 15th of April he began a speech to this purpose with a panegyric on the volunteers, and the late conduct of the people. The Irish, he said, were no longer a divided colony, but an united land, manifesting itself to the rest of the world in signal instances of glory. In the rest of Europe the ancient spirit was expired; liberty was yielded, or empire lost; nations were living upon the memory of past glory, or under the care of mercenary armies. In Ireland, however, the people, by departing from the example of other nations, had become an example to them. Liberty, in former times and in other nations, was recovered by the quick feelings and rapid impulse of the populace. But in Ireland, at the present period, it was recovered by an act of the whole nation reasoning for three years on its situation, and then rescuing itself by a settled sense of right pervading the land. The meeting of the delegates at Dungannon was an original measure; and, like all of that kind, continued to be matter of surprise, until at last it became matter of admiration. Great measures, such as the meeting of the English at Bunty's Mead, and of the Irish at Dungannon, were not the consequences of precedent, but carried in themselves both precedent and principle; and the public cause in both instances would infallibly have been lost had it been trusted to parliament. The meeting at Dungannon had resolved, that the claim of the British parliament was illegal; and this was a constitutional declaration. The Irish volunteers were associated for the preservation of the laws, but the conduct of the British parliament subverted all law. England, however, had no reason to fear the Irish volunteers; they would sacrifice their lives in her cause. The two nations formed a general confederacy. The perpetual annexation of the crown was a greater bond, but magna charta was a greater. It would be easy for Ireland to find a king; but it would be impossible to find a nation who would communicate to them such a charter as magna charta: and it was this which made their natural connexion with England. The Irish nation were too high in pride, character, and power, to suffer any other nation to make their laws. England had indeed brought forward the question, not only by making laws for Ireland the preceding session, but by enabling his majesty to repeal all the laws which England had made for America. Had she consented to repeal the declaratory law against America? and would she refuse to repeal that against Ireland? The Irish nation were incapable of submitting to such a distinction.

It is agreed to.

Mr. Grattan now found his eloquence much more powerful than formerly. The motion which, during this very session, had been rejected by a great majority, was now agreed to after a short debate, and the address to his majesty prepared accordingly. In this, after thanking his majesty for his gracious message, and declaring their attachment to his person and government, they assured him, that the subjects of Ireland are a free people; that the crown of Ireland is an imperial crown, inseparably annexed to that of Britain, on which connection the interests and happiness of both nations essentially depend; but the kingdom of Ireland is distinct, with a parliament of its own: that there is no body of men competent to make laws to bind Ireland, except the king, lords, and commons thereof, nor any other parliament that hath any power or authority of any sort whatsoever, in this country, except the parliament of Ireland. They assured his majesty, that they humbly conceive, that in this right the very essence of their liberties did exist; a right which they, as the part of all Ireland, do claim as their birthright, and which they cannot yield but with their lives. They assured his majesty, that they had seen with concern certain claims advanced by the parliament of Great Britain, in an act intituled, "For the better securing the dependency of Ireland;" an act containing matter entirely irreconcilable to the fundamental rights of the nation. They informed his majesty, that they conceived this act, and the claims it advanced, to be the great and principal cause of the discontents and jealousies in the kingdom. They assured him that his commons did most sincerely wish, that all the bills, which become law in Ireland, should receive the approbation of his majesty under the seal of Great Britain; but yet, that they conceived the practice of suppressing their bills in the council of Ireland, or altering them anywhere, to be another just cause of discontent and jealousy. They further assured his majesty, that an act intituled, "For the better accommodation of his majesty's forces," being unlimited in duration, and defective in some other circumstances, was another just cause of jealousy and discontent. These, the principal causes of jealousies and discontent in the kingdom, they had submitted to his majesty, in humble expectation of redress: and they concluded with an assurance, that they were more confident in the hope of obtaining redress, as the people of Ireland had been, and were, not more disposed to share the freedom of England, than to support her in her difficulties, and to share her fate.

To this remarkable address a most gracious answer was given. In a few days the lord-lieutenant made a zately response to both houses; in which he informed them, that, by the magnanimity of the king, and wisdom of the British parliament, he was enabled to assure them, that immediate attention had been paid to their representations, and that the legislature of Britain had concurred in a resolution to remove the causes of their discontent, and were united in a desire to gratify every wish expressed in the late address to the throne; and that, in the mean time, his majesty was graciously disposed to give his royal assent to acts to prevent the suppressing of bills in the Irish privy-council, and to limit the mutiny-bill to the term of two years.

The joy which now diffused itself was more the joy of the Irish. The warmest addresses were presented not only to his majesty but to the lord-lieutenant. The commons instantly voted 100,000l. to his majesty, to enable him to raise 20,000 men for the navy; and soon after, 5000 men were likewise voted from the Irish establishment. The volunteers became in a peculiar manner the objects of gratitude and universal panegyric; but none was placed in so conspicuous a position as the king's.
Ireland.

114
Mr Grattan rewarded.

115
Jealousies began to revive.

116

Ireland.

Some time after the above transaction, the commercial propositions of Mr Pitt were rejected by both houses of the Irish parliament; and in the latter end of the year 1788, very warm debates took place on the regency bill; but the sudden and unexpected recovery of his majesty put a period to this political contest. The question respecting the emancipation of the Roman Catholics was much agitated about this period, and the ministry rendered themselves still more popular by appointing Earl Fitzwilliam to succeed the marquis of Buckingham as lord-lieutenant of Ireland. It is to be presumed, however, that the joy of the people on this occasion chiefly originated from the hope, that the bill for the Catholic emancipation, brought in by Mr Grattan on the 12th of February 1795, and another on the 14th of the same month, for the diminution of the national expenditure, would be allowed to pass. The Bill in question, however, seemed to reprobate these measures, of the Catholics rejected.

114

An English law was passed, permitting importation from one of the West India islands to all his majesty's dominions; and of course including Ireland, though the trade of the latter had already been declared absolutely free. This was looked upon in a very unfavourable light. Great offence was also taken at a member of the English house of lords for a speech in parliament, in which he asserted, that Great Britain had a right to bind Ireland in matters of external nature; and proposed to bring in a bill for that purpose. The public discontent was also greatly inflamed by some circumstances relating to this bill, which were particularly obnoxious. Lord Beauchamp, in a letter addressed to one of the volunteer corps, was at pains to show that the security of the legislative privileges obtained from the parliament of Britain was insufficient. The lawyers corps, also, who took the question into consideration, were of the same opinion; but the circumstance which gave the greatest offence was, that the chief justice in the English court of king's bench gave judgment in an Irish cause directly contrary to a law which had limited all such judgments to the first of June. All these reasons of discontent, however, were removed on the death of the marquis of Rockingham, and the appointment of the new ministry who succeeded him. Lord Temple came over to Ireland, and his brother and secretary Mr Grenville went to England, where he made such representations of the discontent which prevailed concerning the insufficiency of the declaratory act, that Mr Townshend, one of the secretaries of state, moved in the house of commons for leave to bring in a bill to remove from the minds of the people of Ireland all doubts respecting their legislative and judicial privileges. This bill contained, in the fullest and most express terms, a relinquishment on the part of the British legislature of all claims of a right to interfere with the judgment of the Irish courts, or to make laws to bind Ireland in time to come. Thus the contest was at last ended; and ever since this kingdom has continued to flourish, and to enjoy the blessings of tranquility and peace, free from every kind of restriction either on its commerce or manufactures, till the commencement of the rebellion in 1798.

115

French at

116

It was no doubt a fortunate circumstance for Britain, yet the internal anarchy and confusion of Ireland were still rapidly gaining ground. The members of the society of United Irishmen, instituted in the year 1791, professed to have no other objects in view than a reform in parliament, and that the people of every religious profession should enjoy an equality of civil rights; but it was afterwards undeniably proved, that they anxiously wished to bring about a revolution, and establish a republican government, similar to that which then deluged France with blood. The members swore "to obtain a complete reform in the legislature, on the principles of civil, political, and religious liberty; and never to inform, or give evidence, in any court, against any member of that or similar societies." So Origin of the rebellion, the rebellion was only suggested by these plausible objects, that their numbers increased with astonishing rapidity, and their divisions and subdivisions were soon extended all over the kingdom. Many loyal subjects, afraid of the extension of Roman Catholic privileges, also formed associations under the title of Orangemen, in order to deprive Papists of arms; and they in their turn assumed the name of defenders: in consequence of which the most terrible outrages were committed on both sides. The United Irishmen still continued the most numerous; but the first
IRELAND.

Ireland. First direct communication between them and the French directory took place in 1795 through the medium of one Mr Lewins; and in the following year the invasion, already mentioned, was concerted on the frontiers of France, between Lord Fitzgerald, Arthur O'Connor, and General Hoche, the failure of which did not seem to intimidate the rebels. Arms continued to be distributed with secrecy among the members, and a correspondence with the French directory was still preserved.

As proceedings of such a nature were justly alarming to the British government, the Insurrection Act was passed in March 1796, by which magistrates were authorized to place the people under martial law; a measure no doubt justifiable from the alarming nature of the times; but it certainly had the effect of increasing the discontented, and was also productive of numerous acts of oppression. Yet such as were connected with the United Irishmen were guilty of actions equally atrocious. So fully convinced were they of ultimate success, that in December 1797 an executive directory was nominated for the government of the Irish republic, consisting of Lord Edward Fitzgerald, Mr A. O'Connor, Mr. Oliver Bond, Dr M'Niven, and Connellor Emmet. With such consummate art as their conspiracy planned, and with such profound secrecy was it conducted, that there is great reason to believe it might have been carried into effect; had not Mr Reynolds made a discovery in March 1798, which led to the apprehension of the principal ringleaders, and Fitzgerald received a mortal wound while resisting the officers. This reverse of fortune did not prevent the nomination of another directory; but its fate was similar to the former, and information was given against them by a Captain Armstrong, who had entered into their society for the purpose of betraying them. John and Henry Sheares, two of the directors, were apprehended on the 21st of May 1798; Mr Neilson and a number more of the same description on the 23rd, and the metropolis was declared in a state of insurrection. The guards were made three times stronger than before; and the whole city might be considered as forming but one garrison. Dublin was thus delivered from the dreadful havoc and devastation premeditated by the rebels; but in the provinces of Leinster and Connaught, as well as in various other places, they appeared in formidable bodies, intercepted the mail coaches, and thus gave the signal for a general insurrection.

In their attack upon the town of Naas, on the 24th of May, they experienced a signal defeat from Lord Gosford at the head of the Armagh militia, and left 400 men dead on the field. General Dundas defeated a considerable body of the rebels near Killculen, and on the 25th Lord Roden VANQUISHED ANOTHER BODY OF THEM ABOUT 400 strong, the leaders of whom were taken and executed. On the 26th they shared the same fate at Tallagh hill, when 350 of them were slain. They attacked the town of Carlow to the number of 1000, where they were defeated with the loss of 400 men; but as the inhabitants fired upon the king's troops, one half of the town was burnt in revenge. The rebels made an attack upon Kildare on the 29th, but the gallant conduct of Sir J. Duff and the troops under his command, made them soon retire with the loss of 300 men. In Wicklow and Wexford, however, the rebellion raged with the most dreadful fury; in the latter of which they were computed to have 15,000 men on the 23rd of May, when they surrounded and cut to pieces the North York militia at Oulard, commanded by Colonel Foot and Major Lombard. They attacked and carried the town of Ennisinorthy, but with the loss of 400 men, and a party of the Meath militia fell into their hands on the 29th. The town of Wexford surrendered to them next day, when Harvey, Fitzgerald, and Colclough, who had been made prisoners on the 26th for treason, were instantly set at liberty, and Harvey was appointed their commander-in-chief. Having left a garrison in the town, the rebel commander marched on the 5th of June to attack New Ross, where Major-general Johnston obstinately defended the town for several hours, and at last forced the enemy to retreat with considerable loss. This defeat so exasperated the rebels, that they butchered 105 royalists whom they found in the jail of Wexford. Their attempt upon Gorey was ineffectual, as well as that upon Newton Barry on the third of June, where Colonel Lestrangé defeated them with the loss of 300 men killed in the action. On the following day, however, the tide of fortune seemed to turn in their favour near Slievenabe mountain, where the royal forces under Colonel Walpole were defeated with the loss of 54 men, and the commander himself was slain in the action. Encouraged by this success, they resolved to make an attack upon Arklow; but the grape-shot of General Needham made terrible havoc among them; yet their strong position near Vinegar hill was still maintained by their main body, from which it was found impracticable to dislodge them before the 21st, when they were nearly surrounded by General Lake, with his troops in five columns, led into action by Generals Dundas, Johnson, Eustace, Duff, and Loftus. The carnage was terrible, as the rebels defended themselves with great obstinacy for an hour and a half, and lost 13 pieces of cannon. The town of Wexford surrendered next day, and on the 26th Harvey and Colclough were apprehended on one of the Saltee islands, who were tried and executed, together with Keogh, the rebel governor of Wexford.

The details of carnage and bloodshed are by no means agreeable to the feelings of humanity, yet a regard to historical truth obliges us to give them, as concise a manner as we possibly can. The rebels gained possession of Antrim about the 7th of June, but were soon obliged to abandon it by the exertions of General Nugent. Still, however, a spirit of insurrection continued formidable in the counties of Antrim and Down; but the rebels were defeated on the 12th at Ballynahinch, where they lost upwards of 400 men, and the royal forces only 20 killed in wounded. Munro, their general, was taken prisoner and executed. It is to be lamented that both rebels and royalists seemed, during this unnatural contest, to be such utter strangers to every principle of humanity, that some have deemed it a very difficult matter to determine which party was the worst, although the bishop of Kilala, who suffered much for his attachment to government, gives it against the latter. This, however, was destined to be terminated in a very short time, for Marquis Cornwallis was now appointed lord-lieutenant of Ireland, and arrived in Dublin on the 10th of June. The
IRELAND.

The first measure, adopted by his excellency, soon after his arrival, had a more powerful effect in crushing the rebellion than all the rigorous measures formerly pursued. On the 7th of July he made an offer of his majesty's pardon to all who should surrender before a certain day. The consequence of this proclamation was, that numbers returned to their allegiance, and delivered up all the arms in their possession. Some, however, of the most notorious offenders were tried by a special commission, condemned, and executed, such as J. and H. Sheares, McCann, Byrne, and others. Mr Oliver Bond, who was condemned on the 23d of July, had powerful interest made for him in order to save his life on account of his respectable connexions. The sentence of death was to be changed into banishment, on condition he would tell all he knew respecting the rebellion. He was accordingly pardoned, but his death happened soon after. Some of the most desperate of the rebels still continued to lurk about the mountains of Wicklow and Wexford, notwithstanding the proclamation of the amnesty, but these were gradually reduced.

It was the general opinion about this time, that the rebellion was completely ended, when the people were suddenly and unexpectedly alarmed by the landing of a body of French troops under General Humbert. This happened at Killala, on the 22d of August 1798. Their number was at first very much exaggerated, Lord Cornwallis designed to march against them in person at the head of the army. In the mean time Humbert marched on towards Castlebar, where he engaged the British forces under General Lake, obliging them to retreat with the loss of six pieces of cannon, and a considerable number of men. Lord Cornwallis came up with the French near Castlebar, and forced them to retreat; and General Humbert having been joined by a number of the rebels, he made a circuitous march in order to favour their escape, in consequence of which the greater part of them got away in safety. Ninety-three of them and three of their generals were taken prisoners. The French having surrendered, the public were astonished to find that this tremendous army amounted to no more than 844 men.

On the 16th of September a French brig made its appearance off the island of Rutland, on the north-west coast of Donegal, where the crew landed, together with General Rey and the celebrated Napper Tandy, sustaining the rank of a French general of brigade. On inquiring after Humbert, they seemed astonished at being informed that he and his men were prisoners. In the end of September a ship of the line and eight frigates, with troops and ammunition for Ireland, sailed from Brest harbour; but the coast was too well defended by the squadron under the command of Sir J. B. Warren, for such an armament to be successful. The ship of the line, called the Hoche, struck after a gallant defence; and the whole squadron was captured, with the exception of two frigates. This defeat was a death-blow to the hopes of the French as well as to the Irish rebels. The celebrated Theobald Wolfe Tone was found among the prisoners on the Hoche, who was considered as the ablest man at Paris from Ireland, in respect of negociating. He was tried by a court martial at Dublin, where it was allowed that he made a very manly defence, neither denying nor excusing his crime, but resting the merit of his plea on the idea of his being, as he thought, a citizen of France, and an officer in the service of that country. His arguments, however, were ineffectual, and the court would not even grant his request to be shot rather than hanged, in consequence of which he committed suicide in prison. The spirit of rebellion might be said to die with this wonderful man; for the few rebels who still continued with General Holt, the last of the rebel chiefs, gradually laid down their arms, as did Holt himself, who was banished for life.

At the termination of this horrible contest, it was computed that not fewer than 30,000 persons lost their lives, independent of many thousands who were wounded or transported.

The only remaining event of any importance connected with the history of this country, is its union with Great Britain. This event had been long in contemplation, but it was first announced in the British house of commons on the 22d of January 1799, by a message from his majesty, conceived in these words: "George R. His majesty is persuaded, that the unremitting industry with which our enemies persevere in their avaricious design of effecting the separation of Ireland from this country, cannot fail to engage the particular attention of parliament; and his majesty recommends it to this house, to consider of the most effectual means of finally defeating this design, by disposing the parliaments of both kingdoms, to provide in the manner they shall judge most expedient, for settling such a complete and final adjustment, as may best tend to improve and perpetuate a connection essential for their common security, and consolidate the strength, power, and resources of the British empire." On the 31st the measure was taken into consideration, when Mr Pitt moved seven resolutions as the basis of it, which were opposed by Mr Sheridan, who gave it as his decided opinion, that the fair and free approbation of parliament could never be ascertained, while any of its members were under government influence, on which account he opposed the union; as did also Messrs Grey, Tierney, Jones, Sir F. Burdett, General Fitzpatrick, Dr Lawrence and others. It also met with considerable opposition in the house of peers, and in the Irish parliament the opposition was formidable. In the address to his majesty, the paragraph recommending an union was voted to be expunged, by a majority of 11 against 106, in consequence of which the city of Dublin was twice illuminated. In the house of peers, however, a majority appeared in favour of the union; and when it was introduced in form by a message from the lord-lieutenant, it was carried in favour of the union, after a long and interesting debate, by a majority of 162 against 115. The articles of the intended union were transmitted to England by the lord-lieutenant; they were again submitted to the British parliament on the 2d of April; on the 2d of July the bill received the royal assent, and the union took place on the 1st of January 1801.

In consequence of this union, which we trust will prove an unpeachable blessing to both countries, the Irish are to have a share of all the commerce of Great Britain, with the exception of such parts of it as belong to chartered companies, and consequently not free to the inhabitants of the British empire indiscriminately.
IRELAND.

We may form some idea of what the trade of Ireland must have been in former times, when, so late as the reign of Brian Boru, who died in 1014, notwithstanding the ravages and distresses which a Danish war, of above 200 years continuance, must have produced throughout the kingdom, the annual duties arising from goods imported into the single port of Limerick, and paid in red wine, amounted to 355 pipes! Even so lately as the last century, it is scarcely credible what riches this city derived from the bare manufacture of shoes, which were exported in amazing quantities; whereas now, instead of shoes and boots, we see the raw hides shipped off for foreign markets.

No country in the world seems better situated for a maritime power than Ireland, where the ports are convenient to every nation in Europe, and the havens safe and commodious. The great plenty of timber, the superior excellence of the oak, and the acknowledged skill of her ancient artificers in wood-works, are circumstances clearly in her favour. That the Irish formerly exported large quantities of timber, is manifest from the churches of Gloucester, Westminster monastery and palace, &c. being covered with Irish oak.

The government of the kingdom is in the bands of Government, a viceroy, or lord-lieutenant, who lives in very great state, his excellencies, generally three in number, viz. lord primates, lord high chancellor, and, before the union, the speaker of the house of commons. The parliament of Ireland, while it existed, was regulated in the same way as the British parliament.

Ireland is divided into four large provinces, and those again into 32 counties, as follows:

An account of the actual population of Ireland, drawn from a survey by government, is a great desideratum in the statistics of the country. But it is likely to be soon supplied, as it is understood that the census now taking in Great Britain (1821) is to be extended to the sister country. The following table shows with what rapidity the numbers of the people have increased within the last 50 years.

</table>

It is believed, on good grounds, that the population at present is not less than 5,500,000.

It has been frequently observed by the most celebrated writers on political arithmetic, that plenty of food, frequency of marriage, a salubrious climate, a mild and equitable government, and an increased demand for labour, are the never failing criteria of an increasing population in any country whatever. The three first of these have contributed in a very powerful manner to increase the population of Ireland in the 18th century. The climate of that country has changed for the better in a most astonishing degree since the middle of the 17th century, and the extensive forests with which it once abounded, no longer exist, to obstruct the circulation of a free current of air.

The agriculture of Ireland is, generally speaking, in a very backward state. With a few exceptions, the farmers are destitute of capital, and labour small crofts which they hold of middle-men interposed between them and the landlord. The leases are generally of long continuance; three lives, or 31 years, is a common period. In a very great proportion of the country the lands are cultivated with the spade. The capital laid out in the improvement of the soil is extremely small.

In 1799, Mr Young calculated, that converting Irish acres into English, it would require an outlay of 51. an acre to place Ireland on a footing with England in this respect, or an outlay of 88,341,136 l. for the whole country. From the change in the value of money, Mr Wakefield has since calculated that the sum for this purpose would be 120,000,000 l. independently altogether of the capital which the British agriculturist brings to his farm in order to carry on the cultivation of the land. Notwithstanding this disadvantage the rent of land in Ireland is very high. Mr Wakefield estimates he average rent of all the lands in the island at 17s. per English acre, and the total rental of the country at 17,228,540l. in Irish money. When it is considered how little capital is thus sunk in the Irish soil, and recollected that the average rent of England is only 20s. an acre, even under the superior mode of cultivation which is there pursued, it is obvious how much the proportion of the produce of the soil which goes to the landlord has encroached on what should be left as a remuneration to the farmer.

The manufactures of Ireland are now very considerable, particularly the linen manufacture. It enhances the value of this branch of industry to the Irish people, that the raw material used is almost entirely raised within the country. In 1810, the number of acres under flax was little short of 100,000; which, at 30 stone an acre, and 10s. 6d. the stone, will give an annual produce worth 1,500,000l. The flax is still spun chiefly by the hand, though machinery has been partially introduced. The average earnings of a linen weaver may be estimated at 7s. per week. The annual export of linen at different periods was as follows.

Of this quantity, it is computed that upwards of 2,000,000l. comes to Great Britain.

The cotton manufacture has been established in Ireland, but has made much less progress than in England and Scotland. The import of cotton wool in 1810 consisted of 32,257 cwt. and of cotton yarn 1,557,115 lbs. The official value of the cotton goods exported in 1820, was only 54,777l.

The woollen manufacture was long depressed by the jealousy of England, and exists only to a very considerable extent. The woollen goods made are chiefly coarse fabrics for domestic use.

The distilleries of Ireland are very extensive; but the quantity of spirits made at the unlicensed stills is, in all probability, much greater. The quantity of corn spirits which paid duty in Ireland was,

The revenue of Ireland is principally derived from customs, excise, stamps, and post duties; and from assessed taxes on hearths, windows, houses, carriages, servants, and horses. The net revenue of Ireland in 1791 was 1,184,684l. In 1800, it was 2,825,536l., and in 1815, it was 5,325,699l.

According to Young, Newenham, and others, the soil in point of fertility even surpasses that of England; it contains not such a large proportion of waste land, and many extensive tracts of the productive soil seem to be wholly unvalued in respect of fertility. For an ample detail of the uncommon richness and fertility of the soil of Ireland in general, we refer our readers to the instructive Tour of Mr. A. Young, which contains many experiments made by himself on the soils of different counties.

What a valuable acquisition to the British empire, of which it now happily forms a constituent part, since it can augment the military strength of the whole in a very powerful manner, and make such respectable additions to the British revenue as cannot fail to result from its flourishing commerce. Ireland in a state of enmity against Britain, both weakened the latter, and rendered herself vulnerable in a high degree; but since both are happily united, and have only one common interest, we trust that the most daring enemy shall ever find them invulnerable.

Beauty seems to be more diffused in England, among the lower ranks of life, than in Ireland; which may, however, be attributed to the modes of living. In England, the meanest cottager is better fed, better lodged, and better dressed, than the most opulent farmers here, who, unaccustomed to what our peasants reckon the comforts of life, know no luxury but in deep potatoes of aquavitae.

From this circumstance, we may account for a fact reported by the officers of the army here. They say, that the young fellows of Ireland, who offer to enlist, are more generally below the given height than in England. There can be no appeal from their testimony; for they were Irish, and the standard is an infallible test. No reason, indeed, can be given why the causes which promote or prevent the growth of other animals, should not have similar effects upon the human species. In England, where there is no stint of provisions, the growth is not checked; but, on the contrary, it is extended to the utmost bound of nature's original intention; whereas, in Ireland, where food is neither in the same quantity nor of the same quality, the body cannot expand itself, but is dwarfed and stunted in its dimensions. The gentlemen of Ireland are full as tall as those of England: the difference, then, between them and the commonalty, can only proceed from the difference of food.

The inhabitants, in general, of this kingdom are very far from, what they have too often and unjustly been represented by those of our country who never saw them, a nation of wild Irish. Miserable and oppressed, as by far too many of them are, an Englishman will find as much civility in general, as amongst the same class in his own country; and, for a small pecuniary consideration, they will exert themselves to please you as much as any people perhaps in the king's dominions. Poverty and oppression will naturally make mankind sour, rude, and unsociable; and eradicate, or at least suppress, all the more amiable principles and passions of humanity. But it should seem unfair and ungenerous to judge of, or decide against, the natural disposition of a man reduced by indigence and oppression almost to desperation. Let commerce, agriculture, and arts, but call forth the dormant activity of their genius, and rouse the native spirit of enterprise, which now lies torpid within them; let liberal laws unfetter their minds, and plentifully cheer their tables; they will soon shew themselves deserving to rank with the most respectable societies in Europe.

"The lower Irish, (says Carr,) are remarkable for their ingenuity and docility, and a quick conception; in these properties they are equalled only by the Russians. It is curious to see with what scanty materials they will work; they build their own cabins, make bridles, stirrups, cruppers, and ropes for every rustic purpose, of hay; and British adjutants allow that Irish recruits are sooner made soldiers of than English ones."

That the Irish are not naturally lazy, is evident from the quantity of laborious work which they will perform, when they have much to do, which is not frequently the case in their own country, and are adequately paid for, so as to enable them to get proper food to support severe toil. Upon this principle, in England, an Irish labourer is always preferred.

The handsomest peasants in Ireland are the natives of Kilkenny and the neighbourhood; and the most wretched and squalid near Cork and Waterford, and in Munster and Connacht. In the county of Roscommon the male and female peasantry and horses are handsome, the former are fair and tall, and possess great flexibility of muscle: the men are the best leapers in Ireland: the finest hunters and most expert huntsmen are to be found in the fine sporting county of Fermanagh. In the county of Meath the peasants are very heavily limbed. In the county of Kerry, and along the western shore, the peasants very much resemble the Spaniards in expression of countenance, and colour of hair.

The instruction of the common people is in the lowest state of degradation. In the summer a wretched uncharacterized itinerant derives a scanty and precarious existence by wandering from parish to parish, and opening a school in some ditch covered with heath, and furze, to which the inhabitants send their children to be instructed by the miserable breadless being, who is nearly as ignorant as themselves; and in the winter these pedagogue pedlars go from door to door offering their services, and pick up just sufficient to prevent themselves from perishing by famine. What proportion of morals and learning can flow from such a source into the mind of the ragged young pupil, can easily be imagined, but cannot be reflected upon without serious concern.
IRELAND.

IRELAND. (续)

IRENÆUS, St., a bishop of Lyons, was born in Greece about the year 120. He was the disciple of Pappias and St. Polycarp, by whom, it is said, he was sent into Gaul in 157. He lived at Lyons, where he performed the office of a priest; and in 178 was sent to Rome, where he disputed with Valentinus, and his two disciples Florinus and Blatus. At his return to Lyons, he succeeded Photinus, bishop of that city; and suffered martyrdom in 202, under the reign of Severus. He wrote many books in Greek, of which there only remains a barbarous Latin version of his five books against heretics, some Greek fragments in different authors, and Pope Victor’s letter mentioned by Eusebius. The best editions of his works are those of Erasmus, in 1526; of Grabe, in 1702; and of Father Massuet, in 1710.

He ought not to be confounded with St. Irenæus the deacon, who in 275 suffered martyrdom in Tuscany, under the reign of Aurelian; nor with St. Irenæus, bishop of Sirmich, who suffered martyrdom on the 25th of March 304, during the persecution of Diocletian and Maximianus.

IRENE, empress of the east, celebrated for her valour, wit, and beauty; but detestable for her cruelty, having sacrificed her own son to the ambition of reigning alone. She died in 803.

IRESINE, a genus of plants belonging to the dicoty class, and in the natural method ranking under the 54th order, Miscellaneous. See Botany Index.

IRIDIUM, a metal obtained from crude platinia. See Chemistry, No. 2155, p. 699.

IRENUS, a bishop born at Lyons, about the year 120. He was the disciple of Pappias and St. Polycarp. He was sent into Gaul in 157, where he lived and afterwards returned to Rome, where he disputed with Valentinus, and his two disciples Florinus and Blatus. At his return to Lyons, he succeeded Photinus, bishop of that city; and suffered martyrdom in 202, under the reign of Severus. He wrote many books in Greek, of which there only remains a barbarous Latin version of his five books against heretics, some Greek fragments in different authors, and Pope Victor’s letter mentioned by Eusebius. The best editions of his works are those of Erasmus, in 1526; of Grabe, in 1702; and of Father Massuet, in 1710.

He ought not to be confounded with St. Irenæus the deacon, who in 275 suffered martyrdom in Tuscany, under the reign of Aurelian; nor with St. Irenæus, bishop of Sirmich, who suffered martyrdom on the 25th of March 304, during the persecution of Diocletian and Maximianus.

IRENE, empress of the east, celebrated for her valour, wit, and beauty; but detestable for her cruelty, having sacrificed her own son to the ambition of reigning alone. She died in 803.

IRESINE, a genus of plants belonging to the dicoty class, and in the natural method ranking under the 54th order, Miscellaneous. See Botany Index.

IRIDIUM, a metal obtained from crude platinia. See Chemistry, No. 2155, p. 699.

IRON, one of the metals, and one of the hardest and most useful, as well as the most abundant. See Chemistry and Mineralogy Index.

Iron-making, the art of extracting iron from the ore. See Supplement.

Iron-Moutah, and spots of ink in linen, may be taken out by moistening the stained part in a solution of oxalic acid in distilled water, and then washing it out in pure water.

Iron-Sick, in the sea-language, is said of a ship or boat.
Irritability.

Iron-sick

Iron-wood, in Botany. See Sideroxylon, Botany Index.

Iron-wort, in Botany. See Sideritis, Botany Index.

Irony, in Rhetoric, is when a person speaks contrary to his thoughts, in order to add force to his discourse; whence Quintilian calls it diversitioqueuis.

Thus, when a notorious villain is scornfully complimented with the title of a very honest and excellent person; the character of the person commended, the air of contempt that appears in the speaker, and the exorbitancy of the commendations, sufficiently discover the dissimulation of irony.

Ironic exhortation is a very agreeable kind of trope; which, after having set the inconveniences of a thing in the clearest light, concludes with a feigned encouragement to pursue it. Such is that of Horace, when, having beautifully described the noise and tumults of Rome, he adds ironically,

Go now, and study tuneful verse at Rome!

Iroquois, the name of five nations in North America. They occupied an extensive tract of country near Lake Ontario, and make a considerable figure in the early history of British America. They are now greatly reduced.

Irradiation, the act of emitting subtle effluvia, like the rays of the sun, every way. See Exuvia.

Irregular, something that deviates from the common forms or rules; thus, we say an irregular fortification, an irregular building, an irregular figure, &c.

Irregular, in Grammar, such inflections of words as vary from the general rules; thus we say, irregular nouns, irregular verbs, &c.

The distinction of irregular nouns, according to Mr Ruddiman, is into three kinds, viz. variable, defective, and abundant; and that of irregular verbs into anomalous, defective, and abundant.

Irritability, in Anatomy and Medicine, a term first invented by Glisson, and adopted by Dr Haller to denote an essential property of all animal bodies; and which, he says, exists independently of and in contradistinction to sensibility. This ingenious author calls that part of the human body irritable, which becomes shorter upon being touched; very irritable, if it contracts upon a slight touch; and the contrary, if by a violent touch it contracts but little. He calls that a sensible part of the human body, which upon being touched transmits the impression of it to the soul: and in brutes, he calls those parts sensible, the irritation of which occasions evident signs of pain and disquiet in the animal. On the contrary, he calls that insensible, which being burnt, tore, pricked, or cut till it is quite destroyed, occasions no sign of pain nor convulsion, nor any sort of change in the situation of the body. From the result of many cruel experiments he concludes, that the epidermis is insensible; that the skin is sensible in a greater degree than any other part of the body; that the fat and cellular membrane are insensible; and the muscular flesh sensible, the sensibility of which he ascribes rather to the nerves than to the flesh itself. The tendons, he says, having no nerves distributed to them, are insensible. The ligaments and capsule of the articulations are also concluded to be insensible; whence Dr Haller infers, that the sharp pains of the gut are not seated in the capsule of the joint, but in the skin, and in the nerves which creep upon its external surface. The bones are all insensible, says Dr Haller, except the teeth; and likewise the marrow. Under his experiments the periosteum and pericranium, the dura and pia mater, appeared insensible; and he infers, that the sensibility of the nerves is owing to the medulla, and not to the membranes. The arteries and veins are held susceptible of little or no sensation, except the carotid, the lingual, temporal, pharyngeal, labial, thyroidal, and the aorta near the heart; the sensibility of which is ascribed to the nerves that accompany them. Sensibility is allowed to the internal membranes of the stomach, intestines, bladder, ureters, vagina, and womb, on account of their being of the same nature with the skin; the heart is also admitted to be sensible: but the lungs, liver, spleen, and kidneys, are possessed of a very imperfect, if any, sensation. The glands, having few nerves, are endowed with only an obtuse sensation. Some sensibility is allowed to the tunic choroidis and the iris, though in a less degree than the retina; but none to the cornea. Dr Haller concludes, in general, that the nerves alone are sensible of themselves; and that, in proportion to the number of nerves apparently distributed to particular parts, such parts possess a greater or less degree of sensibility.

Irritability, he says, is so different from sensibility, that the most irritable parts are not at all sensible, and vice versa. He alleges facts to prove this position, and also to demonstrate, that irritability does not depend upon the nerves, which are not irritable, but upon the original formation of the parts which are susceptible of it. Irritability, he says, is not proportioned to sensibility; in proof of which, he observes, that the intestines, though rather less sensible than the stomach, are more irritable; and that the heart is very irritable, though it has but a small degree of sensibility.

Irritability, according to Dr Haller, is the distinguishing characteristic between the muscular and cellular fibres; whence he determines the ligaments, periosteum, meninges of the brain, and all the membranes composed of the cellular substance, to be void of irritability. The tendons are irritable; and though he does not absolutely deny irritability to the arteries, yet his experiments on the aorta produced no contraction. The veins and excretory ducts are in a small degree irritable, and the gall-bladder, the ductus choledochus, the ureters and urethra, are only affected by a very acrid corrosive; but the lacteal vessels are considerably irritable. The glands and mucous sinuses, the uterus in quadrupeds, the human matrix, and the genitals, are all irritable; as are also the muscles, particularly the diaphragm. The oesophagus, stomach, and intestines, are irritable: but of all the animal organs the heart is endowed with the greatest irritability. In general, there is nothing irritable in the animal body but the muscular fibres: and the vital parts are the most irritable. This power of motion, arising from irritations, is supposed
ISA

Irresistibility is different from all other properties of bodies, and probably resides in the glutinous mucus of the muscular fibres, altogether independent of the influence of the soul. The irritability of the muscles is said to be destroyed by drying the fibres, congealing of the fat, and more especially by the use of opium in living animals. The physiological system, of which an abstract has been now given, has been adopted and confirmed by Castelli and Zimmermann, and also by Dr Brocklesby, who suggests, that irritability, as distinguished from sensibility, may depend upon a series of nerves different from such as serve either for voluntary motion or sensation. This doctrine, however, has been controverted by M. le Cat, and particularly by Dr Wilytt in his Physiological Essays. See also Anatomy, No 86, et seq., and No 136.

RROGATRIO, a law term amongst the Romans, signifying the instrument in which were put down the punishments which the law provided against such offences as any person was accused of by a magistrate before the people. These punishments were first proclaimed viva voce by the accuser, and this was called Inquisitio: The same, being immediately after expressed in writing, took the name of Rogatio, in respect of the people, who were to be consulted or asked about it, and was called Irrogratio in respect of the criminal, as it imported the mulct or punishment assigned him by the accuser.

IRROMANGO, or ERRROMANGO, one of the New Hebrides islands, is about 24 or 25 leagues in circuit; the middle of it lies in E. Long. 169° 19' 8 Lat. 18° 54'. The inhabitants are of the middle size, and have a good shape and tolerable features. Their colour is very dark; and they paint their faces, some with black, and others with red pigment; their hair is curly and crisp, and somewhat woolly. Few women were seen, and those very ugly: they wore a petticoat made of the leaves of some plant. The men were quite naked, excepting a belt tied about the waist, and a piece of cloth, or a leaf, used for a wrapper. No canoes were seen in any part of the island. They live in houses covered with thatch: and their plantations are laid out by line, and fenced round. An unlucky scuffle between the British sailors and these people, in which four of the latter were desperately wounded, prevented Captain Cook from being able to give any particular information concerning the produce, &c. of this island.

IIRITS, a large river of Asia, in Siberia, which rises among the hills of the country of the Kalmucks, and, running north-east, falls into the Oby near Tobolsk. It abounds with fish, particularly sturgeon, and delicate salmon.

IRVINE, a sea-port and borough town of Scotland, in the bailiwick of Cunningham, and county of Ayr; seated at the month of a river of the same name on the frith of Clyde, in W. Long. 2° 55' N. Lat. 55° 36'. This port has formerly several busses in the herrings-fishery. A number of vessels is employed in the coal trade to Ireland, and also in the Baltic and carrying trade. Ship-building and rope-making are carried on to a considerable extent at Irvine. The population in 1811 was estimated at 5752, of which nearly 4200 were employed in trade and manufactures.

ISAAC, the Jewish patriarch, and example of filial obedience, died 1716 B.C. aged 185.

ISAUS, a Greek orator, born at Colchis, in Syria, was the disciple of Lysias, and the master of Demosthenes; and taught eloquence at Athens, about 344 years B.C. Sixty-four orations are attributed to him; but he composed no more than 50, of which only 10 are now remaining. He took Lysias as his model, and so well imitated his style and elegance, that we might easily confound the one with the other, were it not for the figures which Isaeus first introduced into frequent use. He was also the first who applied eloquence to politics, in which he was followed by his disciple Demosthenes.

He ought not to be confounded with Isaeus, another celebrated orator, who lived at Rome in the time of Piny the younger, about the year 97.

ISAIAH, or the Prophecy of Isaiah, a canonical book of the Old Testament. Isaiah is the first of the four greater prophets; the other three being Jeremiah, Ezekiel, and Daniel. This prophet was of royal blood, his father Amos being brother to Azariah king of Judah. The first chapters of his prophecy relate to the reign of Uzziah; the vision in the sixth chapter happened in the time of Jotham: the next chapters, to the fifteenth, include his prophecies under the reign of Ahaz; and those that were made under the reigns of Hezekiah and Manasseh, are related in the next chapters to the end. Isaiah foretold the deliverance of the Jews from their captivity in Babylon by Cyrus, one hundred years before it came to pass. But the most remarkable of his predictions are those concerning the Messiah, which describe not only his descent, but all the remarkable circumstances of his life and death. The style of this prophet is noble, nervous, sublime, and florid, which he acquired by converse with men of the greatest abilities and eloquence: Grotius calls him the Demosthenes of the Hebrews. However, the profundities of his thoughts, the loftiness of his expressions and the extent of his prophecies, render him one of the most difficult of all the prophets; and the commentaries that have been hitherto written on his prophecy fall short of a full explication of it. Bishop Lowth's new translation, &c. published in 1778, throws considerable light on the composition and meaning of Isaiah.

ISATIS, Woad: a genus of plants belonging to the tetradynamia class; and in the natural method ranking under the 39th order, Siligiosae. One species of this plant, the tinctoria, yields a colouring matter. See Colour-Making and Dyeing Index.

ISATIS, in Zoology, a synonym of the canis lagopus. See Canis, Mammalia Index.

ISURA, or Isaurus, in Ancient Geography, a strong city at Mount Taurus, in Isauria, twice demolished; first by Perdiccas, or rather by the inhabitants, who, through despair, destroyed themselves by fire rather than fall into the hands of the enemy; again by Servilius, who thence took the surname Isauricus. Strabo says there were two Isaurias, the old and the new, but so near that other writers took them but for one.

ISURIA, a country touching Pamphylia and Cilicia on the north, rugged and mountainous, situated almost in Mount Taurus, and taking its name from Isaura; according to some, extending to the Mediterranean by a narrow slip. Stephanus, Ptolemy, and Zosimus, make
ISENHEIN, a town of the Netherlands, with the title of a principality, seated on the river Mander, in F. Long. 30. N. Lat. 52. 44.

ISERE, a department in the south-east of France, containing 3440 square miles, and 472,000 inhabitants. The southern part lies among the Alps, and is mountainous; the northern part is more level. The climate is cold. The produce consists chiefly of hemp, silk, corn, wine, oil; and the pastures are extensive. Grenoble is the chief town.

ISH, in Scots Law, signifies expiry. Thus we say "the isth of a lease." It signifies also to go out; thus we say "free isth and entry" from and to any place.

ISIA, Isis, feasts and sacrifices anciently solemnized in honour of the goddess Isis. The Isia were full of the most abominable impurities; and for that reason, those who were initiated into them were obliged to take an oath of secrecy. They held for nine days successively, but grew so scandalous, that the senate abolished them at Rome, under the consulate of Piso and Gabinius. They were re-established by Augustus, and the emperor Commodus himself assisted at them, appearing among the priests of that goddess with his head shaven, and carrying the Anubis.

ISIAC TABLE, is one of the most considerable monuments of antiquity, discovered at Rome in 1525, and supposed by the various figures in bas relief upon it, to represent the feasts of Isis, and other Egyptian deities. There have been various opinions as to the antiquity of this monument: some have supposed that it was engraved long before the time when the Egyptians worshipped the figures of men and women. Others, among whom is Bishop Warburton, apprehend, that it was made at Rome by persons attached to the worship of Isis. Dr Warburton considers it as one of the most modern of the Egyptian monuments, on account of the great mixture of hieroglyphic characters which it bears.

ISIACI, priests of the goddess Isis.—Dioscorides tells us, that they bore a branch of sea wormwood in their hands instead of olive. They sung the praises of the goddess twice a day, viz. at the rising of the sun, when they opened her temple; after which they begged alms the rest of the day, and returning at night, repeated their orisons, and shut up the temple.

Such were the life and office of the isiaici; they never covered their feet with anything but the thin bark of the plant papyrus, which occasioned Prudentius and others to say they went barefooted. They wore no garments but linen, because Isis was the first who taught mankind the culture of this commodity.

ISIDORUS, called DAMIANITUS, or PELUSIOTA, from his living in a solitude near that city, was one of the most famous of all St Chrysostom's disciples, and flourished in the time of the general council held in 421. We have 20 of his epistles in five books. They are short, but well written, in Greek. The best edition is that of Paris, in Greek and Latin, printed in 1638, in folio.

ISIGNI, a town of France, in Lower Normandy, with a small harbour, and well known on account of its salts works, its cyder, and its butter. W. Long. 0. 50. N. Lat. 49. 20.

ISINGLASS. See Ichthyocolla.

ISIS, a celebrated deity of the Egyptians, daughter...
ter of Saturn and Rhe, according to Dioscorus of Sicily. Some suppose her to be the same as Is, who was changed into a cow, and restored to her human form in Egypt, where she taught agriculture, and governed the people with mildness and equity, for which reasons she received divine honours after death. According to some traditions mentioned by Plutarch, Isis married her brother Osiris, and was pregnant by him even before she had left her mother’s womb. These two ancient deities, as some authors observe, comprehended all nature and all the gods of the heathens. Isis was the Venus of Cyprus, the Minerva of Athens, the Cybele of the Phrygians, the Ceres of Eleusis, the Proserpine of Sicily, the Diana of Crete, the Bel- lions of the Romans, &c. Osiris and Isis reigned conjointly in Egypt; but the rebellion of Typhon, the brother of Osiris, proved fatal to this sovereignty. The ox and the cow were the symbols of Osiris and Isis; because these deities, while on earth, had diligently applied themselves to cultivating the earth. As Isis was supposed to be the moon, as Osiris the sun, she was represented as holding a globe in her hand, with a vessel full of ears of corn. The Egyptians believed that the yearly and regular inundations of the Nile proceeded from the abundant tears which Isis shed for the loss of Osiris, whom Typhon had basely murdered. The word Isis, according to some, signifies “ancient,” and on that account the inscriptions on the statues of the goddess were often in these words: “I am all that has been, that shall be; and none among mortals has hitherto taken off my veil.” The worship of Isis was universal in Egypt, the priests were obliged to observe perpetual chastity, their heads were closely shaved, and they always walked barefooted, and clothed themselves in linen garments. They never ate onions, they abstained from salt with their meat, and were forbidden to eat the flesh of sheep and of hogs. During the night they were employed in continual devotion near the statue of the goddess. Cleopatra, the beautiful queen of Egypt, was wont to dress herself like this goddess, and affected to be called a second Isis.

Isis, or Thames, a river that has its rise in Gloucestershire, and flows through only a small part of Wiltshire. It enters this county near its source, and begins to be navigable for boats at Cricklade; but after running in a serpentine manner about four miles, it leaves Gloucestershire at a village called Castle Eaton.

Isis, a genus of animals belonging to the order zoophyta, in the class vermes. See Helminthology Index.

Islam, or Islamism; the true faith, according to the Mahometans. See Mahometanism.

Island, a tract of dry land encompassed with water; in which sense it stands contradistinguished from continent, or Terra Firma.

Several naturalists are of opinion, that the islands were formed at the deluge; others think, that there have been new islands formed by the casting up of vast heaps of clay, sand, mud, &c.; others think they have been separated from the continent by violent storms, inundations, and earthquakes. These last have observed, that the East Indies, which abound in islands more than any other part of the world, are likewise more annoyed with earthquakes, tempests, lightnings, volcanoes, &c. than any other part. Others again conclude, that islands are as ancient as the world, and that there were some at the beginning; and among other arguments, support their opinion from Gen. x. 5. and other passages of Scripture.

Varrensia thinks that there have been islands produced each of these ways. St Helena, Ascension, and other steep rocky islands, he supposes to have become so by the sea’s overflowing their neighbouring campaigns; but by the heaping up huge quantities of sand, and other terrestrial matter, he thinks the islands of Zealand, Japan, &c. were formed. Sumatra and Ceylon, and most of the East Indies islands, he thinks, were rent off from the main land; and concludes, that the islands of the Archipelago were formed in the same way, imagining it probable that Decal’s flood might contribute towards it. The ancients had a notion that Deles, and a few other islands, rose from the bottom of the sea; which, how fabulous soever it may appear, agrees with later observations. Seneca takes notice, that the island Therasia rose thus out of the Egean sea in his time, of which the mariners were eye witnesses.

It is indeed very probable, that many islands have existed not only from the deluge, but from the creation of the world; and we have undoubted proofs of the formation of islands in all the different ways above mentioned. Another way, however, in which, islands are frequently formed in the sooth sea, is by the coraline insects. On this subject there is a curious dissertation by Alexander Dalrymple, Esq. in the Philosophical Transactions for the year 1768, to which we refer the reader. See also Geography Index.

Islands of Ice. See Ice-Island.

Floating Islands. Histories are full of accounts of floating islands; but the greatest part of them are either false or exaggerated. What we generally see of this kind is no more than the concretion of the lighter and more viscous matter floating on the surface of the water in cakes; and, with the roots of the plants, forming congeries of different sizes, which, not being fixed to the shore in any part, are blown about by the winds, and float on the surface. These are generally found in lakes, where they are confined from being carried too far; and, in process of time, some of them acquire a very considerable size. Seneca tells us of many of these floating islands in Italy; and some later writers have described not a few of them in other places. But, however true these accounts might have been at the time when they were written, very few proofs of their authenticity are now to be found; the floating islands having either disappeared again, or been fixed to the sides in such a manner as to make a part of the shore. Pliny tells us of a great island which at one time swam about in the lake Cutilia in the country of Retinum, which was discovered to the old Romans by a miracle; and Pomponius tells us, that in Lydia there were several islands so loose in their foundations, that every little accident shook and removed them.

Island (or Iceland) Crystal. See Crystal, Iceland; Mineralogy Index.

Isle-adam, a town of France, with a handsome castle,
Isle-adam, castle, and the title of a baron; seated on the river Oise, three miles from Beaumont, and 20 from Paris.

Isle-de-Dieu, a small island of France, in the sea of Gascony, and on the coast of Poitou, from which it is distant 14 miles. W. Long. 2° 5'. N. Lat. 46° 45'.

Isle-de-France, one of the twelve general governments of France, under the old division; bounded on the north by Picardy, on the west by Normandy, on the south by the government of Orleans, and on the east by that of Champagne. It is about 90 miles in length, and as much in breadth, and is watered by the rivers Seine, Marne, Oise, and Aisne. The air is temperate, and the soil fertile; and it abounds in wine, corn, and fruits. It contains ten small districts, and Paris is the capital city.

Islebians, in ecclesiastical history, a name given to those who adopted the sentiments of a Lutheran divine of Saxony, called John Agricola, a disciple and companion of Luther, a native of Isleb, whencesoever the name; who interpreting literally some of the precepts of St. Paul with regard to the Jewish law, declaimed against the law and the necessity of good works. See Antinomians.

Islington, a village of Middlesex, on the north side of London, to which it is almost contiguous. It appears to be of Saxon origin; and in the Conqueror's time was called Isledon, or Isendon. The church is one of the prebends of St. Paul's; to the dean and chapter of which a certain precentor here belongs, for the probate of wills, and granting administrations. The church was a Gothic structure, erected in 1503, and stood till 1751, when the inhabitants applied to parliament for leave to rebuild it, and soon after erected the present structure, which is a very substantial brick edifice, though it does not want an air of lightness. The number of houses in Islington was 2700; and the total amount of the population, as it was estimated in 1811, was more than 15,000. The White-conduit house in this place, so called from a white stone conduit that stands before the entrance, has handsome gardens with good walks, and two large rooms, one above the other, for the entertainment of company at tea, &c. In the south-west part of this village is that noble reservoir, improperly called New River Head; though they are only two basins, which receive from the river from Hertfordshire, and from whence the water is thrown by an engine into the company's pipes for the supply of London. In the red moat on the north side of these basins, called Six-Acre Field, from the contents of it, which is the third field beyond the White Conduit, there appears to have been a fortress in former days, enclosed with a rampart and ditch, which is supposed to have been a Roman camp, made use of by Suetonius Paulinus after his retreat, which Tacitus mentions, from London, before he sallied thence, and routed the Britons under their queen Boudicea; and that which is vulgarly, but erroneously, called Jack Straw's castle, is a square place in the south-west angle of the field, supposed to have been the seat of the prætorium or Roman general's tent. In this parish are two charity-schools; one founded in 1613, by Dame Alice Owen, for educating 30 children. This foundation, together with that of a row of almshouses, are under the care of the brewers company. Here is an hospital with its chapel, and a workhouse for the poor. There is a spring of chalybeate water in a very pleasant garden, which for some years was honoured by the constant attendance of the princess Amelia, and many persons of quality, who drank the waters. To this place, which is called New Tunbridge Wells, many people resort, especially during the summer, the price of drinking the waters being 10s. 6d. for the season. Near this place is a house of entertainment, called Saddler's Wells, where, during the summer season, people are amused with balloonists, walking on the wire, rope-dancing, tumbling, and pantomime entertainments.

Islip, a town of Oxfordshire, 36 miles from London, is noted for the birth and baptism of Edward the Confessor. By means of inland navigation, it has communication with the rivers Mersey, Dee, Ribble, Ouse, Trent, Darwent, Severn, Humber, Thames, Avon, &c.; which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham, York, Lancaster, Westmoreland, Chester, Stafford, Warwick, Leicester, Oxford, Worcester, &c. It has a good market for sheep and wool remains of an ancient palace, said to have been King Ethelred's. Here is a charity school. The chapel wherein Edward was baptized stood at a small distance from the church, is still called the king's chapel, was entirely desecrated during Cromwell's usurpation, and converted to the meanest uses of a farm-yard; at present it has a roof of thatch. It is built of stone, is 15 yards long, and 7 broad, and retains traces of the arches of an oblong window at the east end. This manor was given by Edward the Confessor to Westminster abbey, to which it still belongs.

Ismaelites, the descendants of Israel; dwelling from Havila to the wilderness of Sur, towards Egypt, and thus overspreading Arabia Petraea, and therefore Josephus calls Israel the founder of the Arabs.

Ismarus, in Ancient Geography, a town of the Cicones in Thrace, giving name to a lake. In Virgil it is called Ismar. Servius supposed it to be a mountain of Thrace; on which mountain Orpheus dwelt.

Isnardia, a genus of plants, belonging to the tetrandroa class, and native from France and Italy. See Botany Index.

Isny, a town of Germany, in the kingdom of Wurttemberg; seated on the river Issy, in E. Long. 9° 10'. N. Lat. 47° 45'.

Isnic, a town of Turkey in Asia, and in Natalia, a Greek archbishop's see. It is the ancient Nice, famous for the first general council held here in 325. There is now nothing remaining of its ancient splendour, but an aqueduct. The Jews inhabit the greatest part of it; and it is seated in a country fertile in corn and excellent wine. E. Long. 29° 50'. N. Lat. 40° 16'.

Ischronal, is applied to such vibrations of a pendulum as are performed in the same space of time; as all the vibrations or swings of the same pendulum are, whether the arcs it describes are shorter or longer.
ISP

ISOCRANAL LINE, that in which a heavy body is supposed to descend without any acceleration.

ISOCRATES, one of the greatest orators of Greece, was born at Athens, 436 B.C. He was the son of Theodorus, who had enriched himself by making musical instruments, and gave his son a liberal education. Isocrates was the disciple of Prodicus, Gorgias, and other great orators. He endeavoured at first to decline in public, but without success; he therefore contented himself with instructing his scholars, and making private orations. He always showed great love for his country; and being informed of the loss of the battle of Cheronesus, he abstained four days from eating, and died, aged 98. There are still extant 21 of his discourses or orations, which are excellent performances, and have been translated from the Greek into Latin by Wolfius. Isocrates particularly excelled in the justness of his thoughts, and the elegance of his expressions. There are also nine letters attributed to him.

ISOETES, a genus of plants belonging to the cryptogamia class. See BOTANY INDEX.

ISOLA, a town of Italy, in the kingdom of Naples, and in the farther tableland, with a bishop’s see. It is a sea-port town, and is seated 15 miles southeast of St Severina. E. Long. 17° 33'. N. Lat. 39° 2'.

ISOPERIMETRICAL FIGURES, in Geometry, are such as have equal perimeters or circumferences.

ISOPYRUM, a genus of plants belonging to the polyantria class, and in the natural method ranking under the 26th order, Multisiliqua. See BOTANY INDEX.

ISOSCELES TRIANGLE, in Geometry, one that has two equal sides.

ISPAHAN, or, as the Persians pronounce it, SPAUHAWN, the capital of Persia, is situated in the province of Isac Agemi, or Persia Proper, upon the ruins, as is generally supposed, of the ancient Hecatompylon, or, as others think, of the Asa of Plutarch. Most of the eastern astronomers and geographers place it in N. Lat. 32° 25'. E. Long. 86° 45'. It stands in a very extensive plain, surrounded by mountains; and has eight districts belonging to it, that contain about 450 towns and villages. The fertility of the soil, the mildness of the seasons, and the fine temperature of the air, all conspire to render Isphahan one of the most charming and delightful cities in the world. It is unanimously agreed, that the present city is of no great antiquity; and the two parts into which it is divided, preserve the names of two contiguous towns, from the junction of which it was formed. The inhabitants of these, notwithstanding their neighbourhood, bear an inveterate antipathy to each other; which they discover on all public occasions. Spauhawn owes the glory it now possesses to the great Shah Abas; who, after the conquest of the kingdoms of Laz and Ormus, charmed with the situation of this place, made it the capital of his empire, between the years 1620 and 1628. The mountains, with which this city is surrounded, defend it alike from the sultry heats of summer and the piercing winds of the winter season: and the plain on which it stands is watered by several rivers, which contribute alike to its ornament and use. Of these rivers, the Zenderoud, after being joined by the Mahmod, passes by Spauhawn, where it has three fine bridges over it, and is as broad as the Ispahan Seine at Paris. The waters of these united streams are sweet, pleasant, and wholesome, almost by comparison; as indeed are all the springs found in the gardens belonging to the houses of Spauhawn. The extent of Spauhawn is very great; not less perhaps than 20 miles within the walls, which are of earth, poorly built, and covered with houses and gardens. The Persians are wont to say, Spauhawn nisipigien, i.e. Spauhawn is half the world. Chardin says, that some reckoned the number of inhabitants at 1,000,000; but he did not look upon it as more populous than London, or containing more than 600,000. Mr Kinneir, a late traveller, thinks they do not exceed 200,000. At a distance, the city is not easily distinguished; many of the streets being adorned with plantains, and every house having its garden, the whole looks like a wood. The streets in general are neither broad nor convenient; there being three great evils which attend them: the first is, that being built on common sewers, these are frequently broke up, which is very dangerous, considering that most people are on horseback; the second is, that there are many wells or pits in them, which are not less dangerous; the third arises from the people’s emptying all their ordure from the tops of their houses: this last, indeed, in some measure qualified by the dryness of the air, and by its being quickly removed by the peasants, who carry it away to dune their grounds. Some reckon right, and others ten gates, besides porters; but all agree that there is no difficulty of entering at any hour of the day or night. The three principal suburbs annexed to it are, Abas-Abad, built by Shah Abas, and belonging to the people of Tauris; Jufa, inhabited by a colony of Armenians, called by some New Jufa, to distinguish it from the ancient city of that name, situated in Armenia, upon the Araxes, whence the original inhabitants of New Jufa were brought; and Ghebr-Abad, or, as the Arabs pronounce it, Kebr-Abad, the street of the magians, occupied entirely by the professors of magism, or the religion of the ancient Persians. The river Zenderoud separates the city of Isphahan and Abas-Abad from Jufa and Ghebr-Abad. This city has suffered greatly since the commencement of the dreadful rebellion in 1721. The whole kingdom from that period, till a few years ago, having been almost a continued scene of blood, ravages, and confusion. A celebrated modern traveller, who was on the spot, tells us, that the inhabitants of Jufa, not many years before the above revolution happened, amounted to 30,000 souls; had 13 churches, and above 100 priests; and paid the Persian court 200 tomans annually for the free exercise of their religion; that some of the streets were broad and handsome, and planted with trees, with canals and graced with handsome and pleasing fountains in the middle; others narrow and crooked, and arched with arches; others again, though extremely narrow, as well as turning and winding many ways; were of an incredible length, and resembled so many labyrinths: that, at a small distance from the town, there were public walks adorned with plane-trees on either hand, and ways paved with stones, fountains, and cisterns: that there were above 100 caravanseras for the use of merchants and travellers, many of which were built by the kings and prime nobility of Persia: that, as little rain fell there, the streets were frequently full of dust, which rendered the city disagreeable during a considerable
ISRAEL, a considerable part of the summer; that the citizens, however, to make this inconvenience more tolerable, used to water them when the weather was warmer than usual: that there was a castle in the eastern part of the town, which the citizens looked upon as impregnable, in which the public money, and most of the military stores, were said to be kept: that, notwithstanding the baths and caravanserais were almost innumerable, there was not one public hospital: that most of the public buildings were rather neat than magnificent, though the great medan or market-place, the royal palace (which is three quarters of a league in circumference), and the alley denominated Toher bag adjoined to it, made a very grand appearance: that the former contained the royal mosque; the building denominated kaiserich, where all sorts of foreign commodities were exposed to sale; and the mint, styled by the Persians seron-Khouch, where the current money of the kingdom was coined: that, besides the native Persians, there were then in Isphahan above 10,000 Indians all supported by trade; 20,000 Georgians, Circassians, and Tartars of Dagestan or Lesees, with a considerable number of English, Dutch, Portuguese, and a few French: that the Capuchins, discalced, and barefoot Carmelites, Jesuits, Dominicans, and Austin friars, had likewise their convents here; though they were unable to make any converts; and that there were above 100 mosques and public colleges. But since the fatal period above mentioned, the suburb of Juifa was almost totally abandoned by the Armenians. The government of Isphahan, twenty-three leagues long and as many broad, comprehending several districts, most of them formerly well peopled, appeared not many years ago little better than a desert; for most of the inhabitants of that fertile and delightful tract had been driven out and dispersed. 'Multitudes of them took a precarious refuge in the mountains of Loristan, lying between Isphahan and Suster, while their lands were left untilled, and their houses mouldered into ruins. In short, all the distresses of an unsuccessful war, or the invasion of a barbarous enemy, could not have plunged the people of Isphahan into greater misery than the victories of their tyrannical king Nadir Shah, who seemed more solicitous to humble his own subjects than to crush his enemies. See Persia.

ISPIDA. See ALCEDO, ORNITHOLOGY INDEX.

ISRAEL, the name which the angel gave Jacob, after having wrestled with him all night at Mahanaim or Penuel (Gen. xxxii. 1, 2, and 28, 29, 30, and Hosea xii. 3). It signifies a conqueror of God or a prince of God, or, according to many of the ancients, a man who sees God.

By the name of Israel is sometimes understood the person of Jacob; sometimes the whole people of Israel, or the whole race of Jacob; and sometimes the kingdom of Israel, or of the ten tribes, distinct from the kingdom of Judah.

ISRAELITES, the descendants of Israel; who were at first called Hebrews, by reason of Abraham, who came from the other side of the Euphrates; and afterwards Israelites, from Israel the father of the twelve patriarchs; and lastly Jews, particularly after their return from the captivity of Babylon, because the tribe of Judah was then much stronger and more numerous than the other tribes, and foreigners had scarcely any knowledge of this tribe.

ISSACHAR, one of the divisions of Palestine by tribes; lying to the south of Zebulon, so as by a narrow slip to reach the Jordan, between Zebulon and Manasseh, (Josh. xix.). But whether it reached to the sea, is a question; some holding that it did; an assertion not easy to be proved, as Joshua makes no mention of the sea in this tribe, nor does Josephus extend it farther than to Mount Carmel; and in Josh. xvii. 10. Asher is said to touch Manasseh on the north, which could not be if Issachar extended to the sea.

ISSOUDUN, a town of France, in Berry, which carries on a trade in wool, cattle, cloth, hats, and stockings; it is seated partly in a plain, and partly on an eminence. E. Long. 2* 5' N. Lat. 45° 57'.

ISSUE, in common law, has various applications; being sometimes taken for the children begotten between a man and his wife—sometimes for profits growing from amercements or fines—sometimes for profits of lands and tenements—but more frequently for the point of matter depending in suit, whereupon the parties join, and put their cause to the trial of the jury.

In all these occasions, issue has but one significance, which is, an effect of a cause preceding; as the children are the effect of the marriage between the parents; the profits growing to the king or lord, from the punishment of any man's offence, are the effect of his transgression; the point referred to the trial of twelve men is the effect of pleading, or process. See Plea and Issue.

ISSUES, in Surgery, are little ulcers made designedly by the surgeon in various parts of the body, and kept open by the patient, for the preservation and recovery of his health.

ISSUS, now Issaz, a town of Cilicia in Natolia, with a harbour on the Levant sea, a little to the north of Scanderoff. E. Long. 35° 25' N. Lat. 36° 36'.

Near this place, in a difficult pass between the mountains and the sea, Alexander the Great fought his second battle with Darius. One great cause of the defeat which the Persians received here was the bad conduct of their monarch, who led his numerous forces into a narrow place, where they had not room to act. Alexander was so much surprised when he first received the news that Darius was behind him, that he could scarcely believe it to be true: but when he was thoroughly satisfied of the fact, and that Darius had again passed the river Pinarus, he called a council of war, wherein, without asking any body's advice, he only told them, that he hoped they would remember their former actions: and that they, who were always conquerors, were about to fight people who were always beaten. He further observed, that Darius seemed to be infatuated, since he had with such expedition quitied an open and spacious country, where his numbers might have acted with advantage, to fight in a place inclosed, where the Macedonian phalanx might not be drawn up, and where his numbers could not be incommode him. He then made the necessary dispositions for repassing the mountains, posted guards where he found them necessary, and then commanded his troops to refresh themselves, and to take their rest till morning.

At break of day he began to repass the mountains, obliging his forces to move in close order where the road was narrow, and to extend themselves as they
had more room; the right wing keeping always close to the mountain, and the left to the sea-shore. On the right there was a battalion of heavy-armed troops, besides the tarpeeters under the command of Nicanor the son of Parmenio. Next these, extending to the phalans, were the corps of Callas and Perdicgas; and on the left the respective bodies commanded by Amyntas, Ptolemy, and Meleager. The foot appointed to support them were commanded by Craterus; but the whole left wing was committed to Parmenio, with strict orders not to decline from the sea-shore, lest the Persians should surround them. Darius ordered 20,000 foot and 30,000 horse to retire, finding that he already wanted room to draw up the rest. His first line consisted of 30,000 Greek mercenaries, having on their right and left 60,000 heavy-armed troops, being the utmost the ground would allow. On the left, towards the mountain, he posted 20,000 men, which, from the hollow situation of the place, were brought quite behind Alexander's right wing. The rest of his troops were formed into a close line behind the Greek mercenaries, to the number in all of 600,000 men. When this was done, he suddenly recalled the horse who had retired, sending part of them to take post on his right against the Macedonians commanded by Parmenio; and the rest he ordered to the left towards the mountain: but, finding them unserviceable there, he sent the greatest part of them to the right; and then took upon himself, according to the custom of the Persian kings, the command of the main body. As soon as Alexander perceived that the weight of the Persian horse was disposed against his left wing, he dispatched with as much secrecy as he could, the Thessalian cavalry thither, and supplied their places on the right by some brigades of horse from the van, and light-armed troops. He also made such dispositions, that, notwithstanding the mighty advantage of the hollow mountain, the Persians could not surround him. But, as these precautions had considerably weakened the centre of his army, he ordered those advanced posts on the enemy's left, of which he was most apprehensive of being attacked at the very beginning of the fight; and, when they were easily driven from them, he recalled as many troops as were necessary to strengthen his centre.

When all things were in order, Alexander gave strict command, that his army should march very slowly. As for Darius, he kept his troops fixed in their posts, and in some places threw up ramparts; whence the Macedonians rightly observed, that he thought himself already a prisoner. Alexander at the head of the right wing engaged first, and without any difficulty broke and defeated the left wing of Darius. But, endeavouring to pass the river Pinarus after them, his troops in some measure losing their order, the Greek mercenaries fell upon them in flank, and made them fight, not only for victory, but for their lives. Ptolemy son of Seleucus, and 120 Macedonians of some rank, were killed upon the spot. But the foot next to Alexander's right wing coming in seasonably to its relief, fell upon the mercenaries in flank, amongst whom a dreadful carnage was made; they being in a manner surrounded by the horse and light-armed troops, which at first pursued the left wing, and the foot that now passed the river. The Persian horse on the right still fought gallantly; but, when they were thoroughly informed of the rout of their left wing and of the destruction of the Greek mercenaries, and that Darius himself was fled, they began to break, and betake themselves to flight also. The Thessalian cavalry pursued them close at the heels; and the narrow clogged roads incommoded them exceedingly, so that vast numbers of them perished. As for Darius, he fled, soon after the left wing was broken, in a chariot with a few of his favourites: as far as the country was plain and open, he escaped well enough; but, when the roads became rocky and narrow, he quitted it, and mounting a horse, rode all the night; his chariot, in which were his cloak and his bow, fell into the hands of Alexander, who carried them back to his camp.

In respect to the battle of Issus, Diodorus informs us, that Alexander looked everywhere about for Darius; and, as soon as he discovered him, with his handful of guards attacked him and the flower of the Persian army which was about him; being as desirous of obtaining this victory by his personal valour, as of subduing the Persian empire by the courage of his soldiers. But when Oxathres, the brother of Darius, saw Alexander's design, and how fiercely he sought to accomplish it, he threw himself, with the horse who were about him, between his brother's chariot and the enemy, where an obstinate fight was maintained, till the dead bodies rose like an entrenchment about the chariot of Darius. Many of the Persian nobility were slain, and Alexander himself was wounded in the thigh. At last the horses in the chariot of Darius started, and became so unquiet, that the king himself was forced to take the reins; the enemy, however, pressed so hard upon him, that he was constrained to call for another chariot, and mounted it in great danger. This was the beginning of the rout, which soon after became general. According to this author, the Persians lost 200,000 foot, and 10,000 horse; the Macedonians 300 foot, and 150 horse.

Justin informs us, that the Persian army consisted of 400,000 foot, and 100,000 horse. He says, that the battle was hand fought, that both the kings were wounded, and that the Persians still fought valiantly when their king fled, but that they were afterwards speedily and totally routed: he is very particular as to their loss, which he says amounted to 61,000 foot, 10,000 horse, and 40,000 taken prisoners; of the Macedonians he says there fell no more than 230 foot, and 150 horse. Curtius says, that of the Persians there fell 100,000 foot, and 10,000 horse: of Alexander's army 504, he says, were wounded; 32 foot and 150 horse killed. That we may not suspect any error in transcribers, his own observation confirms the fact: Tontudo spectandor ingens victoria stetit, "So small was the cost of so great a victory."

**Isthmia, or Isthmian Games**; one of the four solemn games which were celebrated every fifth year in Greece. They derived their name from the isthmus of Corinth, where they were celebrated. In their first institution, according to Pausanias, they consisted only of funeral rites and ceremonies in honour of Melicertes: but Theseus afterwards, as Plutarch informs us, in emulation of Hercules, who had appointed games at Olympia in honour of Jupiter, dedicated those to Neptune, his reputed father, who was regarded as the particular protector of the isthmus and commerce of Corinth. The same trials of skill were exhibited here as at the other three
It is accounted one of the most perfect among the modern tongues. It is complained, indeed, that it has too many diminutives and superlatives, or rather augmentatives; but without any great reason: for if those words convey nothing farther to the mind than the just ideas of things, they are no more faulty than our pleonasms and hyperboles.

The language corresponds to the genius of the people, who are slow and thoughtful: Accordingly their language runs heavily, though smoothly; and many of their words are lengthened out to a great degree. They have a great taste for music; and to gratify their passion in this way, have altered abundance of their primitive words; leaving out consonants, taking in vowels, softening and lengthening out their terminations, for the sake of the cadence.

Hence the language is rendered extremely musical, and succeeds better than any other in operas and some parts of poetry: but it fails in strength and nervousness; and a great part of its words, borrowed from the Latin, become so far disguised that they are not easily known again.

The multitude of sovereign states into which Italy has been divided has given rise to a great number of different dialects in that language; which, however, are all good in the place where they are used. The Tuscan is usually preferred to the other dialects, and the Roman pronunciation to that of the other cities; whence the Italian proverb, Lingua Toscana in bocca Romana.

ITALIC CHARACTER, in Printing. See LETTER.

ITALICA, in Ancient Geography, a town of Baetica in Spain, built by Scipio Africanus, after finishing the Spanish war, for the reception of the wounded soldiers. At first it was a municipium; afterwards a colony: which was a matter of wonder to the emperor Adrian, the privileges of a municipium being beyond those of a colony (Gellius). Famous for being the birthplace of the emperors Trajan and Adrian, and of the poet Silius Italicus. Now Sevilla Vieja, scarcely four miles from Seville; a small village of Andalusia, on the Guadalquivir.—Corfinium in Italy was thus also called.

ITALY, one of the finest countries of Europe, lying between 7 and 10 degrees of E. Long. and between 37 and 46 degrees of N. Lat. On the north, northwest, and north-east, it is bounded by France, Switzerland, the country of the Grisons, and Germany; on the east, by the Adriatic sea or gulf of Venice; and on the south and west, by the Mediterranean; its figure bearing some resemblance to that of a boot. Its length from Aosta, at the foot of the Alps in Savoy, to the utmost verge of Calabria, is about 600 miles; but its breadth is very unequal, being in some places near 400 miles, in others not above 25 or 30.

Italy was anciently known by the names of Seternumia, Oenomīria, Hesperia, and Ausonia. It was called Saternumia from Saturn, who, being driven out of Crete by his son Jupiter, is supposed to have taken refuge here.

The names of Oenomia and Ausonia are borrowed from its ancient inhabitants the Oenotrians and Ausones; and that of Hesperia or Western was given it by the Greeks, from its situation with respect to Greece. The name of Italia, or Italy, which in process of time prevailed over all the rest, is by some derived from Italia, a king of the Siculi: by others, from the Greek word Itās, signifying an ex; this country abounding, by reason of its rich pastures, with oxen of an extraordinary size and beauty. All these names were originally peculiar to particular provinces of Italy, but afterwards applied to the whole country.

This country, like most others, was in ancient times divided into a great number of petty states and kingdoms. Afterwards when the Gauls settled in the western, and many Greek colonies in the eastern parts,
ITALY.

In the year 476, the Heruli, presuming on the services they had done the empire, demanded a third part of the lands of Italy; and being refused, chose one Odoacer, a man of low birth, but of great valor and experience, for their king; and having totally destroyed the remains of the Roman empire, proclaimed Odoacer king of Italy. The new monarch, however, did not think proper to alter the Roman form of government, but suffered the people to be governed by the senate, consuls, &c. as before. He enjoyed his dignity in peace till the year 498, when Zeno, emperor of Constantinople, being hard pressed by Theodoric king of the Ostrogoths, advised him to turn his arms against Odoacer, whom he could easily overcome, and thus make himself sovereign of one of the finest countries in the world.

Theodoric accepted the proposal with great joy, and set out for Italy, attended by an infinite number of people, carrying with them their wives, children, and effects, on waggons. Several Romans of great distinction attended him in this war; while, on the other hand, many of his countrymen chose to remain in Thrace, where they became a separate nation, and lived for a long time in amity with the Romans. The Goths, being destitute of shipping, were obliged to go round the Adriatic. Their march was performed in the depth of winter; and during the whole time, a violent famine and plague raged in their army. They were also opposed by the Gepidæ and Sarmatians; but at last having defeated those enemies, and overcome every other obstacle, they arrived in Italy in the year 499. Theodoric advanced to the river Sontius, now Zonzo, near Aquileia, where he halted for some time to refresh his troops. Here he was met by Odoacer at the head of a very numerous army, but composed of many different nations commanded by their respective chiefs, and consequently without sufficient union or zeal for the common cause. Theodoric therefore gained an easy victory, cut many of his enemies in pieces, and took their camp. Odoacer retired to the plains of Verona, and encamped there at a small distance from the city; but Theodoric pursued him close, and soon forced him to a second engagement. The Goths obtained another victory; but it cost them dear. Odoacer’s men made a much better resistance than before, and great numbers fell on both sides. The victory, however, was so far decisive, that Odoacer was obliged to shut himself up in Ravenna; so that Theodoric having now no enemy to oppose him in the field, besieged and took several important places, and among the rest Milan and Pavia. At the same time, Tula, commander in chief of Odoacer’s forces, deserted to the enemy with the greatest part of the troops he had with him, and was immediately employed in conjunction with a Gothic officer in pursuit of his sovereign. Odoacer had left that city, and was advanced as far as Ancona, where he was closely besieged by Tula; but the traitor, declaring again for his old master, joined him with all his troops, and delivered up several officers that had been appointed by Theodoric to serve under him. These were sent in irons to Ravenna; and Odoacer being joined by Frideric, one of Theodoric’s allies, with a considerable body of troops, once more advanced against his enemies. He recovered all Liguria, took the city of Milan,
ITALY.

The Goths, having brought all their families and effects along with them, were greatly distressed for want of room; and must have undoubtedly submitted, if their enemies had continued to agree among themselves. The quarrels of his followers proved the ruin of Odoacer. Theodosic finding that the enemy remitted the vigour of their operations, applied for succours to Alaric king of the Visigoths, who had settled in Gaul. As the Visigoths and Ostrogoths were originally one and the same nation, and the Visigoths had received among them some years before a great number of Ostrogoths under the conduct of Widemer cousin-german to Theodosic, the supplies were readily granted. The inaction of the enemy gave these succours time to arrive; upon which which Theodosic instantly joined them, and marching against his enemies gave them a total overthrow. Odoacer again took refuge in Ravenna, but was closely besieged by Theodosic in 490. The siege lasted three years; during which Odoacer defended himself with great bravery, and greatly annoyed the besiegers with his salutes. Theodosic, however, impatient of delay, leaving part of his army to blockade the city, marched with the rest against the strongholds which Odoacer had garrisoned. All these he reduced with little difficulty; and in 492 returned to the siege of Ravenna. The besieged were now reduced to great straits both by the enemy without and a famine within, the price of wheat being risen to six pieces of gold per bushel. On the other hand, the Goths were quite worn out with the fatigues of such a long siege; so that both parties being willing to put an end to the war, Odoacer sent John bishop of Ravenna to Theodosic with terms of accommodation. Jornandes informs us, that Odoacer only begged his life; which Theodosic bound himself, by a solemn oath, to grant him: but Procopius says, that they agreed to live together on equal terms. This last seems very improbable; but whatever were the terms of the agreement, it is certain that Theodosic did not keep them: for having a few days after invited Odoacer to a banquet, he dispatched him with his own hand. All his servants and relations were massacred at the same time; except his brother Arpalus, and a few more, who had the good luck to make their escape, and retired beyond the Danube.

Thus Theodosic became master of all Italy, and took upon himself the title of king of that country, as Odoacer had done before; though, with a pretended deference to the emperor of Constantinople, he sent messengers asking liberty to assume that title after he had actually taken it. Having secured his new kingdom as well as he could by foreign alliances, Theodosic next applied himself to legislation, and enacted many salutary laws besides those of the Romans which he retained. He chose Ravenna for the place of his residence, in order to be near at hand to put a stop to the incursions of the barbarians. The provinces were governed by the same magistrates that had presided over them in the times of the emperors, viz. the consules, rectores, and presides. But besides these, he sent, according to the custom of the Goths, inferior judges, distinguished by the name of countes, to each city. These were to administer justice, and to decide all controversies and disputes. And herein the policy of the Goths far excelled that of the Romans. For in the Roman times a whole province was governed by a consularius, a corrector, or a preses, who resided in the chief city, and to whom recourse was to be had at a great charge from the most remote parts: but Theodosic, besides these officers, appointed not only in the principal cities, but in every small town and village, inferior magistrates of known integrity, who were to administer justice, and by that means save those who had law-suits the trouble and expense of recurring to the governor of the whole province; no appeals to distant tribunals being allowed, but in matters of the greatest importance, or in cases of manifest injustice.

Under the administration of Theodosic Italy enjoyed as great happiness as had been experienced under the very best emperors. As he had made no alteration in the laws except that above mentioned; so he contented himself with the same tributes and taxes that had been levied by the emperors; but was, on all occasions of public calamity, much more ready to remit them than most of the emperors had been. He did not treat the natives as those of the other Roman provinces were treated by the barbarians who conquered them. These stripped the ancient proprietors of their lands, estates, and possessions, dividing them among their chiefs; and giving to one a province with the title of dux, to another a frontier-country with the title of marquis; to some a city with the title of count, to others a castle or village with the title of baron. But Theodosic, who piqued himself upon governing after the Roman manner, and observing the Roman laws and institutions, left every one in the full enjoyment of his ancient property. As to religion, though he himself, like most of his countrymen, professed the tenets of Arius, he allowed his subjects to profess the orthodox doctrine without molestation, giving liberty even to the Goths to renounce the doctrines in which they had been educated, and embrace the contrary opinions. In short, his many virtues, and the happiness of his subjects, are celebrated by all the historians of those times. The end of his reign, however, was attended by trials and misfortunes; in the death of the celebrated philosopher Boethius, and in the murder of his father-in-law Symmachus. The latter were both belauded, and the former lamented as great losses to his court. The death of Symmachus put an end to the reign of Theodosic, and abandoned himself to the most pensive sorrow. The excess of his grief affected his understanding; for not long after, the head of a large fish being served up to supper, he fancied the head of the fish to be that of Symmachus threatening him in a ghastly manner. Heavily weighted with sorrow and amazement, he was carried to his bed-chamber, where he died in a few days, on the 26th of September 526.

After the death of Theodosic, the kingdom devolved to Aetius his grandson; who being at that time only eight years of age, his mother Amalasuntha took upon herself the regency. Her administration was equally upright with that of Theodosic himself; but the barbarians of whom her court was composed, finding itself great ge

Amalasuntha,
ITALY.

Amalasuntha, exerting her authority, seized three of the ringleaders of the sedition, whom she confined in the most remote parts of Italy. But these maintaining a secret correspondence with their friends and relations, never ceased to stir up the people against her; insomuch, that the queen, apprehending that the faction might in the end prevail, wrote to the emperor Justinian, begging leave to take refuge in his dominions. The emperor readily complied with her request, offering a noble palace at Durazzo for her habitation; but the queen having in the mean time caused the three ringleaders to be put to death, and no new disturbances arising thereupon, she did not accept of the emperor's offer. In 533, Athalaric having contracted a lingering distemper by his riotous living and debaucheries, Amalasuntha, in case of his death, formed a design of delivering it up to Justinian: but before her scheme was ripe for execution, Athalaric died. Upon which the queen took for her colleague one Theodotus her cousin; obliging him, however, to swear that he would suffer her to enjoy and exercise her former power. This he very readily did, but soon forgot his promise; and when she took the liberty to remind him of it, caused her to be seized and confined to an island of the lake Bolsena in Tuscany. But as Theodotus had great reason to believe that this conduct would be resented by Justinian, he obliged her to write to him that no injury or injustice had been done her. Along with this letter he sent one written by himself, and filled with heavy complaints against Amalasuntha. The emperor, however, was so far from giving credit to what Theodotus urged against her, that he openly espoused her cause, wrote her a most affectionate letter, and assured her of his protection. But before this letter could reach her, the unhappy princess was strangled in the bath by the friends of those whom in the reign of her son she had deservedly put to death for raising disturbances in the state.

Out of fear of Amalasuntha’s death, Justinian resolved upon an immediate war with the Goths; and, to facilitate the enterprise, used his utmost endeavours to induce the Franks to assist him. To his solicitations he added a large sum of money; which last was very acceptable to his new allies. They promised to assist the emperor to the utmost of their power; but instead of performing their promise, while Justinian’s arms were employed against the Goths, Thierry, the eldest son of Clovis, seized on several cities of Liguria, the Alpes Cottiae, and great part of the present territory of Venice, for himself. Justinian, however, found sufficient resources in the valour of Belisarius, notwithstanding the defection of his treacherous allies. This celebrated general was vested with the supreme command, and absolute authority. His instructions were to pretend a voyage to Carthage, but to make an attempt upon Sicily; and if he thought he could succeed in the attempt, to land there; otherwise to sail for Africa, without discovering his intentions. Another general, named Mundus, commander of the troops in Illyricum, was ordered to march into Dalmatia, which was subject to the Goths, and attempt the reduction of Salone, the better to open a passage into Italy. This he accomplished without difficulty, and Belisarius made himself master of Sicily sooner than he himself had expected. The island was reduced on the last of December 535; upon which Belisarius, without loss of time, passed over to Reggio, which opened its gates to him. From Reggio he pursued his march to Rome, the provinces of Abrutium, Lucania, Puglia, Calabria, and Bammium, readily submitting to him. The city of Naples endured a siege; but Belisarius entered through in an aqueduct, and gave it up to be plundered by his soldiers.

Theodotus alarmed at these successes, and having neither capacity nor inclination to carry on the war, sent ambassadors to Justinian with proposals of peace. He agreed to renounce all pretensions to the island of Sicily; to send the emperor yearly a crown of gold weighing 300 pounds; and to supply him with 3000 men whenever he should think proper to demand them. Several other articles were contained in the proposal, which amounted to the owning of Justinian for his lord, and that he held the crown of Italy only through his favour. As he apprehended, however, that these offers might not yet be satisfactory, he recalled his ambassadors for further orders. They were now desired to inform Justinian, that Theodotus was willing to resign the kingdom to him, and content himself with a pension suitable to his quality. But he obliged them by an oath not to mention this proposal, till they found that the emperor would not accept of the other. The first proposals were accordingly rejected as they had supposed; upon which the ambassadors produced the second, signed by Theodotus himself, who in his letter to the emperor told him, among other things, that being unacquainted with war, and addicted to the study of philosophy, he preferred his quiet to a kingdom. Justinian, transported with joy, and imagining the war already finished, answered the king in a most obliging manner, extolling his wisdom, and giving him besides what he demanded the greatest honours of the empire. The agreement being confirmed by mutual oaths, lands were assigned to Theodotus out of the king’s domain, and orders were dispatched to Belisarius to take possession of Italy in his name.

In the mean time, a body of Goths having entered Dalmatia, with a design to recover the city of Salone, were encountered by an inferior army of Romans, commanded by the son of Mundus above mentioned. The Goths proved victorious; and the young general of the Romans was killed, and most of his army cut in pieces. Mundus marched against the enemy to revenge the death of his son; but met with no better success, his troops being defeated, and he himself killed in the engagement. Upon this the Romans abandoned Salone and all Dalmatia; and Theodotus, elated with his success, refused to fulfil the terms of the treaty. Justinian dispatched Constantianus, an officer fulfil the treaty. Justinian dispatched Constantianus, an officer of great valour and experience, into Illyricum, with orders to raise forces there, and to enter Dalmatia; at the same time he wrote to Belisarius to pursue the war with the utmost vigour.

The Goths were now reduced to the greatest straits. Constantianus drove them out of Dalmatia; and Belisarius having reduced all the provinces which compose the present kingdom of Naples, advanced towards Rome. The chief men of the nation, finding their king incapable of preventing the impending ruin, assembled...
ITALY.

Italy assembled without his consent, and dispatched ambassadors to Belisarius with proposals of peace. These proposals were rejected; and Belisarius returned for answer, that he would hearken to no terms, nor sheath his sword, till Italy was reunited to the empire to which it belonged. The Goths finding Theodatus still inactive, unanimously deposed him; and chose in his stead one Vitiges, a man of great valor, but of a mean descent. Theodatus fled to Ravenna; but the new king despatched after him a messenger, who soon overtook him and cut off his head.

Vitiges began his government by writing a circular letter, in which he exhorted his countrymen to exert their ancient courage, and fight bravely for their lives and liberties. He then marched with what forces he could collect towards Rome; but not thinking himself able to defend that city against the Roman forces, he abandoned it to Belisarius, and arriving at Ravenna was joined by the Goths from all parts, so that he soon found himself at the head of a considerable army. Belisarius in the mean time entered Rome without opposition, on the 9th or 10th of December 537. The Gothic garrison retired by the Porta Flamia, while Belisarius entered by the Porta Asinaria. Leudarius, governor of the city, who stood behind, was taken, and the keys of the city given to the emperor. Belisarius immediately applied himself to the repairing of the walls and other fortifications; filled the granaries with corn, which he caused to be brought from Sicily; and stored the place with provisions, as if he had been preparing for a siege; which gave no small uneasiness to the inhabitants, who chose rather that their city should lie open to every invader, than that they should be liable to the calamities of a siege. While Belisarius was thus employed at Rome, the city of Benevento, with great part of the territory of Sannium, was delivered up to him: at the same time the cities of Narnia, Spoleto, and Perusia, revolting from the Goths, received Roman garrisons; as did most of the cities of Tuscany.

In the mean time, Vitiges having collected an army of 150,000 men, resolved to march directly to Rome, and engage Belisarius; but, if he declined an engagement, to lay siege to the city. But apprehending that the Franks, who were in confederacy with the emperor, might fall upon him at the same time, he sent ambassadors to them, with offers of all the Gothic possessions in Gaul, besides a considerable sum of money, provided they joined him against the emperor. The Franks with their usual treachery consented to the proposal, received the money and the territories agreed on, and then refused to fulfil the terms of the treaty. Vitiges, however, began his march to Rome, leaving behind him all the fortified towns on the road, the reduction of which he knew would cost him too much trouble. Belisarius, whose army, reduced by the many towns he had garrisoned, did not now amount to above 5000 men, dispatched messengers to Constantine in Tuscany; and to Bessas, by nation a Goth, but of the emperor's party, in Umbria, with orders to join him with all possible expedition; writing at the same time to the emperor himself for supplies in the most pressing manner. Constantianus joined him pursuant to his orders; and soon after, Bessas, falling in with part of the enemy's vanguard, killed a considerable number of them, and put the rest to flight. Belisarius had built a fort upon a bridge about a mile from Rome, and placed a strong garrison in it to dispute the passage with the enemy; but the garrison, seized with a panic at the approach of the Goths, abandoned their post in the night, and fled into Campania. Early in the morning Vitiges passed over great part of his army, and marched on till he was met by Belisarius, who, knowing nothing of what had happened, came with 1000 horse to view the ground about the bridge. He was greatly surprised when he beheld the enemy marching up against him; however, he did not allow himself to be engaged, he stood his ground, and received the enemy at Goths and the head of his small body, exposing himself, without Romans, his usual prudence and discretion, to the greatest dangers. Being known by some fugitives, and discovered to the enemy, they all aimed at him alone, which made his own men the more solicitous to defend him; so that the whole contest was for some time about his person. At last the Goths were driven back to their camp, which the Romans with great temerity attempted to force. In this attempt, however, they met with such a vigorous resistance, that they soon abandoned the enterprise, and retired with precipitation to a neighbouring eminence, whence they were forced down by the enemy, put to flight, and pursued to the very gates of the city. Here they were in greater danger than ever; for those within, fearing that the enemy might in that confusion enter with them, refused to admit them. The general himself cried out earnestly to them, telling who he was, and commanding them to open the gates; but as they had been informed by those who first fled, that he was slain, and they could not distinguish him on account of the blood and dust with which his face was covered, they gave no ear to what he said. In this extremity, having encouraged his men, who were now driven into a narrow compass, to make a last effort, he put himself at their head, and attacked the enemy with such fury, that the Goths, imagining fresh troops were sallying out upon them, began to give ground, and at last retired to their camp. The Roman general did not pursue them; but entered the city, where he was received with loud acclamations.

A few days after, the city was closely invested by Vitiges; who, to distress the inhabitants, pulled down the aqueducts by which water was conveyed into the city, and which had been built at an immense charge by the Roman emperors. Belisarius on his part omitted nothing for his defence; insomuch that the cowardly citizens assembled in a tumultuous manner, and railed at the general on account of his supposed temerity. Vitiges, to encourage this mutinous disposition, dispatched ambassadors to the senate with proposals of peace. These ambassadors, however, were dismissed without any answer, and the siege was begun with great vigour. Belisarius made a gallant defence, and in seven months is said to have destroyed 40,000 of the Goths. About this time he received a supply of 1600 archers from the emperor; and these, in several successful sallies, are said to have killed 4000 more of the enemy.

The Romans, elated with their successes, now became impatient for an engagement; and at last, notwithstanding
IT A L Y.

withstanding all the remonstrances of their general, forced him to lead them out against the enemy. The success was ascribed to the rash attempt. The Romans were defeated, with the loss of some of their bravest officers, and a great many of their common soldiers; after which they contented themselves with sallying out in small parties, which they commonly did with the greatest success.

But though the Romans had the satisfaction of thus cutting off their enemies, they were most grievously afflicted with a famine and plague; insomuch that the inhabitants, no longer able to bear their calamities, were on the point of forcing Belisarius to venture a second battle, when a seasonable supply of troops, viz. 3000 Isaurians, 800 Thracian horse, and 1300 horse of other nations, together with 500 Italians who joined them by the way, arrived at Rome. Belisarius immediately sallied out by the Flaminian gate, and fell upon the Gotths in order to give his allies time to enter by the opposite side of the city, which they did without the loss of a man.—The Goths hearing of the arrival of these troops, and their numbers being magnified as is usual in such cases, began to despair of becoming masters of the city; especially as the famine and plague raged with great violence in their camp, and their army was much reduced. Ambassadors were therefore dispatched to Belisarius with proposals of peace; but the only thing they could obtain was a cessation of arms for three months, during which time they might send ambassadors to the emperor. The negotiations with the emperor, however, proved unsuccessful; and the siege was pursued with great vigour till Vitiges received the news of the taking of Rimini by the Romans. As this city was but a day's journey from Ravenna, the Goths were so much alarmed, that they immediately raised the siege of Rome, after it had continued a year and nine days. Belisarius fell upon their rear as they passed the bridge of the Tibre, and cut great numbers of them in pieces, while others, struck with a panic, threw themselves into the river and were drowned.

The first enterprise of Vitiges, after raising the siege of Rome, was an attempt upon Rimini; but while he was employed in this siege, the Romans made themselves masters of Milan; upon which a Gothic general, named Uras, was immediately despatched with a powerful army to retake it. In the mean time, however, a supply of 7000 Romans arrived from the emperor, under the command of Narses, a celebrated general. The immediate consequence of this was the raising of the siege of Rimini; for Vitiges perceiving the two Roman armies coming against him, and concluding, from the many fires they made, that they were much more numerous than they really were, fled in such haste, that the greatest part of the baggage was left behind. The confusion of the Goths was so great, that, had not the garrison been extremely feebile, they might have easily cut them off in their retreat, and thus put an end to the war at once. The success of the Romans, however, was now retarded by some misunderstandings between the two generals: so that, though Belisarius made himself master of Urbium and Urbiventum, while Narses reduced some other places, yet the important city of Milan was suffered to fall into the hands of the Goths, who massacred all the inhabitants that were able to bear arms, to the number of 30,000, and sold the women for slaves. The city was also totally demolished; and this disaster made such an impression on the mind of Justinian, that he immediately recalled Narses, and gave the command of his troops to Belisarius.

Vitiges, who had promised himself great advantages from the disagreement of the two generals, was much disappointed by the recall of Narses: and therefore dreading the power of Belisarius when at the head of a formidable army, thought of engaging in alliance with some foreign prince. In his choice, however, he was somewhat at a loss. He knew the treachery of the Franks, and therefore did not apply to them. He applied to the Lombards; but, though tempted by the offer of a large sum of money, they continued inviolably attached to the Roman interest. At last he found means to persuade Chosroes king of Persia to make war upon Justinian, which he thought would infallibly procure the recall of Belisarius. But the Roman general, understanding his design, pushed on the war in the most vigorous manner; while, in the mean time, the treacherous Franks, thinking both nations sufficiently weakened by their mutual hostilities, were resolved to attack both, and seize upon the country, for which they contended. Accordingly, Theodebert, unmindful of the oaths he had taken both to the Goths and Romans, passed the Alps, at the head of 250,000, or, as some will have it, 200,000 men, and entered Liguria. As no hostilities were committed by them on their march, the Goths concluded that they were come to their assistance; and therefore took care to supply them with provisions. Thus they crossed the Po without opposition; and having secured the bridge, marched towards the place where a body of Goths was encamped; who, looking upon them as friends, admitted them without hesitation. But they were soon convinced of their mistake; for the Franks, falling unexpectedly upon them, drove them out of the camp with great slaughter, and seized on their baggage and provisions. A body of Romans that lay at a small distance from the Goths, concluding that they had been defeated by Belisarius, advanced with great joy to meet them as they imagined; but the Franks falling upon them, treated them as they had done the Goths, and made themselves masters of their camp. Thus they acquired a very considerable booty and store of provisions; but the latter being soon consumed, and the country round about quite exhausted, vast numbers of the Franks perished; so that Theodebert at last found himself obliged to return. In his way he destroyed Genoa and several other places, and arrived in his own dominions loaded with booty.

In the mean time, Belisarius was making great progress. He took the cities of Auximium and Frascula, and after an obstinate siege; the inhabitants of the former having for some time fed on grass before they would surrender. After this he invested Ravenna, the capital of all the Gothic dominions in Italy. The place was defended by a very numerous garrison, commanded by the king in person, who exerted all his bravery in the defence of his metropolis. As the siege, however, was pushed on with great vigour, it was evident that the city must at last submit; and the great successes of the Romans began to give jealousy to the neighbouring potentates.
ITALY.  

Theodobert king of the Franks offered to assist Vitiges with an army of 300,000 men; but Belisarius, being informed of this negotiation, sent ambassadors to Vitiges, putting him in mind of the treachery of the Franks, and assured him that the emperor was ready to grant him very honourable terms. The king, by the advice of his counsellors, rejected the alliance of the Franks, and sent ambassadors to Constantinople; but in the mean time, Belisarius, in order to bring the citizens to his own terms, bribed one of them to set fire to a magazine of corn, by which means the city was soon straitened for want of provisions. But, notwithstanding this distress, they still continued to hold out, till the arrival of the ambassadors from Constantinople, who brought very favourable terms. These were, That the country beyond the Po, with respect to Rome, should remain to the Goths; but that the rest of Italy should be yielded to the emperor, and that the royal treasure of the Goths should be equally divided between him and the king. To these conditions, however, Belisarius positively refused to assent; being desirous of leading captive the king of the Goths, as he had formerly done the king of the Vandals, to Constantinople. He therefore pursued the siege with more vigour than ever, without slackening the complaints of his soldiers, and officers, who were quite tired out with the length of the siege: he only obliged such of the officers as were of opinion that the the town could not be taken, to express their opinion in writing, that they might not deny it afterwards.

The Goths were as weary of the siege as the Romans; but fearing lest Justinian should transplant them to Thrace, formed a resolution, without the consent of their king, of surrendering to Belisarius himself, and declaring him emperor of the west. To this they were the more encouraged by the refusal of Belisarius to agree to the terms proposed by the emperor; whence they concluded that he designed to revolt, and make himself emperor of Italy. Of this, however, Belisarius had no design; but thought proper to accept of that title, in order to accelerate the surrender of the city, after acquainting his principal officers with what had passed. Vitiges at last discovered the plot; but finding himself in no condition to oppose it, he commended the resolution of his people, and even wrote to Belisarius, encouraging him to take upon him the title of king, and assuring him of his assistance. Upon this Belisarius pressed the Goths to surrender; upon which, however, they still refused, till he had taken an oath that he would treat them with humanity, and maintain them in the possession of all their rights and privileges. He was then admitted into the city, where he conducted himself with great moderation towards the Goths; but seized on the royal treasure, and secured the person of the king. The Roman army, when it entered Ravenna, appeared so very inconsiderable, that the Gothic women on beholding it could not forbear spitting in the faces of their husbands, and reviling them as cowards.

The captivity of Vitiges, and the capture of Ravenna, did not terminate the war. Belisarius was soon after recalled to take the command of the army in the east. The Goths were greatly surprised that he should leave his new kingdom out of regard to the orders of the emperor; but, after his departure, chose one Ildibald, a man of great experience in affairs both civil and military, for their king. He revived the drooping spirits of his countrymen, defeated the Romans, and reduced all the province of Venetia; but was in a short time murdered, and Eraric, a Bogian, succeeded to the throne. He was scarcely invested with the sovereignty, when his subjects began to think of deposing him, and raising Totila to the throne; which the latter accepted, upon condition that they previously dispatched Eraric. This was accordingly done; after which Totila was proclaimed king of Italy in the year 542.

The new king proved a very formidable enemy to success of the Romans, who now lost ground everywhere. They made an attempt on the city of Verona; in which they miscarried through their own avarice, having disputed about the division of the plunder till the opportunity of taking the town was past. They were next defeated in two bloody engagements; the consequence of which was, that the Goths made themselves masters of all the strong places in Tuscany. From thence marching into Campania and Samnium, they reduced the strong town of Beneventum, and laid siege to Narni. During the siege of this last place, several detachments were sent from the king's army, which took Cam, and recovered all Bruttia, Lucania, Apulia, and Calabria, where they found considerable sums which had been gathered for the emperor's use.

The Romans, in the mean time, disheartened by their losses, and deprived of those sums which should have paid their wages, refused to take the field. A considerable fleet was therefore sent by Justinian to the relief of Naples; but Totila, having timely notice of this design, manned, with incredible expedition, a great number of light vessels; which, falling unexpectedly on the Roman fleet, took or sunk every ship, and made prisoners of all on board, excepting a few who escaped in their boats. A similar fate attended another fleet dispatched from Sicily for the same purpose. They put to sea in the depth of winter; and, meeting with a violent storm, were driven ashore near the enemy's camp; who sunk the ships, and made what slaughter they pleased of the seamen and soldiers. This second disaster the Neapolitans, despairing of further relief, submitted to Totila, who granted them honourable terms, and treated them with great humanity. As they had been long pinched with famine, Totila, apprehending they might endanger their lives by indulging their appetites too much at first, placed guards at the gates to prevent their going out, taking care at the same time to supply them sparingly with provisions, but increasing their allowance every day. Being thus by degrees restored to their former strength, he ordered the gates to be set open, and gave every one full liberty to stay in the city or remove as he thought fit. The garrison he treated with extraordinary kindness. They were first supplied with ships to carry them to Constantinople; but the king having discovered that their real design was to sail to Rome, in order to reinforce the garrison of that city (which they knew he was soon to besiege), he was so far from punishing them as they expected, that he furnished them with horses, waggons, and provisions, and ordered a body of Goths to escort them to Rome by land.
land, as the winds had proved unfavourable for their passage by sea.

Totila having thus become master of Naples and most of the other fortresses in these parts, began to think of reducing Rome also. He first attempted to persuade the citizens to a surrender; but finding his persuasions intellectual, he sent a detachment of his army into Calabria to reduce Otranto, which had not yet submitted; after which, he marched with the rest of his forces against the towns in the neighbourhood of Rome. The city of Tibur, now Tivoli, about 18 miles from Rome, was betrayed to him; and all the inhabitants, together with their bishop, were put to the sword. Several other strongholds in the neighbourhood of that city he took by storm; so that Rome was in a manner blocked up by land, all communication with the neighbouring country being cut off.

Justinian, in the mean time, being greatly perplexed by the bad news he every day received from Italy, recalled Belisarius from Persia, notwithstanding the success which attended him there. To save Rome, however, was now impossible even for Belisarius himself. As soon as he arrived in Italy, finding himself unable either to relieve the towns which were besieged, or to stop the progress of the Goths, he dispatched letters to Justinian, informing him, that being destitute of men, arms, and money, it was impossible for him to prosecute the war; upon which the emperor ordered new levies to be made, all the veterans being engaged in the Persian war. In the mean time, however Totila pursued his good fortune; took the cities of Firmum, Asculum, Auxinum, Spoleto, &c. and at length advanced to Rome, which he invested on all sides. As he drew near the city, two officers, whom Belisarius had sent into the city, ventured to make a sally, though contrary to the express orders of their general, thinking they should surprise the Goths; but they were themselves taken in an ambuscade, and, most of their men being cut in pieces, narrowly escaped falling into the hands of the enemy. Belisarius made several attempts to relieve the city; but all of them, however well concerted, by some accident or other proved unsuccessful; which gave him so much uneasiness, that he fell into a feverish disorder, and was for some time thought to be in danger of his life. The city was soon reduced to great straits; a dreadful famine ensued; and the unhappy citizens having consumed everything that could be supposed to give them nourishment, even the grass that grew near the walls, were obliged, it is said, to feed on their own excrements. Many put an end to their lives, in order to free themselves from the intolerable calamities they suffered. The rest addressed their governor Bessas in the most pathetic manner, intreating him to supply them with food; or if that was not in his power, either to give them leave to go out of the town, or to terminate their misery by killing them rather than allow them to supply them with food was impossible; to let them go, unsafe; and to kill them impious. In the end, however, he suffered those who were willing to retire, to leave the city, upon paying him a sum of money; but most of them either died on the road, or were cut in pieces by the enemy. At last, the besieged, unable to bear their miseries any longer, began to mutiny, and to press their governor to come to an agreement with Totila. This, however, he still refused; upon which, four of the Saudis who guarded one of the gates, went privately to the camp of Totila, and offered to admit him into the city. The king received this proposal with great joy; and sending four Goths of great strength and intrepidity into the town along with them, he silently approached the gates in the night-time with his whole army. The gates were opened by the Saudis, as they had promised; and upon the first alarm, Bessas with most of the soldiers and officers fled out of the town. The inhabitants took sanctuary in the churches; and only 60 of them and 26 soldiers were killed after the town was taken. Totila, however, gave his soldiers full liberty to plunder the city; which they did for several days together, stripping the inhabitants of all their wealth, and leaving nothing in their houses but naked walls; by which means many persons of distinction were reduced to beg their bread from door to door. In the house of Bessas was found an immense treasure, which he had scandalously amassed during the siege, by selling to the people, at an exorbitant price, the corn which had been stored up for the use of the garrison.

Totila, thus became master of Italy, sent ambassadors to Justinian with very respectful letters, desiring to live on the same terms with him that Theodoric had done with his predecessor Anastasius; promising in that case to respect him as his father, and to assist him, when he pleased, with all his force, against any other nation whatever. On the contrary, if the emperor rejected his offers, he threatened to level Rome with the ground, to put the whole senate to the sword, and to carry the war into Illyricum. The emperor returned no other answer, than that he referred the whole to Belisarius, who had full power to manage all things of that nature. Upon this Totila resolved to destroy the city; and had actually thrown down a third part of the wall, when he received a letter from Belisarius, dissuading him from his intention. After having seriously considered this letter, Totila thought proper to alter his resolution with regard to the destruction of the city; but sent every one of the inhabitants into Lucania, without leaving a single person in the metropolis. Belisarius hearing of this, immediately returned to the capital, and undertook to reproove and repair it. He cleared the ditch which had been filled by Totila, but was for the present obliged to fill up the breaches in the walls with stones loosely heaped upon one another, and in this situation the city was again attacked by the Goths. Belisarius, however, had taken care to supply the inhabitants with plenty of provisions, so that they were now in no danger of suffering by famine; and the assaults of the enemy were vigorously repelled, notwithstanding the bad situation of the fortifications, so that Totila at last abandoned the enterprise.

In the mean time the Persians gained great advantage over the Romans in the East, so that there was no necessity for recalling Belisarius a second time. He was no sooner gone, than Totila renewed his efforts with greater vigour than ever; and at the same time the Franks, concluding that both Romans and Goths would be much weakened by such a destructive war, seized upon Venetia, which belonged to both nations, and made it a province of the French empire. Totila did not oppose them; but having obtained a reinforcement of
of 6000 Lombards, returned immediately before Rome, fully intent on making himself master of that metropolis. Having closely invested it by sea and land, he hoped in a short time to reduce it by famine: but against this the governor wisely provided, by causing corn to be sown within the walls; so that he could probably have denied the power of Totila, had not the city been again betrayed by the Isaurians, who opened one of the gates and admitted the enemy.

Thus the empire of the Goths was a third time established in Italy: and Totila, immediately on his becoming master of Rome, dispatched ambassadors to Justinian, offering to assist him as a faithful ally against any nation whatever, provided he would allow him the quiet possession of Italy. But Justinian was so far from hearkening to this proposal, that he would not even admit the ambassadors into his presence; upon which Totila resolved to pursue the war with the utmost vigour, and to make himself master not only of those places which the Romans possessed in Italy, but in Sicily also. This he fully accomplished; when Narses, who had formerly been joined in the command with Belisarius, was appointed general, with absolute and uncontrolled authority. But while this general was making the necessary preparations for his expedition, Totila, having equipped a fleet of 300 galleys, sent them to pillage the coasts of Greece, where they got an immense booty. They made a descent on the island of Corfu; and having laid it waste, they sailed to Epirus, where they surprised and plundered the cities of Nicopolis and Anchialus, taking many ships and cattle, among which were some laden with provisions for the army of Narses. After these successes they laid siege to Ancona in Dalmatia. Being defeated, however, both by sea and land, Totila once more sent ambassadors to Constantinople, offering to yield Sicily and all Dalmatia, to pay an annual tribute for Italy, and to assist the Romans as a faithful ally in all their wars: but Justinian, bent upon driving the Goths out of Italy, would not even suffer the ambassadors to appear in his presence.

Totila finding that no terms could be obtained, began to levy new forces, and to make great preparations by sea and land. He soon reduced the islands of Corsica and Sardinia; but this was the last of his successes. Narses arrived in Italy with a very formidable army, and an immense treasure to pay the troops their arrears, the want of which had been one great cause of the bad success of Belisarius in his last expedition. He immediately took the road to Rome; while Totila assembled all his forces, in order to decide the fate of Italy by a general engagement. The battle proved very obstinate; but at last the Gothic cavalry being put to the rout, and retiring in great confusion among the infantry, the latter were thereby thrown into such disorder, that they could never afterwards rally. Narses, observing their confusion, encouraged his men to make a last effort; which the Goths not being able to withstand, betook themselves to flight, with the loss of 6000 men killed on the spot. Totila finding the day irrecoverably lost, fled with only five horsemen for his attendants; but was pursued and mortally wounded by a commander of one of the bodies of barbarians who followed Narses. He continued his flight, however, for some time longer; but was at last obliged to halt in order to get his wound dressed, soon after which he expired.

This disaster did not yet entirely break the spirit of the Goths. They chose for their king one Teia, deservedly esteemed one of the most valiant men of their nation, and who had on several occasions distinguished himself in a most eminent manner. All the valor and experience of Teia, however, were now insufficient to stop the progress of the Romans. Narses made himself master of a great number of cities, and of Rome itself, before the Goths could assemble their forces. The Roman general next proceeded to invest Cumae; which Teia determined at all events to relieve, as the royal treasure was lodged in that city. This brought on an engagement, which, if Procopius is to be credited, proved one of the most bloody that ever was fought. The Roman army consisted of vast multitudes brought from different nations: the Goths were few in comparison; but, animated by despair, and knowing that all was at stake, they fought with the utmost fury. Their king placed himself in the first rank, to encourage his men by his example; and is said to have given such proofs of his valor and conduct as equalled him to the most renowned heroes of antiquity. The Romans discovering him, and knowing that his death would probably put an end to the battle, if not to the war itself, directed their whole force against him, some attacking him with spears, and others discharging against him showers of darts and arrows. Teia maintained his ground with great steadiness, received the missive weapons on his shield, and killed a great number of the enemy with his own hand. When his shield was so loaded with darts that he could not easily wield it, he called for another. Thus he shifted his shield three times; but as he attempted to change it another time, his breast being necessarily exposed for a moment, a dart struck him in that moment with such force, that he immediately fell down dead in the place where he had stood from the beginning of the battle, and upon heaps of the enemy whom he had killed. The Romans, seeing him fall, cut off his head and exposed it to the sight of the Goths, not doubting but they would be immediately disheartened and retire. In this, however, they were disappointed. The Goths maintained the fight with great vigour, till night put an end to the engagement. The next day the engagement was renewed early in the morning, and continued till night: but on the third day, the Goths despairing of being able to overcome an enemy so much superior to them in numbers, sent deputies to Narses, offering to lay down their arms, provided such of them as chose to remain in Italy were allowed to enjoy their estates and possessions without molestation, as subjects of the empire; and those who were willing to retire elsewhere, were suffered to carry with them all their goods and effects.

To these terms Narses readily assented; and thus the end of the empire of the Goths in Italy was finally destroyed, the empire country now becoming a province of the eastern Roman empire.

In this conquest Narses had been assisted, as already observed, by many barbarous nations, among whom were the Lombards, at that time settled in Pannonia. On the conclusion of the war, they were dismissed with rich presents, and the nation for some time continued.
ITALY.

...continued faithful allies to the Romans. In the mean
time Justinian dying, Narses, who governed Italy with
an absolute sway, was accused to the emperor Justin II.
and to the empress Sophia, of aspiring to the sovereig
of the country. Hereupon he was recalled, and
Longinus sent to succeed him. As Narses was an
emancipator, the empress is reported to have said, that his
emplacement at Constantinople should be to distribute
in the apartment of her women the portion of wool
which each was to spin. Narses, enraged at this sar
casm, replied, that he should begin such a web as
she should never be able to finish; and immediately dis
patched messengers to Alboinus king of the Lombards,
inviting them into Italy. Along with the mes
sengers he sent some of the best fruits the country af
forded, in order to tempt him the more to become mas
ter of such a rich kingdom.

Alboinus, highly pleased with the opportunity of
invading a country with which his subjects were already
well acquainted, began without loss of time to make
the necessary preparations for his journey. In the
month of April, 568, he set out with his whole nation,
men, women, and children; carrying with them all
their moveables. This promiscuous multitude arrived
by the way of Istria; and advancing through the pro
vince of Venetia, found the whole country abandoned,
the people being long flown to the neighbouring islands
in the Adriatic. The gates of Aquileia were opened
by the few inhabitants who had courage to stay; most
of them, however, had fled with all their valuable ef
fects; and among the rest the patriarch Paulinus,
who had carried with him all the sacred utensils of
the churches. From Aquileia, Alboinus proceeded to
Forum Julii, of which he likewise became master with
out opposition. Here he spent the winter; during
which time he erected Friuli into a dukedom, which
has continued ever since. In 569, he made himself
master of Trivigi, Oderzo, Monte Selce, Vicenza,
Verona, and Trent; in each of which cities he left a
strong garrison of Lombards under the command of an
officer, whom he distinguished by the title of duke:
but these dukedoms were only officers and governors of
cities, who bore the title no longer than the prince
thought proper to continue them in their command or
government. Padua and some other cities Alboi
nus left behind him without attempting to reduce
them, either because they were too well garrisoned,
or because they lay too much out of his way. In
570, he entered Liguria. The inhabitants were so
terrified at his approach, that they left their habita
tions with such of their effects as they could carry off,
and fled into the most mountainous and inaccessible
parts of the country. The cities of Brescia, Berga
mo, Lodi, Como, and others quite to the Alps, being
left almost without inhabitants, submitted of course;
after which he reduced Milan, and was thereupon pro
claimed king of Italy.

But though the Lombards had thus conferred the
title of king of Italy on their sovereign, he was by no
means possessed of the whole country, nor indeed was
it ever in the power of the Lombards to get possession
of the whole. Alboinus having made himself master
of Venetia, Liguria, Æmilia, Heturia, and Umbria,
applied himself to legislation and the civilization of his
subjects. But before he could make any progress in
this work, he was taken off by the treachery of his
wife; and Clephis, one of the nobles, chosen king in
his stead. Clephis rebuilt some cities which had been
ruined during the wars between the Goths and Lo
mans, and extended his conquests to the very gates of
Rome; but as he behaved both to the Romans and Lo
birds with the greatest cruelty, he was murdered,
after a short reign of 18 months. His cruelty gave the
Lombards such an aversion against regal power, that they
changed their form of government, being govern
ed only by their dukes for the space of ten years.
During this interregnum, they proved successful in
their wars with the Romans, and made themselves masters
of several cities: but perceiving that their kingdom,
thus divided, could not subsist, they resolved once
more to submit to the authority of one man; and ac
coringly, in 585, Autharius was chosen king of the
Lombards.

The great object of ambition to the new race of Lo
bard monarchs was the conquest of all Italy; and Charle
manque this proved at last the ruin of their empire by Charles
the Great, as related under the article FRANCE, No. 27.
As the Lombards, however, had not been possessed of
the whole territory of Italy, so the whole of it never
came into the possession of Charlemagne: neither since
the time of the Goths, has the whole of this country
been under the dominion of any single state. Some of
the southern provinces were still possessed by the em
perors of Constantinople; and the liberal grants of Pe
pin and Charlemagne himself to the pope, had invested
him with a considerable share of temporal power. The
territories of the pope indeed were supposed to be held
in vassalage from France; but this the pope them
selves always stily denied. The undisputed territory his Italian
domains.

of Charlemagne in Italy, therefore, was restricted to
Piedmont, the Milanes, the Mantuan, the territory
of Genoa, Parma, Modena, Tuscany, Bologna, the
dukedoms of Friuli, Spoleto, and Benevento; the last
of which contained the greatest part of the present
kingdom of Naples.

The feudal government which the Lombards had
introduced into Italy, naturally produced revolts and
commodations, as the different dukedoms inclined either to
change their masters or to set up for themselves. Se
veral revolts indeed happened during the life of Char
lemagne himself; which, however, he always found
means to crush: but after his death, the sovereignty of
Italy became an object of contention between the
kings of France and the emperors of Germany. That
great monarch had divided his extensive dominions
among his children; but they all died during his life
time, except Louis, whom he associated with himself
in the empire, and who succeeded to all his dominions
after his death. From this time we may date the trou
bles with which Italy was so long overwhelmed; and
of which, as they proceeded from the ambition of those
called kings of Italy and their nobles, of the kings of
France, and of the emperors of Germany, it is diffi
t to have any clear idea. The following short sketch,
however, may perhaps give some satisfaction on this
perplexed subject.

At the time Louis the son of Charlemagne was de
clared emperor of the West, Italy was held by Ber
nard the son of Pepin, brother to Louis. Though this the time of
Charles
monste...
ITALY.

In 877 the pope was reconducted to Italy with an army by Boson son-in-law to Louis II. of France; but though he inclined very much to have raised this prince to the dignity of king of Italy, he found his interest insufficient for that purpose, and matters remained in their former situation. The nobles, who had driven out the pope, were now indeed reconciled to him; but notwithstanding this reconciliation, the state of the country was worse than ever: the great men renouncing the authority of any superior, and every one claiming to be sovereign in his own territories. To add to the calamities which ensued through the ambition of these despots, the Saracens committed every where the most terrible ravages; till at last, the Italian nobles, despising the kings of the Carolingian race, who had weakened themselves by their mutual dissensions, began to think of throwing off even all nominal submission to a foreign yoke, and retaining the imperial dignity among themselves. Thus they hoped, that, by being more united among themselves, they might be more able to resist the common enemy. Accordingly, in 886, they went to Pope Adrian; and requesting him to join them in asserting the independency of Italy, they obtained of him the two interesting decrees, viz. that the popes, after their election, might be consecrated without waiting for the presence of the king or his ambassadors; and that if Charles the Gross died without sons, the kingdom of Italy, with the title of emperor, should be conferred on some of the Italian nobles.

These decrees were productive of the worst consequences imaginable. The emperor complained of being deprived of his right; and the dissensions between the Italian nobles themselves became more fatal than ever. The two most powerful of these noblemen, Berengarius duke of Friuli, and Guido or Vido, duke of Spoleto, entered into an agreement, that on the death of the emperor, the former should seize on the kingdom of Italy, and the latter on the kingdom of France. Berengarius succeeded without opposition; but Vido was disappointed, the French having already chosen Eudes or Otho for their king. Upon this, he returned to Italy, and turned his arms against Berengarius. Vido proved victorious in an engagement, and drove his rival into Germany; where he sought the assistance of Arnolphus, who had succeeded to the crown after the death of Charles. Having thus obtained the kingdom of Italy, Vido employed his time in reforming the abuses of the state, and confirming the grants formerly given to the pope, out of gratitude for his having sanctified his usurpation and declared him lawful king of Italy. This tranquillity, however, was of short duration. Arnolphus sent an army into Italy; the Saracens from Spain ravaged the northern parts of the country, and getting possession of a castle near the Alps, held it for many years after, to the great distress of the neighbouring parts, which were exposed to their continual incursions; and at the same time Benevento was besieged and taken by the forces of the eastern emperor, so that Vido found his empire very considerably circumscribed in its dimensions.

The new king, distressed by so many enemies, associated his son Lambert with him in the government, and
ITALY.

In 893, however, they again invaded Italy; but were suddenly obliged to leave the country, after having put Berengarius in possession of Pavia. In the mean time, Vido died, and his son Lambert drove out Berengarius; but having joined a faction, headed by one Sergius, against Pope Formosus, the latter offered the kingdom of Italy to Arnolphus; who thereupon entered the country with an army, besieged and took Rome, massacring the faction of Sergius with the most unrelenting cruelty.

Arnolphus was master of Italy, and crowned emperor by the pope, began to form schemes of strengthening himself in his new acquisitions by putting out the eyes of Berengarius: but the latter having timely notice of this treachery, fled to Verona; and the Italians were so provoked at this and the other cruelties of Arnolphus, that they drove him out of the country. His departure occasioned the greatest confusion at Rome. Formosus died soon after; and the successors to the papal dignity, having no army to fear, excited the greatest disturbances. The body of Formosus was dug up and thrown into the Tiber by one pope; after which that pope was strangled, and Formosus's body buried again in the Vatican, by order of another. At last the coronation of Arnolphus was declared void, the Saxon faction entirely demolished, and the above-mentioned decrees of Adrian were annulled; it being now determined that the elected popes should not be consecrated but in presence of the emperor or his ambassadors.

During these confusions Lambert enjoyed the kingdom in quiet; but the nobles hating him on account of his arbitrary and tyrannical government, began again to think of Berengarius. In the mean time, however, another faction offered the crown to Louis king of Arles. This new competitor entered Italy with an army in 899; but was forced by Berengarius to renounce his claim upon oath, and to swear that he would never enter Italy, even though he should be invited to be crowned emperor.—This oath, however, was soon forgotten. Louis readily accepted of another invitation, and was crowned king of Italy at Pavia in 901. The following year he forced Berengarius to fly into Bavaria; but having unhappily disbanded his army, as thinking himself now securely seated on the throne, Berengarius, who watched every opportunity, surprised him at Verona, and put out his eyes.

Thus Berengarius at last became king of Italy without a rival; and held his kingdom for 20 years after, without any opposition from his subjects, who at last became sensible of the mischief arising from civil discord. He was not yet, however, without troubles. The Hungarians invaded Italy with a formidable army, and advanced within a small distance of Pavia. Berengarius armed the whole force of his dominions; and came against them with such a multitude, that the Hungarians retired without venturing an engagement. A great many of their men were lost in passing a river; upon which they sent deputies to Berengarius, offering to restore all their booty, and never to come again into Italy, provided they were allowed a safe retreat. These conditions were imprudently denied; upon which the Hungarians attacked the army of Berengarius in despair, and defeated them with great slaughter. After this they overspread the whole country, and plundered the towns of Treviso, Vicenza, and Padua, without resistance, the inhabitants flying everywhere into fortified places. This devastation they continued for two years; nor could their departure be procured without paying them a large sum of money: which, however, proved of little avail; for the following year they returned and ravaged the territory of Friuli without control. Scarcely were these invaders departed, when the Saracens, who had settled at the foot of the Alps, invaded Apulia and Calabria, and made an irruption as far as Aquil in the neighbourhood of Pavia; while the inhabitants, instead of opposing them, fled to some forts which had been erected in the time of the first irruption of the Hungarians. In 912, however, John, presbyter of Ravenna, having attained the papal dignity by means of Theodora wife of Aldebert count of Tuscany, applied himself to regulate the affairs of the church, and to repress the insurrections of the Saracens. While he was considering on the most proper methods of effecting this, one of the Saracens, who had received an injury from his countrymen, fled to Rome, and offered to deliver the Italians from their invasions, if the pope would but allow him a small body of men. His proposals being accepted, 60 young men were chosen all well armed; who being conducted by the Saracen into by-paths, attacked the infidels as they were returning from their inroads, and several times defeated great parties of them. These losses affecting the Saracens, a general alliance was concluded amongst all their cities; and having fortified a town on the Garigliano, they abandoned the rest, and retired hither. Thus they became much more formidable than before; which alarming the pope, he consulted with Arnolphus prince of Benevent and Capua, sending at the same time ambassadors to Constantine the Greek emperor, inviting him to an alliance against the infidels. The Saracens, unable to withstand such a powerful combination, were besieged in their city: where being reduced to great straits, they at last set fire to it, and sallied out into the field; but being pursued by the Italians, they were all cut off to a man.

In this expedition it is probable that Berengarius gave great assistance: for this very year, 915, he was crowned emperor by the pope. This gave displeasure to many of the ambitious nobles; conspiracies were repeatedly formed against him; in 922, Rodolphus king of Burgundy was crowned also king of Italy; and in 924, Berengarius was treacherously assassinated at Verona; of which disturbances the Hungarians taking the advantage, plundered the cities of Mantua, Brescia, and Bergamo. Marching afterwards to Pavia, they invested it closely on all sides; and about the middle of March 925, taking advantage of the wind, they set fire to the houses next to the walls, and during the conflagration broke open the gates, and getting possession of the city treated the inhabitants with the greatest barbarity. Having burnt the capital of the kingdom, they next proceeded to Piacenza, where they plundered the suburbs; and then returned to Pannonia laden with booty.

The affairs of Italy now fell into the utmost confusion. A faction was formed against Rodolphus in favour of Hugh count of Arles. The latter prevailed, and was crowned king at Pavia in 927. The Italians, however, soon repented of their choice. The Romans, first
He deprived him however, of the dukedom of Friuli and marquisate of Verona, which he gave to Henry duke of Bavaria.

Berengarius, thus freed from all apprehension, not Otho only oppressed his subjects in a most tyrannical manner, but revolted against Otho himself. This at last procured his ruin: for, in 961, Otho returned with an army into Italy, where he was crowned king by the archbishop of Milan; and the year following was crowned emperor by the pope. On this occasion he received the imperial crown from his holiness, and kissed his feet with great humility: after which they both went to the altar of St Peter, and bound themselves by a solemn oath, the pope to be always faithful to the emperor, and to give no assistance to Berengarius or Adelbert his enemies; and Otho, to consult the welfare of the church, and to restore to it all its patrimony granted by former emperors. Otho, besides this, bestowed very rich presents on the church of St Peter. He ordained that the election of popes should be according to the canons; that the elected pope should not be consecrated till he had publicly promised, in presence of the emperor's commissaries, to observe every thing formerly specified with regard to the rights of the emperors; that these commissaries should constantly reside at Rome, and make a report every year how justice was administered by the judges; and in case of any complaints, the commissaries should lay them before the pope; but if he neglected to intimate them, the imperial commissaries might then do what they pleased.

Thus we see that Otho, however much he might allow the pope's supremacy in spiritual matters, plainly assumed the sovereignty in temporals to himself; and thus Italy was for upwards of 300 years accounted a part of the German empire. The popes, however, by no means relished this superiority of the emperor. The latter was hardly departed, when the pope, (John XII.) broke the oath which he had just before sworn with so much solemnity; and entered first into an alliance with Adelbert count of Tuscany to expel the Germans, and then solicited the Hungarians to invade Italy. This treachery was soon punished by Otho. He returned with part of his army, and assembled a council of bishops. As the pope did not appear, Otho pretended great concern for his absence. The bishops replied, that the consciousness of his guilt made him afraid to show himself. The emperor then inquired particularly into his crimes; upon which the bishops accused him of filling the palace with lewd women, of ordaining a bishop in a stable,卡特里亚 a cardinal, drinking the devil's health, &c. As the pope still refused to appear in order to justify himself from these charges, he was formally deposed; and Leo the chief secretary, though a layman, elected in his stead.

The new pope, in compliment to the emperor, granted a bull, by which it was ordained that Otho and his successors should have a right of appointing the popes and investing archbishops and bishops; and that none should dare to consecrate a bishop without leave obtained from the emperor. Thus were the affairs of the Italians still kept in the utmost confusion even during the reign of Otho I. who appears to have been a wise and active prince. He was no sooner gone, than the
ITALY.

A new pope was deposed, all his decrees annulled, and John replaced. The party of Leo was now treated with great cruelty: but John was soon stopped in his career; for about the middle of May, the same year (964) in which he had been restored, being surprised in bed with a Roman lady, he received a blow on the head from the devil (according to the authors of those times), of which he died eight days after. After his death a cardinal deacon, named Benedict, was elected by the Romans, but deposed by Otho, and banished to Hamburg.

The emperor was scarce returned to Germany, when his fickle Italians revolted, and sent for Adelbert, who had fled to Cordesio. But being soon reduced, they continued quiet for about a year; after which they revolted again, and imprisoned the pope. Otho, however, provoked at their rebellious disposition, soon returned, and punished the rebels with great severity; after which he made several laws for the better regulation of the city of Rome, granting several privileges to the Venetians, and caused his son Otho, then only thirteen years of age, to be crowned emperor.

This ceremony being over, Otho dispatched an ambassador to Nicephorus, emperor of Constantinople, demanding his step-daughter Theophania in marriage for the young emperor; but upon this alliance being rejected, and that not without circumstances of the most atrocious perfidy, Otho instantly invaded the countries of Apulia and Calabria, and entirely defeated the Greek army in those parts. In the mean time, however, Nicephorus being killed, and his throne usurped by John Zimisces, Otho immediately entered into an alliance with the latter, and easily obtained Theophania for his son. She was crowned with great solemnity on the 8th of April 969; at the same time it is pretended by some authors, that the Greeks renounced their rights to Calabria and Apulia; though this is denied by others.

After the celebration of this marriage, the emperor undertook an expedition against the Saracens, who still resided at the foot of the Alps; but being informed of the death of several nobles in Germany, he thought proper to return thither, where he died of an apoplexy in the year 975.

At the time of Otho's death Italy was divided into the provinces of Apulia, Calabria, the dukedom of Benevento, Campania, Terra Romana, the dukedom of Spoleto, Tuscany, Romagna, Lombardy, and the marquises of Ancona, Verona, Friuli, Treviso, and Genoa. Apulia and Calabria were still claimed by the Greeks; but all the rest were either immediately subject to, or held of, the kings of Italy. Otho conferred Benevento (including the ancient Samnium) on the duke of that name. Campania and Lucania he gave to the dukes of Capua, Naples, and Salerno. Rome with its territory, Ravenna with the exarchate, the dukedom of Spoleto, with Tuscany, and the marquisate of Ancona, he granted to the pope; and retained the rest of Italy under the form of a kingdom. Some of the cities were left free, but all tributary. He appointed several hereditary marquises and counties, but reserved to himself the sovereign jurisdiction in their territories. The liberty of the cities consisted in a freedom to choose their own magistrates, to be judges by their own laws, and to dispose of their own revenues, on condition that they took the oath of allegiance to the king, and paid the customary tribute. The cities that were not free were governed by the comissaries or lieutenants of the emperor; but the free cities were governed by two or more consuls, afterwards called potestates, chosen annually, who took the oath of allegiance to the emperor before the bishop of the city or the emperor's commissary. The tribute exacted was called foderum, parata, et mansionicum. By the foderum was meant a certain quantity of corn which the cities were obliged to furnish to the king when marching with an army or making a progress through the country; though the value of this was frequently paid in money. By the parata was understood the expense laid out in keeping the public roads and bridges in repair; and the mansionicum included those expenses which were required for lodging the troops or accommodating them in their camp. Under pretence of this last article, the inhabitants were sometimes stripped of all they possessed, except their oxen and seed for the land. Besides regulating what regarded the cities, Otho distributed honors and possessions to those who had served him faithfully. The honours consisted in the titles of duke, marquis, count, captain, valvassor, and' valor; the possessions were, besides land, the duties arising from harbours, ferries, roads, fishponds, mills, salt-pits, the uses of rivers, and all pertaining to them, and such like. The dukedoms, marquises, and counts, were those who received dukedoms, marquises, and counties, from the king in fief; the captains had the command of a certain number of men by a grant from the king, duke, marquis, or count; the valvassors were subordinate to the captains, and the valvasins to them.

No sooner was the death of Otho I. known in Italy, than, as if they had been now freed from all restraint, the nobles declared war against each other; some cities revolted, and chose to themselves consuls; while the dominions of others were seized by the nobles, who confirmed their power by erecting citadels. Rome especially was harassed by tumults, occasioned chiefly by the seditious practices of one Cincius, who pressed his fellow-citizens to restore the ancient republic. As the pope continued firm in the interests of the emperor, Cincius caused him to be strangled by one Franco a cardinal deacon; who was soon after rewarded with the pontificate, and took upon him the name of Boniface VII. Another pope was chosen by the faction of the count of Tuscany; who being approved by the emperor, drove Cincius and Boniface out of the city. Disturbances of a similar kind took place in other cities, though Milan continued quiet and loyal in the midst of all this uproar and confusion.

In the mean time Boniface fled for refuge to Constantinople, where he excited the emperor to make war against Otho II. In 979 an army was accordingly sent into Italy, which conquered Apulia and Calabria; but the next year Otho entered Italy with a formidable army; and having taken a severe revenge on the authors of the disturbances, drove the Greeks entirely out of the provinces they had seized. Having then caused his son Otho III. at that time a boy of ten years of age, to be proclaimed emperor, he died at Rome in the year 983. Among the regulations made by this emperor, one is very remarkable, and must give us a
strange idea of the inhabitants of Italy at that time. He made a law, That no Italian should be believed upon his oath; and that in any dispute which could not be decided otherwise than by witnesses, the parties should have recourse to a duel.

Otho III. succeeded to the empire at twelve years of age; and during his minority the disturbances in Italy revived. Cincius, called also Crescentius, renewed his scheme of restoring the republic. The pope (John XV.) opposing his schemes, was driven out of the city, but was soon after recalled, on hearing that he had applied to the emperor for assistance. A few years after Crescentius again revolted, and expelled Gregory V., the successor of John XV.; raising to the papal dignity a creature of his own, under the name of John XVI. Otho, enraged at this insult, returned to Rome with a powerful army in 998, besieged and took it by assault; after which he caused Crescentius to be beheaded, and the pope he had set up to be thrown headlong from the castle of St. Angelo, after having his eyes pulled out, and his nose cut off. Four years after, he himself died of the smallpox; or, according to some, was poisoned by the widow of Crescentius, whom he had deposed under the promise of marriage, just as he was about to punish the Romans for another revolt.

Otho succeeded in the imperial throne by Henry duke of Bavaria, and grandson to Otho II. Henry had no sooner settled the affairs of Germany, than he found it necessary to march into Italy against Arduin marquis of Ivrea, who had assumed the title of king of Italy. Him he defeated in an engagement, and was himself crowned king of Italy at Pavia in 1003; but a few years after, a new contest arose about the papal chair, which again required the presence of the emperor. Before he arrived, however, one of the competitors (Benedict VIII.) got the better of his rival, and both Henry and his queen received the imperial crown from his hands. Before the emperor entered the church, the pope proposed to him the following question: ‘Will you observe your fidelity to me and my successors in everything?’ To which, though a kind of homage, he submitted, and answered in the affirmative. After his coronation, he confirmed the privileges bestowed on the Roman see by his predecessors, and added some others of his own; still, however, reserving for himself the sovereignty and the power of sending commissaries to bear the grievances of the people. Having repelled the incursions of the Saracens, repulsed some more rebellions of his subjects, and reduced the greatest part of Apulia and Calabria, he died in the year 1024.

The death of this emperor was, as usual, followed by a competition for the crown. Conrad being chosen emperor of Germany, was declared king of Italy by the archbishop of Milan; while a party of the nobles made offer of the crown to Robert king of France, or his son Hugh. But this offer being declined, and likewise another to William duke of Guiene, Conrad enjoyed the dignity conferred on him by the archbishop without molestation. He was crowned king of Italy at Monza in 1026; and the next year he received the imperial crown from Pope John XX. in presence of Canute the Great, king of England, Denmark, and Norway, and Redolph III. king of Burgundy. His reign was similar to that of his predecessors. The Italians revolted, the pope was expelled, the malecontents were subdued, and the pope restored, after which the emperor returned to Germany, and died in 1039.

Under Henry III. who succeeded Conrad, the disturbances were prodigiously augmented. Pope Sylvester II. was driven out by Benedict; who in his turn was expelled by John bishop of Sabinus, who assumed the title of Sylvester III. Three months after Benedict was restored, and excommunicated his rivals; but soon after resigned the pontificate for a sum of money. In a short time he reclaimed it; and there were at once three popes, each of whom was supported on a branch of the papal throne, while all of them made themselves odious by the scandalous lives they led. At last a priest called Gratian put an end to this singular triumvirate. Partly by artifice, and partly by present, he persuaded all the three to renounce their pretensions to the see; and the people of Rome, out of gratitude for so signal a service to the church, chose him pope, under the name of Gregory VI. Henry III. took umbrage at this election, in which he had not been consulted, and marched with an army into Italy. He deposed Gregory, as having been guilty of simony, and filled the papal chair with his own chancellor Heidiger, bishop of Bamberg, who assumed the name of Clement II. and afterwards consecrated Henry and the empress Agnes. This ceremony being over, and the Romans having sworn never to elect a pope without the approbation of the reigning emperor, Henry proceeded to Capo, where he was visited by Drago, Raimulphus, and other Norman adventurers; who leaving their country at different times, had made themselves masters of great part of Apulia and Calabria, in the extent of the Greeks and Saracens. Henry entered into treaty with them; and not only solemnly invested them with those territories which they had acquired by some territorial conquest, but prevailed on the pope to excommunicate Anacleto the Beneventines, who had refused to open their gates to him, and bestowed that city and its dependencies, as siefs of the empire, upon the Normans, provided they took possession by force of arms. The emperor was scarce returned into Germany when he received intelligence of the death of Clement II. He was succeeded in the apostolic see by Damusus II.; who also dying soon after his elevation, Henry nominated Bruno bishop of Toiu to the vacant chair. This Bruno, who was the emperor’s relation, immediately assumed the pontificate; but being a modest and pious prelate, he threw them off in his journey, by the persuasion of a monk of Cluny, named Hildebrand, afterwards the famous Gregory VII. and went to Rome as a private man. ‘The emperor alone (said Hildebrand) has no right to create a pope.’ He accompanied Bruno to Rome, and secretly retarded his election, that he might arrogate to himself the merit of obtaining it. The scheme succeeded to his wish; Bruno, who took the name of Leo IX. believing himself indebted to Hildebrand for the pontificate, favoured him with his particular friendship and confidence; and hence originated the power of this enterprising monk, of obscure birth, but boundless ambition, who governed Rome so long, and whose zeal for
the exaltation of the church occasioned so many troubles to Europe.

Leo soon after his elevation waited on the emperor at Worms, to crave assistance against the Norman princes, who were become the terror of Italy, and treated their subjects with great severity. Henry furnished the pope with an army; at the head of which he marched against the Normans, after having communicated them, accompanied by a great number of bishops and other ecclesiastics, who were all either killed or taken prisoners, the Germans and Italians being totally routed. Leo himself was led captive to Benevento, which the Normans were now masters of, and which Henry had granted to the pope in exchange for the fief of Bamberg in Germany; and the apostolic see is to this day in possession of Benevento, by virtue of that donation. The Normans, however, who had a right to the city by a prior grant, restored it, in the mean time, to the princes of Lombardy; and Leo was treated with so much respect by the conquerors, that he revoked the sentence of excommunication, and joined his sanction to the imperial investiture for the lands which they held in Apulia and Calabria.

Leo died soon after his release; and the emperor about the same time caused his infant son, afterwards the famous Henry IV., to be declared King of the Romans, a title still in use for the acknowledged heir of the empire. Gebehard, a German bishop, was elected pope, under the name of Victor II., and confirmed by the address of Hildebrand, who waited on the emperor in person for that purpose, though he disdained to consult him beforehand. Perhaps Hildebrand would not have found this task so easy, had not Henry been involved in a war with the Hungarians, who pressed him hard, and whom he obliged at last to pay a large tribute, and furnish him annually with a certain number of fighting men.

As soon as the emperor had finished this war and others to which it gave rise, he marched into Italy to inspect the conduct of his sister Beatrice, widow of Boniface marquis of Mantua, and made her prisoner. She had married Gozelo, duke of Lorraine, without the emperor's consent; and contracted her daughter Matilda, by the marquis of Mantua, to Godfrey duke of Spoleto and Tuscany, Gozelo's son by a former marriage. This formidable alliance justly alarmed Henry; he therefore attempted to dissolve it, by carrying his sister into Germany, where he died soon after his return, in the 39th year of his age, and the 16th of his reign.

The emperor, in his last journey to Italy, concluded an alliance with Contarini, doge of Venice. That republic was already rich and powerful, though it had only been enfranchised in the year 998, from the tribute of a mantle of cloth of gold, which it formerly paid, as a mark of subjection to the emperor of Constantinople. Genoa was the rival of Venice in power and in commerce, and was already in possession of the island of Corsica, which the Genoese had taken from the Saracens. These two cities engaged at this time almost all the trade of Europe. There was no city in any respect equal to them either in France or Germany.

Henry IV. was only five years old at his father's death. The popes made use of the respite given them by his minority, to shake off in a great measure their dependence upon the emperors. After a variety of contests about the pontificate, Nicholas II., a creature of Hildebrand's, was elected: who, among others, passed the following celebrated decree, viz. That for the future, the cardinals only should elect the pope; and that the election should afterwards be confirmed by the rest of the clergy and the people, "Saving the honour (adds he) due to our dear son Henry, now king; and who, if it please God, shall be one day emperor, according to the right which we have already conferred upon him." After this he entered into a treaty with the Norman princes above mentioned; who, though they had lately sworn to hold their possessions from the emperor, now swore to hold them from the pope; and hence arose the pope's claim of sovereignty over the kingdoms of Naples and Sicily.

Thus was the power of the German emperors in Italy greatly diminished, and that of the popes proportionally exalted; of which Henry soon had sufficient evidence. For having assumed the government into his own hands in the year 1072, being then 23 years of age, he was summoned by Alexander II. to his court. He appears before the tribunal of the holy see, on account of his loose life, and to answer the charge of having exposed the investiture of bishops to sale; at the same time that the pope excised his German subjects to rebel against him. The rebels, however, were defeated, and peace was restored to Germany; but soon after, Hildebrand above mentioned being elected to the pontificate under the name of Gregory VII. openly assumed the superiority over every earthly monarch whatever. He began with excommunicating every ecclesiastic who should receive a benefice from the hands of a layman, and every layman who should take upon him to confer such a benefice. Henry, instead of resenting this insolence, submitted, and wrote a penitential letter to the pope: who, upon this, condescended to take him into favour, after having severely reprimanded him for his loose life; of which the emperor now confessed himself guilty.

The quarrel between the church and the emperor was, however, soon brought to a crisis by the following accident. Solomon king of Hungary, being depo'ed by his brother Geyss, had fled to Henry for protection, and renewed the homage of Hungary to the empire. Gregory, who favoured Geyss, exclaimed against this act of submission; and said in a letter to Solomon, "You ought to know that the kingdom of Hungary belongs to the Roman church; and learn that you will incur the indignation of the holy see, if you do not acknowledge that you hold your dominions of the pope, and not of the emperor." Henry, though highly provoked at this declaration, thought proper to treat it with neglect; upon which Gregory resumed the dispute about investitures. The predecessors of Henry had always enjoyed the right of nominating bishops and abbots, and of giving them investiture by the cross and the ring. This right they had in common with almost all princes. The predecessors of Gregory VII. had been accustomed, on their part, to send legates to the emperors, in order to entreat their assistance, to obtain their confirmation, or desire them to come and receive the papal sanction, but for no other purpose. Gregory, however, sent two
ITALY.

in the month of January, bare-footed and fasting, before he was permitted to kiss the feet of his holiness; who all that time was shut up with the devout Matilda, whose spiritual director he had long been, and, as some say, her gallant. But that as it may, her attachment to Gregory, and her hatred to the Germans, was so great, that she made over all her estates to the apostolic see; and this donation is the true cause of all the wars which since that period have raged between the emperors and the popes. She possessed in her own right great part of Tuscany, Mantua, Parma, Reggio, Placentia, Ferrara, Modena, Verona, and almost the whole of what is now called the patrimony of St Peter, from Viterbo to Orvieto; together with part of Umbria, Spoleto, and the Marche of Ancona.

The emperor was at length permitted to throw himself at the pontiff's feet; who condescended to grant him absolution, after he had sworn obedience to him in all things, and promised to submit to his solemn decision at Augsburg: so that Henry got nothing but disgrace by his journey; while Gregory, elated by his triumph, and now looking upon himself (not altogether without reason) as the lord and master of all the crowned heads in Christendom, said in several of his letters, that it was his duty "to pull down the pride of kings."

This extraordinary accommodation gave much disgust to the princes of Italy. They never could forgive the insolence of the pope, nor the abject humility of the emperor. Happily, however, for Henry, their indignation at Gregory's arrogance overbalanced their detestation of his meanness. He took advantage of this temper; and by a change of fortune, hitherto unknown to the German emperors, he found a strong party in Italy, when abandoned in Germany. All Lombardy took up arms against the pope, while he was raising all Germany against the emperor. Gregory, on the other hand, made use of every art to get another emperor elected in Germany: and Henry, on his part, left nothing undone to persuade the Italians to elect another pope. The Germans chose Rodolph, duke of Suabia, who was solemnly crowned at Mentz; and Gregory, hesitating on this occasion, behaved truly like the supreme judge of kings. He had deposed Henry, but still it was in his power to pardon that prince: he therefore affected to be displeased that Rodolph was consecrated without his order; and declared, that he would acknowledge as emperor and king of Germany, him of the two competitors who should be most submissive to the holy see.

Henry, however, trusting more to the value of his troops than to the generosity of the pope, set out immediately for Germany, where he defeated his enemies in several engagements: and Gregory, seeing no hopes of submission, thundered out a second sentence of excommunication against him, confirming at the same time the election of Rodolph, to whom he sent a golden crown, on which the following well known verse, equally naughty and coarse, was engraved.

Petra dedit Petro, Petrus diadema Rodolpho.

This donation was also accompanied with a most enthusiastic anathema against Henry. After depriving him of strength and combat, and condemning him never to be victorious, it concludes with the following remarkable
ITALY.

which might have been expected from the death of Gregory. The subsequent popes trode in the path of their predecessor. In 1126, Pascal II. excised young Henry to rebel against his father. The emperor did all in his power to dissuade him from proceeding to extremities, but in vain. The young prince persisted in his rebellious intentions; and having by feigned submissions prevailed on the emperor to disband his army, he treacherously seized and confined him. Henry, however, found means to escape from his confinement, and attempted to engage all the sovereigns of Europe in his quarrel; but before any thing effectual could be done, he died at Liege in the year 1106.

The dispute about investitures was not terminated by the deposition and death of Henry IV. His son, the King of Germany, and the Pope, had deposed his father. Pascal opposed him with violence; upon which Henry gave him an invitation into Germany, to end the dispute in an amicable manner. Pascal did not think proper to accept of this invitation; but put himself under the protection of Philip I. of France, who undertook to mediate between the contending parties. His mediation, however, proved ineffectual, and Henry was prevented by the wars in Hungary and Poland from paying any further attention to the affair of investitures. At last, having settled his affairs in Germany, he took a resolution of going to Rome, in order to settle the dispute personally with the pope. To give his arguments the greater weight, however, he marched at the head of an army of 80,000 men. Pascal received him with great appearance of friendship, but would not renounce the claim of investitures; and Henry, finding himself deceived in his expectations, ordered the pope to be seized. The consuls put the citizens in arms to defend the pope, and a battle was fought within the walls of Rome. The slaughter was so great, that the waters of the Tiber were tinged with blood. The Romans were defeated, and Pascal was taken prisoner. The latter renounced his right of investiture; solemnly swore never to resume it, and broke his oath as soon as Henry was gone, by fulminating the sentence of excommunication against him. In 1114 died the countess Matilda, who had bequeathed all her dominions to the pope, as we have already observed; but Henry thinking himself the only lawful heir, alleged, that it was not in Matilda's power to alienate her estates, which depended immediately on the empire. He therefore set out for Lombardy, and sent ambassadors to the pope, beseeching him to revoke the sentence of excommunication above mentioned. Pascal, however, would not even favour the ambassadors with an audience; but dreading the approach of Henry himself, he took refuge among the Norman princes in Apulia. Henry arrived at Rome in 1117; but being soon after obliged to leave it, in order to settle some affairs in Tuscany, the pope returned to Rome, but died in a few days. On the third day after his decease, Cardinal Cajetan was elected his successor, without the privy of the emperor, under the name of Gelasius II. The new pope was instantly deposed by Henry; who set up the archbishop of Prague, under the name of Gregory VIII. Gelasius, though supported by the Norman princes, was obliged to take refuge.
ITALY.

made several salutary regulations for the preservation of good order and military discipline. Continuing to advance, he besieged Milan, which surrendered at discretion. He was crowned king of Lombardy at Monza; and having made himself master of all the other cities of that country, he ordered a minute inquiry to be set on foot concerning the rights of the empire, and exacted homage of all those who held of it, without excepting even the bishops. Grievances were redressed; magistracies reformed; the rights of regality discussed and ascertained; new laws enacted for the maintenance of public tranquillity and the encouragement of learning, which now began to revive in the school of Bologna; and, above all, subvassals were not only prohibited from alienating their lands, but also compelled, in their oath to their lords paramount, to except the emperor nominally, when they swore to serve and assist them against all their enemies.

The pope took umbrage at this behaviour towards the ecclesiastics: but Frederic justified what he had done, telling his deputies it was but reasonable they should do homage for the fiefs they possessed; as Jesus Christ himself, though the lord of all the sovereigns upon earth, had designed to pay for himself and St Peter the tribute which was due to Cesar.

Frederic having sent commissaries to superintend the election of new magistrates at Milan, the inhabitants were so much provoked at this infringement of their old privileges, that they insulted the imperialists, revolted, and refused to appear before the emperor's tribunal. This he highly resented, and resolved to chastise them severely: for which purpose he sent for a reinforcement from Germany, which soon after arrived with the emperor, while he himself ravaged Liguria, declared the Milanese rebels to the empire, and plundered and burnt the city of Crema which was in alliance with that of Milan.

In the mean time, Pope Adrian IV. dying, two opposite factions elected two persons known by the names of Victor II. and Alexander III. The emperor's allies necessarily acknowledged the pope chosen by him; and those princes who were jealous of the emperor, acknowledged the other. Victor II. Frederic's pope, had Germany, Bohemia, and one half of Italy on his side; while the rest submitted to Alexander III. The emperor took a severe revenge on his enemies; Milan was razed from the foundation, and despoys Milan, &c.

Italy invaded by Frederic Barbarossa.

In the reign of Conrad III. who succeeded Lothario, the celebrated factions called the Guelfs and Ghibelines arose, which for many years deluged the cities of Italy with blood. They took their origin during a civil war in Germany, in which the enemies of the emperor were styled Guelfs, and his friends Ghibelines; and those names were quickly received in Italy as well as other parts of the emperor's dominions. Of this civil war many of the cities in Italy took the advantage to set up for themselves; neither was it in the power of Conrad, who during his whole reign was employed in unsuccessful crusades, to reduce them; but in 1158 Frederic Barbarossa, successor to Conrad, entered Italy at the head of a very numerous and well disciplined army. His army was divided into several columns, for the convenience of entering the enemy by as many different routes. Having passed the Alps, he reduced the town of Brescia; where he

and his eldest son Henry, who commanded his fleet, fell into the hands of the enemy. The pope, in honour of this victory, sailed out into the open sea, accompanied by the whole senate; and after having pronounced a thousand benedictions on that element, threw into it a ring as a mark of his gratitude and affection. Hence the origin of that ceremony which is annually performed by the Venetians, under the notion of esposing the Adriatic. These misfortunes disposed the emperor towards a reconciliation with the pope: but, reckoning it below his dignity to make an advance, he rallied his troops, and exerted himself with so much vigour in repairing his loss, that the confederates were defeated in a battle; after which he made proposals of peace, which were now joyfully accepted, and Venice was the place appointed for a reconciliation. The emperor, the pope, and a great many princes and cardinals, attended; and there the emperor, in 1177, put an end to the dispute, by acknowledging the pope, kissing his feet, and holding his stirrup while he mounted his mule. This reconciliation was attended with the submission of all the towns of Italy which had entered into an association for their mutual defence. They obtained a general pardon, and were left at liberty to use their own laws and forms of government, but were obliged to take the oath of allegiance to the emperor as their superior lord. Calixtus, the antipope, finding himself abandoned by the emperor in consequence of this treaty, made also his submission to Alexander, who received him with great humanity; and in order to prevent for the future those disturbances which had so often attended the elections of the popes, he called a general council, in which it was decreed, that no pope should be deemed duly elected without having two-thirds of the votes in his favour.

The affairs of Italy being thus settled, Barbarossa returned to Germany; and having quieted some disturbances which had arisen during his absence in Italy, at last undertook an expedition into the Holy Land; where having performed great exploits, he was drowned as he was swimming in the river Jordan in the year 1156. He was succeeded by his son Henry VI., who at the same time became heir to the dominions of Sicily by the right of his wife, daughter of William king of that country. After settling the affairs of Germany, the new emperor marched with an army into Italy, in order to be crowned by the pope, and to recover the succession of Sicily, which was usurped by Tancred his wife's natural brother. For this purpose, he endeavoured to conciliate the affections of the Lombards, by enlarging the privileges of Genoa, Pisa, and other cities, in his way to Rome; where the ceremony of the coronation was performed by Celestine III. on the day after Easter in the year 1191. The pope, then in the 86th year of his age, had no sooner placed the crown upon Henry's head than he kicked it off again, as a testimony of the power residing in the sovereign pontiff to make and unmake emperors at his pleasure.

The coronation being over, Henry prepared for the conquest of Naples and Sicily; but in this he was opposed by the pope: for though Celestine considered Tancred as an usurper, and desired to see him deprived of the crown of Sicily, which he claimed as a fief of the sea, yet he was much more averse to the emperor's being put in possession of it, as that would render him too powerful in Italy for the interest of the church. Henry, however, without paying any regard to the threats and remonstrances of his holiness, took almost all the towns of Campania, Calabria, and Apulia; invested the city of Naples; and sent for the Genoese fleet, which he had before engaged, to come and form the blockade by sea; but before its arrival, he was obliged to raise the siege, in consequence of a dreadful mortality among his troops: and all future attempts upon Sicily were ineffectual during the life of Tancred.

The whole reign of Henry from this time seems to his posterity to have been a continued train of the most abominable perfidies and cruelties. Having treacherously seized and imprisoned Richard I. of England, in the manner related under that article, No. 125—126, he had no sooner received the ransom paid for his royal captive, than he made new preparations for the conquest of Sicily. As Tancred died about this time, the emperor with the assistance of the Genoese, accomplished his purpose. The queen-dowager surrendered Salerno, and her right to the crown, on condition that her son William should possess the principality of Tarentum; but Henry no sooner found himself master of the place than he ordered the infant king to be castrated, to have his eyes put out, and to be confined in a dungeon. The royal treasure was transported to Germany, and the queen and her daughter confined in a convent.

In the mean time, the empress, though near the age of 50, was delivered of a son, named Frederic; and Henry soon after assembled a diet of the princes of Germany, to whom he explained his intentions of rendering the imperial crown hereditary, in order to prevent those disturbances which usually attended the election of emperors. A decree passed for this purpose; and Frederic, yet in his cradle, was declared king of the Romans. Soon after, the emperor being solicited to undertake a crusade, obeyed the injunctions of the pope, but in such a manner as to make it turn out to his own advantage. He convened a general diet at Worms, where he solemnly declared his resolution of employing his whole power, and even of hazarding his life, for the accomplishment of so holy an enterprise; and he expatiated upon the subject with so much eloquence, that almost the whole assembly took the cross. Nay, such multitudes from all the provinces of the empire enlisted themselves, that Henry divided them into three large armies; one of which, under the command of the bishop of Mentz, took the route of Hungary, where it was joined by Margaret, queen of that country, who entered herself in this pious expedition, and actually ended her days in Palestine: the second was assembled in Lower Saxony, and embarked in a fleet furnished by the inhabitants of Lubeck, Hamburg, Holstein, and Friesland: and the emperor in person conducted the third into Italy, in order to take vengeance on the Normans in Naples and Sicily who had risen against his government.

The rebels were humbled; and their chiefs were condemned to perish by the most excruciating tortures. One Jornandi, of the house of the Norman princes, was tied naked on a chair of red-hot iron, and crowned
ITALY.

But before anything was settled relative to this affair, the empress died, leaving the regency of the kingdom to the pope; so that he was enabled to prescribe what conditions he thought proper to young Frederic. The troubles of Germany still continued; and the pope redoubled his efforts to detach the princes and prelates from the cause of Philip, notwithstanding the remonstrances of the king of France, to whom he proudly replied, “Either Philip must lose the empire, or I the papacy.” But all these dissensions and troubles in Europe did not prevent the formation of another crusade, or expedition into Asia, for the recovery of the Holy Land. Those who took the cross were principally French and Germans: Baldwin, count of Flanders, was their commander; and the Venetians, as greedy of wealth and power as the ancient Carthaginians, furnished them with ships, for which they took care to be amply paid both in money and territory. The Christian city of Zara, in Dalmatia, had withdrawn itself from the government of the republic: the army of the cross undertook to reduce it to obedience; and it was besieged and taken, notwithstanding the threats and excomunication of the pope.

While the crusaders were spreading desolation through the east, Philip and Otho were in like manner desolating the west. At length Philip prevailed; and Otho, obliged to abandon Germany, took refuge in England. Philip, elated with success, confirmed his election by a second coronation, and proposed an accommodation with the pope, as the means of finally establishing his throne; but before it could be brought about, he fell a sacrifice to private revenge, being assassinated by the count Palatine of Bavaria, whose daughter he had promised to marry, and afterwards rejected. Otho returned to Germany on the death of Philip; married that prince’s daughter; and was crowned at Rome by Pope Innocent III. after yielding to the holy see the long-disputed inheritance of the countess Matilda, and confirming the rights and privileges of the Italian cities. But these concessions, as far at least as regarded the pope, were only a sacrifice to present policy: Otho, therefore, no sooner found himself in a condition to act offensively, than he resumed his grand; and in 1210 not only recovered the possessions of the empire, but made hostile incursions into Apulia, ravaging the dominions of young Frederic king of Naples and Sicily, who was under the protection of the holy see. For this reason he was excomunicated by Innocent; and Frederic, now 17 years of age, was elected emperor by a diet of the German princes. Otho, however, on his return to Germany, finding his party still considerable, and not doubting but he should be able to humble his rival by means of his superior force, entered into an alliance with his uncle John king of England, against Philip Augustus king of France, A.D. 1213. The unfortunate battle of Bouvines, where the confederates were defeated, completed the fate of Otho. He attempted to retreat into Germany, but was prevented by young Frederic; who had marched into the empire at the head of a powerful army, and was everywhere received with open arms. Thus abandoned by all the princes of Germany, and altogether without resource, Otho retired to Brunswick, where he lived four years as a private man, dedicating his time to the duties of religion.

Vol. XL. Part I.
Frederic II. being now universally acknowledged emperor, was crowned at Aix-la-Chapelle in 1215, with great magnificence; when, in order to preserve the favour of the pope, he added to the other solemnities of his coronation a vow to go in person to the Holy Land.

The bad success of this expedition hath been already taken notice of under the article of CROSADA. The emperor had, on various pretences, refused to go into the East; and in 1225, the pope, incensed at the loss of Daniella, wrote a severe letter to him, taxing him with having sacrificed the interests of Christianity by delaying so long the performance of his vow, and threatening him with immediate excommunication if he did not instantly depart with an army to Asia. Frederic, exasperated at these reproaches, renounced all correspondence with the court of Rome; renewed his ecclesiastical jurisdiction in Sicily; filled up vacant sees and benefices; and expelled some bishops, who were creatures of the pope, on pretence of their being concerned in practices against the state.

The pope at first threatened the emperor with the thunder of the church, for presuming to lift up his hand against the sanctuary; but finding Frederic not to be intimidated, he became sensible of his own impropriety in wantonly incurring the resentment of so powerful a prince, and thought proper to soothe him by submission of apologies and gentle exhortations. They were accordingly reconciled, and conferred together at Veroli in 1226; where the emperor, as a proof of his sincere attachment to the church, published some very severe edicts against heresy, which seem to have authorised the tribunal of the inquisition. A solemn assembly was afterwards held at Ferentino, where both the pope and the emperor were present, together with John de Brienne, titular king of Jerusalem, who was come to Europe to demand succours against the soldan of Egypt. John had an only daughter named Yolanda, whom he proposed as a wife to the emperor, with the kingdom of Jerusalem as her dowry, on condition that Frederic should within two years perform the vow he had made to lead an army into the Holy Land. Frederic married her on these terms, because he chose to please the pope; and since that time the kings of Sicily have taken the title of King of Jerusalem. But the emperor was in no hurry to go and conquer his wife's portion, having business of more importance on his hands at home. The chief cities of Lombardy had entered into a secret league, with a view to renounce his authority. He convoked a diet at Cremona, where all the German and Italian noblemen were summoned to attend. A variety of subjects were there discussed; but nothing of consequence was settled. An accommodation, however, was soon after brought about by the mediation of the pope; who, as umpire of the dispute, decreed, that the emperor should lay aside his resentment against the confederate towns, and that the towns should furnish and maintain 400 knights for the relief of the Holy Land.

Peace being thus concluded, Honorius reminded the emperor of his vow; Frederic promised compliance; but his holiness died before he could see the execution of a project which he seemed to have so much at heart. He was succeeded in the papal chair by Gregory IX., brother of Innocent III.; who, pursuing the same line of policy, urged the departure of Frederic for the Holy Land; and finding the emperor still backward, declared him incapable of the imperial dignity, as having incurred the sentence of excommunication. Frederic, incensed at such insolence, ravaged the patrimony of St Peter; and was actually excommunicated. The animosity between the Guelphs and Gibelines revived; the pope was obliged to quit Rome; and Italy became a scene of war and desolation, or rather of an hundred civil wars; which, by inflaming the minds and exciting the resentment of the Italian princes, accustomed them but too much to the horrid practices of poisoning and assassination.

During these transactions, Frederic, in order to remove the cause of all these troubles, and gratify the prejudices of a superstitious age, by the advice of his friends resolved to perform his vow: and he accordingly embarked for the Holy Land, leaving the affairs of Italy to the management of Renaldo duke of Spoleto. The pope prohibited his departure before he should be absolved from the curses of the church; but Frederic went in contempt of the church, and succeeded better than any person who had gone before him. He did not indeed desolate Asia, and gratify the barbarous zeal of the times by spilling the blood of infidels; but he concluded a treaty with Miledin, soldan of Egypt, and master of Syria, by which the end of his expedition seemed fully answered. The soldan ceded to him Jerusalem and its territory as far as Joppa; Bethleem, Nazareth, and all the country between Jerusalem and Ptolemais; Tyre, Sidon, and the neighbouring territories: in return for which, the emperor granted the Saracens a truce of ten years; and in 1230 prudently returned to Italy, where his presence was much wanted.

Frederic's reign, after his return from the east, was one continued quarrel with the popes. The cities of Lombardy had revolted during his absence, at the instigation of Gregory IX.; and before they could be reduced, the same pontiff excited the emperor's son Henry, who had been elected king of the Romans, to rebel against his father. The rebellion was suppressed, the prince was confined, and the emperor obtained a complete victory over the associated towns. But his troubles were not yet ended. The pope excommunicated him anew, and sent a bull filled with the most absurd and ridiculous language, into Germany, in order to sow divisions between Frederic and the princes of the empire.

Frederic retorted in the same strain, in his apology to the princes of Germany, calling Gregory the Great Dragon, the Antichrist, &c. The emperor's apology was sustained in Germany; and finding he had nothing to fear from that quarter, he resolved to take ample vengeance on the pope and his associates. For that purpose he marched to Rome, where he thought his party was strong enough to procure him admission; but this favourite scheme was defeated by the activity of Gregory, who ordered a crusade to be preached against the emperor, as an enemy of the Christian faith; a step which incensed Frederic so much, that he ordered all his prisoners who wore the cross to be exposed to the most cruel tortures. The two factions of the Guelphs and Gibelines continued to rage with greater violence than ever, involving cities, districts,
and even private families, in troubles, divisions, and civil butchery; no quarter being given on either side. Meanwhile Gregory IX. died, and was succeeded in the see of Rome by Celestine IV. and afterwards by Innocent IV., formerly Cardinal Fiesque, who had always expressed the greatest regard for the emperor and his interest. Frederic was accordingly congratulated upon this occasion; but having more penetration than those about him, he sagely replied, "I see little reason to rejoice; the cardinal was my friend, but the pope will be my enemy." Innocent soon proved the justice of this conjecture. He attempted to negotiate a peace for Italy; but not being able to obtain from Frederic his exorbitant demands, and in fear for the safety of his own person, he fled into France, assembled a general council at Lyons, and in 1245 deposed the emperor.

Conrad, the emperor's second son, had already been declared king of the Romans, on the death of his brother Henry, which soon followed his confinement; but the empire being now declared vacant by the pope, the German bishops (for none of the princes were present), at the instigation of his holiness, proceeded to the election of a new emperor; and they chose Henry landgrave of Thuringia, who was styled in desirion, The king of priests. Innocent now renewed the crusade against Frederic. It was proclaimed by the preaching friars, since called Dominicans, and the minor friars, known by the name of Cordeliers or Franciscans. The pope, however, did not confine himself to these measures only, but engaged in conspiracies against the life of an emperor who had dared to resist the decree of a council, and oppose the whole body of the monks and zealots. Frederic's life was several times in danger from plots, poisonings, and assassinations; which induced him, it is said, to make choice of Mahometan guards, who, he was certain, would not be under the influence of the prevailing superstition.

About this time the landgrave of Thuringia dying, the same prelates who had taken the liberty of creating one emperor made another; namely, William count of Holland, a young nobleman of 20 years of age, who bore the same contemptuous title with his predecessor. Fortune, which had hitherto favoured Frederic, seemed now to desert him. He was defeated before Parma, which he had long besieged; and to complete his misfortune, he soon after learned, that his natural son En tius, whom he had made king of Sardinia, was worsted and taken prisoner by the Bolognese.

In this extremity Frederic retired to his kingdom of Naples, in order to recruit his army; and there died of a fever in the year 1250. After his death, the affairs of Germany fell into the utmost confusion, and Italy continued long in the same distracted state in which he had left it. The clergy took arms against the laity; the weak were oppressed by the strong; and all laws divine and human were disregarded. After the death of Frederic's son Conrad, who had assumed the imperial dignity as successor to his father, and the death of his competitor William of Holland, a variety of candidates appeared for the empire, and several were elected by different factions; among whom was Richard Earl of Cornwall, brother to Henry II. king of England: but no emperor was properly acknowledged till the year 1273, when Rudolph, count of Hapsburg, was unanimously raised to the vacant throne. During the interrogum which preceded the election of Rudolph, Denmark, Holland, and Hungary, entirely freed themselves from the homage they were wont to pay to the empire; and much about the same time several German cities erected a municipal form of government, which still continues. Lubec, Cologne, Brunswick, and Dantzic, united for their mutual defence against the encroachments of the great lords, by a famous association, called the Hanseatic league; and these towns were afterwards joined by 80 others, belonging to different states, which formed a kind of commercial republic. Italy also, during this period, assumed a new plan of government. That freedom for which the cities of Lombardy had so long struggled, was confirmed to them for a sum of money: they were emancipated by the fruits of their industry. Sicily likewise changed its government and its prince; of which revolution a particular account is given under the article Sicily.

From the time of Frederic II. we may date the ruin of the German power in Italy. The Florentines, the Pisans, the Genoese, the Lucchans, &c. became independent, and could not again be reduced. The power of the emperor, in short, was in a manner annihilated, when Henry VII. undertook to restore it in the beginning of the 14th century. For this purpose a diet was held at Frangfort, where proper supplies being granted for the emperor's journey, well known by the name of the Roman expedition, he set out for Italy, accompanied by the dukes of Austria and Bavaria, the archbishop of Triers, the bishop of Liege, the counts of Savoy and Flanders, and other noblemen, together with the militia of all the imperial towns. Italy was still divided by the factions of the Guelphs and Ghibelines, who butchered one another without humanity or remorse. But their contest was no longer the same: it was not now a struggle between the empire and the priesthood, but between faction and faction, inflamed by mutual jealousies and animosities. Pope Clement V. had been obliged to leave Rome, which was in the anarchy of popular government. The Colonnaus, the Ursini, and the Roman barons, divided the city; and this division was the cause of a long abode of these enemies in France, so that Rome seemed equally lost to the popes and the emperors. Sicily was in the possession of the house of Arragon, in consequence of the famous massacre called the Sicilian vespers, which delivered that island from the tyranny of the French. Carobert, King of Hungary, disputed the kingdom of Naples with his uncle Robert, son of Charles II. of the house of Anjou. The house of Este had established itself at Ferrara; and the Venetians wanted to make themselves masters of that country. The old league of the Italian cities no longer subsisted. It had been formed with no other view than to oppose the emperors: and since they had neglected Italy, the cities were wholly employed in aggrandizing themselves, at the expense of each other. The Florentines and the Genoese made war upon the republic of Pisa. Every city was also divided into factions within itself. In the midst of these troubles Henry VII. appeared in Italy in the year 1311, and caused himself to be crowned king of Lombardy at Milan. But the Guelphs had concealed the old iron crown of the Lombard kings, as
if the right of reigning were attached to a small cir-
cle of metal. Henry ordered a new crown to be
made, with which the ceremony of inauguration
was performed.

Cremona was the first place that ventured to oppose
the emperor. He reduced it by force, and laid it un-
der heavy contributions. Parma, Vicenza, and Pia-
centia, made peace with him on reasonable conditions.
Pavia paid 100,000 crowns, and received an imperial
officer as governor. The Venetians presented Henry
with a large sum of money, an imperial crown of
gold enriched with diamonds, and a chain of very cu-
rious workmanship. Brescia made a desperate resis-
tance, and sustained a very severe siege; in the course
of which the emperor's brother was slain, and his
army diminished to such a degree, that the inhabitants
marched out under the command of their prefect
Thibault de Drusati, and gave him battle: but they
were repulsed with great loss, after an obstinate en-
gagement; and at last obliged to submit, and their
city was dismantled. From Brescia Henry marched
to Genoa, where he was received with expressions of
joy, and splendidly entertained. He next proceeded
to Rome; where, after much bloodshed, he received
the imperial crown from the hands of the cardinals.
Clement V., who had originally invited Henry into
Italy, growing jealous of his success, had leagued with
Robert king of Naples and the Usurini faction, to
oppose his entrance into Rome. He entered it in spite
of them by the assistance of the Colonnas. Now
master of that ancient city, Henry appointed it a gover-
nor; and ordered, that all the cities and states of Ita-
ly should pay him an annual tribute. In this order he
comprehended the kingdom of Naples, to which he was
going to make good his claim of superiority by arms,
when he died at Benevento in 1315, is as commonly
supposed, of poison given him by a Dominican friar, in
the consecrated wine of the sacrament.

The efforts of Henry VII. were unable to restore
the imperial power in Italy. From this time the authority
of the emperor in that country consisted in a great mea-
sure in the convenience which the Ghibelines found in
opposing their enemies under the sanction of his name.
The power of the pope was much of the same nature.
He was less regarded in Italy than in any other coun-
try in Christendom. There was indeed a great party
who called themselves Guelphs; but they affected this
distinction only to keep themselves independent of the
imperialists; and the states and princes who called
themselves Guelphs paid little more acknowledgment to
his holiness than sheltering themselves under his name
and authority. The most desperate wars were carried
on by the different cities against each other; and in
these wars Castruccio Castracani, and Sir John Hawk-
wood an Englishman, are celebrated as heroes.

A detail of these transactions would furnish materials
for many volumes; and after all seems to be but of little
importance, since nothing material was effected by the
utmost efforts of valour, and the belligerent states were
commonly obliged to make peace without any advan-
tage on either side. By degrees, however, this martial
spirit subsided; and in the year 1492, the Italians
were so little capable of resisting an enemy, that
Charles VIII. of France conquered the whole king-
dom of Naples in six weeks, and might easily have sub-
duced the whole country had it not been for his own
imprudence. Another attempt on Italy was made by
Louis XII. and a third by Francis I. as related under
the article France. In the reigns of Louis XIII.
and XIV. an obstinate war was carried on between
the French and Spaniards, in which the Italian states bore
a very considerable share. The war concluded in 1660,
with very little advantage to the French, who have been
always unsuccessful in their Italian wars. The like
bad success attended them in that part of the world, in
the war which commenced between Britain and Spain
in the year 1740. But the particulars of these wars,
with regard to the different states of Italy, naturally
fall to be considered under the history of those states
into which the country is now divided; viz. Sardinia,
Milan or the Milanese, Genoa, Venice, Tuscany or
Florence, Lucca, St. Marino, Parma, Mantua, Modena,
Rome, and Naples.

The air in Italy is very different, according to the Air,
&c. of different situations of the several countries contained in it.
It is that northern of the Appenines it is more
temperate, but on the south it is generally very warm.
The air of the Campania of Rome, and of the Perra-
rese, is said to be unhealthy; which is owing to the
land not being duly cultivated, nor the marshes drain-
ed. That of the other parts is generally pure, dry,
and healthy. In summer, the heat is very great in the
kingdom of Naples; and would be almost intolerable,
if it was not somewhat alleviated by the sea breezes.
The soil of Italy in general is very fertile, being wa-
tered by a great number of rivers. It produces a great
variety of vines, and the best oil in Europe; excellent
silk in abundance; corn of all sorts, but not in such
plenty as in some other countries; oranges, lemons,
citrons, pomegranates, almonds, raisins, sugar, mul-
berry-trees without number, figs, peaches, nectarines,
apricots, pears, apples, filberts, chestnuts, &c. Most
of these fruits were at first imported by the Romans
from Asia Minor, Greece, Africa, and Syria, and
were not the natural products of the soil. The tender
plants are covered in winter on the north side of the
Appenines, but on the south side they have no need of
it. This country also yields good pasture; and abounds
with cattle, sheep, goats, buffaloes, wild boars, mul-
s, and horses. The forests are well stored with game;
and the mountains yield not only mines of iron, lead,
alum, sulphur, marble of all sorts, alabaster, jasper,
porphyry, &c. but also gold and silver; with a great
variety of aromatic herbs, trees, shrubs, and evergreens,
as thyme, lavender, laurel, and bay, wild olive trees,
tamarinds, juniper, oaks, and pines.

A very extensive trade is carried on in many places
in Italy, particularly at Leghorn, Genoa, Bologna,
Venice, and Naples; the country having a great va-
riety of commodities and manufactures for exportation,
especially wine, oil, perfumes, fruits, and silks. Trav-
ellers also bring large sums of money into Italy, be-
cides what they lay out in pictures, curiosities, relics,
antiquities, &c.

The Italians are generally well proportioned, though
their complexions are none of the best. As to dress,
position, &c. of the inhabi-
tants.
ITALY.

The extraordinary successes of the French in 1796, reduced most of the Italian powers to a state of dependence on France. The arrival of the Russians restored them to liberty for a little, but the battle of Marengo again gave Italy to France. Naples was allowed to enjoy a nominal independence till 1806, when the king was expelled. From that period Italy was in reality a province of Bonaparte’s empire, till she was liberated by the arms of the allies in 1814.

By a census taken under Bonaparte, the population of Italy was found to be as under:

- Naples, 4,963,000
- The territories of Sardinia, 3,024,000
- Lombardy and Venice, 4,014,000
- Ecclesiastical state, 2,346,000
- Tuscany, 1,180,000
- Parma, Placentia, and Guastalla, 377,000
- States of Modena, 370,000
- Lucca, 158,000

Total 16,412,000

The agriculture, commerce, population, arts, &c. of Italy, are fully described in the article ITALY in the SUPPLEMENT.

ITCH, a cutaneous disease, appearing in small watery pustules on the skin; commonly of a mild nature, though sometimes attended with obstinate and dangerous symptoms. See Medicine Index.

ITCH-Insect. See ACRUS, Entomology Index.

In speaking of the manner of finding these insects in the itch, Fabricius observes, that the failure of many who have sought for them has been owing to their having expected to meet with them in the larger vehicles that contain a yellowish fluid like pus; in these, however, he tells us, he has never found them, but in those pustules only which are recent, and contain only a watery fluid. We must therefore, he observes, not expect to find them in the same proportionate number in patients who for many months have been afflicted with the disease, as in those in whom its appearance is recent, and where it is confined to the fingers or wrists. The cause of this difference with respect to the pustules, he conjectures, may be owing to the death of the insect after it has deposited its eggs.

A small transparent vesicle being found, a very minute white point, distinct from the surrounding fluid, may be discovered, and very often even without the assistance of a glass; this is the insect, which may be easily taken out on the point of a needle or penknife, and when placed on a green cloth may be seen much more distinctly, and observed to move. All this, we must remark, probably depends on optical deception.

ITEA, a genus of plants belonging to the pentandria class. See Botany Index.

ITHACA, in Ancient Geography, an island in the Ionian sea, on the coast of Epirus; the country of Ulysses, with a town and port situated at the foot of Mount Neus. According to Pliny it is about 23 miles in compass; according to Artemidorus only 10; and is now found to be 17 miles long and four broad. See IONIAN ISLES, SUPPLEMENT.

ITZ

ITINERARY, Itinerarium; a journal, or an account of the distances of places. The most remarkable is that which goes under the names of Antoninus and Ethicus; or, as Barthius found in his copy, Antoninus Ethicus; a Christian writer, posterior to the times of Constantine. Another, called Hieroclesphilus, from Bourdeaux to Jerusalem, and from Hercules through Aulonia and Rome to Milan, under Constantine. Itinerarium denotes a day’s march.

ITIUS PORTUS, in Ancient Geography, the crux geographorum, such being the difficulty of ascertaining its position. It would be useless to recite the several opinions concerning it, with the several reasons advanced in support of them. Three ports are mentioned by Caesar; two without any particular name, viz. the Higher and the Lower with respect to the Portus Itius. Calais, Boulogne, St Omer, and Whitstand, have each in their turn had their several advocates. Caesar gives two distinctive characters or marks which seem to agree equally to Boulogne and Whitstand, namely, the shortness of the passage, and the situation between those two other ports; therefore nothing can with certainty be determined about the situation of the Portus Itius.

ITYS, in fabulous history, a son of Tereus king of Thrace, by Proene daughter of Pandion king of Athens. He was killed by his mother when he was about six years old, and served up before his father. He was changed into a pleasant, his mother into a swallow, and his father into an owl.

ITZECUINTEPOTZOTLI, or HUNCH-BACKED DOG, a Mexican quadruped similar to a dog. It is as large as a Maltese dog, the skin of which is varied with white, tawny, and black. The characteristic mark is a great hunch which it bears from its neck to its rump. This animal abounds most in the kingdom of Michoacan.

ITZEOOA,
ITZEHOA, an ancient and handsome town of
Germany, in the circle of Lower Saxony, and duchy
of Holstein. It belongs to the king of Denmark,
and is seated on the river Steen, in E. Long. 9° 25'.
N. Lat. 54° 8'.
IVA, a genus of plants belonging to the monotoca
class; and in the natural method ranking under
the 4th order, Composite. See Botany Index.
IVAHAH is the name of a canoe of the South sea
islanders for short excursions to sea: it is wall-sided,
flat-bottomed, and of different sizes, from 72 feet to
10: but their breadth is by no means in proportion;
for those of ten feet are about a foot wide, and those
of more than 70 are scarcely two. The building ivahah
is the longest, with its head and stern considerably
raised. The fishing ivahahs are from 40 feet long to 10;
those of 25 feet and upwards occasionally carry sail.
The travelling ivahah is always double, and furnished
with a small neat house.
JUAN DE FUCA, a strait on the north-west coast of
America, was surveyed by Captain Vancouver, and the
entrance of which he places in N. Lat. 48° 20'.
and W. Long. 124°. The object of this survey was to dis-
cover a communication between the North Pacific and
North Atlantic oceans; but none of the inlets or chan-
nels in this broken coast was found to extend more than
100 miles to the eastward of the entrance into the strait.
Thus it appeared, that the land forming the north
side of that strait is part of an island, or of an archip-
ello, extending nearly 100 leagues in length from
south-east to north-west; and on the side of this land,
most distant from the continent, is situated Nootka
sound. The most peculiar circumstance of this naviga-
tion is the extreme depth of water, when contrasted
with the narrowness of the channels.
The people of Juan de Fuca are said to be well ac-
quainted with the principles of trade, which they carry
on in a very fair and honourable manner. The com-
modities most prized by them are copper, fire-arms, and
great-coats. Their dresses, besides skins, are a kind of
woollen garments. According to Vancouver, the dogs
belonging to this tribe of Indians are numerous, resem-
bling those of Pomaria, though larger in general. The
population even in the greatest towns or villages does
not exceed 600, and the smallpox is reckoned to be a
disease very fatal among them. Their method of dis-
posing of their dead is singular. "Basket (says Van-
couver) were found suspended on high trees, each con-
taining the skeleton of a young child, in some of which
were also small square boxes filled with a kind of white
paste, resembling such as I had seen the natives eat,
supposed to be made of the saranne root: some of these
boxes were quite full; others were nearly empty, eaten
probably by the mice, squirrels, or birds."
JUAN, St. de la Frontera, a town of South America,
in Chili, in the province of Chiquito, near the lake Gu-
arancho. The territory of this town is inhabited by
20,000 native Americans, who are tributary to Spain.
It contains mines of gold, and produces a kind of al-
monds that are very delicate. It is seated at the foot
of the Andes, in W. Long. 66° 35'. S. Lat. 23° 25'.
JUAN de Porto Rico, an island of America, and one
of the Caribbees, being 120 miles in length and 30
in breadth. It belongs to the Spaniards; and is full
of very high mountains, and extremely fertile valleys,
interspersed with woods, and well watered with springs
and rivulets. It produces sugar, rum, ginger, corn,
and fruits; partly proper to the climate, and partly
introduced from Spain. Besides, there are so many
cattle, that they often kill them for the sake of the
skins alone. Here are a great number of uncommon
trees, and there is a little gold in the north part of the
island. It is commonly said that the air is healthy;
and yet the earl of Cumberland, when he had taken
this island, lost most of his men by sickness; and for
that reason was forced to abandon it. This happened
in the reign of Queen Elizabeth. It is subject to storms
and hurricanes, like the rest of these islands. It lies
to the east of Hispaniola, at the distance of 30 miles.
JUAN de Porto Rico, the capital town of the island
of Porto Rico, with a good harbour defended by se-
veral forts, and a bishop's see. It is seated on the
north coast of the island, in W. Long. 65° 35'. N. Lat.
18° 30'.
JUAN Fernandez, an island in the great South sea,
in S. Lat. 33° 40'. and W. Long. 79° 30'. from Lon-
don. It was formerly a place of resort for the bucca-
nees who annoyed the western coast of the Spanish
continent. They were led to resort hither from the mu-
titude of goats which it nourished; to deprive their
enemies of which advantage, the Spaniards transported
a considerable number of dogs, which increasing grea-
tly have almost exterminated the goats, which now only
find security among the steep mountains in the northern
parts, which are inaccessible to their pursuers. There
are instances of two men living at different times,
alone on this island for many years; the one a Mus-
queto Indian; the other Alexander Selkirk, a Scotch-
man, who was, after five years, taken on board an
English ship, which touched here in 1710, and
brought back to Europe. From the history of this
reclus, Daniel Defoe is said to have conceived the
idea of writing the Adventures of Robinson Crusoe.
This island was very propitious to the remains of Com-
modore Anson's squadron in 1741, after having been
bufeted with tempests, and debilitated by an invete-
rate scurvy, during a three months passage round Cape
Horn: they continued here three months; during
which time the dying towns, who on their arrival could
scarcely with one united effort leave the anchor, were
restored to perfect health. Captain Carteret, in the
Swallow, in 1767, having met with many difficulties
and impediments in his passage into the South sea,
by the straits of Magelhaens, attempted to make this
island in order to recruit the health of his men; but
he found it fortified by the Spaniards, and therefore
chose rather to proceed to the island of Massaufero.
But M. de Bougainville that same year is said to have
touched here for refreshments, although in the narra-
tive of the voyage the fact is cautiously suppressed.
This island is not quite 15 miles long and about six
broad; its only safe harbour is on the north side.
It is said to have plenty of excellent water, and to abud
with a great variety of esculent vegetables highly anti-
scorbutic; besides which, Commodore Anson sowed
a variety of garden-seeds, and planted the stones of
plums, apricots, and peaches, which he was many years
afterwards informed had thriven greatly; and now
doubtless furnish a very valuable addition to the na-
tural productions of this spot. Vast shoals of fish of
various
JUBILEE, among the Jews, denotes every fiftieth year; being that following the revolution of seven weeks of years; at which time all the slaves were made free, and all lands reverted to their ancient owners. The jubilees were not regarded after the Babylonish captivity.

—The word, according to some authors, comes from the Hebrew, 'jobel,' which signifies fifty: but this must be a mistake, for the Hebrew יבֵל, 'jobel,' does not signify fifty; neither do its letters, taken as cyphers, or according to their numerical powers, make that number; being 10, 6, 2, and 30, that is, 48. Others say, that 'jobel' signifies a ram, and that the jubilee was thus called, because proclaimed with a ram's horn, in memory of the ram that appeared to Abraham in the thicket. Masius chooses to derive the word from "Jabal," the first inventor of musical instruments, which for that reason, were called by his name; whence the words 'jobel' and 'jubile' came to signify the year of deliverance and remission, because proclaimed with the sound of one of those instruments which at first was not more than the horn of a ram. Others derive 'jobel' from Heb. יבֵל, 'jabel,' in hiphil יבֵל, 'hoabel,' which signifies to recall or return; because this year restored all slaves to their liberty, &c. The institution of this festival is in Lev. xxv. 8, 17.

The learned are divided about the year of jubilee; some maintaining that it was every forty-ninth, and others that it was every fiftieth, year. The ground of the former opinion is chiefly this, that the forty-ninth year being of course a sabbatical year, if the jubilee had been kept on the fiftieth, the land must have had two sabbaths, or have lain fallow two years, which, without a miracle, would have produced a dearth. On the other hand, it is alleged, that the Scripture expressly declares for the fiftieth year, Lev. xxvi. 10, 11. And besides, if the jubilee and sabbatical year had been the same, there would have been no need of a prohibition to reap, &c. because this kind of labour was prohibited by the law of the sabbatical year, Lev. xxvi. 4, 5. The authors of the Universal History, book i. chap. 7. note R, endeavour to reconcile these opinions, by observing, that as the jubilee began in the first month of the civil year, which was the seventh of the ecclesiastical, it might be said to be either the forty-ninth or fiftieth, according as one or other of these computations, was followed. The political design of the law of the jubilee was to prevent the too great oppressions of the poor, as well as their being liable to perpetual slavery. By this means a kind of equality was preserved through all the families of Israel, and the distinction of tribes was also preserved, that they might be able, when there was occasion, on the jubilee-year, to prove their right to the inheritance of their ancestors. It served also, like the Olympiads of the Greeks, and the Lustra of the Romans, for the reader computation of time. The jubilee has also been supposed to be typical of the gospel state and dispensation, described by Isaiah, lx. ver. 1, 2. in reference to this period, as the "acceptable year of the Lord."

JUBILEE, in a more modern sense, denotes a grand church solemnity or ceremony, celebrated at Rome, wherein the pope grants a plenary indulgence to all sinners; at least to as many as visit the churches of St Peter and St Paul at Rome.

The jubilee was first established by Boniface VII. in 1300, in favour of those who should go ad limina apostolorum; and it was only to return every hundred years. But the first celebration brought in such store of wealth to Rome, that the Germans called this the golden year; which occasioned Clement VI. in 1343, to reduce the period of the jubilee to fifty years. Urban VI. in 1389, appointed it to be held every thirty-five years, that being the age of our Saviour; and Paul II. and Sixtus IV. in 1475, brought it down to every twenty-five, that every person might have the benefit of it once in his life. Boniface IX. granted the privilege of holding jubilees to several princes and monasteries: for instance, to the monks of Canterbury, who had a jubilee every fifty years; when people flocked from all parts to visit the tomb of Thomas à Becket. Jubilees are now become more frequent, and the pope grants them as often as the church or himself have occasion for them. There is usually one at the inauguration of a new pope. To be entitled to the privileges of the jubilee, the bull enjoins fasting, alms, and prayers. It gives the priests a full power to absolve in all cases, even those otherwise reserved to the pope; to make communions of vows, &c. in which it differs from a plenary indulgence. During the time of jubilee, all other indulgences are suspended.

One of our kings, viz. Edward III. caused his birth day to be observed in manner of a jubilee, when he
JUDAH, the fourth son of Jacob, and father of the chief of the tribes of the Jews, distinguished by his name, and honoured by giving birth to the Messiah, died 1636 B.C.

Judah Hakkadosh, or the Saint, a rabbi celebrated for his learning and riches, lived in the time of the emperor Antoninus, and was the friend and preceptor of that prince. Leo of Modena, a rabbi of Venice, tells us, that Rabbi Judah, who was very rich, collected about 26 years after the destruction of the temple, in a book which he called the Misnia, the constitutions and traditions of the Jewish magistrates who preceded him. But as this book was short and obscure, two Babylonish rabbis, Rabba and Ake, collected all the interpretations, disputes, and additions, that had been made until their time upon the Miasna, and formed the book called the Babylonish Talmud or Gemara; which is preferable to the Jerusalem Talmud, composed some years before by Rabbi Jochnan of Jerusalem. The Miasna is the text of the Talmud; of which we have a good edition in Hebrew and Latin by Surenhusius, with notes, in 3 vols. folio. It was to be wished the same had been done to the Gemara.

The Kingdom of Judah was of small extent compared with that of the kingdom of Israel; consisting only of two tribes, Benjamin and Judah: its east boundary, the Jordan; the Mediterranean its west, in common with the Danites, if we except some places recovered by the Philistines and others taken by the kings of Israel; on the south, its limits seem to have been contracted under Hadad of the royal progeny of Edom, (1 Kings xi. 14.)

Tribe of Judah, one of the 12 divisions of Palestine by tribes (Josh. xxv.), having Idumea on the south, from the extremity of the Locus Asphalites, also the Wilderness of Zin, Cadesbarnea, and the brook or river of Egypt; on the east, the said lake; on the west the Mediterranean; and on the north, the mouth of the said lake; where it receives the Jordan, Bethabara, Thimna, quite to Ekron on the sea.

Judaism, the religious doctrines and rites of the Jews. Judaism was but a temporary dispensation, and was to give way, at least the ceremonial part of it, at the coming of the Messiah. For a complete system of Judaism, see the books of Moses. Judaism was anciently divided into several sects; the principal wore of were the Pharisees, Sadducees, and Essenes.

At present there are two sects among the Jews, viz. the Caraites, who admit of no rule of religion but the law written by Moses; and the Rabbinites, who add to the law the traditions of the Talmud.

Judah Maccabees, a celebrated general of the Jews, renowned for his many victories over his enemies, at last slain in battle, 167 B.C. See (History of the Jews, No. 13.)

Judas-Tre. See CERCIS, BOTANY INDEX.

Jude, St., brother of St James the younger, and son of Joseph (Mat. xiii. 55.) He preached in Mesopotamia, Arabia, Syria, Idumea; and died in Berytus for the confession of Christ. He wrote that epistle which goes under his name, and after the death of most of the apostles. He was cruelly put to death for reproving the superstition of the Magi.

Jude, or the General Epistle of Jude, a canonical book of the New Testament, written against the heretics, who, by their disorderly lives and impious doctrines, corrupted the faith and good morals of the Christians. St Jude draws them in lively colours, as men given up to their passions, full of vanity, conducting themselves by worldly wisdom, and not by the spirit of God.

Juda, or the General Epistle of Jude, a canonical book of the New Testament, written against the heretics, who, by their disorderly lives and impious doctrines, corrupted the faith and good morals of the Christians. St Jude draws them in lively colours, as men given up to their passions, full of vanity, conducting themselves by worldly wisdom, and not by the spirit of God.

Judaean, in Ancient Geography, taken largely, either denotes all Palestine, or the greater part of it; and thus it is generally taken in the Roman history: Ptolemy, Rutimius, Jerome, Origen, and Eusebius, take it for the whole of Palestine. Here we consider it as the third part of it on this side the Jordan, and that the southern part is distinct from Samaria and Galilee: under which notion it is often taken, not only in Josephus, but also in the New Testament. It contained four tribes; Judah, Benjamin, Dan, and Simeon, together with Philistia and Idumea; so as to be comprised between Samaria on the north, Arabia Petraea on the south, and to be bounded by the Mediterranean on the west, and by the lake Asphaltites, with part of Jordan, on the east. Josephus divides it into 11 toparchies; Piny into 10; by which it has a greater extent than that just mentioned. See Palestine.

Judenburg, a considerable town of Germany, in the circle of Austria, and capital of Upper Styria, with a handsome castle; the public buildings are a castle, a college, and two convents. It is seated on the river Meur. E. Long. 14. 25. N. Lat. 47. 10.

Jude, Matthew, one of the principal writers of the Centuries of Magdeburg, was born at Tippelswolde in Miasna, in 1528. He taught theology with great reputation; but met with many disquiets in the exercise of his ministry from party- feuds. He wrote several works and died in 1564.

Judge, a chief magistrate of the law, appointed to hear causes, to explain the laws, and to pass sentence.

Judge, in Jewish antiquity, certain supreme magistrates who governed the Israelites from the time of Joshua till the reign of Saul. These judges resembled the Athenian archons or Roman dictators. The dignity
thereon are admitted by the defendant; which is the case of judgements by confession or default: or, lastly, where the plaintiff is convinced that either fact, or law, or both, are insufficient to support his action, and therefore abandons or withdraws his prosecution; which is the case in judgements upon a nonsuit or retracit.

The judgement, though pronounced or awarded by the judges, is not their determination or sentence, but the determination and sentence of the law. It is the conclusion that naturally and regularly follows from the premises of law and fact, which stands thus: Against him who hath rote over my corn, I may recover damages by law: but A hath rote over my corn; therefore I shall recover damages against A. If the major proposition be denied, this is a demurrer in law: if the minor, it is then an issue of fact: but if both be confessed or determined to be right, the conclusion or judgement of the court cannot but follow. Which judgement or conclusion depends not therefore on the arbitrary caprice of the judge, but on the settled and invariable principles of justice. The judgement, in short, is the remedy prescribed by law for the redress of injuries; and the suit or action is the vehicle or means of administering it. What that remedy may be, is indeed the result of deliberation and study to point out; and therefore the style of the judgement is, not that it is decreed or resolved by the court, for then the judgement might appear to be their own; but, “it is considered,” consideratum est per curiam, that the plaintiff do recover his damages, his debt, his possession, and the like: which implies that the judgement is none of their own; but the act of law, pronounced and declared by the court, after due deliberation and inquiry. See Blackst. Comment. iii. 396.

Judgement, in criminal cases, is the next stage of prosecution, after trial and conviction are past, in such crimes and misdemeanors as are either too high or too low to be included within the benefit of clergy. And when, upon a capital charge, the jury have brought in their verdict guilty in the presence of the prisoner; he is either immediately, or at a convenient time soon after, asked by the court, if he has any thing to offer why judgement should not be awarded against him? And in case the defendant be found guilty of a misdemeanor (the trial of which may, and does usually, happen in his absence, after he has once appeared), a copias is awarded and issued, to bring him in to receive his judgement; and if he absconds, he may be prosecuted even to outlawry. But whenever he appears in person, upon either a capital or inferior conviction, he may at this period, as well as at his arraignment, offer any exceptions to the indictment, in arrest or stay of judgement: as for want of sufficient certainty in setting forth either the person, the time, the place, or the offence. And if the objections be valid, the whole proceedings shall be set aside; but the party may be indicted again. And we may take notice, 1. That none of the statutes of jeofails, for amendment of errors, extend to indictments or proceedings in criminal cases; and therefore a defective indictment is not aided by a verdict, as defective pleadings in civil cases are. 2. That, in favour of life, great strictness has at all times been observed, in every point of an indictment. Sir Matthew Hale indeed complains, “that this strict-

Vol. XL Part I.
Judgment is known to be a blemish and inconvenience in the law, and the administration thereof: for that more offenders escape by the over-easy ear given to exceptions in indictments, than by their own innocence; and many times gross murders, burglaries, robberies, and other heinous and crying offences, remain unpunished by these unseemly niceties: to the reproach of the law, to the shame of the government, to the encouragement of villainy, and to the dishonour of God. And yet, notwithstanding this laudable zeal, no man was more tender of life than this truly excellent judge.

A pardon also may be pleaded in arrest of judgement; and it has the same advantage when pleaded here as when pleaded upon arraignment; viz. the saving the attainted, and, of course, the corruption of blood: which nothing can restore but parliament, when a pardon is not pleaded till after sentence. And certainly, upon all accounts, when a man hath obtained a pardon, he is in the right to plead it as soon as possible. See Pardon.

Praying the benefit of clergy may also be ranked among the motions in arrest of judgement. See Benefit of Clergy.

If all the resources fail, the court must pronounce that judgment which the law hath annexed to the crime. Of these some are capital, which extend to the life of the offender, and consist generally in being hanged by the neck till dead; though in very atrocious crimes other circumstances of terror, pain, or disgrace, are superadded: as, in treasons of all kinds, being drawn or dragged to the place of execution; in high treason affecting the king's person or government, embowelling alive, beheading, and quartering; and in murder, a public dissection. And in case of any treason committed by a female, the judgment is to be burned alive. But the humanity of the English nation has authorized, by a tacit consent, an almost general mitigation of such parts of these judgements as savour of torture or cruelty; sledge or hurdle being usually allowed to such traitors as are condemned to be drawn; and there being very few instances (and those accidental or by negligence) of any person's being embowelled or burned, till previously deprived of sensation by strangling. Some punishments consist in exile or banishment, by abjuration of the realm, or transportation beyond the seas: others, in loss of liberty, by perpetual or temporary imprisonment. Some extend to confiscation, by forfeiture of lands, or moveables, or both, or of the profits of lands for life: others induce a disability of holding offices or employments, being heirs, executors, and the like. Some, though rarely, occasion a mutilation or dismembering, by cutting off the hand or ear: others fix a lasting stigma on the offender, by slitting the nostrils or branding in the hand or face. Some are merely pecuniary, by stated or discretionary fines: and, lastly, there are others that consist principally in their ignominy, though most of them are mixed with some degree of corporeal pain; and these are inflicted chiefly for such crimes as either arise from indulgence, or render even opinion disgraceful. Such as whipping, hard labour in the house of correction, the pillory, the stocks, and the ducking-stool.

Disgusting as this catalogue may seem, it will afford pleasure to a British reader, and do honour to the British laws, to compare it with that shocking apparatus of death and torment to be met with in the criminal codes of almost every other nation in Europe. And it is moreover one of the glories of our law, that the nature, though not always the quantity or degree, of punishment is ascertainment for every offence; and that it is not left in the breast of any judge, nor even of a jury, to alter that judgement which the law has beforehand ordained for every subject alike, without respect of persons. For if judgements were to be the private opinions of the judge, men would be slaves to their magistrates; and would live in society, without knowing exactly the conditions and obligations which it lays them under. And, besides, as this prevents oppression on the one hand; so, on the other, it stifles all hopes of impunity or mitigation, with which an offender might flatter himself if his punishment depended on the humour and discretion of the court. Whereas, where an established penalty is annexed to crimes, the criminal may read their certain consequences in that law, which ought to be the unvaried rule, as it is the inflexible judge, of his actions.

Judgement of God. See Judicium Dei.

Judicature, the quality or profession of those who administer justice.

Judicature is also used to signify the extent of the jurisdiction of the judge, and the court wherein he sits to render justice.

Judicium Centumvaria, in Roman antiquity, were trials before the Centumvarii, to whom the praetor committed the decision of certain matters of inferior nature, like our justices of peace at the quarter sessions. During the judicium centumvariale, a spear was stuck up in the forum, to signify that the court was sitting.

Judicium Columnae, was an action brought against the plaintiff for false accusation. The punishment was upon conviction, was ruinatio frontis, or branding in the forehead. See Rustio.

Judicium Dei. Judgment of God, was a term successively applied to all extraordinary trials of secret crimes; as those by arms, and single combat; and the orenda, or those by fire, or red-hot ploughshares, by plunging the arm in boiling water, or the whole body in cold water; in hopes God would work a miracle, rather than suffer truth and innocence to perish. Si super defendere non possit, judicium Dei est. Aequa colles, fierat de co justitia.—These customs were a long time kept up even among Christians; and they are still in use in some nations. See Battæ, Ordeal, &c.—Trials of this sort were usually held in churches in presence of the bishops, priests, and secular judges; after three days fasting, confession, communion, and many adjurations and ceremonies described at large by Du Cange.

Judicium Parium denotes a trial by a man's equals, i.e. of peers by peers, and of commons by commons. In magna charta it is more than once insisted on as the principal bulwark of our liberties, but especially by chap. 29. that no freeman shall be hurt in either his person or property, nisi per legale judicium parium avenient vel per legem terrae. And this was even esteemed in all countries a privilege of the highest and most beneficial nature.
JUG

Judicium Falsi, was an action which lay against the judges for corruption or unjust proceedings.

Judicium Pravationis, was an action brought against the prosecutor, after the criminal was acquitted, for suppressing the evidence of, or extenuating his guilt, rather than urging it home, and bringing it to light.

JUDOIGNE, a town in the kingdom of the Netherlands, in Brabant. Near this town the duke of Marlborough gained that signal victory over the French in 1702, called the battle of Ramillies. It is seated on river Gete, 13 miles south-east of Louvain, and 16 north of Namur.

IYVEACH, the name of two baronies of Ireland, in the county of Down, and province of Ulster. They are distinguished into Upper and Lower Iveyach, and the former is by much the largest barony in that county. The name of Iveyach, or Hy Iveyach, is said to be taken from Aekaine, in Irish called Eoachach, grandfather to King Cooldhaig, as much as to say "the territory of Eoachach;" for hy, in the Irish language, is a common adjective, denoting not only the heads and founders of families, but also the territories possessed by them. Iveyach (including both baronies) was otherwise called Magennis's country, and in Queen Elizabeth's time was governed by Sir Hugh Magennis, esteemed to have been one of the most polite of all the natives in those parts. Through part of this barony runs a chain of mountains considerably high, known by the name of Iveyach mountains.

IUMERNUS, in Ancient Geography, a town in the south-west of Ireland. Now Dunkerram, (Camden); called Dowekyne by the natives, situated on the river Maire, in the province of Munster.

IERNUS, or IERBUS (Ptolemy), a river in the south-west of Ireland. Now called the Maure, or Kenmare, running from east to west, in the province of Munster.

IVES, St., a sea-port town of Cornwall in England, seated on a bay of the same name; which is chiefly frequented by fishermen, for the taking of pilchards. By this trade, and that of Cornish slates, it has thriven greatly. It is a corporation, governed by a mayor, recorder, &c. and it sends two members to parliament. Here is a handsome spacious church, and a grammar-school, which was founded by Charles I. Population 3281 in 1811.

IVES, St., is also the name of a town in Huntingdonshire, 64 miles from London. It has a fine stone bridge over the Ouse, had in the ninth century a mint, and was noted for its medicinal waters. Great part of it was burnt down some years ago, but it was rebuilt. Here is a very good market on Monday for fattened cattle brought from the north. Here Oliver Cromwell rented a farm before he was chosen a burgess for Cambridge. Population 2426 in 1811.

JUGLET, in Roman antiquity, a square of 120 Roman feet; its proportion to the English acre being as 10.000 to 16.097.

JUGGLERS, a kind of people whose profession has not been often deemed either respectable or useful. Yet Professor Beckmann defends them, and pleadibly the cause of the practitioners of legerdemain, in the third volume of his History of Inventions, including rope-dancers, and such as exhibit feats of uncommon strength. He places all these under the general denomination of jugglers; and taking it for granted that every useful employment is full, he contends that there would not be room on the earth for all its present inhabitants, did not some of them practise the art of juggling.

"These arts, he observes, are not unprofitable, for they afford a comfortable subsistence to those who practise them, which they usually spend upon the spot, and this he considers as a good reason why their stay in a place ought to be encouraged. He is also of opinion that if the arts of juggling served no other end than to amuse the most ignorant of our citizens, it is proper that they should be encouraged, for the sake of those who cannot enjoy the more expensive deceptions of an opera. They convey instruction in the most acceptable manner, and serve as an antidote to superstition. We scarcely think, however, that it is innocent to entice the labouring poor, by useless deceptions, to part with their hard-earned pittance to idle vagabonds, whose life cannot be comfortable, which is passed amidst scenes of the most grovelling dissipation."

Juggling is certainly of very great antiquity. The deception of breathing out flames was practised by some of the slaves in Sicily about 150 years before the commencement of the Christian era. It is, however, practised in modern times with much greater dexterity. The ancients made use of naphtha, a liquid mineral oil, which kindles when it only approaches a flame. According to Plutarch, Alexander the Great was astonished and delighted with the secret effects of naphtha, which were exhibited to him at Ecbatana. Wonder has been excited in modern times by persons who could walk over burning coals or red-hot iron, which is easily done by rendering the skin of the feet callous and insensible, so that the nerves under it are secured from injury. We are told by Beckmann, that the Hirpi, who dwell near Rome, jumped through burning coals; that women were accustomed to walk over burning coals at Castabala, near the temple dedicated to Diana; that the exhibition of balls and cups is often mentioned in the works of the ancients; and that the various feats of horsemanship exhibited in our circuses passed, in the 13th century, from Egypt to the Byzantine court, and thence over all Europe.

JUGLANS, the WALNUT, a genus of plants belonging to the polyanthus class; and in the natural method ranking under the 50th order, Amuracetae. See Botany Index.

JUGORA, a considerable province of Muscovy, depending on the government of Archangel. It has the title of a duchy; and is inhabited by a kind of Tartars, who are very savage, and much of the same disposition with the Samoiedes.

JUGULAR, among anatomists, is applied to certain veins and glands of the neck. See Anatomy.

JUGULARES, in the Linnean system, is the name of an order or division of fish, the general character of which is, that the ventral fins are placed before the pectoral. See Ichthyology Index.

JUGUM, an humiliating mode of punishment inflicted by the victorious Romans upon their vanquished enemies. It was thus: They set up two years, and laying a third across, in the form of a gallows, they ordered those who had surrendered themselves to pass under this ignominious erection, without arms or belts. None of them suffered
suffered this disgrace of passing *sub juge* but such as had been obliged to surrender.

JUGURTHA, the illegitimate son of Manastabal the brother of Micipsa. Micipsa and Manastabal were the sons of Masinissa king of Numidia. Micipsa, who had inherited his father's kingdom, educated his nephew with his two sons Adherbal and Hiempsal; but as he saw that the former was of an aspiring disposition, he sent him with a body of troops to the assistance of Scipio, who was besieging Numantia, hoping to lose a youth whose ambition seemed to threaten the tranquility of his children. His hopes were frustrated; Jugurtha showed himself brave and active, and he endeared himself to the Roman general. Micipsa appointed him successor to his kingdom with his two sons; but the kindness of the father proved fatal to the children. Jugurtha destroyed Hiempsal, and stripped Adherbal of his possessions, and obliged him to fly to Rome for safety. The Romans listened to the well-grounded complaints of Adherbal; but Jugurtha's gold prevailed among the senators, and the suppliant monarch, forsaken in his distress, perished by the snares of his enemy. Cæcilius Metellus was at last sent against Jugurtha; and his firmness and success soon reduced the crafty Numidian, obliging him to fly among his savage neighbours for support. Marius and Sylla succeeded Metellus, and fought with equal success. Jugurtha was at last betrayed by his father-in-law Bocchus, from whom he claimed assistance; and he was delivered into the hands of Sylla 106 years before the Christian era. He was exposed to the view of the Roman people, and dragged in chains to adorn the triumph of Marius. He was afterwards put in a prison, where he died six days after of hunger.

IVICA, or YVICA, the name of an island in the Mediterranean. See YVICA.

JUICE, denotes the sap of vegetables, or the liquors of animals. See ANATOMY, BLOOD, PLANTS, SAP, &c.

The juices of several plants are expressed to obtain their essential salts, and for several medicinal purposes, with intention either to be used without further preparation, or to be made into syrups and extracts. The general method of extracting these juices is, by pounding the plant in a marble mortar, and then by putting it into a press. Thus is obtained a muddy and green liquor, which generally requires to be clarified, as we shall soon observe. The juices of all plants are not extracted with equal ease. Some plants, even when fresh, contain so little juice, that water must be added while they are pounded, otherwise scarcely any juice would be obtained by expression. Other plants, which contain a considerable quantity of juice, furnish by expression but a small quantity of it, because they contain also much mucilage, which renders the juice so viscid that it cannot flow. Water must also be added to these plants to obtain their juice. The juices thus obtained from vegetables by a mechanical method, are not, properly speaking, one of their principles, but rather a collection of all the proximate principles of plants which are soluble in water; such as the saponaceous extractive matter, the mucilage, the odoriferous principle, all the saline and saccharine substances; all which are dissolved in the water of the vegetation of the plants. Besides all these matters, the juice contains some part of the resinous substance, and the green colouring matter, which in almost all vegetables is of a resinous nature. These two latter substances, not being soluble in water, are only interposed between the parts of the other principles which are dissolved in the juice, and consequently disturb its transparency. They nevertheless adhere together in a certain degree, and so strongly in most juices, that they cannot be separated by filtration alone. When therefore these juices are to be clarified, some previous preparations must be used by which the filtration may be facilitated. Juices which are acid, and not very mucilaginous, are spontaneously clarified by rest and gentle heat. The juices of most antiscorbutic plants abounding in saline volatile principles, may be disposed to filtration merely by immersion in boiling water; and as they may be contained in close bottles, while they are thus heated in a water bath, their saline volatile part, in which their medicinal qualities chiefly consist, may thus be preserved. Fermentation is also an effectual method of clarifying juices which are susceptible of it; for all liquors which have fermented, clarify spontaneously after fermentation. But this method is not used to clarify juices, because many of them are susceptible of only an imperfect fermentation, and because the qualities of most of them are injured by that process. The method of clarification most generally used, and indispensably necessary for those juices which contain much mucilage, is boiling with the white of an egg. This matter, which has the property of coagulating in boiling water, and of uniting with mucilage, does accordingly, when added to the juice of plants, unite with and coagulate their mucilage, and separates it from the juice in form of scum, together with the greatest part of the resinous and earthy matters which disturb its transparency. And as any of these resinos-matters which may remain in the liquor, after this boiling with the whites of eggs, are no longer retained by the mucilage, they may easily be separated by filtration.

The juices, especially before they are clarified, contain almost all the same principles as the plant itself; because in the operation by which they are extracted, no decomposition happens, but every thing remains, as to its nature, in the same state as in the plant. The principles contained in the juice are only separated from the grosser oily, earthy, and resinous parts, which compose the solid matter that remains under the press. These juices, when well prepared, have therefore the same medicinal qualities as the plants from which they are obtained. They must evidently differ from each other as to the nature and proportions of the principles with which they are impregnated, as much as the plants from which they are extracted differ from each other in those respects.

Most vegetable juices coagulate when they are exposed to the air, whether they are drawn out of the plant by wounds, or naturally run out; though what is called *naturally running out*, is generally the effect of a wound in the plant, from a sort of canker, or some other internal cause. Different parts of the same plant yield different juices. The same veins in their course through the different parts of the plant yield juices of
These juices, as well as the generality of others which bleed from plants, are white like milk; but there are some of other colours. The juice of the great elanthine is of a fine yellow colour; it flows from the plant of the thickness of cream, and soon dries into a hard cake, without any whey separating from it. Another yellow juice is yielded by the seed-vessels of the yellow centaury in the month of July, when the seeds are full grown. This is very clammy; it soon hardens altogether into a cake without any whey separating from it. It sticks to the fingers like birdlime, is of the colour of pale amber, and will never become harder than soft wax if dried in the shade; but if laid in the sun, it immediately becomes hard like resin. These cakes burn like wax, and emit a very pleasant smell. The great angelica also yields a yellowish juice on being wounded; and this will not harden at all, but if kept several years will still be soft and clammy, drawing out into threads or half melted resin.

Another kind of juices very different from all these, are those of a gummy nature. Some of these remain liquid a long time, and are not to be dried without the assistance of heat; and others very quickly harden of themselves, and are not inflammable. The gum of the juice of rhubarb leaves soon hardens; and is afterwards soluble in common water, and sparkles when put into the flame of a candle. The clusters of the common honeysuckle are full of a liquid gum. This they frequently throw out, and it falls upon the leaves, where it retains its own form. The red hairs of the ros solis are all terminated by large bladder of a thin watery fluid. This is also a liquid gum; it sticks to the fingers, draws out into long threads, and stands the force of the sun all day. In the centre of each of these dew-drops there is a small red bladder, which stands immediately on the summit of the red hair, and contains a purple juice which may be squeezed out of it. The pinguicula, or butterwort, has also a gummy matter on its leaves in much greater quantity than the ros solis.

Some plants yield juices which are manifestly of an oily nature. These, when rubbed, are not at all of a clammy nature, but make the fingers glib and slippery, and do not at all harden on being exposed to the air. If the stalk of elecampane be wounded, there flows out an oily juice swimming upon a watery one. The stalks of the hemlock also afford a similar oily liquor swimming upon the other; and in like manner the white mullein, the berries of ivy, the bay, juniper, dog-berry tree, and the fruit of the olive, when wounded, show their oil floating on the watery juice. Some of these oily juices, however, harden into a kind of resin. Our ivy yields such a juice very abundantly; and the juice of the small purple-berried juniper is of the same kind, being hard and fat, and not very gummy. If the bark of the common ivy is wounded in March, there will ooze out a tough and greasy matter of a yellowish colour, which, taken up between the fingers, feels not at all gummy or sticking, but melts in handling into a sort of oil; rich in the properties of time hardens and crusts upon the wounds, and looks like brown sugar. It burns with a lasting flame, and smells very strong. The tops of the wild lettuce, are the
Though it has been pleaded by Julian’s apologists, that the behaviour of the Christians furnished sufficient pre-
tence for most of his proceedings against them, and
the animosities among themselves furnished him with
the means; that they were continually prone to sedi-
tion, and made a merit of insulting the public worship;
and, finally, that they made no scruple of declaring,
that want of numbers alone prevented them from en-
gaging in an open rebellion. Historians mention, that
Julian attempted to prove the falsehood of our Lord’s
prediction with respect to the temple of Jerusalem;
and resolved to have that edifice rebuilt by the Jews,
about 300 years after its destruction by Titus: but
all their endeavours served only the more perfectly to
verify what had been foretold by Jesus Christ; for the
Jews, who had assembled from all parts to Jerusalem,
digging the foundations, flames of fire burst forth and
consumed the workmen. However, the Jews, who were obstinately bent on accomplishing that work, made several attempts; but it is said, that all who en-
deavoured to lay the foundation perished by these
flames, which at last obliged them entirely to abandon
the work. Julian being mortally wounded in a battle
with the Persians, it is said, that he then cast his
hand some of the blood which flowed from his
wound; and throwing it towards heaven, cried—"Thou
Galilean has conquered." But notwithstanding this
popular report, Theodoret relates, that Julian disso-
cvered a different disposition; and employed his last
moments in conversing with Maximus the philosopher
on the dignity of the soul. He died the following
night, aged 32. For a particular account of his reign
and exploits, see (History of) CONSTANTINOPLE, No 7.
33—66.

No prince was ever more differently represented by
different authors; on which account it is difficult to
form a true judgment of his real character. It must,
however, be acknowledged, that he was learned, lib-
eral, temperate, brave, vigilant, and a lover of justice:
but, on the other hand, he had apostatised to Paga-
nism; was an enemy to the Christian religion; and
was, in fact, a persecutor, though not of the most sangu-
inous class. We have several of his discourses or ora-
tions; some of his letters; a treatise intitled Misopogon,
which is a satire on the inhabitants of Antioch; and
some other pieces, all written in an elegant style. They
were published in Greek and Latin by Father Petau
in 1630 in quarto; and of which Spanheimus gave a fine
dition in folio in 1696. His most famous work was
that composed against the Christians, of which there
are some fragments in Cyril’s refutation of it.

JULIAN Period, in Chronology, a period so called, as
being adapted to the Julian year.

It is made to commence before the creation of the
world. Its principal advantage lies here, that the same
years of the cycles of the sun, moon, and induction,
of which three cycles it was made to consist by Joseph Scal-
liger in 1580, belonging to any year of this period,
will never fall together again till after the expiration of
7980 years. There is taken for the first year of this
period that which hath the first of the cycle of the sun,
the first of the cycle of the moon, and the first of the
induction cycle, and so reckoning on.

The first year of the Christian era is always, in our
systems of chronology, the 4714th of the Julian period.

To find what year of the Julian period any given year of Christ answers to: To the given year of Christ add 4713, because so many years of the Julian period were expired A.D. 1; and the sum gives the year of the Julian period sought.

On the contrary, having the year of the Julian period given, to find what year of Christ answers thereto: From the year of the Julian period given subtract 4713, and the remainder will be the year sought.

Julian, St., a harbour on the south of Patagonia, in South America, where ships usually touch that are bound to the South seas. S. Lat. 48° 15'.

JULIERS, a duchy in the circle of Westphalia, in Germany, seated between the rivers Maese and Rhine, now forming part of the Prussian province of the Lower Rhine. It is about 56 miles long, and 30 broad; has a superficial extent of 1600 square miles, with 200,000 inhabitants, and is a very plentiful country, abounding in cattle, corn, and fine meadows, and is well supplied with wood; but it is most remarkable for a fine breed of horses, and wood for dyeing, which is gathered here in abundance. The chief towns are Julliers, Alz-la-Chapelle, Duren, Mossen-Efzel, Besse, Wesemburg, and Eastern. It was transferred from France to Prussia in 1815.

JULIERS, a city, capital of the duchy of Julliers in Westphalia; some think this city was founded by Julius Cæsar or Julia Agrrippina; but this is much questioned by others, because it is not mentioned before Antoninus's Itinerary and Theodosius's Tables. The town is small, but well fortified, and neatly built; the houses are of brick, and the streets broad and regular. The citadel is large and very strong, containing a palace of the ancient dukes and a spacious piazza. In the suburbs there is a monastery of Carthusians, nobly endowed by several dukes of Julliers. The town contains 2150 inhabitants, and there is a fine woollen manufacture in this country, and likewise another of linen. It was taken by Prince Maurice of Nassau in 1610, and by the Spaniards in 1622. It is seated on the river Roer, in E. Long. 6° 18'. N. Lat. 50° 55'.

JULIO ROMANO. See ROMANO.

JULIUS CÆSAR. See CÆSAR.

JULIUS II. Julian de la Rovre, pope; remarkable for his warlike disposition, and his political negotiations: by the latter, he engaged the principal powers of Europe to league with him against the republic of Venice, called the league of Cambrai, signed in 1508. The Venetians having purchased peace by the cession of part of Romania, Julius turned his arms against Louis XII. king of France, and appeared in person armed ca-sap-pe, at the siege of Mirandole, where he took place by assault in 1512. But proceeding to communicate Louis, the king wisely turned his own weapons against him, by calling a general council at Pisa: at which the pope refusing to appear, was declared to be suspended from the holy see; and Louis, in his turn, communicated the pope, who died soon after in 1512. He built the famous church of St Peter at Rome, and was a patron of the polite arts.

JULIUS V, in Ancient Geography, a town of the

Nemettes in Gallia Belgica; situated between the Tres Tabernæ and Noviomagus. Now Gemersheim, a town of the Lower Palatinate, on the west side of the Rhine.

E. Long. 6° 8'. N. Lat. 54° 33'

JULIUS POLLUX. See POLLUX.

JULIUS, a son of Ascanius, born in Lavinium. In the succession to the kingdom of Alba, Æneas Sylvius, the son of Æneas and Lavinia, was preferred to him. He was, however, made chief priest.

JULUS, a genus of insects of the order srepta. See ENTOMOLOGY INDEX.

JULY, the seventh month of the year; during which the sun enters the sign Leo. The word is derived from the Latin Julius, the surname of C. Cæsar the dictator, who was born in it. Mark Antony first gave this month the name July, which before was called Quintilis, as being the fifth month of the year in the old Roman calendar established by Romulus, which began in the month of March. For the same reason, August was called Sextilis; and September, October, November, and December, still retain the name of their first rank.

Quae sequitur, numeris tarda statuuntur. Ovid, Fast.

On the 19th day of this month the dog-days are commonly supposed to begin; when, according to Hippocrates and Pliny, the sea boils, wine turns sour, dogs go mad, the bite is increased and irritates, and all animals decline and languish.

JULY-Flowers. See DIANTHUS, BOTANY INDEX.

JUMIEGE, a town of Normandy in France, and in the territory of Caux, with a celebrated Benedictine abbey. It is seated on the river Seine, in E. Long. 55°. N. Lat. 49° 25'.

JUNICI LANDIZE, the name given by old authors to a species of coral, of the tubularia kind, and composed of a congeries of small tubes. See TUBULARIA, HELMINTHOLOGY INDEX.

JUNCTURE, a joint or clefting of two bodies. See JOINT.

JUNCTURE, in Oratory, is a part of composition particularly recommended by Quintilian, and denotes such an attention to the nature of the vowels, consonants, and syllables, in the connection of words, with regard to their sound, as will render their pronunciation most easy and pleasant, and best promote the harmony of the sentence. Thus the coalition of two vowels, occasioning a hollow and obscure sound, and likewise of some consonants, rendering it harsh and rough, should be avoided: nor should the same syllable be repeated at the beginning and end of words, because the sound becomes hereby harsh and unpleasant.

The following verse in Virgil's Æneid is an example of juncture.

Armis viriämque cano, Trojâ qui primus ob oris.

JUNCUS, the Rush, a genus of plants belonging to the hexandria class; and in the natural method ranking under the 5th order, Tripetaloides. See BOTANY INDEX.

JUNE, the sixth month of the year, during which the sun enters the sign of Cancer. The word comes from
from the Latin Junius, which some derive to Junone. Ovid, in the 6th of his Fasti, makes the goddess say,

-Julius nostro nomine nomen habet.

Others rather derive it to juvenilibus, this being for young people as the month of May was for old ones.

-Julius est juvenilis; qui fuit ante senum.

In this month is the summer aestivalia.

Jungermannia, a genus of plants of the natural order of algea, and belonging to the cryptogamia class. See Botany Index.

Jungia, a genus of plants belonging to the syngenesia class. See Botany Index.

Juniperus, the juniper tree; a genus of plants belonging to the moncetia class; and in the natural method ranking under the 51st order, Coniferae. See Botany Index.

Junius, Adrian, one of the most learned men of the age in which he lived, was born at Hoorin in Holland in 1511. He travelled into all parts of Europe, and practised physic with reputation in England, where, among other works, he composed a Greek and Latin Lexicon, to which he added above 5000 words; an Epitaphium on the marriage of Queen Mary with King Philip of Spain; and Animadversa et de Coma Commentarius, which is the most applauded of all his works. He died in 1575.

Junius, Francis, professor of divinity at Leyden, was born at Bourges in 1545, of a noble family, and studied some time at Lyons. Bartholomew Aenea, who was principal of the college in that city, gave him excellent instructions with regard to the right method of studying. He was remarkable for being proof against all temptations to lewdness; but a libertine so far overpowered him by his sophistry, that he made him an atheist; however, he soon returned to his first faith; and, averse as he was to unlawful love, he had no aversion to marriage, but was married no less than four times. He was employed in public affairs by Henry IV.; and at last was invited to Leyden to be professor of divinity; which employment he discharged with honour, till he was snatched away by the plague in 1602. Lu Pin says, he was a learned and judicious critic. He wrote, in conjunction with Emmanuel Tremellius, a Latin version of the Hebrew text of the Bible. He also published Commentaries on a great part of the Holy Scriptures; and many other works, all in Latin.

Junius, Francis or Francis du Jon, the son of the preceding, was born at Heidelberg in 1589. He at first designed to devote himself to a military life; but after the truce concluded in 1609, he applied himself entirely to study. He came to England in 1620, and lived 30 years in the earl of Arundel’s family. He was greatly esteemed not only for his profound erudition, but also for the purity of his manners; and was so passionately fond of the study of the northern languages, that being informed there were some villages in Friesland where the ancient language of the Saxons was preserved, he went and lived two years in that country. He returned to England in 1625; and after spending a year at Oxford, retired to Windsor, in order to visit Vossius, at whose house he died in 1677. The university of Oxford, to which he bequeathed his manuscripts, erected a very handsome monument to his memory. He wrote, 1. De Pictura Veterum, which is admired by all the learned; the best edition of it is that of Rotterdam in 1694. He published the same work at London in English. 2. An explanation of the old Gothic manuscript, called the Silver one, because the four Gospels are there written in silver Gothic letters; this was published with notes by Thomas Mareschal or Marshal. 3. A large commentary on the Harmony of the four Gospels by Tatian, which is still in manuscript. 4. A Glossary in five languages, in which he explains the origin of the Northern languages; published at Oxford in 1745; in folio, by Mr Edward Lee. Juno, in sea language, a name given to any remnants or pieces of old cable, which is usually cut into small portions, for the purpose of making points, mats, gaskets, sennit, &c.

Juno, in Pagan worship, was the sister and wife of Jupiter, and the goddess of kingdoms and riches; and also styled the queen of heaven: she presided over marriage and childbirth, and was represented as the daughter of Saturn and Rhea. She married Jupiter; but was not the most compliant wife: for according to Homer, that god was sometimes obliged to make use of all his authority to keep her in due submission; and the same author observes, that on her entering into a conspiracy against him, he punished her by suspending her in the air with two anvils fastened to her feet, and golden manacles on her hands, while all the other deities looked on without a possibility of helping her. However, her jealousy made her frequently find opportunities of interrupting her husband in the course of his amours; and prompted her to punish with unrelenting fury Europe, Semele, Io, Latona, and the rest of his mistresses. Jupiter himself having conceived without any commerce with a female, Juno, in revenge, conceived Vulcan by the wind, Mars by touching a flower pointed out to her by the goddess Flora, and Hebe by eating greedily of lettuces.

Juno, as the queen of heaven, preserved great state: her usual attendants were Terror and Boldness, Castor, Pollux, and 14 nymphs; but her most faithful attendant was the beautiful Iris, or the rainbow. Homer describes her in a chariot adorned with precious stones, the wheels of which were of ebony, and which was drawn by horses with reins of gold. But she is more commonly painted drawn by peacocks. She was represented in her temple at Corinth, seated on a throne, with a crown on her head, a pomegranate in one hand, and in the other a sceptre with a cockoon on its top. This statue was of gold and ivory.

Some mythologists suppose that Juno signifies the air: others, that she was the Egyptian Isis; who being represented under various figures, was by the Greeks and Romans represented as so many distinct deities.

Junonalia, a festival observed by the Romans in honour of Juno. It was instituted on account of certain prodigies that happened in Italy, and was celebrated by matrons. In the solemnity two white cows were led from the temple of Apollo into the city through the gate called Carmentalis, and two images of Juno, made of cypress, were borne in procession. Then marched 27 girls, habited in long robes, singing a hymn to the goddess; then came the decumenvi, crown-
JUP [ 401 ]

JUNO, in matters of government, denotes a select council for taking cognizance of affairs of great consequence, which require secrecy.

In Spain and Portugal, it signifies much the same with convention, assembly, or board, among us; thus we meet with the junio of the three estates, of commerce, of tobacco, &c. See Board, &c.

IVORY, in Natural History, &c. a hard, solid, and firm substance, of a white colour, and capable of a very good polish. It is the task of the elephant; and is hollow from the base to a certain height, the cavity being filled up with a compact medullary substance, seeming to have a great number of glands in it. It is observed, that the Ceylon ivory, and that of the island of Achean, do not become yellow in the wearing, as all other ivory does; for this reason the teeth of these places bear a larger price than those of the coast of Guinea.

Hardening, Softening, and Staining of Ivory. See Bones and Horns.

JUPITER, the supreme god of the ancient Pagans. The theologians, according to Cicero, reckoned up three Jupiters; the first and second of whom were born in Arcadia: of these two, the one sprung from Aether, the other from Caelus. The third Jupiter was the son of Saturn, and born in Crete, where they pretended to show his sepulchre. Cicero in other places speaks of several Jupiters who reigned in different countries. The Jupiter, by whom the poets and divines understand the supreme god, was the son of Saturn king of Crete. He would have been devoured by his father as soon as born, had not his mother Rhea substituted a stone instead of the child, which Saturn immediately swallowed. Saturn took this method to destroy all his male children, because it had been foretold by Caelus and Terra, that one of his sons should deprive him of his kingdom. Jupiter, being thus saved from his father's jaws, was brought up by the Curetes in a den on Mount Ida. Virgill tells us, that he was fed by the bees; out of gratitude for which, he changed them from an iron to a golden colour. Some say, that his nurses were Amalthea and Melissa, who gave him goats milk and honey; and others, that Amalthea was the name of the goat which nourished him, and which, as a reward for her great services, was changed into a constellation. According to others, he was fed by wild pigeons, who brought him ambrosia from Oceanus; and by an eagle, who carried nectar in his beak from a steep rock; for which he rewarded the former, by making them the foretellers of winter and summer; and the last by giving him immortality, and making him his thunderer. When grown up, he drove hell out of heaven, and divided the empire of the world with his brothers. For himself, he had heaven and earth. Neptune had the sea and wa-

JUPITER.ters; and Pluto hell. The Titans undertook to destroy Jupiter, as he had done his father. These Titans were giants, the sons of Titan and the Earth. They declared war against Jupiter, and heaped mountains upon mountains, in order to scale heaven: but their efforts were unsuccessful. Jupiter overthrew them with his thunder, and shut them up under the waters and mountains, from which they were not able to get out.

Jupiter had several wives: the first of whom, named Metis, he is said to have devoured when big with child, by which he himself became pregnant; and Minerva issued out of his head, completely armed and fully grown. His second was Themis; the name of his third is not known; his fourth was the celebrated Juno, whom he deceived under the form of a cuckoo, which to shun the violence of a storm flew for shelter to her lap. He was the father of the Muses and Graces; and had a prodigious number of children by his mistresses. He metamorphosed himself into a satyr to enjoy Antiope; into a bull, to carry off Europa; into a swan, to abuse Leda; into a shower of gold, to corrupt Danie; and into several other forms to gratify his passions. He had Bacchus by Semele, Diana and Apollo by Latona, and was the father of Mercury and the other gods.

The heathens in general believed that there was but one supreme God; but when they considered this one great being as influencing the affairs of the world, they gave him as many different names: and hence proceeded their variety of nominal gods. When he thundered or lightened, they called him Jupiter; when he calmed the sea, Neptune; when he guided their councils, Minerva; and when he gave them strength in battle, Mars. In process of time they used different representations of this Jupiter, &c. and considered them, vulgarly at least, as so many different persons. They afterward regarded each of them in different lights: e.g. The Jupiter that uttered down blessings was called the Kind Jupiter; and when punishing, the Terrible Jupiter. There was also one Jupiter for Europe, and another for Africa; and in Europe, there was one great Jupiter who was the particular friend of the Athenians, and another who was the special protector of the Romans; nay, there was scarce a town or hamlet perhaps, in Italy, that had not a Jupiter of its own: and the Jupiter of Terracina or Jupiter Anxur, represented in medals as young and beardless, with rays round his head, more resembled Apollo than the great Jupiter at the Capitol. In this way Jupiter at length had temples and different characters almost everywhere: at Carthage, he was called Ammon; in Egypt, Serapis; at Athens, the great Jupiter was the Olympian Jupiter; and at Rome the greatest Jupiter was the Capitoline Jupiter, who was the guardian and benefactor of the Romans, and whom they called the "best and greatest Jupiter." Jupiter optimus maximus. The figure of this Jupiter was represented in his chief temple on the Capitoline hill, as sitting on a curule chair; with the fulmen or thunder, or rather lightning in one hand, and a sceptre in the other. This fulmen in the figures of the old artists was always adapted to the character, under which they were to represent Jupiter. If his appearance was to be mild and calm, they gave him the comic fulmen or
Jupiter.

A bundle of flames wreathed close together, held down in his hand: When punishing, he holds up the same figure, with two transverse darts of lightning, sometimes with wings added to each side of it, to denote its swiftness; this was called by the poets the threespoked fork of Jove: and when he was going to do some exemplary execution, they put in his hand a handful of flames, all let loose in their utmost fury; and sometimes filled both his hands with flames. The superiority of Jupiter was principally manifested in that air of majesty which the ancient artists endeavored to express in his countenance: particular attention was paid to the head of hair, the eyebrows, and the beard. There are several heads of the mild Jupiter on ancient seals; where his face has a mixture of dignity and ease in it, admirably described by Virgil, Æn. i. ver. 256. The statues of the Terrible Jupiter were generally of black marble, as those of the forms were of white: the one sitting with an air of tranquility; the other standing, more or less disturbed. The face of the one is pacific and serene; of the other angry or clouded. On the head of the one the hair is regular and composed; in the other it is so discomposed, that it falls half way down the forehead. The face of the Jupiter Tonans resembles that of the Terrible Jupiter; he is represented on gems and medals as holding up the triple bolt in his right hand, and standing in a chariot which seems to be whirled on impetuously by four horses. Thus he is also described by the poets. Ovid, Deino. Herc. v. 28; Horace, lib. i. od. 4. v. 8. Jupiter, as the intelligence presiding over a single planet, is represented only in a chariot and pair: on all other occasions, if represented in a chariot, he is always drawn by four horses. Jupiter is well known as the chief ruler of the air, whose particular province was to direct the rains, the thunder, and the lightnings. As the dispenser of rain, he was called Jupiter Pluvius; under which character he is exhibited seated in the clouds, building up his right hand, or extending his arms almost in a straight line each way, and pouring a stream of hail and rain from his right hand upon the earth; whilst the fulmen is held down in his left. The winds that are given him relate to his character of presiding over the air: his hair and beard in the Antonine pillar are all spread down by the rain, which descends in a sheet from him, and falls for the refreshment of the Romans; whilst their enemies are represented as struck with the lightnings, and lying dead at their feet.

Some consider a great part of the fable of Jupiter to include the history of Noah and his three sons; and that Saturn is Noah, who saw all mankind perish in the waters of the deluge; and who, in some sort, swallowed them up, by not receiving them into the ark. Jupiter is Ham; Neptune, Japheth; and Shem, Pluto. The Titans, it is thought, represent the old giants, who built the tower of Babel, and whose pride and presumption God had confounded, by changing their language, and pouring out the spirit of discord and division among them. The name of Jupiter, or Jovis Pater, is thought to be derived from Jehovah, pronounced with the Latin termination Jovis instead of Jov-; and in medals we meet with Jovis in the nominative, as well as oblique cases: for example, Jovis cur- tor, Jovis propagator, Jovis stator. To the name Jovis was added patres; and afterwards, instead of "Jovis patres," Jupiter was used by abbreviation.

The name Jupiter was not known to the Hebrews till the reign of Alexander the Great, and the kings his successors. Autochus Epiphanes commanded the idol of Jupiter Olympias to be placed in the temple at Jerusalem; and that of Jupiter the defender of strangers in the temple on Mount Gerizim, 2 Mac. vi. 2. While St Paul and St Barnabas were at Lystra, they were taken for gods, because they cured one who had been lame from his birth, and that by an expression only; St Paul was taken for Mercury, by reason of his eloquence; and St Barnabas for Jupiter (Acts xiv. xi. 12.), on account probably of his good mien.

Jupiter, 2, in Astronomy, one of the superior planets, remarkable for its brightness; and which by its proper motion seems to revolve round the earth in about twelve years. See Astronomy Index.

Jura, one of the Hebrides, or Western Islands of Scotland, lying opposite to Knabdale in Argyleshire, is supposed to be about 34 miles long and 10 broad. It is the most rugged of all the Hebrides; and is composed chiefly of vast mountains, naked, and without a possibility of cultivation. Some of the south and western sides only are improvable, and in good seasons as much bear and oats are raised as will maintain the inhabitants; though by the distillation, as Mr Pennant supposes, of their grain, they sometimes want. Bear produces four or five fold, and oats threefold. Scones are the only fruits of the island; besides the berries of the mountain-ash, from which an acid for punch is obtained, and a kind of spirit is also distilled. Necessity hath instructed the inhabitants in the use of native dyses. Thus the juice of the tops of heath boiled supplies them with a yellow; the roots of the white water lily with a dark brown; those of the yellow water iris with a black; and the gaftium verum, roots of the islanders, with a very fine red, not inferior to madder. On the hills is some pasture for cattle; and the produce, when Mr Pennant visited the island, amounted to about 300 or 400 head of black cattle, sold annually at 3l. each; and by the number of black cattle annually exported amounted to 500, which brings at an average 8l. each; and about 3000 sheep, which bring 1l. each; but goats are less numerous than formerly; about 100 horses are also sold annually. The other animals of Jura are about 100 stag; though these must formerly have been much more numerous, as the original name of the island was Deir-ay, or the isle of deer, so called by the Norwegians on account of the abundance of deer found in it. Here also Mr Pennant had some obscure account of a worm that, in a less pernicious degree, resembles the Fucis infestans of Linneas. The fillan, a little worm of Jura, small as a thread, and not an inch in length, insinuates itself under the skin, causes a redness and great pain, flies swiftly from place to place; but is cured by a poultice of cheese and honey. Of the mountains of Jura, those from their shapes called the gaps, are the most remarkable. There are only three very large ones: the biggest called Beinn-an-air, or the mountain of gold, lies farthest to the north; the second is called Bain-shheanta, or the hollowed mountain; and the third, Beinn-a-chrochobh, or the mountain of the sound, is the least of the three. Mr Pennant
Pennant ascended the first with great labour and difficulty. It is composed of vast stones, covered with moss near the base; but all above bare, and unconnected with each other. The whole, he says, seems a crater, the work of the last son of Saturn. The grandeur of the prospect from the top abundantly made amends for the fatigue of ascending the mountain. Jura itself afforded a stupendous scene of rock, varied with innumerable little lakes. From the west side of the hill ran a narrow strip of rock terminating in the sea, and called the side of the old hog. To the south appeared Ilay extended like a map beneath his feet; and beyond that the north of Ireland; to the east two other islands, Cantyre, Arran, and the frith of Clyde bounded by Ayrshire; an amazing tract of mountains to the northeast as far as Benlomond; Skarba finished the northern view; and over the western ocean were scattered Colonsay and Oransay, Mull, Iona, and its neighbouring isles; and still further, the long extents of Tirey and Col, just apparent. The other peaks are seen very distinctly, but all of them inferior in height. Mr Banks and his friends mounted that to the south, and found the height to be 2359 feet; but this is far overtopped by Beinn-an-oir. The stones of this mountain are white, a few red, quartz, and composed of small grains; but some are brecciated, or filed with crystalline kernels of an amethystine colour. The other stones of the island are a cincere slate, veined with red, and used here as a whetstone; a micaceous sandstone; and between the small isles and Arfin, a micaceous quartzy rock-stone. On the west side of the island there is an anchoring place called Whitsfearan; towards the north end is a bay called Dal-paul; and on the same coast is formed another riding place for vessels among several small islands. Between the north end of Jura and the small isle of Skarba, there is a famous whirlpool, called Cory Hracent, from Brecon son to a king of Denmark, who perished in this gulf. His body being cast afloat on the north side of Jura, was buried in a cave, and his grave is still distinguished by a tombstone and altar. This vortex, which extends about a mile in breadth, the sea begins to boil and ferment with the tide of flood, increasing gradually to a number of whirlpools, which, in the form of pyramids, spout up the water, with a great noise, as high as the mast of a small vessel, agitated into such a foam as makes the sea appear white even at the distance of two leagues. About half-flood the violence begins to decrease, and continues to do so till about half an hour after high water: then it boils as before, till within an hour of low water, when the smallest fishing boat may cross it without danger.

Jura is furnished with many rivulets and springs of excellent water, and the air is remarkably healthy; its salubrity being increased by the high situation, perpetually favoured by breezes. It is, however, but ill peopled; and did not contain above 700 or 800 inhabitants at the time it was visited by Mr Pennant. The number in 1805 has increased to 1100. The women are prolific, and very often bear twins. The inhabitants live to a great age, and are liable to few distempers. Men of 90 can work; and there was living in Pennant's time a woman of 80, who could run down a sheep. The inhabitants are all Protestants, but addicted to some superstitions. The parish is supposed to be the largest in Great Britain, and the duty the most dangerous and troublesome: it consists of Jura, Oransay, Colonsay, Skarba, and several little islands divided by narrow and dangerous sounds; forming a length of not less than 60 miles; supplied by only one minister and an assistant.

The very old clans of Jura are the Macilweys and the Macnairines; but it seems to have changed masters more than once. In 1539, Donald of Cantyre, Macguilayne of Doward, Macguilayne of Kinlockhuy, and Macduffie of Colonsay were the proprietors; Maclean of Mull had also a share in 1586. Mr Campbell of Jura, and Mr Macneil of Colonsay, are now (1807) the only proprietors of this island; but by far the greatest part belongs to the former.

Jura is also the name of a chain of mountains in Switzerland, beginning in the canton of Zurich, extending from thence along the Rhine into the canton and bishopric of Basle, stretching into the canton of Soloeure and the principality of Neuchatel, and branching out towards the Pays de Vaud; separating that country from Franche Comté and Burgundy, and continued beyond the Genevan territories as far as the Rhone. Many elevated valleys are formed by different parts of this chain in the country of the Pays de Vaud; among which one of the most remarkable is the valley of the lake of Joux, on the top of that part of the chain named Mont Joux. It contains several populous villages, and is beautifully diversified with wood, arable land, and pasture. It is watered by two lakes; the largest of which is that of Joux already mentioned. This has one shore of a high rock covered with wood; the opposite banks forming a gentle ascent, fertile and well cultivated; behind which is a ridge covered with pines, beech, and oak wood. The smaller lake, named Breuet, is bordered with fine corn fields and villages; and the stream which issues from it is lost in a gulf named Entenoir, or the Funnel, where the people have placed several mills. The valley contains about 3000 inhabitants, remarkable for their industry. Some are watchmakers; but the greatest number employ themselves in polishing crystals, granites, and marcasites. The country is much infested with bears and wolves. In ascending to this place there is a very extensive prospect of great part of the Pays de Vaud, the lake of Geneva, and that of Neuchatel, which from that high point of view appear to be nearly on a level; though M. de Luc found the latter to be 159 feet above the level of the lake of Geneva.

Jura, a department in the east of France. It takes its name from Mount Jura, and contains 2050 square miles, and 500,000 inhabitants. It is rather hilly in general, but yields corn, wine, hemp, maize, and has mines of iron, copper, lead, and pitch-cork. Lous-le-Grand is the chief town.

JURATS, jurati, magistrates in the nature of aldermen, for the government of several corporations. Thus we meet with the mayor and jurats of Maidstone, Rye, Winchester, &c.—So also Jersey has a bailiff and twelve jurats, or sworn assistants, to govern the island.

IVREA, an ancient and strong town of Italy, in Piedmont, and capital of Canaves, with a strong fort,
in the process of time they became so much esteemed, that they were called prudentes and sapientes, and the emperors appointed the judges to follow their advice. Augustus advanced them to be public officers of the empire; so that they were no longer confined to the petty councils of private persons.—Bern. Rutilius has written the lives of the most famous jurisconsulti who have lived within these 2000 years.

JURISDICTION, a power or authority which a man has to do justice in cases of complaint made before him. There are two kinds of jurisdiction, the ecclesiastical, the other secular.

Secular Jurisdiction belongs to the king and his justices or delegates. The courts and judges at Westminster have jurisdiction all over England, and are not restrained to any county or place; but all other courts are confined to their particular jurisdiction, which if they exceed, whatever they do is erroneous. There are three sorts of inferior jurisdictions; the first is tenere placita, to hold pleas, and the plaintiff may sue either there or in the king's courts. Another is the consensual of pleas, where a right is invested in the lord of the franchise to hold pleas: and he is the only person that can take advantage of it, by claiming his franchise. The third sort is an exempt jurisdiction, as where the king grants to some city, that the inhabitants shall be sued within their city, and not elsewhere; though there is no jurisdiction that can withstand a certiorari to the superior courts.

Ecclesiastical Jurisdiction belongs to bishops and their deputies.

Bishops, &c. have two kinds of jurisdiction, the one internal, which is exercised over the conscience in things purely spiritual; and this they are supposed to hold immediately of God.

The other is contentious, which is a privilege some princes have given them of terminating disputes between ecclesiastics and laymen.

JURISPRUDENCE, the science of what is just or unjust; or the knowledge of laws, rights, customs, statutes, &c. necessary for the administration of justice. See LAw.

JUROR, a juror, in a legal sense, is one of those twenty-four or twelve men who are sworn to deliver truth upon such evidence as shall be given them touching any matter in question. The punishment of petty jurors attainted of giving a verdict contrary to evidence, willingly, is very severe.

JURY, a certain number of men sworn to inquire into and try a matter of fact, and to declare the truth upon such evidence as shall appear before them.

Juries are, in these kingdoms, the supreme judges in all courts and in all causes in which either the life, property, or reputation, of any man is concerned: this is the distinguishing privilege of every Briton, and one of the most glorious advantages of our constitution; for as every one is tried by his peers, the meanest subject is as safe and as free as the greatest. See the article TRIAL.

Jury Mast, whatever is set up in room of a mast that has been lost in a storm or an engagement, and to which a lesser yard, ropes, and sails, are affixed.

JUS CORONÆ. See HEREDITARY RIGHT, and Succession.
Jus Deliberandi, in Scots Law, that right which an heir has by law of deliberating for a certain time whether he will represent his predecessor.

Jus Devotatum, in Scots Law, the right of the church of presenting a minister to a vacant parish, in case the patron shall neglect to use that right within the time limited by law.

Jus Mariti, in Scots Law, the right the husband acquires to his wife's moveable estate, in virtue of the marriage.

Jus Relicta, in Scots Law, the right the wife has in the goods in communion, in case of the previous decease of the husband.

Jus Precedentis, in Scots Law, the preferable right of jurisdiction acquired by a court, in any cause to which other courts are equally competent, by having exercised the first act of jurisdiction.

Jus Civile, amongst the Romans, signified no more than the interpretation given by the learned, of the laws of the twelve tables, though the phrase now extends to the whole system of the Roman laws.

Jus Civitatis, signifies freedom of the city of Rome, which entitled those persons who had obtained it to most of the privileges of Roman citizens—yet it differs from Jus Quiritium, which extends to all the advantages which a free native of Rome was entitled to; the difference is much the same as betwixt demission and naturalization with us.

Jus Honorarium, was a name given to those Roman laws which were made up of edicts of the supreme magistrates, particularly the pretors.

Jus Imaginis, was the right of using pictures and statues amongst the Romans, and had some resemblance to the right of bearing a coat of arms amongst us. This honour was allowed to none but those whose ancestors or themselves had borne some curule office, that is, had been Curule Edile, Censor, Praetor, or Consul.

The use of statues, &c. which the Jus Imaginis gave, was the exhibiting them in funeral processions, &c. See IMAGE.

Jus Papirianum, was the laws of Romulus, Numa, and other kings of Rome, collected into a body by Sextus Papirius, who lived in the time of Tarquin the Proud; which accounts for the name.

Jus Trium Liberatorum, was a privilege granted to such persons in the city of Rome as had three children, by which they were exempted from all troublesome offices. The same exemption was granted to any person who lived in other parts of Italy, having four children; and those that lived in the provinces, provided they had five (or as some say seven) children, were entitled to the same immunities. This was good policy, and tended to the population of the empire. For a further account of these privileges, see CHILDREN.

JUSSICA, a genus of plants belonging to the decandria class; and in the natural method ranking under the 17th order, Calycanthema. See BOTANY INDEX.

JUST, a sportive kind of combat on horseback, man against man, armed with lances. The word is by some derived from the French joustes, of the Latin juxta, because the combatants fought near one another. Salmansius derives it from the modern Greek σουστρα, or rather σουρσε, which is used in this sense by Nicephorus Gregorius. Others derive it from justa, which in the corrupt age of the Latin tongue was used for this exercise, by reason it was supposed a more just and equal combat than the tournament.

The difference between justs and tournaments consists in this, that the latter is the genus, of which the former is only a species. Tournaments included all kinds of military sports and engagements made out of gallantry and diversions: Justs were those particular combats where the parties were near each other, and engaged with lance and sword. Add, that the tournament was frequently performed by a number of cavaliers, who fought in a body: The just was a single combat of one man against another. Though the justs were usually made in tournaments after a general encounter of all the cavaliers, yet they were sometimes singly, and independent of any tournament. See TOURNAMENT.

He who appeared for the first time at a just, forfeited his helmet or casque unless he had forfeited before at a tournament.

JUSTICE, in a moral sense, is one of the four cardinal virtues, which gives every person his due.

Civilians distinguish justice into two kinds: communicative and distributive. The former establishes fair dealing in the mutual commerce between man and man; and includes sincerity in our discourse, and integrity in our dealings. The effect of sincerity is mutual confidence, so necessary among the members of the same community; and this mutual confidence is sustained and preserved by the integrity of our conduct.

Distributive justice is that by which the differences of mankind are decided, according to the rules of equity. The former is the justice of private individuals; the latter of princes and magistrates.

Fidelity and truth are the foundation of justice. As to be perfectly just is an attribute of the Divine Nature, to be so to the utmost of our ability is the glory of man.

The following examples of this virtue are extracted from various authors.

1. Among the several virtues of Aristides, that for which he was most renowned was justice; because this virtue is of most general use, its benefits extending to a greater number of persons, as it is the foundation, and in a manner the soul, of every public office and employment. Hence it was that Aristides, though in low circumstances, and of mean extraction, obtained the glorious surname of the Just; a title, says Plutarch, truly royal, or rather truly divine: but of which princes are seldom ambitious, because generally ignorant of its beauty and excellency. They choose rather to be called the conquerors of cities and the thunderbolts of war, preferring the vain honour of pompous titles, which convey no other idea than violence and slaughter, to the solid glory of those expressive of goodness and virtue. How much Aristides deserved the title given him, will appear in the following instances; though it ought to be observed, that he acquired it not by one or two particular actions, but by the whole tenor of his conduct.

Themistocles having conceived the design of supplanting the Lacedaemonians, and of taking the government of Greece out of their hands, in order to put it into those of the Athenians, kept his eye and his thoughts.
thoughts continually fixed upon that great project; and as he was not very nice or scrupulous in the choice of his measures, whatever tended towards the accomplishing of the end he had in view he looked upon as just and lawful.

On a certain day then he declared in a full assembly of the people, that he had a very important design to propose; but that he could not communicate it to the people, because its success required it should be carried on with the greatest secrecy; he therefore desired they would appoint a person to whom he might explain himself upon the matter in question. Aristides was unanimously fixed upon by the whole assembly, who referred themselves entirely to his opinion of the affair; so great a confidence had they both in his probity and prudence. Themistocles, therefore, having taken him aside, told him that the design he had conceived was to burn the fleet belonging to the rest of the Grecian states, which then lay in a neighbouring port; and by this means Athens would certainly become mistress of all Greece. Aristides thereupon returned to the assembly, and only declared to them that indeed nothing could be more advantageous to the commonwealth than Themistocles's project, but that at the same time nothing in the world could be more unjust. All the people unanimously ordained that Themistocles should entirely desist from his prospect.

There is not perhaps in all history a fact more worthy of admiration than this. It is not a company of philosophers (to whom it costs nothing to establish fine maxims and sublime notions of morality in the school) who determine on this occasion that the consideration of profit and advantage ought never to prevail in preference to what is honest and just; but the whole people who are highly interested in the proposal made to them, that are convinced it is of the greatest importance to the welfare of the state, and who, however, reject it with unanimous consent, and without a moment's hesitation; and for this only reason, that it is contrary to justice. How black and perfidious, on the other hand, was the design which Themistocles proposed to them, of burning the fleet of their Grecian confederates at a time of entire peace, solely to aggrandize the power of the Athenians! Had he a hundred times the merit ascribed to him, this single action would be sufficient toully all his glory; for it is the heart, that is to say, integrity and probity, which constitutes and distinguishes true merit.

2. The government of Greece having passed from Sparta to the Athenians, it was thought proper under this new government to lodge in the isle of Delos the common treasure of Greece; to fix new regulations with regard to the public money; and to lay such a tax as might be regulated according to the revenue of each city and state, in order that the expenses being equally borne by the several individuals who composed the body of the allies, no one might have reason to murmur. The difficulty was to find a person of so honest and incorrupt a mind, as to discharge faithfully the employment of so delicate and dangerous a kind; the due administration of which so nearly concerned the public welfare. All the allies cast their eyes on Aristides; accordingly they invested him with full powers, and appointed him to levy a tax on each of them, relying entirely on his wisdom and justice. The citizens had no cause to repent their choice. He presided over the treasury with the fidelity and disinterestedness of a man who looks upon it as a capital crime to embezzle the smallest portion of another's possessions, with the care and activity of a father in the management of his own estate, and with the caution and integrity of a person who considers the public money as sacred. In fine, he succeeded in what is equally difficult and extraordinary, viz. to acquire the love of all in an office in which he who escapes the public odium gains a great point. Such is the glorious character which Seneca gives of a person charged with an employment of almost the same kind, and the noblest eulogium that can be given to such as administer public revenues. It is the exact picture of Aristides. He discovered so much probity and wisdom in the exercise of this office, that no man complained; and those times were considered ever after as the golden age; that is, the period in which Greece had attained the highest pitch of virtue and happiness.

While he was treasurer-general of the republic, he made it appear that his predecessors in that office had cheated the state of vast sums of money, and among the rest Themistocles in particular; for this great man with all his merit, was not irreproachable on that head; for which reason, when Aristides came to pass his account, Themistocles raised a mighty faction against him, accused him of having embezzled the public treasure, and prevailed so far as to have him condemned and fined. But the principal inhabitants, and the most virtuous part of the citizens, rising up against so unjust a sentence, not only the judgement was reversed and the fine remitted, but he was elected treasurer again for the year ensuing. He then seemed to repent of his former administration: and by showing himself more tractable and indulgent towards others, he found out the secret of pleasing all that plundered the commonwealth; for as he neither reproved them nor narrowly inspected their accounts, all these plunderers, grown fat with spoil and rapine, now extolled Aristides to the skies. It would have been easy for him, as we perceive, to have enriched himself in a post of that nature, which seems, as it were, to invite a man to it by the many favourable opportunities it lays in his way; especially as he had to do with officers, who for their part were intent upon nothing but robbing the public, and would have been ready to conceal the frauds of the treasurer their master, upon condition he did them the same favour. These very officers now made interest with the people to have him continued a third year in the same employment: but when the time of election was come, just as they were on the point of electing Aristides unanimously, he rose up, and warmly reproved the Athenian people: "What (says he), when I managed your treasure with all the fidelity and diligence an honest man is capable of, I met with the most cruel treatment, and the most mortifying returns; and now that I have abandoned it to the mercy of these robbers of the republic, I am an admirable man and the best of citizens! I cannot help declaring to you, that I am more ashamed of the honour you do me this day, than I was of the condemnation you passed against me this time twelvemonths; and with grief I find that it is more glorious with..."
with us to be complaisant to knaves than to save the
blessed public plunderers and gained the esteem of
all good men.

3. In the Universal History we meet with the fol-
lowing remarkable instance of a scrupulous regard
to justice in a Persian king named Nushirvan. Having
been on a hunting, and desirous of eating some of the
teenage in the field, several of his attendants went to a
neighbouring village and took away a quantity of salt
to season it. The king suspecting how they had acted,
ordered that they should immediately go and pay for
it. Then turning to his attendants, he said: "This is
a small matter in itself, but a great one as it regards me:
for a king ought ever to be just, because he is an exam-
ple to his subjects; and if he swerves in trifles, they
will become dissolute. If I cannot make all my people
just in the smallest things, I can at least show them it
is possible to be so."

These examples to which many more might be
added, are highly pleasing to a sagacious and virtuous
mind; but the sensual and brutal part of mankind,
who regard only the present moment, who see no ob-
jects but those which fall under the cognizance of the
corporeal eye, and estimate the merit of every action
by the gain which it produces, have always considered
justice and utility as independent of each other. They
put utility in the balance against honesty every day;
and never fail to incline the beam in favour of the for-
mer, if the supposed advantage is thought to be con-
siderable. They have no regard to justice but as they
reckon to gain by it, or at least net to lose; and are
always ready to desert it when it exposes them to any
danger or threatens them with any loss. From this
disposition of mind proceeds that avidity of wealth
and that habitual fraud which perpetually embroil civil
society: from this fatal source arises that deluge of
iniquity which has overflowed the world; from this
preference of interest to honesty proceed every unjust
litigation and every act of violence. And yet nothing
is more certain than that "Whatever is unjust must,
upon the whole, be disadvantageous;" which might
be proved thus:

Nothing is advantageous or useful but that which
has a tendency to render us happy: the highest ad-
vantage, or absolute utility, is complete happiness; and
to this happiness, whatever is advantageous or useful
is relative as to an ultimate end; and nothing that is
not thus relative to happiness can properly be said to
be advantageous or useful. But whatever is unjust, is
so far from tending to promote, that it destroys our hap-
iness; for whatever is unjust is contrary to the Divine
will: but it is not possible that we should become hap-
py by resisting that will; because of this will our hap-
iness is the immediate object. God is not a tyrant,
proud of uncontrollable power, who imposes capricious
laws only as tests of our obedience, and to make us
feel the weight of his yoke; all his precepts are lessons
which teach us how to be happy. But it is the will
of God that we should be just; from whence it fol-
lows, that no true happiness can be acquired by those
who are unjust. An action, therefore, which is con-
trary to the will of God, must be inconsistent with
our true interest; and consequently, so far from being
useful or expedient, it must inevitably produce pain
and misery. Injustice sometimes meets with the pu-
ishment it deserves in this world; but if it should
escape here, it does not follow that it will for ever
escape. It proves, on the contrary, that there is an-
other world in which the fates of mankind will be im-
partially decided.

But to prevent the dreadful confusion which the
mistaken notion of interest had introduced among men
of all sorts, it became necessary to have recourse to the
infinite principles of justice; to suspend the balance and
display the sword, for the determination of differences
and the punishment of guilt. This is the reason and
origin of distributive justice, which became the neces-
sary appendage of sovereignty. Accordingly, in an-
cient times, princes administered justice in person and
without delay; but at length being embarrassed and
oppressed by the multiplicity of business which in-
creased with their dominions, or diverted from their
attention to civil government by the command of
armies, certain laws were established with great solemn-
ty to adjust and determine the differences which might arise
among the members of the same community, and to ex-
press the insolence of those who dared to violate the pu-
blie peace, by possessing them with the dread either of
corporeal punishment or infamy. The execution of
these laws was put into the hands of subordinate judges.
These delegates of the sovereign power were called mag-
istrates; and these are the persons by whom justice is
at this time administered, except in particular cases, in
which the sovereign himself interposes. But by whom-
soever this kind of justice is administered, it ought to
be done speedily, impartially, and without expense to
the parties.

4. Aristides being judge between two private per-
sons, one of them declared, that his adversary had
greatly injured Aristides. "Relate rather, good friend
(said he, interrupting him), what wrong he hath done thee;
for it is thy cause, not mine, that I now sit judge of."—Again: Being desired by Simonides, a
poet of Chios, who had a cause to try before him, to
stretch a point in his favour, he replied, "As you
would not be a good poet if your lines ran contrary to
the just measures and rules of your art; so I should
neither be a good judge nor an honest man if I decided
aught in opposition to law and justice."

5. Artabazanes, an officer of Astavakshas king of
Persia, begged his majesty to confer a favour upon him;
which if complied with would be an act of injustice.
The king being informed that the promise of a con-
siderable sum of money was the only motive that in-
duced the officer to make so unreasonable a request,
ordered his treasure to give him thirty thousand da-
rians, being a present of equal value with that which
he was to have received. Giving him the order for the
money, "Here, take (says the king) this token of
my friendship for you: a gift of this nature cannot
make me poor; but complying with your request
would make me poor indeed, for it would make me un-
just."

6. Cambyses king of Persia was remarkable for
the severity of his government and his inexorable re-
gard to justice. The prince had a particular favourite
whom he made a judge; and this judge reckoned him-
self so secure in the credit he had with his master, that
without any more ado causes were bought and sold in
the-
the courts of judicature as openly as provisions in the market. But when Cambyses was informed of these proceedings, enraged to find his friendship so ungratefully abused, the honour of his government prostituted, and the liberty and property of his subjects sacrificed to the avarice of his wretched minion, he ordered him to be seized and publicly degraded; after which he commanded his skin to be stripped over his ears, and the seat of judgment to be covered with it as a warning to others. At the same time, to convince the world that this severity proceeded only from the love of justice, he permitted the son to succeed his father in the honours and office of prime minister.

7. When Charles duke of Burgundy, surnamed the Bold, reigned over spacious dominions, now swallowed up by the power of France, he heaped many favours and honours upon Claudius Rynsault, a German, who had served him in his wars against the insults of his neighbours. The prince himself was a person of singular humanity and justice; and was not prepossessed in favour of Rynsault, upon the decease of the governor of the chief town of Zealand gave him that command. He was not long seated in that government before he cast his eyes upon Sapphira, a woman of exquisite beauty, the wife of Paul Danvelt, a wealthy merchant of the city under his protection and government. Rynsault was a man of a warm constitution, and violent inclination to women. He knew what it was to enjoy the satisfactions which are reaped from the possession of beauty; but was an utter stranger to the decencies, honours, and delicacies, that attend the passion toward them in elegant minds. He could with his tongue utter a passion with which his heart was wholly untouched. In short, he was one of those brutal minds which can be gratified with the violation of innocence and beauty, without the least pity, passion, or love for that with which they are so much delighted.

Rynsault being resolved to accomplish his will on the wife of Danvelt, left no arts untried to get into a familiarity at her house; but she knew his character and disposition too well not to shun all occasions that might ensnare her into his conversations. The governor, despairing of success by ordinary means, apprehended and imprisoned her husband, under pretence of an information that he was guilty of a correspondence with the enemies of the duke to betray the town into their possession. This design had its desired effect; and the wife of the unfortunate Danvelt, the day before that which was appointed for his execution, presented herself in the hall of the governor’s house, and as he passed through the apartment threw herself at his feet, and holding his knees, beseeched his mercy. Rynsault beheld her with a dissatisfied satisfaction; and assuming an air of thought and authority, he bid her rise, and told her she must follow him to his closet; and asking her whether she knew the hand of the letter he pulled out of his pocket, went from her, leaving this admonition alound: “If you would save your husband, you must give me an account of all you know, without prevarication; for every body is satisfied that he is too fond of you to be able to hide from you the names of the rest of the conspirators, or any other particulars whatsoever.” He went to his closet, and soon after the lady was sent for to an audience. The servant knew his distance when matters of state were to be debated; and the governor, laying aside the air with which he had appeared in public, began to be the supplicant, and to rally an affliction which it was in her power easily to remove. She easily perceived his intention; and, bathed in tears, began to deprecate so wretched a design. Lust, like ambition, takes all the faculties of the mind and body into its service and subjection. Her becoming tears, her honest anguish, the wringing of her hands, and the many changes of her posture and figure in the vehemence of speaking, were but so many attitudes in which she beheld her beauty, and farther incentives of his desire. All humanity was lost in that one appetite; and he signified to her in so many plain terms, that he was unhappy till he possessed her, and nothing less should be the price of her husband’s life; and she must, before the following noon, pronounce the death or enlargement of Danvelt. After this notification, when he saw Sapphira enough distracted to make the subject of their discourse to common eyes appear different from what it was, he called his servants to conduct her to the gate. Loaded with unendurable affliction, she immediately repaired to her husband, and having signified to the gossips that she had a proposal to make to her husband from the governor, she was left alone with him, revealed to him all that had passed, and represented the endless conflict she was in between love to his person and fidelity to his bed. It is easy to imagine the sharp affliction this honest pair were in upon such an incident, in lives not used to any but ordinary occurrences. The man was bridled by shame from speaking what his fear prompted upon so near an approach of death; but let fall words that signified to her, he should not think her polluted, though she had not confessed to him that the governor had violated her person, since he knew her will had no part in the action. She parted from him with this oblique permission, to save a life he had not resolution enough to resign for the safety of his honour.

The next morning the unhappy Sapphira attended the governor, and being led into a remote apartment, submitted to his desires. Rynsault commended her chastity; claimed a familiarity after what had passed between them; and with an air of gaiety, in the language of a gallant, bid her return and take her husband out of prison: but, continued he, my fair one must not be offended that I have taken care he should not be an interruption to our future assignations. These last words foreboded what she found when she came to the gaol, her husband executed by the order of Rynsault.

It was remarkable, that the woman, who was full of tears and lamentations during the whole course of her affliction, uttered neither sigh nor complaint, but stood fixed with grief at this consummation of her misfortunes. She betook herself to her abode; and, after having in solitude paid her devotion to Him who is the avenger of innocence, she repaired privately to court. Her person, and a certain grandeur of sorrow negligent of forms, gained her admittance to the duke her sovereign. As soon as she came into the presence, she broke forth into the following words: “Behold, O mighty Charles, a wretch weary of life, though it has always been spent with innocence and virtue.
to whom he applied after quitting many others, hav-
ing brought him a pair of shoes not made to please
his taste, the canon became furious, and seizing one
of the tools of the shoemaker, gave him with it so many
blows upon the head as laid him dead upon the floor.
The unhappy man left a widow, four daughters, and a
son 13 years of age, the eldest of the indigent family.
They made their complaint to the chapter: the can-
on was prosecuted, and condemned not to appear in
the choir for a year. The young shoemaker having
attained to man's estate, was scarcely able to get a
livelihood; and overwhelmed with wretchedness, sat
down on the day of a procession at the door of the
cathedral of Seville in the moment the procession pass-
ed by. Amongst the other canons he perceived the
murderer of his father. At the sight of this man filial
affection, rage, and despair, so far got the better of
his reason, that he fell furiously upon the priest, and
stabb'd him to the heart. The young man was seized,
convicted of the crime, and immediately condemned
to be quartered alive. Peter, whom we call the Cruel,
and whom the Spaniards, with more reason, call the
liver of justice, was then at Seville. The affair came
to his knowledge; and after learning the particulars,
determined to be himself the judge of the young
shoemaker. When he proceeded to give judgment,
he first annulled the sentence just pronounced by the
clergy: and after asking the young man what profes-
sion he was, "I forbid you (said he) to make shoes for
one year to come."

10. In Gladwin's History of Hindostan, a singular
fact is related of the emperor Jehangir, under whose
father Akber the Mogul empire in Hindostan first ob-
tained any regular form. Jehangir succeeded him at
Agra on the 22d of October, 1605; and the first or-
er which he issued on his accession to the throne was
for the construction of the golden chain of justice. It
was made of pure gold, and measured 30 yards, con-
sisting of 60 links, weighing four mounds of Hind-
ostaen (about 400 pounds avoirdupois). One end of this
chain was suspended from the royal bastion of the for-
tress of Agra, and the other fastened in the ground
near the side of the river. The intention of this ex-
traordinary invention was, that if the officers of the
courts of law were partial in their decisions, or dilatory
in the administration of justice, the injured parties
might come themselves to this chain; and making a
noise by shaking the links of it, give notice that they
were waiting to represent their grievances to his ma-
jestey.

JUSTICE is also an appellation given to a person de-
puted by the king to administer justice to his subjects,
whose authority arises from his deputation, and not by
right of magistracy.

Of these justices there are various kinds in England,
viz.

Chief JUSTICE of the King's Bench, is the capital
justice of Great Britain, and is a lord by his office. His
business is chiefly to hear and determine all pleas of
the crown; that is, such as concern offences against
the crown, dignity, and peace of the king; as treasons,
 felonies, &c. This officer was formerly not only
chief justice, but also chief baron for the exchequer,
and master of the court of wards. He usually sat in
the king's palace, and there executed that office, for
merely
merely performed per comitem palati; he determined in that place all the differences happening between the barons and other great men. He had the prerogative of being vicegerent of the kingdom whenever the king went beyond sea, and was usually chosen to that office out of the prime nobility; but his power was reduced by King Richard I. and King Edward I. His office is now divided, and his title changed from capitalis Anglie justitiarius, to capitalis justitiarius ad pla-
cita coram rege tenenda, or capitalis justitiarius banci
regii.

Chief Justice of the Common Pleas, he who with
his assistants hears and determines all cases at the
common law; that is to say, all civil causes between
common persons, as well personal as real; and he is
also a lord by his office.

Justice of the Forest, is a lord by his office, who
has power and authority to determine offences committed in
the king’s forests, &c. which are not to be de-
termined by any other court of justice. Of these there
are two; whereof one has jurisdiction over all the for-
ests on this side Trent, and the other beyond it.

By many ancient records it appears to be a place of
great honour and authority, and is never bestowed but
civil person of great distinction. The court where
this justice sits, is called the justice seat of the forest,
held once every three years, for hearing and determin-
ing all trespasses within the forest, and all claim of
franchises, liberties, and privileges, and all pleas and
causes whatsoever therein arising. This court may fine
and imprison for offences within the forest, it being a
court of record; and therefore a writ of error lies from
hence to the court of King’s Bench. The last court
of justice seat of any note was that held in the reign
of Charles I. before the earl of Holland. After the
Restoration another was held for some time before the
court of Oxford; but since the revolution in 1688, the
forest laws have fallen into total disuse, to the great
advantage of the subject.

This is the only justice who may appoint a deputy:
he is also called justice in eye of the forest.

Justices of Assize, were such as were wont by spe-
cial commission to be sent into this or that county
to take assizes for the ease of the subjects. For,
whereas these actions pass always by jury, so many
men might not without great damage and charge be
brought up to London; and therefore justices, for this
purpose, by commissions particularly authorized, were
sent down to them. These continue to pass the cir-
cuit by two and two twice every year through all
England, except the four northern counties, where
they go only once, dispatching their several businesses
by several commissions; for they have one commission
to take assizes, another to deliver gaols, and another
of oyer and terminer. In London and Middlesex a
court of general gaol-delivery is held eight times in the
year.

All the justices of peace of any county wherein the
assizes are held, are bound by law to attend them, or
else are liable to a fine; in order to return recogni-
zances, &c. and to assist the judges in such matters as
lie within their knowledge and jurisdiction, and in
which some of them have been probably concerned,
by way of previous examination. See ASSIZES and
JURY.
Justice, espoused without the presence or consent of them or one of them. Every justice of peace has a separate power, and his office is to call before him, examine, issue warrants for apprehending, and commit to prison all thieves, murderers, rogues, and vagabonds, and all other delinquents which may occasion the breach of the peace and quiet of the subject; to commit to prison such as cannot find bail, and to see them brought forth in due time to trial; and bind over the prosecutors to the assizes. And if they neglect to certify examinations and informations to the next gaol-delivery, or do not bind over prosecutors, they should be fined. A justice may commit a person that doth a felony in his own view without a warrant; but if on the information of another, he must make a warrant under hand and seal for that purpose. If complaint and oath be made before a justice of goods stolen, and the informer, suspecting that they are in a particular house, shows the cause of his suspicion, the justice may grant a warrant to the constable, &c. to search in the place suspected, to seize the goods and person in whose custody they are found, and bring them before him or some other justice. The search on these warrants ought to be in the day time, and doors may be broke open by constables to take the goods. Justices of peace may make and persuade an agreement in petty quarrels and breaches of the peace, where the king is not entitled to a fine, though they may not compound offences or take money for making agreements. A justice hath a discretionary power of binding to the good behaviour; and may require a recognizance, with a great penalty of one for his keeping of the peace, where the party bound is a dangerous person, and likely to break the peace, and do much mischief; and for default of sureties he may be committed to gaol. But a man giving security for keeping the peace in the king's bench or chancery, may have a supersedeas to the justices in the county not to take security; and also by giving surety of the peace to any other justice. If one make an assault upon a justice of peace, he may apprehend the offender, and commit him to gaol till he finds sureties for the peace; and a justice may record a forcible entry on his own possession; in other cases he cannot judge in his own cause. Contempts against justices are punishable by indictment and fine at the sessions. Justices shall not be regularly punished for any thing done by them in session as judges; and if a justice be tried for any thing done in his office, he may plead the general issue, and give the special matter in evidence; and if a verdict is given for him, or if the plaintiff be nonsuit, he shall have double costs; and such action shall only be laid in the county where the offence is committed, 7 Jac. 5. 21 Jac. cap. 12. But if they are guilty of any misdemeanour in office, information lies against them in the king's bench, where they shall be punished by fine and imprisonment; and all persons who recover a verdict against a justice for any wilful or malicious injury, are entitled to double costs. By 24 Geo. II. cap. 44. no writ shall be sued out against any justice of peace, for any thing done by him in the execution of his office, until notice in writing shall be delivered to him one month before the suit out of the same, containing the cause of action, &c. within which month he may tender amends; and if the tender be found sufficient, he shall have a verdict, &c. Nor shall any action be brought against a justice for any thing done in the execution of his office, unless commenced within six months after the act committed.

A justice is to exercise his authority only within the county where he is appointed by his commission, not in any city which is a county of itself, or town corporate, having their proper justices, &c. but in other towns and liberties he may. The power and office of justices terminates in six months after the demise of the crown, by an express writ of discharge under the great seal, by writ of supersedeas, by a new commission, and by accession of the office of sheriff or coroner.

The original of justices of the peace is referred to the fourth year of Edward III. They were first called conservators or wardens of the peace, elected by the county upon a writ directed to the sheriff: but the power of appointing them was transferred by statutes from the people to the king; and under this appellation appointed by 1 Edward III. cap. 16. Afterwards the statute 34 Edw. III. cap. 1. gave them the power of trying felonies, and then they acquired the appellation of justice. They are appointed by the king's special commission under the great seal, the form of which was settled by all the judges, A.D. 1590; and the king may appoint as many as he shall think fit in every county in England and Wales, though they are generally made at the discretion of the lord chancellor, by the king's leave. At first the number of justices was not above two or three in a county, 18 Edw. III. cap. 2. Then it was provided by 34 Edw. III. cap. 11. that one lord, and three or four of the most worthy men in the county, with some learned in the law, should be made justices in every county. The number was afterwards restrained first to six and then to eight, in every county, by 12 Ric. II. cap. 10. and 14 Ric. II. cap. 11.

But their number has greatly increased since their first institution. As to their qualifications, the statutes just cited direct them to be of the best reputation and most worthy men in the county; and the statute 13 Ric. II. cap. 7. orders them to be of the most sufficient knights, esquires, and gentlemen of the law; and by the 2 Hen. V. stat. 1. cap. 4. and stat. 2. cap. 1. they must be resident in their several counties. And by 18 Hen. VI. cap. 11. no justice was to be put in commission, if he had not lands to the value of 25l. per annum. It is now enacted by 5 Geo. II. cap. 11. that every justice shall have 100l. per annum, clear of all deductions; of which he must make oath by 18 Geo. II. cap. 20. And if he acts without such qualification, he shall forfeit 100l. It is also provided by 5 Geo. II. that no practising attorney, solicitor, or procitor, shall be capable of acting as a justice of the peace.

Justices of the Peace within Liberties, are justices of the peace who have the same authority in cities or other corporate towns as the others have in counties; and their power is the same; only that these have the assize of ale and beer, wood, and victuals, &c. Justices of cities and corporations are not within the qualification act, 5 Geo. II. cap. 17.

Fountain of Justice, one of the characters or attributes of the king. See PREROGATIVE.

By the fountain of justice the law does not mean the

3 F 2

author
Justice. **author or original, but only the distributor.** Justice is not derived from the king as from his **free gift**; but he is the steward of the public, to dispense it to whom it is **due.** He is not the spring, but the reservoir, from whence right and equity are conducted, by a thousand channels, to every individual. The original power of judicature, by the fundamental principles of society, is lodged in the society at large: but as it would be impracticable to render complete justice to each individual, by the people in their collective capacity, therefore every nation has committed that power to certain select magistrates who, with more ease and expedition can hear and determine complaints: and in England this authority has immemorially been exercised by the king or his substitutes. He therefore has alone the right of erecting courts of judicature: for though the constitution of the kingdom hath intrusted him with the whole executive power of the laws, it is impossible, as well as improper, that he should personally carry into execution this great and extensive trust: it is consequently necessary that courts should be erected, to assist him in executing this power; and essentially necessary, that, if erected, they should be erected by his authority. And hence it is that all jurisdictions of courts are either mediately or immediately derived from the crown; their proceedings run generally in the king's name, they pass under his seal, and are executed by his officers.

It is probable, and almost certain, that in very early times, before our constitution arrived at its full perfection, our kings in person often heard and determined causes between party and party. But at present, by the long and uniform usage of many ages, our kings have delegated their whole judicial power to the judges of their several courts; which are the grand depository of the fundamental laws of the kingdom, and have gained a known and stated jurisdiction, regulated by certain and established rules, which the crown itself cannot now alter but by set of parliament. And in order to maintain both the dignity and independence of the judges in the superior courts, it is enacted by the statute 13 W. III. c. 2. that their commissions shall be made, not, as formerly, **durante beneplacito,** but **quoniam bene se gesserint,** and their salaries ascertained and established; but that it may be lawful to remove them on the address of both houses of parliament. And now, by the noble improvements of that law in the statute of 1 Geo. III. c. 29, enacted at the earnest recommendation of the king himself from the throne, the judges are continued in their offices during their good behaviour, notwithstanding any demise of the crown (which was formerly held immediately to vacate their seats), and their full salaries are absolutely secured to them during the continuance of their commissions; his majesty having been pleased to declare, that he looked upon the independence and uprightness of the judges, as essential to the impartial administration of justice; as one of the best securities of the rights and liberties of his subjects; and as most conducive to the honour of the crown."

In criminal proceedings or prosecutions for offences, it would still be a higher absurdity, if the king personally sat in judgment; because, in regard to these, he appears in another capacity, that of **prosecutor.** All offences are either against the king's peace, or his crown and dignity; and are so laid in every indictment. For though in their consequences they generally seem (except in the case of treason and a very few others) to be rather offences against the kingdom than the king; yet, as the public, which is an invisible body, has delegated all its power and rights, with regard to the execution of the laws, to one visible magistrate, all affronts to that power, and breaches of those rights, are immediately offences against him, to whom they are so delegated by the public. He is therefore the proper person to prosecute for all public offences and breaches of the peace, being the person injured in the eye of the law. And this notion was carried so far in the old Gothic constitution (wherein the king was bound by his coronation oath to conserve the peace), that in case of any forcible injury offered to the person of a fellow subject, the offender was accused of a kind of perjury, in having violated the king's coronation oath; **diebatur frigoris juramentum regis juratum.** And hence also arises another branch of the prerogative, that of pardoning offences; for it is reasonable that he only who is injured should have the power of forgiving. See Pardon.

In this distinct and separate existence of the judicial power in a peculiar body of men, nominated indeed, but not removable at pleasure, by the crown, consists one main preservative of the public liberty; which cannot subsist long in any state, unless the administration of common justice be in some degree separated both from the legislative and also from the executive power. Were it joined with the legislative, the life, liberty, and property of the subject would be in the hands of arbitrary judges, whose decisions would be then regulated only by their own opinions, and not by any fundamental principles of law; which, though legislators may depart from, yet judges are bound to observe. Were it joined with the executive, this union might soon be an overbalance for the legislative. For which reason, by the statute of 16 Car. I. c. 10, which abolished the court of star-chamber, effectual care is taken to remove all judicial power out of the hands of the king's privy-council; who, as then was evident from recent instances, might soon be inclined to pronounce that for law which was most agreeable to the prince or his officers. Nothing therefore is more to be avoided in a free constitution, than uniting the provinces of a judge and a minister of state. And indeed, that the absolute power, claimed and exercised in a neighboring nation, is more tolerable than that of the eastern empire, is in a great measure owing to their having vested the judicial power in their parliaments; a body separate and distinct from both the legislative and executive: and if ever that nation recovers its former liberty, it will owe it to the efforts of those assemblies. In Turkey, where every thing is centered in the sultan or his ministers, despotic power is in its meridian, and wears a most dreadful aspect.

A consequence of this prerogative is the **legal ubiquity of the king.** His majesty, in the eye of the law, is always present in all his courts, though he cannot personally distribute justice. His judges are the mirror by which the king's image is reflected. It is the regal office, and not the royal person, that is always present in court, always ready to undertake prosecutions, or pronounce judgment, for the benefit and protection of the subject. And from this ubiquity it follows, that
Justus

Justice

the king can never be nonsuit; for a nonsuit is the desertion of the suit or action by the non-appearance of the plaintiff in court. For the same reason also in the forms of legal proceedings, the king is not said to appear by his attorney, as other men do; for he always appears, in contemplation of law, in his own proper person.

From the same original, of the king's being the fountain of justice, we may also deduce the prerogative of issuing proclamations, which is vested in the king alone. See Proclamation.

Justice Sect. See Forest Courts.

Justicia, Malabar Nut; a genus of plants, belonging to the diandria class; and in the natural method ranking under the 40th order, Personata. See Botany Index.

Justiciar, in the old English laws, an officer instituted by William the Conqueror, as the chief officer of state, who principally determined in all cases, civil and criminal. He was called in Latin Capitarius justiciarius totius Angliae. For Justiciar in Scotland, see Law Index.

Justiciary, or Court of Justiciary, in Scotland. See Law Index.

Justification, in Law, signifies a maintaining or showing a sufficient reason in court why the defendant did what he is called to answer. Pleas in justification must set forth some special matter; thus on being sued for a trespass, a person may justify it by proving that the land is his own freehold; that he entered a house, in order to apprehend a felon; or by virtue of a warrant to levy a forfeiture, or in order to take a distress; and in an assault, that he did it out of necessity.

Justification, in Theology, that act of grace which renders a man just in the sight of God, and worthy of eternal happiness. See Theology.

Different sects of Christians hold very different opinions concerning the doctrine of justification; some contending for justification by faith alone, and others by good works.

Justin, a celebrated historian, lived, according to the most probable opinion, in the second century, under the reign of Antoninus Pius. He wrote, in elegant Latin, an abridgment of the history of Trogus Pompeius; comprehending the actions of almost all nations, from Nius the founder of the Assyrian empire to the emperor Augustus. The original work, to the regret of the learned, is lost: this abridgment, being written in a polite and elegant style, was probably the reason why that age neglected the original. The best editions of Justin are, to vnum, De vita Christi in 4to; and cum notis, curiosior et Gronovii, in 8vo.

Justin, St., commonly called Justin Martyr, one of the earliest and most learned writers of the eastern church, was born at Neapolis, the ancient Secem of Palestine. His father Priscus, a Gentile Greek, brought him up in his own religion, and had him educated in all the Grecian learning. To complete his studies he travelled to Egypt, and followed the sect of Plato. But one day walking by the sea side wrapt in contemplation, he was met by a grave person, of a venerable aspect; who, falling into discourse with him, turned the conversation by degrees from the excellence of Platonism to the superior perfection of Christianity; and reasoned so well, as to raise in him an ardent curiosity to inquire into the merits of that religion; in consequence of which inquiry he was converted about the year 132. On his embracing that religion, he quitted neither the profession nor the habit of a philosopher; but a persecution breaking out under Antoninus, he composed An Apology for the Christians; and afterwards presented another to the emperor Marcus Aurelius, in which he vindicated the innocence and holiness of the Christian religion against Crescens a Cynic philosopher, and other calumniators. He did honour to Christianity by his learning and the purity of his manners; and suffered martyrdom in 167. Besides his two Apologies, there are still extant his Dialogue with Trypho, a Jew; two treatises addressed to the Gentiles, and another on the unity of God. Other works are also ascribed to him. The best editions of St Justin are those of Robert Stephens, in 1551 and 1571, in Greek and Latin; that of Miles, in Greek and Latin, in 1656; and that of Don Prudentius Marandus, a learned Benedictine, in 1742, in folio.

Justinian I., son of Justin the elder, was made Caesar and Augustus in 527, and soon after emperor. He conquered the Persians by Belisarius his general, and exterminated the Vandals; regained Africa; subdued the Goths in Italy; defeated the Moors; and restored the Roman empire to its primitive glory. See History of Constantinople, No. 93—97; and Italy, No. 12, &c.

The empire being now in the full enjoyment of a profound peace and tranquillity, Justinian made the best use of it, by collecting the immense variety and number of the Roman laws into one body. To this end he selected ten of the most able lawyers in the empire; who, revising the Gregorian, Theodosian, and Hermogenian codes, compiled one body, called Codex Justinianus. This may be called the stare-mare law, consisting of the rescripts of the emperors. But the reduction of the other part was a much more difficult task: it was made up of the decisions of the judges and other magistrates, together with the authoritative opinions of the most eminent lawyers, all which lay scattered, without any order, in no less than 2000 volumes and upwards. These were reduced to the number of 50; but ten years were spent in the reduction. The design was completed in the year 533, and the name of Digests or Pandects given to it. Besides these, for the use chiefly of young students in the law, and to facilitate that study, Justinian ordered four books of institutes to be drawn up, containing an abstract or abridgment of the text of all the laws; and lastly, the laws of modern date, posterior to that of the former, were thrown into one volume in the year 534, called the Novella, or New Code.

This emperor died in the year 565, aged 83, in the 30th of his reign, after having built a great number of churches; particularly the famous Sancta Sophia at Constantinople, which is esteemed a masterpiece of architecture.

Justinians, St. Laurence, the first patriarch of Venice, was born there of a noble family in 1381. He died in 1483; he left several religious works, which were printed together at Lyons in 1568, in one volume folio, with his life prefixed by his nephew. He was beatified by Clement VII. in 1524, and he was canonized by Alexander VIII. in 1690.

Justinian.
Justinian. Bernard, was born at Venice in 1408.

He obtained the senator's robe at the age of 19, served the republic in several embassies, and was elected procurator of St Mark in 1474. He was a learned man, and wrote the History of Venice, with some other works of considerable merit; and died in 1498.

Justinian, Augustin, bishop of Nebbio, one of the most learned men of his time, was descended from a branch of the same noble family with the two foregoing; and was born at Genoa in 1480. He assisted at the Fifth council of Lateran, where he opposed some articles of the concordat between France and the court of Rome. Francis I. of France made him his almoner: and he was for five years regius professor of Hebrew at Paris. He returned to Genoa in 1522, where he discharged all the duties of a good prelate; and learning and piety flourished in his diocese. He perished at sea in his passage from Genoa to Nebbio, in 1556. He composed several pieces; the most considerable of which is Psalterium Hebraicum, Graecum, Arabicum, et Chaldecum, cum tribus Latinis interpretationibus et glossis. This was the first psalter of the kind printed; and there is also ascribed to the same prelate a translation of Maimonides' More Novocim.

JUSTNESS, the exactness or regularity of any thing.

Justness is chiefly used in speaking of thought, language, and sentiments. The justness of a thought consists in a certain precision or accuracy, by which every part of it is perfectly true, and pertinent to the subject. Justness of language consists in using proper and well chosen terms; in not saying either too much or too little. M. de Mere, who has written on justness of mind, distinguishes two kinds of justness; the one arising from taste and genius, the other from good sense or right reason. There are no certain rules to be laid down for the former, viz. to shew the beauty and exactness in the turn or choice of a thought; the latter consists in the just relations which things have to one another.

JUTES, the ancient inhabitants of Jutland in Denmark.

JUTLAND, a large peninsula, which makes the principal part of the kingdom of Denmark. It is bounded on the south-east by the duchy of Holstein, and is surrounded on the other sides by the German ocean and the Baltic sea. It is about 180 miles in length from north to south, and 70 in breadth from east to west. Its extent is about 9200 square miles, and its population 440,000. The air is very cold but wholesome; and the soil is fertile in corn and pastures. This was anciently called the Cimbrian Chersonesus, and is supposed to be the country from whence the Saxons came into England. It is divided into two parts, called North and South Jutland; the latter is the duchy of Sleswick, and lies between North Jutland and the duchy of Holstein; and the duke of that name is in possession of part of it, whose capital town is Gottorp; for which reason the sovereign is called the duke of Holstein Gottorp.

JUVENAL, Decius Junius, the celebrated Roman satirist, was born about the beginning of the emperor Claudius's reign, at Aquinum in Campania. His father was probably a freed man, who being rich, gave him a liberal education, and, agreeably to the taste of the times bred him up to eloquence; in which he made a great progress, first under Froton the grammarian, and afterwards, as is generally conjectured, under Quintilian; after which he attended the bar, and made a distinguished figure there for many years by his eloquence. In the practice of this profession he had improved his fortune and interest at Rome before he turned his thoughts to poetry, the very style of which, in his satires, speaks a long habit of declamation; subaeum redolenti declamatorum, say the critics. It is said he was above 40 years of age when he recited his first essay to a small audience of his friends; but being encouraged by their applause, he ventured a greater publication; which reaching the ears of Paris, Domitian's favourite at that time, though but a pantomime player, whom our satirist had severely insulted, that minion made his complaint to the emperor; who sent him thereupon into banishment, under pretence of giving him the command of a cohort in the army, which was quartered at Pentapolis, a city upon the frontiers of Egypt and Libya.

After Domitian's death, our satirist returned to Rome, sufficiently cautioned not only against attacking the characters of those in power, under arbitrary princes, but against any personal complaints upon the great men then living; and therefore he thus wisely concludes the debate he is supposed to have maintained for a while with a friend on this head, in the first satire, which seems to be the first he wrote after his banishment:

Experiar quid concedatur in illos
Quorum Flaminia tegitur cinsis aetate Latina.

"I will try what liberties I may be allowed with those whose ashes lie under the Flaminian and Latin ways," along each side of which the Romans of the first quality used to be buried.—It is believed that he lived till the reign of Adrian in 128. There are still extant 16 of his satires, in which he discovers great wit, strength, and keenness, in his language: but his style is not perfectly natural; and the obscenities with which these satires are filled render the reading of them dangerous to youth.

JUVENCUS, CAIUS VECTICUS AQUILINUS, one of the first of the Christian poets, was born of an illustrious family in Spain. About the year 320 he put the life of Jesus Christ into Latin verse, of which he composed four books. In this work he followed closely the text of the evangelists, but his verses are written in a bad taste and in bad Latin.

JUVENTAS, in Mythology, the goddess who presided over youth among the Romans. This goddess was long honoured in the Capitol, where Servius Tullius erected her statue. Near the chapel of Minerva there was the altar of Juventas, and upon this altar a picture of Proserpine. The Greeks called the goddess of youth Hebe; but it has been generally supposed that this was not the same with the Roman Juventas.

JUXON, Dr. WILLIAM, archbishop of Canterbury, was born at Chichester in 1582. He was educated at Merchant Taylors school, and from thence elected into St John's college, Oxford, of which he became president. King Charles I. made him bishop of London; and in 1635 promoted him to the post of lord high treasurer.
JUX [415] JYN

Jaxon. treasurer of England. The whole nation, and especially the nobility, were greatly offended at this high office being given to a clergyman; but he behaved so well in the administration, as soon put a stop to all the clamour raised against him. This place he held no longer than the 17th of May 1641, when he prudently resigned the staff to avoid the storm which then threatened the court and the clergy. In the following February an act passed, depriving the bishops of their votes in parliament, and incapacitating them from any temporal jurisdiction. In these leading steps, as well as the total abolition of the episcopal order which followed, he was involved with his brethren; but neither as a bishop nor as treasurer was a single accusation brought against him in the long parliament. During the civil wars he resided at his palace at Fulham, where his meek, indefensive, and affable manners, notwithstanding his remaining steady in his loyalty to the king, procured him the visits of the principal persons of the opposite party, and respect from all. In 1648 he attended his majesty at the treaty in the isle of Wight; and by his particular desire, waited upon him at Cotton-house Westminster, the day after the commencement of his trial; during which he frequently visited him in the office of a spiritual father; and his majesty declared he was the greatest comfort to him in that afflictive situation. He likewise attended his majesty on the scaffold, where the king, taking off his cloak and gowns, gave him the latter: after the execution, our pious bishop took care of the body, which he accompanied to the royal chapel at Windsor, and stood ready with the common-prayer book in his hands to perform the last ceremony for the king; but was prevented by Colonel Whiccot, governor of the castle. He continued in the quiet possession of Fulham palace till the ensuing year 1649, when he was deprived, having been spared longer than any of his brethren. He then retired to his own estate in Gloucestershire, where he lived in privacy till the Restoration, when he was presented to the see of Canterbury; and in the little time he enjoyed it, expended in buildings and reparations at Lambeth palace and Croydon house near £5,000. He died in 1663; having bequeathed 7000l. to St John’s college, and to other charitable uses near 5000l. He published a sermon on Luke xviii. 21, and Some Considerations upon the Act of Uniformity.

JUXTAPOSITION, is used by philosophers to denote that species of growth which is performed by the apposition of new matter to the surface or outside of old. In which sense it stands opposed to intussusception; where the growth of a body is performed by the reception of a juice within it diffused through its canals.

IVY. See HEDERA, BOTANY Index.

IXIA, a genus of plants belonging to the triandria class, and in the natural method ranking under the 6th order, Enatae. See BOTANY Index.

IXION, in fabulous history, king of the Lapithè, married Dia, the daughter of Deionius, to whom he refused to give the customary nuptial presents. Deionius in revenge took from him his horses; when Ixion, dissembling his resentment, invited his father-in-law to a feast, and made him fall through a trap-door into a burning furnace, in which he was immediately consumed. Ixion being afterwards stung with remorse for his cruelty, ran mad; on which Jupiter, in compassion, not only forgave him, but took him up into heaven, where he had the impiety to endeavour to corrupt Juno. Jupiter, to be the better assured of his guilt, formed a cloud in the resemblance of the goddess, upon which Ixion begged the centaurs: but boasting of his happiness, Jove hurled him down to Tartarus, where he lies fixed on a wheel encompassed with serpents, which turns without ceasing.

IXORA, a genus of plants belonging to the tetrandria class; and in the natural method ranking under the 4th order, Stellate. See BOTANY Index.

JYNX, a genus of birds belonging to the order of picae. See ORNITHOLOGY Index.

K.

K. The tenth letter, and seventh consonant of our alphabet; being formed by the voice, by a guttural expression of the breath through the mouth, together with a depression of the lower jaw and opening of the teeth.

In sound is much the same with that of the hard c or qu: and it is used for the most part only before c, r, and s, in the beginning of words; as hem, kill, know, &c. It used formerly to be always joined with c at the end of words, but is at present very properly omitted, at least in words derived from the Latin: thus, for pubick, musick, &c. we say, public, music, &c. However in memorials, it is still retained, as jack, black, mock, &c.

K is borrowed from the Greek kappa: and was but little used among the Latins: Priscian looked on it as a superfluous letter; and says it was never to be used except in words borrowed from the Greek. Dionysius, after Sallust, observes that it was unknown to the ancient Romans. Indeed we seldom find it in any Latin authors, excepting in the word kalende, where it sometimes stands in lieu of c.—Carthage, however, is frequently spelt on medals with a K: SALVIS AUG. ET CAES. FEL. KART. and sometimes the letter K alone stood for Carthage.—M. Berger has observed; that a capital K, on the reverse of the medals of the emperors of Constantinople, signified Konstantinus: and on the Greek medals he will have it to signify KOIAH ZYPIA, "Coelianyia."

Quintilian tells us, that in his time some people had
KAB

K A B [416]

K A J

Kabbóbiquas. —

K

K

K

a mistaken notion, that wherever the letter e and a occurred at the beginning of a word, k ought to be used instead of the e. See C.

Lipsius observes, that K was a stigma anciently marked on the foreheads of criminals with a red-hot iron.

The letter K has various significations in old charters and diplomas; for instance KR. stood for chorus; KR. C. for cora civitas; KRM. for carmen; KR. AM. N. for carus amicus noster; KS. chaos; KT. copite tonus, &c.

The French never use the letter k excepting in a few terms of art and proper names borrowed from other countries. Ablancourt, in his dialogue of the letters, brings in k complaining, that he has been often in a fair way to be banished out of the French alphabet, and confined to the countries of the north.

K is also a numeral letter, signifying 250, according to the verse,

K qogue ducentos et quinquaginta tenebit.

When it had a stroke at top, K, it stood for 250,000.

K on the French coinage denotes money coined at Bordeaux.

KARATA, a kingdom in Africa, through which Mr. Park passed from the Gambia to the Niger. According to the country consists of sandy plains and rocky hills, the level part of it being the most extensive. It is inhabited by Negroes, many of whom retain all their ancient superstitions, although converted to the religion of Mahomet. White men, he informs us, are strangers in the kingdom of Karata; and Mr. Park’s appearance had nearly the same effect upon them which ignorant people in our own country attribute to ghosts. Mr. Park was well received by the king at Kemmoo, who at the same time informed him with ingenuous frankness, that he could not protect him, being then at war with the king of Bambarr, but he gave him a guard to Jarra, the frontier town of the neighbouring kingdom of Ludamar. From our author’s account of this war, it seems to be highly impolitic to liberate the negroes from slavery till civilization and Christianity be introduced into Africa. Kemmoo, the metropolis of this kingdom, lies in N. Lat. 14° 15' W. Long. 7° 20'

KAAT’S BAAN, a town of New York, on the west bank of Hudson’s river, seven miles south of Kaat’s Kill.

KAAT’S KILL, a township of New York, on the west bank of Hudson’s river; five miles south of Hudson city, and 125 north of New York. It is the capital of Greene county, and is pleasantly situated near the mouth of Kaat’s Kill river.

KAAT’S KILL MOUNTAINS, a majestic ridge of mountains in the vicinity of the above township, which are the first part of the Alleghany mountains.

KABA. See Mecca.

KABOBIQUAS, a nation in the south of Africa, who are reported never to have seen a white man till the year 1785, when they were visited by M. Vaillant. On his approach they felt his hair, hands, feet, and almost every part of his body. His beard astonished them, and they supposed that his whole body was covered with hair. The children were greatly alarmed, but presents of sugar cane soon reconciled them. The chief showed him every mark of respect, whom he received as a majestic figure, with a long mantle made of four jackal skins. The hair of the people is very short, curled, and ornamented with small copper buttons. Although they go almost naked, the females are remarkably chaste, and very reserved. Their only ornaments are glass beads. M. Vaillant assures us that he never saw a nation so disinterested, as they vied with each other in generosity. Many of them gave away gratuitously, and without receiving any thing in return, part of their herds and flocks. They are also of a courageous and martial character, making use of poisoned arrows and lances with long points. They are extremely obedient to their chief, whose will is a law. They believe in a supreme being who governs all things, and who exists far beyond the stars. They have no idea of a future existence, or of rewards and punishments, and have neither worship, sacrifices, ceremonies, nor priests. Their country lies between Long. 16° 25' and 19° 25' east of Paris, and between 23° and 25° S. Lat.

KADESH, KADESH-BARNEA, or EM-MISHPAT, in Ancient Geography, a city celebrated for several events. At Kadesh, Miriam the sister of Moses died, (Num. xx. 7.) Here it was that the Israelites, showing a distrust in God’s power when they smote the rock at the waters of strife, were condemned to die, without the consolation of entering the promised land (Num. xxii. 14.). The king of Kadesh was one of the princes killed by Joshua (xii. 22.). This city was given to the tribe of Judah, and was situated about eight leagues from Hebron to the south.

Mr Wells is of opinion, that this Kadesh, which was situated in the wilderness of Zin, was a different place from Kadesh-barnea in the wilderness of Paran.

KADMONÆI, or CADMONÆI, in Ancient Geography, a people of Palestine, said to dwell at the foot of Mount Hermon; which lies east, and is the reason of the appellation, with respect to Libanus, Phoenicia, and the northern parts of Palestine. Called also Hevæi (Moses).

KÆMPFÆRIA, ZEODARY, a genus of plants belonging to the monandria class; and in the natural method ranking under the 8th order, Sciamineæ. See Botany Index.

KAJUAGA, a kingdom of Africa, bounded on the south-east and south by Bambouk; on the west by Bondon and Fouta Torra; and on the north by the river Senegal. The air and climate are more pure and healthy than at any of the settlements towards the coast; the face of the country is pleasantly diversified with hills and valleys, and the windings of the river Senegal make the scenery on its banks extremely beautiful. The inhabitants are called Serawoolies, who have a jet black complexion, in which respect they are not to be distinguished from the Jaloobs. The government is monarchical, and the regal authority, according to Mr. Park, is sufficiently formidable. The people are deemed tolerably fair and just in their dealings, and indefatigable in their exertions to acquire wealth.

Their language abounds with gutturals, and therefore is not so harmonious as that which is spoken by the Foulahs; but it is worth a traveller’s while to obtain a knowledge of it, as it is generally understood in many kingdoms of Africa. Jom is the frontier town, enter
KAL [417]

Kalender, a distribution of time, accommodated to the uses of life; or a table or almanack, containing the order of days, weeks, months, feasts, &c., happening throughout the year. See Time, Month, Year, &c.

It is called kalender, from the word kalœnas, anciently written in large characters at the head of each month. See Kalœns.

The days in kalœns were originally divided into octadiæ, or eights; but afterwards, in imitation of the Jews, into hebdomades, or sevens; which custom, Scaliger observes, was not introduced among the Romans till after the time of Theodosius.

There are divers kalœns, according to the different forms of the year and distributions of time established in different countries. Hence the Roman, the Jewish, the Persian, the Julian, the Gregorian, &c., kalœns.

The ancient Roman kalœns is given by Ricciolus, Struvius, Danet, and others; by which we see the order and number of the Roman holidays and work days.

The three Christian kalœns are given by Wölfius in his Elements of Chronology.

The Jewish kalœns was fixed by Rabbi Hillel about the year 363; from which time the days of their year may be reduced to those of the Julian kalœns.

The Roman Kalœns owed its origin to Romulus; but it has undergone various reforms since his time. That legislator distributed time into several periods, for the use of the people under his command: but as he was much better versed in matters of war than of astronomy, he only divided the year into ten months, making it begin in the spring, on the first of March; imagining the sun made his course through all the seasons in 364 days.

Romulus's kalœns was reformed by Numa, who added two months more, January and February; placing them before March: so that his year consisted of 365 days, and began on the first of January. He chose, however, in imitation of the Greeks, to make an intercalation of 45 days; which he divided into two parts; intercalating a month of 22 days at the end of each two years; and at the end of each two years more another of 23 days; which month, thus interposed, he called Marcellónius, or the intercalary February.

But these intercalations being ill observed by the pontiffs, to whom Numa committed the care of them, occasioned great disorders in the constitution of the year; which Caesar, as sovereign pontiff, endeavored to remedy. To this end, he made choice of Sosigenes, a celebrated astrologer of those times; who found, that the consequence of time in the kalœns could never be settled on any sure footing without having regard to the annual course of the sun. Accordingly, as the sun's yearly course is performed in 365 days six hours, he reduced the year to the same number of days: the year of this correction of the kalœns,

Vol. XI. Part II.

†

dar was a year of confusion; they being obliged, in Kalœns, in order to swallow up the 65 days that had been imruently added, and which occasioned the confusion, to add two months besides the Marcellónius, which chance to fall out that year; so that this year consisted of 13 months, or 445 days. This reformation was made in the year of Rome 708, 42 or 43 years before Christ.

The Roman kalœns, called also Julian kalœns, from its reformer Julius, is disposed into quadrennial periods; whereas the first three years, which he called communies, consist of 365 days; and the fourth, bissextile, of 366; by reason of the six hours, which in four years make a day or somewhat less, for in 134 years an intercalary day is to be retrenched. On this account it was, that Pope Gregory XIII. with the advice of Clavius and Ciacconius, appointed, that the hundredth year of each century should have no bissextile, excepting in each fourth century: that is, a subtraction is made of three bissextile days in the space of four centuries; by reason of the 11 minutes wanting in the six hours whereas of the bissextile consists.

The reformation of the kalœns, or the new style as we call it, commenced on the 4th of October 1582, when ten days were thrown out at once, so many having been introduced into the computation since the time of the council of Nice in 325, by the defect of 11 minutes.

Julian Christian Kalœns, is that wherein the days of the week are determined by the letters A, B, C, D, E, F, G, by means of the solar cycle; and the new and full moons, especially the paschal full moon, with the feast of Easter, and the other moveable feasts depending thereon, by means of golden numbers, rightly disposed through the Julian year. See Cycle, and Golden Number.

In this kalœns, the vernal equinox is supposed to be fixed to the 31st day of March: and the cycle of 19 years, or the golden numbers, constantly to indicate the places of the new and full moons; yet both are erroneous. And hence arose a very great irregularity in the time of Easter. To show this error the more apparently, let us apply it to the year 1715. In this year, then, the vernal equinox falls on the 10th of March; and therefore comes too early by 11 days. The paschal full moon falls on the 7th of April; and therefore too late, with regard to the cycle, by three days. Easter, therefore, which should have been on the 10th of April, was that year on the 17th. The error here lies only in the metempsicos, or postposition of the moon, through the defect of the lunar cycle. If the full moon had fallen on the 11th of March, Easter would have fallen on the 13th of March; and therefore the error arising from the anticipation of the equinox would have exceedingly augmented that arising from the postposition. These errors, in course of time, were so multiplied, that the kalœns no longer exhibited any regular Easter. Pope Gregory XIII., therefore, by the advice of Aloysius Lilius, in 1582, threw 10 days out of the month of October, to restore the equinox to its place, viz. the 21st of March; and thus introduced the form of the Gregorian year, with such a provision as that the equinox should be constantly kept to the 21st of March. The new moons and full moons, by advice of the same Lilius, were not to be indicated by golden numbers.
K A L

Kalender numbers, but by epacts. The kalender, however, was still retained in Britain without this correction: whence there was a difference of 11 days between our time and that of our neighbours. But by 24 Geo. II. c. 23, the Gregorian computation is established here, and accordingly took place in 1752.

Gregorian Kalender, is that which, by means of epacts, rightly disposed through the several months, determines the new and full moons, and the time of Easter, with the moveable feasts depending thereon, in the Gregorian year.

The Gregorian kalender, therefore, differs from the Julian, both in the form of the year, and in that epacts are substituted in lieu of golden numbers: for the use and disposition whereof, see Epact.

Though the Gregorian kalender be preferable to the Julian, yet it is not without its defects (perhaps as Tycho Brahe and Cassini imagine, it is impossible ever to bring the thing to a perfect justness). For, first, The Gregorian intercalation does not hinder, but that the equinox sometimes occurs the 23rd of March as far as the 22d; and sometimes anticipates it, falling on the 19th; and the full moon, which falls on the 20th of March, is sometimes the paschal; yet not so accounted by the Gregorians. On the other hand, the Gregorians account the full moon of the 22d of March the paschal; which yet falling before the equinox, is not paschal. In the first case, therefore, Easter is celebrated in a regular month; in the latter, there are two Easters in the same ecclesiastical year. In like manner, the cyclical computation being founded on mean full moons, which yet may precede or follow the true one by some hours, the paschal full moon may fall on Saturday, which is yet referred by the cycle to Sunday: whence, in the first case, Easter is celebrated eight days later than it should be; in the other, it is celebrated on the very day of the full moon, with the Jews and Quartodeciman heretics; contrary to the decree of the council of Nice. Scaliger and Calvisius show other faults in the Gregorian kalender, arising from the negligence and inadvertency of the authors; yet this kalender adhered to by the Romans throughout Europe, &c. and used wherever the Roman breviary is used.

Reformed or Corrected Kalender, is that which, setting aside all apparatus of golden numbers, epacts, and dominical letters, determines the equinox, with the paschal full moon, and the moveable feasts depending thereon, by astronomical computation, according to the Rudolphine Tables.

This kalender was introduced among the Protestant states of Germany in the year 1700, when 11 days were at once thrown out of the month of February; so that in 1700 February had but 18 days: by this means, the corrected style agrees with the Gregorian. This alteration in the form of the year they admitted for a time; in expectation that, the real quantity of the tropical year being at length more accurately determined by observation, the Romanists would agree with them on some more convenient intercalation.

Construction of a Kalender or Almanack. 1. Compute the sun's and moon's place for each day of the year; or take them from ephemerides. 2. Find the dominical letter, and by means thereof distribute the kalender into weeks. 3. Compute the time of Easter, and thence fix the other moveable feasts. 4. Add the moveable feasts, with the names of the martyrs. 5. To every day add the sun's and moon's place, with the rising and setting of each lunary; the length of day and night; the crepuscula, and the aspect of the planets.

5. Add in the proper places the chief phases of the moon, and the sun's entrance into the cardinal points; i.e. the solstices and equinoxes; together with the rising and the setting, especially heliacal, of the planets and chief fixed stars. See Astronomy.

The duration of the crepuscula, or the end of the evening and beginning of the morning twilight, together with the sun's rising and setting, and the length of days, may be transferred from the calendars of one year into those of another; the differences in the several years being too small to be of any consideration in civil life.

Hence it appears, that the construction of a kalender has nothing in it of mystery or difficulty, if tables of the heavenly motions be at hand.

Some divide calendars or almanacks into public and private, perfect and imperfect; others into Heathen and Christian.

Public almanacks are those of a larger size, usually hung up for common or family use; private are those of a smaller kind, to be carried about either in the hand, inscribed on a staff, or in the pocket; perfect, those which have the dominical letters as well as primes and feasts inscribed on them; imperfect, those which have only the primes and moveable feasts. Till about the fourth century, they all carried the marks of heathenism; from that age to the seventh, they are generally divided between heathenism and Christianity.

Almanacks are of somewhat different composition, some containing more points, others fewer. The essential part is the kalender of months and days, with the rising and setting of the sun, age of the moon, &c. To these are added various parerga, astronomical, astrological, meteorological, chronological, and even political, rural, medical, &c. as calculations and accounts of eclipses, solar ingresses, aspects, and configurations of the heavenly bodies, lunations, heliocentric and geocentric motions of the planets, prognostics of the weather, and predictions of other events, tables of the planetary motions, the tides, terms, interest, twilight, equation, kings, &c.

Gelaleon, or Jellaleon Kalender, is a correction of the Persian kalender, made by order of Sultan Gelaliedan, in the 467th year of the Hegira; of Christ 1089.

Kalender, is used for the catalogue or fasti anciently kept in each church, of the saints both universal and those particularly honoured in each church; with their bishops, martyrs, &c. Kalendars are not to be confounded with martylogies; for each church had its peculiar kalender, whereas the martylogies regarded the whole church in general, containing the martyrs and confessors of all the churches. From all the several kalendars were formed one martylogy; so that martylogies are posterior to kalendars.

Kalender, is also applied to divers other compositions respecting the 12 months of the year.

In this sense, Spenser has given the shepherd's kalender; Evelyn and Miller the gardener's kalender, &c.
K A L

Kalendar, is also extended to an orderly table or enumeration of persons or things.

Lord Bacon wishes for a kalendar of doubts. A late writer has given a kalendar of the persons who may inherit estates in see-simply.

Kalendar, Kalendarium, originally denoted, among the Romans, a book containing an account of moneys at interest, which became due on the kalends of January, the usual time when the Roman usurers let out their money.

Kalendar Months, the solar months, as they stand in the kalendar, viz. January 31 days, &c.

Astronomical Kalendar, an instrument engraved upon copper plates, printed on paper, and pasted on board, with a brass slider which carries a hair, and shows by inspection the sun's meridian altitude, right ascension, declination, rising, setting, amplitude, &c. to a greater exactness than our common globes will show.

Kalendar of Prisoners. See Calendar.

Kalendar Brothers, a sort of devout fraternities, composed of ecclesiastics as well as laymen; whose chief business was to procure masses to be said, and alms distributed, for the souls of such members as were deceased. They were also denominated kalend-brothers, because they usually met on the kalends of each month, though in some places only once a quarter.

Kalendarium Festum. The Christians retained much of the ceremony and wantonness of the kalends of January, which for many ages was held a feast, and celebrated by the clergy with great indecencies, under the names festum kalendarum, or hopitatororum, or studorum, that is, the feast of fools; sometimes also liberae decembris. The people met masked in the church; and in a ludicrous way proceeded to the election of a mock pope, or bishop, who exercised a jurisdiction over them suitable to the festivity of the occasion. Fathers, councils, and popes, long laboured in vain to restrain this license, which prevailed at the close of the 15th century.

Kalend. See Calendar.

Kalends, or Kalends, in the Roman chronology, the first day of every month.—The word is formed from kalum, I call or proclaim; because, before the publication of the Roman fasti, it was one of the offices of the pontifices to watch the appearance of the new moon, and give notice thereof to the rex sacrificius; upon which a sacrifice being offered, the pontiff summoned the people together in the Capitol, and there with a loud voice proclaimed the number of kalends, or the day whereon the none would be; which he did by repeating this formula as often as there were days of kalends, Calo Juno Novella. Whence the name calende was given thereto, from calo, calare. This is the account given by Varro. Others derive the appellation hence, That the people being convened on this day, the pontifex called or proclaimed the several feasts or holidays in the month; a custom which continued no longer than the year of Rome 450, when C. Fimbria the curule aedile, on the fasti or kalends of March, set up, in public places, that everybody might know the differences of times; and the return of the festivals.

The kalends were reckoned backwards, or in a retrograde order. Thus, e.g. the first of May being the kalends of May; the last or the 30th of April was the pridie kalendorum, or second of the kalends of May; the 29th of April, the third of the kalends, or before the kalends; and so back to the 13th, where the ides commence; which are likewise numbered invertedly to the fifth, where the none begin; which are numbered after the same manner to the first day of the month, which is the kalends of April. See also, and Noves.

The rules of computation by kalends are included, in the following verses:

Prima dies mensis cujusque est dica kalendae; sex Maiae nonas, Octuber, Julius, et Mars; quatuor at reliquis: habet idus quindecim octo.
Inde dies reliquos omnes dic esse kalendae; quas retro numeratas dice a mense sequentes.

To find the day of the kalends answering to any day of the month we are in; see how many days there are yet remaining of the month, and to that number add two: for example, suppose it the 22d day of April; it is then the 10th of the kalends of May. For April contains 30 days: and 22 taken from 30, there remain 8: to which two being added, the sum is 10. The reason of adding two is, because the last day of the month is called secundo kalendas, the last but one tertio kalendorum, &c.

The Roman writers themselves are at a loss for the reason of this absurd and whimsical manner of computing the days of the month: yet it is still kept up in the Roman chancery; and by some authors, out of a vain affectation of learning, preferred to the common, more natural, and easy manner.

Kalends are also used in church history to denote conferences ancienly held by the clergy of each deanry, on the first day of every month, concerning their duty and conduct, especially in what related to the imposition of penance.

Kalends of January, in Roman antiquity, was a solemn festival consecrated to Juno and Janus; where-in the Romans offered vows and sacrifices to those deities, and exchanged presents among themselves as a token of friendship.

It was only a melancholy day to debtors, who were then obliged to pay their interests, &c. Hence Horace calls it tristes calendae; Lib. I. Serm. Sat. 3.

Kali, the specific name of a plant which yields the substance also called kali or alkali. See Salsola.

Kalis, a province of Lower Poland, with the title of a palatinate. It is bounded on the west by the palatinates of Bosnia, on the east by that of Syrad, on the north by Regal Prussia, and on the south by Silesia.

Kalish is the capital town.

Kalis, a town of Lower Poland, and capital of a palatinate of the same name, where the Jesuits had a magnificent college. It is seated on the river Prum, in a morass, which renders it difficult of access. E. Long. 18. 0. N. Lat. 51. 30.

Kalmia, a genus of plants, belonging to the decandria class; and in the natural method ranking under the 8th order, Bicones. See Botany Index.

Kalmucks, a tribe of Tartars, called also Euthus, inhabiting the larger half of what the Europeans call Western Tartary. Their territory extends from the Caspian sea, and the river Yeik or Ural, in 72 degrees of longitude from Ferro, to Mount Altay, in 110 degrees, and from the 40th to the 52d degree of north.
People that lead a pastoral life enjoy the bodily sens
uses in the greatest perfection. The Kalmuks find the
subtilty of their sense of smell very useful in their mili-
itary expeditions, for by it they perceive at a distance
the smoke of a fire or the smell of a camp; there are many
of them who can tell by applying the nose to the hole
of a fox, or any other quadruped, if the animal be within
or not. They hear at a great distance the trampling of
horses, the noise of any enemy, of a flock of sheep, or
even of strayed cattle; they have only to stretch them-

selves on the ground, and to apply their ear close to
the turf. But nothing is more astonishing than the
sensitiveness of sight in most of the Kalmuks, and the
extraordinary distance at which they often perceive very
minute objects, such as the dust raised by cattle or horses,
and this from places very little elevated; in immense
level deserts, though the particular inequalities of the
surface, and the vapours which in fine weather are seen
to undulate over the soil in great heats, considerably in-
crease the difficulty. They are also accustomed to trace
the print of a foot, and the most distant object, though
they lead a life sufficiently indolent, and enjoy anabun-
dance of every thing they desire, are never excessively
corruptible. Their skin is pretty fair, especially when
young: but it is the custom of the lower sort to allow
their male children to go quite naked both in the heat
of the sun and in the smoky atmosphere of their felt
huts: the men too sleep naked, covered only with their
drawers; and from these circumstances they acquire
that yellowish brown colour which characterizes them.
The women, on the contrary, have a very delicate com-
plexion; among those of a certain rank are found some
with the most beautiful faces, the whiteness of which is
set off by the fine black of their hair; and in this, as
well as in their features, they perfectly resemble the
figures in Chinese paintings.
The physiognomy which distinguishes the Kalmuks,
is pretty generally known. Strangers are made to be-
think that it is frightfully deformed; and though in-
deed there are very ugly men to be found, yet in gen-
eral their countenance has an openness in it that be-
speaks a mild, a frank, and social disposition. In
many it is of a roundish shape, and exceedingly agree-
able; among the women some would be thought beau-
ties even in those European cities where the taste is
most capricious. The characteristic features of a Kalm-
uk or Mongul countenance are the following: The
interior angle of the eye is placed obliquely downwards
towards the nose, and is acute and fleshy; the eye-
brows are black, narrow, and much arched; the nose is of
a structure quite singular, being generally flat and broken
towards the forehead; the cheek bone is high, the head
and face very round; the eye is dark, the lips thick and
fleshy, the chin short, and the teeth exceedingly white,
continuing so to old age; the ears are of an enormous
size, standing out from the head. These characters are
more or less visible in each individual; but the person
that possesses them all in the highest degree is consid-
ered as the most beautifully formed.
Among all the Mongul nations, the men have much
less beard than in our European countries, and among
the Tartars it appears much later. The Kalmuks have
most of it; and yet even with them the beard is very
scanty and thin, and few have much hair on any other
part of the body.

Although the Kalmuks are generally of a sanguine and
and choleric temperament, they live more amicably together than one could expect in a people that lead so independent a life. They seldom come to blows even over their cups, and their quarrels are hardly ever bloody. A murder very rarely happens, though their anger has something in it exceedingly fierce. It would seem that the morality of their religion, though exceedingly idolatrous, has been able to moderate their natural disposition in this respect; for in consequence of their dogmas, with regard to the transmigration of souls, every wanton murder either of men or beasts is thought a deadly sin.

The Kalmucks are exceedingly affable; and of so social a disposition, that it is rare for a traveller to perceive another, even at the distance of several miles, without going to salute him, and to inquire into the object of his journey. When a troop of Kalmucks perceive any person at a distance, it is customary for them to detach one of their number to the next eminence, from whence he makes a signal with his cap for the person to draw near. If this signal is not obeyed, the person is considered as an enemy or a robber, and is often pursued as such. They enter willingly into friendships; but these connexions are not quite disinterested; for to give and to receive presents are with them essential articles. A mere trifle, however, is sufficient to induce them to do you all manner of service; and they are never ungrateful as far as they are able. Adversity cannot deprive them of courage nor alter their good humour. A Kalmuc will never beg if he were in the extremest misery, but rather endeavour to acquire a subsistence by cheating: and when no other way remains, he will hire himself to some rich individual of his nation, or to some Russian, either as a herdsman, a fisherman, or for any other sort of labour. Very few of the rich value themselves much upon their wealth: but those who do, show no contempt for the poor of their own nation; though the meaner sort pay their court very obsequiously to the rich, who are always surrounded with a swarm of idle dependants.

Nothing can be more prudent than that exercise of hospitality practised by wandering nations: it is of the greatest advantage to those among them who travel across their deserts; and each individual who practises it, may rely on reaping the benefit of it wherever he goes. A Kalmuc provided with a horse, with arms and equipment, may ramble from one place to another for three months together, without taking with him either money or provisions. Wherever he comes he finds either distant relations or friends, to whom he is attached by the ties of hospitality, from whom he meets with the kindest reception, and is entertained in the best manner their circumstances afford. Perhaps he lodges in the first unknown cottage he finds upon his road; and scarce has he entered it, but his wants are supplied with the most affectionate cordiality. Every stranger, of whatsoever nation, never fails to be well received by a Kalmuc; and he may depend upon having his effects in the greatest security the moment he has put himself under the protection of his host: for to rob a guest is considered by the Kalmucks as the most abominable of all crimes.

When the master of the house sits down to meat in company with others of inferior rank, he begins ind}ed by serving himself and his family, but whatever Kalmuc remains is distributed among the assistants. When they smoke tobacco, the pipe circulates incessantly from one to another. When any one receives a present either of meat or drink, he divides it faithfully with his companions, even though of inferior rank. But they are much more ingenuously of their other effects, and especially of their cattle, and do not willingly give these away except when they hope to receive a suitable return: or if any relation has accidentally suffered the loss of his flocks, he is sure to be most willingly assisted. Perhaps too it may be related as an article of their hospitality, that they abandon their wives to their friends with the greatest facility, and in general they are very little inclined to jealousy.

Their robberies are never committed upon their equals, and even the greater part of the rapine exercised on other tribes is founded on hatred or national quarrels: neither do they willingly attempt this by open force, but prefer the machinations of cunning, which are so natural to them. It must also be confessed, that it is only those that live with princes, and in camps where these hold their courts, or their priests, that are most addicted to these practices; while the common people, satisfied with the pleasures of a pastoral life, spend their days in innocent simplicity, and never attack the property of another till forced by necessity, or led by their superiors who show them the example.

The Kalmucks are very faithful to their lawful princes; they endure every sort of oppression, and yet are with difficulty induced to revolt; but if they belong to a prince who has not become so by right of succession, they very easily rebel. They honour old age. When young men travel with such as are older than themselves, they take upon them the whole care of the cattle as well as of the feast. They are exceedingly prudent in matters that relate to their sovereign or their nation, or which are recommended to their direction by the priests, to whom they yield an unreserved obedience.

The moveable habitations of the Kalmucks are those felt huts with a conical roof in use among all the roaming Asiatics. The truly ingenious invention of these tents was undoubtedly conceived in the eastern parts of Asia, and most probably by the Mongol nations. As they can be entirely taken to pieces and folded in a small compass, they are very useful, and perfectly agree with the migratory life of these people, who are still ignorant of the use of carriages. The frame of these huts, and the felt they are covered with, though made as light as possible, yet are a sufficient load for a camel or two oxen. But the capacity of these huts, their warmth in winter, their strength in resisting tempests and excluding rain, abundantly compensate for this inconvenience. The wood endures many years; and though the felt begins to break into holes in the second year, the common people, who do not consider it as disgraceful to have them mended and patched, make them serve a good deal longer. The huts are in general use from the prince down to the meanest Kalmuc, differing only in size and in the embellishments within. In winter, they are warm even when heated with the dried excrements of their cattle, to which they are often obliged to have recourse, for want:
furniture from place to place. They think a bull equal to 50 cows. These and the mares give milk only while they suckle their calves or their foals, which are accordingly kept close to the tents during the day, and only suffered to suck freely during the night; a practice which the Kalmuc pretend makes their cattle stronger and more durable. They generally milk their mares three or four times a day, and sometimes every two hours when the herbage is abundant. The cows are milked but twice a day.

The Kalmuc sheep are of the same species with those found in all Great Tartary, having large tails like a bag, exceedingly fat, and which furnish a suet as soft as butter. They have also large pendant ears, and their head is much arched. Their wool is coarse, and the ewes seldom have horns. One ram is sufficient for a hundred ewes. Little use is made of the milk. The wool is fit for nothing but to make felt for the tents. A great many sheep die during winter, and a greater number still of the early lambs: the skins of which are wrought into those fine furs so much esteemed in Russia and foreign parts.

Camels belong only to the rich; for they are very dear, multiply very slowly, and are subject to many diseases. The deserts of the Great Tartary furnish excellent pasture for these animals; but they require not only much attention in winter, but they must be continually under the eye of the herdsmen; for notwithstanding the advantage of their stature, they are of all animals least able to defend themselves against the wolf. They are guarded with much care against the violence of the cold and the winds of winter; nevertheless many of them die of a consumption accompanied with a diarrhoea, occasioned most probably by the moisture of their pasture and of the season. This disease, for which no remedy has been found, makes them languish for six months or more. They are in general so delicate, that a slight wound or blow often proves fatal to them. Besides, no animal is so much tormented with insects; and they often die in summer of those they swallow in eating the leaves of the oak and of the birch. The meloe proscarabaeus, which covers all the plants in many of those places where they feed, is generally fatal to them. In spring, when they cast their hair, and which falls at once from every part of their body, they are exposed to the bite of the spider-scorpion, an animal very common in southern countries. The wound inflicted by this insect on the skin thus naked is so venomous, that the camel dies of it in less than eight days, sometimes in three. In winter, and especially about nitrating time, which happens at the end of March, the camel becomes lean and weak; the bunch upon their back grows flabby, and hangs down upon the side, nor does it recover its plumpness till summer.

Cameiis milk is thick, unctuous, and of a saltish taste, especially when the animals frequent pastures abounding with saline plants; and this last property makes the Kalmuscs fond of it to tea. They make use of the hair for stuffing cushions, and for making ropes, packthread, and felt. It may be wrought into the most beautiful camelots, or into the finest and softest cloths. The camels with two bunches are a very un-

Kalmus. want of other combustibles, in many places of the deserts which are destitute of wood. In summer they remove th...
When a Kalmuc horde intends to remove in search of fresh pasture, which in summer necessarily happens every four, six, or eight days, people are in the first place despatched to reconnoitre the best place for the khans or princes, for the lamas, and for the huts containing the idols. These begin the march, and are followed by the whole troop, each choosing for himself the place he thinks most convenient. The camp is loaded with the most precious furniture is decorated with little bells, the rest march in a string one behind another, and the bulls with burdens are driven on before. On these days the women and girls dress themselves in their best clothes, and lay on abundance of paint. They have the charge, together with the boys, of leading the flocks and the beasts of burden; and on the road they beguile the tedium of the journey with their songs.

The Kalmucs are supplied by their flocks with milk, cheese, butter, and flesh, which are the principal articles of their food. With regard to the last, they are so little squeamish, that they not only eat the flesh of their own diseased cattle, but that of almost every sort of wild beast, and the poor will even feed upon carrion. They eat, however, the roots and stalks of many plants; such as the bulbous-rooted chervil and dandelion, &c. which they use both boiled and raw.

Their ordinary drink is the milk of mares or cows; but the former is for several reasons preferred. This, when fresh, has indeed a very disagreeable taste of garlic: but besides that it is much thinner than cow milk, it takes as it grows sour a very agreeable vinous flavour; it yields neither cream nor curd, but furnishes a very wholesome refreshing beverage, which sensibly invigorates when taken to excess. They never make use of new milk, and still less of milk or of water that have not been boiled. Their milk is boiled as soon as it is taken from the animal; when it is cold it is poured into a large leathern bag, in which there remains as much of the old milk as is sufficient to turn the new quantity sour, for they never think of cleansing those bags; and as the inside is lined with a crust deposited by the caseous part of the milk and other impurities, it is easy to imagine that a nauseous smell must exhale from them. But this is precisely the circumstance in which the secret consists of communicating to the milk a vinous fermentation.

In summer, and as often as the Kalmucs procure much milk from their flocks, they never fail to intoxicate themselves continually with the spirituous liquor which they know how to distil from it. Mares milk is the most spirituous; and the quantity meant to be distilled remains twenty-four hours in summer, and three or four days in winter, in those corrupted bags we mentioned, to prepare it for the operation. The cream is left, but the butter which forms at top is taken off and reserved for other purposes. Cows milk yields one-thirtieth part, and mares milk one-fifteenth part, of spirit. This liquor is limpid and very watery, and consequently does not keep long, but capable of being kept in glass bottles. The rich Kalmucs increase its strength by a second distillation.

These people are exceedingly fond of tea and tobacco. The former is so dear, as it comes to them from China by the way of Russia, that the poor people supply its place with various wild plants; such as a species of liquorice, the seed of the sharp-leaved dock, the roots of wild angelica, and the seed of the Tartarian maple.

The Kalmucs are excellent horsemen. Their arms are lances, bows and arrows, poniards, and crooked sabres, though the rich have fire arms. They wear, when at war, coats of mail, which cost fifty horses, and their helmets are gilded at top. They are fond of falconry, and hunting of all sorts is their principal amusement. Their passion for play, especially with those who play cards, is carried to as great excess among them as in any other nation.

The greater part of their time is spent in diversions; and however miserable their manner of life may seem to us, they are perfectly happy with it. They cannot endure for any time the air of a close room; and think our custom of living in houses insupportable. The greatest part of them, notwithstanding the apparent unhealthiness of their way of life, arrive at a vigorous old age; their diseases are neither frequent nor dangerous. Men of 80 or 100 years old are not uncommon; and at that age they can still very well endure the exercise of riding. Simple food, the free air which they constantly breathe, a hardy vigorous constitution, continual exercise without severe labour, and a mind free from care, are the natural causes of their health and longevity.

It is very remarkable, that a migratory people, whose manner of life seems so congruous to the natural liberty of mankind, should have been subjected from time immemorial to the unlimited authority of an absolute sovereign. The Monguls of Asia afford the only instance of it; for neither written records nor ancient tradition have preserved the smallest trace of their ever having enjoyed a state of independence. On the contrary, they acknowledge that they have at all times been subject to khans and princes, whose authority has been transmitted to them by succession, and is considered as a right perfectly established, sacred, and divine.

KAMAKURA, a famous island of Japan, about three miles in circumference, lying on the south coast of Niphon. It is here they confine their great men when they have committed any fault. The coast of this island is so steep, that they are forced to be lifted up by cranes.

KAMEEL, KAMEL, or Camel, a machine for lifting ships. See Camel.

KAMINIECK, a very strong town of Poland, and capital of Podolia, with two castles and a bishop's see. It was taken by the Turks in 1672, who gave it back in 1692, after the treaty of Carlowitz. It is seated on a craggy rock, in E. Long. 26. 45. N. Lat. 48. 38.

KAMISIN, the name of a hot southerly wind common in Egypt, of which we find the following description in M. Volney's Travels.—These winds, says he, are known in Egypt by the general name of "winds of 50 days," not that they last 50 days without interruption, but because they prevail more frequently in the 50 days preceding and following the equinox. Travellers
vellers have mentioned them under the denomination of poisonous winds, or, more correctly, hot winds of the desert. Such in fact is their quality; and their heat is sometimes so excessive, that it is difficult to form any idea of its violence without having experienced it; but it may be compared to the heat of a large oven at the moment of drawing out the bread. When these winds begin to blow, the atmosphere assumes an alarming aspect. The sky, at other times so clear in this climate, becomes dark and heavy; the sun loses his splendour and appears of a violet colour; the air is not cloudy, but gray and thick, and is in fact filled with an extremely subtle dust, which penetrates everywhere. This wind, always light and rapid, is not at first remarkably hot, but it increases in heat in proportion as it continues. All animated bodies soon discover it by the change it produces in them. The lungs, which a too rarefied air no longer expands, are contracted, and become painful. Respiration is short and difficult; the skin parched and dry, and the body consumed by an internal heat. In vain is recourse had to large draughts of water; nothing can restore perspiration. In vain is coolness sought for; all bodies in which it is usual to feel it deceive the hand that touches them. Marble, iron, water, notwithstanding the sun no longer appears, are hot. The streets are deserted, and the dead silence of night reigns everywhere. The inhabitants of towns and villages shut themselves up in their houses, and those of the desert in their tents or in wells dug in the earth, where they wait the termination of this destructive heat. It usually lasts three days, but if it exceeds that time it becomes insupportable. Woe to the traveller whom this wind surprises remote from shelter: he must suffer all its horrible effects, which sometimes are mortal. The danger is most imminent when it blows in squalls; for then the rapidity of the wind increases the heat to such a degree as to cause sudden death. This death is a real suffocation; the lungs being empty are convulsed, the circulation is disordered, and the whole mass of blood driven by the heart towards the heart and breast; whence the haemorrhage at the nose and mouth which happens after death. This wind is especially destructive to persons of weak constitution, and those in particular who have suffered from it. It destroyed the town of the muskels and the vessels. The corpse remains a long time warm, swells, turns blue, and soon becomes putrid. These accidents are to be avoided by stopping the nose and mouth with handkerchiefs; an efficacious method likewise is that practised by the camels. On this occasion these animals bury their noses in the sand, and keep them there till the squall is over. Another quality of this wind is its extreme aridity, which is such, that water sprinkled on the floor evaporates in a few minutes. By this extreme dryness it withers and strips all the plants; and by exhaling too suddenly the emaciations from animal bodies, crisps the skin, closes the pores, and causes that feverish heat which is the constant effect of suppressed perspiration.

KAMTSCHATKA, KAMSCHATKA, or KAMCHATKA; a large peninsula in the north-eastern part of Asia, lying between 51° and 62° of north latitude, and between 173° and 182° of east longitude from the Isle of Ferro. It is bounded on the east by the sea of Kamtschatka, on the west by the sea of Ochotch and Penzhinsk, and on the north by the country of the Korilaks.

This peninsula was not discovered by the Russians before the end of the last century. It is probable, however, that some of that nation had visited Kamtschatka before the time above mentioned. For when the Russian Volodimor Altassoff entered upon the conquest of this peninsula in 1697, he found that the inhabitants had already some knowledge of the Russians. A common tradition as yet prevails among them, that long before the expedition of Altassoff, one Fedotoff and his companions had resided among them, and had intermarried with the natives; and they still show the place where the Russian habitations stood. None of the Russians remained when Altassoff first visited Kamtschatka. They are said to have been held in great veneration, and almost deified by the natives: who at first imagined that no human power could hurt them, until they quarrelled among themselves, and the blood was seen to flow from the wounds which they gave each other: and soon after, upon a separation taking place, they were all killed by the natives.

—These Russians were thought to be the remains of a ship's crew who had sailed quite round the north-eastern promontory of Asia called Tschuktskii Nos. The account we have of this voyage is as follows.— In 1648, seven ketches or vessels sailed from the mouth of the river Kovyma or Kolyma, lying in the Frozen ocean in about 72° north latitude, and 173° or 174° east longitude from Ferro, in order to penetrate into the eastern ocean. Four of these were never more heard of; the remaining three were commanded by Simon Deshneff, Gerasim Ankudinoff, two chiefs of the Cosacks, and Fedotoff Alexeiv, head of the Promyslicists, or wandering Russians, who occasionally visited Siberia. Each vessel was probably manned with about 30 persons. They met with no obstructions from the ice; but Anukidinoff's vessel was wrecked on the promontory above mentioned, and the crew were distributed on board the two remaining vessels. These two soon after lost sight of each other, and never afterwards rejoined. Deshneff was driven about by tempestuous winds till October, when he was shipwrecked on the northern part of Kamtschatka. Here he was informed by a woman of Yakuia, that Fedotoff and Gerasim had died of the scurry; that part of the crew had been slain; and that a few had escaped in small vessels, who had never afterwards been heard of; and these were probably the people who, as we have already mentioned, settled among the Kamtschatkans.

As the inhabitants of this country were neither numerous nor warlike, it required no great force to subdue them; and in 1711 the whole peninsula was finally reduced under the dominion of the Russians. For some years this acquisition was of very little consequence to the crown, excepting the small tribute of furs exacted from the inhabitants. The Russians indeed occasionally hunted in this peninsula, foxes, wolves, ermines, sables, and other animals, whose skins form an extensive article of commerce among the eastern nations. But the fur trade carried on from thence was very inconsiderable, until the series of islands mentioned in the next article were discovered; since which time the quantities of furs brought from these
these islands have greatly increased the trade of Kamtschatka, and rendered it an important part of the Russian commerce.

The face of the country throughout the peninsula is chiefly mountainous. It produces in some parts birch, poplars, elders, willows, underwood, and berries of different sorts. Greens and other vegetables are raised with great facility; such as white cabbage, turnips, radishes, beet root, carrots, and some cucumbers. Agriculture is in a very low state, owing chiefly to the nature of the soil and the severe hoarfrosts: for though some trials have been made with respect to the cultivation of grain, and oats, barley, and rye, have been sown, yet no crop has ever been procured sufficient in quantity or quality to answer the trouble of raising it. Hemp, however, has of late years been cultivated with great success.—Every year a vessel belonging to the crown sails from Ochotsk to Kamtschatka laden with salt, provisions, corn, and Russian manufactures; and returns in June or July of the following year with skins and furs.

Volcanoes.

Many traces of volcanoes have been observed in this peninsula; and there are some mountains which are in a burning state at present. The most considerable of these is situated near the middle of the peninsula. In 1762, a great noise was heard issuing from the inside of that mountain, and flames of fire were seen to burst from different parts. These flames were immediately succeeded by a large stream of melted snow water, which flowed into the neighbouring valley, and drowned two natives who were there on a hunting party. The ashes and burning matters thrown from the mountain were spread over a surface of 300 versets. In 1767 was another discharge, but less considerable. Every night flames of fire were observed streaming from the mountain; and considerable damage was done by the eruption which attended them. Since that year no flames have been seen; but the mountain emits a constant smoke.

Population, &c.

Kamtschatka is divided by the Russians into four districts; and the government of the whole is dependent upon, and subject to, the inspection of the chancery of Ochotsk. The whole Russian force stationed in this peninsula amounts to no more than 300 men. The present population of Kamtschatka is very small, amounting to scarce 4000 souls. Formerly the inhabitants were more numerous; but in 1768, the smallpox carried off 5268 persons. There are now only about 700 males in the whole peninsula who are tributary, and a few more than 100 in the neighbouring islands, called the Kurile Isles, who are subject to Russia. The fixed annual tribute consists in 279 sables, 464 red foxes, 50 sea otters with a dam, and 38 cub otters. All furs exported from Kamtschatka pay a duty of 10 per cent. to the crown; the tenth part of the cargoes brought from the neighbouring islands is also delivered into the customs.

Many of the natives of Kamtschatka have no fixed habitations, but wander from place to place with their herds of rein deer; others have settled habitations, and reside upon the banks of the rivers and the shore of the Fenshinska sea, living upon fish and sea animals, and such herbs as grow upon the shore: the former dwell in huts covered with deer skins; the latter in places dug out of the earth. The natives are divided into three different peoples, namely, the Kamtschatkans, Koreki, and Kuriles. The Kamtschatkans live upon the south side of the promontory of Kamtschatka: the Koreki inhabit the northern parts on the coast of the Fenshinska sea, and round the eastern ocean almost to the river Anadir, whose mouth lies in that ocean almost in 68° N. Lat.: the Kuriles inhabit the islands in that sea, reaching as far as those of Japan. The Kamtschatkans have this particular custom, that they endeavour to give every thing a name in their language which may express the property of it; but if they do not understand the thing quite well themselves, then they take a name from some foreign language, which perhaps has no relation to the thing itself; as, for example, they call a priest bogbog, because probably they hear him use the word bogbog, “God;” bread they call brightutin augsh, that is Russian root; and thus of several other words to which their language is a stranger.

It appears probable, that the Kamtschatkans lived formerly in Mongolia beyond the river Amur, and made one people with the Mangals; which is farther confirmed by the following observations, such as the Kamtschatkan having several words common to the Mangal Chinese language, as their terminations in ong, ing, oang, chia, chiug, kis, kung; it would be still a greater proof, if we could show several words and sentences the same in both languages. The Kamtschatkans and Mangals also are both of a middling stature, are swarthy, have black hair, a broad face, a sharp nose, with the eyes falling in, eyebrows small and thin, a hanging belly, slender legs and arms; they are both remarkable for cowardice, boasting, and slaughterness to people who use them hard, and for their obstinacy and contempt of those who treat them with gentleness.

Although in outward appearance they resemble the other inhabitants of Siberia, yet the Kamtschatkans differ in this, that their faces are not so long as the other Siberians; their checks stand more out, their teeth are thick, their mouth large, their stature middling, and their shoulders broad, particularly those people who inhabit the sea coast.

Both men and women plait their hair in two locks, binding the ends with small ropes. When any hair starts out, they saw it with threads to make it lie close; by this means they have such a quantity of lice, that they can scrape them off by handfuls, and they are easily enough even to eat them. Those that have not natural hair sufficient, wear false locks, sometimes as much as weigh 10 pounds, which makes their head look like a haystack. But many of the women already wear their hair, and are nearly dressed in the same manner as the Russians, whose language is the most prevalent. It may be said in praise of the Russians, that though they have established a despotic government in this rude climate, it is tempered by a mildness and equity which prevents its inconveniences from being felt. The taxes levied on the Kamtschadales are so trifling, that they may be regarded only as a mark of gratitude to the sovereign. La Perouse considered the people of this peninsula as the same with those of the bay of Castries, their mildness and probity being similar, and their persons very little different.

Their trade is almost entirely confined to procure the immediate necessaries and conveniences of life.
They sell the Koreki sables, fox and white dog skins, dried mushrooms, and the like, in exchange for clothes made of deer skins and other hides. Their domestic trade consists in dogs, boats, dishes, troughs, nets, hemp yarn, and provisions: and this kind of barter is carried on under a great show of friendship; for when one wants any thing that another has, he goes freely to visit him, and without any ceremony, makes known his wants, although perhaps he had never had any acquaintance with him before: the host is obliged to behave according to the custom of the country, and give his guest what he has occasion for; but he may afterwards return the visit, and must be received in the same manner. They fill almost every place in heaven and earth with different spirits, and offer them sacrifices upon every occasion. Some carry little idols about them, or have them placed in their dwellings.

It is very diverting to see them attempt to reckon above ten: for having reckoned the fingers of both hands, they clap them together, which signifies ten; then they begin with their toes, and count to twenty; after which they are quite confused, and cry, Metcha? that is, Where shall I take more? They reckon ten months in the year, some of which are longer and some shorter; for they do not divide them by the changes of the moon, but by the order of particular occurrences that happen in those regions. They commonly divide our year into two, so that winter is one year and summer another: the summer year begins in May, and the winter in November. They do not distinguish the days by any particular appellation, nor form them into weeks or months, nor yet know how many days are in the month or year. They mark their epochs by some remarkable thing or other; such as the arrival of the Russians, or the first expedition to Kamtschatka.

If any one kills another, he is to be killed by the relations of the person slain. They burn the hands of people who have been frequently caught in theft; but for the first offense the thief must restore what he hath stolen, and live alone in solitude, without expounding the assistance of others. They have no disputes about their land or their huts, every one having land and water more than sufficient for his wants. They think themselves the happiest people in the world, and look upon the Russians who are settled among them with contempt. However, this notion begins to change; for the old people who are confirmed in their customs drop off, and the young ones being converted to the Christian religion, adopt the customs of the Russians, and despise the barbarity and superstition of their ancestors. The Greek religion has been established among them without persecution or violence. The vicar of Paratouanka is the son of a native by a Russian woman. The people have insured themselves to the extremes of heat and cold, by going into vapour baths, coming out covered with perspiration, and then rolling themselves in the snow.

In every ostrog or large village, by order of her imperial majesty, is appointed a chief, who is sole judge in all cases except those of life and death; and not only those chiefs, but even the common people, have their chapels for worship. Schools are also erected in almost every village, to which the Kamtschatkans send their children with great pleasure; by this means it is to be hoped that barbarity will be in a short time rooted out from amongst them.

Under the name of ostrog is understood every habitation consisting of one or more huts, all surrounded by an earthen wall or palisado.—The huts are built in the following manner: they dig a hole in the earth their huts about five feet deep, the breadth and length proportioned to the number of people designed to live in it. In the middle of this hole they plant four thick wooden pillars; over these they lay balks, upon which they form the roof or ceiling, leaving in the middle a square opening which serves them for a window and chimney; this they cover with grass and earth, so that the outward appearance is like a round hilltop; but within they are an oblong square, with the fire in one of the long sides of the square: between the pillars round the walls of their huts they make benches, upon which each family lies separately; but on that side opposite to the fire there are no benches, it being designed for their kitchen furniture, in which they dress their victuals for themselves and dogs. In those huts where there are no benches, there are bunks laid upon the floor, and covered with mats. They adorn the walls of their huts with mats made of grass. They enter their huts by ladders, commonly placed near the fire hearth; so that, when they are heating their huts, the steps of the ladder become so hot, and the smoke so thick, that it is almost impossible for a stranger to go up or down without being burnt, and even stifled to death; but the natives find no difficulty in it: and though they can only fix their toes on the steps of the ladder, they mount like squirrels; nor do the woman hesitate to go through this smoke with their children upon their shoulders, though there is another opening through which the women are allowed to pass; but if any man pretend to do the same, he would be laughed at. The Kamtschatkans live in these huts all the winter, after which they go into other hut called balagan: they serve them not only in the winter, but also for magazines. They are made in the following manner: Nine pillars, about two fathoms long, or more, are fixed in the ground, and bound together with bales laid over them, which they cover with rods, and over all lay grass, fastening spars, and a round sharp roof at top, which they cover with bramble, and thatch with grass. They fasten the lower ends of the spars to the bales with ropes and thongs, and have a door on each side, one directly opposite to the other. They make use of the same kind of huts to keep their fish, &c. till winter comes on, when they can more easily remove it; and this without any guard, only taking away the ladders. If these buildings were not so high, the wild beasts would undoubtedly plunder them; for notwithstanding all their precaution, the bears sometimes climb up and force their way into their magazines, especially in the harvest, when the fish and barries begin to grow scarce.

The southern Kamtschatkans commonly build their villages in thick woods and other places which are naturally strong, not less than 20 versets from the sea; and their summer habitations are near the mouths of the rivers; but those who live upon the Penschinska sea and the eastern ocean build their villages very near the shore. They look upon that river near which
In order to kindle fire, they use a board of dry wood with round holes in the sides of it, and a small round stick; this they rub in a hole till it takes fire; and instead of tinder they use dry grass beat soft. These instruments are held in such esteem by the Kamtschatskans, that they are never without them, and they value them more than our steels and flints; but they are excessively fond of iron instruments, such as hatchets, knives, needles; nay, at the first arrival of the Russians, a piece of broken iron was looked upon as a great present; and even now they receive it with thankfulness, finding use for the least fragment, either to point their arrows, or make darts, which they do by hammering it out cold between two stones. As some of them delight in war, the Russian merchants are forbid to sell them any warlike instruments: but they are ingenious enough to make spears and arrows out of the iron pots and kettles which they buy; and they are so dexterous, when the eye of a needle breaks, as to make a new eye, which will repeat until nothing remains but the point.

The Kamtschatskans make their boats of poplar wood; but the Kuriles not having any wood of their own, make use of what is thrown off by the sea, and is supposed to come from the coasts of Japan, China, or America. The northern inhabitants of Kamtschatka, the settled Korekhi and Tschukotskoi, for want of proper timber and plank, make the boats of the skins of sea animals. They sew the pieces together with whale's beards, and caulk them with moss or nettles beat small. These boats hold two persons; one of which sits in the prow, and the other in the stern. They push against the stream with poles, which is attended with great trouble; when the current is strong, they can scarcely advance two feet in ten minutes; notwithstanding which, they will carry these boats, fully loaded, sometimes twenty verst, and when the stream is not very strong, even thirty or forty verst. The larger boats carry thirty or forty pond; when the goods are not very heavy, they lay them upon a float or bridge resting upon two boats joined together. They use this method in transporting their provisions down the stream, and also to and from the islands.

Their clothes for the most part are made of the skins of deer, dogs, several sea and land animals, and even of the skins of birds; those of different animals being frequently joined in the same garment. They make the upper garment after two fashions; sometimes cutting the skirts all of an equal length, and sometimes leaving them long behind in form of a train, with wide sleeves of a length to come down below the knee, and a hood or caul behind, which in bad weather they put over their heads below their caps; the opening above is only large enough to let their heads pass: they sew the skins of dogs feet round this opening, with which they cover their faces in cold stormy weather; and round the skirts and sleeves they put a border of white dog skin; upon their backs they sew the small shreds of skins of different colours. They commonly wear two coats; the under coat with the hair side inwards, the other side being dyed with elder, and the upper with the hair outwards. For the upper garment they choose black, white, or speckled skins, the hair of which is most esteemed for the beauty of its colour.

Men and women without distinction use the above-mentioned garments, their dress only differing in their under clothing and in the covering of their feet and legs. The women have an under garment, which they commonly wear at home in the house, consisting of breeches and a waistcoat sewed together. The breeches are wide like those of the Dutch sappers, and tie below the knee; the waistcoat is wide above, and drawn round with a string. The summer habits are made of dressed skins without hair: their winter garment is made of deer or stone-ram skins with the hair on. The undress or house-dress of the men is a girdle of leather with a bag before, and likewise a leather apron to cover them behind; these girdles are sewed with hair of different colours. The Kamtschatskans used formerly to go a hunting and fishing during the summer in this dress; but now this fashion is changed, and they wear linen shirts, which they buy from the Russians.

The covering of their feet and legs is made of skins of different sorts: in the summer time, during the rains, they wear the skins of seals with the hair outwards: but their most common covering is the skin of the legs of the rein deer, and sometimes of the legs of other beasts, the shaggiest they can find, to preserve them against the cold. But the buskins which both the Cossacks and Kamtschatskans use in their finest dress are made in the following manner: the sole is of white seal skin, the upper part of fine white leather, the hind quarters of white dog skin; what comes round the legs is of dressed leather or dyed seal skin; the upper parts are embroidered. These buskins are so extraordinary, that if a bachelor is observed to wear them, he is immediately concluded to be upon a scheme of courtship.

They wear the same sort of caps as the people of Yakoutsk. In summer they have a sort of hats of birch bark tied about their head. The Kuriles use in the summer time caps made of plaited grass. The women's head dress is the perukes that we formerly mentioned; and these were so dear to them, that when they came to be Christians they were with difficulty prevailed upon to quit this dress for one more decent; however, at present, round the Russian settlements, all is entirely changed, the women wearing shirts, ruffles, waist-casts, caps, and ribbands; which change nobody now complains of except the very old people. The women do all their work in mittens; they formerly never washed their faces, but now they use both white and red paint: for white paint they may use of a rotten wood; and for red a sea plant, which they boil in seas fat, and rubbing their cheeks with it, make them very red. They dress most in the winter time, especially when they either receive or pay visits.

The common clothes for a Kamtschakan and his family will not cost him less than 100 rubles; for the coarsest worsted stockings, which cost in Russia 20 kopecks, cannot be bought here for less than a ruble; and all other things are sold in the same proportion.

The Kuriles are more able to buy good clothes than the Kamtschatskans: for they can purchase for one sea beaver as much as the Kamtschatskans can for twenty foxes; and one beaver costs the Kuriles no more trouble than five foxes do the Kamtschatskans; for he must
be a good hunter who catches more than ten foxes in the winter; and a Kurla thinks himself unlucky if he doth not catch three beavers in the season; besides which, great numbers are thrown upon the shore by storms.

Their diet.

The Kamtschatakans divide their fish into six parts; the sides and tails are hung up to dry; the back and thinner part of the belly are prepared apart, and generally dried over the fire; the head is laid to sour in pits, and then they eat it like salt fish, and esteem it much for its stink is such that a stranger cannot bear it; the ribs and the flesh which remain upon them they hang up and dry, and afterwards pound for use; the larger bones they likewise dry for food for their dogs; in this manner all these different people prepare the yokola, which is their principal food, or, one may say, household bread; and they eat it for the most part dry.

Their second favourite food is caviare, or the roes of fish, which they prepare three different ways. They dry the roe whole in the air; or take it out of the skin which envelops it, and spreading it upon a bed of grass, dry it before the fire; or, lastly, make rolls of it with the leaves of grass, which they also dry. They never take a journey or go to hunting without dry caviare; and if a Kamtschakan has a pound of this, he can subsist without any other provision a great while; for every birch and alder tree furnishes him with bark, which with his dried caviare makes him an agreeable dish; but if they cannot eat separate, for the caviare sticks like glue to the teeth; and it is almost impossible to swallow the bark, chewed ever so long by itself. There is still a fourth method, which both Kamtschakans and Koreki use in preparing their caviare: the first, having covered the bottom of a pit with grass, they throw the fresh caviare into it, and leave it there to grow sour: the Koreki tie theirs in bags, and leave it to sour; this is esteemed their most delicate dish.

There is a third sort of diet, called by the Kamtschakans chuprika, which is prepared in this manner: in their huts, over the fire-place, they make a bridge of stakes, upon which they lay a heap of fish, which remains there, until the but becomes as warm as a bagnio. If there is no great thickness of fish, one fish serves to dress it; but sometimes they are obliged to make two, three, or more fires. Fish dressed in this manner is half roasted half smoked, but has a very agreeable taste, and may be reckoned the best of all the Kamtschakan cookery: for the whole juice and fat is prepared with a gradual heat, and kept in the skin, from which they may when done enough be easily separated; and as soon as it is thus dressed, they take out the guts, and spread the body upon a mat to dry: this they afterwards break small, and putting it into bags, carry it along with them for provision, eating it like the yokola.

The Kamtschakans have a dish which they esteem very much, called huigul: it is fish laid to grow sour in pits; and though the smell of it is intolerable, yet the Kamtschakans esteem it a perfume. This fish sometimes rots so much in the pits, that they cannot take it out without ladies; in which case indeed they use it for feeding their dogs.

As for the flesh of land and the larger sea animals, they boil it in their troughs with several different herbs and roots; the broth they drink out of ladles and bowls, and the meat they take out upon boards, and eat in their hands. The whale and sea horse fat they also boil with roots.

There is a principal dish at all their feasts and entertainments, called seliga, which they make by pounding all sorts of different roots and berries, with the addition of caviare, and whale and seals fat.

Before the canoes go out to sea, and to any thing for drink but plain water, unless when they made merry; then they drank water which had stood some time upon mushrooms. At present they drink spirits as fast as the Russians. After dinner they drink water: and when they go to bed at night, set a vessel of water by them, with the addition of snow or ice to keep it cold, and always drink it up before morning. In the winter time, they amuse themselves frequently by throwing handfuls of snow into their mouths: and the bridegrooms, who work with the fathers of their future brides, find it their hardest task to provide snow for the family in summer time; for they must bring it from the highest hills, be the weather what it will, otherwise they would never be forgiven.

The Kamtschakans commonly travel in sledges drawn by dogs. The animals used for this purpose travelling differ very little from the common house dogs; they with dogs are of a middling size, of various colours, though there seem to be more white, black, and gray, than of any other. In travelling, they are used of the fore that are castrated, and generally yoke four to a sledge. They drive and direct their dogs with a crooked stick about four feet long, which they sometimes adorn with different coloured thongs; this is looked upon as a great piece of finery. They drive their sledge sitting upon their right side, with their feet hanging down; for it would be looked upon as a disgrace for a man to sit down at the bottom of the sledge, or to make use of any person to drive him, nobody doing this but the women. It is very difficult to travel in these sledges; for unless a man keeps the exact balance, he is liable every moment from the height and narrowness of them to be overturned: in a rugged road this would be very dangerous, as the dogs never stop till they come to some house, or are entangled by something upon the road; especially in going down steep hills, when they run with all their force, and are scarcely to be kept in; for which reason, in descending any great declivity, they unyoke all the dogs except one, and lead them softly down. They likewise walk up hills; for it is as much as the dogs can do to drag up a sledge empty. After a deep snow, before it has been hardened by a frost, there is no travelling with dogs till a road be made, which is effected by a man going before upon snow shoes, whom they call brodovskaia. The snow shoes are made of two thin boards, separated in the middle, bound together at the ends, and with the fore bent a little upwards. The brodovskaia, having one of these shoes upon each foot, leaves the dogs and sledge, and going on clears the road for some way; then returning, leads forward the dogs and sledge so far as the road is made; a method which he must continue till he comes to some dwelling house. This is very laborious; and it happens so often, that no driver ever sets out without his snow shoes. When a storm of driven
KAM

KAM

Kamtschatka.

snow surprises them, they are obliged with all haste to seek the shelter of some wood, and stay there as long as the tempest lasts, which sometimes is a whole week. If they are a large company, they dig a place for themselves under the snow, and cover the entry with wood or brambles. Sometimes they hide themselves in caves or holes of the earth, wrapping themselves up in their furs; and when thus covered, they make or turn themselves with the greatest caution lest they should throw off the snow, for under that they lie as warm as in their common huts; they only require a breathing place; but their clothes must not be tight or hard girt about them, for then the cold is unsufferable. Another danger attending travellers is, that in the severest frost several rivers are not quite frozen over; and as the roads for the most part lie close upon the rivers, the banks are very steep, scarce a year passes without many being drowned. A disagreeable circumstance also to those who travel in these parts, is the sometimes being obliged to pass through copse, where they run the risk of having their eyes scratched out or their limbs broken; for the dogs always run most violently in the worst roads, and, to free themselves, very often overturn their driver. The best travelling is in the month of March or April, when the snow is turned hard or frozen a little at top; however, there is still this inconvenience attending it, that sometimes travellers are obliged to lodge two or three nights in desert places; and it is difficult to prevail upon the Kamtschatkans to make a fire either for warming themselves or dressing victuals, as they and their dogs eat dried fish, and find themselves so warm wrapped in their furs, that they want no other heat; nay, all the people in this climate bear cold so well, that they sleep in the open air as sound as others in a warm bed, and awake next morning perfectly refreshed and alert. This seems to be so natural to all here, that some of them have been seen to lie down with their backs uncovered against a fire, and notwithstanding the fire has been burnt out long before morning, they continued to sleep on very comfortably, and without any inconvenience.

The bay of Avatscha is described by M. Perouse as the finest, most convenient, and the safest that is to be met with in any part of the world. The entrance is narrow, the bottom is mud, and excellent bouldering ground. Two vast harbours, one on the eastern, and the other on the western side, are capable of containing all the ships of the French and English navy. The village of St Peter and St Paul is situated on a tongue of land, which forms a little port behind the village, in which three or four vessels might be laid up for the winter. It is found to be in N. Lat. 53°. E. Long. 156°. 30. from Paris.

Islands in the sea of Kamtschatka. So many of these have been discovered by the Russians, that the existence of almost a continued chain of islands between the continents of Asia and America is now rendered extremely probable. Many further discoveries of great importance to science, however, remain yet to be made. The principal islands already known are the Kurile isles, which stretch south-west towards the coast of China or Japan, and are almost uninhabited; those called Bering’s and Copper islands, the Aleutian isles, and Fox islands, or Lysius Ostrove, lie almost directly east, stretching nearly to 230° of longitude east from Ferro. The first project of making discoveries in that tempestuous sea which lies between Kamtschatka and America was set on foot by Peter the Great of Russia. Captains Beering and Tschirikoff were employed in the undertaking; the former of whom was shipwrecked and died on the island which is still called by his name. As this was no great distance from Kamtschatka, the inhabitants of the latter soon ventured over to it, as the sealers and other animals of that kind were accustomed to resort thither in great numbers.

Mednoy Ostrove, or Copper island, which lies in full sight of Beering’s island, was next visited. This island has its name from the great quantity of copper with which the north-east coast of it abounds, the only side which is known to the Russians. It is washed up by the sea, and covers the shores in such abundance that many ships might be loaded with it. Perhaps an India trader might make a profitable voyage from thence to China, where this metal is in high demand. This copper is mostly in a metallic or malleable state, and many pieces seem as if they had formerly been in fusion. The island is not high; but has many hillocks, each of which has the appearance of having formerly been a volcano. With this kind of hillocks all the islands in the sea of Kamtschatka abound, insomuch that not a single island, though ever so small, was found without one; and many of them consisted of nothing else. In short, all the chain of islands above mentioned may without any stretch of imagination be considered as thrown up by some late volcanoes. The apparent novelty of every thing seems to justify this conjecture: nor can any objection be derived from the vegetable productions with which these islands abound; for the summer after the lower district of Zutphen in Holland was gained from the sea, it was covered over with wild mustard.—All these islands are subject to frequent and violent earthquakes, and abound in sulphur. We are not informed whether any lava is found upon them; but a party-coloured stone as heavy as iron, probably a lava, is mentioned as being found there. From this account it is by no means improbable that the copper above mentioned has been melted in some eruption.

Bering’s island is situated east from Kamtschatka, in the 185th degree of longitude; and Copper island is about one degree more to the eastward, and in the latitude of 54° north. The former is from 70 to 80 versats long, and stretches from north-west to south-east in the same direction as Copper island. The latter is about 50 versats in length. About 300 versats east by south of Copper island lie the Aleutian isles; of which Attak is the nearest; it is rather larger than Bering’s island, and stretches from west to south-east. From thence about 20 versats eastward is situated Semitschi, extending from west to east; and near its extremity is another small island. To the south of the strait which separates the two latter islands, and at the distance of 40 versats from both of them, lies Shemiya in a similar position, and not above 25 versats in length. All these islands lie between 54 and 55 degrees of north latitude.

The Fox islands are situated east-north-east from the Fox Aleutians: the nearest of these, Aitchak, is about 800 versats distant; it lies in 56° north latitude, and extends from west-south-west to east-north-east. It greatly resembles...
resembles Copper island, and is provided with a commodious harbour on the north. From thence all the other islands of this chain stretch in a direction towards north-east by east. The next to Atchak is Amlak, and about 15 versts distant; it is nearly of the same size, and has a harbour on its south side. Next follows Sau-
gugawk, at about the same distance, but somewhat smaller: from thence is 50 versts to Amuchta, a small rocky island; and the latter to Yunaksan, another small island. About 20 versts from Yunaksan there is a cluster of five small islands, or rather mountains, Ki-
galista, Kusamila, Tsigulac, Ulag, and Tanka-Onok; and which are therefore called by the Russians Păt Sopki, or the Five Mountains. Of these Tanka-Onok lies most to the north-east, towards which the western point of Umnak advances within the distance of 20 versts.

Umnak stretches from south-west to north-east; it is 150 versts in length, and has a very considerable bay on the west end of the northern coast, in which there is a small island, or rock, called Adjigak: and on the south side Shamalga, another rock. The western point of Agunaalasha, or Unalasha, is separated from the east end of Umnak by a strait near 20 versts in breadth. The position of these two islands is similar; but Agunaalasha is much the largest, and is above 200 versts long. It is divided towards the north-east into three promontories, one of which runs out in a westerly direction, forming one side of a large bay on the north coast of the island: the second stretches out north-east, ends in three points, and is connected with the island by a small neck of land. The third, or most southerly one, is separated from the last-mentioned promontory by a deep bay. Near Unalasha towards the east lies another small island called Shirkin. About 20 versts from the north-east promontory of Agunaalasha lie four islands: the first, Akutan, is about half as big as Umnak; a verst further is the small island Akun; a little beyond is Akunok; and lastly, Kigalga, which is the smallest of these four, and stretches with Akun and Akunok almost from north to south. Kigalga is situated about the 1st degree of latitude. About 100 versts from thence lies an island called Unmak, upon which a Russian navigator (Captain Krenitzin) wintered; and beyond it the inhabitants said there was a large tract of country called Alasha, of which they did not know the boundaries.

The Fox islands are in general very rocky, without containing any remarkably high mountains: they are destitute of wood; but abound in rivulets and lakes, which are mostly without fish. The winter is much milder than in Siberia; the snow seldom falls before the beginning of January, and continues on the ground till the end of March. There is a volcano in Amuchta, and sulphur is produced on another island; in some others are springs hot enough to boil provisions. Sulphurous flames are also sometimes seen at night upon the mountains of Unalasha.

The Fox islands are tolerably populous in proportion to their size. The inhabitants are entirely free, and pay tribute to no one; they are of a middle stature, and live, both in summer and winter, in holes dug in the earth. No sign of religion were found among them. Several persons indeed pass for sorcerers, pretending to know things past and to come; and are accordingly held in high esteem, but without receiving any emolument. Filial duty and respect towards the aged are not held in estimation by these islanders. They are not, however, deficient in fidelity towards each other; they are of a lively and cheerful temper, though rather impetuous, and naturally prone to anger. In general, they do not observe any rules of decency; but follow all the calls of nature publicly, and without the least reserve. Their principal food consists in fish, and other sea animals, small shell fish, and sea plants; their greatest delicacies are wild lilies and other roots, together with different kinds of berries. When they have laid in a store of provisions, they eat at any time of the day without distinction; but in case of necessity, they are capable of fasting several days together. They seldom heat their dwellings: but when they are desirous of warming themselves, they light a bundle of hay, and stand over it; or else they set fire to train oil, which they pour into a hollow stone. They feed their children when very young with the coarsest flesh, and for the most part raw. If an infant cries, the mother immediately carries it to the sea side, and, be it summer or winter, holds it naked in the water until it is quiet. This custom, it is said, is so far from doing the children any harm, that it hardens them against the cold; and accordingly they go barefooted through the winter without the least inconvenience. They are also trained to bathe frequently in the sea; and it is an opinion generally received among the islanders, that by these means they are rendered bold and fortunate in fishing.

The men wear shirts made of the skins of cor-
rants, sea-divers, and gulls; and in order to keep out the rain, they have upper garments of the bladders and other intestines of sea-lions, sea-calves, and whales, blown up and dried. They cut their hair in a circular form quite close to their ears; and shave also a round place on the top. The women, on the contrary, let the hair descend over the forehead as low as the eye-
brows, and tie the remaining part in a knot upon the top of the head. They pierce the ears, and hang in them bits of coral, which they get from the Russians. Both sexes make holes in the grittiest of their noses, and in the under lips, in which they thrust pieces of bone, and are very fond of such kind of ornaments.—
They mark also and colour their faces with different figures. They barter among one another sea-otters, sea-bears, clothes made of birds skins and of dried intestines, skins of sea-lions and sea-calves for the cover-
ings of their canoes, wooden masks, darts, thread made of sinews and hair of rein deer.

Their household utensils are square pitchers and large troughs, which they make out of the wood driven ashore by the sea. Their weapons are bows and arrows pointed with flint, and javelins of two yards in length, which they throw from a small board. Instead of hatchets, they use crooked knives of flint or bone. Some iron knives, hatchets, and lances, were observed among them, which they had probably got by plundering the Russians.

According to the reports of the oldest inhabitants of Umnak and Unalasha, they have never been engaged in any war, either amongst themselves or with their neighbours, except with the people of Alasha, the occasion of which was as follows: The son of the Toiguo
KAM toigon or chief of Umnak had a maimed hand; and some inhabitants of Alashaka, who came to visit upon that island, fastened to his arm a drum, out of mockery, and invited him to dance. The parents and relations of the boy were offended at this insult: hence a quarrel ensued; and from that time the people have lived in continual enmity, attacking and plundering each other by turns. According to the reports of the islanders, there are mountains upon Alashaka, and woods of great extent at some distance from the coast. The natives wear clothes made of the skins of rein-deer, wolves, and foxes, and are not tributary to any of their neighbours. The inhabitants of the Fox islands seem to have no knowledge of any country beyond Alashaka, which is one of the most easterly islands yet discovered in these seas, and is probably not far distant from the continent of America.

Feasts are very common among these islanders; and more particularly when the inhabitants of one island are visited by those of the others. The men of the village meet their guests, beating drums, and preceded by the women who sing and dance. At the conclusion of the dance, the hosts invite them to partake of the feasts; after which ceremony, the former return first to their dwellings, place mats in order, and serve up their best provision. The guests next enter, take their places, and, after they are satisfied, the diversions begin. First, the riders dance and caper, at the same time making a noise with their small drums, while the owners of the huts of both sexes sing. Next, the men dance almost naked, tripping after one another, and beating drums of a larger size: when these are weary, they are relieved by the women, who dance in their clothes, the men continuing in the mean time to sing and beat their drums. At last the fire is put out which had been kindled for the ceremony. The manner of obtaining fire is by rubbing two pieces of dry wood against each other, or most commonly by striking two flints together, and letting the sparks fall upon some sea otter's hair mixed with sulphur. If any sorcerer is present, it is then his turn to play his tricks in the dark; if not, the guests immediately retire to their huts, which are made on that occasion, of their canoes and mats. The natives who have several wives do not withhold them from their guests; but where the owner of the hut has himself but one wife, he then makes the offer of a female servant.

The burning season is principally from the end of October to the beginning of December; during which time they kill great numbers of young sea bears for their clothing. They pass all December in feastings and diversions similar to those above mentioned: with this difference, however, that the men dance in wooden masks, representing various sea animals, and painted red, green, or black, with coarse coloured earths found upon their islands.

During these festivals, they visit each other from village to village, and from island to island. The feasts concluded, masks and drums are broken to pieces, or deposited in caverns among the rocks, and never afterwards made use of. In spring they go out to kill old sea bears, sea lions, and whales. During summer, and even in winter when it is calm, they row out to sea, and catch eel and other fish. Their boats are of bone; and for lines they make use of a string made of a long tenacious sea weed, which is sometimes found in those seas near 150 yards in length.

Whenever they are wounded in any encounter, or bruised by any accident, they apply a sort of yellow root to the wound, and fast for some time. When their head aches, they open a vein in that part with a stone lancet. When they want to glue the points of their arrows to the shafts, they strike their nose till it bleeds, and use the blood as glue.

Murder is not punished among them; for they have no judge. The following ceremonies are used in the burial of the dead. The bodies of poor people are wrapped up in their own clothes, or in mats; then laid in a grave, and covered over with earth. The bodies of the rich are put, together with their clothes and arms, in a small boat made of the wood driven ashore by the sea: this boat is hung upon poles placed crosswise; and the body is thus left to rot in the open air.

The customs and manners of the inhabitants of the Alutian isles are nearly similar to those of the inhabitants of the Fox islands. The former indeed are rendered tributary, and entirely subject to Russia; and most of them have a slight acquaintance with the Russian language, which they have learned from the crews of the different vessels who have landed there.

KAN, or KAN, the name of an officer in Persia, answering to that of governor in Europe. There are kana of provinces, countries, and cities, who have different additions to distinguish them.

KANGUROO. See DIDELPHIS, MAMMALIA Index.

KANISCA, a very strong town of Lower Hungary, capital of the county of Selawar. It was taken by the Imperialists in 1690. It is seated on the river Drava, in E. Long. 17. 37. N. Lat. 46. 23.

KAN-TCHEOU-FOU, a flourishing town of China, in the province of Kiang-ni. Its rivers, port, riches, and population, all contribute to attract strangers. A day's journey from this city is a very rapid current, almost 20 leagues in length, which flows with great impetuosity over a number of scattered rocks that are level with the water. Travellers here are in great danger of being lost, unless they take care to be conducted by one of the pilots of the country; after this passage the river becomes twice as large as the Seine at Rouen; and is continually covered with loaded barks and other vessels under sail. Near the walls of this city is a very long bridge, composed of 130 boats joined together by strong iron chains. The custom-house is upon this bridge, where a receiver constantly resides to visit all vessels, and examine if they have paid the duties imposed on the commodities with which they are loaded. Two or three moveable boats are so placed, that by their means the bridge can be opened or shut, to give or refuse a passage; and no barks are ever permitted to pass until they have been examined. In the territory belonging to this city, a great number of those valuable trees grow, from which varnish distils. Its district is extensive, and contains 12 cities of the third class.

KAOLIN, the name of an earth which is used as one of the two ingredients in oriental porcelain. Some of this earth was brought from China, and examined by Mr. Rusemire. He found that it was perfectly in-
Kaolinite is fusible by fire, and believed that it was a tallow earth; but Mr Macquart observes, that it is more probably of an argillaceous nature, from its forming a tenacious paste with the other ingredient called petuntse, which has no tenacity. Mr Bosworth says, that by analyzing some Chinese kaolin, he found it was a compound earth consisting of clay, to which it owed its tenacity; of calcareous earth, which gave it a muddy appearance; of sparkling crystals of mica; and of small gravel, or particles of quartz crystals. He says, that he has found a similar earth upon a stratum of granite, and conjectures that it may be a decomposed granite. This conjecture is the more probable, as kaolins are frequently found in the neighbourhood of granites. See Porcelain.

KAOOUTCHOUK. See CAOUTCHOUC, CHEMISTRY INDEX.

KARAITES. See CARAITES.

KARECK, an island in the Persian gulf, which was once subject to the Dutch. It was visited by Mr. Ives in 1758. He found the south part of the island well cultivated, with agreeable fields of corn, and producing plenty of excellent vegetables. In the middle are very high hills abounding with a variety of shells. Some fragments torn from their sides afforded an opportunity of observing an immense quantity of oysters, scallop, cockle, and other shells. The common tree here is the banian, but without those luxuriant shoots, which in some other places go downward and take root in the ground. The lavender cotton is also found here; and the island abounds with fowl of various kinds. Pearl oysters are also found, but at considerable depths.

This settlement was founded by Baron Kniphausen, who having left the Prussian service on some disgust, entered into that of France, afterwards went to the East Indies, and was appointed resident to the Dutch factory at Bassora. Here he became an object to the avarice and rapacity of the governor; who accused him of capital crimes, he was at last glad to compound with them for 50,000 rupees, the whole sum he was worth, besides giving directions how they might squeeze other 50,000 from his successor in office (who in truth wished him turned out) and the banian who did the business of the Dutch factory, and who had likewise been concerned in underhand practices against him.

The new resident was overjoyed at his accession, but lost all patience when he found himself obliged to pay 30,000 rupees to the governor as a compliment on his entering into a post of such consequence. Nor had the banian much better reason to be satisfied, being obliged to pay down 20,000 rupees to make up the sum which was to satisfy the rapacity of the governor.

Baron Kniphausen sailed from Bassora the very day after he was set at liberty; but having landed on this island, he, in conjunction with an Arabian sheik, formed the plan of the settlement. He then carried a letter from the sheik to the governor and council of Batavia, in which the former proposed to give up the sovereignty of the island. Before setting out for this place, however, the baron took care to despatch a messenger across the desert to Constantinople, acquainting the Dutch ambassador with the treatment he had received, and requesting liberty of the grand visier for the Dutch to settle at Kareck. The messenger returned with a favourable answer before the baron came back from Batavia. The governor of Bassora, then, having attempted in vain to persuade him to return to that place, wrote a letter of complaint to Batavia, accusing the baron in terms of the utmost exaggeration, but without any mention of the 100,000 rupees. The baron, however, having got intelligence of this proceeding, used such diligence that he got back to Batavia in the very ship which carried the letter. Being thus present on the spot to answer the charges brought against him, he acquitted himself so well that his scheme was instantly approved of, and he was sent back with two ships and 50 men to take possession of Kareck, whose inhabitants at that time amounted to no more than 100 poor fishermen.

Considerable difficulties now occurred in the establishment of the new colony; for he had but very few materials with him, and the government of Batavia was very slow in sending him the succours they had promised. He was therefore obliged to send for workmen from Persia and Arabia, with whose assistance he built a small compact fort, strong enough to defend itself against any of the country powers, and any ships usually sailing to India, excepting those of our East India Company. Nor was he content with putting himself in a posture of defence, but even commenced hostilities against the Turks; and by detaining two vessels very richly laden, which happened to touch at the island, he at last obliged the governor of Bassora to pay back the 100,000 rupees he had extorted, 35,000 of which he restored to his successor in office at Bassora, and 25,000 to the banian. When Mr. Ives visited him, he informs us, that surprising progress had been made during the little time the baron had held the sovereignty of the island, and that he intended to make it a strong and wealthy place; at the same time that he discovered his taste for literature by advancing a sum of money for books and instruments of various kinds, which were afterwards punctually sent. After that time, however, the baron quitting the service of the Dutch; and the island is again in possession of the sheik of Bundaric, to whom it formerly belonged. It is about five miles long and two in breadth; lying nearly in the middle of the Persian gulf, about seven leagues from each side, and about 30 leagues from the mouth of Bassora river, where all ships bound to that port must call for pilots.

KARLE, a Saxo word used in our law, sometimes simply for a man; and sometimes, with an addition, for a servant or clown. Thus the Saxons call a seaman bucarri, and a domestic servant huscarle. From hence comes the modern word churl.

KARMATIANS, a sect of Mohammedans, who occasioned great disorders in the empire of the Arabs. See BAGGAD, No. 49.

KARNAC, the name of a village near Thebes in Upper Egypt, and built on a small part of the site of a single temple, the circumference of which, it is said, it would require half an hour to walk round. The ruins of this temple, which are yet visible, seem to indicate, according to Denon, that it was the largest in the world; and he thinks it probable, that the temple of Karnac,
KAT

Kasana, as well as that of Luxor, was built in the time of Sesostris, when Egypt was in the highest degree of prosperity. The plan of this temple is said to be noble and grand; but Denon supposes that the embellishments were added long after the building of the temple, as they exhibit a more correct and chaste style. The portico alone is composed of 150 columns, the smallest of which are not less than 7½ feet in diameter, and the largest 12.

KASSON, a populous kingdom in the north of Africa, the metropolis of which lies in N. Lat. 14° 33'. W. Long. 8° 43'. The king of the country was extremely kind to Mr Park, although his son plundered him in a very shocking manner. He says that the number of towns and villages, and the extensive cultivation around them, exceeded every thing he had then seen in Africa. A gross calculation may be formed of the number of inhabitants in this enchanting plain, from considering that the king of Kasson can raise 4000 fighting men by the sound of his war drum. It is remarkable, that although the people possess abundance of corn and cattle, both high and low make no scruple of eating rats, moles, squirrels, snakes, and locusts. What is perhaps no less singular, the women of this country are not allowed to eat an egg, although they are used by the men without any scruple in the presence of their wives.

The method of converting the negroes to the religion of Mahomet is worthy of notice. Mr Park assures us that he saw the whole inhabitants of Teecoe, a large unwalled town of Kasson, instantly converted. While he resided in that town, an embassy of 10 people belonging to Almani Abdullah, king of Footta Torra, a country to the west of Bondou, arrived at Teecoe; and desiring Tiggity Segu the governor to call an assembly of the inhabitants, publicly made known the determination of their king—"that unless all the people of Kasson would embrace the Mahometan religion, and evince their conversion by saying eleven public prayers, he (the king of Footta Torra) could not possibly stand neuter in the present contest, but would certainly join his arms to those of Kajasa." Such a message from so potent a prince created great alarm; and the inhabitants, after deliberating for some time, agreed to conform themselves to his will and pleasure, renouncing Paganism and embracing the doctrines of the false prophet.

KASTIL, or Kestrel, a species of falcon. See Falco, Ornithology Index.

KATEGATTE, a noted sea, lying between part of Jutland and the coast of Sweden, and towards the latter covered with a great number of isles. It is almost closed at the extremity by the low Danish islands of Sealand and Funen, which had in old times been (with Sweden) the seat of the Suiones. Between the first and the coast of Sweden is the famous Sound, the passage tributary to the Dano by thousands of ships. These islands were of old called Codomania, and gave to the Kattegatte the name of Sinus Codonanus. Its greatest depth is 35 fathoms. It decreases as it approaches the Sound; which begins with 16 fathoms, and near Copenhagen shallows to even four. The Roman fleet, under the command of Germanicus, sailed, according to Pliny, round Germany, and even doubled the Cimbricum Promontorium, and arrived at the islands which fill the bottom of the Kattegatte; either by ob-

KEA

ervation or information, the Romans were acquainted with 23. One they called Gesseria, from its amber, a fossil abundant to this day on part of the south side of the Baltic. A Roman knight was employed by Nero's master of the gladiators to collect in these parts that precious production, by which he became perfectly acquainted with this country.

KAUFFBEUREN, a town of Germany, situated on the river Wardach, formerly imperial, but now subject to Bavaria. E. Long. 10° 53'. N. Lat. 47° 57'.

KAY, QUAY, or KEY. See KAY.

KAZY, in the East Indies, a Mahometan judge or magistrate; appointed originally by the court of Delhi to administer justice according to their written law; but particularly in matters relative to marriages, the sales of houses, and transgressions of the Koran. He attests or authenticates writings, which under his seal are admitted as the originals in proof.

KEATE, GEORGE, ESQ. F. R. S. An eminent English writer, was born in 1730, and educated at Kingstone school, after which he went to Geneva, where he resided for some years, and became acquainted with M. Voltaire. When he made the tour of Europe, he became a student in the Inner Temple, was called to the bar, but did not meet with such encouragement as to induce him to persevere.

In the year 1760 he published his Ancient and Modern Rome, a poem which was received with considerable applause, and the following year he gave the world A short Account of the Ancient History, present Government and Laws of the Republic of Geneva, 8vo, dedicated to Voltaire, who once intended to translate it into French, but afterwards abandoned his design.

In 1762 he produced an Epistle from Lady Jane Gray to Lord Guildford Dudley; and next year the Alps, a poem, believed to be the best he ever wrote, for truth of description, vigour of fancy, and beauty of versification. In 1764 appeared Netley Abbey, and in 1765, The Temple Student, an Epistle to a Friend, in which he Rally his own want of application to the study of the law, and his consequent want of success in that profession. In 1766 he published a poem to the memory of Mrs Cibber, of whose talents as an actress he entertained a very high opinion. He married in 1769 Miss Hudson, and about the same period he published Ferney, an Epistle to Voltaire. Having praised with energy the beauties of that philosopher's poetical works, he introduces a grand panegyric on the immortal Shakespeare, whom Voltaire used every effort to depreciate, probably from a spirit of envy. This eulogium made the mayor and burgesses of Stratford present our author with a standish, mounted with silver, made out of the famous mulberry tree which Shakespeare had planted.

In 1775 appeared his Monument in Arcadia, a dramatic poem; and in 1779 he published his Sketches from Nature, taken and coloured in a Journey to Margate, justly allowed to be an elegant composition. In the year 1787 came out The Distressed Poet, a serio-comic poem, in three cantos, occasioned by a long and vexatious lawsuit. His last work was perhaps the most honourable of the whole, both to his head and to his heart. Captain Wilson of the Antelope packet having suffered shipwreck on the Pelew islands, was refused any farther command, and reduced to distress, which induced the humane Keate to publish an account of
of these islands for the benefit of that gentleman, which, it is said, brought him about 900 guineas in the space of a year. This work is written with much elegance, although it is probable the amiable part of the manners of the natives of Pelew is somewhat highly coloured.

The life of this poet was spent without any vicissitudes of fortune; he was possessed of a very ample estate, which he never attempted to increase but by prudence in the management of it. He was a man of beneficence and hospitality, and enjoyed the favour of mankind in a very high degree. His health had been gradually declining towards the close of his life. He died in June 1797, leaving one daughter.

KEBBA, an appellation given by the Mahometans to that part of the world where the temple of Mecca is situated, towards which they are obliged to turn themselves when they pray.

KEDAR, in Ancient Geography, a district in the desert of the Saracens (so called from Cedar, the son of Ishmael), according to Jerome, who in another place says that Kedar was uninhabitable, on the north of Arabia Felix. Kedareni, the people; who dwelt in tents like the other Scerites (Psalms xxx.) were rich in cattle (Isaiah lx.); of a swarthy complexion (Canticles i.), and excellent at the bow (Isaiah xxiii.).

Kedes, in Ancient Geography, a city of refuge and Levitical in the tribe of Naphtali, on the confines of Tyre and Galilee (Jos. viii.). Jerome calls it a sacral city, situated on a mountain 20 miles from Tyre, near Panoeas, and called Cedidus; taken by the king of Assyria.—Another Kedes in the tribe of Issachar (1 Chron. vi. 72.) which seems to be called Kishion (Josh. xix.)

Kedge, a small anchor, used to keep a ship steady whilst she rides in a harbour or river, particularly at the turn of the tide, when she might otherwise drive over her principal anchor, and entangle the stock or flukes with her slack cable, so as to loosen it from the ground. This is accordingly prevented by a kedge rope that hinders her from approaching it. The kedges are particularly useful in transporting a ship; i.e. removing her from one part of the harbour to another, by means of ropes which are fastened to these anchors. They are generally furnished with an iron stock, which is easily displaced for the convenience of stowing them.

Kedron, or Cedron, in Ancient Geography, a town which, from the defeat and pursuit of the Syrians (1 Mac. xvi.), appears to have stood on the road which led from the Higher India to Azotus: in this war it was burnt by the Jews.

Kedron, or Cedron, in Ancient Geography. St John calls it a brook, but Josephus a deep valley between Jerusalem and Mount Olivet to the east; called also Kedron from its blackness. A brook only in winter, or in rainy weather, according to Maundrel.

Kee, the principal piece of timber in a ship, which is usually first laid on the blocks in building. If we compare the carcass of a ship to the skeleton of the human body, the keel may be considered as the backbone, and the timbers as the ribs. It therefore supports and unites the whole fabric, since the stem and stern post, which are elevated on its ends, are in some measure a continuation of the keel, and serve to connect and enclose the extremities of the sides by transom; as the keel forms and unites the bottom by timbers.

The keel is generally composed of several thick pieces placed lengthwise, which, after being scarfed together, are bolted, and clenched upon the upper side. When these pieces cannot be procured large enough to afford a sufficient depth to the keel, there is a strong thick piece of timber bolted to the bottom thereof, called the false keel, which is also very useful in preserving the lower side of the main keel. In our largest ships of war, the false keel is generally composed of two pieces, which are called the upper and the lower false keels. See MIDSHIP-FRAME.

The lowest plank in a ship's bottom, called the garboard-streak, has its inner edge let into a groove or channel cut longitudinally on the side of the keel: the depth of this channel is therefore regulated by the thickness of the garboard streak.

Kee is also a name given to a low flat-bottomed vessel, used in the river Tyne to bring the coals down from Newcastle and the adjacent parts, in order to load the colliers for transportation.

Kee-Hauling, a punishment inflicted for various offences in the Dutch navy. It is performed by plunging the delinquent repeatedly under the ship's bottom on one side, and hoisting him up on the other, after having passed under the keel. The blocks or pulleys by which he is suspended are fastened to the opposite extremities of the main yard, and a weight of lead or iron is hung upon his legs, to sink him to a competent depth. By this apparatus he is drawn close up to the yard-arm, and there let fall suddenly into the sea, where, passing under the ship's bottom, he is hoisted up on the opposite side of the vessel. As this extraordinary sentence is executed with a serenity of temper peculiar to the Dutch, the culprit is allowed sufficient intervals to recover the sense of pain, of which indeed he is frequently deprived during the operation. In truth, a temporary insensibility to his sufferings ought by no means to be construed into a disrespect of his judges, when we consider that this punishment is supposed to have peculiar propriety in the depth of winter, whilst the flakes of ice are floating on the stream; and that it is continued till the culprit is almost suffocated for want of air, benumbed with the cold of the water, or stunned with the blows his head receives by striking the ship's bottom.

Keelson, a piece of timber which may be properly defined the interior or counter part of the keel; as it is laid upon the middle of the floor timbers, immediately over the keel, and like it composed of several pieces scarfed together. In order to sit with more security upon the floor timbers and crotches, it is notched about an inch and a half deep, opposite to each of those pieces, and thereby firmly scored down upon them to that depth, where it is secured by spikes or nails. The pieces of which it is formed are only half the breadth and thickness of those of the keel.

The keelson serves to bind and unite the floor-timbers to the keel. It is connected to the keel by long bolts, which, being driven from without through several of the timbers, are forelocked or clenched upon rings on the upper side of the keelson.

Keeper of the Great Seal, is a lord by his office,
KEE, Dr John, a celebrated astronomer and mathematician, was born at Edinburgh in 1671, and studied in the university of that city. In 1694 he went to Oxford; where, being admitted of Balliol college, he began to read lectures according to the Newtonian system in his private chamber in that college. He is said to have been the first who taught Sir Isaac Newton's principles by the experiments on which they are founded: and this, it seems, he did by an apparatus of instruments of his own providing, by which means he acquired a great reputation in the university. The first specimen he gave the public of his skill in mathematical and philosophical knowledge, was his Examination of Dr Burnet's theory of the earth, with Remarks on Mr Whiston's theory: and these theories being defended by their respective inventors, drew from Mr Keill An Examination of the reflections on the theory of the earth, together with A Defence of the remarks on Mr Whiston's new theory. In 1701, he published his celebrated treatise, entitled, Introductio ad veram physican, which only contains 14 lectures; but in the following editions he added two more. This work has been translated into English, under the title of An Introduction to Natural Philosophy. Afterwards, being made fellow of the Royal Society, he published, in the Philosophical Transactions, a paper of the laws of attraction; and being offended at a passage in the Acta eruditorum of Leipsic, warmly vindicated against Mr Leibnitz Sir Isaac Newton's right to the honour of the first invention of his method of fluxions. In 1709 he went to New England as treasurer of the Palatines. About the year 1711, several objections being urged against Sir Isaac Newton's philosophy, in support of Des Cartes's notion of a plenum, Mr Keill published a paper in the Philosophical Transactions on the rarity of matter, and the tenacity of its composition. But while he was engaged in this dispute, Queen Anne was pleased to appoint him her decipherer; and he continued in that place under King George I. till the year 1716. He had also the degree of doctor of physic conferred on him by the university of Oxford in 1713. He died in 1721. He published, besides the works already mentioned, Introductio ad veram astronomiam, which was translated into English by Dr Keill himself; and an edition of Commandinus's Euclid, with additions of his own.

KEILL, James, M.D. an eminent physician, and brother of the former, was born in Scotland about the year 1673; and having travelled abroad, read lectures of anatomy with great applause in the universities of Oxford and Cambridge, by the latter of which he had the degree of doctor of physic conferred upon him. In 1700 he settled at Northampton, where he had considerable practice as a physician; and died there of a cancer in the mouth in 1719. He published, 1. An English translation of Lemery's chemistry. 2. An account of animal secretion, the quantity of blood in the human body, and muscular motion. 3. A treatise on anatomy. 4. Several pieces in the Philosophical Transactions.
KEI

and in the bailiwick of Hagenau, which has belonged to the French ever since the year 1548. It is seated in a pleasant country, in E. Long. 7. 25. N. Lat. 48. 10.

KEISERSLAUTERN, a town of Germany, in the Lower Palatinate, seated on the river Louter, now subject to Bavaria. E. Long. 7. 51. N. Lat. 49. 22.

KEISERTOUL, a town of Switzerland, in the county of Baden, with a bridge over the Rhine, and a castle. It belongs to the bishop of Constance, and is situated in E. Long. 4. 40. N. Lat. 47. 10.

KEISERWERT, a town of Germany, in the circle of Westphalia, the diocese of Cologne, and the duchy of Berg; subject to the king of Prussia. The fortifications are demolished. It is seated on the Rhine, in E. Long. 6. 49. N. Lat. 51. 16.

KEITH, JAMES FRANCIS EDWARD, field-marshal in the Prussian service, was the youngest son of William Keith, earl marshal of Scotland; and was born in 1696. He was designed by his friends for the law; but his inclination led to arms, and the first occasion of drawing his sword was at the age of 18 years, when the rebellion broke out in Scotland. Through the instigation of his mother, he joined James's party, was wounded at the battle of Sheriffmuir, and made his escape to France. Here he applied himself to military studies; and going to Madrid, he, by the interest of the duke of Liria, obtained a commission in the Irish brigades, then commanded by the duke of Orleans. He afterwards attended the duke of Liria, when he went ambassador to Muscovy; and being by him recommended to the Czarina, was promoted to the rank of lieutenant-general, and invested with the order of the black eagle. He distinguished himself by his valour and conduct in the Russian service, and had no inconsiderable share in the revolution that raised Elizabeth the daughter of Peter the Great to the throne; he also served in several embassies; but finding the honours of that country but a splendid kind of slavery, he left that court and entered the Prussian service. The king of Prussia made him field-marshal of the Prussian armies, and governor of Berlin; and distinguished him so far by his confidence, as to travel in disguise with him over a great part of Germany, Poland, and Hungary. In business, he made him his chief counsellor; in his diversions, his chief companion. The king was much pleased with an amusement which the marshal invented in imitation of the game of chess. The marshal ordered several thousand small statues of men in armour to be cast by a founder; these he would set opposite to each other, and range them in battalia, in the same manner as if he had been drawing up an army; he would bring out a party from the wings or centre, and show the advantage or disadvantage resulting from the different draughts which he made. In this manner the king and the marshal often amused themselves, and at the same time improved their military knowledge. This brave and experienced general, after many important services in the wars of that illustrious monarch, was killed in the unfortunate affair of Hochkirchen, in the year 1758.

The family of Keith was among the most ancient in Europe. In 1310 the Scots gained a complete victory over the Danes at Cawse town in Angus; King Malcolm II. as a reward for the signal bravery of a certain young nobleman who pursued and killed Camus the Danish general, bestowed on him several lands, particularly the barony of Keith in East Lothian, from which his posterity assumed their surname. The king also appointed him hereditary great marshall of Scotland, which high office continued in his family till the year 1715, when the last earl engaged in the rebellion, and forfeited his estate and honours; and thus ended the family of Mareschal, after serving their country in a distinguished capacity above 700 years.

KELLINGTON, or KILKHAMPTON, a town of Cornwall in England, which sends two members to parliament. W. Long. 4. 38. N. Lat. 55. 36.

KELLS, a borough town of Ireland, in the county of Meath, and province of Leinster; 32 miles from Dublin. This place gives title of viscount to the family of Colmanedeley; and near it is Headfort, the magnificent seat of Lord Bective. This town is pleasantly situated on the river Blackwater, and has four fairs. It was anciently called Kenanou, and afterwards Kenlis. In former ages it was one of the most famous cities in the kingdom; and on the arrival of the English was walled and fortified with towers. In 1178 a castle was erected where the market place now is; and opposite to the castle was a cross of an entire stone, ornamented with bas-relief figures and many curious inscriptions in the ancient Irish character. Within a small distance was the church of St Senan; and on the south of the churchyard is a round tower which measures 99 feet from the ground, the roof ending in a point; and near the top were four windows opposite to the cardinal points. There was a celebrated monastery founded here in 550 for regular canons, and dedicated to the Virgin Mary. It owed its origin to St Columba, to whom the site of the abbey was granted by Dermot Maceroaill, or Dermot the son of Kervail, king of Ireland. An episcopal see was afterwards erected here, which in the 12th century was united to that of Meath. A priory or hospital was also erected by Walter de Lacie, lord of Meath, in the reign of Richard I. for cross-bearers or crouched friars following the order of St Augustine. There was likewise a perpetual chantry of three priests or chaplains in the parish church of St Columba in Kells to celebrate mass daily; one in the Rood chapel, another in St Mary's chapel, and a third in the chapel of St Catherine the virgin.

KELLS is also the name of a village in the county of Kilkenny, 64 miles from Dublin, situated on Kings river; and was noted for a priory of Augustine, built and richly endowed by Geoffrey Fitzroberts, who came into this kingdom with Strongbow. The prior of this place had the title of lord spiritual, and as such sat in the house of peers before the Reformation; the ruins only of this abbey now remain: a synod was held in it anno 1152, when John Paper, legate from Rome, made one of the number of bishops that were convened there at that time to settle the affairs of the church.

There is a third place of the above name, situated in the county of Antrim and province of Ulster, 89 miles from Dublin.

KELLY, HUGH, an author of considerable repute,
KEL [ 437 ] KEL

Kelly, was born on the banks of Killarney lake in Ireland in 1739. His father, a gentleman of good family, having reduced his fortune by a series of unforeseen misfortunes, was obliged to repair to Dublin that he might endeavour to support himself by his personal industry. A tolerable school education was all he could afford to his son; who was bound an apprentice to a staymaker, and served the whole of his time with diligence and fidelity. At the expiration of his indentures, he set out for London to procure a livelihood by his business; where he encountered all the difficulties a person poor and without friends could be subject to on his first arrival in town. Happening, however, to become acquainted with an attorney, he was employed by him in copying and transcribing; an occupation which he prosecuted with so much assiduity, that he is said to have earned about three guineas a week, an income which, compared to his former gains, might be deemed affluent. Tired, however, of this drudgery, he soon after, about 1762, commenced author, and was intrusted with the management of the Lady's Magazine, the Court Magazine, the Public Ledger, the Royal Chronicle, Owen's Weekly Post, and some other periodical publications, in which he wrote many original essays and pieces of poetry, which extended his reputation, and procured the means of subsistence for himself, his wife to whom he was then lately married, and a growing family. For several years after this period, he continued writing upon a variety of subjects, as the accidents of the times chanced to call for the assistance of his pen; and as during this period politics were the chief objects of public attention, he employed himself in composing many pamphlets on the important questions then agitated, the greater part of which are now buried in oblivion. Among these, however, was a Vindication of Mr Pitt's Administration, which Lord Chesterfield makes honourable mention of in the second volume of his letters. In 1767, the Babler appeared in two pocket volumes, which had at first been inserted in Owen's Weekly Chronicle in single papers; as did the Memoirs of a Magdalen, under the title of Louisa Mildmay. About 1767 he was tempted by the success of Churchill's Roscian to write some strictures on the performers of both theatres, in two pamphlets, entitled Thepiz, which gave great offence to some of the principal persons at each house. The talents for satire, which he displayed in this work, recommended him to the notice of Mr Garrick, who in the next year caused his first play of False Delicacy to be acted at Drury Lane. It was received with great applause; and from this time he continued to write for the stage with profit and success, until the last period of his life. As his reputation increased, he began to turn his thoughts to some mode of supporting his family less precarious than by writing, and for that purpose entered himself a member of the Middle Temple. After the regular steps had been taken, he was called to the bar in 1774, and his proficiency in the study of the law afforded promising hopes that he might make a distinguished figure in that profession. His sedentary course of life had, however, by this time injured his health, and subjected him to much affliction. Early in 1777 an abscess formed in his side, which after a few days illness put a period to his life.

He was the author of six plays besides that above mentioned.

KELP, a term which is used in Britain to signify the saline substance obtained by burning sea-weed, which is chiefly employed in the manufacture of green-glass. Different species of sea-weed, belonging to the genus Fucus, and order Algæ, are cultivated for this purpose. These plants are thrown on the rocks and shores in great abundance, and in the summer months are raked together and dried as hay in the sun and wind, and after burnt to the ashes called kelp. The process of making it is thus: The rocks, which are dry at low water, are the beds of great quantities of sea-weed; which is cut, carried to the beach, and dried: a hollow is dug in the ground three or four feet wide; round its margin are laid a row of stones, on which the sea-weed is placed, and set on fire within, and quantities of this fuel being continually heaped upon the circle, there is in the centre a perpetual flame, from which a liquid like melted metal drops into the hollow beneath; when it is full, as it commonly is ere the close of day, all heterogeneous matter being removed, the kelp is wrought with iron rakes, and brought to an uniform consistence in a state of fusion. When cool, it consolidates into a heavy dark-coloured alkaline substance, which undergoes in the glass-houses a second vitrification, and when pure assumes a perfect transparency. See Soda, Chemistry Index.

KELSO, a town of Roxburghshire in Scotland, pleasantly situated on the river Tweed, in W. Bong. x. 20. N. Lat. 55. 38. Of this town Mr Pennant gives the following description. It is built much after the manner of a Flemish town, with a square and town-house. The population in 1811 amounted to 3630. Kelso has a very considerable market, and great quantities of corn are sold here weekly by sample. The abbey of Tyronensians was a vast pile, and, to judge by the remains, of venerable magnificence. The walls are ornamented with false round arches, intersecting each other. Such intersections form a true Gothic arch: and may as probably have given rise to that mode as the arched shades of avenues. The steeple of the church is a vast tower. This house was founded by David I. when earl of Cumberland. He first placed it at Selkirk, then removed it to Roxburgh, and finally, when he came to the crown, fixed it here in 1128. Its revenues were in money about 2000l. Scots a-year. The abbot was allowed to wear a mitre and pontifical robes; to be exempt from episcopal jurisdiction, and permitted to be present at all general councils. The environs of Kelso are very fine: the lands consist of gentle risings, enclosed with hedges, and extremely fertile. They have much reason to boast of their prospects. From the Chalkhead is a fine view of the forks of the rivers, Roxburgh hill, Sir John Douglas's neat seat, and at a distance Plecrus; and from Pinnacle hill is seen a vast extent of country, highly cultivated, watered with long reaches of the Tweed, well wooded on each margin. These borders ventured on cultivation much earlier than those on the west and east, and have made great progress in every species of rural economy. Turnips and cabbages for the use of cattle cover many large tracts; and potatoes appear in vast fields. Much wheat is raised in the-
the neighbourhood, part of which is sent up the frith of Forth, and part into England. The fleeces here are very fine. The wool is sent into Yorkshire, to Linlithgow, or into Aberdeenshire, for the stocking manufacture; and some is woven here into a cloth called plaine, and sold into England to be dressed. Here is also a considerable manufacture of white leather, chiefly to supply the capital of Scotland. A fine stone bridge of six arches over the Tweed, near its confluence with the Teviot, was in 1798 carried away by a flood. It has since been rebuilt.

KEMPIS, THOMAS, a pious and learned regular canon, was born at the village of Kemp, in the diocese of Cologne, in 1380; and took his name from that village. He performed his studies at Deventer, in the community of poor scholars established by Gerard Groot; and there made great progress in the sciences. In 1399 he entered the monastery of the regular canons of Mount St Agnes, near Swol, of which his brother was prior. Thomas à Kempis there distinguished himself by his eminent piety, his respect for his superiors, his charity to his brother canons, and his continual application to labour and prayer. He died in 1471, aged 90. The best editions of his works, which consist of sermons, spiritual treatises, and lives of holy men, are those of Paris in 1649, and of Antwerp in 1607. The famous and well-known book De Imitatione Christi; which has been translated into almost all the languages of the world, though it has almost always been numbered among the works of Thomas à Kempis, is also found printed under the name of Gerard; and on the credit of some MSS. has been since ascribed to the abbot Gerard of the order of St Benedict. This has occasioned a violent dispute between the canons of St Augustine, and the Benedictines: but while devout Christians find spiritual comfort in the work, the name of the writer is of small importance.

KEMPTEN, a town of Germany, in Lower Swabia, and in Algow, and also in the territory of the abbey of Kempen, who was a prince of the empire. It belongs now to Bavaria. The inhabitants are Protestants, and amount to 5300. It is seated on the river Iller. E. Long. 10. 33. N. Lat. 47. 47.

KEMPTEN, a territory in the circle of Swabia, in Germany, between the bishopric of Augsburg and the county of Walburg. It is about 17 miles long and broad; and has no considerable place but the towns of Kempen and Kauffbeuren, which are imperial.

KEN, THOMAS, an eminent English bishop in the 17th century, was bred at Winchester school, whence he went to Oxford; and in 1669 was made a prebend of Winchester. In 1675, the year of the Jubilee, he travelled to Rome; and used to say, He had reason to give God thanks for his travels, having returned more confirmed of the purity of the reformed religion than he was before. He was appointed by King Charles IL to attend the lord Dartmouth at the demolishing of Tangier; and at his return was made chaplain to his majesty, as he was some time after to the princess of Orange, then residing in Holland. In 1685 he was consecrated bishop of Bath and Wells. The month following he attended King Charles II. at his death; and gave close attendance at the royal bed for three whole days and nights, watching proper intervals to suggest pious and proper thoughts on that serious occasion. In the following reign he zealously opposed the progress of Popery; and in June 1688, he, with five other bishops, and the archbishop of Canterbury, was committed prisoner to the Tower of London, for subscribing a petition to his majesty against the declaration of indulgence. Upon the revolution, however, he refused to take the oaths to King William and Queen Mary, on which account he was deprived of his bishopric. Her majesty Queen Anne bestowed on him a yearly pension of 200l. to his death in 1712. He published several pious books. His charity was so great, that when he was bishop of Bath and Wells, having received a fine of 400l. he gave a great part of it to the French Protestants.

KENDAL, a town of Westmoreland, seated in a valley among hills, on the west side of the river Can or Ken, over which there are two stone bridges, and one of wood which leads to the castle now in ruins. It is a large handsome place; and has two long streets, which cross each other. The inmates have driven a trade with the cotton and woollen manufactory throughout England ever since the reign of Edw. III. and particular laws were enacted for regulating Kendal cloths as early as Richard II. and Henry IV. It is of note also for the manufactory of cottons, druggists, serges, hats, worsted and yarn stockings, &c. Queen Elizabeth incorporated it with aldermen and burgesses; and King James I. with a mayor, recorder, town-clerk, 37 aldermen, 24 burgesses or common-council-men, and 2 attorneys. There are seven companies here who have each their hall, viz. mercers, shearmen, cordwainers, Glover's, tanners, tailors, and pewterers. Here is an elegant town-hall; and there is a court of conscience, which was granted by George III. for debts under 40s. It has a large beautiful church, which stands on the other side of the brook called Blindbeck, out of the liberty of the town; a large, neat, and handsome building, 180 feet long, and 99 broad, with five aisles, each parted by a row of eight pillars, and a strong square steeple. Near it is Abbot's hall, the residence of the abbot when this church belonged to an abbey dissolved by Henry VIII. In 1755, a new chapel was erected in the middle of the town, besides which there are twelve chapels of ease belonging to it. The Dissenters and Quakers have meeting-houses. The free grammar-school is well endowed; and also a charity school for 10 boys and 16 girls, who are all clothed as well as taught. Eastward of the town, on the opposite side of the river, on a hill, from whence is a fine prospect, stand the ruins of a castle, wherein was born Catherine Parr, the sixth wife of Henry VIII. By means of inland navigation, it has communication with the rivers Mersey, Dee, Ribble, Ouse, Trent, Darwent, Severn, Humber, Thames, Avon, &c.; which navigation, including its windings, extends above 500 miles in the counties of Lincoln, Nottingham, York, Lancaster, Chester, Stafford, Warwick, Leicester, Oxford, Worcester, &c. Here are kept the sessions of the peace for this part of the county called the barony of Kendal; and there is a very great market on Saturday, with all kinds of provisions and woollen yarn, which the girls bring hither.
Ken in large bundles. It has fairs on May 6, and Nov. 8. The river here, which runs half through the town in a stony channel, abounds with trout and salmon; and on the banks of it live the dyers and tanners. In 1811 the population amounted to 7,505. Kendal is 236 miles N. W. from London, and in W. Long. 2d. 49. N. Lat. 54. 21.

KENNEL, a term used indifferently for a puddle, a water course in the streets, a house for a pack of hounds, and the pack or cry of hounds themselves.

Mr Beckford, in his Essay on Hunting, is very particular in describing a kennel for hounds; and a kennel he thinks indispensably necessary for keeping those animals in proper health and order. "It is true (says he) hounds may be kept in barns and stables; but those who keep them in such places can best inform you whether their bounds are capable of answering the purposes for which they are designed. The sense of smelling is so exquisite in a hound, that I cannot but suppose that every stench is hurtful to it. Cleanliness is not only absolutely necessary to the nose of the bound, but also to the preservation of his health. Dogs are naturally cleanly; and seldom, if they can help it, dung where they lie. Air and fresh straw are necessary to keep them healthy. They are subject to the mange; a disorder to which poverty and nastiness will very much contribute. The kennel should be situated on an eminence; its front ought to be to the east, and the courts round ought to be wide and airy to admit the sunbeams at any time of the day. It is proper that they should be neat without and clean within; and it is proper to have the master's house, for obvious reasons. It ought to be made large enough at first, as any addition to it afterwards may spoil it in appearance at least." Two kennels, however, in our author's opinion, are absolutely necessary to the wellbeing of hounds: "When there is but one (says he), it is seldom sweet; and when cleaned out, the hounds, particularly in winter, suffer both while it is cleaning, and afterwards as long as it remains wet."

When the feeder first comes to the kennel in the morning, he should first let the hounds into the outer court; and bad weather, should open the door of the hunting kennel (that in which the bounds designed to hunt next day are kept), lest want of rest should incline them to go into it. The lodging room should then be cleaned out, the doors and windows of it opened, the litter shaken up, and the kennel made sweet and clean before the hounds return to it again.—The floor of each lodging room should be bricked, and sloped on both sides to run to the centre, with a gutter left to carry off the water, that when they are washed they may soon be dry. If water should remain through any fault in the floor, it must be carefully mopped up; for dampness are always very prejudicial.

The kennel ought to have three doors; two in the front and one in the back; the last to have a lattice window in it with a wooden shutter, which is constantly to be kept closed when the hounds are in, except in summer, when it should be left open all the day.

At the back of Mr Beckford's kennel is a house thatched and forced up on the sides, big enough to contain at least a load of straw. Here should be a pit ready to receive the dung, and a gallows for the flesh. The gallows should have a thatched roof, and a circular board at the posts to prevent vermin from climbing up. He advises to enclose a piece of ground adjoining to the kennel for such dogs horses as may be brought alive; it being sometimes dangerous to turn them out where other horses go, on account of the disorders with which they may be infected. In some kennels a stove is made use of; but where the feeder is a good one, Mr Beckford thinks that a mop properly used will render the stove unnecessary. "I have a little hay rick (says he) in the grass yard, which I think is of use to keep the hounds clean and fine in their coats. You will frequently find them rubbing themselves against it. The shade of it is also useful to them in summer. If ticks at any time be troublesome in your kennel, let the walls of it be well washed; if that should not destroy them, the walls must then be white washed."

Besides the directions already given concerning the situation of the kennel, our author recommends it to have a stream of water in its neighbourhood, or even running through it if possible. There should also be moveable stages on wheels for the hounds to lie on. The soil ought at all events to be dry.

To KENNEL, a term applied by fox-hunters to a fox when he lies in his hole.

KENNET, DR WHITE, a learned English writer and bishop of Peterborough, in the 18th century, bred at St Edmund Hall, Oxford, where he soon distinguished himself by his vigorous application to his studies, and by his translations of several books into English, and other pieces which he published. In 1695 our author published his Parochial Antiquities. A sermon preached by him on the 30th of January 1703 at Aldgate exposed him to great clamour. It was printed under the title of A compassionate inquiry into the causes of the civil war. In 1706, he published his Case of Improprations, and two other tracts on the same subject. In 1706, he published the third volume of The Complete History of England (the two former volumes compiled by Mr Hughes). In 1709, he published A Vindication of the Church and Clergy of England from some late reproaches rudely and unjustly cast upon them; and A true Account of Dr Sacheverell's Sermon. When the great point in Dr Sacheverell's trial, the change of the ministry, was gained, and very strong addresses were made upon it, there was to be an artful address from the bishop and clergy of London, and they who would not subscribe it were to be represented as enemies to the queen and the ministry. Dr Kenne fell under this imputation. He was exposed to great odium as a low churchman, on account of his conduct and writings. When he was dean of Peterborough, a very uncommon method was taken to expose him by Dr Walton, rector of the church of Whitechapel: for in the altar-piece of that church, which was intended for a representation of Christ and his 12 apostles eating the passover and last supper, Judas the traitor was drawn sitting in an elbow-chair, dressed in a black garment, with a great deal of the air of Dr Kenne's face. It was generally said that the original sketch was for a bishop under Dr Walton's displeasure; but the painter being apprehensive of an action of Scandalum Magnatum, leave was given to drop the bishop, and make the dean. This giving general offence, upon the complaint of others (for Dr Kenne never saw it, or seemed to regard it), the bishop
Kennett, of London, ordered the picture to be taken down. In 1713, he presented the Society for Propagating the Gospel with a great number of books suitable to their design; published his Bibliotheca Americana, in 1714; and founded an antiquarian and historical library at Peterborough. In 1715, he published a sermon entitled, *The Witchcraft of the present Rebellion*, and afterwards several other pieces. In 1717 he was engaged in a dispute with Dr William Nicholson, bishop of Carlisle, relating to some alterations in the bishop of Bangor’s famous sermon; and disliked the proceedings of the convocation against that bishop. Upon the death of Dr Cumberland, bishop of Peterborough, he was promoted to that see, to which he was consecrated in 1718. He sat in that office ten years, and died in 1728. He was an excellent philologist, a good preacher, whether in English or Latin, and well versed in the histories and antiquities of our nation.

Kennett, Basil, a learned English writer, and brother to the preceding, was educated in Corpus Christi college, in the university of Oxford, where he became fellow. In 1706, he went over to the English college at Leghorn; where he met with great opposition from the Papists, and was in danger from the inquisition. He died in the year 1714. He published Lives of the Greek poets; the Roman Antiquities; a volume of Sermons preached at Leghorn: A translation into English of Puffendorf’s Treatise of the Law of Nature and Nations. He was a man of most exemplary integrity, generosity, piety, and modesty.

Kennicott, Dr Benjamin, well known in the learned world for his elaborate edition of the Hebrew Bible and other valuable publications, was born at Totnes in Devonshire in the year 1718. His father was the parish clerk of Totnes, and once master of a charity school in that town. At an early age young Kennicott succeeded to the same employ in the school, being recommended to it by his remarkable sobriety and premature knowledge. It was in that situation he wrote the verses on the recovery of the honourable Mrs Courtney from a dangerous illness, which recommended him to her notice, and that of many neighbouring gentlemen. They, with laudable generosity, opened a subscription to send him to Oxford. In judging of this performance, they may be supposed to have considered not so much its intrinsic merit, as the circumstances under which it was produced. For though it might claim just praise as the fruit of youthful industry struggling with obscurity and indigence, as a poem it never rises above mediocrity, and generally sinks below it. But in whatever light these verses were considered, the publication of them was soon followed by such contributions as procured for the author the advantages of an academical education. In the year 1744 he entered at Wadham college, and it was not long before he distinguished himself in that particular branch of study in which he afterwards became so eminent. His two dissertations on the Tree of Life, and the Oblations of Cain and Abel, came to a second edition so early as the year 1747, and procured him the singular honour of bachelor’s degree conferred on him gratis by the university a year before the statutable time. The dissertations were grateful dedicated to those benefactors whose liberality had opened his way to the university, or whose kindness had made it a scene not only of many labour, but of honourable friendship. With such merit, and such support, he was a successful candidate for a fellowship of Exeter college, and soon after his admission into that society, he distinguished himself by the publication of several occasional sermons. In the year 1753 he laid the foundation of that stupendous monument of learned industry, by which the wise and the good will gaze with admiration, when prejudice, and envy, and ingratitude shall be dumb. This he did by publishing his first dissertation, On the State of the printed Hebrew text, in which he proposed to overthrow the then prevailing notion of its absolute integrity. The first blow indeed, had been struck long before, by Capellus, in his Crítica Sacra, published after his death by his son, in 1650—a blow which Buxtorff, with all his abilities and dialectical skill, was unable to ward off. But Capellus having no opportunity of consulting MSS. though his arguments were supported by the authority of the Samaritan Pentateuch, of parallel passages, and of the ancient versions, could never absolutely prove his point. Indeed the general opinion was that the Hebrew MSS. contained none, or at least very few and trifling variations from the printed text: and with respect to the Samaritan Pentateuch very different opinions were entertained. Those who held the Hebrew verity, of course condemned the Samaritan as corrupt in every place where it deviated from the Hebrew; and those who believed the Hebrew to be incorrect, did not think the Samaritan of sufficient authority to correct it. Besides the Samaritan itself appeared to very great advantage; for no Samaritan MSS. were then known, and the Pentateuch itself was condemned for those errors which ought rather to have been ascribed to the incorrectness of the editions. In this dissertation, therefore, Dr Kennicott proved that there were many Hebrew MSS. extant, which, though they had hitherto been generally supposed to agree with each other, and with the Hebrew text, yet contained many and important various readings; and that from those various readings considerable authority was derived in support of the ancient versions. He announced the existence of six Samaritan MSS. in Oxford only, by which many errors in the printed Samaritan might be removed; and he attempted to prove, that even from the Samaritan, as it was already printed, many passages in the Hebrew might undoubtedly be corrected. This work, as it was reasonable to expect, was examined with great severity both at home and abroad. In some foreign universities the belief of the Hebrew verity, on its being attacked by Capellus, had been insisted on as an article of faith.—*Ista Capellis sententia adeo non approbata fuit sibi sociis, ut putavit Helvetii theologii, et specialium Genevenses, anno 1678, persecutionem nocentem, ne quis in dialeco suo minister ecclésiae recipiatur, nisi fatiscur publici, textum Hebraeum, ut hodie est in exemplaribus Manesici, quod consonant et vocales, divinitum et authenticum esse, (Wolfii Biblioth. Heb. tom. ii. p. 27).* And at home this doctrine of the corrupt state of the Hebrew text was opposed by Comings and Bate, two Hutchinsonians, with as much violence as if the whole truth of revelation were at stake.

The next three or four years of Dr Kennicott’s life were principally spent in searching out and examining Hebrew
time of his death he was employed in printing Remarks on Select Passages in the Old Testament; which were afterwards published, the volume having been comple-
ted from his papers.

KEN. See KINO.

KENDICK, WILLIAM, an author of considerable abilities, was the son of a citizen of London, and brought up, it is said, to a mechanical employment. This, however, he seems early to have abandoned; and to have devoted his talents to the cultivation of letters, by which he supported himself during the rest of his life which might be said to have passed in a state of warms, as he was seldom without an enemy to attack or to de-

fend himself from. He was for some time student at Leyden, where he acquired the title of J. U. D. Not long after his return to England, he figured away as a poet in Epistles Philosophical and Moral, 1759, ad-
dressed to Lorenzo; an avowed defence of infidelity, written whilst under confinement for debt, and with a declaration that he was "much less ambitious of the character of a poet than of a philosopher." From this period he became a writer by profession; and the Pro-
teus shapes under which he appeared, it would be a fruitless attempt to trace. He was for a considerable time a writer in the Monthly Review; but quarrelling with his principal, began a new review of his own. When our great lexicographer's edition of Shakespeare first appeared in 1765, it was followed in a fortnight by a pamphlet, entitled, "A Review of Dr Johnson's new Edition of Shakespeare, in which the ignorance or in-
attention of that editor is exposed, and the poet defend-
ed from the persecution of his commentators, 1765." This pamphlet was followed by an examination of it, and that by a Defence in 1766; in which year he pro-
duced his pleasant comedy of Falstaff's Wedding, at first intended to have been given to the public as an original play of Shakespeare retrieved from obscurity, and is, it must be acknowledged, a happy imitation of our great dramatic bard. With the celebrated English Roscius Dr Kenrick was at one time on terms of the strictest intimacy; but took occasion to quarrel with him in print, in a mode too unmanly to be mentioned. In politics also he made himself not a little conspicuous; particularly in the dispute between his friends Wilkes and Horne. He was the original editor of The Morning Chronicle; whence being ousted for neglect, he set up a new one in opposition. He translated in a very able manner the Emilius and the Eloisa of Rousseau; the Elements of the History of England, by Milot (to injure, if possible, a translation of the same work by Mrs Brooke); and produced several dramatic performances, together with an infinite variety of publications both original and translated. To him also the public are indebted for the collection (imper-
fect as it is) of the Poetical works of Robert Lloyd, M. A. 1774, 2 vols 8vo. Dr Kenrick, died June 9.

1777.

KENSINGTON, a village of Middlesex, on the western road from London, near two miles from Hyde-
Park Corner. It is extremely populous; and besides the palace, now neglected, contains many gentle-
houses and several boarding schools. The palace, which was the seat of the lord chancellor Finch, af-

K.

ferwards earl of Nottingham, was purchased by King William; who greatly improved it, and caused a royal
K E N

road to be made to it, through St James's and Hyde Parks, with lamp posts erected at equal distances on each side. Queen Mary enlarged the gardens. Her sister Queen Anne improved what Mary had begun; and was placed in the house, that she frequently retired during the summer in the greenhouse, which is a very beautiful one; but Queen Caroline completed the design by extending the gardens from the great road in Kensington to Acton; by bringing what is called the Serpentine river into them; and by taking in some acres out of Hyde Park, on which she caused a mount to be erected, with a chair on it that could be easily turned round for shelter from the wind, since decayed. This mount is planted with evergreens, and commands a fine view over the noble gardens, and the country south and west. They were originally designed by Kent, and were afterwards much improved by Brown; and though they contain no striking beauties, which their flat situation will not admit, yet they have many pleasing parts, and afford much delight to the inhabitants of London, particularly to those whose professions will not allow of frequent excursions to more distant places. These gardens, which are three miles and a half in compass, are kept in great order. The palace indeed has none of that grandeur which ought to appear in the residence of a British monarch; but the royal apartments are noble, and some of the pictures good. It was at this place King William, Prince George of Denmark, Queen Anne, and King George II. died. The old church was pulled down in 1699, and a much finer one built in its room. Part of this village, from the palace gate to the Bell, is in the parish of St Margaret's, Westminster. The population of Kensington in 1811 was estimated at 10,886.

KENT, one of the counties of England, situated at the south-east corner of the island, and from thence enjoying many advantages. The capacious estuary of the Thames washes its northern parts, as the sea does the south-east; whence some with so great impropriety have styled it a peninsula. In point of extent, this is the fifth shire in South Britain, little less in its dimensions than the province of Holland; larger in size than the duchy of Juliers in Germany; and almost exactly equal to that of Modena in Italy. Kent is, with great appearance of truth, supposed to be so styled from the ancient British word kent, signifying a corner, or, when applied to a country, a head-land. It is certain, that the Romans bestowed the name of Cantium on the province, and on its most conspicuous promontory the North Foreland; and from the district they inhabited, the people were called Cantii; which has prevailed to our times, when Kent, and the men of Kent, are the common appellatives. It is however probable, that these Cantii were not the original inhabitants, but a later colony from the opposite continent, established here, like the Belgae, not long before the Roman invasion. At the time of Caesar's coming, this spacious and fertile region was divided into four principalities, or, as they are, according to the manners of those days, commonly called kingdoms. It was his observation of these people, that they were particularly distinguished by their civility and politeness; a character which their descendants have preserved. When that wise people became ma-

sters of the southern parts of the island, this province received the most conspicuous marks of their attention, as appears from the stations which they so prudently established, while their government flourished in its full vigour. The care they took of the ports on the sea coast as soon as it came to be in danger, and the several fortresses which they erected for the defence of their subjects against the sudden attempts of barbarous invaders, are evidences of the same kind. These forts, so prudently disposed, and so well secured, were under the direction of a particular great officer, called Littoris Saxonicë Comes, i.e. the count of the Saxon shore; which office seems to have been preserved by the British monarchs who governed here, after the Romans quitted the isle. The Saxon kings of Kent discharged this trust in their legal capacity, from the middle of the fifth to the beginning of the ninth century. Under the northern princes, this post was again revived, though with a change of title, in the Lord Warden of the Cinque Ports. Indeed, under all governments, the people of Kent have been especially considered; as appears from their claim to the post of honour in our land armies, and the privileges granted to their havens, in consideration of their undertaking the defence of our channel.

As to the climate of this county, it varies according to the situation of places. In the low flat lands, and especially in the marshes, the air is heavy, moist, and unhealthy; and yet not to such a degree as it has been sometimes represented; for, with a little care and caution, strangers, as well as natives, quickly reconcile their constitutions to the temperature peculiar by these parts, and live in them without much inconveniency or apparent danger. But, in reference to the rest of the county, the air is as thin, pure, and wholesome, as in any part of Britain. There is no region more happily or more beautifully diversified in regard to soil, so that every kind thereof is, somewhere or other, to be met within its bounds; and in no shire are any of these soils more fertile than they are in this. The Weald yields variety of fine timber, particularly of chestnut; the middle part has very rich arable land, annually bearing every species of grain in immense plenty, and these excellent in their several sorts. There are also many beautiful orchards, which produce a variety of fine fruits, and more especially apples and cherries, which were introduced here from Flanders by one Richard Harris, who was the king's fruiterer, in the reign of Henry VIII. The flat country is renowned for its meadows; and Romney marsh has hardly its equal. We may from this concise description very easily collect, that the natural products of Kent are numerous, and of great value. In the bowels of the earth they find, in several places, a rough hard serviceable stone for paving, which turns to some advantage; but not so much as their exquisite fuller's earth, rich malth, and fine chalk, which are there in abundance. If we except iron ore, indeed they have no mines; but there are prodigious heaps of copper stones thrown on the coast. The isle of Sheppey, and all the adjacent shore as far as Reculver, is justly famous for its wheat. Thanet is in no less credit for its barley, or rather was so; for now it produces, through the painful industry and skilful husbandry of its inhabitants, copious crops of good wheat as well as barley.
Horses, black cattle, and sheep, they have in great numbers, and remarkable in point of size; and hop grounds in all parts of the county, which turn to very considerable account. To which we may add weld, or as some call it dyers weed, which is a very profitable commodity, and of which there grows much in the neighbourhood of Canterbury; also madder, which, or has been, occasionally cultivated. The rivers and sea coasts abound with fish of different kinds. The excellency of its oysters on the eastern shores is celebrated by the Roman poets. Those of Faversham and Milton are not only in great esteem at the London market, but are likewise seat in great quantities to Holland.

The many rich commodities produced in this country, is the reason why most of our writers have represented it as in a manner void of manufactures; which, however, as appears upon a strict and impartial examination, is very far from being the case. Of iron works there were anciently many; and there are still some, where kettles, bombs, bullets, cannon, and such like, are made. At Deptford, Sir Nicholas Crisp had in his lifetime a very famous copperas work; as, indeed, there that ingenious gentleman, one of the greatest improvers and one of the most public spirited persons this nation ever bred, introduced several other inventions. Copperas was also formerly made, together with brimstone, in the Isle of Sheppey. But the original and for many ages the principal manufacture of this county was broad cloth of different colours, established chiefly at Cranbrook by King Edward III, who brought over Flemings to improve and perfect (the trade being introduced long before) his subjects in that important art. At this and other places it flourished so much, that even at the close of Queen Elizabeth's reign, and according to some accounts much later, the best for home consumption, and the largest quantities for exportation, were wrought here; many fulling mills being erected upon almost every river, and the greatest plenty of excellent fuller's earth affording them singular assistance; insomuch that it is still a tradition, that the yeomanry of this county, for which it has been ever famous, were mostly the descendants of rich clothiers, who laid out the money acquired by their industry in the purchase of lands, which they transmitted, with their fees and independent spirit, to their posterity. The duke of Alva's persecution of the Protestants in the Low Countries drove a multitude of Walloons over hither, who brought with them that ingenuity and application for which they had been always distinguished. These diligent and active people settled a manufactory of flannel or baize at Sandwich. By them the silk looms were set up at Canterbury, where they still subsist; and they also introduced the making of silk thread at Maidstone, where yet it remains, and merits more notice and encouragement than hitherto it has met with.

Upon the river Dart, at the confluence of which with the Thames stands the town of Dartford, was set up, in the reign of Queen Elizabeth, the first mill for making white paper by Mr John Spilman, a German, upon whom, long after, King James conferred the honour of knighthood; but King Charles more sensibly bestowed upon this Sir John Spilman a patent and a pension of 300l. a-year, as a reward of his invention, and for the support of the manufacture. About the year 1592, Godfrey Box, a German, erected upon the same river the first slitting mill which was ever used for making iron wire; and also the first battery mill for making copper plates. Other new inventions, requiring the assistance of water, have been set up on other streams; and a great variety of machines of this sort still subsist in different parts of this county. But these things are now so common, that it would be both tedious and useless to insist upon them. Amongst these, we may reckon the making gunpowder in several places. That manufacture, however, which is now the glory of this county, and indeed of Britain, is ship-building; more especially at the royal yards; as at Woolwich, which was settled by Henry VIII, and some considerable ships built there. At present, there is not only a most complete establishment for the building and equipping of men of war, a rope walk, foundery, and magazines; but also many private docks, in which prodigious business is carried on, and multitudes of people are employed. The population of this county in 1811 was more than 372,000.

The Goodwin or Godwin Sands, of which the account and the reference were omitted under the word, are remarkable sand banks off the coast of the Downs, situated between the North and South Foreland. As they run parallel with the coast for nine miles together, about seven miles and a half from it, they give security to that extensive coast, the Downs; for while the land shelters ships with the wind from south-west to north-west only, the force of the sea is broken by these sands when the wind is at east-south-east. The most dangerous wind when blowing hard in the Downs, is the south-south-west. The space they occupy was formerly a large tract of low ground, belonging to Godwyn earl of Kent, father of Harold II; and being afterwards enjoyed by the monastery of St Augustine at Canterbury, the whole tract was drowned by the abbot's neglect to repair the wall which defended it from the sea. This happened in the year 1100. Many vessels have been wrecked upon them. See Kent, Supplement.

KENTIGERN, St., or St Mungo, a famous saint of the Papsish church, who flourished in Scotland in the sixth century, said to have been of the royal blood of both Scots and Picts, being the son of Thimister, the daughter of Lath king of the Picts, by Eugene II, king of Scotland. The bishops of Glasgow and St Asaph were founded by him in 560. He obtained the appellation of Mungo from the affection of his tofer St Serf or Seranus, bishop of Orkney, who called him Mongob, which in the Norwegian language, signifies dear friend.

KENTISH TOWN, a village of Middlesex, three miles north of London, near Hampstead, much improved of late by several handsome houses belonging to the citizens of London, &c. A new chapel has lately been erected here.

KENTUCKY, one of the states of North America, situated on the west side of the Alleghany mountains, and formerly attached to Virginia. It is situated between 36° 30' and 39° 10' north latitude, and 82° and 89° west longitude; being 330 miles in length, and 180 in breadth. It is bounded northwest by the river Ohio; west, by the Mississippi river; south, by Tennessee; east, by Virginia.
The river Ohio washes the north-western side of Kentucky, in its whole extent. Its principal branches which water this fertile tract of country, are Sandy, Licking, Kentucky, Salt, Green, and Cumberland rivers. These again branch, in various directions, into rivulets of different magnitudes, fertilizing the country in all its parts.—There are five noted salt springs or licks in this country, viz. the higher and lower Blue Springs on Licking river, from some of which, it is said, issue streams of brinish water; the Big Bone lick, Drennon's licks, and Bullet's lick at Saltsburg. The last of these licks, though in low order, has supplied this county and Cumberland with salt at twenty shillings the bushel, Virginia currency; and some is exported to the Illinois country. The method of procuring water from these wells is by sinking wells from 30 to 40 feet deep. The water drawn from these wells is more strongly impregnated with salt than the water from the sea.

This whole country, as far as has yet been discovered, lies upon a bed of limestone, which in general is about six feet below the surface, except in the valleys, where the soil is much thinner. A tract of about 20 miles wide along the banks of the Ohio is hilly broken land, interspersed with many fertile spots. The rest of the country is agreeably uneven, gently ascending and descending at no great distances. This country in general is well timbered; and such is the variety and beauty of the flowering shrubs and plants which grow spontaneously in it, that in the proper season the wilderness appears in blossom. The accounts of the fertility of the soil in this country have in some instances exceeded belief, and probably have been exaggerated. That some parts of Kentucky, particularly the high grounds, are remarkably good, all accounts agree. The lands of the first rate are too rich for wheat, and will produce 50 and 65, and in some instances it is affirmed 100 bushels of good corn an acre. In common the land will produce 30 bushels of wheat or rye an acre. Barley, hemp, and flax are grown very successfully, and all kinds common in this climate, yield abundantly. The old Virginia planters say, that if the climate does not prove too moist, few soils known will yield more and better tobacco. The climate is healthy and delightful, some few places in the neighbourhood of ponds and low grounds excepted. The inhabitants do not experience the extremes of heat and cold. Snow seldom falls deep or lies long. The winter, which begins about Christmas, is never longer than three months, and is commonly but two, and is so mild that cattle can subsist without fodder.

As to religion, the prevailing sects are Baptists, Presbyterians, and Methodists. The Baptists are the most numerous. In 1817 they had 421 churches established, besides several congregations where churches were not constituted.

The legislature have made provision for a college in Kentucky, and have endowed it with very considerable landed funds. Schools are established in the several towns, and in general regularly and handsomely supported. In 1810 they had 17 newspapers. They have erected many paper-mills, oil-mills, fulling-mills, saw-mills, and a great number of valuable grist-mills. Their salt works are more than sufficient to supply all the inhabitants at a low price. They make considerable quantities of sugar from the sugar trees.

The population of Kentucky has increased with great rapidity, as appears from the following statement.

This last enumeration includes 80,561 slaves, and 1713 free blacks.

The state government of Kentucky consists of a senate and house of representatives. The latter are chosen annually by the free male inhabitants of 21 years of age, who have been two years resident in the state. The number of representatives is not to exceed 100 or fall below 50. The number of senators may vary from 24 to 38: they are chosen for four years, and renewed by forths yearly. The governor is elected for four years, and is ineligible the next seven.

The Kentuckians, chiefly emigrants from Virginia, are as remarkable for acuteness of intellect, as they are distinguished for their frank, high spirited, honourable nature. They are brave and patriotic in a high degree, and in times of public danger have come forward with a most honourable zeal to serve and defend their country. Slavery, however, has taught the rich to despise labour, and planted the seeds of other vices in their character. The women are frail and industrious, though fond of dancing and innocent amusements. The men have acquired a dangerous attachment to gaming. The Kentuckians are distinguished for expertise in the use of the rifle. They live in a very substantial style, and have a pride in being liberal and open handed.

Some manufactures have been established in this state. In 1815 there were six steam mills in operation at the small town of Washington, two for grain, one for cotton, one for wool, and one for other purposes. At Lexington there is a woollen and cotton manufactory on an extensive scale, employing 150 hands each, and several others of smaller size. The whole amount of manufactures in 1810 was estimated at 6,381,024 dollars.

The first white man who discovered this province was one James Macbride, in the year 1754. From this period it remained unexplored till about the year 1767, when one John Finley and some others, trading with the Indians, fortunately travelled over the fertile region now called Kentucky, then but known to the Indians by the name of the Dark and Bloody Grounds, and sometimes the Middle Ground. This country greatly engaged Mr Finley's attention, and he communicated his discovery to Colonel Daniel Boon, and a few more, who conceiving it to be an interesting object, agreed in the year 1769 to undertake a journey in order to explore it. After a long fatiguing march over a mountainous wilderness, in a westward direction, they at length arrived upon its borders; and from the top of an eminence, with joy and wonder described the beautiful landscape of Kentucky. Here they encamped, and some went to hunt provisions, which were readily procured, there being plenty of game, while Colonel Boon and John Finley made a tour through the country, which
Kentucky, which they found far exceeding their expectations; and returning to camp, informed their companions of their discoveries. But in spite of this promising beginning, this company meeting with nothing but hardships and adversity, grew exceedingly disheartened, and was plundered, dispersed, and killed by the Indians, except Colonel Boon, who continued an inhabitant of the wilderness until the year 1772, when he returned home.

Colonel Henderson of North Carolina being informed of this country by Colonel Boon, he and some other gentlemen held a treaty with the Cherokee Indians at Watauga in March 1775, and then purchased from them the lands lying on the south side of Kentucky river for goods at valuable rates, to the amount of 6000l. specie.

Soon after this purchase, the state of Virginia took the alarm, agreed to pay the money Colonel Donaldson had contracted for, and then disputed Colonel Henderson's right of purchase, as a private gentleman of another state in behalf of himself. However, for his eminent services to the country, and for having been instrumental in making so valuable an acquisition to Virginia, that state was pleased to reward him with a tract of land at the mouth of Green river, to the amount of 200,000 acres: and the state of North Carolina gave him the like quantity in Powell's Valley. This region was formerly claimed by various tribes of Indians, whose title, if they had any, originated in such a manner as to render it doubtful which ought to possess it. Hence this fertile spot became an object of contention, a theatre of war, from which it was properly denominated the Bloody Grounds. Their contentions not being likely to decide the right to any particular tribe, as soon as Mr Henderson and his friends proposed to purchase, the Indians agreed to sell; and notwithstanding the valuable consideration they received, long continued troublesome neighbours to the new settlers.

KEPLER, John, one of the most eminent astronomers who have appeared in any age, was born at Wiel on the 27th of September 1571. His father's name was Henry Kepler, an officer of distinction among the troops of Wintemberg, but reduced to poverty by numerous misfortunes. This exposed young Kepler to many difficulties and interruptions while acquiring the rudiments of his education; but such was his genius, and such his industry for knowledge, that he surmounted every difficulty, and his proficiency was astonishing. He studied at the university of Tübingen, where he obtained the degree of bachelor in the year 1588, and that of master of philosophy in 1591. In the year 1592 he applied himself to the study of divinity; and the sermons he produced were sufficient indications that he would have excelled as a preacher, had he continued in the clerical profession. The mathematics, however, became his favourite study, for his knowledge of which he acquired such distinguished reputation, that he was invited to Grätz in Styria in the year 1594, to fill the mathematical chair in the university of that city. After this period his chief attention was directed to the study of astronomy, and he made many interesting discoveries respecting the laws of planetary motions.

Two years after his marriage with a lady descended from a noble family, persecution on account of his religion compelled him to quit Grätz, to which he was afterwards recalled by the states of Styria. The calamities of war, however, induced him to look for a residence where he might enjoy greater safety and tranquility. During this uncomfortable situation of affairs, the celebrated Tycho Brabé strongly urged him to settle in Bohemia as his assistant, where he himself had every necessary requisite furnished to him by the emperor Rudolph for the prosecution of his astronomical studies. The numerous and urgent letters which Kepler received upon this subject, and solemn assurances that he should be introduced to the emperor, at length prevailed with him to leave the university, and settle in Bohemia with his family in the year 1600. On his way to that country he was seized with a quartan ague, which afflicted him for seven or eight months, and rendered him incapable of contributing that aid to Tycho which he would otherwise have done. He was likewise displeased with the conduct of this astronomer towards him, and thought that he behaved in an unkind manner, by neglecting to do a material service to his family when he had it in his power. Kepler also considered him as by far too reserved, in not communicating to him the whole of his discoveries and improvements. The death of Tycho happened in 1601; and thus the intercourse between these two eminent men, being of such short duration, precluded Kepler either from being very serviceable to, or deriving much advantage from, the investigations and researches of the Danish astronomer. Kepler, however, was introduced to the emperor by Tycho, in conformity to his promise, and appointed mathematician to his imperial majesty, with instructions to complete the Rudolphine Tables which that great man had begun. These were not published till the year 1627, owing to a variety of obstructions and difficulties which were thrown in his way. Two years after the publication of this work, he went to Reisikon, by permission of the emperor, to claim payment of the arrears of his pension, where he was seized with a violent fever, supposed to have been brought upon him by too hard riding; and to this he fell a victim in the month of November 1630, in the 59th year of his age.

The learned world is indebted to this sagacious and able astronomer and mathematician for the discovery of the true figure of the planetary orbs, and the proportions of the motions of the solar system. Like the disciples of Pythagoras and Plato, Kepler was seized with a peculiar passion for finding analogies and harmonies in nature; and although this led him to the adoption of very strange and ridiculous conceits, we shall readily be disposed to overlook these, when we reflect that they were the means of leading him to the most interesting discoveries. He was for some time so charmed with the whimsical notions contained in his Mysterium Cosmographicum, published in 1596, that he declared he would not give up the honour of having invented what was contained in that book for the elector of Saxony;—so easy is it for the greatest of men to be deceived by a darling hypothesis.

He was the first who discovered that astronomers had been invariably mistaken in always ascribing circular orbits and uniform motions to the planets, Kepler each of them to move in an ellipse, having one of its foci at the sun; and, after a variety of fruitless efforts, he, on the 11th of May 1618, made his splendid discovery ** that the squares of the periodic times of the planets were al..."
KER

KERI CETIB, are various readings in the Hebrew Bible; keri signifies that which is read; and cetib that which is written. For where any such various readings occur, the wrong reading is written in the text, and that is called the cetib; and the true reading is written in the margin, with p under it, and called the keri. It is generally said by the Jewish writers, that these corrections were introduced by Ezra; but it is most probable, that they had their original from the mistakes of the transcribers after the time of Ezra, and the observations and corrections of the Massorites. Those Keritibs, which are in the sacred books written by Ezra himself, or which were taken into the canon after his time, could not have been noticed by Ezra himself; and this affords a presumption, that the others are of late date. Those words amount to about 1000; and Dr. Kennicott, in his Dissertatio Generalis, remarks, that all of them, excepting 14, have been found in the text of manuscripts.

KERMAN, the capital city of a province of that name in Persia, seated in E. Long. 56° 30' N. Lat. 50° 0'. The province lies in the south part of Persia, on the Persian gulf. The sheep of this country, towards the latter end of the spring, shed their wool, and become as naked as sucking pigs. The principal revenue of the province consists in these fleeces.

KERMES, in Zoology, the name of an insect produced in the excrences of a species of the oak. See COCCUS.

KERMES MINERAL, so called from its colour, which resembles that of vegetable kermes, is one of the antimonal preparations. See CHEMISTRY and MATERIA MEDICA INDEX.

KER, or Kerne, a term in the ancient Irish militia, signifying a foot soldier. Camden tells us, the armies of Ireland consisted of cavalry, called galloglasses; and infantry, lightly armed, called kernes.—The kernes bore swords and darts; to the last were fitted cords, by which they could recover them after they had been launched out.

KERNES, in our laws, signify idle persons or vagabonds.

KERRY, a county of Ireland, in the province of Munster, anciently called Corripia, or "the rocky country," from Cerrig or Corric, "a rock." It is bounded by the Shannon, which divides it from Clare on the north, by Limerick and Cork on the east, another part of Cork on the south, and by the Atlantic ocean on the west. The best town in it is Dingle, situated in a bay of the same name. It comprehends a great part of the territory formerly called Desmond, and consists of very different kinds of soil. The south parts are plain and fertile, but the north full of high mountains, which, though remarkably wild, produce a great number of natural curiosities. It contains 636,905 Irish plantation acres, 84 parishes, 19,400 houses, and about 140,000 inhabitants. It is about 37 miles long, and from 18 to 40 in breadth, and lies within N. Lat. 51° 30' and 52° 24'. The longitude at the mouth of Kenmare river being 10° 35' west, or 42° 20' difference of time with London. It is the fourth county as to extent in Ireland, and the second in this province; but in respect to inhabitants and culture doth not equal many smaller counties. In it there are two episcopal sees, which have
have been annexed to the bishopric of Limerick since the year 1660, viz. Ardfern and Aghadoe. The see of Ardfert was anciently called the diocese of Kerry, and its bishops were named bishops of Kerry. Few mountains in Ireland can vie with those in this county for height; during the greater part of the year their sides are obscured by fog, and it must be a very serene day when their tops appear. Iron ore is to be had in great plenty in most of the southern baronies. The principal rivers are the Blackwater, Feale, Gale, and Brick, Cashin, Mang, Lee, Flesk, Loun, Carrin, Fartin, Inny, and Roughty; and the principal lake is Killarney. There are some good medicinal waters discovered in this county; particularly Killarney water, Inveragh Spa, Fallow, Dingle, Castlemain, and Tralloe Spas, as also a saline spring at Maherybeg. Some rare and useful plants grow in Kerry, of which Dr. Smith gives a particular account in his history of that county. See Kerry, Supplement.

KERSEY, a kind of coarse woollen cloth, made chiefly in Kent and Devonshire.

KESITAH. This word is to be met with in Genesis and Job, and is translated in the Septuagint and Vulgate "sheep or lambs." But the Rabbins and modern interpreters are generally of opinion, that kesithah signifies rather a piece of money. Bochart and Eugubinus are of opinion the Septuagint meant mines, and not lambs: in Greek θησαυρος, θησαυρον, instead of θησαυροι. Now a mine was worth 60 Hebrew shekels, and consequently 61. 16s. 10d. sterling. M. de Pelletier of Rouen is of opinion, that kesithah was a Persian coin, stamped on one side with an archer (Keseth, or Kesith, in Hebrew signifying "a bow"), and on the other with a lamb; that this was a gold coin known in the east by the name of a daric. Several learned men, without mentioning the value of the kesithah, say it was a silver coin, the impression whereof was a shekel, for which reason the Septuagint and Vulgate translate it by this name. Calmet is of opinion, that kesithah was a purse of gold or silver. In the east they reckon at present by purses. The word κιστα in Chaldee signifies "a measure, a vessel." And Eustathius says, that kistah is a Persian measure. Jonathan and the Targum of Jerusalem translate kesithah "a pearl." (Gen. xxxiii. 19. Job. xliii. 11.) Or g. English, supposing, as Dr. Prideaux does, that a shekel is worth 34. A daric is a piece of gold, worth, as Dr. Prideaux says, 25. English.

KESSEL, a town of Upper Guelderland, in the Netherlands, with a handsome castle. It is the chief town in the territory of the same name, and seated on the river Meuse, between Ruremon and Venlo, it being about five miles from each. It was ceded to the king of Prussia by the treaty of Utrecht. E. Long. 6° 13'. N. Lat. 41° 22'.

KESSELDORF, a village of Germany, in the circle of Upper Saxony, three miles below Dresden, remarkable for the battle gained by the king of Prussia over the Saxons, on the 13th of December 1745.

KESTREL, the English name of a hawk, called also the stannel and the windhoozer, and by authors the tinunculus and cesnereus. It builds with os in hollow oaks, and feeds on partridges and other birds. See Falco, Ornithology Insect.

KESWICK, a town of Cumberland, situated on the side of a lake in a fruitful plain, almost encompassed with mountains, called the Derwent Fells. It was formerly a town of good note, but is now much decayed. However, it is still noted for its mines and miners, who have a convenient smelting-house on the side of the river Derwent, the stream of which is so managed as to make it work the bellows, hammers, and forge, as also to saw boards. There is a workhouse here for employing the poor of this parish and that of Crossthwaite, W. Long. 3°. N. Lat. 54° 30'.

KETCH, a vessel equipped with two masts, viz. the main-mast and mizen-mast, and usually from 100 to 250 tons burden. Ketches are principally used as yachts or as bomb vessels; the former of which are employed to convey princes of the blood, ambassadors, or other great personages, from one part to another; and the latter are used to bombard citadels, towns, or other fortresses. The bomb ketches are therefore furnished with all the apparatus necessary for a vigorous bombardment; they are built remarkably strong, as being fitted with a greater number of riders than any other vessel of war; and indeed this reinforcement is absolutely necessary to sustain the violent shock produced by the discharge of their mortars, which would otherwise in a very short time shatter them to pieces.

KETTLE, in the art of war, a term the Dutch give to a battery of mortars, because it is sunk under ground.

Kettle Drums, are formed of two large basins of copper or brass rounded at the bottom, and covered over with veilum or goat skin, which is kept fast by a circle of iron, and by several holes fastened to the body of the drum, and a like number of screws to screw up and down, and a key for the purpose. The two basins are kept fast together by two straps of leather which go through two rings, and are fastened the one before and the other behind the pomme1 of the kettle drum's saddle. They have each a banner of silk or damask, richly embroidered with the sovereign's arms or with those of the colonel, and are fringed with silver or gold; and, to preserve them in bad weather, they have each a cover of leather. The drumsticks are of crab-tree or of any other hard wood, of eight or nine inches long, with two knobs on the ends, which beat the drum head and cause the sound. The kettle-drum with trumpets is the most martial sound of any. Each regiment of horse has a pair.

Kettle Drummer, a man on horseback appointed to beat the kettle drums, from which he takes his name. He marches always at the head of the squadron, and his post is on the right when the squadron is drawn up.

KEVELS, in Ship-building, a frame composed of two pieces of timber, whose lower ends rest in a sort of step or foot, nailed to the ship's side, from whence the upper ends branch outward into arms or horns, serving to delay the great ropes by which the bottoms of the main-sail and fore-sail are extended.

K.F.W, a village of Surry, in England, opposite to Old Brentford, 10 miles west from London. Here is a chapel the estate erected at the expense of several of the nobility and gentry in the neighborhood, and a portion of ground that was given for that purpose by the late Queen Anne. Here the late Mr. Molineux, secretary
to the late king, when prince of Wales, had a fine seat on the Green, which became the residence of the late prince and princess of Wales, who greatly improved both the house and gardens; now occupied by his present majesty, who has greatly enlarged the gardens, and formed a junction with them and Richmond gardens. The gardens of Kew are not very large, and is their situation by any means advantageous, as it is low and commands no prospects. Originally the ground was one continued dead flat; the soil was in general barren, and without either wood or water. With so many disadvantages it was not easy to produce anything even tolerable in gardening; but princely munificence, guided by a director equally skilled in cultivating the earth and in the polite arts, overcame all difficulties. What was once a desert is now an Eden. In 1758, an act passed for building a bridge across the Thames to Kew Green, and a bridge was built of eleven arches; the two piers and their dependant arches on each side next the shore, built of brick and stone; the intermediate arches entirely wood; the centre arch 30 feet wide, and the road over the bridge 30.—

But this bridge was taken down, and in its place a very elegant one was erected and completed about the year 1791.

KEXHOLM, that part of Finland which borders upon Russia. The lake Ladoga crosses it, and divides it into two parts. By the treaty between Russia and Sweden in 1721, the Swedes were obliged to abandon the best part to the Russians, who now possess the whole. The country in general is full of lakes and marshes, thinly inhabited, and badly cultivated. The lake above mentioned is 120 miles in length.

KEXHOLM, or Careligord, a town of Russia in a territory of the same name, not very large, but well fortified, and has a strong castle. The houses are built with wood. It formerly belonged to the Russians, after which the Swedes had possession of it for a whole century; but it was retaken by the Russians in 1710. Near it is a considerable salmon fishery. It is seated on two islands on the north-west side of the lake Ladoga, in E. Long. 30° 25'. N. Lat. 61° 12'. Near it is another town called New Kexholm.

KEY, an instrument for the opening of locks. See Lock.

L. Molinus has a treatise of keys, De clavibus veterum, printed at Upsal: he derives the Latin name clavis, from the Greek κλαβos, clado, "I shut," or from the adverb clavo, "privately;" and adds, that the use of keys is yet unknown in some parts of Sweden.

The invention of keys is owing to one Theodore of Samos, according to Pliny and Polydore Virgil: but this must be a mistake, the use of keys having been known before the siege of Troy; mention even seems made of them in the 15th chapter of Genesis.

Molinus is of opinion, that keys at first only served for the opening certain knots, wherewith they anciently secured their doors: but the Laconic keys, he maintains, were nearly akin to that use of our own; they consisted of three single teeth, and made the figure of an E; of which form there are still some to be seen in the cabinets of the curious.

There was another key called Calatrycje, made in the manner of a male screw; which had its corresponding female in a bolt affixed to the door. Key is hence become a general name for several things serving to shut up or close others. See the article Lock.

KEY, or Key-stone, of an Arch or Vault, is the last stone placed at top thereof; which being wider and flatter at the top than bottom, wedges, as it were, and binds all the rest. The key is different in the different orders: in the Tuscan and Doric it is a plain stone only projecting; in the Ionic it is cut and waved somewhat after the manner of consoles; in the Corinthian and Composite it is a console enriched with sculpture, foliage, &c.

Key is also used for ecclesiastical jurisdiction; particularly for the power of excommunicating and absolving. The Romanists say, the pope has the power of the keys, and can open and shut paradise as he pleases; grounding their opinion on that expression of Jesus Christ to Peter, "I will give thee the keys of the kingdom of heaven." In St Gregory we read that was the custom heretofore for the popes to send a golden key to princes, wherein they enclosed a little of the filings of St Peter's chains kept with a world of devotion at Rome; and that these keys were worn in the bosom, as being supposed to contain some wonderful virtues.

Key is also used for an index or explanation of a cipher. See Cipher.

KEYS of an Organ, Harpsichord, &c. those little pieces in the fore part of those instruments, by means whereof the jacks play so as to strike the strings. These are in number 28 or 29. In large organs there are several sets of the keys, some to play the secondary organ, some for the main body, some for the trumpet, and some for the echoing trumpet, &c.: in some there are but a part that play, and the rest are only for ornament. There are 20 slits in the large keys which make half notes. See the article ORGAN, &c.

Key, in Music, a certain fundamental note or tone, to which the whole piece, be it in cantata, sonata, concerto, &c. is accommodated, and with which it usually begins but always ends.

Key, or Quay, a long wharf, usually built of stone, by the side of a harbour or river, and having several storehouses for the convenience of lading and discharging merchant ships. It is accordingly furnished with posts and rings, whereby they are secured; together with cranes, capsterns, and other engines, to lift the goods into or out of the vessels which lie alongside.

The verb cajare, in old writers, according to Scaliger, signifies to keep in or restrain; and hence came our term key or quay, the ground where they are made being bound in with planks and posts.

Keys are also certain sunken rocks lying near the surface of the water, particularly in the West Indies.

KEYNSHAM, a town of Somersetshire, 116 miles from London. It is a great thoroughfare in the lower road between Bath and Bristol. They call it proverbially smoky Keynsham, and with equal reason they might call it foggy. It has a fine large church, a stone bridge of 15 arches over the Avon to Gloucestershire, and another over the river Chew. Its chief trade is malting. It has a charity school, a weekly market, and three fairs. Population 1748 in 1811.

KEYSER'S PILLS, a celebrated mercurial medicine, the method of preparing which was purchased by the French...
French government, and was afterwards published by M. Richard. It is the acetate of mercury. See Chemistry and Materia Medica Index.

KEYSLER, JOHN GEORGE, a learned German antiquarian, was born at Thunen in 1689. After studying at the university of Halle, he was appointed preceptor to Charles Maximilian and Christian Charles, the young counts of Giech Buchan; with whom he travelled through the chief cities of Germany, France, and the Netherlands, gaining great reputation among the learned as he went along; by illustrating several monuments of antiquity, particularly some fragments of Celtic idols lately discovered in the cathedral of Paris. Having acquitted himself of this charge with great honour, he procured in 1716 the education of two grandsons of Baron Bernstorff, first minister of state to his Britannic majesty as elector of Brunswick Luneburg. However, obtaining leave in 1718, to visit England, he was elected a fellow of the Royal Society for a learned essay De Dra Nokelienia, numine veterum Walachorum topic: he gave also an explanation of the ancient monument on Salisbury plain called Stonehenge, with a dissertation on the consecrated misletoe of the Druids. Which detached essays, with others of the same kind, he published on his return to Hanover, under the title of Antiquitates selecte Septentrionales et Celtices, &c. He afterwards made the grand tour with the young barons, and to this tour we owe the publication of his travels; which were translated into English, and published in 1756, in 4 volumes, 4to. Mr Keysler on his return spent the remainder of his life under the patronage of his noble pupils, who committed their fine library and museum to his care, with a handsome income. He died in 1743.

KIAM, a great river of China, which takes its rise near the western frontier, crosses the whole kingdom eastward, and falls into the bay or gulf of Nanking, a little below that city.

KIANG-si, a province of China, bounded on the north by that of Kiang-nan, on the west by Hou-quang, on the south by Quang-tong, and on the east by Po-kien and Tche-kiang. The country is extremely fertile; but it is populous and so scantily supplied with the means of its support that the inhabitants sometimes starve and become mendicants; which exposes them to the tyrannies and rapines of the Chinese of the other provinces: however, they are people of great solidity and acuteness, and have the talent of rising rapidly to the dignities of the state. The mountains are covered with simples; and contain in their bowers mines of gold, silver, lead, iron, and tin; the rice it produces is of the finest and most valuable of the empire. This province contains 13 cities of the first class, and 78 of the second and third.

KIANG-nan, a province of China, and one of the most fertile, commercial, and consequently one of the richest in the empire. It is bounded on the west by the provinces of Ho-nan and Hou-quang; on the south by Tche-kiang and Kiang-si; and on the east by the gulf of Nan-king: the rest borders on the province of Chang-tong. The emperors long kept their court in this province; but reasons of state having obliged them to move nearer to Tartary, they made choice of

KID, in Zoology, the name by which young goats are called. See Goat and Capra, Mammalia Index.

KIDDER, Dr Richard, a learned English bishop, was born in Sussex, and bred at Cambridge. In 1669, he was installed dean of Peterborough; and, in 1691, was nominated to the bishopric of Bath and Wells, in the room of Dr Thomas Ken, who had been deprived for not taking the oaths to King William and Queen Mary. He published, 1. The Young Man's Duty. 2. A demonstration of the Messiah, 3 vols 8vo. 3. A commentary on the five books of Moses, 2 vols 8vo; and several other pioues and valuable tracts. He was killed with his lady in his bed by the fall of a stack of chimneys, at his house in Wells, during the great storm in 1703. The bishop, in the dissertation prefixed to his commentary on the five books of Moses, having reflected upon Monsieur Le Clerc, some letters passed between them in Latin, which are published by Le Clerc in his Bibliotheca Choisi.

KIDDERMINSTER, or Kedderminster, a town of Worcestershire, seated under a hill on the river Stour, not far from the Severn, 128 miles from London. It is a large town of 1606 houses, with 8038 inhabitants, who carry on an extensive trade in weaving in various branches. In 1733 a carpet manufactury was established with success, so as to employ in 1772 above 250 looms; and there are upwards of 700 looms employed.
planted in the silk and worsted. Above 1600 hands are employed as spinners, &c. in the carpet looms only in the town and neighbourhood; upwards of 1400 are employed in preparing yarn, which is used in different parts of England in carpeting; and it is supposed not less than 2000 are employed in the silk and worsted looms in the town and neighbourhood. The silk manufacture was established in 1755. The town is remarkably healthy, and has also an extensive manufacture of quilting in the loom in imitation of Marseilles quilting. Here is a Presbyterian meeting house; and they have a handsome church, two good free schools, a charity school, and two almshouses, &c. The town is governed by a bailiff, 12 capital burgesses, 25 common councilmen, &c. who have a town hall. The population in 1801 amounted to 6110. By the late inland navigation, it has communication by the junction of the Severn canal with the rivers Mersey, Dee, Ribble, Ouse, Trent, Darwent, Severn, Humber, Thames, Avon, &c.; which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham, York, Lancaster, Westmoreland, Chester, Stafford, Warwick, Leicester, Oxford, Worcester, &c. This parish extends to Bewdley bridge, has a weekly market, and three fairs. W. Long. 2. 15. N. Lat. 53. 28.

KIDDERS, those that badge or carry corn, dead victuals, or other merchandise, up and down to sell: every person being a common badge, kidder, lader, or carrier, &c. says the stat. 5 Eliz. cap. 12. And they are called kidders, 1 Eliz. cap. 25.

KIDDLIE, or KIDEL, (Kidelus), a dam or wear in a river with a narrow cut in it, for the laying of pots or other engines to catch fish.

The word is ancient; for in Magna Charta, cap. 24. we read, Ommes kidelli deponuntur per Thesmiam et Mclevyam, et per totem Anglia, nisi per cestorum maris. And by King John's charter, power was granted to the city of London, de kidelli amovendis per Thesmiam et Mclevyam. A survey was ordered to be made of the wears, mills, stanks, and kiddels, in the great rivers of England, 1 Hen. IV. Fishermen of late corruptly call these dams kettles; and they are much used in Wales and on the sea coasts of Kent.

KIDDINGTON, a town of Oxfordshire, four miles from Woodstock, and 12 from Oxford. It is situated on the Glym river, which divides the parish in two parts, viz. Over and Nether Kiddington, in the latter of which stands the church. This parish was given by King Offa in 780 to Worcester priory. Here King Ethelred had a palace; in the garden of the manor house is an antique font brought from Edward the Confessor's chapel at I-lip, wherein he received baptism. In Hill wood near this place is a Roman encampment in extraordinary preservation, but little noticed.

KIDNAPPING, the forcible abduction or stealing away of man, woman, or child, from their own country, and sending them into another. This crime was capital by the Jewish law: "He that stealth a man and selleth him, or if he be found in his hand, shall surely be put to death." So likewise in the civil law, the offence of spiriting away and stealing men and children, which was called plagium, and the offenders plagiarii, was punished with death. This is unquestionably a very heinous crime, as it robs the king of his subjects, banishes a man from his country, and may in its consequence be productive of the most cruel and disagreeable hardships; and therefore the common law of England has punished it with fine, imprisonment, and pillory. And also the statute 11 and 12 W. III. c. 7, though principally intended against pirates, has a clause that extends to prevent the leaving of such persons abroad as are thus kidnapped or spirited away; by enacting, that if any captain of a merchant vessel shall (during his being abroad) force any person on shore, or wilfully leave him behind, or refuse to bring home all such men as he carried out, if able and desirous to return, he shall suffer three months imprisonment.

KIDNEYS, in Anatomy. See Anatomy, No 101.

KIDNEY-BEAU. See Phaseolus, Botany Index.

KIEL, a city of Germany, in the duchy of Holstein, in the circle of Lower Saxony, and the residence of the duke of Holstein Gottorp. It has a castle, and a university founded in 1665; and there is a very celebrated fair held here. It is seated at the bottom of a bay of the Baltic sea called Killewerk, at the mouth of the river Schzent, in E. Long. 12. 17. N. Lat. 54. 26.

KIGGELARIA, in Botany, a genus of plants belonging to the dicotia class; and in the natural method ranking under the 37th order, Columinifera. See Botany Index.

KIGHLIE, a town in the west riding of Yorkshire, six miles to the south-east of Skipton in Craven. It stands in a valley surrounded with hills, at the meeting of two brooks, which fall into the river Are one mile below it. Every family is supplied with water brought to or near their doors in stone troughs from a never-failing spring on the west side of it. The parish is six miles long and two broad, and is 60 miles from the east and west seas; yet at the west end of it, near Camel Cross, is a rising ground, from which the springs on the east side of it run to the east sea, and those on the west to the west sea. By means of inland navigation, this town has a communication with the rivers Mersey, Dee, Ribble, Ouse, Trent, Darwent, Severn, Humber, Thames, Avon, &c.; which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham, Lancaster, Westmoreland, Chester, Stafford, Warwick, Leicester, Oxford, Worcester, &c. Population 6864 in 1811.

KILARNEY, see KILIANEY.

KILBEGGAN, a post, fair, and borough town of Ireland, in the county of Westmeath and province of Leinster, 44 miles from Dublin. It formerly returned two members to parliament; patronage in the Lymbert family. It is seated on the river Brosna, over which there is a bridge. There was here a monastery founded in 1200, and dedicated to the Virgin Mary, and inhabited by monks from the Cisterian abbey of Mellifont. The fairs are two.

KILDA, St, one of the Hebrides or Western islands of Scotland. It lies in the Atlantic ocean, about 50° 32' north latitude; and is about three English miles in length from east to west, and its breadth from south to north not less than two. The ground of St Kilda, like much the greatest part of that over all the Highlands, is much better calculated for pasture than tillage.
K I L I

Kilda.

age.—Restricted by idleness, a fault or vice much more pardonable here than in any other part of Great Britain, or discouraged by the form of government under which they live, the people of the island study to rear up sheep, and to kill wild-fowl, much more than to engage daily in the more toilsome business of husbandry.—All the ground hitherto cultivated in this island lies round the village. The soil is thin, full of gravel, and of consequence very sharp. This, though naturally poor, is, however, rendered extremely fertile, by the singular industry of very judicious husbandmen: these prepare and manure every inch of their ground, so as to convert it into a kind of garden. All the instruments of agriculture they use, or indeed require, according to their system, are a spade, a mall, and a rake or harrow. After turning up the ground with a spade, they rake or harrow it very carefully, removing every small stone, every noxious root or growing weed that falls in their way, and pound down every stiff clod into dust. It is certain that a small number of acres well prepared in St Kilda, in this manner, will yield more profit to the husbandman than a much greater number when roughly handled in a hurry, as is the case in the other Western isles. The people of St Kilda sow and reap much earlier than any of their neighbours on the western coast of Scotland. The heat of the sun, reflected from the hills and rocks into a low valley facing the south-east, must in the summer time be quite intense; and however rainy the climate, is the corn must for these reasons grow very fast and ripe early.

The harvest is commonly over at this place before the beginning of September; and should it fail out otherwise, the whole crop would be almost destroyed by the equinoctial storms. All the islanders on the western coast have great reason to dread the fury of such tempests: these, together with the excessive quantities of rain they have generally throughout seven or eight months of the year, are undoubtedly the most disadvantageous and unhappy circumstances of their lives.

Barley and oats are the only sorts of grain known at St Kilda; nor does it seem calculated for any other. Fifty bolls of the former, old Highland measure, are every year brought from thence to Harris; and all the Western islands hardly produce any thing so good of the kind. Potatoes have been introduced among that people only of late, and hitherto they have raised but small quantities of them. The only appearance of a garden in this whole land, so the natives call their principal island in their own language, is no more than a very inconsiderable piece of ground, which is enclosed and planted with some cabbages. On the east side of the island, at a short distance from the bay, lies the village, where the whole body of this little people (the number amounting in 1764 to 88, and in 1799 to about 120) live together like the inhabitants of a town or city. It is certain that the inhabitants were much more numerous formerly than at present; and the island, if under proper regulations, might easily support 300 souls. Martin, who visited it about the end of the 17th century, found 180 persons there; but about the year 1730, one of the people coming to the island of Harris, was seized with the smallpox and died. Unluckily his clothes were carried away by one of his relations next year; and thus was the infection communicated, which made such havoc, that only four grown persons were left alive. The houses are built in two rows, regular, and facing one another; with a tolerable causeway in the middle, which they call the street. These habitations are made and contrived in a very uncommon manner. Every one of them is flat on the roof, or nearly so, much like the houses of some oriental nations. That from any one of these the St Kildans have borrowed their manner of building, no man of sense will entertain a suspicion. They have been taught this lesson by their own reason, improved by experience. The place in which their lot has fallen is peculiarly subject to violent squalls and furious hurricanes: were their houses raised higher than at present, they believe the first winter storm would bring them down about their ears. For this reason the precaution they take in giving them roofs much flatter than ordinary seems to be not altogether unnecessary. The walls of these habitations are made of a rough gritty kind of stones, huddled up together in haste, without either lime or mortar, from eight to nine feet high. In the heart of the walls are the beds, which are overlaid with flags, and large enough to contain three persons. In the side of every bed is an opening, by way of door, which is much too narrow and low to answer that purpose. All their dwelling houses are divided into two apartments by partition walls. In the division next the door, which is much the largest, they have their cattle stalled during the whole winter season; the other serves for kitchen, hall, and bedroom.

It will be readily expected, that a race of men and women bred in St Kilda must be a very slovenly generation, and every way inellegant. It is indeed impossible to defend them from this imputation. Their method of preparing a sort of manure, to them indeed of vast use, proves that they are very indeclicate. After having burnt a considerable quantity of dried turf, they spread the ashes with the nicest care over the floor of that apartment in which they eat and sleep. These ashes, so exactly laid out, they cover with a rich friable sort of earth; over this bed of earth they scatter a proportionable heap of that dust into which peats are apt to crumble away: this done, they water, tread, and beat the whole compost into a hard floor, on which they immediately make new fires very large, and never extinguished till they have a sufficient stock of new ashes on hand. The same operations are repeated with a never-failing punctuality, till they are just ready to sow their barley; by that time the walls of their houses are sunk down, or, to speak more properly, the floors risen about four or five feet high.

To have room enough for accumulating heaps of this compost one above another, the ancient St Kildans had ingenuity enough to contrive their beds within the linings of their walls; and it was for the same reason they took care to raise these walls to a height far from being common in the other Western islands.

It is certain that cleanliness must contribute greatly to health, and of course longevity; but in spite of that instance of indecency now given, and many more which might have been added, the people of this island are not more short lived than other men. Their total want

3 L 2
of those articles of luxury, which have so natural a tendency to destroy the constitution of the human body, and their moderate exercises, will, together with some other circumstances, keep the balance of life equal enough between them and those who are absolute strangers to slovenliness.

Besides the dwelling houses already described, there are a prodigious number of little cells dispersed over all the island; which consist entirely of stones, without any the smallest help of timber. These cells are from 12 to 18 feet in length, and a little more than seven in height. Their breadth at the foundation is nearly equal to the height. Every stone hangs above that immediately below, not perpendicularly, but inclines forward, so as to be nearer the opposite side of the grotto, and thus by imperceptible degrees till the two highest courses are near enough to be covered by a single flag at the top. To hinder the rain from falling down between the interstices above, the upper part of the building is overlaid with turf which looks like a fine green sward while new. The inhabitants secure their peats, eggs, and wild fowl, within these small repositories: every St Kildan has his share of them, in proportion to the extent of land he possesses, or the rent he pays to the steward. From the construction of these cells, and the toil they must have cost before they could have been finished, it seems plain, that those who put them together, were, if not more ingenious than their neighbours in the adjacent islands, at least more industrious than their own successors.

The St Kilda method of catching wild fowl is very entertaining. The men are divided into fouling parties, each of which consists generally of four persons distinguished by their agility and skill. Each party must have at least one rope about 30 fathoms long; this rope is made out of a strong raw cow hide, salted for that very purpose, and cut circularly into three lengths all of equal length; these being closely twisted together, form a three-fold cord, able to sustain a great weight, and durable enough to last for about two generations: to prevent the injuries it would otherwise receive from the sharp edges of the rocks, against which they must frequently strike, the cord is lined with sheep skins, dressed in much the same manner.

This rope is a piece of furniture indispensably necessary, and the most valuable implement a man of substance can be possessed of in St Kilda. In the testament of a father, it makes the very first article in favour of his eldest son; should it happen to fall to a daughter's share, in default of male heirs, it is reckoned equal in value to the heeves of cows in the island.

By the help of such ropes, the people of the greatest prowess and experience here traverse and examine rocks prodigiously high. Linked together in couples, each having either end of the cord fastened about his waist, they go frequently through the most dreadful precipices: when one of the two descends, his colleague plants himself on a strong shelf, and takes care to have such sure footing there, that if his fellow adventurer makes a false step, and tumbles over, he may be able to save him.

The following anecdote of a steward of St Kilda's deputy will give the reader a specimen of the dangers they undergo, and at the same time of the uncommon strength of the St Kildans. This man, observing his colleague lose his hold, and tumbling down from above, placed himself so firmly upon the shelf where he stood, that he sustained the weight of his friend, after falling the whole length of the rope. Undoubtedly these are stupendous adventures, and equal to any thing in the feats of chivalry. Mr Macaulay gives an instance of the dexterity of the inhabitants of St Kilda in catching wild fowl, to which he was an eye witness. Two noted heroes were drawn out from among all the ablest men of the community: one of them fixed himself on a craggy shelf; his companion went down 60 fathoms below him; and after having darted himself away from the face of a most alarming precipice hanging over the ocean, he began to play his gambols; he sung merrily, and laughed very heartily: after having performed several antic tricks, and given all the entertainment his art could afford, he returned in triumph, and full of his own merit, with a large string of fowls about his neck, and a number of eggs in his bosom. This method of fouling resembles that of the Norwegians, as described by Bishop Pontoppidan.

KILDARE, a town of Ireland, and capital of a county of the same name, is situated 28 miles southwest of Dublin. It is governed by a sovereign, recorder, and two portreeves. The church of Kildare was very early erected into a cathedral with episcopal jurisdiction, which dignity it retains to this day; the cathedral, however, has been for several years neglected, and at present is almost in ruins. St Brigid founded a monastery at Kildare, which afterwards came into the possession of the regular canons of St Augustine; this saint died 1st February 523, and was interred here; but her remains were afterwards removed to the cathedral church of Down. In the year 638, Aed Dubh or Black Hugh, king of Leinster, abdicated his throne, and took on him the Augustinian habit in this abbey; he was afterwards chosen abbot and bishop of Kildare, and died on the 10th May. In 756, Eighitigin the abbot, who was also bishop of Kildare, was killed by a priest as he was celebrating mass at the altar of St Brigid; since which time no priest whatsoever was allowed to celebrate mass in that church in the presence of a bishop. In 1220 Henry de Loundres, archbishop of Dublin put out the fire called inextinguishable, which had been preserved from a very early time by the nuns of St Brigid. This fire was however lighted, and continued to burn till the total suppression of monasteries. Here was also a Gray abbey on the south side of the town, erected for friars of the Franciscan order, or, as they were more generally called, Gray friars, in the year 1260, by Lord William de Vesey; but the building was completed by Gerald Fitzmaurice, Lord Ossory. A considerable part of this building yet remains, which appears not to have been of very great extent. A house for White friars was likewise founded in this town by William de Vesey in 1290; the round tower here is 130 feet high, built of white granite to about 12 feet above the ground, and the rest of common blue stone. The pedestal of an old cross is still to be seen here; and the upper part of a cross lies near it on the ground. The number of inhabitants is stated at 36,000.

KILDARE, a county of Ireland, in the province of Leinster, which is 37 miles in length and 20 in breadth.
KILKenny, a county of Ireland, in the province of Leinster, bounded on the south by the county of Waterford, on the west by the Queen's county, on the east by the counties of Wexford and Carlow, and on the north by Upper Ossoy. The greatest length of this county from north to south is 36 miles, the breadth from east to west 18; and it contains 10 baronies. It is one of the most healthful, pleasant, and populous counties of Ireland. It contains 287,650 Irish plantation acres, 96 parishes, and in 1811 had 168,000 inhabitants. Gilbert Clare, earl of Gloucester and Hereford, marrying Isabella, one of the daughters and coheiresses of William Earl Marshall, received as her dowry the county of Kilkenny. See Kilkenny, Supplement.

KILKENNY, the capital of a county of the same name in Ireland, situated in the province of Leinster, 56 miles south of Dublin. It takes its name from the cell or church of Canic, who was an eminent hermit in this country; and is one of the most elegant cities in the kingdom. It is the seat of the bishop of Ossoy, which was translated from Agabo in Ossoy, about the end of Henry II.'s reign, by Bishop O'Dulany. The city is pleasantly situated on the Neor, a navigable river that discharges itself into the harbour of Waterford. It is said of Kilkenny, that its air is without fog, its water without mud, its fire without smoke, and its streets paved with marble. Two of the latter are indeed matter of fact; for they have in the neighbourhood, a kind of coal that burns from first to last without smoke, and pretty much resembles the Welsh coal. Most of the streets are also paved with a stone called black marble; of which there are large quarries near the town. This stone takes a fine polish, and is beautifully intermixed with white granite. The air too is good and healthy, though not remarkably clearer than in many other parts of the kingdom. The city is governed by a mayor, recorder, aldermen, and sheriffs. It comprises two towns, viz. Kilkenny so called, and Irish town, each of which formerly sent two members to parliament, and both together contain 2870 houses, and 14,975 inhabitants. This city was once of great consequence, as may be seen by the venerable ruins yet remaining of churches, monasteries, and abbeys, which even now in their dilapidated state exhibit such specimens of exquisite taste in architecture as may vie with any modern improvements; and the remains of its gates, towers, and walls, show it to have been a place of great strength. Here too at different times parliaments were held, in which some remarkable statutes were passed. It has two churches, and several Catholic chapels; barrack's for a troop of horse and four companies of foot: a market is held twice in the week, and there are seven fairs in the year.—Irish town is more properly called the borough of St Canice, vulgarly Kenny; the patronage of which is in the bishop of Ossoy. The cathedral, which stands in a sequestered situation, is a venerable Gothic pile built about 500 years ago; and close to it is one of those remarkable round towers which have so much engaged the attention of travellers. The bishop's palace is a handsome building, and communicates by a covered passage with the church. The castle was first built in 1152, on the site of one destroyed by the Irish in 1173. The situation in a military view was most eligible: the ground was originally a conoid, the elliptical side abrupt and precipitous, with the river running rapidly at its base: here the natural rampart was faced with a wall of solid masonry 40 feet high; the other parts were defended by bastions, curtains, towers, and outworks; and on the summit the castle was erected. This place, as it now stands, was built by the ancestors of the dukes of Ormond: here the Ormond family resided; and it is now in the possession of Mr. Butler, a descendant of that illustrious race. The college originally founded by the Ormond family is rebuilt in a style of elegance and convenience. The tholsel and market house are both good buildings: and over the latter is a suite of rooms, in which during the winter, and at races and assizes times, assemblies are held. There are two very fine bridges of cut marble over the Neor; John's bridge particularly is light and elegant. The Ormond family built and endowed a free school in this city. Here are the ruins of three old monasteries, called St John's, St Francis's, and the Black abbey: belonging to the latter are the remains of several old monuments, almost buried in the ruins; and the courts of the others are converted into barracks. The manufacture chiefly carried on here are, coarse woollen cloths, blankets of extraordinary fine quality, and considerable quantities of starch. In the neighbourhood also are made very beautiful chimney-pieces of that species of stone already mentioned, called Kilkenny marble: they are cut and polished by the power of water, a mill for that purpose being invented by a Mr. Colles. The Kilkenny coal pits are within nine miles of the town. This city came by marriage into the ancient family of Le Despencer. It was incorporated by charter from King James I. in 1609. The market cross of Kilkenny continued an ornament to the city until 1774, when it was taken down; the date on it was MCCC. Sir James Ware mentions Bishop Cantwell's rebuilding the great bridge of Kilkenny, thrown down by an inundation about the year 1447. It appears also that St John's bridge fell.
KIL [ 454 ]

Killarney.

Kilkenny fell down by a great flood in 1564; and on 2d October 1763, by another like circumstance, Green's bridge near the cathedral fell.—The borough of St Canice, or Irish town, always enjoyed very ancient prescriptive rights. At close roll of 15 Edward III. A.D. 1376, forbids the magistrates of Kilkenny to obstruct the sale of victuals in the market of Irish town, or within the cross, under the pretence of custom for murage; and lest the ample grants made to Kilkenny might be interpreted so as to include Irish town, the corporation of the latter secured their ancient rights by letters-patent, 15 Edward IV. A.D. 1474. These renew their former privileges, and appoint a portreeve to be chosen every 21st September, and sworn into office on the 11th October. The portreeve's prison was at Troy-gate. Whenever the mayor of Kilkenny came within Water-gate, he dropped down the point of the city sword, to show he claimed no pre-eminence within the borough.

KILLALOE, a bishop's see in the county of Clare and province of Munster, in Ireland, 86 miles from Dublin, otherwise Louvia. It was anciently written Kil-la-Lua, i.e. "the church of Lua," from Lua or Molua, who about the beginning of the 6th century founded an abbey near this place. St Molua appears to have derived his name from Louvia, the place of his residence, as was customary amongst the ancient Irish. On the death of St Molua, St Flannan his disciple, and son of the chief of the district, was consecrated bishop of this place at Rome about the year 639, and the church endowed with considerable estates by his father Theodoric. Towards the close of the 12th century, the ancient see of Roscrea was united to that of Killaloe; from which period these united bishoprics have been governed by the same bishop. At Killaloe is a bridge over the Shannon of 17 arches; and here is a considerable salmon and eel fishery. There are many ancient buildings in and about this town. The cathedral is a Gothic edifice in form of a cross, with the steepie in the centre, supported by four arches; it was built by Donald king of Limerick in 1160. There is a building near it, once the oratory of St Molua; and there is another of the same kind in an island of the Shannon, having marks of still higher antiquity. The see house of the bishop is at Clarisford, near to Killaloe. Adjoining to the cathedral are yet some remains of the mausoleum of Brien Boru.

KILLARNEY, a post town of Ireland in the county of Kerry and province of Munster, seated near a fine lake called Lough Leane, or lake of Killarney. It is distant 143 miles from Dublin, and has two fairs. Within a mile and a half of this place are the ruins of the cathedral of Ardfert, an ancient bishopric united to Ardfert; and within four miles the ruins of Aglish church. At this town is the seat and gardens of Lord Kenmore.

The beautiful lake of Killarney is divided properly into three parts, called the lower, middle, and upper lake. The northern or lower lake is six miles in length and from three to four in breadth, and the town is situated on its northern shore. The country on this and the eastern boundary is rather of a tame character; but is here and there diversified with gentle swells, many of which afford delightful prospects of the lake, the islands, and surrounding scenery. The southern shore is composed of immense mountains, rising abruptly from the water, and covered with woods of the finest timber. From the center of the lake the view of this range is astonishingly sublime, presenting to the eye an extent of forest six miles in length, and from half a mile to a mile and a half in breadth, hanging in a robe of rich luxuriance on the sides of two mountains, whose bare tops rising above the whole form a perfect contrast to the verdure of the lower region. On the side of one of these mountains is O'Sullivan's cascade, which falls into the lake with a roar that strikes the timid with awe on approaching it. The view of this sheet of water is uncommonly fine, appearing as if it were descending from an arch of wood, which overhangs it about 70 feet in height from the point of view. Coasting along this shore affords an almost endless entertainment, every change of position presenting a new scene; and rocks hollowed and worn into a variety of forms by the waves, and the trees and shrubs bursting from the pores of the sapless stone, forced to assume the most uncouth shapes to adapt themselves to their fantastic situations. The islands are not so numerous in this as in the upper lake; but there is one of uncommon beauty, viz. Innisfallen, nearly opposite to O'Sullivan's cascade: It contains 18 Irish acres.

The coast is formed into a variety of bays and promontories, skirted and crowned with arbustus, holly, and other shrubs and trees; the interior parts are diversified with hills, and dales, and gentle declivities, on which every tree and shrub appears to advantage: the soil is rich even to exuberance; and trees of the largest size incline across the vales, forming natural arches, with ivy entwining in the branches, and hanging in festoons of foliage. The promontory of Mucrus, which divides the upper from the lower lake, is a perfect land of enchantment; there is a road carried through the centre of the promontory, which unfolds all the interior beauties of the place. Amongst the distant mountains, Turk appears an object of magnificence; and Mangerton's loftier, though less interesting summit, rears itself above the whole. The passage to the upper lake is round the extremity of Mucrus, which confines it on one side, and the approaching mountains on the other. Here is the celebrated rock called the eagle's nest, which produces wonderful echoes. A French horn sounded here, raises a concert superior to 100 instruments; and the report of a single cannon is answered by a succession of peals resembling the loudest thunder, which seems to travel the surrounding scenery, and die away among the distant mountains. The upper lake is four miles in length, and from two to three in breadth; and is almost surrounded by mountains, from which descend a number of beautiful cascades. The islands in this lake are numerous, and afford an amazing variety of picturesque views.—The centre lake, which communicates with the upper, is but small in comparison with the other two, and cannot boast of equal variety. The shores, however, are in many places indented with beautiful bays, surrounded with dark groves of trees, some of which have a most picturesque appearance when viewed from the water. The eastern boundary is formed by the base of Mangerton, down the steep side of which descends a cascade visible for 150 yards: this fall of water is supplied by a circular lake.
KIL

KIL

Killearn lake near the summit of the mountain, called the Devil's Punch Bowl; which on account of its immense depth, and the continual overflow of water, is considered as one of the greatest curiosities in Killearn. — Mr. Smith seems to think, that one of the best prospects this admired lake affords, is from a rising ground near the ruined cathedral of Aghadoe.

The lake of Killearn is otherwise called Lough Lane, or Loch Lean, from its being surrounded by high mountains. Nennius says, that these lakes were encompassed by four circles of mines; the first of tin, the second of lead, the third of iron, and the fourth of copper. In the several mountains adjacent to the lakes are still to be seen the vestiges of the ancient mines of iron, lead, and copper; but tin has not been discovered. Silver and gold are said by the Irish antiquaries to have been found in the early ages; but this is somewhat doubtful, especially in any considerable quantity, though some silver probably was extracted from the lead ore, and small quantities of gold might have been obtained from the yellow copper ore of Mucruis. However, in the neighbourhood of these lakes were found in the early ages, as well as at present, pebbles of several colours, which taking a beautiful polish, the ancient Irish wore in their ears, girdles, and different articles of their dress and furniture.

KILLAS, a genus of stones belonging to the argillaceous class, found chiefly in Cornwall in England. Its texture is either lamellar or coarsely granular; the specific gravity from 2.530 to 2.566. It contains 60 parts of siliceous earth, 25 of argillaceous, 9 of magnesia, and 6 of iron. The greenish kind contains more iron, and gives a green tincture to the nitrous acid.

KILLICRANKIE, a noted pass of Perthshire in Scotland. It is formed by the lofty mountains impending over the river Carrie, which rushes through in a deep, darksome, and horrid channel, beneath. In the last century this was a pass of much danger and difficulty; a path hanging over a tremendous precipice threatened destruction to the least false step of the traveller: at present a fine road formed by the soldiery lent by government, and encouraged by an additional 6d. per day, gives an easy access to the remote Highlands; and the two sides are joined by a fine arch.

Near the north end of this pass, in its open and unimproved state, was fought in the year 1689 the battle of Killiecrankie, between the adherents of James II. under Viscount Dundee, and of William III. under General Mackay. Dundee's army was very much inferior to that of Mackay. When he came in sight of the latter, he found them formed in eight battalions ready for action. They consisted of 4,000 foot, and two troops of horse. The Highlanders under Dundee amounted to little more than half that number. These he ranged instantly in order of battle. Maclean, with his tribe, formed the right wing. The Macdonalds of Skyes, under the chieftain's eldest son, formed the left. The Cameronis, the Macdonalds of Glengary, the followers of Clanraonaid, and a few Irish auxiliaries, were in the centre. A troop of horse was placed behind under Sir William Wallace. The officers sent by James from Ireland were distributed through all the line. This whole army stood in sight of the enemy for several hours on the steep side of a hill, which faced the narrow plain where Mackay had formed his line.

Dundee wished for the approach of night; a season suited for either victory or flight.

At five of the clock in the afternoon, a kind of slight skirmish began between the right wing of the Highlanders and the left of the enemy. But neither army wishing to change their ground, the firing was discontinued for three hours. Dundee in the mean time flew from tribe to tribe, and animated them to action.

At eight of the clock he gave the signal for battle, and charged the enemy in person at the head of the horse. The Highlanders in deep columns rushed suddenly down the hill. They kept their shot till they were within a pike's length of the enemy; and having fired their muskets, fell upon them sword in hand. Mackay's left wing could not for a moment sustain the shock. They were driven by the Macleans with great slaughter from the field. The Macdonalds on the left of the Highlanders, were not equally successful. Colonel Hastings's regiment of foot stood their ground. They even forced the Macdonalds to retreat. Maclean, with a few of his tribe, and Sir Evan Cameron with the head of his clan, fell suddenly on the flank of this galling regiment, and forced them to give way. The slaughter ended not with the battle. Two thousand fell in the field and the flight. The tents, baggage, artillery, and provisions of the enemy, and even King William's Dutch standard, which was carried by Mackay's regiment, fell into the hands of the Highlanders. The victory was now complete. But the Highlanders lost their gallant leader. Perceiving the unexpected resistance of Colonel Hastings's regiment, and the confusion of the Macdonalds, Dundee rode rapidly to the left wing. As he was raising his arm, and pointing to the Camerons to advance, he received a ball in his side. The wound proved mortal; and with Dundee fell all the hopes of King James at that time.

KILLIGREW, William, eldest son of Sir Robert Killigrew, knight, was born in 1635. He was gentleman-usher of the privy-chamber to King Charles I.; and on the Restoration of Charles II. when the latter married the Princess Catharine of Portugal, he was created vice-chamberlain; in which station he continued 22 years, and died in 1693. He was the author of four plays, which, though now thrown aside, were much applauded by the poets of that time, particularly by Waller.

KILLIGREW, Thomas, brother of the former, was born in 1611; and was much distinguished in his time for wit. He was page of honour to King Charles I. and groom of the bedchamber to Charles II. with whom he suffered many years exile; during which he applied his leisure hours to the study of poetry, and to the composition of several plays. After the Restoration he continued in high favour with the king, and had frequently access to him when he was denied to the first peers in the realm; and being a man of great wit and liveliness of parts, and having from his long intimacy with that monarch, and being continually about his person during his troubles, acquired a freedom and familiarity with him, which even the pomp of majesty afterwards could not check in him; he sometimes, by way of jest, which
which King Charles was ever fond of, if genuine, even though himself was the object of the satire, would adventure bold truths which scarcely any one besides would have dared even to hint at. One story in particular is related of him, which if true is a strong proof of the great lengths he would sometimes proceed in his freedom of this kind, which is as follows:— When the king’s unbounded passion for women had given his mistress such an ascendant over him, that, like the effeminate Persian monarch, he was much fitter to have handled a distaff than to wield a sceptre, and for the conversation of his concubines utterly neglected the most important affairs of state, Mr Killigrew went to pay his majesty a visit in his private apartments, habited like a pilgrim who was bent on a long journey. The king, surprised at the oddity of his appearance, immediately asked him what was the meaning of it, and whither he was going? "To hell," bluntly replied the way. "Prithee (said the king), what can your errand be to that place?" To fetch back Oliver Cromwell (rejoined he), that he may take some care of the affairs of England, for his successor takes none at all. —One more story is related of him, which is barren of humour. King Charles’s fondness for pleasure, to which he almost always made business give way, used frequently to delay affairs of consequence, from his majesty’s disappointing the council of his presence when met for the dispatch of business, which neglected great disgust and offence to many of those who were treated with this seeming disrespect. On one of these occasions the duke of Lauderdale, who was naturally impetuous and turbulent, quitted the council chamber in a violent passion; and meeting Mr Killigrew presently after, expressed himself on the occasion in very disrespectful terms of his majesty. Killigrew begged his grace to moderate his passion, and offered to lay him a wager of 100l. that he himself would prevail on his majesty to come to council in half an hour. The duke, surprised at the boldness of the assertion, and warmed by his resentment against the king, accepted the wager; on which Killigrew immediately went to the king, and without ceremony told him what had happened; adding these words, "I know that your majesty hates Lauderdale, though the necessity of your affairs compels you to carry an outward appearance of civility: now, if you choose to get rid of a man who is thus disagreeable to you, you need only go this once to council; for I know his covetous disposition so perfectly, that I am well persuaded, rather than pay this 100l. he would hang himself out of the way, and never plague you more." The king was so pleased with the archness of this observation, that he immediately replied, "Well then, Killigrew, I positively will go;" and kept his word accordingly.—Killigrew died in 1683, and was buried in Westminster abbey.

KILLIGREW, Anne, "a Grace for beauty, and a Muse for wit," as Mr Wood says, was the daughter of Dr Henry Killigrew, brother of the two foregoing, and was born a little before the Restoration. She gave early indications of genius, and became eminent in the arts both of poetry and painting. She drew the duke of York and his duchess to whom she was maid of honour, as well as several other portraits and history pieces; and crowned all her other accomplishments with unblemished virtue and exemplary piety.

Mr Dryden seems quite lavish in her praise, though Killigrew Wood assures us he said no more of her than she was equal if not superior to. This amiable young woman died of the smallpox in 1685, and the year after her poems were published in a thin quarto volume.

KILLILEAGH, a town of Ireland, in the county of Down and province of Ulster, 80 miles from Dublin; otherwise written Killyleagh. It is the principal town in the barony of Dundrum; and seated on an arm of the lake of Strangford, from which it is supplied with a great variety of fish. The family of the Hamiltons created first Lords Clanbois, and afterwards earls of Clanbrassil, had their seat and residence here in a castle standing at the upper end of the great street. At the lower end of the street is a little safe bay, where ships lie sheltered from all winds; in the town are some good houses, a decent market-house, a horse barrack, and a Presbyterian meeting-house. On an eminence a small distance from the town is a handsome church built in the form of a cross. This place suffered much in the calamitous year 1641. It is now thriving, and the linen manufacture carried on in it, and fine thread made, for which it has a great demand. It formerly returned two members to parliament. The celebrated naturalist and eminent physician Sir Hans Sloane was born here 16th April 1660, and his father Alexander Sloane was at the head of that colony of Scots which King James I. settled in the place. This town was incorporated by that king at the instance of the first earl of Clanbois.

KILLOUGH (otherwise PIRT ST ARNE), a port town of Ireland, situated in the county of Down and province of Ulster, 76 miles from Dublin. It lies north of St John’s Point, and has a good quay, where ships lie very safe. The town is agreeably situated; the sea flowing all along the backs of the houses, where ships ride in full view of the inhabitants. There is here a good church, and a horse barrack. They have good fishing in the bay; but the principal trade of the place consists in the exportation of barley, and the importation of such commodities as are consumed in the adjacent county. A manufacturer of salt is also carried on with great advantage. The fields here are five. At a small distance from the town is a charter working school for the reception of 20 children, which was set on foot by the late Mr Justice Ward. There is a remarkable well here called St Scordin’s well, and highly esteemed for the extraordinary lightness of its water. It gushes out of a high rocky bank, close upon the shore, and is observed never to diminish its quantity in the driest season. There is also a mineral spring near the school, the waters of which the inhabitants affirm to be both purgative and emetic. At a small distance from the town near the sea is a rock in which there is an oblong hole, from whose surface the ebbing and flowing of the tide a strange noise is heard somewhat resembling the sound of a hunterman’s horn. In an open field about a quarter of a mile from the town towards St John’s Point there is a very curious cave, which has a winding passage two feet and a half broad, with three doors in it besides the entrance, and leading to a circular chamber three yards in diameter, where there is a fine limpid well. The cave is about 27 yards long.
The parish church was formerly an abbey for regular canons founded by St Mochoallóg, who died between the years 639 and 655; and some writers say, that the Dominican abbey just mentioned was founded in 1291, by Gilbert the second son of John of Callan.

KILMARNOCK, a populous and flourishing town of Ayrshire in Scotland, noted for its manufacture of carpets, milled hosiery, and Scotch bonnets. It gave the title of earl to the noble family of Boyd, residing in this neighbourhood. This title was forfeited by the last earl, who, by engaging in the rebellion of 1745, was deprived of his honours, and lost his life on the scaffold. His son, however, who served in the king's army, afterwards succeeded to the earldom of Errol. The population in 1811 was 10,148.

KILMORE, a bishop's see in the county of Cavan and province of Ulster in Ireland. It was called in former ages Clunes, or Clunis, i.e. the "sequestered place," and is situated near Lough Earn. St Fedlimid founded this bishopric in the sixth century; it was afterwards removed to an obscure village called Triburna; where it continued until the year 1454, when Andrew Macbrady bishop of Triburna erected a church on the site of that founded by Fedlimid, to whose memory it was dedicated, and denominated Kilmore, or "the great church." At present there is neither cathedral, chapter, nor canons, belonging to this see; the small parish church contiguous to the episcopal house serving the purpose of a cathedral.

KILN, a stove used in the manufacture of various articles. A fabric formed for admitting heat, in order to dry or burn materials placed in it to undergo such operations.

KILWORTH, a town of Ireland, situated in the county of Cork and province of Munster, 108 miles from Dublin. It is a thriving place, with a good church, at the foot of a large ridge of mountains called Kilworth mountains, through which a good turnpike road is carried from Dublin to Cork; below the town runs the river Funcheon, which is well stored with salmon and trout, and discharges itself a mile south of this into the Blackwater. Near Kilworth is a good glebe and vicarage house. At this place is Moorpark, the superb seat of Lord Mountcashel; and adjoining to his lordship's improvements stands the castle of Coughlough, boldly situated on the river Funcheon, which has stood several sieges.

KIMBOLTON, a town of Huntingdonshire, seated in a bottom; and noted for the castle of Kimbulton, the seat of the duke of Manchester. W. Long, 0. 15. N. Lat. 52. 18.

KIMCHI, David, a Jewish rabbi, famous as a commentator on the Old Testament, lived at the close of the 12th and beginning of the 13th centuries. He was a Spaniard by birth, son of Rabbi Joseph Kimchi, and brother of Rabbi Moses Kimchi, both men of eminent learning among the Jews; but he exceeded them both, being the best Hebrew grammarian the Jews ever had. He wrote a Grammar and Dictionary of that language; out of the former of which Buxtorf made his Theaurus Linguae Hebrew, and his Lexicon Linguae Hebrew out of the latter. His writings have been held in such estimation among the Jews, that no one can
KIN [458] KIN

of large possessions in this county, or, as Major calls
her, Countess of Angus, who was accessory to the mur-
der of Kenneth II. About two miles from this place,
on the road side, is a cairn of a stupendous size and
uncommon form, which probably might give name to
the parish. About six miles west from Bervie, is situ-
at Loarrenscirk, which, formerly an insignificant
village, by the judicious and liberal exertions of Lord
Gardenstone, has become a handsome little town, with
a right to elect magistrates, and to hold an annual
fair and a weekly market. He established here manu-
ufactures of laws, cambric, linens, and various other
articles. He has also freely renounced all the oppres-
sive services due by his tenants; services which have
been so long and so justly complained of as a check
to agriculture in many parts of Scotland—The north-
west part of the shire, being mountainous, is more em-
ployed in pasture than in cultivation. The principal
mountains are Montfattock, and Cloch-na-bean: the
former is the highest in the county; the latter is remark-
able, as the name imports, for a huge detached rock
near its summit. The population of this county, ac-
cording to its parishes, is the following.

See KINCARDEINESHIRE, SUPPLEMENT.

KINDRED, in Law, persons related to one an-
other, whereof the law reckons three degrees or lines,
viz. the descending, ascending, and collateral line.
See CONSANGUINITY and DESCENT.

On their being no kindred in the descending line,
the inheritance passes in the collateral one.

KING, a monarch or potentate who rules singly
and sovereignly over a people.—Camden derives the
word from the Saxon cynning, which signifies the same;
and that from can, “power,” or ken, “knowledge,” where-
with every monarch is supposed to be invested. The
Latin rex, the Scythian reis, the Frison rosh, the Spa-
nish rey, and French roya, come all, according to Pas-
tal, from the Hebrew šere, rosh, “chief, head.”

Kings were not known among the Israelites till
the
the reign of Saul. Before him they were governed at first by elders as in Egypt; then by princes of God's appointment, as Moses and Joshua; then by judges till the time of Samuel; and last of all by kings. See Judges.

Most of the Grecian states were governed at first by kings, who were chosen by the people to decide differences and execute a power which was limited by laws. They commanded armies, presided over the worship of the gods, &c. This royalty was generally hereditary; but if the vices of the heir to the crown were odious to the people, or if the oracle had so commanded, he was cut off from the right of succession; yet the kings were supposed to hold their sovereignty by the appointment of Jupiter. The ensign of majesty was the sceptre, which was made of wood adorned with studs of gold, and ornamented at the top with some figure; commonly that of an eagle, as being the bird of Jove.

Rome also was governed at first by kings, who were elected by the people, with the approbation of the senate and concurrence of the augurs. Their power extended to religion, the revenues, the army, and the administration of justice. The monarchical form of government subsisted 244 years in Rome, under seven kings, the last of whom was Tarquinius Superbus. See Rome.

Among the Greeks the king of Persia had anciently the appellation of the great king; the king of France now has that of the most Christian king; and the king of Spain has that of Catholic king. The king of the Romans is a prince chosen by the emperor, as a coadjutor in the government of the empire.

The kings of England, under the Lateran council, under Pope Julius II. had the title of Christianissimus conferred on them; and that of defender of the faith was added by Pope Leo X. though it had been used by them some time before. The title of grace was first given to our kings about the time of Henry IV. and that of majesty first to Henry VII. before which time our kings were called grace, highness, &c. In all public instruments and letters, the king styles himself nos. "we;" though till the time of King John he be spoke in the singular number.

The definition of king above given, is according to the general acceptance of the term. It will not therefore strictly apply to the sovereign of Britain; and still less of late to that of France, formerly one of the most absolute, now the most degraded, of princes, without power and without consequence. In Britain, a happy mean prevails. The power of the king is indeed subject to great limitations: but they are the limitations of wisdom, and the sources of dignity; being so far from diminishing his honour, that they add a glory to his crown: For while other kings are absolute monarchs over innumerable multitudes of slaves, the king of Britain has the distinguished glory of governing a free people, the least of whom is protected by the laws: he has great prerogatives, and a boundless power in doing good; and is at the same time only restrained from acting inconsistently with his own happiness, and that of his people.

To understand the royal rights and authority in Britain, we must consider the king under six distinct views.

1. With regard to his title. 2. His royal family. 3. His councils. 4. His duties. 5. His prerogative. 6. His revenue.

I. His title. For this, see Hereditary Right, and Succession.

II. His royal family. See Royal Family.

III. His councils. See Council.

IV. His duties. By our constitution, there are certain duties incumbent on the king; in consideration of which, his dignity and prerogative are established by the laws of the land: it being a maxim in the law, that protection and subjection are reciprocal. And these reciprocal duties are what Sir William Blackstone apprehends were meant by the convention in 1688, when they declared that King James had broken the original contract between king and people. But, however, as the terms of that original contract were in some measure disputed, being alleged to exist principally in theory, and to be only deductible by reason and the rules of natural law, in which deduction different understandings might very considerably differ; it was, after the Revolution, judged proper to declare these duties expressly, and to reduce that contract to a plain certainty. So that, whatever doubts might be formerly raised by weak and scrupulous minds about the existence of such an original contract, they must now entirely cease; especially with regard to every prince who has reigned since the year 1688.

The principal duty of the king is, To govern his people according to law. Nec regionis infinita aut libera potestas, was the constitution of our German ancestors on the continent. And this is not only consonant to the principles of nature, of liberty, of reason, and of society; but has always been esteemed an express part of the common law of England, even when prerogative was at the highest. "The king (saith Bracton, who wrote under Henry III.) ought not to be subject to man; but to God, and to the law: for the law maketh the king. Let the king therefore understand the law, what the law has invested in him with regard to others; dominion, and power: for he is not truly king, where will and pleasure rules, and not the law." And again: "The king hath a superior, namely God; and also the law, by which he was made a king." Thus Bracton; and Fortescue also, having first well distinguished between a monarchy absolutely and despotically regal, which is introduced by conquest and violence, and a political or civil monarchy, which arises from mutual consent (of which last species he asserts the government of England to be), immediately lays it down as a principle, that "the king of England must rule his people according to the decrees of the laws thereof; insomuch that he is bound by an oath at his coronation to the observance and keeping of his own laws." But to obviate all doubts and difficulties concerning this matter, it is expressly declared by statute 12 and 13 W. III. c. 2. "that the laws of England are the birthright of the people thereof; and all the kings and queens who shall ascend the throne of this realm ought to administer the government of the same according to the said laws, and all their officers and ministers ought to serve them respectively according to the same: and therefore all the other laws and statutes of this realm, for securing the established religion, and the rights and liberties of the people thereof, and all other laws and statutes of the same now in force, are by his majesty, by and with
the advice and consent of the lords spiritual and temporal, and commons, and by authority of the same, ratified and confirmed accordingly."

And as to the terms of the original contract between king and people, these, it is apprehended, are now couched in the coronation oath, which by the statute 1 W. and M. stat. x. c. 6, is to be administered to every king and queen who shall succeed to the imperial crown of these realms, by one of the archbishops or bishops of the realm, in the presence of all the people; who on their parts do reciprocally take the oath of allegiance to the crown. This coronation oath is conceived in the following terms:

"The archbishop or bishop shall say, Will you solemnly promise and swear to govern the people of this kingdom of Britain, and the dominions thereto belonging, according to the statutes in parliament agreed, and the laws and customs of the same? — The king or queen shall say, I solemnly promise so to do.

"Archbishop or bishop. Will you to your power cause law and justice, in mercy, to be executed in all your judgments? — King or queen. I will.

"Archbishop or bishop. Will you to the utmost of your power maintain the laws of God, the true profession of the gospel, and the Protestant reformed religion established by the law? And will you preserve unto the bishops and clergy of this realm, and to the churches committed to their charge, all such rights and privileges as by law do or shall appertain unto them, or any of them? King or queen. All this I promise to do.

"After this the king or queen, laying his or her hand upon the holy gospel, shall say, The things which I have here before promised, I will perform and keep: so help me God. And then shall kiss the book." This is the form of the coronation oath, as it is now prescribed by our law; the principal articles of which appear to be at least as ancient as the Mirror of Justices, and even as the time of Bracton: but the wording of it was changed at the Revolution, because (as the statute alleges) the oath itself had been framed in doubtful words and expressions, with relation to ancient laws and constitutions at this time unknown. However, in what form soever it be conceived, this is most indisputably a fundamental and original express contract; though, doubtless, the duty of protection is impliedly as much incumbent on the sovereign before coronation as after: in the same manner as allegiance to the king becomes the duty of the subject immediately on the descent of the crown, before he has taken the oath of allegiance, or whether he ever takes it at all. This reciprocal duty of the subject will be considered in its proper place. At present we are only to observe, that in the king's part of this original contract are expressed all the duties which a monarch can owe to his people, viz. to govern according to law; to execute judgment in mercy; and to maintain the established religion. And with respect to the latter of these three branches, we may farther remark, that by the act of union, 5 Ann. c. 8. two preceding statutes are recited and confirmed; the one of the parliament of Scotland, the other of the parliament of England: which enact, the former, that every king at his accession shall take and subscribe an oath, to preserve the Protestant religion, and Presbyterian church-government in Scotland; the latter, that at his coronation he shall take and subscribe a similar oath, to preserve the settlement of the church of England, within England, Ireland, Wales, and Berwick, and the territories thereunto belonging.

V. His prerogative. See PREROGATIVE.

VI. His revenue. See REVENUE.

Having in the preceding articles chalked out all the principal outlines of this vast title of the law, the supreme executive magistrate, or the king's majesty, considered in his several capacities and points of view; it may not be improper to take a short comparative review of the power of the executive magistrate, or prerogative of the crown, as it stood in former days, and as it stands at present. And we cannot but observe, that most of the laws for ascertaining, limiting, and restraining this prerogative, have been made within the compass of little more than a century past; from the petition of right in 3 Car. I. to the present time. So that the powers of the crown are now to all appearance greatly curtailed and diminished since the reign of King James I. particularly by the abolition of the star-chamber and high-commission courts in the reign of Charles I. and by the disclaiming of martial law, and the power of levying taxes on the subject, by the same prince: by the disuse of forest laws for a century past: and by the many excellent provisions enacted under Charles II.; especially the abolition of military tenures, purveyance, and pre-emption; the habeas corpus act; and the act to prevent the discontinuance of parliaments for above three years; and since the Revolution, by the strong and emphatical words in which our liberties are asserted in the bill of rights, and act of settlement; by the act for triennial, since turned into septennial elections; by the exclusion of certain officers from the house of commons; by rendering the seats of the judges permanent, and their salaries independent; and by restraining the king's pardon from obstructing parliamentary impeachments. Besides all this, if we consider how the crown is impoverished and stripped of all its ancient revenues, so that it greatly depends on the liberality of parliament for its necessary support and maintenance, we may perhaps be led to think that the balance is inclined pretty strongly to the popular scale, and that the executive magistrate has neither independence nor power enough left to form that check upon the lords and commons which the founders of our constitution intended.

But, on the other hand, it is to be considered, that every prince, in the first parliament after his accession, has by long usage a truly royal addition to his hereditary revenue settled upon him for his life; and has never any occasion to apply to parliament for supplies, but upon some public necessity of the whole realm. This restores to him that constitutional independence, which at his first accession seems, it must be owned, to be wanting. And then with regard to power, we may find perhaps that the hands of government are at least sufficiently strengthened; and that a British monarch is now in no danger of being overborne by either the nobility or the people. The instruments of power are not perhaps so open and avowed as they formerly were, and therefore are the less liable to jealous and invidious reflections; but they are not the weaker upon...
Add to all this, that besides the civil list, the immense revenue of almost seven millions sterling, which is annually paid to the creditors of the public, or carried to the sinking fund, is first deposited in the royal exchequer, and thence issued out to the respective offices of payment. This revenue the people can never refuse to raise, because it is not a peremptory act of parliament; which also, when well considered, will appear to be a trust of great delicacy and high importance.

Upon the whole, therefore, it seems clear, that whatever may have become of the nominal, the real power of the crown has not been too far weakened by any transactions in the last century. Much is indeed given up; but much is also acquired. The stern commands of prerogative have yielded to the milder voice of influence: the slavish and exploded doctrine of non-resistance has given way to a military establishment by law; and to the disuse of parliaments has succeeded a parliamentary trust of an immense perpetual revenue.

When, indeed, by the free operation of the sinking fund, our national debts shall be lessened; when the posture of foreign affairs, and the universal introduction of a well planned and national militia, will suffer our formidable army to be thinned and regulated; and when (in consequence of all) our taxes shall be gradually reduced; this adventitious power of the crown will slowly and imperceptibly diminish, as it slowly and imperceptibly rose. But till that shall happen, it will be our especial duty, as good subjects and good Englishmen, to reverence the crown, and yet guard against corrupt and servile influences from those who are intrusted with its authority; to be loyal yet free; obedient, and yet independent; and, above all, to hope that we may long, very long, continue to be governed by a sovereign, who, in all those public acts that have personally proceeded from himself, hath manifested the highest veneration for the free constitution of Britain, hath already in more than one instance remarkably strengthened its outworks; and will therefore never harbour a thought or adopt a persuasion, in any the remotest degree detrimental to public liberty.

King at Arms, or of Arms, is an officer of great antiquity, and anciently of great authority, whose business is to direct the heralds, preside at their chapters, and have the jurisdiction of armoury.

In England there are three Kings of arms, viz. garter, Clarenceux, and norroy.

Garter, principal King of Arms, was instituted by Henry V. His business is to attend the knights of the Garter at their assemblies, to marshal the solemnities at the funerals of the highest nobility, and to carry the garter to kings and princes beyond the sea; on which occasion he used to be joined in commission with some principal peer of the kingdom. See Garter.

Clarenceux King of Arms, is so called from the duke of Clarence, to whom he first belonged. His office is to marshal and dispose the funerals of all the inferior nobility, as baronets, knights, esquires, and gentlemen, on the south side of the Trent. See Clarenceux.

Norroy King at Arms, is to do the same on the north side of the river Trent.

These two last are also called provincial heralds, in regard
KIN [462]

KING:

regard they divide the kingdom between them into provinces. By charter, they have power to visit noblemen's families, to set down their pedigrees, distinguish their arms, appoint persons their arms, and with Garter to direct the other heralds.

Anciently the kings at arms were created and solemnly crowned by the kings of England themselves; but in later times the earl marshal has a special commission at every creation to personate the king.

Lyon King at Arms, for Scotland, is the second king at arms for Great Britain; he is invested and crowned with great solemnity. To him belong the publishing king's proclamations, marshalling funerals, reversing arms, &c. See Lyon.

King, Dr John, a learned English bishop in the 17th century, was educated at Westminster school, and at Oxford, and was appointed chaplain to Queen Elizabeth. In 1605 he was made dean of Christ church, was for several years vice-chancellor of Oxford, and in 1611 he was advanced to the bishopric of London. Besides his Lectures upon Isaiah, delivered at York, he published several sermons. King James I. used to style him the king of preachers; and Lord Chief Justice Coke often declared, that he was the best speaker in the Star-chamber in his time. He was so constant in preaching after he was a bishop, that, unless he was prevented by want of health, he omitted no Sunday in visiting some pulpit in or near London. Soon after his death, it was reported, that he died a member of the Romish church.

But the falsity of this story was sufficiently exposed by his son Dr Henry King, who was bishop of Chichester, in a sermon at St Paul's cross soon after; by Bishop Godwin in the Appendix to his Commentarius de praevalibus Angliae, printed in 1622; and by Mr John Gee, in his book, entitled The Foot out of the Snare.

King, Dr William, a facetious English writer in the beginning of the 18th century, was allied to the noble families of Clarendon and Rochester. He was elected a student of Christ church from Westminster school in 1683, aged 18. He afterward entered upon the study of law, and took the degree of doctor of civil law, soon acquired a considerable reputation as a civilian, and was in great practice. He attended the court of Pembroke, lord lieutenant of Ireland, into that kingdom, where he was appointed judge advocate, sole commissioner of the prizes, keeper of the records, vicar general to the lord primate of Ireland; was consternated by persons of the highest rank, and might have made a fortune. But so far was he from heaping up riches, that he returned to England with no other treasure than a few merry poems and humorous essays, and returned to his student's place at Christ church. He died on Christmas day in 1712, and was interred in the cloisters of Westminster abbey. His writings are pretty numerous. The principal are, 1. Animadversions on a pretended Account of Denmark, wrote by Mr Molesworth, afterwards Lord Molesworth. The writing of these procured Dr King the place of secretary to Princess Anne of Denmark. 2. Dialogues of the dead. 3. The art of love, in imitation of Ovid De arte amandi. 4. A volume of poems. 5. Useful transactions. 6. An historical account of the heathen gods and heroes. 7. Several translations.

King, Dr William, archbishop of Dublin in the 18th century, was descended from an ancient family in

the north of Scotland, but born in the county of Antrim in the north of Ireland. In 1674 he took priests orders, and in 1679 was promoted by his patron, Dr Parker, archbishop of Dublin, to the chancellorship of St Patrick. In 1687 Peter Manby, dean of Londonderry, having published at London, in 4to, a pamphlet entitled Considerations which obliged Peter Manby dean of Londonderry to embrace the Catholic Religion, our author immediately wrote an answer. Mr Manby, encouraged by the court, and assisted by the most learned champions of the church of Rome, published a reply under this title, A reformed Catechism, in two Dialogues, concerning the English Reformation, &c. in reply to Mr King's Answer, &c. Our author soon rejoined, in a Vindication of the Answer. Mr Manby dropped the controversy; but dispersed a loose sheet of paper, artfully written, with this title, A Letter to a Friend, showing the Vanity of this Opinion, that every Man's Sense and Reason are to guide him in Matters of Faith. This Dr King refuted in a Vindication of the Christian Religion and Reformation against the Attempts of a Letter, &c. In 1690 he was twice confined in the Tower by order of King James II. and the same year commenced doctor of divinity. In 1690, upon King James's retreat to France after the battle at the Boyse, he was advanced to the see of Derry. In 1692 he published at London, in 4to, The State of the Protestants of Ireland under the late King James's Government, &c. "A history (says Bishop Burnet), as truly as it is finely written." He had by him at his death attested vouchers of every particular fact alleged in this book, which are now in the hands of his relations. However, it was soon attacked by Mr Charles Lely. In 1693 our author finding the great number of Protestant dissenters, in his diocese of Derry, increased by a vast addition of colonists from Scotland, in order to persuade them to conformity to the established church, published A Discourse concerning the Inventions of Men in the Worship of God. Mr Joseph Boyse, a dissenting minister, wrote an answer. The bishop answered Mr Boyse. The latter replied. The bishop rejoined. In 1702 he published at Dublin, in 4to, his celebrated treatise De Origine Mundi. Mr Edmund Law, M. D., fellow of Christ's college in Cambridge afterwards published a complete translation of this, with many valuable notes, in 4to. In the second edition he has inserted, by way of notes, a large collection of the author's papers on the same subject, which he had received from his relations after the publication of the former edition. Our author in this excellent treatise has many curious observations. He asserts and proves that there is more moral good in the earth than moral evil. A sermon by our author, preached at Dublin in 1709, was published under the title of Divine Predestination and Foreknowledge consistent with the Freedom of Man's Will. This was attacked by Anthony Collins, Esq. in a pamphlet entitled, A Vindication of the Divine Attributes; in some remarks on the archbishop of Dublin's sermon, entitled Divine Predestination, &c. He published likewise, A Discourse concerning the Consecration of Churches; showing what is meant by dedicating them, with the Grounds of that Office. He died in 1720.

King, Dr William, principal of St Mary's hall, Oxford, son of the reverend Peregrine King, was born at
King at Stepney in Middlesex, in the year 1685. He was made doctor of laws in 1715, was secretary to the duke of Ormond, and earl of Arran, as chancellors of the university; and was made principal of St Mary's hall on the death of Dr Hudson in 1719. When he stood candidate for member of parliament for the university, he resigned his office of secretary, but enjoyed his other preferments, and it was all he did enjoy to the time of his death. Dr Clark, who opposed him, carried the election; and after this disappointment, he, in the year 1727, went over to Ireland, where he is said to have written an epic poem, called The Toast, which was a political satire, printed and given away to his friends, but never sold. On the dedication of Dr Radcliff's library in 1749, he spoke a Latin oration in the theatre of Oxford, which was received with the highest acclamations; but it was otherwise when printed, for he was attacked in several pamphlets on account of it. Again, at the memorable contested election in Oxfordshire 1755, his attachment to the old interest drew on him the resentment of the new, and he was libelled in newspapers and pamphlets, against which he defended himself in an Apology, and warmly retaliated on his adversaries. He wrote several other things, and died in 1762. He was a polite scholar, an excellent orator, an elegant and easy writer, and esteemed by the first men of his time for his learning and wit.

King, Peter, lord high chancellor of Great Britain, was the son of an eminent grocer and saltier, and was born at Exeter in 1609, and bred up for some years to his father's business, but his inclination to learning was so strong, that he laid out all the money he could spare in books, and devoted every moment of his leisure hours to study: so that he became an excellent scholar before the world suspected any such thing; and gave the public a proof of his skill in church history, in his Inquiry into the Constitution, Discipline, Unity, and Worship of the primitive Church, that flourished within the first 300 years after Christ. London, 1691, 8vo. This was written with a view to promote the scheme of a comprehension of the dissenters. He afterwards published the second part of the Inquiry into the Constitution, &c.; and having desired, in his preface, to be shown, either publicly or privately, any mistakes he might have made, that request was first complied with by Mr Edmund Elys; between whom and our author there passed several letters upon the subject, in 1692, which were published by Mr Elys in 1694, 8vo, under the title of Letters on several Subjects. But the most formal and elaborate answer to the Inquiry appeared afterwards, in a work entitled, Original Draught of the Primitive Church.

His acquaintance with Mr Locke, to whom he was related, and who left him half his library at his death, was of great advantage to him; by his advice, after he had studied some time in Holland, he applied himself to the study of the law; in which profession his learning and diligence made him soon taken notice of. In the two last parliaments during the reign of King William, and in five parliaments during the reign of Queen Anne, he served as burgess for Beer-Alton, in Devonshire. In 1702, he published at London, in 8vo, without his name, his History of the Apostles' Creed, with critical observations on its several articles; which is highly esteemed. In 1708, he was chosen recorder of the city of London, and in 1710, was one of the members of the house of commons at the trial of Dr Sacheverell. In 1714, he was appointed lord chief justice of the common pleas; and the April following, was made one of the privy council. In 1715, he was created a peer, by the title of Lord King, baron of Ockham in Surrey, and appointed lord high chancellor of Great Britain; in which situation he continued till 1735, when he resigned; and in 1734 died at Ockham in Surrey.

King's Bench. See Bench, King's.

King Bird. See Paradise, Ornithology Index.

King's Fisher. See Alcedo, Ornithology Index.

Books of Kings, two canonical books of the Old Testament, so called because they contain the history of the kings of Israel and Judah from the beginning of the reign of Solomon down to the Babylonish captivity for the space of near 600 years. The first book of Kings contains the latter part of the life of David, and his death; the flourishing state of the Israelites under Solomon, his building and dedicating the temple of Jerusalem, his shameful defection from the true religion, and the sudden decay of the Jewish nation after his death, when it was divided into two kingdoms: the rest of the book is taken up in relating the acts of four kings of Judah and eight of Israel. The second book, which is a continuation of the same history, is a relation of the memorable acts of 16 kings of Judah, and 12 of Israel, and the end of both kingdoms, by the carrying of the 10 tribes captive into Assyria by Shalmaneser, and the other two into Babylon by Nebuchadnezzar.

It is probable that these books were composed by Ezra, who extracted them out of the public records, which were kept of what passed in that nation.

King's County, a county of the province of Leinster in Ireland, taking its name from King Philip of Spain, husband to Queen Mary. It is bounded on the north by West Meath; on the south by Tipperary and Queen's county, from which it is divided by the Barrow; and by part of Tipperary and Galway on the west, from which it is separated by the Shannon. It is a fine fruitful country, containing 375,510, Irish plantation acres, 56 parishes, 11 baronies, and two boroughs. It is about 38 miles long and 30 broad, and the chief town is Philipstown.

King's Evil, or Seraphula. See Medicine Index.

King-te-ching, a famous village belonging to the district of Juan-te-chou-fou, a city of China, in the province of Kiang-si. This village, in which are collected the best workmen in porcelain, is as populous as the largest cities of China. It is reckoned to contain a million of inhabitants, who consume every day more than ten thousand loads of rice. It extends a league and a half along the banks of a beautiful river, and is not a collection of straggling houses intermixed with spots of ground: on the contrary, the people complain that the buildings are too crowded, and that the long streets which they form are too narrow; those who pass through them imagine themselves transported into the midst of a fair, where nothing is heard around but the noise of potters calling out to make way.

Provisions are dear here, because every thing consumed.
Kingston, 464

Kin, as brought from remote places; even wood, so necessary for their furnaces, is actually transported from the distance of an hundred leagues. This village, notwithstanding the high price of provisions, is an asylum for a great number of poor families, who could not subsist anywhere else. Children and invalids find employment here, and even the blind gain a livelihood by pounding colours. The river in this place forms a kind of harbour about a league in circumference: two or three rows of barks placed in a line sometimes border the whole extent of this vast basin.

Kingdom, the territories or extent of country subject to a king.

Kingdoms of Nature. Most naturalists following Linneus, have divided all natural bodies into three great classes, called kingdoms. These are the mineral, the vegetable, and the animal kingdoms. See Natural History.

KINGHORN, a borough town in the county of Fife in Scotland, on the frith of Forth, directly opposite to Leith. The manufacture of thread stockings has been long established; and machinery has been introduced for spinning cotton and flax. Many of the men are employed in coasting ships, in the fishing, or the passage boats from hence to Leith, from which the town of Kinghorn derives considerable advantage. This place gives a second title to the earl of Strathmore. The population in 1811 was 2204.

KINGSBRIDGE, a town of Devonshire, 217 miles west-south-west from London, which has a harbour for boats, and it is a chapel of ease to Cheston. The population in 1811 amounted to 1242.

KINGSCHELRE, a town of Hampshire, is 36 miles from London, was once the seat of the Saxon kings, and contained 1663 inhabitants in 1811.

KINGSFERRY, in Kent, the common way from the main land to the isle of Sheppey; where a cable of about 140 fathoms in length, fastened at each end across the water, serves to get the boat over by hand. For the maintenance of this ferry and keeping up the highway leading to it through the marshes for above one mile in length, and for supporting a wall against the sea, the land occupiers tax themselves yearly one penny per acre for fresh marsh land, and one penny for every 10 acres of salt marsh land. Here is a house for the ferry-keeper, who is obliged to tow all travellers over free, except on these four days, viz. Palm Monday, Whit-Monday, St James's day, and Michaelmas day, when a horseman pays two pence, and a footman one penny. But on Sunday, or after eight o'clock at night, the ferry-keeper demands sixpence of every horseman, and two pence of every footman, whether strangers or the land occupiers.

KINGSTON upon THAMES, a town of Surrey in England, situated 13 miles from London. It takes its name from having been the residence of many of our Saxon kings, some of whom were crowned here on a stage in the market place. It has a wooden bridge of 20 arches over the Thames, which is navigable here by barges. There is another bridge here of brick, over a stream that comes from a spring in a cellar four miles above the town, and forms such a brook as to drive two mills not above a bowshot from it and from each other. It is generally the place for the summer assizes of this county. It is a well built town, and in the reigns of King Edward II. and III. sent members to parliament. It has a free school; an alms house built in 1670, for six men and six women, and endowed with lands to the value of 20l. a year; and a charity school for 30 boys, who are all clothed. Here is a spacious church with eight bells; adjoining to which, on the north side was formerly a chapel dedicated to St Mary, in which were the pictures of three of the Saxon kings that were crowned here, and also that of King John, who gave the inhabitants of this town their first charter of incorporation. But these were all destroyed by the fall of this chapel in 1730. Here is a good market for corn. Population 4144 in 1811.

KINGSTON upon Hull, a town in the east riding of Yorkshire, 173 miles from London. Its common name is simply Hull, and it is situated at the confluence of the rivers Hull and Humber, and near the place where the latter opens into the German Ocean. It lies so low, that by cutting the banks of the Humber the country may be laid under water for five miles round. Towards the land it is defended by a wall and a ditch, with the farther fortification of a castle, a citadel, and blockhouse. Hull has convenient docks for the shipping that frequent this port. The first dock was completed some years ago. The town is large and populous, containing two churches, several meeting houses, a free school, a charity school, and some hospitals. Among the latter is one called Trinity House, in which are maintained many distressed seamen, both of Hull and other places, that are members of its port. It is governed by 12 elder brethren and six assistants; out of the former are chosen annually two wardens, and out of the younger brethren two stewards; they determine questions between masters and seamen, and other sea matters. A handsome infirmary has lately been erected without the town to the north. Here are also an exchange and a custom-house, and over the Hull a wooden draw-bridge. A good harbour was made here by Richard II. This town has not only the most considerable inland traffic of any port in the north of England, but a foreign trade superior to any in the kingdom, excepting the ports of London, Bristol, Liverpool, and Yarmouth. By means of the many large rivers that fall into the Humber, it trades to almost every part of Yorkshire, as well as to Lincolnshire, Nottinghamshire, Staffordshire, Derbyshire, and Cheshire: the commodities of which counties are brought hither, and exported to Holland, Hamburgh, France, Spain, the Baltic, and other parts of Europe. In return for these, are imported iron, copper, hemp, flax, canvas, Russia linen and yarn, besides wine, oil, fruit, and other articles. Such quantities of corn are also brought hither by the navigable rivers, that Hull exports more of this commodity than London. The trade of Hull with London, particularly for corn, lead, and butter, and with Holland and France, in times of peace, for those commodities, as well as for cloth, kersey, and other manufactures of Yorkshire, is very considerable. In 1803 the number of ships belonging to Hull, employed in the Greenland and Davis's straits whale fishery, amounted to 40. The mayor of Hull has two swords, one given by King Richard II. the other by Henry VIII. but only one is borne before him at a time; also a cap of maintenance, and an oar of lignum vitae.
KIN

KIN

KINGSTON, a town of Ireland, in the province of Leinster, and capital of King's county. W. Long. 7° 20'. N. Lat. 53° 15'. It is otherwise called Philpot-Town.

KINGSTON, a town of Jamaica, seated on the north side of the bay of Port Royal. It was founded in the year 1693, when the repeated desolations by earthquake and fire had driven the inhabitants from Port Royal. It extends a mile from north to south, and about as much from east to west, on the harbour. It contains about 3000 houses, besides negro houses, and warehouses. The number of white inhabitants is about 10,000; of free people of colour 5000; and of slaves, about 18,000. It is the county town, where the assizes are held, in January, April, July, and October, and last about a fortnight. It is a place of great trade.

KINTON, or Kyneton, a pretty large town in Herefordshire, 46 miles from London. It is situated on the river Arrow, and is inhabited chiefly by clothiers, who drive a considerable trade in narrow cloth. It has a considerable market for corn, cattle, leather, home-made linen and woollen cloth, and all sorts of provisions.

KINNOR, or Chinnor. See Chinnor.

KINO, a gum resin. See Materia Medica Index.

KINROSS, the county town of Kinross-shire in Scotland, situated in W. Long. 3° 25'. N. Lat. 56° 15'. on the west side of Lochleven, a fresh water lake about 10 miles in compass, abounding with pike, trout, perch, and water fowl. The manufactures are lines and some cutlery ware. The house of Kinross, an elegant ancient structure, stands on the north side of the town. Kinross sends a member to parliament by turns with Clackmannan. In the lake are two islands; on one of which appear the ruins of a priory, heretofore possessed by the Culdees; and the other is famous for the castle in which Queen Mary was imprisoned by her rebellious subjects.

The following is the population of this county according to its parishes *

See Kinross-shire, Supplement.

KINSALE, a town of the county of Cork in Ireland, situated at the mouth of the river Ban or Bandon, 136 miles from Dublin. It is reckoned the third town in the kingdom, and inferior only to Cork in point of trade. It is neat, well built, and wealthy; and is governed by a sovereign and recorder. It is defended by a strong fort built by King Charles II., called Charles's fort; and on the opposite shore there are two well built villages, called Cove and Scilly. In the town and liberties are 6 parishes, 30 plough lands, and therein 68,46 acres, and the population amounts to 10,000. The barracks hold 12 companies of foot, besides a regiment at Charles's fort. In the centre of the town is a good market-house, and near it a strong-built prison; and there are scattered up and down the ruins of several monasteries and religious houses. In time of war Kinsale is a place of much business, being then frequented by rich homeward bound fleets and ships of war, for which reason most of the houses are then let at double rents. The harbour is very commodious, and perfectly secure; so large that the English and Dutch Smyrna fleets have anchored in it at the same time. There is a dock and yard for repairing ships of war, and a crane and gun wharf for landing and shipping heavy artillery. Ships may sail into or out of this harbour, keeping in the middle of the channel, with the utmost safety. Within the haven on the west side lies a great shelf, which shoots a great way off from the land; but leaves an ample passage by the side of it, in which, as in all the rest of the harbour, it is many fathoms deep. Lord Kinsale has the ancient privilege of keeping his boat on in the king's presence. Kinsale gives the title of baron to the very ancient family of Courcy, lineally descended from John de Courcy, earl of Ulster, who from him have the privilege to be seated in the presence of the king of England.

KINTORE, a royal borough of Aberdeenshire in Scotland, situated on the river Don, in W. Long. 2° 6'. N. Lat. 57° 10'. It gives the title of earl to a branch of the noble family of Keith. The population in 1811 was 863.

KINTYRE. See Cantire.

KIOF, or Kiow, a considerable town of Poland, and capital of the Ukrain, in the palatinate of the same name, with an archbishop's see and castle. It belongs to Russia, and carries on a considerable trade. It is divided into the Old and New Town, and seated on the river Nieper, in E. Long. 31° 51'. N. Lat. 50° 12'.

KIPPS, Andrew, a learned and eminent English non-conformist divine and biographer, was born at Nottingham, on the 28th of March 1725. On the death of his father, he was removed to Staford in Lincolnshire at five years of age, where he received his grammar education, and gave such early proofs of talents and progress, as attracted the notice of Mr Merivale, the pastor of a congregation of dissenters at that place. To this excellent man it was probably owing that young Kippis directed his views to the profession of a dissenting minister, and to those studies in which he afterwards so much excelled. In 1741 he was placed in the academy at Northampton, under the tuition of the celebrated Dr Doddridge, a seminary at that time in high reputation. Of the advantages which this institution afforded him, Mr Kipps knew how to make the best improvement, and his regular conduct and proficiency secured him the esteem of his worthy tutor. Having completed his course of studies in five years, he was invited to a dissenting congregation at

3 N

Dorchester.
Dorchester, but he gave the preference to a similar call from Boston in Lincolnshire in 1746, where he remained till 1750, removing from thence to Dorking in Surrey, and two years after to Long Ditch, Westminster, in the room of Dr Hughes deceased. This was in October 1753, and in the preceding month he married Miss Elizabeth Bott, the daughter of a merchant at Boston.

The situation, for which Mr Kippis was eminently qualified by his extensive abilities, being now respectable, introduced him to useful and honourable connections. He became a manager of the presbyterian fund for the assistance of poor congregations in the country in supporting their ministers, and in 1762 he was chosen a member of Dr Williams's trust, nearly for similar purposes, together with the doctor's valuable library, which afforded him opportunities of very extensive usefulness. In 1762, he signified among his friends his design of taking private pupils, and was on the eve of entering into engagements with the parents of two or three young gentlemen, when a more honourable although a less lucrative employment was offered him. He was appointed classical and philosophical tutor in Coward's academy, an office which he filled for upwards of 15 years with uncommon reputation to himself, and unspoilable advantage to his students. He received the degree of D. D. from the University of Edinburgh, by the unsolicited recommendation of the learned Professor Robertson in 1767; in 1778 he was made a member of the Antiquarian, and in 1779 a fellow of the Royal Society.

His literary engagements growing extremely numerous, in 1784 he was obliged to resign his appointment in Coward's academy, which was discontinued in the subsequent year. In 1786, attempts were made to establish a new academy in the vicinity of London; a design which Dr Kippis exerted all his influence to accomplish; and although his numerous engagements made it extremely difficult for him to fill any department in it, he reluctantly yielded to the wishes of the subscribers, and became a tutor. But the inconvenience arising from the distance of Hackney from his place of residence, made him resign that office in a few years. His professional duties and private studies occupied his time after this period; and as he enjoyed an uninterrupted state of good health and constitutional vigour, made his friends hope that his life and usefulness would be long continued; but in consequence of a cold which he caught on a journey, he was seized with a fever which no medical knowledge could subdue, and he died on the 5th of October 1795, in the 71st year of his age.

Dr Kippis was distinguished in a high degree for those virtues and accomplishments which are universally allowed to be the chief ornaments of human nature. His temper was mild and gentle, benevolent and candid; his manners and address were easy, polished and conciliating. Notwithstanding his great reputation, he was void of pride, vanity, and self-conceit; he was humble, modest, affable and engaging. The powers and vigour of his mind were far above mediocrity; he had a sound judgment, a comprehensive understanding, correct imagination, retentive memory, a refined taste, and he could exert his faculties on any subject with the utmost facility. He was an early riser from his youth, to which in a great measure his good health may be ascribed. He excelled in his acquaintance with the classics, belles-lettres, history, and biography. He was the steady friend and advocate of genuine civil and religious liberty; and as a divine, he was well acquainted with the different branches of theology, and with those subjects which are subservient to the critical study of the scriptures. He very seldom introduced controverted topics into the pulpit, but confined himself to such doctrines and duties as have an immediate influence on the temper and practice.

His works are numerous and valuable, of which we give the following as a specimen: Review of the Transactions of the present Reign; The History of Learning, Knowledge, and Taste in Great Britain; A Vindication of the Protestant Dissenting Ministers, with regard to their late application to Parliament; Considerations on the Provisional Treaty with America, and the Preliminary Articles of Peace with France and Spain; The Life of Sir John Pringle; Six Discourses delivered at the Royal Society, on assigning the Copley Medal; The Life of Captain James Cook, of Dr Larnder, and Dr Doddridge; Sermons preached on public occasions; Biographia Britannica, &c. &c. This last great work, which he did not live to finish, has assigned him a high rank among the learned of his country, and will transmit his name to posterity with distinguished reputation.

KIRCH, CHRISTIAN-FREDERIC, of Berlin, a celebrated astronomer, was born at Guben in 1694, and acquired great reputation in the observatories of Dantzic and Berlin. Godfrey Kirch his father, and Mary his mother, acquired considerable reputation by their astronomical observations. This family corresponded with all the learned societies of Europe, and their astronomical works are in some repute.

KIRCHER, ATHANASIUS, a famous philosopher and mathematician, was born at Fulde in 1601. In 1618, he entered into the society of the Jesuits, and taught philosophy, mathematics, the Hebrew and Syriac languages, in the university of Witzburg, with great applause, till the year 1631. He went to France on account of the ravages committed by the Swedes in France, and lived some time at Avignon. He was afterwards called to Rome, where he taught mathematics in the Roman College, collected a rich cabinet of machines and antiquities, and died in 1680. The quantity of his works is immense, amounting to 22 vols in folio, 11 in quarto, and 3 in 8vo; enough to employ a man for a great part of his life even to transcribe them. Most of them are rather curious than useful; many of them visionary and fanciful; and if they are not always accompanied with the greatest exactness and precision, the reader, it is presumed, will not be astonished. The principal of his works are, 1. Prolationes magneticae. 2. Primitiae grammaticae cætoricæ. 3. Ars magna lucis et umbrae. 4. Musurgia universalis. 5. Obelisco Pamphilii. 6. Oedipus Egyptianus, four volumes, folio. 7. Itinerarium exstacticum. 8. Obeliscus Egyptianus, in four volumes, folio. 9. Mundus subterraneus. 10. China illustrata.

KIRIATHAIM, in Ancient Geography, one of the towns built by the Reubenites; reckoned to the tribe
KIR [ 467 ]

Kirrihim

[ Image 3x0 to 583x745 ]

KIRK

KIRK, the ancient residence of the giants called

KIRK-SESSION, the name of a petty ecclesiastical judi-
catory in Scotland. Each parish, according to its ex-
ten, is divided into several particular districts; every one of
these has its own elder and deacon to oversee it. A
consistory of the ministers, elders, and deacons of a
parish, forms a kirk-session. These meet once a week,
the minister being their moderator, but without a
negative voice. It regulates matters relating to public
worship, catechising, visitations, &c. It judges in lesser
matters of scandal; but greater, as adultery, are
left to the presbytery; and in all cases an appeal lies
to the presbytery. Kirk-sessions have likewise the
care of the poor and poor's funds.

KIRKCALDY, a town of the county of Fife in Scot-
tland, two miles to the north-east of Kinghorn. It is a
royal borough, the seat of a presbytery, and gives the
title of laird to the earl of Melville. The town is pop-
ulous, well built, and extends a mile in length from
east to west, enjoying a considerable trade by export-
ing its own produce and manufactures of corn, coal, li-
nen, and salt. The population in 1811 was 3747.

KIRKBY-LONDALE, a town of Westmoreland, 253 miles from London. It has a woolen manufactory
and market on Tuesday. It has a free school well
endowed with three presentations to Christ's college,
Cambridge. It has a large church, and a good stone
bridge of three arches over the Lune. From its church-
yard and the banks of the river, there is a very fine
prospect of the mountains at a vast distance, as well as
of the course of the river, which abounds with salmon,
trout, &c.; and provisions of all sorts are very cheap
there. The number of inhabitants in 1811 was

KIRKBY-STEVEN, or Stephen's Church, a town of
Westmoreland, 257 miles from London, stands on the
river Eden near Sedbergh and Askarth. The church
is a large building with a lofty tower; in it are several
old monuments. Here is a good free school that has
two exhibitions. The town is noted for the manufac-
tory of yarn stockings; and it contained 1235 inhabi-
tants in 1811.

KIRKBY-THEORE, a town of Westmoreland, stands al-
so on the river Eden, north-west of Appleby, 267 miles
from London. A herd of a deer was found here a few
years since, at the depth of four feet from the surface
of the earth; and several other antiquities have been
dug up or taken out of a well, discovered at the end of
the town near the bridge. Below it are the vast ruins of an ancient town, where Roman coins and
urns are frequently dug up. The people call it

Kirby-Thorn.

KIRKCUDBRIGHT, county or stewartry, makes a
considerable part of Galloway, and of which the earls
of Nithsdale were hereditary stewards. It is 45 miles
long, and 30 broad, and with Wigtounshire formed
the ancient province of Galloway. The face of the coun-
try exhibits the appearance of one continued heath,
producing nothing but pasture for sheep and small black
cattle, which are generally sold in England; yet these
dusty moors are intersected with pleasant valleys, and
adorned with a great number of castles belonging to
private gentlemen, every house being surrounded with
an agreeable plantation. It is watered by the river
Dee, which taking its rise from the mountains near
Carrick, runs through a tract of land about 70 miles in
length, and, entering the Irish sea, forms the har-
bour of Kirkcudbright, a borough town, well situated
for the fisheries and other branches of commerce. There
is no other town of any consequence in this stewar-
try. Kirkcudbright gives title of baron to the Macellans,
formerly a powerful family in the county. The popula-
tion of this county, according to its parishes, is the
following.

Population in 1811: 21,205, 26,959

See KIRKCUDBRIGHTSHIRE, SUPPLEMENT.
KIRKHAM, a town of Lancashire, 221 miles from London, stands near the Ribble, six miles from the Irish sea, in that part of the county called the Field lands. It has a market and three fairs, and a free school well endowed. By means of inland navigation, it has a communication with the rivers Mersey, Dee, Ribble, Ouse, Trent, Darwent, Severn, Hum- 
ber, Thames, Avon, &c.; which navigation, including its windings, extends above 300 miles, in the counties of Lincoln, Nottingham, York, Westmorland, Chester, Warwick, and Oxford. Population 2214.

KIRKOSWALD, a town of Cumberland on the Eden, 291 miles from London. It had formerly a castle, which was demolished above 100 years ago. It has a market and two fairs. Its church is a very irregular old building; and the belfry is placed distant from the church on the top of a hill, that the sound of the bells might be more easily heard by the circum-
jacent villages.

KIRKWALL, the capital of the Orkneys, situated in the island of Pomona, in W. Long. 0. 25 N. Lat. 58. 33. It is built upon an inlet of the sea near the middle of the island, having a very safe road and harbour for shipping. It is a royal borough, governed by a provost, bailies, and common council. It was formerly possessed by the Norwegians, who bestowed upon it the name of Cruciocia. From King James III. of Scotland they obtained a new charter, empowering them to elect their own magistrates yearly, to hold borough courts, arrest, imprison, make laws and ordinances for the right government of the town; to have a weekly market, and three fairs annually at certain fixed terms: he moreover granted to them some land adjoining to the town, with the customs and shore dues, the power of pit and gallowes, and exempted them from the expense of sending commissioners to parliament. This charter has been confirmed by succeeding monarchs. At present Kirkwall is the seat of justice, where the steward, sheriff, and commissary, hold their several courts of judicature: Here is likewise a public grammar school, endowed with a competent salary for the master. The town consists of one narrow street about a mile in length; the houses are chiefly covered with slate, though not at all remarkable for neatness and convenience. The principal edifices are the cathedral church and the bishop's palace. The former, called St Magnus, from Magnus king of Norway, the supposed founder of the town, is a large Gothic structure: the roof is supported by 24 pillars on each side, and the spire is built upon four large columns. The gates are decorated with a kind of mosaic work, of red and white stones elegantly carved and flowered. By the ruins of the king's castle or citadel, it appears to have been a strong and stately fortress. At the north end of the town a fortification was built by the English in the time of Oliver Cromwell, but it is now in ruins. It was surrounded with a ditch and rampart; but it has been allowed to fall into ruins. The population in 1801 was 2621.

KIRSTENSUS, PETER, professor of physic at Upsal, and physician extraordinary to the queen of Sweden, was born at Breslaw in 1577. He studied Greek, Latin, Hebrew, Syriac, natural philosophy, anatomy, botany, and other sciences. Being told that a man could not distinguish himself in physic unless he understood Avicenna, he applied himself to the study of Arabic; and not only to read Avicenna, but also Mesue, Rhazes, Arezoar, Abukasis, and Aver- 
roes. He visited Spain, Italy, England, and did not return home from his travels till after seven years. He was chosen by the magistrates of Breslaw to have the direction of their college and of their schools. A fit of sickness having obliged him to resign that difficult employment, with which he was also much disgusted, he applied himself chiefly to the practice of physic, and went with his family into Prussia. Here he obtained the friendship and esteem of the chancellor Oxenstiern, whom he accompanied into Sweden; where he was made professor of physic in the university of Upsal, and physician to the queen. He died in 1650. It is said in his epitaph, that he understood 26 languages. He wrote many works; among which are, 1. Liber secundus Canonis Avicenne, typis Arabicius, et ad verbum in Latinum translatus, in folio. 2. De sero ut et album Medicinae. 3. Gram- matica Arabica, folio. 4. Vita quatuor Evangelista- rum, ex antiquissimo codice MSS. Arabico erat, in folio. 5. Notae in Evangelium S. Matthaei, ex collatione textuum Arabicorum, Syriacorum, Egyptianorum, Graecorum, et Latinorum, in folio, &c.

He ought not to be confounded with George Ker- stenius, another learned physician and naturalist, who was born at Stettin, and died in 1660; and is also the author of several works.

KIRTL, a term used for a short jacket; also for a quantity of flax about a hundred weight.

KIRTON, or KIRKTON, a town of Lincolnshire, 151 miles from London. It had its name from its kirk or church, which is truly magnificent. It has a market and two fairs. This place is famous for the pippin, which, when grafted on its stock, is called the remnet. It gives name to its hundreds, in which are four villages of the same name.

KISSE, the ancient Colonias Asseris in Africa, as appears from many inscriptions still to be met with in the place. Here is a triple portal arch done in a very good taste; there is also a small temple of square figure, having several instruments of sacrifice carved upon it; but the execution is much inferior to the design, which is very curious. The town is situated in the kingdom of Tunes, on the declivity of a hill, above a large fertile plain; which is still called the plain of Surzo, probably from its ancient name Asserus.

KISSING, by way of salutation, or as a token of respect, has been practised in all nations. The Ro-
man emperors saluted their principal officers by a kiss. Kissing the mouth or the eyes was the usual compli-
ment upon any promotion or happy event. Soldiers kissed the general's hand when he quitted his office. Fathers, amongst the Romans, had so much delicacy, that they never embraced their wives in the presence of their daughters. Near relations were allowed to kiss their female kindred on the mouth; but this was done in order to know whether they smelt of wine or not; because the Roman ladies, in spite of a prohibi-
tion to the contrary, were found sometimes to have made too free with the juice of the grape. Soldiers kissed their masters hand, who used to hold it out to them for that purpose. Kissing was a customary mode of salu-
tation.
KIS

KLE

KISSING.

KISTI.

KISTI, an Asiatic nation, which extends from the highest ridge of Caucasus, along the Sundha rivulets. According to Major Rennel*, they are bounded to the west by the little Cabarda, to the east by the Tartars and Leaguiss, and to the south by the Leaguiss and Georgians. He imagines they may be the people whom Gaerber calls the Tashmaiz, i.e. "mountaineers," and to whom he attributes the following strange custom:—"When a guest or stranger comes to lodge with them, one of the host's daughters is obliged to receive him, to unsaddle and feed his horse, take care of his baggage, prepare his dinner, pass the night with him, and continue at his disposal during his stay. At his departure, she saddles his horse and packs up his baggage. It would be very uncourtly to refuse any of these marks of hospitality." The different tribes of this restless and turbulent nation are generally at variance with each other, and with all their neighbours. Their dialects have no analogy with any known language, and their history and origin are at present utterly unknown.

Their districts, as enumerated in Major Rennel's Memoir, are, 1. Ingushi, about 60 miles to the southward of Moosok, in the high mountains about the Kumbelii. 2. Endery, and 3. Assai, on a low ridge between the Sundha and Iaxai rivers. In their territories are the hot wells. 4. Ackinyourt towards the upper part of the Sundha and Iaxai. 5. Ardakli, on the Roshni that joins the Sundha. 6. Water near the Oasen village Tahim, towards the source of the Terek. 7. Angushi, on the upper part of the Kumbelii. 8. Shahk, called by the Russians Maloi Angushi. 9. Tshtseni, on the lower part of the Argun river. 10. Atakhi, a small district on the upper part of the Argun. 11. Kulga, or Oshteni, in the high mountains. 12. Galgor, or Halha, about the source of the Assai, a Sundha rivulet. 13. Tshabrillo, and Shabul, on the Sundha. 14. Tashshini-Kabul, on the Roshni, a Sundha rivulet. 15. Karaboulak, a wandering tribe, who have their little villages about the six uppermost rivulets of the Sundha, particularly the Fortan. 16. Meesti, Meredehi, Galashka, and Duhun, are small tribes on the Assai.

The Ingushi, or first of the above tribes, submitted to Russia in 1770. They are capable of arming about 3000 men; they call themselves Ingushi, Kisti, or Halha; they live in villages near each other, containing about 20 or 30 houses; are diligent husbandmen, and rich in cattle. Half of their villages have a stone tower, which serves in time of war as a retreat to their women and children, and as a magazine for their effects. These people are all armed, and have the custom of wearing shields.—Their religion is very simple, but has some traces of Christianity: They believe in one God, whom they call Daiil, but have no saints or religious persons; they celebrate Sunday, not by any religious ceremony, but by resting from labour; they have a fast in spring, and another in summer; they observe no ceremonies either at births or deaths; they allow of polygamy, and eat pork. One kind of sacrifice is usual among them: at certain times a sheep is killed by a person who seems to be considered as a kind of priest, as he is obliged to live in a state of celibacy. His habitation is in the mountains, near an old stone church, which is said to be adorned with various statues and inscriptions. Under the church is a vault that contains certain old books, which, however, no one ever attempts to approach. Mr Guldenstaedt was prevented by the weather from visiting this church.

The 6th, 7th, and 8th tribes, which were formerly tributary to the Cabardean princes, submitted to Russia in 1770. The 6th, Tshtshen, is governed by its own chiefs, who are related to the Avar-Khan. This tribe is so numerous and warlike, and has given the Russians so much trouble, that its name is usually given by them to the whole Kisti nation. The chief village of Tshtshen lies on the Argun, about 15 miles from its mouth. Its other principal villages are Hardabaul and Tangajent, both on the Sundha.

KIT, in Music, the name of a small violin, of such form and dimension as to be capable of being carried in a case or sheath in the pocket. Its length, measuring from the extremities, is about 16 inches, and that of the bow about 17. Small as this instrument is, its powers are co-extensive with those of the violin.

Kit-Cat Club, an association of above 30 noblemen and gentlemen of distinguished merit, formed in 1703, purely to unite their zeal in favour of the Protestant succession in the house of Hanover. Their name was derived from Christopher Kat, a pastry cook, near the tavern where they met in King's Street, Westminster, who often supplied them with pastries. Old Jacob Tresson was their bookseller; and that family is in possession of a picture of the original members of this famous club, painted by Sir Godfrey Kneller. The design of these gentlemen was to recommend and encourage true loyalty by the powerful influence of wit and humour; and Sir Samuel Garth distinguished himself by the extempore epigrams he made on their teas, which were inscribed on their drinking glasses.

KITCHEN, the room in a house where the provisions are cooked.

Army Kitchen, is a space of about 16 or 18 feet diameter, with a ditch surrounding it three feet wide; the opposite bank of which serves as a seat for the men who dress the victuals. The kitchens of the flank companies are contiguous to the outline of the camp; and the intermediate space is generally distributed equally for the remaining kitchens; and as each tent forms a mess, each kitchen must have as many fire places as there are tents in the company.

Kitchen Garden, a piece of ground laid out for the cultivation of fruit, herbs, pulse, and other vegetables, used in the kitchen. See Gardening.

KITE. See Falco, Ornithology Index.

KITTEN. See Larus, Ornithology Index.

KIU-HOA. See Parthenium, Botany Index.

KIUN-TCHEOU. See Hsi-Nan.

KLEINHOVIA, a genus of plants belonging to...
KLEIST, EDWARD CHRISTIAN DE, a celebrated German poet, and a soldier of distinguished bravery, was born at Zelen, in Pomerania, in 1745. At nine years of age he was sent to pursue his studies at Cron in Poland; and he afterwards studied at Danzig and Königsberg. Having finished his studies, he went to visit his relations in Denmark, who invited him to settle there, and having in vain endeavored to obtain preferment in the law, at twenty-one years of age accepted of a post in the Danish army. He then applied himself to the study of all the sciences that have a relation to military affairs, with the same assiduity as he had before studied civil law. In 1740, at the beginning of the reign of Frederic king of Prussia, Mr de Kleist went to Berlin, and was presented to his majesty, who made him lieutenant of his brother Prince Henry’s regiment; and he was in all the campaigns which distinguished the first five years of the king of Prussia’s reign. In 1749 he obtained the post of captain; and in that year published his excellent poem on the Spring. Before the breaking out of the last war, the king chose him, with some other officers at Potsdam, companion to the young Prince Frederic William of Prussia, and to eat at his table. In the first campaign, in 1756, he was nominated major of Haenzen’s regiment; which being in garrison at Leipsic, he had time to finish several new poems. After the battle of Rossbach, the king gave him, by an order in his own handwriting, the inspection of the great hospital established at Leipsic. On this occasion his humanity was celebrated by the sick and wounded of both parties, and his disinterestedness was equally admired by all the inhabitants of that city. In 1758, Prince Henry coming to Leipsic, Mr Kleist desired to serve in his army with the regiment of Haenzen, which was readily granted. Opportunities of distinguishing himself could not be wanting under that great officer, and he always communicated his courage to the battalion under his command. He also served that prince at the beginning of the campaign of 1759, when he was with him in France, and in all the expeditions of that army, till he was detached with the troops under General de Fink to join the king’s army. On the 13th of August was fought the bloody battle of Kuenersdorf, in which he fell. He attacked the flank of the Russian, and assisted in gaining three batteries. In these bloody attacks he received twelve contusions; and the two first fingers of his right hand being wounded, he was forced to hold his sword in the left. His post of major obliged him to remain behind the ranks; but he never perceived the commander of the battalion wounded and carried away, than he instantly put himself at the head of his troop. He led his battalion in the midst of the terrible fire of the enemy’s artillery, against the fourth battery. He called up the colours of the regiment; and, taking an ensign by the arm, led him on. Here he received a ball in his left arm; when, being no longer able to hold his sword in his left hand, he took it again in the right, and held it with the two last fingers and his thumb. He still pushed forward, and was within thirty steps of the battery, when his right leg was shattered by the wadding of one of the great guns; and he fell from his horse, crying to his men, Klepstuck, My boys, don’t abandon your king.” By the assistance of those who surrounded him, he endeavored twice to remount his horse; but his strength forsook him, and he fainted. He was then carried behind the line; where a surgeon, attempting to dress his wounds, was shot dead. The Cossacks arriving soon after, stripped Mr Kleist naked, and threw him into a muddy place; where some Russian hussars found him in the night, and laid him in some straw near the fire of the grand guard, covered him with a cloak, put a hat on his head, and gave him some bread and water. In the morning one of them offered him a piece of silver, which he refused; on which he tossed it upon the cloak that covered him, and then departed with his companions. Soon after the Cossacks returned, and took all that the generous hussars had given him. Thus he again lay naked on the earth; and in that cruel situation continued till noon, when he was known by a Russian officer, who caused him to be conveyed in a waggon to Frankfort on the Oder; where he arrived in the evening, in a very weak state, and was instantly put into the hands of the surgeons. But the fractured bones separating, broke an artery, and he died by the loss of blood. The city of Frankfort being then in the hands of the enemy, they buried this Prussian hero with all military honours: the governor, a great number of the Russian officers, the magistrates of the city, with the professors and the students, formed the procession, preceded by the funeral music. Mr Kleist’s poems, which are greatly admired, are elegantly printed in the German tongue, in two volumes 8vo.

KLOPSTOCK, FREDERIC THEOPHILUS, who was born at Quedlinburg in 1724, was the greatest and most justly celebrated of the German poets. His father was a man of an elevated character, and a magistrate of that place, who afterwards farmed a bailiwick in the Brandenburg part of Mansfeld. Klopstock was the eldest of eleven children, and having received the rudiments of education at home, he was put to the public school of Quedlinburg, where he soon became conspicuous both for bodily and mental exercises. He went to the college of the same place at the age of sixteen, where, under the tuition of an able teacher, he obtained a knowledge of, and taste for, the beauties of the best classical authors. He composed some pastorals in verse; and even at this early period he conceived the bold design of writing an epic poem, fixing at length, after much deliberation on the “Messiah,” by which he has rendered his name immortal.

He commenced the study of theology at the university of Jena, in the year 1745, although in his retirement he was constantly rumination on his great projected work already mentioned, sketching out the three first cantos. They were first written in prose, as the common measure of German verse did not accord with his own sentiments. Transformed with the melody of Homer’s and Virgil’s strains, he determined to make trial of German hexameters, in which he succeeded so entirely to his own satisfaction, that he fixed upon this majestic verse for the whole of his poem. By his removal from Jena to Leipzig in 1746, he became acquainted with a number of young votaries of the muse, who
KLO [ 471 ]

Kloestock, who occasionally published their essays in a paper called the "Bremen Contributions," in which appeared the three cantos of Kloestock's Messiah, and a number of his odes, for which he was so applauded as to animate him to persevere.

He quitted Leipzig in 1748, and resided at Langenaul, where he carried on a fruitless correspondence with the supposed young lady, who discovered no inclination to return his passion, for which time threw a gloom over his mind. He now published ten books of his Messiah, by which he came to be known and admired all over Germany. It was an extremely popular work among all those who were at once the lovers of poetry and devotion. It was quoted from the pulpit by young divines, while others of a more stern deportment found fault with the author, as indulging too much in fiction on sacred topics.

He travelled into Switzerland in 1750 to pay a visit to Bodmer of Zurich, in consequence of an invitation, where he was received with every token of respect. The sublime scenery of that country, the simplicity of its inhabitants, and the freedom they enjoyed, were admirably suited to the taste and sentiments of Kloestock. Here in all probability he would have breathed his last, had not Baron Bernstorff, who was charmed with his poetry, engaged Count Molke, after returning from France to Copenhagen, to invite him to that city, with assurances of such a pension as would make him independent. Our author accordingly set out for Copenhagen in the year 1751, by the way of Brunswick and Hamburg, at which latter place he became acquainted with a young lady (Miss Moller) of literary abilities, and a heart susceptible of tender impressions. They were soon after married, and seemed destined by Providence to be one of the happiest couples upon earth, but he was very soon deprived of her, for she died in childbirth, and her memory was sacred to Kloestock to the last hour of his existence. He lived for the most part at Copenhagen till the year 1771, after which he resided at Hamburg in the capacity of royal Danish legate, and counsellor of the marquis of Baden, who gave him a pension, and engaged him to pass the year 1775 at his palace of Carlsruhe. Such was the influence of our poet, that it required the most extraordinary condescension on the part of the great to make him easy in their presence.

The decline of his health made no change on the habitual tranquility of his mind; he contemplated his approaching dissolution without any dismay, and his pious fortune continued unshaken amidst the severest sufferings. He died at Hamburg in March 1823, being 79 years of age, and his funeral was attended with such honours as justly belonged to the greatest poet of the country.

The character of Kloestock as a poet is that of exuberance of imagination and sentiment. His sublimity, which is nearly unparalleled, makes him almost lose himself in mystical attraction. A great critic claims for the author of the Messiah, and we think justly, a rank among the very first class of poets. His odes and lyric poems are much admired by his countrymen, and his dramatic works display great force and dignity, but are thought to be better adapted to the closet than the theatre. He was also an excellent prose writer, as is fully evinced by his "Grammatical Kloestock Dialogues."

KNARESBOROUGH, a town in the west riding of Yorkshire in England, 109 miles from London, is an ancient borough by prescription, called by foreigners the Yorkshire Spa. It is almost encompassed by the river Nid, which issues from the bottom of Cra-ven hills; and had a priory, with a castle, long since demolished, on a craggy rock, whence it took the name. The town is about three furlongs in length; and the parish is famous for four medicinal springs near each other, and yet of different qualities. 1. The sweet spaw, or vitriolic well, in Knaresborough forest, three miles from the town, which was discovered in 1620. 2. The stinking or sulphureous spaw, which is used only in bathing. 3. St Mungo's, a cold bath, four miles from the town. 4. The dropping well, which is in the town, and the most noted petrifying spring in England, so called by reason of its dropping from the spongy rock hanging over it. The ground which receives it, before it joins the well, is, for 12 yards long, become a solid rock. From the well it runs into the Nid, where the spring water has made a rock that stretches some yards into the river. The adjacent fields are noted for liquorice, and a soft yellow marl which is rich manure. The town is governed by a bailiff. Its baths are less frequented since Scarborough Spa has been deserted to. It has a good market and six fairs. Here is a stone bridge over the river, near one end of which is a cell dug out of the rock, and called St Robert's Chapel. The number of inhabitants in 1811 was 4234.

Knapdale, one of the divisions of Argyllshire in Scotland. It is parted from Cowal on the east by Lochfin; bounded by Kintyre on the south, by Lorn on the north, by Braidalbin on the north-east, and on the west by the Hebrides. Its length from north to south does not exceed 20 miles, and the breadth in some places may amount to 15. It is joined to Kintyre by a neck of land not above a mile broad, over which the country people draw their boats, to avoid sailing round Kintyre. This part of Knapdale abounds with lakes, some of them containing little islands, on which there are castles belonging to different proprietors. The grounds are more adapted for pasturage than grain; but that on the side of Lochow is fruitful in both.

Knap sack, in a military sense, a rough leather bag which a soldier carries on his back, and which contains all his necessaries. Square knapsacks are most convenient; and should be made with a division to hold the shoes, black ball and brushes, separate from the linen. White goat-skins are the best.

Knavo, an old Saxon word, which had at first a sense of simplicity and innocence, for it signified a boy: Sax. canpa, whence a knowe child, i.e. a boy, distinguished from a girl, in several old writers; afterwards it was taken for a servant boy, and at length for any servant man. Also it was applied to a minister or officer that bore the shield or weapon of his superior; as field knapa, whom the Latins call armiger, and the French escuyer, 14 Edw. Ill. c. 3. And it was sometimes of old made use of as a titular addition; as Joannes C. filius Willelmi C. de Derby, knavo, &c. 22 Hen.

VII
The word is now perverted to the hardest meaning, viz. a false deceitful fellow.

KNAVESHIP, in Scots Law, one of the names of the small duties payable in thirslage to the miller's servants, called sequels.

KNAUTIA, a genus of plants belonging to the tetrandria class, and in the natural method ranking under the 8th order, Aggregatea. See Botany Index.

KNEE, in Anatomy, the articulation of the thigh and leg bones. See Anatomy, No. 59.

Knee, in a ship, a crooked piece of timber, having two branches or arms, and generally used to connect the beams of a ship with her sides or timbers. The branches of the knees form an angle of greater or smaller extent, according to the mutual situation of the pieces which they are designed to unite. One branch is securely bolted to one of the deck beams, whilst the other is in the same manner attached to a corresponding timber in the ship’s side, as represented by E in the plate of Midship Frame.

Besides the great utility of knees in connecting the beams and timbers into one compact frame, they contribute greatly to the strength and solidity of the ship, in the different parts of her frame to which they are bolted; and thereby enable her with greater firmness to resist the effects of a turbulent sea.

In fixing these pieces, it is occasionally necessary to give an oblique direction to the vertical or side branch, in order to avoid the range of an adjacent gusset, or because the knees may be so shaped as to require this disposition; it being sometimes difficult to procure so great a variety of knees as may be necessary in the construction of a number of ships of war.

In France, the scarcity of these pieces has obliged their shipwrights frequently to form their knees of iron.

Knees are either said to be lodging or hanging. The former are fixed horizontally in the ship's frame, having one arm bolted to the beam, and the other across two or three timbers, as represented in the Deck, Plate CLXIX. The latter are fixed vertically, as we have described above. See also Ship-Building, Deck, and Midship Frame.

Knee of the Head, a large flat piece of timber, fixed edgewise upon the fore part of a ship's stem, and supporting the ornamental figure or image placed under the bowsprit. See Ship-Building.

The knee of the head, which may properly be defined a continuation of the stem, as being prolonged from the stem forwards, is extremely broad at the upper part, and accordingly composed of several pieces united into one, YY (Pieces of the Hull, in Ship-Building Plates). It is let into the head, and secured to the ship's bows by strong knees fixed horizontally upon both, and called the cheeks of the head. The heel of it is fastened to the upper end of the foot of the bow; and it is fastened to the stem above by a knee, called a standard, expressed by & in the plate.

Besides supporting the figure of the head, this piece is otherwise useful, as serving to secure the boom or bummkin, by which the fore tack is extended to windward; and by its great breadth, preventing the ship from falling to leeward when close hauled so much as she would otherwise do. It also affords a greater security to the bowsprit, by increasing the angle of the bow-stay, so as to make it act more perpendicularly on the bowsprit.

The knee of the head is a phrase peculiar to shipwrights; as this piece is always called the cut-water by seamen, if we except a few, who, affecting to be wiser than their brethren, have adopted this expression, probably on the presumption that the other is a cant phrase or vulgarism.

Curving Knees, in a ship, those timbers which extend from the ship to the bowway, and bear up the deck on both sides.

KNELLER, Sir Godfrey, a painter, whose fame is well established in these kingdoms. He was born at Lubeck in 1648; and received his first instructions in the school of Rembrandt, but became afterwards a disciple of Ferdinand Bol. When he had gained as much knowledge as that school afforded him, he travelled to Rome, where he fixed his particular attention on Titian and the Caracci. He afterwards visited Venice, and distinguished himself so effectually in that city by his historical pictures and portraits of the noble families there, that his reputation became considerable in Italy. By the advice of some friends he came at last to England, where it was his good fortune to gain the favour of the duke of Monmouth; by his recommendation, he drew the picture of King Charles II. more than once; who was so taken with his skill in doing it, that he used to come and sit to him at his house in Covent-Garden piazza. The death of Sir Peter Lely left him without a competitor in England, and from that time his fortune and fame were thoroughly established. No painter could have more incessant employment, and no painter could be more distinguished by public honour. He was state painter to Charles II. James II. William III. Queen Anne, and George I. equally esteemed and respected by them all: the emperor Leopold made him a knight of the Roman empire, and King George I. created him a baronet. Most of the nobility and gentry had their likenesses taken by him, and no painter excelled him in a sure outline, or in the graceful disposition of his figures: his works were celebrated by the best poets in his time.

He built himself an elegant house at Whitton near Hampton Court, where he spent the latter part of his life; and died in 1726.

KNIFE, a well known instrument, made for cutting, and adapted in form to the uses for which it is designed.

Knives are said to have been first made in England in 1563, by one Matthews, on Fleet Bridge, London. The importation of all sorts of knives is prohibited.

KNIGHT (eques), among the Romans, a person of the second degree of nobility, following immediately that of the senators. See Equestrian Order, and Equestes.

KNIGHT, (or Cnecht, Germ.) in feodal history, was originally an appellation or title given by the ancient Germans to their youth after being admitted to the privilege of bearing arms.

The passion for arms among the Germanic states, as described by Dr. Stuart*, was carried to extremity: a View of It was amidst scenes of death and peril that the young Society in were educated: It was by valour and feats of prowess Europe, that the ambitious signalized their manhood. All the P. 42.
honours they knew were allotted to the brave. The
sword opened the path to glory. It was in the field
that the ingenious and the noble flattered most their
pride, and acquired an ascendancy. The strength of
their bodies, and the vigour of their councils, sur-
rounded them with warriors, and lifted them to com-
mand.

But, among these nations, when the individual felt
the call of valour, and wished to try his strength
against an enemy, he could not of his own authority
take the lance and the javelin. The admission of their
youth to the privilege of bearing arms, was a matter of
too much importance to be left to chance or their own
choice. A form was invented by which they were ad-
vanced to that honour.

The council of the district, or of the canton to
which the candidate belonged, was assembled. His
age and his qualifications were inquired into; and if
he was deemed worthy of being admitted to the privi-
eges of a soldier, a chieftain, his father or one of his
kindred, adorned him with a shield and the lance. In
consequence of this solemnity, he prepared to dis-
tinguish himself; his mind opened to the cares of the
public; and the domestic concerns, or the offices of the
family from which he had sprung, were no longer the
objects of his attention. To this ceremony, so simple
and so interesting, the institution of knighthood is in-
debted for its rise.

Knighthood, however, as a system known under
the denomination of Chivalry, is to be dated only
from the 11th century. All Europe being reduced to
a state of anarchy and confusion on the decline of
the house of Clariemagne, every proprietor of a manor
or lordship became a petty sovereign; the mansion
house was fortified by a moat, defended by a guard,
and called a castle. The governor had a party of 700
or 800 men at his command; and with these he used
freely to make excursions, which commonly ended
in a battle with the lord of some petty state of the
same kind, whose castle was then pillaged, and the
women and treasures borne off by the conqueror.
During this state of universal hostility, there were no friendly
communications between the provinces, nor any
high roads from one part of the kingdom to another:
the wealthy traders, who then travelled from place
to place with their merchandise and their families,
were in perpetual danger; the lord of almost every castle
extorted something from them on the road; and at
last, some one, more rapacious than the rest, seized upon
the whole of the cargo, and bore off the women for
his own use.

Thus castles became the warehouses of all kinds of
rich merchandise, and the prisons of the distressed fe-
males, whose fathers or lovers had been plundered or
slain, and who being therefore seldom disposed to take
the thief or murderer into favour, were in continual
danger of a rape.

But as some are always distinguished by virtue in
the most general defection, it happened that many
lords insensibly associated to repress these allies of vi-
olence and rapine, to secure property, and protect the
ladies and males who were in danger of growing
themselves; and the association was at length strengthened by a
solemn vow, and received the sanction of a religious
ceremony. As the first knights were men of the
highest rank, and the largest possessions, such having
most to lose, and the least temptation to steal, the fra-
ternity was regarded with a kind of reverence, even
by those against whom it was formed. Admission into
the order was deemed the highest honour: many ex-
traordinary qualifications were required in a candidate,
and many new ceremonies were added at his creation.
After having fasted from sunrise, confessed himself,
and received the sacrament, he was dressed in a white
tunic, and placed by himself at a side-table, where he
was neither to speak, nor smile, nor to eat: while the
Knights and ladies, who were to perform the principal
parts of the ceremony, were eating, drinking, and
making merry at the great table. At night his arm-
our was conveyed to the church where the ceremony
was performed; and here having watched it till the
morning, he advanced with his sword hanging about his
neck, and received the benediction of the priest. He
then kneeled down before the lady who was to put on
his armour, who being assisted by persons of the first
rank, buckled on his spurs, put a helmet on his head,
and accoutred him with a coat of mail, a cuirass, brace-
lets, cuisses, and gauntlets.

Being thus armed cap-a-pie, the knight who durbled
him struck him three times over the shoulder with
the flat side of his sword, in the name of God, St
Michael, and St George. He was then obliged to watch
all night in all his armour, with his sword girded,
and his lance in his hand. From this time the
knight devoted himself to the redress of those wrongs
which “patient merit of the unworthy takes,” to se-
cure merchants from the rapacious cruelty of banditti,
and women from ravishers to whose power they were
by the particular confusion of the times continually ex-
posed.

From this view of the origin of chivalry, it will be
easy to account for the castle, the moat, and the bridge,
which are found in romances; and as to the dawf, he
was a constant appendage to the rank and fortune of
those times, and no castle therefore could be without him.
The dwarf and buffoon were then introduced to kill
the card, as the card-table is at present. It will also be
easy to account for the multitude of captive ladies
whom the knights, upon seizing a castle, set at liberty;
and for the prodigious quantities of useless gold and
silver vessels, rich stuffs, and other merchandise,
with which many apartments in these castles are said
to have been filled.

The principal lords who entered into the confrater-
nity of knights, used to send their sons to each other
to be educated, far from their parents, in the mystery
of chivalry. These youths, before they arrived at the
age of 21, were called bachelors, or bas chevaliers, in-
terior knights, and at that age were qualified to receive
the order.

So honourable was the origin of an institution, com-
monly considered as the result of caprice and the
source of extravagance; but which, on the contrary,
rose naturally from the state of society in those times,
and had a very serious effect in refining the manners
of the European nations; Valour, humanity, courtesy,
justice, honour, were its characteristics; and to these
was added religion; which, by infusing a large portion
of enthusiastic zeal, carried them all to a roman-
tic excess, wonderfully suited to the genius of the age,
and productiveness of the greatest and most permanent effects both upon policy and manners. War was carried on with less ferocity, when humanity, no less than courage, came to be deemed the ornament of knighthood, and knighthood a distinction superior to royalty, and an honour which princes were proud to receive from the hands of private gentlemen: more gentle and polished manners were introduced, when courtesy was recommended as the most amiable of knightly virtues, and every knight devoted himself to the service of a lady: violence and oppression decreased, when it was accounted meritorious to check and to punish them: a scrupulous adherence to truth, with the most religious attention to fulfill every engagement, but particularly those between the sexes as more easily violated, became the distinguishing character of a gentleman, because chivalry was regarded as the school of honour, and incultated the most delicate sensibility with respect to that point; and valour, seconded by so many motives of love, religion, and virtue, became altogether irresistible.

That the spirit of chivalry sometimes rose to an extravagant height, and had often a pernicious tendency, must however be allowed. In Spain, under the influence of a romantic gallantry, it gave birth to a series of wild fortunes which have been deservedly ridiculed: in the train of Norman ambition, it extinguished the liberties of England, and deluged Italy in blood; and at the call of superstition, and as the engine of papal power, it desolated Asia under the banner of the cross. But these ought not to be considered as arguments against an institution laudable in itself, and necessary at the time of its foundation; and those who pretend to despise it, the advocates of ancient barbarism and ancient rusticity, ought to remember, that chivalry not only first taught mankind to carry the civilities of peace into the operations of war, and to mingle politeness with the use of the sword; but roused the soul from its lethargy, invigorated the human character even while it softened it, and produced exploits which antiquity cannot parallel. Nor ought they to forget, that it gave variety, elegance, and pleasure, to the intercourse of life, by making women a more essential part of society; and is therefore entitled to our gratitude, though the point of honour, and the refinements in gallantry, its more doubtful effects, should be excluded from the improvement of modern manners. For,

To illustrate this topic more particularly, we may observe, that women, among the ancient Greeks and Romans, seem to have been considered merely as objects of sensuality, or of domestic convenience; they were devoted to a state of seclusion and obscurity, had few attentions paid them, and were permitted to take as little share in the conversation as in the general commerce of life. But the northern nations, who paid a kind of devotion to the softer sex, even in their native forests, had no sooner settled themselves in the provinces of the Roman empire, than the female character began to assume new consequence. Those fierce barbarians, who seemed to thirst only for blood, who involved in one undistinguishing ruin the monuments of ancient grandeur and ancient ingenuity, and who devoted to the flames the knowledge of ages, always forbore to offer any violence to the women. They brought along with them the respectful gallantry of the north, which had power even to restrain their savage ferocity: and they introduced into the west of Europe a generosity of sentiment, and a complaisance toward the ladies, to which the most polished nations of antiquity were strangers. These sentiments of generous gallantry were fostered by the institution of chivalry, which lifted woman yet higher in the scale of life. Instead of being nobody in society, she became her primum mobile. Every knight devoting himself to danger, declared himself the humble servant of some lady, and that lady was often the object of his love. Her honour was supposed to be intimately connected with his, and her smile was the reward of his valour; for her he attacked, for her he defended, and for her he shed his blood. Courage, animated by so powerful a motive, lost sight of every thing but enterprise: incredible toils were cheerfully endured, incredible actions were performed, and adventures seemingly fabulous were more than realized. The effect was reciprocal. Women, proud of their influence, became worthy of the heroism which they had inspired: they were not to be approached but by the high minded and the brave; and men then could only be admitted to the bosom of the chaste fair, after proving their fidelity and affection by years of perseverance and peril.

Again, as to the change which took place in the operations of war, it may be observed, that the perfect hero of antiquity was superior to fear, but he made use of every artifice to annoy his enemy: impelled by animosity and hostile passion, like the savage in the American woods, he was only anxious of attaining his end, without regarding whether fraud or force were the means. But the true knight or modern hero of the middle ages, who seems in all his encounters to have had his eye on the judicial combat or judgment of God, had an equal contempt for stratagem and danger. He disdained to take advantage of his enemy: he desired only to see him, and to combat him upon equal terms, trusting that heaven would declare in behalf of the just; and as he professed only to vindicate the cause of religion, of injured beauty, or oppressed innocence, he was further confirmed in this enthusiastic opinion by his own heated imagination. Strongly persuaded that the decision must be in his favour, he fought as if under the influence of divine inspiration rather than of military ardour. Thus the system of chivalry, by a singular combination of manners, blended the heroic and sanctified characters, united devotion and valour, zeal and gallantry, and reconciled the love of God and of the ladies.

Chivalry flourished most during the time of the crusades. From these holy wars it followed, that new fraternities of knighthood were invented: hence the knights of the Holy Sepulchre, the Hospitallers, Templars, and an infinite number of religious orders. Various other orders were at length instituted by sovereign princes: the Garter, by Edward III. of England; the Golden Fleece, by Philip the Good, duke of Burgundy; and St Michael, by Louis XI. of France. From this time ancient chivalry declined to an empty name; when sovereign princes established regular companies in their armies, knights, bannerets were no more, though it was still thought an honour to.
to be dubbed by a great prince or victorious hero; and all who professed arms without knighthood assumed the title of esquire.

There is scarce a prince in Europe that has not thought fit to institute an order of knighthood; and the simple title of knight, which the kings of Britain confer on private subjects, is a derivation from ancient chivalry, although very remote from its source. See Knight-Bachelor.

**Knight** Service (*servitium militare,* and in law French *chivalry*); a species of TENURE, the origin and nature of which are explained under the articles CHIVALRY, and FEODAL SYSTEM, No. 15—21.

The knights produced by this tenure differed most essentially from the knights described in the preceding article; though the difference seems not to have been accurately attended to by authors (A). The one class of knights was of a high antiquity: the other was not heard of till the invention of a fee. The device with arms and the blow of the sword made the act of the creation of the ancient knight; the new knight was constituted by an investment in a piece of land. The former was the member of an order of dignity which had particular privileges and distinctions; the latter was the receiver of a feudal grant. Knighthood was an honour; knight service a tenure. The first communicated splendour to an army; the last gave it strength and numbers. The knight of honour might serve in any station whatever; the knight of tenure was in the rank of a soldier. It is true, at the same time, that every noble and baron were knights of tenure, as they held their lands by knight service. But the number of fees they possessed, and their creation into rank, separated them widely from the simple individuals to whom they gave out grants of their lands, and who were merely the knights of tenure. It is no less true, that the sovereign, without conferring nobility, might give even a single fee to a tenant; and such vassals in capite of the crown, as well as the vassals of single fees from a subject, were the mere knights of tenure. But the former, in respect of their holding from the crown, were to be called to take upon themselves the knighthood of honour; a condition in which they might rise from the ranks, and be promoted to offices and command. And as to the vassals in capite of the crown who had many fees, their wealth of itself sufficiently distinguished them beyond the state of the mere knights of tenure. In fact, they possessed an authority over men who were of this last description; for, in proportion to their lands were the fees they gave out and the knights they commanded.

By the tenure of knight service the greatest part of the lands in England were held, and that principally of the king in capite, till the middle of the last century; and which was created, as Sir Edward Coke expressly testifies, for a military purpose, viz. for the defence of the realm by the king's own principal subjects, which was judged to be much better than to trust to hirelings or foreigners. The description here given is that of knight service proper, which was to attend the king in his wars. There were also some other

(A) "The terms knight and chivalry (Dr Stuart observes), denoted both the knight of honour and knight of tenure; and chivalry was used to express both knighthood and knight service. Hence it has proceeded, that these persons and these states have been confounded. Yet the marks of their difference are so strong and pointed, that one must wonder that writers should mistake them. It is not, however, mean and common to all who have been deceived. Sir Edward Coke, notwithstanding his distinguishing head, is of this number. When estimating the value of the knight's fee at 230. per annum, he appeals to the statute de militia, and 1 Ed. II. and, by the sense of his illustration, he conceives, that the knights alluded to were the same with the possessors of knights fees; and they, no doubt, had knights fees: but a knight's fee might be enjoyed not only by the tenant in capite of the crown, but by the tenant of a vassal, or by the tenants of a sub-vassal. Now, to these the statute makes no allusion. It did not mean to annex knighthood to every landholder in the kingdom who had a knight's fee; but to encourage arms, by requiring the tenants in capite of the crown to take to them the dignity. He thus confounds knighthood and the knight's fee. Coke on Littleton, p. 69.

"If I am not deceived, Sir William Blackstone has fallen into the same mistake, and has added to it. Speaking of the knights of honour, or the equites aurati from the gift spars they wore, he thus expresses himself: They are also called, in our law, militæ, because they formed a part, or indeed the whole, of the royal army, in virtue of their feudal tenures; one condition of which was, that every one who held a knight's fee (which in Henry II.'s time amounted to 230. per annum), was obliged to be knighted, and attend the king in his wars, or fined for noncompliance. The exertion of this prerogative, as an expedient to raise money, in the reign of Charles I. gave great offence, though warranted by law, and the recent example of Queen Elizabeth: but it was, at the Restoration, together with all other military branches of the feudal law, abolished; and this kind of knighthood has since that time fallen into great disrepute." Book I. ch. 12.

"After what has been said, I need hardly observe, that this learned and able writer has confounded the knight of honour, and the knight of tenure; and that the requisition to take knighthood was not made to every possessor of a knight's fee, but to the tenants of knights fees held in capite of the crown, who had merely a sufficiency to maintain the dignity, and were thence disposed not to take it. The idea that the whole force of the royal army consisted of knights of honour, or dubbed knights, is so extraordinary a circumstance, that it might have shown of itself to this eminent writer the source of his error. Had every soldier in the feudal army received the investiture of arms? Could be wear a seal, surpass in silk and dress, use ensigns armorial, and enjoy all the other privileges of knighthood? But, while I hazard these remarks, my reader will observe, that it is with the greatest deference I dissent from Sir William Blackstone, whose abilities are the object of a most general and deserved admiration."
other species of knight service; so called, though improperly, because the service or render was of a free and honourable nature, and equally uncertain as to the time of rendering as that of knight service proper, and because they were attended with similar fruits and consequences. Such was the tenure by grand serjeanty, per magnum servitium, whereby the tenant was bound, instead of serving the king generally in his wars, to do some special honorary service to the king in person; as to carry his banner, his sword, or the like; or be his butler, champion, or other officer, at his coronation. It was, in most other respects, like knight service; only he was not bound to pay aid or escuage; and when tenant by knight service paid five pounds for a relief on every knight’s fee, tenant by grand serjeanty paid one year’s value of his land, were it much or little. Tenure by cornage, which was to wind a horn when the Scots or other enemies entered the land, in order to warn the king’s subjects, was (like other services of the same nature) a species of grand serjeanty.

These services, both of chivalry and grand serjeanty, were all personal, and uncertain as to their quantity or duration. But the personal attendance in knight service growing troublesome and inconvenient in many respects, the tenants found means of compounding for it, by first sending others in their stead, and in process of time making a pecuniary satisfaction to the lords in lieu of it. This pecuniary satisfaction at last came to be levied by assessments, at so much for every knight’s fee; and therefore this kind of tenure was called scutagium in Latin, or servitium scuti; scutum being then a well-known denomination of money: and in like manner it was called, in our Norman French escuage; being indeed a pecuniary instead of a military service. The first time this appears to have been taken, was in the 5 Hen. II. on account of his expedition to Toulouse; but it soon came to be so universal, that personal attendance fell quite into disuse. Hence we find in our ancient histories, that, from this period when our kings went to war, they levied scutages on their tenants, that is on all the landholders of the kingdom, to defray their expenses and to hire troops; and these assessments in the time of Henry II. seem to have been made arbitrarily, and at the king’s pleasure. Which prerogative being greatly abused by his successors, it became matter of national clamour; and King John was obliged to consent, by his magna charta, that no scutage should be imposed without consent of parliament. But this clause was omitted in his son Henry III.’s charter; where we only find, that scutages or escuage should be taken as they were used to be taken in the time of Henry II.; that is, in a reasonable and moderate manner. Yet afterwards, by statute 25 Edw. I. c. 5. and 6. and many subsequent statutes, it was enacted, that the king should take no aids or tasks but by the common assent of the realm. Hence it is held in our old books, that escuage or scutage could not be levied but by consent of parliament; such scutages being indeed the groundwork of all succeeding subsidies, and the land tax of later times.

Since, therefore, escuage differed from knight service in nothing but as a compensation differs from actual service, knight service is frequently confounded with it. And thus Littleton must be understood, when he tells us, that tenant by homage, fealty, and escuage, was tenant by knight service; that is, that this tenure (being subservient to the military policy of the nation) was respected as a tenure in chivalry. But as the actual service was uncertain, and depended upon emergencies, so it was necessary that this pecuniary compensation should be equally uncertain, and depend on the assessments of the legislature suited to these emergencies. For had the escuage been a settled invariable sum, payable at certain times, it had been neither more nor less than a mere pecuniary rent; and the tenure, instead of knight service, would have then been of another kind, called socage.

By the degenerating of knight service, or personal military duty, into escuage or pecuniary assessments, all the advantages (either promised or real) of the feudal constitutions were destroyed, and nothing but the hardships remained. Instead of forming a national militia composed of barons, knights, and gentlemen, bound by their interest, their honour, and their oaths, to defend their king and country, the whole of this system of tenures now tended to nothing else but a wretched means of raising money to pay an army of occasional mercenaries. In the mean time the families of all our nobility and gentry groaned under the intolerable burdens (which in consequence of the fiction adopted after the conquest) were introduced and laid upon them by the subtlety and finesse of the Norman lawyers. For, besides the scutages to which they were liable in defect of personal attendance, which, however, were assessed by themselves in parliament, they might be called upon by the king or lord paramount for aida, whenever his eldest son was to be knighted, or his eldest daughter married; not to forget the ransom of his own person. The heir, on the death of his ancestor, if of full age, was plundered of the first emoluments arising from his inheritance, by way of relief and primer scisin: and if under age, of the whole of his estate during infancy. And then, as Sir Thomas Smith very feelingly complains, when he came to his own, after he was out of wardship, his woods decayed, houses fallen down, stock wasted and gone, lands let forth and ploughed to be barren, to make amends, he was yet to pay half a year’s profits as a fine for siving out his livery; and also the price or value of his marriage, if he refused such wife as his lord and guardian had bartered for, and imposed upon him; or twice that value, if he married another woman. Add to this, the untimely and expensive honour of knighthood, to make his poverty more completely splendid. And when, by these deductions, his fortune was so shattered and ruined, that perhaps he was obliged to sell his patrimony, he had not even that poor privilege allowed him, without paying an exorbitant fine for a license of alienation.

A slavery so complicated and so extensive as this, called aloud for a remedy in a nation that boasted of her freedom. Palliatives were from time to time applied by successive acts of parliaments, which assuaged some temporary grievances. Till at length the humanity of King James I. consented, for a proper equivalent, to abolish them all, though the plan then proceeded not to effect; in like manner, as he had formed a scheme, and began to put it in execution, for removing
Knight.

The feudal grievances of heritable jurisdictions in Scotland, which has since been pursued and effectuated by the statute 20 Geo. II. c. 43. King James’s plan for exchanging our military tenures seems to have been nearly the same as that which has been since pursued; only with this difference, that by way of compensation for the loss which the crown and other lords would sustain, an annual fee-farm rent should be settled and inseparably annexed to the crown, and assured to the inferior lords, payable out of every knight’s fee within their respective seignories. An expedient seemingly much better than the hereditary excise which was afterwards made the principal equivalent for these cessions. For at length the military tenures, with all their heavy appendages, were destroyed at one blow by the statute 12 Car. II. c. 24, which enacts, “that the court of ward or liverties, and all wardships, liveries, prime seisin, and ousterleases, values and forfeitures of marriages, by reason of any tenure of the king or others, be totally taken away. And that all fines for alienations, tenures by homage, knights service, and escue, and also aids for marrying the daughter or knightling the son, and all tenures of the king in capite, be likewise taken away. And that all sorts of tenures, held of the king or others, be turned into free and common socage: save only tenures in frankaldmoine, copyholds, and the honorary services (without the slavish part) of grand serjeancy.” A statute which was a greater acquisition to the civil property of this kingdom than even magna charta itself: since that only pruned the luxuries that had grown out of the military tenures, and thereby preserved them in vigour: but the statute of King Charles extirpated the whole. See Chivalry, Supplement.

Knights-Errant. During the prevalence of chivalry, the ardour of redressing wrongs seized many knights so powerfully, that, attended by esquires, they wandered about in search of objects whose misfortunes and misery required their assistance and succours. And as ladies engaged more particularly their attention, the relief of unfortunate damsels was the achievement they most courted. This was the rise of knights-errant, whose adventures produced romance. These were originally told as they happened. But the love of the marvellous came to interfere; fancy was indulged in her wildest exaggerations; and poetry gave her charms to the most monstrous fictions, and to scenes the most unnatural and gigantic. See Knight.

Knight-Bachelor. See Bachelor.

Knight-Baronet. See Baronet.

Knights of the Shire, or Knights of Parliament, are two gentlemen of worth, chosen on the king’s writ in pleno comitato, by such of the freeholders of every county as can expend 40s. per annum, to represent such county in parliament. These, when every man who held a knight’s fee in capite of the crown was customarily constrained to be a knight, were of necessity to be elected by radio cinct, for con the writ runs to this day; but now custom admits esquires to be chosen to this office. They must have at least 300l. per annum; and their expenses are to be defrayed by the county, though this be seldom now required.

Knight-Marshal, an officer in the king’s household, who has jurisdiction and cognizance of any trespass within the king’s household and verge; as also of contracts made there, whereof one of the house is party.

Knight-Fish. See Eques, Ichthyology Index.

Knights, in a ship, two short thick pieces of wood, commonly carved like a man’s head, having four shivers in each, three for the halyards, and one for the top to run in: one of them stands fast bolted on the beams abaft the foremast, and is therefore called the fore-knight; and the other, standing abaft the mainmast, is called the main-knight.

Knighthood, a military order or honour, or a mark or degree of ancient nobility, or reward of personal virtue and merit. There are four kinds of knighthood; military, regular, honorary, and social.

Military Knighthood, is that of the ancient knights, who acquired it by high feats of arms. They are called milites, in ancient charters and titles, by which they were distinguished from mere bachelors, &c. These knights were girt with a sword, and wore a pair of gilt spurs; whence they were called equites aurati.

Knighthood is not hereditary, but acquired. It does not come into the world with a man like nobility; nor can it be revoked. The sons of kings, and kings themselves, with all other sovereigns, heretofore had knighthood conferred on them as a mark of honour. They were usually knighted at their baptism or marriage, at their coronation, before or after a battle, &c.

Regular Knighthood, is applied to all military orders which profess to wear some particular habit, to bear arms against the infidels, to succour and assist pilgrims in their passage to the Holy Land, and to serve in hospitals where they should be received: such were the knights templars, and such still are the knights of Malta, &c.

Honorary Knighthood, is that which princes confer on other princes, and even on their own great ministers and favourites; such are knights of the Garter, Bath, St. Patrick, Nova Scotia, Thistle, &c. See these articles; and for a representation of their different insignias, see Plate CCLXXXVIII.

Social Knighthood, is that which is not fixed nor confirmed by any formal institution, nor regulated by any lasting statutes; of which kind there have many orders been erected on occasion of factions, of tilts and tournaments, masquerades, and the like.

The abbot Bernardino Justiniani, at the beginning of his History of Knighthood, gives us a complete catalogue of the several orders: according to this computation, they are in number ninety. Favin has given us two volumes of them under the title of Theatrum d’Honnem et de Chevalerie. Menenius has published Delectae Equestrium Ordinum, and André Mendo has written De Ordinalbus Militaribus. Beloi has traced their original; and Géliot, in his Armorial Index, has given us their institution. To these may be added, Father Menecrius de la Chevalerie Anciennie et Moderne, Michel’s Traité Militaire, Caramuel’s Thesologia Regia, Mirvieux’s Origines Equestrium sine Militarium Ordinum; but above all, Justinian’s Historia Chronologicae dell’ Origine de gl’ Ordini Militari, e di tutte le Religioni Cavaleresche; the edition which is fullest is that of Venice in 1693, in two vols folio.
KNIGHTLOW HILL or CROSS, which gives name to a hamlet in Warwickshire, stands in the road from Coventry to London, at the entrance of Dunmore Heath. About 40 towns in this hamlet, which are specified by Dogdale, are obliged, on the forfeiture of 30s., and a white bull, to pay a certain sum to the lord of the hamlet, called worth-money, or swept-money; which must be deposited every Martinmas day in the morning at this cross before sunrise; when the party paying it must go thrice about the cross, and say the worth-money, and then lay it in the hole of the said cross before good witness.

KNIGHTON, a well built town of Radnorshire in South Wales, 155 miles from London. It is pleasantly situated on an elevation rising from a small river, which divides this part of Wales from Shropshire. It carries on a considerable trade, and has a market and a fair, with about 952 inhabitants.

KNIGHTSBRIDGE, a village of Middlesex, and the first village from London on the great western road. It lies in the parishes of St Margaret’s Westminster, and St George by Hanover Square; and has a chapel, which is nevertheless independent. At the entrance of it from London stands that noble infirmary for sick and wounded, called St George’s Hospital, erected and maintained by the contributions of our nobility and gentry, of whom there are no less than 300 governors. In the centre of this village, there is a fabric lately erected, where is carried on one of the most considerable manufactories in England for painting floor-cloths, &c.

KNOCOTHER, a borough and market town of Ireland, in the county of Kilkenny and province of Leinster, 63 miles from Dublin. Before the union, this town returned two members to the Irish parliament.

KNOLL, a term used in many parts of the kingdom for the top of a small hill, or for the hill itself.

KNOLLES, RICHARD, was born in Northamptonshire, about the middle of the 16th century, and educated at Oxford, after which he was appointed master of the free-school at Sandwich in Kent. He composed Grammatica Latina, Graeca, et Hebraica, compendium, cum radicibus, London 1606; and sent many excellent scholars to the universities. He also spent 12 years in compiling a history of the Turks, which was first printed in 1610. It is called, The general history of the Turks, from the first beginning of that nation to the rising of the Ottoman family, &c. He died in 1610, and this history has since been continued by several hands: the best continuation is that by Paul Ricaut consul at Smyrna, folio, London, 1680. Knollès wrote also, "The lives and conquests of the Ottoman kings and emperors to the year 1610," which was not printed till after his death in 1621, to which time it was continued by another hand; and lastly, "A brief discourse of the greatness of the Turkish empire, and wherein the greatness of the strength thereof consisteth," &c.

KNOT, a part of a tree, from which shoot out branches, roots, or even fruit. The use of the knots is, to strengthen the stem; they serve also as seacoasts, to filtrate, purify, and refine the juices raised up for the nourishment of the plant.

Knots of a Rope, among seamen, are distinguished into three kinds, viz. whole knot, that made so with the lays of a rope that it cannot slip, serving for sheets, tacks, and stoppers: bowline knot, so firmly made and fastened to the rings of the sails, that they must break or the sail split before it slips: and sheet-bank knot, that made by shortening a rope without cutting it, which may be presently loosed, and the rope not the worse for it.

Knots of the Log-line, at sea, are the divisions of it. See the article LOG.

Knot. See Tringa, Ornithology Index.
Knot-Grass, or Bistort. See Polygonum, Botany Index.

KNOTTESFORD, a town of Cheshire, near the Mersey, 184 miles from London, is divided into the upper and lower towns by a rivulet called Bickn. In the former is the church; and in the latter is the market and town-house. Population 2358 in 1811.

KNOTTINGLEY, a town in the west riding of Yorkshire, on the Aire near Ferrybridge, is noted for its trade in lime. The stones of which it is made are dug up plentifully at Elmet, and here burnt; from whence it is conveyed at certain seasons in great quantities to Wakefield, Sandal, and Standbridge, for sale, and so carried into the western parts of the county for manure.

KNOUT, the name of a punishment inflicted in Russia, with a kind of whip called knout, and made of a long strap of leather prepared for this purpose. With this whip the executioners dexterously carry off a slip of skin from the neck to the bottom of the back laid bare to the waist, and repeating their blows, in a little while read away all the skin of the back in parallel stripes. In the common knout the criminal receives the lashes suspended on the back of one of the executioners: but in the great knout, which is generally used on the same occasions as racking on the wheel in France, the criminal is raised into the air by means of a pulley fixed to the gallows, and a cord fastened to the two wrists tied together; a piece of wood is placed between his two legs also tied together; and another of a crucial form under his breast. Sometimes his hands are tied behind over his back; and when he is pulled up in this position, his shoulders are dislocated. The executioners can make this punishment more or less severe; and it is said, are so dexterous, that when a criminal is condemned to die, they can make him expire at pleasure either by one or several lashes.

Knowledge, is defined by Mr Locke to be the perception of the connexion and agreement or disagreement and repugnancy of our ideas. See Metaphysics and Logic.

KNOX, JOHN, greatly distinguished by the part he took in the reformation in Scotland, was born in 1505, at Gifford near Haddington, and educated at the university of St Andrew’s, where he took a degree in arts, and commenced teacher very early in life. At this time the new religion of Martin Luther was but little known in Scotland; Mr Knox therefore at first was a zealous Roman Catholic: but attending the sermons of a certain Black friar, named Guisilium, he began to waver in his opinions; and afterwards conversing with the famous Wishart, who in 1544 came to Scotland with the commissioners sent by Henry VIII. he renounced the Roman religion, and became a zealous reformer. Bein
having appointed tutor to the sons of the lairds of Ormitoyn and Longaidely, he began to instruct them in the principles of the Protestant religion; and on that account was so violently persecuted by the bishop of St Andrew's, that with his two pupils he was obliged in the year 1547 to take shelter in the castle of that place. But the castle was besieged and taken by 21 French galleys. He continued a prisoner on board a galley two years, namely, till the latter end of the year 1549; when, being set at liberty, he landed in England, and having obtained a license, was appointed preacher, first at Berwick, and afterwards at Newcastle. Strype conjectures that in 1552 he was appointed chaplain to Edward VI. He certainly obtained an annual pension of 40l. and was offered the living of All-hallows in London; which he refused, not choosing to conform to the liturgy.

Soon after the accession of Queen Mary, he retired to Geneva; thence, at the command of John Calvin, he removed to Frankfort, where he preached to the exiles: but a difference arising an account of his refusing to read the English liturgy, he was sent back to Geneva; and from thence in 1555 returned to Scotland, where the reformation had made considerable progress during his absence. He now travelled from place to place, preaching and exhorted the people with unremitting zeal and resolution. About this time (1556), he wrote a letter to the queen regent, earnestly entreat her to hear the Protestant doctrine; which letter she treated with contempt. In the same year the English Calvinists at Geneva, invited Mr Knox to reside among them. He accepted their invitation. Immediately after his departure from Scotland, the bishop summoned him to appear, and he not appearing, condemned him to death for heresy, and burned his effigy at the cross of Edinburgh.

Our reformer continued abroad till the year 1559, during which time he published his "First Blast against the monstrous Regiment of Women." Having now returned to Scotland, he resumed the great work of reformation with his usual ardour, and was appointed minister at Edinburgh. In 1561 Queen Mary arrived from France. She, it is well known, was bigoted to the religion in which she had been educated; and on that account was exposed to continual insults from her reformed subjects. Mr Knox himself frequently insulted her from the pulpit; and when addressed to her presence, regardless of her sex, her beauty, and her high rank, behaved to her with a most unjustifiable freedom. In the year 1571 our reformer was obliged to leave Edinburgh, on account of the confusion and danger from the opposition to the earl of Lennox, then regent; but he returned the following year, and resumed his pastoral functions. He died at Edinburgh in November 1572, and was buried in the churchyard of St Giles's in that city. — His History of the Reformation was printed with his other works at Edinburgh in 1584, 1586, 1644, and 1732. He published many other pieces; and several more are preserved in Calderwood's History of the Church of Scotland. He left also a considerable number of manuscripts, which in 1732 were in the possession of Mr Wodrow, minister of Eastwood.

As to his character, it is easily understood, notwithstanding the extreme dissimilitude of the two portraits drawn by Popish and Calvinistical pencils. According to the first, he was a devil; according to the latter, an angel. The following character is drawn by Dr Robertson. "Zeal, intrepidity, dignity and gravity, were virtues that he possessed in an eminent degree. He was acquainted too with the learning cultivated in that age; and excelled in that species of eloquence which is calculated to rouse and to inflame. His maxims, however, were often too severe, and the impetuousity of his temper excessive. Rigid and uncomplying, he showed no indulgence to the iniquities of others. Regardless of the distinctions of rank and character, he uttered his admonitions with an acrimony and vehemence more apt to irritate than to reclaim; and this often betrayed him into indecent expressions, with respect to Queen Mary's person and conduct. Those very qualities, however, which now render his character less amiable, fitted him to be the instrument of Providence for advancing the Reformation among a fierce people, and enabled him to face dangers, and to surmount opposition, from which a person of a more gentle spirit would have been apt to shrink back. By an unwearying application to study and to business, as well as by the frequency and fervour of his public discourses, he had worn out a constitution naturally strong. During a lingering illness, he discovered the utmost fortitude; and met the approach of death with a magnanimity inseparable from his character. He was constantly employed in acts of devotion, and comforted himself with those prospects of immortality, which not only preserve good men from desponding, but fill them with exultation in their last moments. The earl of Morton, who was present at his funeral, pronounced his eulogium in a few words, the more honourable for Knox, as they came from one whom he had often censured with peculiar severity; "Here lies he who never feared the face of man."

KNOXIA, a genus of plants belonging to the tetrandra class; and in the natural method ranking under the 47th order, Stellatae. See Botany Index.

KNUTZEN, Matthias, a native of Holstein, the only person on record who openly professed and taught atheism. It is said he had about 1000 disciples in different parts of Germany. They were called Conscienctiaries, because they asserted there is no other God, no other religion, no other lawful magistracy, but conscience, which teaches every man the three fundamental principles of the law of nature:—To hurt nobody, to live honestly, and to give every one his due. Several copies of a letter of his from Rome were spread abroad, containing the substance of his system. It is to be found entire in the last edition of Micælius.

KOEDOE. See Capra.

KOET-TECHO, a province of China, and one of the smallest in the empire. On the south it has Quang-si, on the east Hou-quang, on the north Se-ctchuen, and Yen-man on the west. The whole country is almost a desert, and covered with inaccessible mountains: it may justly be called the Siberia of China. The people who inhabit it are mountaineers, accustomed to independence, and who seem to form a separate nation: they are no less ferocious than the savage animals among which they live. — The mandarins and governors who are sent to this province are sometimes disgraced noblemen, whom the emperor does not think proper to discard entirely, either on account of their alliances, or the services which
which they have rendered to the state: numerous garrisons are intrusted to their charge, to overawe the inhabitants of the country; but these troops are found insufficient, and the court desairs of being ever able thoroughly to subdue these untractable mountaineers. Frequent attempts have been made to reduce them to obedience, and new forts have from time to time been erected in their country; but the people, who are not ignorant of those designs, keep themselves shut up among their mountains, and seldom issue forth but to destroy the Chinese works or ravage their lands. Neither silk stuffs nor cotton cloths are manufactured in this province; but it produces a certain herb much resembling our hemp, the cloth made of which is used for summer dresses. Mines of gold, silver, quicksilver, and copper, are found here; of the last metal, those small pieces of money are made which are in common circulation throughout the empire.—Koel-techeou contains 10 cities of the first class, and 38 of the second and third.

KOEMPFER, Engelbert, was born in 1651 at Lemgow in Westphalia. After studying in several towns, he went to Dantzick, where he gave the first public specimen of his proficiency, in a dissertation De Magnesatis Divisione. He then went to Thorn; and from thence to the university of Cracow, where he took his degree of doctor in philosophy; after which he went to Köningsberg in Prussia, and staid there four years. He next travelled into Sweden, where he soon began to make a figure, and was appointed secretary of the embassy to the sophi of Persia. He set out from Stockholm with the presents for that emperor; and went through Aaland, Finland, and Ingemeland, to Narva, where he met Mr Fabricius the ambassador, who had been ordered to take Moscow in his way. The ambassador having ended his negociations at the Russian court, set out for Persia. During their stay, two years, at Isphahan, Dr Kömpfner, whose curious and inquisitive disposition suffered nothing to escape him unobserved, made all the advantages possible of remaining so long in the capital of the Persian empire. The ambassador, towards the close of 1685, preparing to return into Europe, Dr Kömpfner chose rather to enter into the service of the Dutch East India Company, in quality of chief surgeon to the fleet, then cruising in the Persian gulf. He went aboard the fleet, which, after touching at many Dutch settlements, came to Batavia in September 1689. Dr Kömpfner here applied himself chiefly to natural history. Hence he set out for Japan, in quality of a physician to the embassy which the Dutch East India Company send once a year to the Japanese court. He quitted Japan to return to Europe in 1692. In 1694 he took his degree of doctor of physic at Leyden; on which occasion he communicated, in what are called Inaugural Theses, ten very singular and curious observations made by him in foreign countries. He intended to digest his memoirs into proper order; but was prevented, by being made physician to the count de Lippe. He died in 1716. His principal works are: 1. Amaranthus Exoticus, in 4to; a work which includes many curious and useful particulars in relation to the civil and natural history of the countries through which he passed. 2. Herbarum Ultra-Ganeticum. 3. The history of Japan, in German, which is very curious and much esteemed; and for which the public is indebted to the late Sir Hans Sloane, who purchased for a considerable sum of money all our author's curiosities, both natural and artificial, as likewise all his drawings and manuscript memoirs, and prevailed with the learned Dr Scheuchzer to translate the Japanese history into English.

KOEMPFERIA. See KEMPFERIA.
KOENIGIA, a genus of plants belonging to the triandria class. See BOTANY Index.

KONGSBERG, a town of Norway, belonging to Denmark, and celebrated for its silver mines, whose produce has been considerably exaggerated by most of the travellers that have published on this subject. The town, which stretches on both sides the river Lowe, contains about 1000 houses, and including the miners 6000 inhabitants. The mines, which lie about two miles from the town, were first discovered and worked during the reign of Christian IV.; and of their present state the following account is given by Mr Cox: There are 36 mines now working; the deepest where is 112 feet perpendicular. The matrix of the ore is the smutum of Linneus. The silver is extracted according to the usual process; either by smelting with charcoal or by pounding. The pure silver is occasionally found in small grains and in small pieces of different sizes, seldom weighing more than four or five pounds. Sometimes, indeed, but extremely rare, masses of a considerable bulk have been discovered; and one in particular which weighed 409 marks, and was worth 3000 rix-dollars, or 600l. This piece is still preserved in the cabinet of curiosities at Copenhagen. Formerly these mines produced annually 350,000 rix-dollars, or 70,000l; and in 1769, even 79,000l.; at present they seldom yield above from 44,000l. to 50,000l. Formerly above 4000 men were necessary for working the mines, smelting and preparing the ore; but a few years ago 2400 miners were removed to the cobalt works lately established at Fossum, and to other mines; and the number is now reduced to 2500. By these and other reductions, the expense, which was before estimated at 5760l. per month, now amounts to only 4400l. or about 5280l. per annum. Yet even with this diminution the expenses generally equal, and sometimes exceed the profits. Government, therefore, draws no other advantages from these mines, than by giving employment to so many persons, who would otherwise be incapable of gaining their livelihood, and by receiving a certain quantity of specie, which is much wanted in the present exhausted state of the finances in Denmark. For such is the deficiency of specie, that even at Kongsberg itself change for a bank note is with difficulty obtained. The miners are paid in small bank notes, and the whole expenses are defrayed in paper currency. The value of 33,000 rix-dollars, or 2600l. in block silver is annually sent to Copenhagen; the remainder of the ore is coined in the mint at Kongsberg, and transferred to Copenhagen. The largest piece of money now struck at Kongsberg is only eight skillings or fourpence.

KÖNIG, GEORGE MATTHIAS, a learned German, born at Altorf in Franconia in 1616. He became professor of poetry and of the Greek tongue there, and librarian to the university; in which last office he succeeded his father. He gave several public specimens of his learning; but is principally known for a Biographical
KOR

Korakas, a tribe of Hottentots inhabiting a district in the south of Africa, on the confines of the Namibian country. The people are much taller than the other Hottentots of the colonies, though they evidently appear to be descended of the same race, having the same language and customs with their neighbours the Namibians, who are undoubtedly of the same extraction. Like other savage tribes, the Korakas are ever ready to pillage, and appropriate to their own use whatever they find pleasing, or suited to their purposes. They attempted to carry off some of M. Vaillant’s effects, even before his face; and he was obliged, either to watch over or deposit them in some place of safety, in order to prevent their rapacity.

The excessive dryness of the country renders springs extremely rare; but to supply this defect the inhabitants dig in the earth a kind of cisterns, to which they gradually descend by means of steps; the greatest marks of industry which M. Vaillant could discover among any of the African nations. To secure this scanty supply of water even from the birds, they are in the practice of covering the mouth of the hole with stones and the branches of trees; yet in spite of all this economy, the wells frequently become dry, in which case the bordes must remove to some other quarter. This circumstance renders the Korakas a more wandering people than any of the other western tribes. They colour their bodies differently according to whim or caprice, and it is no uncommon thing to see them vary it every day, which gives each to each a strange appearance as if they were dressed for a masquerade.

KORELI, the country of the Koraiacs. See next article.

KORIACS, a people inhabiting the northern part of Kamtschatska, and all the coast of the Eastern ocean from thence to the Anadir. They are divided into the Rein-deer or Wandering Koraiacs, and the Fixed Koraiacs. The former lead an erratic life, in the track bounded by the Pescchinika sea to the south-east, the river Koroyma to the west, and the river Anadir to the north. They wander from place to place with their rein deer, in search of the moss, the food of those animals, which are their only wealth. They are squalid, cruel, and warlike; the terror of the Fixed Koraiacs, as much as the Tschutsaki are of them. They never frequent the sea, nor live on fish. Their habitation are joruts, or places half sunk in the earth; and they never use balangs or summer houses elevated on posts like the Kamtschakans. They are in their persons lean, and very short; have small heads and black hair, which they shave frequently; their faces are oval; their nose is short; their eyes are small; their mouth is large; and their beard is black and pointed, but often eradicated.—The Fixed Koraiacs are likewise short; but rather taller than the others, and strongly made: the Anadir is also their boundary, the north, the ocean to the east, and the Kamtschakans to the south. They have a few rein deer, which they use in their sledges; but neither of the tribes of Koraiacs are civilized enough to apply them to the purposes of the dairy. Each speaks a different dialect of the same language: but the Fixed in most things resemble the Kamtschakans; and, like them, live almost entirely on fish. They are timid to a high degree, and behave to their wandering brethren with the utmost submission; who call them by a name which signifies their slaves. These poor people seem to have no alternative: for, by reason of the scarcity of rein deer, they depend on these tyrants for the essential article of clothing.—These two nations, Mr Pennant supposes, from their features, to be the offspring of Tartars, which have spread to the east, and degenerated in size and strength by the rigour of the climate, and often by scarcity of food.

KOS, in Jewish antiquity, a measure of capacity, containing about four cubic inches; this was the cup of blessing out of which they drank when they gave thanks after solemn meals, like that of the passover.

KOTTERUS, CHRISTOPHER, was one of the three fanatics whose visions were published at Amsterdam in 1657, with the title of Lutus in tenebris. He lived at Sprotta in Silesia, and his visions began in 1616. He fancied he saw an angel under the form of a man, who commanded him to go and declare to the magistrates, that, unless the people repented, the wrath of God would make dreadful havoc. The elector palatine, whom the Protestants had declared king of Bohemia, was introduced in those visions. Kotterus 3 P waited
KOUIL-KHAN, THOMAS, or Schah Nadir, was not the son of a shephard, as the author of the English Biographical Dictionary asserit: his father being chief of a branch of the tribe of Afshara, and governor of a fortress erected by that people against the Turks. Upon his father's death, his uncle usurped his government, under the pretext of taking care of it during the minority of Kouli-Khan; or, more properly, young Nadir. Disgust at this affront made him commence adventurer. He entered into the service of the beglerbeg or governor of Muschada, in Khorasan; who, discovering in him strong marks of a military genius, promoted him to the command of a regiment of cavalry. In 1720, the Usbee Tartars having made an irruption into Khorasan with 10,000 men, the beglerbeg, whose whole force consisted only of 4,000 horse and 2,000 infantry, called a council of war, in which it was declared imprudent to face the enemy with such an inferior force: but Kouli-Khan proposed to march against the enemy, and engaged to conduct the expedition, and be answerable for the success of it. He was accordingly made general; defeated the Tartars, and took their commander prisoner. Hosein Beglerbeg received him at his return with marks of distinction; but growing jealous of his rising fame, instead of obtaining him the rank of lieutenant-general of Khorasan, as he had promised, obtained it for another; which so exasperated Kouli-Khan, that he publicly complained of the governor's ingratitude and perfidy; who thereupon broke him, and ordered him to be punished with the bastinado so severely, that the nails of his great toes fell off. This affront occasioned his flight, and his joining a banditti of robbers (not his stealing his father's or his neighbour's sheep). The rest of his adventures are too numerous to be inserted in this work. In 1729 he was made general of Persia by Schah Thomas, and permitted to take his name Thomas, and that of Kham, which signifies slave: his title therefore was The slave of Thomas; but he was ennobled by the addition of Khan. In 1736, he fomented a revolt against his master, for having made an ignominious peace with the Turks; and having the army at his command, he procured his deposition, and his own advancement to the throne. In 1739 he conquered the Mogul empire; and from this time growing as cruel as he was ambitious, he at length met with the usual fate of tyrants, being assassinated by one of his generals, in league with his nephew and successor, in 1747, aged sixty.

KOUMISS, a sort of wine made in Tartary, where it is used by the natives as their common beverage during the season of it, and often serves them instead of all other food. It is said to be so nourishing and salutary, that the Baschkir Tartars, who towards the end of winter are much emaciated, no sooner return in summer, to the use of koumiss, than they become strong and fat. The author of "A historical description of all the nations which compose the Russian empire," says, speaking of koumiss, Elle est fort nourrissante, et peut tenir lieu de tout autre aliment. Les Baschiks s'en trouvent très bien, elle les rend bien portants et gaus; elle leur donne de l'empouvoir, et de bonne couleur. From the Tartars it has been borrowed by the Russians, who use it medicinally. It is made with fermented mare's milk.
KOU [ 483 ]

Koumis, milk, according to the following recipe, communicated by Dr. Grieve, in the Edinburgh Philosophical Transactions, as he obtained it from a Russian nobleman, who went into that part of Tartary where it is made, for the sake of using it medicinally.

"Take of fresh mare's milk, of one day, any quantity; add to it a sixth part of water, and pour the mixture into a wooden vessel; use then, as a ferment, an eighth part of the sour milk that can be got; but at any future preparation, a small portion of old koumis will better answer the purpose of souring; cover the vessel with a thick cloth, and set it in a place of moderate warmth; leave it at rest 24 hours, at the end of which time the milk will have become sour, and a thick substance will be gathered on the top; then with a stick made at the lower end in the manner of a churn staff, beat it till the thick substance above-mentioned be blended intimately with the subjacent fluid. In this situation, leave it again at rest for 24 hours more; after which pour it into a higher and narrower vessel, resembling a churn, where the agitation must be repeated as before, till the liquor appear to be perfectly homogeneous; and in this state it is called koumis, of which the taste ought to be a pleasant mixture of sweet and sour. Agitation must be employed every time before it be used."—To this detail of the process the nobleman subjoined, that in order to obtain milk in sufficient quantity, the Tartars have a custom of separating the fat from the mare during the day, and allowing it to sink during the night; and when the milk is to be taken from the mare, which is generally about five times a day, they always produce the fat, on the supposition that she yields her milk more copiously when it is present.

To the above method of making koumis, our author has added some particulars taken from other communications with which he was favoured by Tartars themselves. According to the account of a Tartar who lived in the south-east of Orenbourg, the proportion of milk and souring ought to be the same above; only, to prevent changing the vessel, the milk may be put at once into a pretty high and narrow vessel; and in order to accelerate the fermentation, some warm milk may be added to it, and if necessary, more souring.—From a Tartar whom the doctor met with at the fair of Macariss upon the Volga, and from whom he purchased one of the leathern bags which are used by the Kalmezes for the preparation and carriage of their koumis, he learned that the process may be much shortened by beating the milk before the souring be added to it, and as soon as the parts begin to separate, and a thick substance to rise to the top, by agitating it every hour or oftener. In this way he made some in the doctor's presence in the space of 12 hours. Our author learned also, that it was common among some Tartars to prepare it in one day during summer, and that with only two or three agitations; but that in winter, when, from a deficiency of mare's milk, they are obliged to add a great proportion of that of cows, more agitation and more time are necessary: and though it is commonly used within a few days after the preparation, yet when well secured in close vessels, and kept in a cold place, that it may be preserved for three months, or even more, without any injury to its qualities. He was told farther, that the acid fermentation might be produced by sour milk as above, by a sour paste of rye flour, by the rennet of a lamb's stomach, or, what is more common, by a portion of old koumis, and that in some places they saved much time, by adding the new milk to a quantity of that already fermented; on being mixed with which, it very soon undergoes the vinous change.

It was according to the process first mentioned, however, that all koumis which the doctor employed in medicine was prepared.—It has been found serviceable in hectic and nervous complaints; and our author relates some very striking cases which the use of it had completely cured. All those who drank it, our author informs us, agreed in saying, that during its use, they had little appetite for food; that they drank it in very large quantities, not only without disgust, but with pleasure; that it rendered their veins turgid, without producing languor; that, on the contrary, they soon acquired from it an uncommon degree of sprightliness and vivacity; that even in cases of some excess it was not followed by indigestion, headach, or any of the symptoms which usually attend the abuse of other fermented liquors.

The utility, however, of this preparation as a medicine, supposing it completely ascertained, would among us, as our author observes, be greatly circumscribed by the scarcity of mare's milk in this country. Hence (says he) inquiries will naturally be made, whether other species of milk admit of a similar vinous fermentation, and what proportion of spirit they contain. As these have never been the object, however, of my attention; I will here give the substance of what I have been able to learn from others respecting which is the most common, the milk of cows.

"Dr. Pallas, in the work above quoted, says, that cows' milk is also susceptible of the vinous fermentation, and that the Tartars prepare a wine from it in winter, when mare's milk fails them; that the wine prepared from cows' milk, they call ayres; but that they always prefer koumis when it can be got, as it is more agreeable, and contains a greater quantity of spirit; that koumis on distillation yields of a weak spirit one third, but that ayres yields only two ninths of its whole parts, which spirit they call ayros.

"This account is confirmed by Oseretzkowsky, a Russian, who accompanied Lepechin and other academicians, in their travels through Siberia and Tartary.

(A) This bag was made of a horse's hide undressed, and by having been smoked had acquired a great degree of hardness. Its shape was conical, but was at the same time somewhat triangular, from being composed of three different pieces, set in a circular base of the same hide. The sutures, which were made with tendons, were secured by a covering on the outside, with a doubling of the same skin, very closely secured. It had a dirty appearance, and a very disagreeable smell. On being asked the reason of this, he said, "The remains of the old koumis were left, in order to supply a ferment to the new milk."
Kubera, which falls into it in Lat. 16° 25', and rises far to the southward from a dubious fountain. This river derives considerable celebrity from its having had on its banks at one period the splendid city of Vijayagad, in Lat. 13° 22', founded in 344 B.C. by Dedalios, king of the Carnatic, which at that time comprehended the whole peninsula. This vast city is said to have been 24 miles in circumference. In the remaining part of the course of the Krishna, there is nothing to be met with which is any way remarkable.

KUBESA. See LAGUES.

KUMI, the name of an island situated between Japan and China, which was visited by the unfortunate navigator Perouse. The inhabitants of this island are neither Japanese nor Chinese, but seem to participate of the nature of both. They wear a shirt and cotton drawers; and their hair, tucked up on the crown of the head, is rolled round a needle, probably of gold. Each wears a dagger with a golden handle; their canoes are made of trees hollowed out, which they manage with no great dexterity. At Kumi, vessels in want of provisions, wood and water, might find a seasonal supply; but as the whole island does not exceed 12 miles in circumference, the population can scarcely be estimated at more than 500; and as M. Perouse well observes, a few gold needles are not of themselves a proof of wealth, so that the trade with its inhabitants would of necessity be very limited. Kumi lies in 24° 33' N. Lat. and 120° 56' E. Long from Paris.

KUNCKEL, JOHN, a celebrated Saxon chemist, was born in the duchy of Sleswick, in 1692. He became chemist to the elector of Saxon, the elector of Brandenburgh, and Charles XI. king of Sweden, who gave him the title of counsellor in metals; and letters of nobility, with the surname of Lauenstein. He employed 50 years in chemistry; in which, by the help of the furnace of a glasshouse which he had under his care, he made several excellent discoveries, particularly of the phosphorus of urine. He died in Sweden in 1772; and left several works, some in German, and others in Latin: among which, that entitled Observationes Chemicæ, and the Art of Making Glass, printed at Paris in 1752, are the most esteemed.

KUBIL or KURILSKY ISLES, extending from N. Lat. 51° to 45°, which probably once lengthened the peninsula of Kamtschatka before they were convulsed from it, are a series of islands running south from the low promontory Lapatska, between which and Shoomaka the most northerly is only the distance of one league. On the lofty Paramos, the second in the chain, is a high peaked mountain, probably volcanic; there is also a volcano on the fourth, called Aurosmakotan; and there are others on some of the smaller islands. Japan also abounds with volcanoes; so that there is a series of spires from Kamtschatka to Japan, the last great link of this extensive chain.—The Russians soon annexed these islands to their conquests. The sea abounded with otters, and the land with bears and foxes; and some of the isles sheltered the sable; but now, it is said, the furs of the sea otters have become extremely scarce both here and in Kamtschatka.

Of the 21 islands subject to the Russian empire, no more than four are inhabited, which are the first, second, thirteenth, and fourteenth, as they are distinguished.
KUS

Kuril

The inhabitants pass the winter on No. 14, and the
summer months on No. 13. The rest of these islands
are wholly uninhabited; but visited occasionally, for
the purpose of hunting otters and foxes. Between
the islands the currents are extremely violent, especially
at the entrance of the channels, some of which are block-
ed up with rocks on a level with the sea. The popu-
lization of the four inhabited islands may amount to
3,400. The natives are hairy, have long beards, and
subsist entirely on the produce of the chase, on seals,
and other species of fish. At the time when Perouse
visited this island, the people were exempted for ten
years from the tribute paid to the emperor of Russia,
because the number of otters was greatly diminished;
a pleasing proof of the mildness of that government,
which has been so often represented as rigidly despotici.
The people of these islands are represented as poor, but
virtuous, given to hospitality, and docile, and all of
them believers of the Christian religion. They extend
from 51° to 43° N. Lat.

KURTUS, a genus of fishes belonging to the order
Ichthyes. See Ichthysology Index.

KUSTER, Ludolf, a very learned writer in the
18th century, was born at Blomberg in Westphalia.
When very young, he was appointed tutor to the two
sons of the count de Schwerin, prime minister of the
king of Prussia, who, upon his author's quitting that
station, procured him a pension of 400 livres. He was
promised a professorship in the university of Joachim;
and till this should be vacant, being then but 25, he
resolved to travel. He read lectures at Utrech; went
to England; and from thence to France, where he
collated Suidas with three MSS. in the king's library,
which furnished him with a great many fragments
that had never been published. He was honoured
with the degree of doctor by the university of Cam-
bidge, which made him several advantageous offers
to continue there; but he was called to Berlin, where
he was installed in the professorship promised him.
Afterwards he went to Antwerp; and being brought
erover to the Catholic religion, he abjured that of the
Protestants. The king of France rewarded him with
a pension, and ordered him to be admitted supernu-
merary associate of the Academy of Inscriptions. But
he enjoyed this, however, a very short time; he died
in 1716, aged 46. He was a great master of the
Latin tongue, and wrote well in it; but his chief
Kuster
excellence was his skill in the Greek language, to
which he almost entirely devoted himself. He wrote
many works; the principal of which are, 1. Historia
critica Homeri. 2. Jambicucus de vita Pythagore. 3. An
elegant edition of Suidas, in Greek and Latin, three
volumes, folio. 4. An edition of Aristophanes, in
Greek and Latin, folio. 5. A new Greek edition of the
New Testament, with Dr Mills's Variations, in
folio.

KYLE, a district of Ayrshire in Scotland, the
limits of which are erroneously stated in the account
which is given in that country. There are three dis-
tricts in Ayrshire, Carrick to the south, Kyte in the
middle, and Cunningham to the north. Carrick is di-
vided from Kyl by the river Doon, and not by the
river Ayr as has been noted by mistake; the boundaries
of Kyte are the river Doon on the south, and the river
Irvine on the north. See AYRSIRE.

KYPHONISM, KYPHONISMUS, or Cyphonismus,
an ancient punishment which was frequently undergone
by the martyrs in the primitive times; wherein the
body of the person to suffer was anointed with honey,
and so exposed to the sun, that the flies and wasps
might be tempted to torment him. This was per-
formed in three ways: sometimes they only tied
the patient to a stake; sometimes they hoisted him
up into the air, and suspended him in a basket; and
sometimes they stretched him out on the ground
with his hands tied behind him. The word is originally Greek,
and comes from µύρος, which signifies either the stake
to which the patient was tied, the collar fitted to his
neck, or an instrument wherewith they tormented him:
the scholar on Aristophanes says, it was a wooden
lock, or cage; and that it was called so from µυρος,
"to crook or bend," because it kept the tortured in
a crooked, bowing posture: others take the µυρος
for a log of wood laid over the criminal's head, to
prevent his standing upright. Hesychius describes the µυρος
as a piece of wood whereon criminals were stretched and
tormented. In effect, it is probable the word
might signify all these several things. It was a generi-
cal name, whereof these were the species.

Suidas gives us the fragment of an old law, which
punished those who treated the laws with contempt
with kyphonomia for the space of twenty days; after
which they were to be precipitated from a rock, dress-
ed in women's habit.

L.

L, a semi vowel, or liquid, making the eleventh
letter of the alphabet.

It was derived from the old Hebrew Lamed, or Greek
Lambda λ. It is sounded by intercepting the breath
between the tip of the tongue and forepart of the pa-
late, with the mouth open, and makes a sweet sound,
with something of an aspiration; and therefore the
Britons and Spaniards usually doubled it, or added an
A to it, in the beginning of words, as in Ilam, or Ilam,
"a temple," sounding nearly like ft, &c. In English
words of one syllable it is doubled at the end, as tell,
bell, knell, &c., but in words of more syllables than one
it is single, at the end, as evil, general, constitutional, &c.
It is placed after most of the consonants in the begin-
ing.
so safe there as he imagined, he withdrew privately to Geneva, where he imposed on the people by his devout preaching and carriage; and from thence was invited to Middleburg, where his spirituality made him and his followers be considered as so many saints, distinguished by the name of Labadists. They increased so much, that he excited the attention of the other churches, whose authority he disputed, till he was formally deposed by the synod of Dort. Instead of obeying, he procured a tumultuous support from a crowd of his devotees; and at length formed a little settlement between Utrecht and Amsterdam, where he erected a printing press, which sent forth many of his works. Here he was betrayed by some deserters, who exposed his private life, and informed the public of his familiarities with his female disciples, under pretence of uniting them more particularly to God; and was finally obliged to retire to Altena in Holstein, where he died in 1674.

LABADISTS, a sect of religious men in the 17th century, followers of the opinions of John Labadie, of whom an account is given in the preceding article. Some of their opinions were: 1. That God could, and did deceive men. 2. That, in reading the Scriptures, greater attention should be paid to the internal inspiration of the Holy Spirit than to the words of the text. 3. That baptism ought to be deferred till mature age. 4. That the good and the wicked entered equally into the old alliance, provided they descended from Abraham; but that the new admitted only spiritual men. 5. That the observation of Sunday was a matter of indifference. 6. That Christ would come and reign 1000 years on earth. 7. That the eucharist was only a commemoration of the death of Christ; and that, though the symbols were nothing in themselves, yet that Christ was spiritually received by those who partook of them in a due manner. 8. That a contemplative life was a state of grace, and of divine union during this life, the summit of perfection, &c. 9. That the man whose heart was perfectly content and calm, half enjoys God, has familiar entertainments with him, and sees all things in him. 10. That this state was to be come at by an entire self-abnegation, by the mortification of the senses and their objects, and by the exercise of mental prayer.

LABARUM, the banner or standard borne before the Roman emperors in the wars. The labarum consisted of a long lance, with a staff a-top, crossing it at right angles; from which hung a rich streamer, of a purple colour, adorned with precious stones. Till the time of Constantine it had an eagle painted on it; but that emperor, in lieu thereof, added a cross with a cipher expressing the name of Jesus.

This standard the Romans took from the Germans, Dacae, Sarmatae, Pannonians, &c. whom they had overcome. The name laborum was not known before the time of Constantine; but the standard itself, in the form we have described it, abating the symbols of Christianity, was used by all the preceding emperors. Some derive the word from labor, as if this signified their labours; some from philous, "reverence, piety," others from labens, "to take;" and others from albo, "spoils."

LABAT, JOHN BAPTIST, a celebrated traveller, of the order of St Dominic, was born at Paris, taught philosophy
philosophy at Nancy, and in 1693 went to America in quality of a missionary. At his return to France in 1705, he was sent to the chapter of his order at Bologna to give an account of his mission, and stayed several years in Italy. He died at Paris in 1738. His principal works are, 1. A new voyage to the American islands, 6 vols 12mo. 2. Travels in Spain and Italy, 8 vols 12mo. 3. A new account of the western parts of Africa, 5 vols 12mo. Father Labat was not in Africa, and therefore was not a witness of what he relates in that work. He also published the "Chevalier des Marchais's voyage to Cochin-China," in 4 vols 12mo; and an historical account of the western parts of Ethiopia, translated from the Italian of Father Cavazzi, 5 vols 12mo.

LABDANUM, or Ladanum, a resinous juice which exudes from a tree of the cistus kind. See CHEMISTRY and MATERIA MEDICA INDEX.

LABDASEBA, a tribe of savage Arabs inhabiting the desert of Sahara in Africa. They are considered as the most powerful of all those tribes except the Ouadellms, and very much resemble them in every particular. See SAHARA and OUADELLMS.

LABEL, a long, thin, brass rule, with a small sight at one end, and a centre hole at the other; commonly used with a tangent line on the edge of a circumferentor, to take altitudes, &c.

LABEL, in Law, is a narrow slip of paper, or parchment, affixed to a deed or writing, in order to hold the appending seal.—Any paper annexed by way of addition or explication, to any will or testament, is also called a label or codicil.

LABEL, in Heraldry, a fillet usually placed in the middle along the chief of the coat, without touching its extremities. Its breadth ought to be a ninth part of the chief. It is adorned with pendants; and when there are above three of these, the number must be specified in blazoning.

It is used on the arms of eldest sons while the father is alive, to distinguish them from the younger; and is esteemed the most honourable of all differences. See HERALDRY.

LABIAL LETTERS, those pronounced chiefly by means of the lips.

LABIATED FLOWERS, monopetalous flowers, consisting of a narrow tube with a wide mouth, divided into two or more segments. See BOTANY.

LABIAU, a small town of Prussia, in a circle of the same name, seated at the mouth of the river Deime, with a strong castle, two sides of which are surrounded with water, and the other defended by a wall and ditch. E. Long. 21. 15. N. Lat. 55. 17.

LABORATORY, or ELABORATORY, the chemists' workhouse, or the place where furnaces are built, vessels kept, and operations are performed. In general the term laboratory is applied to any place where physical experiments in pharmacy, chemistry, pyrotechny, &c. are performed.

As laboratories must be of very different kinds, according to the nature of the operations to be performed in them, it is impossible that any directions can be given which will answer for every one. Where the purposes are merely experimental, a single furnace or two of the portable kind will be sufficient. It is scarcely needful to add, that shelves are necessary for holding vessels with the products of the different operations: and that it is absolutely necessary to avoid confusion and disorder, as by these means the products of the operations might be lost or mistaken for one another. Mortars, filters, levigating stones, &c. must also be procured: but from a knowledge of the methods of performing the different chemical operations will easily be derived the knowledge of a proper place and proper apparatus; for which see CHEMISTRY, and FURNACE.

Morveau has contrived a portable laboratory with which many chemical experiments may be conveniently performed. The following is a description of it.

Fig. 1. represents the whole apparatus ready mounted for distillation, with the tube of safety and a pneumatic receiver. A is the body or reservoir of Argand's lamp, with its shade and glass chimney. The lamp may be raised or lowered at pleasure by means of the thumb-screw B, and the wick rises and falls by the motion of the small-toothed wheel placed over the waste cup. This construction is most convenient, because it affords the facility of altering the position of the flame with regard to the vessels, which remain fixed; and the troublesome management of bended wires above the flame for the support of the vessels is avoided, at the same time that the flame itself can be brought nearer to the matter on which it is intended to act. D, a support consisting of a round stem of brass, formed of two pieces which screw together at about two-thirds of its height. Upon this the circular ring E, the arm F, and the nut G slide, and are fixable each by its respective thumb-screw. The arm carries a movable piece H, which serves to suspend the vessels in a convenient situation, or to secure their position. The whole support is attached to the square iron stem of the lamp by a piece of hard wood I, which may be fixed at any required situation by its screw. K represents a stand for the receivers. Its moveable tablet L is fixed at any required elevation by the wooden screw M. The piece which forms the foot of this stand is fixed on the board N; but its relative position with regard to the lamp may be changed by sliding the foot of the latter between the pieces OO. P, another stand for the pneumatic trough. It is raised or lowered, and fixed to its place, by a strong wooden screw Q. R is a tube of safety, or reversed syphon, which serves, in a great measure, to prevent the bad effects of having the vessels either perfectly closed, or perfectly open. Suppose the upper bell-shaped vessel to be nearly of the same magnitude as the bulb at the lower end of the tube, and that a quantity of water, or other suitable fluid, somewhat less than the contents of that vessel, be poured into the apparatus. In this situation, if the elasticity of the contents of the vessel be less than that of the external air, the fluid will descend in the bulb, and atmospheric air will follow and pass through the fluid in the vessels: but, on the contrary, if the elasticity of the bulb be greater, the fluid will be either sustained in the tube, or driven into the bell-shaped vessel; and if the force be strong enough, the gaseous matter will pass through the fluid, and in part escape.

Fig. 2. Shews the lamp furnace disposed to produce the saline fusion; the chimney of glass shortened; the support D turned down; the capsule of platina or silver S placed on the ring very near the flame.
The same part of the apparatus, in which, instead of the capsule, a very thin and small crucible of platinum T is substituted, and rests upon a triangle of iron wire placed on the ring.

Fig. 3. Exhibits the plan of fig. 3.

Laboratory, in military affairs, signifies that place where all sorts of fire-works are prepared, both for actual service and for experiments, viz. quick matches, fusives, port-fires, grape shot, case shot, carcasses, hand-grenades, cartridges, shells filled, and fusives fixed, wads, &c. &c.

Labour, in general, denotes a close application to work or business.—Among seamen a ship is said to labour when she rolls and tumbles very much, either a-hull, under sail, or at anchor. It is also spoken of a woman in travail or childbirth; see Midwifery.

Labourer, generally signifies one that does the most slavish and least artful part of a laborious work, as that of husbandry, masonry, &c.

Laboureur, John Le, almoner to the king of France, and prior of Juvenile, was born at Montmorency near Paris in 1623. At the age of 18, he distinguished himself by publishing "a collection of the monuments of illustrious persons buried in the church of the Celestines at Paris, with their elegies, genealogies, arms, and mottoes," 4to. He afterwards published an excellent edition of The Memoirs of Michael de Castelane, with several other genealogical histories; and died in 1675. He had a brother, Louis le Labourer, bailiff of Montmorency, author of several pieces of poetry; and an uncle, Dome Claude le Labourer, provost of the abbey of L'Isle Barbe, of which abbey he wrote a history, and published notes and corrections upon the breviary of Lyons, with some other things.

Labrador, the same with New Britain, or the country round Hudson's Bay. See these articles.

Labrador stone, a species of mineral which exhibits a great variety of colours. See Mineralogy Index.

Labrum, in antiquity, a great tub which stood at the entrance of the temples, containing water for the priests to wash themselves in previous to their sacrifices. It was also the name of a bathing tub used in the baths of the ancients.

Labrus, a genus of fishes belonging to the order of thornii. See Ichthyology Index.

Laburnum. See Cytisus, Botany Index.

Laborinth, among the ancients, was a large intricate edifice cut out into various aisles and meanders running into each other, so as to render it difficult to get out of it. There is mention made of several of those edifices among the ancients; but the most celebrated are the Egyptian and the Cretan labyrinths.

That of Egypt, according to Pliny, was the oldest of all the known labyrinths, and was subsisting in his time after having stood 3000 years. He says it was built by King Peteaca, or Thitoee; but Herodotus makes it the work of several kings: it stood on the banks of the lake pear, and consisted of 12 large contiguous palaces, containing 3000 chambers, 1500 of which were under ground. Strabo, Diodorus Siculus, Pliny, and Mela, speak of this monument with the same admiration as Herodotus: but not one of them tells us that it was constructed to bewildor those who attempted to go over it; though it is manifest that, Labyrinth without a guide, they would be in danger of losing their way.

It was this danger, no doubt, which introduced a new term into the Greek language. The word labyrinth, taken in the literal sense, signifies a circumvallated space, intersected by a number of passages, some of which cross each other in every direction like those in quarries and mines, and others make larger or smaller circuits round the place from which they depart like the spiral lines we see on certain shells. In the figurative sense, it was applied to obscure and capricious questions, to indirect and ambiguous answers, and to those discussions which, after long digressions, bring us back to the point from which we set out.

The Cretan labyrinth is the most famed in history or fable; having been rendered particularly remarkable by the story of the Minotaur, and of Theseus who found his way through all its windings by means of Ariadne's clue. On Plate CCLI.XXXIX. is exhibited a supposed plan of it, copied after a draught given by Meursius, taken from an ancient stone. But what in Crete was the real nature of this labyrinth, merits a more particular inquiry.

Diodorus Siculus relates as a conjecture, and Pliny as a certain fact, that Daedalus constructed this labyrinth on the model of that of Egypt, though on a less scale. They add, that it was formed by the command of Minos, who kept the Minotaur shut up in it; and that in their time it no longer existed, having been either destroyed by time, or purposely demolished. Diodorus Siculus and Pliny, therefore, considered this labyrinth as a large edifice; while other writers represent it simply as a cavern hollowed in the rock, and full of winding passages. The two former authors, and the writers last mentioned, have transmitted to us two different traditions; it remains for us to choose that which is most probable.

If the labyrinth of Crete had been constructed by Daedalus under Minos, whence is it that we find no mention of it, neither in Homer, who more than once speaks of that prince and of Crete; nor in Herodotus, who describes that of Egypt, after having said that the monuments of the Egyptians are much superior to those of the Greeks; nor in any of the writers of the ages when Greece flourished?

This work was attributed to Daedalus, whose name is alone sufficient to discredit a tradition. In fact, his name, like that of Hercules, had become the resource of ignorance, whenever it turned its eyes on the early ages. All great labours, all works which required more strength than ingenuity, were attributed to Hercules; and all those which had a relation to the arts, and required a certain degree of intelligence in the execution, were ascribed to Daedalus.

The opinion of Diodorus and Pliny supposes, that in their time no traces of the labyrinth existed in Crete, and that even the date of its destruction had been forgotten. Yet it is said to have been visited by the disciples of Apollo of Tyana, who was contemporary with those two authors. The Cretans, therefore, then believed that they possessed the labyrinth.

"I would request the reader (continues the abbé Traverso, of St. Barthelimi, from whom these observations are extracted)"
Labyrinth was
treated to attend to the following passage in Strabo.

Lac.

At Napulia, near the ancient Argos, (says that judicious writer,) are still to be seen vast caverns, in which are constructed labyrinths that are believed to be the work of the Cyclops: the meaning of which is, that the labours of men had opened in the rock passages which crossed and returned upon themselves, as is done in quarries. Such, if I am not mistaken, is the idea we ought to form of the labyrinth of Crete.

"Were there several labyrinths in that island? Ancient authors speak only of one, which the greater part place at Cnosus; and some, though the number is small, at Gortyna.

Belon and Tournesort have given us the description of a cavern situated at the foot of Mount Ida, on the south side of the mountain, at a small distance from Gortyna. This was only a quarry according to the former, and the ancient labyrinth according to the latter; whose opinion I have followed, and abridged his account. Those who have added critical notes to his work, besides this labyrinth, admit a second at Cnosus, and adduce as the principal support of this opinion the coins of that city, which represent the plan of it according as the artists conceived it. For on some of these it appears of a square form, on others round: on some it is only sketched out; on others it has, in the middle of it, the head of the Minotaur. In the Memoirs of the Academy of Belles Lettres, I have given an engraving of one which appears to me to be of about the 15th century before Christ, and on which we see on one side the figure of the Minotaur, and on the other a rude plan of the labyrinth. It is therefore certain, that at the time that the Cnossians believed they were in possession of that celebrated cavern; and it also appears that the Gortynians did not pretend to contest their claim, since they have never given the figure of it on their money.

"The place where I suppose the labyrinth of Crete to have been situated, according to Tournesort, is but one league distant from Gortyna; and, according to Strabo, it was distant from Cnosus six or seven leagues. All we can conclude from this, is, that the territory of the latter city extended to very near the former.

"What was the use of the caverns to which the name of labyrinth was given? I imagine that they were first excavated in-part by nature; that in some places stones were extracted from them for building cities; and that in more ancient times they served for a habitation or asylum to the inhabitants of a district exposed to frequent incursions. In the journey of Achaearis through Phocis, I have spoken of two great caverns of Parmenius, in which the neighbouring people took refuge; in the one at the time of the deluge of Deucalion, and in the other at the invasion of Xerxes. I here add, that, according to Diodorus Siculus, the most ancient Cretans dwelt in the caves of Mount Ida. The people, when inquiries were made on the spot, said that their labyrinth was originally only a prison. It may have been put to this use; but it is difficult to believe, that, to prevent the escape of a few unhappy wretches, such immense labours would have been undertaken."

LABYRHINTH OF THE EAR. See Anatomy Index.

LAC, MILK. See Milk, Chemistry Index.

Vol. XI. Part II. +

LAC, Gum. See LACCA.

LACCA, LAC, or Gum Lac, is a substance of which a species of insects form cells upon trees, like honeycombs. This is the corusc lacca, Linn. See Entomology Index. In these cells remain some of the dead insects, which give a red colour to the whole substance of the lac. That called stick lac is the wax adhering to some of the small branches of the tree, and which is unprepared. This lac, when separated from the adhering sticks, and grossly powdered, and deprived of its colour by digestion with menstruums for the sake of the dyes and other purposes, is called seed lac; when the stick lac is freed from impurities by melting it over a gentle fire, and formed into cakes, it is called lump lac; and, lastly, that called shell lac is the cells liquefied, strained, and formed into thin transparent laminae. See Dyeing Index.

The following are some of the purposes to which this substance is applied.

1. For sealing wax. Take a stick, and heat one end of it upon a charcoal fire; put upon it a few leaves of the shell lac softened above the fire; keep alternately heating and adding more shell lac until you have got a mass of three or four pounds of liquefied shell lac upon the end of your stick (in which manner lump lac is formed from seed lac.) Knead this upon a wetted board with three ounces of levigated cinnabars; form it into cylindrical pieces; and to give them a polish, rub them while hot with a cotton cloth.

2. For japanning. Take a lump of shell lac, prepared in the manner of sealing wax, with whatever colour you please, fix it upon the end of a stick, heat the polished wood over a charcoal fire, and rub it over with the half melted lac, and polish by rubbing it even with a piece of folded plantain leaf held in the hand; heating the lacquer, and adding more lac as occasion requires. Their figures are formed by lac charged with various colours in the same manner.

3. For varnish. In ornamenting their images and religious houses, &c. they make use of very thin beat lead, which they cover with various varnishes, made of lac charged with colours. The preparation of them is kept a secret. The leaf of lead is laid upon a smooth iron heated by fire below while they spread the varnish upon it.

4. For grindstones. Take of river sand three parts, of seed lac washed one part: mix them over the fire in a pot, and form the mass into the shape of a grindstone, having a square hole in the centre, fix it on an axis with liquefied lac, heat the stone moderately, and by turning the axis it may be easily be formed into an exact orbicular shape. Polishing grindstones are made only of such sand as will pass easily through fine muslin, in the proportion of two parts sand to one of lac. This sand is found at Raginum. It is composed of small angular crystalline particles tinged red with iron, two parts to one of black magnetic sand. The stonecutters, instead of sand, use the powder of a very hard granite called sorsone. These grindstones cut very fast. When they want to increase their power, they throw sand upon them, or let them occasionally touch the edge of a vitrified brick. The same composition is formed upon sticks, for cutting stones, shells, &c. by the hand.

3 Q 5. For
LAC

5. For painting. Take one gallon of the red liquid from the first washing for shell lac, strain it through a cloth, and let it boil for a short time, then add half an ounce of soap earth (fossil alkali); boil an hour more, and add three ounces of powdered load (bark of a tree); boil a short time, let it stand all night, and strain next day. Evaporate three quarts of milk without cream to two quarts upon a slow fire, curdle it with sour milk, and let it stand for a day or two; then mix it with the red liquid above mentioned; strain them through a cloth; add to the mixture one ounce and a half of alum, and the juice of eight or ten lemons: mix the whole, and throw it into a cloth bag strainer. The blood of the insect forms a coagulum with the caseous part of the milk, and remains in the bag, while a limpid acid water drains from it. The coagulum is dried in a shade, and is used as a red colour in painting and colouring.

The method of obtaining the fine red lac used by painters from this substance, is by the following simple process: Boil the stick lac in water, filter the decoction, and evaporate the clear liquor to dryness over a gentle fire. The occasion of this easy separation is, that the beautiful red colour here separated, adheres only slightly to the outsides of the sticks broke off the trees along with the gum lac, and readily communicates itself to boiling water. Some of the sticking matter also adhering to the gum itself, it is proper to boil the whole together; for the gum does not at all prejudice the colour, nor dissolve in boiling water; so that after this operation the gum is as fit for making sealing wax as before, and for all other uses which do not require its colour.

6. For dyeing. See DYEING INDEX.

Lac is likewise employed for medicinal purposes.

The stick lac is the sort used. It is of great esteem in Germany, and other countries, for laxity and sponginess of the gums proceeding from cold or a scorbutic habit: for this use the lac is boiled in water, with the addition of a little alum, which promotes its solution; or a tincture is made from it with rectified spirit. This tincture is recommended also internally in the flux albus; and in scrofulous and scrofulous disorders: it has a grateful smell, and not unpleasant, bitterish, astringent taste.

The gum-lac has been used as an electric, instead of glass, for electrical machines. See LACQUER, LACE, and VARNISH.

Artificial Lacca, or Lacque, is also a name given to a coloured substance drawn from several flowers; as the yellow from the flower of the juniper, the red from the poppy, and the blue from the iris or violet. The tinctures of these flowers are extracted by digesting them several times in aqua vitae, or by boiling them over a stove fire in a lixivium of pot ashes and alum.

An artificial lacca is also made of Brasil wood, boiled in a lixivium of the branches of the vine, adding a little cochineal, turmeric, calcined alum, and arsenic, incorporated with the bones of the cattle fish pulverized, and made up into little cakes and dried. If it be boiled a second time, they add the juice of lemon to it; to make it brown, they add oil of tartar. Dye-coloured or colombine lacca is made with Brasil of Fernambuc, steeped in distilled vinegar for the space of a month, and mixed with alum incorporated in cuttle fish bone. For other processes, see COLOURING.

LACE, in Commerce, a work composed of many threads of gold, silver, or silk, interwoven the one with the other, and worked upon a pillow with spindles according to the pattern designed. The open work is formed with pins, which are placed and displaced as the spindles are moved. The importation of gold and silver lace is prohibited.

Method of Cleaning Gold Lace and Embroidery when tarnished.—For this purpose alkaline liquors are by no means to be used; for while they clean the gold, they corrode the silk, and change or discharge its colour. Soap also alters the shade, and even the species, of certain colours. But spirit of wine may be used without any danger of its injuring either the colour or quality of the subject; and in many cases proves as effectual, for restoring the lustre of the gold, as the corrosive detergents. A rich brocade, flowered with a variety of colours, after being disagreeably tarnished, had the lustre of the gold perfectly restored by washing it with a soft brush dipt in warm spirit of wine; and some of the colours of the silk, which were likewise soiled, became at the same time remarkably bright and lively. Spirit of wine seems to be the only material adapted to this intention, and probably the boasted secret of certain artists is no other than this spirit disguised.

Among liquids, Dr Lewis says, he does not know of any other that is of sufficient activity to discharge the foul matter, without being hurtful to the silk: as to powders, however fine, and however cautiously used, they scratch and wear the gold, which here is only superficial and of extreme tenacity.

But though spirit of wine is the most innocent material that can be employed for this purpose, it is not in all cases proper. The golden covering may be in some parts worn off; or the base metal, with which it had been iniquitously alloyed, may be corroded by the air, so as to leave the particles of the gold disunited; while the silver underneath, tarnished to a yellow hue, may continue a tolerable colour to the whole; in which cases it is apparent, that the removal of the tarnish would be prejudicial to the colour, and make the lace or embroidery less like gold than it was before. A piece of old tarnished gold lace, cleaned by the spirit of wine, was deprived, with its tarnish, of the greatest part of its golden hue, and looked now almost like silver lace.

Method of separating the Gold and Silver from Lace without burning it.—Cut the lace in pieces, and (having separated the thread from it by which it was sewed to the garment) tie it up in a linen cloth, and boil it in soap ley, diluted with water, till you perceive it is diminished in bulk; which will take up but a little time, unless the quantity of lace be very considerable. Then take out the cloth, and wash it several times in cold water; squeezing it pretty hard with your foot, or beating it with a mallet, to clear it of the soap ley; then untie the cloth, and you will have the metallic part of the lace pure, and nowhere altered in colour or diminished in weight.

This method is abundantly more convenient and less troublesome than the common way of burning; and as a small quantity of the ley will be sufficient, the expence
expence will be trifling, especially as the same key may be used several times, if cleared of the silky calcinartion. It may be done in either an iron or copper vessel. The key may be had at the soap boilers, or it may be made of pear ash and quicklime boiled together in a sufficient quantity of water. The reason of this sudden change in the lace will be evident to those who are acquainted with chemistry; for silk, on which all our laces are wove, is an animal substance, and all animal substances are soluble in alkales, especially when rendered more caustic by the addition of quicklime; but the linen you tie it in, being a vegetable, will remain unaltered. Blond Lace, a lace made of fine linen thread or silk, much in the same manner as that of gold and silver. The pattern of the lace is fixed upon a large round pillow, and pins being stuck into the holes or openings in the patterns, the threads are interwoven by means of a number of bobbins made of bone or ivory, each of which contains a small quantity of fine thread, in such a manner as to make the lace exactly resemble the pattern. There are several towns in England, and particularly in Buckinghamshire, that carry on this manufacture; but vast quantities of the finest lace have been imported from Flanders.

Lacedemon, in fabulous history, a son of Jupiter and Tayget the daughter of Atlas, who married Sparta the daughter of Europa, by whom he had Amyclas and Euridyce the wife of Acisius. He was the first who introduced the worship of the Graces in Laconia, and who first built them a temple. From Lacedemon and his wife, the capital of Laconia was called Lacedaemon and Sparta.

Lacedemon, a noble city of Peloponnesus, called also Sparta; these names differing in this, that the latter is the proper and ancient name of the city, the former of the country, which afterwards came to be applied to the city (Strabo, Stephanus). Homer also makes this distinction; who calls the country holy, because encompassed with mountains. It has also been severally known by the name of Leged, from the Leleges the first inhabitants of the country, or from Lelex one of their kings; and Oebalus, from Oebalus the sixth king from Euritas. It was also called Hecatompolis, from 100 cities which the whole province once contained. This city was the capital of Laconia, situated on the right or west side of the Eurotas: it was less in compass than, however equal, or even superior to, Athens in power. Polybius makes it 48 stadia, a circuit much inferior to that of Athens. Lelex is supposed to have been the first king of Lacedaemon. His descendants, 33 in number, reigned successively after him, till the reign of the sons of Orestes, when the Heraclides recovered the Peloponnesus about 80 years after the Trojan war. Procles and Eurystheus, the descendants of the Heraclides, usurped the crown together; and after them it was decreed that the two families should always sit on the throne together. The monarchical power was abolished, and the race of the Heraclides extinguished at Sparta about 219 years before Christ. Lacedaemon in its flourishing state remained without walls, the bravery of its citizens being instead of them (Nepos). At length in Cassander's time, or after, when the city was in the hands of tyrants, distrusting the defence by arms and

bravery, a wall was built round it, at first slight, and in a tumultuous or hasty manner; which the tyrant Nabis made very strong (Livy, Justin). Pausanias ascribes the first walls to the times of Demetrius and Pyrrhus, under Nabis. The walls of the city were pulled down 188 years before Christ by Philipomen, who was then at the head of the Achæan league, and Lacedaemon some time after became a Roman province when reduced by Mummium. See SPARTA.—The present city is called Missira, situated in E. Long. 23° 0. N. Lat. 36. 55.

LACERNA, a coarse thick garment worn by the Romans over their gowns, like a cloak, to keep off the rain and cold. It was first used in the camp, but afterwards admitted into the city. The emperors wore the lacerma of a purple dye. The lacerma was at first very short, but was lengthened after it became fashionable, which was not till the civil wars and the triumvirate; before this time it was confined to the soldiers. Senators were forbidden wearing it in the city by Valentinian and Theodosius. Martial makes mention of lacerma worth 10,000 sesterces. Some confused this garment with the penuia; but it seems rather to have resembled the chlamys and bireus.

LACERTA, including the LIZARD, CROCODILE, &c. a genus of amphibious animals, belonging to the order of reptilia. See ZOOLOGY Index.

LACHES, (from the French laccher, i. e. lacher, or lasche, ignaus), in the English law signifies slackness or negligence, as it appears in Littleton, where laches of entry is a neglect of the heir to enter. And probably it may be an old English word: for where we say there is laches of entry, it is all one as if we were said there is a lack of entry; and in this signification it is used. No laches shall be adjudged in the heir within age; and regularly, laches shall not bar infants or female covertors for not entry or claim, to avoid descents; but laches shall be accounted in them for non-performance of a condition annexed to the state of the land.

LACHESIS, in Mythology, one of the Parcae. Her name is derived from laches, to measure out by lot. She presided over futurity, and was represented as spinning the thread of life, or, according to others, holding the spindle. She generally appeared covered with a garment variegated with stars, and holding spindles in her hand.

LACHISH, in Ancient Geography, a city southward of the tribe of Judah. Eusebius and St Jerome tell us, that in their-time there was a village called Lachish, seven miles from Eleutheropolis, southward. Sennacherib besieged Lachish, but did not take it. From thence it was that he sent Rabshakeh against Jerusalem. Here King Amaziah was slain by his rebel subjects.

LACHNEA, a genus of plants belonging to the oecandria class, and in the natural method ranking under the 21st order, Vegeculae. See BOTANY Index.

LACHRYMATOR, in Anatomy, an appellation given to several parts of the eye. See ANATOMY.

LACHRYMATORY, in antiquity, a vessel wherein were collected the tears of a deceased person's friends, and preserved along with the ashes and urn. They were small glass or earthen bottles, chiefly in the form of phials. At the Roman funerals, the friends
of the deceased, or the *preface*, women hired for that purpose, used to fill them with their tears, and deposite them very carefully with the ashes, in testimony of their sorrow, imagining the manners of the deceased were thereby greatly comforted. Many specimens of them are preserved in the cabinets of the curious, particularly in the British Museum.

LACINIUM, in *Ancient Geography*, a noble promontory of the Bruttii, in Italy, the south boundary of the Sinus Tarentinus and the Adriatic; all to the south of it being deemed the Ionian sea; it was famous for a rich temple of Juno, surnamed Lacinius, with a pillar of solid gold standing in it; which Hannibal intending to carry off, was, according to Cicero, dissuaded by a dream. *Now Capo delle Colonne*, from the columns of Juno’s temple still standing, on the north-east coast of Calabria Ultra.

**LACK OF RUPEES**, is 100,000 rupees; which supposing them standard, or siccas, at 2s. 6d. amounts to 125,000 sterling.

**LACMUS**, a dye stuff prepared by the Dutch from the *Lichen roccellos*. See *Dyeing Index*.

LACONIA, or LACONIC, a country in the southern parts of Peloponnesus, having Argos and Arcadia on the north, Messenia on the west, the Mediterranean on the south, and the bay of Argos on the east. Its extent from north to south was about 90 miles. It was watered by the river Eurotas. The capital was called Sparta, or Lacedaemon; (See Lacedaemon and Sparta). The brevity with which the Lacoonians always expressed themselves is now become proverbial; and by the epithet of Laconic we understand whatever is concise, and is not loaded with unnecessary words.

LACONIUM, (whence our term laconic), a short pithy sententious speech, such as the Lacedaemonians were remarkable for: Their way of delivering themselves was very concise, and much to the purpose. See the preceding article.

LACQUERS, are varnishes applied upon tin, brass, and other metals, to preserve them from tarnishing, and to improve their colour. The basis of lacquers is a solution of the resinous substance called seed lac, in spirit of wine. The spirit ought to be very strong, in order to dissolve much of the lac. For this purpose, some authors direct dry potash to be thrown into the spirit. This alkali attracts the water, with which it forms a liquid that subsides distinctly from the spirit at the bottom of the vessel. From this liquid the spirit may be separated by decantation: but by this process the spirit is impregnated with part of the alkali, which depraves its colour, and communicates a property to the lacquer of imbibing moisture from the air. These inconveniences may be prevented by distilling the spirit; or, if the artist has not an opportunity of performing that process, he may cleanse the spirit in a great measure from the alkali, by adding to it some calcined alum; the acid of which uniting with the alkali remaining in the spirit, forms with it a vitriolated tartar, which, not being soluble in spirit of wine, falls to the bottom together with the earth of the decomposed alum. To a pint of the purified spirit, about three ounces of powdered shell lac are to be added; and the mixture to be digested during same day with a moderate heat. The liquor ought then to be poured off, strained, and cleared by settling. This clear liquor is now fit to receive the required colour from certain resinous colouring substances, the principal of which are gamboge and anatto; the former of which gives a yellow, and the latter an orange colour. In order to give a golden colour, two parts of gamboge are added to one of anatto; but these colouring substances may be separately dissolved in the tincture of lac, and the colour required may be adjusted by mixing the two solutions in different proportions. When silver leaf or tin are to be lacquered, a larger quantity of the colouring materials is requisite than when the lacquer is intended to be laid on brass.

LACSHA, the Indian name of the lac insect. See Lac, Chemistry, and Dyeing Index.

LACTATIO, LACTATION, among medical writers, denotes the giving suck. The mother’s breast, if possible, should be allowed the child, at least during the first month; for thus the child is more peculiarly benefited by what it sucks, and the mother is preserved from more real inconveniences than the falsely delicate imagine they would suffer by compliance herewith: but if by reason of an infirm constitution, or other causes, the mother cannot suckle her child, let dry nursing under the mother’s eye be pursued.

When women lose their appetite by giving suck, both the children and themselves are thereby injured; wet nurses are to be preferred, who, during the time they give the breast, have rather an increased appetite, and digest more quickly; the former are apt to waste away, and sometimes die consumptive. In short, those nurses with whom lactation may for a while agree, should wean the child as soon as their appetite lessens, their strength seems to fail, or a tendency to hysterical symptoms is manifest.

When the new born child is to be brought up by the mother’s breast, apply it thereto in ten or twelve hours after delivery: thus the milk is sooner and more easily supplied, and there is less hazard of a fever than when the child is not put to it before the milk begins to flow of itself.

The mother does not suckle her child, her breasts should be kept so warm with flannels, or with a bare skin, that a constant perspiration may be supported; thus there rarely will arise much inconvenience from the milk.

The child, notwithstanding all our care in dry nursing, sometimes pinches if a breast is not allowed. In this case a wet nurse should be provided, if possible one that hath not been long delivered of a child. She should be young, of a healthy habit, and an active disposition, a mild temper, and with breasts well filled with milk. If the milk is good, it is sweetish to the taste, and totally free from saltiness; to the eye it appears thin, and of a bluish cast. That the woman hath her senses, in other respects objections be not made, need not be any; and as to the custom with many, of abstaining from venery while they continue to suckle a child, it is so far without reason to support it, that the truth is, a rigorous chastity is as hurtful, and often more penurious, than an immoderate use of venery. Amongst the vulgar errors, is that of red-haired women being improper for wet nurses.
LACTANTIIUS, Lucius Coelius Firmianus, a celebrated author at the beginning of the 4th century, was, according to Baronius, an African; but, according to others, was born at Fermo in the marquisate of Ancona, from whence it is imagined he was called Firmianus. He studied rhetoric under Arnobius; and was afterwards a professor of that science in Africa and Nicaeumedia, where he was so admired, that the emperor Constantine chose him preceptor to his son Crispus Caesar. Lactantius was so far from seeking the pleasure and riches of the court, that he lived there in poverty, and, according to Eusebius, frequently wanted necessaries. His works are written in elegant Latin. The principal of which are, 1. De tra divina. 2. De operibus Dei, in which he treats of the creation of man, and of divine providence. 3. Divine Institutions, in seven books: this is the most considerable of all his works: he there undertakes to prove the truth of the Christian religion, and to refute all the difficulties that had been raised against it; and he solidly, and with great strength, attacks the illusions of Paganism. His style is pure, clear, and natural, and his expressions noble and elegant, on which account he has been called the Ciceron of the Christians. There is also attributed to him a treatise De morte persecutorum; but several of the learned doubt its being written by Lactantius. The most copious edition of Lactantius’s works is that of Paris in 1748, 2 vols. 4to.

LACTAEIS, or LACTEAL VESSELS, a kind of long slender tubes for the conveyance of the chyle from the intestines to the common reservoir. See ANATOMY, No 105.

LACTIFEROUS, an appellation given to plants abounding with a milky juice, as the sow thistle and the like. The name of lactiferous, or lacteal, is given to all those plants which abound with a thick coloured juice, without regarding whether it is white or not. Most lactiferous plants are poisonous, except those with compound flowers, which are generally of an innocent quality.

Of the poisonous lacteous plants the most remarkable are sumach, agaric, maple, burning thorny plant, cassada, celadine, succocon, prickly poppy, and the plants of the natural order contorta, as swallow-wort, apocynum, cynanchum, and cerbera.

The bell-shaped flowers are partly noxious, as cardinal flower; partly innocent, as campanula.

Among the lacteous plants with compound flowers that are innocent in their quality, may be mentioned dandelion, picris, hyoseris, wild lettuce, gum succory, hawkweed, bastard hawkweed, hypericin, goat's beard, and most species of lettuce: we say most species, because the prickly species of that genus are said to be of a very virulent and poisonous nature; though Mr Lightfoot denies this, and affirms that they are a safe and gentle opiate, and that a syrup made from the leaves and stalks is much preferable to the common diocodium.

LACTUCA, LETTUCE, a genus of plants belonging to the synogenesis class; and in the natural method ranking under the 49th order, Compositae. See BOTANY Law. And for the method of cultivating lettuce, see GARDENING INDEX.

LACUNAE, in Anatomy, certain excretory canals in the genital parts of women.

LACUNAR, in Architecture, an arched roof or ceiling, more especially the planking or flooring above porticoes or piazzas.

LACYDES, a Greek philosopher, born at Cyrene, was the disciple of Arcesilaus, and his successor in the academy. He taught in a garden given him by Attalus king of Pergamus; but that prince sending for him to court, he replied, "That the pictures of kings should be viewed at a distance." He imitated his master in the pleasure he took in doing good without caring to have it known: he had a goose which followed him everywhere by night as well as by day; and when she died, he made a funeral for her, which was as magnificent as if it had been for a son or a brother. He taught the same doctrine as Arcesilaus; and pretended that we ought to determine nothing, but always to suspend our opinion. He died 212 B.C.

LADDER, a frame made with a number of steps, by means of which people may ascend as on a stair to places otherwise inaccessible.

Scaling LADDERS, in the military art, are used in scaling when a place is to be taken by surprise. They are made several ways: here we make them of flat staves, so that they may move about their pins, and shut like a parallel ruler, for conveniently carrying them: the French make them of several pieces, so as to be joined together, and to be made of any necessary length: sometimes they are made of single ropes, knotted at proper distances, with iron hooks at each end, one to fasten them upon the wall above, and the other in the ground; and sometimes they are made with two ropes, and staves between them, to keep the ropes at a proper distance, and to tread upon. When they are used in the action of scaling walls, they ought to be rather too long than too short, and to be given in charge only to the stoutest of the detachment. The soldiers should carry these ladders with the left arm passed through the second step, taking care to hold them upright close to their sides, and very
Ladder very short below, to prevent any accident in leaping into the ditch.

The front rank of each division, provided with ladders, should set out with the rest at the signal, marching resolutely with their firelocks along, to jump into the ditch; when they are arrived, they should apply their ladders against the parapet, observing to place them towards the salient angles rather than the middle of the curtain, because the enemy have less force there. Care must be taken to place the ladders within a foot of each other, and not to give them too much nor too little slope, so that they may not be overturned or broke with the weight of the soldiers mounting upon them.

The ladders being applied, they who have carried them, and they who come after, should mount up, and rush upon the enemy sword-in-hand: if he who goes first, happens to be overturned, the next should take care not to be thrown down by his comrade; but, on the contrary, immediately mount himself, so as not to give the enemy time to load his piece.

As the soldiers who mount first may be easily tumbled over, and their fall may cause the attack to fail, it would perhaps be right to protect their breasts with the fore parts of cuirasses; because, if they can penetrate, the rest may easily follow.

The success of an attack by scaling is infallible, if they mount the four sides at once, and take care to shower a number of grenadiers amongst the enemy, especially when supported by some grenadiers and pikquets, who share the attention and fire of the enemy.

LADEN, in the sea language, the state of a ship when she is charged with a weight or quantity of any sort of merchandizes, or other materials, equal to her tonnage or burden. If the cargo with which she is laden is extremely heavy, her burden is determined by the weight of the goods; and if it is light, she carries as much as she can stow, to be fit for the purposes of navigation. As a ton in measure is generally estimated at 2000 lb. in weight, a vessel of 200 tons ought accordingly to carry a weight equal to 400,000 lb. when the matter of which the cargo is composed is specially heavier than the water in which she floats; or, in other words, when the cargo is so heavy that she cannot float high enough with so great a quantity of it as her hold will contain.

LADEN in Bulk, the state of being freighted with a cargo which is neither in casks, boxes, bales, nor cases, but lies loose in the hold; being defended from the moisture or wet of the hold, by a number of mats and a quantity of damage. Such are usually the cargoes of corn, salt, or such materials.

LADENBURG, a town of Germany in the duchy of Baden, seated on the river Neckar, in E. Long. 8° 43', N. Lat. 49° 27'. It belongs to the grand duke of Baden.

LADISLAUS, the name of several kings of Poland. See POLAND.

LADOGA, a lake in Russia, between the gulfs of Onega and Finland, measuring 130 miles by 75, and considered as the largest in Europe. Seals are among the fish with which it abounds. It is full of quicksands, which often prove fatal to the Russian flat-bottomed vessels; these sands often shifting from place to place by violent storms, and forming a number of shelves.

On this account Peter the Great cut a canal 67 miles in length from the south-west extremity of the lake, thus opening a communication between it and the gulf of Finland.

LADOGA, New, a town in the Russian government of Petersburg, seated on the Volkof, between the canal and lake of Ladoga. Old Ladoga is higher up the river, and a place of no great extent. The former is 70 miles east of Petersburg, in N. Lat. 60° E. Long. 21° 44'.

LADOGNA, or LACEDOGNA, a town of Italy in the kingdom of Naples, and in the Capitanata, with a bishop's see. E. Long. 15° 12', N. Lat. 41° 16'.

LADON, in Ancient Geography, a river of Arcadia falling into the ALPHEUS. The metamorphosis of Daphne into a laurel, and of Syrinx into a reed, happened near its banks.

LADRONE or MARIAN islands, a cluster of twelve islands lying in the Pacific ocean, in about 14° 50' of east longitude, and between the 17th and 21st degree of north latitude. They were first discovered by Magellan, who sailed round the world through the straits which bear his name. He gave them the name of Ladrone islands, or the islands of Thieves, from the thievish disposition of the inhabitants. At the time these islands were discovered by the Europeans, the natives were totally unacquainted with any other country besides their own; and having no traditionary accounts of their own origin, they imagined that the author of their race was formed of a piece of the rock of Funa, one of their smallest islands. Many things looked upon by us as absolutely necessary to our existence, were utterly unknown to these people. They had no animals of any sort; and would not even have had any idea of them, had it not been for the birds; and even of them they had but one species, somewhat like the turtle dove, which they never killed for eating, but only tamed them, and taught them to speak. They were much astonished on seeing a horse which a Spanish captain left among them in 1673, and could not for a long time be satisfied with adoring him. But what is more surprising and incredible in their history is, that they were utterly unacquainted with the element of fire, till Magellan, provoked by their repeated thefts, burned one of their villages. When they saw their wooden houses blazing, they first thought that the fire was a beast which fed upon the wood; and some of them who came too near, being burnt, the rest stood at a distance, lest they should be devoured or poisoned by the breathings of this terrible animal.

The inhabitants of the Ladrones are olive coloured, but not of such a deep dye as those of the Philippine islands; their stature is good, and their limbs well proportioned. Though their food consists entirely of fish, fruits, and roots, yet they are so fat, that to strangers they appear swelled; but this does not render them less nimble and active. They often live to 100 years or more, yet retain the vigour and health of men of 50. The men go stark naked, but the women are covered. They are not ill looked, and take great care of their beauty, though their ideas on that subject are very different from ours. They love black teeth and white hair. Hence one of their principal occupations is to keep their teeth black by the help of certain
LAD [495] LAE

LADrone. Certain herbs, and to whiten their hair, sprinkling upon it a certain water for this purpose. The women have their hair very long; but the men generally shave it close, except a single lock on the crown of the head, after the manner of the Japanese. Their language much resembles that of the people called Tagačeš, in the Philippine islands. It is agreeable to the ear, with a soft and easy pronunciation. One of its chief graces consists in the facility of transposing words, and even all the syllables of one word; and thus furnishing a variety of double meanings, with which these people are greatly delighted. Though plunged in the deepest ignorance, and destitute of every thing valued by the rest of mankind, no nation ever showed more presumption or greater conceit of themselves, than these islanders, looking on their own nation as the only wise, sensible, and polished one in the world, and beholding every other people with the greatest contempt. Though they are ignorant of the arts and sciences, yet, like every other nation, they have their fables which serve them for history, and some poems which they greatly admire. A poet is with them a character of the first eminence, and greatly respected.

It is not known at what time, or from what place, the Ladrone islands were first peopled. As Japan lies within six or seven days sail of them, some have been induced to believe, that the first inhabitants of the Ladrones came from Japan. But from their greater resemblance to the inhabitants of the Philippine islands than to the Japanese, it is more probable that they came from the former than the latter. Formerly most of the islands were inhabited; and about 90 years ago, the three principal islands, Guam, Tinian, and Rota, are said to have contained 50,000 people; but since that time, Tinian has been entirely depopulated, and only 200 or 300 Indians left at Rota to cultivate rice for the island of Guam, which alone is inhabited by Europeans, and where the Spaniards have a governor and a garrison: here also the annual Manilla ship touches for refreshments in her passage from Acapulco to the Philippines. The island of Tinian afforded an asylum to Commodore Anson in 1742; and the masterly manner in which the author of that voyage paints the natural beauties of the country, has given a degree of estimation not only to this island, but to all the rest, which they had not before. Commodore Byron, in 1765, continued nine weeks at Tinian, and anchored in the very spot where the Centurion lay; but gives a much less favourable account of this climate and country than the former navigator. The water, he says, is brackish, and full of worms; many of his men were seized with fevers, occasioned by the intense heat; the thermometer, which was kept on board the ship, generally stood at 86°, which is but 10 or 11 degrees less than the heat of the blood at the heart; and had the instrument been auburn, he imagines it would have stood much higher than it did. It was with the greatest difficulty that they could penetrate through the woods; and when they had fortunately killed a bull, and with prodigious labour dragged it through the forests to the beach, it stank, and was full of fly-blooms by the time it reached the shore. The poultry was ill tasted; and within an hour after it was killed, the flesh became as green as grass, and swarmed with maggots. The wild hogs were very fierce; and to large, that a carcass frequently weighed 200 pounds. Cotton and indigo were found on the island. Captain Wallis continued here a month in 1767, but makes no such complaints.

LADY. This title is derived from two Saxon words, which signify low-day, which words have in time been contracted into the present appellation. It properly belongs only to the daughters of earls, and all of higher rank; but custom has made it a word of complaisance for the wives of knights and of all eminent women.

As to the original application of this expression, it may be observed, that heretofore it was the fashion for these families, whom God had blessed with affluence, to live constantly at their mansion houses in the country, and that once a-week, or oftener, the lady of the manor distributed to her poor neighbours, with her own hands, a certain quantity of bread; but the practice, which gave rise to this title is now as little known as the meaning of it; however, it may be from that hospitable custom, that to this day the ladies in this kingdom alone serve the meat at their own table.

LADY’s Bedstraw. See Galium, 
LADY’S Mantle. See Alchemilla, } BOTANY
LADY’S Smoke. See Cardamine, Index.

LADY’S Treacle. See Ophrys, } 
LADY Day, in Law, the 35th of March, being the anniversary of the Holy Virgin. See Annunciation.

LAElius, CAIUS, a Roman consul and great orator, surmounted the Wise, distinguished himself in Spain in the war against Viraithus the Spanish general. He is highly praised by Cicero, who gives an admirable description of the intimate friendship which subsisted between Lucius and Scipio Africanus the Younger. His eloquence, his modesty, and his abilities, acquired him a great reputation; and he is thought to have assisted Terence in his comedies. He died about the year 126 B. C.

LAENA, in antiquity, was a gown worn by the Roman augurs, and peculiar to their office. In this gown they covered their heads, when they made their observation on the flight of birds, &c. See Augur.

LAER. See Bambocci.

LESTRYGONES, the most ancient inhabitants of Sicily. Some suppose them to be the same as the people of Leonium, and to have been neighbours to the Cyclopes. They fed on human flesh; and when Ulysses came on their coasts, they sunk his ships and devoured his companions. They were of a gigantic stature, according to Homer’s description. A colony of them, as some suppose, passed over into Italy with Lamus at their head, where they built the town of Fermia, whence the epithet of LestrYGonIa is often used for that of Formiana.

LETIA, a genus of plants belonging to the polyandrini class, and in the natural method ranking with those of which the order is doubtful. See Botany. Index.

LÆVINUS, TORRENTINUS, commonly called Van- 

der Bekin, or Torrentin, was a native of Ghent, and bred in the university of Louvain. He afterwards made the tour of Italy, where his virtues obtained him the friendship of the most illustrious personages of his time.
time. On his return to the Low Countries, he was made canon of Liege, and vicar-general to Ernest de Bavière, bishop of that see. At length, having executed a successful embassy to Philip II. of Spain, he was rewarded with the bishopric of Antwerp; from whence he was translated to the metropolitan church of Mechlin, and died there in 1595. He founded a college of Jesuits at Louvain, to which he left his library, medals, and curiosities. He wrote several poems that obtained him the character of being, after Horace, the prince of lyric poets.

LÆVIUS, a Latin poet. It is not well known at what time he lived, but probably before the age of Cicero. A poem of his, entitled, Erotopogonia, i.e. Love-Games, is quoted by Aulus Gellius. Apuleius also quotes six lines from the same poet; but he does not tell from what work he borrowed them. Lævius had also composed a poem, entitled, The Centaurs, which Festus quotes under the title of Petrarum.

LAGAN, or Lagon. See Flotson.

LAGEMAN (logummanus), homo habens legem, or homo legis sui legitor; such as we call now "good men of the jury." The word is frequently used in Domestay, and the laws of Edward the Confessor, cap. 38.

LAGEN (Legena), in ancient time, was a measure of wine, containing six sextars: whence probably is derived our flagon. The lieutenant of the Tower has the privilege to take unam agenam vini ante malum et retro, of all wine ships that come upon the Thames; and Sir Peter Leicester, in his Antiquities of Cheshire, interprets agena vini, "a bottle of wine."

LAGERSTROEMIA, a genus of plants belonging to the polyandria class. See Botany Index.

LAGNY, a town of the Isle of France, with a famous Benedictine Abbey. It is seated on the river Marne, in E. Long. 2° 45'. N. Lat. 48° 50'.

LAGOECIA, a genus of plants belonging to the pentandria class. See Botany Index.

LAGOON, an island in the South sea, lying in S. Lat. 18° 47'. W. Long. 139° 28'. It is of an oval form, with a lake in the middle, which occupies much the greatest part of it. The whole is covered with trees of different growth. It is inhabited by a race of Indians, tall, of a copper colour, with long black hair. Their weapons are poles or spikes, which are twice as long as themselves. Their habitations were seen under some clumps of palm trees, which formed very beautiful groves. This island was discovered by Captain Cook in April 1769.

LAGOPUS, the Ptarmigan. See Tetrao, Ornithology Index.

LAGOS, a sea port town of Portugal, in the province of Algarve, with a castle near the sea, where there is a good harbour, and where the English fleets bound to the Straits usually take in fresh water. W. Long. 8° 5'. N. Lat. 35° 45'.

LAGUNA, or San Christoval de Laguna, a considerable town in the island of Tenerife, near a lake of the same name, on the declivity of a hill. It has three handsome buildings, and a fine square. W. Long. 16° 24'. S. Lat. 28° 30'.

LAGUNES OF VENICE, are marshes or lakes in Italy on which Venice is seated. They communicate with the sea, and are the security of the city. There are about 62 islands in these Lagunes, which together make a bishop's see. Eugano is the most considerable, next to those on which Venice stands.

LAGURUS, a genus of plants belonging to the triandria class, and in the natural method ranking under the 4th order, Gramina. See Botany Index.

LAHOLM, a sea port town of Sweden, in the province of Gothland, and territory of Halland, seated near the Baltic sea, with a castle and a harbour, in E. Long. 13° 13'. N. Lat. 56° 35'.

LAHOR, a large town of Asia, in Indostan, and capital of a province of the same name, and one of the most considerable in the country. It is of a vast circumference, and contains a great number of mosques, public baths, caravansarays, and pagods. It was once the residence of the Great Mogul; but since the removal of the court, the fine palace is going to decay. There is a magnificent walk of shady trees, which runs from this to Agra, that is upwards of 300 miles. Here they have manufactories of cotton cloths and stuffs of all kinds, and they make very curious carpets. E. Long. 75° 55'. N. Lat. 31° 40'.

LAINEZ, JAMES, a Spaniard, companion of Ignatius of Loyola, second general of the Jesuits, and a man of more daring and political character. Having procured from Pope Paul IV. the perpetual generalship of the new order of Jesuits, after the death of Ignatius, he got the following privileges ratified by that pontiff, which show that he was in fact the founder of the worst part of their institution: 1. The right of making all sorts of contracts (without the privy of the community) vested in the generals and their delegates. 2. That of giving authenticity to all comments and explanations of their constitutions. 3. The power of making new, and altering the old: this opened the door to their bloody political tenets, not to be attributed to Loyola. 4. That of having prisons independent of the secular authority, in which they put to death refractory brethren. Lainez died in 1565, aged 53.

LAIRESSER, GERARD, an eminent Flemish painter, born at Liege in 1640. He received the principal part of his instruction from his father Renieu de Lairesse, though he is also accounted a disciple of Bartollet. He first settled at Utrecht, where he lived in distressed circumstances; but an accidental recommendation carrying him to Amsterdam, he soon exchanged want and obscurity for influence and reputation. He was a perfect master of history; his designs are distinguished by the grandeur of the composition; and the back grounds, wherever the subjects required it, are rich in architecture, which is an uncommon circumstance in that country. He had the unaccustomed happiness to lose his sight several years before his death, which happened in 1711; so that the treatise on Design and Colouring, which passes under his name, was not wrote by him, but collected from his observations after he was blind, and published after his death. He had three sons, two of whom were painters; and also three brothers, Ernest, James, and John: Ernest and John painted animals, and James was a flower painter. He engraved a good deal in aquafortis: his works consist of 256 plates, above half of which were done with his own hand. He wrote an excellent book on the art, which
LAIS, a celebrated courtesan, daughter of Timandra, the mistress of Alcibiades, born at Hyccara in Sicily. She was carried away from her native place when Nicias the Athenian general invaded Sicily. She first began to sell her favours at Corinth for 10,000 drachmas, and the immense number of princes, noblemen, philosophers, orators, and plebeians, which courted her embraces, show how much commendation is owed to her personal charms. The excuses which attended her pleasures, gave rise to the proverb of Non cuius hominis contemptus sit ad Rogers Corinthum. Even Demosthenes himself visited Corinth for the sake of Laís; but when he was informed by the courtesan, that admission to her bed was to be bought at the enormous sum of about 2001. English money, the orator departed, and observed that he would not buy repentance at so dear a price. The charms which had attracted Demosthenes to Corinth had no influence upon Xenocrates. When Laís saw the philosopher unmoved by her beauty, she visited his house herself; but there she had no reason to boast of the licentiousness or easy submission of Xenocrates. Diogenes the Cynic was one of her warmest admirers, and though slyly in his dress and manners, yet he gained her heart, and enjoyed her most unbounded favours. The sculptor Mycon also solicited the favours of Laís, but he met with coldness; he, however, attributed the cause of his ill reception to the whiteness of his hair, and dyed it a brown colour, but to no purpose: "Fool that thou art (said the courtesan) to ask what I refused yesterday to thy father." Laís ridiculed the austerity of philosophers, and laughed at the weakness of those who pretend to have gained a superiority over their passions, by observing that the sages and philosophers of the age were not above the rest of mankind, for she found them at her door as often as the rest of the Athenians. The success which her debaucheries met at Corinth encouraged Laís to pass into Thessaly, and more particularly to enjoy the company of a favourite youth called Hippostratus. She was however disappointed: the women of the place, jealous of her charms, and apprehensive of her corrupting the fidelity of their husbands, assassinated her in the temple of Venus, about 340 years before the Christian era. Some suppose that there were two persons of this name, a mother and her daughter.

LAITY, the people as distinguished from the clergy; (see clergy). The lay part of his majesty's subjects is divided into three distinct states; the civil, the military, and the maritime. See CIVIL, MILITARY, and MARITIME.

LAKE, a collection of waters contained in some cavity in an inland place, of a large extent, surrounded with land, and having no communication with the sea. Lakes may be divided into four kinds. 1. Such as neither receive nor send forth rivers. 2. Such as receive rivers, without receiving any. 3. Such as receive rivers, without emitting any. And 4. Such as both receive and send forth rivers. Of the first kind, some are temporary, and others perennial. Most of those that are temporary owe their origin to the rain, and the cavity or depression of the place in which they are lodged; thus in India there are several such lakes made by the industry of the natives, of which some are a mile, and some two miles, in circuit; these are surrounded with a stone wall, and being filled in the rainy months, supply the inhabitants in dry seasons, who live at a great distance from springs or rivers. There are also several of this kind formed by the inundations of the Nile and the Niger; and in Muscovy, Finland, and Lapland, there are many lakes formed, partly by the rains, and partly by the melting of the ice and snow: but most of the perennial lakes, which neither receive nor emit rivers, probably owe their rise to springs at the bottom, by which they are constantly supplied. The second kind of lakes, which emit without receiving rivers, is very numerous. Many rivers flow from these as out of cisterns; where their springs being situated low within a hollow place, first fill the cavity and make it a lake, which not being capacious enough to hold all the water, it overflows and forms a river; of this kind is the Wolga, at the head of the river Wolga; the lake Odium at the head of the Tanais; the Adac, from whence one branch of the river Tigiris flows; the Ozero, or White lake, in Muscovy, which is the source of the river Shaka; the great lake Chaamay, which emits four very large rivers, which water the countries of Siam, Pegu, &c., viz. the Menan, the Ava, the Caipoumou, the Lackia, &c. The third species of lakes, which receive rivers but emit none, apparently owe their origin to those rivers which, in their progress from their source, falling into some extensive cavity, are collected together, and form a lake of such dimensions as may lose as much by exhalation as it continually receives from these sources: of this kind is that great lake, improperly called the Caspian sea; the lake Asphaltites, also called the Dead sea; the lake of Geneva, and several others. Of the fourth species, which both receive and emit rivers, we reckon three kinds, as the quantity they emit is greater, equal, or less, than they receive. If it be greater, it is plain that they must be supplied by springs at the bottom; if less, the surplus of the water is probably spent in exhalations; and if it be equal, their springs just supply what is evaporated by the sun.

Lakes are also divided into those of fresh water and those of salt. Dr Halley is of opinion, that all great perennial lakes are saline, either in a greater or less degree; and that this saltness increases with time: and on this foundation be proposes a method for determining the age of the world.

Large lakes answer the most valuable purposes in the northern regions, the warm vapours that arise from them moderating the pinching cold of those climates; and, what is still a greater advantage, when they are placed in warmer climates at a great distance from the sea, the exhalations raised from them by the sun cause the countries that border upon them to be refreshed with frequent showers, and consequently prevent their being barren deserts.

LAKE, or Lacque, a preparation of different substances into a kind of magistery for the use of painters. One of the finest and first invented of which was that of gum lacca or lacque; from which all the rest, as made by the same process, are called by the common name lacques. See LACCA.

The method of preparing these in general may be known...
LAKE

known by the example of that of the coromandel root of the shops, called *turmeric* root; the process for the making of which is this: Take a pound of turmeric root in the powder, three pints of water, and an ounce of oil of tartar; put all into a glazed earthen vessel, and let them boil together over a clear gentle fire, till the water appears highly impregnated with the root, and will stain a paper of a beautiful yellow. Filter this liquor, and gradually add to it a strong solution of rock alum in water, till the yellow matter is all coagulated together and precipitated; after this pour the whole into a filter of paper, and the water will run off and leave the yellow matter behind. It is to be washed many times with fresh water, till the water comes off insipid, and then is obtained the beautiful yellow called *lapis of turmeric*, and used in painting.

In this manner may a lake be made of any of the tanning substances that are of a somewhat strong texture, as madder, logwood, &c.; but it will not succeed in the more tender species, as the flowers of roses, violets, &c. as it destroys the nice arrangement of parts in those subjects on which the colour depends.

A yellow lake for painting is to be made from brome flowers in the following manner: Make a ley of pot ashes and lime reasonably strong; in this boil, at a gentle fire, fresh brome flowers till they are white, the ley having extracted all their colour; then take out the flowers, and put the ley to boil in earthen vessels over the fire; add as much alum as the liquor will dissolve; then empty this ley into a vessel of clean water, and it will give a yellow colour at the bottom. Let all settle, and decant off the clear liquor. Wash this powder, which is found at the bottom, with more water, till all the salts of the ley are washed off; then separate the yellow matter, and dry it in the shade. It proves a very valuable yellow.

Lake is at present seldom prepared from any other substance than scarlet rags, cochineal, and Brazil wood. The best of what is commonly sold is made from the colour extracted from scarlet rags, and deposited on the cuttle-bone; and this may be prepared in the following manner: Dissolve a pound of the best pearl ashes in two quarts of water, and filter the liquor through paper; add to this solution two more quarts of water and a pound of clean scarlet silks, and boil them in a greater boiler till the silks have lost their scarlet colour; take out the silks and press them, and put the coloured water yielded by them to the other; in the same solution boil another pound of the silks, preserving in the same manner; and likewise a third and fourth pound. While this is doing, dissolve a pound and a half of cuttle-fish bone in a pound of strong aquafortis in a glass receiver; adding more of the bone if it appears to produce any ebullition in the aquafortis; and pour this strained solution gradually into the other; but if any ebullition be occasioned, more of the cuttle-fish bone must be dissolved as before, and added till no ebullition appears in the mixture. The common sediment deposited by the liquor thus prepared is the lake: pour off the water; and stir the lake in two gallons of hard spring water, and mix the sediment in two gallons of fresh water; let this method be repeated four or five times. If no hard water can be procured, or the lake appears too purple, half an ounce of alum should be added to each quantity of water before it be used. Having thus sufficiently freed the lake from the salts, drain off the water through a filter, covered with a worn linen cloth. Then it has been trained to a proper dryness, let it be dropped through a proper funnel on clean boards, and the drops will become small cones or pyramids, in which form the lake must be suffered to dry, and the preparation is completed.

Lake may be prepared from cochineal, by gently boiling two ounces of cochineal in a quart of water; filtering the solution through paper, and adding two ounces of pearl-ashes dissolved in half a pint of warm water, and filtered through paper. Make a solution of cuttle-bone as in the former process; and to a pint of it add two ounces of alum dissolved in half a pint of water. Put this mixture gradually to that of the cochineal and pearl-ashes, as long as any ebullition appears to arise, and proceed as above. A beautiful lake may be prepared from Brazil wood, by boiling three pounds of it for an hour in a solution of three pounds of common salt in three gallons of water, and filtering the hot fluid through paper; add to this a solution of five pounds of alum in three gallons of water. Dissolve three pounds of the best pearl-ashes in a gallon and a half of water, and purify it by filtering; put this gradually to the other, till the whole of the colour appear to be precipitated, and the fluid be left clear and colourless. But if any appearance of purple be seen, add a fresh quantity of the solution of alum by degrees, till a scarlet hue be produced. Then pursue the directions given in the first process with regard to the sediment. If half a pound of seed lac be added to the solution of pearl-ashes, and dissolved in it before its purification by the filter, and two pounds of the wood, and a proportional quantity of the common salt and water be used in the coloured solution, a lake will be produced that will stand well in oil or water, but is not so transparent in oil as without the seed lac. The lake with Brazil wood may be also made by adding half an ounce of anotto to each pound of the wood; but the anotto must be dissolved in the solution of pearl-ashes. There is a kind of beautiful lake brought from China; but as it does not mix well with either water or oil, though it dissolves entirely in spirit of wine, it is not of any use in our kinds of painting. This has been erroneously called *safflower*.

Orange Lake, is the tinging part of anotto precipitated together with the earth of alum. This pigment, which is of a bright orange colour, and fit for varnish painting, where there is no fear of flying, and also for putting under crystal to imitate the vinegar granet, may be prepared by boiling four ounces of the best anotto and one pound of pearl-ashes half an hour in a gallon of water; and straining the solution through paper. Mix gradually with this a solution of a pound and a half of alum in another gallon of water; distilling when no ebullition attends the commixtures. Treat the sediment in the manner already directed for other kinds of lake, and dry it in square bits or round lozenges.

LAMA, a synonyme of the canemus pacem. See CAMELUS, MAMMALIA Index.

LAMA, the sovereign pontif, or rather god, of the Asiatic Tartars, inhabiting the country of Barastola. The
The lama is not only adored by the inhabitants of the country, but also by the kings of Tartary, who send him rich presents, and go in pilgrimage to pay him adoration, calling him lama conreg, i.e. "god, the everlasting father of heaven." He is never to be seen but in a secret place of his palace, amidst a great number of lamps, sitting cross-legged upon a cushion, and adorned all over with gold and precious stones; where at a distance they prostrate themselves before him, it not being lawful for any to kiss even his feet. He is called the great lama, or lama of lamas; that is, "priest of priests." The orthodox opinion is, that when the grand lama seems to die either of old age or infirmity, his soul is not only quite a crazy habitation to look for another younger or better; and it is discovered again in the body of some child, by certain tokens known only to the lamas or priests, in which order he always appears.

The following account of the ceremonies attending the inauguration of the infant lama in Tibet is extracted from the first volume of the Asiatic researches.

The emperor of China appears on this occasion to have assumed a very conspicuous part in giving testimony of his respect and zeal for the great religious father of his faith. Early in the year 1794, he dismissed ambassadors from the court of Pekin to Teessho Loomboo, to represent their sovereign in supporting the dignity of the high priest, and do honour to the occasion of the assumption of his office. Dalai Lama and the vicerey of Lassa, accompanied by all the court, one of the Chinese generals stationed at Lassa with a part of the troops under his command, two of the four magistrates of the city, the heads of every monastery throughout Tibet, and the emperor's ambassadors, appeared at Teessho Loomboo, to celebrate this epocha in their theological institutions. The 28th day of the seventh month, corresponding nearly, as their year commenced with the vernal equinox, to the middle of October 1794, was chosen as the most auspicious for the ceremony of inauguration: a few days previous to which the lama was conducted from Terapling, the monastery in which he had passed his infancy, with every mark of respect and homage that could be paid by an enthusiastic people. So great a concourse as assembled either from curiosity or devotion was never seen before, for not a person of any condition in Tibet was absent who could join the suite. The procession was hence necessarily constrained to move so slow, that though Terapling is situated at the distance of 20 miles only from Teessho Loomboo, three days expired in the performance of this short march. The first halt was made at Teonde; the second at Summar, about six miles off, whence the most splendid parade was reserved for the lama's entry on the third day, the account of which is given by a person who was present in the procession. The road, he says, was previously prepared by being whitened with a wash, and having piles of stones heaped up with small intervals between on either side. The processions passed between a double row of priests, who formed a street extending all the way from Summar to the gates of the palace. Some of the priests held lighted rods of a performed composition that burn like decayed wood, and emit an innusceptible smoke; the rest were furnished with the different musical instruments they use at their devotions, such as the gongs, the symbol, hautboy, trumpets, drums, and sea shells, which were all sounded in union with the hymns they chanted. The crowd of spectators was kept without the street, and none admitted on the high road but such as properly belonged to or had a prescribed place in the procession, which was arranged in the following order.

The van was led by three military commandants or governors of districts at the head of 6,000 or 7,000 horsemen armed with quivers, bows, and matchlocks. In their rear followed the ambassador with his suite, carrying his diploma, as is the custom of China, made up in the form of a large tube, and fastened on his back. Next the Chinese general advanced with the troops under his command, mounted, and accoutred after their way with fire arms and sabres; then came a very numerous group bearing the various standards and insignia of state; next to them moved a full band of wind and other sonorous instruments: after which were led two horses richly caparisoned, each carrying two large circular stones disposed like and two across the horse's back and filled with burning aromatic woods. These were followed by a senior priest, called a lama, who bore a box containing books of their form of prayer and some favourite idols. Next nine expectancy heroes were led loaded with the lama's apparel; after which came the priests immediately attached to the lama's person for the performance of daily offices in the temple, amounting to about 7000; following them were two men each carrying on his shoulder a large cylindrical gold insignia emblazoned with emblematical figures (a gift from the emperor of China). The Durnneri and Scopoons, who were employed in communicating addresses and distributing alms, immediately preceded the lama's bier, which was covered with a gaudy canopy, and borne by eight of the 16 Chinese appointed for this service. On one side of the bier attended the regent, on the other the lama's father. It was followed by the heads of the different monasteries, and as the procession advanced, the priests who formed the street fell into the rear and brought up the suite, which moved at an extremely slow pace, and about noon was received within the confines of the monastery, amidst an amazing display of odeums, the acclamations of the crowd, solemn music, and the blessing of their priests.

The lama being safely lodged in the palace, the regent and Scopoos Coombboo went out, as is a customary compliment paid to visitors of high rank on their near approach, to meet and conduct Dalai Lama and the vicerey of Lassa, who were on the way to Teessho Loomboo. Their rites observed the following morning at the foot of Painoom castle, and the next day together entered the monastery of Teessho Loomboo, in which both Dalai Lama and the vicerey were accommodated during their stay.

The following morning, which was the third after Teessho Lama's arrival, he was carried to the great temple, and about noon seated upon the throne of his progenitors; at which time the emperor's ambassador delivered his diploma, and placed the presents with which he had been charged at the lama's feet.

The three next ensuing days, Dalai Lama met Teessho Lama in the temple, where they were assisted by
all the priests in the invocation and public worship of their gods. The rites then performed completed, as we understood, the business of inauguration. During this interval all who were at the capital were entertained at the public expense, and alms were distributed with reserve. In conformity likewise to previous notice circulated everywhere for the same space of time, universal rejoicings prevailed throughout Tibet. Banners were unfurled on all their fortresses, the peasantry filed up the day with music and festivity, and the night was celebrated by general illuminations. A long period was afterwards employed in making presents and public entertainments to the newly induced lama, who at the time of his accession to the musnud, or, if we may use the term, pontificate of Teeshoo Lombooo, was not three years of age. The ceremony was begun by Dalai Lama, whose offers are said to have amounted to a greater value, and his public entertainments to have been more splendid than the rest. The second day was dedicated to the viceroy of Lassa. The third to the Chinese general. Then followed the cullong or magistrates of Lassa, and the rest of the principal persons who had accompanied Dalai Lama. After which the regent of Teeshoo Lombooo, and all those who were dependent on that government, were severally admitted, according to pre-eminence of rank, to pay their tribute of obedience and respect. As soon as the acknowledgments of all those who were admissible to the privilege, Teeshoo Lama made in the same order suitable returns to each, and the consumption lasted 40 days.

Many opportunities were used with Dalai Lama to prolong his stay at Teeshoo Lombooo; but he excused himself from encumbering the capital any longer with so numerous a concourse of people as attended on his movements, and deeming it expedient to make his absence as short as possible from the seat of his authority, at the expiration of 40 days he withdrew with all his suite to Lassa, and the emperor’s ambassador received his submission to return to China, and thus terminated this famous festival.

LAMANON, ROBERT PAUL, a celebrated naturalist, was born at Salon in Provence, in the year 1752, of a respectable family. He was destined for the church, and sent to Paris to study divinity; but the acquaintance of philosophers soon made him relinquish his theological pursuits, and he turned his attention to chemistry and mineralogy. Yet he afterwards became a canon in the church; but the death of his father and elder brother caused him to resign an office to which he was never attached, and he now possessed the power of directing his own future exertions. One amiable trait in the character of Lamanon is highly worthy of notice, and that is, that he refused to accept of his paternal inheritance, but as an equal sharer with his brothers and sisters. When offered a considerable sum to resign his office of canon in favour of a certain individual, he replied, “the chapter of Arles did not sell me my benefice; I shall therefore restore it in the same manner that I received it,” which was a conduct undoubtedly meritorious. Anxious to remove the veil which conceals the secrets of nature from mortal eyes, he travelled through Provence and Dauphine, and scaled the Alps and Pyrenees. He reached the summit of rocks, and explored the abyss of caverns, weighed the air, analysing specimens, and in short considered himself qualified to form a new system of this world.

After some time he returned to Paris, and from thence went over to England; and although he was in imminent danger of being overwhelmed by the unchangeable fury of the waves, he ordered himself to be tied to the mainmast, that he might be enabled to contemplate more at leisure this grand and terrific spectacle. Instead of being dismayed, he was transported with the tremendous roar of thunder, the vivid flashes of lightning, the glancing spray with which he was almost incessantly covered; and in his own estimation this was the most exquisite day which he ever enjoyed.

During the time which Lamanon afterwards spent at Paris, he became one of the founders of the museum. Again resolving to revisit Switzerland and Italy, he went first to Turin, where he joined himself to the learned of that country. From Piedmont he went to Italy, returning by the way of Switzerland, where he explored the Alps, and ascended to the top of Mont Blanc; and on his return to Provence with the spoils of the countries which he had visited, he properly arranged the interesting fruits of his journey. While Lamanon was preparing for the press his interesting work on the Theory of the Earth, the French government conceived the design of completing the discoveries of Captain Cook, and the academy of sciences was charged with the selection of men qualified to testify our notions of the southern hemisphere. Condorcet therefore made choice of Lamanon for advancing the progress of natural history connected with this great enterprise, and he received the invitation of that philosopher with the most eager transports. He set out for Paris, refused the salary offered him, took leave of his friends, and went directly for Brest. The armament under the command of the justly celebrated but unfortunate la Perouse, set sail on the 1st of August 1785; and having reached the island of Maouna, Lamanon went ashore with the crew of two boats, where he fell a sacrifice to the fury of the savages, bravely fighting in self-defence.

In the estimation of his eulogist M. Ponce, Lamanon seemed destined to effect some great revolution in science. His ideas were profound, his character energetic, his mind sagacious, and he possessed that lively curiosity which can draw instruction out of any thing, and which might have led him in time to the most interesting discoveries. His person was tall, his countenance highly expressive, his strength and activity almost incredible. His style as a writer is nervous, and he was eminently endowed with the precision of logical reasoning, which cannot fail to command attention and enforce persuasion.

LAMB, in Zoology, the young of the sheep kind. See OTIS, MAMMALIA INDEX.

Scythian LAMB, a kind of moss, which grows about the roots of fern in some of the northern parts of Europe and Asia, and sometimes assumes the form of a quadruhed; so called from a supposed resemblance in shape to that animal. It has something like four feet, and its body is covered with a kind of down. Travellers report that it will suffer no vegetable to grow within a certain distance of its roots. Sir Hans Sloane read a memoir upon this plant before the Society; for which those who think it worth while may consult their Transactions.
LAM [ 501 ]

Lamb, Mr Bell, in his "Account of a journey from St. Petersburg to Isphahan," informs us that he searched in vain for this plant in the neighborhood of Astrakan, when at the same time the most sensible and experienced amongst the Tartars treated the whole history as fabulous.

Lambricius, Peter, born at Hamburg in 1628, was one of the most learned men of his time. He went very young to study in foreign countries, at the expense of his uncle the learned Holstenius. He was chosen professor of history at Hamburg in 1653, and rector of the college of that city in 1660. He had taken his degree of doctor of law in France before. He suffered a thousand vexations in his own country; because his enemies charged him with atheism, and censured his writings bitterly. He married a rich lady, but who was so very covetous that he left her in disgust within a fortnight. He went to Vienna, and from thence to Rome, where he publicly professed the Catholic religion. He returned to Vienna in 1662, where he was kindly received by the emperor, who appointed him his sublibrarian, and afterwards his principal librarian, with the title of counselor and historiographer; in which employment he continued till his death, and gained a great reputation by the works he published, viz. 1. An Essay on Aulus Gallius. 2. The Antiquities of Hamburg. 3. Remarks on Codinus's Antiquities of Constantinople, &c.

Lambert of Aachenfeld, a Benedictine monk, in the 11th century, wrote several works; among which is a history of Germany, from the year 1020 to 1077.

Lambert, John, general of the parliament's forces in the civil wars of the last century, was of a good family, and for some time studied the law in one of the inns of court; but on the breaking out of the rebellion, went into the parliament army, where he soon rose to the rank of colonel, and by his conduct and valor performed many eminent services. But when Cromwell seemed inclined to assume the title of king, Lambert opposed it with great vigour, and even refused to take the oath required by the assembly and council to be faithful to the government; on which Cromwell deprived him of his commission, but granted him a pension of 2000L a year. This was an act of prudence rather than of generosity; as he well knew, that such genius as Lambert's, rendered desperate by poverty, was capable of attempting anything. Lambert being now divested of all employment, retired to Wimbledon house; where turning florist, he had the finest tulips and gillyflowers that could be got for love or money. Yet amidst these amusements he still nourished his ambition; for when Richard Cromwell succeeded his father, he acted so effectually with Fleetwood, Desborough, Vane, Berry, and others, that the new protector was obliged to surrender his authority; and the members of the long parliament, who had continued sitting till the 20th of April 1653, when Oliver dismissing them, were restored to their seats, and Lambert was immediately appointed one of the council of state, and colonel of a regiment of horse and another of foot. For this service the parliament presented him 2000L to buy a jewel; but he distributed it among his officers. This being soon known to the parliament, they concluded that he intended to secure a party in the army. They therefore courteously invited him to come to London; but resolved, as soon as he should arrive, to secure him from doing any further harm. Lambert, apprehensive of this, delayed his return, and even refused to resign his commission when he was demanded of him and of eight of the other leading officers; and, marching up to London with his army, dislodged the parliament by force in October 1659. He was then appointed, by a council of the officers, major-general of the army, and one of the new council for the management of public affairs; and sent to command the forces in the north. But General Monk, marching from Scotland into England to support the parliament, against which Lambert had acted with such violence, the latter, being deserted by his army, was obliged to submit to the parliament, and by their order was committed prisoner to the Tower; whence escaping, he soon appeared in arms with four troops under his command, but was defeated and taken prisoner by Colonel Ingoldsby.

At the Restoration he was particularly excepted out of the act of indemnity. Being brought to his trial on the 4th of June 1662, for levying war against the king, this daring general behaved with more submission that the meanness of his fellow prisoners, and was by his majesty's favour reprieved at the bar, and sentenced to be confined during life in the island of Guernsey.

Lambert, Anna, Theresia de Marguenat de Courcelles, marchioness of, an elegant moral writer, was the only daughter of Stephen Marguenat lord of Courcelles. In 1666 she married Henry de Lambert, who at his death was lieutenant-general of the army; and she afterwards remained a widow with a son and a daughter, whom she educated with great care. Her house was a kind of academy, to which persons of distinguished abilities regularly resorted. She died at Paris in 1773, aged 86. Her works, which are written with much taste, judgement, and delicacy, are printed in 2 vols. The advice of a mother to her son and daughter are particularly esteemed.

Lambin, Dennis, an eminent classical commentator, was born at Montreuil-sur-Mer, in Picardy, and acquired great skill in polite literature. He lived for a long time at Rome; and at his return to Paris was made royal professor of the Greek language. He died in 1572, aged 56, of pure grief at the death of his friend Ramus, who was murdered at the massacre on St. Bartholomew's day. He wrote commentaries on Plautus, Lucretius, Cicero, and Horace, and other works. His commentary on Horace is more particularly esteemed.

Lamech, of the race of Cain, was the son of Methusael, and father of Jabal, Jubal, Tubal-cain, and Naamah, Gen. iv. 18, 19, 20, &c. Lamech is celebrated in Scripture for his polygamy, whereof he is thought to be the first author in the world. He married Adah and Zillah. Adah was the mother of Jabal and Jubal; and Zillah of Tubal-cain, and Naamah his sister. One day Lamach said to his wives, "Hear me, ye wives of Lamech; I have slain a man to my wounding, and a young man to my hurt. If Cain shall be avenged seven fold, truly Lamech seventy and seven fold." These words are an unintelligible riddle. The reader may consult the commentators. There is a tradition among the Hebrews, that Lamech growing blind,
LAMIA, the son of Mathaniah, and father of Noah. He lived a hundred fourscore and two years before the birth of Noah, (Gen. v. 25, 31.) and after that, he lived five hundred and ninety-five years longer; thus the whole time of his life was seven hundred and seventy-seven years, being born in the year of the world 814, and dying in the year of the world 1671.

LAMELLÆ, in Natural History, denotes very thin plates, such as the scales of fishes are composed of.

LAMENTATIONS, a canonical book of the Old Testament, written by the prophet Jeremiah, according to Archbishop Usher and some other learned men, who follow the opinion of Josephus and St Jerome, an occasion of Josiah's death. But this opinion does not seem to agree with the subject of the book, the lamentation composed by Jeremiah on that occasion being probably lost. The fifty-second chapter of the book of Jeremiah was probably added by Ezra, as a preface or introduction to the Lamentations: the two first chapters are employed in describing the calamities of the siege of Jerusalem; in the third the author deplores the persecutions he himself had suffered: the fourth treats of the desolation of the city and temple, and the misfortunes of Zedekiah, &c. The fifth chapter is a prayer for the Jews in their dispersion and captivity; and at the close of all, he speaks of the misery of the Edomites, who had insulted Jerusalem in her misery. All the chapters of this book, except the last, are in metre, and digested in the order of the alphabet; with that difference, in the first, second, and fourth chapters, the first letter of every word follows the order of the alphabet; but in the third the same initial letter is continued for three verses together. This order was probably adopted, that the book might be more easily learnt and retained. The subject of this book is of the most moving kind; and the style throughout lively, pathetic, and affecting. In this kind of writing the prophet Jeremiah was a great master, according to the character which Crotius gives of him. Muses in affectibus conciliana.

LAMIA, in Ancient Geography, a town of the Phœbiots, a district of Thessaly. Famous for giving name to the Belium Lamiæum, waged by the Greeks, on the Macedonians after Alexander's death.

LAMICUM BELLUM happened after the death of Alexander, when the Greeks, and particularly the Athenians, incited by their orators, resolved to free Greece from the garrisons of the Macedonians. Leosthenes was appointed commander of a numerous force, and marched against Antipater, who then presided over Macedonia. Antipater entered Thessaly at the head of 13,000 foot and 600 horse, and was beaten by the superior forces of the Athenians and of their Greek confederates. Antipater, after this blow fled to Lampsacus, where he resolved, with all the courage and sagacity of a careful general, to maintain a siege with about 8000 or 9000 men that had escaped from the field of battle. Leosthenes, unable to take the city by storm, began to make a regular siege. His operations were delayed by the frequent sallies of Antipater: and Leosthenes being killed by the blow of a stone which he received, Antipater made his escape out of Lampsacus, and soon after, with the assistance of the army of Craterus brought from Asia, he gave the Athenians battle near Cenæon, and though only 500 of their men were slain, yet they became so dispirited, that they sued for peace to the conqueror. Antipater at last with difficulty consented, provided they raised taxes in the usual manner, received a Macedonian garrison, destroyed the exchequer of the war, and, lastly, delivered into his hands Demosthenes and Hyperides, the two orators whose prevailing eloquence had excited their countrymen against him. These disadvantageous terms were accepted by the Athenians, yet Demosthenes had time to escape and poison himself. Hyperides was carried before Antipater, by whose orders, his tongue being previously cut out, he was put to death.

LAMINÆ, a sort of domus which had their existence in the imaginations of the heathens, and were supposed to devour children. Their form was human, resembling beautiful women. Harase makes mention of them in his Art of Poetry. The name, according to some, is derived from latus, "to bear"; or according to others, is a corruption of a Hebrew word signifying to devour. They are also called Larves or Lamas.

LAMINUM, in Botany, thin plates, or tables, whereby any thing consists; particularly the human skull, which are two, the one laid over the other.

LAMINIUM, in Ancient Geography, a town of the Carpathians, in the Higher Spain; at the distance of seven miles from the head of the Anna or Guadiana: New Montiel, a citadel of New Castle; and the territory, called Ager Laminium, is now called Campo de Montiel, (Clavis.)

LAMINUM, Dead-Nettle, a genus of plants belonging to the Didymá又好 class; and in the natural system ranking under the 434 order, Portulacae. See Botany Index.

LAMMAS-DAY, the first of August; so called, as some will have it, because lambs then grow out of season, as being too big. Others derive it from a Saxon word, signifying "lost-mass," because on that day our forefathers made an offering of bread made with new wheat.

On this day the tenants who formerly held lands of the cathedral church in York, were bound by their tenure to bring a lamb alive into the church at high mass.

LAMOIGNON, CHRISTIAN FRANCIS DE, marquis of Baville, and president of the parliament of Paris, was born in 1644. His father would not trust the education of his son to another, but took it upon himself, and entered into the minutest particulars of his first studies: the love of letters and a solid taste were the fruits the scholar reaped from this valuable education. He learned rhetoric in the Jesuits' college, made the tour of England and Holland, and returned home the admiration of these meetings regularly held by persons of the first merit at his father's house. The several
veral branches of literature were however only his amusement: the law was his real employ; and the eloquence of the bar at Paris owes its reformation from bombast and affected oration to the plain and noble pleading of M. Lamengnon. He was appointed the king's advocate general in 1673; which he discharged until 1693, when the presidency of the parliament was conferred on him. This post he held nine years, when he was allowed to resign in favour of his eldest son; he was chosen president of the Royal Academy of Inscriptions in 1705. The only work he suffered to see the light was his Pleadier, which is a monument of his eloquence and inclination to polite letters. He died in 1709.

LAMP, a vessel containing oil, with a lighted wick. Lamps were in general use amongst the Jews, Greeks, and Romans. The candlestick with seven branches, placed in the sanctuary by Moses, and those which Solomon afterwards prepared for the temple, where crystal lamps filled with oil, and fixed upon the branches. The lamps or candlesticks made use of by a very high stand on the ground. The lamps supposed to be used by the foolish virgins, &c. in the gospel, were of a different kind. According to critics and antiquaries, they were a sort of torches, made of iron or potters earth, wrapped about with old linen, and moistened from time to time with oil. Math. xxv. 1, 2. The lamps of Cideon's soldiers were of the same kind. The use of wax was not unknown to the Romans, but they generally burnt lamps; hence the proverb Tempus est oleum perditum. "I have lost my labour." Lamps were sometimes burnt in honour of the dead, both by Greeks and Romans.

Dr. St. Clair, in the Philos. Trans. N° 154, gives the description of an improvement in the common lamp. He proposes that it should be made two or three inches deep, with a pipe coming from the bottom almost as high as the top of the vessel. Let it be filled as high with water that it may cover the whole of the pipe at the bottom, that the oil may not get in at the pipe and so be lost. Then let the oil be poured in so as to fill the vessel almost brim full; and to the vessel must be adapted a cover having as many holes as there are to be wicks. When the vessel is filled and the wicks lighted, if water falls in by drops at the pipe, it will always keep the oil at the same height or very near it; the weight of the water being to that of the oil as 20½ to 19, which in two or three inches makes no great difference. If the water runs faster than the oil wastes, it will only run over at the top of the pipe, and what does not run over will come under the oil, and keep it at the same height.

From experiments made in order to ascertain the expense of burning chamber oil in lamps, it appears, that a taper lamp, with eight threads of cotton in the wick, consumes in one hour 8.004 oz. of spermaceti oil at 28. 64. per gallon; so that the expense of burning 22 hours is 4.57 farthings. This lamp gives as good a light as the candles of eight and ten in the pound; it seldom wants wicking, and exists a strong and steady light. A taper, chamber, or watch lamp, with four ordinary threads of cotton in the wick, consumes 8.1604 oz. of spermaceti oil in one hour; the oil at 28.

Perpetual Lamps. The testimony of Pliny, St. Austin, and others, have led many to believe that the ancients had the invention of perpetual lamps; and some moderns have attempted to find out the secret, but hitherto in vain. Indeed it seems an easy matter to find out either a perpetual wick or perpetual oil. The curious may read Dr. Plot's conjectures on the subject in the Philos. Trans. N° 154; or in Lowthorp's Abridgment, vol. iii. p. 636. But few, we believe, will give themselves the trouble of searching for the secret, when they consider that the credulity of Pliny and of St. Austin was such, that their testimony does not seem a sufficient inducement to us to believe a lamp was ever formed to burn 1200 or 1000 years: much less is it credible that the ancients had the secret of making one burn for ever.

Rolling Lamps. A machine AB, with two moveable Plate circles DE, FG, within it; whose common centre of curvature and gravity is at K, where their axes of motion cross one another. If the lamp KG, made pretty heavy and moveable about its axis HI, and whose centre of gravity is at C, be fitted within the inner circle, the common centre of gravity of the whole machine will fall between K and C; and by reason of the pivots A, B, D, E, H, I, will be always at liberty to descend: hence, though the whole machine be rolled along the ground, or moved in any manner, the flame will always be uppermost, and the oil cannot spill. It is in this manner they hang the compass at sea; and thus should all the moon lanterns be made, that are carried before coaches, chaises, and the like.

Argand's Lamp. This is a very ingenious contrivance, and the greatest improvement in lamps that has yet been made. It is the invention of a citizen of Geneva; and the principle on which the superiority of the lamp depends, is the admission of a larger quantity of air to the flame than can be done in the common lamp. This is accomplished by making the wick of a circular form; by which means a current of air rushes through the cylinder on which it is placed with great force; and, along with that which has access to the outside, excites the flame to such a degree that the smoke is entirely consumed. Thus both the light and heat are prodigiously increased, at the same time that there is very considerable saving in the expense of oil, the combustion being exceedingly augmented by the quantity of air admitted to the flame; and what in common lamps is dissipating smoke is here converted into a brilliant flame.

This lamp is now very much in use; and is applied not only to the ordinary purposes of illumination, but also to that of a lamp furnace for chemical operations, in which it is found to exceed every other contrivance yet invented. It consists of two parts, viz. a reservoir for the oil, and the lamp itself. The reservoir is usually in the form of a vase, and has the lamp proceeding from its side. The latter consists of an upright metallic tube about one inch and six-tenths in diameter, three inches in length, and open at both ends. Within this is another tube about one inch in diameter, and nearly of an equal length; the space between the two being left clear for the passage of the air. The inter-
Lamp.

The lamp is closed at the bottom, and contains another similar tube about half an inch in diameter, which is soldered to the bottom of the second. It is perforated throughout, so as to admit a current of air to pass through it; and the oil is contained in the space between the tube and that which surrounds it. A particular kind of cotton cloth is used for the wick, the longitudinal threads of which are much thicker than the others, and which nearly fills the space into which the oil flows; and the mechanism of the lamp is such, that the wick may be raised or depressed at pleasure. When the lamp is lighted, the flame is in the form of a hollow cylinder; and by reason of the strong influx of air through the heated metallic tube, becomes extremely bright, the smoke being entirely consumed for the reasons already mentioned. The heat and light are still further increased, by putting over the whole a glass cylinder nearly of the size of the exterior tube. By diminishing the central aperture, the heat and light are proportionally diminished, and the lamp begins to smoke. The access of air both to the external and internal surfaces of the flame is indeed so very necessary, that a sensible difference is perceived when the hand is placed even at the distance of an inch below the lower aperture of the cylinder; and there is also a certain length of wick at which the effect of the lamp is strongest. If the wick be very short, the flame, though white and brilliant, emits a disagreeable and pale kind of light; and if very long, the upper part becomes brown, and smoke is emitted.

The saving of expense in the use of this instrument for common purposes is very considerable. By some experiments it appears that the lamp will continue to burn three hours for the value of one penny: and the following was the result of the comparison between the light emitted by it and that of a candle. The latter having been suffered to burn so long without snuffing, that large lamps of coaly matter were formed upon the wick, gave a light at 24 inches distance equal to the lamp at 129 inches; whence it appeared that the light of the lamp was equal to 28 candles in this state. On snuffing the candle, however, its light was so much augmented, that it became necessary to remove it to the distance of 67 inches before its light became equal to that of the lamp at 129 inches; whence it was concluded that the light of the lamp was somewhat less than that of four candles fresh snuffed. At another trial, in which the lamp was placed at the distance of 124 inches, and a candle at the distance of 55 inches, the lights were equal. In these experiments the candles made use of were 10 1/2 inches long, and 2 3/4 inches in diameter. When the candle was newly snuffed, it appeared to have the advantage; but the lamp soon got the superiority; and on the whole it was concluded, that the lamp is at least equivalent to half a dozen of tallow candles of six in the pound; the expense of the one being only two-pence halfpenny, and the other eightpence, in seven hours.

The best method of comparing the two lights together seems to be the following: Place the greater light at a considerable distance from a white paper, the smaller one being brought nearer or removed farther off as occasion requires. If an angular body be held before the paper, it will project two shadows; these two shadows can coincide only in part; and their angular extremities will, in all positions but one, be at some distance from each other; and being made to coincide in a certain part of their bulk, they will be bordered by a lighter shadow, occasioned by the exclusion of the light from each of the two luminous bodies respectively. These lighter shadows, in fact, are spaces of the white paper illuminated by the different luminous bodies, and may easily be compared together, because at a certain point they actually touch one another. If the space illuminated by the smaller light appear brightest, the light must be removed farther off, but the contrary if it appear more obscure.

On cutting open one of Argand's wicks longitudinally, and thus reducing the circular flame to a straight-lined one, the lights appeared quite equal in power; but the circular one had by far the greatest effect in dazzling the eyes; though when the long flame was made to shine on the paper, not by the broadside, but in the direction of its length, it appeared more dazzling than the other. On placing this long flame at right angles to the ray of Argand's lamp, it projected no shadow; but when its length was placed in the direction of the ray, it gave a shadow bordered with two broad, well defined, and bright lines.

The broad-wicked lamp seems to have the advantage of the other, as requiring less apparatus; and indeed by this contrivance we may at the most trilling expense have a lamp capable of giving any degree of light we please. The only disadvantage attending either the one or the other is, that they cannot easily be carried from one place to another; and in this respect it does not seem possible by any means to bring lamps to an equality with candles.

The most economical method of lighting up large apartments by means of different lamps and candles, as it is of great importance, has occupied the attention of many ingenious men, particularly of Count Rumford and M. Hassenfratz. The following is the simple and accurate method proposed by the count, for measuring the relative quantities of light emitted by lamps differently constructed.

Let the two lamps or other burning bodies to be compared, be denominated A and B; and let them be placed at equal heights upon two light tables, or moveable stands, in a darkened room; let a sheet of clean white paper be equally spread out, and fastened upon the wainscot, or side of the room, at the same height from the floor as the lights; and let the lights be placed opposite to this sheet of paper, at the distance of six and eight feet from it, and the same from each other, in such a manner, that a line drawn from the centre of the paper perpendicular to its surface, shall bisect the angle formed by lines drawn from the lights to that centre; in which case, considering the paper as a plane speculum, the one light will be precisely in the line of reflection of the other.

If the one light be weaker than the other, and the weaker being placed at the distance of four feet from the centre of the paper, it should be found necessary, in order that the shadows may be of the same density, to remove the stronger light to the distance of eight feet from that centre; in that case, the real intensity of the stronger light will be to that of the weaker as 8 to 4, or as 4 to 1.

When the shadows are of equal density at any given point,
LAMPRIDIUS, Benedict, of Cremona, a celebrated Latin poet of the 16th century. He taught Greek and Latin at Rome and at Padua, until he was invited to Mantua by Frederick Gonzaga to undertake the tuition of his son. We have epigrams and lyric verses of this writer, both in Greek and Latin, which were printed separately, as well as among the Delicia of the Italian poets.

LAMPSACUS, or LAMPSACUM, in Ancient Geography, a considerable city of Mysia; more anciently called Pitaxe, (Homer), because abounding in pine trees, a circumstance confirmed by Pliney; situated at the north end or entrance of the Hellespont into the Propontis, with a commodious harbour, opposite to Callipolis, in the Thracian Chersonesus. It was assigned by Artaxerxes to Themistocles, for furnishing his table with wine, in which the country abounded. It was saved from the ruin threatened by Alexander because in the interest of Persia, by the address of Anaximenes the historian, sent by his fellow-citizens to avert the king's displeasure; who hearing of it, solemnly declared he would do the very reverse of Anaximenes's request, who therefore begged the king utterly to destroy it, which he could not do because of his Lampsacus the epithet, denoting lascivus, the character of the people; still called Lampsacus. E. Long. 23° N. Lat. 40° 12.

LAMPEYRIS, the Fire-fly, a genus of insects belonging to the coleoptera order. See Entomology Index.

LANCARIM SPRING, the name of a mineral water of Glamorganshire. It has its name from a town near which it rises; and has been long famous for the cure of the king's evil. The spring is very clear, and rises out of a pure white marl. The cures that have been performed there, are proofs of a real power in the water. The persons who come for relief not only drink of the spring, but also bathe the parts affected afterwards in the water.

LANCASHIRE, a large maritime province of England, washed by the Irish sea on the west; bordering on the north with part of Cumberland and Westmoreland; bounded on the east by the west riding of Yorkshire, and on the south by Cheshire; extending 73 miles in length, and 41 in breadth, comprehending 6 hundreds, 63 parishes, 27 market towns, 594 villages, with 148,552 houses, and 828,303 inhabitants in the year 1811.

The eastern parts of the province are rocky, and in the northern districts we see many single mountains remarkably high, such as Ingleborough hill, Cloughborough hill, Pendle hill, and Longridge hill. Nor is there any want of wood in this county, either for timber or fuel; witness Wiersdale forest and Bowland forest to the northward, and Simon's wood in the southern part of Lancashire.

This county is well watered with rivers and lakes. Among the lakes or mere of Lancashire, we reckon the Winander mere; and the Kinington mere, which, though neither so large nor so well stored with fish, yet affords plenty of excellent char. There was on the south side of the Ribble another lake called Marion, several miles in circumference, which is now drained, and converted into pasture ground. In this operation, the workmen found a great quantity of fish, together with eight canoes, resembling those of America, suppos

Lancashire.

posed to have been used by the ancient British fishermen. Besides these merees or lakes, this county aboundes with morasses and mosses, from which the inhabitants dig excellent peat or turf for fuel, as well as marl for manuring the ground, and trunks of old fir trees, supposed to have lain there since the general deluge. Some of these are so impregnated with turpentine, that when divided into splinters, they burn like candles, and are used for that purpose by the common people. There is a great variety of mineral waters in this county, some periodical springs, and one instance of a violent eruption of water at Kirkby in Foursness. The most remarkable chalybeate spas are those of Latham, Wigan, Stockport, Burnley, Bolton, Plumpton, Middleton, Strangeways, Lancaster, Larbrick, and Chorley. At Anchill, in the neighbourhood of Wigan, is a fountain called the Burning Well, from whence a bituminous vapour exhaled, which being set on fire by a candle burns like brandy, so as to produce a heat that will boil eggs to a hard consistence, while the water itself retains its original coldness. There is at Barton a fountain of salt water, so strongly impregnated with the mineral, as to yield six times as much as can be extracted from the same quantity of sea water. At Rotherham, in Foursness, there is a purging saline fountain; and in the neighbourhood of Rassell, where the ground is frequently overflowed by the sea, a stream descends from Hagburn hills, which, in the space of seven years, is said to convert the marl into a hard freestone fit for building. The air of Lancashire is pure, healthy, and agreeable, an observation equally applicable even to the fens and the sea shore, according to the experience of those who have dwelt on that coast for many years. The soil is various in different parts of the county, poor and rocky on the hills, fat and fertile in the valleys and champaign country. The colour of the peat is white, gray, or black, according to the nature of the composition and the degree of putrefaction which the ingredients have undergone. There is a bituminous earth about Ormskirk, that smells like the oil of amber, and indeed yields an oil of the same nature, both in respect of its quality and medicinal effects, which moreover reduces raw flesh to the consistence of mummy; this earth burns like a torch, and is used as such by the country people. The metals and minerals of this county consist of lead, iron, copper, antimony, black lead, lapis calaminaris, spar, green vitriol, slums, sulphur, pyrites, freestone, and pit and canal coal.

The level country produces plenty of wheat and barley, and the skirts of the hills yield good harvests of excellent oats: very good hemp is raised in divers parts of the province; and the pasture which grows in the valley is so peculiarly rich, that the cattle which feed upon it are much larger and fatter than in any other part of England. No part of the world is better supplied than Lancashire with provisions of all kinds, and at a very reasonable rate; such as beef, veal, mutton, lamb, pork, poultry, and game of all sorts, caught upon the moors, breast, and commons, in the hilly part of the shire. Besides the sea fowl common to the shores of England, such as duck, casserlings, teal, and plover, many uncommon birds are observed on the coast of Lancashire, the sea crow is riegated with blue and black, the puffin, the cormorant, the curlew, the razor-bill, the copper wren, the redshanks, the swan, the tropic bird, the king's fisher, &c.

The chief manufactures of this county are woollen and cotton cloths of various kinds, tickings, and cotton velvets, for which Manchester is particularly famous. The principal rivers are the Mersey, which parts Cheshire and this county; and the Ribble, which rises in Yorkshire, and enters this county at Clitheroe, running south-west by Preston into the Irish sea. Besides these there are many lesser streams. The navigation made by its grace the duke of Bridgewater in this county is highly worthy of notice. The canal receives vessels of 60 tons burden, and is carried over two rivers, the Mersey and the Irwell. The sough or adit, which was necessary to be made, in order to drain the water from the coal mines, is rendered navigable for boats of six or seven tons burden, and forms a kind of subterraneous river, which runs about a mile and a half under ground, and communicates with the canal. This river leads to the head of the mines, is arched over with brick, and is just wide enough for the passage of the boats: at the mouth of it are two folding doors, which are closed as soon as you enter, and you then proceed by candle light, which casts a livid gloom, serving only to make darkness visible. But this dismal gloom is rendered still more awful by the solemn echo of this subterraneous water, which returns various and discordant sounds. One while you are struck with the grating noise of engines, which by a curious contrivance let down the coals into the boats; then again you hear the shock of an explosion, occasioned by the blowing up the hard rock, which will not yield to any other force than that of gunpowder; the next minute your ears are saluted by the songs of meniment from either sex, who thus beguile their labours in the mine. You have no sooner reached the head of the works, then a new scene opens to your view. These you behold men and women almost in their primitive state of nature, toiling in different capacities, by the glimmering of a dim taper, some digging coal out of the bowels of the earth; some again loading it in little waggons made for the purpose; others drawing those waggons to the boats. To perform this canal, without impeding the public roads, bridges are built over it, and where the earth has been raised to preserve the level, arches are formed under it; but what principally strikes every beholder, is a work raised near Barton bridge, to convey the canal over the river Mersey. This is done by means of three stone arches, so spacious and lofty, as to admit vessels sailing through them; and indeed nothing can be more singular and pleasing, than to observe large vessels in full sail under the aqueduct, and at the same time the duke of Bridgewater's vessels sailing over all, near 50 feet above the navigable river. By this inland navigation communication has been made, with the rivers Mersey, Dee, Ribble, Ouse, Trent, Derwent, Severn, Humber, Thames, Avon, &c.; which navigation, including its windings, extends above 500 miles in the counties of Lincoln, Nottingham, York, Lancaster, Westmoreland, Chester, Stafford, Warwick, Leicester, Oxford, Worcestershire, &c.

Lancashire was erected into a county palatinate by Edward III, who conferred it as an appendage to his son John of Gaunt, thence called duke of Lancaster: but the
Lancashire the duchy contained lands that are not in Lancashire, and among other demesnes, the palace of the Savoy, and all that district in London, which indeed belong to it at this day. The revenues of this duchy are administered by a court which sits at Westminster, and a shonover court at Preston, which has a seal distinct from that of the county palatine. The title of Lancaster distinguished the posterity of John of Gaunt from those of his brother, who succeeded to the duchy of York, in their long and bloody contest for the crown of England. Lancashire sends two members to parliament for the county; and 12 for the six boroughs of Lancaster, Preston, Newton, Wigan, Clitheroe, and Liverpool.

LANCASTER, the capital of the county of Lancashire in England, is pleasantly situated on the south side of the river Lune, over which there is a handsome stone bridge. It is an ancient town, and is supposed to have been the Longovicum of the Romans. King John confirmed to the burgesses all the liberties he had granted to those of Bristol; and Edward III. granted that pleas and sessions, should be held there, and nowhere else in the county. It is governed by a mayor, recorder, 7 aldermen, and 24 borough. The city is governed by burgesses, a town clerk, and 2 sergeants at arms. The assizes are held in the castle, where is also the county gaol. It carries on a very considerable trade with Jamaica and the other islands in the West Indies, as also with Portugal, Hamburg, &c. There is a market on Wednesday by grant, and another on Saturday by prescription, besides one other every Wednesday throughout the year for cattle; and three fairs, in May, July, and October. The castle is not large, but neat and strong. Not very long ago, in digging a cellar, there were found several Roman utensils and vessels for sacrifices, as also the coins of Roman emperors; so that it is supposed there was here a Roman fortress. On the top of the castle is a square tower, called John of Gaunt's chair, whence there is a charming prospect of the adjacent country, and especially towards the sea, where is an extensive view even to the Isle of Man. There is but one church, a fine Gothic building. It is placed on the same elevation, and from some point a fine view of the castle, which gives the mind a most magnificent idea of this important place. The late considerable additional new streets and a new chapel, with other improvements, give an air of elegance and prosperity to the town, and the new bridge of 5 equal elliptic arches, in all 549 feet in length, adds not a little to the embellishment and convenience of the place. Adjoining to the castle, the new gait is erected on an improved plan. On the side of the hill below it, hangs a piece of a Roman wall, called Very-Wall. By means of inland navigation, Lancaster has communication with the rivers Mersey, Dee, Ribble, Ouse, Trent, Darwent, Severn, Humber, Thames, Avon, &c. although such extensive communication was once considered impracticable. Population 9247. For its peculiar government, see Duchy-Court.

LANCE, LANCEA, a spear; an offensive weapon worn by the ancient cavaliers, in form of a half pike. The lance consisted of three parts, the shaft or handle, the wings, and the dart. Pliny attributes the invention of lances to the Etruscans. But Varro and Aulus Gellius say, the word lance is Spanish; whence others conclude the use of this weapon was borrowed by the people of Italy from the Spaniards. Diodorus Siculus derives it from the Gaulish, and Festus from the Greek λαγός, which signifies the same.

LANCE, or Sand-eel. See AMMODYTES, Ichthyology Index.

LANCEOLATED LEAF. See Botany Index.

LANCET, a chirurgical instrument, sharp-pointed and two-edged, chiefly used for opening veins in the operation of phlebotomy or bleeding; also for laying open abscesses, tumors, &c.

LANCH, a peculiar sort of long boat, used by the French, Spanish, and Italian shipping, and in general by those of other European nations when employed in voyaging in the Mediterranean sea.

A lanch is proportionally longer, lower, and more flat bottomed than the long boat; it is by consequence less fit for sailing, but better calculated for rowing and approaching a flat shore. Its principal superiority to the long boat, however, consists in being by its construction much fitter to under-run the cable; which is a very necessary employment in the harbours of the Levant, where the cables of different ships are fastened across each other, and frequently render this exercise extremely necessary.

LANCH, is also the movement by which the ship or boat descends from the shore, either when she is at first built, or at any time afterwards.

To facilitate the operation of lanching, and prevent any interruption therein, the ship is supported by two strong platforms, laid with a gradual inclination to the water, on the opposite side of her keel, to which they are parallel. Upon the surface of this declivity are placed two corresponding ranks of planks, which compose the base of a frame, called the cradle, whose upper part envelopes the ship's bottom, whereon it is securely attached. Thus the lower surface of the cradle, conforming exactly to that of the frame below, lies flat upon it lengthwise, under the opposite sides of the ship's bottom; and as the former is intended to slide downwards upon the latter, carrying the ship along with it, the planes or faces of both are well daubed with soap and tallow.

The necessary preparations for the launch being made, all the blocks and wedges, by which the ship was formerly supported are driven out from under her keel, till her whole weight gradually subsides upon the platforms above described, which are accordingly called the ways. The shores and stanchions, by which she is detained upon the stocks till the period approaches for lanching, are at length cut away, and the screws applied to move her if necessary. The motion usually begins on the instant when the shores are cut, and the ship slides downward along the ways, which are generally prolonged under the surface of the water, to a sufficient depth to float her as soon as she arrives at the farthest end thereof.

When a ship is to be lanchèd, the ensign, jack, and pendant, are always hoisted, the last being displayed from a staff erected in the middle of the ship.

Ships of the first rate are commonly constructed in dry docks, and afterwards floated out, by throwing open the flood gates, and suffering the tide to enter as soon as they are finished.
LAND, in a general sense, denotes terra firma, as distinguished from sea.

LAND, in a limited sense denotes arable ground. See Agriculture.

LAND, in the sea language, makes part of several compound terms; thus, land-laid, or, to lay the land, is just to lose sight of it. Land-locked, is when land lies all round the ship, so that no point of the compass is open to the sea. If she is at anchor in such a place, she is said to ride land-locked, and is therefore concluded to ride safe from the violence of the winds and tides. Land-mark, any mountain, rock, steeple, tree, &c. that may serve to make the land known at sea. Land is shut in, a term used to signify that another point of land hides the sight of that from which the ship came. Land-to, or the ship lies land-to; that is, she is so far from shore, that it can only just be discerned. Land-torn is a wind that in almost all hot countries blows at certain times from the shore in the night. To set the land; that is, to see by the compass how it bears.

LAND TAX, one of the annual taxes raised upon the subject. See Tax.

The land tax, in its modern shape has superseded all the former methods of rating either property or persons in respect of their property, whether by tenths or five-hundredths, subsidies on land, hydages, scutages, or tallages: a short explication of which will, however, greatly assist us in understanding our ancient laws and history.

Tenths and five-hundredths were temporary aids issuing out of personal property, and granted to the king by parliament. They were formerly the real tenth or five-hundredth part of all the moveables belonging to the subject; when such moveables, or personal estates, were a very different and much less considerable thing than what they usually are at this day. Tenths are said to have been first granted under Henry II. who took advantage of the fashionable zeal for crossades to introduce this new taxation, in order to defray the expense of a pious expedition to Palestine, which he really or seemingly had projected against Saladin's emperor of the Saracens, whence it was originally denominated the Saladin's tenth. But afterwards five-hundredths were more usually granted than tenths. Originally the amount of these taxes was uncertain, being levied by assessments new made at every fresh grant of the commons, a commission for which is preserved by Matthew Paris: but it was at length reduced to a certainty in the eighth year of Edward III., when, by virtue of the king's commission, new taxation were made of every township, borough, and city in the kingdom, and recorded in the exchequer; which rate was, at that time, the fifth part of the value of every township, the whole amounting to about 20,000l. and therefore it still kept up the name of a fifteenth, when, by the alteration of the value of money and the increase of personal property, things came to be in a very different situation. So that when, of later years, the commons granted the king a fifteenth, every parish in England immediately knew their proportion of it: that is, the same identical sum that was assessed by the same aid in the eighth of Edward III.; and then raised it by a rate among themselves, and returned it into the royal exchequer.

The other ancient levies were in the nature of a modern land tax: for we may trace up the original of that charge as high as to the introduction of our military tenures; when every tenant of a knight's fee was bound, if called upon, to attend the king in his army for 40 days in every year. But this personal attendance growing troublesome in many respects, the tenants found means of compounding for it, by first sending others in their stead, and in process of time by making a pecuniary satisfaction to the crown in lieu of it. This pecuniary satisfaction at last came to be levied by assessments, at so much for every knight's fee, under the name of scutages, which appear to have been levied for the first time in the fifth year of Henry II. on account of his expedition to Toulouse, and was then (Sir Wm. Blackstone apprehends) more arbitrary compositions, as the king and the subject could agree.

But this precedent being afterwards abused into a means of
of oppression (by levying scutages on the landholders by the king's authority only, whenever our kings went to war, in order to hire mercenary troops and pay their contingent expenses), it became thereupon a matter of national complaint; and King John was obliged to promise, in his magna charta, that no scutage should be imposed without the consent of the common council of the realm.

Of the same nature with scutages upon knights fees were the assessments of hydage upon all other lands, and of tallage upon cities and boroughs. But there all gradata fall into disuse, upon the introduction of subsidies, about the time of King Richard II. and King Henry IV. These were a tax, not immediately imposed upon property, but upon persons in respect of their reputed estates, after the nominal rate of 4s. in the pound for lands, and 2s. 6d. for goods; and for those of aliens in a double proportion. But this assessment was also made according to an ancient valuation, wherein the computation was so very moderate, and the rental of the kingdom was supposed to be so exceeding low, that one subsidy of this sort did not, according to Sir Edward Coke, amount to more than 70,000l. whereas a moderate land tax at the same rate produces two millions. It was anciently the rule never to grant more than one subsidy and two tenths at a time: but this rule was broke through for the first time on a very pressing occasion, the Spanish invasion in 1588; when the parliament gave Queen Elizabeth two subsidies and four tenths. Afterwards, as money sunk in value, more subsidies were given; and we have an instance, of the first parliament of 1650, of the king's desire of 12 subsidies of the commons, to be levied in three years; which was looked upon as a startling proposal; through Lord Clarendon tells us that the speaker, Sergeant Clavering, made it manifest to the house, how very considerable a sum 12 subsidies amounted to, by telling them he had computed what he was to pay for them: and when he named the sum, he being known to be possessed of a great estate, it seemed not worth any farther deliberation. And, indeed, upon calculation, we shall find, that the total amount of these 12 subsidies, to be raised in three years, is less than what is now raised in one year by a land tax of 2s. in the pound.

The grant of scutages, tallages, or subsidies by the commons, did not extend to spiritual prelatures; those being usually taxed at the same time by the clergy themselves in convolution; which grants of the clergy were confirmed in parliament; otherwise they were illegal, and not binding; as the same noble writer observes, the subsidies granted by the commons, which continued sitting after the dissolution of the first parliament in 1640. A subsidy granted by the clergy was after the rate of 4s. in the pound, according to the valuation of their livings in the king's books; and amounted, Sir Edward Coke tells us, to about 20,000l. While this custom continued, convocations were wont to sit as frequently as parliaments; but the last subsidies, thus given by the clergy, were those confirmed by statute 15 Car. II. c. 10, since which another method of taxation has generally prevailed, which takes in the clergy as well as the laity: in recompense for which the beneficed clergy have from that period been allowed to vote at the election of knights of the shire; and thenceforward also the practice of giving ecclesiastical subsidies hath fallen into total disuse.

The lay subsidy was usually raised by commissioners appointed by the crown, or the great officers of state: and therefore in the beginning of the civil wars between Charles I. and his parliament, the latter having no other sufficient revenue to support themselves and their measures, introduced the practice of laying weekly and monthly assessments of a specific sum upon the several counties of the kingdom; to be levied by a pound rate on lands and personal estates; which were occasionally continued during the whole usurpation, sometimes at the rate of 120,000l. a month, sometimes at inferior rates. After the Restoration, the ancient method of granting subsidies, instead of such monthly assessments, was twice, and twice only, renewed; viz. in 1663, when four subsidies were granted by the temporality and four by the clergy; and in 1670, when 800,000l. was raised by way of subsidy, which was the last time of raising supplies in that manner. For the monthly assessments being now established by custom, being raised by commissioners named by parliament, and producing a more certain revenue; from that time forwards we hear no more of subsidies, but occasional assessments were granted as the national emergencies required. These periodical assessments, the subsidies which preceded them, and the more ancient scutage, hydage, and tallage, were to all intents and purposes a land tax; and the assessments were sometimes expressly called so. Yet a popular opinion has prevailed, that the land tax was first introduced in the reign of King William III.; because in the year 1692 a new assessment or valuation of estates was made throughout the kingdom; which, though by no means a perfect one, had this effect, that a supply of 500,000l. was equal to 1s. in the pound of the value of estates given in. And, according to this enhanced valuation, from the year 1693 to the present, a period of near a century, the land tax has continued an annual charge upon the subject; about half the time at 4s. in the pound, sometimes at 3s. sometimes at 2s. twice at 1s. but without any total intermission. The medium has been 3s. 3d. in the pound; being equivalent to 23 ancient subsidies, and amounting annually to more than a million and a half of money. The method of raising it is by charging a particular sum upon each county, according to the valuation given in, A.D. 1692; and this sum is assessed and raised upon individuals (their personal estate, as well as real, being liable thereto) by commissioners appointed in the act, being the principal landholders in the county and their officers.

An act passes annually for the raising in general, 2,037,627l. 9s. 10d. by the above said tax at 4s. in the pound; whereof there shall be raised in the several counties in England, according to the proportions expressed in the act, 1,089,673l. 7s. 10d. and in Scotland, 479,54l. 15. 2d. by an eight months cess of 5994l. 5s. 1d. per mensam, to be raised out of the land rent, and to be paid at four terms, as specified in the act, by two months amount each time.

Land Wast, an officer of the customs, whose duty is, upon landing any merchandise, to examine, taste, weigh, measure them, &c. and to take an account thereof.
LANDAFF, a town or village of Glamorganshire in South Wales, with a bishop's see, and on that account has the title of a city. It is seated upon an ascent on the river Taff, or Tave, near Cardiff; but the cathedral stands on a low ground, and is a large stately building. The original structure was built about the beginning of the 12th century. The building now used as the cathedral includes part of the body of the ancient one; but is in other respects as modern as the present century, about the middle of which the old church underwent such repair as was almost equivalent to rebuilding. The ruins are at the west end of the modern church, and consist of the original western door-way, and part of the north and south sides. The arch over the door is circular, and has a well-carved episcopal statue immediately over it. On the upper part of the front under which this door stands is a whole length figure of the Virgin Mary, with a cross on the apex of the building. In this front are two rows of neat pointed arches for windows; and on the north and south sides above mentioned are two circular door-cases half sunk in the earth. These ruins exhibit an aspect very different from the present cathedral, the new part of which the architect formed principally on the Roman model, without considering how incongruous this style of architecture is with the plan pursued in the ancient part.—Landaff is a place of but small extent, and has no market. It is a port town, however, and carries on a good trade, as it has a very tolerable harbour that opens into the river Severn about four miles distant. The ruins of the bishop's palace show it to have been castellated. It was built in 1200, and was destroyed by Henry IV. Population 504 in 1811. W. Long. 3. 32. N. Lat. 51. 33.

LANDAU, an ancient, handsome, and very strong town in Lower Alsace. It was formerly imperial, and belonged to Germany, till the treaty of Munster, when it was given up to France; but she lost it again in 1815. It is seated on the river Rhine, in a pleasant fertile country. It was severely bombarded by the allies in 1793, but they were obliged to raise the siege. E. Long. 8. 12. N. Lat. 49. 42.

LANDEN, a town of the Austrian Netherlands, in Brabant, famous for a battle gained over the French by the allies, in July 1693, when 20,000 men were killed. It is seated on the river Beck, in E. Long. 5. 5. N. Lat. 52. 45.

LANDEN, John, F. R. S. an eminent mathematician, was born at Prakirk, near Peterborough in Northamptonshire, in January 1719. He became very early a proficient in the mathematics, for we find him a very respectable contributor to the Ladies Diary in 1744; and he was soon among the foremost of those who then contributed to the support of that small but valuable publication, in which almost every English ma-
The papers which were to have formed this book lay long by him; but he never found leisure to put them in order for the press.

On the 15th of January 1766, Mr. Landen was elected a fellow of the Royal Society, and admitted on the 24th of April following. In the 5th volume of the Philosophical Transactions, for the year 1768, he gave a "Specimen of a new method of comparing curvilinear areas; by means of which many areas are compared, that did not appear to be comparable by any other method;" a circumstance of no small importance in that part of natural philosophy which relates to the doctrine of motion. In the 6th volume of the same work for the year 1770, he gave "Some new theorems for computing the whole areas of curve lines, where the ordinates are expressed by fractions of a certain form;" in a more concise and elegant manner than had been done by Cotes, De Moivre, and others who had considered the subject before him. In the 8th volume for 1771, he has investigated several new and useful theorems for computing certain fluents, which are assemblable by arcs of the conic sections. This subject had been considered before both by Mr. Maclaurin and M. d'Alembert; but some of the theorems which were given by these celebrated mathematicians, being in part expressed by the difference between an arc of a hyperbola and its tangent, and that difference being not directly attainable when the arc and its tangent both become infinite, as they will do when the whole fluent is wanted, although such fluent be finite; these theorems therefore fail in those cases, and the computation becomes impracticable without farther help. This defect Mr. Landen has removed by assigning the limit of the difference between the hyperbolic arc and its tangent, while the point of contact is supposed to be removed to an infinite distance from the vertex of the curve. And he concludes the paper with a curious and remarkable property relating to pendulous bodies, which is deducible from these theorems. In the same year he published, "Animadversions on Dr. Stewart's computation of the sun's distance from the earth."

In the 8th volume of the Philosophical Transactions, for 1775, he gave the investigation of a general theorem, which he had promised in 1771, for finding the length of any arc of a conic hyperbola by means of two elliptic arcs; and observes, that by the theorems there investigated, both the elastic curve and the curve of equable recess from a given point, may be constructed in those cases where Mr. Maclaurin's elegant method fails. In the 7th volume, for 1777, he gave "A new theory of the motion of bodies revolving about an axis in free space, when that motion is disturbed by some extraneous force, either permissive or accelerative." At this time he did not know that the subject had been handled by any person before him; and he considered only the motion of a sphere's spheroid and cylinder. The publication of this paper, however, was the cause of his being told, that the doctrine of rotatory motion had been considered by M. d'Alembert; and purchasing that author's Opuscula Mathematicae, he there learned that M. d'Alembert was not the only one who had considered the matter before him; for M. d'Alembert there speaks of some mathematician, though he does not mention his name, who, after reading what had been written on the subject, doubted whether there be any solid whatever, besides the sphere, in which any line, passing through its centre of gravity, will be a permanent axis of rotation. In consequence of this, Mr. Landen took up the subject again; and though he did not then give a solution to the general problem, viz. "To determine the motions of a body of any form whatever, revolving without restraint about any axis passing through its centre of gravity," he fully removed every doubt of the kind which had been started by the person alluded to by M. d'Alembert; and pointed out several bodies, which, under certain dimensions, have that remarkable property. This paper is given, among many others equally curious, in a volume of Memoirs which he published in the year 1780. But what renders that volume yet more valuable, is a very extensive appendix, containing "Theorems for the calculation of fluents."

The tables which contain these theorems are more complete and extensive than any which are to be found in any other author, and are worthy of his own investigating; being such as had occurred to him in the course of a long and curious application to mathematical studies in almost every branch of those sciences. In 1781, 1782, and 1783, he published three little tracts on the summation of converging series, in which he explained and showed the extent of some theorems which had been given for that purpose by M. de Moivre, Mr. Sterling, and his old friend Thomas Simpson, in answer to some things which he thought had been written to the disparagement of those excellent mathematicians. It was the opinion of some, that Mr. Landen did not show less mathematical skill in explaining and illustrating these theorems, than he has done in his writings on original subjects; and that the authors of them were as little aware of the extent of their own theorems as the rest of the world were before Mr. Landen's ingenuity made it obvious to all.

About the beginning of the year 1782, Mr. Landen had made such improvements in his theory of rotatory motion, as enabled him, he thought, to give a solution of the general problem specified above; but finding the result of it to differ very materially from the result of the solution which had been given of it by M. d'Alembert, and not being able to see clearly where that gentleman had erred, he did not venture to make his own solution public. In the course of that year, having procured the Memoirs of the Berlin Academy for 1777, which contain M. Euler's solution of the problem, he found that this gentleman's solution gave the same result as had been deduced by M. d'Alembert; but the perspicuity of M. Euler's manner of writing enabled him to discover where he had erred, which the obscurity of the other did not do. The agreement, however, of two writers of such established reputation as M. Euler and M. d'Alembert made him long dubious of the truth of his own solution, and induced him to revise the process again and again with the utmost circumspection; and being every time more convinced that his own solution was right and theirs wrong, he at length gave it to the public in the 7th volume of the Philosophical Transactions for 1785.
The extreme difficulty of the subject, joined to the concise manner in which Mr Landen had been obliged to give his solution in order to confine it within proper limits for the Transactions, rendered it too difficult, or at least too laborious, a piece of business for most mathematicians to read it; and this circumstance, joined to the established reputation of Euler, induced many to think that his solution was right and Mr Landen's wrong, and that it was not necessary to attempt to prove it. But notwithstanding these attempts were manifestly wrong, and that every one who perused them saw it, they convinced Mr Landen that there was a necessity for giving his solution at greater length, in order to render it more generally understood. About this time also he met by chance with the late P. Frisi's Cosmographiae Physicae et Mathematicae, in the second part of which there is a solution of this problem, agreeing in the result with those of M. Euler and D'Alembert, which is not surprising, as P. Frisi employs the same principle that they did. Here Mr Landen learned that M. Euler had revised the solution which he had given formerly in the Berlin Memoirs, and given it another form and a greater length in a volume published at Gryphiiswell in 1765, entitled, "Theoria Motus corporum solidorum seu rigidorum." Having therefore procured this book, Mr Landen found the same principles employed in it, and of course the same conclusion resulting from them that he had found in M. Euler's former solution of the problem: but as the reasoning was given at greater length, he was enabled to see more distinctly how M. Euler had been led into the mistake, and to set that mistake in a stronger point of view. As he had been convinced of the necessity of explaining his ideas on the subject more fully, so he now found it necessary to lose no time in setting about it. He had for several years been severely afflicted with the stone in the bladder, and toward the latter part of his life to such a degree as to be confined to his bed for more than a month at a time: yet even this dreadful disorder did not abate his ardour for mathematical studies; for the second volume of his Memoirs was written and revised during the intervals of his disorder. This volume, besides a solution of the general problem concerning rotatory motion, contains the resolution of the problem concerning the motion of a top; an investigation of the motion of the equinoaxes, in which Mr Landen has first of any one pointed out the cause of Sir Isaac Newton's mistake in his solution of this celebrated problem; and some other papers of considerable importance. He just lived to see this work finished, and received a copy of it the day before his death, which happened on the 17th of January 1790, at Milton, near Peterborough, in the 71st year of his age.

LANDERNNEAU, a town of France, in Lower Bretagne, now the department of Finistere, seated on the river Elbourn, 20 miles east of Brest. In an inn here is a well which ebbs and flows like the sea, but at contrary times. E. Long. 4° 13'. N. Lat. 48° 25'.

LANDES, a department in the south-west of France. It contains 3700 square miles, with 240,000 inhabitants. It is one of the most barren districts in the kingdom, three-fourths of it consisting of heaths. The produce consists of corn, wine, olives, and wood.

There are mines of iron; and salt is made on the coast. Mont de Marsan is the chief town.

LANDGRAVE, (formed of the German land, earth, and graff, or grave, judge or count); a name formerly given to those who executed justice in behalf of the emperor, with regard to the internal policy of the country. The title does not seem to have been used before the 11th century. These judges were first appointed within a certain district of Germany: in process of time the title became hereditary, and these judges assumed the sovereignty of the several districts or counties over which they presided. Landgrave is now applied by way of eminence to those sovereign princes of the empire who possess by inheritance certain estates called landgraves, and of which they receive the investiture of the emperor. There are four princes who have this title, viz. those of Thuringia, Hesse, Alsatia, and Leuchtenberg. There are also other landgraves, who are not princes but counts of the empire. See Count.

LANDGRAVATE, or LANDGRAFATE, the office, authority, jurisdiction, or territory of a landgrave.

LANDGUARD FORT seems to belong to Suffolk, but is in the limits of Essex, and has a fine prospect of the coast from both counties. It was erected, and is maintained, for the defence of the port of Harwich over against it; for it commands the entry of it from the sea up the Manningtree water, and will reach any ship that goes in or out. It is placed on a point of land so surrounded with the sea at high water, that it looks like a little island at least one mile from the shore. The making its foundation solid enough for so good a fortification cost many years labour and a prodigious expense. It was built in the reign of King James I. Here is a small garrison, with a governor, and a platform of guns.

LANDISFARN, or LINDISFARN. See Holy Island.

LANDRECY, a town of the French Netherlands, in Hainault, ceded to France by the treaty of the Pyrenees, and is now very well fortified. It was besieged by Prince Eugene in 1712, but to no purpose. It was taken by the allies in April 1794, but retaken in July following. It is seated in a plain on the river Sambre, in E. Long. 3° 47'. N. Lat. 50° 7'.

LANDSCAPE, in painting, the view or prospect of a country extended as far as the eye will reach. See Painting and Drawing.

LANDSCROON, a sea port town of Sweden, in South Gothland, and territory of Schonen, seated on the Baltic sea, within the Sound, 22 miles north of Copenhagen. E. Long. 12° 20'. N. Lat. 57° 42'.

LANDSWOWNE, a town of Somersetshire, near Bath, where there is a fair in October for cattle and cheese.

LANDSHUT, a strong town of Germany in Lower Bavaria, with a strong castle on an adjacent hill. It is seated on the river Isar. E. Long. 12° 15'. N. Lat. 48° 29'. There is another small town of the same name in Silesia, and in the duchy of Schweidnitz, seated on the river Zeider, which falls into the Baubier; and there is also another in Moravia, seated on the river Morava, on the confines of Hungary and Austria.
LANDSKIP. See LANDSCAPE.

LANARKSHIRE, or LANARKSHIRE, a county of Scotland, called also Clydesdale, from the river Clyde by which it is watered. It is bounded on the north by the county of Dumfart ; on the east by Stirling, Linlithgow, Edinburgh, and Peebles; on the south by Dumfriesshire; and on the west by Ayr and Renfrew shires. Its extent from north to south is about 40 miles, from east to west 36. — The river Clyde, descending from the southern part of this county, divides it into two almost equal parts; and after a course of about 50 miles, meets the tide a little below Glasgow; (see Glasgow). Proceeding up the river from Glasgow, the country is rich and well cultivated. Bothwell castle, now in ruins, stands on an eminence which overlooks the Clyde. Some of its walls are still remaining, which measure 15 feet in thickness and 60 feet in height. Between this castle and the priory of Blantyre on the opposite side of the Clyde, there is said to have been in ancient times a subterraneous passage under the river. A little above stands Bothwell bridge, noted for the defeat of the Covenanters by the duke of Monmouth in 1679. — East from Bothwell castle, in an elevated situation, stands the Kirk of Shotts, amid a wild and stony country. This kirk is covered with heath; and though a high situation, is flat, and very marshy in many places. It is chiefly employed as sheep walks; and notwithstanding the vicinity of coal and lime, seems scarce capable of cultivation. This want is, however, compensated by the abundance of iron stone and coal, which are here brought together by the hand of nature. Nor is this advantage confined to the barren tract in the north-east corner of the shire. The whole country abounds with these valuable minerals; and two iron works are erected on the banks of the Clyde, one a little above Glasgow, and another at Cleland near Hamilton. But the most considerable work of this kind in the county is that of Cleugh, a few miles south-east from the Kirk of Shotts. A village is here built for the accommodation of the workmen. It is called Filtonstone from the name of the proprietors. There are besides these, two other iron works in this county, one on the banks of the Cadder near Airdrie, and the other at Shotts. — The small borough of Lanark is situated on the brow of a hill, on the north-east side of the Clyde, commanding a fine prospect over the river. In this neighbourhood are some of the greatest cotton manufactories in Scotland. The Clyde near this place runs for several miles between high rocks covered with woods; and in its course exhibits many astonishing cataracts: (see the article Clyde). — From Lanark, passing the village of Carstairs, a few miles to the east we meet the small town of Carnwath. In this neighbourhood, and along the Clyde to the south-east, there is much cultivation and rich pasture. — To the south of Carnwath is the town of Biggar; where is seen the ruin of a collegiate church founded in 1545. — The lands about the villages of Culter and Lamington are fertile; but further up the Clyde we meet with nothing but sheep walks and pasture grounds in tracing it to its source.

In the southern part of the shire, generally called Clydesdale, the country is not less wild. Among the mountains here, or rather in a hollow near their summits, we meet with the village of Leadhills, by some said to be the highest human habitation in the island of Great Britain. Here, however, reside many hundreds of miners with their families. These miners, though in a great measure excluded from society by their situation, yet not only find means to procure a comfortable subsistence, but also pay more attention to the cultivation of the mind than many of their countrymen. They are very intelligent, and have provided a circulating library for the instruction and amusement of the little community belonging to the village. — Amid these mountains particles of gold have sometimes been found washed down by the rains and streams of water; but this desert tract is chiefly valuable for producing metals of inferior worth. "Nothing (says Mr Pennant) can equal the gloomy appearance of the country round. Neither tree, nor shrub, nor verdure, nor picturesque rock, appear to amuse the eye. The spectator must plunge into the bowels of these mountains for entertainment. "The veins of lead lie mostly north and south; their thickness varies from a few inches to 20 inches and 10 feet. At one place the Susannah vein (the richest ever discovered at Leadhills) swelled out to the extraordinary thickness of 14 feet. Some have been found filled with ore within two fathoms of the surface; others sink to the depth of 90 fathoms. The Earl of Hopetoun, the proprietor, has in his possession a solid mass of lead ore from these mines weighing five tons. His lordship has also, it is said, a piece of native gold that weighs two ounces, which was found here. The lead smelted at this place is all sent to Leith, where it has the privilege of being exported free of duty. The scanty pasture afforded by this barren region feeds some sheep and cattle; but those in the neighbourhood of the mines sometimes perish by drinking of the water in which the lead ore has been washed; for the lead ore communicates a deleterious quality to the water, though that liquid acquires no hurtful taint from remaining in leaden pipes or cisterns. North from this mountainous region lies Crawford muir.

About nine miles north of Leadhills, on the east side of the small river Douglas, which falls into the Clyde a few miles below, stands Douglas castle, for many ages the residence of the second family in Scotland. A modern building has been erected on the same site, in imitation of the ancient castle. Near it stands the town of Douglas. A few miles to the north-east is Tinto, a remarkable conic mountain, round the base of which the Clyde makes a noble sweep. Westward, beyond Douglas, the river Nethan descends into the Clyde through the populous parish of Lesmahago. — Hamilton house, the seat of the Duke of Hamilton, stands in a plain between the rivers Clyde and Avon. It is a magnificent structure, surrounded by many venerable oaks. In the vicinity is the town of Hamilton, which contains many handsome houses: (see Hamilton). Here are seen the ruins of a collegiate church, founded in 1457. At a little distance from Hamilton house is an elegant appendage to it, called Chatelherault, the name of the ancient possessions held by the family in France. This building is seated on the river Avon, and is surrounded by woods and deep
LAN

LANK

LANFRANC, John, an eminent Italian history painter, born at Parma in 1681. He was first the disciple of Augustin Caracci; and, after his death, of Hannibal, whose taste in design and colouring was so happily attained, that he was instructed to execute some of his designs in the Papal palace at Rome. He finished in so masterly a manner, that the difference is imperceptible to this day between his work and that of his master. His genius directed him to grand compositions, which he had a peculiar facility in designing and in painting either in fresco or in oil; he did indeed aspire to the grace of Correggio, but could never arrive at his excellence; his greatest power being manifested in composition and form. His colouring was sometimes admirable, was frequently too dark. By order of Pope Urban VIII., he painted in St. Peter's church at Rome the representation of that saint walking on the water, which afforded the pope so much satisfaction that he knighted him. He died in 1647.

LANFRANC, AN, an eminent Italian history painter, born at Parma in 1681. He was first the disciple of Augustin Caracci; and, after his death, of Hannibal, whose taste in design and colouring was so happily attained, that he was instructed to execute some of his designs in the Papal palace at Rome. He finished in so masterly a manner, that the difference is imperceptible to this day between his work and that of his master. His genius directed him to grand compositions, which he had a peculiar facility in designing and in painting either in fresco or in oil; he did indeed aspire to the grace of Correggio, but could never arrive at his excellence; his greatest power being manifested in composition and form. His colouring was sometimes admirable, was frequently too dark. By order of Pope Urban VIII., he painted in St. Peter's church at Rome the representation of that saint walking on the water, which afforded the pope so much satisfaction that he knighted him. He died in 1647.

LANGBAINE, GERARD, D. D., a learned English writer, was born in 1568. He was educated at Queen's college, Oxford; and became keeper of the archives of that university, and provost of his college. He was highly esteemed by Archbishop Usher, Selden, and other learned men; he died in 1657. He published, 1. An edition of Longinus, in Greek and Latin, with notes; and other works.

LANGBAINE, Geran, an eminent writer, the son of the former, was born in 1636. He was put apprenticeship to Mr. Symonds, bookseller in St. Paul’s churchyard; but was soon after called from these by his mother upon the death of his eldest brother, and by her entered a gentleman commoner of University college, Oxford, in 1672. Here he ran out a good part of his estate; but afterwards corrected his manner of living, and for some years lived in retirement near Oxford. During this time he improved his taste for dramatic poetry; and at first wrote some small pieces without his name, but afterwards published several works which he publicly owned. In 1690 he was elected inferior beadle of arts in the university of Oxford; and, in January following, was chosen superior beadle of law, but died soon after in 1692. He wrote, 1. The Hunter, a discourse on horsemanship. 2. A new catalogue of English plays with their best editions, and divers remarks on the originals of most plays, and on the plagiarisms of several authors. 3. An account of the English dramatic poets.

LANGELAND, ROBERT, an old English poet of the 14th century, and one of the first disciples of Wickliffe the reformer. He is said to have been born in Shropshire. He wrote the visions of Piers Plowman, a piece which abounds with imagination and humour, though dressed to great disadvantage in very uncouth versification.
LANGUAGE

Language, in the proper sense of the word, signifies the expression of our ideas and their various relations by certain articulate sounds, which are used as the signs of those ideas and relations. By articulate sounds are meant those modulations of simple voices, or of sound emitted from the thorax, which are formed by means of the mouth and its several organs—the teeth, the tongue, the lips, and the palate. In a more general sense of the word, language is sometimes used to denote all sounds by which animals of any kind express their particular feelings and impulses in a manner that is intelligible to their own species.

Nature has endowed every animal with powers sufficient to make known all those of its sensations and desires, with which it is necessary, for the preservation of the individual or the continuance of the kind, that others of the same species should be acquainted. For this purpose, the organs of all vocal animals are so formed, as, upon any particular impulse, to utter sounds, of which those of the same species instinctively know the meaning. The summons of the hen is instantly obeyed by the whole brood of chickens; and in many others of the irrational tribes a similar mode of communication may be observed between the parents and the offspring, and between one animal and its customary associate. But it is not among animals of the same species only that these instinctive sounds are mutually understood. It is as necessary for animals to know the language, voices of their enemies as the voice of their friends; and the roaring of the lion is a sound, of which, previous to all experience, every beast of the forest is naturally afraid. Between these animal voices and the language of men there is however very little analogy. Human language is capable of expressing ideas and notions, which there is every reason to believe that the brutal mind cannot conceive. "Speech (says Aristotle) is made to indicate what is expedient and what inadexpedient, and in consequence of this what is just and unjust. It is therefore given to men; because it is peculiar to them, that of good and evil, just and unjust, they only (with respect to other animals) possess a sense or feeling." The voices of brutes seem intended by nature to express, not distinct ideas or moral modes, but only such feelings as it is for the good of the species that they should have the power of making known; and in this, as in all other respects, these voices are analogous, not to our speaking, but to our weeping, laughing, singing, groaning, screaming, and other natural and audible expressions of appetite and passion. Another difference between the language of men and the voices of brute animals consists in articulation, by which the former may be resolved into distinct elementary sounds or syllables; whereas the latter, being for the most part unarticulated, are not capable of such a resolution. Hence Homer and Hesiod characterize man by the epito...
that were there any instinctive language, the first words language, uttered by all children would be the same; and that every child, whether born in the desert or in society, would understand the language of every other child, however educated or however neglected. Nay more, we may venture to affirm, that such a language, though its general use might, in society, be superseded by the prevailing dialect of art, could never be wholly lost; and that no man of one country would find it difficult, far less impossible, to communicate the knowledge of the natural and most pressing wants to the men of any other country, whether barbarous or civilized. The exercise of cultivated reason, and the arts of civil life, have indeed eradicated many of our original instincts, but they have not eradicated them all: (see Instinct). There are external indications of the internal feelings and desires, which appear in the most polished society, and which are confessedly instinctive. The passions, emotions, sensations, and appetites, are naturally expressed in the countenance by characters which the savage and the courtier can read with equal readiness. The look serene, the smoothed brow, the dimpled smile, and the glistening eye, denote equanimity and good will in terms which no man mistakes. The contracted brow, the glancing eye, the sullen gloom, and the threatening air, denote rage, indignation, and defiance, as plainly and forcibly as revilings or imprecations. To teach men to disguise these instinctive indications of their temper, and

"To carry smiles and sunshine in their face,  
When discontent sits heavy at their heart."

constitutes a great part of modern and refined education. Yet in spite of every effort of the utmost skill, and of every motive resulting from interest, the most consummate hypocrite, or the most knavish politician, is not always able to prevent his real disposition from becoming apparent in his countenance. He may indeed, by long practice, have acquired a very great command both over his temper and over the instinctive signs of it; but at times nature will predominate over art, and a sudden and violent passion will flash in his face, so as to be visible to the eye of every beholder. If these observations be just, and we flatter ourselves with the belief that no man will call them in question, it seems to follow, that, if mankind were prompted by instinct to use articulate sounds as indications of their passions, affections, sensations, and ideas, the language of nature could never be wholly forgotten, and that it would sometimes predominate over the language of art. Groans, sighs, and some inarticulate lively sounds, are naturally expressive of pain and pleasure, and equally intelligible to all mankind. The occasional use of these no art can wholly banish; and if there were articulate sounds naturally expressive of the same feelings, it is not conceivable that art or education could banish the use of them, merely because by the organs of the mouth they are broken into parts and resolvable into syllables.

It being thus evident that there is no instinctive articulate language, it has become an inquiry of some importance, how mankind were first induced to fabricate articulate sounds, and to employ them for the purpose of communicating their thoughts. Children learn to speak by insensible imitation; and when advanced,
either revealed from heaven, or an art invented by men.

The latter opinion is held by Diodorus Siculus, Lucretius, Horace, and many other Greek and Roman writers, who consider language as one of the arts invented by man. The first men, say they, lived for some time in woods and caves after the manner of beasts, uttering only confused and indistinct noises; till associating for mutual assistance, they came by degrees to use articulate sounds mutually agreed upon for the arbitrary signs or marks of those ideas in the mind of the speaker which he wished to communicate to the hearer. This opinion sprang from the atomic cosmogony which was framed by Moschus the Phenician, and afterwards improved by Democritus and Epicurus; and though it is part of a system in which the first men are represented as having grown out of the earth like trees and other vegetables, it has been adopted by several modern writers (A) of high rank in the republic of letters, and is certainly in itself worthy of examination.

The most learned, and on every account the most respectable author who now supports this opinion, candidly acknowledges, that if language was invented, it was of very difficult invention, and far beyond the reach of the grossest savages. Accordingly he holds, that though men were originally solitary animals, and had no natural propensity to the social life; yet before language could be invented they must have been associated for ages, and have carried on of concert some common work. Nay, he is decidedly of opinion, that before the invention of an art so difficult as language, men must not only have herded together, but have also formed some kind of civil polity, have existed in that political state a very long time, and have acquired such powers of abstraction as to be able to form general ideas. (See Logic and Metaphysics.) But it is obvious, that men could not have instituted civil polity, or have carried on of concert any common work, without communicating their designs to each other; and there are four ways by which the author thinks that this could have been done before the invention of speech; viz.

1st, Inarticulate cries, expressive of sentiments and passions; 2d, Gestures and the expression of countenance; 3d, Imitative sounds expressive of audible things; and 4th, Painting, by which visible objects may be represented. Of these four ways of communication it is plain that only two have any connection with language, viz. inarticulate cries and imitative sounds; and of these the author abandons the latter as having contributed nothing to the invention of articulation, though be

thinks it may have helped to advance its progress. "I Language am disposed (says he) to believe, that the framing of words with an analogy to the sound of the things expressed by them belongeth rather to languages of art than to the first languages spoken by rude and barbarous nations." It is therefore inarticulate cries only that must have given rise to the formation of language. Such cries are used by all animals who have any use of voice to express their wants; and the fact is, that all barbarous nations have cries expressing different things, such as joy, grief, terror, surprise, and the like. These, together with gestures and expression of the countenance, were undoubtedly the methods of communication first used by men: and we have but to suppose (says our author) a great number of our species carrying on some common business, and conversing together by signs and cries; and we have men just in a state proper for the invention of language. For if we suppose their numbers to increase, their wants would increase also; and then these two methods of communication would become too confined for that larger sphere of life which their wants would make necessary. The only thing then that remained to be done was to give a greater variety to the instinctive cries; and as the natural progress is from what is easy to what is more difficult, the first variation would be merely by tones from low to high, and from grave to acute. But this variety could not answer all the purposes of speech in society; and being advanced so far, it was natural that an animal so sagacious as man should go on farther, and come at last to the only other variation remaining, namely, articulation. The first articulation would be very simple, the voice being broken and distinguished only by a few vowels and consonants. And as all natural cries are from the throat and larynx, with little or no operation of the organs of the mouth, it is natural to suppose, that the first languages were for the greater part spoken from the throat; that what consonants were used to vary the cries, were mostly guttural; and that the organs of the mouth would at first be very little employed. From this account of the origin of language it appears, that the first sounds articulated were the natural cries by which men signified their wants and desires to one another, such as calling one another for certain purposes, and other such things as were most necessary for carrying on any joint work: then in process of time other cries would be articulated, to signify, that such and such actions had been performed or were performing, or that such and such events had happened relative to the common business. The names would be invented of such objects as they were conversant with; but as we cannot suppose savages to be deep in abstraction or skillful in the art of arranging things according to their genera and species, all things however similar, except perhaps the individuals of the lowest species, would be expressed by different words not related to each other either by derivation or composition. Thus would language grow by degrees; and as it grew, it would be more and more broken and articulated by consonants; but still the words would retain a great deal of their original na-

(A) Father Simon, Voltaire, L'Abbe Condillac, Dr Smith, and the author of the Origin and Progress of Language.
tare of animal cries. And thus things would go on, words unrelated still multiplying, till at last the language would become too cumbersome for use; and then art would be obliged to interpose, and form a language upon a few radical words, according to the rules and method of etymology.

Those (3) who think that language was originally revealed from heaven, consider this account of its human invention as a series of mere suppositions hanging loosely together, and the whole suspended from no fixed principle. The opinions of Diodorus, Vitruvius, Horace, Lucertius, and Cicero, which are frequently quoted in its support, are in their estimation of no greater authority than the opinions of other men; for as language was formed and brought to a great degree of perfection long before the era of any historian with whom we are acquainted, the antiquity of the Greek and Roman writers, who are comparatively of yesterday, gives them no advantage in this inquiry over the philosophers of France and England. Aristotle has defined man to be οὐσίαν ἀληθινόν; and the definition is certainly so far just, that man is much more remarkable for imitation than invention; and therefore, say the reasoners on this side of the question, had the human race been originally οὐσίαν ἀληθινόν, they would have continued so to the end of time, unless they had been taught to speak by some superior intelligence. That the first men sprang from the earth like vegetables, no modern philosopher has ventured to assert; nor does there anywhere appear sufficient evidence that men were originally in the state of savages. The oldest book extant contains the only rational cosmogony known to the ancient nations; and that book represents the first human inhabitants of this earth, not only as reasoning and speaking animals, but also as in a state of high perfection and happiness, of which they were deprived for disobedience to their Creator. Moses, setting aside his claim to inspiration, derives, from the consistence of his narrative, at least as much credit as Moschus, or Democritus, or Epicurus; and from his prior antiquity, if antiquity could on this subject have any weight, he would deserve more, as having lived nearer to the period of which they all write. But the question respecting the origin of language may be decided without resting in authority of any kind, merely by considering the nature of speech and the mental and corporeal powers of man. Those who maintain it to be of human invention, suppose men at first to have been solitary animals, afterwards to have herded together without government or subordination, then to have formed political societies, and by their own exertions to have advanced from the grossest ignorance to the refinements of science. But, say the reasoners whose cause we are now pleading, this is a supposition contrary to all history and all experience. There is not upon record a single instance well authenticated of a people emerging by their own efforts from barbarism to civilization. There have indeed been many nations raised from the state of savages; but it is known that they were polished, not by their own repeated exertions, but by the influence of individuals or colonies from nations more enlightened than themselves. The language of Greece was tamed by the Pelasgians, a foreign tribe; and were afterwards further polished by Omerus, Cercopes, Catimni, &c., who derived their knowledge from Egypt and the East. The ancient Romans, a ferocious and motley crew, received the blessings of law and religion from a succession of foreign kings; and the conquests of Rome at a latter period contributed to civilize the rest of Europe. In America, the only two nations which at the invasion of the Spaniards could be said to have advanced a single step from barbarism, were indebted for their superiority over the other tribes, not to the gradual and unassisted progress of the human mind, but to the wise institutions of foreign legislators.

This is not the proper place for tracing the progress of man from the savage state to that of political society (see Savage State); but experience teaches us that in every art it is much easier to improve than to invent. The human mind, when put into the proper track, is indeed capable of making great advances in arts and sciences; but if any credit be due to the records of history, it has not, in a people sunk in ignorance and barbarity, sufficient vigour to discover that track, or to conceive a state different from the present. If the rudest inhabitants of America and other countries have continued, as there is every reason to believe they have continued, for ages in the same unvaried state of barbarism; bow is it imaginable that people so much ruder than they, as to be ignorant of all language, should think of inventing an art so difficult as that of speech, or even to frame a conception of the thing? In building, fishing, hunting, navigating, &c. they might imitate the instinctive acts of other animals, but there is no other animal that expresses its sensations and affections by arbitrary articulate sounds.—It is said that before language could be invented, mankind must have existed for ages in large political societies, and have carried on in concert some common work; but if articulate cries, and the natural visible signs of the passions and affections, were modes of communication sufficiently accurate to keep a large society together for ages, and to direct its members in the execution of some common work, what could be their inducement to the invention of an art so useful and difficult as that of language? Let us however suppose, say the advocates for the cause which we are now supporting, that different nations of savages set about inventing an art of communicating their thoughts, which experience had taught them was not absolutely necessary; how came they all, without exception, to think of the one art of articulating the voice for this purpose? Inarticulate cries, out of which language is fabricated, have indeed an instinctive connexion with our passions and affections; but there are gestures and expressions of countenance with which our passions and affections are in the same manner connected. If the natural cries of passion could be so modified and enlarged as to be capable of communicating to the hearer every idea in the mind of the speaker, it is certain that the natural gestures could be so modified as to answer the need.
LANGUAGE.

It is a truth which could hardly occur to savages, who had never experienced the fitness of either; and if, to counterbalance the superior fitness of articulate sound, its extreme difficulty be taken into view, it must appear little less than miraculous that every savage tribe should think of it rather than the easier method of artificial gesticulation. Savages, it is well known, are remarkable for their indolence, and for always preferring ease to utility; but their modes of life give such plausibility to their bodies, that they could with very little trouble bond their limbs and members into any positions agreed upon as the signs of ideas. This is so far from being the case with respect to the organs of articulation, that it is with extreme difficulty, if at all, that a man advanced in life can be taught to articulate any sound which he has not been accustomed to hear. No foreigner who comes to England after the age of thirty ever pronounces the language tolerably well; an Englishman of that age can hardly be taught to utter the guttural sound which a Scotchman gives to the Greek χ, or even the French sound of the vowel ü; and of the solitary savages who have been caught in different forests, we know not that there has been one who, after the age of manhood, learned to articulate any language so as to make himself readily understood. The present age has indeed furnished many instances of deaf persons being taught to speak intelligibly by skilful masters moulding the organs of the mouth into the positions proper for articulating the voice; but who was to perform this task among the inventors of language, when all mankind were equally ignorant of the means by which articulation is effected? In a word, daily experience informs us, that men who have not learned to articulate in their childhood, never afterwards acquire the faculty of speech; and by such helps as savages cannot obtain; and therefore, if speech was invented at all, it must have been either by children who were incapable of invention, or by men who were incapable of speech. A thousand, nay a million, of children could not think of inventing a language. While the organs are pleasurable, there is not understanding enough to frame the conception of a language; and by the time that there is understanding, the organs are become too stiff for the task, and therefore, say the advocates for the divine origin of language, reason as well as history intimates, that mankind in all ages must have been speaking animals; the young having constantly acquired this art by imitating those who were elder; and we may warrantably conclude, that our first parents received it by immediate inspiration.

To this account of the origin of language an objection readily offers itself. If the first language was communicated by inspiration, it must have been perfect, and held in reverence by those who spoke it, i.e. by all mankind. But a vast variety of languages have prevailed in the world; and some of those which remain are known to be very imperfect, whilst there is reason to believe that many others are lost. If different languages were originally invented by different nations, all this would naturally follow from the mixture of these nations; but what could induce men possessed of one perfect language of divine origin, to forsake that barbarous jargon of their own invention, and in every respect inferior to that with which their forefathers or themselves had been inspired?

In answer to this objection, it is said, that nothing was given by inspiration but the faculty of speech and the elements of language; for when once men had the language, it is easy to conceive how they might have modified it by their natural powers, as thousands can now improve what they could not invent. The first language, if given by inspiration, must in its principles have had all the perfection of which language is susceptible; but from the nature of things it could not possibly be very copious. The words of language are either proper names or the signs of ideas and relations; but it cannot be supposed that the All-wise Instructor would load the memories of men with words to denote things then unknown, or with the signs of ideas which they had not then acquired. It was sufficient that a foundation was laid of such a nature as would support the largest superstructure which they might ever after have occasion to raise upon it, and that they were taught the method of building by composition and derivation. This would long preserve the language radically the same, though it could not prevent the introduction of different dialects in the different countries over which men spread themselves. In whatever region we suppose the human race to have been originally placed, the increase of their numbers would in process of time either disperse them into different nations, or extend the one nation to a vast distance on all sides from what we may call the seat of government. In either case they would everywhere meet with new objects, which would occasion the invention of new names, and as the difference of climate and other natural causes would compel those who removed eastward or northward to adopt modes of life in many respects different from the modes of those who travelled towards the west or the south, a vast number of words would in one country be fabricated to denote complex conceptions, which must necessarily be unintelligible to the body of the people inhabiting countries where those conceptions had never been formed. Thus would various dialects be unavoidably introduced into the original language, even whilst all mankind remained in one society and under one government. But after separate and independent societies were formed, these variations would become more numerous, and the several dialects would deviate farther and farther from each other, as well as from the idea and genius of the parent tongue, in proportion to the distance of
LANGUAGE.

Language, the tribes by whom they were spoken. If we suppose a few people either to have been banished together from the society of their brethren, or to have wandered of their own accord to a distance, from which through trackless forests they could not return (and such emigrations have often taken place), it is easy to see how the most copious language must have in their mouths have soon become narrow, and how the offspring of inspiration must have in time become so deformed as hardly to retain a feature of the ancestor whence it originally sprung. Men do not long retain a practical skill in those arts which they never exercise; and there are abundance of facts to prove, that a single man cast upon a desert island, and having to provide the necessities of life by his own ingenuity, would soon lose the art of speaking with fluency his mother tongue. A small number of men east away together, would indeed retain that art somewhat longer; but in a space of time not very long, it would in a great measure be lost by them or their posterity. In this state of banishment, as their time would be almost wholly occupied in hunting, fishing, and other means within their reach to support a wretched existence, they would have very little leisure, and perhaps less desire, to preserve by conversation the remembrance of that ease and those comforts of which they now found themselves for ever deprived; and they would of course soon forget all the words which in their native language had been used to denote the accommodations and elegancies of polished life. This at least seems to be certain, that they would not attempt to teach their children a part of a language which in their circumstances could be of no use to them, and of which it would be impossible to make them comprehend the meaning; for where there are no ideas, the signs of ideas cannot be made intelligible. From such colonies as this dispersed over the earth, it is probable that all those nations of savages have arisen, which have induced so many philosophers to imagine that the state of the savage was the original state of man; and if so, we see that from the language of inspiration must have unavoidably sprung a number of different dialects all extremely rude and narrow, and retaining nothing of the parent tongue, except perhaps the name of the most conspicuous objects of nature, and of those wants and enjoyments which are inseparable from humanity. The savage state has no artificial wants, and furnishes few ideas that require terms to express them. The habits of solitude and silence influence a savage rarely to speak; and when he speaks, he uses the same terms to denote different ideas. Speech therefore, in this rude condition of men, must be extremely narrow and extremely various. Every new region, and every new climate, suggests different ideas and creates different wants, which must be expressed either by terms entirely new, or by old terms used with a new signification. Hence must originate great diversity among the savage nations, the words retained of the original language being used in various senses, and pronounced, as we may believe, with various accents. When any the world of those savage tribes emerged from their barbarism, whether by their own efforts or by the aid of people more enlightened than themselves, it is obvious that the improvement and copiousness of their language would keep pace with their own progress in knowledge and in the arts of civil life; but in the infinite multitude of words which civilization and refinement add to language, it would be little less than miraculous were any two nations to agree upon the same sounds to represent the same ideas. Superior refinement, indeed, may induce imitation, conquests may impose a language, and extension of empires may melt down different nations and different dialects into one mass; but independent tribes naturally give rise to diversity of tongues, nor does it seem possible that they should retain more of the original language than the words expressive of those objects with which all men are at all times equally concerned.

The variety of tongues, therefore, the copiousness of some, and the narrowness of others, furnish no good objection to the divine origin of language in general; for whether language was at first revealed from heaven, or in a course of ages invented by men, a multitude of dialects would inevitably arise as soon as the human race was separated into a number of distinct and independent nations. We pretend not to decide for our readers in a question of this nature: we have given the best arguments on both sides which we could either devise or find in the writings of others: and if it be seen, as we doubt not it will, that our own judgment leans to the side of revelation, let it not be hastily condemned by those whose knowledge of languages extends no farther than to Greece and Rome, and France and England; for if they will carry their philological inquiries to the east, they may perhaps be able to trace the remains of one original language through a great part of the globe at this day (c).

(c) Numberless instances of this might be given, but our limits will permit us to produce only a very few. In the Sanscrit, or ancient language of the Gentoo, our signifies a day: (See Halkett's preface to the code of Gentoo laws). In other eastern languages, the same word was used to denote both light and fire. Thus in the Chaldean, UK is fire; in the Egyptian, or the sun or light, (Plut. of Osir. et Isat.): In the Hebrew, AUR is light: in the Greek, AOI is the air, often light: in Latin, AURA is the air, from the Hellenic Greek; and in Irish it is AEIR. From the very same original we have the Greek word, and the English fire. In Hebrew, or signifies to raise, lift up one's self, or be raised: hence plainly are derived the Greek AEIOU, to raise, excite, and the Latin ORIO or oris; whence, OREIN, the east, and Eng. orient, oriental: also Lat. origo and Eng. origin, originate, &c. The word KHUNT in the Sanscrit dialect, signifies a small territory, which is retained in KAH, KENT, CANTON, CONSTANTIA. The word KHAN, KHAN, GAN, GEN, OIN, is of the same kind, and designates the plains from the Ganges to the Carpathes. The words LIGHT, English, LIGHT, Flemish, and Roman, and AYE, Greek, has been traced to Egypt. AER, AER, PUNIC, HERTHA, LIGHT, and ERDE, are all one word from Palestine and Chaldea to Britain and Germany. The Chaldeans turned the
Language, whatever was its origin, must be subject to perpetual changes from its very nature, as well as from that variety of incidents which affect all sublunary things; and those changes must always correspond with the change of circumstances in the people by whom the language is spoken. When any particular set of ideas becomes prevalent among any society of men, words must be adopted to express them; and from these the language must assume its character. Hence the language of a brave and martial people is bold and sanguine, although perhaps rude and uncultivated; while the languages of those nations in which luxury and effeminacy prevail, are flowing and harmonious, but devoid of force and energy of expression.

But although some may be considered as a general rule, that the language of any people is a very exact index of the state of their minds, yet it admits of some particular exceptions. For as man is naturally an imitative animal, and in matters of this kind never has recourse to invention but through necessity, colonies planted by any nation at whatever distance from the mother country, always retain the same general sounds and idioms of language from those with whom they are associated. In process of time, however, the colonists and the people of the mother country, by living under different climates, by being engaged in different occupations, and by adopting, of course, different modes of life, may lose all knowledge of one another, assume different national characters, and form each a distinct language to themselves, totally different in genius and style, though agreeing with one another in the fundamental sounds and general idiom. If, therefore, this particular idiom, formed before their separation, happen to be more peculiarly adapted to the genius of the mother country than of the colonies, these will labour under an inconvenience on this account, which they may never be wholly able to overcome; and this inconvenience must prevent their language from ever attaining to that degree of perfection to which, by the genius of the people, it might otherwise have been carried. Thus various languages may have been formed out of one parent tongue; and thus that happy concurrence of circumstances which has raised some languages to a high degree of perfection, may be entirely accounted for, while many ineffectual efforts have been made to raise other languages to the same degree of excellence.

As the knowledge of languages constitutes a great part of erudition, as their beauty and deformities furnish employment to taste, and as these depend much upon the idioms of different tongues, we shall proceed to make a few remarks upon the advantages and defects of some of those idioms of language with which we are best acquainted. As the word idiom and genius of a language are often confounded, it will be necessary to inform the reader, that by idiom we would here be understood to mean that general mode of the arranging words into sentences which prevails in any idiom of a particular language: and by the genius of a language we mean to express the particular set of ideas which the words of any language, either from their formation or multiplicity, are most naturally apt to excite in the mind of any one who hears it properly uttered. Thus, although the English, French, Italian, and Spanish languages nearly agree in the same general idiom, yet the particular genius of each is remarkably different: the English is naturally bold, nervous, and strongly articulated; the French is weaker, and more flowing; the Italian more soothing and harmonious; and the Spanish more grave, sonorous, and stately. Now, when two idioms are most esteemed in Europe, we find that there are only two idioms among them which are essentially distinguished from one another; and all those languages are divided between these two idioms, following sometimes the one and sometimes the other, either in whole or in part. The languages which may be said to adhere to the first idiom, are those which in their construction follow the order of nature; that is, express their ideas in the natural order in which they occur to the mind; the subject which occasions the action appearing first; then the action accompanied with its several modifications; and, last of all, the object to which it has reference. These may properly be called the analogous languages; and of this kind are the English, French, and most of the modern languages in Europe. The languages which may be referred to the other idiom, are those which follow no other order in their construction than what the taste or fancy of the composer may suggest; sometimes making the object, sometimes the action, and sometimes the modification of the action, to precede or follow the other parts. The confusion which this might occasion, is avoided by the particular manner of inflecting their words, by which they...
Language.

they are made to refer to the others with which they ought to be connected, in whatever part of the sentence they occur, the mind being left at liberty to connect the several parts with one another after the whole sentence is concluded. And as the words may be here transposed at pleasure, those languages may be called TRANSITIVE languages. To this class we must, in an especial manner, refer the Latin and Greek languages. As each of these idioms has several advantages and defects peculiar to itself, we shall endeavour to point out the most considerable of them, in order to ascertain with greater precision the particular character and excellence of some of those languages now principally spoken or studied in Europe. The partiality which our forefathers, at the revival of letters in Europe, naturally entertained for the Greek and Roman languages, made them look upon every distinguishing peculiarity belonging to them as one of the many causes of the amazing superiority which those languages evidently enjoyed above every other at that time spoken in Europe. This blind deference still continues to be paid to them, as our minds are early prepossessed with these ideas, and as we are taught in our earliest infancy to believe, that to entertain the least idea of our own language being equal to the Greek or Latin in any particular whatever, would be a certain mark of ignorance or want of taste. Their rights, therefore, like those of the church in former ages, remain still to be examined; and we, without exerting our reason to discover truth from falsehood, tamely sit down satisfied with the idea of their unprotested preeminence in every respect. But if we look around us for a moment, and observe the many excellent productions which are to be met with in almost every language of Europe, we must be satisfied, that even these are now possessed of some powers which might afford at least a presumption, that, if they were cultivated with a proper degree of attention, they might, in some respects, be made to rival, if not to excel, those beautiful and justly admired remains of antiquity. Without endeavouring to derogate from their merit, let us, with the cool eye of philosophic reasoning, endeavour to bring before the sacred tribunal of Truth some of those opinions which have been most generally received upon this subject, and rest the determination of the cause on her impartial decision.

The learned reader well knows, that the several changes which take place in the arrangement of the words in every TRANSITIVE language, could not be admitted without occasioning great confusion; unless certain classes of words were endowed with particular variations, by means of which they might be made to refer to the other words with which they ought naturally to be connected. From this cause proceeds the necessity of several variations of verbs, nouns, and adjectives; which are not in the least essential or necessary in the ANALOGOUS languages, as we have pretty fully explained under the article GRAMMAR, to which we refer for satisfaction on this head. We shall in this place consider, whether these variations are an advantage or a disadvantage to language.

As it is generally supposed, that every language whose verbs admit of INFLICTION, is on that account much more perfect than one where they are varied by auxiliaries; we shall in the first place, examine this with some degree of attention; and that what is said on this head may be the more intelligible, we shall give examples from the Latin and English languages. We make choice of these languages, because the Latin is more purely transitive than the Greek, and the English admits of less inflection than any other language that we are acquainted with.

If any preference be due to a language from the diversity of one or the other method of conjugating verbs, it must be in a variety of expression, in a great measure being owing to one or more of these three causes:—Either it must admit of a greater variety of sounds, and consequently more room for variation of diversity of tenses in the language:—or a meaning—greater freedom of expression is allowed in uttering any simple idea, by the one admitting of a greater variety in the arrangement of the words which are necessary to express that idea than the other does:—or, lastly, a greater precision and accuracy in fixing the meaning of the person who uses the language, write from the use of one of these forms, than from the use of the other: for, as every other circumstance which may serve to give a diversitiy to language, such as the general and most prevalent sounds, the frequent repetition of any one particular letter, and a variety of other circumstances of that nature, which may serve to debase a particular language, are not influenced in the least by the different methods of varying the verbs, they cannot be here considered. We shall therefore proceed to make a comparison of the advantages or disadvantages which may accrete to a language by inflecting its verbs with regard to each of these particulars—variety of sound, variety of arrangement, and accuracy of meaning.

The first particular that we have to examine is, Diversity of Whether the one method of expressing the variations sounds of a verb admits of a greater variety of sounds? In this respect the Latin seems, at first view, to have a great advantage over the English: for the words uo, omnibus, omnium, omnino, omnium, &c., seem to be more different from one another than the English terminations of these, I love, I did love, I had loved, I shall have loved, I may love, &c.; for although the syllable am is repeated in every one of the first, yet as the last syllable usually strikes the ear with greater force and leaves a greater impression than the first, it is very probable that many will think the frequent repetition of the word LOVE in the last instance, more striking to the ear than the repetition of am in the former. We will therefore allow this its full weight, and grant that there is as great, or even a greater difference between the sounds of the different tenses of a Latin verb, than there is between the words that are equivalent to them in English. But as we here consider the variety of sounds of the language in general, before any just conclusion can be drawn, we must not only compare the different parts of the same verb, but also compare the different verbs with one another in each of those languages. And here, at first view, we perceive a most striking distinction in favour of the analogous language over the INFLECTED: for as it would be impossible to form a particular set of inflections different for one another for each particular verb, all those languages which have recourse to this method have been obliged to reduce their verbs into a small number of classes; all the words of each of which classes gramm.
The similarity of sounds is here so obvious in the Latin, as to be perceived at the first glance; nor can we be surprised to find it so, when we consider that all their regular verbs, amounting to 4000 or upwards, must be reduced to four conjugations, and even these differing but little from one another, which most of necessity produce the sameness of sounds which we have perceived; whereas, every language that follows the natural order, like the English, instead of this small number of uniform terminations have almost as many distinct sounds as original verbs in their language.

But if instead of the present of the indicative mood, we should take almost any other tense of the Latin verb, the similarity of sounds would be still more perceptible, as many of these tenses have the same termination in all the four conjugations, particularly in the imperfect of the indicative, as below.

| Pono, I put | Moveo, I move |
| Done, I give | Doleo, I ail |
| Cavo, I sing | Lugeo, I mourn |
| Sono, I sound | Obeo, I die |
| Ordo, I adorm | Rubeo, I rejoice |
| Puno, I fight | Incipio, I begin |
| Lego, I read | Facio, I make |
| Scribo, I write | Fodo, I dig |
| Puto, I think | Rideo, I laugh |
| Vivo, I live | Impleo, I fill |
| Ambulo, I walk | Abstineo, I forbear |

Abula-bam; I did walk; I walked.
Move-bam; I did move; I moved.
Dole-bam; I did ail; I ailed.
Luge-bam; I did mourn; I mourned.
Obi-bam; I did die; I died.
Incipie-bam; I did begin; I began.
Facie-bam; I did make; I made.
Ride-bam; I did laugh; I laughed.
Impie-bam; I did fill; I filled.
Abstine-bam; I did forbear; I forbore.

It is unnecessary to make any remarks on the Latin words in this example; but in the English translation, we have carefully marked in the first column the words without any infection; and in the second, have put down the same meaning by an infection of our verb; which we have been enabled to do, from a peculiar excellency in our own language unknown to any other either ancient or modern. Were it necessary to pursue this subject farther, we might observe, that the perfect tense in all the conjugations ends universally in -m, the pluperfect in ERAM, and the future, in AM or BM; in the subjunctive mood, the imperfect universally in REm, the perfect in ERM, the pluperfect in ESEM, and the future in EKO; and as a still greater sameness is observable in the different variations for the persons in these tenses, seeing the first person plural in all tenses ends in MUS, and the second person in TES, with little variation in the other persons; it is evident that, in respect to diversity of sounds, this method of conjugating verbs by inflexion, is greatly inferior to the more natural method of expressing the various conjunctions and relations of the verbal attributive by different words, usually called auxiliaries.

The second particular, by which the different means of marking the relation of the verbal attributive expressions which either of these may admit of in uttering the same sentiment. In this respect, likewise, the method of conjunction by inflexion seems to be defective. Thus the present of the indicative mood in Latin can at most be expressed only in two ways, viz. scribo and EGO scribo; which ought perhaps in strictness to be admitted only as one: whereas, in English, we can vary it in four different ways, viz. I write, I wrote; do not write; 3ly, WRITE I do; 4thly, WRITE do I (d). And if we consider the further variation which these receive in power as well as in sound, by having

\[3\ 2\]

The.

(c) We are sufficiently aware, that the last variation cannot in strictness be considered as good language; although many examples of this manner of using it in serious composition, both in poetry and prose, might be easily produced from the best authors in the English language. But however unjustifiable it may be in serious composition; yet, when judiciously employed in works of humour, this and other forced expressions of the like nature produce a fine effect, by giving a burlesque air to the language, and beautifully contrasting it to the perer ciction of solid reasoning. The sagacious Shakespeare, has, on many occasions, showed how successfully these may be employed in composition, particularly in drawing the character of ancient Pistol in Henry V. Without this liberty, Butler would have found greater difficulty in drawing the inimitable character of Hudibras. Let this apology suffice for having inserted this and other variations of the same kind; which, although they may be often improper for serious composition, have still their use in language.
the emphasis placed on the different words; instead of
four, we will find eleven different variations: thus, 1st,
I write, with the emphasis upon the I; 2nd, I
write, with the emphasis upon the write.
Let any one pronounce these with the different em-
phasis necessary, and he will be immediately satisfied
that they are not only distinct from each other with
respect to meaning, but also with regard to sound;
and the same must be understood of all the other parts
of this example.

3. I do write. 8. Write I do.
4. I do write. 9. Write do I.
5. I do write. 10. Write do I.
6. Write I do. 11. Write do I.
7. Write I do.

None of the Latin tenses admit of more variations
than the two above mentioned: nor do almost any
of the English admit of fewer than in the above ex-
ample; and several of these phrases, which must be
considered as exact translations of some of the tenses
of the Latin verb, admit of many more. Thus the
imperfect of the subjunctive mood, which in Latin
admits of the above two variations, admits in English
of the following:

1. I might have written. 4. Written might have I.
2. Written I might have. 5. I written might have.
3. Have written I might. 6. Have written might I.

And if we likewise consider the variations which may
be produced by a variation of the emphasis, they will be
as under:

1. I might have written. 13. WRITTEN might have I.
2. I MIGHT have written. 14. Written MIGHT have I.
3. I might have written. 15. Written might have I.
4. I might have written. 16. Written might have I.
5. WRITTEN I might have. 17. I written might have.
6. Written I might have. 18. I written might have.
7. Written I might have. 19. I written might have.
8. Written I might have. 20. I written might have.
9. HAVE written I might. 21. HAVE written might I.
10. HAVE written I might. 22. HAVE written might I.
11. Have written I might. 23. Have written MIGHT I.
12. Have written I might. 24. Have written might I.

In all 24 variations, instead of two.—If we likewise
consider, that the Latins were obliged to employ the
same word, not only to express “I might have written,
but also, “I could, I would, or I should have written”;
each of which would admit of the same variations as
the word might; we have in all ninety-six different ex-
pressions in English for the same phrase which in Latin
admits only of two, unless they have recourse to other
forced turns of expression, which the defects of their
verbs in this particular has compelled them to in-
vant.

But if it should be objected, that the last circum-
stance we have taken notice of as a defect, can only
be considered as a defect of the Latin language, and
is not to be attributed to the infection of their verbs,
seeing they might have had a particular sense for each
of these different words might, could, would, and should;
we answer, that, even admitting this excuse as valid;
the superiority of the analogous language, as such,
still remains in this respect as 12 to 1.—Yet even this
concession is greater than ought to have been made:
For as the difficulty of forming a sufficient variety of
words for all the different modifications which a verb
may be made to undergo is too great for any rude peo-
ple to overcome; we find, that every nation which
has adopted this mode of inflection, not excepting the
Greeks themselves, has been obliged to remain satis-
fied with fewer words than would have been necessary
even to effect this purpose, and make the same word
serve a double, treble, or even quadruple office, as in
the Latin tense which gave rise to these observations:
So that, however in physical necessity, this may not
be chargeable upon the particular mode of construc-
tion, yet in moral certainty it must always be the case;
and therefore we may safely conclude, that the mode
of varying verbs by inflection affords less variety in the
arrangement of the words of the particular phrases,
than the method of varying them by the help of auxi-
liaries.

But if there should still remain any shadow of doubt
in the mind of the reader, whether the method of var-
ying the verbs by inflection is inferior to that by auxi-
liaries, with regard to diversity of sounds, or variety
of expression; there cannot be the least doubt, but English
is that with respect to precision, distinctness, and accu-
sary, in expressing any idea, the latter enjoys a supe-
riority beyond all comparison.—Thus the Latin verb
Amo, may be Englished either by the words, I love,
or I do love, and the emphasis placed upon any of the
words that the circumstances may require; by means
of which, the meaning is pointed out with a force and
energy which it is altogether impossible to produce by
the use of any single word. The following line from
Shakespeare’s Othello may serve as an example:

Excellent wretch!

In which the strong emphasis upon the word DO, gives
it a force and energy which conveys, in an irresistible
manner, a most perfect knowledge of the situation of
the mind of the speaker at the time.—That the whole
energy of the expression depends upon this seemingly
insignificant word, we may be at once satisfied of, by
keeping it away in this manner:

Excellent wretch!

In which the strong emphasis upon the word DO, gives
it a force and energy which conveys, in an irresistible
manner, a most perfect knowledge of the situation of
the mind of the speaker at the time.—That the whole
energy of the expression depends upon this seemingly
insignificant word, we may be at once satisfied of, by
keeping it away in this manner:

Excellent wretch!

But there should still remain any shadow of doubt
in the mind of the reader, whether the method of var-
ying the verbs by inflection is inferior to that by auxi-
liaries, with regard to diversity of sounds, or variety
of expression; there cannot be the least doubt, but English
is that with respect to precision, distinctness, and accu-
sary, in expressing any idea, the latter enjoys a supe-
riority beyond all comparison.—Thus the Latin verb
Amo, may be Englished either by the words, I love,
or I do love, and the emphasis placed upon any of the
words that the circumstances may require; by means
of which, the meaning is pointed out with a force and
energy which it is altogether impossible to produce by
the use of any single word. The following line from
Shakespeare’s Othello may serve as an example:

Excellent wretch!
Language, breast, be even confirms it with an oath.—Perdition catch my soul, but I do love thee.—In spite of all the falsehoods with which I know thou hast deceived me—in spite of all the crimes of which I know thee guilty—in spite of all those reasons for which I ought to hate thee—in spite of myself.—Still I find that I love—yes, I do love thee.' We look upon it as a thing altogether impossible to transmute the energy of this expression into any language whose verbs are regularly inflected.

In the same manner we might go through all the other tenses, and show that the same superiority is to be found in each. Thus, in the perfect tense of the Latins, instead of the simple amavi, we say I have loved; and by the liberty we have of putting the emphasis upon any of the words which compose this phrase, we can in the most accurate manner fix the precise idea which we mean to excite; for if we say, I have loved, with the emphasis upon the word I, it at once points out the person as the principal object in that phrase, and makes us naturally look for a contrast in some other person, and the other parts of the phrase become subordinate to it:—'he has loved thee much, but I have loved thee infinitely more.' The Latins too, as they were not prohibited from joining the pronoun with their verb, were also acquainted with this excellence, which Virgil has beautifully used in this verse:

Tu, Titre, lentus in umbra, &c.

but we are not only enabled thus to distinguish the person in as powerful a manner as the Latins, but can also with the same facility point out any of the other circumstances as principals; for if we say, with the emphasis upon the word have, 'I have loved,' it as naturally points out the time as the principal object, and makes us look for a contrast in that peculiarity, I have: 'I have loved indeed;—my imagination has been led astray—my reason has been perverted—but, now that time has opened my eyes, I can smile at those imaginary distresses which once perplexed me.'

In the same manner we can put the emphasis upon the other word of the phrase loved,—I have loved.'—Here the passion is exhibited as the principal circumstance; and as this can never be excited without some object, we naturally wish to know the object of that passion.—'Who? what have you loved?' are the natural questions we would put in this case. 'I have loved—Eliza.'—In this manner we are, on all occasions, enabled to express, with the utmost precision, that particular idea which we would wish to excite, so as to give an energy and perspicuity to the language, which can never be attained by those languages whose verbs are conjugated by inflection: and if to this we add the inconvenience which all inflected languages are subject to, by having too small a number of tenses, so as to be compelled to make one word on many occasions supply the place of two, three, or even four, the balance is turned still more in our favour.—Thus, in Latin, the same word amabo stands for shall or will love, so that the reader is left to guess from the context which of the two meanings it was most likely the writer had in view.—In the same manner, may or can love are expressed by the same word amem; as are also might, could, would, or should, love, by the single word amem, as we have already observed; so that the reader is left to guess which of these four meanings the writer intended to express: which occasions a perplexity very different from that clear precision which our language allows of, by not only pointing out the different words, but also by allowing us to put the emphasis upon any of them we please, which superadds energy and force to the precision, it would have had without that assistance.

Upon the whole, therefore, after the most candid examination, we must conclude, that the method of conjugating verbs by inflection is inferior to that which is performed by the help of auxiliaries;—because it does not afford such a diversity of sounds,—nor allows inflection such variety in the arrangement of expression so as to give for the same thought,—nor give so great distinction and precision in the meaning.—It is, however, attended with one considerable advantage above the other method: for as the words of which it is formed are necessarily of great length, and more sonorous, than in the analogous languages, it admits of a more flowing harmony of expression; for the number of monosyllables is less; it greatly checks that pompous dignity which usually results from longer words. Whether this single advantage is sufficient to counterbalance all the other defects with which it is attended, is left to the judgment of the reader to determine; but we may remark, before we quit the subject, that even this excellence is attended with some peculiar inconveniences, which shall be more particularly pointed out in the sequel.

But perhaps it might still be objected, that although the comparisons we have made above may be fair, and the conclusion just, with regard to the Latin and English languages; yet it does not appear clear, that on that account the method of conjugating verbs by inflection is inferior to that by auxiliaries; for although it be allowed that the Latin language is defective in point of tenses; yet if a language were formed which had a sufficient number of inflected tenses to answer every purpose; if it had, for instance, a word properly formed for every variation of each tense: one for I love, another for I do love; one for I shall, another for I will love; one for I might, another for I could, and would, and should love; and so on through all the other tenses; that this language would not be liable to the objections we have brought against the inflection of verbs; and that of course the objections we have brought are only valid against those languages which have followed that mode and executed it imperfectly.

We answer, that although this would in some measure remedy the evil, yet it would not remove it entirely. For, in the first place, unless every verb, or every small number of verbs, were conjugated in one way, having the sound of the words in each tense, and division of tenses, as we may say, different from all the other conjugations,—it would always occasion a sameness of sound, which would in some measure prevent that variety of sounds so proper for a language. And even if this could be effected, it would not give such a latitude to the expression as auxiliaries allow; for although there should be two words, one for I might, and another for I could love; yet as these are single words, they cannot be varied; whereas, by auxiliaries, either
of these can be varied 24 different ways, as has been shown above. In the last place, no single word can ever express all that variety of meaning which we can do by the help of our auxiliaries and the emphasis. I have loved, if expressed by any one word, could only denote at all times one distinct meaning; so that to give it the power of ours, three distinct words at least would be necessary. However, if all this were done; that is, if there were a distinct conjugation formed for every 40 or 50 verbs;—if each of the tenses were properly formed, and all of them from different every other tense as well as every other verb; and these all carried through each of the different persons, so as to be all different from one another;—and if likewise there were a distinct word to mark each of the separate meanings which each tense could be made to assume by means of the emphasis; and if all this infinite variety of words could be formed in a distinct manner, different from each other, and harmonious; this language would have powers greater than any that could be formed by auxiliaries, if it were possible for the human powers to acquire such a degree of knowledge as to be able to employ it with facility. But how could this be attained, since upwards of ten thousand words would be necessary to form the variations of any one verb, and a hundred times that number would not include the knowledge of the verbs alone of such a language? (x)—How much, therefore, ought we to admire the simple perspicuity of our language, which enables us, by the proper application of ten or twelve seemingly trifling words, the meaning and use of which can be attained with the utmost ease, to express all that could be expressed by this unwieldy apparatus? What can equal the simplicity or the power of the one method, but the well known powers of the 24 letters, the knowledge of which can be obtained with so much ease—and their powers know no limits?—or, what can be compared to the fancied perfection of the other, but the transcript of it which the Chinese seem to have formed in their unintelligible language?

Having thus considered pretty fully the advantages and defects of each of these two methods of varying verbs, we cannot help feeling a secret wish arise in our mind, that there had been a people sagacious enough to have united the powers of the one method with those of the other; nor can we help being surprised, that among the changes which took place in the several languages of Europe after the downfall of the Roman monarchy, some of them did not accidentally stumble on the method of doing it. From many concuring circumstances, it seems probable that the greatest part, if not all the Gothic nations that overran Italy at that time, had their verbs varied by the help of auxiliaries; and many of the modern European languages which have sprung from them, have so far borrowed from the Latin, as to have some of the tenses of their verbs inflected; yet the English alone have in language any instance combined the joint powers of the two, which could only be done by forming inflections for the different tenses in the same manner as the Latin, and at the same time retaining the original method of varying them by auxiliaries; by which means either the one or the other method could have been employed as occasion required. We have luckily two tenses formed in that way; the present of the indicative, and the aorist of the past. In almost all our verbs these can be declined either with or without auxiliaries. Thus the present, without an auxiliary, is, I love, I write, I speak; with an auxiliary, I do write, I do love, I do speak. In the same manner, the past tense, by inflection, is, I loved, I wrote, I spoke; by auxiliaries, I did love, I did speak, I did write. Every author, who knows any thing of the power of the English language, knows the use which may be made of this distinction. What a pity it is that we should have stooped so soon! how blind was it in many other nations to imitate the defects without making a proper use of that beautiful language which is now numbered among the dead?

After the verbs, the next most considerable variation and transition we find between the analogous and transpositive languages is in the nouns; the latter varying the different cases of these by inflection; whereas the former, with respect to the expression of other words, prefixed, called prepositions. Now, if cases of these we consider the advantages or disadvantages of either of these methods under the same heads as we have done the verbs, we shall find, that with regard to the first particular, viz. variety of sounds, almost the same remarks may be made as upon the verbs; for if we compare any particular noun by itself, the variety of sound appears much greater between the different cases in the transpositive, than between the translation of these in the analogous language. Thus rex, regis, regis, regem, &c. are more distinct from one another, in point of sound, than the translation of these, a king, of a king, to a king, a king, &c. But if we proceed one step further, and consider the variety which is produced in the language in general by the one or the other of these methods, the case is entirely reversed. For as it would have been impossible to form distinct variations, different from one another, for each case of every noun, they have been obliged to reduce all their nouns into a few general classes, called declensions, and to give to all those included under each class the same termination in every case, which produces a like similarity in diversity of sound with what we already observed in our study of sounds. The Latin languages, as there is no necessity for any constraint, there is almost as great a variety of sounds as there are of nouns. The Latins have only five different declensions; so that all the great number of words of this general order must be reduced to the very small diversity of sounds which these few classes admit

(x) This assertion may perhaps appear to many very much exaggerated; but if any should think so, we only beg the favour that he will set himself to mark all the variations of tenses, mode, person, and number, which an English verb can be made to assume, varying each of these in every way that it will admit, both as to the diversity of expression and the emphasis; he will soon be convinced that we have here said nothing more than enough.
LANGUAGE

Language, admit of; and even the sounds of these few classes are not so much diversified as they might have been, as many of the different cases in the different declensions have exactly the same sounds, as we shall have occasion to remark more fully hereafter. We might here produce examples to show the great similarity of sounds between different nouns in the Latin language, and variety in the English, in the same way as we did of the verbs: but as every reader in the least acquainted with these two languages can satisfy himself in this particular, without any further trouble than by marking down any number of Latin nouns, with their translations into English, we think it unnecessary to dwell longer on this particular.

But if the inflection of nouns is a disadvantage to a language in point of diversity of sounds, it is very much the reverse with regard to the variety it allows in the arranging the words of the phrase. Here, indeed, the transpositive language shines forth in all its glory, and the analogous must yield the palm without the smallest dispute. For as the nominative case (or that noun which is the cause of the energy expressed by the verb) is different from the accusative (or that noun upon which the energy expressed by the verb is exerted); these may be placed in any situation that the writer shall think proper, without occasioning the smallest confusion: whereas in the analogous languages, as these two different states of the noun are expressed by the same word, they cannot be distinguished but by their position alone: so that the noun which is the efficient cause must always precede the verb, and that which is the passive subject must follow; which greatly cramps the harmonious flow of composition. Thus the Latin, without the smallest perplexity in the meaning, could say either Brutum amavit Cassius, or Cassius amavit Brutum, or Brutum Cassius amavit, or Cassius Brutum amavit. As the termination of the word Cassius always points out that it is in the nominative case, and therefore that he is the person from whom the energy proceeds; and in the same manner, as the termination of the word Brutum points out that it is in the accusative case, and consequently that he is the object upon whom the energy is exerted; the meaning continues still distinct and clear, notwithstanding of all these several variations: whereas in the English language, we would only say, Cassius loved Brutus, or, by a more forced phraseology, Cassius Brutus loved: Were we to reverse the case, as in the Latin, the meaning also would be reversed; for if we say Brutus loved Cassius, it is evident, that instead of being the person beloved, as before, Brutus now becomes the person from whom the energy proceeds, and Cassius becomes the object beloved. In this respect, therefore, the analogous languages are greatly inferior to the transpositive; and indeed it is from this single circumstance alone that they derive their chief excellence.

But although it thus appears evident, that any language, which has a particular variation of its nouns to distinguish the accusative from the nominative case, has an advantage over those languages which have none; yet it does not appear that any other of their cases adds to the variety, but rather the reverse; for, in Latin, we can only say Amor Dei; in English the same phrase may be rendered, either, the love of God, or God the love, or, by a more forced arrangement, God the love of. And as these oblique cases, as the language.

Latin called them except the accusative, are clearly distinguished from one another, and from the nominative, by the preposition which accompanies them, we are not confined to any particular arrangement with regard to these as with the accusative, but may place them in what order we please, as in Milton's elegant invocation at the beginning of Paradise Lost:

Of man's first disobedience, and the fruit
Of that forbidden tree, whose mortal taste
Brought death into the world, and all our woe,
With loss of Eden, till one greater Man
Restore us, and regain the blissful seat,
Sing, heavenly Muse.

In this sentence the transposition is almost as great as the Latin language would admit of, and the meaning as distinct as if Milton had begun with the plain language of prose, thus—"Heavenly muse, sing of man's first disobedience," &c.

Before we leave this head, we may remark, that the little attention which seems to have been paid to this peculiar advantage derived from the use of an accusative case different from the nominative, is somewhat surprising. The Latins, who had more occasion to attend to this with care than any other nation, and even the Greeks themselves, have in many cases overlooked it, as is evident from the various instances we meet with in their languages where this is not distinguished. For all nouns of the nester gender both in Greek and Latin have in every declension their nominative and accusative singular alike. Nor in the plural of such nouns is there any distinction between these two cases; and in Latin all nouns whatever of the third, fourth, and fifth declensions, of which the number is very considerable, have their nominative and accusative plural alike. So that their language reaps no advantage in this respect from almost one half of their nouns. Nor have any of the modern languages in Europe, however much they may have borrowed from the ancient languages in other respects, attempted to copy them in this particular; from which perhaps more advantage would have been gained, than from copying all the other supposed excellencies of their language. But to return to our object.

It remains that we consider, whether the inflection greatly so of nouns gives any advantage over the method of defining them by prepositions, in point of distinctness and precision of meaning? But in this respect, too, the analogous languages must come off victorious. Indeed this is the particular in which their greatest excellence consists; nor was it, we believe, ever disputed, but that, in point of accuracy and precision, this method must excel all others, however it may be defective in other respects. We observed under this head, when speaking of verbs, that it might perhaps be possible to form a language by inflection which should be capable of as great accuracy as in the more simple order of auxiliaries: but this would have been such an infinite labour, that it was not to be expected that even human powers would have been able to accomplish it. More easy would it have been to have formed the several inflections of the nouns so different from one another, as to have rendered it impossible ever to mistake the meaning. Yet even this has not been attempted. And as we find that those languages
languages which have adopted the method of inflecting
their verbs are more imperfect in point of precision
than the other, so the same may be said of inflecting
the nouns: for, not to mention the energy which the
analogous languages acquire by putting the accent
upon the noun, or its preposition (when in an oblique
case), according to the subject may require, to express
which variation of meaning as particular variety of
words have been invented in any inflected language,
they are not even complete in other respects. The
same, in particular, is in many cases defective; the same
termination being employed in many instances for dif-
cerent cases of the same noun. Thus the genitive and
dative singular, and nominative and vocative plural, of
the first declension, are all equally alike, and can only
be distinguished from one another by the formation
of the sentence; as are also the nominative, voca-
tive, and ablative singular, and the dative and abla-
tive plural. In the second, the genitive singular, and
nominative and vocative plural, are the same, as are al-
so the dative and ablative singular, and dative and abla-
tive plural; except those in $um$, whose nominative,
accusative, and vocative singular, and nominative, accu-
sative, and vocative plural, are alike. The other three
decensions agree in as many of their cases as these do;
which evidently tends to perplex the meaning, unless
the learner is particularly attentive to and well acquaint-
ed with the particular construction of the other parts of
the sentence; all of which is totally removed, and the
clearest certainty exhibited at once, by the help of pre-
positions in the analogous languages.

It will hardly be necessary to enter into such a mi-
ute examination of the advantages or disadvantages
attending the variation of adjectives; as it will ap-
pear evident, from what has been already said, that
the ending them with terminations similar to, and
and corresponding with, substantives, must tend still more
to increase the similarity of sounds in any language,
than any of those particulars we have already taken
notice of; and were it not for the liberty which they
have, in transpositive languages, of separating the ad-
jective from the substantive, this must have occasioned
such a jingle of similar sounds as could not fail to have
been most disgusting to the ear; but as it would have
been impossible in many cases, in those languages where
the verbs and nouns are inflected, to have pronounced
the words which ought to have followed each other,
unless their adjectives could have been separated from
the substantives; therefore, to remedy this inconve-
ience, they were forced to devise this unnatural method
of inflecting them also; by which means it is easy to
recognise to what substantive any adjective has a re-
ference, in whatever part of the sentence it may be
placed. In these languages, therefore, this inflection,
both as to gender, number, and case, becomes abso-
lutely necessary; and, by the diversity which it admits
in the arranging the words of the several phrases,
might counterbalance the jingle of similar sounds which
it introduced into the language.

Having thus examined the most striking particu-
lars in which the transpositive and analogous languages
differ, and endeavoured to show the general ten-
dency of every one of the particulars separately, it
would not be fair to dismiss the subject without con-
sidering each of these as a whole, and pointing out
their general tendency in that light: for we all know,
that it often happens in human inventions, that every
part which composes a whole, taken separately, may
appear extremely fine; and yet, when all these parts
are put together, they may not agree, but produce
a jarring and confusion very different from what we
might have expected. We therefore imagine, a few
remarks upon the genius of each of these two distinct
idioms of language considered as a whole will not be
indeed useless.

Although all languages agree in this respect, that
they are the means of conveying the ideas of one man positive id-

to another; yet as there is an infinite variety of ways
for solemn

composition,

and at other times by more solemn addresses to the
understanding, by pompous declamation, &c. it may
so happen, that the genius of one language may be
more properly adapted to the one of these than the
other, while another language may excel in the op-
posite particular. This is exactly the case in the two
general idioms of which we now treat. Every partic-
ular in a transpositive language, is peculiarly calcu-
lated for that solemn dignity which is necessary for
pompous orations. Long sounding words, formed by
the inflection of the different parts of speech—flowing
periods, in which the attention is kept awake by the
harmony of the sounds, and in expectation of that
word which is to unravel the whole,—if composed by
a skilful artist, are admirably suited to that solemn
dignity and awful grace which constitute the essence of a
public language. On the contrary, in private conver-
sation, where the mind wishes to unbend itself with
ease, these become so many clogs which encumber,
and perplex. At these moments we wish to transmute
and written di-
every unnecessary syllable—and wish to be freed from
the trouble of attention as much as may be. Like our
state robes, we would wish to lay aside our pompous
language, and enjoy ourselves at home with freedom
and ease. Here the solemnity and windings of the
transpositive language are troublesome, while the faci-
ity with which a sentiment can be expressed in the ana-
lologous language is the thing that we wish to acquire.
Accordingly in Terence and Plautus, where the beau-
ties of dialogue are most charmingly displayed, trans-
position is sparingly used. In this humble, though
most engaging sphere, the analogous language moves
unrivalled; in this it wishes to indulge, and never tires.
But it in vain attempts to rival the transpositive in digni-
y and pomp: The number of monosyllables inter-
rupts the flow of harmony; and although they may
give a greater variety of sounds, yet they do not natu-
really possess that dignified gravity which suits the other
language. This, then, must be considered as the stri-
kling particular in the genius of these two different
idioms, which marks their character.

If we consider the effects which these two different
characters of language must naturally produce
upon the people who employ them, we shall soon pre-
ceive, that the genius of the analogous language is
much more favourable for the most engaging purposes
of life, the civilizing the human mind by mutual
intercourse of thought, than the transpositive. For as it
is chiefly by the use of speech that man is raised above
been already explained; so that it will not be surprising to find their progress in the one keep pace with that of the other: but it will be of utility to point out some advantages which that distinguished people possessed, which other nations, perhaps not less distinguished for talents or taste, have not enjoyed, which have contributed to render their language the most universally admired in ancient as well as in modern times.

It has been already observed, that the original inhabitants of Greece who were gross savages, and whose language of course would be very rude and narrow, was first tamed by the Pelasgi, an eastern or an Egyptian tribe. From the east it is well known that arts and sciences were spread over the rest of the world, and that Egypt was one of the countries first civilized. The language, therefore, imported into Greece by the Pelasgi would be pure from the fountain head, and much more perfect in its structure than if it had been transmitted through many nations. But this was not the only circumstance highly fortunate for the Greek language. Before it had time to be fully established among the people, its aspersions, which it had in common with the other dialects of the east, were polished away by such a succession of poets, musicians, philosophers and legislators, from different countries, as never appeared in any other nation at a period so early as to give their genius and taste its full influence. In this respect, no people were ever so eminently distinguished as the ancient Greeks, who had their Orpheus, their Linus, their Cepheus, and their Cadmus, who introduced their different improvements at a time when the nation had no standard of taste formed by itself. Hence the original sounds of the Greek language were the most harmonious, and the most agreeable to the ear, of any that have hitherto been invented. They are indeed agreeable to every person who hears them, even when the meaning of the word is not understood; whereas almost all other languages, till they are understood, appear, to an ear which has not been accustomed to them, jarring and discordant. This is the fundamental excellence of that justly admired language: nor have the people failed to improve this to the utmost of their power, by many aids of their own invention. The Greek language is of the transpositive kind: but a people so lively, so acute, and so loquacious, could ill bear the ceremonious restraint to which that mode of language naturally subjected them: and have therefore, by various methods, freed it in a great measure from the stiffness which that produced. In inflecting their nouns and verbs, they sometimes prefix a syllable, and sometimes add one; which, besides the variety that it gives to the sounds of the language, adds greatly to the distinctness, and admits of a more natural arrangement of the words than in the Latin, and of consequence renders it much fitter for the easiness of private conversation: and indeed the genius of the people so far prevailed over the idiom of the language, as to render it, in the age of its greatest perfection, capable of as much ease, and requiring as small treatment of position of words, as those languages which have been called analogous. But as those nations who spoke this language were all governed by popular assemblies, and no authority could be obtained among them but by a skill in rhetoric and the powers of persuasion; it
Carthage was destroyed, and they had no longer that
powerful curb upon their ambition; when riches flowed in upon them by the multiplicity of their conquests;
luxury began to prevail, the stern austerity of their manners to relax, and selfish ambition to take place of that
disinterested love for their country so eminently
conspicuous among all orders of men before that pe-
period.—Popularity began then to be courted; ambi-
tious men, finding themselves not possessed of that me-
rit which ensured them success with the virtuous se-
nate, amused the mob with artful and seditious har-
rangues; and by making them believe that they were
possessed of all power, and had their sacred rights en-
croached upon by the senate, led them about at their
pleasure, and got themselves exalted to honours and
riches by these insidious arts. It was then the Ro-
man first began to perceive the use to which a com-
mand of language could be put. Ambitious men
then studied it with care, to be able to accomplish
their ends; while the more virtuous were obliged to
acquire a skill in this, that they might be able to repel
the attacks of their adversaries.—Thus it happened,
that in a short time that people from having entirely
neglected, began to study their language with the
greatest assiduity; and as Greece happened to be sub-
jected to the Roman yoke about that time, and a
friendly intercourse was established between these two
countries, this greatly conspired to nourish in the minds
of the Romans a taste for that art of which they had
lately become so much enamoured. Greece had long
before this period been corrupted by luxury; their
taste for the fine arts had degenerated into unnecessary
refinement; and all their patriotism consisted in popu-
lar harangues and unmeaning declamation. Oratory
was then studied as a refined art; and all the suble-
ties of it were taught by rule, with as great care as
the gladiators were afterwards trained up in Rome.
But while they were thus idly trying who should be
the lord of their own people, the nerves of govern-
ment were relaxed, and they became an easy prey to
every invading power. In this situation they became the
subjects, under the title of the auxilis, of Rome, and in-
cluded among them the same taste for haranguing
which prevailed among themselves. Well acquainted
as they were with the powers of their own language,
they set themselves with unwavering assiduity to polish
and improve that of their new masters: but with all
their assiduity and pains, they never were able to make
it arrive at that perfection which their own language
had acquired; and in the Augustan age, when it had
arrived at the summit of its glory, Cicero bitterly com-
plains of its want of copiousness in many particulars.

But as it was the desire of all who studied this lan-
guage with care, to make it capable of that stately
dignity and pomp necessary for public harangues, they
followed the genius of the language in this particular,
glacce of grec, and in a great measure neglected those lesser delicacies
which form the pleasure of domestic enjoyment; so
that, while it acquired more copiousness, more har-
mony, and precision, it remained stiff and inflexible
for conversation; nor could the minute distinction of
nice grammatical rules be ever brought down to the
apprehension of the vulgar: whence the language spo-
ken among the lower class of people remained rude and
unpolished even to the end of the monarchy. The

The Latin language inferior to the Greek; and why.

The Romans, a people of fierce and warlike disposi-
tions, for many ages during the infancy of their re-
public, more intent on pursuing conquests and military
glory than in making improvements on literature or
the fine arts, bestowed little attention to their language.
Of a disposition less social or more phlegmatic than the
Greeks, they gave themselves no trouble about rendering
their language fit for conversation; and it remained
strong and nervous, but, like their ideas,
was limited and confined. More disposed to command
respect by the power of their arms, than by the force
of persuasion, they despaired the more effeminate powers of speech: so that, before the Punic wars, their lan-
guage was perhaps more reserved and uncouth than
any other at that time known.—But after their rival

Huns
LANGUAGE.

Hans who overran Italy, incapable of acquiring any knowledge of such a difficult and abstruse language, never adopted it; and the native inhabitants being made acquainted with a language more natural and easily acquired, quickly adopted that idiom of speech introduced by their conquerors, although they still retained many of those words which the confined nature of the barbarian language made necessary to allow them to express their ideas. And thus it was that the language of Rome, that proud mistress of the world, from an original defect in its formation, although it had been carried to a perfection in other respects superior to any northern language at that time, easily gave way to them, and in a few ages the knowledge of it was lost among mankind: while, on the contrary, the more easy nature of the Greek language has still been able to keep some slight footing in the world, although the nations in which it has been spoken have been subjected to the yoke of foreign dominion for upwards of two thousand years, and their country has been twice ravaged by barbarous nations, and more cruelly depressed than ever the Romans were.

From the view which we have already given of the Latin language, it appears evident, that its idiom was more strictly transpositive than that of any other language yet known, and was attended with all the defects to which that idiom is naturally subjected: nor could it boast of such favourable alleviating circumstances as the Greek, the prevailing sounds of the Latin being far less harmonious to the ear; and although the formation of the words is such as to admit of full and distinct sounds, and the words are so modulated as to lay no restraint upon the voice of the speaker; yet, to a person unacquainted with the language, they do not convey that enchanting harmony so remarkable in the Greek language. The Latin is stately and solemn; it does not excite disgust; but at the same time it does not charm the ear, so as to make it listen with delightful attention. To one acquainted with the language, indeed, the nervous boldness of the thoughts, the somnious rounding of the periods, the full solemn swelling of the sounds, so distinguishable in the most eminent writers in that language which have been preserved to us, all conspire to make it pleasant and agreeable. In these admired works we meet with all its beauties, without perceiving any of its defects; and we naturally admire, as perfect, a language which is capable of producing such excellent works. Yet with all these seeming excellencies, this language is less copious and more limited in its style of composition, than many modern languages; far less capable of precision and accuracy than almost any of these; and infinitely behind them all in point of easiness in conversation. But these points have been so fully proved already, as to require no further illustration. Of the compositions in that language which have been preserved to us, the Orations of Cicero are best adapted to the genius of the language, and we see there it in its utmost perfection. In the Philosophical Works of that great author we perceive some of its defects; and it requires all the powers of that great man to render his Epistles agreeable, as these have the genius of the language to struggle with. Next to oratory, history agrees with the genius of this language; and Cæsar, in his Commentaries, has exhibited the language in its purest elegance, without the aid of pomp or foreign ornament. Among the poets, Virgil has best adapted his works to his language. The flowing harmony and pomp of it is well adapted for the epic strain, and the correct delicacy of his taste rendered him perfectly equal to the task. But Horace is the only poet whose force of genius was able to overcome the bars which the language threw in his way, and succeed in lyric poetry. Were it not for the brilliancy of the thoughts, and acuteness of the remarks, which so eminently distinguish this author's compositions, his odes would long ere now have sunk into utter oblivion. But so conscious have all the Roman poets been of the unfitness of their language for easy dialogue, that almost none of them, after Plautus and Terence, have attempted any dramatic compositions in that language. Nor have we any reason to regret that they neglected this branch of poetry, as it is probable, if they had ever become fond of these, they would have been obliged to adopt so many unnatural contrivances to render them agreeable, as would have prevented us (who of course would have considered ourselves as bound to follow them) from making that progress in the drama which so particularly distinguishes the productions of modern times.

The modern Italian language, from an insufficiency of the ancient Latin language, is called Italian, from the mixture of the barbarous language of those people who conquered Italy. The truth is, the case is directly reversed: for this language, in its general idiom and fundamental principles, is evidently of the analogous kind, first introduced by those fierce invaders, although it has borrowed many of its words, and some of its modes of phraseology, from the Latin, with which they were so intimately blended that they could scarcely be avoided; and it has been from remarking this slight connexion, so obvious at first sight, that superficial observers have been led to draw this general conclusion, so contrary to fact.

When Italy was over-run by the Lombards, and the empire destroyed by these northern invaders, they, as conquerors, continued to speak their own native language. Fierce and illiterate, they would not stoop to the servility of studying a language so clogged with rules, and difficult of attainment, as the Latin would naturally be to a people altogether unacquainted with nice grammatical distinctions: while the Romans, of necessity, were obliged to study the language of their conquerors, as well to obtain some relief of their grievances by prayers and supplications, as to destroy that odious distinction which subsisted between the conquerors and conquered, while they continued as distinct people. As the language of their new masters, although rude and confined, was natural in its order, and easy to be acquired, the Latins would soon attain a competent skill in it: and as they bore such a proportion to the whole number of people, the whole language would partake somewhat of the general sound of the former; for, in spite of all their efforts to the contrary, the organs of speech could not at once be made to acquire a perfect power of uttering any uncustomed sounds; and as it behaved the language of the barbarians to be much less copious than the Latin, whenever they
they found themselves at a loss for a word, they would
naturally adopt those which most readily presented
themselves from their new subjects. Thus a language
in time was formed, somewhat resembling the Latin
both in the general tenor of the sounds and in the mean-
ing of many words: and as the barbarians gave them-
selves little trouble about language, and in some cases
perhaps hardly knew the general analogy of their own
language, it is not surprising if their new subjects should
find themselves sometimes at a loss on that account;
or if, in these situations, they followed, on some occasions,
the analogy suggested to them by their own: which
accounts for the strange degree of mixture of hetero-
genous grammatical analogy we meet with in the Italian
as well as Spanish and French languages. The idiom
of all the Gothic languages is purely analogous; and
in all probability, before their mixture with the Latins
and other people in their provinces, the several gram-
matical parts of speech followed the plain simple idea
which that supposes, the verbs and nouns were all prob-
ably varied by auxiliaries, and their adjectives retained
their simple unalterable state:—but by their mixture
with the Latins, this simple form has been in many
cases altered: their verbs become in some cases inflec-
ed; but their nouns in all these languages still retained
their original form; although they have varied their
adjectives, and foolishly clogged their nouns with gen-
der, according to the Latin idioms. From this hetero-
genous and fortuitous (as we may say, because injusti-
ficous) mixture of parts, results a language possessing
almost all the defects of each of the languages of which
it is composed, with few of the excellencies of either:
for it has neither the ease and precision of the analo-
gous, nor the pomp and boldness of the transpositi-
ve, languages; at the same time that it is clogged with al-
most as many rules, and liable to as great abuses.

These observations are equally applicable to the
French and Spanish as to the Italian language. With
regard to this last, in particular, we may observe, that
as the natural inhabitants of Italy, before the last in-
vansion of the barbarians, were sunk and enervated by
luxury, and by that depression of mind and genius
which anarchy always produces, they have become fond
of festivity and entertainments, and the enjoyment of
sensual pleasures constituted their highest delight; and
their language partook of the same debility as their
body. —The barbarians too, unaccustomed to the sed-
ductions of pleasure, soon fell from their original bold-
ness and intrepidity, and, like Hannibal's troops of
old, were enervated by the sensual gratifications in
which a nation of conquerors unaccustomed to the re-
straint of government freely indulged. The softness
of the air, the fertility of the climate, the unaccustomed
flow of riches which they at once acquired, together
with the voluptuous manner of their conquered sub-
jects; all conspired to enervate their minds, and render
them soft and effeminate. No wonder then, if a lan-
guage new-moulded at this juncture should partake of
the genius of the people who formed it; and instead of
participating of the martial boldness and ferocity of
either of their ancestors, should be softened and en-
feebled by every device which an effeminate people
could invent. —The strong consonants which termin-
ated the words, and gave them life and boldness, be-
ing thought too harsh for the delicate ears of these
sons of sloth, were banished their language; while so-
norous vowels, which could be protracted to any length
in music, were unhesitatingly employed by it. Thus the
Italian language is formed flowing and harmonious,
but destitute of those nerves which constitute the
strength and vigour of a language: at the same time,
the sounds are neither enough diversified, nor in them-
selves of such an agreeable tone, as to afford great
pleasure without the aid of musical notes; and the species of
small pleasure which this affords is still lessened by the
little variety of measure which the great similarity of
the terminations of the words occasions. Hence it
happens that the language is fitted for excelling in
fewer branches of literature than almost any other:
and although we have excellent historians, and more
than ordinary poets, in Italian, yet they labour under
great inconveniences from the language wanting nerves
and stateliness for the former, and sufficient variety of
modulation for the latter. It is, more particularly on
this account, altogether unfit for an epic poem: and
though attempts have been made in this way by two
men, whose genius, if not fettered by the language,
might have been crowned with success; yet these,
notwithstanding the fame that with some they may
have acquired, must, in point of poetical harmony, be
deemed defective by every impartial person. Nor is it
possible that a language which hardly admits of poetry
without rhyme, can ever be capable of producing a
perfect poem of great length; and the stanzas to which
their poets have ever confined themselves, must always
produce the most disagreeable effect in a poem where
unrestrained pomp and pathos are necessary qualifica-
tions. The only species of poetry in which the Italian
language can claim a superior excellence, is the tender
tone of elegy: and here it remains unrivalled and
alone; the plaintive melody of the sounds, and smooth
flow of the language, being perfectly adapted to ex-
press that soothing melancholy which this species of
poetry requires. On this account the plaintive scenes
of the Pastor Filio of Guerini have justly gained to that
poem an universal applause; although, unless on this
account alone, it is perhaps inferior to almost every
other poem of the kind which ever appeared. —We
must observe with surprise, that the Italians, who have
fettered every other species of poetry with the severest
shackles of rhyme, have in this species showed an ex-
ample of the most unrestrained freedom; the happy
effects of which ought to have taught all Europe the
powerful charms attending it: yet with amazement we
perceive, that scarce an attempt to imitate them has
been made by any poet in Europe except by Milton in
his Lycidas; no dramatic poet, even in Britain, having
ever adopted the unrestrained harmony of numbers to
be met with in this and many other of their best dra-
matic compositions.

Of all the languages which sprung up from the mix-
ture of the Latins with the northern people on the de-
struction of the Roman empire, none approach so
near to the genius of the Latin as the Spanish does.—
For as the Spaniards have been always remarkable
for their military prowess and dignity of mind, their
language is naturally adapted to express ideas of
that kind. Sonorous and solemn, it admits nearly
LANGUAGE.

Language, of as much dignity as the Latin. For conversation, it is the most elegant and courteous language in Europe.

The humane and generous order of chivalry was first invented, and kept its footing longest, in this nation; and although it ran at last into such a ridiculous excess as deservedly made it fall into universal disrepute, yet it left such a strong tincture of romantic heroism upon the minds of all ranks of people, as made them jealous of their glory, and strongly emulous of cultivating that heroic politeness, which they considered as the highest perfection they could attain. Every man disdained to flatter, or to yield up any point of honour which he possessed; at the same time, he rigorously exacted from others all that was his due. —

These circumstances have given rise to a great many terms of respect and courteous condescension, without meanness or flattery, which gave their dialogue a respectful politeness and elegance unknown to any other European language. This is the reason why the characters so finely drawn by Cervantes in Don Quixote are still unknown to all but those who understand the language in which he wrote. Nothing can be more unlike the gentle meekness and humane heroism of the knight, or the native simplicity, warmth of affection, and respectful lucidity of the squire, than the inconsistent follies of the one, or the impertinent forwardness and disrespectful petulance of the other, as they are exhibited in every English translation. Nor is it, as we imagine, possible to represent so much familiarity, united with such becoming condescension in the one, and unfeigned deference in the other, in any other European language, as is necessary to paint these two admirable characters.

Although this language, from the solemn dignity and majestic elegance of its structure, is perhaps better qualified than any other modern one for the sublime strains of epic poetry; yet as the poets of this nation have all along imitated the Italians by a most servile subjection to rhyme, they have never produced one poem of this sort, which in point of poetry or style deserves to be transmitted to posterity. And in other species of poetry but this, or the higher tragedy, it is not naturally fitted to excel. But although the drama and other polite branches of literature were early cultivated in this country, and made considerable progress in it, before the thirst of gain debased their souls, or the desire of universal dominion made them forfeit that liberty which they once so much prized; since they became enslaved by an overbearing pride, and their minds enslaved by superstition, all the polite arts have been neglected: so that, while other European nations have been advancing in knowledge, and improving their language, they have remained in a state of torpid inactivity; and their language has not arrived at that perfection which its nature would admit, or the acute genius of the people might have made us naturally expect.

It will perhaps by some be thought an unpardonable insult, if we do not allow the French the preference of all modern languages in many respects. But so far must we pay a deference to truth, as to be obliged to rank it among the poorest languages in Europe. Every other language has some sounds which can be uttered clearly by the voice; even the Italian, although it wants energy, still possesses distinctness of articulation. But the French is almost incapable of either of these beauties; for in that language the vowels are so much curtailed in the pronunciation, and the words run into one another in such a manner as necessarily to produce an indistinctness which renders it incapable of measure or harmony. From this cause, it is in a great measure incapable of poetic modulation, and rhyme has been obliged to be substituted in its stead; so that this poorest of all contrivances which has ever yet been invented to distinguish poetry from prose, admitted into all the modern languages when ignorance prevailed over Europe, has still kept some footing in the greatest part of these, rather through a deference for established customs than from any necessity. Yet as the French language admits of so little poetic modulation, rhyme is in some measure necessary to it; and therefore this poor deviation from prose has been adopted by it, and dignified with the name of Poetry. But by their blind attachment to this artifice, the French have neglected to improve, so much as they might have done, the small powers for the art of which their language is possessed, and by being long accustomed to this false taste, they have become fond of it to such a ridiculous extent, as to have all their tragedies, no even their comedies, in rhyme. While the poet is obliged to enervate his language, and check the flow of composition, for the sake of linking his lines together, the judicious actor finds more difficulty in destroying the appearance of that measure, and preventing the clinking of the rhymes, than in all the rest of his task. — After this, we will not be surprised to find Voltaire attempt an epic poem in this species of poetry; although the more judicious Ficelion, in his Telamon, had shown to his countrymen the only species of poetry that their language could admit of for any poem which aspired to the dignity of the epic strain. —

Madam Deshouliers, in her Idyllic, has shown the utmost extent of harmony to which their language can attain in smaller poems: indeed in the tenderness of an elegy, or the gaiety of a song, it may succeed; but it is so destitute of force and energy, that it can never be able to reach the pindaric, or even perhaps the lyric strain, as the intellectual efforts even of the harmonious Rousseau, in his translation of the Psalms of David, of this stamp, may fully convince us.

With regard to its powers in other species of composition, the sententious rapidity of Voltaire, and the more nervous dignity of Rousseau, afford us no small presumption, that, in a skilful hand, it might acquire so much force, as to transmit to futurity historical facts in a style not altogether navworthy of the subject. In attempts of pathetic declamation, the superior abilities of the composer may perhaps on some occasions excite a great idea; but this is ever cramped by the genius of the language: and although no nation in Europe can boast of so many orations where this grandeur is attempted; yet perhaps there are few who cannot produce more perfect, although not more laboured, compositions of this kind.

But notwithstanding the French language labours under all these inconveniences; although it can neither equal the dignity or genuine politeness of the Spanish, the nervous boldness of the English, nor the melting softness of the Italian; although it is destitute of poetic:
Language and poetic harmony, and so much crammed in sound as to be absolutely unfit for almost every species of musical composition (F) yet the sprightly genius of that volatile people has been able to surmount all these difficulties, and render it the language most generally esteemed, and most universally spoken, of any in Europe; for this people, naturally gay and loquacious, and fond to excess of those superficial accomplishments which engage the attention of the fair sex, has invented such an infinity of words capable of expressing vague and unmeaning compliment, now dignified by the name of politeness, that, in this strain, one who uses the French can never be at a loss; and as it is easy to converse more, and really say less, in this than in any other language, a man of very moderate talents may distinguish himself much more by using this than any other that has ever yet been invented. On this account, it is peculiarly well adapted to that species of conversation which must ever take place in those general and promiscuous companies, where many persons of both sexes are met together for the purposes of relaxation or amusement; and must of course be naturally admitted into the courts of princes, and assemblies of great personages, who, having fewer equals with whom they can associate, are more under the necessity of conversing with strangers, in whose company the tender stimulus of friendship does not so naturally expand the heart to mutual trust or unrestrained confidence. In these circumstances, as the heart remains disengaged, conversation must necessarily flag; and mankind in this situation will gladly adopt that language in which they can converse most easily without being deeply interested. On these accounts the French now is, and probably will continue to be, reckoned the most polite language in Europe, and therefore the most generally studied and known: nor should we envy them this distinction, if our countrymen would not weaken and enervate their own manly language, by adopting too many of their unmeaning phrases.

The excellence and defects of the English tongue.

The English is perhaps possessed of a greater degree of excellence, blended with a greater number of defects, than any of the languages we have hitherto mentioned. As the people of Great Britain are a bold, daring, and impetuous race of men, subject to strong passions, and from the absolute freedom and independence which reigns amongst all ranks of people throughout this happy isle, little solicitous about conserving these passions; our language takes its strongest characteristic distinction from the genius of the people; and, being bold, daring, and abrupt, is admirably well adapted to express those great emotions which spring up in an intrepid mind at the prospect of interesting events. Peculiarly happy too in the full and open sounds of the vowels, which form the characteristic tone of the language, and in the strong use of the aspirate H in almost all those words which are used as exclamations, or marks of strong emotions upon interesting occasions, that particular class of words called interjections have, in our language, more of that fulness and unrestrained freedom of tones, in which their chief power consists, and are pushed forth from the inmost recesses of the soul in a more forcible and unrestrained manner, than in any other language whatever. Hence it is more peculiarly adapted for the great and interesting scenes of the drama than any language that has yet appeared on the globe. Nor has any other nation ever arrived at that perfection which the English may justly claim in that respect; for however faulty our dramatic compositions may be in some of the critical niceties which relate to this art, in nervous force of diction, and in the natural expression of those great emotions which constitute its soul and energy, we claim, without dispute, an unrivaled superiority. Our language too, from the great intercourse that we have had with almost all the nations of the globe by means of our extensive commerce, and from the eminent degree of perfection which we have attained in all the arts and sciences, has acquired a copiousness beyond what any other modern language can lay claim to; and even the most partial favours of the Greek language are forced to acknowledge, that in this respect, it must give place to the English. Nor is it less happy in that facility of construction which renders it more peculiarly adapted to the genius of a free people, than any other form of language. Of an idiom purely analogous, it has deviated less from the genius of that idiom, and possesses more of the characteristic advantages attending it, than any other language that now exists: for, while others, perhaps by their more intimate connexion with the Romans, have adopted some of their transpositions, and clogged their language with unnecessary fetters, we have preserved ourselves free from the contagion, and still retain the primitive simplicity of our language. Our words

(5) An author of great discernment, and well acquainted with the French language, has lately made the same remark; and as the loftiness of his genius often prevents him from bringing down his illustrations to the level of ordinary comprehension, he has on this and many other occasions been unjustly accused of being fond of paradoxes. But as music never produces its full effect but when the tones it assumes are in unison with the idea that the words naturally excite, it is not necessary follows, that if the words of any language do not admit of that fulness of sound, or that species of tones, which the passion or affection that may be described by the words would naturally require to excite the same idea in the mind of one who was unacquainted with the language, it will be impossible for the music to produce its full effect, as it will be cramped and confined by the sound of the words—and as the French language does not admit of those full and open sounds which are necessary for pathetic expression in music, it must of course be unfit for musical composition. It is true indeed, that in modern times, in which so little attention is bestowed on the simple and sublime charms of pathetic expression, and a fantastical tingling of unmeaning sounds is called music—where the sense of the words is lost in fugues, quavers, and unnecessary repetition of particular syllables—all languages are nearly fitted for it; and among these the French: nor is it less to be doubted, that, in the easy gaiety of a song, this language can properly enough admit of all the musical expression which those species of composition may require.
Language. Verbs are all varied by auxiliaries (except in the instance we have already given, which is so much in our favour); our nouns remain free from the perplexing embarrassment of genders, and our pronouns mark this distinction where necessary with the most perfect accuracy; our articles also are of course freed from this unnatural encumbrance, and our adjectives preserve their natural freedom and independence. From these causes our language follows an order of construction so natural and easy, and the rules of syntax are so few and obvious, as to be within the reach of the most ordinary capacity. So that from this, and the great clearness and distinctness of meaning with which this mode of construction is necessarily accompanied, it is much better adapted for the familiar intercourse of private society, and liable to fewer errors in using it, than any other language yet known; and on this account we may boast, that in no nation of Europe do the lower class of people speak their language with so much accuracy, or have their minds so much enlightened by knowledge, as in Great Britain. What then shall we say of the discernment of those grammarians, who are every day echoing back to one another complaints of the poverty of our language on account of the few and simple rules which it requires in syntax? As justly might we complain of an invention in mechanics, which, by means of one or two simple movements, obvious to an ordinary capacity, little liable to accidents, and easily put in order by the rudest hand, should possess the whole powers of a complex machine, which had required an infinite apparatus of wheels and contrary movements, the knowledge of which could only be acquired, or the various accidents to which it was exposed by using it be repaired, by the powers of the ingenious artist, as complain of this characteristic excellence of our language as a defect.

But if we thus enjoy in an eminent degree the advantages attending an analogous language, we likewise feel in a considerable measure the defects to which it is exposed; as the number of monosyllables with which it always must be embarrassed, notwithstanding the great improvements which have been made in our language since the revival of letters in Europe, prevents in some degree that swelling fulness of sound which so powerfully contributes to harmonious dignity and graceful cadences in literary compositions. And as the genius of the people of Britain has always been more disposed to the rougher arts of command than to the softer insinuations of persuasion, no pains have been taken to correct these natural defects of our language; but, on the contrary, by an inattention, of which we have hardly a parallel in the history of any civilized nation, we meet with many instances, even within this last century, of the harmony of sound being sacrificed to that brevity so desirable in conversation, as many elegant words have been curtained, and harmonious syllables suppressed, to substitute in their stead others, shorter indeed, but more barbarous and uncouth. Nay, little attention have our grammarians bestowed upon these varieties of sounds in our language, that one would be tempted to think, on looking back to its primitive state, that they had on some occasions studiously debased it. Our language, at its first formation, seems to have laboured under a capital defect in point of sound, as such a number of S's enter into the formation of our words, and such a number of letters and combinations of other letters assume a similar sound, as to give a general bias through the whole tenor of our language, which must be exceedingly disagreeable to every unprejudiced ear. We would therefore have naturally expected, that at the revival of letters, when our forefathers became acquainted with the harmonious languages of Greece and Rome, they would have acquired a more correct taste, and endeavoured, if possible, to diminish the prevalence of this disgusting sound. But so far have they been from thinking of this, that they have multiplied this letter exceedingly. The plurals of almost all our nouns were originally formed by adding the harmonious syllable en to the singular, which has given place to the letter s; and instead of houses formerly, we now say houses. In like manner, many of the variations of our verbs were formed by the syllable eth, which we have likewise changed into the same disagreeable letter; so that, instead of loveth, moveth, writeth, walketh, &c. we have changed them into the more modish forms of loves, moves, writes, walks, &c. Our very auxiliary verbs have suffered the same change; and instead of hast and dost, we now make use of has and does. From these causes, notwithstanding the great improvements which have been made in language, within these few centuries, in other respects; yet, with regard to the pleasingness of sound alone, it was perhaps much more perfect in the days of Chaucer than at present; and although custom may have rendered these sounds so familiar to our ear, as not to affect us much; yet to an unprejudiced person, unacquainted with our language, we have not the smallest doubt but the language of Bacon or Sidney would appear more harmonious than that of Robertson or Hume. This is indeed the fundamental defect of our language, and loudly calls for reform.

But notwithstanding this great and radical defect with regard to pleasingness of sounds, which must be so strongly perceived by every one who is unacquainted with the meaning of our words; yet to those who understand the language, the exceeding copiousness which it allows in the choice of words proper for the occasion, and the nervous force with the perspicuity and graceful elegance the emphasis bestows upon it, make this defect be totally overlooked; and we could produce such numerous works of prose, which excel in almost every different style of composition, as would be tiresome to enumerate: every reader of taste and discernment will be able to recollect a sufficient number of writings which excel in point of style, between the graceful and becoming gravity so conspicuous in all the works of the author of the Whole Duty of Man, and the animated and nervous diction of Robertson in his history of Charles the Fifth,—the more flowery style of Shaftesbury, or the Attic simplicity and elegance of Addison. But although we can equal, if not surpass, every modern language in works of prose, it is in its poetical powers our language shines forth with the greatest lustre. The brevity to which we must here necessarily confine ourselves, prevents us from entering into a minute examination of the poetical powers of our own, compared with other languages; otherwise it would be easy to show, that every
Language, every other modern language labours under great restraints in this respect which ours is freed from; that our language admits of a greater variety of poetic movements, and diversity of cadence, than any of the admired languages of antiquity; that it distinguishes with the greatest accuracy between accent and quantity, and is possessed of every other poetic excellence which their languages were capable of: so that we are possessed of all the sources of harmony which they could boast; and, besides all these, have one super-added, which is the cause of great variety and more forcible expression in numbers than all the rest; that is, the unlimited power given by the emphasis over quantity and cadence; by means whereof, a necessary union between sound and sense, numbers and meaning, in versification, unknown to the ancients, has been brought about, which gives our language in this respect a superiority over all those justly admired languages. But as we cannot here pursue further this subject, we shall only observe, that these great and distinguishing excellencies far more than counterbalance the inconveniences that we have already mentioned; and although, in mere pleasantness of sounds, or harmonious flow of syllables, our language may be inferior to the Greek, the Latin, Italian, and Spanish; yet in point of manly dignity, graceful variety, intuitive distinctness, nervous energy of expression, unconstrained freedom and harmony of poetic numbers, it will yield the palm to none. Our immortal Milton, slowly rising in graceful majesty, stands as equal, if not superior, in these respects, to any poet, in any other language that ever yet existed; while Thomson, with more humble aim, in melody more smooth and flowing, softens the soul to harmony and peace: the plaintive moan of Hammond calls forth the tender tear and sympathetic sigh; while Gray's more soothing melancholy fixes the sober mind to silent contemplation: more tender still than these, the amiable Shesstone comes; and from his Doric reed, still free from courtly affectation, flows a strain so pure, so simple, and of such tender harmony, as even Arcadian shepherds would be proud to own. But far before the rest, the daring Shakespeare steps forth conspicuous, clothed in native dignity; and pressing forward with unremitting ardour, boldly lays claim to both dramatic crowns held out to him by Thalia and Melpomene: his rivals, far behind, look up, and envy him for these unifying glories; and the astonished nations round, with distant awe, behold and tremble at his daring flight. —Thus the language, equally obedient to all, bends with ease under their hands, whatever form they would have it assume; and, like the yielding wax, readily receives, and faithfully transmits to posterity, those impressions which they have stamped upon it.

Such are the principal outlines of the language of Great Britain, such are its beauties, and such its most capital defects; a language more peculiarly circumstanced than any that has ever yet appeared. —It is the language of a great and powerful nation, whose fleets surround the globe, and whose merchants are in every port: a people admired or revered by all the world: and yet it is less known in every foreign country than many of the other languages in Europe. In it are written more perfect treatises on every art and science than are to be found in any other language; yet it is less sought after or esteemed by the literati in any part of the globe than almost any of these. Its superior powers for every purpose of language are sufficiently obvious from the models of perfection in almost every particular which can be produced in it: yet it is neglected, despised, and vilified by the people who use it; and many of those authors who owe almost the whole of their fame to the excellence of the language in which they wrote, look upon that very language with the highest contempt. Neglected and despised, it has been trodden under foot as a thing altogether unworthy of cultivation or attention. Yet in spite of all these inconveniences, in spite of the many wounds it has thus received, it still holds up its head, and preserves evident marks of thatloominess and vigour which are its characteristic distinction. Like a healthy oak planted in a rich and fertile soil, it has sprung up with vigour: and although neglected, and suffered to be overrun with weeds; although exposed to every blast, and unprotected from every violence: it still bears reared all its attainments, and shoots up with a robust healthiness and wild luxuriance of growth. Should this plant, so sound and vigorous, be now cleared from these weeds with which it has been so much encumbered; should every obstacle which now buries it under thick shades, and hides it from the view of every passenger, be cleared away; should the soil be cultivated with care, and a strong fence be placed around it, to prevent the idle or the wicked from breaking or disturbing its branches; who can tell with what additional vigour it would flourish, or what amazing magnitude and perfection it might at last attain! —How would the astonished world behold, with reverential awe, the majestic gracefulness of that object which they so lately despised!

Beauty of Language considered in regard to Composition. The beauties of language may be divided into three classes: 1. Those which arise from sound; 2. Those which respect significance; 3. Those derived from a resemblance between sound and signification.

I. With respect to sound. In a cursory view, you would imagine, that the agreeableness or disagreeableness of a word with respect to sound, should depend only upon the agreeableness or disagreeableness of its component syllables: which is true in part, but not entirely: for we must also take under consideration the effect of syllables in succession. In the first place, Syllables in immediate succession, pronounced each of them with the same, or nearly the same, aperture of the mouth, produce a succession of weak and feeble sounds; witness the French words dit il, pathetique: on the other hand, a syllable of the greatest aperture succeeding one of the smallest, or the contrary, makes a succession which, because of its remarkable disagreeableness, is distinguished by a proper name, viz. hiatus. The most agreeable succession is, where the cavity is increased and diminished alternately, within moderate limits: examples, Alternation, longovity, pusilanimous. Secondly, words consisting wholly of syllables pronounced slow, or of syllables pronounced quick, commonly called long and short syllables, have little melody in them; witness the words petiton, fruiterer, dissiness; on the other hand, the intermixture of long and short syllables is remarkably agreeable;
LANGUAGE.

To proceed to the music of periods. As the arrangement of words in succession, so as to afford the greatest pleasure to the ear, depends on principles remote from common view, it will be necessary to premise some general observations upon the appearance that objects make when placed in an increasing or decreasing series; which appearance will vary according to the prevalence of resemblance or of contrast. Where the objects vary by small differences so as to have a mutual resemblance, we in ascending conceive the second object of no greater size than the first, the third of no greater size than the second, and so of the rest; which diminishes in appearance the size of every object except the first: but when beginning at the greatest object, we proceed gradually to the least, resemblance makes us imagine the second as great as the first, and the third as great as the second; which in appearance magnifies every object except the first. On the other hand, in a series varying by large differences, where contrast prevails, the effects are directly opposite: a great object succeeding a small one of the same kind, appears greater than usual; and a little object succeeding one that is great, appears less than usual.

Hence a remarkable pleasure in viewing a series ascending by large differences; directly opposite to what we feel when the differences are small. The least object of a series ascending by large differences has the same effect upon the mind as if it stood single without making a part of the series; but the second object, by means of contrast, appears greater than when viewed singly and apart; and the effect is perceived in ascending progressively, till we arrive at the last object. The opposite effect is produced in descending; for in this direction, every object, except the first, appears less than when viewed separately and independent of the series. We may then assume as a maxim, which will hold in the composition of language as well as of other subjects, That a strong impulse succeeding a weak, makes a double impression on the mind; and that a weak impulse succeeding a strong, makes scarce any impression.

After establishing this maxim, we can be at no loss about its application to the subject in hand. The following rule is laid down by Diomedes: "In verbis observandum est, ne a majoribus ad minora descendat oratio; melius enim dicitur, Vir est optimus, quam, Vir optimus est." This rule is also applicable to entire members of a period, which, according to our author's expression, ought not, more than single words, to proceed from the greater to the less, but from the less to the greater. In arranging the members of a period, no writer equals Cicero: The following examples are too beautiful to be altered over by a reference.

Quicum quies fuerat,
Quicum me soris consuetudine majorum,
Quicum me deorum hominumque judicium conjuxerat.

Again:

Habet honorem quem petimus,
Habet spem quam propositum nobis habemus,
Vol. XI. Part II.

Again:

Habet existimationem, multo sude, labore, viget.

Quorum crudelitas nostro sanguine non potest expleri.

De Oratore, lib. i. § 52.

This order of words or members gradually increasing in length, may, so far as concerns the pleasure of sound, be denominated a climax in sound.

With respect to the music of periods as united in a discourse, this depends chiefly on variety. Hence a rule for arranging the members of different periods with relation to each other: That to avoid a tedious uniformity of sound and cadence, the arrangement, the cadence, and the length of the members, ought to be diversified as much as possible: and if the members of different periods be sufficiently diversified, the periods themselves will be equally so.

II. With respect to signification. The beauties of language with respect to signifies, may not improperly be distinguished into two kinds: first, the beauties that arise from a right choice of words or materials for constructing the period; and next, the beauties that arise from a due arrangement of these words or materials.

1. Communication of thought being the chief end of language, it is a rule, That perspicuity ought not to be sacrificed to any other beauty whatever. Nothing, therefore, in language ought more to be studied, than to prevent all obscurity in the expression; for to have no meaning, is but one degree worse than to have a meaning that is not understood. We shall here give a few examples where the obscurity arises from a wrong choice of words.

Livy, speaking of a rout after a battle, "Multique in ruina maiorum fuga oppressi obrucales," This author is frequently obscure by expressing but part of his thought, leaving it to be completed by his reader. His description of the sea fight, lib. 25. cap. 30. is extremely perplexed.

Unde tibi reidium certo subtemine Parem Rupere.

Qui persepe cava testudine flavit amorem,
Non elaboratum ad pedem.

Me fabuloae Vultum in Appulo,
Altricias extra limen Apuliam,
Lude, fatigatamque somno,
Fronde nova pauerum palumbes Texere.

Pars rivus aque, silvaque jugerum
Pavocorum, et segetis certa fides men,
Fulgentem imperio fertilis Africe
Puliti sorte beatar.

Cum fas atque nefas exiguo fine libidinum
Discernunt avidi.

Ac spem fronte serenat.

The rule next in order is, That the language ought
The field look'd up, and knew
His mounted scale aloft; nor more, but fled
Murm'ring, and with him fled the shades of night.
Paradise Lost, book iv. at the end.

There is no natural connection between a person's flying or retiring, and the succession of daylight to darkness; and therefore to connect artificially the terms that signify these things cannot have a sweet effect.

Two members of a thought connected by their relation to the same action, will naturally be expressed by two members of the period governed by the same verb; in which case these members, in order to improve their connection, ought to be constructed in the same manner. This beauty is so common among good writers as to have been little attended to; but the neglect of it is remarkably disagreeable: for example, "He did not mention Leonora, nor that her father was dead." Better thus: "He did not mention Leonora, nor her father's death."

Where two ideas are so connected as to require but a copulative, it is pleasant to find a connexion in the words that express their ideas, were it even so slight as where both begin with the same letter. Thus,
"The peacock, in all his pride, does not display half the colour that appears in the garments of a British lady, when she is either dressed for a ball or a birthday." Spect.
"Had not my dog of a steward run away as he did, without making up his accounts, I had still been immersed in sin and sea-coal." Ib.

My life's companion, and my bosom friend,
One faith, one name, one fate shall both attend.

Dryden, Translation of Ænecid.

Next, as to examples of disjunction and opposition in the parts of the thought, imitated in the expression; an imitation that is distinguished by the name of antithesis.

Speaking of Coriolanus soliciting the people to be made consal:

With a proud heart he wore his humble weeds.

Coriolanus.

"Had you rather Caesar were living, and die all slaves, than that Caesar were dead, to live all free men?"

Julius Caesar.

He hath cool'd my friends and heated mine enemies.

Shakespeare.

An artificial connection among the words, is undoubtedly a beauty when it represents any peculiar connection among the constituent parts of the thought; but where there is no such connection, it is a positive deformity, because it makes a discordance between the thought and expression. For the same reason, we ought also to avoid every artificial opposition of words where there is none in the thought. This last, termed verbal antithesis, is studied by low writers, because of a certain degree of liveliness in it. They do not consider how incongruous it is, in a grave composition, to cheat the reader, and to make him expect a contrast in the thought, which upon examination is not found there.

Post acer Mnesheus adducit arcu,
Alta petens, pariterque oculos telumque tendit.

But to justify this artificial connexion among the words, the ideas they express ought to be intimately connected; for otherwise that concordance which is required between the sense and the expression will be impaired. In that view, the following passage from Tacitus is exceptionable; where words that signify ideas very little connected, are however forced into an artificial union. "Germania omnis à Gallis, Rheni et Danubio fluminibus; à Sarmatis Daïisque, mutuo mutu aut montibus separatur."

Upon the same account, the following passage seems equally exceptionable.
A fault directly opposite to the last mentioned, is to conjoin artificially words that express ideas opposed to each other. This is a fault too gross to be in common practice; and yet writers are guilty of it in some degree, when they conjoin by a copulative things transacted at different periods of time. Hence a want of neatness in the following expression: "The nobility too, whom the king had no means of retaining by suitable offices and preferments, had been seized with the general discontent, and unwarily threw themselves into the scale which began already too much to preponderate." Hume. In periods of this kind, it appears more next to express the past time by the participle passive, thus: "The nobility having been seized with the general discontent, unwarily threw themselves," &c. or, "The nobility, who had been seized, &c. unwarily threw themselves," &c.

It is unpleasant to find even a negative and affirmative proposition connected by a copulative:

If it appear not plain, and prove untrue,
Deadly divorce step between me and you.

Shakespeare.

In mirth and drollery it may have a good effect to connect verbally things that are opposite to each other in the thought. Example: Henry IV. of France introducing the maréchal Biron to some of his friends, "Here gentlemen (says he) is the maréchal Biron, whom I freely present both to my friends and enemies."

This rule of studying uniformly between the thought and expression may be extended to the construction of sentences or periods. A sentence or period ought to express one entire thought or mental proposition; and different thoughts ought to be separated in the expression by placing them in different sentences or periods. It is therefore offending against neatness, to crowd into one period entire thoughts requiring more than one; which is joining in language things that are separated in reality. Of errors against this rule take the following examples:

"Behold, thou art fair, my beloved, yea pleasant: also our bed is green."

Burnet, in the history of his own times, giving Lord Sunderland’s character, says: "His own notions were always good; but he was a man of great experience."

"I have seen a woman’s face break out in heat, as she has been talking against a great lord, whom she had never seen in her life; and indeed never knew a party-woman that kept her beauty for a twelvemonth."

Spect.

Lord Bolingbroke, speaking of Strada: "I single him out among the moderns, because he had the foolish presumption to censure Tacitus, and to write history himself; and your lordship will forgive this short excursion in honour of a favourite writer."

To crowd into a single member of a period different subjects, is still worse than to crowd them into one period.

Trojan genitore Adamasto
Paupere (manissecutque utinam fortuna!) profectus.

From conjunctions and disjunctions in general, we proceed to comparisons, which make one species of language, beginning with similes. And here also, the intimate connection that words have with their meaning requires, in describing two resembling objects, a resemblance in the two members of the period ought to be studied. To begin with examples of resemblances expressed in words that have no resemblance.

I have observed of late, the style of some great ministers very much to exceed that of any other productions." Swift. This, instead of studying the resemblance of words in a period that expresses a comparison, is going out of one’s road to avoid it. Instead of productions, which resemble not ministers great nor small, the proper word is writers or authors.

"I cannot but fancy, however, that this imitation, which passes so currently with other judgments must at some time or other have stuck a little with your lordship.” Shaftesb. Better thus: "I cannot but fancy, however, that this imitation, which passes so currently with others, must at some time or other have stuck a little with your lordship.”

"A glutton or mere sensualist is as ridiculous as the other two characters.” Id.

"They wisely prefer the generous efforts of good will and affection, to the reluctant compliance of such as obey by force.” Bolingb.

It is a still greater deviation from congruity, to affect not only variety in the words, but also in the construction.

Hume speaking of Shakespeare: "There may remain a suspicion that we overrate the greatness of his genius, in the same manner as bodies appear more gigantic on account of their being disproportioned and misshapen.” This is studying variety in a period where the beauty lies in uniformity. Better thus: "There may remain a suspicion that we overrate the greatness of his genius, in the same manner as we overrate the greatness of bodies that are disproportioned and misshapen."

Next of comparison where things are opposed to each other. And here it must be obvious, that if resemblance ought to be studied in the words which express two resembling objects, there is equal reason for studying opposition in the words which express contrasted objects. This rule will be best illustrated by examples of deviations from it.

"A friend exaggerates a man’s virtues; an enemy inflames his crimes.” Spect. Here the opposition in the thought is neglected in the words; which at first view seem to import, that the friend and enemy are employed in different matters, without any relation to each other, whether of resemblance or of opposition. And therefore the contrast or opposition will be better marked by expressing the thought as follows: "A friend exaggerates a man’s virtues, an enemy his crimes."

"The wise man is happy when he gains his own approbation; the fool when he recommends himself to the applause of those about him.” Ib. Better: "The wise man is happy when he gains his own approbation, the fool when he gains that of others."

We proceed to a rule of a different kind. During the course of a period, the scene ought to be continued without variation: the changing from person to person, from
In this view Longinus justly compares copulative in a period to strait tying, which in a race obstructs the freedom of motion.

It follows, that a plurality of copulative in the same period ought to be avoided; for if the laying aside copulative give force and liveliness, a redundancy of them must render the period languid. The following instance may be appealed to, though there are but two copulative:

"Upon looking over the letters of my female correspondents, I find several from women complaining of jealous husbands; and at the same time protesting their own innocence, and desiring my advice upon this occasion." _Spect._

Where the words are intended to express the coldness of the speaker, there indeed the redundancy of copulative is a beauty:

"Dining one day at an alderman's in the city, Peter observed him expatiating after the manner of his brethren in the praises of his surliouk of beef. "Beef (said the sage magistrate) is the king of meat: beef comprehends in it the quintessence of partridge, and quail, and venison, and pheasant; and plum pudding, and custard." _Tale of a Tub_, § 4. And the author shows great delicacy of taste by varying the expression in the mouth of Peter, who is represented more animated: "Bread (says he), dear brothers, is the staff of life; in which bread is contained, inclusive, the quintessence of beef, mutton, veal, venison, partridge, plum pudding, and custard."

Another case must also be excepted. Copulative have a good effect where the intention is to give an impression of a great multitude consisting of many divisions, for example: 'The army was composed of Greeks, and Carians, and Lycians, and Pamphylians, and Phrygians.' The reason is, that a leisurely survey, which is expressed by the copulative, makes the parts appear more numerous than they would do by a hasty survey: in the latter case, the army appears in one group; in the former, we take as it were an accurate survey of each nation, and of each division.

2. To pave the way for the rules of arrangement, it will here be necessary to explain the difference between a natural style and that where transposition or inversion prevails. In a natural style, relative words are by juxtaposition connected with those to which they relate, going before or after, according to the peculiar genius of the language. Again, a circumstance connected by a preposition, follows naturally the word with which it is connected. But this arrangement may be varied, when a different order is more beautiful: a circumstance may be placed before the word with which it is connected by a preposition; and may be interjected even between a relative word and that to which it relates. When such liberties are frequently taken, the style becomes inverted or transposed.

But as the liberty of inversion is a capital point in the present subject, it will be necessary to examine it more narrowly, and in particular to trace the several degrees in which an inverted style recodes more and more from that which is natural. And first, as to the placing

_Language_. from subject to subject, or from person to person, within the bounds of a single period, distracts the mind, and affords no time for a solid impression.

Hook, in his Roman history, speaking of Eumenes, who had been beat to the ground with a stone, says, "After a short time he came to himself; and the next day they put him on board his ship, which conveyed him first to Corinth, and thence to the island of Aegina."

The following period is unpleasant, even by a very slight deviation from the rule: "That sort of instruction which is acquired by inculcating an important moral truth," &c. This expression includes two persons, one acquiring, and one inculcating; and the scene is changed without necessity. To avoid this blemish, the thought may be expressed thus: "That sort of instruction which is afforded by inculcating," &c.

The bad effect of such a change of person is remarkable in the following passage: "The Britons, daily harassed by cruel inroads from the Picts, were forced to call in the Saxons for their defence, who consequently reduced the greatest part of the island to their own power, drove the Britons into the most remote and mountainous parts, and the rest of the country, in customs, religion, and language, became wholly Saxon." _Swift_.

The following passage has a change from subject to person: "This prostitution of praise is not only a deceit upon the gross of mankind, who take their notion of characters from the learned; but also the better sort must by this means lose some part at least of that desire of fame which is the incentive to generous actions, when they find it promiscuously bestowed on the meritorious and undeserving." _Guardian_, No. 4.

The present head, which relates to the choice of materials, shall be closed with a rule concerning the use of copulative. Longinus observes, that it animates a period to drop the copulative; and he gives the following example from Xenophon: "Closing their shields together, they were pushed, they fought, they slew, they were slain." The reason may be what follows. A continued sound, if not loud, tends to lay us asleep: an interrupted sound rouses and animates by its repeated impulses: thus feet composed of syllables, being pronounced with a sensible interval between each, make more lively impressions than can be made by a continued sound. A period of which the members are connected by copulative, produceth an effect upon the mind approaching to that of a continued sound; and therefore the suppressing copulative must animate a description. It produces a different effect akin to that mentioned: the members of a period connected by proper copulative, glide smoothly and gently along; and are a proof of sedateness and leisure in the speaker: on the other hand, one in the hurry of passion, neglecting copulative and other particles, expresses the principal image only; and for that reason, hurry or quick action is best expressed without copulative:

_Veni, vidi, vici._

_Ite:_

_Ferte citio flavam, date vela, impellite remos._

_Eneid_, iv. 593.
Language.

In mystic dance, not without song, resound His praise.

Where the word first introduced imports a relation, the disjunction will be found more violent:

Of man's first disobedience, and the fruit Of that forbidden tree, whose mortal taste Brought death into the world, and all our wo, With loss of Eden, till one greater Man Restore us, and regain the blissful seat, Sing heav'nly muse.

Upon the firm opaque globe Of this round world, whose first convex divides The luminous inferior orbs enclos'd From chaos and th' inroad of darkness old, Satan alighted walks.

On a sudden open fly, With impetuous recoil and jarring sound, Th' infernal doors.

Wherein remain'd, For what could else? to our almighty foe Clear victory, to our part loss and rout.

Language would have no great power, were it confined to the natural order of ideas: By inversion a thousand beauties may be compassed, which must be relinquished in a natural arrangement.

Rules. 1. In the arrangement of a period, as well as in a right choice of words, the first and great object being perspicuity, the rule above laid down, that perspicuity ought not to be sacrificed to any other beauty, holds equally in both. Ambiguities occasioned by a wrong arrangement are of two sorts: the one where the arrangement leads to a wrong sense, and the other where the sense is less doubtful. The first, being the more culpable, shall take the lead, beginning with examples of words put in a wrong place.

"How much the imagination of such a presence must exalt a genius, we may observe merely from the influence which an ordinary presence has over men." Shaftesb. The arrangement leads to a wrong sense: The adverb merely seems by its position to affect the preceding word; whereas it is intended to affect the following words, an ordinary presence; and therefore the arrangement ought to be thus: "How much the imagination of such a presence must exalt a genius, we may observe from the influence which an ordinary presence merely has over men." [Or better], "which even an ordinary presence has over men."

"Sixtus the Fourth was, if I mistake not, a great collector of books at least." Boling. The expression here leads evidently to a wrong sense: the adverb at least, ought not to be connected with the substantive books, but with collector, thus: "Sixtus the Fourth was a great collector at least, of books."

Speaking of Louis XIV. "If he was not the greatest king, he was the best actor of majesty at least that ever filled a throne." Id. Better thus: "If he was not the greatest king; he was at least the best actor of majesty," &c. This arrangement removes the wrong sense occasioned by the juxtaposition of majesty and at least.

The
The following examples are of a wrong arrangement of members.

"I have confined myself to those methods for the advancement of piety, which are in the power of a prince limited like ours by a strict execution of the laws." Swift. The structure of this period leads to a meaning which is not the author's, viz., power limited by a strict execution of the laws. That wrong sense is removed by the following arrangement: "I have confined myself to those methods for the advancement of piety, which, by a strict execution of the laws, are in the power of a prince limited like ours."

"This morning, when one of Lady Lizard's daughters was looking over some hoods and ribbands brought by her tirewoman, with great care and diligence, I employed no less in examining the box which contained them." Guardian. The wrong sense occasioned by this arrangement, may be easily prevented by varying it thus: "This morning, when, with great care and diligence, one of Lady Lizard's daughters was looking over some hoods and ribbands," &c.

"A great stone that I happened to find after a long search by the sea shore, served me for an anchor." Swift. One would think that the search was confined to the sea shore; but as the meaning is, that the great stone was found by the sea shore, the period ought to be arranged thus: "A great stone that, after a long search, I happened to find by the sea shore, served me for an anchor."

Next of a wrong arrangement where the sense is left doubtful; beginning, as in the former sort, with examples of a wrong arrangement of words in a member.

"These forms of conversation by degrees multiplied and grew troublesome." Spec. Here it is left doubtful whether the modification by degrees relates to the preceding member or to what follows: it should be, "These forms of conversation multiplied by degrees."

"Nor does this false modesty expose us only to such actions as are indiscreet, but very often to such as are highly criminal." Spec. The ambiguity is removed by the following arrangement: "Nor does this false modesty expose us to such actions only as are indiscreet," &c.

"The empire of Blefuscu is an island situated to the north-east side of Lilliput, from whence it is parted only by a channel of 800 yards wide." Swift. The ambiguity may be removed thus: "from whence it is parted by a channel of 800 yards wide only."

In the following examples the sense is left doubtful by wrong arrangement of members.

The minister who grows less by his elevation, like a little statue placed on a mighty pedestal, will always have his jealousy strong about him." Bolingbroke. Here, so far as can be gathered from the arrangement, it is doubtful, whether the object introduced by way of simile relates to what goes before or to what follows. The ambiguity is removed by the following arrangement: "The minister who, like a little statue placed on a mighty pedestal, grows less by his elevation, will always," &c.

Speaking of the superstitious practice of locking up the room where a person of distinction dies: "The knight, seeing his habitation reduced to so small a compass, and himself in a manner shut out of his own house, upon the death of his mother, ordered all the apartments to be flung open, and exercised by his chaplain." Spect. Better thus: "The knight, seeing his habitation reduced to so small a compass, and himself in a manner shut out of his own house, ordered, upon the death of his mother, all the apartments to be flung open."

Speaking of some indecencies in conversation: "As it is impossible for such an irrational way of conversation to last long among a people that make any profession of religion, or show of modesty, if the country gentlemen get into it, they will certainly be left in the lurch." Ib. The ambiguity vanishes in the following arrangement: "the country gentlemen, if they get into it, will certainly be left in the lurch.

"And since it is necessary that there should be a perpetual intercourse of buying and selling, and dealing upon credit, where fraud is permitted or connived at, or hath no law to punish it, the honest dealer is always undone, and the knave gets the advantage." Swift. Better thus: "And since it is necessary that there should be a perpetual intercourse of buying and selling, and dealing upon credit, the honest dealer, where fraud is permitted or connived at, or hath no law to punish it, is always undone, and the knave gets the advantage."

From these examples, the following observation will occur; that a circumstance ought never to be placed between two capital members of a period; for by such situation it must always be doubtful, so far as we gather from the arrangement, to which of the two members it belongs: where it is interjected, as it ought to be, between parts of the member to which it belongs, the ambiguity is removed, and the capital members are kept distinct, which is a great beauty in composition. In general, to preserve members distinct that signify things distinguished in the thought, the best method is, to place first in the consequent member, some word that cannot connect with what precedes it.

If it shall be thought, that the objections here are too scrupulous, and that the defect of perspicuity is easily supplied by accurate punctuation; the answer is, That punctuation may remove an ambiguity, but will never produce that peculiar beauty which is perceived when the sense comes out clearly and distinctly by means of a happy arrangement. Such influence has this beauty, that, by a natural transition of perception, it is communicated to the very sound of the words, so as in appearance to improve the music of the period. But as this curious subject comes in more properly elsewhere, it is sufficient at present to appeal to experience, that a period, so arranged as to bring out the sense clear, seems always more musical than where the sense is left in any degree doubtful.

The next rule is, That words expressing things connected in the thought, ought to be placed as near together as possible. This rule is derived immediately from human nature, prone in every instance to place together things in any manner connected; where things are arranged according to their connexions, we have a sense of order; otherwise we have a sense of
from which we can conclude that things are placed in the order in which we naturally place them, and that the things signify the order in which we would place them. The effect of a violent separation of words or members thus intimately connected, will appear from the following examples.

For the English are naturally fanciful, and very often disposed, by that glibness and melancholy of temper which is so frequent in our nation, to many wild notions and visions, to which others are not so liable. Spect. Here the verb or assertion is, by a pretty long circumstance, violently separated from the subject to which it refers: this makes a harsh arrangement; the less excusable that the fault is easily prevented by placing the circumstance before the verb, after the following manner: "For the English are naturally fanciful, and by that glibness and melancholy of temper which is so frequent in our nation, are often disposed to many wild notions, &c."

From whence we may date likewise the rivalship of the house of France, for we may reckon that of Valois and that of Bourbon as one upon this occasion, and the house of Austria, that continues at this day, and has oft cost so much blood and so much treasure in the course of it." Bolingbroke.

"It cannot be impertinent or ridiculous therefore in such a country, whatever it might be in the abbot of St. Real's, which was Savoy, I think; or, in Peru, under the inca, where Garcia de la Vega says it was lawful for none but the nobility to study—for men of all degrees to instruct themselves in those affairs wherein they may be actors, or judges of those that act, or controllers of those that judge." Ib. ibd.

"If Scipio, who was naturally given to women, for which anecdote we have, if I mistake not, the authority of Polybius, as well as some verses of Nicias preserved by Aulus Gellius, had been educated by Olympias at the court of Philip, it is improbable that he would have restored the beautiful Spaniard." Ib. ibd.

If any one has a curiosity for more specimens of this kind, they will be found without number in the works of the same author.

A pronoun, which saves the naming a person or thing a second time, ought to be placed as near as possible to the name of that person or thing. This is a branch of the foregoing rule; and with the reason there given, another occurs, viz. That if other ideas intervene, it is difficult to recall the person or thing by reference.

If I had leave to print the Latin letters transmitted to me from foreign parts, they would fill a volume, and be a full defence against all that Mr. Patridge, or his accomplices of the Portuguese inquisition, will be ever able to object; who, by the way, are the only enemies my predications have ever met with at home or abroad." Better thus: "and be a full defence against all that can be objected by Mr. Patridge, or his accomplices of the Portuguese inquisition; who, by the way, are, &c.

"There being a round million of creatures in human figure, throughout this kingdom, whose whole subsistence, &c. Swift. Better: "There being, throughout this kingdom, a round million of creatures in human figure, whose whole subsistence, &c.

The following rule depends on the communication of emotions to related objects: a principle in human language, nature that hath an extensive operation; and we find this operation, even where the objects are not otherwise related than by juxtaposition of the words that express them. Hence, to elevate or depress an object, one method is, to join it in the expression with another that is naturally high or low: witness the following speech of Eumenes to the Roman senate.

"Causam venienti sibi Romanam, praeter cupiditatem visendi des hominum, quorum beneficio in ea fortuna esset, supra quam ne optare quidem auderet, etiam ut ceramic monet senatum ut Perseus conatus obviam iret." Livy. To join the Romans with the gods in the same enunciation, is an artful stroke of flattery, because it tacitly puts them on a level.

On the other hand, the degrading or vilifying an object, is done successfully by ranking it with one that is really low: "I hope to have this entertainment in readiness for the next winter; and doubt not but it will please more than the opera or puppet show." Spect.

"Manifold have been the judgments which Heaven from time to time, for the chastisement of a sinful people, has inflicted upon whole nations. For when the degeneracy becomes common, it is but just the punishment should be general. Of this kind, in our own unfortunate country, was that destructive pestilence, whose mortality was so fatal as to sweep away, if Sir William Petty may be believed, five millions of Christian souls, besides women and Jews." Arbuthnot.

"Such also was that dreadful conflagration ensuing in this famous metropolis of London, which consumed, according to the computation of Sir Samuel Moreland, 100,000 houses, not to mention churches and stables." Ib. ibd.

"But on condition it might pass into a law, I would gladly exempt both lawyers of all ages, subalterns and field officers, young heirs, dancing masters, pickpockets, and players." Swift.

Sooner let earth, air, sea, to chaos fall,
Men, monkeys, lap dogs, parrots, perish all.
Rope of the Lock.

Circumstances in a period resemble small stones in a building, employed to fill up vacuities among those of a larger size. In the arrangement of a period, such under parts crowded together make a poor figure; and never are graceful but when interspersed among the capital parts.

"It is likewise urged, that there are, by computation, in this kingdom, above 10,000 persons, whose revenues, added to those of my lords the bishops, would suffice to maintain, &c. Swift. Here two circumstances, viz. by computation, and in this kingdom, are crowded together unnecessarily. They make a better appearance separated in the following manner: "It is likewise urged, that in this kingdom there are by computation, above 10,000 persons, &c.

If there be room for a choice, the sooner a circumstance is introduced, the better; because circumstances are proper for that coolness of mind, with which we begin a period as well as a volume; in the progress the mind warms, and has a greater relish for matters of importance. When a circumstance is placed at the beginning of the period, or near the beginning, the transition from it to the principal subject is agreeable:
it is like ascending, or going upward. On the other hand, to place it late in the period has a bad effect; for after being engaged in the principal subject, one is with reluctance brought down to give attention to a circumstance. Hence evidently the preference of the following arrangement, "Whether in any country a choice altogether unexceptionable has been made, seems doubtful;" before this other, "Whether a choice altogether unexceptionable has in any country been made," &c.

For this reason the following period is exceptionable in point of arrangement. "I have considered formerly, with a good deal of attention, the subject upon which you command me to communicate my thoughts to you." Boling. Which, with a slight alteration, may be improved thus: "I have formerly, with a good deal of attention, considered the subject," &c.

Swift, speaking of a virtuous and learned education: "And although they may be, and too often are, drawn by the temptations of youth, and the opportunities of a large fortune, into some irregularities, when they come forward into the great world; it is ever with reluctance and compunction of mind, because their bias to virtue still continues." Better: "And although, when they come forward into the great world, they may be, and too often," &c.

In arranging a period, it is of importance to determine in what part of it a word makes the greatest figure, whether at the beginning, during the course, or at the close. The breaking silence rouses the attention, and prepares for a deep impression at the beginning: the beginning, however, must yield to the close; which being succeeded by a pause, affords time for a word to make its deepest impression. Hence the following rule. That to give the utmost force to a period, it ought, if possible, to be closed with that word which makes the greatest figure. The opportunity of a pause should not be thrown away upon accessories, but reserved for the principal object, in order that it may make a full impression; which is an additional reason against closing a period without a circumstance. There are, however, periods that admit not such a structure; and in that case the capital word ought, if possible, to be placed in the front, which next to the close is the most advantageous for making an impression. Hence, in directing our discourse to a man of figure, we ought to begin with his name; and one will be sensible of a degradation when this rule is neglected, as it frequently is for the sake of versel. We give the following examples.

Integer vitae, scelestique purus,  
Non eget Mauris jaculis, neque arcu,  
Nec venenatis gravida sagittis,  

Je crains Dieu, cher Abner, et n’ai point d’autre crainte.

In these examples, the name of the person addressed to makes a mean figure, being like a circumstance slip into a corollary. That this criticism is well founded, we need no other proof than Addison’s translation of the last example.

O Abner! I fear my God, and I fear none but him. Guardian, No 117.

O father, what intends thy hand, she cry’d,  
Against thy only son? What fury, O son,  
Possesses thee to bend that mortal dart  
Against thy father’s head?  
Paradise Lost, book ii. l. 727.

Every one must be sensible of a dignity in the invocation at the beginning, which is not attained by that in the middle. It is not meant, however, to censure this passage; on the contrary, it appears beautiful, by distinguishing the respect that is due to a father from that which is due to a son.

The substance of what is said in this and the foregoing section, upon the method of arranging words in a period, so as to make the deepest impression with respect to sound as well as signification, is comprehended in the following observation: That order of words in a period will always be the most agreeable, where, without obscuring the sense, the most important images, the most sonorous words, and the longest members, bring up the rear.

Hitherto of arranging single words, single members, and single circumstances. But the enumeration of many particulars in the same period is often necessary: and the question is, In what order they should be placed? And, first, with respect to the enumerating particulars of equal rank: As there is no cause for preferring any one before the rest, it is indifferent to the mind in what order they be viewed; therefore it is indifferent in what order they be named. As, if a number of objects of the same kind, differing only in size, are to be ranged along a straight line, the most agreeable order to the eye is of an increasing series: in surveying a number of subjects, beginning at the least, and proceeding to greater and greater, the mind swells gradually with the successive objects, and in its progress has a very sensible pleasure. Precisely for the same reason, words expressive of such objects ought to be placed in the same order. The beauty of this figure, which may be termed a chronos en scene, has esteemed Lord Bolingbroke in the first member of the following period: "Let but one great, great, brave, disinterested, active man arise, and he will be received, followed, and almost adored." The following arrangement has sensibly a better effect: "Let but one brave, great, active, disinterested man arise," &c.

Whether the same rule ought to be followed in enumerating men of different ranks, seems doubtful: on the one hand, a number of persons presented to the eye in form of an increasing series, is undoubtedly the most agreeable order; on the other hand, in every list of names, we set the person of the greatest dignity at the top, and descend gradually through his inferiors. Where the purpose is to honour the persons named according to their rank, the latter ought to be followed; but every one who regards himself only, or his reader, will choose the former order. As the sense of order directs the eye to descend from the principal to its greatest accessory, and from the whole to its greatest part, and in the same order through all the parts and accessories, till we arrive at the minutest; the same order ought to be followed in the enumeration of such particulars.

When force and liveliness of expression are demanded, the rule is, to suspend the thought as long as possible,
III. Beauties from a Resemblance between Sound and Signification. There being frequently a strong resemblance of one sound to another, it will not be surprising to find an articulate sound resembling one that is not articulate; thus the sound of a bow string is imitated by the words that express it:

The string let fly,

Twang’d short and sharp, like the shrill swallow’s cry.

_—The string let fly,_

_Odyssey, xxii. 449._

The sound of felling trees in a wood:

Loud sounds the axe, redoubled strokes on strokes,
On all sides round the forest huris her oaks
Headlong. Deep echoing groan the thickets brown,
Then rustling, crackling, cracking, thunder down.

_Iliad, xxiii. 144._

But when loud surges lash the sounding shore,
The hoarse rough verse should like the torrent roar.

_Pope’s Essay on Criticism,_ 369.

Dire Scylla there a scene of horror forms,
And here Charybdis fills the deep with storms:
When the tide rushes from her rumbling caves,
The rough rock roars; tumultuous boil the waves.

_Pope._

No person can be at a loss about the cause of this beauty; it is obviously that of imitation.

That there is any other natural resemblance of sound to signification, must not be taken for granted. There is no resemblance of sound to motion, nor of sound to sentiment. We are, however, apt to be deceived by artful pronunciation: the same passage may be pronounced in many different tones, elevated or humble, sweet or harsh, brisk or melancholy, so as to accord with the thought or sentiment: such concord must be distinguished from that concord between sound and sense which is perceived in some expressions independent of artful pronunciation; the latter is the poet’s work, the former must be attributed to the reader. Another thing contributes still more to the deceit: in language, sound and sense being intimately connected, the properties of the one are readily communicated to the other; for example, the quality of grandeur, of sweetness, or of melancholy, though belonging to the thought solely, is transferred to the words, which by that means resemble in appearance the thought that is expressed by them. That there may be a resemblance of articulate sounds to some that are not articulate, is self-evident; and that in fact there exist such resemblances successfully employed by writers of genius, is clear from the foregoing examples, and from many others that might be given. But we may safely pronounce, that this natural resemblance can be carried no farther; the objects of the different senses differ so widely from each other, as to exclude any resemblance: sound in particular, whether articulate or inarticulate, resembles not in any degree taste, smell, nor motion; and as little can it resemble any internal sentiment, feeling, or emotion. But must we then admit, that nothing but sound can be imitated by sound? Taking imitation in its proper sense, as importing a resemblance between two objects, the proposition must be admitted: and yet in many cases...
sages that are not descriptive of sound, every one must be sensible of a peculiar concord between the sound of the words and their meaning. As there can be no doubt of the fact, what remains is to inquire into its cause.

Resembling causes may produce effects that have no resemblance; and causes that have no resemblance may produce resembling effects. A magnificent building, for example, resembles not in any degree a heroic action; and yet the emotions they produce are concordant, and bear a resemblance to each other. We are still more sensible of this resemblance in a song, when the music is properly adapted to the sentiment; there is no resemblance between the thought and sound; but there is the strongest resemblance between the emotion raised by music tender and pathetic, and that raised by the complaint of an unsuccessful lover. Applying this observation to the present subject, it appears, that, in some instances, the sound even of a single word makes an impression resembling that which is made by the thing it signifies: witness the word running composed of two short syllables; and more remarkably the words rapidity, impetuosity, precipitation. Brutal manners produce in the spectator an emotion not unlike what is produced by a harsh and rough sound; and hence the beauty of the figurative expression, rugged manners. Again, the word little, being pronounced with a very small aperture of the mouth, has a weak and faint sound, which makes an impression resembling that made by a diminutive object. This resemblance of effects is still more remarkable where a number of words are connected in a period: words pronounced in succession make often a strong impression; and when this impression happens to accord with that made by the sense, we are sensible of a complex emotion, peculiarly pleasant; one proceeding from the sentiment, and one from the melody or sound of the words. But the chief pleasure proceeds from having these two concordant emotions combined in perfect harmony, and carried on in the mind to a full close. Except in the single case where sound is described, all the examples given by critics, of sense being imitated in sound, resolve into a resemblance of effects: emotions raised by sound and signification may have a resemblance; but sound itself cannot have a resemblance to any thing but sound.

Proceeding now to particulars, and beginning with those cases where the emotions have the strongest resemblance, we observe, first, That by a number of syllables in succession, an emotion is sometimes raised, extremely similar to that raised by successive motion; which may be evident even to those who are defective in taste, from the following fact, that the term movement in all languages is equally applied to both. In this manner, successive motion, such as walking, running, galloping, can be imitated by a succession of long or short syllables, or by a due mixture of both: for example, slow motion may be justly imitated in a verse where long syllables prevail; especially when aided by a slow pronunciation:

Ili inter se se magna vi branchia tollunt.  
Georg. iv. 174.

On the other hand, swift motion is imitated by a succession of short syllables:

Quadrupedante putrem sonitu quattit ungula cam-

Again:

Radit iter liquidum, celeres neque commovet alas:

Thirdly, A line composed of monosyllables makes an impression by the frequency of its pauses, similar to what is made by laborious interrupted motion:

With many a weary step, and many a groan,
Up the high hill he leaves a huge round stone.

Odyssey, xi. 736.

First march the heavy mules securely slow;
O'er hills, o'er dales, o'er cragge, o'er rocks they go.

Fourthly, The impression made by rough sounds in succession, resembles that made by rough or tumultuous motion: on the other hand, the impression of smooth sounds resembles that of gentle motion. The following is an example of both:

Two craggy rocks projecting to the main,
The roaring winds tempestuous rage restrain;
Within, the waves in softer murmurs glide,
And ships secure without their haulers ride.

Odyssey, iii. 118.

Another example of the latter:

Soft is the strain when Zephyr gently blows,
And the smooth stream in smoother numbers flows.

Essay on Criticism, 366.

Fifthly, Prolonged motion is expressed in an Alexandrine line. The first example shall be of a slow motion prolonged:

A needless Alexandrine ends the song;
That, like a wounded snake, drags its slow length along.

Ib. 335.

The next example is of forcible motion prolonged:

The waves behind impel the waves before,
Wide-rolling, foaming high, and tumbling to the shore.

Ibid, xiii. 1004.

The last shall be of rapid motion prolonged:

Not so when swift Camilla scoursthe plain,
Flies o'er the unbending corn, and skims along the main.

Essay on Criticism, 373.

Again, speaking of a rock torn from the brow of a mountain:

Still gathering force, it smokes, and urg'd again,
Whirls, leaps, and thunders down impetuous to the plain.

Ibid, xiii. 197.

Sixthly, A period consisting mostly of long syllables, that is, of syllables pronounced slow, produces an emotion resembling faintly that which is produced by gravity and solemnity. Hence the beauty of the following verse:

Olli sedato respondet corde Latinus.

It resembles equally an object that is insipid and uninteresting.

Tredet quotidiamur harum formarum.  
Thence.

Seventhly,
Seventhly, A slow succession of ideas is a circumstance that belongs equally to settled melancholy, and to a period composed of polysyllables pronounced slow; and hence, by similarity of emotion, the latter is imitative of the former:

In those deep solitudes, and awful cells,
Where hea'ly pensive Contemplation dwells,
And ever-musing Melancholy reigns.

Pope, Essay to Abelard.

Eighthly, A long syllable made short, or a short syllable made long, raises, by the difficulty of pronouncing contrary to custom, a feeling similar to that of hard labour:

When Ajax strives some rock's vast weight to throw,
The line too labours, and the words move slow.

Essay on Criticism, 370.

Ninthly, Harsh or rough words pronounced with difficulty, excite a feeling similar to that which proceeds from the labour of thought to a dull writer.

Just writes to make his barrenness appear,
And strains from hard-bound brains eight lines a year.

Pope's Epistle to Dr Arbuthnot, l. 181.

We shall close with one example more, which of all makes the finest figure. In the first section mention is made of a climax in sound; and in the second of a climax in sense. It belongs to the present subject to observe, that when these coincide in the same passage, the concordance of sound and sense is delightful: the reader is conscious of pleasure not only from the two climaxes separately, but of an additional pleasure from their concordance, and from finding the sense so justly imitated by the sound. In this respect, no periods are more perfect than those borrowed from Cicero in the first section.

The concord between sense and sound is not less agreeable in what may be termed an antyclimax, where the progress is from great to little; for this has the effect to make diminutive objects appear still more diminutive.

In this article we have mentioned none of the beauties of language but what arise from words, taken in their proper sense. Beauties that depend upon the metaphorical and figurative power of words, are treated under the separate articles of Figures, Personification, Apostrophe, Hyperbole, Metaphor, &c. See also Oratory.

Purity of Language. Both the Greeks and Romans were particularly careful of preserving the purity of their language. It seems amongst the Romans to have been a point which they thought worthy the attention of the state itself; for we find the Cumeans not daring to make use of the Latin language in their public acts without having first obtained leave in form. Tiberius himself would not hazard the word monopolium in the senate without making an excuse for employing a foreign term. Seneca gives it as a certain maxim, that wherever a general false taste in style and expression prevails, it is an infallible sign of corruption of manners in that people: A liberty of introducing obsolete words, or forming new ones, is a mark, he thinks, of an equal licentiousness of the moral kind. Accordingly it is observed, there are scarce more than eight or ten instances of new words to be produced from the most approved Roman writers, in the course of two or three centuries. If this mode of reasoning concerning the morals of the state was introduced and applied in our own country, no nation on the face of the earth could appear more abandoned; for no nation is more fond of adopting new words; though our language is sufficiently copious. This delicacy of Seneca appears to be carried a little too far, and his manner of estimating the morals of the people must be a little fallacious. The Greeks were very remarkable for their discernment of provincialisms, especially the Athenians, whose dialect was inconceivably sweet and elegant.

L A N G U A G E

LANUED, in Heraldry, expresses such animals whose tongue, appearing out of the mouth, is borne of a different colour from the rest of the body.

LANUEDOC, a large and maritime province of France; bounded on the north by Quercy, Bourbon, Auvergne, and Ligeois; on the east by Dauphiny and Provence; on the west by Gascony; and on the south by the Mediterranean sea and Roussillon. It is 225 miles in length, and 100 in breadth where broadest. It forms the departments of what are now called Aude, Gard, Upper Garonne, and Herault. The clergy were more rich and numerous here than in the rest of France, before the Revolution. Lanedoc is divided into the Upper and Lower; and in general it is a very pleasant country, fertile in corn, fruits, and excellent wines; and the inhabitants carry on a considerable trade. There are many curious medicinal plants, with iron mines, quarries of marble, and turquoise stone. There is also a great deal of kelp, and on the heaths are considerable numbers of the kermes oak. The principal rivers are the Rhone, the Loire, the Aude, the Garonne, the Tarn, and the Allier. There are also a great number of mineral springs. Toulouse is the capital town. This province is famous for the royal canal, which runs through it, joining the Mediterranean with the Atlantic ocean. This canal was undertaken in 1666, and finished in 1680; the mathematician who undertook it made a basin 400 yards long, 300 broad, and 7 feet deep, which is always kept full of water, and may be let out by means of a sluice on the side of the Mediterranean, as well as by another on the side of the Atlantic.

LANUET, Hubert, born at Viteaux in Burgundy in 1518, gained great reputation by his learning and virtue in the 16th century. Having read one of Melanchthon's books at Bologna, he conceived so high an esteem for the author, that he went to Wittenberg purposely to visit him; he arrived there in 1549, when he contracted a strict friendship with Melanchthon, and embraced the Protestant religion. In 1555, he was one of the first counsellors of Augustus.
LANIARD (from Lanier, Fr.), a short piece of cord or line fastened to several machines in a ship, and serving to secure them in a particular place, or to manage them more conveniently. Such are the laniards of the gun port, the laniard of the buoy, the laniard of the cat hook, &c.—The principal laniards used in a ship, however, are those employed to extend the shrouds and stays of the masts by their communication with the dead-eyes, so as to form a sort of mechanical power resembling that of a tackle. These laniards are fixed in the dead-eyes as follows: one end of the laniard is thrust through one of the holes of the upper dead-eye, and then knotted, to prevent it from drawing out; the other is then passed through one of the holes in the lower dead-eye, whence, returning upward, it is inserted through the second hole in the upper dead-eye, and next through the second in the lower dead-eye, and finally through the third hole in both dead-eyes. The end of the laniard being then directed upwards from the lowest dead-eye, it is stretched as stiff as possible by the application of tackles; and that the several parts of it may slide with more facility through the holes of the dead-eyes, it is well smeared with hog's lard or tallow, so that the strain is immediately communicated to all the turns at once.

LANIGEROUS, an appellation given to whatever bears wool.

LANISTA, in antiquity, is sometimes used to signify an executioner; but more frequently for a master gladiator, who taught the use of arms, and had always people under him ready to exhibit shows of that kind. For this purpose, they either purchased gladiators, or educated children in that art that had been exposed.

LANIUS, the Shrike, or Butcher bird, a genus of birds belonging to the order of accipitres. See Ornithology Index.

LANNER, or LANNAU. See FALCO, Ornithology Index.

LANSDOWNE, LORD. See GRANVILLE.

LANQUINET, the name of a game at cards, of French origin.

It may be played at by any indiscriminate number of people, though a single pack of cards is used during the deal. The dealer, who possesses an advantage, shuffles the cards, and after they have been cut by another of the party, deals out two cards on his left hand, turning them up, then one for himself, and a fourth that he places on the table for the company, which is called the ruseissance. On this card any, or all the company, the dealer excepted, may put their money, which the dealer is compelled to answer. The dealer continues turning the cards upwards, one by one, till two of a sort come up, that is to say, two aces, two deuces, &c., which, to prevent mistakes, or their being considered as single cards, he places on each side of his own card: and as often as two, three, or the fourth sort of a card come up, he invariably places, as before mentioned, on each side of his own card. The company has a right to take and put money upon any single card, unless the dealer's card should happen to be double, which is often the case, by this card being the same as one of the two hands, which he first dealt out on his left hand: thus he continues dealing till he brings either their cards or...
LAN[549]LAO

Lansquenet or his own. Whilst the dealer’s own card remains undrawn, he wins; and whichever card is turned up first, loses. If he draws out the two cards on his left hand, which are styled the hand-cards, before his own, he is entitled to deal again. This advantage amounts to no more than his being exempted from losing, when he turns up a similar card to his own, immediately after he has turned up one for himself.

Lansquenet is often played without the rejoyance, the dealer giving every one of the party a card to put their money upon. It is also often played by dealing only two cards, one for the company and the other for the dealer.

It should likewise be observed, that a limitation is generally fixed for the sum to be placed upon any card or number of cards, either in gold or silver, beyond which the dealer is not obliged to answer.

LANTANA, or INDIAN SAGE, a genus of plants belonging to the didynamia class; and in the natural method ranking under the 40th order, Persoeta. See BOTANY Index.

LANTERN, or LANTHORN, a device to carry a candle in; being a kind of cover usually made of white iron, with an iron of some transparent matter, as glass, horn, &c. to transmit the light.

Sir George Staunton informs us that some of the Chinese lanterns were entirely made of horn, so very thin and transparent that they were at first taken for glass, to which they prefer it as being cheaper, less liable to accident, and more easily repaired. Those which Sir George had the opportunity of examining, consisted of one uniform piece of horn, the seams being made invisible by an art found out by the Chinese. The horns commonly used are those of sheep or goats, which being bent by immersing them in boiling water, are cut open and flattened, after which they are easily separated into two or three thin plates. To make these lamine or plates join readily, they are exposed to the penetrating heat of steam till they are perfectly soft, and the edges that are to lap over each other are scraped and slanted off, so that the joinings may be no thicker than any other part of the plate.

Such lanterns would be extremely proper for military storehouses; and Rochou of the National Institute was desired to attempt to make them for the marine storehouses of France. While he was thus engaged, it occurred to him that he might supply the urgent necessities of the navy without horn, by filling up the interstices of wire cloth with fine transparent glue. He first tinned the iron wires of the sieve-cloth made use of; but afterwards found it more convenient to give it a coating of oil paint to preserve it from rust. The glue he made use of was procured by boiling the clippings of parchment with the air-bladders and membranes of sea-fish, not from any conviction of their superiority to other articles, but as being the cheapest he could procure. To this he added the juice of garlic and eyder, in such proportions as he found to communicate great tenacity. Into this transparent pure glue he plunged his wire-cloth, which came out with its interstices filled with the compound. The case with which lanterns made of this substance are repaired in case of accident, by a slight coating of glue, is given by the inventor as a great advantage; and, according to him, they were employed as signal lanterns in the expedition to Ireland.

Dark LANTERN, one with only one opening, which may also be closed up when the light is to be entirely hid, or opened when there is occasion for the assistance of the light to discover some object.

Magic LANTERN, an optical machine, whereby little painted images are represented so much magnified, as to be accounted the effect of magic by the ignorant. See DIOPTRICS, Art. X. p. 37.

LANTERN, in Architecture, a little dome raised over the roof of a building to give light, and serve as a crowning to the fabric.

The term lantern is also used for a square cage of carpentry, placed over the ridge of a corridor or gallery, between two rows of shops, to illuminate them, like that of the Royal Exchange, London.

LANTERN, on ship board, a well known machine, of which there are many in a ship, particularly for the purpose of directing the course of other ships in a fleet or convoy; such are the poop and top lanterns, &c.

Feast of Lanterns, in China, is a celebrated feast held on the 15th day of the first month; so called from the infinite number of lanterns hung out of the houses and streets; which, it is said, is no less than two hundred millions. On this day are exposed lanterns of all prices, whereof some are said to cost 2000 crowns. Some of their Grandees retrench somewhat every day out of their table, out of their dress, equipage, &c. to appear the more magnificent in lanterns. They are adorned with gilding, sculpture, painting, japanning, &c. And as to their size, it is extravagant; some being from 25 to 30 feet diameter: they represent balls and chambers, and two or three such machines together would make handsome houses; so that in China they are able to eat, lodge, receive visits, have balls, and act plays in a lantern. To illumine them, they should have bonfires; but as that would be inconvenient, they content themselves with lighting up in them an infinite number of torches or lamps, which at a distance have a beautiful effect. In these they exhibit various kinds of shows, to divert the people. Besides these enormous lanterns, there is a multitude of others smaller, which usually consist of six faces or lights, each about four feet high, and one and a half broad, framed in wood finely gilt and adorned; over these they stretch a fine transparent silk, curiously painted with flowers, trees, and sometimes human figures: the painting is very extraordinary, and the colours extremely bright; and when the torches are lighted, they appear highly beautiful and surprising.

LANTERN FLY. See FULGORA, ENTOMOLOGY Index.

LANUGO, the soft down of plants, like that growing on the fruit of the peach tree. See HAIR.

LAOCOON, in fabulous history, a son of Priam and Hecuba, or according to others of Antenor or of Cypreus. As being priest of Apollo, he was commissioned by the Trojans to offer a bullock to Neptune to render him propitious. During the sacrifice two enormous serpents issued from the sea, and attacked Laocoön's two sons who stood next to the altar. The father immediately attempted to defend his sons; but the serpents falling upon him squeezed him in their tremendous writhings, and he died in the greatest agonies. This
punishment was said to have been inflicted upon him for dissuading the Trojans to bring into the city the fatal wooden horse which the Greeks had consecrated to Minerva, as also for his impious in hurling a javelin against the sides of the horse as it entered within the walls. According to Hyginus, he suffered the above punishment for his marriage against the consent of Apollo, or, according to others, for his polluting the temple, by his commerce with his wife Antiope, before the statue of the god.

LACOON, in the history of the arts, is a celebrated monument of Greek sculpture executed in marble by Agesander, Polydorus, and Athenodorus, the three famous artists of Rhodes. Agesander is supposed to have been the father of the two latter. This remain of antiquity was found at Rome in the ruins of the palace of Titus, in the beginning of the sixteenth century, under the pontificate of Julius II. and afterwards deposited in the Farnese palace. Laocoon, the priest of Apollo and Neptune, is here represented with his two sons, with two hideous serpents clinging round his body, gawing it, and injecting their poison: Virgil has given us the following description of the fact:

---Serpena amplexus uterque
Implicat, et minores murus depascitur artus:
Corripitur, spiriisque ligant ingentibus, et jam
Bis medium amplexi, bis colo squatuea circum
Terge dati, superant capite et cervicibus altis.

This statue exhibits the most astonishing dignity and tranquillity of mind in the midst of the most excruciating torments: Pliny * says of it, that it is, opus omnibus pictorece et statuariorce artis, præferendum.

When Italy was overrun by the French during the late revolution, this wonderful monument of ancient art was removed along with the celebrated Apollo Belvédère, &c. from the Vatican, where they had been seen and admired for 300 years, and placed in the Museum of Arts at Paris. A hero (says the French account of the latter), guided by victory, drew it from the Vatican, and transporting it to the banks of the Seine, has fixed it there for ever.

The Laocoon, Dr Gillys * observes, may be regarded as the triumph of Grecian sculpture; since bodily pain, the grossest and most ungovernable of all our passions, and that pain united with anguish and torture of mind, are yet expressed with such propriety and dignity, as afford lessons of fortitude superior to any taught in the schools of philosophy. The horrible shriek which Virgil's Laocoon emits is a proper circumstance for poetry, which speaks to the fancy by images and ideas borrowed from all the senses, and has a thousand ways of ennobling its object: but the expression of this shriek would have totally disgraced the statue. It is softened, therefore, into a patient sigh, with the eyes turned to heaven in search of relief. The intolerable agony of suffering nature is represented in the lower part, and particularly in the extremities of the body; but the many breast struggles against calamity. The contention is still more plainly perceived in his furrowed forehead; and his languishing paternal eye demands assistance, less for himself than for his miserable children, who look up to him for help.

The groupe of the Laocoon is composed of five pieces of marble, joined together with so much art and neatness, that Pliny thought the whole was of one. The right arm of the father, and two of the arms of the children are wanting. The deficiency is supplied by arms moulded on the groupe in plaster of Paris.

LAODICEA on the Lycus, in Ancient Geography, a town of Phrygia, at first called Diospolis, then Rhosos. It was built by Antiochus son of Stratonice, and called after his consort Laodice. It was long an inconsiderable place; but increased toward the age of Augustus Caesar, after having suffered in a siege from Mithridates. The fertility of the soil, and the good fortune of some of its citizens, raised it to greatness. Hiero who adorned it with many offerings, left the people his heir to more than 2000 talents. After that benefactor followed Zeno the rhetorician; and his son Polemo, as renowned a sophist as ever lived. This person flourished at Smyrna; but was buried here by the Syrian gate, near which were the sepulchres or coffins of his ancestors. Laodicea, though inland, grew more potent than the cities on the coast; and became one of the largest towns in Phrygia. It was often damaged by earthquakes, and restored by its own opulence or by the munificence of the Roman emperors. These resources failed, and the city, it is probable, became early a scene of ruin. About the year 1097 it was possessed by the Turks, and submitted to Ducas general of the emperor Alexius. In 1120 the Turks sacked some of the cities of Phrygia by the Macedon, but were defeated by the emperor John Comnenus, who took Laodicea, and built anew or repaired the walls. About 1161 it was again unfortified. Many of the inhabitants were then killed with their bishop, or carried with their cattle into captivity by the Turks. In 1190 the German emperor, Frederick Barbarossa, going by Laodicea, with his army toward Syria on a crusade, was received so kindly, that he prayed on his knees for the prosperity of the people. About 1196 this region with Cari was dreadfully ravaged by the Turks. The sultan, on the invasion of the Tartars in 1255, gave Laodicea to the Romans; but they were unable to defend it, and it soon returned to the Turks. It is now totally ruined and deserted. Several remains of its ancient grandeur are, however, still to be seen; particularly the ruins of theatres and an amphitheatre. The memory of this place is consecrated in Scripture, being one of the seven churches to which St John in the Apocalypse addresses himself, commended by St Paul.

LAODICEA on the sea, in Ancient Geography, according to Strabo, was a town of Secleucis in Syria, extremely well built, with a commodious harbour. The country about it yielded great quantities of wine. The city took its name from Laodice, mother of Secleucus the founder of it.

LAOMEDON, a king of Troy, whose history is involved in fables. He was son of Ilus king of Troy; and married Strymo, called by some Placia, or Leucippe, by whom he had Podarcis, afterwards known by the name of Priam, and Hesione. He built the walls of Troy, and was assisted by Apollo and Neptune, whom Jupiter had banished from heaven, and condemned to be servient to the will of Laomedon for one year. When the walls were finished, Laomedon refused to reward the labours of the gods; and soon after his territories were laid waste by the sea or Neptune,
in the island. Besides the advantage of a fine situation, it furnishes the best productions in the country; and though Cyprus is in general not very abundant in fruits, Lapithus seems a favoured spot in this respect, and may be called the garden of the island.

LAPIDARY, an artificer who cuts precious stones.

The art of cutting precious stones is of great antiquity. The French have carried this art to a very great perfection, but not in any degree superior to the British.

There are various machines employed in the cutting of precious stones, according to their quality. The diamond, which is extremely hard, is cut on a wheel of soft steel, turned by a mill, with diamond dust tempered with olive oil, which also serves to polish it.

The oriental ruby, sapphire, and topaz, are cut on a copper wheel with diamond dust tempered with olive oil, and are polished on another copper wheel with tripoli and water. The hyacinth, emerald, ametyst, garnet, agates, and other stones not of an equal degree of hardness with the other, are cut on a leaden wheel with small and water, and polished on a tin wheel with tripoli. The turquoise of the old and new rock, girasol, and opal, are cut and polished on a wooden wheel with tripoli also.

The lapidaries of Paris have been a corporation since the year 1290. It is governed by four jurats, who superintend their rights and privileges, visit the master workmen, take care of the masterpiece of workmanship, bind apprentices, and administer the freedom.

Lapidary is also used for a virtuoso skilled in the nature, kinds, &c. of precious stones; or a merchant who deals in them.

Lapidary Style, denotes the style proper for monumental or other inscriptions.

This is a kind of medium between prose and verse; the jejun and the brilliant are here equally to be avoided. Cicero has prescribed the rules of it: Accedat oratio varia, vehemens, plena spiritu. Omnium sententiarum gravitate, omnium verborum ponderibus, est utendum.

The lapidary style, which was lost with the ancient monuments, has been retrieved at the beginning of this age by Count Emanuel Tesoro: it is now used various ways at the beginning of books; and even epistles dedicatory are composed in it, of which we have no example among the ancients.

Lapidescence, any thing which has the faculty of petrifying, or turning bodies to a stony nature. The older naturalists speak of a lapidescence principle, a lapidescence spirit, a lapidescence juice, &c.

Lapis, in general, is used to denote a stone of any kind.
LAPLAND, the most northerly country of Europe, extending from the North Cape in 71° 30' N. Lat. to the White sea under the arctic circle, is inhabited by the same people, though the country is subject to different powers. Norwegian Lapland lies between the northern sea, the river Pais, and the lake Enarak. Swedish Lapland comprehends all the country from the Baltic to the mountains that separate Norway from Sweden. It is divided into six districts, designated mark or territory; and these are distinguished by the names of rivers, such as Aunghnerman-land, Elma, Peta, Lula, Torna, and Kimi. The eastern part, subject to Russia, situated between the lake Enarak and the White sea, is divided into three distinct prefectures; namely that of the sea coast towards the north, called Mournamkoi Leporie; the Terakoi Leporie, upon the coast of the White sea; and the third, or inland, known by the name of Bellamoreskoi Leporio. In Swedish Lapland, which is the most considerable of the three, the provinces or marks are subdivided into smaller districts called biars, consisting each of a certain number of families; among which the land is parcelled out by government, or the prefect of the district appointed by the king of Sweden.

Lapland may be termed a huge congeries of frightful rocks and stupendous mountains; interspersed, however, with many pleasant valleys, watered by an infinite number of rivulets that run into the rivers and lakes, which discharge themselves into the gulf of Bothnia. The names of the principal lakes in Lapland are the Great Ume, the Great Windel, the Oreavan, the Stor-avan, the Great Lula; the lakes of Kartoni, Kali, Torno, Enara, and Kimi. Some of these extend 60 leagues in length, and contain a great number of islands; Stor-avan is said to be 356; and Enara contains an archipelago of islands so large that no Laplander has lived long enough to visit each particular island. The natives believe this country to be the terrestrial paradise; and indeed nothing could be more enchanting than such vast prospects of mountains, hills, forests, lakes, rivers, &c. if the country was in a moderate climate; though even here, in summer the roses are seen blowing wild on the banks of the lakes and rivers, with all the beautiful glow of colour which appears in those cultivated in our gardens. But all the intervals between the mountains are not engrossed by these agreeable prospects; great part of the flat country is covered with brown dusky forests of fir and pine trees; and these are often skirted by wide extended morasses, the stagnating waters of which in summer produce myriads of mischievous insects, that are more intolerable than even the cold of winter.

The cold of Lapland is very intense during the winter, freezing even branded and the watery part of spirit of wine, if the latter is not highly rectified: all the lakes and rivers are frozen to a prodigious thickness; and the whole face of the country is covered with snow to the depth of four or five feet. While this continues loose, it is impossible to travel: for a man's eyes are not only blinded with it, but if a strong wind should rise he will be buried in the drifts of snow: yet should a partial thaw take place for a few hours, the surface of this snow is formed by the succeeding frost into a hard impenetrable crust, over which the Laplander travels in his sledge with great celerity. While the thaw prevails, the air is surcharged with vapours, and the climate is rainy; but while the north wind blows, the sky is beautifully serene, and the air very clear.

The heat of summer is almost as intolerable in Lapland as the cold of winter. At the northern extremity of the country the sun never sets for three months in summer, and in winter there is an uninterrupted night of the same duration; but this is qualified in such a
rivers they fish for pearls, which are generally pale; but some of them are as bright as the oriental pearls, and much larger and rounder. These pearls are found in mussel shells; and the fishery is not in the sea, but in rivers.

Lapland, as well as Norway, is infested with a great number of gray wolves and bears, with whom the inhabitants wage perpetual war. The most honourable exploit among the Laplanders is that of killing a bear; and the heroes adorn their caps with a small plate of lead or pewter for every bear they have slain. The country abounds also with elk, beavers, and otters, which live here un molested, and find plenty of fish for their subsistence. The forests of this country furnish haunts to a great number of beautiful martens and squirrels, which last change their colour every winter from brown to gray. Lapland is also the native country of the zibeline or sable, whose skin is extremely valuable. Here are likewise armes, weasels, hares, savage black cats which attack the Laplanders in hunting, and little pricket-eared curs trained to the game. But the most remarkable animal of Lapland is the rein deer, for an account of which, see Cervus, Mammalia Linneus. These animals, so useful in various respects to the natives, are kept at no expense. In summer they feed upon grasses and alpine plants; in winter, as already mentioned, upon the lichen rangiferus, or reindeer lichen, and its varieties, which are so abundant as in many parts almost totally to cover the ground for the space of several miles, and which the sagacious animal discovers under the snow by the peculiar acuteness of its smell. Most of those used for draught are castrated when very young, and are larger and fatter than the bucks. The woods, mountains, and rivers, are well stocked with wild fowl; such as bustard, partridge, grouse, heathcock, pheasants, lapwings, swans, wild geese, wild ducks, and all sorts of aquatic birds that build and breed in northern climates. In the beginning of the spring the swans go thither in numerous flights from the German ocean; the lapwings follow in such swarms that they darken the sky as they pass along, and scream so loud that they may be heard at a great distance. The rocks and mountains are likewise frequented by eagles, hawks, falcons, kites, and other birds of prey. The rivers abound with delicious salmon from the gulf of Bothnia, trout, breem, and perch of exquisitely flavour and amazing magnitude; and the inhabitants of Wardhus, or Danish Lapland, are well supplied with fish from the northern ocean.—

With respect to insects, the flies hatched in the morrows and woods in summer are so numerous, that they often obscure the face of day; and so venomous, troublesome, and intolerable, that the rein deer fly to the tops of the highest mountains for shelter, and the Laplanders betake themselves to the sea side, which is the least infested by these pestilent vermin.—

M. de Maupertuis, in his account of the voyage he made to Lapland, in company with the other French mathematicians sent thither by the king to measure a degree of the meridian, gives us to understand, that on the tops of the mountains in Torno the flies were so troublesome, that even the Finland soldiers, who are accounted the most hardy troops in the service of Sweden, were obliged to cover their faces with the skirts of their coats from the attacks of these
Lapland, animals, which swarmed to such a degree, that the moment a piece of flesh appeared it was blackened all over. Some of these flies are very large, with green heads, and fetch blood from the skin wherever they strike. The Laplanders stand themselves in the smoke of a large fire kindled for that purpose; yet even this disagreeable expeditious was not sufficient to defend the French philosophers: they were obliged, notwithstanding the excessive heat, to wrap up their heads in garments made of the skins of rein deer, called in that country lapmudes, and to cover themselves with a thick rampart of fir boughs; yet all these precautions proved ineffectual. M. de Maupertuis observed a lake quite covered with little yellowish grubs, resembling millet seed, which he supposed to be the chrysalides of some of these insects.

The Laplanders are very low in stature, and are likewise remarkable for having large heads. They are also ill-shaped, and their features harsh. They are, however, strong, hardy, and robust, inasmuch that they will bear incredible fatigue; and it is remarked that the stoutest Norwegian is not able to bend the bow of a Laplander. The women are much less homely than the men, and many of them are noted for a delicate and florid complexion.

These people are simple, honest, hospitable, and timorous: their timidity, however, respects war alone; for to many other species of dangers they expose themselves with surprising intrepidity, whether in ascending and descending mountains and precipices with their snow shoes and in sledges, or in venturing amidst whirlpools and cataracts in little slender boats made of thin fir boards, fastened together with thongs of leather, sinews of wild beasts, or tough and flexible twigs of willow and osier. These boats are of different sizes, from two to six yards in length, managed with oars and caulked with moss so tight as to keep out the water. The Laplanders are partly settled, and in part wild and roving: the latter live in tents made of coarse cloth; the former are fixed in small villages near the lakes, and chiefly follow fishing. They build their cottages somewhat in the shape of a cone, by placing a circle of large trees or poles aslant in the earth, and doing so each other, so that their tops meet, and form a small hole at the inner issue of the smoke; they cover the ground within with branches of trees. In spring their food consists principally of the eggs of water fowl, which are extremely plentiful in those parts; in summer and autumn, of the birds themselves, and of various others of the partridge tribe; and in winter of the milk and flesh of the rein deer and dried fish. They had till lately no bread; but in lieu thereof used the inner rind of the pine tree dried and ground, and dried fish reduced to powder. They make confections and decoctions of berries, angelica, and sorrel, which they justly reckon to be preservatives against the scurvy. The Laplander is secured in the possession of uninterrupted health by temperance and exercise, which, together with the severity of the climate, brace his nerves to a very unusual pitch of strength, and fortify his constitution in such a manner, that he often lives to the age of 100, without feeling the least pang of distemper, or even perceiving his vigour in the least impaired; for it is not uncommon to see a Laplander, in extreme old age, hunting, fowling, skating, and performing all the severest exercises with undiminished agility.

The summer garb of the men consists of a long coat of coarse cloth, reaching down the middle of the leg, and girded round the waist with a belt or girdle; from which hang a Norway knife, and a pouch containing flints, matches, tobacco, and other necessaries; the girdle itself being decorated with brass rings and chains. Their caps are made of the skin of the northern diver, with the feathers on; and their shoes of the rein deer skin, with the hair outwards. They wear no linen; but the garments of the better sort are of a finer cloth, and they delight in a variety of colours, though red, as the most glaring, is the most agreeable. In winter they are totally casued up in coats, caps, boots, and gloves, made of the rein deer skins. In the Flora Lapponica Linnaeus says, "Perhaps the curious reader will wonder how the people in Lapland, during the terrible cold that reigns there in winter, can preserve their lives; since almost all birds, and even some wild beasts, desert it at that time. The Laplander, not only in the day, but through the whole winter nights is obliged to wander about in the woods with his herds of rein deer. For the rein deer never come under cover, nor eat any kind of fodder, but a particular kind of liverwort. On this account the herdsmen are under the necessity of living continually in the woods, in order to take care of their cattle, lest they should be devoured by wild beasts. The Laplander easily does without more light, as the snow reflects the rays that come from the stars, and as the aurora borealis illuminates the air every night with a great variety of figures. No part of our body is more easily destroyed by cold than the extremities of the limbs which are most remote from the sun of this microcosm, the heart. The kibes that happen to our hands and feet, so common in the northern parts of Sweden, prove this. In Lapland you will never see such a thing; although, were we to judge by the situation of the country, we should imagine just the contrary, especially as the people wear no stockings, as we do, not only single, but double and triple. The Laplander guards himself against the cold in the following manner: He wears breeches made of rein deer skins with the hair on, reaching to the knee; and shoes made of the same materials, the hairy part turned outwards. He puts into his shoes slender-cased broad-leaved cypress grass (Carex vesicaria, Spec. Pl. or the bladder carex), that is cut in summer and dried. This he first combs and rubs in his hands, and then places it in such a manner that it not only covers his feet quite round, but his legs also; and being thus guarded, he is quite secured against the intense cold. With this grass they stuff their gloves likewise, in order to preserve their hands. As this grass keeps off the cold in winter, so in summer it hinders the feet from sweating, and at the same time preserves them from being annoyed by striking against stones, &c. For their shoes are very thin, being made, not of tanned leather, but the raw hide."
Lapland. selves entirely with coarse blankets to defend them from the gales, which are intolerable. The Laplanders are not only well disposed, but naturally ingenious. They make all their own furniture, their boats, sledges, bows and arrows. They form neat boxes of thin birch boards, and inlay them with the horn of the rein deer. The Swedes are very fond of the Lapland baskets made of the roots of trees, slit in long thin pieces, and twisted together so nicely that they will hold water. Among the manufactures of this country, we likewise number curious horn spoons, and moulds in which they cast the trinkets of tin which adorn their girdles. Over and above these domestic occupations, the men within doors perform the office of cooks in dressing viands for the family. The women act as tailors and embroiderers; they make clothes, shoes, and boats, and harness for the rein deer; they spin thread of flax, and knit it into caps and gloves that are very soft and warm. They draw tin into wire through a horn; and with this they cover the thread which they use in embroidering the figures of beasts, flowers, trees, and stars upon their caps and girdles.

The Laplanders make surprising excursions upon the snow in their hunting expeditions. They provide themselves each with a pair of skates, or snow shoes, which are no other than fir boards covered with the rough skin of the rein deer, torned in such a manner that the hair rises against the snow, otherwise they would be too slippery. One of these shoes is usually as long as the person who wears it; the other is about a foot shorter. The feet stand in the middle, and to them the shoes are fastened by thongs or buttons. The Laplander thus equipped wields a long pole in his hand, near the end of which there is a round ball of wood to prevent its piercing too deep in the snow; and with this he stops himself occasionally. By means of these accoutrements he will travel at the rate of 60 miles a-day without being fatigued; ascending steep mountains, and sliding down again with amazing swiftness.

The Laplander not only travels a-foot, but is provided with a carriage drawn by the rein deer, in which he journeys with still greater rapidity. The sledge, called pulka, is made in the form of a small boat, with a convex bottom, that it may slide the more easily over the snow: the prow is sharp and pointed; but the sledge is flat behind. The traveller is swathed in this carriage like an infant in a cradle, with a stick in his hand to steer the vessel, and disengage it from pieces of rock or stumps of trees that may chance to encounter it in the route. He must also balance the sledge with his body, otherwise he will be in danger of being overturned. The traces, by which this carriage is fastened to the rein deer, are fixed to a collar about the animal's neck, and run down over the breast between the fore and hind legs, to be connected with the prow of the sledge: the reins, managed by the traveller, are tied to the horns; and the travois are furnished with little bells, the sound of which is agreeable to the animal. With this draught at his tail, it has been reported that the rein deer will fly like lightning over hill and dale at the rate of 200 miles a-day. But this representation is greatly exaggerated. According to the best accounts, the common pace of the rein deer is only at the rate of about four miles an hour; though, if he be pressed, he will travel 10 or 12 Swedish miles (70 or 84 English miles) in a day; but by such hard driving is generally destroyed. It, however, frequently happens, that he will persevere in his journey 50 miles without intermission, and without taking any refreshment, except occasionally moistening his mouth with the snow. Before he sets out, the Laplander whips his car or the way he is to follow, and the place at which he is to halt, firmly persuaded that the beast understands his meaning: but, in spite of this induction, he frequently stops short long before he has reached the journey's end; and sometimes he overshoots the mark by several leagues. In the beginning of winter the Laplanders mark the most frequented roads, by strewing them with fir boughs; and indeed these roads are no other than pathways made through the snow by the rein deer and the polkas: their being frequently covered with new snow, and alternately beaten by the carriage, consolidates them into a kind of causeway; which is the harder if the surface has felt a partial thaw, and been crusted by a subsequent frost. It requires great caution to follow these tracks; for if the carriage deviates to the right or left, the traveller is plunged into an abyss of snow. In less frequented parts, where there is no such beaten road, the Laplander directs his course by certain marks which he has made on the trees.

The chief occupation of the Laplanders is hunting, and this exercise they perform in various ways. In summer they hunt the wild beasts with small dogs, trained to the diversion. In winter they pursue them by their tracks upon the snow, skating with so great velocity, that they very often run down the prey. They catch ermines in traps and sometimes with dogs. They kill squirrels, martens, and sables, with blunt darts, to avoid wounding the skin. Foxes and beavers are slain with sharp-pointed darts and arrows; in shooting which, they are accounted the best marksmen in the world. The larger beasts, such as bears, wolves, elks, and wild rein deer, they either kill with fire-arms purchased in Sweden or Norway, or take in snares and pits dug in the forests. Their particular laws relating to the chase are observed with great punctuality. The beast becomes the property of the man in whose snare or pit he is caught; and he who discovers a bear's den has the exclusive privilege of hunting him to death. The conquest of a bear is the most honourable achievement that a Laplander can perform; and the flesh of this animal they account the greatest delicacy on earth. The bear is always despatched with a fusil, sometimes laid as a snare, ready cocked and primed; but more frequently in the hands of the hunter, who runs the most imminent risk of his life should he miss his aim of wounding the beast mortally. The death of a bear is celebrated by the Laplanders as a signal victory. The carcass is drawn to the cabin or hut of the victor by a rein deer, which is kept sacred from any other work for a whole year after this service. The bear is surrounded by a great number of men, women, and children, reciting a particular hymn or song of triumph, in which they sing the venerated enemy for having allowed himself to be overcome without doing any mischief to his conqueror, and welcome his arrival: then they make an apostrophe to heaven, expressing their acknowledgment to

4 A 2

God,
L A P
Lapland.

God, that he has created beasts for the use of men, and endowed mankind with strength and courage to overcome and attack the fiercest of the brute creation. The hero is saluted by the women, who spit chewed elderberry in his face. He is feasted three days successively, and his cap is decorated with an additional figure wrought in tin wire.

The manner in which the young Laplander chooses a wife is equally remarkable and ludicrous. When he has pitched upon a female, he employs some friends as mediators with the father; and these being provided with some bottles of brandy, the suitors accompanies them to the hut of his future father-in-law, who invites the mediators to enter; but the lover is left without until the liquor he drank, and the proposal discussed: then he is called in, and entertained with such fare as the hut affords; yet without seeing his mistress, who retires and goes out on this occasion. Having obtained leave of her parents to make his addresses in person, he puts on his best apparel, and is admitted to the lady, whom he salutes with a kiss; then he presents her with the tongue of a rein deer, a piece of beaver’s flesh, or some other sort of provision. She declines the offer, which is made in presence of her sisters and relations; but makes a signal to the lover to follow her into the fields, where she accepts the present. Thus encouraged, he begs her permission to sleep with her in the hut; if she consents, there is no further difficulty; if she disapproves of the proposal, she drops her presents on the ground. When the lovers are agreed, the youth is permitted to visit his inamorata as often as he shall think proper; but every time he comes, he must purchase this pleasure with a fresh bottle of brandy; a requisit so agreeable to the father, that he often postpones the celebration of the nuptials for two or three years. At length the ceremony is performed at church by the priest of the parish. Even after this event, the husband is obliged to serve his father-in-law a whole year; at the expiration of which he retires to his own habitation with his wife and her patrimony of rein deer, and receives presents from all his friends and relations. From this period he sequesters his wife from the company of all strangers, especially of the male sex, and watches over her conduct with the most jealous vigilance.

Many Lapland women are barren, and none of them are very fruitful. A woman, immediately after delivery, swallows a draught of whale fat: the child is washed with snow or cold water, and wrapped up in a bare skin. The mother is seldom above five days in the straw, and in fourteen is generally quite recovered: then she carries the child to church to be baptized. Before she can reach the residence of the priest, she is often obliged to traverse large forests, mountains, lakes, and wide extended wastes of snow. The infant is fastened in a hollowed piece of wood, stretched naked on a bed of fine moss, covered with the soft skin of a young rein deer, and slung by two straps to the back of the mother, who always suckles her own child. At home this little cradle is hung to the roof of the hut, and the child lulls asleep by swinging it from one side to the other. The boys from their infancy practise the bow; and are not allowed to break their fast until they have hit the mark. The female children are as early initiated in the business peculiar to their sex.

These people, though for the most part vigorous and healthy, are not altogether exempted from dissipation. They are subject to sore eyes, and even to blindness, from the smoke of their huts, and the fire to which they are almost continually exposed. Some waste away in consumptions; others are afflicted with rheumatic pains and the scurvy; and a few are subject to vertigo and apoplexy. For the cure of all their internal disorders, they use no other medicine than the decoction of a certain species of moss; and when this cannot be procured, they boil the stalk of angelica in the milk of the rein deer. In order to remove a fixed pain, they apply a large mushroom, burning hot, to the part affected; and this produces a blister, which is supposed to draw off the peccant humour. To their wounds they apply nothing but the turpentine that drops from the fir tree. When they are frost bitten (though according to the above extract from Linnæus this seldom or never happens), we are told that they thrust a red-hot iron into a cheese made of rein deer’s milk, and with the fat that drops from it among the frozen member, which generally recovers. When a Laplander is supposed to be on his death-bed, his friends exhort him to die in the faith of Christ, and bear his sufferings with resignation, by remembering the passion of our Saviour. They are not, however, very ready to attend him in his last moments; and as soon as he expires, quit the place with precipitation, apprehending some injury from his spirit or ghost, which they believe remains with the corpse and takes all opportunities of doing mischief to the living. The deceased is wrapped up in woollen or linen, according to his circumstances, and deposited in a coffin by a person selected for that purpose: but this office he will not perform, unless he is first secured from the ill offices of the mœnas, by a consecrated brass ring fixed on his left arm. The Christian religion in this country has not yet dispelled all the rites of heathenish superstition: together with the body they put into the coffin an axe, a flint, and steel, a flasket of brandy, some dried fish and venison. With the axe the deceased is supposed to hew down the bushes or bushes that may obstruct his passage in the other world: the steel and flint are designed for striking a light, should he find himself in the dark at the day of judgment; and on the provision they think he may subsist during his journey.

The Muscovite Laplanders observe other ceremonies, that bear an affinity to the superstitions of the Greek church. They not only supply the defunct with money, but likewise provide him with money for the porter of paradise, and a certificate signed by the priest, and directed to St Peter, specifying that the bearer had lived like a good Christian, and ought to be admitted into heaven. At the head of the coffin they place a little image of St Nicholas, who is greatly revered in all parts of Muscovy as a friend to the dead. Before the interment, the friends of the deceased kindle a fire of fir boughs near the coffin, and express their sorrow in tears and lamentations. They walk in procession several times round the body, demanding, in a whining tone, the reason of his leaving them on earth. They ask
LAPLAND, or Sea-hare; a genus of marine animals belonging to the class of vermes. See Helminthology Index.

LAPSANA, Nipplewort; a genus of plants belonging to the synogenesis class; and in the natural method ranking under the 49th order, Compositae. See Botany Index.

LAPSE, in ecclesiastical law, a slip or omission of a patron to present a clerk to a benefice within six months of its being void: in which case, the benefice is said to be in lapsae, or lapsed, and the right of presentation devolved to the ordinary.

And if the ordinary neglect to present during the same time, the right of presentation accresces to the metropolitan, and to the king by neglect of the metropolitan. This right of lapsae was first established in the reign of Henry II. when the bishops first began to exercise universally the right of institution to churches: and therefore when there is no right of institution, there is no right of lapsae; so that no donative can lapse to the ordinary, unless it hath been augmented by the king's bounty; but no right of lapsae can accrue, when the original presentation is in the crown. In case the benefice becomes void by death, or cession through plurality of benefices, there the patron is bound to take notice of the vacancy at his own peril; but in case of a vacancy by resignation or canonical deprivation, or if a clerk presented be refused for insufficiency, those being matters of which the bishop alone is presumed to be cognizant, here the law requires him to give notice thereof to the patron, otherwise he can take no advantage by way of lapsae; neither shall any lapsae accrue thereby to the metropolitan or the king. If the bishop refuse or neglect to examine and admit the patron's clerk, without good reason assigned or notice given, he shall have no title to present by lapsae; and if the right of presentation be litigious or contested, and an action be brought against the bishop to try the title, no lapsae shall occur till the question of right be decided. If the bishop be both patron and ordinary, he shall not have a double time allowed him to collate in: and if the bishop doth not collate his own clerk immediately to the living, and the patron presents, though after the six months are lapsed, yet the presentation is good, and the bishop is bound to institute the patron's clerk. If the bishop suffer the presentation to lapse to the metropolitan, the patron also has the same advantage if he presents before the archbishop; has filled up the benefice: yet the ordinary.
ordinary cannot, after lapsus to the metropolitan, collate his own clerk to the prejudice of the archbishop.

But if the presentation lapses to the king, the patron shall never recover his right till the king has satisfied his turn by presentation; for nullum tempus occurs regi.

LAPWING. See Tringa, Ornithology Index.

LAQUEARIUS, a kind of athlete among the ancients, who in one hand held a lapesus, i.e. a sort of amere, wherewith to embarass and entangle his antagonist, and in the other a poniard to stab him.

LAQUEUS, in Surgery, a kind of ligature so contrived, that, when stretched by any weight or the like, it draws up close. Its use is to extend broken or disjuncted bones, to keep them in their places while they are set, and to bind the parts close together.

LAR, a town of Persia, in the province of Fars, with a castle. It carries on a great trade in silk; and its territory abounds in oranges, lemons, and very large tamarinds. E. Long. 54. 15. N. Lat. 27. 30.

LARACHA, an ancient and strong town of Afries, in the kingdom of Fez. It is seated at the mouth of a river of the same name, with a good harbour. It was once in the possession of the Spaniards; but the Moors took it from them. W. Long. 5. 35. N. Lat. 35. 0.

LARARIUM, was a chapel which the Romans frequently had in their houses for the household gods, called larves. Spartan says, that Alexander the son of Mammuse kept in his lararium the figure of our Saviour, together with his other idols.

LARBORD, among seamen, the left-hand side of the ship when you stand with your face towards the head.

LARCENY, or Theft, by abstraction for latrocinum, latrocinium, is distinguished by the law into two sorts: the one called simple larceny, or plain theft, unaccompanied with any other atrocious circumstance; and mixed or compounded larceny, which also includes in it the aggravation of a taking from one's house or person.

I. Simple larceny, when it is the stealing of goods above the value of twelvepence, is called grand larceny; when of goods to that value, or under, is petit larceny: offences, which are considerably distinguished in their punishment, but not otherwise. See Theft.

II. Mixed, or compounded larceny, is such as has all the properties of the former, (see Theft) but is accompanied with either one or both of the aggravations of a taking from one's house or person. First therefore of larceny from the house; and then of larceny from the person.

1. Larceny from the house, though it might seem to have a higher degree of guilt than simple larceny, yet is not at all distinguished from the other at common law; unless where it is accompanied with the circumstance of breaking the house by night; and then it falls under another description, viz. that of burglary, (see Burglary.) But now by several acts of parliament (the history of which is very ingeniously deduced by a learned modern writer, who hath shown them to have gradually arisen from our improvements in trade and opulence), the benefit of clergy is taken from larcenies committed in a house in almost every instance: except that larceny of the stock or utensils of the Plate Glass Company from any of their houses, &c. is made only single felony, and liable to transportation for seven years. The multiplicity of the general acts is apt to create some confusion; but upon comparing them differently, we may collect, that the benefit of clergy is denied upon the following domestic aggravations of larceny: viz. first, in larcenies above the value of twelvepence, committed, 1. In a church or chapel, with or without violence, or breaking the same: 2. In a booth, or tent in a market or fair, and in the daytime or in the night, by violence or breaking the same, the owner or some of his family being therein: 3. By robbing a dwelling house in the daytime (which robbing implies a breaking), any person being therein: 4. In a dwelling house by day or by night, without breaking the same, any person being therein and put in fear; which amounts in law to a robbery: and in both these last cases the accessory before the fact is also excluded from his clergy. Secondly, in larcenies to the value of five shillings, committed, 1. By breaking any dwelling house, or any outhouse, shop, or warehouse therein belonging, in the daytime, although no person be therein; which also now extends to idlers, shopkeepers, and accessories before the fact: 2. By privately stealing goods, wares, or merchandise in any shop, warehouse, coach-house, or stable, by day or by night; though the same be not broken open, and though no person be therein: which likewise extends to such as assist, hire, or command the offence to be committed. Lastly, in larcenies to the value of forty shillings in a dwelling house, or its outhouses, although the same be not broken, and whether any person be therein or not; unless committed against their masters by apprentices under the age of 15. This also extends to those who aid or assist in the commission of any such offence.

2. Larceny from the person, is either by privately stealing, or by open and violent assault, which is usually called robbery.

The offence of privately stealing from a man's person, as by picking his pocket or the like, privately, without his knowledge, was debarred of the benefit of clergy so early as by the statute 8 Eliz. c. 4. But then it must be such a larceny as stands in need of the benefit of clergy, viz. of above the value of 6d.; else the offender shall not have judgment of death. For the statute creates no new offence; but only takes away the benefit of clergy, which was a matter of grace, and leaves the thief to the regular judgment of the ancient law. This severity (for a most severe law it certainly is) seems to be owing to the case with which such offences are committed, the difficulty of guarding against them, and the boldness with which they were practised (even in the queen's court and presence) at the time when this statute was made: besides that this is an infringement of property in the personal occupation or corporal possession of the owner, which was an offence even in a state of nature. And therefore the saccadorii, or cutpurse, were more severely punished than common thieves by the Roman and Athenian laws.

As to open and violent larceny from the person, see Robbery.

LARDIZABALA, a genus of plants belonging to the dioecia class, and order hexandria. It is a native of
of Chili, and is thus described from the drawings of La Martiniere the naturalist, who accompanied La Perouse in his voyage of discovery.

**Male Flower.**—Calyx formed of six expanding leaves, oblong, oval, and obtuse; the three outermost being largest. Corolla composed of six sharp petals, shorter than the leaves of the calyx.

**Female Flower.**—Calyx similar to that of the male, but larger. Corolla composed of six petals rarely entire, but commonly trifid at their top. Stamina six; filaments distinct; anthers six, oblong, barren. Seed-bud; cells from three to six, oblong, nearly the length of the corolla; styles none; stigmas sitting, permanent. Berries equal in number to the cells, oblong, compressed, divided into six cells, containing several angular seeds.

**LARDNER, Nathaniel,** an eminent English dissenting divine, was born at Hawkhurst in Kent, June 16 & 1684. After a grammatical education, to which great attention must have been given, and in which a no small share of genius was displayed, he was sent first to a dissenting academy in London, which was under the care of the Rev. Dr Joshua Oldfield; and thence, in his 16th year, to prosecute his studies at Utrecht, under the celebrated professors D'Ures, Greaves, and Burnam. Here he remained somewhat more than three years, and then removed for a short space to Leyden. In 1703 he returned to England, continuing at his father's house to employ himself by close and diligent preparation for the sacred profession which he had in view. Qualified as he was, it was not till 1709 that he preached his first sermon, from Romans i. 16—"a text (his biographer remarks) than which there could not have been a more proper one for a man who was destined in the order of Divine Providence to be one of the ablest advocates for the authenticity and truth of the Christian revelation that ever existed."

A few years after this, Lardner was received into Lady Treby's family as domestic chaplain and tutor to her son, and continued in this comfortable situation till her ladyship's death in 1721. This event threw him into circumstances of some perplexity, having preached to several congregations during his residence with Lady Treby without the approbation or choice of any one congregation. Here we are told, "that it reflected no honour on the Dissenters, that a man of such merit should so long have been neglected." But it has been observed upon this, that the pulpit was not the place in which Mr Lardner was calculated either to convey improvement or acquire reputation. Dr Kippis afterwards informs us, "that his mode of elocution was very unpleasant; that from his early and extreme deafness he could have no such command of his voice as to give it a due modulation; and that he greatly dropped his words." It cannot then, as his biographer adds, be matter of surprise that he was not popular; nor, it may be added, can it be any reflection on the congregations to which he occasionally preached, that they did not choose for their ministry a man, who, notwithstanding his great learning and amiable virtues, was so deficient as a public speaker, that it was impossible to bear him with any pleasure, and scarcely without pain.

Though Mr Lardner had no church at which he officiated as minister, he was engaged with some of his dissenting brethren in preaching a Tuesday evening lecture at the Old Jewry. Acquainted probably with the direction of his studies, they appointed him to preach on the proof of the Credibility of the Gospel History. This he discussed, as we are told, in two sermons; and prosecuting the subject which he had taken up in these discourses, in February 1727, he published, in two volumes octavo, the First Part of "The Credibility of the Gospel History, or the Facts Occasionally mentioned in the New Testament, confirmed by Passages of Ancient Authors who were contemporaries with our Saviour or his Apostles, or lived near their Time." An Appendix was subjoined, relating to the time of Herod's death.

Thus Mr Lardner commenced author, and began his literary career with singular reputation. "It is scarcely necessary to say (observes Dr Kippis), how well this work was received by the learned world. Not only was it highly approved by the Protestant Dissenters, with whom the author was more immediately connected, but by the clergy in general of the established church; and its reputation gradually extended into foreign countries. It is indeed an invaluable performance, and hath rendered the most essential service to the cause of Christianity. Whoever pursues this work (and to him that does not peruse it, it will be to his own loss) will find it replete with admirable instruction, sound learning, and just and candid criticism." These two, with the subsequent fifteen, volumes octavo, and the four thin quartos entitled Jewish and Heathen Testimonies, occupied him, with the interruption arising from some smaller productions, during the space of forty-three years.

Dr Kippis gives us a particular account of the time when each volume was published, and of the subjects discussed in each. The following useful information which the doctor introduces, in speaking of the "Supplement to the Credibility," deserves well to be transcribed. "I cannot avoid strongly recommending this work (says he) to the attention of all young divines. Indeed, I think that it ought to be read by every theological student before he quits the university or academy in which he is educated. There are three other works which will be found of eminent advantage to those who are intended for, or beginning to engage in, the Christian ministry. These are, Butler's Analogy, Bishop Law's Considerations on the Theory of Religion, and Dr Taylor's Key to the Apostolical Writings, prefixed to his Paraphrase on the Epistle to the Romans. Without agreeing with every circumstance advanced in these works, it may be said of them with the greatest truth, that they tend to open and enlarge the mind; that they give important views of the evidence, nature, and design of revelation; and that they display a vein of reasoning and inquiry which may be extended to other objects besides those immediately considered in the books themselves. It must not be forgotten, that the Supplement to the Credibility has a place in the excellent collection of treatises in divinity which has lately been published by Dr Watson bishop of Landaff. For a collection which cannot fail of being eminently conducive to the instruction and improvement of younger clergymen, and for the noble, ready, and truly evangelical purpose by which it is preceded,
LA R

LA R

ceded, this great prelate is entitled to the gratitude of
the Christian world." It may not be improper to add,
that the Supplement to the Credibility was some years
ago, published separately by the booksellers, under
the title of The History of the Gospels and Epistles.

Appraised as Dr Lardner's works were, he received
little recompense for them. Some of the latter volumes
of the Credibility were published at a loss; and at last
he sold the copy-right and all the remaining printed co-
ties to the booksellers, for the trifling sum of 150l. His
object, however, was not private emolument, but to ser-
ve the interests of truth and virtue; and it pleased Divine
Providence to spare his life, both to complete his exten-
sive plan, and to see the last volume, the 4th of the
Testimonies, published. This was in 1767. He was
seized with a decline in the summer following; and
was carried off in a few days at Hawkhurst the place
of his nativity, where he had a small paternal estate.
He died in the 8th year of his age.

LAREDO, a sea port town of Spain, in the bay of
Biscay, with a large safe harbour. It is 30 miles west
of Bilboa, and 72 north by west of Burgos. W. Long.
3. 45. N. Lat. 43. 23.

LARENTINALIA, in antiquity, a feast held
among the Romans on the 23rd day of December, but
ordered to be observed twice a year by Augustus; by
some supposed to have been in honour of the Lares,
but by others, with more probability, in honour of
Acca Laurentia; and to have been the same with Lau-
rentalia.

LARES, among the ancients, derived by Apule-
lius (De Deo Socratis), from lare, familiaris; a kind
of domestic genius, or divinities, worshipped in houses,
and esteemed the guardians and protectors of families;
supposed to reside more immediately in the chimney
corner.

The Lares were distinguished from the Penates: as
the former were supposed to preside over housekeeping,
the servants in families, and domestic affairs; and
the latter were the protectors of the masters of families,
their wives and children. Accordingly the Lares were
dressed in short succinct habits, to show their readiness
to serve; and they held a sort of cornucopia in their
hands, as a signal of hospitality and good housekeep-
ing. According to Ovid, there were generally two of
them, who were sometimes represented with a dog at
their feet.

Plutarch distinguishes good and evil Lares, as he
had before done good and evil Genii. There are also
some public, others private Lares.

Apuleius tells us the domestic Lares were no more
than the souls of departed persons, who had lived well,
and discharged the duties of their station; whereas
those who had done otherwise, were vagabonds, wan-
dering about and frightening people, called Larvae and
Lemures.

The Lares were also called Penates, and were wor-
shipped under the figures of little marmousets, or images
of wax, silver, or earthen ware.

The public Lares were also called Compitales, from
compitum, "a cross way." and Viales, from via, "a way
or public road;" as being placed at the meetings of
roads and in the high ways, and esteemed the persons
and protectors of travellers.

The private Lares took care of particular houses
and families: these they also called Præstites from
præsto;

They gave the name Urbes, i. e. "Lares of cities," to
those who had cities under their care; and Hostili, to
those who were to keep their enemies off. There were
also Lares of the country, called Rurales, as appears by
several antique inscriptions.

The Lares were also genial gods, and were supposed
to take care of children from their birth. It is for this
reason that when Macrobius tells us the Egyptians had
four gods who presided over the births of children,
viz. the Genius, Fortune, Love, and Necessity, called
præstites, some interpret him as if he had said the
Egyptians had Lares; but they have mentioned that
there was a great difference between the Lares of the
Romans and the Præstites of the Egyptians. Howev-
er, the learned Mr Bryant affirms that they were the
same.

The ancients differ extremely about the origin of
the Lares. Varro and Macrobius say that they were the
children of Mania; Ovid makes them the issue of Mer-
cury, and the Naiad Lara or Larunda; Apuleius assures
us they were the posterity of the Lemures; Nigrigidus,
called to, according to Arnobius, made them sometimes the
guardians and protectors of houses, and sometimes the
same with the Curetes of Samothracia, which the Greeks call
Idai dactylth. Nor was Varro more consistent in his
opinion of these gods; sometimes making them the
names of heroes, and sometimes gods of the air.

T. Tatius king of the Sabines was the first who
built a temple to the Lares. The chimney and fire-
place in the house were particularly consecrated to
them.

Tertullian tells us the custom of worshipping the
Lares arose from this, that they anciently interred
their dead in their houses; whence the credulous
people took occasion to imagine their souls continued
there also, and proceeded to pay them divine honours.
To this it may be added, that the custom being after-
wards introduced of burying in the high ways, they
might hence take occasion to regard them as gods of
the high ways.

The victim offered to the Lares in the public sacri-
fices was a hog: in private, they offered them wine,
incense, a crown of wool, and a little of what was left
at the table. They also crowned them with flowers,
particularly the violet, myrtle, and rosemary. Their
symbol was a dog, which was usually represented
by their side, on account of its fidelity and the ser-
vice it does to a man in watching his house. They
were sometimes also represented as clothed in a dog's
skin.

The term Lares, according to Mr Bryant, was
formed from laren, an ancient word by which the ark
was represented: and he supposes that the Lares and
Manes were the same domestic deities under different
names; and that by these terms the Hetrurians and
Latinians denoted the divs arctiae, who were no other than
their arkite ancestors, or the persons preserved in the
laren or ars; the genius of which was Leis, the re-
puted parent of the world. He observes farther, that
they are described as deamos and genii, who once lived
on earth, and were gifted with immortality. Arnobius,
LARES, a sea term applied to the wind when it crosses the line of a ship's course in a favourable direction, particularly on the beam or quarter. Thus, if a ship steers west, then the wind in any point of the compass to the eastward of the ship may be called large, unless when it is directly east, and then it is said to be right aft. Sailing large is, therefore, advancing with a large wind, so as that the sheets are slackened and flowing, and the bow lines entirely disused. This phrase is generally opposed to sailing close hauled.

LARGESS. See LARGITTO.

LARGITTO, in Roman antiquity, was a distribution of corn, provision, clothes, money, &c. to the people. Gracchus, when tribune, to make himself popular, passed a law for supplying the Roman citizens with corn at a very low rate, out of the public granaries. Claudius, another tribune, with the same views to popular applause, procured it to be distributed gratis. Catullus, to win the common people from Cæsar, persuaded the senate to do the same, and 300,000 citizens shared in the distribution. Cæsar, after his triumph, extended his bounty to 1,500,000, giving them each a mina. The Roman emperors enlarged still further the list of those who were to partake of their distributions. Largitio is frequently taken in a bad sense, to signify a masked bribery; whereby candidates purchased votes, when they stood for places of honour or trust in the state. The distribution of money was called congiarium, and the distributors divisores and sequestres.

LARGS, a village on the west coast of Scotland, opposite to the island of Bute; rendered memorable by the defeat of the Norwegians here in their last invasion of this country. —This invasion was made in the year 1253, with a fleet of 160 sail and an army of 20,000 men, commanded by Haquin king of Norway, whose ravages on the coast of Ayr, Bute, and Arran, reaching the Scottish court, an army was immediately assembled by Alexander III. and a bloody engagement ensued at this village, when 16,000 of the invaders were slain in the battle and flight, with 5000 Scots. Haquin escaped to the Orkneys, where he soon after died of grief. The entrenchments of the Norwegian camp may still be traced along the shore of this place. The Scottish commanders who fell in battle were buried in a rising field, near the village; three or four persons were interred in one grave, on each side of which was a large stone, a third was placed across the grave, supported at the extremities by the side stones, and in this rude manner the warriors lay entombed. Some years ago the proprietor of the field demolished these repositories of the dead, leaving only one (a special favour!) which serves to give an idea of the whole.

Vol. XI. Part II.
LAS [ 562 ] LAT

200 tons burden. It is but a small place, consisting of about 100 houses built of wood; but has a stone fort, with a few guns. E. Long. 67°. N. Lat. 25°. 0.

LARVA, in *Natural History*, a name given by Linnaeus to insects in that state, called by other writers *eruca* or *caterpillar*. See *Entomology Index*.

LARVI, in antiquity, derived from the Hittite word *lar* or *lars*, signifying "prince or lord," denoted the ghosts of the deceased, considered as wicked and mischievous. Hence is formed the term *larvatus*, i.e. *larvid indutus* or *demoniac*. The ingenious Mr Farmer urges the etymology and use of this term to prove, that the heathen demons were human ghosts. — The larvo were also called *clemens*.

LARUS, the *gull*, a genus of birds belonging to the order of *anseres*. See *Ornithology Index*.

LARYNX, in *Anatomy*, the upper part of the windpipe. See *Anatomy*, No. 116.

LASCARIS, ANDREW JOHN, surnamed *Rynacetus*, of an ancient Greek family, went into Italy, after the taking of Constantinople by the Turks in 1453. He was well received by Lawrence de Medicis, a distinguished protector of learned men; and twice sent to Constantinople to collect the best Greek manuscripts, by which means numberless scarce and valuable treasures of literature were carried into Italy. At his return, Louis XII. king of France prevailed on him to settle in the university of Paris, and sent him twice ambassador to Venice. Ten years after, Cardinal John de Medicis being elected pope, under the name of Leo X. John Lascaris, his old friend, went to Rome, and had the direction of a Greek college. He died at Rome in 1535, at about the 90th year of his age. He brought into the west most of the fine Greek manuscripts that are now extant, and composed some epigrams in Greek and Latin.

LASCARIS, Constantine, one of the Greeks who were principally concerned in the revival of learning in the West, retired into Italy in 1454, and taught polite literature at Milan, whither he was called by Francis Borgia; he afterwards went to Rome, where he was well received by Cardinal Bessarion. He afterwards taught rhetoric and the Greek tongue at Naples; and ended his days at Messina, leaving the senate of that city many excellent manuscripts which he had brought from Constantinople. He was interred at the public expense, and the senate of Messina erected a marble tomb to his memory. He wrote some grammatical works.

LASTERPITIUM, Lazar-wort, a genus of plants belonging to the pentandra class; and in the natural method ranking under the 45th order, *Umbellata*. See *Botany Index*.

LASH, or LACE, in the sea language, signifies to bind and make fast; as, to lash the bonet to the course, or the drabber to the bonnets; also the carpenter takes care that the spare yards be lashed fast to the ship's side; and in a rolling sea, the gunners mind that the guns be well lashed, lest they should break loose. Lashers are properly those ropes which bind fast the tackles and the breechings of the ordnance, when hauled or made fast within board.

LASSITUDE, or Weariness, in *Medicine*, a morbid sensation, that comes on spontaneously, without any previous motion, exercise, or labour. This is a frequent symptom in acute distempers: it arises either from an increase of bulk, a diminution of proper evacuation, or too great a consumption of the fluids necessary to maintain the spring of the solids, or from a vitiated secretion of that juice.

LASSUS, or LASUS, a dithyrambic poet, born at Hermione in Peloponnesus about 500 years before Christ. He is reckoned among the wise men of Greece by some. He is particularly known by the answer he gave to a man who asked him what could best render life pleasant and comfortable? Experience. He was acquainted with music. Some fragments of his poetry are to be found in Athenaeus. He wrote an ode upon the Centaurs, and a hymn to Ceres, without inserting the letter S in the composition.

LAST, in general, signifies the burden or load of a ship. It signifies also a certain measure of fish, corn, wool, leather, &c. A Last of codfish, white herrings, meal, and ashes for soap, is twelve barrels; of corn or rapsessed, ten quarters; of gunpowder, twenty-four barrels; of red herrings, twenty cades; of hides, twelve dozen; of leather, twenty dickers; of pitch and tar, fourteen barrels; of wool, twelve sacks; of stock fish, one thousand; of flax or feathers, 1700lbs.

LASTAGE, or LESTAGE, a duty exacted in some fairs and markets, for carrying things bought whither one will. It signifies also the ballast or lading of a ship; and sometimes is used for garbage, rubbish, or such like filth.

LATERAN was originally the proper name of a man; whence it descended to an ancient palace in Rome, and to the buildings since erected in its place; particularly a church called St John of Lateran, which is the principal see of the popedom.

Councils of the Lateran, are those held in the basilica of the Lateran; of these there have been five, held in 1123, 1139, 1179, 1215, and 1513.

Canons Regular of the Congregation of the Lateran, is a congregation of regular canons; whereof that church is the principal place of rest.

It is pretended there has been an uninterrupted succession of clerks, living in community, from the time of the apostles; and that a number of these were established in the Lateran in the time of Constantine. But the canons were not introduced till the time of Leo I. and these held the church 800 years, till the reign of Boniface, who took it from them, and placed secular canons in their room: 150 years after, the regulars were reinstated.

A LATERE, a term used to denote the qualifications of the cardinals whom the pope sends as legates into foreign countries. They are called *legates a latere*, as being his holiness's assistants and counsellors in ordinary. These are the most considerable of the other three kinds of legates, being such as the pope commissions to take his place in council; and so called, in regard that he never gives this office to any but his favourites and confidants, who are always *a latere*, at his side. A legate a latere has the power of conferring benefices without a mandate, of legitimating bastards to hold offices, and has a cross carried before him as the emblem of his authority.

De Later, legates who are not cardinals, but yet are intrusted with an apostolical legation. See the article Legate.
LATE-WAKES, a ceremony used at funerals in the Highlands of Scotland. The evening after the death of any person, the relations and friends of the deceased met at the house, attended by a bagpipe or fiddle; the nearest of kin, be it wife, son, or daughter, opens a melancholy ball, dancing, and greeting (i.e. crying violently) at the same time, and this continues till day light; but with such gambols and frolics among the younger part of the company, that the loss which occasioned them is often more than supplied by the consequences of that night. If the corpse remains unburied for two nights, the same rites are renewed. Thus, Scythian-like, they rejoice at the deliverance of their friends out of this life of misery.

LATEEN SAIL, a long triangular sail extended by a lateen yard, and frequently used by xebecs, palarxes, etcetera, and other vessels in the Mediterranean sea.

LATH, in building, a long, thin, and narrow slip of wood nailed to the rafter s of a roof or ceiling, in order to sustain the covering.

Lath-Bricke, a particular sort of bricks made in some parts of England, of 22 inches in length and 6 in breadth, which are used in the place of laths or spars, supported by pillars in casts, for the drying of malt. This is an excellent contrivance; for besides that they are not liable to fire, as the wooden laths are, they retain the heat vastly better; so that being once heated, a very small quantity of fire will serve to keep them so.

LATHE, a very useful engine for the turning of wood, ivory, metals, and other materials. The invention of the lathe is very ancient; Diodorus Siculus says, the first who used it was a grandson of Deidalus, named Talus. Pliny ascribes it to Theodorus Samos; and mentions one Thericles, who rendered himself very famous by his dexterity in managing the lathe. With this instrument the ancients turned all kinds of vases, many whereof they enriched with figures and ornaments in basso relievo. Thus Virgil:

Lenta quibus torni facili superaddita visis.

The Greek and Latin authors make frequent mention of the lathe; and Cicero calls the workmen who used it "tectularii." It was a proverb among the ancients, to say a thing was formed in the lathe, to express its delicacy and justness.

The lathe is composed of two wooden cheeks or sides, parallel to the horizon, having a groove or opening between; perpendicular to these are other pieces called "puppets", made to slide between the cheeks, and to be fixed down at any point at pleasure. These have two points, between which the piece to be turned is sustained; the piece is turned round, backwards and forwards by means of a string put round it, and fastened above to the end of a pliable pole, and underneath to a treble or board moved with the foot. There is also a rest which bears up the tool, and keeps it steady.

As it is the use and application of this instrument that makes the greatest part of the art of turning, we refer the particular description thereof, as well as the manner of applying it in various works, to that head. See TURNING.

LATHREA, a genus of plants belonging to the didynamia class; and in the natural method ranking under the 40th order, "Pepuratae." See BOTANY INDEX.

LATHREVE, LEIDGREVE, or THITENGREVE, was an officer under the Saxon government, who had authority over a third part of the county; and whose territory was therefore called trithing, otherwise a leid or leithain, in which manner the county of Kent is still divided; and the rapes in Sussex seem to answer to the same. As to the jurisdiction of this officer, those matters that could not be determined in the hundred court, were thence brought to the trithing; where all the principal men of the three or more hundreds being assembled by the lathreve, or trithingreve, did debate and decide it; or if they could not, then the lathreve sent it up to the county court, to be there finally determined.

LATHYRUS, CHICKLING, a genus of plants belonging to the diadelphica class; and in the natural method ranking under the 32d order, "Fapulinae." See BOTANY INDEX.

LATIAR, in Roman antiquity, a feast or ceremony instituted by Tarquinius Superbus, in honour of Jupiter Latarius or Latialis.—Tarquin having made a treaty of alliance with the Latins, proposed, in order for perpetuating it, to erect a common temple, where all the allies, the Romans, Latins, Hernici, Volsci, &c. should assemble themselves every year, hold a kind of fair, exchange merchandise, feast, sacrifice, and make merry together. Such was the institution of the Latiar. The founder only appointed one day for this feast: the first consul added another to it, upon concluding the peace with the Latins; and a third was added after the people who had retired to the Mons Sacer were returned to Rome: and a fourth, after appeasing the sedition raised on occasion of the plebeians aspiring to the consulate.

These four days were called the Latins feriae; and all things done during the course of the feriae, as feasts, sacrifices, offerings, &c. were called Latiarce.

LATICLEAVE, (Laticlave), in Roman antiquity, was an honourable distinction, peculiar, in the times of the republic, to the senators: but whether it was a particular kind of garment, or only an ornament upon it, the critics are not agreed: But the more general opinion is, that it was a broad stripe of purple sewed upon the fore part of their tunic, and round the middle of the breast. There were buttons set on the latus clavus or laticleave, which appeared like the heads of large nails, whence some think it derived its name.

—The senators, praetors, and chief magistrates of colonies and municipal cities had a right to wear it. The praetexta was always worn over it; but when the praetor pronounced sentence of death, the praetexta was then put off and the laticlave retained. The laticlaviun differed from the augusticlavium, but authors do not agree in what this difference consisted; the most general opinion seems to be, that the slips or stripes of purple were narrower in the augusticlavia.

LATIMER, HUGH, bishop of Worcester, was born about the year 1480 at Thurcaston in Leicestershire, the only son of a yeoman of that village. At the age of fourteen he was sent to Christ's college, Cambridge, where he applied himself to the study of divinity, and in proper time took the degree of bachelor in that science. At this time he was a zealous Papist.
in time became sensible of the necessity of its being generally understood for the convenience of commerce; and accordingly used their endeavours, that all the nations subject to their empire should be united by one common language; so that at length they imposed the use of it by a particular law for that purpose. After the translation of the seat of the empire from Rome to Constantinople, the emperors of the east, being always desirous of retaining the title of Roman emperors, appointed the Latin to be still used; but at length neglecting the empire of the west, they abandoned all care of the Latin tongue, and used the Greek. Charemagne coming to the empire of the west, revived this language; but at length it gave way, and the French took place of the Latin; it was, however, prodigiously degenerated before it came to be laid aside, in which condition it was found at the time of the Reformation, when Vives, Erasmus, &c. began to open the way for its recovery: since which time the monkish latinity has been declining, and all endeavours have been used to retrieve the pure language of the Augustan age. See Language.

Latin Church. See Church.

Latin, an ancient nation of Italy. See Latin.

Latinus, king of the Latins in Italy, was the son of Faunus; and, it is said, began to reign about the 1216th year before the Christian era. Latinius, his only daughter, married Æneas, after that Trojan prince had killed Turnus king of the Rutuli. See Rome.

Latissimus, in Anatomy, the name of several muscles. See Anatomy, Table of the Muscles.

Latitude, in Astronomy, is the distance of a star north or south from the ecliptic. In geography it signifies the distance of any place north or south from the equator. See Astronomy, and Geography, passim.

Latitudinarian, a person of moderation with regard to religious opinions, who believes there is a latitude in the road to heaven, which may admit people of different persuasions.

Latin, in Ancient Geography, the country of the Latins, at first contained within very narrow bounds, but afterwards increased by the accession of various people. The appellation, according to Virgil, is Æquitus, from Saturn’s lying hid there from the hostile pursuits of his son Jupiter; and from Latium comes the name Latini, the people (Virgil): though Dionysius Halicarnassus derives it from King Latinus, who reigned about the time of the Trojan war. But whatever be in this, it is certain, that Latium, when under Æneas and his descendants, or the Alban kings, contained only the Latins, exclusive of the Æqui, Volsci, Hernici, and other people; only that Æneas reckoned the Rutuli, after their conquest, among the Latins. And this constituted the ancient Latium, confined to the Latins; but afterwards, under the kings, and after their time, it reached from the Tiber to Cervice. Under the consuls, the country of the Æqui, Volsci, Hernici, &c. after long and bloody wars, was added to Latium, under the appellation adjectitious or superseded Latium, as far as the river Liris, the eastern boundary, and to the north as far as the Marsi and Sabines. The various people, which in succession occupied
The Romanists say, "They honour God with the worship of latria, and the saints with the worship of dulia." But the terms, however distinct, are usually confounded.

The worship of latria, besides its inner characters, has its external marks to distinguish it; the principal whereof is sacrifice, which cannot be offered to any other but God himself, as being a solemn acknowledgment or recognition of the sovereignty of God, and our dependence on him.

Mr Daille seems to own, that some of the fathers of the fourth century allowed the distinction between latria and dulia.

Latrixæ, were public houses of office, or necessary, amongst the Romans. We do not find, in the writings or buildings that remain of antiquity, that they had any privies in their dwellings. The latrixæ were public places where the slaves washed and emptied their masters' close stools. We are pretty well assured that the Romans had public places of convenience, which were covered over, and had a sponge hanging up in them for cleanliness. Rich men had close stools, which were taken away occasionally to the common sewers.

Latinumæ, a game amongst the Romans, of much the same nature with our chess. The latinumæ were properly the chess men, called also latriomes and calculi. They were made of glass, and distinguished by black and white colours. Sometimes they were made of wax or other convenient substances. Some give the invention of this game to Palamedes when at the siege of Troy: Seneca attributes it to Chilon, one of the seven Grecian sages; others honour Pyrrhus with the invention; and others again contend that it is of Persian origin—but is not this Lis de luna coprarna? Frequent allusions to this game are met with in the Roman classics, and a little poem was written upon it, addressed to Piso, which some say was the work of Ovid, others of Lucan, in the end of some editions of whose works it is to be found, and to which we refer for a fuller account of the game. This game expresses so well the chance and order of war, that it is, with great appearance of probability, attributed to some military officer as the inventor. One Canius Julius was so exceedingly fond of chess, that after he was sentenced to death by Caligula, he was found playing, but interrupted in his game by a call to execution; he obeyed the summons, but first desired the centurion who brought the fatal order, to bear witness that he had one man upon the board more than his antagonist, that he might not falsely brag of victory when he should be no more.

Lattæ denotes iron plates tinned over, of which ten canisters are made.

Plates of iron being prepared of a proper thinness, are smoothed by rusting them in an acid liquor, as common water made eager with rye. With this liquor they fill certain troughs, and then put in the plates, which they turn once or twice a day, that they may be equally rusted over. After this they are taken out, and well scoured with sand; and, to prevent their rusting again, are immediately plunged into pure water, in which they are to be left till the instant they are to be tinned or blanched; the manner of doing which is this: They flux the tin in a large iron crucible, which
has the figure of an oblong pyramid with four faces, of which two opposite ones are less than the other two. The crucible is heated only from below, its upper part being luted with the furnace all round. The crucible is always deeper than the plates which are to be tinned are long; they always put them in downright, and the tin ought to swim over them; to this purpose artificers of different trades prepare plates of different shapes, though Mr. Reaumur thinks them all exceptional. But the Germans use no sort of preparation of the iron to make it receive the tin, more than the keeping it always steeped in water till the time; only when the tin is melted in the crucible, they cover it with a layer of a sort of suet, which is usually two inches thick, and the plate must pass through this before it can come to the melted tin. The first use of this covering is to keep the tin from burning; for if any part should take fire, the suet would soon moisten it, and reduce it to its primitive state again. The blanchers say, this suet is a compounded matter. It is indeed a black colour; but Mr. Reaumur supposed that to be only an artifice to make it a secret, and that it is only coloured with soot or the smoke of a chimney: but he found it true so far, that the common unprepared suet was not sufficient; for after several attempts, there was always something wanting to render the success of the operation certain. The whole secret of blanching, therefore, was found to lie in the preparation of this suet; and this at length discovered to consist only in the first frying and burning it. This simple operation not only gives it the colour, but puts it in a condition to give the iron a disposition to be tinned, which it does surprisingly.

The melted tin must also have a certain degree of heat: for if it is not hot enough, it will not stick to the iron; and if it is too hot, it will cover it with too thin a coat, and the plates will have several colours, as red, blue, and purple, and upon the whole will have a cast of yellow. To prevent this, by knowing when the fire has a proper degree of heat, they might try with small pieces of iron; but, in general, use teaches them to know the degree, and they put in the iron when the tin is at a different standard of heat, according as they would give it a thicker or thinner coat. Sometimes also they give the plates a double layer, as they would have them very thickly covered. This they do by dipping them into the tin when very hot the first time, and when less hot the second. The tin which is to give the second coat must be fresh covered with suet; and that with the common suet, not the prepared.

**Litten Brass**, plates of milled brass reduced to different thickness, according to the uses they are intended for.

**Lattimo**, in the glass trade, a name for a fine milk-white glass. There are several ways of making it, but the best of all is this: take 400 weight of crystal frit, 60 pounds of calcined tin, and two pounds and a half of prepared manganese; mix these well with the frit, and set them in a pot in a furnace to melt and refine. At the end of 18 hours this will be purified; then cast it into water, purify it again afterwards in the furnace, and make a proof of it. If it be too clear, add 15 pounds more of calcined tin; mix it well with the metal, and let it stand one day to purify; it will then be of a whiteness surpassing even that of snow, and is fit to work into vessels.

**Latius Primarium**, a right line drawn through the vertex of the section of a cone, within the same, and parallel to the base.

**Latius Transversarium** of the hyperbola, is the right line between the vertices of the two opposite sections, or that part of their common axis lying between the two opposite cones.

**Lava**, a stream of melted minerals which runs, out of the mouths, or bursts out through the sides, of burning mountains, during the time of an eruption. See *Aetna, Vesuvius, Hecla*, and see also *Volcano, Geology Index*.

The lava at its first discharge is in a state of prodigious ignition, greatly superior to anything we can have an idea of from the small artificial furnaces made by us. Sir William Hamilton informs us, that the lava of Vesuvius, at the place whence it issued (in the year 1767), "had the appearance of a river of red hot and liquid metal, such as we see in the glass houses, on which were large floating cinders half lighted, and rolling one another with great precipitation down the side of the mountain, forming on the whole a most beautiful and uncommon cascade." Now, if we consider the materials of which the lava consists, which undoubtedly are the common matters to be found everywhere in the earth, namely, stones, metallic ores, clay, sand, &c. we shall find that our hottest furnaces would by no means be able to bring them into any degree of fusion; since the materials for glass cannot be melted without a great quantity of very fusible salts, such as alkalies, nitre, &c. mixed along with them. The heat of a volcano must therefore be immense; and besides its heat, it is sometimes attended with a very uncommon circumstance; for Sir Exceded Hamilton informs us, that "the red-hot heat of stones thrown up by Vesuvius on the 31st of March 1766, were perfectly transparent;" and the like remark be makes on the vast stream of lava which issued from the same volcano in 1779. This we cannot look upon to be the mere effect of heat; for more heat with us will not make a solid body transparent; and these stones, we are sure, were not in a state of fusion, or the resistance of the air would have broke them all to pieces, even supposing them, which is very improbable, to have been in that state detached from the rest of the lava. For the transparency, therefore, (according to some authors) we must have recourse to electricity; which in some of our experiments hath the property of rendering opaque bodies transparent. Indeed it is scarcely possible but the lava and every other matter thrown out of a volcano must be in the highest degree electrical, if the fire itself takes its rise from electricity.

The lava, after having once broke out, does not constantly continue running from the same vent, but in a highly electrified state often has intermissions, after which it will burst out sometimes at the same place, and sometimes at another. No real flame ever appears to come from the lava. In the day time its progress is marked by a thick white smoke, from which the light of the red-hot matter being reflected in the night time, makes it appear like flame. But if, during its progress, it meets with trees or other combustible substances, which it frequently does, a bright flame immediately issues from its
its surface, as hath also been remarked by Sir William Hamilton.—This liquid substance, after having run pure for about 100 yards (more or less, in doubt, according to different circumstances), begins to collect cinders, stones, and a scum is formed on the surface. Our author informs us, that the lava which he observed, with its scum, had the appearance of the river Thames, as he had seen it after a hard frost and a great fall of snow, when beginning to thaw, carrying down vast masses of snow and ice. In some places it totally disappeared, and ran in a subterraneous passage formed by the scum for several paces; after which it came out pure, having left the scum behind, though a new one was quickly formed. This lava at the farthest extremity from its source did not appear liquid, but like a heap of red-hot coals, forming a wall in some places 10 or 12 feet high, which rolling from the top soon formed another wall, and so on.—This was the appearance also put on by the lava which issued in the great eruption of 1783 in Iceland; with this difference, that the wall was at one time 210 feet high, and the general thickness of it was more than 100: (See Mr. C. A.). While a lava is in this state, Sir William is of opinion, that it is very practicable to divert it into another channel, in a manner somewhat similar to what is practised with rivers. This he was afterwards told had been done with success during the great eruption of Etna in 1669: that the lava was directing its course towards the walls of Catania, and advancing very slowly, when they prepared a channel for it round the walls of the town, and turned it into the sea. A succession of men, covered with sheep skins wetted, were employed to cut through the tough flanks of lava, till they made a passage for that in the centre, which was in perfect fusion, to disgorgie itself into the channel prepared for it. But this, it is evident, can only take place in small streams of this burning matter; with that above mentioned it would have been impossible. It has been also observed of the lavas of Etna, that they do not constantly fall down to the lowest places, but will sometimes ascend in such a manner as to make the valleys rise into hills. On this Sir William Hamilton has the following note: “Having heard the same remark with regard to the lavas of Vesuvius, I determined, during an eruption of that volcano, to watch the progress of a current of lava, and I was soon enabled to comprehend this seeming phenomenon, though it is, I fear, very difficult to explain. Certain it is, that the lavas, while in their most fluid state, follow always the courses of other fluids; but when at a great distance from their source, and consequently encumbered with scoria and cinders, the air likewise having rendered their outward coating tough, they will sometimes (as I have seen) be forced up a small ascent, the fresh matter pushing forward that which went before it, and the exterior parts of the lava acting always as conductors (or pipes, if I may be allowed the expression) for the interior parts, that have retained their fluidity from not being exposed to the air.”

From the year 1767 to 1779, this gentleman made many curious observations on the lavas of Vesuvius. He found, that they constantly formed channels in the mountain as regular as if they had been made by art; and that, whilst in a state of perfect fusion, they continued their course in those channels, which sometimes fell to the brim, and at others more or less as according to the quantity of matter thrown out. These channels, after small interruptions, were generally from two to five or six feet wide, and seven or eight in depth. They were often fed from the sight by a quantity of scoriam that had formed a crust over them, and the lavas, having been conveyed in a covered way for some yards, came out again fresh into an open channel. Our author informs us, that he had walked in some of these subterraneous galleries, which were exceedingly curious, the sides, top, and bottom, being exceedingly smooth and even: others were incrusted with what he calls very extraordinary scoriam, beautifully ramified white salts in the form of dropping stalactites, &c.

On viewing a stream of lava while in its fluid state in the month of May 1779, he perceived the operation of it in the channels above described in great perfection. After quitting it, it spread itself in the valley, and ran gently like a river that had been frozen, and had masses of ice floating upon it. The wind happening then to shift, our traveller was so incommoded by the smoke, that the guide proposed to cross it, which was instantly put in execution without any inconvenience than the violent heat with which the legs and feet were affected. The crust was so tough, that their weight made no impression upon it, and the motion so slow that they were in no danger of falling. This circumstance, according to Sir William, points out a method of escape should any person happen to be enclosed between two lavas, but ought never to be tried except in cases of real necessity; and indeed, if the current of melted matter was very broad, must undoubtedly be attended with extreme danger, both from the heat of the upper crust and the chance of its breaking and falling down with the passenger into the burning liquid below. That which Sir William Hamilton crossed was about 50 or 60 feet broad.

Having passed this burning stream, our travellers walked up along the side of it to its very source. Here they saw it boiling and bubbling violently up out of the ground, with a hissing and crackling noise like that which attends the playing off an artificial fire work. A billock of about 15 feet high was formed by the continual splashing up and cooling of the vitrified matter. Under this was an arched hollow, red hot within, like a heated oven; the lava which ran from it being received into a regular channel raised upon a sort of wall of scoriam and cinders, almost perpendicularly, of about the height of 8 or 10 feet, and much resembling an ancient aqueduct. On quitting this fountain of lava, they went quite up to the crater, where as usual they found a little mountain throwing up stones and red-hot scoriam with loud explosions; but the smoke and smell of sulphur were so intolerable, that they were obliged to quit the place with precipitation.

By the great eruption in August 1779, the curious channels above mentioned were entirely destroyed, the cone of the mountain was covered with a stratum of lava full of deep cracks, from whence continually issued a sulphurous smoke that tinged the scoriam and cinders with a deep yellow, or sometimes white tint. The lava of this eruption appeared to be more perfectly vitrified than that of any former one he had observed.
The pores of the fresh lava were generally full of a perfect vitrification, and the scoriæ themselves, viewed through a magnifying glass, appeared like a confused heap of filaments of foul vitrification. When a piece of the solid lava had been cracked in its fall, without separating entirely, fibres of perfect glass were always observed reaching from side to side within the cracks. The natural spun glass which fell in some places along with the ashes of this eruption, and which has likewise been observed in other places, he is of opinion must have proceeded from an operation of the kind just mentioned; the lava cracking and separating in the air at the time of its emission from the crater, and by that means spinning out the pure vitrified matter from its pores or cells; the wind at the same time carrying off the filaments of glass as fast as they were produced.

Our author observed a kind of pumice stone sticking to some very large fragments of the new lava. On close inspection, however, he found that this substance had been forced out of the minute pores of the solid lava itself; and was a collection of fine vitreous fibres or filaments confounded together at the time of their being pressed out by the contraction of the large fragments of lava in cooling, and which had been bent downwards by their own weight. This curious substance (says he) has the lightness of a pumice, and resembles it in every respect, except that it is of a darker colour. When the pores of this lava were large, and filled with pure vitrified matter, the latter was sometimes found blown into bubbles on the surface; probably by the air which had been forced out at the time the lava contracted itself in cooling; and from these thin bubbles it appeared, that this kind of volcanic glass has much the same transparency with our common glass bottles, and like them is of a dirty yellow colour; but when large pieces of it were broken off with a hammer, they appeared perfectly black and opaque.

In the lava of this eruption it was observed, that many detached pieces were in the shape of a barley-corn or plum stone, small at each end, and thick in the middle. Some of these did not weigh above an ounce; but others could not be less than 60 pounds. Our author took them to be drops from the liquid fountain of fire, which might naturally acquire such a form in their fall. There were also many other curious vitrifications, different from any he had seen before, mixed with this huge shower of scoriæ and masses of lava.

In treating of Mount Etna, M. Houel makes mention of a piece of lava which, after having been once ejected by the volcano, was swallowed up, and thrown out a second time. The intense heat to which it was then subjected, had such an effect upon it, that it appeared all full of chinks to a considerable depth, and which run at right angles to one another. He had also an opportunity of observing to great advantage some of the hollow channels formed by the lavas of Etna, similar to those described by Sir William Hamilton, but on a much larger scale. Here the great eruption of water in 1755 had overturned, in a vertical direction, a huge tube of this kind for the length of half a mile. The tube itself appeared to be composed of enormous masses, somewhat resembling planks; each two feet thick and twelve or fifteen in breadth, continued in a straight line through the whole of that space. At the same time by the action of the lava a kind of walls had been formed, from ten to sixteen feet in height, and curved at the top. Some of these walls appear rolled together like paper; and M. Houel is of opinion, that these various appearances on the surface of the lava when cooled, must have arisen from particles heterogeneous to the real lava; and which detach themselves from it, rising to the surface under a variety of forms proportioned to the spaces of time taken up in cooling. These crusts are formed of different kinds of scoriæ and dirty lava, mixed with sand or ashes. At the same place are also found great numbers of small pieces like those of ice heaped upon one another after having floated for some time on a river. Beneath these the pure lava is met with, and which has evidently been in a state of perfect fusion. This is extremely dense; and by looking narrowly into its chinks, the composition of the whole appears to be merely homogeneous. It is curious (says he) to observe, so near one species of lava which is very pure, another which has likewise arrived at the same place in a fluid state, and has there undergone so great a change as scarce to retain an appearance of its original state. It is, however, like iron dress, in grains of unequal sizes. We find it also at various distances, such as one, two, or more hundred fathoms. It is sometimes found in large pieces like tables, covered over with sharp points, some longer, and others shorter. All these pieces are quite detached from one another, as if they had been brought together and scattered from a tumbril. The matter of which the crust of the lava is formed, seems to have issued from it in the same manner in which froth rises upon solution of soap in water. It appears afterwards to have swelled, burst, and assumed its present form, presenting to the view various spaces filled with small loose stones. A great number of new lavas were likewise observed, all of them putting forth various kinds of efflorescences in great quantity.

The hardness, density, and solidity of lavas, no doubt proceed from the degree of heat to which they have been exposed, and which seems to be greater or less according to their quantity. Hence the Icelandic volcanoes, which pour forth the greatest quantities of lava, produce it also in the greatest degree of liquification, and Dr Van Trol observes, that what he saw must have been liquefied to an extreme degree.

The composition of the lavas of different volcanoes, and even of different parts of those of the same volcano, is extremely different. Sir William Hamilton is of opinion that this difference in composition contributes not a little to the facility or difficulty with which they afterwards receive earth capable of vegetation. Some (says he) have been in a more perfect state of vitrification than others, and are consequently less liable to the impressions of time. I have often observed on Mount Vesuvius, when I have been close to a mouth from whence the lava was disgorgeing itself, that the quality of it varied greatly from time to time. I have seen it as fluid and coherent as glass when in fusion; and I have seen it farinaceous, the particles separating as they forced their way out, just like meal coming from under the grindstone. A stream of lava of this
sort being less compact, and containing more earthy particles, would certainly be much nearer fit for vegetation than one composed of the more perfect vitrified matter."

Mr. Bergman, who has accurately analyzed some Icelandic lavas, informs us, that one kind is very coarse, heavy, and hard, full of bladders, almost black, intermixed with white grains resembling quartz, which in some places have a figure not very unlike a square. This black matter is not attracted by the magnet; but if a piece of it is held against a compass, the needle visibly moves. When tried in the crucible, it yields from ten to twelve pounds of iron in every hundred weight. It does not dissolve in the least with sal soda, and very difficultly with borax, and scarcely at all with urinous salt. It seems to contain a great deal of clay in its composition, which may be extracted by all acid solvents. This last he is likewise, from experiments, assured is the case with the lava of Solfaterra in Italy.

The white lava, which possesses more or less of those transparent grains or rays with which lavas are generally chequered, does not seem to be of the nature of quartz, as it cannot be attacked by sal soda; it is, however, soluble with some difficulty by borax and fusible urinous salt, or microcosmic acid. These effects are perfectly similar to those produced upon the diamond, ruby, sapphire, topaz, and hyacinth. The chrysolite, garnet, tourmaline, and schoeit, can neither be dissolved by sal soda, though they are somewhat attacked by it when reduced to a fine powder; and upon the two last-mentioned ones it produces a slight effervescence; on which account, says Mr. Bergman, it is possible that the precious stones found upon Mount Vesuvius, which are sold at Naples, are nearer related to the real precious stones than is generally imagined. He found no such grains in a finer kind of lava, quite porous within, and entirely burnt out, and considerably lighter than the former ones.

The Iceland agate is of a black or blackish brown colour, a little transparent at the thin edges like glass, and gives fire with steel. It cannot easily be melted by itself; but becomes white, and flies in pieces. It can hardly be dissolved in the fire by fusible urinous salt; but it succeed a little better with borax, though with some difficulty. With sal soda it dissolves very little, though in the first moments some effervescence is perceived, and the whole mass is afterwards reduced to powder. Hence Mr. Bergman concludes that, this agate must have been produced by an excessive fire out of the black lava formerly mentioned.

In the Iceland jasper-stone, quartz and crystals were often found, particularly in the black and reddish brown kind. The stones thrown out of the volcano, whether gray, or burnt brown, seemed to consist of a hardened clay, mixed with a siliceous earth. They were sprinkled with rays and grains resembling quartz, and some few flakes of mica. They fused with great difficulty in the fire; with sal soda they showed some effervescence at first, but which ceased in a short time. The parts resembling quartz produced no motion at all; from whence Mr. Bergman concludes, that the black lava already mentioned proceeds principally from this mass. Several other stones which were sent him from Iceland, Mr. Bergman supposed to have no connexion with the eruptions, but to have been produced some other way.

In Mr. Forster's travels through Italy, we are informed, that he has seen species of lava so exactly resembling blue iron slag, that it was not to be distinguished from them but with great difficulty. The same author tells us likewise; "that the Vicentine and Venetian lavas and volcanic ashes contain enclosed several sorts of fire-striking and flint horn-stones, of a red, black, white, green, and variegated colour, such as jasper and agates; that hyacinths, chrysolites, and piétre obsidienne, described by Mr Arduini in his Giornale d'Italia, are found at Leonato; and that chalcedony or opal pebbles, and nodules with enclosed water drops, (chaledoni o pelli enhydri), are dug out of the volcanic cineritious hills near Vicenza."

M. Dolomieu considers the chemical analysis of lava. When subjected to the mica's optical force of fire a second time, they are all of them reducible to the same kind of glass; from which it has been concluded, that all volcanic products have been formed of the same kind of materials, and that the subterraneous fire has always acted on and variously modified the same kind of stone. But an analysis by fire, he justly observes, is of all others the most fallacious. The substances are all fusible, and we have no proper methods of measuring the intensity of our fire; so that the same substance which to-day may come out of our furnaces untouched, may to-morrow be found completely altered, even though the fire employed should not appear to us to be any more violent than the former. Analyses by different means have not been more successful. Mr. Bergman has indeed analyzed Mr. Bergman's lava with acids, and gives with astonishing precision the following result, viz. that a hundred parts of lava contain forty-nine of siliceous earth, thirty-five of argilaceous earth, four of calcareous earth, and twelve of iron. These experiments, however, our author observes, give us no information with regard to lavas in general. They only show the composition of the particular specimen that he tried; and even after the descriptions that he has given, we are a good deal at a loss to discover the species of lava which he subjected to analysis. "It would be as ridiculous (says M. Dolomieu), to apply this analysis to every volcanic product, as it would be to believe that the component parts of a fissile rock were the same with those of every rock composed of limestone or thin strata." For these reasons he is of opinion, that, in order to understand the nature of lavas, we should consider not only that of the lavas themselves, but of the bases on which they rest. Had this been done, we would have found that the volcanic fires generally exist in beds of argilaceous schistus and horn-stone; frequently in a species of porphyry, the gluten of which is intermediate between volcanic horn-stone and petrosilex; containing a large quantity of schoeit, feldspar, and greenish quartz or chrysolite, in little rounded nodules. These substances, he tells us, would have been found in those mountains which are called primitive, and in strata buried under beds of calcareous stone; and, among other things, would have convinced us that the fluidity of lavas does not make them lose the distinctive characters of their bases. In the mountains called Primitive, those rocks which

Vol. XI. Part II.
are assigned as the bases of the mere common lavas are found intermixed with micaceous ones, with gneiss, granite, &c. and they generally rest on masses of granite. Hence lavas must consist of all these matters, and the fire must act upon them all whenever it meets with them. Our author has constantly observed, that volcanoes situated at the greatest distance from the centre of the chain or group of mountains on which they are established, produce lavas of a more homogeneous composition, and less varied, and which contain most iron and argillaceous earth. Those, on the contrary, placed nearer the centre, are more diversified in their products; containing substances of an infinite variety of different kinds. The seat of the fire, however, he observes, does not long continue among the granites, the inflammation being either extinguished, or returning to the centre of the schistus rocks in its neighbourhood.

From this knowledge of the materials of which lavas are composed, we acquire also a considerable knowledge of the matters that are found in greatest quantity in the bowels of the earth. The excavations made by mines, &c. on the surface of the earth, are mere scratches in comparison of the depths of volcanic fires; and as he considers the mountains themselves as the productions of those fires, it thence follows, that by attentively examining the materials of which they are composed, we may thence determine what kind of substances are most common at these great depths in the earth.

Thus our author thinks it probable, that schoolers and porphyries, though rare on the surface, are very common in the internal parts of the earth. As an instance of the truth of his observations, our author informs us, that he was convinced, from no other circumstance but merely inspecting the lavas of Mount Etna, that in some parts of the island of Sicily, there existed granites, porphyries, with schistus and argillaceous horn-stones. In this opinion he persisted, notwithstanding the generally opposite sentiments of the inhabitants themselves. He searched in vain three-fourths of the island; and at last found that all the mountains, forming the point of Sicily called Pelorus, contain rocks of the kind above mentioned. He then saw that the base of these mountains was produced under Mount Etna on one side, and under the Lipari islands on the other. "We must, therefore, (says he) believe, that these mountains have furnished the materials on which the volcanoes have, for thousands of years, exerted their power."

By travelling among those elevations called the Neptunian Mountains, or Mons Pelorus, he was enabled to discover the reason why the products of Etna and the Lipari islands differ from one another. This, he says, is the unequal distribution of the granite and schistus rocks among them. The islands rest almost immediately on the granite, or are separated from it by a very thin stratum of argillaceous rock which contains porphyry; but the Sicilian volcano is situated on the prolongation of the schistus rock, which it must pierce before it reaches the granite; and accordingly very little of its lava seems to have granite for its basis. If the seat of the fire was still more distant from the centre of the mountains, their lavas would be more homogeneous; because the schist, which succeeds to the horn-stone, is less various, and hardly includes any bodies foreign to its own substance. Thus the lavas, in the extinguished volcanoes of the Val di Noto, which lie 15 leagues to the south-east of Etna, contain neither granite nor porphyry; but have for their bases simple rocks, with particles of chrysolite and some schoolers.

To the granites which extend to Metazzo, opposite to Lipari, he ascribes the formation of pumice; as they contain an immense quantity of scaly and micaceous rocks, black and white, with fossil granites or gneiss; the basis of which is a very fusible feldspar; and these he supposes to be the proper materials of the pumice, having found pieces of them almost untouched in pumice-stones. There are beds of almost pure feldspar; to the semivitrification of which he ascribes an opaque enamel like lava mentioned in other parts of his works. Few porphyries, however, he acknowledges, are to be met with among the Neptunian mountains, though these stones abound in the lavas of Etna. "They are not distant (says he) from the granites; and those I have found have neither the hardness nor perfection of those pieces which I gathered in the gullies, and which had been apparently washed out of the anterior parts of the mountain by water. But though the porphyries I saw here bear no proportion to those in the products of Etna, I was sufficiently convinced of their existence, and their analogy with those of volcanoes, by discovering that the centre of these mountains contains a great number of them. Porphyries, in general, are very rare on the surface of the earth. Nature generally conceals them from us by burying them under calcareous strata, or by enclosing them in schistus rocks with which they are almost always mixed: but we are indebted to the labour of volcanoes for informing us that they are among the most common substances in the bowels of the earth; and they are never so much disguised by the subterranean fire as to be mistaken in the lavas of which they form the basis."

For an account of volcanic productions, see Mineralogy. Index.

The quantity of matter thrown out from volcanoes under the name of lava is prodigious. After the great eruption of Etna, in 1669, Borelli, from Pisa to Sicily, to observe the effects of it. The matter thrown out at that time amounted to 93,830,750 cubic paces; so that had it been extended in length on the surface of the earth, it would have reached more than four times round the whole earth. All this matter, however, was not lava, but consisted also of sand, stone, gravel, &c. The lava he computed at 6,400,000 paces, which formed a river, according to our author, sometimes two miles broad; but according to others, it was six or seven miles broad, and sometimes 20 or 30 yards in depth. Sir William Hamilton informs us, that the lavas of Etna are very commonly 15 or 20 miles in length, six or seven in breadth, and 30 feet deep. The most considerable is scarce less than 30 miles long and 15 broad. The most considerable lavas of Vesuvius do not exceed seven miles in length. The same author, however, tells us, that the lava which issued from Vesuvius in 1707, was six miles long, two in breadth, and in most places 60 or 70 feet deep. In

**BOTANY Index.**

LAVATER, John Gaspard Christian, best known by his writings on physiognomy, was born at Zurich in Switzerland, in 1741. He was brought up a Protestant minister, and entered into holy orders in 1761. He was for some time pastor of the orphans church in that city; but from the year 1778, he was deacon and pastor of St Peter's church in the same place. The eloquence of his discourses in the pulpit procured for him an early reputation, as well as the ardent zeal and Christian benevolence with which he discharges the duties of his office. Though not much conversant with books, he had a very extensive knowledge of human nature, and a most acute discernment. His theological writings in prose and verse are little known, but his works on physiognomy have extended his fame throughout every part of Europe. We are informed by himself, that he felt an early propensity to study the human face, and frequently drew much features as made a peculiar impression upon his mind; but his choice of physiognomy was fixed by the suggestion of Dr Zimmerman, who, having heard his remarks on the singular countenance of a soldier whom they saw passing by as they stood together at a window, urged him to pursue and methodise his ideas. He soon acquired a full conviction of the reality of physiognomical science, and of his own discoveries in it. His first volume on this subject appeared at Leipzig in 1776, and the 20 sections of which it was composed he modestly denominated fragments. With him it appeared to be an axiom, "that the powers and faculties of the mind have representative signs in the solid parts of the countenance." This notion he extended to all animated nature, firmly believing that internal qualities invariably denote themselves by external marks or tokens.

Two more volumes soon appeared in succession, containing a wonderful assemblage of curious observations, refined reasoning, delicate feeling, and philanthropic sentiments, with a number of engravings highly finished and singularly expressive. This work was well translated into the French and English languages, and was for some time the favourite topic of literary discussion. So much was its author admired, that no foreigner of distinction passed through Zurich without obtaining an interview with Lavater, and asking his opinion of some character from a shade or miniature. His huge volumes, however, are now seldom looked at except for the sake of the plates, and his physiognomical notions appear to be consigned to oblivion with other sciences of a chimerical nature. One of the best known of his miscellaneous publications is his Aphorisms on Man, which contain originality both of sentiment and expression, with deep and philosophical views of human nature.

Lavater was zealously attached to the Christian revelation, and translated Bonnet's Enquiry into the Evidence of Christianity, into the German language. This book is dedicated to the celebrated Jewish philosopher, Moses Mendelssohn, with a challenge either to refute it publicly, or profess his conviction of the truth.
LAVATER of its arguments. This challenge he afterwards confessed to have been inconsiderate, and that his zeal had misled him. His popularity at Zurich was so extremely great, that in his walks it was no uncommon thing to see the people flocking around him, and kissing his hand in token of respect. He had a most exemplary moral character, and his zeal in doing good was scarcely ever surpassed. He was mild and moderate in conversation, although naturally full of fire and sensibility; he was candid in his estimate of such as differed from him in opinion; he always rose early, and never took his breakfast till he thought he had earned it. He was the determined enemy of tyranny in every shape, being possessed of the genuine Swiss zeal for liberty. He was therefore a friend to the French revolution at its commencement; but the rapine, plunder, and bloodshed which afterwards disgraced it, made him one of its bitterest antagonists. On the day when the unfortunate city of Zurich was stormed by Massena in 1799, he received a wound in the breast from a Swiss soldier in the streets, to whom he had formerly been a benefactor. He never wholly recovered from the effects of this wound; and he brought on a train of dangerous symptoms by attending for more than an hour, in the open air, a man who was condemned to be shot as a spy. The activity and vigour of his mind, however, continued till a short time before his death, which took place on the 2d of January, 1801.

LAVATERA, a genus of plants, belonging to the polyadelpheia class, and in the natural method ranking under the 37th order, Columniferas. See Botany Index.

LAVATORY, or Lavadero, a name given to certain places in Chili and Peru, where gold is got out of earth by washing.

M. Frézier gives us the following description of the lavatories of Chili:—They dig deep into the earth, in such places as have reason to expect gold in; and, in order to facilitate this digging, turn a stream of water upon the spot, loosening the earth as much as possible all the time, that the current may have the greater effect, and tear up the earth more strongly. When they are got to the earth they want, they turn off the stream, and dig dry.

The earth that they now get, is carried on mules, and discharged into a basin, made somewhat in the manner of a smith’s bellows; into which a little rivellet of water runs with a great deal of rapidity, dissolving the parts of the earth, and carrying every thing away with it, excepting the particles of gold, which, by their great weight, precipitate to the bottom of the basin, and mix with fine black sand, where they are almost as much hidden as they were before in the earth.

Sometimes they find very considerable pieces in lavatories, particularly pieces of twenty-four ounces each. There are several lavatories, where they find peptias, or pieces of virgin gold, of a prodigious size. Among others, they tell of one that weighed 512 ounces, bought by the count de la Moncloa, viceroy of Peru.

Nine or ten leagues to the east of Coquimbo, are the lavatories of Andacoll, the gold whereof is 23 carats fine. Their works here always turn to great profit, except when the water fails them.—The natives maintain that the earth is creative, that is, it produces gold, continually; because, after having been washed 60 or 80 years, they find it impregnated afresh, and draw almost as much out of it as at first.

LAUBACH, a handsome and strong town of Germany, in the circle of Austria, and in Carniola, with a bishop’s see, a castle, and very handsome houses. It is seated on a river of the same name, wherewith are the largest crayfish in Europe. E. Long. 14. 45. N. Lat. 46. 10.

LAUD, WILLIAM, archbishop of Canterbury in the 17th century, was born at Reading in 1573, and educated in St John’s college, Oxford, of which he was afterwards a fellow and grammar reader. In 1610, he went into orders. In 1611, he was elected president of St John’s college; but his election being disputed, it was confirmed by his majesty. The same year he was sworn the king’s chaplain. In 1621, he was nominated bishop of St David’s. In 1628, he was translated to the bishopric of London. In 1630, he was elected chancellor of the university of Oxford. In 1633, he attended the king into Scotland, and was sworn a privy councillor for that kingdom. During his stay in Scotland, he formed the resolution of bringing that church to an exact conformity with the church of England. In the same year, he succeeded Archbishop Abbot in the see of Canterbury; and soon after came out his majesty’s declaration about lawful sports on Sundays, which the archbishop was charged with having revived and enlarged, and that with the vexations prosecutions of such clergymen as refused to read it in their churches. In 1634-5, the archbishop was put into the great committee of trade and the king’s revenue; on the 4th of March following, he was appointed one of the commissioners of the treasury; and on the 6th of March 1635, he received the staff of lord high treasurer of England. In order to prevent the printing and publishing what he thought improper books, he procured a decree to be passed in the star-chamber, on the 11th of July 1637, whereby it was enjoined that the master printers should be reduced to a certain number, and that none of them should print any books till they were licensed either by the archbishop or the bishop of London, or some of their chaplains, or by the chancellors or vice chancellors of the two universities. A new parliament being summoned, met on the 13th of April 1640; and the convocation the day following; but the commons launching out into complaints against the archbishop, and insisting upon a redress of grievances before they granted any supply, the parliament was dissolved on the 7th of May. The convocation, however, continued sitting; and made 17 canons, which were supposed to be formed under the immediate direction of the archbishop. In the beginning of the long parliament he was attacked on account of those canons: and they being condemned by the house of commons on the 16th of December 1640, “as containing many things contrary to the king’s prerogative, to the fundamental laws and statutes of this realm, to the rights of parliament, to the property and liberty of the subject, and tending to sedition, and of dangerous consequences,” he was, on the 18th of December, accused by the commons of high treason, and sent to the Tower.
Being tried before the house of lords, for endeavouring to subvert the laws, and to overthrow the Protestant religion, he was found guilty, and beheaded on Tower-hill on January 10th following, in the 72d year of his age. This learned prelate, notwithstanding his being charged with a design to bring in Popery, wrote an Answer to Dr Fisher, which is esteemed one of the best pieces that has been printed against that religion. He was temperate in his diet, and regular in his private life: but his fondness for introducing new ceremonies, in which he showed a hot and indiscreet zeal, his encouraging of sports on Sundays, his illegal and cruel severity in the star-chamber and high commission courts, and the fury with which he persecuted the dissenters, and all who presumed to contradict his sentiments, exposed him to popular hatred. Besides his Answer to Fisher, he published several sermons, and other works.

LAUDANUM. See OPium, MATERIA MEDICA

LAUDATIO, in a legal sense, was anciently the testimony delivered in court of the accused person’s good behaviour and integrity of life. It resembled the custom, which prevails in our trials, of calling persons to speak to the character of the prisoner. The least number of the tautologos among the Romans was ten.

LAUDER, William, a native of Scotland, was educated at the university of Edinburgh, where he finished his studies with great reputation, and acquired a considerable knowledge of the Latin tongue. In May 22, 1734, he received a testimonial from the heads of the university, certifying that he was a fit person to teach humanity in any school or college whatever. In 1739 he published at Edinburgh an edition of Johnston’s Psalms. In 1742, he was recommended by Mr Patrick Cumming and Mr Colin MacLaurin, professors of church history and mathematics, to the mastership of the grammar school at Dundee, then vacant. Whether he succeeded in his application or not, is uncertain: but a few years afterwards we find him in London, contriving to ruin the reputation of Milton; an attempt which ended in the destruction of his own. His reason for the attack probably sprung from the virulence of a violent party-spirit, which triumphed over every principle of honour and honesty. He began first to retail part of his design in the Gentleman’s Magazine, 1747; and finding that his forgeries were not detected, was encouraged in 1751 to collect them, with additions, into a volume, entitled “An Essay on Milton’s Use and Imitation of the Moderns in his Paradise Lost,” 8vo. The fidelity of his quotations had been doubted by several people; and the falsehood of them was soon after demonstrated by Dr Douglas, in a pamphlet, entitled “Milton Vindicated from the Charge of Plagiarism brought against him by Lauder, and Lauder himself convicted of several Forgeries and gross Impositions on the Public: In a Letter Humbly addressed to the Right Honourable the Earl of Bath, 1751,” 8vo. The appearance of this Detection overthrew Lauder with confusion. He subscribed a confession, dictated by a learned friend, wherein he ingenuously acknowledged his offence, which he professed to have been occasioned by the injury he had received from the disappointment of his expectations of profit from the publication of Johnston’s Psalms. This misfortune he ascribed to a couplet in Mr Pope’s Dunciad, Book iv. ver. 3, and from whence originated his rancour against Milton. He afterwards imputed his conduct to other motives; abused the few friends who continued to countenance him; and, finding that his character was not to be retrieved, quitted the kingdom, and went to Barbadoes, where he some time taught a school. His behaviour there was mean and despicable; and he passed the remainder of his life in universal contempt. “He died (says Mr. Nicholas) some time about the year 1771, as my friend Mr Reed was informed by the gentleman who read the funeral service over him.”

LAUDICENI, amongst the Romans, applauders, who for reward entered the rehearsal-rooms, attended the repetition of plays, and were in waiting when orations were pronounced, in order to raise or increase the acclamation and applause.

LAUDOHN, FIELD MARSHAL, a celebrated general in the Imperial service, born in 1716, was a native of Livonia, and descended from a Scottish family. He made his first campaigns under Marshal Muuith, in the war of 1736, between the Russians and Turks; and was at the taking of Oczkow, Choczim, and Sadowitzhane, where the Turks were entirely defeated. Frederick the Great refused, in 1741, to take young Laudohn into his service, saying he did not like his countenance; though this monarch, who was considered as the greatest general of his age, afterwards said, that he often admired the positions of other generals, but that he had ever dreaded the battles of Laudohn. In 1756, when but just entered into the service of the house of Austria, with the rank of lieutenant-colonel, he made such a rapid progress, that within less than a year he was a general of artillery, and within three years commander in chief of the whole army. He rescued Olmutz, when besieged by the Prussians; beat the king himself at Frankfort on the Oder; at Zornedorf, took General Fouquet prisoner; carried Glatz and Schweinditz by assault; and stopped the progress of Frederick in a war which might have proved fatal to the house of Austria. In 1778, when elevated to the rank of marshal, at the head of 60,000 men, he hindered Henry, brother to the king of Prussia, from joining his army to that of the king. At Dubitzza, Novi, Grandisca, and Belgrade, in the late war between the emperor and the Turks, he had but to present himself before the place, and say with Cesar, Veni, vidi, Vici. But at his head quarters in Moravia, he was seized with a fever, in consequence of an operation he underwent for an obstruction in the urethra. His impatience under the medical applications, the impetuous ardour of his character, and the knowledge, above all, of his importance in the war, contributed to irritate his mind, and promote the violence of the fever. He resisted the application of cataplasms, before and after the incisions were made, with a fatal obstinacy, which raised the inflammation to such a height, that he expired under the accession of the fever on the 14th of July 1792, in the 74th year of his age.

LAUDS; LAUDES, the second part of the ordinary office of the breviary, said after matins; though, here-tofore, it ended the office of the night.

The laudes consist principally of psalms, hymns, &c.
with laughter; if it cause sadness and melancholy, it likewise affects the precordia, and demonstrates itself by causing the glands of the eyes to emit tears. Dr
Willis accounts for the pleasure of kissing from the same cause; the branches of this fifth pair being spread to the lips, the precordia, and the genial parts; whence arises a sympathy between those parts.

The affection of the mind by which laughter is produced is seemingly so very different from the other passions with which we are endowed, that it hath engaged the attention of very eminent persons to find it out.—1. Aristotle, in the fifth chapter of his Poetics, observes of comedy, that "it imitates those vices or meannesses only which partake of the ridiculous:—now the ridiculous (says he) consists of some fault or turpitude not attended with great pain, and not destructive." 2. "The passion of laughter (says Mr Hobbes) is nothing else but sudden glory arising from some sudden conception of some eminency in ourselves, by comparison with the infirmity of others, or with our own formerly. For men (continues he) laugh at the follies of themselves past, when they come suddenly to remembrance, except when we bring with them any sudden dishonour." 3. Akenside, in the third book of his excellent poem, treats of ridicule at considerable length. He gives a detail of ridiculous characters; ignorant pretenders to learning, boastful soldiers, and lying travellers, hypocritical churchmen, conceited politicians, old women that talk of their charms and virtue, ragged philosophers who rail at riches, virtuous intent upon trifles, romantic lovers, wits wantonly satirical, fools that out of vanity appear to be diseased and profligate, dastards who are ashamed or afraid without reason, and fools who are ignorant of what they ought to know. Having finished the detail of characters, he makes some general remarks on the cause of ridicule; and explains himself more fully in a prose definition illustrated by examples. The definition, or rather description, is in these words: "That which makes objects ridiculous, is some ground of admiration or esteem connected with other more general circumstances comparatively worthless or deform'd: or it is some circumstance of turpitude or deformity connected with what is in general excellent or beautiful; the inconsistent properties existing either in the objects themselves, or in the apprehension of the person to whom they relate; belonging always to the same order or class of being; implying sentiment and design, and exciting no acute or vehement commotion of the heart." 4. Hutcheson has given another account of the ludicrous quality, and seems to think that it is the contrast or opposition of dignity and meanness which occasions laughter.

All these opinions are refuted by Dr Beattie in his Essay on Laughter and Ludicrous Composition, where he has treated the subject in a masterly manner. "To provoke laughter (says he), is not essential either to wit or humour. For though that unexpected discovery of resemblance between ideas supposed dissimilar, which is called wit—and that comic exhibition of singular characters, sentiments, and imagery, which is denominated humour,—do frequently raise laughter, they do not raise it always. Addison's poem to Sir Godfrey Kneller, in which the British kings are likened to heathen gods, is exquisitely witty, and yet not laughable. Pope's Essay
Laughter. 

Laughter. Essay on Man abounds in serious wit; and examples of serious humour are not uncommon in Fielding's History of Parson Adams, and in Addison's account of Sir Roger De Coverley. Wit, when the subject is grave, and the allusions sublime, raises admiration instead of laughter: and if the comic singularities of a good man appear in circumstances of real distress, the imitation of these singularities in the epic or dramatic comedy will form a species of humour, which, if it should force a smile, will draw forth a tear at the same time. An inquiry, therefore, into the distinguishing characters of wit and humour has no necessary connection with the present subject.

"Some authors have treated of ridicule, without marking the distinction between ridiculous and ludicrous ideas. But I presume the natural order of proceeding in this inquiry, is to begin with ascertaining the nature of what is purely ludicrous. Things ludicrous and things ridiculous have this in common, that both excite laughter; but the former excite pure laughter, the latter excite laughter mixed with disapprobation and contempt. My design is to analyze and explain that quality in things or ideas, which makes them provoke proper laughter, and entitles them to the name of ludicrous or laughable."

"When certain objects, qualities, or ideas, occur to our senses, memory, or imagination, we smile or laugh at them, and expect that other men should do the same. To smile on certain occasions is not less natural, than to weep at the sight of distress or cry out when we feel pain.

"There are different kinds of laughter. As a boy, passing by night through a churchyard, sings or whistles in order to conceal his fear even from himself; so there are men, who, by forcing a smile, endeavour sometimes to hide from others, and from themselves too perhaps, their malevolence or envy. Such laughter is unnatural. The sound of it offends the ear; the features distorted by it seem horrible to the eye. A mixture of hypocrisy, malice, and cruel joy, thus displayed on the countenance, is one of the most hateful sights in nature, and transforms the "human face divine" into the visage of a fiend. Similar to this is the smile of a wicked person pleasing himself with the hope of accomplishing his evil purposes. Milton gives a striking picture of it in that well-known passage:

He ceas'd; for both seem'd highly pleased; and Death Grinn'd horrible a ghastly smile, to hear
His famine should be fill'd, and blest his maw
Destin'd to that good hour.

But enough of this. Laughter that makes a man a fiend or a monster, I have no inclination to analyze. My inquiries are confided to that species of laughter which is at once natural and innocent.

"Of this there are two sorts. The laughter occasioned by tickling or gladness is different from that which arises on reading the Tale of a Tub. The former may be called animal laughter: the latter (if it were lawful to adopt a new word which has become very common of late) I should term sentimental. Smiles admit of similar divisions. Not to mention the scornful, the envious, the malevolent smile, I would only remark, that of the innocent and agreeable smile there are two sorts. The one proceeds from the risible emo-

The other is the effect of good humour, complacency, and tender affection. This last sort of smile renders a countenance amiable in the highest degree. Homer ascribes it to Venus in an epithet (φιλοσάρπις), which Dryden and Pope, after Waller, improperly translate laughter-loving; an idea that accords better with the character of a romp or boyden, than with the goddess of love and beauty.

"Animal laughter admits of various degrees; from the gentle impulse excited in a child by moderate joy, to that terrifying and even mortal convulsion which has been known to accompany a change of fortune. This passion may, as well as joy and sorrow, be communicated by sympathy; and I know not whether the entertainment we receive from the playful tricks of kittens and other young animals may not in part be resolved into something like a fellow-feeling of their vivacity. Animal and sentimental laughter are frequently blended; but it is easy to distinguish them. The former is often excessive; the latter never, unless heightened by the other. The latter is always pleasant, both in itself and in its cause; the former may be painful in both. But their principal distinction is this:

—The one always proceeds from a sentiment or emotion excited in the mind, in consequence of certain ideas or objects being presented to it, of which emotion we may be conscious even when we suppress laughter;—the other arises not from any sentiment or perception of ludicrous ideas, but from some bodily feeling, or sudden impulse on what is called the animal spirits, proceeding, or seeming to proceed, from the operation of causes purely material. The present inquiry regards that species of which is here distinguished by the name of sentimental laughter.

"The pleasing emotion, arising from the view of ludicrous ideas, is known to every one by experience; but, being a simple feeling, admits not of definition. It is to be distinguished from the laughter that generally attends it, as sorrow is to be distinguished from tears; for it is often felt in a high degree by those who are remarkable for gravity of countenance. Swift seldom laughed, notwithstanding his uncommon talents in wit and humour, and the extraordinary delight he seems to have had in surveying the ridiculous side of things. Why this agreeable emotion should be accompanied with laughter as its outward sign, or sorrow express itself by tears, or fear by trembling or paleness, I cannot ultimately explain, otherwise than by saying, that such is the appointment of the Author of nature.

—All I mean by this inquiry is, to determine, "What is peculiar to those things which produce laughter,—or rather, which raise in the mind that pleasing sentiment or emotion whereof laughter is the external sign.

"Philosophers have differed in their opinions concerning this matter. In Aristotle's definition quoted above, it is clear that he means to characterize, not laughable qualities in general (as some have thought), but the objects of comic ridicule only; and in this view the definition is just, however it may have been overlooked or despised by comic writers. Crimes and misfortunes are often, in modern plays, and were sometimes in the ancient, held up as objects of public merriment; but if poets had that reverence for
Laughter, for nature which they ought to have, they would not
shock the common sense of mankind by so absurd a
representation. The definition from Aristotle does not,
however, suit the general nature of ludicrous ideas;
for it will appear by and by, that men laugh at those
in which there is neither fault nor turpitude of any
kind.

"The theory of Mr. Hobbes would hardly have
deserved notice, if Addison had not spoken of it with
approbation in the 47th paper of the Spectator. He
justly observes, after quoting the words of Mr. Hobbes
formerly mentioned, that "according to this account,
when we hear a man laugh excessively, instead of saying
that he is very merry, we ought to tell him that he is
very proud." It is strange, that the elegant au-
uthor should be aware of this consequence, and yet ad-
mit the theory: for so good a judge of human nature
could not be ignorant, that laughter is not considered
as a sign of pride; persons of singular gravity being
often suspected of that vice, but great laughers seldom
or never. When we see a man attentive to the inno-
cent humours of a merry company, and yet maintain a
fixed solemnity of countenance, is it natural for us to
think that he is the humblest, and the only humble per-
son in the circle?

"Another writer in the Spectator, No. 249, remarks,
in confirmation of this theory, that the "most part of
mankind are most addicted to the passion of laughter.
Now, how can this be, if the "proudest part of mankind
are also most addicted to it, unless we suppose vanity
and pride to be the same thing? But they certainly
are different passions. The proud man despises other
men, and derives his chief pleasure from the contempla-
tion of his own importance: the vain man stands in
need of the applause of others, and cannot be happy
without it. Pride is apt to be reserved and sullen; va-
nity is often affable, and officiously obliging. The
pride man is so confident of his merit, and thinks it
so obvious to all the world, that he will scarcely give
himself the trouble to inform you of it: the vain man,
to raise your admiration, scruples not to tell you, not
only the whole truth, but a great deal more. In the
same person these two passions may, no doubt, be
united; but some men are too proud to be vain, and
some vain men are too conscious of their own weakness
to be proud. Be all this, however, as it will, we have
not as yet made any discovery of the cause of laugh-
ter: in regard to which, I apprehend, that the vain are
not more inimperate than other people; and I am sure
that the proud are much less so.

"Hutcheson's account of the origin of laughter is
equally unsatisfactory. Granting what he says to be
true, I would observe, in the first place, what the
ingenious author seems to have been aware of, that there
may be a mixture of meanness and dignity where there
is nothing ludicrous. A city, considered as a collec-
tion of low and lofty houses, is no laughable object.
Nor was that person either ludicrous or ridiculous, whom Pope so justly characterises,

"The greatest, wisest, meanest of mankind."

—But, secondly, cases might be mentioned, of laugh-
ter arising from a group of ideas or objects, where-
in there is no discernible opposition of meanness or
dignity. We are told of the dagger of Hbelbrus, Laughter,
that

"It could scrape trenches, or chip bread,
"Toast cheese or bacon, though it were
"To bait a mouse trap, 'twould not care;
"Twould make clean shoes, or in the earth
"Set leeks and onions, and so forth."

The humour of the passage cannot arise from the mean-
ness of these offices compared with the dignity of the
dagger, nor from any opposition of meanness and dig-
nity in the offices themselves, they being all equally
mean; and must therefore be owing to some peculiari-
ty in the description. We laugh, when a droll mi-
mics the solemnity of a grave person; here dignity and
meanness are indeed united: but we laugh also (though
not so heartily perhaps) when he mimics the peculiari-
ties of a fellow as insignificant as himself, and dis-
plays no opposition of dignity and meanness. The le-
vities of Sancho Panza opposed to the solemnity of his
master, and compared with his own schemes of prefer-
ment, form an entertaining contrast: but some of the
vagaries of that renowned squire are truly laughable,
even when his preferment and his master are out of the
question. Men laugh at puns; the wisest and wittiest
of our species have laughed at them; Queen Elizabeth,
Cicero, and Shakespeare, laughed at them; clowns and
children laugh at them; and most men, at one time or
other, are inclined to do the same: but in this sort of
low wit, is it an opposition of meanness and dignity
that entices us? Is it not rather a mixture of same-
ness and diversity,—sameness in the sound, and diver-
sity in the signification?

"In the characters mentioned by Akenside, the
author does not distinguish between what is laughable
and what is contemptible; so that we have no reason to
think, that he meant to specify the qualities peculiar
to those things which provoke pure laughter; and
whatever account we may make of his definition, which
to those who acquiesce in the foregoing reasonings
may perhaps appear not quite satisfactory, there is in
the poem a passage that deserves notice, as it
seems to contain a more exact account of the ludic-
rus quality than is to be found in any of the theo-
ries above mentioned. This passage we shall soon have
occasion to quote."

Our author now goes on to lay down his own theory
concerning the origin of laughter, which he supposes
to arise from the view of things incongruous united in
the same assemblage. "However imperfect (says he)
the above-mentioned theories may appear, there is none
of them destitute of merit; and indeed the most fanci-
ful philosopher seldom frames a theory without consult-
ing nature in some of her more obvious appearances.
Laughter very frequently arises from the view of dig-
nity and meanness united in the same object; some-
times, no doubt, from the appearance of assumed in-
feriority, as well as of small faults and unimportant tur-
ritudes; and sometimes, perhaps, though rarely, from
that sort of pride which is described in the passage al-
ready quoted from Hobbes.

"All these accounts agree in this, that the cause of
laughter is something compounded; or something that
disposes the mind to form a comparison, by passing
Laughter from one object or idea to another. That is this is in fact the case, cannot be proved a priori; but this holds in all the examples hitherto given, and will be found to hold in all that are given hereafter. May it not then be laid down as a principle, That laughter arises from the view of two or more objects or ideas disposing the mind to form a comparison? According to the theory of Hobbes, this comparison would be between the ludicrous object and ourselves; according to those writers who misapply Aristotle's definition, it would seem to be formed between the ludicrous object and things or persons in general; and if we incline to Hutchesson's theory, which is the best of the three, we shall think that there is a comparison of the parts of the ludicrous object, first with one another, and secondly with ideas or things extraneous.

"Further: every appearance that is made up of parts, or that leads the mind of the beholder to form a comparison, is not ludicrous. The body of a man or woman, of a horse, a fish, or a bird, is not ludicrous, though it consists of many parts; and it may be compared to many other things without raising laughter; but the picture described in the beginning of the epistle to the Pisces, with a man's head, a horse's neck, feathers of different birds, limbs of different beasts, and the tail of a fish, would have been thought ludicrous 3000 years ago, if we believe Horace, and in certain circumstances would no doubt be so at this day. It would seem then, that the parts of a laughable assemblage must be in some degree unsuitable and heterogeneous."

"Moreover: any one of the parts of the Horatian monster, a human head, a horse's neck, the tail of a fish, or the plumage of a fowl, is not ludicrous, in itself; nor would those several pieces be ludicrous if attended to in succession, without any view to their union. For to see them disposed on the different shelves of a museum, or even on the same shelf, nobody would laugh, except, perhaps, the thought of uniting them were to occur to his fancy, or the passage of Horace to his memory. It seems to follow, that the incongruous parts of a laughable idea or object must either be combined so as to form an assemblage, or must be supposed to be so combined."

"May we not then conclude, that laughter arises from the view of two or more inconsistent, unsuitable, or incongruous parts or circumstances, considered as united in one complex object or assemblage, or as acquiring a sort of mutual relation from the peculiar manner in which the mind takes notice of them? The lines from Akeside formerly referred to, seem to point at the same doctrine:

Where'er the pow'r of ridicule displays
Her quaint-ey'd visage, some incongruous form,
Some stubborn dissonance of things combin'd,
Strikes on the quick observer.

And to the same purpose, the learned and ingenious Dr. Gerard, in his Essay on Taste: 'The sense of ridicule is gratified by an inconsistency and dissonance of circumstances in the same object, or in objects nearly related in the main; or by a similitude or a relation unexpected between things on the whole opposite and unlike.'

"And therefore, instead of saying, with Hutchesson, Vol. XI. Part II."

4 D Launcelot

that the cause or object of laughter is an opposition of dignity and meanness; I would say, in more general terms, that it is an opposition of suitableness or unsuitableness, or of relation and the want of relation, united, or supposed to be united, in the same assemblage. Thus the offices ascribed to the dagger of Hudibras seem quite heterogenous; but we discover a bond of connection among them, when we are told that the same weapon could occasionally perform them all. Thus, even in that monstrous weapon, which displays no opposition of dignity and meanness, we perceive the actions of one man joined to the features and body of another; that is, a mixture of unsuitableness, or want of relation, arising from the difference of persons, with congruity and similitude, arising from the sameness of the action. And here let it be observed in general, that the greater number of incongruities that are blended in the same assemblage, the more ludicrous it will probably be. If, as in Butler's resemblance of the morning to a boiled lobster, there is a mixture of dignity and meanness, as well as of likeness and dissimilitude, the effect of the contrast will be more powerful, than if only one of these oppositions had occurred in the ludicrous idea. The sublimity of Don Quixote's mind, contrasted and connected with his miserable equipage, forms a very comical exhibition; but when all this is still further connected and contrasted with Sancho Panza, the ridicule is heightened exceedingly. Had the knight of the lions been better mounted and accoutred, he would not have made us smile so often; because, the hero's mind and circumstances being more adequately matched, the whole group would have united fewer inconsistencies, and reconciled fewer incongruities. Butler has combined a still greater variety of uncouth and jarring circumstances in Ralphe and Hudibras; but the picture, though more elaborate, is less natural. Yet this argues no defect of judgment. His design was, to make his hero not only ludicrous, but contemptible; and therefore he jumbles together, in his equipage and person, a number of mean and disgusting qualities, pedantry, ignorance, nastiness, and extreme deformity. But the knight of La Mancha, though a ludicrous, was never intended for a contemptible, personage. He often moves our pity, he never forfeits our esteem; and his adventures and sentiments are generally interesting; which could not have been the case if his story had not been natural, and himself been endowed with great as well as good qualities. To have given him such a shape, and such weapons, arguments, boots, and breeches, as Butler has bestowed on his champion, would have destroyed that solemnity which is so striking a feature in Don Quixote; and Hudibras, with the manners and person of the Spanish hero, would not have been that paltry figure which the English poet meant to hold up to the laughter and contempt of his countrymen. Sir Launcelot Greaves is of Don Quixote's kindred, but a different character. Smollet's design was not to expose him to ridicule, but rather to recommend him to our pity and admiration. He has therefore given him youth, strength, and beauty, as well as courage and dignity of mind; has mounted him on a generous steed, and arrayed him in an elegant suit of armour. Yet, that the history might have a comic air, he has been careful to contrast and connect Sir
Launcelot with a squire and other associates of very dissimilar tempers and circumstances.

"What has been said of the cause of laughter does not amount to an exact description, far less to a logical definition; there being innumerable combinations of congruity and incongruity, of relation and contrariety, of likeness and dissimilitude, which are not ludicrous at all. If we could ascertain the peculiarities of these, we should be able to characterise with more accuracy the general nature of ludicrous combination. But before we proceed to this, it would be proper to evince, that of the present theory thus much at least is true, that though every incongruous combination is not ludicrous, every ludicrous combination is incongruous.

"It is only by a detail of facts or examples that any theory of this sort can be either established or overthrown. By such a detail, the foregoing theories have been, or may be, shown to be ill founded, or not sufficiently comprehensive. A single instance of a laughable object, which neither unites, nor is supposed to unite, incongruous ideas, would likewise show the insufficiency of the present; nor will I undertake to prove (for indeed I cannot) that no such instance can be given. A complete enumeration of ludicrous objects it would be in vain to attempt: and therefore we can never hope to ascertain, beyond the possibility of doubt, that common quality which belongs to all ludicrous ideas that are, or have been, or may be, imagined. All that can be done in a case of this kind is to prove by a variety of examples, that the theory now proposed is more comprehensive, and better founded, than any of the foregoing." This our author afterwards shows at full length; but as the variety of examples adduced by him would take up too much room to be inserted here, and as every reader must be capable of adding innumerable instances of ludicrous cases to himself, we shall content ourselves with the above explanation of the different theories of laughter, referring those who desire further satisfaction to the treatise already quoted.

LAVINGTON EAST, a town of Wilts, four miles south of the Devizes, and 35 miles from London. It is called in our histories Stepnorton; but now Cheaping or Market Lavington, on account of its markets, which are on Monday and Wednesday. It is supposed to have been a market town above 200 years. Here is a charity school for 36 children, who have books given them, and the girls are taught to knit and sew. Population 890 in 1811.

LAVINIUM, in Ancient Geography, a town of Latium, six miles to the east of Laurentum, according to an ancient map; so named from Lausus, consort of Ancasia, and daughter of King Latinus, and built by the Trojans. The first town of Roman origin in Latium, and the seat of the Diva Penates, (Livy,) situated near the river Numicus, or Numinicus, between which and the Tiber Ancasia landed, according to Virgil. Holsteinius supposes the town to have stood on an eminence, now called il Monte de Lavena.

LAUNCE. See LANCE.

LAUNCESTON, a town of Cornwall in England, seated on the river Tamar, 214 miles from London. It is also called Dunawind, from its situation on a down. King Henry III. made it a free-borough. It was composed before of two other boroughs, viz. Dunawind and Newport. It has been the place for choosing knights of the shire ever since the reign of King Edward I. and the assizes town ever since Richard II. till by a late act of parliament the lord chancellor or lord keeper was empowered to name any other place in the county for it; since which the summer assizes have been held at Bodmin. It was incorporated by Queen Mary in 1555. It is governed by a mayor, recorder, and eight aldermen, has a free school which was founded by Queen Elizabeth, and is a populous trading town. In the 3rd of Henry VIII. an act was made for the repair of this and other decayed Cornish boroughs; and it endowed this town with the privileges of a sanctuary, though it does not appear to have used them. It had a monastery and a noble castle, which, because of its strength, was called castle terrible, and was given by King Richard I. to his brother, afterwards King John. Here are two charity schools for 48 children of both sexes, where the girls are taught to knit, sew, and make bonnet. Leland says it was walled in his time, and one mile in compass. The lower part of its ancient castle is used for the gaol.

Population 1758 in 1811.

LAUNCH, in the seas language, signifies to put out: as, Launch the ship, that is, Put her out of dock; launch off, or forward, speaking of things that are stove in the hold, is Put them more forward; launch he! is a term used when a yard is hoisted high enough, and signifies hoist no more. See also LANCE.

LAUNDER, in Mineralogy, a name given in Devonshire, and other places, to a long and shallow trough, which receives the powdered ore after it comes out of the box or coffer, which is a sort of mortar, in which it is powdered with iron pestles. The powdered ore, which is washed into the launder by the water from the coffer, is always finest near the grate, and coarser all the way down.

LAVOISIER, ANTOINE LAURENT, a celebrated chemical philosopher, was born at Paris on the 26th of August 1745. His father being a man of opulent circumstances, spared no cost on the education of his son, who soon gave a decided preference to the physical sciences. An extraordinary premium having been offered by the French government in the year 1764, for the best and most economical method of lighting the streets of an extensive city, our author, although at that time only 21 years of age, gained the gold medal; and his excellent memoir was published by the academy, of which he became a member on the 23rd of May 1768. His attention was alternately occupied with the pretended conversion of water into earth, the analysis of the gypsum found in the vicinity of Paris, the congelation of water, the phenomena of thunder, and the aurora borealis.

By undertaking journeys with Guettard into every province of France, he was enabled to procure an immense variety of materials for a description of the mineralogical kingdom, serving as the foundation of a great work on the revolutions of the globe, two admirable sketches of which are to be seen in the memoirs of the French academy for 1773 and 1777. His whole time and fortune were dedicated to the cultivation of the sciences, nor did he seem more attached to one than to another, till an interesting event decided his choice in favour of chemistry. The discovery of gases
Lavoisier was just made known to the learned world, by Black, Priestley, Scheele, Cavendish, and Mackenzie, which appeared like a new creation.

About the year 1779, Lavoisier was so struck with the grandeur and importance of the discovery, that he turned all his attention to this fountain of truths, perceiving the powerful influence which this new science would have over every physical research. He was inspired with the true spirit of inductive philosophy, and all his experiments had a direct reference to general views. He published his chemical operations in the year 1774, containing a history of whatever had been done before respecting the gases, and concluding with his own grand and interesting experiments. He demonstrated that metals, in calcination, derive their increased weight from the absorption of air, of which he afterwards proved that nitrous acid is composed. His chemical ingenuity was now so well known, that Turgot employed him in 1776 to inspect the manufacture of gunpowder, which he made to carry 120 less than 90. In the year 1778 he discovered that all acids contain the respirable portion of the atmosphere as a constituent principle, and to this he gave the name of oxygen. This was the first grand step towards the new chemistry, which was fully completed by his confirming the discovery of the composition of water, ascertained in 1783.

His Elements of Chemistry were published in 1789, which is a beautiful model of scientific composition, elegant, clear, and logical. His celebrated systems almost universally adopted in a very few years, so full was the conviction it carried along with it to every candid, reflecting mind. The last of Lavoisier's philosophical works was on the perspiration of animals, first read to the academy on the 4th of May 1791. By a number of the newest experiments, he found that a man in one day perspires 45 ounces; that he consumes 33 ounces of vital air, or oxygen; that 8 cubic feet of carbonic acid gas are discharged from his lungs; that the weight of water discharged from the lungs is 23 ounces, composed of 3 of hydrogen and 20 of oxygen, which interesting discoveries he directed to the improvement of medicine.

There are no fewer than 40 memoirs of Lavoisier in the volumes of the Academy of Sciences from 1772 to 1793, full of the grand phenomena of the science; such as the analysis of atmospheric air, the formation of elastic fluids, the properties of the matter of heat, the composition of acids, the decomposition of water, &c. &c. To the sciences, arts, and manufactures, he rendered the most essential services, both in a public and private capacity. After Buffon and Tillet, he was treasurer to the academy, into the accounts of which he introduced both economy and order. He was consulted by the national convention as to the most eligible means of improving the manufacture of assignats, and of augmenting the difficulties of forging them. He turned his attention also to political economy, and between 1778 and 1785, he allowed 200 carpenters in the Vendémois to experimental agriculture, and increased the ordinary produce by one half. In 1791, the constituent assembly invited him to draw up a plan for rendering more simple the collection of the taxes, which produced an excellent report, printed under the title of Territorial Biocles of France.

While the horrors of Robespierre's usurpation continued, he used to observe to Lalande that he foresaw he would be deprived of all his property, but that he was extremely willing to work for his subsistence; and it is supposed that he meant to pursue the professions of botany, as most congenial to his studies. But the unmerciful tyrant had already fixed his doom. He suffered on the scaffold with 20 farmers general on the 8th of May 1794, for no other crime but because he was opulent. A paper was presented to the tribunal, drawn up by Citizen Hallé, containing a description of the works, and a recapitulation of the merits, of Lavoisier, sufficient to make an impression on the most obdurate heart; but it was not even read by these men, who were the blind, stupid, and ferocious instruments of cruelty and death.

A man so rare and so extraordinary ought to have enjoyed the respect of the most ignorant, and even the most wicked. To produce the contrary, it was necessary that power should fall into the hands of a tyrant who respected none, and whose blind and malignant ambition sacrificed every thing to the desire of pleasing the people.

Lavoisier was tall, and possessed a countenance full of benignity, through which his genius shone conspicuous. As to his character, it was mild, benevolent, docile, obliging; and he discovered an incredible degree of activity. He had great influence on account of his credit, fortune, reputation, and his office in the treasury; but all the use he made of it was to do good: yet this did not prevent jealousy on the part of others. In 1777 he married Marie-Anne-Pierrette-Padoze, the daughter of a farmer-general, whose excellent accomplishments formed the delight of his life, who assisted him in his labours, and even drew the figures for his last work. She had the misfortune to behold her father, husband, and intimate friends, assassinated in one day: she was herself imprisoned, and even treated with a similar fate; but the unshaken fortitude of her mind made her rise superior to the horrors of her condition. We learn that she has since given her hand to the celebrated Count Rumford.

LAURA, in church history, a name given to a collection of little cells at some distance from each other, in which the hermits in ancient times lived together in a wilderness.

These hermits did not live in community, but each monk provided for himself in his distinct cell. The most celebrated laureates mentioned in ecclesiastical history were in Palestine: as the laura of St Euthymius, at four or five leagues distance from Jerusalem; the laura of St Saba, near the brook Cedron; the laura of the Towers, near the river Jordan, &c.

Pope Laureate, an officer of the household of the kings of Britain, whose business consists only in composing an ode annually on his majesty's birthday, and on the new year; sometimes also, though rarely, on occasion of any remarkable victory. Of the first institution of poets laureates, Mr Wharton has given the following account in his History of English poetry. "Great confusion has entered into this subject, or account of the degrees in grammar, which included rhetoric and versification, anciently taken in our universities, particularly at Oxford: on which occasion, a wreath of laurel was presented to the new graduate, who was afterwards usually styled Poeta Laureatus. These
that this officer was a Latin scholar. He was a native of Toulouse, and an Augustinian monk. He was not only the king's poet laureate, as it is supposed, but his historiographer, and preceptor in grammar to Prince Arthur. He obtained many ecclesiastical preferences in England. All the pieces now to be found, which he wrote in the character of poet laureate, are in Latin. These are, An Address to Henry VIII. for the most auspicious beginning of the 10th year of his reign, with an Epithalamium on the marriage of Francis the dauphin of France with the king's daughter; A New Year's Gift for the year 1515; and, Verses wishing prosperity to his majesty's 13th year. He has left some Latin hymns; and many of his Latin prose pieces, which he wrote in the quality of historiographer to both monarchs, are remaining.

"I am of opinion, that it was not customary for the royal laureate to write in English, till the reformation of religion had begun to diminish the veneration for the Latin language; or, rather, till the love of novelty, and a better sense of things, had banished the narrow pedantry of monastic erudition, and taught us to cultivate our native tongue."

LAUREL. See PRUNUS and LAURUS, BOTANY.

LAURELS, pieces of gold coined in the year 1619, with the king's head laureated, which gave them the name of laurels; the 20s. pieces whereof were marked with XX. the 10s. X. and the 5s. pieces with V.

LAURENS CASTRA. See LAURENTUM.

LAURENTALIA, or LARENTALIA, called also LARENTINALIA, LAURENTALES, and LARENTALES, feasts celebrated among the Romans on the 10th of the kalends of January, or 23rd of December, in memory of Acca Laurentia, wife of the shepherd Faustulus, and nurse of Romulus and Remus.

Acca Laurentia, from whom the sobriquet took its name, is represented as no less remarkable for the beauty of her person, than for her lasciviousness; on account of which she was nick-named by her neighbours lupa, "she wolf;" which is said to have given rise to the tradition of Romulus and Remus being suckled by a wolf. She afterwards married a very rich man, who brought her great wealth, which, at her death, she left to the Roman people; in consideration whereof they performed to her these honours; though others represent the feast as held in honour of Jupiter Latiarius. See LARENTIALIA and LARES.

LAURENTIUS, one of the first printers, and, according to some, the inventor of the art, was born at Haerlem about the year 1370, and executed several departments of magistracy of that city. Those writers are mistaken who assign to him the surname of Coster, or assert that the office of editorius was hereditary in his family. In a diploma of Albert of Bavaria in 1380, in which, among other citizens of Haerlem, our Laurentius's father is mentioned by the name of Ioannes Laurentii filius, Beroldus is called editorius, who was surely of another family; and in 1396 and 1398 Heinricus de Loven enjoyed that office; after whose resignation, Count Albert conferring on the citizens the privilege of electing their editorius, they probably soon after, fixed on Laurentius: who was afterwards called Coster from his office, and not from his family name, as he was descended from an illegitimate
Commodus retired during a pestilence. Its name was from an adjoining grove of bay trees, midway between Ostia and Antium. Supposed to have stood in the place now called San Lorenzo, which seems to be confirmed from the Via Laurentina leading to Rome.

LAURO, PHILIPPO, a celebrated painter, was born at Rome in 1623. He learned the first rudiments of the art from his father Balthasar, who was himself a good painter. He afterwards studied under Angelo Carosello, his brother-in-law; and proved so great a proficient, that in a short time he far surpassed his tutor in design, colouring, and elegance of taste. He applied himself to painting historical subjects in a small size, enriching the back grounds with lively landscapes, that afforded the eye and the judgment equal entertainment; but though his small paintings are best approved, he finished several grand compositions for altar pieces that were highly esteemed. He died in 1694; and his works are eagerly bought up at high prices all over Europe.

LAURO, or LAURON, in Ancient Geography, a town of the Hither Spain, where Cn. Pompeius, son of Pompey the Great, was defeated and slain. Now Lorique, five leagues to the north of Liria in Valencia.

LAURUS, the Bay Tree, a genus of plants belonging to the eneaedria class; and in the natural method ranking under the 11th order, Holaraceae. See Botany Index.

LAUS, or LAOS, in Ancient Geography, a river of Italy, separating Lucania from the Bruttii, and running from east to west into the Tuscan sea; with a cognominal bay, and a town, the last of Lucania, a little above the sea; a colony from Sybaris, according to Strabo, Pliny, and Stephænus. Both town and river are now called Laino, in the Calabria Citra; and the bay called Golfo della Scala, or di Policastro, two adjoining towns, is a part of the Tuscan sea, extending between the promontory Palinurus and the mouth of the Laus.

LAUS Pompeii, in Ancient Geography, a town of Insubria, situated to the east of Milan, between the rivers Addua and Lamb. A town built by the Boii after they were passing the Alps; its small and built Castane to name is unknown. Strabo Pompeii, father of Pompey the Great, having thither a colony, gave it a new name, and conferred the Jus Latii on the ancient inhabitants who remained there. The modern Lodi is built from its ruins, at some distance off. E. Long. 10. 15. N. Lat. 45. 22.

LAUSANNE, a large, ancient, and handsome town of Switzerland, capital of the country of Vaud, and in the canton of Berne, with a famous college and bishop's see. The townhouse and the other public buildings are magnificent. It is seated between three hills near the lake of Geneva, in E. Long. 6. 35. N. Lat. 46. 30. and contains about 8000 inhabitants.—The town stands on an ascent, so steep that in some places the horses cannot draw up a carriage without great difficulty, and foot passengers ascend to the upper parts of the town by steps. Here is an academy for the students of the country; the professors are appointed by government; and there is a pretty good public library. The church, formerly the cathedral, is a magnificent Gothic building, standing on the most elevated part of the town. Among other sepulchres it contains that of Amadocus VIII. duke of Savoy, styled
LAW

PART I. OF THE NATURE OF LAWS IN GENERAL.

Law, in its most general and comprehensive sense, signifies a rule of action; and is applied indiscriminately to all kinds of action, whether animate or inanimate, rational or irrational. Thus we say, the laws of motion, of gravitation, of optics, of mechanics, as well as the laws of nature and of nations. And it is that rule of action which is prescribed by some superior, and which the inferior is bound to obey.

Thus when the Supreme Being formed the universe, and created matter out of nothing, he impressed certain principles upon that matter, from which it can never depart, and without which it would cease to be. When he put that matter into motion, he established certain laws of motion, to which all movable bodies must conform. And, to descend from the greatest operations to the smallest, when a workman, forms a clock, or other piece of mechanism, he establishes at his own pleasure certain arbitrary laws for its direction; so, that the hand shall describe a given space in a given time; to which law as long as the work conforms, so long it continues in perfection, and answers the end of its formation.

If we further advance, from mere inactive matter to vegetable and animal life, we shall find them still governed by laws; more numerous indeed, but equally fixed and invariable. The whole progress of plants, from the seed to the root, and from thence to the seed again; the method of animal nutrition, digestion, secretion, and all other branches of vital economy; are not left to chance, or the will of the creature itself, but are performed in a wondrous involuntary manner, and guided by unerring rules laid down by the great Creator.

This then is the general signification of law, a rule of action dictated by some superior being: and, in those creatures that have neither the power to think nor to will, such laws must be invariably obeyed, so long as the creature itself subsists; for its existence depends on that obedience. But laws, in their more confined sense, and in which it is our present business to consider them, denote the rules, not of action in general, but of human action or conduct: that is, the precepts by which man, the noblest of all sublunary beings, a creature endowed with both reason and free will, is commanded to make use of those faculties in the general regulation of his behaviour.

Man, considered as a creature, must necessarily be subject to the laws of his Creator, for he is entirely a dependent being. A being, independent of any other, has no rule to pursue but such as he prescribes to himself; but a state of dependence will inevitably oblige the inferior to take the will of him on whom he depends as the rule of his conduct; not indeed in every particular, but in all those points wherein his dependence consists. This principle therefore has more or less extent and effect, in proportion as the superiority of the one and the dependance of the other is greater or less, absolute or limited. And consequently, as man depends absolutely upon his Maker for every thing, it is necessary that he should in all points conform to his Maker's will.

This will of his Maker is called the law of nature. Law of For as God, when he created matter, and endued it with a principle of mobility, established certain rules for the perpetual direction of that motion; so, when he created man, and endued him with free will to conduct himself in all parts of life, he laid down certain immutable laws of human nature, whereby that free will is in some degree regulated and restrained, and gave him also the faculty of reason to discover the purpose of those laws.

Considering the Creator only as a being of infinite power,
power, he was able unquestionably to have prescribed whatever laws he pleased to his creature man, however unjust or severe. But as he is also a Being of infinite wisdom, he has laid down only such laws as were founded in those principles of justice, that exist in the nature of things antecedent to any positive precept. These are the eternal immutable laws of good and evil, to which the Creator himself in all his dispensations conforms; and which he has enabled human reason to discover, so far as they are necessary for the conduct of human actions. Such, among others, are these principles: That we should love honestly, should hurt nobody, and should render to every one his due to which three general precepts Justinian has reduced the whole doctrine of law.

But if the discovery of these first principles of the law of nature depended only upon the due exertion of right reason, and could not otherwise be obtained than by a chain of metaphysical disquisitions, mankind would have wanted some inducement to have quickened their inquiries, and the greater part of the world would have rested content in mental indolence, and ignorance its inseparable companion. As therefore the Creator is a being, not only of infinite power and wisdom, but also of infinite goodness, he has been pleased so to contrive the constitution and frame of humanity, that we should want no other prompter to inquire after and pursue the rule of right, but only our own self-love, that universal principle of action. For he has so intimately connected, so inseparably interwoven, the laws of eternal justice with the happiness of each individual, that the latter cannot be attained but by observing the former; and if the former be punctually observed, it cannot but induce the latter. In consequence of which mutual connexion of justice and human felicity, he has not perplexed the law of nature with a multitude of abstracted rules and precepts, referring merely to the fitness or usefulness of things, as some have vainly supposed; but has graciously reduced the rule of obedience to this one paternal precept, “that man should pursue his own happiness.” This is the foundation of what we call ethics, or natural laws. For the several articles into which it is branched in our systems amount to no more than demonstrating, that this or that action tends to man’s real happiness, and therefore very justly concluding, that the performance of it is a part of the law of nature; or, on the other hand, that this or that action is destructive of man’s real happiness, and therefore that the law of nature forbids it.

This law of nature, being coeval with mankind, and dictated by God himself, is of course superior in obligation to any other. It is binding over all the globe, in all countries, and at all times: no human laws are of any validity, if contrary to this, and such of them as are valid derive all their force, and all their authority, mediately or immediately, from this original.

But in order to apply this to the particular exigencies of each individual, it is still necessary to have recourse to reason: whose office it is to discover, as was before observed, what the law of nature directs in every circumstance of life, by considering, what method will tend the most effectually to our own substantial happiness. And if our reason were always, as in our first ancestor before his transgression, clear and perfect, unruffled by passions, unclouded by prejudice, unlimited by disease or intemperance, the task would be in general pleasant and easy; we should need no other guide but this. But every man now finds the contrary in his own experience, that his reason is corrupt, and his understanding full of ignorance and error.

This has given manifold occasion for the benign interposition of Divine Providence; which, in compassion to the frailty, the imperfection, and the blindness of human reason, hath been pleased, at sundry times and in divers manners, to discover and enforce its laws by an immediate and direct revelation. The doctrines thus delivered, we call the revealed or divine law, and they are to be found only in the Holy Scriptures. These precepts, when revealed, are found upon comparison to be really a part of the original law of nature, as they tend in all their consequences to man’s felicity. But we are not from thence to conclude, that the knowledge of these truths was attainable by reason in its present corrupted state; since we find that, until they were revealed, they were hid from the wisdom of ages. As then the moral precepts of this law are indeed of the same original with those of the law of nature, so their intrinsic obligation is of equal strength and perpetuity. Yet undoubtedly the revealed law is of infinitely more authenticity than that moral system which is framed by ethical writers, and denominated the natural law: because one is the law of nature, expressly declared to be by God himself, the other is only what, by the assistance of human reason, we imagine to be that law. If we could be as certain of the latter as we are of the former, both would have an equal authority: but till then they can never be put in any competition together.

Upon these two foundations, the law of nature and the law of revelation, depend all human laws; that is, to say, no human laws should be suffered to contradict these. There are, it is true, a great number of indifferent points, in which both the divine law and the natural leave a man at his own liberty; but which are found necessary, for the benefit of society, to be restrained within certain limits. And herein it is that human laws have their greatest force and efficacy: for, with regard to such points as are not indifferent, human laws are only declaratory of, and act in subordination to, the former. To instance in the case of murder: this is expressly forbidden by the divine, and demonstrably by the natural law; and from these prohibitions arises the true unlawfulness of this crime. Those human laws that annex a punishment to it, do not at all increase its moral guilt, or superadd any fresh obligation in foro conscientiae to abstain from its perpetration. Nay, if any human law should allow or enjoin us to commit it, we are bound to transgress that human law, or else we must offend both the natural and the divine. But with regard to matters that are in themselves indifferent, and are not commanded or forbidden by those superior laws, such, for instance, as exporting of wool into foreign countries; here the inferior legislature has scope and opportunity to interpose, and to make that action unlawful which before was not so.

If man were to live in a state of nature, unconnected with other individuals, there would be no occasion for any other laws than the law of nature and the law of God. Neither could any other law possibly exist: for
L A W.

Part I.

Of Laws.

In general.

Of Laws.

is true there is an obligation which a compact carries with it, equal in point of conscience to that of a law; but then the original of the obligation is different. In compacts, we ourselves determine and promise what shall be done; before we are obliged to do it; in laws, we are obliged to act without ourselves determining or promising anything at all. Upon these accounts law is defined to be "a rule."

Municipal law is also "a rule of civil conduct." Second.

This distinguishes municipal law from the natural or property. revealed: the former of which is the rule of moral conduct; and the latter not only the rule of moral conduct, but also of faith. These regard man as a creature; and point out his duty to God, to himself, and to his neighbour, considered in the light of an individual. But municipal or civil law regards him also as a citizen, and bound to other duties towards his neighbour, than those of mere nature and religion: duties, which he has engaged in by enjoying the benefits of the common union; and which amount to no more, than that he do contribute, on his part, to the subsistence and peace of the society.

It is likewise "a rule prescribed." Because a bare Third.

resolution, confined in the breast of the legislator, with property, out manifesting itself by some external sign, can never be properly a law. It is requisite that this resolution be notified to the people who are to obey it. But the manner in which this notification is to be made, is matter of very great indiffERENCE. It may be notified by universal tradition and long practice, which supposes a previous publication, and is the case of the common law of England and of Scotland. It may be notified vico cvoce, by officers appointed for that purpose; as is done with regard to proclamations, and such acts of parliament as are appointed to be publicly read in churches and other assemblies. It may, lastly, be notified by writing, printing, or the like; which is the general course taken with all our acts of parliament.

Yet, whatever way is made use of, it is incumbent on the promulgators to do it in the most public and perspicuous manner; not like Caligula, who (according to Dio Cassius) wrote his laws in a very small character, and hung them up upon high pillars, the more effectually to ensnare the people. There is still a more unreasonable method than this, which is called making of laws ex post facto: when after an action (indifferent in itself) is committed, the legislator then for the first time declares it to have been a crime, and inflicts a punishment upon the person who has committed it. Hence it is impossible that the party could foresee, that an action, innocent when it was done, should be afterwards convicted to guilt by a subsequent law. For he had therefore no cause to abstain from it; and all punishment for not abstaining must of consequence be cruel and unjust. All laws should be therefore made to commence in futuro, and be notified before their commencement; which is implied in the term "prescribed." But when this rule is in the usual manner notified or prescribed, it is then the subject's business to be thoroughly acquainted therewith; for if ignorance of what he might know, were admitted as a legitimate excuse, the laws would be of no effect, but might always be eluded with impunity.

But
But further: Municipal law is "a rule of civil conduct prescribed by the supreme power in a state." For legislation, as was before observed, is the greatest act of superiority that can be exercised by one being over another. Wherefore it is requisite to the very essence of a law, that it be made by the supreme power. Sovereignty and legislature are indeed convertible terms; one cannot subsist without the other.

This will naturally lead us into a short inquiry concerning the nature of society and civil government; and the natural inherent right that belongs to the sovereignty of a state, wherefrom that sovereignty be lodged, of making and enforcing laws.

The only true and natural foundations of society are the wants and fears of individuals. Not that we can believe, with some theoretical writers, that there ever was a time when there was no such thing as society; and that, from the impulse of reason, and through a sense of their wants and weaknesses, individuals met together in a large plain, entered into an original contract, and chose the tallest man present to be their governor. This notion, of an actually existing unconnected state of nature, is too wild to be seriously admitted; and besides, it is plainly contradictory to the revealed accounts of the primitive origin of mankind, and their preservation 2000 years afterwards; both which were effected by the means of single families. These formed the first society among themselves, which every day extended its limits; and when it grew too large to subsist with convenience in that pastoral state wherein the patriarchs appear to have lived, it necessarily subdivided itself by various migrations into more. Afterwards, as agriculture increased, which employs and can maintain a much greater number of hands, migrations became less frequent; and various tribes, which had formerly separated, reunited again; sometimes by compulsion and conquest, sometimes by accident, and sometimes perhaps by compact. But though society had not its formal beginning from any convention of individuals, actuated by their wants and their fears; yet it is the sense of their weakness and imperfection that keeps mankind together, that demonstrates the necessity of this union, and that therefore is the solid and natural foundation, as well as the cement of society. And this is what we mean by the original contract of society; which, though perhaps in no instance it has ever been formally expressed at the first institution of a state, yet in nature and reason must always be understood and implied in the very act of associating together; namely, that the whole should protect all its parts, and that every part should pay obedience to the will of the whole; or, in other words, that the community should guard the rights of each individual member, and that (in return for this protection) each individual should submit to the laws of the community; without which submission of all, it was impossible that protection could be certainly extended to any.

For when society is once formed, government results of course, as necessary to preserve and to keep that society in order. Unless some superior be constituted, whose commands and decisions all the members are bound to obey, they would still remain as in a state of nature, without any judge upon earth to define their several rights, and redress their several wrongs. But

° 46

as all the members of society are naturally equal, it may be asked, In whose hands are the reins of government to be intrusted? To this the general answer is easy; but the application of it to particular cases has occasioned one half of those mischiefs which are apt to proceed from misguided political zeal. In general, all mankind will agree, that government should be reposed in such persons, in whom those qualities are most likely to be found, the perfection of which is among the attributes of him who is emphatically styled the Supreme Being; the three grand requisites, namely, of wisdom, of goodness, and of power: wisdom, to discern the real interest of the community; goodness, to endeavour always to pursue that real interest; and strength or power to carry this knowledge and intention into action. These are the natural foundations of sovereignty, and these are the requisites that ought to be found in every well constituted frame of government.

How the several forms of government we now see in the world at first actually began, is matter of great uncertainty, and has occasioned infinite disputes. It is not our business or intention to enter into any of them. However they began, or by what right soever they subsist, there is and must be in all of them a supreme, irresistible, absolute, uncontrolled authority, in which the jura summa imperii, or the rights of sovereignty, reside. And this authority is placed in those hands, wherein (according to the opinion of the founders of such respective states, either expressly given or collected from their tacit approbation) the qualities requisite for supremacy, wisdom, goodness, and power, are the most likely to be found.

The political writers of antiquity will not allow different more than three regular forms of government: the first, when the sovereign power is lodged in an aggregate assembly consisting of all the members of a community, which is called a democracy; the second, when it is lodged in a council composed of select members, and then it is styled an aristocracy; the last, when it is intrusted in the hands of a single person, and then it takes the name of a monarchy. All other species of government, they say, are either corruptions of, or reducible to, these three.

By the sovereign power, as was before observed, is meant the making of laws; for wherever that power resides, all others must conform to and be directed by it, whatever appearance the outward form and administration of the government may put on. For it is at any time in the option of the legislature to alter that form and administration by a new edict or rule, and to put the execution of the laws into whatever hands it pleases: and all the other powers of the state must obey the legislative power in the execution of their several functions, or else the constitution is at an end.

In a democracy, where the right of making laws resides in the people at large, public virtue or goodness of intention is more likely to be found than either of the other qualities of government. Popular assemblies are frequently foolish in their contrivance, and weak in their execution; but generally meant to do the thing that is right and just, and have always a degree of patriotism or public spirit. In aristocracies there is more wisdom to be found than in the other forms of government; being composed, or intended to be composed,
L A W.

Part I.

On Laws, otherwise more experienced citizens: but there is in general less honesty than in a republic, and less strength than in a monarchy. A monarchy is indeed the most powerful of any, all the sinews of government being knit and united together in the hand of the prince; but then there is imminent danger of his employing that strength to improvident or oppressive purposes.

Thus these three species of government have all of them their several perfections and imperfections. Democracies are usually the best calculated to direct the end of a law; aristocracies, to invent the means by which that end shall be obtained; and monarchies, to carry those means into execution. And the ancients, as was observed, had in general no idea of any other permanent form of government but these three: for though Cicero declares himself of opinion, "esse optimé constitutam rempublicam, qua ex tribus generibus illis, regali, optimo, et populari, sit modicé confusa," yet Tacitus treats this notion of a mixed government, formed out of them all, and partaking of the advantages of each, as a visionary whim, and one that, if effected, could never be lasting or secure.

But, happily for us of this island, the British constitution has long remained, and we trust will long continue, a standing exception to the truth of this observation. For, as with us the executive power of the laws is lodged in a single person, they have all the advantages of strength and despatch that are to be found in the most absolute monarchy: and, as the legislature of the kingdom is intrusted to three distinct powers, entirely independent of each other; first, the king; secondly, the lords spiritual and temporal, which is an aristocratical assembly of persons selected for their piety, their birth, their wisdom, their valour, or their property; and, thirdly, the house of commons, freely chosen by the people from among themselves, which makes it a kind of democracy; as this aggregate body, actuated by different springs and attentive to different interests, composes the British parliament, and has the supreme disposal of every thing, no innovation can be attempted by either of the three branches, but will be withstood by one of the other two, each branch being armed with a negative power sufficient to repel any new measure which it shall think inexpedient or dangerous.

Here, then, is lodged the sovereignty of the British constitution; and lodged as beneficially as is possible for society. For in no other shape could we be so certain of finding the three great qualities of government so well and so happily united. If the supreme power were lodged in any one of the three branches separately, we must be exposed to the inconveniences of either absolute monarchy, aristocracy, or democracy; and so want two of the three principal ingredients of good polity, either virtue, wisdom, or power. If it were lodged in any two of the branches; for instance, in the king and house of lords; our laws might be providently made and well executed, but they might not always have the good of the people in view; if lodged in the king and commons, we should want that circumspection and mediatory caution, which the wisdom of the peers is to afford: if the supreme rights of legislature were lodged in the two houses only, and the king had no negative upon their proceedings, they might be tempted to encroach upon the royal prerogative, or perhaps to abolish the kingly office, and thereby weaken the strength of the executive in general power. But the constitutional government of this island is so admirably tempered and confounded, that nothing can endanger or hurt it, but destroying the equilibrium of power between one branch of the legislature and the rest. For if ever it should happen, that the independence of any one of the three should be lost, or that it should become subservient to the views of either of the other two, there would soon be an end of our constitution. The legislature would be changed from that which was originally set up by the general consent and fundamental act of the society, and such a change, however effected, is, according to Mr Locke (who perhaps carries his theory too far), at once an entire dissolution of the bands of government; and the people are thereby reduced to a state of anarchy, with liberty to constitute to themselves a new legislative power.

Having thus cursorily considered the three usual species of government, and our own singular constitution selected and compounded from them all, we proceed to observe, that, as the power of making laws constitutes the supreme authority, so wherever the supreme authority in any state resides, it is the right of that authority to make laws; that is, in the words of our definition, to prescribe the rule of civil action. And this may be discovered from the very end and institution of civil states. For a state is a collective body, composed of a multitude of individuals, united for their safety and convenience, and intending to act together as one man. If it is therefore to act as one man, it ought to act by one uniform will. But, inasmuch as political communities are made up of many natural persons, each of whom has his particular will and inclination, these several wills cannot by any natural union be joined together, or tempered and disposed into a lasting harmony, so as to constitute and produce that one uniform will of the whole. It can therefore be no otherwise produced than by a political union; by the consent of all persons to submit their own private wills to the will of one man, or of one or more assemblies of men, to whom the supreme authority is intrusted; and this will of that one man, or assembly of men, is in different states, according to their different constitutions, understood to be law.

Thus far as to the right of the supreme power to make laws: but farther, it is its duty likewise. For since the respective members are bound to conform themselves to the will of the state, it is expedient that they receive directions from the state declaratory of that will. But it is impossible, to so great a multitude, to give injunctions to every particular man, relative to each particular action, therefore the state establishes general rules, for the perpetual information and direction of all persons in all points, whether of positive or negative duty: and this, in order that every man may know what to look upon as his own, what as another's; what absolute and what relative duties are required at his hands; what is to be esteemed honest, dishonest, or indifferent; what degree every man retains of his natural liberty, and what he has given up as the price of the benefits of society; and after what manner each person is to moderate the use and exercise of those rights which the state assigns to him.
LAW.

Part I.

Of Law in general.

From what has been advanced, the truth of the former branch of our definition is (we trust) sufficiently evident, that "municipal law is a rule of civil conduct, prescribed by the supreme power in a state." We proceed now to the latter branch of it; that it is a rule so prescribed, "commanding what is right, and prohibiting what is wrong."

Now, in order to do this completely, it is first of all necessary that the boundaries of right and wrong be established and ascertained by law. And when this is once done, it will follow of course, that it is likewise the business of the law, considered as a rule of civil conduct, to enforce these rights, and to restrain or redress these wrongs. It remains, therefore, only to consider, in what manner the law is said to ascertain the boundaries of right and wrong; and the methods which it makes to command the one and prohibit the other.

For this purpose, every law may be said to consist of several parts; one, declaratory, whereby the rights to be observed, and the wrongs to be eschewed, are clearly defined and laid down; another, directory, whereby the subject is intrusted and enjoined to observe those rights, and to abstain from the commission of those wrongs: a third, remedial, whereby a method is pointed out to recover a man's private rights, or redress his private wrongs: to which may be added a fourth, usually termed the sanction or vindicatory branch of the law, whereby it is signified what evil or penalty shall be incurred by such as commit any public wrongs, and transgress or neglect their duty.

With regard to the first of these, the declaratory part of the municipal law; this depends not so much upon the law of revelation or of nature, as upon the wisdom and will of the legislator. This doctrine, which before was slightly touched, deserves a more particular explanation. Those rights, then, which God and nature have established, and are therefore called natural rights, such as are life and liberty, need not the aid of human laws to be more effectually invested in every man than they are; neither do they receive any additional strength when declared by the municipal laws to be inviolable. On the contrary, no human legislature has power to abridge or destroy them, unless the owner shall himself commit some act that amounts to a forfeiture. Neither do divine or natural duties (such as, for instance, the worship of God, the maintenance of children, and the like) receive any stronger sanction from being also declared to be duties by the law of the land. The case is the same as to crimes and misdemeanors, that are forbidden by the superior laws, and therefore styled mala in se, such as murder, theft, and perjury; which contract no additional turpitude from being declared unlawful by the inferior legislation. For that legislation in all these cases acts only, as was before observed, in subordination to the Great Lawgiver, transcribing and publishing his precepts. So that, upon the whole, the declaratory part of the municipal law has no force or operation at law, with regard to actions that are naturally and intrinsically right or wrong.

But with regard to things in themselves indifferent, the case is entirely altered. These become either right or wrong, just or unjust, duties or misdemeanors, according as the municipal legislator sees proper, for in general, promoting the welfare of the society, and more effectually carrying on the purposes of civil life. Thus our own common law has declared, that the goods of the wife do instantly upon marriage become the property and right of the husband: and our statute law has declared all monopolies a public offence: yet that right, and this offence, have no foundation in nature; but are merely created by the law, for the purposes of civil society. And sometimes, where the thing itself has its rise from the law of nature, the particular circumstances and mode of doing it become right or wrong, as the laws of the land shall direct. Thus, for instance, in civil duties; obedience to superiors is the doctrine of revealed as well as natural religion: but who those superiors shall be, and in what circumstances, or to what degrees they shall be obeyed, is the province of human laws to determine. And so, as to injuries or crimes, it must be left to our own legislature to decide, in what cases the seizing another's cattle shall amount to the crime of robbery; and where it shall be a justifiable action, as when a landlord takes them by way of distress for rent.

Thus much for the declaratory part of the municipal Directory law: and the directory stands much upon the same part footing; for this virtually includes the former, the declaration being usually collected from the direction. The law that says, "Thou shalt not steal," implies a declaration that stealing is a crime. And we have seen, that, in things naturally indifferent, the very essence of right and wrong depends upon the direction of the laws to do or to omit them.

The remedial part of a law is so necessary a con-Remedial sequence of the two former, that laws must be very part vague and imperfect without it. For in vain would rights be declared, in vain directed to be observed, if there were no method of recovering and asserting those rights when wrongfully withheld or invaded. This is what we mean properly, when we speak of the protection of the law. When, for instance, the declaratory part of the law has said, that "the field or inheritance which belonged to Titius's father is vested by his death in Titius," and the directory part has "forbidden any one to enter on another's property without the leave of the owner," if Gaius after this will presume to take possession of the land, the remedial part of the law will then interpose its office; will make Gaius restore the possession to Titius, and also pay him damages for the invasion.

With regard to the sanction of laws, or the evil that may attend the breach of public duties; it is observed, that human legislators for the most part chosen to make the sanction of their laws rather vindicatory than remuneratory, or to consist rather in punishments than in actual particular rewards: Because, in the first place, the quiet enjoyment and protection of all our civil rights and liberties, which are the sure and general consequence of obedience to the municipal law, are in themselves the best and most valuable of all rewards: because also, the exercise of every virtue to be enforced by the proposal of particular rewards, it were impossible for any state to furnish stock enough for so profuse a bounty; and further, because the dread of evil is a much more forcible principle
principle of human actions than the prospect of good. For which reasons, though a prudent bestowing of rewards is sometimes of exquisite use, yet we find that those civil laws, which enforce and enjoin our duty, do seldom, if every, propose any privilege or gift to such as obey the law; but do constantly come armed with a penalty denounced against transgressors, either expressly defining the nature and quantity of the punishment, or else leaving it to the discretion of the judges, and those who are intrusted with the care of putting the laws in execution.

Of all the parts of a law the most effectual is the vindicatory. For it is but lost labour to say, "Do this, or avoid that," unless we also declare, "This shall be the consequence of your noncompliance." We must therefore observe, that the main strength and force of a law consists in the penalty annexed to it. Herein is to be found the principal obligation of human laws. Legislators and their laws are said to compel and oblige: not that, by any natural violence, they so constrain a man as to render it impossible for him to act otherwise than as they direct, which is the strict sense of obligation; but because, by declaring and exhibiting a penalty against offenders, they bring it to pass that no man can easily choose to transgress the law; since, by reason of the impending correction, compliance is in a high degree preferable to disobedience. And, even where rewards are proposed as well as punishments threatened, the obligation of the law seems chiefly to consist in the penalty: for rewards, in their nature, can only persuade and allure; nothing is compulsory but punishment.

It has been held true, and very justly, by the principal of our ethical writers, that human laws are binding upon men's consciences. But, if that were the only or most forcible obligation, the good only would regard the laws, and the bad would set them at defiance. And, true as this principle is, it must still be understood with some restriction. It holds, we apprehend, as to rights; and that, when the law has determined the field to belong to Titius, it is a matter of conscience no longer to withhold or to invade it. So also in regard to natural duties, and such offences as are mala in se: here we are bound in conscience, because we are bound by superior laws, before those human laws were in being, to perform the one and abstain from the other. But in relation to those laws which enjoin only positive duties, and forbid only such things as are not mala in se, but mala prohibita merely, without any intermixture of moral guilt, annexing a penalty to noncompliance; here conscience seems to be no farther concerned, than by directing a submission to the penalty, in case of our breach of those laws: for otherwise the multitude of penal laws in a state would not only be looked upon as an impolitic, but would also be a very wicked, thing; if every such law were a snare for the conscience of the subject. But in these cases the alternative is offered to every man; either abstain from this, or submit to such a penalty? and his conscience will be clear whichever side of the alternative he thinks proper to embrace. Thus, by the statutes for preserving the game, a penalty is denounced against every unqualified person that kills a hare, and against every person who possesses a partridge in August. And so too, by other statutes, pecuniary penalties are inflicted for exercising trades without serving an apprenticeship thereto, for erecting cottages in general without annexing four acres of land to each, for not burying the dead in woollen, for not performing statute work on the public roads, and for innumerable other positive misdemeanors. Now these prohibitory laws do not make the transgression a moral offence, or sin: the only obligation in conscience is to submit to the penalty, if levied. It must, however, be observed, that we are here speaking of laws that are simply and purely penal, where the thing forbidden or enjoined is wholly a matter of indifference, and where the penalty inflicted is an adequate compensation for the civil inconvenience supposed to arise from the offence. But where disobedience to the law involves in it also any degree of public mischief or private injury, there it falls within our former distinction, and is also an offence against conscience.

We have now gone through the definition laid down of a municipal law; and have shown that it is "a rule of civil conduct—prescribed—by the supreme power in a state—commanding what is right, and prohibiting what is wrong:" in the explication of which we have endeavoured to interweave a few useful principles, concerning the nature of civil government, and the obligation of human laws. Before we conclude this part, it may not be amiss to add a few observations concerning the interpretation of laws.

When any doubt arose upon the construction of the Roman laws, the usage was to state the case to the emperor in writing, and take his opinion upon it. This was certainly a bad method of interpretation. To interrogate the legislature to decide particular disputes, is not only endless, but affords great room for partiality and oppression. The answers of the emperor were called his rescript, and these had in succeeding cases the force of perpetual laws; though they ought to be carefully distinguished, by every rational civilian, from those general constitutions which had only the nature of things for their guide. The emperor Marcinus, as his historian Capitolinus informs us, had once resolved to abolish these rescripts, and retain only the general edicts: he could not bear that the hasty and crude answers of such princes as Commodus and Caracalla should be reverenced as laws. But Justinian thought otherwise, and he has preserved them all. In like manner the canon laws, or decretal epistles of the popes, are all of them rescripts in the strictest sense. Contrary to all true forms of reasoning, they argue from particulars to generals.

The fairest and most rational method to interpret the will of the legislator, is by exploring his intentions at the time when the law was made, by signs the most natural and probable. And these signs are either the words, the context, the subject-matter, the effects and consequence, or the spirit and reason of the law. Let us take a short view of them all.

1. Words are generally to be understood in their usual and most known signification; not so much regarding the propriety of grammar, as their general and popular use. Thus the law mentioned by Puffendorf, which forbade a layman to lay hands on a priest, was adjudged to extend to him who had hurt a priest with a weapon. Again: Terms of art, or technical terms, must be taken according to the acceptance of the
the learned in each art, trade, and science. So in the law of settlement, where the crown of England is limited to the princess Sophia, and the heirs of her body being Protestants, it becomes necessary to call in the assistance of lawyers, to ascertain the precise idea of the words "heirs of her body;" which in a legal sense comprise only certain of her linear descendants. Lastly, Where words are clearly repugnant in two laws, the latter takes place of the elder; leges posteriores priores contrarias abrogant, is a maxim of universal law, as well as of our own constitutions. And accordingly it was laid down by a law of the twelve tables at Rome, Quod populus postremum jussit, id jus ratum est.

24. If words happen to be still dubious, we may establish their meaning from the context; with which it may be of singular use to compare a word or a sentence, whenever they are ambiguous, equivocal, or intricate. Thus the preface, or preamble, is often called in to help the construction of an act of parliament. Of the same nature and use is the comparison of a law with other laws that are made by the same legislator, that have some affinity with the subject, or that expressly relate to the same point. Thus, when the law of England declares murder to be felony without benefit of clergy, we must resort to the same law of England to learn what the benefit of clergy is, and when the common law censures simoniacal contracts, it affords great light to the subject to consider what the canon law has adjudged to be simony.

3. As to the subject-matter, words are always to be understood as having a regard thereto; for that is always supposed to be in the eye of the legislator, and all his expressions directed to that end. Thus, when a law of Edward III. forbids all ecclesiastical persons to purchase provisions at Rome, it might seem to prohibit the buying of grain and other victual; but when we consider that the statute was made to repress the usurpations of the papal see, and that the nominations to benefices by the pope were called provisions, we shall see that the restraint is intended to be laid upon such provisions only.

4. As to the effects and consequence, the rule is, that words bear either none, or a very absurd signification, if literally understood, we must a little deviate from the received sense of them. Therefore the Bolognian law, mentioned by Puffendorf, which enacted that whoever drew blood in the streets should be punished with the utmost severity, was held after long debate not to extend to the surgeon who opened the vein of a person who fell down in the street with a fit.

5. But, lastly, The most universal and effectual way of discovering the true meaning of a law, when the words are dubious, is by considering the reason and spirit of it, or the cause which moved the legislator to enact it. For when this reason ceases, the law itself ought likewise to cease with it. An instance of this is given in a case put by Cicero, or whoever was the author of the rhetorical treatise inscribed to Herennius.

There was a law that those who in a storm forsook the ship should forfeit all property therein, and the ship in general, and the cargo should belong entirely to those who stood in it. In a dangerous tempest, all the mariners forsook the ship, except only one sick passenger, who by reason of his disease was unable to get out and escape. By chance the ship came safe to port. The sick man kept possession, and claimed the benefit of the law. Now here all the learned agree, that the sick man is not within the reason of the law; for the reason of making it was, to give encouragement to such as should venture their lives to save the vessel: but this is a merit which he could never pretend to, who neither stood in the ship upon that account, nor contributed anything to its preservation.

From this method of interpreting laws by the rea-equity of them, arises what we call equity: which is thus defined by Grotius, "the correction of that, wherein the law is, (by reason of its universality) is deficient." For since in laws all cases cannot be foreseen or expressed, it is necessary, that, when the general decrees of the law come to be applied to particular cases, there should be somewhere a power vested of defining those circumstances, which (had they been foreseen) the legislator himself would have expressed. And these are the cases which, according to Grotius, lex non exacte definit, sed arbitrio boni viri permittis.

Equity thus depending, essentially, upon the particular circumstances of each individual case, there can be no established rules and fixed precepts of equity laid down, without destroying its very essence, and reducing it to a positive law. And, on the other hand, the liberty of considering all cases in an equitable light must not be indulged too far; lest thereby we destroy all law, and leave the decision of every question entirely in the breast of the judge. And law, without equity, though hard and disagreeable, is much more desirable for the public good, than equity without law; which would make every judge a legislator, and introduce infinite confusion: as there would then be almost as many different rules of action laid down in our courts, as there are differences of capacity and sentiment in the human mind.

Having thus considered the nature of laws in general, we shall proceed to give a view of the particular two follow-law of our own country; 1. Of England; 2. Of Scot-land. The English law, however, being too extensive to admit of detail in a body, we can only here give such a sketch of it as may be sufficient to show the connexion of its parts; but the principal of these parts themselves are explained at large, under their proper names, in the general alphabet.—A contrary method is followed with regard to the law of Scotland. This being less extensive, is given in a body, with all its parts not only in regular connection, but sufficiently explained; these parts, again, not being explained in the order of the alphabet, but marked with numerical references to their explanations in the system.

PART
INTRODUCTION.

THE municipal law of England, or the rule of civil conduct prescribed to the inhabitants of that kingdom, may with sufficient propriety be divided into two kinds: the lex non scripta, the unwritten or common law; and the lex scripta, the written or statute law.

The lex non scripta, or unwritten law, includes not only general customs, or the common law properly so called; but also the particular customs of certain parts of the kingdom, and likewise those particular laws that are by custom observed only in certain courts and jurisdictions.

In calling these parts of the law leges non scriptae, we would not be understood as if all those laws were at present merely oral, or communicated from the former ages to the present solely by word of mouth. It is true indeed, that in the profound ignorance of letters which formerly overspread the whole western world, all laws were entirely traditional; for this plain reason, that the nations among which they prevailed had but little idea of writing. Thus the British as well as the Gallic Druids committed all their laws as well as learning to memory; and it is said of the primitive Saxons here, as well as their brethren on the continent, that leges sola memoriam et usi retinebant. But, with us at present, the monuments and evidences of our legal customs are contained in the records of the several courts of justice, in books of reports and judicial decisions, and in the treatises of learned sages of the profession, preserved and handed down to us from the times of highest antiquity. However, we therefore style these parts of our law leges non scriptae, because their original institution and authority are not set down in writing, as acts of parliament are; but they receive their binding power, and the force of laws, by long and immemorial usage, and by their universal reception throughout the kingdom: in like manner as Aulus Gelius defines the jus non scriptum to be that which is tacito et illiterato dominum consensu et moribus expressum.

Our ancient lawyers, and particularly Fortescue, insist with abundance of warmth, that these customs are as old as the primitive Britons, and continued down through the several mutations of government and inhabitants to the present time, unchanged and undulterated. This may be the case as to some. But in general, as Mr Selden in his notes observes, this assertion must be understood with many grains of allowance; and ought only to signify, as the truth seems to be, that there never was any formal exchange of one system of laws for another; though doubtless, by the intermixture of adventitious nations, the Romans, the Picts, the Saxons, the Danes, and the Normans, they must insensibly have introduced and incorporated many of their own customs with those that were before established; thereby, in all probability, improving the texture and wisdom of the whole, by the accumulated wisdom of diverse particular countries. Our laws, saith Lord Bacon, are mixed as our language; and as our language is so much the richer, the laws are the more complete.

And indeed our antiquarians and first historians do all positively assure us, that our body of laws is of this compound nature. For they tell us, that in the time of Alfred the local customs of the several provinces of the kingdom were grown so various, that he found it expedient to compile his dome book, or liber judicialis, for the general use of the whole kingdom. This book is said to have been extant so late as the reign of Edward IV. but is now unfortunately lost. It contained, we may probably suppose, the principal maxims of the common law, the penalties for misdemeanors, and the forms of judicial proceedings. Thus much may at least be collected from that injunction to observe it, which we find in the laws of King Edward the Elder, the son of Alfred. Omnis in municipiis presunt etiam etiam atque etiam mandat, ut omnis qui aquos se praebat judices perinde ac in judiciis libro scriptum habitaret nec quisquam condemnaret nisi jussum commune audacter librigique dicavit.

But the irruption and establishment of the Danes in England, which followed soon after, introduced new customs, and caused this code of Alfred in many provinces to fall into disuse, or at least to be mixed and debased with other laws of a coarser alloy. So that, about the beginning of the 11th century, there were three principal systems of laws prevailing in different districts. 1. The Mercian Law, or Mercian laws, which were observed in many of the inland counties, and those bordering on the principality of Wales, the retreat of the ancient Britons; and therefore very probably intermixed with the British or Druidical customs. 2. The West Saxon Law, or laws of the West Saxons, which obtained in the counties to the south and west of the island, from Kent to Devonshire. These were probably much the same with the laws of Alfred above mentioned, being the municipal law of the far most considerable part of his dominions, and particularly including Berkshire, the seat of his peculiar residence. 3. The Dane Law, or Danish law, the very name of which speaks its original and composition. This was principally maintained in the rest of the midland counties, and also on the eastern coast, the part most exposed to the visits of that piratical people. As for the very northern provinces, they were at that time under a distinct government.

Out of these three laws, Roger Hoveden and Ranulphus Cestrensis inform us, King Edward the Conserver extracted one uniform law, or digest of laws, to be observed throughout the whole kingdom; though Hoveden and the author of an old manuscript chronicle assure us likewise, that this work was projected and begun by his grandfather King Edgar. And indeed a general digest of the same nature has been constantly found expedient, and therefore put in practice by other great nations, which were formed from an assemblage of little provinces, governed by peculiar customs. As in Portugal, under King Edward, about the beginning of the 15th century. In Spain, under Alonzo X. who...

Part II.

About the year 1250 executed the plan of his father, St. Ferdinand, and collected all the provincial customs into one uniform law, in the celebrated code entitled "Las Partidas." And in Sweden, about the same era, a universal body of common law was compiled out of the particular customs established by the laggan of every province, and entitled the "Land's Lög," being analogous to the common law of England.

Both these undertakings of King Edgar and Edward the Confessor, seem to have been no more than a new edition, or fresh promulgation, of Alfred's code or drona book, with such additions and improvements as the experience of a century and a half had suggested. For Alfred is generally styled by the same historians the "legum Anglicarum conditor," as Edward the Confessor is the "restitutor." These, however, are the laws which our histories so often mention under the name of the laws of Edward the Confessor; which our ancestors struggled so hardly to maintain, under the first princes of the Norman line; and which subsequent princes so frequently promised to keep and restore, as the most popular act they could do, when pressed by foreign emergencies or domestic discontent. These were the laws, that so vigorously withstood the repeated attacks of the civil law; which established in the 12th century a new Roman empire over the most of the states on the continent: states that have lost, and perhaps upon that account, their political liberties; while the free constitution of England, perhaps upon the same account, has been rather improved than debased. These, in short, are the laws which gave rise and origin to that collection of maxims and customs which is now known by the name of the common law: A name either given to it, in contradistinction to other laws, as the statute law, the civil law, the law merchant, and the like; or, more probably, as a law common to all the realm, the jus commune or folciht, mentioned by King Edward the Elder, after the abolition of the several provincial customs, and particular laws before mentioned.

But though this is the most likely foundation of this collection of maxims and customs, yet the maxims and customs so collected, are of higher antiquity than memory or history can reach: nothing being more difficult than to ascertain the precise beginning and birth of any of an ancient and long established custom. Whence it is, that in our law the goodness of a custom depends upon its having been used in time of mind; or, in the solemnity of our legal phrase, time whereof the memory of man runneth not to the contrary. This it is that gives it its weight and authority; and of this nature are the maxims and customs which compose the common law, or lex non scripta, of this kingdom.

This unwritten, or common, law, is properly distinguished into three kinds: 1. General customs; which are the universal rule of the whole kingdom, and form the common law in its stricter and more usual significations. 2. Particular customs; which for the most part affect only the inhabitants of particular districts. 3. Certain particular laws; which by custom are adopted and used by some particular courts, of pretty general and extensive jurisdiction.

As to general customs, or the common law properly so called; this is that law, by which proceedings and determinations in the king's ordinary courts of justice are guided and directed. This, for the most part, settles the course in which lands descend by inheritance; the manner and form of acquiring and transferring property; the solemnities and obligation of contracts; the rules of expounding wills, deeds, and acts of parliament; the respective remedies of civil injuries; the several species of temporal offences, with the manner and degree of punishment, and an infinite number of minuter particulars, which diffuse themselves as extensively as the ordinary distribution of common justice requires. Thus, for example, that there shall be four superior courts of record, the chancery, the king's bench, the common pleas, and the exchequer;—that the eldest son alone is heir to his ancestor;—that property may be acquired and transferred by writing;—that a deed is of no validity unless sealed and delivered;—that wills shall be construed more favourably, and deeds more strictly;—that money lent upon bond is recoverable by action of debt;—that breaking the public peace is an offence, and punishable by fine and imprisonment;—all these are doctrines that are not set down in any written statute or ordinance; but depend merely upon immemorial usage, that is, upon common law, for their support.

Some have divided the common law into two principal grounds or foundations: 1. Established customs; such as that, where there are three brothers, the eldest brother shall be heir to the second, in exclusion of the youngest; and, 2. Established rules and maxims; as, "that the king can do no wrong, that no man shall be bound to accuse himself," and the like. But these seem to be one and the same thing. For the authority of these maxims rests entirely upon general reception and usage; and the only method of proving that this or that maxim is a rule of the common law, is by showing that it hath been always the custom to observe it.

But here a very natural, and very material, question arises: How are these customs or maxims to be known, and by whom is their validity to be determined? The answer is, By the judges in the several courts of justice. They are the depository of the laws; the living oracles, who must decide in all cases of doubt, and who are bound by an oath to decide according to the law of the land. Their knowledge of that law is derived from experience and study; from the "viginti annorum lucubrationes," which Fortescue mentions; and from being long personally accustomed to the judicial decisions of their predecessors. And indeed these judicial decisions are the principal and most authoritative evidence, that can be given, of the existence of such a custom as shall form a part of the common law. The judgment itself, and all the proceedings previous thereto, are carefully registered and preserved under the name of records, in public repositories set apart for that particular purpose; and to them frequent recourse is had, when any critical question arises, in the determination of which former precedents may give light or assistance. And therefore, even so early as the Conquest, we find the "præteritorum memoria eventorum" reckoned up as one of the chief qualifications of those who were held to be "legibus patria optime instituit." For it is an established rule, To abide by former precedents, where the same points come again in litigation, as well to keep the scale of justice even and steady, and not liable to wander with...

Part II.

LAW.

with every new judge's opinion; as also because the law in that case being solemnly declared and determined, what before was uncertain, and perhaps indifferent, is now become a permanent rule, which is not in the breast of any subsequent judge to alter or vary from according to his private sentiments: he being sworn to determine, not according to his own private judgement, but according to the known laws and customs of the land; not delegated to pronounce a new law, but to maintain and expound the old one. Yet this rule admits of exception, where the former determination is most evidently contrary to reason; much more if it be contrary to the divine law. But even in such cases the subsequent judges do not pretend to make a new law, but to vindicate the old one from misrepresentation. For if it be found that the former decision is manifestly absurd or unjust, it is declared, not that such a sentence was bad law, but that it was not law; that is, that it is not the established custom of the realm, as has been erroneously determined. And hence it is that our lawyers are with justice so copious in their encomiums on the reason of the common law: that they tell us, that the law is the perfection of reason, that it always intends to conform thereto, and that what is not reason is not law. Not that the particular reason of every rule in the law, can at this distance of time be always precisely assigned; but it is sufficient that there be nothing in the rule flatly contradictory to reason, and then the law will presume it to be well founded. And it hath been an ancient observation in the laws of England, that whenever a standing rule of law, of which the reason perhaps could not be remembered or discerned, hath been wantonly broke in upon by statutes or new resolutions, the wisdom of the rule hath in the end appeared from the inconveniences that have followed the innovation.

The doctrine of the law then is this: That precedents and rules must be followed, unless flatly absurd or unjust; for though their reason be not obvious at first view, yet we owe such a deference to former times as not to suppose they acted wholly without consideration. To illustrate this doctrine by examples. It has been determined, time out of mind, that a brother of the half blood shall never succeed as heir to the estate of his half brother, but it shall rather escheat to the king, or other superior lord. Now this is a positive law, fixed and established by custom; which custom is proved by judicial decisions; and therefore can never be departed from by any modern judge without a breach of his oath and the law. For herein there is nothing repugnant to natural justice; though the artificial reason of it, drawn from the feudal law, may not be quite obvious to every body. And therefore on account of a supposed hardship upon the half brother, a modern judge might wish it had been otherwise settled, yet it is not in his power to alter it. But if any court were now to determine, that an elder brother of the half blood might enter upon and seize any lands that were purchased by his younger brother, no subsequent judges would scruple to declare that such prior determination was unjust, was unreasonable, and therefore was not law. So that the law, and the opinion of the judge, are not always convertible terms, or one and the same thing; since it sometimes may happen that the judge may mistake the law. Upon the whole, however, we may take it as a general rule, 'That the decisions of courts of justice are the evidence of what is common law,' in the same manner as in the civil law, what the emperor had once determined was to serve for a guide for the future.

The decisions therefore of courts are held in the highest regard, and are not only preserved as authentic records in the treasuries of the several courts, but are handed out to public view in the numerous volumes of reports which furnish the lawyers library. These reports are histories of the several cases, with a short summary of the proceedings, which are preserved at large in the record; the arguments on both sides, and the reasons the court gave for its judgment: taken down in short notes by persons present at the determination. And these serve as indexes to, and also to explain, the records; which always, in matters of consequence and nicety, the judges direct to be searched. The reports are extant in a regular series from the reign of King Edward II, inclusive; and from his time to that of Henry VIII. were taken by the prothonotaries, or chief scribes of the court, at the expense of the crown, and published annually, whence they are known under the denomination of the peer books. And it is much to be wished that this beneficial custom had, under proper regulations, been continued to this day; for though King James I, at the instance of Lord Bacon, appointed two reporters, with a handsome stipend, for this purpose; yet that wise institution was soon neglected, and from the reign of Henry VIII. to the present time this task has been executed by many private and contemporary hands; who sometimes through haste and inaccuracy, sometimes through mistake and want of skill, have published very crude and imperfect (perhaps contradictory) accounts of one and the same determination. Some of the most valuable of the ancient reports are those published by Lord Chief Justice Coke; a man of infinite learning in his profession, though not a little infected with the pedantry and quaintness of the times he lived in, which appear strongly in all his works. However, his writings are so highly esteemed, that they are generally cited without the author's name (A).

Besides these reporters, there are also other authors, to whom great veneration and respect are paid by the students of the common law. Such are Glanville and Bracton, Britton and Fleta, Littleton and Fitzherbert, with

(A) His reports, for instance, are styled, see report, "the reports," and in quoting them we usually say, 1 or 2 Rep. or 1 or 2 Coke's Rep. as in citing other authors. The reports of Judge Coke are also cited in a peculiar manner, by the name of those princes in whose reigns the cases reported in his three volumes were determined; viz. Queen Elizabeth, King James, King Charles I; as well as by the number of each volume. For sometimes we call them *, 2., and 3 Cro.; but more commonly Cro. Eliz. Cro. Jac. and Cro. Car.
II. The second branch of the unwritten laws of England are particular customs, or laws which affect only the inhabitants of particular districts.

These particular customs, or some of them, are second without doubt the remains of that multitude of local branch of customs before mentioned, out of which the common law, as it now stands, was collected at first by King Alfred, and afterwards by King Edgar and Edward the Confessor: each district mutually sacrificing some of its own special usages, in order that the whole kingdom might enjoy the benefit of one uniform and universal system of laws. But, for reasons that have been long forgotten, particular counties, cities, towns, manors, and lordships, were very early indulged with the privilege of abiding by their own customs, in contradistinction to the rest of the nation at large: which privilege is confirmed to them by several acts of parliament.

Such is the custom of gavelkind in Kent and some other parts of the kingdom (though perhaps it was also general till the Norman conquest) which ordains among other things, that not the eldest son only of the father shall succeed to his inheritance, but all the sons alike; and that, though the ancestor be attainted and hanged, yet the heir shall succeed to his estate, without any escheat to the lord.—Such is the custom that prevails in divers ancient boroughs, and therefore called borough English, that the youngest son shall inherit the estate, in preference to all his elder brothers.—Such is the custom, in other boroughs, that a widow shall be entitled, for her dower, to all her husband's lands; whereas at the common law she shall be endowed of one-third part only.—Such also are the special and particular customs of manors, of which every one has more or less, and which bind all the copyholders tenants that hold of the said manors.—Such likewise is the custom of holding divers inferior courts, with power of trying causes, in cities and trading towns; the right of holding which, when no royal grant can be shown, depends entirely upon immemorial and established usage.—Such, lastly, are the many particular customs within the city of London, with regard to trade, apprentices, widows, orphans, and a variety of other matters. All these are contrary to the general law of the land, and are good only by special usage; though the customs of London are also confirmed by act of parliament.

To this head may most properly be referred a particular system of customs used only among one set of the king's subjects, called the custom of merchants, or lex mercatoria: which, however different from the general rules of the common law, is yet ingrained into it, and made a part of it; being allowed for the benefit of trade, to be of the utmost validity in all commercial transactions; for it is a maxim of law, that cut libet in sua orto creendum est.

The rules relating to particular customs regard either

---

(a) It is usually cited either by the name of Co. Litt. or as 1 Inst.
(c) These are cited as 2, 3, or 4 Inst. without any author's name: An honorary distinction, which, we observed, is paid to the works of no other writer; the generality of reports and other tracts being quoted in the name of the compiler, as 2 Ventris, 4 Leonard, 1 Siderio, and the like.
the proof of their existence; their legality when proved; or their usual method of allowance. And first we will consider the rules of proof.

As to gavelkind and borough English, the law takes particular notice of them; and there is no occasion to prove, that such customs actually exist, but only that the lands in question are subject thereto. All other private customs must be particularly pleaded; and as well the existence of such customs must be shown, as that the thing in dispute is within the customs alleged. The trial in both cases (both to show the existence of the custom, as, "That in the manor of Dale lands shall descend only to the heirs male, and never to the heirs female," and also to show "that the lands in question are within that manor") is by a jury of twelve men, and not by the judges; except the same particular custom has been before tried, determined, and recorded, in the same court.

The customs of London differ from all others in point of trial: for if the existence of the custom be brought in question, it shall not be tried by a jury, but by a certificate from the lord mayor and aldermen by the mouth of their recorder; unless it be such a custom as the corporation is itself interested in, as a right of taking toll, &c. for then the law permits them not to certify on their own behalf.

When a custom is actually proved to exist, the next inquiry is into the legality of it; for if it is not a good custom, it ought to be no longer used. *Malus usus abolendus est,* is an established maxim of the law. To make a particular custom good, the following are necessary requisites:

1. That it has been used so long, that the memory of man runneth not to the contrary. So that if any one can show the beginning of it, it is no good custom. For which reason, no custom can prevail against an express act of parliament; since the statute itself is a proof of a time when such a custom did not exist.

2. It must have been continued. Any interruption would cause a temporary ceasing: the revival gives it a new beginning, which will be within time of memory, and thereupon the custom will be void. But this must be understood with regard to an interruption of the right: for an interruption of the possession only for 10 or 20 years, will not destroy the custom. As if the inhabitants of a parish have a customary right of watering their cattle at a certain pool, the custom is not destroyed, though they not use it for 10 years; it only becomes more difficult to prove: but if the right be anyhow discontinued for a day, the custom is quite at an end.

3. It must have been peaceable, and acquiesced in; not subject to contention and dispute. For as customs owe their original to common consent, their being immemorially disputed, either at law or otherwise, is a proof that such consent was wanting.

4. Customs must be reasonable; or rather, taken negatively, they must not be unreasonable. Which is not always, as Sir Edward Coke says, to be understood of every unlearned man's reason; but of artificial and legal reason, warranted by authority of law. Upon which account a custom may be good, though the particular reason of it cannot be assigned; for it sufficeth, if no good legal reason can be assigned against it.

Thus, a custom in a parish, that no man shall put his beasts into the common, till the third of October, would be good; and yet it would be hard to show the reason why that day in particular is fixed upon rather than the day before or after. But a custom that no cattle shall be put in till the lord of the manor has first put in his, is unreasonable, and therefore bad: for peradventure the lord will never put in his; and then the tenants will lose all their profits.

5. Customs ought to be certain. A custom, that lands shall descend to the most worthy of the owner's blood, is void; for how shall this worth be determined? but a custom to descend to the next male of the blood, exclusive of females, is certain, and therefore good. A custom to pay twopence an acre in lieu of tithes, is good; but to pay sometimes twopence and sometimes threepence, as the occupier of the land pleases, is bad for its uncertainty. Yet a custom, to pay a year's improved value for a fine on a copyhold estate, is good; though the value is a thing uncertain; for the value may at any time be ascertained; and the maxim of law is, *Id certum est, quod certum reddi potest.*

6. Customs, though established by consent, must be (when established) compulsory: and not left to the option of every man, who he will use them or no. Therefore a custom, that all the inhabitants shall be rated toward the maintenance of a bridge, will be good; but a custom, that every man is to contribute thereto at his own pleasure, is idle and absurd, and indeed no custom at all.

7. Lastly, Customs must be consistent with each other. One custom cannot be set up in opposition to another. For if both are really customs, then both are of equal antiquity, and both established by mutual consent: which to say of contradictory customs, is absurd. Therefore, if one man prescribes that by custom he has a right to have windows looking into another's garden; the other cannot claim a right by custom to stop up or obstruct those windows: for these two contradictory customs cannot both be good, nor both stand together. He ought rather to deny the existence of the former custom.

Next, as to the allowance of special customs. Customs, in derogation of the common law, must be construed strictly. Thus, by the custom of gavelkind, an infant of 15 years may by one species of conveyance (called a deed of seffment) convey away his lands in fee simple, or for ever. Yet this custom does not empower him to use any other conveyance, or even to lease them for seven years: for the custom must be strictly pursued. And, moreover, all special customs must submit to the king's prerogative. Therefore, if the king purchases lands of the nature of gavelkind, where all the sons inherit equally; yet, upon the king's demise, his eldest son shall succeed to those lands alone. And thus much for the second part of the *leges non scriptae,* those particular customs which affect particular persons or districts only.

III. The third branch of them are those peculiar and special laws which by custom are adopted and used only in the courts of certain peculiar courts and jurisdictions. And by these are understood the civil and canon laws.

It may seem a little improper, at first view, to rank these laws under the head of *leges non scriptae,* or unwritten laws, seeing they are set forth by authority in their
their predecessors, their codes, and their institutions; their councils, decrees, and decretals; and enforced by an immense number of expositions, decisions, and treatises of the learned in both branches of the law. But this is done after the example of Sir Matthew Hale, because it most plain, that it is not on account of their being written laws, that either the canon law, or the civil law, have any obligation within this kingdom: neither do their force and efficacy depend upon their own intrinsic authority; which is the case of our written laws or acts of parliament. They bind not the subjects of England, because their materials were collected from popes or emperors, were digested by Justinian, or declared to be authentic by Gregory. These considerations give them no authority here: for the legislature of England doth not, nor ever did, recognize any foreign power, as superior or equal to it in this kingdom: or as having the right to give law to any the meanest of its subjects. But all the strength that either the papal or imperial laws have obtained in this realm (or indeed in any other kingdom in Europe) is only because they have been admitted and received by innumerable usage and custom in some particular cases, and some particular courts; and then they form a branch of the leges non scriptae, or customary law: or else, because they are in some other cases introduced by consent of parliament, and then they owe their validity to the leges scriptae, or statute law. This is expressly declared in those remarkable words of the statute 23 Hen. VIII. c. 41. addressed to the king's royal majesty.—"This your grace's realm, recognizing no superior under God but your grace, hath been and is free from subjection to any man's law, but only to such as have been devised, made, and ordained within this realm for the wealth of the same; or to such other as, by s suffrage of your grace and your progenitors, the people of your grace have taken at their free liberty, by their own consent, to be used among them; and have bound themselves by long use and custom to the observance of the same: not as to the observance of the laws of any foreign prince, potentate, or vassal; but as to the consented and ancient laws of this realm, originally established as laws of the same, by the said suffrage, consent, and custom; and none otherwise."

Civil law.

1. By the civil law, absolutely taken, is generally understood the civil or municipal law of the Roman empire, as comprised in the Institutes, the Code, and the Digest of the emperor Justinian, and the novel constitutions of himself and some of his successors; of which it may not be amiss to give a short and general account.

The Roman law (founded first upon the regal constitutions of their ancient kings, next upon the 12 tables of the decemviri, then upon the laws or statutes enacted by the senate or people, the edicts of the prefect, and the responsa prudentium or opinions of learned lawyers, and lastly upon the imperial decrees or constitutions of successive emperors) had grown so great a bulk, or, as Livy expresses it, tam immensus abhorum super ochis acceperatur ignis cumulus, that they were computed to be many carrials load by an author who preceded Justinian. This was in part remedied by the collection of three private lawyers, Gregorius, Hermogenes, and Papirius; and then by the emperor Theodosius the younger, by whose orders a code was compiled, A. D. 438, being a methodical collection of all the imperial constitutions then in force: which Theodosian code was the only book of civil law received as authentic in the western part of Europe, till many centuries after: and to this it is probable that the Franks and Goths might frequently pay some regard, in framing legal constitutions for their newly erected kingdoms. For Justinian commanded only in the eastern remains of the empire; and it was under his auspices, that the present body of civil law was compiled and finished by Trebonian and other lawyers, about the year 533.

This consists of, 1. The Institutes; which contain the elements or first principles of the Roman law, in four books. 2. The Digests or Pandects, in 50 books; containing the opinions and writings of eminent lawyers, digested in a systematical method. 3. A new code, or collection of imperial constitutions; the lapse of a whole century having rendered the former code of Theodosius imperfect. 4. The Novels, or new constitutions, posterior in time to the other books, and amounting to a supplement to the code; containing new decrees of successive emperors, as new questions happened to arise. These form the body of Roman law, or corpus juris civilis, as published about the time of Justinian: which, however, fell soon into neglect and oblivion, till about the year 1130, when a copy of the Digests was found at Amalfi in Italy; which accident, concurring with the policy of the Roman ecclesiastics, suddenly gave new vogue and authority to the civil law, introduced it into several nations, and occasioned that mighty inundation of voluminous comments, with which this system of law, more than any other, is now loaded.

2. The canon law is a body of Roman ecclesiastical law, relative to such matters as that church either has, or pretends to have, the proper jurisdiction over. This is compiled from the opinions of the ancient Latin fathers, the decrees of general councils, the decretal epistles and bulls of the holy see. All which lay in the same disorder and confusion as the Roman civil law; till, about the year 432, one Gratian, an Italian monk, animated by the discovery of Justinian's Pandects, reduced the ecclesiastical constitutions also into some method, in three books; which he entitled Concordia discordantium canonum, but which are generally known by the name of Decretum Gratiani. These reached as low as the time of Pope Alexander III. The subsequent papal decrees, to the pontificate of Gregory IX. were published in much the same method under the auspices of that pope, about the year 1230, in five books; entitled Decretalium Gregorii noni. A sixth book was added by Boniface VIII. about the year 1298, which is called Sextus Decretalium. The Clementine constitutions, or decrees of Clement V. were in like manner authenticated in 1317 by his successor John XXII.; who also published 20 constitutions of his own, called Extravagantes Joannis. All which in some measure answer to the novels of the civil law. To these have been since added some decrees of later popes, in five books, called Extravagantes Commanes. And all these together, Gratian's decree, Gregory's decrees, the sixth decretal, the Clementine constitutions, and the Extravagants of John and his successors,
From the Corpus Juris Canonici, or Body of the Roman Canon Law.

Part II.

Besides these pontifical collections, which during the time of popes were received as authentic in this island, as well as in other parts of Christendom, there is also a kind of national canon law, composed of legislative and provincial constitutions, and adapted only to the exigencies of this church and kingdom. The legislative constitutions were ecclesiastical laws, enacted in national synods, held under the cardinals Otho and Octobon, legates from Pope Gregory IX. and Pope Clement IV. in the reign of King Henry III. about the years 1220 and 1268. The provincial constitutions are principally the decrees of provincial synods, held under divers archbishops of Canterbury, from Stephen Langton in the reign of Henry III. to Henry Chichele in the reign of Henry V.; and adopted also by the province of York in the reign of Henry VI. At the dawn of the Reformation, in the reign of King Henry VIII., it was enacted in parliament, that a review should be had of the canon law; and till such review should be made, all canons, constitutions, ordinances and synodal provincial, being then already made, and not repugnant to the law of the land or the king's prerogative, should still be used and executed. And, as no such review has yet been perfected, upon this statute now depends the authority of the canon law in England.

As for the canons enacted by the clergy under James I., in the year 1603, and never confirmed in parliament, it has been solemnly adjudged upon the principles of law and the constitution, that where they are not merely declaratory of the ancient canon law, but are introductory of new regulations, they do not bind the laity, whatever regard the clergy may think proper to pay them.

There are four species of courts, in which the civil and canon laws are permitted under different restrictions to be used.

1. The courts of the archbishop and bishops, and their derivative officers; usually called courts Christiani, (curiae Christianitatis), or the ecclesiastical courts.

2. The military courts.

3. The courts of admiralty.

4. The courts of the two universities.

In all, their reception in general, and the different degrees of that reception, are groundless entirely upon custom; corroborated in the latter instance by act of parliament, ratifying those charters which confirm the customary law of the universities. The more minute consideration of them will fall under their proper articles. It will suffice at present to remark a few particulars relative to them all, which may serve to inculcate more strongly the doctrine laid down concerning them.

1. And first, the courts of common law have the supremest sway over these courts; to keep them within their jurisdictions; to determine wherein they exceed them; to restrain and prohibit such excesses; and (in case of contumacy) to punish the officer who executes, and in some cases the judge who enforces, the sentence so declared to be illegal.

2. The common law has reserved to itself the exposition of all such acts of parliament, as concern either the extent of these courts, or the matters depending before them. And therefore, if these courts either refuse to allow these acts of parliament, or will expound them in any other sense than what the common law puts upon them, the king's court at Westminster will grant prohibitions to restrain and control them.

3. An appeal lies from all these courts to the king, in the last resort; which proves that the jurisdiction exercised in them is derived from the crown of England, and not from any foreign potentate, or intrinsic authority of their own. And, from these three strong marks and ensigns of superiority, it appears beyond a doubt, that the civil and canon laws, though admitted in some cases by custom in some courts, are only subordinate and leges sub gratiis regi; and that thus admitted, restrained, altered, new-modelled, and amended, they are by no means with us a distinct independent species of laws, but are inferior branches of the customary or unwritten laws of England, properly called the king's ecclesiastical, the king's military, the king's maritime, or the king's academical laws.

Let us next proceed to the leges scriptae, the written laws of the kingdom; which are statutes, acts, or men's laws, edicts, made by the king's majesty, by and with the advice of the lords spiritual and temporal and commissars in parliament assembled. The oldest of these now extant, and printed in our statute books, is the famous Magna Charta, as confirmed in parliament 9 H. III. though doubtless there were many acts before that time, the records of which are now lost, and the determinations of them perhaps at present currently received for the maxims of the old common law.

The manner of making these statutes being explained under the articles Bill and Parliament, we shall here only take notice of the different kinds of statutes; and of some general rules with regard to their construction (d).

First, As to several kinds. Statutes are either general or special. They are also variously termed, and sometimes expressed by different words.

...

Part II.

Law of

general or special, public or private. A general or public act is an universal rule that regards the whole community: and of this the courts of law are bound to take notice judicially and ex officio, without the statute being particularly pleaded, or formally set forth, by the party who claims an advantage under it. Special or private acts are rather exceptions than rules, being those which only operate upon particular persons and private concerns; such as the Romans entitled senatus consultum, which regarded the whole community; and of those the judges are not bound to take notice, unless they be formally shown and pleaded. Thus, to show the distinction, the statute 13 Eliz. c. 10, to prevent spiritual persons from making leases for longer terms than 27 years or three lives, is a public act; it being a rule prescribed to the whole body of spiritual persons in the nation: but an act to enable the bishop of Chester to make a lease to A. B. for 60 years, is an exception to this rule; it concerns only the parties and the bishop's successors, and is therefore a private act.

Statutes also are either declaratory of the common law, or remedial of some defects therein. Declaratory, where the old custom of the kingdom is almost fallen into disuse, or become disputable; in which case the parliament has thought proper, in perpetuum rei testimonium, and for avoiding all doubts and difficulties, to declare what the common law is and ever hath been. Thus the statute of treasons, 25 Edw. III. cap. 2, doth not make any new species of treasons: but only, for the benefit of the subject, declares and enumerates those several kinds of offence, which before were treason at the common law. Remedial statutes are those which are made to supply such defects, and abridge such superfluities, in the common law, as arise either from the general imperfection of all human laws, from change of time and circumstances, from the mistakes and unadvised determinations of unlearned judges, or from any other cause whatsoever. And this being done, either by enlarging the common law where it was too narrow and circumscribed, or by restraining it where it was too lax and luxuriant, hath occasioned another subordinate division of remedial acts of parliament into enlarging and restraining statutes. To instance again in the case of treason. Clipping the current coin of the kingdom was an offence not sufficiently guarded against by the common law: therefore it was thought expedient by statute 5 Eliz. c. 11, to make it high treason, which it was not at the common law: so that this was an enlarging statute. At common law, also, spiritual corporations might lease out their estates for any term of years, till prevented by the statute 13 Eliz. before mentioned: this was therefore a restraining statute.

Secondly, the rules to be observed with regard to the construction of statutes are principally these which follow.

1. There are three points to be considered in the construction of all remedial statutes; the old law, the mischief and the remedy; that is, how the common law stood at the making of the act; what the mischief was, for which the common law did not provide; and what remedy the parliament had provided to cure this mischief. And it is the business of the judges so to construe the act, as to suppress the mischief and advance the remedy. Let us instance again in the same restraining statute of 13 Eliz. c. 10. By the common law, ecclesiastical corporations might let as long leases as they thought proper: the mischief was, that they let long and unreasonable leases, to the impoverishment of their successors; the remedy applied by the statute was by making void all leases by ecclesiastical bodies for longer terms than three lives or 21 years. Now in the construction of this statute it is held, that leases, though for a longer term, if made by a bishop, are not void during the bishop's continuance in his see; or, if made by a dean and chapter, they are not void during the continuance of the dean; for the act was made for the benefit and protection of the successor. The mischief is therefore sufficiently suppressed by vacating them after the determination of the interest of the granters; but the leases, during their continuance, being not within the mischief, are not within the remedy.

2. A statute, which treats of things or persons of an inferior rank, cannot by any general words be extended to those of a superior. So a statute, treating of "deans, prebendaries, parsons, vicars, and others having spiritual promotion," is held not to extend to bishops, though they have spiritual promotion; deans being the highest persons named, and bishops being of a still higher order.

3. Penal statutes must be construed strictly. Thus the statute 1 Edw. IV. c. 12, having enacted that those who are convicted of stealing horses should not have the benefit of clergy, the judges conceived that this did not extend to him who should steal but one horse, and therefore procured a new act for that purpose in the following year. And, to come nearer to our own times, by the statute 14 Geo. II. c. 6. stealing sheep or other cattle, was made felony without benefit of clergy. But these general words, "or other cattle," being looked upon as much too loose to create a capital offence, the act was held to extend to nothing but mere sheep. And therefore, in the next sessions, it was found necessary to make another statute, 15 Geo. II. c. 34. extending the former to bullocks, cows, oxen, steers, bullocks, heifers, calves, and lambs, by name. But this difference is here to be taken: where the statute acts upon the offender, and inflicts a penalty, as the pillory or a fine, it is then to be taken strictly; but when the statute acts upon the offence, by setting aside the fraudulent transaction, here.
here it is to be construed literally. Upon this footing the statute of 13 Eliz. c. 5, which voids all gifts of goods, &c. made to defraud creditors and others, was held to extend by the general words to a gift made to defraud the queen of a forfeiture.

5. One part of a statute must be so construed by another, that the whole may (if possible) stand: ut rei magnitude quam percutiat. As if land be vested in the king and his heirs by act of parliament, saving the right of A; and A has at that time a lease of it for three years, here A shall hold it for his term of three years, and afterwards it shall go to the king. For this interpretation furnishes matter for every clause of the statute to work and operate upon. But,

6. A saving, totally repugnant to the body of the act, is void. If therefore an act of parliament vests land in the king and his heirs, saving the right of all persons whatsoever; or vests the land of A in the king, saving the right of A: in either of these cases the saving is totally repugnant to the body of the statute, and (if good) would render the statute of no effect or operation; and therefore the saving is void, and the land vests absolutely in the king.

7. Where the common law and a statute differ, the common law gives place to the statute; and an old statute gives place to a new one. And this upon the general principle laid down in the last section, that leges posterioriores priorum contradicent abrogant. But this is to be understood only when the latter statute is couched in negative terms, or by its matter necessarily implies a negative. As if a former act says, that a jury upon such a trial shall have twenty pounds a-year, and a new statute comes and says he shall have twenty marks; here the latter statute, though it does not express, yet necessarily implies, a negative, and virtually repeals the former. For if twenty marks be made qualification sufficient, the former statute which requires twenty pounds is at an end. But if both the acts be merely affirmative, and the substance such that both may stand together, here the latter does not repeal the former, but they shall both have a concurrent efficacy. If by a former law an offence be indictable at the quarter sessions, and a latter law makes the same offence indictable at the assizes; here the jurisdiction of the sessions is not taken away, but both have a concurrent jurisdiction, and the offender may be prosecuted at either: unless the new statute subjoins express negative words; as, that the offence shall be indictable at the assizes, and not elsewhere.

8. If a statute, that repeals another, is itself repealed afterwards, the first statute is hereby revived, without any formal words for that purpose. So when the statutes of 26 and 35 Henry VIII. declaring the king to be the supreme head of the church, were repealed by a statute 1 and 2 Philip and Mary, and this latter statute was afterwards repealed by an act of 2 Eliz. there needed not any express word of revival in Queen Elizabeth’s statute, but these acts of King Henry were impliedly and virtually revived.

9. Acts of parliament derogatory from the power of subsequent parliaments bind not. So the statute 11 Hen. VIII. c. 1, which directs, that no person for assisting a king de facto shall be attainted of treason by act of parliament or otherwise, is held to be good only as to common prosecutions for high treason; but will not restrain or clog any parliamentary attainer. Because the legislator, being in truth the sovereign power, is always of equal, always of absolute authority: it acknowledges no superior upon earth, which the prior legislature must have been if its ordinances could bind the present parliament. And upon the same principle Cicero, in his letters to Atticus, treats with a proper contempt these restraining clauses, which endeavour to tie up the hand of succeeding legislatures. “When you repeal the law itself (says he), you at the same time repeal the prohibitory clause which guards against such repeal.”

10. Lastly, Acts of parliament that are impossible to be performed are of no validity; and if there arise out of them collaterally any absurd consequences, manifestly contradictory to common reason, they are with regard to those collateral consequences void. We lay down the rule with these restrictions; though we know it is generally laid down more largely, that acts of parliament contrary to reason are void. But if the parliament will positively enact a thing to be done which is unreasonable, we know of no power that can control it: and the examples usually alleged in support of this sense of the rule do none of them prove that where the main object of a statute is unreasonable, the judges are at liberty to reject it: for that were to set the judicial power above that of the legislature, which would be subversive of all government. But where some collateral matter arises out of the general words, and happens to be unreasonable; there the judges are in decency to conclude that this consequence was not foreseen by the parliament, and therefore they are at liberty to expound the statute by equity, and only quoad hoc disregard it. Thus if an act of parliament gives a man power to try all causes that arise within his manor of Dale; yet, if a cause should arise in which be himself is party, the act is construed not to extend to that, because it is unreasonable that any man should determine his own quarrel. But, if we could conceive it possible for the parliament to enact, that he should try as well his own causes as those of other persons, there is no court that has power to defeat the intent of the legislature, when couched in such evident and express words as leave no doubt whether it was the intent of the legislature or not.

These are the several grounds of the laws of England: over and above which, equity is also frequently called in to assist, to moderate, and to explain them. What equity is, and how impossible in its very essence to be reduced to stated rules, hath been shown above. It may be sufficient therefore, to add in this place, that, besides the liberality of sentiment with which our common law judges interpret acts of parliament, and such rules of the unwritten law as are not of a positive kind, there are also courts of equity established for the benefit of the subject, to detect latent frauds and concealments, which the process of the courts of law is not adapted to reach; to enforce the execution of such matters of trust and confidence, as are binding in conscience, though not cognizable in a court of law; to deliver from such dangers as are owing to misfortune or oversight; and to give a more specific relief, and more adapted to the circumstances of the case, than can always be obtained by the generality of the rules of the positive or common law. This is the business of
of the courts of equity, which however are only conservant in matters of property. For the freedom of our constitution will not permit, that in criminal cases a power should be lodged in any judge to construe the law otherwise than according to the letter. This caution, while it admirably protects the public liberty, can never bear hard upon individuals. A man cannot suffer more punishment than the law assigns, but he may suffer less. The laws cannot be strained by partiality to inflict a penalty beyond what the letter will warrant; but, in cases where the letter induces any apparent hardship, the crown has the power to pardon.

The objects of the laws of England are, 1. The rights of persons. 2. The rights of things. 3. Private wrongs. 4. Public wrongs.

CHAP. I. Of the Rights of Persons.

SECT. I. Of the Absolute Rights of Individuals.

(2) Rights are the rights of persons, or the rights of things.

(3) The rights of persons are such as concern, and are annexed to, the persons of men: and, when the person to whom they are due is regarded, they are called (simply) rights; but, when we consider the person from whom they are due, they are then denominated duties.

(4) Persons are either natural, that is, such as they are formed by nature; or artificial, that is, created by human policy, as bodies politic or corporations.

(5) The rights of natural persons are, 1. Absolute, or such as belong to individuals. 2. Relative, or such as regard members of society.

(6) The absolute rights of individuals regarded by the municipal laws (which pay no attention to duties, of the absolute kind), compose what is called political or civil liberty.

(7) Political or civil liberty is the natural liberty of mankind, so far restrained by human laws, as is necessary for the good of society.

(8) The absolute rights or civil liberties of Englishmen, as frequently declared in parliament, are principally three: the right of personal security, of personal liberty, and of private property.

(9) The right of personal security consists in the legal enjoyment of life, limb, body, health, and reputation.

(10) The right of personal liberty consists in the free power of loco-motion, without illegal restraint or banishment.

(11) The right of private property consists in every man’s free use and disposal of his own lawful acquisitions, without injury or illegal diminution.

(12) Besides these three primary rights, there are others which are secondary and subordinate; viz. (to preserve the former from unlawful attacks). 1. The constitution and power of parliaments; 2. The limitation of the king’s prerogative; and (to vindicate them when actually violated); 3. The regular administration of public justice; 4. The right of petitioning for redress of grievances; 5. The right of having and using arms for self-defence.

SECT. II. Of the Parliament.

(1) The relations of persons are, 1. Public; 2. Private. The public relations are those of magistrates and people. Magistrates are superior or subordinate. And of supreme magistrates, in England, the parliament is the supreme legislative, the king the supreme executive.

(2) Parliaments, in some shape, are of as high antiquity as the Saxon government in this island; and have subsisted, in their present form, at least five hundred years.

(3) The parliament is assembled by the king’s writs, and its sitting must not be intermitted above three years.

(4) Its constituent parts are the king’s majesty, the lords spiritual and temporal, and the commons represented by their members: each of which parts has a negative, or necessary, voice in making laws.

(5) With regard to the general law of parliament; its power is absolute: each house is the judge of its own privileges; and all the members of either house are entitled to the privilege of speech, of person, of their domestics, and of their lands and goods.

(6) The peculiar privileges of the lords (besides their judicial capacity), are, to hunt in the king’s forests; to be attended by the maids of the law; to make proxies; to enter protests; and to regulate the election of the 16 peers of North Britain.

(7) The peculiar privileges of the commons are, to frame taxes for the subject; and to determine the merits of their own elections, with regard to the qualifications of the electors and elected, and the proceedings at elections themselves.

(8) Bills are usually twice read in each house, committed, engrossed, and then read a third time; and when they have obtained the concurrence of both houses, and received the royal assent, they become acts of parliament.

(9) The houses may adjourn themselves; but the king only can prorogue the parliament.

(10) Parliaments are dissolved, 1. At the king’s will. 2. By the demise of the crown, that is, within six months after. 3. By length of time, or having sat for the space of seven years.

SECT. III. Of the King and his Title.

(1) The supreme executive power of this kingdom is lodged in a single person; the king or queen.

(2) This royal person may be considered with regard to, 1. His title. 2. His royal family. 3. His councils. 4. His duties. 5. His prerogative. 6. His revenue.

(3) With regard to his title, the crown of England, by the positive constitution of the kingdom, hath ever been descendible, and so continues.

(4) The crown is descendible in a course peculiar to itself.

(5) This course of descent is subject to limitation by parliament.

(6) Notwithstanding such limitations, the crown retains...
retains its descendible quality, and becomes hereditary in the prince to whom it is limited.

(7.) King Egbert, King Canute, and King William I. have been successively constituted the common stocks, or ancestors, of this descent.

(8.) At the Revolution, the convention of estates, or representative body of the nation, declared, that the misconduct of King James II. amounted to an abdication of the government, and that the throne was thereby vacant.

(9.) In consequence of this vacancy, and from a regard to the ancient line, the convention appointed the next Protestant heirs of the blood royal of King Charles I. to fill the vacant throne, in the old order of succession; with a temporary exception, or preference, to the person of King William III.

(10.) On the impending failure of the Protestant line of King Charles I. (whereby the throne might again have become vacant) the king and parliament extended the settlement of the crown to the Protestant line of King James I. viz. to the princess Sophia of Hanover, and the heirs of her body, being Protestants: And she is now the common stock, from whom the heirs of the crown must descend.

Sect. IV. Of The King's Royal Family.

1. The king's royal family consists, first, of the queen: who is regnant, consort, or dowager.
2. The queen consort is a public person, and hath many personal prerogatives and distinct revenues.
3. The prince and princess of Wales, and the princess-royal, are peculiarly regarded by the law.
4. The other princes of the blood-royal are only entitled to precedence.

Sect. V. Of the Councils belonging to the King.

1. The king's councils are, 1. The parliament. 2. The great council of peers. 3. The judges, for matters of law. 4. The privy council.
2. In privy counsellors may be considered, 1. Their creation. 2. Their qualifications. 3. Their duties. 4. Their powers. 5. Their privileges. 6. Their dissolution.

Sect. VI. Of the King's Duties.

1. The king's duties, are to govern his people according to law, to execute judgment in mercy, and to maintain the established religion. These are his part of the original contract between himself and the people; founded in the nature of society, and expressed in his oath at the coronation.

Sect. VII. Of the King's Prerogative.

1. Prerogative is that special power and pre-eminence which the king hath above other persons, and out of the ordinary course of law, in right of his regal dignity.
2. Such prerogatives are either direct, or incidental. The incidental, arising out of other matters, are considered as they arise: We now treat only of the direct.

3. The direct prerogatives regard, 1. The king's dignity, or royal character. 2. His authority, or regal power. 3. His revenue, or royal income.
5. In the king's authority, or regal power, consists the executive part of government.
6. In foreign concerns; the king, as the representative of the nation, has the right or prerogative, 1. Of sending and receiving ambassadors. 2. Of making treaties. 3. Of proclaiming war or peace. 4. Of issuing reprisals. 5. Of granting safe conduct.
7. In domestic affairs; the king is, first, a constituent part of the supreme legislative power; hath a negative upon all new laws; and is bound by no statute, unless specially named therein.
8. He is also considered as the general of the kingdom, and may raise fleets and armies, build forts, appoint havens, erect beacons, prohibit the exportation of arms and ammunition, and confine his subjects within the realm, or recall them from foreign parts.
9. The king is also the fountain of justice, and general conservator of the peace; and therefore may erect courts (where he hath a legal ubiquity,) prosecute offenders, pardon crimes, and issue proclamations.
10. He is likewise the fountain of honour, of office, and of privilege.
11. He is also the arbiter of domestic commerce; (not of foreign, which is regulated by the law of merchants;) and is therefore entitled to the erection of public masts, the regulation of weights and measures, and the coining or legitimation of money.
12. The king is, lastly, the supreme head of the church; and, as such, convenes, regulates, and dissolves synods, nominates bishops, and receives appeals in all ecclesiastical causes.

Sect. VIII. Of the King's Revenue.

1. The king's revenue is either ordinary or extraordinary. And the ordinary is, 1. Ecclesiastical. 2. Temporal.
2. The king's ecclesiastical revenue consists in, 1. The custody of the temporalities of vacant bishoprics. 2. Canopies and pensions. 3. Extra-parochial tithes.
4. The king's extraordinary revenue, consists in aids, subsidies, and supplies, granted him by the commons in parliament.
5. Heretofore these were usually raised by grants of the (nominal) tenth or fifteenth part of the moveable
the peace, to keep watch and ward, and to apprehend offenders.

(6.) Surveys of the highways are officers appointed annually in every parish; to remove annoyances in, and to direct the repairment of the public roads.

(7.) Overseers of the poor are officers appointed annually in every parish; to relieve such impotent, and employ such sturdy poor, as are settled in each parish, —by birth, —by parentage, —by marriage, or by 40 days' residence; accompanied with, 1. Notice. 2. Renting a tenement of ten pounds annual value. 3. Paying their assessed taxation. 4. Serving an annual office. 5. Hiring and service for a year. 6. Apprenticeship for seven years. 7. Having a sufficient estate in the parish.

SECT. X. Of the People, whether Aliens, Denizens, or Natives.

(1.) The people are either aliens, that is, born out of the dominions or allegiance of the crown of Great Britain, or natives, that is, born within it.

(2.) Allegiance is the duty of all subjects; being the reciprocal tie of the people to the prince, in return for the protection he affords them; and, in natives, this duty of allegiance is natural and perpetual: in aliens, is local and temporary only.

(3.) The rights of natives are also natural and perpetual: those of aliens, local and temporary only; unless they be made denizens by the king, or naturalized by parliament.

SECT. XI. Of the Clergy.

(1.) The people, whether aliens, denizens, or natives, are also either clergy, that is, all persons in holy orders, or in ecclesiastical offices: or laity, which comprehends the rest of the nation.

(2.) The clerical part of the nation, thus defined, are, 1. Archbishops and bishops; who are elected by their several chapters at the nomination of the crown, and afterwards confirmed and consecrated by each other. 2. Deans and chapters. 3. Archdeacons. 4. Rural deans. 5. Parsons (under which are included appropriators) and vicars: to whom there are generally requisite, holy orders, presentation, institution and induction. 6. Curates. To which may be added, 7. Church wardens. 8. Parish clerks and sextons.

SECT. XII. Of the Civil State.

(1.) The laity are divisible into three states: civil, military, and maritime.

(2.) The civil state (which includes all the nation, except the clergy, the army, and the navy, and many individuals among them also), may be divided into the nobility and the commonalty.

(3.) The nobility are dukes, marquises, earls, viscounts, and barons. These had anciently duties annexed to their respective honours: they are created either by writ, that is, by summons to parliament; or by the king's letters patent, that is, by royal grant: and they enjoy many privileges exclusive of their senatorial capacity.
(4.) The commonalty consist of knights of the gar-
tier, knights bannerets, baronets, knights of the bath,
knights bachelors, esquires, gentlemen, yeomen, trades-
men, artificers, and labourers.

Sect. XIII. Of the Military and Maritime States.

(i.) The military state, by the standing constitutional
law, consists of the militia of each county, rais-
ed from among the people by lot, officered by the
principal landholders, and commanded by the lord lieut.
ent.

(2.) The more disciplined occasional troops of the
kingdom are kept on foot only from year to year by
parliament; and, during that period, are governed by
martial law, or arbitrary articles of war, formed at the
pleasure of the crown.

(3.) The maritime state consists of the officers and
mariners of the British navy; who are governed by ex-
press and permanent laws, or the articles of the navy,
established by act of parliament.

Sect. XIV. Of Master and Servants.

(i.) The private, economical, relations, of persons
are those of, 1. Master and servants. 2. Husband and
wife. 3. Parent and child. 4. Guardian and ward.

(2.) The first relation may subsist between a master
and four species of servants, (for slavery is unknown
to our laws): viz. 1. Menial servants; who are hired.
2. Apprentices; who are bound by indentures. 3. La-
bourers; who are casually employed. 4. Stewards, bail-
iffs, and factors; who are rather in a ministerial state.

(3.) From this relation result divers powers to the
master, and emoluments to the servant.

(4.) The master hath a property in the service of
his servant; and must be answerable for such acts as
the servant does by his express, or implied, command.

Sect. XV. Of Husband and Wife.

(i.) The second private relation is that of marriage;
which includes the reciprocal rights and duties of hus-
band and wife.

(2.) Marriage is duly contracted between persons,
1. Consent. 2. Free from canonical impediments,
which make it voidable. 3. Free from all civil
impediments—of prior marriage,—of want of age—of
non-consent of parents or guardians, where requisite,
—and of want of reason; either of which make it to-
tally void. And it must be celebrated by a clergyman
in due form and place.

(3.) Marriage is dissolved, 1. By death. 2. By di-

torce in the spiritual court: not à membro et thoro only,
but à vinculo matrimonii, for canonical cause existing
previously to the contract. 3. By act of parliament, as
for adultery.

(4.) By marriage the husband and wife become one
person in law; which unity is the principal foundation
of their respective rights, duties, and disabilities.

Sect. XVI. Of Parent and Child.

(i.) The third, and most universal private relation
is that of parent and child.

(ii.) Children are, 1. Legitimate, being those who
are born in lawful wedlock, or within a competent time
after. 2. Bastards, being those who are not so.

(3.) The duties of parents to legitimate children are,
1. Maintenance. 2. Protection. 3. Education.

(4.) The power of parents consists principally in cor-
rection, and consent to marriage. Both may after
death be delegated by will to a guardian; and the former is
either, living the parent, to a tutor or master.

(5.) The duties of legitimate children to parents are
obedience, protection, and maintenance.

(6.) The duty of parents to bastards is only that of
maintenance.

(7.) The rights of a bastard are such only as he can
acquire; for he is incapable of inheriting any thing.

Sect. XVII. Of Guardian and Ward.

(i.) The fourth private relation is that of guardian
and ward, which is plainly derived from the last; these
being, during the continuance of their relation, reciprocally
subject to the same rights and duties.

(2.) Guardians are of divers sorts: 1. Guardians by
nature, or the parents. 2. Guardians for nurture, as-
signed by the ecclesiastical courts. 3. Guardians in so-
cage, assigned by the common law. 4. Guardians by
statute, assigned by the father’s will. All subject to
the superintendence of the court of chancery.

(3.) Full age in male or female for all purposes is
the age of 21 years (different ages being allowed for
different purposes); till which age the person is an in-
fant.

(4.) An infant, in respect of his tender years, hath
various privileges, and various disabilities, in law;
chiefly with regard to suits, crimes, estates and con-
tracts.

Sect. XVIII. Of Corporations.

(i.) Bodies politic, or corporations, which are arti-
ficial persons, are established for preserving in perpetual
succession certain rights which, being conferred on
natural persons only, would fail in process of time.

(2.) Corporations are, 1. Aggregate, consisting of
many members. 2. Sole, consisting of one person only.

(3.) Corporations are also either spiritual, erected
to perpetuate the rights of the church; or lay. And the
lay are, 1. Civil; erected for many temporal purposes.
2. Ecclesiastical; erected to perpetuate the charity of
the founder.

(4.) Corporations are usually erected and named by
virtue of the king’s royal charter; but may be created
by act of parliament.

(5.) The powers incident to all corporations are,
1. To maintain perpetual succession. 2. To act in their
corporate capacity like an individual. 3. To hold lands,
subject to the statutes of mortmain. 4. To have a com-
mon seal. 5. To make by-laws. Which last power, in
spiritual or ecclesiastical corporations, may be exec-
uted by the king or the founder.

(6.) The duty of corporations is to answer the ends
of their institution.

(7.) To enforce this duty, all corporations may be
suitable: spiritual corporations by the ordinary; lay cor-
porations by the founder, or his representatives; viz.
the
the civil by the king (who is the fundator incipiens of all represented in his court of king's bench; the eleemosynary by the enower (who is the fundator per- cicios of such), or by his heirs or assigns.

(8.) Corporations may be dissolved. 1. By act of parliament. 2. By the natural death of all their members. 3. By surrender of their franchises. 4. By forfeiture of their charter.

CHAP. II. Of the Rights of Things.

SECT. I. Of Property in General.

(1.) All dominion over external objects has its original from the gift of the Creator to man in general.
(2.) The substance of things was, at first, common to all mankind; yet a temporary property in the use of them, might even then be acquired, and continued, by occupancy.
(3.) In process of time a permanent property was established in the substance, as well as the use of things, which was also originally acquired by occupancy only.
(4.) Lost this property should determine by the owner’s derriction or death, whereby the thing would again become common, societies have established conveyances, wills, and heirships, in order to continue the property of the first occupant: and where by accident such property becomes discontinued or unknown, the thing usually results to the sovereign of the state, by virtue of the municipal law.
(5.) But of some things, which are incapable of permanent substantial dominion, there still subsists only the same transient usufructuary property, which originally subsisted in all things.

SECT. II. Of Real Property; and, first, of Corporeal Hereditaments.

(1.) In this property, or exclusive dominion, consist the rights of things; which are, 1. Things real. 2 Things personal.
(2.) In things real may be considered, 1. Their several kinds. 2. The tenures by which they may be held. 3. The estates which may be acquired therein. 4. Their title, or the means of acquiring and losing them.
(3.) All the several kinds of things real are reducible to one of these three, viz. lands, tenements, or hereditaments; whereof the second includes the first, and the third includes the first and second.
(4.) Hereditaments, therefore, or whatever may come to be inherited (being the most comprehensive denomination of things real), are either corporeal or incorporeal.
(5.) Corporeal hereditaments consist wholly of lands, in their largest legal sense; wherein they include not only the face of the earth, but every other object of sense adjoining thereto, and subsisting either above or beneath it.

SECT. III. Of Incorporeal Hereditaments.

(1.) Incorporeal hereditaments are rights issuing out of things corporeal, or concerning, or annexed to, or exercisable within the same.
(3.) An adowron is a right of representation to an ecclesiastical benefice; either appendant, or in gross. This may be, 1. Presentative. 2. Collative. 3. Donative.
(4.) Tithes are the tenth part of the increase yearly arising from the profits and stock of lands, and the personal industry of mankind. These, by the ancient and positive law of the land, are due of common right to the parson, or (by endowment) to the vicar; unless specially discharged, 1. By real composition. 2. By prescription, either de modo decimandi, or de non decimando.
(5.) Common is a profit which a man hath in the land of another; being, 1. Common of pasture, which is either appendant, appurtenant, because of vicinage, or in gross. 2. Common of piscary. 3. Common of turbary. 4. Common of estovers, or boles.
(6.) Ways are a right of passing over another man’s ground.
(7.) Offices are the right to exercise a public or private employment.
(8.) For dignities, which are titles of honour, see chap. i. sect. 12.
(9.) Franchises are a royal privilege, or branch of the king’s prerogative, subsisting in the hands of a subject.
(10.) Corodies are allotments for one’s sustenance; which may be converted into pensions, see chap. i. sect. 8.
(11.) An annuity is a yearly sum of money, charged upon the person, and not upon the lands of the granter.
(12.) Rents are a certain profit issuing yearly out of lands and tenements; and are reducible to, 1. Rent-service. 2. Rent-charge. 3. Rent-seck.
SECT. V. Of the Ancient English Tenures.

(1.) The distinction of tenures consisted in the nature of their services: as, 1. Chivalry, or knight-service; where the service was free, but uncertain. 2. Free socage; where the service was free, and certain. 3. Pure villegage; where the service was base, and uncertain. 4. Privileged villegage, or villein socage; where the service was base, but certain.

(2.) The most universal ancient tenure was that in chivalry, or by knight-service; in which the tenant of every knight's fee was bound, if called upon, to attend his lord to the wars. This was granted by livery, and perfected by homage and fealty; which usually drew after them suit of court.

(3.) The other fruits and consequences of the tenure by knight-service were, 1. Aid. 2. Relief. 3. Primer seisin. 4. Wardship. 5. Marriage. 6. Fines upon alienation. 7. Escheat.

(4.) Grand serjeancy differed from chivalry principally in its renders, or service; and not in its fruits and consequences.

(5.) The personal service in chivalry was at length gradually changed into pecuniary assessments, which were called serjeancy by socage.

(6.) These military tenures (except the services of grand serjeancy) were, at the restoration of King Charles, totally abolished, and reduced to free socage by act of parliament.

SECT. VI. Of the Modern English Tenures.

(1.) Free socage is a tenure by any free, certain, and determinate service.

(2.) This tenure, the relick of Saxon liberty, includes petit serjeancy, tenure in burgage, and gavel-kind.

(3.) Free socage lands partake strongly of the feudal nature, as well as those in chivalry: being held; subject to some service, at the least to fealty and suit of court; subject to relief, to wardship, and to escheat; but not to marriage; subject also formerly to aids, primer seisin, and fines for alienation.

(4.) Pure villegage was a precarious and slavish tenure, at the absolute will of the lord, upon uncertain services of the basest nature.

(5.) From hence, by tacit consent or encroachment, have arisen the modern copiesholds, or tenure by copy of court-roll: in which lands may be still held at the nominal will of the lord, (but regulated) according to the custom of the manor.

(6.) These are subject, like socage lands, to services, relief, and escheat; and also to heriots, wardship, and fines upon descent and alienation.

(7.) Privileged villegage, or villein socage, is an exalted species of copyhold tenure, upon base, but certain, services; subsisting only in the ancient demesnes of the crown; whence the tenure is denominated the tenure in ancient demesne.

(8.) These copyholds of ancient demesne have divers immunities annexed to their tenure; but are still held by copy of court-roll, according to the custom of the manor, though not at the will of the lord.
Chap. II.

LAW.

are estovers, and emblems: and to estates pur aoter via general occupancy was also incident; as special occupancy still is, if custum que vie survives the tenant.

4. Legal estates for life are, 1. Tenancy in tail, after possibility of issue extinct. 2. Tenancy by the curtesy of England. 3. Tenancy in dower.

5. Tenancy in tail, after possibility of issue extinct, is where an estate is given in special tail; and, before issue had, a person dies from whose body the issue was to spring; whereupon the tenant (if surviving) becomes tenant in tail, after possibility of issue extinct.

6. This estate partakes both of the incidents to an estate in tail, and those of an estate for life.

7. Tenancy by the curtesy of England is where a man's wife is seized of an estate of inheritance; and he by his issue, born alive, which was capable of inheriting her estate; in which case he shall, upon her death, hold the tenements for his own life, as tenant by the curtesy.

8. Tenancy in dower is where a woman's husband is seized of an estate of inheritance, of which her issue might by any possibility have been heir; and the husband dies: the woman is thereupon entitled to dower, or one-third part of the lands and tenements, to hold for her natural life.

9. Dower is either by the common law; by special custom: ad ostium ecclesiae; or, ex assensu patris.

10. Dower may be forfeited or barred, particularly by an estate in jointure.

Sect. IX. Of Estates less than Freehold.

1. Estates less than freehold are, 1. Estates for years. 2. Estates at will. 3. Estates at sufferance.

2. An estate for years is where a man, seized of lands and tenements, let them to another for a certain period of time, which transfers the interest of the term; and the lessee enters thereon, which gives him possession of the term, but not legal seisin of the land.

3. Incident to this estate are estovers; and also emblems, if it determines before the full end of the term.

4. An estate at will is where lands are let by one man to another, to hold at the will of both parties; and the lessee enters thereon.

5. Copyholds are estates held at the will of the lord, (regulated) according to the custom of the manor.

6. An estate at sufferance is where one comes into possession of land by lawful title, but keeps it afterwards without any title at all.

Sect. X. Of Estates upon Condition.

1. Estates (whether freehold or otherwise) may also be held upon condition; in which case their existence depends on the happening, or not happening, of some uncertain event.

2. These estates are, 1. On condition implied. 2. On condition expressed. 3. Estates in gage. 4. Estates by statute, merchant or staple. 5. Estates by elegit.

3. Estates on condition implied are where a grant of an estate has, from its essence and constitution, a condition inseparably annexed to it; though none be expressed in words.

4. Estates on condition expressed are where an express qualification or provision is annexed to the grant of an estate.

5. On the performance of these conditions either expressed or implied (if precedent) the estate may be vested or enlarged; or, on the breach of them (if subsequent) an estate already vested may be defeated.

6. Estates in gage, in vado, or in pledge, are estates granted as a security for money lent; being, 1. In vivo vado, or living gage; where the profits of land are granted till a debt be paid, upon which payment the grantor's estate will revive. 2. In mortuo vado, in dead, or mort gage; wherein an estate is granted, on condition to be void at a day certain, if the grantor then repays the money borrowed; on failure of which, the estate becomes absolutely dead to the grantor.

7. Estates by statute-merchant, or statute-staple, are also estates conveyed to creditors, in pursuance of certain statutes, till their profits shall discharge the debt.

8. Estates by elegit are where, in consequence of a judicial writ so called, lands are delivered by the sheriff to a plaintiff, till their profits shall satisfy a debt adjudged to be due by law.

Sect. XI. Of Estates in Possession, Remainder, and Reversion.

1. Estates, with respect to their time of enjoyment, are either in immediate possession, or in expectancy; which estates in expectancy are created at the same time, and are parcel of the same estates, as those upon which they are expectant. These are, 1. Remainders. 2. Reversions.

2. A remainder is an estate limited to take effect, and be enjoyed, after another particular estate is determined.

3. Therefore, 1. There must be a precedent particular estate, in order to support a remainder. 2. The remainder must pass out of the grantor, at the creation of the particular estate. 3. The remainder must vest in the grantee, during the continuance, or at the determination, of the particular estate.

4. Remainders are, 1. Vested; where the estate is fixed to remain to a certain person, after the particular estate is spent. 2. Contingent; where the estate is limited to take effect, either to an uncertain person, or upon an uncertain event.

5. An executory devise is such a disposition of lands, by will, that an estate shall not vest thereby at the death of the devisor, but only upon some future contingency, and without any precedent particular estate to support it.

6. A reversion is the residue of an estate left in the grantor, to commence in possession after the determination of some particular estate granted: to which are incident fealty, and rent.

7. Where two estates, the one less, the other greater, the one in possession, the other in expectancy, meet together in one and the same person, and in one and the same right, the less is merged in the greater.

Sect.
SECT. XII. Of Estates, in Severalty, Joint Tenancy, Coparcenary, and Common.

1. Estates, with respect to the number and connections of their tenants, may be held, 1. In severalty. 2. In joint tenancy. 3. In coparcenary. 4. In common.

2. An estate in severalty is where one tenant holds it in his own sole right, without any other person being joined with him.

3. An estate in joint tenancy is where an estate is granted to two or more persons; in which case the law construes them to be joint tenants, unless the words of the grant expressly exclude such construction.

4. Joint tenants have an unity of interest, of title, of time and of possession; they are seised per my et per tout; and therefore upon the decease of one joint tenant, the whole interest remains to the survivor.

5. Joint tenancy may be dissolved, by destroying one of its four constituent units.

6. An estate in coparcenary is where an estate of inheritance descends from the ancestor to two or more persons, who are called coparceners, and all together make but one heir.

7. Parceners have an unity of interest, title, and possession; but are only seised per my, and not per tout; wherefore there is no survivorship among parceners.

8. Incident to this estate is the law of hotchpot.

9. Coparcenary may also be dissolved, by destroying any of its three constituent units.

10. An estate in common is where two or more persons hold lands, possibly by distinct titles, and for distinct interests; but by unity of possession, because none knoweth his own severally.

11. Tenants in common have therefore an unity of possession, (without survivorship; being seised per my, and not per tout;) but no necessary unity of title, time, or interest.

12. This estate may be created, 1. By dissolving the constituent unities of the two former; 2. By express limitation in a grant; and may be destroyed, 1. By uniting the several titles in one tenant; 2. By partition of the land.

SECT. XIII. Of the Title to Things Real, in General.

1. A title to things real is the means whereby a man cometh to the just possession of his property.

2. Herein may be considered, 1. A mere or naked possession. 2. The right of possession; which is, est, an apparent, 2dly, an actual right. 3. The mere right of property. 4. The conjunction of actual possession with both these rights; which constitutes a perfect title.

SECT. XIV. Of Title by Descent.

1. The title to things real may be reciprocally acquired or lost, 1. By descent. 2. By purchase.

2. Descent is the means whereby a man, on the death of his ancestor, acquires a title to the estate, in right of his representation, as his heir at law.

(3.) To understand the doctrine of descents, we must form a clear notion of consanguinity; which is the connexion, or relation, of persons descended from the same stock or common ancestor; and it is, 1. Lineal, where one of the kinsmen is lineally descended from the other. 2. Collateral, where they are lineally descended, not one from the other, but from both from the same common ancestor.

4. The rules of descent, or canons of inheritance, observed by the laws of England, are these:

1st. Inheritance shall lineally descend to the issue of the person last actually seised, in infinitum; but shall never lineally ascend.

2d. The male issue shall be admitted before the female.

3d. Where there are two or more males in equal degree, the eldest only shall inherit; but the females all together.

4th. The lineal descendants, in infinitum, of any person deceased shall represent their ancestor; that is, shall stand in the same place as the person himself would have done, had he been living.

5th. On failure of lineal descendants, or issue, of the person last seised, the inheritance shall descend to the blood of the first purchaser; subject to the three preceding rules. For evidence which blood, the two following rules are established.

6th. The collateral heir of the person last seised must be his next collateral kinsman, of the whole blood.

7th. In collateral inheritances, the male stocks shall be preferred to the female; that is, kindred derived from the blood of the male ancestors shall be admitted before those from the blood of the female; unless where the lands have, in fact, descended from a female.

SECT. XV. Of Title by Purchase, and first by Escheat.

1. Purchase, or perquisition, is the possession of an estate which a man hath by his own act or agreement; and not by the mere act of law, or descent from any of his ancestors. This includes, 1. Escheat. 2. Occupancy. 3. Prescription. 4. Forfeiture. 5. Alienation.

2. Escheat is where, upon deficiency of the tenant's inheritable blood, the estate falls to the lord of the fee.

3. Inheritable blood is wanting to, 1. Such as are not related to the person last seised. 2. His collateral relations in paternal inheritances, and vice versa. 3. His kindred of the half blood. 4. Monesters. 5. Bastards. 6. Aliens, and their issue. 7. Persons attainted of treason or felony. 8. Papists, in respect of themselves only, by the statute law.

SECT. XVI. Of Title by Occupancy.

1. Occupancy is the taking possession of those things which before had no owner.

2. Thus, at the common law, where tenant per curter vie died during the life of cestay que vie, he, who could first enter, might lawfully retain the possession; unless by the original grant the heir was made a special occupant.

3. The law of derrictions and alluvions has narrowed the title of occupancy.

SECT.
Sect. XVII. Of Title by Prescription.

1. Prescription (as distinguished from custom) is a personal immemorial usage of enjoying a right in some incorporeal hereditament, by a man, and either his ancestors or those whose estate of inheritance he hath: of which the first is called prescribing in his ancestors, the latter in a que estate.

Sect. XVIII. Of Title by Forfeiture.

1. Forfeiture is a punishment annexed by law to some illegal act, or negligence, in the owner of things real; whereby the estate is transferred to another, who is usually the party injured.

3. Forfeitures for crimes, or misdemeanor, are for, 1. Treason. 2. Felony. 3. Misprision of treason. 4. Premunire. 5. Assaults on a judge, and batteries, sitting the courts. 6. Popish recusancy, &c.

4. Alienations, or conveyances, which induce a forfeiture, are, 1. Those in mortmain, made to corporations contrary to the statute law. 2. Those made to aliens. 3. Those made by particular tenants, when larger than their estates will warrant.

5. Lapse is a forfeiture of the right of presentation to a vacant church, by neglect of the patron to present within six kalender months.

6. Simony is the corrupt presentation of any one to an ecclesiastical benefice, whereby that turn becomes forfeited to the crown.

7. For forfeiture by nonperformance of conditions, see Sect. 10.

8. Waste is a spoil, or destruction, in any corporeal hereditaments, to the prejudice of him that hath the inheritance.

9. Copyhold estates may have also other peculiar cases of forfeiture, according to the custom of the manor.

10. Bankruptcy is the act of becoming a bankrupt; that is, a trader who secludes himself, or does certain other acts tending to defraud his creditors, see Sect. 22.

11. By bankruptcy all the estates of the bankrupt are transferred to the assignees of his commissioners, to be sold for the benefit of his creditors.

Sect. XIX. Of Title by Alienation.

1. Alienation, conveyance, or purchase in its more limited sense, is a means of transferring real estate, wherein they are voluntarily resigned by one man, and accepted by another.

2. This formerly could not be done by a tenant, without license from his lord; nor by a lord, without attornment of his tenant.

3. All persons are capable of purchasing; and all that are in possession of any estates, are capable of conveying them; unless under peculiar disabilities by law: as being attainted, non compotes, infants under duces, free coverts, aliens, or papists.
(16.) A surrender is the yielding up of an estate for life, or years, to him that hath the immediate remainder or reversion; wherein the particular estate may be defective.

(17.) An assignment is the transfer, or making over to another, of the whole right one has in any estate; but usually in a lease, for life or years.

(18.) A defeasance is a collateral deed, made at the same time with the original conveyance; containing some condition, upon which the estate may be defeated.

(19.) Conveyances by statute depend much on the doctrine of uses and trusts: which are a confidence reposed in the terre tenent, or tenant of the land, that he shall permit the profits to be enjoyed, according to the directions of estuity que use, or estuity que trust.

(20.) The statute of uses, having transferred all uses into actual possession, (or, rather, having drawn the possession to the use,) has given birth to divers other species of conveyance: 1. A covenant to stand seized to use. 2. A bargain and sale enrolled. 3. A lease and release. 4. A deed to lead or declare the use of other more direct conveyances. 5. A revocation of uses; being the execution of a power, reserved at the creation of the use, of recalling at a future time the use or estate so creating. All which owe their present operation principally to the statute of uses.

(21.) Deeds which are used not to convey, but only to charge real property, and discharge it, are, 1. Obligations. 2. Recognisances. 3. Defeasances upon both.

Sect. XXI. Of Alienation by matter of Record.

(1.) Assurances by matter of record are where the sanction of some court of record is called in, to substantiate and witness the transfer of real property. These are, 1. Private acts of parliament. 2. The king's grants. 3. Fines. 4. Common recoveries.

(2.) Private acts of parliament are a species of assurances, calculated to give (by the transcendant authority of parliament) such reasonable powers or relief as are beyond the reach of the ordinary course of law.

(3.) The king's grants, contained in charters or letters patent, are all entered on record, for the dignity of the royal person, and security of the royal revenue.

(4.) A fine (sometimes said to be a seoffment of record) is an amicable composition and agreement of an actual, or fictitious, suit; whereby the estate in question is acknowledged to be the right of one of the parties.

(5.) The parts of a fine are, 1. The writ of covenant. 2. The license to agree. 3. The concord. 4. The note. 5. The foot. To which the statute hath added, 6. Proclamation.

(6.) Fines are of four kinds: Sur cognizance de droit, come ceo que il ad de son done. 2. Sur cognizance de droit tantum. 3. Sur conscient. 4. Sur done, grant, et render; which is a double fine.

(7.) The force and effect of fines (when levied by such as have themselves any interest in the estate) are to assure the lands in question to the cognizee, by barring the respective rights of parties, privies, and strangers.

Sect. XXII. Of Alienation by Special Custom.

(1.) Assurances by special custom are confined to the transfer of copyhold estates.

(2.) This is effected by 1. Surrender by the tenant into the hands of the lord to the use of another, according to the custom of the manor. 2. Presentment, by the tenants or homage, of such surrender. 3. Admittance of the surrenderee by the lord, according to the uses expressed in such surrender.

(3.) Admittance may also be had upon original grants to the tenant from the lord, and upon descente to the heir from the ancestor.

Sect. XXIII. Of Alienation by Devise.

(1.) Devise is a disposition of lands and tenements, contained in the last will and testament of the owner.

(2.) This was not permitted by the common law, as it stood since the conquest; but was introduced by the statute law, under Henry VIII. since made more universal by the statute of tenures under Charles II. with the introduction of additional solemnities by the statute of frauds and perjuries in the same reign.

(3.) The construction of all common assurances should be, 1. Agreeable to the intention. 2. To the words of the parties. 3. Made upon the entire deed. 4. Bearing strongest against the contractor. 5. Conformable to law. 6. Rejecting the latter of two totally repugnant clauses in a deed, and the former in a will. 7. Most favourable in a case of devise.

Sect. XXIV. Of Things Personal.

(1.) Things personal are comprehended under the general name of chattels; which includes whatever wants either the duration, or the immobility, attending things real.

(2.) In these are to be considered, 1. Their distribution. 2. The property of them. 3. The title to that property.

(3.) As to the distribution of chattels, they are, 1. Chattels real. 2. Chattels personal.

(4.) Chattels real are such quantities of interest, in things movables, as are short of the duration of freeholds; being limited to a time certain, beyond which they cannot subsist. (See Sect. 7.)

(5.) Chattels
SECT. XXV. Of Property in Things Personal.

(1.) Property, in chattels personal, is either in possession, or in action.

(2.) Property in possession, where a man has the actual enjoyment of the thing, is 1. Absolute. 2. Qualified.

(3.) Absolute property is where a man has such an exclusive right in the thing, that it cannot cease to be his, without his own act or consent.

(4.) Qualified property is such as is not, in its nature, permanent; but may sometimes subsist, and at other times sometimes not subsist.

(5.) This may arise, 1. Where the subject is incapable of absolute ownership. 2. From the peculiar circumstances of the owners.

(6.) Property in action, is where a man hath not the actual occupation of the thing; but only a right to it, arising upon some contract, and recoverable by an action at law.

(7.) The property of chattels personal is liable to remainders, expectant on estates for life; to joint tenancy; and to tenancy in common.

SECT. XXVI. Of Title to Things Personal by Occupancy.

(2.) Occupancy still gives the first occupant a right to those few things which have no legal owner, or which are incapable of permanent ownership. Such as, 1. Goods of alien enemies. 2. Things found. 3. The benefit of the elements. 4. Animals from nature. 5. Emblems. 6. Things gained by accession; or, 7. By confusion. 8. Literary property.

SECT. XXVII. Of Title by Prerogative, and Forfeiture.

(1.) By prerogative is vested in the crown, or its grantees, the property of the royal revenue, (see Chap. I. Sect. 8); and also the property of all game in the kingdom, with the right of pursuing and taking it.

(2.) By forfeiture, for crimes and misdemeanors, the right of goods and chattels may be transferred from one man to another; either in part or totally.

SECT. XXVIII. Of Title by Custom.

(1.) By custom, obtaining in particular places, a right may be acquired in chattels; the most usual of which customs are those relating to, 1. Heriots. 2. Mortuaries. 3. Heir looms.

(2.) Heriots are either heriot service, which differs little from a rent; or heriot custom, which is a customary tribute, of goods and chattels, payable to the lord of the fee on the decease of the owner of lands.

(3.) Mortuaries are a customary gift, due to the minister in many parishes, on the death of his parishioners.

(4.) Heir looms are such personal chattels as descend by special custom to the heir, along with the inheritance of his ancestor.

SECT. XXIX. Of Title by Succession, Marriage, and Judgment.

(1.) By succession the right of chattels is vested in corporations aggregate; and likewise in such corporations sole as are the heads and representatives of bodies aggregate.

(2.) By marriage the chattels real and personal of the wife are vested in the husband, in the same degree of property, and with the same powers, as the wife when sole had over them; provided he reduces them to possession.

(3.) The wife also acquires, by marriage, a property in her own marriageable.

(4.) By judgment, consequent on a suit at law, a man may in some cases, not only recover, but originally acquire, a right to personal property. As, 1. To penalties recoverable by action popular. 2. To damages.

3. To costs of suit.

SECT. XXX. Of Title by Gift, Grant, and Contract.

(1.) A gift, or grant, is a voluntary conveyance of a chattel personal in possession, without any consideration or equivalent.

(2.) A contract is an agreement, upon sufficient consideration, to do or not to do a particular thing; and, by such contract, any personal property (either in possession or in action) may be transferred.

(3.) Contracts may either be express or implied; either executed or executory.

(4.) The consideration of contracts is, 1. A good consideration. 2. A valuable consideration; which is, 1. Do, ut des. 2. Facio, ut facias. 3. Facio, ut des. 4. Do, ut facias.

(5.) The most usual types of personal contracts are, 1. Sale or exchange. 2. Bailment. 3. Hiring or borrowing. 4. Debt.

(6.) Sale or exchange is a transmutation of property from one man to another, in consideration of some recompense in value.

(7.) Bailment is the delivery of goods in trust; upon a contract, express or implied, that the trust shall be faithfully performed by the bailee.

(8.) Hiring or borrowing is a contract, whereby the
Sect. XXXI. Of Title by Bankruptcy.

1. Bankruptcy (as defined in Sect. 18.) is the act of becoming a bankrupt.
2. Herein may be considered,
   1. Who may become a bankrupt.
   2. The acts whereby he may become a bankrupt.
   3. The proceedings on a commission of bankruptcy.
   4. How his property is transferred thereby.
3. Persons of full age, using the trade of merchandise, by buying, and selling, and seeking their livelihood thereby, are liable to become bankrupts; for debts of a sufficient amount.
4. A trader, who endeavours to avoid his creditors, or evade their just demands, by any of the ways specified in the several statutes of bankruptcy, doth thereby commit an act of bankruptcy.
5. The proceedings on a commission of bankruptcy, so far as they affect the bankrupt himself, are principally by,
   1. Petition.
   2. Commission.
   3. Declaration of bankruptcy.
   5. The bankrupt's surrender.
   6. His examination.
   7. His discovery.
   8. His certificate.
   9. His allowance.
10. His indemnity.
6. The property of a bankrupt's personal estate is,
   1. Immediately upon the act of bankruptcy, vested by construction of law in the assignees; and they, when they have collected, distribute the whole by equal dividends among all the creditors.

Sect. XXXII. Of Title by Testament, and Administrations.

1. Concerning testaments and administrations, considered jointly, are to be observed,
   1. Their original and antiquity.
   2. Who may make a testament.
   3. Its nature and incidents.
   4. What are executors and administrators.
   5. Their office and duties.
2. Testaments have subsisted in England immemorially; whereby the deceased was at liberty to dispose of his personal estate, reserving ancienly to his wife and children their reasonable part of his effects.
3. The goods of intestates belonged ancienly to the king; who granted them to the prelates to be disposed in pious uses: but, on their abuse of this trust in the times of Popery, the legislature compelled them to delegate their power to administrators expressly provided by law.
4. All persons may make a testament unless dis-
sect. III. Of Courts in General.

(1.) Redress, that is effected by the act both of law and of the parties, is by suit or action in the courts of justice.

(2.) Herein may be considered, 1. The courts themselves. 2. The cognizance of wrongs or injuries therein. And, of courts, 1. Their nature and incidents. 2. Their several species.

(3.) A court is a place wherein justice is judicially administered, by officers delegated by the crown; being a court either of record, or not of record.

(4.) Incident to all courts are a plaintiff, defendant, and judge: and, with us, there are also usually attorneys; and advocates or counsel, viz. either barristers or serjeants at law.

sect. IV. Of the Public Courts of Common Law and Equity.

(1.) Courts of justice, with regard to their several species, are, 1. Of a public, or general, jurisdiction throughout the realm. 2. Of a private, or special, jurisdiction.

(2.) Public courts of justice are, 1. The courts of common law and equity. 2. The ecclesiastical courts. 3. The military courts. 4. The maritime courts.

(3.) The general and public courts of common law and equity are, 1. The court of piepound. 2. The court baron. 3. The hundred court. 4. The county court. 5. The court of common pleas. 6. The court of king's bench. 7. The court of exchequer. 8. The court of chancery. (Which two last are courts of equity as well as law). 9. The courts of exchequer chamber. 10. The house of peers. To which may be added, as auxiliaries, 11. The courts of assize and nisi prius.

sect. V. Of Courts Ecclesiastical, Military, and Maritime.

(1.) Ecclesiastical courts, (which were separated from the temporal by William the Conqueror,) or courts Christian, are, 1. The courts of the archdeacons. 2. The court of the bishop's consistory. 3. The court of arches. 4. The court of peculiars. 5. The prerogative court. 6. The court of delegates. 7. The court of review.

(2.) The only permanent military court is that of chivalry; the courts martial, annually established by act of parliament, being only temporary.

(3.) Maritime courts are, 1. The court of admiralty and vice-admiralty. 2. The court of delegates. 3. The lords of the privy council, and others, authorized by the king's commission, for appeals in prize-causes.

sect. VI. Of Courts of a Special Jurisdiction.

Courts of a special or private jurisdiction are, 1. The forest court; including the courts of attachments, regard, scire partes, and justice seat. 2. The court of commissioners of sewers. 3. The court of policies of assurance. 4. The court of the marshalsea and the palace court. 5. The courts of the principality of Wales. 6. The court of the duchy chamber of Lancaster. 7. The courts of the counties palatine, and other royal franchises. 8. The stannary courts. 9. The courts of London, and other corporations:—To which may be referred the courts of requests or courts of conscience; and the modern regulations of certain courts baron and county courts. 10. The courts of the two universities.

sect. VII. Of the Cognizance of Private Wrongs.

(1.) All private wrongs or civil injuries are cognizable either in the courts ecclesiastical, military, maritime, or those of common law.

(2.) Injuries cognizable in the ecclesiastical courts are, 1. Pecuniary. 2. Matrimonial. 3. Testamentary.

(3.) Pecuniary injuries, here cognizable, are, 1. Subtraction of tithes. For which the remedy is by suit to compel their payment, or an equivalent; and also their double value. 2. Non-payment of ecclesiastical dues. Remedy: by suit for payment. 3. Spoliation. Remedy: by suit for restitution. 4. Dilapidations. Remedy: by suit for damages. 5. Non-repair of the church, &c.; and non-payment of church-rates. Remedy: by suit to compel them.

(5.) Testamentary injuries are, 1. Disputing the validity of wills. Remedy: by suit to establish them. 2. Obstructing of administrations. Remedy: by suit for the granting them. 3. Subtraction of legacies. Remedy: by suit for the payment.

(6.) The course of proceedings herein is much conformed to the civil and canon law; but their only compulsive process is that of excommunication; which is enforced by the temporal writ of significavit, or de excommunicato capiendo.

(7.) Civil injuries, cognizable in the court military, or court of chivalry, are, 1. Injuries in point of honour. Remedy: by suit for honourable amends. 2. Encroachments in coat-armour, &c. Remedy: by suit to remove them. The proceedings are in a summary method.

(8.) Civil injuries cognizable in the courts maritime, are injuries, in their nature, of common law cognizance, but arising wholly upon the sea, and not within the precincts of any county. The proceedings are herein also much conformed to the civil law.

(9.) All other injuries are cognizable only in the courts of common law: of which in the remainder of this chapter.

(10.) Two of them are, however, commissible by those and other inferior courts, viz. 1. Refusal, or neglect of justice. Remedies: by writ of procedendo, or mandamus. 2. Encroachment of jurisdiction. Remedy: by writ of prohibition.
(16.) Injuries to a master are, 1. Retaining his servants. Remedy: by action on the case; for damages.

2. Beating them. Remedy: by action on the case, e.g., per quod servitutum amissi; for damages.

Sect. IX. Of Injuries to Personal Property.

(1.) Injuries to the rights of property are either to those of personal or real property.

(2.) Personal property is either in possession or in action.

(3.) Injuries to personal property in possession are, 1. By dispossession. 2. By damage, while the owner remains in possession.

(4.) Dispossession may be effected, 1. By an unlawful taking. 2. By an unlawful detaining.

(5.) For the unlawful taking of goods and chattels personal, the remedy is, 1. Actual restitution, which (in case of a wrongful distress) is obtained by action of replevin. 2. Satisfaction in damages: 1st, in case of rescous, by action of rescous, poundbreach, or on the case; 2ndly, in case of other unlawful takings, by action of trespass or trover.

(6.) For the unlawful detaining of goods lawfully taken, the remedy is also, 1. Actual restitution; by action of replevin or detinue. 2. Satisfaction in damages; by action on the case, for trover and conversion.

(7.) For damage to personal property, while in the owner's possession, the remedy is in damages; by action of trespass vi et armis, in case the act be immediately injurious; or by action of trespass on the case, to address consequential damage.

(8.) Injuries to personal property, in action, arise by breach of contracts, 1. Express. 2. Implied.

(10.) Implied contracts are such as arise, 1. From the nature and constitution of government. 2. From reason and the construction of law.

(11.) Breaches of contracts, implied in the nature of government, are by the nonpayment of money which the laws have directed to be paid. Remedy: by action of debt (which, in such cases is frequently a popular frequently a qui tam action); to compel the specific payment—or, sometimes, by action on the case; for damages.

(12.) Breaches of contracts, implied in reason and construction of law, are by the non-performance of legal presumptive assumpsits: for which the remedy is in damages; by an action on the case on the implied assumpsit. 1. Of a quantum meruit. 2. Of a quantum valebat. 3. Of money expended for another. 4. Of receiving money to another's use. 5. Of an insanius consuetudine, on an account stated (the remedy on an account unstated being by action of account). 6. Of performing one's duty, in any employment, with integrity, diligence, and skill. In some of which cases
Sect. X. Of Injuries to Real Property; and, first, of Dispossession, or Ouster, of the Freehold.

2. Ouster is the act of possession; and, 1. From freeholds. 2. From chattels real.

3. Ouster from freeholds is effected by: 1. Abatement. 2. Intrusion. 3. Disseisin. 4. Discontinuance. 5. Deforcement.

4. Abatement is the entry of a stranger, after the death of the ancestor, before the heir.

5. Intrusion is the entry of a stranger, after a particular estate of freehold is determined, before him in remainder or reversion.

6. Disseisin is a wrongful putting out of him that is seised of the freehold.

7. Discontinuance is where tenant in tail, or the husband of tenant in fee, makes a larger estate of the land than the law allowed.

8. Deforcement is any other detainer of the freehold from him that hath the property, but who never had the possession.

9. The universal remedy for all these is restitution or delivery of possession; and, sometimes, damages for the detention. This is effected: 1. By mere entry. 2. By action possessory. 3. By writ of right.

10. Mere entry, on lands, by him who hath the apparent right of possession, will (if peaceable) divest the mere possession of a wrongdoer. But forcible entries are remedied by immediate restitution, to be given by a justice of the peace.

11. Where the wrongdoer hath not only mere possession, but also an apparent right of possession, this may be divested by him who hath the actual right of possession, by means of the possessory actions of writ of entry or assise.

12. A writ of entry is a real action, which proves the title of the tenant, by showing the unlawful means under which he gained or continues possession. And it may be brought either against the wrongdoer himself, or in the degrees called the per, the per and cur, and the post.

13. An assise is a real action, which proves the title of the demandant, by showing his own or his ancestor's possession. And it may be brought either to remedy abatements; viz. the assize of mort d'ancestor, &c. Or to remedy recent disseisins; viz. the assize of pollut disseisins.

14. Where the wrongdoer hath gained the actual right of possession, he who has the right of property can only be remedied by a writ of right, or some writ of a similar nature. As, 1. Where such right of possession is gained by the discontinuance of tenant in tail. Remedy, for the right of property: by writ of formation. 2. Where gained by recovery in a possessory action, had against tenants of particular estates by their own default. Remedy: by writ of quod is deforcent. 3. Where gained by recovery in a possessory action, had upon the merits. 4. Where gained by the statute of limitations.

Sect. XI. Of Dispossession, or Ouster, of Chattels real.

1. Ouster from chattels real is: 1. From estates by statute and egestis. 2. From an estate for years.

2. Ouster from estates by statute or egestis, is effected by a kind of disseisin. Remedy: restitution, and damages; by assize of novel disseisin.

3. Ouster from an estate for years, is effected by a like disseisin, or ejectment. Remedy: restitution, and damages; 1. By writ of ejectione ferman. 2. By writ of quare ejecti infra terminum.

4. A writ of ejectio ferman, or action of trespass in ejectment, lieth where lands, &c. are let for a term of years, and the lessee is ousted or ejected from his term; in which case he shall recover possession of his term, and damages.

5. This is now the usual method of trying titles to land, instead of an action real: viz. By 1. The claimant's making an actual (or supposed) lease upon the land to the plaintiff. The plaintiff's actual (or supposed) entry thereupon. 3. His actual (or supposed) ouster and ejectment by the defendant. For which injury this action is brought either against the tenant, or (more usually) against some casual or fictitious ejector; in whose stead the tenant may be admitted defendant, on condition that the lease, entry, and ouster, be confessed, and that nothing else be disputed but the merits of the title claimed by the lessor of the plaintiff.

6. A writ of quare ejecti infra terminum is an action of a similar nature; only not brought against the wrongdoer or ejector himself, but such as are in possession under his title.

Sect. XII. Of Trespass.

Trespass is an entry upon, and damage done to, another's lands, by one's self, or one's cattle; without any lawful authority, or cause of justification: which is called a breach of his close. Remedy: damages; by action of trespass, quare clausum fregit; besides that of distress, damage feasant. But, unless the title to the land came chiefly in question, or the trespass was wilful or malicious, the plaintiff (if the damages be under forty shillings) shall recover no more costs than damages.

Sect. XIII. Of Nuisance.

1. Nuisance, or annoyance, is any thing that worketh damage or inconvenience: and it is either a public and common nuisance, of which in the next chapter; or, a private nuisance, which is any thing done to the hurt or annoyance of, 1. The corporeal; 2. The incorporeal, hereditaments of another.

2. The remedies for a private nuisance (besides that of abatement) are: 1. Damages; by action on the case; which also lies for special prejudice by a public nuisance. 2. Removal thereof and damages; by assize of nuisance. 3. Like removal, and damages; by writ of Quod permissit proutermere.
Sect. XIV. Of Waste.

1. Waste is a spoil and destruction in lands and tenements, to the injury of him who hath, 1. An immediate interest (as, by right of common) in the lands. 2. The remainder of reversion of the inheritance.

2. The remedies, for a commoner, are restitution, and damages; by assize of commo: Or damages only; by action on the case.

3. The remedy, for him in remainder, is reversion, is, 1. Preventive: by writ of sequestration at law, or injunction out of chanters; to stay waste. 2. Corrective: by action of waste; to recover the place wasted, and damages.

Sect. XV. Of Sub traction.

1. Subtraction is when one, who owes services to another, withdraws or neglects to perform them. This may be, 1. Of rents, and other services, due by tenure. 2. Of those due by custom.

2. For subtraction of rents and services, due by tenure, the remedy is, 1. By distress; to compel the payment or performance. 2. By action of debt. 3. By assize. 4. By writ of non sequitur et servitutis; to compel the payment. 5. By writ of cessavit; and, 6. By writ of right sur disclaimer; to recover the land itself.

3. To remedy the oppression of the land, the law has also given, 1. The writ of Nisi invisi. 2. The writ of mesue.

4. For subtraction of services, due by custom, the remedy is, 1. By writ of Saeptum ad molestam, furcum toruale, &c. to compel the performance, and recover damages. 2. By action on the case; for damages only.

Sect. XVI. Of Disturbance.

1. Disturbance is the hindering, or disquieting, the owners of an incorporeal hereditament, in their regular and lawful enjoyment of it.

2. Disturbances are, 1. Of franchises. 2. Of commons. 3. Of ways. 4. Of tenure. 5. Of patronage.

3. Disturbance of franchises is remedied by a special action on the cases; for damages.

4. Disturbance of common, is, 1. Intercumining without right. Remedy: damage; by an action of the case, or of trespass: besides distress, damage feasant; to compel satisfaction. 2. Surcharging the common. Remedies: distress, damage feasant; to compel satisfaction: action on the case: for damages; or, writ of admeasurement of pasture; to apportion the common: and writ de secunda supererogationes; for the supernumerary cattle, and damages. 3. Enclosure, or obstruction. Remedies: restitution of the common and damages; by assize of nullitatis intestae, and by writ of quod admissit: or, damages only; by action on the case.

5. Disturbance of ways, is the obstruction, 1. Of a way in gross, by the owner of the land. 2. Of a way appendant, by a stranger. Remedy, for both: damages; by action on the case.
of the several forms of trial.

Sect. XXII. Of the Several Species of Trial.

(1.) Trial is the examination of the matter of fact put in issue.

(2.) The species of trial are:
   1. By the record.
   2. By inspection.
   3. By certificate.
   4. By waives.
   5. By wager of battel.
   6. By wager of law.
   7. By jury.

(3.) Trial by the record is had, when the existence of such record is the point in issue.

(4.) Trial by inspection or examination is had by the court, principally when the matter in issue is the evident object of the senses.

(5.) Trial by certificate is had in those cases, where such certificate must have been conclusive to a jury.

(6.) Trial by witnesses (the regular method in the civil law) is only used on a writ of dower, when the death of the husband is in issue.

(7.) Trial by wager of battel, in civil cases, is only had on a writ of right; but, in lieu thereof, the tenant may have at his option, the trial by the grand assize.

(8.) Trial by wager of law is only had, where the matter in issue may be supposed to have been privily transacted between the parties themselves, without the intervention of other witnesses.

Sect. XXIII. Of the Trial by Jury.

(1.) Trial by jury is:
   1. Extraordinary; as, by the grand assize, in writs of right, and by the grand jury, in writs of attainder.
   2. Ordinary.

(2.) The method and process of the ordinary trial by jury is:
   1. The writ of securitatem to the sheriff, coroner, or almoner, with the following compulsory process of habeas corpus, or distraint.
   2. The carrying down of the record to the court of nisi prius.
   3. The sheriff's return, or panel of, 1st, special; 2nd, common jurors.
   4. The challenges; 1st, to the array; 2nd, to the poll of the jurors; either propter horum respectuum, propter defectum, propter affectum, (which is sometimes a principal challenge, sometimes to the favour, or propter delictum.
   5. The tales de circumstantialibus.
   6. The oath of the jury.
   7. The evidence; which is either by parol, 1st, written; 2nd, parol: or, by the private knowledge of the jurors.
   8. The verdict; which may be, 1st, guilty; 2nd, public; 3rd, special.

Sect. XXIV. Of Judgment and its Incidents.

(1.) Whatever is transacted at the trial in the court of nisi prius, is added to the record under the name of a postea: consequent upon which is the judgment.

(2.) Judgment may be arrested or stayed for causes:
   1. Extrinsic, or dehors the record; as in the case of new trials.
   2. Intinsic, or within it; as where the declaration varies from the writ, or the verdict from the pleadings, and issue; or where the case, laid in the declaration, is not sufficient to support the action in point of law.

(3.) Where the issue is immaterial or insufficient, the court may award a replacer.
(4.) Judgment is the sentence of the law, pronounced by the court, upon the matter contained in the record.

(5.) Judgments are, 1. Interlocutory; which are incomplete till perfected by a writ of inquiry. 2. Final.

(6.) Costs, or expenses of suit, are now the necessary consequence of obtaining judgment.

Sect. XXV. Of Proceedings, in the Nature of Appeals.

(1.) Proceedings, in the nature of appeals from judgment, are, 1. A writ of attainder; to impeach the verdict of a jury; which of late has been superseded by new trials. 2. A writ of audita querela; to discharge a judgment by matter that has since happened. 3. A writ of error; from one court of record to another; to correct judgments, erroneous in point of law, and not helped by the statutes of amendment and jessuits.

(2.) Writs of error lie, 1. To the court of king's bench, from all inferior courts of record; from the court of common pleas at Westminster; and from the court of king's bench in Ireland. 2. To the courts of exchequer chamber, from the law side of the courts of exchequer; and from proceedings in the court of king's bench by bill. 3. To the house of peers, from proceedings in the court of king's bench by original, and on writs of error; and from the several courts of exchequer chamber.

Sect. XXVI. Of Execution.

Execution is the putting in force of the sentence or judgment of the law. Which is effected, 1. Where possession of any hereditaments is recovered: by writ of habere facias seissinam, possessionem, &c. 2. Where any thing is awarded to be done or rendered; by a special writ for that purpose: as, by writ of abatement, in case of nuisance; returna habendo and capias in citatem, in repelsum; distringas and scire facias, in detinere. 3. Where money only is recovered; by writ of, 1st, Capias ad satisfaciendum, against the body of the defendant; or in default therefore, scire facias against his bail. 2dly, Peces facias, against his goods and chattels. 3dly, Levare facias, against his goods and the profits of his lands. 4thly, Elegies, against his goods, and the possession of his lands. 5thly, Extentia facias, and other process, on statutes, recognizances, &c. against his body, lands, and goods.

Sect. XXVII. Of Proceedings in the Courts of Equity.

(1.) Matters of equity which belong to the peculiar jurisdiction of the court of chancery, are, 1. The guardianship of infants. 2. The custody of idiots and lunatics. 3. The superintendence of charities. 4. Commissions of bankrupt.

(2.) The court of exchequer and the duchy court of Lancaster, have also some peculiar causes, in which the interest of the king is more immediately concerned.

(3.) Equity is the true sense and sound interpretation of the rules of law; and, as such, is equally attended to by the judges of the courts both of common law and equity.

(4.) The essential differences, whereby the English courts of equity are distinguished from the courts of law, are, 1. The mode of proof, by a discovery on the oath of the party; which gives a jurisdiction in matters of account, and fraud. 2. The mode of trial; by depositions taken in any part of the world. 3. The mode of relief; by giving a more specific and extensive remedy than can be had in the courts of law; as, by carrying agreements into execution, staying waste or other injuries by injunction, directing the sale of encumbered lands, &c. 4. The true construction of securities for money, by considering them merely as a pledge. 5. The execution of trust, or second uses, in a manner analogous to the law of legal estates.

(5.) The proceedings in the court of chancery (to which those in the exchequer, &c. very nearly conform) are, 1. Bill. 2. Writ of subpœna; and, perhaps, injunction. 3. Process of contempt; viz. (ordinarily) attachment, attachment with proclamations, commission of rebellion, sergeant at arms, and sequestrations. 4. Appearance. 5. Demurrer. 6. Plead. 7. Answer. 8. Exceptions; amendments; cross, or supplemental, bills; bills of revivor, interpleader, &c. 9. Replication. 10. Issue. 11. Depositions, taken upon interrogatories; and subsequent publication thereof. 12. Hearing. 13. Interlocutory decree; feigned issue, and trial; reference to the master, and report; &c. 14. Final decree. 15. Rehearing, or bill of review. 16. Appeal to parliament.

Chap. IV. Of Public Wrongs.

Sect. I. Of the Nature of Crimes, and their Punishment.

(1.) In treating of public wrongs may be considered, 1. The general nature of crimes and punishments. 2. The persons capable of committing crimes. 3. Their several degrees of guilt. 4. The several species of crimes, and their respective punishments. 5. The means of prevention. 6. The method of punishment.

(2.) A crime, or misdemeanour, is an act committed, or omitted, in violation of a public law either forbidding or commanding it.

(3.) Crimes are distinguished from civil injuries, in that they are a breach and violation of the public rights, due to the whole community, considered as a community.

(4.) Punishments may be considered with regard to, 1. The power; 2. The end; 3. The measure—of their infliction.

(5.) The power, or right, of inflicting human punishments for natural crimes, or such as are malae in se, was by the law of nature vested in every individual; but, by the fundamental contract of society, is now transferred to the sovereign power; in which also is vested, by the same contract, the right of punishing positive offenses, or such as are malae prohibita.

(6.) The end of human punishments is to prevent future offenses; 1. By amending the offender himself. 2. By deterring others through his example. 3. By depriving him of the power to do future mischief.

(7.) The measure of human punishments must be determined by the wisdom of the sovereign power, and
Chap. IV.

Law of England may be regulated, and assisted, by certain general, equitable, principles.

Sect. II. Of the Persons capable of Committing Crimes.

(1.) All persons are capable of committing crimes, unless there be in them a defect of will: for, to constitute a legal crime, there must be both a vitious will, and a vitious act.

(2.) The will does not concur with the act. 1. Where there is a defect of understanding. 2. Where no will is exerted. 3. Where the act is constrained by force and violence.

(3.) A vitious will may therefore be wanting, in the cases of, 1. Infancy. 2. Idiocy, or lunacy. 3. Drunkenness; which doth not, however, excuse. 4. Misfortune. 5. Ignorance, or mistake of fact. 6. Compulsion, or necessity; which is, 1st, that of civil subjection; 2dly, that of duress per minas; 3dly, that of choosing the least pernicious of two evils, where one is unavoidable; 4thly, that of want, or hunger; which is no legitimate excuse.

(4.) The king, from his excellence and dignity, is also incapable of doing wrong.

Sect. III. Of Principals and Accessories.

(1.) The different degrees of guilt in criminals are, 1. As principals. 2. As accessories.

(2.) A principal in a crime is, 1. He who commits the fact. 2. He who is present at, aiding, and abetting, the commission.

(3.) An accessory is be who doth not commit the fact, nor is present at the commission; but is in some sort concerned therein, either before or after.

(4.) Accessory can only be in petit treason, and felony: in high treason, and misdemeanors, all are principals.

(5.) An accessory, before the fact, is one who, being absent when the crime is committed, hath procured, counselled, or commanded, another to commit it.

(6.) An accessory after the fact, is where a person, knowing a felony to have been committed, receives, relieves, comforts, or assists, the felon. Such accessory is usually entitled to the benefit of clergy; where the principal, and accessory before the fact, are excluded from it.

Sect. IV. Of Offences against God and Religion.

(1.) Crimes and misdemeanors cognizable by the laws of England are such as more immediately offend, 1. God, and his holy religion. 2. The law of nations. 3. The king, and his government. 4. The public, or Commonwealth. 5. Individuals.

(2.) Crimes more immediately offending God and religion are, 1. Apostacy. For which the penalty is incapacity, and imprisonment. 2. Heresy. Penalty, for one species thereof: the same. 3. Offences against the established church:—Either, by revulsing its ordinances. Penalties: fine; deprivation; imprisonment; forfeiture. Or, by nonconformity to its worship; Vol. XI. Part II.

Sect. V. Of Offences against the Law of Nations.

(1.) The law of nations is a system of rules, deducible by natural reason, and established by universal consent, to regulate the intercourse between independent states.

(2.) In England, the law of nations is adopted in its full extent, as part of the law of the land.

(3.) Offences against this law are principally incident to whole states or nations; but, when committed by private subjects, are then the objects of the municipal law.

(4.) Crimes against the law of nations, animadverted on by the laws of England, are, 1. Violation of safe conduct. 2. Infringement of the rights of ambassadors. Penalty, in both: arbitrary. 3. Piracy. Penalty: judgment of felony, without clergy.

Sect. VI. Of High Treason.

(1.) Crimes and misdemeanors more peculiarly offending the king and his government are, 1. High treason. 2. Felonies injurious to the prerogative. 3. Perjury. 4. Other misprisments and contempts.

(2.) High treason may, according to the statute of Edward III. be committed, 1. By compassing or imagining the death of the king, or queen-consort, or their eldest son and heir: demonstrated by some overt act. 2. By violating the king's companion, his eldest daughter, or the wife of his eldest son. 3. By some overt act of levying war against the king in his realm. 4. By adherence to the king's enemies. 5. By counterfeiting the king's great or privy seal. 6. By counterfeiting the king's money, or importing counterfeit money. 7. By killing the chancellor, treasurer, or king's justices, in the execution of their offices.

(3.) High treasons, created by subsequent statutes, are such as relate, 1. To Papists: as, the repeated defence of the pope's jurisdiction; the coming from beyond sea of a natural born popish priest; the renouncing of allegiance, and reconciliation to the pope or other foreign power. 2. To the coinage, or other signatures of the king: as, counterfeiting (or, importing and uttering counterfeit foreign coin, here current; forging the sign-manual, privy signet, or privy seal; falsifying, &c. the current coin. 3. To the

Protestant
Protestant succession; as, corresponding with, or remitting to, the late Pretender's sons; endeavouring to impede the succession; writing or printing in defence of any pretender's title, or in derogation of the act of settlement, or of the power of parliament to limit the descent of the crown.

(4.) The punishment of high treason, in males, is (generally) to be, 1. Drawn. 2. Hanged. 3. Embowelled alive. 4. Beheaded. 5. Quartered. 6. The head and quarters to be at the king's disposal. But, in treasons relating to the coin, only to be drawn, and hanged till dead. Females, in both cases, are to be drawn, and burned alive.

Sect. VII. Of Felonies injurious to the King's Prerogative.

(1.) Felony is that offence which occasions the total forfeiture of lands or goods, at common law; now usually also punishable with death, by hanging; unless through the benefit of clergy.

(2.) Felonies injurious to the king's prerogative (of which some are within, others without clergy) are, 1. Such as relate to the coin as, the wilful uttering of counterfeit money, &c.; (to which head some inferior misdemeanors affecting the coinage may be also referred). 2. Contending or attempting to kill a privy councillor. 3. Serving foreign states, or insulting soldiers for foreign service. 4. Embezzling the king's armour or stores. 5. Desertion from the king's armies by land or sea.

Sect. VIII. Of Præsumptia.

(1.) Præsumptia, in its original sense, is the offence of adhering to the temporal power of the pope, in derogation of the regal authority. Penalty: outlawry, forfeiture, and imprisonment: which hath since been extended to some offences of a different nature.

(2.) Among these are, 1. Importing popish trinkets. 2. Contributing to the maintenance of Popish seminaries abroad, or Popish priests in England. 3. Molesting the possessors of abbey lands. 4. Acting as broker in an usurious contract, for more than ten per cent. 5. Obtaining any stay of proceedings in suits for monopoles. 6. Obtaining an exclusive patent for gunpowder or arms. 7. Exertion of purveyance or pre-emption. 8. Asserting a legislative authority in both or either house of parliament. 9. Sending any subject a prisoner beyond sea. 10. Refusing the oaths of allegiance and supremacy. 11. Preaching, teaching, or advised speaking, in defence of the right of any pretender to the crown, or in derogation of the power of parliament to limit the succession. 12. Treating of other matters by the assembly of peers of Scotland, convened for electing their representative in parliament. 13. Unwarrantable undertakings by unlawful subscriptions to public funds.

Sect. IX. Of Misprisions and Contempts affecting the King and Government.

(1.) Misprisings and contempts are all such high offences as are under the degree of capital.

(2.) These are, 1. Negative, in concealing what ought to be revealed. 2. Positive, in committing what ought not to be done.

(4.) Positive misprisings, or high misdemeanors and contempts, are, 1. Mal-administration of public trusts, which includes the crime of peculation. Usual penalties: banishment; fines; imprisonment; disability. 2. Contempts against the king's prerogative. Penalty: fine, and imprisonment. 3. Contempt against the king's person and government. Penalty: fine, imprisonment, and infamous corporal punishment. 4. Contempts against his title. Penalties: fine, and imprisonment; or fine, and disability. 5. Contempts against his palaces, or courts of justice. Penalties: fine; imprisonment; corporal punishment; loss of right hand; forfeiture.

Sect. X. Of Offences against Public Justice.

(1.) Crimes especially affecting the commonwealth are offences. 1. Against the public justice. 2. Against the public peace. 3. Against the public trade. 4. Against the public health. 5. Against the public police or economy.

Sect. XI. Of Offences against the Public Peace.

Offences against the public peace, are, 1. Riotous assemblies to the number of twelve. 2. Appearing armed,

Chap. IV.

SECT. XII. Of Offences against Public Trade.

Offences against the public trade, are, 1. Owling. Penalties: fine; forfeiture; imprisonment; loss of left hand; transportation; judgment of felony. 2. Smuggling. Penalties: fines; loss of goods; judgment of felony, without clergy. 3. Fraudulent bankruptcy. Penalty: judgment of felony, without clergy. 4. Usury. Penalty: fine, and imprisonment. 5. Cheating. Penalties: fine; imprisonment; pillory; tumbril, whipping, or other corporal punishment, transportation. 6. Forestalling. 7. Restrainting. 8. Engrossing. Penalties, for all three: loss of goods; fine; imprisonment; pillory. 9. Monopolies and combinations to raise the price of commodities. Penalties: fines; imprisonment; pillory; loss of ear; infamy; and, sometimes the pains of premunire. 10. Exercising a trade, not having served as an apprentice. Penalty: fine. 11. Transporting, or residing abroad of artificers. Penalties: fine; imprisonment; forfeiture; incapacity; becoming aliens.

SECT. XIII. Of Offences against the Public Health, and Public Police or Economy.

1. Offences against the public health, are, 1. Irregularity, in the time of the plague, or of quarantine. Penalties: whipping; judgment of felony, with and without clergy. 2. Selling unwholesome provisions. Penalties: amercement; pillory; fine; imprisonment; abjuration of the town.

2. Offences against the public police and economy, or domestic order of the kingdom, are, 1. Those relating to clandestine and irregular marriages. Penalties: judgment of felony, with and without clergy. 2. Bigamy, or (more properly) polygamy. Penalty: judgment of felony. 3. Wandering, by soldiers or mariners. 4. Remaining in England, by Egyptians; or being in their fellowship one month. Both these are felonies, without clergy. 5. Common nuisances, 1st, By annoyances or purserites in highways, bridges, and rivers; 2dly, By offensive trades and manufactures; 3dly, By disorderly houses; 4thly, By lotteries; 5thly, By cottages; 6thly, By firework; 7thly, By evershopping. Penalty: in all fine. 8thly, By common scolding. Penalty: the ducking stool. 9thly, Disorder, discourtesy, and incorrigible rougery. Penalties: imprisonment; whipping; judgment of felony. 7. Luxury, in diet. Penalty, discretionary. 8. Gaming. Penalties: to gentlemen, fine; to others, fine and imprisonment; to cheating gamasters, fine, infamous, and the corporal pains of perjury. 9. Destroying the game. Penalties: fines, and corporal punishment.

SECT. XIV. Of Homicide.

1. Crimes especially affecting individuals, are, 1. Against their persons. 2. Against their habitations. 3. Against their property. 2. Crimes against the persons of individuals, are, 1. By homicide, or destroying life. 2. By other corporal injuries.

3. Homicide is, 1. Justifiable. 2. Excusable. 3. Felonious.

4. Homicide is justifiable. 1. By necessity, and command of law. 2. By permission of law; 1st, For the furtherance of public justice; 2dly, For prevention of some forcible felony.

5. Homicide is excusable, 1. Per infortunium, or by misadventure. 2. Se defensendo, or in self-defence, by chance-medley. Penalty, in both: forfeiture of goods, which however is pardoned of course.

6. Felonious homicide is the killing of a human creature without justification or excuse. This is, 1. Killing one's self. 2. Killing another.

7. Killing one's self, or self-murder, is where one deliberately, or by any unlawful malicious act, puts an end to his own life. This is felony; punished by ignominious burial, and forfeiture of goods and chattels.

9. Manslaughter is the unlawful killing of another, without malice, express or implied. This is either, 1. Voluntary, upon a sudden heat. 2. Involuntary, in the commission of some unlawful act. Both are felony, but within clergy; except in the case of stabbing.

10. Murder is when a person, of sound memory and discretion, unlawfully killeth any reasonable creature, in being, and under the king's peace; with malice aforethought, either express or implied. This is felony, without clergy; punished with speedy death, and hanging in chains or dissection.

11. Petit treason (being an aggravated degree of murder) is where the servant kills his master, the wife her husband, or the ecclesiastical his superior. Penalty: in men, to be drawn and hanged; in women, to be drawn and burned.

SECT. XV. Of Offences against the Persons of Individuals.

Crimes affecting the persons of individuals, by other corporal injuries not amounting to homicide, are, 1. Mayhem; and also shooting at another. Penalties: fine; imprisonment; judgment of felony, without clergy.

2. Forsible abduction, and marriage or defilement, of an heiress; which is felony: also, stealing, and deflowering or marrying, any woman child under the age of sixteen years; for which the penalty is imprisonment, fine, and temporary forfeiture of her lands. 3. Rape, and also carnal knowledge, of a woman child under the age of ten years. 4. Buggery, with man or beast. Both these are felonies, without clergy.

5. Assaults. 6. Battery; especially of clergymen.

7. Wounding. Penalties, in all three: fine; imprisonment; and other corporal
Sect. XVI. Of Offences against the Habitations of Individuals.

(1.) Crimes affecting the habitations of individuals are, 1. Arson. 2. Burglary.

(2.) Arson is the malicious and wilful burning of the house, or out-house, of another man. This is felony: in some cases within, in others without, clergy.

(3.) Burglary is the breaking and entering, by night, into a mansion house: with intent to commit a felony. This is felony, without clergy.

Sect. XVII. Of Offences against Private Property.

(1.) Crimes affecting the private property of individuals are, 1. Larceny. 2. Malicious mischief. 3. Forgery.

(2.) Larceny is, 1. Simple. 2. Mixed or compound.

(3.) Simple larceny is the felonious taking, and carrying away, of the personal goods of another. And it is, 1. Grand larceny; being above the value of twelvepence. Which is felony: in some cases within, in others without, clergy. 2. Petit larceny; to the value of twelvepence or under. Which is also felony, but not capital; being punished with whipping, or transportation.

(4.) Mixed, or compound, larceny, is that wherein the taking is accompanied with the aggravation of being, 1. From the house. 2. From the person.

(5.) Larcenies from the house, by day or night, are felonies without clergy, when they are, 1. Larcenies, above twelvepence, from a church; or by breaking a tent or booth in a market or fair, by day or night, the owner or his family being therein; or by breaking a dwelling house by day, any person being therein; or from a dwelling house by day, without breaking, any person therein put in fear; or from a dwelling house by night, without breaking, the owner, or his family being therein and put in fear. 2. Larcenies, of five shillings, by breaking the dwelling house, shop, or ware-house by day, though no person be therein; or by private stealing in any shop, ware-house, coach-house, or stable, by day or night, without breaking, and though no person be therein. 3. Larcenies, of forty shillings, from a dwelling house or its out-houses, without breaking, and though no person be therein.

(6.) Larceny from the person is, 1. By privately stealing, from the person of another, above the value of twelvepence. 2. By robbery; or the felonious and forcible taking, from the person of another, in or near the highway, goods or money of any value, by putting him in fear. These are both felonies without clergy. An attempt to rob is also felony.

(7.) Malicious mischief, by destroying dykes, goods, cattle, ships, garments, fish ponds, trees, woods, churches, chapels, meeting-houses, houses, out-houses, corn, hay, straw, sea or river banks, hop-binds, coal-mines (or engines thereto belonging), or any fences for enclo
the public police. 3. Attachments for contempts to the superior courts of justice.

Sect. XXI. Of Arrests.

2. An arrest is the apprehending, or restraining, of one's person; in order to be forthcoming to answer a crime whereof one is accused or suspected.

3. This may be done, 1. By warrant. 2. By an officer, without warrant. 3. By a private person, without warrant. 4. By hue and cry.

Sect. XXII. Of Commitment and Bail.

1. Commitment is the confinement of one's person in prison, for safe custody, by warrant from proper authority; unless, in bailable offences, he be put in sufficient bail, or security for his future appearance.

2. The magistrate is bound to take reasonable bail, if offered; unless the offender be not bailable.

3. Such are, 1. Persons accused of treason; or, 2. Of murder; or, 3. Of manslaughter, by indictment; or if the prisoner was clearly the slayer. 4. Prison breakers, when committed for felony. 5. Outlaws. 6. Those who have abjured the realm. 7. Approvers, and appellees. 8. Persons taken with the mainour. 9. Persons accused of arson. 10. Excommunicated persons.

4. The magistrate may, at his discretion, admit to bail, or otherwise, persons not of good fame, charged with other felonies, whether as principals or as accessories.

5. If they be of good fame, he is bound to admit them to bail.

6. The court of king's bench, or its judges in time of vacation, may bail in any case whatsoever.

Sect. XXIII. Of the Several Modes of Prosecution.

1. Prosecution, or the manner of accusing offenders, is either by a previous finding of a grand jury; as, 1. By presentment. 2. By indictment. Or, without such finding. 3. By information. 4. By appeal.

2. A presentment is the notice taken by a grand jury of any offence, from their own knowledge or observation.

3. An indictment is a written accusation of one or more persons of a crime or misdemeanor, preferred to, and presented on oath by, a grand jury; expressing, with sufficient certainty, the person, time, place, and offence.

4. And information is, 1. At the suit of the king and a subject, upon penal statutes. 2. At the suit of the king only. Either, 1. Filed by the attorney general ex officio, for such misdemeanors as affect the king's person or government; or, 2. Filed by the master of the crown office (with leave of the court of king's bench) at the relation of some private subject for other gross and notorious misdemeanors. All differing from indictments in this, that they are exhibited by the informer, or the king's officer; and not on the oath of a grand jury.

5. An appeal is an accusation or suit, brought by one private subject against another, for larceny, rape, mayhem, arson, or homicide: which the king cannot discharge or pardon, but the party alone can release.

Sect. XXIV. Of Process upon an Indictment.

1. Process to bring in an offender, when indicted in his absence, is, in misdemeanors, by venire facias, distress infinite, and capias: in capital crimes, by capias only: and, in both, by outlawry.

2. During this stage of proceedings, the indictment may be removed into the court of king's bench from any inferior jurisdiction, by writ of certiorari facias: and cognizance must be claimed in places of exclusive jurisdiction.

Sect. XXV. Of Arraignment, and its Incidents.

1. Arraignment is the calling of the prisoner to the bar of the court, to answer the matter of the indictment.

2. Incident hancvanto are, 1. The standing mate of the prisoner: for which, in petit treason, and felonies of death, he shall undergo the peine fort et dure. 2. His confession; which is either simple, or by way of approbation.

Sect. XXVI. Of Plea, and its Issue.

1. The plea, or defensive matter alleged by the prisoner, may be, 1. A plea to the jurisdiction. 2. A demurrer in point of law. 3. A plea in abatement. 4. A special plea in bar; which is, 1st, Auterfois acquisi; 2dly, Auterfois convict; 3dly, Auterfois attesté; 4thly, A pardon. 5. The general issue, not guilty.

2. Hereupon issue is joined by the clerk of the arraigns, on behalf of the king.

Sect. XXVII. Of Trial, and Conviction.

1. Trials of offence, by the laws of England, were and are, 1. By ordeal, of either fire or water. 2. By the cornced. Both these have been long abolished. 3. By battle, in appeals and improvements. 4. By the peers of Great Britain. 5. By jury.

2. The method and process of trial by jury is, 1. The impanelling of the jury. 2. Challenges; 3dly, upon cause; 2dly, peremptory. 3. Tales de circumstantibus. 4. The oath of the jury. 5. The evidence. 6. The verdict, either general or special.

3. Conviction is when the prisoner pleads, or is found guilty: whereupon, in felonies, the prosecutor is entitled to, 1. His expenses. 2. Restoration of his goods.

Sect.
Sect. XXVIII. Of the Benefit of Clergy.

(1.) Clergy, or the benefit thereof, was originally derived from the usurped jurisdiction of the Popish ecclesiastics; but hath since been new-modelled by several statutes.

(2.) It is an exemption of the clergy from any other secular punishment for felony, than imprisonment; and it is extended likewise, absolutely, to lay peers, for the first offence; and to all lay-commoners, for the first offence also, upon condition of branding, imprisonment, or transportation.

(3.) All felonies are entitled to the benefit of clergy, except such as are now ousted by particular statutes.

(4.) Felons, on receiving the benefit of clergy, (though they forfeit their goods to the crown,) are discharged of all clergyable felonies before committed, and restored in all capacities and credits.

Sect. XXIX. Of Judgment, and its Consequences.

(1.) Judgment (unless any matter be offered in arrest thereof) follows upon conviction; being the pronouncing of that punishment which is expressly ordained by law.

(2.) Attainer of a criminal is the immediate consequence, 1. Of having judgment of death pronounced upon him. 2. Of outlawry for a capital offence.

(3.) The consequences of attainer are, 1. Forfeiture to the king. 2. Corruption of blood.

(4.) Forfeiture to the king is, 1. Of real estates, upon attainer;—in high treason, absolutely, till the death of the late Pretender’s sons;—in felonies, for the king’s year, day, and waste;—in misprision of treason, assault on a judge, or battery sitting the courts; during the life of the offender. 2. Of personal estates, upon conviction; in all treason, misprision of treason, felony, excusable homicide, petit larceny, standing mute upon arraignment, the above-named contemptts of the king’s courts, and flight.

(5.) Corruption of blood is an utter extinction of all inheritable quality therein: so that, after the king’s forfeiture is first satisfied, the criminal’s lands eschew to the lord of the fee; and he can never afterwards inherit, be inherited, or have any inheritance derived through him.

Sect. XXX. Of Reversal of Judgment.

(1.) Judgments, and their consequences, may be avoided, 1. By falsifying, or reversing, the attainer. 2. By replevin, or pardon.

(2.) Attainers may be falsified, or reversed, 1. Without a writ of error; for matter decors the record. 2. By writ of error; for mistakes in the judgment, or record. 3. By act of parliament; for favour.

(3.) When an outlawry is reversed, the party is restored to the same plight as if he had appeared upon the capias. When a judgment, on conviction, is reversed, the party stands as if never accused.

Sect. XXXI. Of Reprieve, and Pardon.

(1.) A reprieve is a temporary suspension of the judgment. 1. Ex arbitrio judicis. 2. Ex necessitate legis; for pregnancy, insanity, or the trial of identity of person, which must always be tried instanter.

(2.) A pardon is a permanent avoider of the judgment by the king’s majesty, in offences against his crown and dignity; drawn in due form of law, allowed in open court, and thereby making the offender a new man.

(3.) The king cannot pardon, 1. Imprisonment of the subject beyond the seas. 2. Offences prosecuted by appeal. 3. Common nuisances. 4. Offences against popular or penal statutes, after information brought by a subject. Nor is his pardon pleasurable to an impeachment by the commons in parliament.

Sect. XXXII. Of Execution.

(1.) Execution is the completion of human punishment, and must be strictly performed in the manner which the law directs.

(2.) The warrant for execution is sometimes under the hand and seal of the judge; sometimes by writ from the king; sometimes by rule of court; but commonly by the judges signing the calendar of prisoners, with their separate judgments in the margin.

PART III. THE LAW OF SCOTLAND.

GENERAL OBSERVATIONS.

1. THE municipal law of Scotland, as of most other countries, consists partly of statutory or written law, which has the express authority of the legislative power; partly of customary or unwritten law, which derives force from its presumed or tacit consent.

2. Under our statutory or written law is comprehended, (1.) Our acts of parliament: not only those which were made in the reign of James I. of Scotland, and from thence down to our union with England in 1707, but such of the British statutes enacted since the Union as concerned this part of the united kingdom.

3. The remains of our ancient written law were published by Sir John Skene, clerk register, in the beginning of the last century, by license of parliament. The ten books of Regiam Majestatem, to which the whole collection owes its title, seem to be a system of Scots law, written by a private lawyer at the command of David I.; and though no express confirmation of that treatise by the legislature appears, yet it is admitted to have been the ancient law of our kingdom by express statutes. The borough laws, which were also enacted by the same King David, and the statutes of William, Alexander II. David II. and the three Roberts, are universally allowed to be genuine. Our parliament have once and again appointed commissions to revise and amend...
Part III.

LAW.

Amend the Regiam Majestatem, and the other ancient books of our law, and to make their report: but as no report appears to have been made, nor consequently any ratification by parliament, none of these remains are received, as of proper authority, in our courts; yet they are of excellent use in proving and illustrating our most ancient customs.

4. Our written law comprehends, (2) The acts of sedition, which are ordinances for regulating the forms of proceeding before the court of session in the administration of justice, made by the judges, who have delegated power from the legislature for that purpose. Some of these acts depend upon matter of right, which declare what the judges apprehend to be the law of Scotland, and what they are to observe afterwards as a rule of judgment.

Authority of the civil and canon laws.

5. The civil, or Roman and canon laws, though they are not perhaps to be deemed proper parts of our written law, have undoubtedly had the greatest influence in Scotland. The powers exercised by our sovereigns and judges have been justified upon no other ground, than that they were conformable to the civil or canon law; and a special statute was judged necessary, upon the Reformation, to rescind such of their constitutions as were repugnant to the Protestant doctrine. From that period, the canon law has been little respected, except in questions of tithes, patronages, and some few more articles of ecclesiastical right; but the Roman continues to have great authority in all cases where it is not derogated from by statute or custom, and where the genius of our law suffers us to apply it.

Customary or common law.

6. Our unwritten or customary law, is that which without being expressly enacted by statute, derives its force from the tacit consent of king and people; which consent is presumed from the ancient custom of the community. Custom, as it is equally founded in the will of the lawgiver with written law, has therefore the same effects; hence, as one statute may be explained or repealed by another, so a statute may be explained by the uniform practice of the community, and even go into disuse by a posterior contrary custom. But this power of custom to derogate from prior statutes is generally confined by lawyers to statutes concerning private right, and does not extend to those which regard public policy.

Decisions of the session.

7. An uniform tract of the judgments or decisions of the court of session is commonly considered as part of our customary law; and without doubt, where a particular custom is thereby fixed or proved, such custom of itself constitutes law: but decisions, though they bind the parties litigating, have not, in their own nature, the authority of law in similar cases; yet, where they continue uniform, great weight is justly laid on them. Neither can the judgments of the house of peers of Great Britain reach farther than to the parties in the appeal, since in these the peers act as judges, not as lawyers.

Judgments of the house of peers.

8. Though the laws of nature are sufficiently published by the internal suggestion of natural light, civil laws cannot be considered as a rule for the conduct of life, till they are noticed to those whose conduct they are to regulate. The Scots acts of parliament were, by our most ancient custom, proclaimed in all the different shires, boroughs, and baron courts, of the kingdom.

But after our statutes came to be printed, that custom was gradually neglected; and at last the publication of our laws, at the market-cross of Edinburgh, was declared sufficient; and they became obligatory 40 days thereafter. British statutes are deemed sufficiently notified, without formal promulgation; either because the printing is truly a publication; or because every subject is, by a maxim of the English law, party to them, as being present in parliament either by himself or his representative. After a law is published, no pretense of ignorance can excuse the breach of it.

As laws are given for the government of our conduct, they can regulate future cases only; for past actions, being out of our power, can admit of no rule. Declaratory laws form no exception to this; for a statute, where it is declaratory of a former law, does no more than interpret its meaning; and it is included in the notion of interpretation, that it must draw back to the date of the law interpreted.

Interpretation of laws.

10. By the rules of interpreting statute law received in Scotland, an argument may be used from the title to the act itself, à rubro ad nigrum; at least, where the rubric has either been originally framed, or afterwards adopted by the legislature. The preamble or narrative, which recites the inconveniences that have arisen from the former law; and the causes inducing the enactment, may also lead a judge to the general meaning of the statute. But the chief weight is to be laid on the statutory words.

11. Laws, being directed to the unlearned as well as the learned, ought to be construed in their most obvious meaning, and not explained away by subtle distinctions; and no law is to suffer a figurative interpretation, where the proper sense of the words is as commodious, and equally fitted to the subject of the statute. Laws ought to be explained so as to exclude absurdities, and in the sense which appears most agreeable to former laws, to the intention of the lawgiver, and to the general frame and structure of the constitution. In prohibitory laws, where the right of acting is taken from a person, solely for the private advantage of another, the consent of him, in whose behalf the law was made, shall support the act done in breach of it; but the consent of parties immediately interested has no effect in matters which regard the public utility of a state. Where the words of a statute are capable but of one meaning, the statute must be observed, however hard it may bear on particular persons. Nevertheless, as no human system of laws can comprehend all possible cases, more may sometimes be meant by the lawgiver than is expressed; and hence certain statutes, where extension is not plainly excluded, may be extended beyond the letter, to similar and omitted cases: others are to be confined to the statutory words.

12. A strict interpretation is to be applied, (1) To strict correctory statutes, which repeal or restrict former laws; and to statutes which enact heavy penalties, or restrain the natural liberties of mankind. (2) Laws, made on occasion of present exigencies in a state, ought not to be drawn to similar cases, after the pressure is over. (3) Where statutes establish certain solemnities as requisite to deeds, such solemnities are not applicable by equivalents; for solemnities lose their nature, when they are not performed specifically. (4) A statute, which enumerates special cases, is, with difficulty, to be extended.
Chap. I. Of Persons.

Among persons, judges, who are invested with jurisdiction, deserve the first consideration.

Sect. I. Of Jurisdiction and Judges in General.

Jurisdiction is a power conferred upon a judge or magistrate, to take cognizance of and decide causes according to law, and to carry his sentences into execution. That tract of ground, or district, within which a judge has the right of jurisdiction, is called his territory: and every act of jurisdiction exercised by a judge without his territory, either by pronouncing sentence, or carrying it into execution, is null.

2. The supreme power, which has the right of enacting laws, falls naturally to have the right of erecting courts, and appointing judges, who may apply these laws to particular cases: but, in Scotland this right has been always intrusted with the crown, as having the executive power of the state.

3. Jurisdiction is either supreme, inferior, or mixed. That jurisdiction is supreme, from which there lies no appeal to a higher court. Inferior courts are those whose sentences are subject to the review of the supreme courts, and whose jurisdiction is confined to a particular territory. Mixed jurisdiction partakes of the nature both of the supreme and inferior: thus the judge of the high court of admiralty, and the commissaries of Edinburgh, have an universal jurisdiction over Scotland, and they can review the decrees of inferior admirals and commissaries: but since their own decrees are subject to the review of the courts of session or justiciary, they are, in that respect, inferior courts.

5. Jurisdiction is either civil or criminal: by the first, questions of private right are decided; by the other, crimes are punished. But, in all jurisdiction, though merely civil, there is a power inherent in the judge to punish either corporally, or by a pecuniary fine, those who offend during the proceedings of the court, or who shall afterwards obstruct the execution of the sentence.

5. Jurisdiction is either private or cumulative. Private jurisdiction, is that which belongs only to one court, to the exclusion of all others. Cumulative, otherwise called concurrent, is that which may be exercised by any one of two or more courts, in the same case. In civil cumulative jurisdiction, the private pursuer has the right of election before which of the courts he shall sue; but as, in criminal questions, which are prosecuted by a public officer of court, a collision of jurisdiction might happen, through each of the judges claiming the exercise of their right, that judge, by whose warrant the delinquent is first cited or apprehended (which is the first step of jurisdiction), acquires thereby (jure preventionis) the exclusive right of judging the cause.

6. All rights of jurisdiction, being originally granted in consideration of the fitness of the grantees, were therefore personal, and died with himself. But, upon the introduction of the feudal system, certain jurisdictions were annexed to lands, and descended to heirs, as well as the lands to which they were annexed; but now all heritable jurisdictions, except those of admiralty and a small pittance reserved to barons, are either abolished, or resumed and annexed to the crown.

7. Jurisdiction is either proper or delegated. Proper jurisdiction, is that which belongs to a judge or magistrate himself, in virtue of his office. Delegated, is that which is communicated by the judge to another who acts in his name, called a depute or deputy. Where a deputy appoints one under him, he is called substitute. No grant of jurisdiction, which is an office requiring personal qualifications, can be delegated by the grantee to another, without an express power in the grant.

8. Civil jurisdiction is founded, 1. Ratione domicilii, if the defender has his domicile within the judge's territory. A domicile is the dwelling place where a person lives with an intention to remain; and custom has fixed it as a rule, that residence for 40 days founds jurisdiction. If one has no fixed dwelling place, e.g. a soldier, or a travelling merchant, a personal citation against him within the territory is sufficient to found the judge's jurisdiction over him, even in civil questions. As the defender is not obliged to appear before a court to which he is not subject, the pursuer must follow the defender's domicile.

9. It is founded, 2. Ratione res sitae, if the subject in question lie within the territory. If that subject be immovable, the judge, whose jurisdiction is founded in this way, is the sole judge competent, excluding the judge of the domicile.
10. Where one, who has not his domicile within the territory, is to be sued before an inferior court, *ratione rei sitae*, the court of session must be applied to, whose jurisdiction is universal, and who, of course, grants letters of supplemental to the defender to appear before the inferior judge. When the party to be sued resides in another kingdom, and has an estate in this, the court of session is the only proper court, as the *commune forum* to all persons residing abroad; and also to the defender, if his estate be heritable, is considered as lawfully summoned to that court, by a citation at the market cross of Edinburgh, and pier and shore of Leith: but where a stranger, not a native of Scotland, has only a moveable estate in this kingdom, he is deemed to be so little subject to the jurisdiction of our courts, that action cannot be brought against him till his effects be first attached by an arrestment *jurisdictionem fundandas causa*; which is laid on by a warrant issuing from the supreme courts of session, or admiralty, or from that within whose territory the subject is situated, at the suit of the creditor.

11. A judge may, in special cases, arrest or secure the persons of such as have neither domicile nor estate within his territory, even for civil debts. Thus, on the border between Scotland and England, warrants are granted of course by the judge-ordinary of either side, against those who have their domicile upon the opposite side, for arresting their persons, till they give caution *judicio siste*; and even the persons of citizens or natives may be so secured, where there is just reason to suspect that they are *in mediatum fugae*, i.e. that they intend suddenly to withdraw from the kingdom; upon which suspicion, the creditor, who applies for the warrant must make oath. An inhabitant of a borough-royal, who has furnished one who lives without the borough in meat, clothes, or other merchandise, and who has no security for it but his own account book, may arrest his debtor, till he give security *judicio siste*.

12. A judge may be declined, i.e. his jurisdiction disowned judicially, *ratione causa*, from his incompetency to the special cause brought before him. *Ratione suspeci judicis*, where either the judge himself, or his near kinsman, has an interest in the suit. No judge can vote in the cause of his father, brother, or son, either by consanguinity or affinity; nor in the cause of his uncle or nephew by consanguinity. *Ratione privilegii*, where the party is by privilege exempted from their jurisdiction.

13. Prorogated jurisdiction (*jurisdictionio in consententia*) is that which is, by the consent of parties, conferred upon a judge, who, without such consent, would be incompetent. Where a judge is incompetent, every step he takes must be null, till his jurisdiction be made competent by the party's actual submission to it. It is otherwise where the judge is competent, but may be declined by the party upon privilege.

14. In order to prorogation, the judge must have jurisdiction, such as may be prorogated. Hence, prorogation cannot be admitted, where the judge's jurisdiction is excluded by statute. Yet where the cause is of such a nature as to make the judge competent, though law may have confined his jurisdiction within a certain sum, parties may prorogue it above that sum unless where prorogation is prohibited. Prorogation is not admitted in the king's causes; for the interest of the crown cannot be hurt by the negligence of its officers.

15. All judges must at their admission swear: 1. The oath of allegiance, and subscribe the assurance; 2. The oath of abjuration; 3. The oath of supremacy; lastly, the oath of *faith administratio*.

16. A party who has either properly declined the Letters of jurisdiction of the judge before whom he had been cited, or who thinks himself aggrieved by any proceedings in the cause, may, before decree, apply to the court of session to issue letters of advocacy for calling the action from before the inferior court to themselves. The grounds, therefore, upon which a party may pray for letters of advocacy, are incompetency and iniquity. Under incompetency, is comprehended not only defect of jurisdiction, but all the grounds of declining a jurisdiction, in itself competent, arising either from suspicion of the judge, or privilege in the parties. A judge is said to commit iniquity, when he either delays justice, or pronounces sentence, in the exercise of his jurisdiction, contrary to law.

17. That the court of session may not waste their Advocates in trifles, no cause for a sum below twelve pounds is to be taken into account for the court of session from the inferior judge competent, but if an inferior judge shall proceed upon a cause to which he is incompetent, the cause may be carried from him by advocacy, let the subject be ever so inconsiderable.

SECTION II. Of the Supreme Judges and Courts of Scotland.

1. The king, who is the fountain of jurisdiction, King, might by our constitution have judged in all causes, either in his own person, or by those whom he pleased and used to vest with jurisdiction.

2. The parliament of Scotland, as our court of the Parliament last resort, had the right of reviewing the sentences of all our supreme courts.

3. By the treaty of Union, 1707, the parliaments of Parliament Scotland and England are united into one parliament of Great Britain. From this period, the British house of peers, as coming in place of the Scots parliament, is become our court of the last resort, to which appeals lie from all the supreme courts of Scotland; but that court has no original jurisdiction in civil matters, in which they judge only upon appeal. By art. 22. of that treaty, the Scots share of the representation in the house of peers is fixed to 16 Scots peers elective; and in the house of commons, to 45 commoners, of which 30 are elected by the freeholders of counties, and 15 by the royal boroughs. The Scots privy council was also thereupon abolished, and sunk into that of Great Britain, which for the future is declared to have no other powers than the English privy council had at the time of the union.

4. A court was erected in 1425, consisting of one Court of one Court of certain persons to be named by the king, out of the three estates of parliament, which was vested with the jurisdiction formerly lodged in the council, and got the name of the *session*, because it was ordained to hold annually a certain number of sessions at the places to be specially appointed by the king. This court had a jurisdiction, cumulative with the judge ordinary, in ejectments, and other possessory actions, and in debts;
but they had no cognizance in questions of property of heritable subjects. No appeal lay from its judgments to the parliament. The judges of this court served by rotation, and were changed from time to time, after having sat 40 days; and became so negligent in the administration of justice, that it was at last thought necessary to transfer the jurisdiction of this court to a council to be named by the king, called the 'daily council.'

5. The present model of the court of session, or college of justice, was formed in the reign of James V. The judges, thereof, who were vested with an universal civil jurisdiction, consisted originally of seven churchmen, seven laymen, and a president, whom it behoved to be a prelate; but spiritual judges were in 1584 partly, and in 1620 totally, prohibited. The judges of session have been always received by warrants from the crown. Anciently his majesty seems to have transferred to the court itself the right of choosing their own president; and in a sederunt recorded June 26. 1593, the king condescended to present to the lords, upon every vacancy in the bench, a list of three persons, out of which they were to choose one. But his majesty soon resumed the exercise of both rights, which continued with the crown till the usurpation; when it was ordained that the king should name the judges of the session, by the advice of parliament. After the Restoration, the nomination was again declared to be solely in the sovereign.

6. Though judges may, in the general case, be named at the age of 21 years, the lords of session must be at least 25. No person can be named lord of session who has not served as an advocate or principal clerk of session for five years, or as a writer to the signet for ten; and in the case of a writer to the signet, he must undergo the ordinary trials upon the Roman law, and be found qualified two years before he can be named. Upon a vacancy in the bench, the king presents the successor by a letter addressed to the lords, wherein he requires them to try and admit the person presented. The powers given to them to reject the presentee upon trial are taken away, and a bare liberty to renounce substituted in its place.

7. Besides the 15 ordinary judges, the king was allowed to name three or four lords of his great council, who might sit and vote with them. These extraordinary lords were suppressed in the reign of Geo. I.

8. The appellation of the college of justice is not confined to the judges, who are distinguished by the name of senators, but comprehends advocates, clerks of session, writers to the signet, and others, as described, Act S. 23d Feb. 1587. Where, therefore, the college of justice is entitled to any privilege, it extends to all the members of the college. They are exempted from watching, warding, and other services within borough; and from the payment of ministers stipends, and of all customs, &c. imposed upon goods carried to or from the city of Edinburgh. Part of these privileges and immunities were lately called in question by the city of Edinburgh; but they were found by the court of session (affirmed upon appeal) to be in full force.

Though the jurisdiction of the session be properly limited to civil causes, the judges have always sustained themselves as competent to the crime of falsehood. Where the falsehood deserves death or demobilation, they, after finding the crime proved, remit the criminal to the court of judicature. Special statute has given to the court of session jurisdiction in contraventions of law—burrows, deforcements, and breach of arrestment; and they have been in use to judge in battery pendente lite, and in usury.

10. In certain civil causes, the jurisdiction of the session is exclusive of all inferior jurisdictions; as in declarators of property, and other competitions of heritable rights, proving of the tenor, sessiones bonorum; restitution of minors, reductions of decrees or of writings, sales of the estates of minors or bankrupts, &c. In a second class of causes, their jurisdiction can be only exercised in the way of review, after the cause is brought from the inferior court; as in maritime and consistorial causes, which must be pursued in the first instance before the admiralty or consistory; and in actions, below twelve pounds sterling, which must be commenced before the judge ordinary. In all civil actions, which fall under neither of those classes, the jurisdiction of the session is concurrent, even in the first instance, with that of the judge ordinary. The session may proceed as a court of equity by the rules of conscience, in abating the rigour of law, and giving aid in proper cases to such as in a court of law can have no remedy: and this power is inherent in the supreme court of every country, where separate courts are not established for law and for equity.

This court formerly met upon the 12th day of June and rose upon the 11th day of August for the summer session; but now, in consequence of an act passed in the session of parliament 1795, it meets on the 12th of May and rises on the 11th of July for the summer session; the winter sederunt still remaining as formerly, viz. from the 12th of November to the 11th of March inclusive.

11. The supreme criminal judge was styled the Justiciary Justiciar; and he had anecently an universal civil jurisdiction, even in matters of heritage. He was obliged to hold two justice courts or ayres yearly at Edinburgh or Peebles, where all the freeholders of the kingdom were obliged to attend. Besides this universal court, special justice ayres were held in all the different shires in the kingdom twice in the year. These last having gone into disuse, eight deputies were appointed, two for every quarter of the kingdom, who should make their circuits over the whole in April and October.

12. The office of deputies was suppressed in 1672; and five lords of session were added, as commissioners of judicature, to the justice general and justice clerk. The justice general, if present, is constant president of the court, and in his absence the justice clerk. The kingdom is divided into three districts, and two of the judges are appointed to hold circuits in certain boroughs of each district twice in the year; one judge may proceed to business in the absence of his colleague. In trials before this court the verdict was always taken down in writing till the act 23d Geo. III. was passed; by which the judges may try and determine all causes by the verdict of an assize upon examining the witnesses in voce, without reducing the testimony into writing, unless it shall appear more expedient to proceed in the
LAW.

Chap. I.

13. By an old statute, the crimes of robbery, rape, murder, and wilful fire raising (the four plea of the crown), are said to be reserved to the king's court of justice; but the only crime in which, de praet, the jurisdiction of justice became at last exclusive of all inferior criminal jurisdiction, was that of high treason. The court of justice, when sitting at Edinburgh, has a power of advocating causes from all inferior criminal judges, and of suspending their sentences.

14. The circuit court can also judge in all criminal causes which do not infer death or demanorization, upon appeal from any inferior court within their district; and has a supreme civil jurisdiction, by way of appeal, in all causes not exceeding twelve pounds sterling, in which their decrees are not subject to review; but no appeal is to lie to the court, till the cause be finally determined in the inferior court.

15. The court of exchequer, as the king's chamberlain court, judged in all questions of the revenue. In pursuance of the treaty of Union, that court was abolished, and a new court erected, consisting of the lord high treasurer of Great Britain, and a chief baron, with four other barons of exchequer; which barons are to be made of serjeants at law, English barristers, or Scots advocates of five years standing. This court has a private jurisdiction conferred upon it, as to the duties of customs, excise, or other revenues appertaining to the king or prince of Scotland, and as to all honours and estates that may accrue to the crown; in which matters, they are to judge by the forms of proceeding used in the English court of exchequer, under the following limitations: That no debt due to the crown shall affect the debtor's real estate in any other manner than such estate may be affected by the laws of Scotland, and that the validity of the crown's titles to any honours or lands shall continue to be tried by the court of session. The barons have the powers of the Scots court transferred to them, of passing the accounts of sheriffs, or other officers who have the execution of writs issuing from, or returnable to, the court of exchequer, and of receiving resignations, and passing signatures of charters, gifts of casualties, &c. But though all these must pass in exchequer, it is the court of session only who can judge of their preference after they are completed.

16. The jurisdiction of the admiral in maritime causes was of old concurrent with that of the session. The high admiral is declared the king's justice general upon the seas, on fresh water within flood mark, and in all harbours and creeks. His civil jurisdiction extends to all maritime causes: and comprehends questions of charter parties, freights, salvages, bottomries, &c. He exercises this supreme jurisdiction by a delegate, the judge of the high court of admiralty; and he may also name inferior deputies, whose jurisdiction is limited to particular districts, and whose sentences are subject to the review of the high court. In causes which are declared to fall under the admiral's cognizance, his jurisdiction is sole; insomuch, that the session itself, though it may review his decrees by suspension or reduction, cannot carry a maritime question from him by advocation. The admiral has acquired, by usage, a jurisdiction in mercantile causes, even where they are not strictly maritime, cumulative with that of the judge of ordinary.

17. All our supreme courts have seals or signets, pro-siget, per to their several jurisdictions. The courts of session and justice used formerly the same signet, which was called the king's, because the writs issuing from them run in the king's name; and though the justice got at last a separate signet for itself, yet that of the session still retains the appellation of the king's signet. In this office are sealed summonses for citation, letters of executorial diligence, or for staying or prohibiting of diligence, and generally whatever passes by the warrant of the session, and is to be executed by the officers of the court. All these must, before sealing, be signed by the writers or clerks of the signet: But letters of diligence, where they are granted in a depending process, merely for probate, though they pass by the signet, must be subscribed by a clerk of session. The clerks of the signet also prepare and subscribe all signatures of charters, or other royal grants, which pass in exchequer.

SECT. III. Of inferior Judges and Courts of Scotland.

1. Sheriff (from receiv governor, and shcar to cut or divide) is the judge ordinary constituted by the crown over a particular division or county. The sheriff's jurisdiction, both civil and criminal, was, in ancient times, nearly as ample within his own territory as that of the supreme courts of session and justice was over the whole kingdom.

2. His civil jurisdiction now extends to all actions upon contracts, or other personal obligations; forthcoming, findings of the ground, mails and duties; and to all possessory actions, as removing, ejections, spolitudes, &c.; to all briefs issuing from the chancery, as of inquest, tertce, division, tutury, &c.; and even to adjudications of land estates, when proceeding on the renunciation of the apparent heir. His present criminal jurisdiction extends to certain capital crimes, as theft, and even murder, though it be one of the pleas of the crown; and he is competent to most questions of public police, and has a cumulative jurisdiction with justices of the peace in all riots and breaches of the peace.

3. Sheriffs have a ministerial power, in virtue of which they return juries, in order to a trial of causes that require juries. The writs for electing members of parliament have been, since the union, directed to the sheriffs, who, after they are executed, return them to the crown office from whence they issued. They also execute writs issuing from the court of exchequer; and in general, take care of all estates, duties, or casualties that fall to the crown within their territory, for which they must account to the exchequer.

4. A lord of regality was a magistrate who had a lord of grant of lands from the sovereign, with royal jurisdic-regality annexed thereto. His civil jurisdiction was equal to that of a sheriff; his criminal extended to the four pleas of the crown. He had a right to replead or reclaim all criminals, subject to his jurisdiction from any other competent court, though it were the justice itself, to his own. He had also right, according to the most common anion, to the single escheat of all de-
nounced persons residing within his jurisdiction, even though such privilege had not been expressed in the
grant of regality.

5. The steward was the magistrate appointed by the
king over such regality lands as happened to fall to the
crown by forfeiture, &c. and therefore the steward's
jurisdiction was equal to that of a regality. The two
stewartries of Kirkcudbright, and of Orkney and Zet-
land, make shires and counties by themselves, and send
each a representative to parliament.

6. Where lands not erected into a regality fell into
the king's hands, he appointed a bailie over them,
whose jurisdiction was equal to that of a sheriff.

7. By the late jurisdiction act, 20 Geo. II. all heri-
table regalities and bailiwicks, and all such heritable
stewarships and stewartries as were only parts of a shire,
are dissolved; and the powers formerly vested in them
are made to devolve upon such of the king's courts as
these powers would have belonged to if the jurisdictions
dissolved had never been granted. All stewarships and
stewartries that were not part of a shire, where they had
been granted, either heritably or for life, are resumed
and annexed to the crown. No high sheriff or steward
can thereafter judge personally in any cause. One sheriff
or steward-depute is to be appointed by the king in
every shire, who must be an advocate of three years
standing; and whose office as sheriff or steward-depute
is now by 28 Geo. II. held ad vitam aut culpam.

8. The appanage, or patrimony, of the prince of
Scotland, has been long erected into a regality jurisdic-
tion, called the Principality. It is personal to the
king's eldest son, upon whose death or succession it
returns to the crown. The prince has, or may have, his
own chancery, from which his writs issue, and may
name his own chamberlain and other officers for re-
cieving and managing his revenue. The vassals of the
prince are entitled to elect, or to be elected, members
of parliament for counties, equally with those who hold
of the crown.

9. Justices of the peace are magistrates named by
the sovereign over the several counties of the kingdom,
for the special purpose of preserving the public peace.
Anciently their power reached little farther than to
bind over disorderly persons for their appearance before
the privy council or justiciary; afterwards they were
authorised to judge in breaches of the peace, and in
most of the laws concerning public policy. They may
compel workmen or labourers to serve for a reasonable
fee, and they can condemn masters in the wages due to
their servants. They have power to judge in questions
of highways, and to call out the tenants with their
cottars and servants to perform six days work yearly
for upholding them. It has been lately, however,
found by the court of session, that justices have no juris-
diction whatever in common actions for debt. So that
it now seems fixed, that they are incompetent in such
actions, except where they are declared competent by
special statute.

10. Since the union, our justices of the peace, over
and above the powers committed to them by the laws of
Scotland, are authorised to exercise whatever be-
longing to the office of an English justice, in rela-
tion to the public peace. From that time, the Scots
and the English commissions have run in the same
style, which contains powers to inquire into and judge
in all capital crimes, witchcraft, felonies, and several
others specially enumerated: with this limitation sub-
joined, of which justices of the peace may lawfully in-
quire. Two justices can constitute a court. Special
statute has given the cognizance of several matters of
excise to the justices, in which their sentences are fi-
nal. As to which, and the powers thereby vested in
them, the reader must of necessity be referred to the
excise laws; it not falling within the plan of this
work, to enter into so very minute a detail as that
would prove.

11. A borough is a body corporate, made up of
the inhabitants of a certain tract of ground, erected
by the sovereign, with jurisdiction annexed to it. Bo-
roughs are erected, either to holden of the sovereign
himself, which is the general case of royal boroughs;
or of the superior of the lands erected, as boroughs of
regality and barony. Boroughs royal have power, by
their charters, to choose annually certain office bearers
or magistrates; and in boroughs of regality and bar-
ony, the nomination of magistrates is, by their char-
ter, lodged sometimes in the inhabitants, sometimes in
the superior. Bailies of boroughs have jurisdiction in
matters of debt, services, and questions of possession
between the inhabitants. Their criminal jurisdiction
extends to petty riots, and reckless fire-raising. The
dean of guild is that magistrate of a royal borough
who is head of the merchant company; he has the cog-
nizance of mercantile causes within borough; and the
inspection of buildings, that they encroach neither on
private property, nor on the public streets; and he
may direct insufficient houses to be pulled down. His
jurisdiction has no dependence on the court of the bo-
rough, or bailie court.

12. A baron, in the large sense of that word, is one
Barons.
who holds his lands immediately of the crown; and, as
such, had, by our ancient constitution, right to a seat
in parliament, however small his freehold might have
been. The lesser barons were exempted from the bur-
den of attending the service of parliament. This ex-
emption grew insensibly into an utter disability in all the
lesser barons from sitting in parliament, without elec-
tion by the county; though no statute is to be found
expressly excluding them.

13. To constitute a baron in the strict law sense, his
lands must have been erected, or at least confirmed,
by the king in liberam baroniam; and such baron had
a certain jurisdiction, both civil and criminal, which he
might have exercised, either in his own person, or by
his bailie.

14. By the late jurisdiction act, the civil jurisdic-
tion of a baron is reduced to the power of recovering
from his vassals and tenants, the rents of his lands, and
of condemning them in mill services; and of judging
in causes where the debt and damages do not exceed
40s. sterling. His criminal jurisdiction is, by the
same statute, limited to assaults, batteries, and other
smaller offences, which may be punished by a fine not
exceeding 20s. sterling, or by setting the offender in
the stocks in the day time not above three hours; the
fine to be levied by poinding, or one month's imprison-
ment. The jurisdiction formerly competent to pro-
prieters of mines, coal or salt works, over their
workmen, is reserved: and also that which was com-
petent to proprietors who had the right of fairs or
markets,
The high constable of Scotland had no fixed territorial jurisdiction, but followed the court; and had, jointly with the marshal, the cognizance of all crimes committed within two leagues of it. All other constables were dependent on him; these had castles, and sometimes borouges, subject to their jurisdiction, as Dundee, Montrose, &c. and among other powers, now little known, they had the right of exercising criminal jurisdiction within their respective territories during the continuance of fairs. By the late jurisdiction act, all jurisdictions of constabulary are dissolved, except that of high constable.

16. The office of the Lyon king of arms was chiefly ministerial, to denounce war, proclaim peace, carry public messages, &c. But he has also a right of jurisdiction, whereby he can punish all who usurp arms contrary to the law of arms, and deprive or suspend messengers, heralds, or pursuivants, (who are officers named by himself;) but he has no cognizance of the damage arising to the private party through the messenger’s fault. Messengers are subservient to the supreme courts of Session and Justiciary; and their proper business is to execute all the king’s letters either in civil or criminal causes. They must find caution for the proper discharge of their duty qua messengers; and in case of any malversation, or neglect, by which damage arises to their employers, their securities may be recovered upon for indemnification. These securities, however, are not answerable for the conduct of the messenger in any other capacity but qua such; and, therefore, if a messenger is authorised to uplift payment from a debtor, and fails to account to his employer, the cautioner is not liable; his obligation extending only to the regular and proper duties of the office in executing the diligence or the like.

17. Our judges had, for a long time, no other salaries or appointments than what arose from the sentences they pronounced. Our criminal judges applied to their own use the fines or issues of their several courts; and regalities had a right to the single esheath of all persons denounced, who resided within their jurisdiction; and our civil judges got a certain proportion of the sum contained in the decree pronounced. But these were all prohibited upon regular salaries being settled upon them.

Sect. V. Of Ecclesiastical Persons.

1. The pope, or bishop of Rome, was long acknowledged, over the western part of Christendom, for the head of the Christian church. The papal jurisdiction was abolished in Scotland anno 1560. The king was, by act 1669, declared to have supreme authority over all persons, and in all causes ecclesiastical; but this act was repealed by 1690, as inconsistent with Presbyterian church government, which was then upon the point of being established.

2. Before the reformation from Popery, the clergy was divided into secular and regular. The secular had a particular tract of ground given them in charge, within which they exercised the pastoral office of bishop, presbyter, or other church officer. The regular clergy had no care of souls; but were tied down to residence in their abbeys, priories, or other monasteries; and they got the name of regular, from the rule of mortification to which they were bound, according to the institution of their several orders. Upon the vacancy of any benefice, whether secular or regular, commendators were frequently appointed to levy the fruits, as factors or stewards during the vacancy. The pope alone could give the higher benefices in commendam; and, at last, from the plenitude of his power, he came to name commendators for life, and without any obligation to account. After the Reformation, several abbeys and priories were given by James VI. in perpetuum commendam, to laics.

3. Upon abolishing the pope’s authority, the regular clergy were totally suppressed; and in place of all the different degrees which distinguished the secular clergy, we had, at first only parochial presbyters or ministers, and superintendents, who bad the oversight of the church within a certain district; soon thereafter the church government became episcopal by archbishops, bishops, &c. and after some intermediate turns, is now Presbyterian by kirk sessions, presbyteries, synods, and general assemblies.

4. Priests, in our statutes, signifies a bishop, abbot, or other dignified clergyman, who, in virtue of his office, had a seat in parliament. Every bishop had his chapter, which consisted of a certain number of the ministers of the diocese, by whose assistance he managed the affairs of the church within that district. The nomination of bishops to vacant sees has been in the crown since 1540, though under the appearance of continuing the ancient right of election, which was in the chapter. The confirmation by the crown under the great seal, of the chapter’s election, conferred a right to the spirituality of the benefice; and a second grant upon the consecration of the bishop-elect, gave a title to the temporality; but this second grant fell soon into disuse.

5. He who founded or endowed a church was entitled patronage to the right of patronage thereof, or advocatio ecclesiae; whereby, among other privileges, he might present a churchman to the cure, in case of a vacancy. The presentee, after he was received into the church, had a right to the benefice proprio jure; and if the church was parochial, he was called a parson. The pope claimed the right of patronage of every kirk to which no third party could show a special title; and, since the Reformation, the crown, as coming in place of the pope, is considered as universal patron, where no right of patronage appears in a subject. Where two churches are united, which had different patrons, each patron presents by turns.

6. Gentlemen of estates frequently founded colleges or collegiate churches; the head of which got the name of provost, under whom were certain prebendaries, or canons, who had their several stalls in the church, where they sung masses. Others of lesser fortunes founded chaplainries, which were donations granted for the singing of masses for deceased friends at particular altars in a church. Though all these were suppressed upon the Reformation, their founders continued patrons.
in their favour of all the small benefices not exceeding 500 merks. Bishops, by the act which restored them to the whole of their benefices, were obliged to maintain the ministers within their dioceses, out of the thirds; and in like manner, the laic titulars, who got grants of the teinds, became bound, by their acceptation thereof, to provide the kiris within their erections in competent stipends.

11. But all those expedients for the maintenance of those clergy having proved ineffectual, a commission for the parliament was appointed in the reign of James VI. for planting kiris, and modifying stipends to ministers out of the teinds; and afterwards several other commissions were appointed, with the more ample powers of dividing large parishes, erecting new ones, &c. all of which were, in 1707, transferred to the court of session, with this limitation, that no parish should be disjoined, nor new church erected, nor old one removed to a new place, without the consent of three-fourths of the heritors, computing the votes, not by their numbers, but by the valuation of their rents within the parish. The judges of session, when sitting in that court, are considered as a commission of parliament, and have their proper clerks, macers, and other officers of court, as such.

12. The lowest stipend that could be modified to a minister by the first commission, was 500 merks, or five chalders of victual, unless where the whole teinds of the parish did not extend too far: and the highest was 1000 merks, or ten chalders. The parliament 1633 raised the minimum to eight chalders of victual, and proportionably in silver; but as neither the commission appointed by that act, nor any of the subsequent ones, was limited to the maximum, the commissioners have been in use to augment stipends considerably above the old maximum, where there is sufficiency of free teinds, and the cure is burdensome, or living expensive.

13. Where a certain quantity of stipend is modified to a minister out of the teinds of a parish, without proportioning that stipend among the several heritors, the decree is called a decree of modification; but where the commissioners also fix the particular proportions payable by each heritor, it is a decree of modification and locality. Where a stipend is only modified, it is secured on the whole teinds of the parish, so that the minister can insist against any one heritor to the full extent of his teinds; such heritor being always entitled to relief against the rest for what he shall have paid above his just share: but where the stipend is also localised, each heritor is liable in no more than his own proportion.

14. Few of the reformed ministers were, at first, provided with dwelling houses; most of the Papish clergy having, upon the first appearance of the Reformation, let their manses in feu, or in long tack: ministers therefore got a right, in 1563, to as much of these manses as would serve them, notwithstanding such feus or tacks. Where there was no parson's nor vicar's manse, one was to be built by the heritors, at the sight of the bishop, (now the presbytery), the charge not exceeding 1000l. Scots, or below 300 merks. Under a manse are comprehended stable, barn, and byre, with a garden; for all which it is usual to allow half an acre of ground.

15. Every
Chap. I.

Law of Scotland.

15. Every incumbent is entitled at his entry to have his manse put in good condition; for which purpose the presbytery may appoint a visitation by tradesmen, and order estimates to be laid before them of the sums necessary for the repairing, which they may proportion among the heritors according to their valuations. The presbytery, after the manse is made sufficient, ought, upon application of the heritors, to declare it a free manse; which lays the incumbent under an obligation, to uphold it in good condition during his incumbency, otherwise he or his executors shall be liable in damages; but they are not bound to make up the loss arising from the necessary decay of the building by the waste of time.

Glebe, and

16. All ministers, where there is any landward or country parish, are, over and above their stipend, entitled to a glebe, which comprehends four acres of arable land, or sixteen sowms of pasture ground where there is no arable land (a sowm is what will graze ten sheep or one cow); and it is to be designed or marked by the bishop or presbytery out of such kirklands within the parish as lie nearest to the kirk, and, in default of kirklands, out of temporal lands.

17. A right of relief is competent to the heritors, whose lands are set off for the manse or glebe, against the other heritors of the parish. Manses and glebes being once regularly designed, cannot be feued or sold by the incumbent in prejudice of his successors, which is in practice extended even to the case where such alienation evidently appears profitable to the benefice.

Grass.

18. Ministers, beside their glebe, are entitled to grass for a horse and two cows. And if the lands, out of which the grass may be designed, either lie at a distance, or are not fit for pasture, the heritors are to pay to the minister 20l. Scots yearly, as an equivalent. Ministers have also freedom of loggare, pasturage, fuel, feal, divot, loaning, and freeish and entry, according to use and wont: but what these privileges are, must be determined by the local custom of the several parishes.

19. The legal terms at which stipends become due to ministers are Whitunday and Michaelmas. If the incumbent be admitted to his church before Whitunday (till which term the corns are not presumed to be fully sown), he has right to that whole year's stipend; and, if he is received after Whitunday, and before Michaelmas, he is entitled to the half of that year; because, though the corns were sown before his entry, he was admitted before the term at which they are presumed to be reaped. By the same reason, if he dies or is transported before Whitunday, he has right to no part of that year; if before Michaelmas, to the half; and if not till after Michaelmas, to the whole.

20. After the minister's death, the executors have right to the annat; which, in the sense of the canon law, was a right reserved to the pope of the first year's fruits of every benefice. Upon a threatened invasion from England anno 1547, the annat was given by our parliament, notwithstanding this right in the pope, to the executors of such churchmen as should fall in battle in defence of their country: but the word annat or ann, as it is now understood, is the right which law gives to the executors of ministers, of half a year's benefice over and above what was due to the minister himself for his incumbency.

21. The executors of a minister, need make up no title to the ann by confirmation: neither is the right assignable by the minister, or affectable with his debts; for it never belonged to him, but is a mere gratuity given by law to those for whom it is presumed the deceased could not sufficiently provide; and law has given it expressly to executors: and if it were to be governed by the rules of succession in executory, the widow, in case of no children, would get one half, the other would go to the next of kin; and where there are children, she would be entitled to a third, and the other two-thirds would fall equally among the children. But the court of session, probably led by the general practice, have in this last case divided the ann into two equal parts; of which one goes to the widow, and the other among the children in capite.

22. From the great confidence that was, in the first jurisdiction ages of Christianity, reposed in churchmen, dying per os of bishops, sons frequently committed to them the care of their estates, and of their orphan children; but these were simply rights of trust, not of jurisdiction. The clergy soon had the address to establish to themselves a proper jurisdiction, not confined to points of ecclesiastical right, but extending to questions that had no concern with the church. They judged not only in teneinds, patronages, testaments, breach of vow, scandal, &c. but in questions of marriage and divorce, because marriage was a sacrament; in others, because these were given in consideration of marriage; in all questions where an oath intervened, on pretence that oaths were a part of religious worship, &c. As churchmen came, by the means of this extensive jurisdiction, to be diverted from their proper functions, they committed the exercise of it to their officials, or commissaries: hence the commissary court was called the bishop's court, and curia Christianitatis; it was also styled the consistorial court; from consistory, a name first given to the court of appeals of the Roman emperors, and afterwards to the courts of judicature held by churchmen.

23. At the Reformation, all episcopal jurisdiction exercised under the authority of the bishop of Home was abolished. As the course of justice in consistorial causes was thereby stopped, Q. Mary, besides naming a commissary for every diocese, did, by a special grant, establish a new commissary court at Edinburgh, consisting of four judges or commissaries. This court is vested with a double jurisdiction; one dioecesan, which is exercised in the special territory contained in the grant, viz. the counties of Edinburgh, Haddington, Linlithgow, Peebles, and a great part of Stirlingshire; and another universal, by which the judges confirm the testaments of all who die in foreign parts, and may reduce the decrees of all inferior commissaries, provided the reduction be pursued within a year after the decree. Bishops, upon their re-establishment in the reign of James V. I. were restored to the right of naming their several commissaries.

24. As the clergy, in time of Popery, assumed a jurisdiction independent of the civil power or any secular court, their sentences could be reviewed only by the pope, or judges delegated by him; so that, with regard
copia subsequent to a promise of marriage into actual marriage.

3. It is not necessary that marriage should be celebrated by a clergyman. The consent of parties may be declared before any magistrate, or simply before witnesses: and though no formal consent should appear, marriage is presumed from the cohabitation, or living together at bed and board, of a man and woman who are generally reputed husband and wife. One's acknowledgment of his marriage to the midwife whom he be called to his wife, and to the minister who baptized his child, was found sufficient presumptive evidence of marriage, without the aid either of cohabitation or of habit and repute. The father's consent was, by the Roman law, essential to the marriage of children in familia: but, by our law, children may enter into marriage, without the knowledge, and even against the remonstrances, of a father.

4. Marriage is forbidden within certain degrees of blood. By the law of Moses (Leviticus xvi.), which is constituted by the act 1567. c. 15, has been adopted by us, seconds in blood, and all remoter degrees, may all lawfully marry. By seconds in blood are meant first cousins. Marriage in the direct line is forbidden in infinitum; as it is also in the collateral line, in the special case where one of the parties is loco parentis to the other, as grand uncle, great grand uncle, &c. with respect to his grand niece, &c. The same degrees that are prohibited in consanguinity, are prohibited in affinity; which is the tie arising from marriage between one of the married pair and the blood relations of the other. Marriage is also, where either of the parties is naturally unfit for generation, or stands already married to a third person, is ipso jure null.

5. To prevent bigamy and incestuous marriages, when the church has introduced proclamations of banns; as is the ceremony of publishing the names and designations of those who intend to intermarry in the churches where the bride and bridgroom reside, after the congregation is assembled for divine service; that all persons who know any objection to the marriage may offer it. When the order of the church is observed, the marriage is called regular; when otherwise, clandestine. Marriage is valid when entered into in either of these ways; but when clandestine, there are certain penalties imposed upon the parties as well as the celebrator and witnesses.

6. By marriage, a society is created between the married pair, which draws after it a mutual communication of their civil interests, in as far as is necessary for maintaining it. As the society lasts only for the joint lives of the socii; therefore rights that have the nature of a perpetuity, which our law styles heritable, are not brought under the partnership or communion of goods; as a land estate, or bonds bearing a yearly interest: it is only moveable subjects, or the fruits produced by heritable subjects during the marriage, that become common to man and wife.

7. The husband, as the head of the wife, has the property of managing the goods in commissum, which is called sua succreti. This right is so absolute, that it bears but little resemblance to a right of administering a common subject. For the husband can, in virtue thereof, sell, or even gift, at his pleasure, the whole goods
8. From this right are excepted paraphernal goods, which, as the word is understood in our law, comprehend the wife's wearing apparel, and the ornaments proper to her person; as necklaces, ear-rings, breast or arm jewels, buckles, &c. These are neither alienable by the husband, nor affectable by his creditors. Things of promiscuous use to husband and wife, as plate, medals, &c. may become paraphernalia, by the husband's giving them to the wife, at or before marriage; but they are paraphernal only in regard to that husband who gave them as such, and are esteemed common moveables, if the wife, whose paraphernalia they were, be afterwards married to a second husband; unless he shall in the same manner appropriate them to her.

9. The right of the husband to the wife's moveable estate, is burdened with the moveable debts contracted by her before marriage; and as his right is universal, so also is his burden; for it reaches to her whole moveable estate, though she should far exceed his moveable estate. Yet the husband is not considered as the true debtor in his wife's debts. In all actions for payment, she is the proper defender: the husband is only cited for his interest: that is, as curator to her, and administrator of the society goods. As soon therefore as the marriage is dissolved, and the society goods thereby suffer a division, the husband is no farther concerned in the share belonging to his deceased wife: and consequently is no longer liable to pay her debts, which must be recovered from her representatives or her separate estate.

10. This obligation upon the husband is, however, perpetuated against him, (1.) Where his proper estate, real or personal, has been affected, during the marriage, by proper legal diligence; in which case, the husband must, by the common rules of law, relieve his property from the burden with which it stands charged; but the utmost diligence against his person is not sufficient to perpetuate the obligation; nor even incomplete diligence against his estate. (2.) The husband continues liable, even after the wife's death, so far as he is lucratus or profited by her estate: Still, however, the law does not consider a husband who has got but a moderate share in the wife as lucratus by the marriage; it is the excess only which it considers as lucrum, and that must be estimated by the quality of the parties and their condition of life. As he was at no time the proper debtor in his wife's moveable debts; therefore, though he should be lucratus, he is, after the dissolution, only liable for them subsidiarie, i.e. if her own separate estate is not sufficient to pay them off.

11. Where the wife is debtor in that sort of debt, which, if it had been due to her, would have excluded the jus maritii, e.g. in bonds bearing interest, which, as we shall afterwards see (cixiii. 4.), continues inheritable as to the rights of husband and wife, notwithstanding the enactment of the statute 1667, which renders all moveable in certain other respects, the husband is liable only for the bygone interests, and those that may grow upon the debt during the marriage; because his obligation for her debts must be commensurated to the interest he has in her estate. It is the husband alone who is liable in personal diligence for his wife's debts, while the marriage subsists: the wife, who is the proper debtor, is free from all personal execution upon them while she is vestita viro.

12. The husband by marriage becomes the perpertual curator of the wife. From this right it arises that no suit can proceed against the wife till the husband be cited for his interest. (2.) All deeds, done by a wife without the husband's consent, are null; neither can she sue in any action without the husband's concurrence. Yet, where the husband refuses, or by reason of forfeiture, &c. cannot concur; or where the action is to be brought against the husband himself, for performing his part of the marriage articles; the judge will authorize her to sue in her own name. The effects arising from this curatorial power discover themselves even before marriage, upon the publication of banns; after which the bride, being no longer suis juris, can contract no debt, nor do any deed, either to the prejudice of her future husband, or even to her own. But in order to this, it is necessary that the banns shall have been published in the bride's parish church as well as in that of her husband.

13. If the husband should either withdraw from his separate wife, or turn her out of doors; or if, continuing in amity with her, he should by severe treatment endanger her life; the commissaries will authorize a separation a mensa et thoro, and give a separate alimony to the wife, suited to her husband's estate, from the time of such separation until either a reconciliation or a sentence of divorce.

14. Certain obligations of the wife are valid notwithstanding her being sub cura maritii; ex. gr. obligations arising from delict; for wives have no privilege to commit crimes. But if the punishment resolves in a pecuniary mulct, the execution of it must, from her incapacity to fulfil, be suspended till the dissolution of the marriage, unless the wife has a separate estate exempted from the jus maritii.

15. Obligations arising from contract, affect either the person or the estate. The law has been so careful to protect wives while sub cura maritii, that all personal obligations granted by a wife, though with the husband's consent, as bonds, bills, &c. are null; with the following exceptions: (1.) Where the wife gets a separate peculium or stock, either from her father or a stranger, for her own or her children's aliment, she may grant personal obligations in relation to such stock: and by stronger reason, personal obligations granted by a wife are good, when her person is actually withdrawn from the husband's power by a judicial separation. (2.) A wife's personal obligation, granted in the form of a deed inter vivos, is valid, if it is not to take effect till her death. (3.) Where the wife is by the husband proposita negavit, intrusted with the management either of a particular branch of business or
of his whole affairs, all the contracts she enters inti.

Inhibition against a wife.

16. A wife, while she remains in family with her husban,

in the exercise of her præpositura are effectual, even though

de to be reduced to writing, but should arise merely

ex re, from furnishings made to her: but such obliga-

tions have no force against the wife; it is the hus-

band only, by whose commission she acts, who is there-

by obliged.

20. Marriage, like other contracts, might, by the Dimisso

Roman laws, be dissolvd by the contrary consent of the

parties; but by the law of Scotland, it cannot be dis-

solved till death, except by divorce, proceeding either

upon the head of adultery or of wilful desertion.

21. Marriage is dissolved by death, either within

year and day from its being contracted, or after year

and day. If it is dissolved within year and day, all

rights granted in consideration of the marriage (unless

secured against in the contract) become void, and

things return to the same condition in which they stood

before the marriage; with this restriction, that the

husband is considered as a bona fide possessor, in relation

to what he has consumed upon the faith of his

right; but he is liable to repay the tocher, without

any deduction, in consideration of his family expense

during the marriage. If things cannot be restored on

both sides, equity hinders the restoring of one party

and not the other. In a case which was lately before

the court of session, it was determined after a long

hearing in presence, that where a marriage had been

dissolved within the year without a living child, by the
death of the husband, the widow was entitled to be al-

mented out of an estate of which she was possessed,

though there were no conventional provisions stipulated

in favour of the wife.

22. Upon the dissolution of a marriage, after year

and day, the surviving husband becomes the irrevocable

proprietor of the tocher; and the wife, where she sur-

vives, is entitled to her jointure, or to her legal provi-

sions. She has also right to mourning, suitable to the

husband’s quality; and to alimony from the day of his

death till the term at which her dower provision, either legal or conventional, commences. If a

living child be procreated by the marriage, the mar-

riage has the same effect as if it had subsisted beyond

the year. A day is adjucted to the year, in majores
evidentiam, that it may clearly appear that the year it-

self is elapsed; and therefore, the running of any part of

the day, after the year, has the same effect as if the

whole were elapsed. The legal right of courtesy

competent to the surviving husband is explained below,

No. clxx. 28.

23. Divorce is such a separation of married persons, Divine
during their lives, as leaves them from the nuptial tie,

and leaves them to freedom to intermarry with others.

But neither adultery, nor wilful desertion, are grounds

which must necessarily dissolve marriage; they are on-

ly handles, which the injured party may take hold of

to be free. Cohabitation, therefore, by the injured

party, after being in the knowledge of the acts of

adultery, implies a passage from the injury; and no

divorce can proceed, which is carried on by collusion be-

twixt
twixt the parties, lest, contrary to the first institution of marriage, they might disengage themselves by their own consent; and though, after divorce, the guilty person, as well as the innocent, may contract second marriages; yet, in the case of divorce upon adultery, marriage is by special statute (1600 c. 20.) prohibited betwixt the two adulterers.

24. Where either party has deserted from the other for four years together, that other may sue for adherence. If this has no effect, the church is to proceed, first by admonition, then by excommunication; all which previous steps are declared to be a sufficient ground for pursuing a divorce. De praet, the commission, pronounces sentence in the adherence, after one year’s desertion; but four years must intervene between the first desertion and the decree of divorce.

25. The legal effects of divorce on the head of desertion are, that the offending husband shall restore the tocher, and forfeit to the wife all her provisions, legal and conventional; and, on the other hand, the offending wife shall forfeit to the husband her tocher, and all the rights that would have belonged to her in the case of her survivance. This was also esteemed the rule in divorces upon adultery. But by a decision of the court of session 1662, founded on a tract of ancient decisions recovered from the records, the offending husband was allowed to retain the tocher.

Sect. VII. Of Minors, and their Tutors and Curators.

1. The stages of life principally distinguished in law are pupillarity, puberty or minority, and majoriety. A child is under pupillarity, from the birth to 14 years of age if a male, and till 15 if a female. Minority begins where pupillarity ends, and continues till majoriety; which, by the law of Scotland, is the age of 21 years complete, both in males and females: but minority, in a large sense, includes all under age, whether pupils or paroers. Because pupils cannot in any degree act for themselves, and minors seldom with discretion, pupils are put by law under the power of tutors, and minors may put themselves under the direction of curators. Tutory is a power and faculty to govern the person, and administer the estate, of a pupil. Tutors are either nominal, of law, or dative.

2. A tutor nominate is he who is named by a father, in his testament or other writing, to a lawful child. Such tutor is not obliged to give caution for the faithful discharge of his office; because his fidelity is presumed to have been sufficiently known to the father.

3. If there be no nomination by the father, or if the tutors nominate do not accept, or if the nomination falls by death or otherwise, there is a place for a tutor of law. This sort of tutor devolves upon the nextagnate; by which we understand he who is nearest related by the father, though females intervene.

4. Where there are two or more agnates equally near to the pupil, he who is entitled to the pupil’s legal succession falls to be preferred to the others. But as the law suspects that he may not be over careful to preserve a life which stands in the way of his own interest, this sort of tutor is excluded from the custody of the pupil’s person; which is commonly committed to the mother, while a widow, until the pupil be seven years old; and, in default of the mother, to the next cognate, i.e. the highest relation by the mother. The tutor of law must (by act 1474) be at least 25 years of age. He is served or declared by a jury of sworn men, who are called upon a brief issuing from the chancery, which is directed to any judge having jurisdiction. He must give security before he enters upon the management.

5. If no tutor of law demands the office, any person, even a stranger, may apply for a tutury dative. But because a tutor in law ought to be allowed a competent time to deliberate whether he will serve or not, no tutor dative can be given till the elapsing of a year from the time at which the tutor of law had first a right to serve. It is the king alone, as the father of his country, who gives tutors dative, by his court of exchequer; and by act 1672, no gift of tutury can pass in exchequer, without the citation or consent of the next of kin to the pupil, both by the father and mother, nor till the tutor give security, recorded in the books of exchequer. There is no room for a tutor of law, or tutor dative, while a tutor nominate can be hoped for: and tutors of law or dative, even after they have begun to act, may be excluded by the tutor nominate, as soon as he offers to accept, unless he has expressly renounced the office. If a pupil be without tutors of any kind, the court of session will, at the suit of any kinsman, name a factor (steward) for the management of the pupil’s estate.

6. After the years of pupillarity are over, the minor is considered as capable of acting by himself, if he has confidence enough of his own capacity and prudence. The only two cases in which curators are imposed upon minors are, (1) Where they are named by the father, in a state of health. (2) Where the father is himself alive; for a father is suo jure, without any service, administrator, that is, both tutor and curator of law to his children, in relation to whatever estate may fall to them during their minority. This right in the father does not extend to grandchildren, nor to such even of his immediate children as are forisfamiliated. Neither has it place in subjects which are left by a stranger to the minor exclusive of the father’s administration. If the minor chooses to be under the direction of curators, he must raise and execute a summons, citing at least two of his next of kin to appear before his own judge ordinary, upon nine days warning (by act 1555). At the day and place of appearance, he offers to the judge a list of those whom he intends for his curators: such of them as resolve to undertake the office must sign their acceptance, and give caution; upon which an act of curatory is extracted.

7. Those curators are styled ad negotiis; to distinguish them from another sort called curators ad lites, who are authorized by the judge to come in with a minor in actions of law, either where he is without tutors and curators, or where his tutors and curators are parties to the suit. This sort is not obliged to give caution, because they have no intermeddling with the minor’s estate: they are appointed for a special purpose; and when that is over, their office is at an end. Whichever women are capable of being tutors and curators under the following restrictions: (1) The office of a female tutor and curator.
tutor or curator fails by her marriage, even though the nomination should provide otherwise; for she is no longer sui juris, and incapable of course of having another under her power. (2.) No woman can be tutor of law. Papists are (by act 1700) declared incapable of tutor or curatory. Where the minor has more tutors and curators than one, who are called in the nomination to the joint management, they must all concur in every act of administration; where a certain number is named as a quorum, that number must concur: where any one is named sine qua non, no act is valid without that one's special concurrence. But if they are named without any of these limitations, the concurrence of the majority of the nominees then alive is sufficient.

8. In this, tutor differs from curatory, that as pupils are incapable of consent, they have no person capable of acting; which defect the tutor supplies: but a minor pubes can act for himself. Hence, the tutor subscribes alone all deeds of administration; but in curatory, it is the minor who subscribes as the proper party; the curator does no more than consent. Hence also, the persons of pupils are under the power either of their tutors or of their nearest cognates; but the minor, after pupillarity, has the disposal of his own person, and may reside where he pleases. In most other particulars, the nature, the powers, and the duties of the two offices, coincide. Both tutors and curators must, previous to their administration, make a judicial inventory, subscribed by them and the next of kin, before the minor judge, ordinary, of his whole estate personal and real; of which, one subscribed duplicate is to be kept by the tutors or curators themselves; another, by the next of kin on the father's side; and a third by the next of kin on the mother's. If any estate belonging to the minor shall afterwards come to their knowledge, they must add it to the inventory within two months after their attaining possession thereof. Should they neglect this, the minor's debtors are not obliged to make payment to them: they may be removed from their offices as suspected; and they are entitled to no allowance for the sums disbursed by them in the minor's affairs (act 1672), except the expense laid out upon the minor's entertainment, upon his lands and houses, and upon completing his titles.

9. Tutors and curators cannot grant leases of the minor's lands, to endure longer than their own office; nor under the former rental, without either a warrant from the court of session, or some apparent necessity.

10. They have power to sell the minor's moveables, but cannot sell their pupil's land estate, without the authority of a judge; yet this restraint reaches not to such alienations as the pupil could by law be compelled to grant, e.g. to renunciations of wedsets upon redemption by the reverser; for in such case, the very tenor of his own right lays him under the obligation; nor to the renewal of charters to heirs; but the charter must contain no new right in favour of the heir. The alienation, however, of heritage by a minor, with consent of his curators, is valid.

11. Tutors and curators cannot, contrary to the nature of their trust, authorize the minor to do any deed for his own benefit; nor can they acquire any debt affecting the minor's estate; and, where a tutor or curator makes such acquisition, in his own name, for a less sum than the right is entitled to draw, the benefit thereof accrueth to the minor. It seems, however, that such purchase would be considered as valid, provided it were bona fide acquired at a public sale; for in such case it occurs that the tutor or curator is in fact bettering the situation of his ward by enhancing the value of his property by a fair competition. In general, it seems to be the genius and spirit of our law, that tutors and curators shall do every thing in their power towards the faithful and proper discharge of their respective offices.

12. By the Roman law, tutor and curatory, being their ob- munera publica, might be forced upon every one who had not a relevant ground of excuse: but, with us, the persons named to these offices may either accept or decline: and where a father, in liese pouiste (when in a state of health) names certain persons both as tutors and curators to his children, though they have acted as tutors, they may decline the office of curatory. Tutors and curators having once accepted, are liable in diligence, that is, are accountable for the consequences of their neglect in any part of their duty from the time of their acceptance. They are accountable singuli in solidum, i.e. every one of them is answerable, not only for his own diligence, but for that of his co-tutors; and any one may sue without citing the rest: but he who is condemned in the whole, has action of relief against his co-tutors.

13. From this obligation of diligence, we may except, (1.) Fathers or administrators-in-law, who, from the presumption that they act to the best of their power for their children, are liable only for actual intrusions. (2.) Tutors and curators named by the father in consequence of the act, 1696, with the special provisio, that they shall be liable barely for intrusions, not for omissions; and that each of them shall be liable only for himself, and not an solidum for the co- tutors: but this power of exemption from diligence is limited to the estate descending from the father himself. Tutors or curators are not entitled to any salary or allowance for pains, unless a salary has been expressly contained in the testator's nomination; for their office is presumed gratuitous.

14. Though no person is obliged to accept the office of tutor or curator; yet having once accepted, he cannot throw it up or renounce it without sufficient cause; but, if he should be guilty of misapplying the minor's money, or fail in any other part of his duty, he may be removed at the suit of the minor's next in kin, or by a co-tutor or co-curator. Where the misconduct proceeds merely from indolence or inattention, the court, in place of removing the tutor, either join a curator with him, or, if he be a tutor nominate, they oblige him to give caution for his past and future management.

15. The offices of tutor and curatory expire also by the pupil's attaining the age of puberty, or the minor's attaining the age of 21 years complete; and by the death either of the minor, or of his tutor and curator.

Curatory also expires by the marriage of a female minor, who becomes thereby under the coverture of her own husband. After expiry of the office, reciprocal actions lie at the instance both of the tutor and curators, and of the minor. That at the instance of the minor is called actio tutela directa, by which he can compel
pel the tutors to account; that at the instance of the tutors, actio tutela contraria, by which the minor can be compelled to repay what has been profitably expended during the administration; but this last does not lie till after accounting to the minor; for till then the tutors are presumed in tute habere to the effects in their own hands for answering their disbursements.

16. Deeds either by pupils, or by minors having curators without their consent, are null; but they oblige the granters in as far as relates to sums profitably applied to their use. A minor under curators can indeed make a testament by himself; but whatever is executed in the form of a deed inter vivos, requires the curator's consent. Deeds by a minor who has no curators, are as effectual as if he had had curators, and signed them with their consent; he may even alien his heritage, without the interposition of a judge.

17. Minors may be restored against all deeds granted in their minority, that are hurtful to them. Deeds, in themselves void, need not the remedy of restitution; but where hurtful deeds are granted by a tutor in his pupil's affairs, or by a minor who has no curators, as these deeds subsist in law, restitution is necessary: and even where a minor, having curators, executes a deed hurtful to himself with their consent, he has not only action against the curators, but also has the benefit of restitution against the deed itself. The minor cannot be restored, if he does not raise and execute a summons for reducing the deed, ex capite minorentulatis et lesionis, before he be 25 years old. These four years, between the age of 21 and 25, called quadrennium stile, are indulged to the minor, that he may have a reasonable time, from that period, when he is first presumed to have the perfect use of his reason, to consider with himself what deeds done in his minority have been truly prejudicial to him.

18. Questions of restitution are proper to the court of session. Two things must be proved by the minor, in order to the reduction of the deed: (1.) That he was minor when it was signed; (2.) That he is hurt or lesed by the deed. This lesion must not proceed merely from accident; for the privilege of restitution was not intended to exempt minors from the common misfortune of life; it must be owing to the imprudence or negligence of the minor, or his curator.

19. A minor cannot be restored against his own de- licit or fraud; e.g. if he should induce one to bargain with him by saying he was major. (1.) Restitution is excluded, if the minor, at any time after majority, has approved of the deed, either by a formal ratification, or tacitly by payment of interest, or by other acts inferring approbation. (2.) A minor, who has taken himself to business, as a merchant-shopkeeper, &c. cannot be restored against any deed granted by him in the course of that business, especially if he was proximus majorentulatis at signing the deed. (3.) According to the more common opinion, a minor cannot be restored in a question against a minor, unless some gross unfairness shall be qualified in the bargain.

20. The privilege of restitution does not always die with the minor himself. (1.) If a minor succeeds to a minor, the time allowed for restitution is governed by the minority of the heir, not of the ancestor. (2.) If a minor succeeds to a major, who was not full 25, the privilege continues with the heir during his minority; but he cannot avail himself of the annul utilitie, except in so far as they were unexpired at the ancestor's death.

21. No minor can be compelled to state himself as a defender, in any action, whereby his heritable estate is flowing from ascendants may be evicted from him, by one pretending a preferable right.

22. This privilege is intended merely to save minors from the necessity of disputing upon questions of preference. It does not therefore take place, (1.) Where the action is pursued upon the father's falsehood or delict. (2.) Upon his obligation to convey heritage. (3.) On his liquid bond for a sum of money, though such action should have the effect to carry off the minor's estate by adjudication. (4.) Nor in actions pursued by the minor's superior, upon feudal casualties. (5.) This privilege cannot be pleased in bar of an action which had been first brought against the father, and is only continued against the minor, nor where the father was not in the peaceable possession of the heritable subject at his death. Before the minor can plead it, he must be served heir to his father. The persons of pupils are by said act 1656 protected from imprisonment on civil debts.

23. Curators are given, not only to minors, but to the minors of general to every one who, either through defect of judgment, or unfitness of disposition, is incapable of rightly managing his own affairs. Of the first sort, are idiots and furtive persons. Idiots, or furtivi, are entirely deprived of the faculty of reason. The dismanner of the furtive person does not consist in the defect of reason; but in an overheated imagination, which obstructs the application of reason to the purposes of life. Curators may be also granted to lunatics; and even to persons dumb and deaf, though they are of sound judgment, where it appears that they cannot exert it in the management of business. Every person, who is come of age, and is capable of acting rationally, has a natural right to conduct his own affairs. The only regular way, therefore, of appointing this sort of curators, is by a jury summoned upon a brief from the chancery; which is not, like the brief of common tutors, directed to any judge ordinary, but to the judge of the special territory where the person alleged to be furtive or furtive resides; that, if he is truly of sound judgment, he may have an opportunity to oppose it: and for this reason, he ought to be made a party to the brief. The curalty of idiots and furtive persons belongs to the nearestagnate; but a father is preferred to the curatory of his furtive son, and the husband to that of his furtive wife, before the agnate.

24. A clause is inserted in the brief, for inquiring how long the furtive or furtive person has been in that condition: and the verdict to be pronounced by the inquest has a retrospective effect: for it is declared a sufficient ground, without further evidence, for reducing all deeds granted after the period at which it appeared by the proof that the futility or furtivity began. But, as furtive and furtive persons are, by their very state, incapable of being obliged, all deeds done by them may be declared void, upon proper evidence of their
their futility at the time of signing, though they should never have been cognised idiots by an inquest.

25. We have some few instances of the sovereign's giving curators to idiots, where the next agnate did not claim; but such gifts are truly deviations from our law, since they pass without any inquiry into the state of the person upon whom the curatory is imposed. Hence the curator of law to an idiot serving quandocunque, is preferred, as soon as he offers himself, before the curator-ative. This sort of curatory does not determine by the lucid intervals of the person sub cura; but it expires by his death, or perfect return to a sound judgment, which last ought regularly to be declared by the sentence of a judge.

26. Persons, let them be ever so profound, or liable to be imposed upon, if they have the exercise of reason, can effectually oblige themselves, till they are fettered by law. This may be done by Interdicts, which is a legal restraint laid upon such persons from signing any deed to their own prejudice, without the consent of their curators or interdictors.

27. There could be no interdict by our ancient practice, without a previous inquiry into the person's condition. But as there were few who could bear the shame that attends judicial interdict, however necessary the restraint might have been, voluntary interdict has received the countenance of law; which is generally executed in the form of a bond, whereby the grantor obliges himself to do no deed that may affect his estate, without the consent of certain friends there- in mentioned. Though the reasons inductive of the bond should be but gently touched in the recital, the interdict remains good. Voluntary interdict, though it be imposed by the sole act of the person interdicted, cannot be recalled at his pleasure, but may be taken off, (1.) By a sentence of the court of session, declaring, either that there was from the beginning no sufficient ground for the restraint; or that the party is, since the date of the bond, become sui sui providus. (2.) If false, even without the authority of the lords, by the joint act of the person interdicted, and his interdictors, concursus, to take it off. (3.) Where the bond of interdict requires a certain number as a quorum, the restraint ceases, if the interdictors shall by death be reduced to a lesser number.

28. Judicial interdict is imposed by a sentence of the court of session. It commonly proceeds on an action brought by a near kinsman to the party; and sometimes from the mobile officium of the court, when they perceive, during the pendency of a suit, that any of the litigants is, from the facility of his temper, subject to imposition. This sort must be taken off by the authority of the same court that imposed it.

29. An interdict need not be served against the person interdicted; but it must be executed, or published by a messenger, at the market cross of the jurisdiction where he resides, by publicly reading the interdict there, after three oysesses made for convocating the lieges. A copy of this execution must be affixed to the cross; and thereafter, the interdict, with its execution, must (by the act 1581) be registered in the books both of the jurisdiction where the person interdicted resides and where his lands lie, or (by the act 1600) in the general register of the session, within 40 days from the publication. An interdict, before it is registered, has no effect against third parties, though they should be in the private knowledge of it; but it operates against the interdictors themselves, as soon as it is delivered to them.

30. An interdict, duly registered, has this effect, that all deeds done thereafter, by the person interdicted, without the consent of his interdictors, affecting his heritable estate, are subject to reduction. Registration in the general register secures all his lands from alienation, wherever they lie; but where the interdict is recorded in the register of a particular shire, it covers no lands except those situated in that shire. But persons indebted have still power to dispose of their moveables, not only by testament, but by present deeds of alienation: And creditors, in personal bonds granted after interdict, may use all execution against their debtor's person and moveable estate: such bonds being only subject to reduction in so far as diligence against the heritable estate may proceed upon them.

31. All onerous or rational deeds granted by the person interdicted, are as effectual, even without the consent of the interdictors, as if the grantor had been laid under no restraint; but he cannot alter the succession of his heritable estate, by any settlement, let it be ever so rational. No deed, granted with consent of the interdictors, is reducible, though the strongest reason or prejudice to the grantee should appear: the only remedy competent, in such case, is an action by the grantor against his interdictors, for making up to him what he has lost through their undue consent. It is no part of the duty of interdictors to receive sums or mortgages any estate; they are given merely ad Ecuador ad præstandum, to interpose their authority to reasonable deeds; and so are accountable for nothing but their fraud or fault, in consenting to deeds hurtful to the person under their care.

32. The law concerning the state of children falls next to be explained. Children are either born in wedlock, or out of it. All children born in lawful marriage or wedlock, are presumed to be forgotten by the person to whom the mother is married; and consequently to be lawful children. This presumption is so strongly founded, that it cannot be defeated but by direct evidence that the mother's husband could not be the father of the child, &c. where he is impotent, or was absent from the wife till within six lunar months of the birth. The canons indeed maintain, that the concurring testimony of the husband and wife, that the child was not procreated by the husband, is sufficient to elide this legal presumption for legitimacy: but it is an agreed point, that no regard is to be paid to such testimony, if it be made after they have owned the child to be theirs. A father has the absolute right of disposing of his children's person, of directing their education, and of moderate chastisement; and even after they become puberes, he may compel them to live in family with him, and to contribute their labour and industry, while they continue there, towards his service. A child who gets a separate stock from the father for carrying on any trade or employment, even though he should continue in the father's house, may be said to be emancipated or forisfamiliated, in so far as it concerns that stock; for the profits arising from it are his own. Forisfamiliation, when taken in this sense, is also inter-
37. The poor make the lowest class or order of persons. Indigent children may be compelled to serve any of the king's subjects without wages, till the age of thirty years. Vagrants and sturdy beggars may be also compelled to serve any manufacturer. And because few persons were willing to receive them into their service, public workhouses are ordained to be built for setting them to work. The poor who cannot work, must be maintained by the parishes in which they were born; and where the place of their nativity is not known, that burden falls upon the parishes where they have had their most common resort, for the three years immediately preceding their being apprehended or their applying for the public charity. Where the contributions collected at the churches to which they belong are not sufficient for their maintenance, they are to receive bakes from the minister and kirk session, in virtue of which they may ask alms at the dwelling-houses of the inhabitants of the parish.

cap.

The things, or subjects, to which persons have right, are the second object of law.

SECT. I. Of the Division of Rights, and the several ways by which a Right may be acquired.

1. The right of enjoying and disposing of a subject's property, at one's pleasure, is called property. Proprietors are restrained by law from using their property emulously to their neighbour's prejudice. Every state or sovereign has a power over private property, called, by some lawyers, dominium eminos, in virtue of which, the proprietor may be compelled to sell his property for an adequate price, where an evident utility on the part of the public demands it.

2. Certain things are by nature itself incapable of Things inapropriation; as the air, the light, the ocean, &c.; capable of none of which can be brought under the power of any one person, though their use be common to all. Others are by law exempted from private commerce, in respect of the uses to which they are destined. Of this last kind are, (1.) Res publice, as navigable rivers, highways, bridges, &c. the right of which is vested in the king, chiefly for the benefit of his people, and they are called regalia. (2.) Res universitatis, things which belong in property to a particular corporation or society, and whose use is common to every individual in it, but both property and use are subject to the regulations of the society; as town houses, corporation halls, market places, churchyards, &c. The lands or other revenue belonging to a corporation do not fall under this class, but are juris privati, quod the corporation.

3. Property may be acquired either by occupation or ways of accession; and transferred by tradition or prescription; acquiring but prescription being also a way of losing property, property falls to be explained under a separate title. Occupation, or occupancy, is the appropriating of things which have no owner, by apprehending them, or seizing their possession. This was the original method of acquiring property: and continued, under certain restrictions, the doctrine of the Roman law, Quod nullius est, sit occupantis: but it can have no room in the feudal plan.
Law of Scotland.

plan, by which the king is looked on as original proprietor of all the lands within his dominions.

4. Even in that sort of moveable goods which are presumed to have once had an owner, this rule obtains by the law of Scotland, *Quod nullius est, fit domini regis.* Thus, the right of treasure hid under ground is not acquired by occupation, but accrues to the king. Thus also, where one finds strayed cattle or other moveables, which have been lost by their former owner, the finder acquires no right in them, but must give public notice thereof, and if, within year and day after such notice, the proprietor does not claim his goods, they fall to the king, sheriff, or other person to whom the king has made a grant of such escheats.

5. In that sort of moveables which never had an owner, as wild beasts, fowls, fishes, or pearls found on the shore, the original law takes place, that he who first apprehends, becomes proprietor; insomuch, that though the right of hunting, fishing, and catching game, even that is caught in contravention of the law, becomes the property of the catcher (unless where the confiscation thereof is made part of the penalty), the contravener being obnoxious, however, to the penal enactment of the statutes in consequence of his transgression. It was not for a long time a fixed point whether a person, though possessed of the valued rent by law entitled him to kill game, could hunt upon another person's ground without consent; but it was lately found by the court of session, and affirmed upon appeal, that he could not; it being repugnant to the idea of property, that any person, however qualified, should have it in his power to traverse and hunt upon another's grounds without consent of the proprietor. Although certain things became the property of the first occupant, yet there are others which fall not under this rule. Thus, whales thrown in or killed on our coasts, belong neither to those who kill them, nor to the proprietor of the grounds on which they are cast; but to the king, providing they are so large as that they cannot be drawn by a wain with six oxen.

Accession.

6. Accession is that way of acquiring property, by which, in two things which have a connexion with, or dependence on, one another, the property of the principal thing draws after it the property of its accessory. Thus the owner of a cow becomes the owner of the calf; a house belongs to the owner of the ground on which it stands, though built with materials belonging to and at the charge of another; trees taking root in our ground, though planted by another become ours. Thus also the inessential addition made to one's ground by what a river washes from other grounds, (which is called *alluvio*), accures to the master of the ground which receives the addition; but where it happened that a large piece of ground was disjoined and annexed to another person's by the force of a river or any other accident, and which was by the Romans called *auulio*, they considered the owner's right of property still to subsist, § 21. *Inst. de rer. divin.;* and it is probable that, in a similar case, our courts would countenance the distinction. The Romans excepted from this rule the case of paintings drawn on another man's board or canvas, in consideration of the excellency of the art; which exception our practice has for a like reason extended to similar cases.

7. Under accession is comprehended Specification; by which is meant, a person's making a new species or subject, from materials belonging to another. Where the new species can be again reduced to the matter of which it was made, law considers the former mass as still existing; and therefore, the new species, as an accessory to the former subject, belongs to the proprietor of that subject: but where the thing made cannot be so reduced, as in the case of wine, which cannot be again turned into grapes, there is no place for the *fictio juris*; and therefore the workmanship draws after it the property of the materials. But the person who thus carries the property from the other is bound to indemnify him according to the true value; and in case it was done *mala fide*, he may be made liable in the *premium affectionis* or utmost value.

8. Though the new species should be produced from the *commixtion* or confusion of different substances belonging to different proprietors, the same rule holds; but where the mixture is made by the common consent of the owners, such consent makes the whole a common property, according to the shares that each proprietor had formerly in the several subjects. Where things of the same sort are mixed without the consent of the proprietors, which cannot again be separated; e. g. two hogsheads of wine, the whole likewise becomes a common property; but, in the after division, regard ought to be had to the different quality of the wines: if the things so mixed admit of a separation, e. g. two flocks of sheep, the property continues distinct.

9. Property is carried from one to another by *tradition,* which is the delivery of possession by the proprietor with the intention to transfer the property to the receiver. Two things are therefore requisite, in order to the transmitting of property in this way: 1. The intention or consent of the former owner to transfer it on some proper title of alienation, as sale, exchange, gift, &c. (2.) The actual delivery in pursuance of that intention. The first is called the *causa,* the other the *modus transfrerendi dominii*; which last is so necessary to the acquiring of property, that he who gets the last right, with the first tradition, is preferred according to the rule, *Traditionibus, non mundis pactis, transfreruntur rerum dominii.*

10. Tradition is either real, where the *ipsa corpora* of moveables are put into the hands of the receiver; or symbolic, which is used where the thing is incapable of real delivery, or even when actual delivery is only inconvenient. Where the possession or custody of the subject has been before with him to whom the property is to be transferred, there is no room for tradition.

11. Possession, which is essential both to the acquisition and enjoyment of property, is defined, the detention of a thing, with a design or *animus* in the detainer of holding it as his own. It cannot be acquired by the sole act of the mind, without real detention; but, being once acquired, it may be continued *solo animo.* Possession is either natural, or civil. Natural possession is, when one possesses by himself: thus, we possess lands by cultivating them and reaping their fruits, houses by inhabiting them; moveables by detaining them in our hands. Civil possession is our holding the thing, either by the sole act of the mind, or by the hands of another who
who holds it in our name: thus, the owner of a thing lent possesses it by the borrower; the proprietor of lands, by his tacksman, trustee, or steward, &c. The same subject cannot be possessed entirely, or in se solidum, by two different persons at one and the same time: and therefore possession by an act of the mind ceases, as soon as the natural possession is so taken up by another, that the former possessor is not suffered to re-enter. Yet two persons may, in the judgment of law, possess the same subject, at the same time, on different rights: thus, in the case of a pledge, the creditor possesses it in his own name, in virtue of the right of impositions: while the proprietor is considered as possessing, in and through the creditor, in so far as is necessary for supporting his right of property. The same doctrine holds in inferencers, tacksman, and, generally, in every case where there are rights affecting a subject distinct from the property.

12. A bona fide possessor is he who, though he is not really proprietor of the subject, yet believes himself proprietor on probable grounds. A male fide possessor is he who knows, or is presumed to know, that what he possesses is the property of another. A possessor bona fide acquired right, by the Roman law, to the fruits of the subject possessed, that had been reaped and consumed by himself, while he believed the subjects his own. By our customs, perception alone, without consumption, secures the possessor: nay, if he has sown the ground, while his bona fides continued, he is entitled to reap the crop, proprio curam et cultura. But this doctrine does not reach to civil fruits, e. g. the interest of money, which the bona fide receiver must restore, together with the principal, to the owner.

13. Bona fides necessarily causeth the conscientia rei alienae in the possessor, whether such consciousness should proceed from legal interpellation, or private knowledge. Male fides is sometimes induced by the true owner's bringing his action against the possessor, sometimes not till litigation, and, in cases uncommonly favourable, not till the sentence be pronounced against the possessor.

14. The property of moveable subjects is presumed by the bare act of possession, until the contrary be proved; but possession of an immovable subject, though for a century of years together, if there is no seizin, does not create even a presumptive right to it: Nulla sesina, nulla terra. Such subject is considered as caducary, and so accresces to the sovereign. Where the property of a subject is contested, the lawful possessor is entitled to continue his possession, till the point of right be discussed; and, if he has lost it by force or stealth, the judge will, upon summary application, immediately restore it to him.

15. Where a possessor has several rights in his person, affecting the subject possessed, the general rule is, that he may aspire his possession to which of them he pleases; but one cannot prescribe his possession to a title other than that on which it commenced, in prejudice of him from whom his title flowed.

Sect. II. Of Heritable and Moveable Rights.

1. For the better understanding the doctrine of this title, it must be known, that by the law of Scotland, and indeed of most nations of Europe since the intro...

2. All rights of, or affecting lands, under which are divisions of comprehended houses, mills, fishings, teinds; and all rights into rights of subjects that are fundo unica, whether composed by seizin or not, are heritable ex sua natura. On the other hand, every thing that moves itself or can be moved, and in general whatever is not united to land, is moveable; as household furniture, corus, cattle, cash, arrears of rent and of interest, even though they should be due on a right of annuellment; for though the arrears last mentioned are secured on land, yet being presently payable, they are considered as cash.

3. Debts, (nomina debitorum), when due by bill, promissory note, or account, are moveable. When constituted by bond, they do not all fall under any one head; but are divided into heritable and moveable, by the following rules. All debts constituted by bond bearing an obligation to inflect the creditor in any heritable subject in security of the principal sum and annuellment, or annuellment only, are heritable; for they not only carry a yearly profit, but are secured upon land.

4. Bonds merely personal, though bearing a clause of interest, are, by act 1667, declared to be moveable as to succession; i.e. they go, not to the heir, but to the next of kin or executors; but they are heritable with respect to the fisk, and to the rights of husband and wife; that is, though by the general rule, moveable rights fall under the communion of goods consequent upon marriage, and the moveables of denominated persons fall to the crown or fisk by single escheat, yet such bonds do neither, but are heritable in both respects.

5. Bonds taken payable to heirs and assigns, excluding executors, are heritable in all respects, from the destination of the creditor. But a bond, which is made payable to heirs, without mention of executors, descends, not to the proper heir in heritage, though heirs are mentioned in the bond, but to the executor; for the word heir, which is a generic term, points out him who is to succeed by law in the right; and the executor, being the heir in mobilibus, is considered as the person to whom such bond is taken payable. But where a bond is taken to heirs male, or to a series of heirs, one after another, such a bond is heritable, because its destination necessarily excludes executors.

(1) By the proprietor's destination. Thus a jewel, able rights or any other moveable subject, may be provided to the become heir, from the right competent to every proprietor to dispose his property on whom he pleases. (2) Moveable rights may become heritable, by the supervening of an heritable security: Thus, a sum due by a personal bond becomes heritable, by the creditor's accepti
Rights of Persons not having an heritable right for securing it, or by adjudging it upon it.

7. Heritable rights do not become moveable by necessary moveable securities; the heritable right being in such case the *jus mobilius*, which draws the other after it.

8. Certain subjects partake, in different respects, of the nature both of heritable and moveable. Personal bonds are, by the above cited act 1667, moveable in respect of succession; but heritable as to the fish, and the rights of husband and wife. All bonds, whether merely personal, or even heritable, on which no seizure has followed, may be affected at the suit of creditors, either by adjudication, which is the diligence proper to heritage, or by arrestment, which is peculiar to moveables. Bonds excluding executors, though they descend to the creditor's heir, are payable by the debtor's executors, without relief against the heir; since the debtor's succession cannot be affected by the destination of the creditor.

9. All questions, whether a right be heritable or moveable, must be determined according to the condition of the subject at the time of the ancestor's death. If it was heritable at that period, it must belong to the heir; if moveable, it must fall to the executor, without regard to any alterations that may have affected the subject in the intermediate period between the ancestor's death and the competition.

I. HERITABLE RIGHTS.

SECT. III. Of the Constitution of Heritable Rights by Charter and Scin

1. Heritable rights are governed by the feudal law, which owed its origin, or at least its first improvements, to the Longobards; whose kings, upon having penetrated into Italy, the better to preserve their conquests, made grants to their principal commanders of great part of the conquered provinces, to be again subdivided by them among the lower officers, under the conditions of fidelity and military service.

2. The feudal constitutions and usages were first reduced into writing about the year 1150, by two lawyers of Milan, under the title of *Constatudines Feudorum*. None of the German emperors appear to have expressly confirmed this collection by their authority: but it is generally agreed, that it had their tacit approbation, and was considered as the customary feudal law of all the countries subject to the empire. No other country has ever acknowledged these books for their law; but each state has formed to itself such a system of feudal rules, as best agreed with the genius of its own constitution. In feudal questions, therefore, we are governed, in the first place, by our own statutes and customs; where these fail us, we have regard to the practice of neighbouring countries, if the genius of their laws appears to be the same with ours; and should the question still remain doubtful, we may have recourse to those written books of the feuds, as to the original plan on which all feudal systems have proceeded.

3. This military grant got the name, first of *beneficium*, and afterwards of *feudum*; and was defined a

gratuitous right to the property of lands, made under the conditions of fealty and military service, to be performed to the grantor by the receiver; the radical right of the lands still remaining in the greater. Under lands, in this definition, are comprehended all rights or subjects so connected with land, that they are deemed a part thereof; as houses, mills, fisheries, jurisdictions, patronages, &c. Though feus in their original nature were gratuitous, they soon became the subject of commerce; services of a civil or religious kind were frequently substituted in place of military; and now, of a long time, services of every kind have been entirely dispensed with, in certain feudal tenures. He who makes the grant is called the superior, and he who receives it the vassal. The subject of the grant is commonly called the feu; though that word is at other times, in our law, used to signify one particular tenure. (See Sect. iv. 2.) The interest retained by the superior in the feu is styled *dominium directum*, or the superiority; and the interest acquired by the vassal, *dominium utile*, or the property. The word *feu* is promiscuously applied to both.

4. Alloidal goods are opposed to feus; by which are *alloidal* understood goods enjoyed by the owner, independent goods of a superior. All moveable goods are alloidal; lands only are so when they are given without the condition of fealty or homage. By the feudal system, the sovereign, who is the fountain of feudal rights, reserves to himself the superiority of all the lands of which he makes the grant; so that, with us, no lands are alloidal, except those of the king's own property, the superiorities which the king reserves in the property-lands of his subjects, and manors and glebes, the right of which is completed by the procuracy's designation, without any feudal grant.

5. Every person who is in the right of an immovable, who can able subject, provided he has the free administration grant feu of his estate, and is not debauched by statute, or by the dali rights. nature of his right, may dispose of it to another. Nay, a vassal, though he has only the *dominium utile*, can sublet his property to a subvassal by a subalterm right, and thereby raise a new *dominium directum* in himself, subordinate to that which is in his superior; and so in infinitum. The vassal who thus sublets is called the subvassal's immediate superior, and the vassal's superior is the subvassal's mediate superior.

6. All persons who are not disabled by law, may acquire and enjoy feudal rights. Papists cannot purchase receive a land estate by any voluntary deed. Aliens, who owe allegiance to a foreign prince, cannot hold a feudal right without naturalization: and, therefore, where such privilege was intended to be given to favoured nations or persons, statutes of naturalization were necessary, either general or special; or, at least, letters of naturalization by the Sovereign.

7. Every heritable subject capable of commerce, What real may be granted in feu. From this general rule are exceptions accepted. 1. The unenfranchised property of the crown, which is not alienable without a special dissolution in parliament. 2. Tailzied lands, which are devised under condition that they shall not be aliened. 3. An estate in *hereditate jacenti* cannot be effectually aliened by the heir-apparent (i.e. not entitled); but such alienation becomes effectual upon his death, the supervening
right accruing in that case to the purchaser; which is a rule applicable to the alienation of all subjects not belonging to the vendor at the time of the sale.

8. The feudal right, or, as it is called, _vincivendae_, is constituted by charter and seisin. By the charter, we understand that writing which contains the grant of the feudal subject to the vassal, whether it is executed in the proper form of a charter, or of a dispensation. Charters by subject superiors are granted, either, 1. A _me de superiori_ vassal, when they are to be helden, not of the granter himself, but of his superior. This sort is called a public holding, because vassals were in ancient times publicly received in the superior's court before the _pars curae_ or co-vassals. Or, 2. _De me_, where the lands are to be helden of the granter. These were called sometimes _base rights_ from _de me_, lower; and sometimes private, because, before the establishment of our records, they were easily concealed from third parties; the nature of all which will be more fully explained, Sect. vii. An original charter is that by which the fee is first granted: A charter by progress is a renewed disposition of that fee to the heir or assignee of the vassal. All doubtful clauses in charters by progress ought to be construed agreeably to the original grant; and all clauses in the original charter are understood to be implied in the charters by progress, if there be no express alteration.

9. The first clause in an original charter, which follows immediately after the name and designation of the granter, is the narrative or recital, which expresses the causes inductive of the grant. If the grant be made for a valuable consideration, it is said to be onerous; if for love and favour, gratuitous. In the dispositive clause of a charter, the subjects made over are described either by special boundaries or march stones, (which is called a _bounding charter_), or by such other characters as may sufficiently distinguish them. A charter regularly carries right to no subjects but what are contained in this clause, though they should be mentioned in some other clause of the charter. It has been however found, that a right to salmon fishing was carried by a clause _cum piscarum in the tenement of a charter_, the same having been followed with possession.

10. The clause of _tenendas_ (from its first words _tenendas predictas terras_) expresses the particular tenure by which the lands are to be helden. The clause of _redendo_ (from the words _redendo inas annus_) specifies the particular duty or service which the vassal is to pay or perform to the superior.

11. The clause of _warrandice_ is that by which the granter obliges himself that the right conveyed shall be effectual to the receiver. Warrandice is either personal or real. _Personal_ warrandice, where the granter is only bound personally, is either, 1. _Simplici_, that he shall grant no deed in prejudice of the right; and this sort, which is confined to future deeds, is implied even in donations. 2. Warrandice _from fact and deed_, by which the granter warrants that the right whereby he has been, nor shall be, hurt by any fact of his. Or, 3. _Absolute_ warrandice _contra omnes mortales_, whereby the right is warranted against all legal defects in it which may carry it off from the receiver either wholly or in part. Where a sale of land proceeds upon an _onerous_ cause, the granter is liable in absolute warrandice, though no warrandice be expressed; but in _signationis_ to debts or decrees, no higher warrandice than from fact and deed is implied.

12. Gratuitous grants by the crown imply no warrandice; and though warrandice should be expressed, that clause is ineffectual, from a presumption that it has been made by the negligence of the crown's officers. But where the crown makes a grant, _jure coram_, but for an adequate price, the sovereign is in the same case with his subjects.

13. Absolute warrandice, in case of eviction, affords effects of an action to the grantee against the granter, for making warrandice up to him all that he shall have suffered through dices, the defect of the right; and not simply for his indemnification, by the granter's repayment of the price to him. But as warrandice is penal, and consequently _stricti juris_, it is not easily presumed, nor is it incurred from every light servitude that may affect the subject; far less does it extend to burdens which may affect the subject posterior to the grant, nor to those imposed by public statute, whether before or after, unless specially warranted against.

14. Real warrandice is either, 1. _Express_, whereby, real warrandice in security of the lands principally conveyed, other real warrandice lands, called _warrandice lands_, are also made over to, to which the receiver may have recourse in case the principal lands be evicted. Or, 2. _Tacit_, which is constituted by the exchange or excommision of one piece of land for another; for, if the lands exchanged are carried off from either of the parties, the law itself, without any pactio, gives that party immediate recourse upon his own first lands, given in exchange for the lands evicted.

15. The charter concludes with a _precept of seisin_. Precept of which is the command of the superior granter of the seisin, right to his bailie, for giving seisin or possession to the vassal, or his attorney, by delivering to him the proper symbols. Any person, whose name may be inserted in the blank left in the precept for that purpose, can execute the precept as bailie; and whoever has the precept of seisin in his hands, is presumed to have a power of attorney from the vassal for receiving possession in his name.

16. A seisin is the instrument or attestation of a no-instrumentary, that possession was actually given by the superior of seisin, or his bailie, to the vassal or his attorney; which is considered as so necessary a solemnity, as not to be suppliable, either by a proof of natural possession, or even of the special fact that the vassal was duly entered to the possession by the superior's bailie.

17. The symbols by which the delivery of possession is expressed, are, for lands, earth and stone; for _in seisin_ rights of annal right payable forth of land, it is also solemn earth and stone, with the addition of a penny money: for _in seisin_ rights of corn; for jurisdictions, the book of the court; for patronages, a pew book, and the keys of the church; for fisheries, net and cable; for mills, clap and hopper, &c. The seisin must be taken upon the ground of the lands, except where there is a special dispensation in the charter from the crown.

18. All seisins must be registered within 60 days after their date, either in the general register of seisins of _seisin_ at Edinburgh, or in the register of the particular shire.
Law of Scotland.

19. Unregistered seisins are ineffectual against third parties, but are valid against the grantees and their heirs. Seisins regularly recorded, are preferable not according to their own dates, but the dates of their registration.

20. Seisin necessarily supposes a superior by whom it is given; the right therefore which the sovereign, who acknowledges the superior, has over the whole lands of Scotland, is constituted jure coronae without seisin. In several parcels of land that lie contiguous to one another, one seisin serves for all, unless the right of the several parcels be either held by different superiors, or derived from different authors, or enjoyed by different tenures under the same superior. In discontinuous lands, a separate seisin must be taken on every parcel, unless the sovereign has united them into one tenantry by a charter of union; in which case, if there be no special place expressed, a seisin taken on any part of the united lands will serve for the whole, even though they be situated in different shires. The only effect of union is, to give the discontinuous lands the same quality as if they had been contiguous or naturally united; union, therefore, does not take off the necessity of separate seisins, in lands held by different tenures, or the rights of which flow from different superiors, these being incapable of natural union.

21. The privilege of barony carries a higher right than union does, and consequently includes union in it as the lesser degree. This right of barony can neither be given, nor transmitted, unless by the crown; but the quality of simple union, being once conferred on lands by the sovereign, may be communicated by the vassal to a subvassal. Though part of the united lands or erected into a barony be sold by the vassal to be held a me, the whole union is not thereby dissolved: what remains unsold retains the quality.

22. A charter, not perfected by seisin, is a right merely personal, which does not transfer the property (see No. clxxiii. 1.) and a seisin of itself bears no faith without its warrant: It is the charter and seisin joined together that constitutes the feudal right, and secures the receiver against the effect of all posterior seisins, even though the charters on which they proceed should be prior to his.

23. No quality which is designed as a lien or real burden on a feudal right, can be effectual against singular successors, if it be not inserted in the investiture. If the creditors in the burden are not particularly mentioned, the burden is not real; for no perpetual unknown encumbrance can be created upon lands. Where the right itself is granted with the burden of the sum therein mentioned, or where it is declared void if the sum be not paid against a day certain, the burden is real; but where the receiver is simply obliged by his acceptance to make payment, the clause is effectual only against him and his heirs.

Sect. IV. Of the several kinds of Holding.

1. Feudal subjects are chiefly distinguished by their different manners of holding, which were either word, ward, blanch, feu, or burgage. Ward-holding, (which is now abolished by 20 Geo. II. c. 50.) was that which was granted for military service. Its proper reddendo was held, or services used and wont; by which last was meant the performance of service whenever the superior's occasions required it. As all feudal rights were originally held by this tenure, ward-holding was in due professed. Hence, though the reddendo had contained some special service or yearly duty, the holding was presumed ward, if another holding was not particularly expressed.

2. feu-holding is that whereby the vassal is obliged to pay to the superior a yearly rent in money or grain, and sometimes also in services proper to a farm, as ploughing, reaping, carrying, &c. This kind of tenure was introduced for the encouragement of agriculture, the improvement of which was considerably obstructed by the vassal's obligation to military service. It appears to have been a tenure known in Scotland as far back as leges burgorum.

3. Blanch-holding is that whereby the vassal is to

4. Burgage-holding is that, by which boroughs were held.

5. Feudal subjects, granted to churches, monasteries, &c. are said to be mortified, or granted ad manum mortuorum; either because all casualties must necessarily be lost to the superior, where the vassal is a corporation, which never dies; or because the property of these subjects is granted to a dead hand, which cannot transfer it to another. In lands mortified in times of poverty to the church, whether granted to prelates for the behoof of the church, or in parva olimmssimam; the only services payable by the vassals were prayers, and singing of masses for the souls of the deceased, which approaches nearer to blanch-holding than ward. The purposes of such grants having been, upon the Reformation, declared superstitious, the lands mortified were annexed to the crown: but mortifications to universities, hospitals, &c. were not affected by that annexion; and lands may, at this day, be mortified to any lawful purpose, either by blanch or by feu-holding.
L A W.

Sect. V. Of the Casualties due to the Superior.

1. The right of the superior continues unimpaired, notwithstanding the feudal grant, unless in so far as the dominium utile, or property, is conveyed to his vassal. The superiority carries a right to the services and annual duties contained in the redendo of the vassal's charter. The duty payable by the vassal is a debitum fundi, i.e. it is recoverable, not only by a personal action against himself, but by a real action against the land.

2. Besides the constant fixed rights of superiority, there are others which, because they depend upon uncertain events, are called casualties.

Ward-holding.

3. The casualties proper to a ward-holding, while that tenure subsisted, were ward, recognition, and marriage, which is now unnecessary to explain, as by the late statutes 20 and 25 Geo. II. for abolishing ward-holdings, the tenure of the lands helden ward of the crown or prince is turned into bland, for payment of one penny Scots yearly, si petatur tunc; and the tenure of those holden of subjects into feu, for payment of such yearly feu duty in money, victual, or cattle, in place of all services, as should be fixed by the court of session. And accordingly that court, by act of sedentum Feb. 8, 1749, laid down rules for ascertaining the extent of these feu duties. A full history of their casualties, and of the effects consequent upon their falling to the superior, will be found in Erskine's large Institute, B. 2. t. 5. § 5, et sequen.; to which the reader is referred.

Fen-holding.

4. The only casualty, or rather forfeiture, proper to fen-holding, is the loss or trespass of the feu right, by the neglect of payment of the feu duty for two full years. Yet where there is no conventional irritancy in the feu right, the vassal is allowed to purge the legal irritancy at the bar; that is, he may prevent the forfeiture, by making payment before sentence; but where the legal irritancy is fortified by a conventional, he is not allowed to purge, unless where he can give a good reason for the delay of payment.

Non-entry.

5. The casualties common to all holdings are non-entry, relief, livery, escheat, disclaimation, and purpresture. Non-entry is that casualty which arises to the superior out of the rents of the feudal subject, through the heirs neglecting to renew the investiture after his ancestor's death. The superior is entitled to this casualty, not only where the heir has not obtained himself infest, but where his return or infestment is set aside upon nullities. The heir, from the death of the ancestor, till he be cited by the superior in a process of a general declarator of non-entry, loses only the retourned duties of his lands, (see next parag.) and he forfeited these, though his delay should not argue any contempt of the superior, because the casualty is considered to fall, as a condition implied in the feudal right, and not as a penalty of transgression: but reasonable excuses are now admitted to liberate even from the retourned duties before citation.

6. For understanding the nature of retourned duties, it must be known, that there was a frequently a general valuation of all the lands in Scotland, aimed both for regulating the proportion of public subsidies, and for ascertaining the quantity of non-entry and relief duties payable to the superior; which appears, by a contract between K. Bruce and his subjects anno 1327, preserved in the library of the Faculty of Advocates, to have been settled at least as far back as the reign of Alexander III. This valuation became in the course of time, by the improvement of agriculture, and perhaps also by the heightening of the nominal value of our money, from the reign of Robert I. downwards to that of James III. much too low a standard for the superior's casualties; wherefore, in all services of heirs, the inquest came at last to take proof likewise of the present value of the lands contained in the brief (quantum nunc valent), in order to fix these casualties. The first was called the old, and the other the new, extant. Old and both extents were ordained to be specified in extents. All retours made to the chancery upon briefs of inquest; yet by the appellation of retourned duties in a question concerning casualties, the new extent is always understood. The old extent continued the rule for leasing public subsidies, till a tax was imposed by new proportions, by several acts made during the usurpation. By two acts of Cromwell's parliament, held at Westminster in 1656, imposing taxation in Scotland, the rates laid upon the several counties are precisely fixed. The subsidy granted by the act of convention 1667 was levied on the several counties, nearly in the same proportions that were fixed by the usurper in 1656; and the sums to which each county was subjected were subdivided among the individual landholders in that county, according to the valuations already settled, or that should be settled by the commissioners appointed to carry that act into execution. The rent fixed by these valuations is commonly called the valued rent; according to which the land tax and most of the other public burdens, have been levied since that time.

7. In feu holdings, the feu duty is retourned as the rent, because the feu duty is presumed to be, and truly was at first, the rent. The superior therefore of a feu-holding gets no non-entry, before citation in the general declarator; for he would have been entitled to the yearly feu duty, though the feu had been full, i.e. though there had been a vassal infest in the lands. The superior of teinds gets the fifth part of the retourned duty as non-entry, because the law considers teinds to be worth a fifth part of the rent. In rights of annuallent which are holden of the granter, the annuallenter becomes his debtor's vassal; and the annuallent contained in the right is retourned to the blanck or other duty contained in the right before declarator.

8. It is because the retourned duty is the presumed rent, that the non-entry is governed by it. If, therefore, no retour of the lands in non-entry can be produced, nor any evidence brought of the retourned duty, the superior is entitled to the real, or at least to the valued, rent, even before citation. In lands formerly helden ward of the king, the heir, in place of the retourned...
toured duties, is subjected only to the annual payment of one per cent. of the valued rent.

9. The heir, after he is cited by the superior in the action of general declarator, is subjected to the full rents till his entry, because his neglect is less excusable after citation. The decree of declarator, proceeding on this action, entitles the superior to the possession, and gives him right to the rents downward from the citation. As this sort of non-entry is properly penal, our law has always restricted it to the retoured duties, if the heir had a probable excuse for not entering.

10. Non-entry does not obtain in burgage holdings, because the incorporation of inhabitants holds the whole incorporated subjects of the king; and there can be no non-entry duty in lands granted to communities, because there the vassal never dies. This covers the right of particulars from non-entry: for if non-entry be excluded with regard to the whole, it cannot obtain with regard to any part. It is also excluded, as to a third of the lands, by the terce, during the widow’s life; and as to the whole of them, by the courtesy during the life of her husband. But it is not excluded by a precept of seisin granted to the heir till seisin be taken thereupon.

Relief.

11. RELIEF is that causality which entitles the superior to an acknowledgment or consideration from the heir for receiving him as vassal. It is called relief, because by the entry of the heir, his fee is relieved out of the hands of the superior. It is not due in feu-holdings flowing from subjects, unless where it is expressed in the charter by a special clause for doubling the feu duty at the entry of an heir; but in feu rights helden of the crown, it is due, though there should be no such clause in the charter. The superior can recover this causality, either by a poinding of the ground, as a debitum fundi, or by a personal action against the heir. In blanc and feu-holdings, where this causality is expressly stipulated, a year’s blanc or feu duty is due in name of relief, beside the current year’s duty payable in the name of blanc or feu farm.

Escheat.

12. ESCHEAT (from escoeur, to happen or fall) is that forfeiture which falls through a person’s being denounced rebel. It is either single or liferent. Single escheat, though it does not accrue to the superior, must be explained in this place, because of its coincidence with liferent.

Letters of horning.

13. After a debt is constituted either by a formal decree, or by registration of the ground of debt, which to the special effect of execution, is in law accounted a decree: the creditor may obtain letters of horning, issuing from the signet, commanding messengers to charge the debtor to pay or perform his obligation, within a day certain. Where horning proceeds on a formal decree of the session, the time indolged by law to the debtor is fifteen days; if upon a decree of the commission of teinds or admiral, it is ten; and upon the decrees of all inferior judges, fifteen days. Where it proceeds on a registered obligation, which specifies the number of days, that number must be the rule; and, if no precise number be mentioned, the charge must be given in fifteen days, which is the term of law, unless where special statute interposes; as in bills, upon which the debtor may be charged on six days.

14. The messenger must execute these letters (and indeed all summonses against the debtor, either personally or at his dwelling house; and, if he get not access to the house, he must strike six knocks at the gate, and thereafter affix to it a copy of his execution. If payment be not made within the days mentioned in the horning, the messenger, after proclaiming three oyes at the market cross of the head borough of the debtor’s domicile, and reading the letters there, blows three blasts with a horn, by which the debtor is understood to be proclaimed rebel to the king for contempt of his authority; after which, he must affix a copy of the execution to the market cross: This is called the publication of the diligence, or a denunciation at the horn. Where the debtor is not in Scotland, he shall be charged on sixty days, and denounced at the market cross of Edinburgh, and pier and shore of Leith.

15. Denunciation, if registered within 15 days, either in the sheriff’s books, or in the general register, increased after it the rebel’s single escheat, i.e. the forfeiture of his moveables to the crown. Persons denounced rebels have not a persona stans in judicio; they can neither sue nor defend in any action. But this incapacity being unfavourable, is personal to the rebel, and cannot be pleaded against his assignee.

16. Persons cited to the court of judicature may be persona stans in judicio; they are declared fugitives from the law. Single escheat falls, without denunciation, upon sentence of death pronounced in any criminal trial; and, by special statute, upon one’s being convicted of certain crimes, though not capital; as perjury, bigamy, defacement, breach of arrestment, and usury. By the late act abolishing ward-holdings, the casualties both of single and liferent escheat are discharged, when proceeding upon denunciation for civil debts; but they still continue, when they arise from criminal causes. All moveables belonging to the rebel at the time of his rebellion, (whether proceeding upon denunciation, or sentence in a criminal trial), and all that shall be afterwards acquired by him until relaxation, fall under single escheat.

17. The king never retains the right of escheat to himself, but makes it over to a dominitory, whose gift is not perfected till, upon an action of general declarator, it be declared that the rebel’s escheat has fallen to the crown by his denunciation, and that the right of it is now transferred to the purchaser by the gift in his favour. Every creditor therefore of the rebel, whose debt was contracted before rebellion, and who has used diligence before declarator, is preferable to the dominitory. But the escheat cannot be affected by any debt contracted, or by any voluntary deed of the rebel after rebellion.

18. The rebel, if he either pays the debt charged Letters for, or suspends the diligence, may procure letters of relaxation from the horn, which, if published in the same place, and registered 15 days thereafter in the same register with the denunciation, have the effect to restore
restore him to his former state; but they have no re-
spect to the moveables already fallen under es-
cheat, without a special clause for that purpose.

19. The rebel, if he continues unequalled for year
and day after rebellion, is construed to be civilly dead:
and therefore, where he holds any feudal right, his su-
priors, as being without a vassal, are entitled, each of
them, to the rents of such of the lands belonging to
the rebel as hold of himself, during all the days of the
rebel's natural life, by the customary of life of
escheat; except where the denunciation proceeds upon
treason or proper rebellion, in which case the escheat
fails to the king.

20. It is that estate only, to which the rebel has a
proper right of escheat in his own person, that falls un-
der his former escheat.

21. Though neither the superior nor his donatory
can enter into possession in consequence of this casualty,
all decree of declarator; yet that decree, being truly
declaratory, has a retrospective, and does not so properly
consist a new right, as declare the right formerly con-
stituted to the superior, by the civil death of his vassal.
Hence, all charters or heritable deeds, though granted
prior to the rebellion, and all adjudications, though led
upon debts contracted before that period, are ineffectual
against the customary of escheat, unless seizin be taken
thereon within year and day after the grantor's rebel-

22. Here, as in single escheat, no debt contracted
after rebellion can hurt the donatory, nor any voluntary
right granted after that period, though in security or
satisfaction of prior debts.

23. Declaration that casualty whereby a vassal
forfeits his whole feu to his superior, if he disowns
or declares himself, without ground, as any part of it.

24. All grants from the crown, whether charters,
gifts of casualties, or others, proceed on signatures
which pass the signet. When the king resided in Scot-
land, all signatures were superscribed by him; but, on
the accession of James VI. to the crown of England,
a charter or seal was made, having the king's name en-
graved on it, in pursuance of an act of the privy coun-

25. If lands held by the crown were to be con-
veyed, the charter passed, before the union of the
kingdoms in 1707, by the great seal of Scotland; and
now by a seal substituted in place thereof. Grants of
church dignities, during Episcopacy, passed also by
the great seal; and the commissions to all the principal
officers of the crown, as justices clerk, king's advocate,
solicitor, &c. do so at this day. All rights which sub-
jects may transmit by simple assignation, the king trans-
mits by the privy seal; as gifts of moveables, or of

26. Seals are to royal grants what subscription is to
their use. To rights derived from subjects, and give them authority; they serve also as a check to gifts procured (sub-
scriptione vel obrectione) by concealing the truth, or
expressing a falsehood; for, where this appears, the gift
may be stopped before passing the seals, though the signa-
ture should have been signed by the king. All rights
passing under the great or privy seal must be registered
in the registers of the great or privy seal respectively,
before ascribing the seal.

Sect. VI. Of the Right which the Vassal acquires by

1. Under the dominium utile which the vassal acquires

2. Proprietors are prohibited to bold dove-cots, un-
less their yearly rent, lying within two miles thereof,
extend to ten charlders of victual. A purchaser of lands,
with a dove-cot, is not obliged to pull it down, though
he should not be qualified to build one; but, if it be-
comes ruinous, he cannot rebuild it. The right of
brewing, though not expressed in the grant, is implied
in the nature of property; as are also the rights of fash-
ing, fowling, and hunting, in so far as they are not re-
strained by statute.

3. There are certain rights naturally consequent on Regalia

4. Salmons fishing is likewise a right understood to be

but
but 40 years possession thereof, where the lands are either erected into a barony, or granted with the general clause of fisheries, establishes the full right of the salmon fishing in the vassal. A charter of lands within which any of the king's forests lie, does not carry the property of such forest to the vassal.

5. All the subjects which were by the Roman law accounted res publicae, as rivers, highways, ports, &c. are, since the introduction of feus, held to be inter regalia, or in patronimio principis; and hence encroachment upon a highway is said to infringe property. No person has the right of a free port without a special grant, which implies a power in the grantor to levy anchorages and shore dues, and an obligation upon him to uphold the port in good condition. In this class of things, our forefathers reckoned fortalice, or small places of strength, originally built for the defence of the country, either against foreign invasions or civil commotions; but these now pass with the lands in every charter.

6. The vassal acquires right by his grant, not only to the lands specially contained in the charter, but to those that have been possessed 40 years as pertinent thereof. But, 1. If the lands in the grant are marked out by special limits, the vassal is circumscribed by the tenor of his own right, which excludes every subject without these limits from being pertinent of the lands. 2. A right possessed under an express infestment is preferable, ceteris paribus, to one possessed only as pertinent. 3. Where neither party is infest per expressum, the mutual promiscuous possession by both, of a subject as pertinent, resolves into a community of the subject possessed; but if one of the parties has exercised all the acts of property of which the subject was capable, while the possession of the other was confined to pasturage only, or to casting seal and divot, the first is to be deemed sole proprietor, and the other to have merely a right of servitude.

7. As barony is a nomen universalis, and unites the several parts contained in it into one individual right, the general conveyance of a barony carries with it all the different tenements of which it consists, though they should not be specially enumerated (and this holds, even, without exception into a barony, in lands that have been united under a special name). Hence, likewise, the possession by the vassal of the smallest part of the barony lands preserves to him the right of the whole.

8. The vassal is entitled, in consequence of his property, to levy the rents of his own lands, and to recover them from his tenants by an action for rent before his own court; and from all other possessors and intermitters, by an action of maims and duties before the sheriff. He can also remove from his lands, tenants who have no leases; and he can grant tacks or leases to others. A tack is a contract of location, whereby the use of land, or any other immovable subject, is set to the lessee or tacksman for a certain yearly rent, either in money, the fruits of the ground, or services. It ought to be reduced into writing, as it is a right concerning lands: tacks, therefore, that are given verbally, to endure for a term of years, are good against neither party for more than one year. An obligation to grant a tack is as effectual against the grantor as a formal tack. A liferenter having a temporary property in the fruits, may grant tacks to endure for the term of his own liferent.

9. The tacksman's right is limited to the fruit which sprung up annually from the subject set, either naturally, or by his own industry; he is not therefore entitled to any of the growing timber above ground, and far less to the minerals, coal, clay, &c. under ground, the use of which consumes the substance. Tacks are, like other contracts, personal rights in their own nature; and consequently ineffectual against singular successors in the lands; but, for the encouragement of agriculture they were, by act 1449, declared effectual to the tacksman for the full time of their endurance, into whose handssoever the lands might come.

10. To give a written tack the benefit of this statute, it must mention the special tack duty payable to the proprietor, which, though small, if it be not exonerated, secures the tacksman; and it must be followed by possession, which supplies the want of a seisin. If a tack does not express the terms of entry, the entry will commence at the next term after its date, agreeable to the rule, Quod purum debetur, praesenti die debetur. If he does not mention the ish, i.e. the term at which it is to determine, it is good for one year only; but, if the intention of parties to continue it for more than one year, should appear from any clause in the tack, (e.g. if the tacksman should be bound to certain annual payments,) it is sustained for two years as the minimum. Tacks granted to perpetuity, or with an indefinite ish, have not the benefit of the statute. Tacks of houses within borough do not fall within this act, it being customary to let these from year to year.

11. Tacks necessarily imply a delectus personae, a choice made by the settler of a proper person for his tenant. Hence the conveyance of a tack which is not granted to assignees, is ineffectual without the landlord's consent. A right of tack, though it be heritable, falls under the jus mariti, because it cannot be separated from the laboring cattle and implements of tillage, which are movable subjects. A tack, therefore, granted to a single woman, without the liberty of assigning, falls by her marriage; because the marriage, which is a legal conveyance thereof to the husband, cannot be annulled. This implied exclusion from assignees, at least, is limited to voluntary, and does not extend to necessary, assignments; as an adjudication of a tack by the tacksman's creditor: but a tack, expressly excluding assignees, cannot be carried even by adjudication. It was not a fixed point for a long time, whether a tenant could sublet without consent of the landlord; but the court of session, in a case which occurred a few years ago, denied the power of subsetting in the tenant. Liferent tacks, because they import a higher degree of right in the tacksman than tacks for a definite term, may be assigned, unless assignees be specially excluded.

12. If neither the settlor nor tacksman shall properly discover their intention to have the tack dissolved at the term fixed for its expiration, they are understood, or presumed, to have entered into a new tack upon the same terms with the former, which is called tacit refection; and continues till the landlord warns the tenant to remove, or the tenant renounces his tack to the landlord: this obtains also in the case of moveable tenants, who possess from year to year without written tacks.
tack, to remove at the site without warning, such obligation is, by the said act, declared to be a sufficient warrant for letters of horning; upon which, if the landlord charge his tenant forty days before the said Whitunday, the judge is authorized to eject him within six days after the term of removing expressed in the tack.

18. Actions of removing might, even before this act actions of of sedentary, have been pursued without any previous removing warning. (1.) Against vicious possessors, i.e. persons who seized the possession by force, or who, without any legal title, had intruded into it, after the last possessor had given it up. (2.) Against possessors who had a naked tenancy. (3.) Against tenants who had run in arrear of rent, during the currency of their racks. (4.) Against such as had sold their lands, and yet continued to possess after the term of the purchaser's entry. Upon the same ground, warning was not required, in removing against possessors of lervemented lands, after the death of the lerventer who died in the natural possession: but if he possessed by tenants, these tenants could not be disturbed in their possessions till the next Whitunday, that they might have time to look out for other farms; but they might be compelle to move at that term, by an action of removing, without warning.

19. A landlord's title in a removing, let it be ever so llime, cannot be brought under question by a tenant whose rack flows immediately from him; but, if he is to insist against tenants not his own, his right must be perfected by infestment, unless it be such as requires no infestment; as terce, &c.

20. The defender, in a removing, must (by act 1555) violent before offering any defence which is not instantly verisimosi, give security to pay to the setter the violent profits, if they should be awarded against him. These are so called, because the law considers the tenant's possession after the warning as violent. They are estimated, in tenements within borough, to double the rent; and in lands, to the highest profits the pursuer could have made of them, by possessing them either by a tenant or by himself.

21. If the action of removing shall be passed from, effect of or if the landlord shall, after using warning, accept of warning rent from the tenant, for any term subsequent to that of the removal, he is presumed to have changed his mind, and tacit relocation takes place. All actions of removing against the principal or original tacksman, and decrees thereupon, if the order be used, which is set forth supra (17), are, by the act of sederunt 1756, declared to be effectual against the assignees to the tack or subtenants.

22. The landlord has, in security of his tack-duty, hypothec, over and above the tenant's personal obligation, a tacit pledge or hypothec, not only on the fruits, but on the cattle pasturing on the ground. The corn, and other fruits are hypothecated for the rent of that year whereof they are the crop; for which they remain affected, though the landlord should not use his right for years together. In virtue of this hypothec, the landlord is entitled to a preference over any creditor, though he has actually used a poinding; except in the special case, that the poinding is executed after the term of payment, when the landlord can appropriate the crop for his payment, the poinder in such case being obliged
Law of Scotland.

23. The whole cattle on the ground considered as a quantity, are hypothecated for a year's rent, one after another successively. The landlord may apply this hypothec for payment of the past year's rent, at any time within three months from the last conventional term of payment, after which it ceases for that year. As the tenant may increase the subject of this hypothec, by purchasing oxen, sheep, &c. so he can impair it, by selling part of his stock; but if the landlord suspects the tenant's management, he may, by sequestration or pointing, make his right, which was before general upon the whole stock, special upon every individual. A superior has also a hypothec for his feud-duty, of the same kind with that just explained.

24. In tacks of houses, breweries, shops, and other tenements which have no natural fruits, the furniture, and other goods brought into the subject set are hypothecated to the landlord for one year's rent. But the tenant may by sale impair this hypothec, as he might that of cattle in rural tenements; and indeed, in the particular case of a shop, the tenant rents it for no other purpose than as a place of sale.

SECT. VII. OF THE TRANSMISSION OF RIGHTS, BY CONFIRMATION AND RESIGNATION.

1. A vassal may transmit his feu either to universal successors, as heirs; or to singular successors, i.e. those who acquire by gift, purchase, or other singular title. This last sort of transmission is either voluntary, by disposition; or necessary, by adjudication.

2. By the first feudal rules, no superior could be compelled to receive any vassal in the lands, other than the heir expressed in the investiture; for the superior alone had the power of ascertaining to what order of heirs the fee granted by himself was to descend. But this right of refusal in the superior did not take place, (1.) In the case of creditors appraisers or adjudgers, whom superiors were obliged to receive upon payment of a year's rent (1639. c. 37. 1672. c. 19.) (2.) In the case of purchasers of bankrupt estates, who were put on the same footing with adjudgers, by 1690. c. 20. The crown refuses no voluntary disposition, on his paying a composition to the exchequer of a sixth part of the valued rent. Now, by 20 Geo. II. superiors are directed to enter all singular successors (except incorporations) who shall have got from the vassal a disposition, containing procuratory of resignation: they always receiving the fees or casualties that law entitles them to on a vassal's entry, i.e. a year's rent (A).

3. Base rights, i.e. dispossession to be holde of the disperser, are transmissions only of the property, the superiority remaining as formerly. As this kind of right might, before establishing the registers, have been kept quite concealed from all but the grantor and receiver, a public right was preferable to it, unless clothed with possession: but as this distinction was no longer necessary after the establishment of the records, all infestments are declared preferable, according to the dates of their several registrations; without respect to the former distinction of base and public, or of being clothed and not clothed with possession.

4. Public rights, i.e. dispossession to be holde of the public grantor's superior, may be perfected either by confirmation or resignation; and therefore they generally contain both precept of seisin and procuratory of resignation. When the receiver is to complete his right in the first way, he takes seisin upon the precept: but such seisin is ineffectual without the superior's confirmation; for the dispence cannot be deemed a vassal till the superior receive him as such, or confirm the holding. By the usual style in the transmission of lands, the disposition contains an obligation and precept of infestment, both a me and de me, in the option of the dispence; upon which, if seisin is taken indefinitely, it is construed in favour of the dispence to be a base infestment, because a public right is null without confirmation: but if the receiver shall afterwards obtain the superior's confirmation, it is considered as if it had been from the beginning a public right.

5. Where two several public rights of the same subject are confirmed by the superior, their preference is in confusion governed by the dates of the confirmations, not of the infestments confirmed; because it is the confirmation which completes a public right.

6. Though a public right becomes, by the super-page confirmation, valid from its date; yet if any impediment intervene between that period and the confirmation, to hinder the two from being conjoined, e.g. if the grantor of a public right should afterwards grant a base right to another, upon which seisin is taken before the superior's confirmation of the first, the confirmation will have effect only from its own date; and consequently the base right first completed will carry the property of the lands preferable to the public one.

7. Resignation is that form of law, by which a vassal surrenders his feu to his superior; and it is either an act of perpemum remanentia, or in favorem. In resignations ad remanentia, where the feu is resigned, to the effect that it may remain with the superior, the superior, who before had the superiority, acquires, by the resignation, the property also of the lands resigned: and as his infestment in the lands still subsisted, notwithstanding the right by which he had given his vassal the property; therefore, upon the vassal's resignation, the superior's

(A) It was long matter of doubt how this composition due to the superior upon the entry of singular successors should be regulated. The matter at last received a solemn decision; finding that the superior is entitled, for the entry of singular successors, in all cases where such entries are not taxed, to a year's rent of the subject, whether lands or houses, as the same are set, or may be set at the time; deducting the feu-duty and all public burdens, and likewise all annual burdens imposed on the lands by consent of the superior, with all reasonable annual repairs to houses and other perishable subjects.
8. Resignations in favor are made, not with an intention that the property resigned should remain with the superior, but that it should be again given by him, in favor either of the resigner himself, or of a third party; consequently the fee remains in the resigner, till the person in whose favor resignation is made gets his right from the superior perfected by seisin. And because resignations in favor are but incomplete personal deeds, our law has made no provision for recording them. Hence, the first seisin on a second resignation is preferable to the last seisin upon the first resignation; but the superior, accepting a second resignation, whereupon a prior seisin may be taken in prejudice of the first resignatory, is liable in damages.

9. By our former decisions, one who was vested with a personal right of lands, i.e. a right not completed by seisin, effectually divested himself by disposing it to another; after which no right remained in the dispositor, which could be carried by a second disposition, because a personal right, is no more than a just obligatio, which may be transferred by any deed sufficiently expressing the will of the grantor. But this doctrine, at the same time that it rendered the security of the records extremely uncertain, was not truly applicable to such rights as required seisin to complete them; and therefore it now obtains, that the grantor even of a personal right of lands is not so divested by conveying the right to one person, but that he may effectually make it over afterwards to another; and the preference between the two does not depend on the dates of the dispositions, but on the priority of the seisins following upon them.

Sect. VIII. Of Redeemable Rights.

1. An heritable right is said to be redeemable, when it contains a right of reversion, or return, in favour of the person from whom the right flows. Reversions are either legal, which arise from the law itself, as in adjudications, which law declares to be redeemable within a certain term after their date; or conventional, which are constituted by the agreement of parties, as in wadsets, rights of annuallent, and rights in security. A wadset (from wad or pledge) is a right, by which lands, or other heritable subjects, are impignorated to the proprietor to his creditor in security of his debt; and, like other heritable rights, is perfected by seisin. The debtor, who grants the wadset, and has the right of reversion, is called the reverser; and the creditor, receiver of the wadset, is called the wadsetter.

2. Wadsets, by the present practice, are commonly made out in the form of mutual contracts, in which one party sells the land, and the other grants the right of reversion. When the right of reversion is thus incorporated in the body of the wadset, it is effectual without registration; because the singular successor in the wadset is, in that case, sufficiently certified of the reversion, though it be not registered, by looking into his own right, which bears it in gremio. But where
7. After a decree of declarator is obtained, by which the lands are declared to return to the debtor, the consigned money, which comes in place of the lands, becomes the wadsetter's, who therefore can charge the consignatory upon letters of hormal to deliver it up to him; but, because the reverser may, at any time before decree, pass from his order, as one may do from any other step of diligence, the consigned sums continue to belong to the reverser, and the wadsetter's interest in the wadset continues inheritable till that period.

8. If the wadsetter chooses to have his money rather than the lands, he must require from the reverser, under form of instrument, the sums due by the wadset, in terms of the right. The wadset-sums may be heritable, notwithstanding requisition, which may be passed from the wadsetter even after the reverser has consigned the redemption money in consequence thereof.

Wadsets

9. Wadsets are either proper or improper. A proper wadset is that whereby it is agreed, that the use of the land shall go for the use of the money; so that the wadsetter takes his hazard of the rents, and enjoys them without accounting, in satisfaction, or in solutum of his interest.

10. In an improper wadset, the reverser, if the rent should fall short of the interest, is taken bound to make up the deficiency; if it amounts to more, the wadsetter is obliged to impute the excess over the principal sum paid from the adventitious profits. And, as soon as the whole sums, principal, and interest, are extinguished by the wadsetter's possession, he may be compelled to renounce, or divest himself in favour of the reverser.

11. If the wadsetter be entitled by his right to enjoy the rents without accounting, and if at the same time the reverser be subjected to the hazard of their deficiency, such contract is justly declared usurious: and also in all proper wadsets wherein any unreasonable advantage has been taken of the debtor, the wadsetter must (by act 1661), during the non-requisition of the sum lent, either quit his possession to the reverser, upon his giving security to pay the interest, or subject himself to account for the surplus rents, as in improper wadsets.

12. Infeñments of annualrent, the nature of which has been explained, are also redeemable rights. A right of annualrent does not carry the property of the lands; but it creates a real nexum or burden upon the property, for payment of the interest or annualrent contained in the right; and consequently the bygone interests due upon it are debita fundi. The annualrenter may therefore either insist in a real action for obtaining letters of poinding the ground, or sue the tenant in a personal action towards the payment of his past interest: and in a competition for those rents, the annualrenter's preference will not depend on his having used a poinding of the ground, for his right was completely by the seisin; the power of poinding the ground, arising from that antecedent right, is mere facultas, and need not be exercised, if payment can be otherwise got.

As it is only the interest of the sum lent which is a burden upon the lands, the annualrenter, if he wants his principal sum, cannot recover it either by poinding or by a personal action against the debtor's tenants; but must demand it from the debtor himself, on his personal obligation in the bond, either by requisition, or by a charge of letters of hormal, according as the right is drawn.

13. Rights of annualrent, being servitudes upon the property, and consequently consistent with the right of property in the debtor, may be extinguished without resignation.

14. Infeñments in security are another kind of rights of deemable rights (now frequently used in place of rights security. of annualrent), by which the receivers are infed in the lands themselves, and not simply in an annualrent forth of them, for security of the principal sums, interest, and penalty, contained in the rights. If an infeñment in security be granted to a creditor, be may thereupon enter into the immediate possession of the lands or annualrent for his payment. They are extinguished as rights of annualrent.

15. All rights of annualrent, rights in security, and generally whatever constitutes a real burden on the fee, may be the ground of an adjudication, which is preferable to all adjudications, or other diligences, intervening between the date of the right and of the adjudication deduced on it; not only for the principal sum contained in the right, but also for the whole past interest contained in the adjudication. This preference arises from the nature of real debts, or debita fundi: but in order to obtain it for the interest of the interest accumulated in the adjudication, such adjudication must proceed on a process of poinding the ground.

SEC. IX. Of Servitudes.

1. Servitude is a burden affecting lands, or rather heritable subjects, whereby the proprietor is either restrained from the full use of what is his own, or is servitude. obliged to suffer another to do something upon it. Servitudes are either natural, legal, or conventional. Nature itself may be said to constitute a servitude upon inferior tenements, whereby they must receive the water that falls from those that stand on higher ground. Legal servitudes are established by nature or custom, from considerations of public policy; among which may be numbered the restraints laid upon the proprietors of tenements within the city of Edinburgh. There is as great a variety of conventional servitudes, as there are ways by which the exercise of property may be restrained by action in favour of another.

2. Conventional servitudes are constituted, either by grant, where the will of the party burdened is expressed in writing: or by prescription, where his consent is presumed from his acquiescence in the burden for 40 years. A servitude constituted by writing, or grant, is not effectual against the grantor's singular successor, unless the grantee has been in the use or exercise of his right: but they are valid against the grantor and his heirs even without use. In servitudes that may be acquired by prescription, 40 years exercise of the rights is sufficient, without any title in writing, other than a charter and seisin of the lands to which the servitude is claimed to be due.

3. Servitudes constituted by grant are not effectual,
in a question with the superior of the tenements burdened with the servitude, unless his consent be absolute; for a superior cannot be hurt by his vassal's deed: but where the servitude is acquired by prescription, the consent of the superior whose right afforded him a good title to interrupt it, is implied. A servitude by grant, though followed only by a partial possession, must be governed, as to its extent, by the tenor of the grant; but a servitude by prescription is limited by the measure or degree of the use had by him who prescribes: agreeable to the maxim, Tantum prescriptum, quantum possessum.

4. Servitudes are either preial or personal. Preial servitudes are burdens imposed upon one tenement, in favour of another tenement. That to which the servitude is due is called the dominant, and that which owes it is called the servient tenement. No person can have right to a preial servitude, if he is not proprietor of some dominant tenement that may have benefit by it; for that right is annexed to a tenement, and so cannot pass from one person to another, unless some tenement goes along with it.

5. Preial servitudes are divided into rural servitudes, or of lands; and urban servitudes, or of houses. The rural servitudes of the Romans were iter, actus, via, aquaeductus, aqua estoites, and jus posseendi pecor. Similar servitudes may be constituted with us, of a foot-road, horse-road, cart-road, damps and aqueducts, watering of cattle, and pastureage. The right of a highway is not a servitude constituted in favour of a particular tenement, but is a right common to all travellers. The care of high-ways, bridges, and ferries, is committed to the sheriffs, justices of peace, and commissioners of supply in each shire.

6. Common pastureage, or the right of feeding one's cattle upon the property of another, is sometimes constituted by a general clause of pastureage in a charter or disposition, without mentioning the lands burdened; in which case, the right comprehends whatever had been formerly appropriated to the lands disposed of the granter's own property, and likewise all pastureage due to them out of other lands. When a right of pastureage is given to several neighbouring proprietors, on a moor or common belonging to the granter, indefinite as to the number of cattle to be pastured, the extent of their several rights is to be proportioned according to the number that each of them can foster in winter upon his own dominant tenement.

7. The chief servitudes of houses among the Romans were those of support, viz. tigern innimissenda, and oneris ferendi. The first was the right of fixing in our neighbour's wall, a joist or beam from our house: the second was that of resting the weight of one's house upon his neighbour's wall.

8. With us, where different floors or stories of the same house belong to different persons, as is frequent in the city of Edinburgh, the property of the house cannot be said to be entirely divided; the roof remains a common roof to the whole, and the area on which the house stands supports the whole; so that there is a communication of property, in consequence of which the proprietor of the ground floor must, without the constitution of any servitude, uphold it for the support of the upper, and the owner of the highest story must uphold that as a cover to the lower. When the high-
est is divided into garrets among the several proprietors, each proprietor is obliged, according to this rule, to uphold that part of the roof which covers his own garret.

2. No proprietor can build, so as to throw the rain water falling from his own house, immediately upon his neighbour's ground, without a special servitude, which is called of stillidice; but, if it falls within his own property, though at the smallest distance from the march, the owner of the inferior tenement must receive it.

10. The servitudes altius non tollendi, et non officiendi luminum vel prospectui, restrain proprietors from raising their houses beyond a certain height, or from making any building whatsoever that may hurt the light or prospect of the dominant tenement. These servitudes cannot be constituted by prescription alone; for, though a proprietor should have his house ever so low, or should not have built at all upon his grounds for 40 years together, he is presumed to have so for his own conveniency or profit; and therefore cannot be barred from afterwards building a house on his property, or raising it to what height he pleases, unless he be tied down by his own consent.

11. We have two preial servitudes to which the servitude Romans were strangers, viz. that of fuel or fuel and divot, and of thirlage. The first is a right, by which the owner of the dominant tenement may turn up peats, turf, fuel, or divots, from the ground of the servient, and carry them off either for fuel, or thatch, or the other uses of his own tenement.

12. Thirlage is that servitude, by which lands are thircle astricted, or thirled, to a particular mill; and the possessors bound to grind their grain there, for payment of certain multures and sequels as the agreed price of grinding. In this servitude, the mill is the dominant tenement and the lands astricted (which are called also the third or sucken) the servient. Multure is the quantity of grain or meal payable to the proprietor of the mill, or to the multerer his taskman. The sequels are the small quantities given to the servants, under the name of knaveship, bannock, and lock or growen. The quantities paid to the mill by the lands not astricted, are generally proportioned to the value of the labour, and are called out-town or out-sucken multures; but those paid by the thrill are ordinarily higher, and are called in-town or in-sucken multures.

13. Thirlage may be constituted by a laudholder, when, in the disposition of certain lands, he astrights them to his own mill; or when in the disposition of a mill, he astrights his own lands to the mill disposed; or when in letting his lands, he makes it a condition in the tacks. The grant of a mill with the general charge of multures, without specifying the lands astricted, conveys the thirlage of all the lands formerly astricted to that mill, whether they were the property of the granter, or of a third party.

14. A less formal constitution serves to astright barony lands to the mill of the barony, than is necessary in any other thirlage; which perhaps proceeds from the effects of the union betwixt the two. Hence, if a baron makes over the mill of a barony, cum multuris, or cum astrictis multuris, it infers an astriction of the barony lands to the mill conveyed, although they had not formerly been astricted. But if prior to the baron's
Law of Scotland.

The conveyance of his mill sum multarius, he had sold any part of the barony lands to another sum multarius, the first purchaser's lands are not straited by the posterior grant; for a right of lands with the multures, implies a freedom of these lands from thirillage.

16. Thirillage is either, 1. Of grindable corn; or, 2. Of all growing corn; or, 3. Of the inverta et illata, i.e., of all the grain brought within the thirl, though of another growth. Where the thirillage is of grindable grain, it is in practice restricted to the corn which the tenants have occasion to grind, either for the support of their families, or for other uses; the surplus may be carried out of the thirl unmanufactured, without being liable in multure. Where it is of the grana crescentia, the whole grain growing upon the thirl is straited, with the exceptions, 1. Of seed and horsecorn, which are destined to uses inconsistent with grinding; and, 2. Of the farm duties due to the landlord, if they were delivered in grain not grinded. But, if the rent be payable in meal, flour, or malt, the grain of which these are made must be manufactured in the dominant mill.

17. Thirillage, in the general case, cannot be established by prescription alone, for sic quae sunt merae facultatis non prescribatur; but where one has paid for 40 years together the heavy in-sunken multures, the slightest title in writing will subject his lands. Thirillage may, contrary to the common rule, be constituted by prescription alone, where one pays to a mill a certain sum, or quantity of grain yearly, in name of multure, whether he grinds at it or not (called dry multure).

18. The possessors of the land straited are bound to uphold the mill, repair the dam dykes and aqueducts, and bring home the millstones. These services, though not expressed in the constitution, are implied.

19. Servitudes, being restraints upon property, are stricti juris: they are not therefore presumed if the acts upon which they are claimed can be explained consistently with freedom: and when servitudes are constituted, they ought to be used in the way least burdensome to the servient tenement. Hence, one who has a servitude of peats upon his neighbour's moss, is not at liberty to extend it for the use of any manufacture which may require an extraordinary expense of fuel: but must confine it to the natural uses of the dominant tenement.

20. Servitudes are distinguished. (1.) Confusion, when the person comes to be proprietor of the dominant and servient tenements; for res sua noni servit, and the use the proprietor therefore makes of the servient tenement is not jure servitutis, but is an act of property. (2.) By the perishing either of the dominant or servient tenement. (3.) Servitudes are lost non utendo, by the dominant tenement neglecting to use the right of 40 years; which is considered as a desertion of it, though he who has the servient tenement should have made no interruption by doing acts contrary to the servitude.

21. Personal servitudes are those by which the property of a subject is burdened, in favour, not of a tenement, but of a person. The only personal servitude known in our law, is usufruct or liferent; which is a right to use and enjoy a thing during life, the substance of it being preserved. A liferent cannot therefore be stinted upon things which perish in the use; and though it may upon subjects which gradually wear out by time, as household furniture, &c. yet with us, it is generally applied to heritable subjects. A whose property is burdened, is usually called the sizar.

22. Liferents are divided into conventional and illegal. Conventional liferents are either simple, or by reservation. A simple liferent, or by a separate constitution, is that which is granted by the proprietor in favour of another: And this sort, contrary to the nature of predest servitudes, requires seisim in order to affect singular successors; for a liferent of lands is, in strict speech, not a servitude, but a right resembling property which constitutes the liferentor vassal for life; and singular successors have no way of discovering a liferent right, which perhaps is not yet commenced, but by the records: whereas, in predest servitudes, the constant use of the dominant tenement makes them public. The proper right of liferent is intransmissible: possidens non successurit inherent: When the profits of the liferent subject are transmitted to another, the right becomes merely personal: for it entitles the assignee to the rent, not during his own life, but his cedent's; and is therefore carried by simple assignation, without seisin.

23. A liferent by reservation, is that which a proprietor reserves to himself in the same writing by which he conveys the fee to another. It requires no seisin; for the granter's former seisin, which virtually included the liferent, still subsists as to the liferent which is expressly reserved. In conjunct infelments taken to husband and wife, the wife's right of conjunct fee resolves, in the general case, into a liferent.

24. Liferents, by law, are the servos and the corv. ten.
Chap. II.

LAW.

The terce (tertia) is a liferent competent by law to widows, who have not accepted of special provisions, in the third of the heritable subjects in which their husbands died infest; and takes place only where the marriage has subsisted for year and day, or where a child has been born alive of it (a).

25. The terce is not limited to lands, but extends to teinds, and to servitudes and other burdens affecting lands; thus, the widow is entitled, in the right of her terce, to a liferent of the third of the sums secured, either by rights of annuallent, or by rights in security. In improper waifs, the terce is a third of the sum lent: in those that are proper, it is a third of the waif lands; or, in case of redemption, a third of the redemption money. Neither right of reversion, superiority, nor patronage, fall under the terce; for none of these have fixed profits, and so are not proper subjects for the widow's subsistence; nor tacks, because they are not feudal rights. Burgage tenements are also excluded from it, the reason of which is not so obvious. Since the husband's seisin is both the measure and security of the terce, such debts or diligences alone, as exclude the husband's seisin, can prevail over it.

26. Where a terce is dug out of lands burdened with a prior terce still subsisting, the second terce has only right to a third of the two thirds that remain unaffected by the first terce. But upon the death of the first widow, whereby the lands are disburdened of her terce, the lesser terce becomes enlarged, as if the first had never existed. A widow, who has accepted of a special provision from her husband, is thereby excluded from the terce, unless such provision shall contain a clause that she shall have right to both.

27. The widow has no title of possession, and so cannot receive the rents in virtue of her terce, till she be served to it; and in order to this she must obtain a brief out of the chancery, directed to the sheriff, who calls an inquest, to take proof that she was wife to the deceased, and that her husband died infest in the subjects-contained in the brief. The service or sentence of the jury, finding these points proved, does, without the necessity of a return to the chancery, entitle the wife to enter into the possession; but she can only possess with the heir pro indiviso, and so cannot remove tenants till the sheriff lends her to her terce, or divides the lands between her and the heir. In this division, after determining by lot or kavil, whether to begin by the son or the shade, i.e. by the east or the west, the sheriff sets off the two first acres for the heir, and the third for the widow. Sometimes the division is executed, by giving one entire farm to the widow, and two of equal value to the heir. The widow's right is not properly constituted by this service; it was constituted before by the husband's seisin, and fixed by his death; the service only declares it, and so entitles her to the third part of the rents retro to her husband's death, preferable to any rights that may have affected the lands in the intermediate period between that and her own service. The relitig, if she was reputed to be lawful wife to the deceased, must be served, notwithstanding any objections by the heir against the marriage, which may be afterwards tried by the commissary.

28. Courtesy is a liferent given by law, to the surviving husband, of all his wife's heritage in which she died infest, if there was a child of the marriage born alive. A marriage, though of the longest continuance, gives no right to the courtesy, if there was no issue of it. The child born of the marriage must be the mother's heir: If she had a child of the former marriage, who is to succeed to her estate, the husband has no right to the courtesy while such child is alive; so that the courtesy is due to the husband, rather as father to an heir, than as husband to an heiress. Heritage is here opposed to conquest; and so is to be understood only of the heritable rights to which the wife succeeded as heir to her ancestors, excluding what she herself had acquired by singular titles.

29. Because the husband enjoys the liferent of his wife's whole heritage, on a lucrative title, he is considered as her temporary representative; and so is liable in payment of all the yearly burdens chargeable on the subject, and of the current interest of all her debts, real and personal, to the value of the yearly rent he enjoys by the courtesy. The courtesy needs no solemnity to its constitution: That right which the husband had to the rents of his wife's estate during the marriage, jure mariti, is continued with him after her death, under the name of courtesy, by an act of the law itself. As in the terce, the husband's seisin is the ground and measure of the wife's right; so in the courtesy, the wife's seisin is the foundation of the husband's; and the two rights are, in all other respects, of the same nature; if it is not that the courtesy extends to burgage holdings, and to superiors.

30. All liferenters must use their right salus rei substantiae: whatever therefore is part of the fee itself, cannot be encroached on by the liferenter, e.g. woods or growing timber, even for the necessary uses of the liferented tenement. But, where a coppice or situs caduus has been divided into hags, one of which was in use to be cut annually by the proprietor, the liferenter may continue the former yearly cuttings; because these are considered as the annual fruits the subject was intended to yield, and so the proper subject of a liferent.

31. Liferenters are bound to keep the subject liferented in proper repair. They are also burdened with the alimony of the heir; where he has not enough for maintaining himself. The bare right of apperancy

(a) In the case referred to, when treating of the effects of the dissolution of marriage within the year without a living child, and where no special provisions had been granted to, or accepted by, the widow; she did not demand her legal provisions of terce or jus relictit, but merely insisted, that as widow she was entitled to be alimented out of the heritable estate of which her husband died possessed: So that the decision in that case cannot so properly be said to be an alteration in the law, as an equitable interpolation of the court of session, in their capacity as a court of equity, in order to grant a subsistence to the widow of a man whose estate was fully sufficient, and who, it could not reasonably be presumed, would have inclined that his widow should be left destitute, when his estate went perhaps to a distant series of heirs.
LAW.

Part III

Law of Scotland.

sec. 32. Life renter is extinguished by the life renter's death. That part of the rents which the life renter had a proper right to, before his death, falls to his executors; the rest, as never having been in bome of the deceased, goes to the far. Martinmas and Whitsunday are, by our custom, the legal terms of the payment of rent: consequently, if a life renter of lands survives the term of Whitsunday, his executors are entitled to the half of that year's rent, because it was due the term before his death; and if he survives the term of Martinmas, they have right to the whole. If the life renter, being in the natural possession, and having first sowed the ground, should die, even before Whitsunday, his executors are entitled to the whole crop, in respect that both seed and industry were his. In a life rent of money constituted by a moveable bond, the executors have a right to the interest, down to the very day of the life renter's death, where no terms are mentioned for the payment thereof; but in the case of an heritable bond, or of a money life rent secured on land, the interests of life renter and fiar (or of heir and executor, for the same rules serve to fix the interests of both) are both governed by the legal terms of land rent, without regard to the conventional.

Sect. X. Teinds.

1. Teinds, or tithes, are that liquid proportion of our rents or goods, which is due to churchmen for performing divine service, or exercising the other spiritual functions proper to their several offices. Most of the canonists affirm, that the precise proportion of a tith, not only of the fruits of the ground, but of what is acquired by personal industry, is due to the Christian clergy, of divine right, which they therefore call the proper patrony of the church; though it is certain that tithes, in their infancy, were given, not to the clergy alone, but to lay-monks who were called popercres, and to other indigent persons. Charles the Great was the first secular prince who acknowledged this right in the church. It appears to have been received with us, as far back as David I.

2. The person employed by a cathedral church or monastery to serve the cure in any church annexed was called a vicar, because he held the church, not in his own right, but in the right or vice of his employers; and so was removable at pleasure, and had no share of the benefice, other than what they thought fit to allow him: but, in the course of time, the appellation of vicar was limited to those who were made perpetual, and who got a stated share of the benefice for their incumbency; from whence arose the distinction of benefices into parsonages and vicarages.

3. Parsonage teinds are the teinds of corn; and they are so called because they are due to the parson or other titular of the benefice. Vicarage teinds are the small teinds of calves, lint, hemp, eggs, &c. which were commonly given by the titular to the vicar who served the cure in his place. The first sort was universally due, unless in the case of their infeudation to laics, or of a pontifical exemption; but by the customs of almost Christendom, the lesser teinds were not demanded where they had not been in use to be paid. By the practice of Scotland, the teinds of animals, or of things produced from animals, as lambs, wool, calves, are due though not accustomed to be paid; but roots, herbs, &c. are not titheable, unless use of payment be proved: neither are personal teinds (i.e. the tenth of what one acquires by his own industry) acknowledged by our law: yet they have been found due, when supported by 40 years possession.

4. The person who was entitled to the teind of corn, made his right effectual, either by accepting of a certain number of teind boills yearly from the proprietor in satisfaction of it; or, more frequently, by drawing or separating upon the field his own tenth part of the corn, after they were reaped, from the stock or the remaining nine-tenths of the crop, and carrying it off to his own granaries; which is called draun teind.

5. After the Reformation, James VI. considered himself as proprietor of all the church lands; partly because the purposes for which they had been granted were declared superstitions; and partly, in consequence of the resignations which he, and Queen Mary his mother, had procured from the beneficiaries: and even as to the teinds, thoug our reformed clergy also claimed them as the property of the church, our sovereign did not submit to that doctrine farther than extended to a competent provision for ministers. He therefore erected or secularized several abbacies and priories into temporal lordships; the grantees of which were called sometimes lords of erection, and sometimes titulars, as having by their grants the same title to the erected benefices that the monasteries had formerly.

6. As the crown's revenue suffered greatly by these erections, the temporality of all church benefices (i.e. church lands) was, by 1587, c. 29. annexed to the crown. That statute excepts from the annexation such benefices as were established before the Reformation, laymen, whose rights the legislature had no intention to weaken. Notwithstanding this statute his majesty continued to make farther erections, which were declared null by 1592, c. 119, with an exception of such as had been made in favour of lords of parliament since the general act of annexation in 1587.

7. King Charles I. soon after his succession, raised a reduction of all these erections, whether granted before or after the act of annexation, upon the grounds mentioned at length by Mr Forbes in his Treatise of Tithes, p. 219. At last the whole matter was referred to the king himself by four several submissions or compromizes; in which the parties on one side were the titulars and their tacksamen, the bishops with the inferior clergy, and the royal boroughs, for the interest they had in the teinds that were gifted for the provision of ministers, school, or hospitals within their boroughs; and, on the other part, the proprietors who wanted to have the leading of their own teinds. The submission by the titulars contained a surrender into his majesty's hands of the superiorities of their several erections.

8. Upon each of these submissions his majesty announced several decrees arbitral, dated Sept. 2. 1629. of which are subjoined to the acts of parliament of his reign.
He made it lawful to proprietors to sue the titulaires for a valuation, and if they thought fit for a sale also, of their teinds, before the commissioners named or to be named for that purpose. The rate of teind, when it was possessed by the proprietor jointly with the stock, for payment of a certain duty to the titular, and so did not admit a separate valuation, was fixed at a fifth part of the constant yearly rent, which was accounted a reasonable surrogatum, in place of a tenth of the increase. Where it was drawn by the titular, and consequently might be valued separately from the stock, it was to be valued as its extent should be ascertained, upon a proof before the commissioners; but in this last valuation, the king directed the fifth part to be deducted from the proved teind, in favour of the proprietor, which was therefore called the king's case. The proprietor suing for a valuation gets the leading of his own teinds as soon as his suit commences, providing he does not allow protestation to be extracted against him for not insisting.

9. Where the proprietor insisted also for a sale of his teinds, the titular was obliged to sell them at nine years purchase of the valued teind duty. If the pursuer had a tack of his own teinds, not yet expired; or if the defender was only tacksman of the teinds, and so could not give the pursuer an heritable right; an abatement of the price was to be granted accordingly by the commissioners.

10. There is no provision in the decrees arbitral, for selling the teinds granted for the sustentation of ministers, universities, schools, or hospitals; because these were to continue, as a perpetual fund, for the maintenance of the persons or societies to whom they were appropriated; and they are expressly declared not subject to sale, by 1690, c. 30—1693, c. 23. By the last of these acts, it is also provided, that the teinds belonging to bishops, which had then fallen to the crown upon the abolishing of Episcopacy, should not be subject to sale as long as they remained with the crown not disposed of; nor those which the proprietor, who had right both to stock and teind, reserved to himself in a sale or feu of the lands. But, though none of these teinds can be sold, they may be valued.

11. The king, by the decrees arbitral, declared his own right to the superiorities of erection which had been resigned to him by the submission, reserving to the titulars the feu duties thereof, until payment by himself to them of 1000 merks Scots for every chandler of feu victual, and for each 100 merks of feu duty; which right of redeeming the feu duties was afterwards renounced by the crown. If the church vassal should consent to hold his lands of the titular, he cannot thereafter recur to the crown as his immediate superior.

12. In explaining what the constant rent is by which the teind must be valued, the following rules are observed. The rent drawn by the proprietor from the sale of subjects, that are more properly parts of the land than of the fruits, e.g. quarries, minerals, mosses, &c. is to be deducted from the rental of the lands, and also the rent of supernumerary houses, ever and above what is necessary for agriculture; and the additional rent that may be paid by the tenant, in consideration of the proprietor's undertaking any burden that law imposes on the tenant, e.g. uphold.

ing the tenant's houses, because none of these articles are paid properly on account of the fruits. Orchards must also be deducted, and mill rent, because the profits of a mill arise from industry; and the corns manufactured there suffer a valuation as rent payable by the tenant, and therefore ought not to be valued a second time against the titular as mill rent. The yearly expence of culture ought not to be deducted: for no rent can be produced without it: but, if an improvement of rent is made at an uncommon expence, e.g. by draining a lake, the proprietor is allowed a reasonable abatement on that account.

13. Notwithstanding the several ways of misapply—Teinds reserving parochial teinds in the times of Popery, some few decennial benefits remained entire in the hands of the persons, &c.

The ministers planted these, after the Reformation, continued to have the full right to them, as proper beneficiaries: but a power was afterwards granted to the patron, to redeem the whole teind from such beneficiaries, upon their getting a competent stipend modified to them; which teind so redeemed, the patron is obliged to sell to the proprietor, at six years purchase.

14. Some teinds are more directly subject to an allocation for the minister's stipend than others. The teinds in the hands of the lay titular fall first to be allocated, who, since he is not capable to serve the cure in his own person, ought to provide one who can; and if the titular, in place of drawing the teind, has set it in tack, the tack duty is allocated: this sort is called free teind. Where the tack duty, which is the titular's interest in the teinds, falls short, the tack itself is burdened, or, in other words, the surplus teind over and above the tack duty: but, in this case, the commissioners are empowered to compensate the tacksman, by prorogating his tack for such a number of years as they shall judge equitable. Where this likewise proves deficient, the allocation falls on the teinds heritably conveyed by the titular, unless he has warranted his grant against future augmentations; in which case, the teinds of the lands belonging in property to the titular himself must be allocated in the first place.

15. Where there is sufficiency of free teinds in a parish, the titular may allocate any of them he shall think fit for the minister's stipend, since they are all his own; unless there has been a previous decree of locality: and this holds, though the stipend should have been paid immemorially out of the teinds of certain particular lands. This right was frequently abused by titulaires, who, as soon as a proprietor had brought an action of sale of his teinds, allocated the pursuer's full teind for the stipend, whereby such action became ineffectual: it was therefore provided, that after citation in a sale of teinds, it shall not be in the titular's power to allocate the pursuer's teinds solely, but only in proportion with the other teinds in the parish.

16. Ministers globes are declared free from the payment of teind. Lands cum decemis inclusis are also exempted from teind. But in order to exempt lands from payment of teind, it is necessary that the proprietor prove his right thereto, cum decemis inclusis, as far back as the above act of annexation 1587.

17. Teinds are debita fructuum, not fundi. The ministers action therefore for bygone teinds is only personal, &c. against those who have intermeddled, unless where the

LAW.

Inhibition of teinds.

18. In tacks of teinds, as of lands, there is place for tacit relocation: to stop the effect of which, the titular must obtain and execute an inhibition of teinds against the tacksman; which differs much from inhibition of lands (explained under the next section), and is intended merely to inter-rup or inhibit the tacksman from farther intermeddling. This diligence of inhibition may also be used at the suit of the titular, against any other possessor of the teinds; and if the tacksman or possessor shall intermeddle after the inhibition is executed, he is liable in a spoilize.

19. Lands and teinds pass by different titles: a disposition of lands, therefore, though granted by one who has also right to the teind, will not carry the teind, unless it shall appear from special circumstances that a sale of both was designed by the parties. In lands sum decimus inclusis, where the teinds are consolidated with the stock, the right of both must necessarily go together in all cases.

SECT. XI. Of Inhibitions.

classii.

1. The constitution and transmission of feudal rights being explained, and the burdens with which they are chargeable, it remains to be considered how these rights may be affected at the suit of creditors by legal diligence. Diligences are certain forms of law, whereby a creditor endeavours to make good his payment, either by affecting the person of his debtor, or by securing the subjects belonging to him from alienation, or by carrying the property of these subjects to himself. They are either real or personal. Real diligence is that which is proper to heritable or real rights; personal, is that by which the person of the debtor may be secured, or his personal estate affected. Of the first sort we have two, viz. inhibition and adjudication.

Inhibition.

2. Inhibition is a personal prohibition, which passes by letters under the signet, prohibiting the party inhibited to contract any debt, or do any deed, by which any part of his lands may be aliened or carried off in prejudice of the creditor inhibiting. It must be executed against the debtor, personally, or at his dwelling house, as summonses, and thereafter published and registered in the same manner with interdictions. (see No clxxxviii. 21.)

3. Inhibition may proceed, either upon a liquid obligation, or even on an action commenced by a creditor for making good a claim not yet sustained by the judge; which last is called inhibition upon a depending action. The summons, which constitutes the dependence, must be executed against the debtor before the letters of inhibition pass the signet; for no suit can be said to depend against one till he be cited in it as a 'defender:' but the effect of such inhibition is suspended till decree be obtained in the action against the debtor; and in the same manner, inhibitions on conditional debts have no effect till the condition be satisfied. Inhibitions are not granted, without a trial of the cause, when they proceed on conditional debts. And though, in other cases, inhibitions now pass of course, the lords are in use to stay, or recall them, either on the debtor's showing cause why the diligence should not proceed, or even ex officio where the ground of the diligence is doubtful.

4. Though inhibitions, by their uniform style, disable the debtor from selling his moveable as well as his heritable estate, their effect has been long limited to heritage, from the interruption that such an embargo upon moveables must have given to commerce; so that debts contracted after inhibition may be the foundation of diligence against the debtor's person and moveable estate. An inhibition secures the inhibitor against the alienation, not only of lands that belonged to his debtor when he was inhibited, but of those that he shall afterwards acquire: but no inhibition can extend to such after-purchases as lie in a jurisdiction where the inhibition was not registered; for it could not have extended to these though they had been made prior to the inhibition.

5. This diligence only strikes against the voluntary debts or deeds of the inhibited person; it does not restrain him from granting necessary deeds, i.e. such as he was obliged to grant anterior to the inhibition, since he might have been compelled to grant these before the inhibitor had acquired any right by his diligence. By this rule, a wadsetter or annualrater might, after being inhibited, have effectually remonstrated his right to the reverse on payment, because law could have compelled him to it; but to secure inhibitors against the effect of such alienations, it is declared by act of sederunt of the court of session, Feb. 19, 1683, that, after intimation of the inhibition to the reverse, no renunciation or grant of redemption shall be sustained, except upon declarator of redemption brought by him, to which the inhibitor must be made a party.

6. An inhibition is a diligence simply prohibitory, so that the debt, on which it proceeds, continues personal after the diligence; and consequently, the inhibitor, in a question with anterior creditors whose debts are not struck at by the inhibition, is only preferable from the period at which his debt is made real by adjudication: and where debts are contracted on heritable security, though posterior to the inhibition, the inhibitor's debt, being personal, cannot be ranked with them; he only draws back from the creditors ranked the sums contained in his diligence. The heir of the person inhibited is not restrained from alienation by the diligence used against his ancestor; for the prohibition is personal, affecting only the debtor against whom the diligence is used.

7. Inhibitions do not of themselves make void the posterior debts, or deeds of the person inhibited; they only afford a title to the user of the diligence to set them aside, if he finds them hurtful to him; and even where a debt is actually reduced ex capite inhibitionis, such reduction, being founded solely in the inhibitor's interest, is profitable to him alone, and cannot alter the natural preference of the other creditors.

8. Inhibitions may be reduced upon legal nullities arising.
arising either from the ground of debt or the form of diligence. When payment is made by the debtor to the inquirer, the inquisition is said to be purged. Any creditor, whose debt is struck at by the inquisition, may, upon making payment to the inquirer, compel him to assign the debt and diligence in his favour, that he may make good his payment the more effectually against the common debtor.

Sect. XII. Of Comprisings, Adjudications, and Judicial Sales.

1. Heritable rights may be carried from the debtor to the creditor, either by the diligence of appraising (now adjudication), or by a judicial sale carried on before the court of session. Appraising, or apprising, was the sentence of a sheriff, or of a messenger who was specially constituted sheriff for that purpose, by which the heritable rights belonging to the debtor were sold for payment of the debt due to the appraiser; so that appraisals were, by their original constitution, proper sales of the debtor's lands to any purchaser who offered. If no purchaser could be found, the sheriff was to appraise or tax the value of the lands by an inquest (whence came the name of appraising), and to make over to the creditor lands to the value of the debt. A full history of appraisings will be found in the beginning of Mr. Erskine's Large Institute under this title; it being considered as unnecessary to enter into a deduction now no longer necessary, as by the act 1672 adjudications were substituted in their place.

2. That creditors may have access to the state of their deceased debtor, though the heir should stand off from entering, it is made lawful (by 1542, c. 126.) for any creditor to charge the heir of his debtor to enter to his ancestor (year and day being past after the ancestor's death), within 40 days after the charge; and if the heir fails, the creditor may proceed to appraise his debtor's lands, as if the heir had been entered. Custom has so explained this statute, that the creditor may charge the heir, immediately after the death of his ancestor, provided that the summons which is to be founded on the charge be not raised till after the expiry both of the year and of the 40 days next ensuing the year, within which the heir is charged to enter. But this statute relates only to such charges on which appraising is to be led against the ancestor's land; for in those which are to be merely the foundation of a common summons or process against the heir, action will be sustained if the year be escaped from the ancestor's death before the execution of the summons, though the 40 days should not be also expired. Though the statute authorizes such charges against majori only, practice has also extended it against minors, and the rule is extended to the case where the heir is the debtor. One must, in this matter, distinguish between a general and a special charge. A general charge serves only to fix the representation of the heir who is charged, so as to make the debt his which was formerly his ancestor's; but a special charge makes up for the want of a service (N° clxx. 25.) and states the heir, fictio juris, in the right of the subjects to which he is charged to enter. Where, therefore, the heir is the debtor, a general charge for fixing the representation against him is unnecessary, since the only concern of the creditor is, that his debtor make up titles to the ancestor's estate, which is done by a special charge: but where the deceased was the debtor, the creditor must first charge his heir to enter in general, that it may be known whether he is to represent the debtor: if he does not enter within forty days, the debt may be fixed against him by a decree; after which the heritable rights belonging to the ancestor will fall to be attached; in doing which, the diligence to be used is different, according to the state of the titles in the ancestor's person: for if the ancestor stood vested by inquest, the heir must be charged to enter heir in special; but if the ancestor had but a personal right to the subjects (i.e. not perfected by seisin), which would have been carried to the heir by a general service, then what is called a general special charge must be given to the heir. These charges either special or general special, as the circumstances of the case may require, are by the statute 1540 made equivalent to the heir's actual entry; and therefore an adjudication led after the inducement of the charges are elapsed, effectually carries to the creditor the subjects to which the heir was charged to enter.

3. Appraisings in course of time underwent many adjudications in their form and effect, till at length, by actions. 1672, c. 19. adjudications were substituted in their place, and are carried on by way of action before the court of session. By that statute, such part of the debtor's lands is to be adjudged as is equivalent to the principal sum and interest of the debt, with the composition due to the superior and expenses of inquest, and a fifth part more in respect the creditor is obliged to take land for his money. The debtor must deliver to the creditor a valid right of the lands to be adjudged, or transsumpt thereof, renounce the possession in his favour, and ratify the decree of adjudication: and law considers the rent of the houses as precisely commensurate to the interest of the debt; so that the adjudger lies under no obligation to account for the surplus rents. In this, which is called a special adjudication, the legal, or time within which the debtor may redeem, is declared to be five years; and the creditor attaining possession upon it can use no further execution against the debtor, unless the lands be evicted from him.

4. Where the debtor does not produce a sufficient right to the lands, or is not willing to renounce the possession, and ratify the decree (which is the case that has most frequently happened), the statute makes it lawful for the creditor to adjudge all right belonging to the debtor in the same manner, and under the same reversion of ten years, as he could, by the former laws have appraised it. In this last kind, which is called a general adjudication, the creditor must limit his claim to the principal sum, interest, and penalty, without demanding a fifth part more. But no general adjudication can be insisted on, without libelling in the summons the other alternative of a special adjudication; for special adjudications are introduced by the statute in the place of appraisings; and it is only where the debtor refuses to comply with the terms thereof, that the creditor can lead a general adjudication.

5. Abbreviates are ordained to be made of all adjudications, which must be recorded within 90 days after the date of the decree. In every other respect,
two kinds of adjudications.

6. There are two kinds of adjudication, which took place at the same time with appraisings, and still obtain; viz. adjudications on a decree cognitionis causa, otherwise called contra hereditatem iocentem; and adjudications in implement. Where the debtor's apparent heir, who is charged to enter, formally renounces the succession, the creditor may obtain a decree cognitionis causa; in which, though the heir renouncing is cited for the sake of form, no sentence condemnatory can be pronounced against him, in respect of his renunciation; the only effect of it is to subject the hereditas jacentis to the creditor's diligence.

7. Adjudications contra hereditatem iocentem, carry not only the lands themselves that belonged to the deceased, but the rents thereof fallen due since his death; for these, as an accessory to the estate belonging to the deceased, would have descended to the heir if he had entered, which rule is applied to all adjudications led on a special charge. This sort of adjudication is declared redeemable within seven years, by any co-adjudicating creditor, either of the deceased debtor or of the heir renouncing. The heir himself, who renounces, cannot be restored against his renunciation, nor consequently redeem, if he be not a minor. But even a major may redeem indirectly, by granting a simulacrum bond to a confidant person: the adjudication upon which, when conveyed to himself, is a good title to redeem all other adjudications against the lands belonging to his ancestor.

8. Adjudications in implement are deduced against those who have granted deeds without procuration of resignation or precept of seisin, and refuse to divest themselves; to the end that the subject conveyed may be effectually vested in the grantee. These adjudications may be also directed against the heir of the grantor, upon a charge to enter. Here there is no place for a legal reversion; for as the adjudication is led for completing the right of a special subject, it must carry that subject as irredeemably as if the right had been voluntarily completed.

9. All adjudications led within year and day of that one which has been made first effectual by seisin (where seisin is necessary), or exact diligence for obtaining seisin, are preferable pari passu. The year and day runs from the date of the adjudication, and not of the seisin or diligence, for obtaining it. After the days of that period, they are preferable according to their dates. All the co-adjudicators within the year are preferable pari passu, as if one adjudication had been led for all their debts. This makes the seisin or diligence on the first adjudication a common right to the rest, who must therefore refund to the owner of that diligence his whole expense laid out in carrying on and completing it. And though that first adjudication should be redeemed, the diligence upon it still subsists as to the rest. This pari passu preference, however, does not destroy the legal preference of adjudications led on debita fundis (see N°cclxxi. 15.), nor does it take place in adjudications in implement.

A new sort of adjudication has been lately introduced into the law of Scotland by the act of the 23d Geo. III. for rendering the payment of the creditors of insolvent debtors more equal and expeditious. Among the many other provisions in that statute for expediting the payment of creditors, and lessening the expense of diligence against the debtor's estate, it is enacted, That upon an order from the court of session or lord ordinary, the bankrupt shall be bound to execute a disposition or dispositions, making over to the trustee or trustees chosen by the creditors the whole estate real and personal, wherever situated; and in case of the bankrupt's refusal, or of the order not being complied with from any other reason, the court or the lord ordinary shall, upon the application of the trustee, issue an act or decree, adjudging the property of the whole sequestered estate to be in the trustee for the benefit of the creditors; which shall have the same effect as if the bankrupt had executed the conveyance: and by a subsequent clause in the statute, it is enacted, that this disposition of the heritable estate, together with the order of the court or lord ordinary on which it proceeds, or failing thereof, the decree of adjudication of the court or the lord ordinary, shall within 60 days of the date thereof be registered in the register of abstracts of adjudications; and shall have the effect to entitle the trustee for the benefit of the whole creditors to rank in the same manner upon the heritable estate as if it had been a proper decree of adjudication, obtained at the date of the interlocutor awarding the sequestration; accumulating the whole debts, principal and interest, as at that period, and adjudging for security or payment thereof, so as to rank pari passu with any prior effectual adjudication, and within year and day of the same. By this act also, in order to lessen the number of adjudications, and consequently the expense upon a bankrupt estate, it is declared, that intimation shall be made of the first adjudication which is called, so as all creditors who are in readiness may, within such a reasonable time as may be allowed, not exceeding twenty sedentary days, produce their grounds of debt, and be conjoined in the decree to follow on said first adjudication. At the same time it may be proper to mention, that this act is only temporary; and after eight years experience, will probably suffer very considerable alterations, when it shall become necessary to digest another bankrupt law for Scotland.

10. Before treating of judicial sales of bankrupt estates, the nature of sequestration may be shortly explained, which is a diligence that generally usher in actions of sale. Sequestration of lands is a judicial act of the court of session, whereby the management of an estate is put into the hands of a factor charged with the administration thereof by the court, who gives security, and is to be accountable for the rents to all having interest. This diligence is competent, either where the right of the lands is doubtful; if it be applied for before either of the competitors has attained possession, or where the estate is heavily
heavily charged with debts: but, as it is an unfavourable diligence, it is not admitted, unless that measure shall appear necessary for the security of creditors. Subjects not brought before the court by the diligence of creditors, cannot fall under sequestration; for it is the competition of creditors which alone founds the jurisdiction of the court to take the disputed subject into their possession.

17. The court of session who decrees the sequestration has the nomination of the factor, in which they are directed by the recommendation of the creditors. A factor appointed by the session, though the proprietor had not been in the lands, has a power to remove tenants. Judicial factors must, within six months after extracting their factory, make up a rental of the estate, and a list of the arrears due by tenants, to be put into the hands of the clerk of the process, as a charge against themselves, and a note of such alterations in the rental as may afterwards happen: and must also deliver to the clerk annually a scheme of their accounts, charge and discharge, under heavy penalties. They are, by the nature of their office, bound to the same degree of diligence that a prudent man abhors in his own affairs; they are accountable for the interest of the rents, which they either have, or by diligence might have, recovered, from a year after their falling due. As it is much in the power of those factors to take advantage of the necessities of creditors, by purchasing their debts at an undervalue, all such purchases made either by the factor himself, or to his behalf, are declared equivalent to an acquittance or extinction of the debt. No factor can warrantably pay to any creditor, without an order of the court of session; for he is, by the tenor of his commission, directed to pay the rents to those who shall be found to have the best right to them. Judicial factors are entitled to a salary, which is generally stated at five per cent. of their intimosions: but it is seldom ascertained till their office expires, or till their accounting; that the court may modify a greater or smaller salary, or none, in proportion to the factor's integrity and diligence. Many cases occur, where the court of session, without sequestration, name a factor to preserve the rents from perishing; e. g. where an heir is deliberating whether to enter, where a minor is without tutors, where a succession opens to a person residing abroad; in all which cases the factor is subjected to the rules laid down in act of sedentary, Feb. 13, 1730.

As to sequestrations under the bankrupt act before recited, the reader must necessarily be referred to the act itself; for being only temporary, as before mentioned, it seems quite inconsistent with the plan of this work to enter into a minute detail of the different regulations thereby laid down in cases of sequestration under it.

12. The word bankrupt is sometimes applied to persons whose funds are not sufficient for their debts; and sometimes, not to the debtor, but to his estate. The court of session are empowered, at the suit of any real creditor, to try the value of a bankrupt's estate, and sell it for the payment of his debts.

13. No process of sale, at the suit of a creditor, can proceed without a proof of the debtor's bankruptcy, or at least that his lands are so charged with debts that no prudent persons will buy from him; and therefore the summons of sale must comprehend the debtor's whole estate. The debtor, or his apparent heir, and all the real creditors in possession, must be made parties to the suit; but it is sufficient if the other creditors be called by an edictal citation. The summons of sale contains a conclusion of ranking, or preference of the bankrupt's creditors. In this ranking, first and second terms are assigned to the whole creditors for exhi-

14. The expense of those processes is disburred by the factor out of the rents in his hands; by which the whole burden of such expense falls upon the posterior creditors.

15. Apparent heirs are entitled to bring actions of sale of the estates belonging to their ancestors, whether bankrupt or not; the expense of which ought to fall upon the pursuer, if there is any excessiveness of the price, after payment of the creditors: but if there be no excessiveness, the creditors, who alone are gainers by the sale, ought to bear the charge of it.

16. As processes of ranking and sale are designed for the common interest of all the creditors, no diligence carried on or completed during their pendency ought to give any preference in the competition; pen-

dente lite, nihil innovandum.

17. It is a rule in all real diligences, that where a creditor is preferable on several different subjects, he cannot use his preference arbitrarily, by favouring one creditor more than another; but must allocate his universal or catholic debt proportionally against all the subjects or parties whom it affects. If it is material to such creditor to draw his whole payment out of any one fund, he may apply his debt so as may best secure himself: but that inequality will be rectified as to the posterior creditors, who had—likewise by their rights and diligences, affected the subjects out of which he drew his payment, by obliging him to assign in their favour his right upon the separate subjects which he did not use in the ranking; by which they may recur against these separate subjects for the shares which the debt
debt preferred might have drawn out of them. As the obligation to assign is founded merely in equity, the catholic creditor cannot be compelled to it, if this assigning shall weaken the preference of any separate debt vested in himself, affecting the special subject sought to be assigned. But if a creditor upon a special subject shall acquire from another a catholic right, or a catholic creditor shall purchase a debt affecting a special subject, with a view of creating to the special debt a higher degree of preference than was naturally due to it, by an arbitrary application of the catholic debt, equity cannot prevent him from assigning in favour of the creditor excluded by such application, especially if, prior to the purchase, the subject has become litigious by the process of ranking.

II. MOVEABLE RIGHTS.

The law of heritable rights being explained, Moveable Rights fall next to be considered; the doctrine of which depends chiefly on the nature of obligations.

Sect. XIII. Of Obligations and Contracts in general.

Obligation.

1. An obligation is a legal tie, by which one is bound to pay or perform something to another. Every obligation on the person obliged implies an opposite right in the creditor, so that what is a burden in regard to the one is a right with respect to the other; and all rights founded on obligation are called personal. There is this essential difference between a real and a personal right, that a jus in re, whether of property, or of an inferior kind, as servitude, entitles the person vested with it to possess the subject as his own; or if he is not in possession, to demand it from the possessor; whereas the creditor in a personal right has only jus ad rem, or a right to compel the debtor to fulfill his obligation; without any right in the subject itself, which the debtor is bound to transfer to him. One cannot obligate himself, but by a present act of the will. A bare resolution, therefore, or purpose, to be obliged, is at the pleasure.

Division of obligations.

2. Obligations are either, (1.) Merely natural, where one person is bound to another by the law of nature, but cannot be compelled by any civil action to the performance. Thus, though deeds granted by a minor having curators, without their consent, are null, yet the minor is naturally obliged to perform such deeds; and parents are naturally obliged to provide their children in reasonable patrimonies. Natural obligations entitle the creditor to retain what he has got in virture thereof, without being subjected to restore it. (2.) Obligations are merely civil, which may be sued upon by an action, but are slain by an exception in equity; this is the case of obligations granted through force or fear, &c. (3.) Proper or full obligations are those which are supported both by equity and the civil sanction.

3. Obligations may also be divided into, (1.) Pure, to which neither day nor condition is added. These may be exacted immediately. (2.) Obligations (ex die), which have a day adj usted to their performance. In these, dies statim occidit, sed non venit; a proper debt arises from the date of the obligation, because it is certain that the day will exist; but the exception is sus-pended till the lapse of that day. (3.) Conditional obligations; in which there is no proper debt (dies non occidit) till the condition be fulfilled, because it is possible the condition may never exist; and which therefore are said to create only the hope of a debt; but the grantor, even of these, has no right to resile. An obligation, to which a day is adj usted that possibly may never exist, implies a condition; dies in certa pro conditioni habetur. Thus, in the case of a provision to a child, payable when he attains to the age of fourteen, if the child dies before that age, the provision fails.

4. Obligations, when considered with regard to their cause, were divided by the Romans into those arising from contract, quasi contract, delict, and quasi delict; but there are certain obligations, even full and proper ones, which cannot be derived from any of these sources, and to which Lord Stair gives the name of obediential. Such as the obligation on parents to alment or maintain their children; which arises singly from the relation of parent and child, and may be enforced by the civil magistrate. Under parents are comprehended, the mother, grandfather, and grandmother, in their proper order. This obligation on parents extends to the providing of their issue in all the necessaries of life, and giving them suitable education; and their issue in the meantime may earn a livelihood by their own industry; but the obligation on parents to maintain their indigent children, and reciprocally on children to maintain their indigent parents, is perpetual. This obligation is, on the father’s death, transfused to the eldest son, the heir of the family; who, as representing the father, must alment his younger brother and sisters: the brothers are only entitled to almony till their age of twenty-one, after which they are presumed able to do for themselves; but the obligation to maintain the sisters continues till their marriage. In persons of lower rank, the obligation to alment the sisters ceases after they are capable of subsisting by any service or employment.

5. All obligations, arising from the natural duty of restitution, fall under this class; thus, things given upon the view of a certain event, must be restored, if that event does not afterwards exist: thus also, things given ob turpem causam, where the turpitude is in the receiver and not in the giver, must be restored. And on the same principle, one upon whose ground a house is built or repaired by another, is obliged, without any covenant, to restore the expense laid out upon it, in so far as it has been profitable to him.

6. A contract is the voluntary agreement of two or more persons, whereby something is to be given or performed upon one part, for a valuable consideration, either present or future, on the other part. Consent, which is implied in agreement, is excluded, (1.) By error in the essentials of the contract: for, in such case, the party does not properly contract, but errs or is deceived; and this may be also applied to contracts which take their rise from fraud or imposition. (2.) Consent is excluded by such a degree of restraint upon any of the contracting parties, as extorts the agreement; for where violence or threatening are used against a person, his will has really no part in the contract.

7. Loan, or mutuum, is that contract which obliges Loan, a person, who has borrowed any fungible subject from another, to restore to him as much of the same kind, and
and of equal goodness. Whatever receives its estimation in number, weight, or measure, is a fungible as corn, wine, current coin, &c. The only proper subjects of this contract are things which cannot be used without either their extinction or alienation; hence the property of the thing lent is necessarily transferred by delivery to the borrower, who consequently must run all the hazards either of its deterioration or its perishing, according to the rule, res perit suo domino. Where the borrower neglects to restore at the time and place agreed on, the estimation of the thing lent must be made according to its price at that time and in that place; because it would have been worth so much to the lender, if the obligation had been duly performed. If there is no place nor time stipulated for, the value is to be stated according to the price that the commodity gave when and where it was demanded. In the loan of money, the value put on it by public authority, and not its intrinsic worth, is to be considered. This contract is one of those called by the Romans unilateral, being obligatory only on one part; for the lender is subjected to no obligation: the only action therefore that it produces, is pointed against the borrower, that he may restore as much in quantity and quality as he borrowed, together with the damage the lender may have suffered through default of due performance.

8. Commodity is a species of loan, gratuitous on the part of the lender, where the thing lent may be used, without either its perishing or its alienation. Hence, in this sort of loan, the property continues with the lender; the only right the borrower acquires in the subject is its use, after which he must restore the individual thing that he borrowed; consequently, if the subject perishes, it perishes to the lender, unless it has perished by the borrower’s fault. What degree of fault or negligence makes either of the contracting parties liable to the other in damages, is comprehended under the following rules. Where the contract gives a mutual benefit to both parties, each contract is bound to exhibit a middle sort of diligence, such as a man of ordinary prudence uses in his affairs. Where one only of the parties has benefit by the contract, that party must use exact diligence; and the other who has no advantage by it, is accountable only for done, or for gross omissions, which the law construes to be done. Where one employs less care on the subject of any contract which implies an exonerant trust, than he is known to employ in his own affairs, it is considered as done.

9. Hence it will appear that this is a bilateral contract; the borrower must be exactly careful of the thing lent, and restore it at the time fixed by the contract, or alter that use is made of it for which it was lent: if he puts it to any other use, or neglects to restore it, at the time connected, and if the thing perishes thereafter, even by mere accident, he is bound to pay the value. On the other part, the lender is obliged to restore to the borrower such of the expenses disturbed by him on that subject as arose from any uncommon accident, but not those that naturally attend the use of it. Where a thing is lent gratuitously, without specifying any time of re-delivery, it constitutes the contract of precarium, which is revocable at the lender’s pleasure, and, being entered into from a personal regard to the borrower, ceases by his death.

10. Deposition is also a bilateral contract, by which one who has the custody of a thing committed to him (the depository) is obliged to restore it to the depositor. If a reward is bargain’d for by the depository for his care, it resolves into the contract of location. As this contract is gratuitous, the depository is only answerable for the consequences of gross neglect; but after the deposit is redeemed, he is accountable even for casual misfortunes. He is entitled to a full indemnification for the losses he has sustained by the contract, and to the recovery of all sums expended by him on the subject.

11. An obligation arises without formal paction, barely by a traveller’s entering into an inn, ship, or stable, and there depositing his goods, or putting up his horses; whereby the innkeeper, shipmaster, or stabler, is accountable, not only for his own facts and those of his servants (which is an obligation implied in the very exercise of these employments), but of the other guests or passengers; and, indeed, in every case, unless where the goods have been lost damnō fatali, or carried off by pirates or house-breakers. Not only the masters of ships, but their employers, are liable each of them for the share that he has in the ship; but by the present custom of trading nations, the goods brought into a ship must have been delivered to the master or mate, or entered into the ship books. Carriers fall within the intendment of this law; and practice has extended it to vintners within borough. The extent of the damage sustained by the party may be proved by his own oath in litem.

12. Sequestration, whether voluntarily consented to by the parties, or authorized by the judge, is a kind of deposit; but as the office of sequestrer, to whose care the subject in dispute is committed, is not considered as gratuitous, he cannot throw it up at pleasure, as a common depositary may do; and is liable in the middle degree of diligence. Consignation of money is also a deposit. It may be made, either where the debt is called in question by the debtor, as in suspensions; or where the creditor refuses to receive his money, as in wadsets, &c. The risk of the consigned money lies on the consignor, where he ought to have made payment, and not consignation; or has consigned only a part; or has chosen for consignatory, a person neither named by the parties nor of good credit. The charger, or other creditor, runs the risk, if he has charged for sums not due, or has without good reason refused payment, by which refusal the consignation became necessary. It is the office of a consignatory, to keep the money in safe custody till it is called for: if therefore he puts it out at interest, he must run the hazard of the debtor’s insolvency; but for the same reason, though he should draw interest for it, he is liable in none to the consignor.

13. Pledge, when opposed to wadset, is a contract, by which a debtor puts into the hands of his creditor a special moveable subject in security of the debt, to be re-delivered on payment. Where a security is established 5

must not now be understood to apply universally: for the court of session, in different cases which lately occurred before them, and founding upon the law and practice of England in similar cases, have found, that no hypothec exists for the expense of repairs done in a home port. Owners of ships have an hypothec on the cargo for the freight; heritors on the fruits of the ground; and landlords on the *invecta et illeta* for their rents. Writers also, and agents, have a right of hypothec, or more properly of retention, in their constituent's writings, for their claim of pains and disbursements. A creditor cannot, for his own payment, sell the subject impugnated, without applying to the judge ordinary for a warrant to put it up to public sale or roup; and to this application the debtor ought to be made a party.

Sect. XIV. Of Obligations by Word or Writ.

1. The appellation of verbal may be applied to all obligations to the constitution of which writing is not essential, which includes both real and consensual contracts; but as these are explained under separate titles, obligations by word, in the sense of this rubric, must be restricted, either to promises, or to such verbal agreements as have no special name to distinguish them. Agreement implies the intervention of two different parties, who come under mutual obligations to another. Where nothing is to be given or performed but on one part, it is properly called a promise; which, as it is gratuitous, does not require the acceptance of him to whom the promise is made. An offer, which must be distinguished from a promise, implies something to be done by the other party; and consequently is not binding on the offerer, till it be accepted, with its limitations or conditions, by him to whom the offer is made; after which, it becomes a proper agreement.

Writing.

2. Writing must necessarily intervene in all obligations and bargains concerning heritable subjects, though they should be only temporary; as tacks, which, when they are verbal, last but for one year. In these, no verbal agreement is binding, though it should be referred to the oath of the party; for, till writing is adhibited, law gives both parties a right to resile, as from an unfinished bargain; which is called locus *puellitcns*. If, upon a verbal bargain of lands, part of the price shall be paid by him who was to purchase, the *interiuntis reli*, the actual payment of money, creates a valid obligation, and gives a beginning to the contract of sale; and, in general, wherever matters are no longer entire, the right to resile seems to be excluded. An agreement, whereby a real right is passed from, or restricted, called *pacta quos loboratorum*, may be perfect ed verbally; for freedom is favourable, and the purpose of such agreement is rather to dissolve than to create an obligation. Writing is also essential to bargains made under condition that they shall be reduced into writing; for in such cases, it is *pars contractis*, that, till writing be adhibited, both parties shall have liberty to withdraw. In the same manner, verbal or nuncupative testaments are rejected by our law; but verbal legacies are sustained, where they do not exceed 100l Scots.

3. Anciently, when writing was little used, deeds were executed by the party appending his seal to them in presence of witnesses. For preventing frauds that might happen by appending seals to false deeds, the subscription also of the grantor was afterwards required, and, if he could not write, that of a notary. As an additional precaution, there might be of dangerous consequence to give full force to the subscription of the parties by initials, which is more easily counterfeited; our practice, in order to sustain such subscription, seems to require a proof, not only that the grantor used to subscribe in that way, but that de facto he had subscribed the deed in question; at least, such proof is required, if the instrumentary witnesses be still alive.

4. As a further check, it was afterwards provided, that all writings carrying any heritable right, and other deeds of importance, be subscribed by the principal parties, if they can subscribe; otherwise, by two notaries, before four witnesses specially designated. The subsequent practice extended this requisite of the designation of the witnesses to the case where the parties themselves subscribed. Custom has construed obligations for sums exceeding 100l Scots, to be obligations of importance. In a divisible obligation, ex. gr. for a sum of money, though exceeding 100l, the subscription of one notary is sufficient, if the creditor restricts his claim to 100l. But in an obligation indivisible, e. g. for the performance of a fact, if it be not subscribed in terms of the statute, it is void. When notaries thus attest a deed, the attestation or docquet must specially express that the grantor gave them a mandate to sign; nor is it sufficient that this be mentioned in the body of the writing.

5. In every deed, the name of him who writes it, with his dwelling place or other mark of distinction, must be inserted. The witnesses must both subscribe as witnesses, and their names and designations be inserted in the body of the deed. And all subscribing witnesses must know the grantor, and either see him subscribe, or hear him acknowledge his subscription; otherwise they are declared punishable as accessory to forgery. Deeds, decrees, and other securities, consisting of more than one sheet, may be written by way of book, in place of the former custom of pasting together the several sheets, and signing the joinings on the margin; provided each page be signed by the grantor, and marked by its number, and the testing clause express the number of pages.

6. Instruments of seisin are valid, if subscribed by one notary, before a reasonable number of witnesses; which is extended by practice to instruments of resignation. Two witnesses are deemed a reasonable number to every deed that can be executed by one notary. It is not necessary that the witnesses to a notorial instrument or execution see the notary or messenger sign; for they are called as witnesses to the transaction which is attested, and not to the subscription of the person attesting.

7. A new requisite has been added to certain deeds since the Union, for the benefit of the revenue: They must be executed on stamped paper, or parchment, paying a certain duty to the crown. These duties must also be paid before wrote upon, under a penalty; but they are so numerous and complex, that it would be tedious, even if it fell under our plan, to enter into an enumeration of them. They will be found at length
the person drawn on should not be designed, his acceptance presumes that it was he whom the drawer had in his eye. Bills drawn blank, in the creditor's name, fall under the statutory nullity; for though indorsements of bills are excepted from it, bills themselves are not. Not only the person drawn upon must sign his acceptance, but the drawer must sign his draught, before any obligation can be formed against the acceptor; yet it is sufficient in practice, that the drawer signs before the bill is produced in judgment; though it should be after the death both of the creditor and acceptor. A creditor in a bill may transmit it to another by indorsement, though the bill should not bear to his order; by the same rule that other rights are transmissible by assignation, though they do not bear to assignees.

12. The drawer, by signing his draught, becomes obligated for the value to the creditor in the bill, in cases the person drawn upon either does not accept, or after acceptance does not pay; for he is presumed to have received value from the creditor at giving him the draught, though it should not bear for value received. But, if the drawer was debtor to the creditor in the bill before the draught, the bill is presumed to be given towards payment of the debt, unless it expressly bears for value. The person drawn upon, if he refuses to accept, while he has the drawer's money in his hand, is liable to him in damages. As a bill presumes value from the creditor, indorsement presumes value from the indorser; who therefore, if he cannot obtain payment from the acceptor, has recourse against the indorser, unless the bill be indorsed in these words, without recourse.

13. Payment of a bill, by the acceptor, acquits both the drawer and him at the hands of the creditor; but it emotes the acceptor, if he was not the drawer's debtor, to an action of recourse against him; and, if he was, to a ground of compensation. Where the bill does not bear value in the hands of the person drawn upon, it is presumed that he is not the drawer's debtor, and consequently he has recourse against the drawer, ex mandato.

14. Bills, when indorsed, are considered as so many bags of money delivered to the onerous indorser; which therefore carry right to the contents, free of all burdens that do not appear on the bills themselves. Hence, a receipt or discharge, by the original creditor, if granted on a separate paper, does not exempt the acceptor from second payment to the indorsee; hence, also, no ground of compensation competent to the acceptor against the original creditor can be pleaded against the indorsee: but, if the debtor shall prove, by the oath of the indorsee, either that the bill is indorsed to him for the indorser's own behoof, or that he paid not the full value for the indorsation, the indorsee is justly considered as but a name; and therefore all exceptions, receivable against the original creditor, will be sustained against him. A protested bill, after registration, cannot be transmitted by indorsement, but by assignation.

15. Bills must be negotiated by the possessor, against negein. The person drawn upon, within a precise time, in order to preserve recourse against the drawer. In case it should be payable so many days after sight, the creditor has a discretion: power of fixing the payment somewhat sooner or later, as his occasions shall require. Bills payable on a day certain, need not be presented for acceptance till the day of payment, because that day can...
neither be prolonged nor shortened by the time of acceptance. For the same reason the acceptance of bills, payable on a precise day, need not be dated; but, where a bill is drawn payable so many days after sight, it must; because that the term of payment depends on the date of acceptance.

Days of grace.

16. Though bills are, in strict law, due the very day on which they are made payable, and may therefore be protested on the day thereafter; yet there are three days immediately following the day of payment, called days of grace, within any of which the creditor may protest the bill; but if he delay protesting till the day after the last day of grace, he loses his recourse. Where a bill is protested, either from not acceptance or not payment, the dishonour must be notified to the drawer or indorser, within three posts at farthest. This strictness of negotiation is confined to such bills as may be protested by the possessor upon the third day of grace: where, therefore, bills are indorsed after the days of grace are expired, the indorsee is left more at liberty, and does not lose his recourse, though he should not take a formal protest for not payment, if, within a reasonable time, he shall give the indorser notice of the acceptor’s refusing to pay. Not only does the possessor, who neglects strict negotiation, lose his recourse against the the drawer, where the person drawn upon becomes afterwards bankrupt; but though he should continue solvent: for he may in that case recover payment from the debtor, and so is not to be indulged in an unnecessary process against the drawer, which he has tacitly renounced by his negligence. Recourse is preserved against the drawer, though the bill should not be duly negotiated, if the person drawn upon was not his debtor; or for there the drawer can qualify no prejudice by the neglect of diligence, and he ought not to have drawn on one who owed him nothing.

17. The privileges superadded to bills by statute are, that though, by their form, they can have no clause of registration, yet, if duly protested, they are registrable within six months after their date in case of not acceptance, or in six months after the term of payment in the case of not payment; which registration is made the foundation of summary diligence, either against the drawer or indorser in the case of not acceptance, or against the acceptor in the case of not payment. This is extended to inland bills, i.e. bills both drawn and made payable in Scotland. After acceptance, summary diligence lies against no other than the acceptor; the drawer and indorser must be pursued by an ordinary action. It is only the principal sum in the bill, and interest, that can be charged for summarily: the exchange, when it is not included in the draught, the re-exchange incurred by suffering the bill to be protested and returned, and the expense of diligence, must all be recovered by an ordinary action; because these are not liquid debts, and so must be previously constituted.

18. Bills, when drawn payable at any considerable distance of time after date, are denied the privileges of bills: for bills are intended for currency, and not to lie as a security in the creditor’s hands. Bills are not valid which appear ex facie to be donations. No extrinsic stipulation ought to be contained in a bill which deviates from the proper nature of bills: hence, a bill to which a penalty is adjourned, or with a clause of interest from the date, is null. Inland proceps drawn, not for money, the medium of trade, but for fungibles, are null, as wanting writer’s name and witnesses. It is not an agreed point whether promissory notes, without writer and witnesses, unless holograph, are probative.

19. So stood the law of Scotland, in regard to bills and later promissory notes, previous to the statute 12 Geo. III. as to bills and By that statute, however, the law of Scotland has undergone very material alterations. They are declared to have the same privileges, and to prescribe in six years after the term of payment. Bank notes and private bills are excepted from this prescription: nor does it run during the years of the creditor’s minority. Inland bills and promissory notes must be protested within the days of grace, to secure recourse; and the dishonour notified within 14 days after the protest. Summary diligence may pass not only against the acceptor, but likewise against the drawer, and all the indorsers jointly and severally; and at the instance of any indorser, though the bill was not protested in his name, upon his producing a receipt or letter from the protesting indorser. This act was in force only for seven years after 15th May 1772, and to the end of the then next session of parliament. But as it was found by experience that it had been of great advantage to Scotland, it was made perpetual by the late act 23 Geo. III. so that it has now become a permanent part of the law of Scotland.

20. As for the solemnities essential to deeds signed in a foreign country, where they come to receive execution in Scotland, it is a general rule, that no law can be of authority beyond the dominions of the lawgiver. Hence, in strictness, no deed, though perfected according to the law of the place where it is signed, can have effect in another country where different solemnities are signed in a required to a deed of that sort. But this rigour is so softened ex comitate, by the common consent of nations, that all personal obligations granted according to the law of that country where they are signed, are effectual everywhere; which obtains in obligations to convey heritage. Conveyances themselves, however, of heritable subjects must be perfected according to the law of the country where the heritage lies, and from which it cannot be removed.

21. A writing, while the granter keeps it under his own power or his doer’s, has no force; it becomes ob-solvent, only after it is delivered to the grantee him-selves, or found in the hands of a third person. As to which last, the following rules are observed. A deed found in the hands of one who is doer both for the granter and grantee, is presumed to have been put in his hands as doer for the grantee. The presumption is also for delivery, if the deed appears in the hands of one who is a stranger to both. Where a deed is deposited in the hands of a third person, the terms of deposit may be proved by the oath of the depository, unless where they are reduced into writing. A deed appearing in the custody of the grantee himself is considered as his absolute right; insomuch that the granter is not allowed to prove that it was granted in trust, otherwise than by a written declaration signed by the trustee, or by his oath.

22. The following deeds are effectual without delivery. (1.) Writings containing a clause dispensing effectual with the delivery: these are of the nature of revocable without delivery, deeds, where the death of the granter is equivalent to
L

quantity of farm-wheat, sold without distinguishing the parcel to be delivered from the rest of the farm. (3.) The periculum lies on the vender till delivery, if he be obliged by a special article in the contract to deliver the subject at a certain place.

4. Location is that contract where a hire is stipulated for the use of things, or for the service of persons. He who lets his work or the use of his property to hire is the locatice or lessor; and the other, the conductor or lessee. In the location of things, the lessee is obliged to deliver the subject, fitted to the use it was let for; and the lessor must preserve it carefully, put it to no other use, and, after that is over, restore it. Where a workman or artificer lets his labour, and if the work is either not performed according to contract, or if it be insufficient, even from mere unskillfulness, he is liable to his employer in damages, for he ought not, as an artificer, to have undertaken a work to which he was not equal. A servant hired for a certain term is entitled to his full wages, though from sickness or other accident he should be disabled for a part of his time: but if he die before the term, his wages are only due for the time he actually served. If a master dies, or without good reason turns off, before the term, a servant who eats in his house, the servant is entitled to his full wages, and to his maintenance till that term; and, on the other part, a servant who without ground deserts his service, forfeits his wages and maintenance, and is liable to his master in damages.

5. Society or copartnership is a contract, whereby the society of several partners agree concerning the communication of loss and gain arising from the subject of the contract. It is formed by the reciprocal choice which the partners make one of another; and so is not constituted in the case of co-heirs, or of several legateses in the same subject. A copartnership may be so constituted, that one of the partners shall, either from his sole right of property in the subject, or from his superior skill, be entitled to a certain share of the profits, without being subjected to any part of the loss; but a society, where one partner is to bear a certain proportion of the loss without being entitled to an any share of the profits, called by the Romans societas leonina, is justly reprobated. All the partners are entitled to shares of profit and loss proportioned to their several stocks where it is otherwise covenanted.

6. As partners are united, from a delectus persona, in a kind of brotherhood, no partner can, without a special power contained in the contract, transfer any part of his share to another. All the partners are bound in solidum by the obligation of any one of them, if he subscribe by the first or social name of the company; unless it be a deed that falls not under the common course of administration. The company effects are the common property of the society subjected to its debts; so that no partner can claim a division thereof, even after the society is dissolved, till they are paid; and, consequently, no creditor of a partner can, by diligence, carry to himself the property of any part of the common stock, in prejudice of a company creditor: but he may, by arrestment, secure his debtor's share in the company's hands, to be made forthcoming to him at the close of the copartnership, in so far as it is not exhausted by the company debts.

7. Society being founded in the mutual confidence among
among the socii, is dissolved, not only by the renunciation, but by the death of any one of them, if it be not otherwise specially covenanted. A partner who renounces upon unfair views, or at a critical time, when his withdrawing may be fatal to the society, looses his partners from all their engagements to him, while he is bound to them for all the prelms he shall make by his withdrawing, and for the loss arising thereby to the company. Not only natural, but civil death, e.g. arising from a sentence inflicting capital punishment, makes one incapable to perform the duties of a partner, and consequently dissolves the society. In both cases of death and renunciation, the remaining partners may continue the copartnership, either expressly, by entering into a new contract; or tacitly, by carrying on their trade as formerly. Public trading companies are now every day constituted, with rules very different from those which either obtained in the Roman law, or at this day obtain in private societies. The proprietors or partners in these, though they may transfer their shares, cannot renounce; nor does their death dissolve the company, but the share of the deceased descends to his representative.

A joint trade is not a copartnership, but a momentary contract, where two or more persons agree to contribute a sum, to be employed in a particular course of trade, the produce whereof is to be divided among the adventurers; according to their several shares, after the voyage is finished. If, in a joint trade, that partner who is intrusted with the money for purchasing the goods, should, in place of paying them in cash, buy them upon credit, the furnish who followed his faith alone in the sale, has no recourse against the other adventurers, he can only recover from them what of the buyer's share is yet in their hands. Where any one of the adventurers in a joint trade becomes bankrupt, the others are preferable to his creditors, upon the common stock, as long as it continues undivided, for their relief of all the engagements entered into by them on account of the adventure.

Mandate. 9. Mandate is a contract, by which one employs another to manage any business for him; and by the Roman law, it must have been gratuitous. It may be constituted tacitly, by one's suffering another to act in a certain branch of his affairs, for a tract of time together, without challenge. The mandate is at liberty not to accept of the mandate; and, as his powers are solely founded in the mandant's commission, he must, if he undertakes it, strictly adhere to the directions given him: Nor is it a good defence, that the method he followed was more rational; for in that his employer was the proper judge. Where no special rules are prescribed, the mandatory, if he acts prudently, is secure, whatever the success may be; and he can sue for the recovery of all the expenses reasonably disbursed by him in the execution of his office.

10. Mandate may be general, containing a power of administering the mandant's whole affairs; but no mandate implies a power of disposing gratuitously of the constituent's property, nor even of selling his heritage for an adequate price; but a general mandate may sell such of the moveables as must otherwise perish. No mandatory can, without special powers, transact doubtful claims belonging to his constituent, or refer them to arbitrators.

Part III.

11. Mandates expire, (1.) By the revocation of the employer, though only tacit, as if he should name another mandator for the same business. (2.) By the renunciation of the mandatory; even after he has executed a part of his commission, if his office be gratuitous. (3.) By the death either of the mandant or mandatory: But if matters are not entire, the mandate continues in force, notwithstanding such revocation, renunciation, or death. Procureurs of resignation and precepts of seisin are made out in the form of mandates; but, because they are granted for the sole benefit of the mandatory, all of them, excepting precepts of clari constit, are declared (by act 1693) to continue after the death either of the grantor or grantee. Deeds which contain a clause or mandate for registration, are for the same reason made registrable after the death of either (by act 1693 and 1696).

12. The favour of commerce has introduced a tacit mandate, by which masters of ships are empowered to contract in name of their exercitors or employers, for repairs, ship-provisions, and whatever else may be necessary for the ship or crew; so as to oblige not themselves only, but their employers. Whoever has the actual charge of the ship is deemed the master, though he should have no commission from the exercitors, or should be substituted by the master in the direction of the ship without their knowledge. Exercitors are liable, whether the master has paid his own money to a merchant for necessities, or has borrowed money to purchase them. The furnish or lender must prove that the ship needed repairs, provision, &c. to such an extent; but he is under no necessity to prove the application of the money or materials to the ship's use. If there are several exercitors, they are liable singuli in solidum. In the same manner the undertaker of any branch of trade, manufacture, or other land negociation, is bound by the contracts of the institors whom he sets over it, in so far as relates to the subject of the procussura.

13. Contracts and obligations, in themselves imper Yomologate, receive strength by the contractor or his heirs doing, ing any act thereafter which imports an approbation of them, and consequently supplies the want of an original legal consent. This is called homologation; and it takes place even in deeds intrinsically null, whether the nullity arises from the want of statutory solemnities or from the incapacity of the grantee. It cannot be inferred, (1.) By the act of a person who was not in the knowledge of the original deed; for one cannot approve what he is ignorant of. (2.) Homologation has no place where the act or deed, which is pleaded as such, can be ascribed to any other cause; for an intention to come under an obligation is not presumed.

14. Quasi-contracts are formed without explicit consent, by one of the parties doing something which by its nature either obliges him to the other party, or the other party to him. Under this class may be reckoned tutoriy, &c. the entry of an heir, negotiorum gestio, indebit solutio, communion of goods between two or more common proprietors, and mercium jactus levandar causas. Negotiorum gestio forms those obligations which arise from the management of a person's affairs, in his absence, by another, without any mandate. As such manager acts without authority from the proprietor, he ought to be liable in exact diligence, unless he has

Digitized by Google
from friendship interposed in affairs which admitted no delay: and he is accountable for his intromissions with interest. On the other part, he is entitled to the recovery of his necessary disbursements on the subject, and to be relieved of the obligations in which he may have bound himself in consequence of the management.

15. Indebit solutio, or the payment to one of what is not due to him, if made through any mistake, either of fact, or even of law, founds him who made the payment in an action against the receiver for repayment (condictio indebitis). This action does not lie, (1) If the sum paid was due ex equitate, or by a natural obligation: for the obligation to restore is founded solely in equity. (2) If he who made the payment knew that nothing was due: for qui custulo dat quod non debetat, presumitur donare.

16. Where two or more persons become common proprietors of the same subject, either by legacy, gift, or purchase, without the view of copartnership, an obligation is thereby created among the proprietors to communicate the profit and loss arising from the subject, while it remains common: And the subject may be divided at the suit of any having interest. This division, where the question is among the common proprietors, is according to the valuation of their respective properties: But where the question is between the proprietors and those having servitudes upon the property, the superfice is only divided, without prejudice to the property. Commons belonging to the king, or to royal boroughs, are not divisible. Lands lying runrig, and belonging to different proprietors, may be divided, with the exception of borough and incorporated acres; the execution of which is committed to the judge ordinary, or justices of the peace.

17. The throwing of goods overboard, for lightening a ship in a storm, creates an obligation, whereby the owners of the ship and goods saved are obliged to contribute for the relief of those whose goods were thrown overboard, so that all may bear a proportional loss of the goods ejected for the common safety. In this contribution, the ship's provisions suffer no estimate. A master who has cut his mast, or parted with his anchor, to save the ship, is entitled to this relief: but if he has lost them by the storm, the loss falls only on the ship and freight. If the election does not save the ship, the goods preserved from shipwreck are not liable in contribution. Election may be lawfully made, if the master and a third part of the mariners judge that measure necessary, though the owner of the goods should oppose it: and the goods ejected are to be valued at the price that goods of the same sort which are saved shall be afterwards sold for.

18. There are certain obligations which cannot subsist by themselves, but are necessitations to, or make a part of, other obligations. Of this sort are fiduciation, and the obligation to pay interest. Cautiony, or fiduciation, is that obligation by which one becomes engaged as security for another, that he shall either pay a sum, or perform a deed.

19. A cautioner for a sum of money may be bound, either simply as cautioner for the principal debtor, or conjunctly and severally for and with the principal debtor. The first has, by our customs, the beneficium ordinis, or of discussion; by which the creditor is obliged to discuss the proper debtor, before he can insist for payment against the cautioner. Where one is bound as full debtor with and for the principal, or conjunctly and severally with him, the two obligants are bound equally in the same obligation, each in solidum; and consequently, the cautioner, though he is but an accessory, may be sued for the whole, without either discussing or even citing the principal debtor. Cautioners for performance of acts by another, or for the faithful discharge of an office (e.g. for factors, tutors, etc.), cannot by the nature of their engagement be bound conjunctly and severally with the principal obligant, because the fact to which the principal is bound cannot possibly be performed by any other. In such engagements, therefore, the failure must be previously constituted against the proper debtor, before action can be brought against the cautioner for making up the loss of the party suffering.

20. The cautioner, who binds himself at the desire of the principal debtor, has an actio mandati or of relief against him, for recovering the principal and interest paid by himself to the creditor, and for necessary damages: which action lies de jus, though the creditor should not assign to him on payment. As relief against the debtor is implied in fidejussory obligations, the cautioner, where such relief is cut off, is no longer bound: hence the defence of prescription frees the cautioner, as well as the principal debtor.

21. But (1) Where the cautionary is interposed to an obligation merely natural, the relief is restricted to the sums that have really turned to the debtor's profit. (2) A cautioner who pays without citing the debtor, loses his relief, in so far as the debtor had a relevant defence against the debt, in whole or in part. Relief is not competent to the cautioner, till he either pays the debt, or is distressed for it; except, 1st, Where the debtor is expressly bound to deliver to the cautioner his obligation cancelled, against a day certain, and has failed; or, 2ndly, Where the debtor is vergens ad inopiam; in which case the cautioner may, by proper diligence, secure the debtor's funds for his own relief, even before payment or distress.

22. A right of relief is competent de jus to the cautioner, who pays, against his co-cautioners, unless where the cautioner appears to have renounced it. In consequence of this implied relief, a creditor, if he shall grant a discharge to any one of the cautioners, must, in demanding the debt from the others, deduct that part as to which he has cut off their relief by that discharge. Where the principal debtor, in a bond in which the cautioner is bound, grants bond of corroboration with a new cautioner, both cautioners, as they intervene for the same debt, and at the desire of the same debtor, have a mutual relief against each other; but where the cautioner in the first bond signs as a principal obligant in the corroboration, the cautioner in the new bond, it would seem, would be entitled to a total relief against the first cautioner. At the same time, the decisions of the court of session are not perfectly at one upon this branch of the doctrine of cautionary.

23. Cautionary is also judicial, as in a suspension. If Judicial is sufficient to loose the cautioner, that when he became cautionary, the suspender had good reason to suspend, e.g. if the charger had at that period no title, or had not then performed his part, though these grounds of suspension
pension should be afterwards taken off. In all maritime causes, where the parties are frequently foreigners, the defendant must give caution judicio sìstì et judicatus solvi: such cautioner gets free by the death of the defendant before sentence, but he continues bound, though the cause should be carried from the admiralty to the court of session. This sort of caution is only to be expected in causes strictly maritime.

24. It happens frequently, that a creditor takes two or more obligants bound to him, all as principal debtors, without seisin or possession. Where they are so bound, for the performance of facts that are in themselves indivisible, they are liable each for the whole or singuli in solidum. But, if the obligation be for a sum of money, they are only liable pro rata; unless, (1.) Where they are in express words bound conjunctively and severally; or, (2.) In the case of bills or promissory notes. One of several obligants of this sort, who pays the whole debt, or fulfills the obligation, is entitled to a proportional relief against the rest; in such manner, that the loss must, in every case, fall equally upon all the solvent obligants.

25. Obligations for sums of money are frequently accompanied with an obligation for the annuity of interest thereof. Interest (usura) is the profit due by the debtor of a sum of money, to the creditor for the use of it. The canon law considered the taking of interest as unlawful: the law of Moses allowed it to be exacted from strangers; and all the reformed nations of Europe have found it necessary, after the example of the Romans, to authorise it at certain rates fixed by statute. Soon after the Reformation, our legal interest was fixed at the rate of 20 per cent. per annum: from which time it had been gradually reduced, till at last, by 23 Ann. stat. 2. c. 16. it was brought to five per cent. and has continued at that rate ever since.

26. Interest is due, either by law or by action. It is due by law, either from the force of statute, under which may be included acts of sedentum, or from the nature of the transaction. Bills of exchange, and inland bills, though they should not be protested, carry interest from their date in case of non acceptance; or from the day of their falling due, in case of acceptance and non payment. Where a bill is accepted, which bears no term of payment, or which is payable on demand, no interest is due till demand be made of the sum, the legal voucher of which is a notarial protest. Interest is due by a debtor after demurrage, for all the sums contained in the diligence, even for that part which is made up of interest. Sums paid by cautioners on distress carry interest, not only to the principal sum in the obligation, but as to the interest paid by the cautioner. Factors named by the court of session are liable for interest, by a special act of sedentum; see No. clxxii. 11.

27. It arises ex lege, or from the nature of the transaction, that a purchaser in a sale is liable in interest for the price of the lands bought from the term of his entry, though the price should be arrested in his hands, or though the seller should not be able to deliver to him a sufficient progress or title to the lands; for no purchaser can in equity enjoy the fruits of the land, while at the same time he retains the interest of the price: but lawful consignation of the price made by a purchaser, upon the refusal of the person's having right to receive it, stops the currency of interest. Where one intercedes with money belonging to another which carries interest, he ought to restore it sum omni obstante et causa; and is therefore liable in the interest of it, as being truly an accessory of the subject itself. It is also from the nature of the transaction, that interest is in certain cases allowed to merchants or others in name of damages.

28. Interest is due by express action, where there is a clause in a bond or obligation, by which money is made to carry interest. An obligation is not lawful, where it is agreed on, that the yearly interest of the sum lent, if it should not be paid punctually as it falls due, shall be accumulated into a principal sum bearing interest; but an obligation may be lawfully granted, not only for the sum truly lent, but for the interest to the day at which the obligation is made payable, whereby the intermediate interest is accumulated into a principal sum from the term of payment. Interest may be also due by implied action: Thus where the interest upon a debt is by a letter promised for time past, such promise implies a paction for interest as long as the debt remains unpaid; thus also the use of payment of interest presumes a paction, and when interest is expressed for one term, it is presumed to be bargained for till payment.

29. The subject matter of all obligations consists either of things or of facts. Things exempted from commerce cannot be the subject of obligation. (See section N. clxxxii. 2. One cannot be obliged to the performance of a fact naturally impossible; nor of a fact in itself immoral, for that is also in the judgment of law impossible. Since impossible obligations are null, no penalty or damage can be incurred for non-performance: but it is otherwise, if the fact be in itself possible, though not in the debtor's power; in which case the rule obtains, locum facti impræstabilis subit damnum et interesse.

30. An obligation, to which a condition is objected, either naturally or morally impossible, is in the general case null; for the parties are presumed not to have been serious. But such obligation is valid, and the condition thereof held pro non scripta, (1.) In testaments: (2.) In obligations, to the performance of which the granter lies under a natural tie, as in bonds of provision to a child. Where an obligation is granted under a condition, lawful but unfavourable, e. g. that the creditor shall not marry without the consent of certain friends, no more weight is given to the condition than the judge thinks reasonable. A condition, which is in some degree in the power of the creditor himself, is held as fulfilled, if he has done all he could to fulfil it. Implement or performance cannot be demanded in a mutual contract, by that party who himself declines or cannot fulfil the counterpart.

31. Donation, so long as the subject is not delivered to the donee, may be justly ranked among obligations; and it is that obligation which arises from the mere good will and liberality of the granter. Donations imply no warrandice, but from the future facts of the donor. They are hardly revocable by our law for ingratitude, though it should be of the grossest kind: those betwixt man and wife are revocable by the
the donor, even after the death of the donee; but re-
muneratory grants, not being truly donations, cannot
be so revoked. That special sort of donation, which
is constituted verbally, is called a promise. The Ro-
man law entitled all donors to the beneficium com-
teniae, in virtue of which they might retain such part
of the donation as was necessary for their own subsis-
tence. Our law affords this benefit to fathers, with
respect to the provisions granted to their children;
and to grandfathers, which is a natural consequence
of children's obligation to aliment their indigent pa-
rents; but to no collateral relation, not even to bro-
thers.

32. Donations made in contemplation of death, or
mortis causa, are of the nature of legacies, and like
them revocable; consequently, not being effectual in
the granter's life, they cannot compete with any of
his creditors; not even with those whose debts were
contracted after the donation. They are understood
to be given from a personal regard to the donee, and
therefore fall by his predecease. No deed, after de-
ivery, is to be presumed a donation mortis causa; for
revocation is excluded by delivery.

33. Deeds are not presumed, in dubio, to be dona-
tions. Hence, a deed by a debtor to his creditor, if
donation be not expressed, is presumed to be granted
in security or satisfaction of the debt; but bonds of
provision to children are, from the presumption of pa-
tenance, construed to be intended as an addi-
tional provision; yet a tocher, given to a daughter
in her marriage contract, is presumed to be in satis-
faction of all former bonds and debts; because mar-
rriage contracts usually contain the whole provisions
in favour of the bride. One who aliment a person that
is come of age, without an express act for board,
is presumed to have entertained him as a friend, unless
in the case of those who earn their living by the enter-
tainment or board of strangers. But aliment given
to minors, who cannot bargain for themselves, is not
accounted a donation; except either where it is pre-
sumed from the near relation of the person alimenting,
it was given ex piate; or where the minor had a
father or curators, with whom a bargain might have
been made.

Sect. XVI. Of the Dissolution or Extinction of Obliga-
tions.

1. Obligations may be dissolved by performance,
or implement, consent, compensation, novation, and con-
fusion. (1.) By specific performance; thus, an obli-
gation for a sum of money is extinguished by payment.
The creditor is not obliged to accept payment by parts,
unless where the sum is payable by different divi-
sions. If a debtor in two or more separate bonds to
the same creditor, made an indefinite payment, with-
out ascribing it at the time to any one of the obliga-
tions, the payment is applied, 1st, To interest, or to
suns not bearing interest. 2dly, To the sums that are
least secured, if the debtor thereby incur no rigorous
penalty. But, 3dly, If this application be penal on
the debtor, e.g. by suffering the legal of an adjudica-
tion to ensue, the payment will be applied so as to
save the debtor from that forfeiture. Where one of the
debts is secured by a cautioner, the other not, the ap-
plication is to be so made, ceteris paribus, that both
creditor and cautioner may have equal justice done to
them.

2. Payment made by the debtor upon a mistake in
fact, to one whom he believed, upon probable grounds,
to have the right of receiving payment, extinguishes
the obligation. But payment made to one, to whom
the law denies the power of receiving it, has not this
effect; as if a debtor, seized by letters of captation,
should make payment to the messenger; for ignoriantia
periculo uitius excusat. In all debts, the debtor, if he
be not interpellated, may safely pay before the term, ex-
cept in tuck duties or feu duties; the payment where-
of, before the terms at which they are made payable,
is construed to be collusive, in a question with a cre-
ditor of the landlord or superior. Payment in dubio
presumed, by the voucher of the debt being in the
hands of the debtor; chirographum, apo defbitorum
repertum, praeconit solutum.

3. Obligations are extinguishable by the consent of
the creditor, who, without full implement, or even
sent any implement, may renounce the right constituted in
his own favour. Though a discharge or acquittance
granted by one whom the debtor bona fide took for
the creditor, but who was not, extinguishes the obli-
gation, if the satisfaction made by the debtor was
real; yet where it is imaginary, the discharge will
not screen him from paying to the true creditor the
debt for which he had made no prior satisfaction. In
all debts which are constituted by writing, the extinc-
tion, whether it be by specific performance or bare
consent, must be proved, either by the oath of the
creditor, or by a discharge in writing; and the same
solemnities which law requires in the obligation, are
necessary in the discharge; but, where payment is
made, not by the debtor himself, but by the creditor's
intromission with the rents of the debtor's estate, or by
delivery to him of goods in name of the debtor, such
delivery or intromission, being facti, may be proved by
witnesses, though the debt should have been not only
constituted by writing, but made real on the debtor's
lands by adjudication.

4. A discharge, though it should be general, of all
that the granter can demand, extends not to debts of
an uncommon kind, which are not presumed to have
been under the granter's eye. This doctrine applies
also to general assignations. In annual payments, as
of rents, feu-duites, interest, &c. three consecutive dis-
charges by the creditor, of the yearly or termly duties,
preserve the payment of all precedings. Two discharges
by the ancestor, and the third by the heir, do not infer
this presumption, if the heir be ignorant of the ances-
tor's discharges. And discharges by an administrator,
as a factor, tutor, &c. presume only the payment of
all preceding duties incurred during his administra-
tion. This presumption arises from repeating the dis-
cargas thrice successively; and so does not hold in
the case of two discharges, though they should include the
duties of three or more terms.

5. Where the same person is both creditor and com-
debtor to another, the mutual obligations, if they are penalties
for equal sums, are extinguished by compensation; if for unequal, still the lesser obligation is extinguished,
and the greater diminished, as far as the consequent
of debt and credit goes. To found compensa-
tion,
LAW

Each of the parties must be debtor and creditor at the same time. (2.) Each of them must be debtor and creditor in his own right. (3.) The mutual debts must be of the same quality: hence, a sum of money cannot be compensated with a quantity of corns; because, till the prices are fixed, at which the corns are to be converted into money, the two debts are incommensurable. Lastly, Compensation cannot be admitted, where the mutual debts are not clearly ascertained, either by a written obligation, the sentence of a judge, or the oath of the party. Where this requires but a short discussion, sentence for the pursuer is delayed for some time, ex equitate, that the defender may make good his ground of compensation. Where a debt for fungibles is ascertained in money by the sentence of a judge, the compensation can have no effect farther back than the liquidation; because, before sentence, the debts were incommensurable: but, where a debt for a sum of money is, in the course of a suit, constituted by the oath of the debtor, the compensation, after it is admitted by the judge, operates retro, in so far as concerns the currency of interest, to the time when, by the parties acknowledgment, the debt became due: for, in this case, the debtor's oath is not what creates the debt, or makes it liquid: it only declares that such a liquid sum was truly due before. Compensation cannot be offered after decree, either by way of suspension or reduction; unless it has been formerly pleaded, and unjustly repelled. Decrees in absence are excepted.

5. The right of retention, which bears a near resemblance to compensation, is chiefly competent, where the mutual debts, not being liquid, cannot be the ground of compensation; and it is sometimes admitted ex equitate in liquid debts, where compensation is excluded by statute: thus, though compensation cannot be pleaded after decree, either against a creditor or his assignee, yet, if the original creditor should become bankrupt, the debtor, even after decree, may retain against the assignee, till he gives security for satisfying the debtor's claim against the creditor. This right is frequently found in the expense disbursed on work employed on the subject retained, and so arises from the mutual obligations incumbent on the parties. It has never been disputed that retention of goods was competent, until payment or satisfaction of the debt incurred in relation to these goods; but it was found, by the court of session, in a case which was very lately before them, that goods could not be retained by a manufacturer until payment of a prior debt; the debt incurred upon the goods in his hands being offered; and although the debtor had become bankrupt, and the manufacturer must otherwise rank as a common creditor for his prior debt. But retention may be sustained, though the debt due to him who claims it does not arise from the nature of the obligation by which he is debtor: thus, a factor on a land estate may retain the sums levied by him in consequence of his factors, not only till be be paid of the disbursements made on occasion of such estate, but also till be discharged from the separate engagements he may have entered into on his constituent's account.

7. Obligations are dissolved by novation, whereby one obligation is changed into another, without changing either the debtor or creditor. The first obligation being thereby extinguished, the cautioners in it are loosed, and all its consequences discharged; so that the debtor remains bound only by the last. As the creditor to whom a right is once constituted, ought not to lose it by implication, novation is not easily presumed, and the new obligation is construed to be merely corroborative of the old; but, where the second obligation by express bears to be in satisfaction of the first, these words must necessarily be explained into novation. Where the creditor accepts of a new debtor, in place of the former who is discharged, this method of extinction is called delegation.

8. Obligations are extinguished confusions, where the debt and credit meet in the same person, either by succession or singular title, e.g. when the debtor succeeds to the creditor, or the creditor to the debtor, or a stranger to both; for one cannot be debtor to himself. If the succession, from which the confusion arises, happens afterwards to be divided, so as the debtor and creditor come again to be different persons; the confusion does not produce an extinction, but only a temporary suspension of the debt.

SECT. XVII. Of Assignations.

1. Heritable rights, when they are clothed with investiture, are transmitted by dispossess, which is a writing containing procuratory of resignation and precept of seisin; but those which either require no seisin, or on which seisin has not actually followed, are transmissible by simple assignation. He who grants the assignation is called the cedent; and he who receives it, the assignee or cessionary: if the assignee convey his right to a third person, the deed of conveyance is called a translation; and if he assigns it back to the cedent, a retrocession. Certain rights are, from the use to which they are destined, incapable of transmission, as alimentary rights: others cannot be assigned by the person invested in them, without special powers given to him; as tacks, reversions: the transmission of a third sort, is not presumed to be intended, without an express conveyance; as of paraphernal goods, which are so proper to the wife, that a general assignation, by her to her husband, of all that did or should belong to her at her decease, does not comprehend them. A different right is, by its nature, incapable of a proper transmission; but its profits may be assigned while it subsists.

2. Assignations must not only be delivered to the assignee, but intimated to him by the debtor. Intimations of assignations are considered as so necessary for completing the conveyance, that in a competition between two assignations, the last, if first intimated, is preferred.

3. Though, regularly, intimation to the debtor is made by an instrument, taken in the hands of a notary by the assignee or his procurator; yet the law admits equipollencies, where the notice of the assignation given to the debtor is equally strong. Thus, a charge on letters of horning at the assignee's instance, or a suit brought by him against the debtor, supplies the want of intimation; these being judicial acts, which expose the conveyance to the eyes both of the judge and of the debtor; or the debtor's promise of payment by writing to the assignee, because that is in effect a corroborating
Chap. II. Law of Scotland.

In what cases not necessary.

1. The diligences whereby a creditor may affect his debtor's moveable subjects, are arrestment and pouding. By arrestment is sometimes meant the securing of a criminal's person till trial; but as it is understood in the rubric of this title, it is the order of a judge, by which he who is debtor in a moveable obligation to the arrester's debtor, is prohibited to make payment or delivery till the debt due to the arrester be paid or secured. The arrester's debtor is usually called the common debtor; because, where there are two or more competing creditors, he is debtor to all of them. The person in whose hands the diligence is used is styled the arrester.

2. Arrestment may be laid on by the authority either

Vol. XI. Part II.

of the supreme court, or of an inferior judge. In the first case, it proceeds either upon special letters of arrestment, or on a warrant containing letters of haring: and it must be executed by a messenger. The warrants granted by inferior judges are called precepts of arrestment, and are executed by the officer proper to the court. Where the creditor to the common debtor is a pupil, arrestment is properly used in the hands of the tutor, as the pupil's administrator: this doctrine may perhaps extend to other general administrators, as commissioner, &c. But arrestment used in the hands of a factor or steward, cannot found an action of forthcoming without calling the constituent. Where the debtor to the common debtor is a corporation, arrestment must be used in the hands of the directors or treasurer, who represent the whole body. Arrestment, when it is used in the hands of the debtor himself, is inept; for that diligence is intended only as a restraint upon third parties.

3. All debts in which one is personally bound, though they should be heritably secured, are grounds upon which the creditor may arrest the moveable estate belonging to his debtor. Arrestments may proceed on a debt, the term of payment whereof is not yet come, in case the debtor be ertgens ad inopia. If a debt be not yet constituted by decree or registration, the creditor may arise and execute a summons against his debtor for payment, on which pending action arrestment may be used, in the same manner as inhibition, which is called arrestment upon a dependence. If one's ground of credit be for the performance of a fact, or if his depending process be merely declaratory, without a conclusion of payment or delivery, such claims are not admitted to be sufficient grounds for arrestment.

4. Moveable debts are the proper subject of arrestment; under which are comprived conditional arrestable debts, and even depending claims. For lessening the expense of diligence to creditors, all bonds which have not been made properly heritable by seisin are declared arrestable: but this does not extend to adjudications, wads, or other personal rights of lands, which are not properly debts. Certain moveable debts are not arrestable. (1.) Debts due by bill, which pass from hand to hand as bags of money. (2.) Future debts; for though inhibition extends to adquirenda as well as adquisita, yet arrestment is limited, by its warrant, to the debt due at the time of serving it against the arrestee. Hence, an arrestment of rents or interest carries only those that have already either fallen due or at least become current. Claims, depending on the issue of a suit, are not considered as future debts; for the sentence, when pronounced, has a retrospect to the period at which the claim was first founded. The like doctrine holds in conditional debts. (3.) Alimentary debts are not arrestable; for these are granted on personal considerations, and are not communicable to creditors: but the past interest due upon such debt may be arrested by the person who has furnished the alimony. One cannot secure his own effects to himself for his maintenance, so as they shall not be affectable by his creditors. Salaries annexed to offices granted by the king, and particularly those granted to the judges of the session, and the fees of servants, are considered as alimentary funds; but the surplus fee, over
and above what is necessary for the servant's personal use, may be arrested. It has also been found, that a
wadset sum consigned after an order of redemption used, but before decree of declarator, is not arrestable.

Effect of breach of arrestment.

5. If, in contempt of the arrestment, the arrestee
shall make payment of the sum, or deliver the goods
arrested, to the common debtor, he is not only liable
criminally for breach of arrestment, but he must pay
the debt again to the arrestee. As the law formerly
stood, an arrestment used at the market cross of Edin-
burgh, pier and shore of Leith, against a person
forth of the kingdom, was good; so that if the arrestee
made payment to his creditor after the date of the
arrestment, he was found liable in second payment to the
arrestee, because he had done all in his power to notify
his diligence. This, however, is very properly altered
by § 3. of the act of the 23d Geo. III. which declares
that an arrestment used at the market cross of Edin-
burgh, pier and shore of Leith, in the hands of any
person out of the kingdom, without other sufficient no-
tification, shall not interpret the arrestee from paying
bona fide to the original creditor. Arrestment is not
merely prohibitory, as inquisitions are; but is a step of
diligence which founds the user in a subsequent action
whereby the property of the subject arrested may be
adjudged to him. It therefore does not, by our latter
practice, fall by the death of the arrestee; but continues
to subsist, as a foundation for an action of forthcoming
against his heir, while the subject arrested remains in
medio. Far less is arrestment lost, either by the death
of the arrestee, or of the common debtor.

Loosing of arrestment.

6. Where arrestment proceeds on a depending
arrestment, it may be loosed by the common debtor's giving
security to the arrestee for his debt in the event it shall
be found due. Arrestment founded on decrees, or on
registered obligations, which in the judgment of law
are decrees, cannot be loosed but upon payment or con-
signation; except, (1.) Where the term of payment of
the debt is not yet come, or the condition has not
yet existed. (2.) Where the arrestment has proceed-
ed on a registered contract, in which the debts or mu-
tual obligations are not liquid. (3.) Where the
decree is suspended, or turned into a libel: for, till the
suspension be discussed, or the pending action conclu-
ded, it cannot be known whether any debt be truly
due. A loosing takes off the nexus which had been
laid on the subject arrested; so that the arrestee may
thereafter pay safely to his creditor, and the cautioner
is substituted in place of the arrestment, for the arrest-
ee's security: yet the arrestee may, while the subject
continues with the arrestee, pursue him in a forthcoming,
notwithstanding the loosing.

Forthcoming on arrestment.

7. Arrestment is only an inchanted or begun di-
glene; to perfect it, there must be an action brought
by the arrestee against the arrestee, to make the debt
or subject arrested forthcoming. In this action, the
common debtor must be called for his interest, that he
may have an opportunity of excepting to the lawfulness
or extent of the debt on which the diligence pro-
ceeded. Before a forthcoming can be pursued, the
debt due by the common debtor to the arrestee must be
liquidated; for the arrestee can be no further entitled
to the subject arrested than to the extent of the debt
due to him by the common debtor. Where the sub-
ject arrested is a sum of money, it is, by the decree of
forthcoming, directed to be paid to the pursuer towards
satisfying his debt; where goods are arrested, the judge
ordains them to be exposed to sale, and the price to be
delivered to the pursuer. So that, in either case de-
crees of forthcoming are judicial assignations to the ar-
restee of the subject arrested.

8. In all competitions, regard is had to the dates, Preference
not of the grounds of debt, but of the diligences pro-
ceeding upon them. In the competition of arrestments,
the preference is governed by their dates, according to
the priority even of hours, where it appears with any
certainty which is the first. But, as arrestment is but
a begun diligence, therefore if a prior arrestee shall
neglect to insist in an action of forthcoming for such a
time as may be reasonably construed into a desertion of
his begun diligence, he loses his preference. But, as
deliction of diligence is not easily presumed, the dis-
course of above two years, between the first arrestment
and the decree of forthcoming, was found not to make
such a mora as to entitle the posterior arrestee to a
preference. This rule of preference, according to the
dates of the several arrestments, holds by our present
practice, whether they have proceeded on a decree or
on a dependence; on debts not yet payable, or on
debts already payable; provided the pendency shall
have been closed, or the debt have become payable, be-
fore the issue of the competition.

By act 23d Geo. III. § 2. it is enacted, that when
a debtor is made bankrupt, in terms of the act 1696,
as thereby extended (clxxi. 13.), all arrestments
which shall have been used for attaching any personal
effects of such bankrupt within thirty days prior to the
bankruptcy, or within four kalender months immedi-
aply subsequent, shall be pari passu preferable; and in
order to save as far as possible the expense of a multi-
plicity of arrestments, it is declared, that where the effects
of a debtor are arrested by any creditor within
thirty days before the bankruptcy, or within four
months after it, and a process of forthcoming or mul-
tiple pouding is brought in which such arrestment is
founded on, it shall be competent for any other credi-
tor producing his interest, and making his claim in the
said process, at any time before the expiration of the
said four months, to be ranked in the same manner
as if he had used the form of arrestment; the expense of
raising the process, and of the diligence at the instance
of the creditor who raises it, being always paid out of
the common fund. We here again repeat, that the
enactments of this statute are only temporary, and not
yet a permanent part of the law of Scotland, whatever
they may become when the subject is resumed by the
legislature upon the expiry of the act.

9. In the competition of arrestments with assigna-
tions, an assignation by the common debtor, intimat-
ated before arrestment, is preferable to the arrestment.
If the assignation is granted before arrestment, but not
intimated till after it, the arrestee is preferred.

10. POINDING is that diligence affecting movable
subjects, by which their property is carried directly to
the creditor. No poinding can proceed, till a charge
be given to the debtor to pay or perform, and the days
thereof be expired, except poindings against vassals
for their feu-duties, and poindings against tenants for rent,
proceeding upon the landlord's own decree; in which
the ancient custom of poinding without a previous charge continues. A debtor’s goods may be poinded by one creditor, though they have been arrested before by another; for the assessment being but an imperfect diligence, it leaves the right of the subject still in the debtor, and so cannot hinder any creditor from using a more perfect diligence, which has the effect of carrying the property directly to himself.

11. No cattle pertaining to the plough, nor instruments of tillage can be poinded in the time of labouring or tilling the ground, unless where the debtor has no other goods. By labouring time is understood, that time, in which that tenant, whose goods are to be poinded, is ploughing, though he should have been earlier or later than his neighbours; but summoning does not fall under this rule.

12. In the execution of poinding, the debtor’s goods must be appraised, first, on the ground of the lands they are laid hold on, and a second time at the market cross of the jurisdiction, by the stated appraisers thereof; or, if there be none, by persons named by the messenger or other officer employed in the diligence. Next, the messenger must, after public intimation by three oyeses, declare the value of the goods according to the second appraisement, and require the debtor to make payment of the debt, including interest and expenses. If payment shall be offered to the creditor, or in his absence to his lawful attorney; or if, in case of refusal by them, consignation of the debt shall be made in the hands of the judge ordinary or his clerk, the goods must be left with the debtor; if not, the messenger ought to adjudge and deliver them over, at the appraised value, to the use of the diligence towards his payment: and the debtor is entitled to a copy of the warrant and executions, as a voucher that the debt is discharged in whole or in part by the goods poinded.

13. Ministers may poind for their stipends, upon one appraisement on the ground of the lands, and landlords were always in use to poind so, for their rents. Appraisement of the goods at the market cross of the next royal borough, or of the next head borough of stewartry or regality, though these jurisdictions be abolished, is declared as sufficient as if they were carried to the head borough of the shire. Poinding, whether it be considered as a sentence, or as the execution of a sentence, must be proceeded in between sun-rising and sun-setting; or at least it must be finished before the going off of day-light. The powers of the officer employed in the execution of poindings are not clearly defined by custom, in the case of a third party claiming the property of the goods to be poinded. This is certain, that he may take the oath of the claimant upon the verity of his claim; and if from thence it shall appear that the claimant’s title is collusive, he ought to proceed in the diligence; but if there remains the least doubt, his safest course is to deliver the goods to the claimant, and to express in his execution the reasons why poinding did not proceed.

14. Any person who stops a poinding via facti, on groundless pretences, is liable, both criminally, in the pains of deforacement (see No. clxxvi. 15.), and civilly, in the value of the goods which might have been poinded by the creditor.

By the foresaid statute 23. Geo. III. § 4. it is declared, that after a person is rendered bankrupt, as thereby directed, no poinding of the moveables belonging to such bankrupt, within 30 days before his bankruptcy, or within four calendar months thereafter, shall give a preference to such poinder over the other lawful creditors of the bankrupt; but the goods so poinded shall be considered as in medio, and the person receiving the price of them shall be liable to make the same forthcoming, so as that all the other creditors of the bankrupt who are possessed of liquidate grounds of debt or decrees for payment, shall be entitled to their proportion of the same; provided they make their claim by summoning the poinder at any time before the expiration of the said four months, deducting always the expense of such poinding from the first end of the price of such goods, together with 20 per cent. on the appraised value, which the poinder shall retain to account of his debt in preference to the other creditors; reserving liberty to him to rank on the remaining sum for the full amount of the debt contained in his diligence. And it is by the said act further declared, that where any person concerned in trade or manufactures is bankrupt, as before mentioned, it may be lawful for any creditor, to the amount of 100l. any two creditors to the amount of 150l. or any three or more creditors to the amount of 200l. or upwards, to apply for sequestration of the estate real or personal belonging to the debtor; after awarding which, an interim factor, and then a trustee, shall be chosen by the creditors, who is to conduct the business of the sequestration, according to the various rules fixed and laid down by the statute. The act, however, expressly excludes all others, except those concerned in trade or manufacture, from the benefit of the sequestration; but it is probable, when it comes to be renewed or digested in another form, this part of it will suffer an alteration.

SECT. XIX. Of Prescription.

cix.

1. Prescription, which is a method, both of establishing and of extinguishing property, is either positive or negative. Positive prescription is generally defined, as the Roman usucapio. The acquisition of property (it should rather be, when applied to our law, the securing it against all further challenge) by the possessor’s continuing his possession for the time which law has declared sufficient for that purpose: negative, is the loss or omission of a right, by neglecting to follow it forth, or use it, during the whole time limited by law. The doctrine of prescription, which is, by some writers, condemned as contrary to justice, has been introduced, that the claims of negligence creditors might not subsist forever, that property might be at last fixed, and forgeries discouraged, which the difficulty of detecting must have made exceeding frequent, if no length of time had limited the legal effect of writings.

2. Positive prescription was first introduced into our Positive law by 1617, c. 12 which enacts, that whoever shall have possessed his lands, annuallents, or other heritages, peaceably in virtue of investments, for 40 years continually after their dates, shall not thereafter be disquieted in his right by any person pretending a better title. Under heritages are comprehended every right that is fundo annexum, and capable of continual possess.
action where the pursuer is admitted to prove his libel by his own oath in item.

6. Servant's fees, house rents, men's ordinaries, (i.e. money due for board), and merchants accounts, fall under the triennial prescription, (by 1779, c. 83.). There is also a general clause subjoined to this statute, &c. of other the like debts, which includes alimentary debts, wages due to workmen, and accounts due to writers, agents, or procurators. These debts, may, by this act, be proved after the three years, either by the writing or oath of the debtor; so that they prescribe only as to the mean of proof by witnesses: but after the three years it behoves the creditor to refer to the debtor's oath, not only the constitution, but the subsistence of the debt. In the prescription of house rents, servants fees, and alimony, each term's rent, fee, or alimony, runs a separate course of prescription; so that in an action for these the claim will be restricted to the arrears incurred within the three years immediately before the citation: But, in accounts, prescription does not begin till the last article; for a single article cannot be called an account. Actions of removing must also be pursued within three years after the warning. Reductions of erroneous retours prescribe, if not pursued within 20 years.

7. Ministers stipends and muthures prescribe in five of minim years after they are due; and arrears of rent, five years after the tenant's removing from the lands. As the prescription of masts and duties was introduced in favour of poor tenants, that they might not suffer by neglecting to preserve their discharges, a proprietor of lands subject to a liferent, who had obtained a lease of all the liferented lands from the liferenter is not entitled to plead it, nor a tacksman of one's whole estate, who had by the lease a power of removing tenants. Bargains concerning moveables, or sums of money which are provable by witnesses, prescribe in five years after the bargain. Under these are included sales, locations, and all other consensual contracts, to the constitution of which writing is not necessary. But all the above-mentioned debts, may, after the five years, be proved, either by the oath or the writing of the debtor; of which above, (par. 6). A quinquennal prescription is established in arrestment whether on decrees or depending actions: The first prescribe in five years after using the arrestments, and the last in five years after sentence is pronounced on the depending action.

8. No person binding for or with another, either as limitation cautioner or co-principal, in a bond or contract for a sum of money, continues bound after seven years from the date of the bond, provided he has either a clause of relief in the bond, or a separate bond of relief, intimated to the creditor, at his receiving the bond. But all diligence used within the seven years against the cautioner shall stand good. As this is a public law, intended to prevent the bad consequences of rash engagements, its benefit cannot, before the lapse of the seven years, be renounced by the cautioner: As it is corrigible, it is strictly interpreted: Thus, bonds bearing a mutual clause of relief pro rata, fall not under it; nor bonds of corroboration, nor obligations, where the condition is not purified, or the term of payment not come within the seven years; because no diligence
a right can be either acquired or lost by it; so that interruption, made on the last day of the 40th year, breaks its course. The positive prescription runs against the sovereign himself, even as to his annexed property; but it is generally thought he cannot suffer the negative: he is secured against the negligence whom it of his officers in the management of his processes, by runs express statute, 1650, c. 14. The negative, as well as the positive prescription, runs against the church, though churchmen have but a temporary interest in their benefits. But because the rights of beneficiaries to their stipends are liable to accidents, through the frequent change of incumbents, 13 years possession does, by a rule of the Roman chancery which we have adopted, found a presumptive title in the beneficiary: but this is not properly prescription; for if by titles recovered, perhaps out of the incumbent's own hands, it shall appear that he has possessed tithes or other subjects to a greater extent than he ought, his possession will be restricted accordingly. This right must not be confounded with that established in favour of churchmen, which is confined to church lands and rents, and constitutes a proper prescription upon a possession of 30 years.

13. The clause in the act 1617, saving minors from prescription, is extended to the positive, as well as to the negative prescription; but the exception of minority is not admitted in the case of hospitals for children, where there is a continual succession of minors, that being a casus in solius. Minors are expressly excepted in several of the short prescriptions, as 1779, c. 13.—1769, c. 9.; but where law leaves them in the common case, they must be subject to the common rules.

14. Prescription does not run contra non volentes aeger; against one who is barred by some legal incapacity, from pursuing; for in such case, neither negligence nor dereliction can be imputed to him. This rule is, by a favourable interpretation, extended to wives, who ex reverentia martiali forbear to pursue actions competent to them against their husbands. On the same ground, prescription runs only from the time that the debt or right could be sued upon. Thus, inhibition prescribes only from the publishing of the deed granted to the inhibitor's prejudice; and in the prescription of removing, the years are computed only from the term at which the defender is warned to remove. Neither can prescription run against persons who are already in possession, and so can gain nothing by a pursuit. Thus, where a person who has two adjudications affecting the same lands, is in possession upon one of them, prescription cannot run against the other during such possession.

15. Certain rights are incapable of prescription: Certain (1.) Things that law has exempted from commerce, right is incapable of prescription; (2.) Res mercas facultatis, e. g. a faculty to charge a prescription subject with debts, to revoke, &c. cannot be lost by prescription; for faculties may, by their nature, be exercised at any time: hence, a proprietor's right of using any act of property on his own grounds cannot be lost by the greatest length of time. (3.) Exceptions competent to a person for clading an action, cannot prescribe, unless the exception is founded on a right productive of an action, e. g. compensation; such right must be insisted on within the years of prescription.
Obligations of yearly pensions or payments, though no demand has been made on them for 40 years, do not suffer a total prescription, but still subsist as to the arrears fallen due within that period; because prescription cannot run against an obligation till it be payable, and each year's pension or payment is considered as a separate debt.

16. No right can be lost non utendo by one, unless the effect of that prescription be to establish it in another. Hence the rule arises, juri sanguinis nunquam prescriptur. Hence also, a proprietor of land cannot lose his property by the negative prescription, unless he who objects it can himself plead the positive. On the same ground, a superior's right of feu duties cannot be lost non utendo; because being inherent in the superiority, it is truly a right of lands that cannot suffer the negative prescription, except in favour of one who can plead the positive; which the vassal cannot do, being destitute of a title. This rule applies also to parsonage tithes, which are an inherent burden upon all lands not specially exempt; and from which therefore the person liable cannot prescribe an immunity by bare non-payment: but such vicarage tithes as are only due where they are established by usage, may be lost by prescription. In all these cases, though the radical right cannot suffer the negative prescription, the bygone duties, not demanded within the 40 years, are lost to the proprietor, superior, or titular.

Prescription may be interrupted by any deed whereby the proprietor or creditor uses his right or ground of debt. In all interruptions, notice must be given to the possessor of the subject, or the debtor, that the proprietor or creditor intends to sue upon his right. All writings whereby the debtor himself acknowledges the debt, and all processes for payment brought, or diligences used against him upon his obligation, by harking, inhibition, arrestment, &c. must be effectual to interrupt prescription.

17. Interruptions by citation upon libelled summons, where they are not used by a minor, prescribe, if not renewed every seven years; but where the appearance of person, or any judicial act has followed thereupon, it is no longer a bare citation, but an action which subsists for 40 years. It has been found, that the sexennial prescription of bills is not interrupted by a blank citation, as practised in the court of admirality. Citations for interrupting the prescription of real rights must be given by messengers; and the summons, on which such citations proceed, must pass the signet upon the bill, and be registered within 60 days after the execution, in a particular register appointed for that purpose and where interruption of real rights is made via facti, an instrument must be taken upon it, and recorded in the said register; otherwise it can have no effect against singular successors.

19. Interruption has the effect to cut off the course of prescription, so that the person prescribing can avail himself of no part of the former time, but must begin a new course, commencing from the date of the interruption. Minority, therefore, is no proper interruption: for it neither breaks the course of prescription, nor is it a document or evidence taken by the minor on his right: it is a personal privilege competent to him, by which the operation of the prescription is indefinitely suspended during the years of minority, which are therefore discounted from it; but it continues to run after majority, and the years before and after the minority may be conjoined to complete it. The same doctrine applies to the privilege arising from one's incapacity to act.

20. Diligence used upon a debt, against any one of two or more co-obligants, preserves the debt itself, and so interrupts prescription against all of them; except in the special case of cautioners, who are not affected by any diligence used against the principal debtor. In the same manner, a right of annulment, constituted upon two separate tenements, is preserved as to both from the negative prescription, by diligence used against either of them. But whether such diligence has also the effect to hinder the possessor of the other tenement by singular titles from the benefit of the positive prescription, may be doubted.

III. OF SUCCESSION.

SECT. XX. OF SUCCESSION IN HERITABLE RIGHTS.

1. Singular successors are those who succeed to a person yet alive, in a special subject by singular title, but succession, in its proper sense, is a method of transmitting rights from the dead to the living. Heritable rights descend by succession to the heir properly so called, moveable rights to the executor, who are sometimes said to be heirs in moveables. Succession is either by special destination, which descends to those named by the proprietor himself; or legal, which devolves upon the persons whom the law marks out for successors, from a presumption that the proprietor would have named them had he made a destination. The first is in all cases preferred to the other, as presumption must yield to truth.

2. In the succession of heritage, the heirs at law, who are otherwise called heirs general, heirs whatsoever, or heirs of line; and they succeed by the right of blood, in the following order. First, Descendants: among these, sons are preferred to daughters, and the eldest son to all the younger. Where there are daughters only, they succeed equally, and are called heir portioners. Failing immediate descendants, grand-children succeed; and in default of them, great-grand-children; and so on in infinitum; preferring, as in the former case, males to females, and the eldest male to the younger.

3. Next after descendants, collateral succeed; among whom the brothers german of the deceased have the first place. But as, in no case, the legal succession of heritage is, by the law of Scotland, divided into parts, unless where it descends to females; the immediate younger brother of the deceased excludes the rest, according to the rule, heritage descend. Where the deceased is himself the youngest, the succession goes to the immediate elder brother, as being the least deviation from this rule. If there are no brothers german, the sisters german succeed equally; then brothers consanguineus, in the same order as brothers german; and failing them, sisters consanguineus equally. Next the father succeeds. After him, his brothers and sisters, according to the rules already explained; then the grandfather; failing him, his brothers and sisters; and
so upwards, as far back as propriety can be proved.

Though children succeed to their mother, a mother cannot to her child; nor is there any succession by our law through the mother of the deceased; insomuch that one brother uterine, i.e. by the mother only, cannot succeed to another, even in that estate which flowed originally from their common mother.

4. In heritage there is a right of representation, by which one succeeds, not from any title in himself, but in the place, and as representing some of his deceased ascendants. Thus, where one leaves a younger son, and a grandchild by his eldest, the grandchild, though farther removed in degree from the deceased than his uncle, excludes him, as coming in place of his father the eldest son. Hence arises the distinction between succession in capite, where the division is made into as many equal parts as there are capite or heirs, which is the case of heirs portioners; and succession in stirpes, where the remoter heirs draw no more among them than the share belonging to their ascendants or stirpes, whom they represent; an example of which may be figured in the case of one who leaves behind him a daughter alive, and two grand-daughters by a daughter deceased. In which case the two grand-daughters would succeed equally to that half which would have belonged to their mother had she been alive.

5. In the succession of heirs portioners, indivisible rights, e.g. titles of dignity, fall to the eldest sister. A single right of superiority goes also to the eldest; for it hardly admits a division, and the condition of the vassal ought not to be made worse by multiplying superiors upon him. Where there are more such rights, the eldest may perhaps have her election of the best; but the younger sisters are entitled to a recom pense, in so far as the divisions are unequal; at least, where the superiorities yield a constant yearly rent. The principal seat of the family falls to the eldest, with the garden and orchard belonging to it, without recom pense to the younger sisters; but all other houses are divided amongst them, together with the lands on which they are built, as houses and personal effects of the deceased. A person portioned in this way is due only in the case of succession of heirs portioners ab intestato; and there therefore is no place for it where the succession is taken under a deed of conquest.

6. Those heritable rights, to which the deceased did himself succeed as heir to his father or other ancestor, get sometimes the name of heritage in a strict sense, in opposition to the feuda nova, or feus of conquest, which he had acquired by singular titles, and which descend not to his heir of line, but of conquest. This distinction obtains only where two or more brothers or uncles, or their issue, are next in succession; in which case, the immediate younger brother, as heir of line, succeeds to the proper heritage, because that descends; whereas the conquest ascends to the immediate elder brother. It has no place in female succession, which the law divides equally among the heirs portioners. Where the deceased was the younger brother, the immediate elder brother is heir both of line and of conquest. An estate disponed by a father to his eldest son, is not conquest in the son's person, but heritage: because the son would have succeeded to it, though there had been no disposition. The heir of conquest succeeds to all rights affecting land, which require seisin to perfect them. But

teinds go to the heir of line; because they are merely a burden on the fruits, not the land. Tacks do not fall under conquest, because they are complete rights without seisin: nor personal bonds taken to heirs excluding executors.

7. The heir of line is entitled to the succession, not hiship, only of subjects properly heritable, but to that sort of movables called heirship, which is the best of certain kinds. This doctrine has been probably introduced, that the heir might not have a house and estate to succeed to, quite dismantled by the executor. In that sort which goes by pairs or dozans, the best pair or dozen is the heirship. There is no heirship in fungibles, or things estimated by quantity; as grain, hay, current money, &c. To entitle an heir to this privilege, the deceased must have been either, (1.) A prelate; (2.) A baron, i.e. who stood infest at his death in lands, though not erected into a barony; or even in a right of annu rent: Or, (3.) A burgess; not an honorary one, but a trading burgess of a royal borough, or at least one entitled to enter burgess in the right of his ancestor. Neither the heir of conquest, nor of tailzie, has right to heirship movables.

8. As to succession by destination, no proprietor can settle any heritable estate, in the proper form of a testa by destination; not even bonds excluding executors, though these are not heritable ex sua natura: But, where a testament is in part drawn up in the style of a deed inter vivos, such part of it may contain a settlement of heritage, though executors should be named in the testamentary part. The common method of settling the succession of heritage is by disposition, contract of marriage, or simple procuratory of resignation: and, though a disposition settling heritage should have neither precept nor procuratory, it founds an action against the heir of line to complete his titles to the estate; and thereafter devest himself in favour of the devisee. The appellation of tailzie, or entail, is chiefly used in the case of a land estate, which is settled on a long series of heirs substituted one after another. The person first called in the tailzie, is the institute; the rest, the heirs of tailzie, or the substitutes.

9. Tailzie, when considered in relation to their several degrees of force, are either, (1.) Simple destinations. (2.) Tailzie with prohibitory clauses. (3.) Tailzie with prohibitory, resolutive, and irritant clauses. That is a simple destination, where the persons called to the succession are substituted one after another, without any restraint laid on the exercise of their property. The heirs, therefore, succeeding to such estate, are absolute heirs, and consequently may alter the destination at pleasure.

10. In tailzie with clauses prohibitory, e.g. declairing that it shall not be lawful to the heirs to contract debts or alien the lands in prejudice of the succession, none of the heirs can alien gratuitously. But the members of entail may contract debts which will be effectual to the creditors, or may dispose of the estate for onerous causes. In both these sorts the maker himself may alter the tailzie: except, (1.) Where it has been granted for an onerous cause, as in mutual tailzie: or, (2.) Where the maker is expressly disabled, as well as the institute or the heirs.

11. Where a tailzie is guarded with irritant and resolutive clauses, the estate entailed cannot be carried off
by the debt, or 'deed, of any of the heirs succeeding thereto, in prejudice of the substitutes. It was long doubted, whether such tailizies ought to be effectual, even where the superior's consent was adhibited; because they sunk the property of estates, and created a perpetuity of liferents. They were first explicitly authorized by 1685, c. 22. By this statute, the entail must be registered in a special register established for that purpose; and the irritant and resolute clauses must be inserted, not only in the procuratories, precepts, and seizins, by which the tailizies are first constituted, but in all the after conveyances thereof; otherwise they can have no force against singular successors. But a tailizie, even without these requisites, is effectual against the heir of the grantor, or against the institute who accepts of it. It has been found, that an entail, though completed by infeftment before the act 1685, was ineffectual, because not recorded in terms of the act.

Heirs of entail, their powers and restrictions.

12. An heir of entail has full power over the entailied estate, except in so far as he is expressly fettered; and as entails are an unfavourable restraint on property, and a frequent snare to trading people, they are strictissimi juris; so that no prohibition or irritancies are to be inferred by implication. By 10 Geo. III. c. 51. heirs of entail are entitled (notwithstanding any restriction in the deed of entail) to improve their estates by granting leases, building farm houses, draining, enclosing, and excaving, under certain limitations, and to claim repayment of three-fourths of the expense from the next heir of entail. This act extends to all tailizies, whether made prior or posterior to the 1685.

Contravention, by whom inferred.

13. An heir, who counteracts the directions of the tailizie, by aliening any part of the estate, charging it with debt, &c. is said to contravene. It is not the simple contracting of debt that inferre contravention; the lands entailed must be actually adjudged upon the debt contracted. An heir may, where he is not expressly barred, settle rational provisions on his wife and children, without incurring contravention. It is not quite clear whether the heirs also of the contravener would forfeit their right from the acts or deeds of their predecessor where there is no express clause in the entailed settling it; and though the words of the act 1685 (which declares, that entails executed according to the directions of it, shall be effectual only against the contravener and his heirs, but against creditors), may seem to favour the idea that heirs also would forfeit, the more favourable opinion has received the sanction of our supreme court. For the greater security, however, a clause is now usually inserted in tailizies, declaring that the contravention of the heir in possession shall not affect his descendants, when such is the intention of the grantor.

In what cases an heir may sell.

14. When the heirs of the last person specially called in a tailizie come to succeed, the irritancies have no longer any person in favour of whom they can operate, and consequently, the fee, which was before tailizied, becomes simple and unlimited in the person of such heirs. By the late act 20th George II. for abolishing wardholdings, the king may purchase lands within Scotland, notwithstanding the strictest entail; and where the lands are in the bands of minors or fatuous persons, his majesty may purchase them from the curators or guardians. And heirs of entail may sell to their vassals the superiorities belonging to the entailied estate; but in all cases, the price is to be settled in the same manner that the lands or superiorities sold were settled before the sale.

15. Rights, not only of land estates, but of bonds, are sometimes granted to two or more persons in conjunct fee. Where a right is so granted to two strangers, without any special clause adjointed to it, each of them has an equal interest in the fee, and the part of the deceased descends to his own heir. If the right is taken to the two jointly, and the longest lives, their heirs, the several shares of the conjunct fees are affectable by their creditors during their lives; but, on the death of any one of them, the survivor has the fee of the whole, in so far as the share of the deceased remains free, after payment of his debts. Where the right is taken to the two in conjunct fee, and to the heirs of one of them, he to whose heirs the right is taken is the only heir; the right of the other resolves into a simple liferent: yet where a father takes a right to himself and his son jointly, and to the son's heirs, such right being gratuitous, is not understood to strip the father of the fee, unless a contrary intention shall plainly appear from the tenor of the right.

16. Where a right is taken to husband and wife, in conjunct fee and liferent, the husband, as the person senior, is the only heir: the wife's right resolves into a liferent, unless it be presumable, from special circumstances, that the fee was intended to be in the wife. Where a right of moveables is taken to husband and wife, the heirs of both succeed equally, according to the natural meaning of the words.

17. Heirs of provision are those who succeed to any subject, in virtue of a provision in the investiture, or other deed of settlement. This appellation is given most commonly to heirs of a marriage. These are more favourably regarded than heirs by simple destination, who have only the hope of succession; for heirs of a marriage, because their provisions are constituted by an onerous contract, cannot be disappointed of them by any gratuitous deed of the father. Nevertheless, as their right is only a right of succession, which is not designed to restrain the father from granting onerous or rational deeds, he continues to have the full power of selling the subject, or charging it with debts, unless a proper right of credit be given to the heir by the marriage contract, e.g. if the father should obligate himself to infeft the heir in the lands, or make payment of the sum provided against a day certain, or when the child attains a certain age, &c.; for such rights, when perfected by infeftment, or secured by diligence, are effectual against all the posterior deeds of the father, even onerous.

18. Though all provisions to children, by a marriage contract conceived in the ordinary form, being merely rights of succession, are postponed to every one to child the debt of the grantor, even to those contracted posterior to the provisions; yet where a father executes a bond of provision to a child actually existing, whether such child be the heir of a marriage or not, a proper debt is thereby created, which, though it be without doubt gratuitous, is not only effectual against the father himself and his heirs, but is not reducible at the instance even of his prior onerous creditors, if he was solvent at the time of granting it. A father may, notwithstanding
the universitas of the whole heritable rights which his predecessor had acquired by singular titles; then, the heir male, or of a marriage; for their propinquity of blood subjects them more directly than any other heir of tailzie, who may possibly be a stranger; and who for that reason is not liable to be discussed, except for such of the predecessor's debts or deeds as relate specially to the lands tailzie'd; as to which he is liable even before the heir of line. Heirs partitioners are liable pro rata for their predecessor's debts; but if any of them prove insolvent, the creditors may, after discussing her, insist for her share against the rest, who will be liable in so far as they are lucrata by the succession. Where an heir, liable subsidiarius, pays the predecessor's debt, he has relief against the heir who is more directly liable, in respect of whom he is not co-heir, but creditor.

22. Before an heir can have an active title to his ancestor's rights, he must be entered by service and return. He who is entitled to enter heir, is, before his actual entry, called apparent heir. The bare right of apparent heir carries certain privileges with it. An apparent heir may defend his ancestor's titles against any third party who brings them under challenge. Tenants may safely pay him their rents; and after they have once acknowledged him by payment, he may compel them to continue it; and the rents not uplifted by the apparent heir belong to the executors, upon his death.

23. As an heir is, by his entry, subjected universally quam delibera, to his ancestor's debts, apparent heirs have therefore a year (annis delibera) allowed to them from the ancestor's decease, to deliberate whether they will enter or no: till the expiry of which, though they may be charged by creditors to enter, they cannot be sued in any process founded upon such charge. Though declaratory actions, and others which contain no personal conclusion, may be pursued against the apparent heir without a previous charge, action does not lie even upon these, within the year, if the heir cannot make the proper defence without incurring a passive title. But judicial sales, commenced against an ancestor, may by special act of sederunt be continued upon a partition of the heir, without waiting the year of deliberation. This annum delibera is computed, in the case of a posthumous heir, from the birth of such heir. An apparent heir, who, by immixing with the estate of his ancestor, is as much subjected to his debts as if he had entered, can have no longer a right to deliberate whether he will enter or not.

24. All services proceed on briefs from the chan-chancery, which are called brevies of inquest, and have been heirs long known in Scotland. The judge, to whom the brief is directed, is required to try the matter by an inquest of 15 sworn men. The inquest, if they find the claim verified, must declare the claimant heir to the deceased, by a verdict or service, which the judge must attest, and return the brief, with the service proceeding on it, to the chancery; from which an extract is obtained called the return of the service.

25. The service of heirs is either general or special; general and special subjects, which either do not require seisin, or which have not been perfected by seisin in the person of the ancestor. A public right, therefore, according to
the feudal law, though followed by seisin, having no legal effects till it be confirmed by the superior, must, as a personal right, be carried by a general service. A special service, followed by seisin, vests the heir in the right of the special subjects in which the ancestor died intestate.

26. If an heir, doubtful whether the estate of his ancestor be sufficient for clearing his debts, shall, at any time within the annum deliberae, submit an oath a full inventory of all his ancestor’s heritable subjects to the clerk of the shire where the lands lie; and if, there be no heritage requiring seisin, the clerk of the shire where he died; and if, after the same is subscribed by the sheriff or sheriff-depute, the clerk, and himself, and registered in the sheriff’s books, the extract thereof shall be registered within four days after expiry of the annum deliberae in the general register appointed for that purpose, his subsequent entry will subject him no farther than to the value of such inventory. If the inventory be given up and registered within the time prescribed, the heir may serve on it, even after the year.

27. Creditors are not obliged to acquiesce in the value of the estate given up by the heir; but, if they be real creditors, may bring the estate to a public sale, in order to discover its true value; since an estate is always worth what can be got for it. An heir by inventory, as he is in effect a trustee for the creditors, must account for that value to which the estate may have been improved since the death of the ancestor, and he must communicate to all the creditors the cases he has got in transacting with any one of them.

28. Practice has introduced an anomalous sort of entry, without the interposition of an inquest, by the sole consent of the superior; who, if he be satisfied that the person applying to him is the next heir, grants him a precept (called of clare constat, from the first words of its recital), commanding his bailie to enter in the subjects that belonged to his ancestor. The heir, by taking seisin on this precept, becomes passivae liable for all the debts on his ancestor; and, on the other hand, acquires an active title, as to the subjects contained in the precept in questions with the superior or his heirs; and they may, when followed by a creditor, afford a title of prescription: But as no person can be declared an heir by private authority, they cannot bar the true heir from entering after 20 years, as a legal entry would have done; the true heir, in such case, having it still in his power to set aside that right, and obtain himself regularly served at any time within the years of prescription. Of the same nature is the entry by h Exp and staple, commonly used in burbage tenements of houses; by which the bailie, without calling an inquest, cognoeaces or declares a person heir, upon evidence, brought before himself; and, at the same time, infefts him in the subject, by the symbol of the h Exp and staple of the door. Charges given by creditors to apparent heirs to enter, stand in the place of an actual entry, so as to support the creditor’s diligence (elxii. 2).

29. A general service cannot include a special one; since it has no relation to any special subject, and carries only that class of rights on which seisin has not proceeded; but a special service implies a general one of the same kind or character, and consequently carries even such rights as have not been perfected by seisin. Law.

30. An heir, by mixting with his ancestor’s estate Passer, without entry, subjects himself to his debts, as if he had been entered; or, in our law phrase, incurs a passive title. The only passive title by which an apparent heir becomes liable universally for all his ancestor’s debts, is gestio pro herede, or his behaving as none but an heir has right to do. Behaviour as heir is inferred from the apparent heir’s intromission, after the death of the ancestor with any part of the lands or other heritable subjects belonging to the deceased, to which he himself might have completed an active title by entry.

31. This passive title is excluded, if the heir’s intromission be by order of law; or if it be founded on singular titles, and not as heir to the deceased. But an apparent heir’s purchasing any right to his ancestor’s estate, otherwise than at public disposal (auction), or his possessing it in virtue of rights settled in the person of any near relation of the ancestor, to whom he himself may succeed as heir, otherwise than upon purchase by public sale, is deemed behaviour as heir.

32. Behaviour as heir is also excluded where the intromission is small, unless an intention to defraud the ancestor’s creditors be presumable from the circumstances attending it. Neither is behaviour inferred against the apparent heir, from the payment of his ancestor’s debt, which is a voluntary act, and profitable to the creditors; nor by his taking out of brevies to serve; for one may alter his purpose, while it is not completed: nor by his assuming the titles of honour belonging to his ancestor, or exercising an honorary office hereditary in the family; for these rights answer to the blood, which may be used without proper representation. But the exercising an heritable office of profit, which may pass by voluntary conveyance, and consequently is adjudgable, may reasonably be thought to infer a passive title. Lastly, as passive titles have been introduced merely for the security of creditors; therefore, where questions concerning behaviour arise among the different orders of heirs, they are liable to one another no farther than in valorum of their several intromissions.

33. Another passive title in heritage, may be incurred by the apparent heir’s accepting a gratuito right heirato from the ancestor, to any part of the estate to which he himself might have succeeded as heir; and it is called praeceptio harredistatis, because it is a taking of the succession by the heir before it opens to him by the death of his ancestor. If the right be onerous, there is no passive title; if the consideration paid for it does not amount to its full value, the creditors of the deceased may reduce it, in so far as it is gratuitous, but still it infers no passive title.

34. The heir incurring this passive title is no farther liable, than if he had at the time of his acceptance entered heir to the grantor, and so subjected himself to the debts that were then chargeable against him; but with the posterior debts he has nothing to do, not even with those contracted between the date of the right and the intimation taken upon it, and he is therefore called successor titule lucrativo post contractum debitem.
35. Neither of these passive titles takes place, unless
the subject intermeddled with or disposed be such as
the introuter or receiver would succeed to himself.
In this also, these two passive titles agree, that the
intromission in both must be after the death of the ance-
stor; for there can be no termini habiles of a passive
title, while the ancestor is alive. But in the following
respect they differ: Desisto pro harrele, being a vicious
passive title founded upon a quasi delict, cannot be ob-
jected against the delinquent’s heir, if process has not
been litigated, but the delinquent himself was
alive; whereas the successor situlo lucrativo is by the ac-
ceptance of the disposition understood to have entered
into a tacit contract with the grantor’s creditors, by
which he undertakes the burden of their debts; and
all actions founded on contract are transmissible against
heirs.

36. An apparent heir, who is cited by the ancestor’s
creditor in a process for payment, if he offers any pe-
reptory defence against the debt, passes a passive
title, for he can have no interest to object against it,
but in the character of heir. In the same manner, the
heir’s not renouncing upon a charge to enter heir, in-
fers it: But the effect of both these is limited to the
special debt pursued for, or charged upon. This pas-
sive title, which is inferred from the heir’s not renon-
ciating, has no effect till decrees pass against him; and
even a renunciation offered after decree, if the decree
be in abeyance, will entitle the heir to a suspension of all
diligence against his person and estate, competent upon
his ancestor’s debts.

37. By the principles of the feudal law, an heir,
when he is to complete his titles by special service, must
necessarily pass over his immediate ancestor, c. e. his
father, if he was not infeft; and serve heir to that an-
cestor who was last vested and seized in the right, and in
whom hereditatis jaceae the right must remain, till title
be connected thereto from him. As this bore hard
upon creditors who might think themselves secure in
contracting with a person whom they saw for some time
in the possession of an estate, and from thence con-
cluded that it was legally vested in him; it is there-
fore provided by act 1605, that every person, passing
over his immediate ancestor who had been three years
in possession, and serving heir to one more remote, shall
be liable for the debts and deeds of the person inter-
jected, to the value of the estate to which he is served.
This being correctly of the feudal maxims, has been
strictly interpreted, so as not to extend to the gratuit-
ous deeds of the person interjected, nor to the case where
the interjected person was a naked heir, and possessed
only civilly through the liferenter.

38. Our law, from its jealousy of the weakness of
mankind while under sickness, and of the importunity
of friends on that occasion, has declared that all deeds
affecting heritage, if they be granted by a person on
deathbed, (i. e. after contracting that sickness which
ends in death, to the damage of the heir, are inelec-
tual, for where the debts of the grantor have laid
him under a necessity to alien his lands. As this law
of deathbed is founded solely in the privilege of the
heir, deathbed deeds, when consented to by the heir,
are not reducible. The term properly opposed to
deathbed is liege poustir, by which is understood a state
of health; and it gets the name, because persons in
health have the legittima poesttas, or lawful power, of
disposing of their property at pleasure.

39. The two extremes being proved, of the grantor’s
sick was immediately before signing, and of his death
followed it, though at the greatest distance of time, death-
bed did, by one former law, found a presumption that the deed
was granted on deathbed, which could not have
been elided but by a positive proof of the grantor’s
convalescence; but now the allegation of deathbed is
also excluded, by his having lived 60 days after sign-
ing the deed. The legal evidence of convalescence is
the grantor’s having been, after the date of the deed,
at kirk OR market unsupported; for a proof of either
will secure the deed from challenge. The going to
kirk or market must be performed when the people
are met together in the church or churchyard for any
public meeting, civil or ecclesiastical, or in the mar-
tet place at the time of public market. No other
proof of convalescence is receivable, because at kirk
and market there are always present unsuspected wit-
nesses, which we can hardly be sure of in any other
case.

40. The privilege of setting aside deeds ex capite To what
heirs is competent to all heirs, not to heirs of line only, heirs to
but of conquest, taillie, or provision: not only to the immedi-
ate, but to remoter heirs, as soon as the succes-
sion opens to them. But, where it is consented to
or ratified by the immediate heir, it is secured against
all challenge, even from the remoter. Yet the imme-
diate heir cannot, by any antecedent writing, renounce
his right of reduction, and thereby give strength to
deeds that may be afterwards granted in lecto to his
burr; for no private renunciation can authorize a per-
son to act contrary to a public law; and such renun-
ciation is presumed to be extinguished through the fear
of excommunication. If the heir should not use this privi-
lege of reduction, his creditor may, by adjudication, trans-
fer it to himself; or he may, without adjudication,
reduce the deed, libelling upon his interest as credi-
tor to the heir: But the grantor’s creditors have no
right to this privilege, in regard that the law of death-
bed was introduced, not in behalf of the grantor him-
self, but of his heir.

41. The law of deathbed strikes against dispositions Whatright
every subject to which the heir would have succeed, may be thus
ed, or from which he would have had any benefit, had set aside.
Deathbed deeds granted in consequence of a full or proper obligation in liege pou-
stir, are not subject to reduction; but, where the an-
tecedent obligation is merely natural, they are reducible.
By stronger reason, the deceased cannot, by a deed
merely voluntary, alter the nature of his estate on death-
bed to the prejudice of his heir, so as from heritable
make it moveable; but if he should, in liege poustis,
exclude his apparent heir, by an irrevocable deed con-
taining reserved faculties, the heir cannot be heard to
quarrel the exercise of these faculties on deathbed.

42. In a competition between the creditors of the
deceased and of the heir, one law (act 1661) has
justly preferred the creditors of the deceased; as every
man’s estate ought to be liable, in the first place, for
his own debt. But this preference is, by the statute,
limited to the case where the creditors of the deceased
have used diligence against their debtor’s estate, with-
in three years from his death; and therefore the heir’s
creditors
creditors may, after that period, affect it for their own payment. All dispositions by an heir, of the ancestor’s estate, within a year after his death, are null, in so far as they are hurtful to the creditors of the ancestor. This takes place, though these creditors should have used no diligence, and even where the dispositions are granted after the year: It is thought they are ineffectual against the creditors of the deceased who have used diligence within the three years.

**Sect. XXI. Of Succession in Moveables.**

1. In the succession of moveable rights, it is an universal rule, that the next in degree to the deceased (or next of kin) succeeds to the whole; and if there are two or more equally near, all of them succeed by equal parts, without that prerogative, which takes place in heritage, of the eldest son over the younger, or of males over females. Neither does the right of representation (explained No clix. 4.) obtain in the succession of moveables, except in the single case of a competition between the full blood and the half blood; for a niece by the full blood will be preferred before a brother by the half blood, though she is by one degree more remote from the deceased than her uncle. Where the estate of a person deceased consists partly of heritage, and partly of moveables, the heir in the heritage has no share of the moveables, if there are others as near in degree to the deceased as himself: But where the heir, in such case, finds it his interest to renounce his exclusive claim to the heritage, and betake himself to his right as one of the next of kin, he may collate or communicate the heritage with the others, who in their turn must collate the moveables with him; so that the whole is thrown into one mass, and divided equally among all of them. This doctrine holds, not only in the line of descendants, but of collateral; for it was introduced, that the heir might in no case be worse than the other next of kin.

2. One may settle his moveable estate upon whom he pleases, excluding the legal successor, by a testament; which is a written declaration of what a person wills to be done with his moveable estate after his death. No testamentary deed is effectual till the death of the testator; who may therefore revoke it at pleasure, or make a new one, by which the first loses its force, according to the rule, voluntas testatoris est ambulatoria usque ad mortem; and hence testaments are called last or latter wills. Testaments, in their strict acceptance, must contain a nomination of executors, i.e. of persons appointed to administer the succession according to the will of the deceased: Yet nothing hinders one from making a settlement of moveables, in favour of an universal legatee, though he should not have appointed executors; and on the other part, a testament where executors are appointed is valid, though the person who is to have the right of succession should not be named. In this last case, if the executor nominated be a stranger, i.e. one who has no legal interest in the moveable estate, he is merely a trustee, accountable to the next of kin; but he may retain a third of the dead’s part (explained par. 6.) for his trouble in executing the testament; in payment of which, legacies, if any be left to him, must be imputed. The heir, if he be named executor, has right to the third as a stranger; but if one be named who has an interest in the legal succession, he has no allowance, unless such interest is less than a third. Nuncupative or verbal testaments are not, by the law of Scotland, effectual for supporting the nomination of an executor, lest the subject of the succession be ever so small: But verbal legacies, not exceeding 100l. Scots, are sustained: and even where they are granted for more, they are ineffectual only as to the excess.

3. A legacy is a donation by the deceased, to be paid by the executor to the legatee. It may be granted either in the testament or in a separate writing. Legacies are not due till the granter’s death; and consequently they can transmit no right to the executors of the legatee, in the event that the granter survives him. A case occurred some years ago, where a testator left a legacy payable when the legatee arrived at a certain age. The legatee survived the testator, but died before the legacy was payable. It was found, chiefly upon the authority of the Roman law, that the legacy vested in the legatee à morte testatoris, and upon his decease was due to the legatee’s next of kin.

4. Legacies, where they are general, i.e. of a certain sum of money indefinitely, give the legatee no right in any one debt or subject; he can only insist in a personal action against the executor for payment out of the testator’s effects. A special legacy, i.e. of a particular debt due to the deceased, or of a particular subject belonging to him, is of the nature of an assignation, by which the property of the special debt or subject vests, upon the testator’s death, in the legatee, who can therefore directly sue the debtor or possessor: Yet as no legacy can be claimed till the debts are paid, the executor must be cited in such process, that it may be known, whether there are free effects sufficient for answering the legacy. Where there is not enough for payment of all the legacies, each of the general legatees must suffer a proportional abatement: But a special legatee gets his legacy entire, though there should be nothing over for payment of the rest; and, on the contrary, he has no claim, if the debt or subject bequeathed should perish, whatever the extent of the free executory may be.

5. Minors, after puberty, can test without their co-representors, wives without their husbands, and persons interdicted without their interdictors: but bastards cannot test, except in the cases afterwards set forth, No clix. 4. As a certain share of the goods, falling under the communion that is consequent on marriage, belongs upon the husband’s decease, to his widow, jure retributionis, and a certain share to the children, called the legatees, portion naturalis, or bairns part of gear; one who has a wife or children, though he be the absolute administrator of all these goods during his life, and consequently may alien them by a deed inter vivos, in liege possession, even gratuitously, if no fraudulent intention to disappoint the wife or children shall appear, yet cannot impair their shares gratuitously on deathbed: nor can he dispose of his moveables to their prejudice by testament, though it should be made in liege possession; since testaments do not operate till the death of the testator.
at which period the division of the goods in communion have their full effect in favour of the widow and children.

6. If a person deceased leaves a widow, but no child, his testament, or, in other words, the goods in communion, divide in two: one half goes to the widow: the other is the dead's part, i.e. the absolute property of the deceased, on which he can test, and which falls to his next of kin, if he dies intestate. Where he leaves children, one or more, but no widow, the children get one half as their legitime: the other half is the dead's part: which falls also to the children, if the father has not tested upon it. If he leaves both widow and children, the division is tripartite: the wife takes one-third by herself; another falls, as legitime, to the children equally among them, or even to an only child, though he should succeed to the heritage: the remaining third is the dead's part. Where the wife predeceases without children, one half is retained by the husband, the other falls to her next of kin: Where she leaves children, the division ought also to be tripartite, by the common rules of society, since no legitime is truly due on a mother's death: yet it is in practice tripartite: two-thirds remain with the surviving father, as if one third were due to him proprio nomine, and another as administrator of the legitime for his children; the remaining third, being the wife's share, goes to her children, whether of that or any former marriage: for they are all equally her next of kin.

7. Before a testament can be divided, the debts owing by the deceased are to be deducted; for all executry must be free. As the husband has the full power of burdening the goods in communion, his debts affect the whole, and so lessen the legitime and the share of the relict, as well as the dead's part. His funeral charges, and the mourning and alimony due to the widow, are considered as his proper debts; but the legacies, or other gratuitous rights granted by him on deathbed, affect only the dead's part. Bonds bearing interest, due by the deceased, cannot diminish the relict's share, because such bonds, when due to the deceased, do not increase it. The funeral charges of the wife predeceasing, fall wholly on her executors who have right to her share. Where the deceased leaves no family, neither husband, wife, nor child, the testament suffers no division, but all is the dead's part.

8. The whole issue of the husband, not only by that marriage which was dissolved by his death, but by any former marriage, has an equal interest in the legitime; otherwise the children of the first marriage would be cut out, as they could not claim the legitime during their father's life. But no legitime is due, (1) Upon the death of a mother. (2) Neither is it due to grandchildren, upon the death of a grandfather. Nor, (3) To children forisfamiliae, i.e. to such as, by having renounced the legitime, are no longer considered as in familia, and so are excluded from any farther share of the movables estate than they have already received.

9. As the right in legitime is strongly founded in nature, the renunciation of it is not to be inferred by implication. Renunciation by a child of his claim of legitime has the same effect as his death, in favour of the other children entitled thereto; and consequently the share of the renouncer divides among the rest; but he does not thereby lose his right to the dead's part, if he does not also renounce his share in the father's executry. Nay, his renunciation of the legitime, where he is the only younger child, has the effect to convert the whole subject thereof into dead's part, which will therefore fall to the renouncer himself as next of kin, if the heir be not willing to collate the heritage with him. Yet it has been found that the renunciation of the only younger child made the whole legitime accrue to the heir without collation.

10. For preserving an equality among all the children who continue entitled to the legitime, we have adopted the Roman doctrine of collatio bonorum; whereby the child, who has got a provision from his father, is obliged to collate it with the others, and impute it towards his own share of the legitime; but if from the deed of provision, the father shall appear to have intended it as a præcipuillum to the child, collation is excluded. A child is not bound to collate an heritable subject provided to him, because the legitime is not impaired by such provision. As this collation takes place only in questions among children who are entitled to the legitime, the relict is not bound to collate donations given her by her husband, in order to increase the legitime; and on the other part, the children are not obliged to collate their provisions, in order to increase her share.

11. As an heir in heritage must complete his title by entry, so an executor is not vested in the right of the moveable estate of the deceased without confirmation. Confirmation is a sentence of the commissary or bishop's court, empowering an executor, one or more, upon making inventory of the moveables pertaining to the deceased, to recover, possess, and administer them, either in behalf of themselves, or of others interested therein. Testaments must be confirmed in the commissariat where the deceased had his principal dwelling house at his death. If he had no fixed residence, or died in a foreign country, the confirmation must be at Edinburgh, as the commune forum; but if he went abroad with an intention to return, the commissariot within which he resided before he left Scotland, is the only proper court.

12. Confirmation proceeds upon an edict, which is affixed on the door of the parish church where the deceased dwelt, and serves to intimate to all concerned the day of confirmation, which must be nine days at least after publishing the edict. In a competition for the office of executor, the commissary prefers primo loco, the person named to it by the deceased himself, whose nomination he ratifies or confirms, without any previous decerniture: this is called the confirmation of a testamentary. In default of an executor named by the deceased, universal disponere are by the present practice preferred; after them the next of kin; then the relict; then creditors; and, lastly, speciallegatees. All these must be decerned executors, by a sentence called a decree-dative; and if afterwards they incline to confirm, the commissary authorizes them to administer, upon their making inventory, and giving security to make the subject thereof forthcoming to all having interest; which is called the confirmation of a testament dative.

13. A creditor, whose debtor's testament is already confirmed, may sue the executor, who holds the officium gesto for all concerned, to make payment of his debt. Where executor there preferred.
there is no confirmation, he himself may apply for the office, and confirm as executor-creditor; which entitles him to sue for and receive the subject confirmed, for his own payment; and where one applied for a confirmation as executor-creditor, every co-creditor may apply to be conjoined with him in the office. As this kind of confirmation is simply a form of diligence, creditors are exempted from the necessity of confirming more than the amount of their debts.

24. A creditor, whose debt has not been constituted or his claim not closed by decree, during the life of his debtor, has no title to demand directly the office of executor qua creditor: but he may charge the next of kin who stands off, to confirm; who must either renounce within twenty days after the charge, or be liable for the debt; and if the next of kin renounces, the pursuer may constitute his debt, and obtain a decree cognitio causa, against the hereditas jacens of the movables, upon which he may confirm as executor-creditor to the deceased. Where one is creditor, not to the deceased, but to his next of kin who stands off from confirming, he may affect the moveables of the deceased, by obtaining himself decreed executor-dative to the deceased, as if he were creditor to him, and not to his next of kin.

25. Where an executor has either omitted to give up any of the effects belonging to the deceased in inventory, or has estimated them below their just value, there is place for a new confirmation, ad omissa vel mali appretiata, at the suit of any having interest; and if it appears that he has not omitted or undervalued any subject dobor, the commissary will ordain the subjects omitted, or the difference between the estimations in the principal testament and the true values, to be added thereto; but if dole shall be presumed, the whole subject of the testament ad omissa vel mali appretiata, will be carried to him who confirms it, to the exclusion of the executor in the principal testament.

26. The legitimate and relict's share, because they are rights arising ex lege, operate ipso jure, upon the father's death, in favour of the relict and children; and consequently pass from them, though they should die before confirmation, to their next of kin: whereas the dead's part, which falls to the children or other next of kin in the way of succession, remains, if they should die before confirming, in bonis of the first deceased; and so does not descend to their next of kin, but may be confirmed by the person who, at the time of confirmation, is the next of kin to the first deceased. Special assignations, though neither intimated nor made public during the life of the grantor, carry to the assignee the full right of the subjects assigned, without confirmation. Special legacies are really assignations, and so fall under this rule. The next of kin, by the bare possession of the ipso corpus of moveables, acquires the property thereof without confirmation, and transmits it to his executors.

27. The confirmation of any one subject by the next of kin, as it proves his right of blood, has been adjudged to carry the whole executors out of the testament of the deceased, even what was omitted, and to transmit all to his own executors. The confirmation of a stranger, who is executor nominated, as it is merely a trust for the next of kin, has the effect to establish the right of the next of kin to the subjects confirmed, in the same manner as if himself had confirmed them.

28. Executors, though it carries a certain degree of representation of the deceased, is properly an office; executors therefore are not subjected to the debts due by the deceased, beyond the value of the inventory; but, at the same time, they are liable in diligence for making the inventory effectual to all having interest. An executor-creditor who confirms more than his debt amounts to, is liable in diligence for what he confirms. Executors are not liable in interest, even upon such bonds recovered by them as carried interest to the deceased, because their office obliges them to retain the sums they have made effectual, in order to a distribution thereof among all having interest. This holds though they should again lend out the money upon interest, as they do it at their own risk.

29. There are certain debts of the deceased called In what privileged debts, which were always preferable to all other. Under that name are comprehended, medicines furnished to the deceased on deathbed, physicians fees during that period, funeral charges, and the rent of his house, and his servants wages for the year or term current at his death. These the executors are in safety to pay on demand. All the other creditors, who either obtain themselves confirmed, or who cite the executor already confirmed, within six months after their debtor's death, are preferred, pari passu, with those who have done more timely diligence; and therefore no executor can either retain for his own debt, or pay a testamentary debt, so as to exclude any creditor, who shall use diligence within the six months, from the benefit of the pari passu preference; neither can a decree for payment of debt be obtained, in that period, against an executor, because, till that term be elapsed, it cannot be known how many creditors may be entitled to the fund in his hands. If no diligence be used within the six months, the executor may retain for his own debt, and pay the residue primo venienti. Such creditors of the deceased as have used diligence within a year after their debtor's death, are preferable on the subject of his testament to the creditors of his next of kin.

30. The only passive title in moveables is vitiosa in- Vitiosa in- Vertion; which may be defined, an unwarrantable intermeddling with the moveable estate of a person deceased, without the order of law. This is not confined, as the passive titles in heritage are, to the persons interested in the succession, but strikes against all intromitters whatever. Where an executor confirmed intromits with more than he has confirmed, he incurs a passive title; fraud being in the common case presumed from his not giving up in inventory the full subject intermeddled with. Vitosus intromission is also presumed, where the repositories of a dying person are not sealed up, as soon as he becomes incapable of senses; by his nearest relations; or, if he dies in a house not his own, they must be sealed by the master of such house, and the keys delivered to the judge ordinary, to be kept by him, for the benefit of all having interest.

31. The passive title of vitiosus intromission does not take place where there is any probable title or circumstance that takes off the presumption or fraud. In consequence of this rule, necessary intromission, or cautelae cause,
IV. OF LAST HEIRS AND BASTARDS.

1. By our ancient practice, feudal grants taken to the vassal, and to a special order of heirs, without settling the last termination upon heirs whatsoever, returned to the superior, upon failure of the special heirs therein contained; but now that fees are become patrimonial rights, the superior is, by the general opinion, held to be fully divested by such grant, and the right descends to the vassal's heirs at law. And even where a vassal dies without leaving any heir who can prove the remotest propinquity to him, it is not the superior, as the old law stood, but the king, who succeeds as last heir, both in the heritable and moveable estate of the deceased, in consequence of the rule, Quod nullius est, credit domino Regi.

2. If the lands to which the king succeeds be held immediately of himself, the property is consolidated with the superiority, as if resignation had been made in the sovereign's hand. If they are held of a subject, the king, who cannot be vassal to his own subject, names a donatory; who, to complete his title, must obtain a decree of declaratory; and thereafter he is presented to the superior, by letters of presentation from the king under the quarter seal, in which the superior is charged to enter the donatory. The whole estate of the deceased, is, in this case, subject to his debts, and to the widow's legal provisions. Neither the king nor his donatory is liable beyond the value of the succession. A person who has no heir to succeed to him, cannot alien his heritage in loco, to the prejudice of the king, who is entitled to set aside such deed, in the character of ultimus heres.

3. A bastard can have no legal heirs, except those of his own body; since there is no succession but by the father, and a bastard has no certain father. The bastard therefore succeeds to him, failing his lawful issue as last heir. Though the bastard, as absolute proprietor of his own estate, can dispose of his heritage in large pective, and of his moveables by any deed inter vivos; yet he is disabled ex defectu naturalis, from bequeathing by testament, without letters of legitimation from the sovereign. If the bastard has lawful children, he may test without such letters, and name tutors and curators to his issue. Letters of legitimation, let their clauses be ever so strong, cannot enable the bastard to succeed to his natural father, to the exclusion of lawful heir.

4. The legal rights of succession, being founded in lawful marriage, can be claimed only by those who are born in lawful marriage; the issue therefore of an unlawful marriage are incapable of succession. A bastard is excluded, (1.) From his father's succession; because law knows no father who is not marked out by marriage. (2.) From all heritable succession, whether by the father or mother; because he cannot be pronounced lawful heir by the inquest, in terms of the brief. And, (3.) From the moveable succession of his mother; for though the mother be known, the bastard is not her lawful child, and legitimacy is implied in all succession conferred by law. A bastard, though he cannot succeed jure sanguinis, may succeed by destination, where he is specially called to the succession by an entail or testament.

5. Certain persons, though born in lawful marriage, are incapable of succession. Aliens are, from their allegiance to a foreign prince, incapable of succeeding in feudal rights, without naturalization. Children born in a foreign state, whose fathers were natural born subjects, and not attainted, are held to be natural born subjects. Persons educated in, or professing the Popish or Papist religion, if they shall neglect, upon their retaining the age of 15, to renounce its doctrines by a signed declaration, cannot succeed in heritage: but must give place to the next Protestant heir, who will hold the estate irredeemably, if the Popish heir does not, within ten years after incurring the irritancy, sign the formula prescribed by the statute 1700, c. 3.

CHAP. III. Of ACTIONS.

HITHERTO of Persons, and Rights, the two first objects of law: Actions are its third object, whereby persons make their rights effectual.

SECT. I. Nature, Division, &c. of Actions.

1. An action may be defined, A demand regularly made an action, and insisted in, before the judge competent, for the obtaining...
2. Actions are either real or personal. A real action is that which arises from a right in the thing itself, and which therefore may be directed against all possessors of that thing: thus, an action for the recovery, even of a moveable subject, when founded on a jus in re, is in the proper acceptance real; but real actions are, in vulgar speech, confined to such as are directed against heritable subjects. A personal action is founded only on an obligation undertaken for the performance of some fact, or the delivery of some subject; and therefore can be carried on against no other than the person obliged, or his heirs.

3. Actions, again, are either ordinary or rescissory. All actions are, in the sense of this division, ordinary, which are not rescissory. Rescissory actions are divided, (1.) Into actions of proper improbation. (2.) Actions of simple reduction. Proper improbations, which are brought for declaring writings false or forged, are noticed below, No olxxvi. 32. Reduction-improbation is an action, whereby a person who may be hurt or affected by a writing, insists for producing or exhibiting it in court, in order to have it set aside, or its effect ascertained, under the certification that the writing, if not produced, shall be declared false and forged. This certification is a fiction of law, introduced that the production of writings may be more effectually forced, and therefore it operates only in favour of the pursuer. Because the summons in the action proceeds on alleged grounds of falsehood, his majesty’s advocate, who is the public prosecutor of crimes, must concur in it.

4. As the certificate in this process draws after it so heavy consequences, two terms are assigned to the defendants for production. After the second term is elapsed, intimation must be made judicially to the defendant, to satisfy the production within ten days; and until these are expired, no certification can be pronounced. Certification cannot pass against deeds recorded in the books of session, if the defender shall, before the second term, offer a condescension of the dates of their registration, unless falsehood be objected: in which case, the original must be brought from the record to the court. But an extract from the inferior court is no bar to certification; the principal writing must be laid before the court of session on a proper warrant.

5. In an action of simple reduction the certification is only temporary, declaring the writings called for null, until they be produced; so that they recover their full force after production, even against the pursuer himself; for which reason, that process is now seldom used. Because its certification is not so severe as in reduction-improbation, there is but one term assigned to the defender for producing the deeds called for.

6. The most usual grounds of reduction of writings are, the want of the requisite solemnity; that the grantor was minor, or interdicted, or inhibited; or that he signed the deed on deathbed, or was compelled or frightened into it, or was circumvented; or that he granted it in prejudice of his lawful creditors.

7. In reduction on the head of force, or fear, or fraud and circumvention, the pursuer must libel the particular circumstances from which his allegation is to be proved. Reduction is not competent upon every degree of force or fear; it must be such as would shake a man of constancy and resolution. Neither is it competent, on that fear which arises from the just authority of husbands or parents, over their wives or children, nor upon the fear arising from the regular execution of lawful diligence by citation, provided the deeds granted under that fear relate to the ground of debt contained in the diligence; but if they have no relation to that debt, they are reducible as above.

8. Alienations granted by debtors after contracting of lawful debts, in favour of conjunct or confident persons, without just and necessary causes, and without a just price really paid, are, by the act 1621, declared to be null. One is deemed a prior creditor, whose ground of debt existed before the right granted by the debtor; though the written voucher of the debt should bear a date posterior to it. Persons are accounted conjunct, whose relation to the grantor is so near, as to bar them from judging in his cause. Confident persons are those who appear to be in the grantor’s confidence, by being employed in his affairs or about his person; as a deacon, steward, or domestic servant.

9. Rights, though gratuitous, are not reducible, if the grantor had, at the date thereof, a sufficient fund for the payment of his creditors. Provisions to children are, in the judgment of law, gratuitous; so that their effect, in a question with creditors, depends on the solvency of the grantor; but settlements to wives, either in marriage contracts, or even after marriage, are onerous, in so far as they are rational, and consequently are not reducible, even though the grantor was insolvent. This rule holds also in rational terrors contracted to husbands: But it must, in all cases, be qualified with the limitation, if the insolvency of the grantor was not publicly known; for if it was, fraud is presumed in the receiver of the right, by contracting with the bankrupt.

10. The receiver of the deed, if he be a conjunct or confident person, must instruct or support the onerous cause of his right, not merely by his own oath, but by some circumstances or admissions. But where a right is granted to a stranger, the narrative of it expressing an onerous cause, is sufficient per se to secure it against reduction.

11. All voluntary payments or rights made by a bankrupt to one creditor, to disappoint the more onerous diligence of another, are reducible at the instance of that creditor who has used the prior diligence. A creditor, though his diligence be but begun by citation, may insist in a reduction of all posterior voluntary rights granted to his prejudice; but the creditor who neglects to complete his begun diligence within a reasonable time, is not entitled to reduce any right granted by the debtor, after the time that the diligence is considered as abandoned.

12. A prohibited alienation, when conveyed by the receiver to another, who is not privy to the fraud, subsists in the person of the bona fide purchaser. In the case of moveable rights, this nullity is receivable by exception; but it must be declared by reduction, where the right is heritable.
13. By act 1696, c. 5, all alienations by a bankrupt, within 60 days before his bankruptcy, to one creditor in preference to another, are reducible, at the instance even of such co-creditors as had not used the least step of diligence. A bankrupt is there described by the following character: diligence used against him by horning and caption; and insolvency, joined either with imprisonment, retiring to the sanctuary, absconding, or forcibly compelling himself from diligence. It is sufficient that a caption is raised against the debtor, though it be not executed, provided he has retired to shun it. And by the late bankrupt statute 23 Geo. III. it is declared, that in all actions and questions arising upon the construction and effect of the act 1696; when a debtor is out of Scotland, or not liable to be imprisoned by reason of privilege or personal protection, a charge of horning executed against him, together with either an arrestment of any of his personal effects not leased or discharged within fifteen days, or a poinding executed of any of his moveables, or a decree of adjudication of any part of his heritable estate, or sequestration by the act of a proper court, of all or any part of his estate or effects, heritable or moveable, for payment of debt, shall, when joined with insolvency, be held as sufficient proof of obtaining bankruptcy; and from and after the last step of such diligence, the said debtor, if insolvent, shall be held bankrupt. It is provided (by said act 1696), that all heritable bonds or rights on which seisin may follow, shall be reckoned, in a question with the grantor’s other creditors upon this act, to be of the date of the seisin following thereon. But this act was found to relate only to securities for former debts, and not to nova debita.

14. Actions are divided into rei persequatoria, and penales. By the first, the pursuer insists barely to recover the subject that is his, or the debt due to him: and this includes the damage sustained; for one is as truly a sufferer in this patrimonial interest by that damage, as by the loss of the subject itself. In penal actions, which always arise ex delicto, something is also demanded by way of penalty.

15. Actions of spolizie, ejection, and intrusion, are penal. An action of spolizie is competent to one dispossessed of a movable subject violently, or without order of law, against the person dispossessing: not only for being restored to the possession of the subject, if extant, or for the value, if it be destroyed, but also for the violent profits, in case the action be brought within three years from the spoliation. Ejection and intrusion are, in heritable subjects, what spolizie is in moveables. The difference between the two first is, that in ejection, violence is used; whereas the intruder enters into the void possession, without either a title from the proprietor, or the warrant of a judge. The actions arising from all the three are of the same general nature.

16. The action of contravention of law-burrowers is also penal. It proceeds on letters of law-burrowers, (from borghe, a cautioner), which contain a warrant to charge the party complained upon, that he may give security not to hurt the complainant in his person, family, or estate. These letters do not require the previous citation of the party complained upon, because the caution which the law requires is only for doing what is every man’s duty; but, before the letters are executed against him, the complainant must make oath that he dreads bodily harm from him. The penalty of contravention is ascertained to a special sum, according to the offender’s quality; the half to be applied to the fisk, and the half to the complainant. Contravention is not incurred by the uttering of reproachful words, where they are not accompanied, either with acts of violence, or at least a real injury; and as the action is penal, it is elided by any probable ground of excuse.

17. Penalties are the consequence of delict, or Penal actions; and as no heir ought to be accountable for the delict of his ancestor, farther than the injured person has really suffered by it, penal actions die with the delinquent, and are not transmissible against heir or pursuer.

Yet the action, if it has been commenced and instituted in the delinquent’s lifetime, may be continued against the heir, though the delinquent should die during the dependence. Some actions are rei persequatoria on the part of the pursuer, when he insists for simple restitution; which yet may be penal in respect of the defender: e.g. the action on the passive title of vitious intrussion, by which the pursuer frequently recovers the debt due to him by the deceased, though he should exceed the value of the goods intermeddled with by the defenders.

18. The most celebrated division of actions in our laws is into petitory, possessory, and declaratory. Petitory action, and actions are those, where something is demanded from the defendant, in consequence of a right of property, or of credit in the pursuer: Thus, actions for restitution of moveables, actions of poinding, of forthcoming, and indeed all personal actions upon contracts, or quasi-contracts, are petitory. Possessory actions are those which possessory are founded, either upon possession alone, as spolizies; or upon possession joined with another title, as removings; and they are competent either for getting into possession, for holding it, or for recovering it; analogous to the interdicts of the Roman law, quorum bonorum, uti possidetis, and unde vi.

19. An action of molestation is a possessory action, of molestation, competent to the proprietor of a land estate, against those who disturb his possession. It is chiefly used in questions of community, or of controverted marches. Where a declarator of property is conjoined with a process of molestation, the session alone is competent to the action. Actions on briefs of perambulation, have the same tendency with molestation actions: viz. the settling of marches between contumacious lands.

20. The action of mails and duties is sometimes of mails, petitory, and sometimes possessory. In either case, it is directed against the tenants and natural possessors of land estates, for payment to the pursuer of the rents remaining due by them for past crops, and of the full rent for the future. It is competent, not only to a proprietor whose right is perfected by seisin, but to a simple disponee, for a disposition of lands includes a right to the mails and duties; and consequently to an adjudger, for an adjudication is a judicial disposition. In the petitory action, the pursuer, since he founds Petitory, upon the right, not possession, must make the proprietor, from whom the tenants derive their right, party to the suit; and he must support his claim by titles of property or diligences, preferable to those in the person
of his competitor. In the possessory, the pursuer who
libels that, be his ancestors, or authors, have been seven
years in possession, and that therefore he has the bene-
fit of a possessory judgment, need produce no other title
than a seisin, which is a title sufficient to make the
possession of heritage lawful; and it is enough, if he
calls the natural possessors, though he should neglect
the proprietor. A possessory judgment founded on
seven years possession, in consequence either of a seisin
or a tack, has this effect, that though one should claim
under a title preferable to that of the possessor, he can
not compete with him in the possession, till in a formal
process of reduction he shall obtain the possessor's title
declared void.

21. A declaratory action is that, in which some right
is craved to be declared in favour of the pursuer, but
nothing sought to be paid or performed by the defend-
er, such as declarators of marriage, or irritancy, of
expiry of the legal reversion, &c. Under this class
may be also comprehended rescissory actions, which
without any personal conclusion against the defendant,
tend simply to set aside the rights or writings libelled,
in consequence of which a contrary right or immunity
arises to the pursuer. Decreas upon actions that are
properly declaratory confer no new right; they only
declare what was the pursuer's right before, and so leave
a retrospect to the period at which that right first com-
enced. Declarators, because they have no personal
conclusion against the defendant, may be pursued against
an apparent heir without a previous charge given him
to enter to his ancestor; unless where special circum-
stances require a charge.

22. An action for proving the tenor, whereby a writ-
ing, which is destroyed or amissing, is endeavoured to
be revived, is in effect declaratory. In obligations that
are extinguishable barely by the debtor's retiring, or
cancelling them, the pursuer, before a proof of the
tenor is admitted, must descend on such a casus amissa-
sio, or accident by which the writing was destroyed,
as shows it was lost when in the creditor's possession;
otherwise bonds that have been cancelled by the debtor
on payment, might be reared up as still subsisting
against him: But in writings which require contrary
deeds to extinguish their effect, as assignations, disposi-
tions, charters, &c. it is sufficient to libel that they
were lost, even casu fortuito.

23. Regularly no deed can be revived by this action.
without some admixture in writing, referring to that
which is libelled: for no written obligation ought to
be raised up barely on the testimony of witnesses. If
these admixture afford sufficient conviction that the
deed libelled did once exist, the tenor is admitted to
be proved by witnesses, who must depose, either that
they were present at signing the deed, or that they
afterwards saw it duly subscribed. Where the rela-
tive writings contain all the substantial clauses of that
which is lost, the tenor is sometimes sustained with-
out witnesses. In a writing which is libelled to have
contained uncommon clauses, all these must appear by
the admixture. Actions of proving the tenor are, on
account of their importance, appropriated to the court
of session; and, by the old form, the testimony of the
witnesses could not be received but in presence of all
the judges.

24. The action of double or multiple-poinding may
be also reckoned declaratory. It is competent to a
debtor, who is distressed, or threatened with distress,
by two or more persons claiming right to the debt,
and who therefore brings the several claimants into the
field, in order to dispute and settle their several prefer-
ences, that so he may have one to whom his estate shall
be found preferable. This action is daily pursued by an arrestee, in the case of several arrestees
used in his hands for the same debt; or by tenants in
the case of several adjudicators, all of whom claim right
to the same rents. In these competitions, any of the
competitors may bring an action of multiple-poinding
in name of the tenants, or other debtors, without their
consent, or even though they should disclaim the pro-
cess; since the law has introduced it as the proper re-
medy for getting such competitions determined: And
while the subject in controversy continues in medio, any
third person who conceives he has a right to it, may,
though he should not be cited as a defendant, produce
his titles, as if he were an original party to the suit,
and will be admitted for his interest in the competition.

25. Certain actions may be called accessory, because
they are merely preparatory or subservient to other
actions. Thus, exhibitions ad deliberandum, at the in-
stance of an heir against the creditors or custodiers
of his ancestor's writings, are intended only to pave the
way for future processes. An action of transference
is also of this sort, whereby an action, during the pen-
dency of which the defendant happens to die, is craved
to be transferred against his representative, in the same
condition in which it stood formerly. Upon the por-
suer's death his heir may insist in the cause against the
defender, upon producing either a retour or a confir-
med testament, according as the subject is heritable or
moveable. Transferences being but incidental to other
actions, can be pronounced by that inferior judge al-
one before whom the principal cause depended; but
where the representatives of the deceased live in an-
other territory, it is the supreme court must transfer.
Obligations may now be registered summarily after the
creditor's death; which before was not admitted, with-
out a separate process of registration, to which the grant-
er was necessarily to be made a party.

26. A process of wakening is likewise accessory.
An action is said to sleep, when it lies over not insti-
ted in for a year, in which case its effect is suspended;
but even then it may, at any time within the years of
prescription, be revived or wakened by a summons, in
which the pursuer recites the last step of the process,
and concludes that it may be again carried on as if it
had not been discontinued. An action that stands upon
any of the inner-house rolls cannot sleep, nor an action
in which decree is pronounced, because it has got its
full completion: Consequently the decree may be ex-
tracted after the year, without the necessity of a wak-
ening.

27. An action of transumpt falls under the same class.
Chap. III.

Law of Scotland.

class. It is competent to those who have a partial interest in writings that are not in their own custody, against the possessors thereof, for exhibiting them, that they may be transsumed for their behalf. Though the ordinary title in this process be an obligation by the defender to grant transsumptu to the pursuer, it is sufficient if the pursuer can show that he has an interest in the writings; but in this case, he must transsum them on his own charges. Actions of transsumption may be pursued before any judge-ordinary. After the writings to be transsumed are exhibited, full duplicates are made out, collated, and signed, by one of the clerks of court, which are called transsumptu, and are as effectual as an extract from the register.

Brevier.

Acts proceeded anciently upon brevies issuing from the chancery, directed to the justiciary or judge-ordinary, who tried the matter by a jury, upon whose verdict judgment was pronounced: And to this day we retain certain brevies, as of inquest, terce, idio-tery, tutory, perambulation, and perhaps two or three others: But summonees were, immediately upon the institution of the college of justice, introduced in the place of brevies. A summons, when applied to actions pursued before the session, is a writ in the king's name, issuing from his signet upon the pursuer's complaint, authorizing messengers to cite the defender to appear before the court and make his defence, with certificate, if he fail to appear, that decree will be pronounced against him in terms of the certification of the summons.

Summanon.

The days indulged by law to a defendant, between his citation and appearance, to prepare for his defence are called inducias legales. If he be within the kingdom, 21 and 6 days, for the first and second diets of appearance, must be allowed him for that purpose; and if out of it, 60 and 15. Defenders residing in Orkney or Zetland must be cited on 40 days. In certain summonees which are privileged, the inducias are shortened: Spuillizie and ejections proceed on 15 days; wakings and transfersence, being but incidental, on six; (see the list of privileged summonees, in act of sederunt June 30, 1672). A summons must be executed, i.e. served against the defender so as the last diet of appearance may be within a year after the date of the summons; and it must be called within a year after that diet, otherwise it falls for ever. Offence against the authority of the court, acts of malversation in office by any member of the college of justice, and acts of violence and oppression committed during the dependence of a suit by any of the parties, may be tried without a summons, by a summary complaint.

Consent of nature.

Though the Romans acknowledged a concours of actions in their proceedings, it is not known in the law of Scotland. Therefore, where an action is in part penal, e.g. a removing, spuillizie, &c. a pursuer who restrains his demand to, and obtains a decree merely for, restitution, cannot thereafter bring a new process for the violent profits. Yet the same fact may be the foundation both of a criminal and civil action, because these two are intended for different purposes; the one for satisfying the public justice, the other for indemnifying the private party: And though the defender should be absolved in the criminal trial, for want of evidence, the party injured may bring an action ad eisulain effectum, in which he is entitled to refer the libel to the defender's oath.

31. One libel or summonees may contain different conclusions on the same ground of right, recissory, declaratory, peremptory, &c. if the same are not repugnant to one another.

32. Defences are plea offered by a defender for defesa sliding an action. They are either dilatory, which do not enter into the cause itself, and so can only procure an absolvitor from the lis pendens: Or, peremptory, which entirely cut off the pursuer's right of action. The first, because they relate to the forms of proceeding, must be offered in limine judicis, and all of them at once. But peremptory defences may be proponed at any time before sentence. By an act of sederunt, however (1787), all defences, both dilatory and peremptory, so far as they are known, must be proponed at returning the summonses, under a penalty; and the same enactment extends to the cases of suspensions and adjournments. The writings to be founded upon by the parties also must be produced: the intention of the court, in framing the act of sederunt, being to accelerate as much as possible the decision of causes.

33. A cause, after the parties had litigated it before the judge, was said by the Romans to be liticosseated, restitutio. By liticosseation a judicial contract is understood to be entered into by the litigants, by which the action is perpetuated against heirs, even when it arises de jure. By our law, liiticosseation is not formed till an act is extracted, admitting the libel or defences to proof.

SECT. II. Of Probation.

cexxiv.

1. All allegations by parties to a suit, must be sup-probation, ported by proper proof. Probation is either by writing, by the party's own oath, or by witnesses. In the case allegations, which may be proved by either of the three ways, a proof is said to be admitted prout de prout de jure; because, in each case, all the legal methods of jure; probation are competent to the party; if the proof be brings by writing be lame, he may have recourse either to witnesses or to his adversary's oath; but, if he should first take himself to the proof by oath, he cannot thereafter use any other probation (for the reason assigned par. 2); and, on the contrary, a pursuer who has brought a proof by witnesses, on an extracted act, is not allowed to recur to the oath of the defendant.

Single combat, as a sort of appeal to Providence, was by single by our ancient law, admitted as evidence, in matters combat; both civil and criminal. It was afterwards restricted to the case of such capital crimes where no other proof could be had; some traces of this blind method of trial remained even in the reign of James VI, who, by 1600, c. 12, might authorize duels on weighty occasions.

2. As obligations or deeds signed by the party him- by writing, self, or his ancestors or author, must be, of all evidence, the least liable to exception; therefore every debt or allegation may be proved by proper evidence in writing. The solemnities essential to probative deeds have been already explained, (N° clxxiv. 3. et seq.). Books of account kept by merchants, tradesmen, and other dealers.

482
in business, though not subscribed, are probative against him who keeps them; and, in case of furnishings by a shopkeeper, such books, if they are regularly kept by him, supported by the testimony of a single witness, afford a semiplena probatio in his favour, which becomes full evidence by his own oath in supplement. Notorial instruments and executions by messengers bear full evidence, that the solemnities therein set forth were used, not to be invalidated otherwise than by a proof of falsehood; but they do not prove any other extrinsic facts therein averred, against third parties.

3. Regularly, no person's right can be proved by his own oath, nor taken away by that of his adversary; because these are the bare averments of parties in their own favour. But, where the matter in issue is referred by one of the parties to the oath of the other, such oath, though made in favour of the deponent himself, is decisive of the point; because the reference is a virtual contract between the litigants, by which they are understood to put the issue of the cause upon what shall be deposed: and this contract is so strictly regarded, that the party who refers to the oath of the other cannot afterwards, in a civil action, plead upon any deed against the party deposeing, inconsistent with his oath. To obviate the snare that may be laid for perjury, he to whose oath of verity a point is referred, may refuse to depose, till his adversary swear that he can bring no other evidence in proof of his allegation.

4. A defender, though he cannot be compelled to swear to facts in a libel properly criminal; yet may, in trespasses, where the conclusion is limited to a fine, or to damages. In general, an oath of party cannot either hurt or benefit third parties; being, as to them, res inter alios acta.

5. An oath upon reference is sometimes qualified by special limitations restricting it. The qualities which are admitted by the judges as part of the oath, are called intrinsic; those which the judge rejects or separates from the oath, extrinsic. Where the quality makes a part of the allegation which is relevantly referred to oath, it is intrinsic. Thus, because a merchant suing for furnishings after the three years, must, in order to make a relevancy, offer to prove by the defender's oath, not only the delivery of the goods, but that the price is still due: in such a case, though the defender should acknowledge upon oath his having received the goods, yet, if he adds, that he paid the price, this last part being a denial that the debt subsists, is intrinsic, since it is truly the point referred to oath. Where quality does not import an extinction of the debt, but merely a counter-claim, or mutua petitio, against the pursuer, it is held as intrinsic, and must be proved absente. Neither can a defender who in his oath admits the constitution of a debt, get off by adjuring the quality of payment, where the payment ought by its nature to be vouched by written evidence.

6. Oaths of verity are sometimes referred by the judge to either party, ex officio; which, because they are not founded on any implied contract between the litigants, are not finally decisive, but may be traversed on proper evidence afterwards produced. These oaths are commonly put by the judge for supplying a lame or imperfect proof, and are therefore called oaths in supplement. (See par. 2.)

7. To prevent groundless allegations, oaths of calamity have been introduced, by which either party may demand his adversary's oath, that he believes the fact contained in his libel or defences to be just and true. As this is an oath, not of verity, but only of opinion, the party who puts it to his adversary does not renounce other probation; and therefore no party is bound to give an oath of calamity, on recent facts of his own, for such oath is really an oath of verity. These oaths have not been so frequent since the act of seducunt, Feb. 1. 1715, whereby no party, against whom a fact shall be alleged, is obliged, without making oath, to confess or deny it; and, in case of calamitous denial, is subjected to the expece that the other party has thereby incurred.

8. In all oaths, whether of verity or calamity, the citation carries, or at least implies, a certification, that if the party does not appear at the day assigned for deposing, he shall be held pro confesso; from a presumption of his consciousness, that the fact upon which he declines to swear makes against him; but no party can be held pro confesso, if he be in the kingdom, without a previous personal citation used against him. Though an oath which resolves into a non memini cannot be said to prove any point; yet where one so deposes upon a recent fact, to which he himself was privy, his oath is considered as a dissembling of the truth, and he is held pro confesso, as if he had refused to swear.

9. An oath in litis is that which the judge refers to a pursuer, for ascertaining either the quantity or the value of goods which have been taken from him by the defender without order of law, or the extent of his damages. An oath in litis, as it is the affirmation of a party in his own behalf, is only allowed where there is proof that the other party has been engaged in some illegal act, or where the public policy has made it necessary, (see No clxviii. 11). This oath, as to the quantities, is not admitted, where there is a concurring testimony of witnesses brought in proof of it. When it is put as to the value of goods, it is only an oath of credibility; and therefore it has always been subject to the modification of the court.

10. The law of Scotland rejects the testimony of false witnesses. (1.) In payment of any sum above 100l. by Scots, all which must be proved either scripto Oro pro confesso, or in the court. (2.) In all gratuitous promises, though for the smallest trifle. (3.) In all contracts, where writing is either essential to their constitution, (see No clxiv. 2.), or where it is usually adhibited, as to the borrowing of money. And it is a general rule, subject to the restriction mentioned in the next part, that no debt or right, once constituted by writing, can be taken away by witnesses.

11. On the other part, probatio by witnesses is admissible to the extent of 100l. Scots, in payments, non-admissible to captivus legacies, and verbal agreements which contain mutual obligations. And it is received to the highest extent, (1.) In all bargains which have known engagements naturally arising from them concerning moveable goods. (2.) In facts performed in satisfaction even of a written obligation, where such obligation binds the party precisely to the performance of them. (3.) In facts which with difficulty admit of a proof by writing, even though the effect of such proof should be the extinction of a written obligation, especially if the facts import fraud or violence; thus a bond is relatable...
cible as de odes, on a proof by witnesses. Lastly, all
intromission by a creditor with the rents of his debtor's
estate payable in grain, may be proved by witnesses:
and even intromission with the silver rent, where the
creditor has entered into the total possession of the
debtor's land.

12. Nor person, whose near relation to another bars
him from being a judge in his cause, can be admitted
as a witness for him: but he may against him, except
a wife or child, who cannot be compelled to give testi-
mony against the husband or parent, ob reverentiam
personae et metum perjurii. Though the witness whose
propinquity to one of the parties is objected to, be
as nearly related to the other, the objection stands
good.

13. The testimony of infamous persons is rejected,
i.e. persons who have been guilty of crimes that law
declares to infer infamy, or who have been declared
infamous by the sentence of a judge; but infamia facti
does not disqualify a witness. Pupils are incapable wit-
nesses; being, in the judgment of law, incapable of the
impressions of an oath. And in general witnesses all
otherwise exceptionable may, where there is a penury of
witnesses arising from the nature or circumstances of
the fact, be received cum nota; that is, their testimo-
y, though not quite free from suspicion, is to be con-
joined with the other evidence, and to have such weight
given it as the judge shall think it deserves.

14. All witnesses, before they are examined in the
cause, are purged of partial counsel; that is, they must
declare that they have no interest in the suit, nor have
given advice how to conduct it; that they have got
neither bribe nor promise, nor have been instructed how
to depose; and that they bear no enmity to either of
the parties. These, because they are the points put
to a witness before his making oath, are called initia
testimonial. Where a party can bring present proof of
witness's partial counsel in any of the above particu-
lars, he ought to offer it before the witness be sworn;
but, because such objection, if it cannot be instantly
verified, will be no bar to the examination, law allows
the party in that case to protest for reprobator, before
the witness is examined; i.e. that he may be after-
wards allowed to bring evidence of his enmity, or other
inability. Reprobator is competent even after sen-
tence, where protestation is duly entered; but in that
case, the party insisting must consign 100l. Scots, which
he forfeits if he succumbs. This action must have the
concourse of the king's advocate, because the con-
clusion of it imports perjury; and for this reason, the
witness must be made a party to it.

15. The interlocutory sentence or warrant, by which
parties are authorized to bring their proof, is either by
way of act, or of incident diligence. In an act, the
lord ordinary who pronounces it is no longer judge
in the process; but in an incident diligence, which is
commonly granted upon special points, that do not
exhaust the cause, the lord ordinary continues judge.
If a witness does not appear at the day fixed by
the warrant of citation, a second warrant is granted of the
nature of a caption, containing a command to mes-
sengers to apprehend and bring him before the court.
Where the party to whom a proof is granted, brings
none within the term allowed by the warrant, an inter-
locuter is pronounced, circumscribing the term, and pro-

cluding him from bringing evidence thereafter. Where
evidence is brought, if it be upon an act, the lord or-
dinary on the acts, after the term for providing is elaps-
ed, declares the proof concluded; and thereupon a
state of the case is prepared by the ordinary on con-
cluded causes, which must be judged by the whole
lords; but if the proof be taken upon an incident dili-
gence, the import of it may be determined by the lord
ordinary in the cause.

16. Where facts do not admit a direct proof, pre-
sumptions are received as evidence which, in many cases,
are made as convincing a proof as the direct. Presump-
tions are consequences deduced from facts known or
proved, which infer the certainty, or at least a strong
probability, of another fact to be proved. This kind
of probaton is therefore called artificial, because it re-
quires a reasoning to infer the truth of the point in
question, from the facts that already appear in proof.
Presumptions are either, 1. juris et de jure; 2. juris;
or, 3. hominis or judicis. The first sort obtains, where
statute or custom establishes the truth of any point upon
a presumption; and it is so strong that it rejects all
proof that may be brought to elide it in special cases.
Thus, the testimony of a witness, who forwardly offers
himself without being cited, is, from a presumption of
his partiality, rejected, let his character be ever so
fair; and thus also, a minor, because he is by law pre-
sumed incapable of conducting his own affairs, is upon
that presumption disabled from acting without the con-
sent of his curators, though he should be known to be
with the greatest prudence. Many such presum-
ptions are fixed by statute.

17. Presumptiones juris are those which our law
books or decisions have established, without founding
any particular consequences upon them, or statuting
super prsumpto. Most of this kind are not proper pre-
sumptions inferred from positive facts, but are founded
merely on the want of a contrary proof: thus, the legal
presumptions for freedom, for life, for innocence, &c.
are in effect so many negative propositions, that servi-
tude, death, and guilt, are not to be presumed, with-
out evidence brought by him who makes the allegation.
All of them, whether they be of this sort, or proper
presumptions, as they are only conjectures formed from
what commonly happens, may be elided, not only by
direct evidence, but by other conjectures, affording a
stronger degree of probability to the contrary. Pre-
sumptiones hominis or judicis, are those which arise
daily from the circumstances of particular cases; the
strength of which is to be weighed by the judge.

18. A fictio juris differs from a presumption. Things
pictio are presumed, which are like to be true, but a fictio
of law assumes for truth what is either certainly
false, or at least is as probably false as true. Thus an
heir is presumed or considered in law as the same person
with his ancestor. Fictions of law, must, in their ef-
efts, be always limited to the special purposes of equity
for which they were introduced; see an example, No
clxxxiii. 3.

Chap. III. Of Sentences and their Executions.
the parties: every state has therefore fixed the character of final to certain sentences or decrees, which in the Roman law are called res judicata, and which exclude all review or rehearing.

2. Decrees of the court of session, are either in foro contradictoria, where both parties have litigated the cause, or in absence of the defendant. Decrees of the session in foro cannot, in the general case, be again brought under the review of the court, either on points which the parties neglected to plead before sentence (which we call competent and omitted), or upon points pleaded and found insufficient (proposed and repelled). But decrees, though in foro, are reversible by the court, where either they labour under essential nullities; e.g. where they are ultra petita, or not conformable to their grounds and warrants, or founded on an error in calculation, &c.; or where the party against whom the decree is obtained has thereafter recovered evidence sufficient to overturn it, of which he knew not before.

3. As parties might formerly reclaim against the sentences of the session, at any time before extracting the decree, no judgment was final till extract; but now, a sentence of the inner house, either not retracted against within six sederunt days after its date, or adhered to upon a reclaiming bill, though it cannot receive execution till extract, makes the judgment final as to the court of session. And by an order of the house of lords, March 24, 1725, no appeal is to be received by them from the sentences of the session after five years from extracting the sentence; unless the person entitled to such appeal be minor, clothed with a husband, non compos mentis, imprisoned, or out of the kingdom. Sentences pronounced by the lord ordinary have the same effect, if they were pronounced; as if they were pronounced in presence; and all petitions against the interlocutor of an ordinary must be preferred within eight sederunt days after signing such interlocutor.

4. Decrees in absence of the defendant, have not the force of res judicata as to him; for where the defendant does not appear, he cannot be said to have subjected himself by the judicial contract which is implied in litiscontestation: a party therefore may be restored against these, upon paying the other his costs in recovering them. The sentences of inferior courts may be reviewed by the court of session,—before decree, by advocate; and after decree, by suspension or reduction; which two last are also the methods of calling in question such decrees of the session itself, as can again be brought under the review of the court.

5. Reduction is the proper remedy, either where the decree has already received full execution by payment, or where it decrees nothing to be paid or performed, but simply declares a right in favour of the pursuer. Suspension is that form of law by which the effect of a sentence condemnatory, that has not yet received execution, is stayed or postponed till the cause be again considered. The first step towards suspension is a bill preferred to the lord ordinary on the bills. This bill, when the desire of it is granted, is a warrant for issuing letters of suspension which pass the signet; but if the presenter of the bill shall not, within 12 days after passing it, expedite the letters, execution may by act of sederunt 1677 proceed on the sentence. In practice, however, it is usual for the charger to put up a protestation in the minute book for production of the suspension, which may be expeditated at any time before this is done; and if the suspender shall allow the protestation to be extracted, the sest falls. Suspensions of decrees in foro cannot pass, but by the whole lords in time of session, and by three in vacation time; but other decrees may be suspended by any one of the judges. By the act of sederunt (1787), in order to remedy the abuse of presenting a multiplicity of bills of suspension of the decrees of inferior judges in small cases which have passed in absence, it is declared, that all bills of suspension of decrees by inferior judges, in absence of the defendants, in cases under 12l. sterling value, shall be refused and remitted to the inferior judge, if competent; the suspender, however, before being heard in the inferior court, reimbursing the charger of the expenses incurred by him previous to the remit.

6. As suspension has the effect of staying the execution of the creditor's legal diligence, it cannot, in the most general case, pass without caution given by the suspender to pay the debt, in the event it shall be found due. Where the suspender cannot, from his low or suspicious circumstances, procure unquestionable security, the lords admit juratory caution, i.e. such as the suspender swears is the best he can offer; but the reasons of suspension are, in that case, to be considered with particular accuracy at passing the bill. Decrees in favour of the clergy, of universities, hospitals, or parish-schoolmasters, for their stipends, rents, or salaries, cannot be suspended, but upon production of discharges, or on consignation of the sums charged for. A charger, who thinks himself secure without a caution, and wants despatch, may, where a suspension of his diligence is sought, apply to the court to get the reasons of suspension summarily discussed on the bill.

7. Though he, in whose favour the decree suspended is pronounced, be always called the charger, yet a when a decree may be suspended before a charge be given on it. Nay, suspension is competent even where there is no decree, for putting a stop to any illegal act whatsoever: thus, a building, or the exercise of a power which one assumes unwarrantably, is a proper subject of suspension. Letters of suspension are considered merely as a prohibitory diligence; so that the suspender, if he would turn provoker, must bring an action of reduction. If, upon discussing the letters of suspension, the reasons shall be sustained, a decree is pronounced, suspending the letters of diligence on which the charge was given simpliciter; which is called a decree of suspension, and takes off the effect of the decree suspended. If the reasons of suspension be repelled, the court finds the letters of diligence orderly proceeded, i.e. regularly carried on: and they ordain them to be put to further execution.

8. Decrees are carried into execution, by diligence, either against the person or against the estate of the debtor. The first step of personal execution is by letters of hombing which pass by a warrant of the court of session, on the decrees of magistrates of boroughs, sheriffs, admirals, and commissaries. If the debtor does not obey the will of the letters of hombing within the days of the charge, the charger, after denouncing him
 Chap. III.

Law.

him rebel, and registering the bond, may apply for letters of caption, which contain a command, not only to messengers, but to magistrates, to apprehend and imprison the debtor. All messengers and magistrates, who refuse their assistance in executing the caption, are liable subditiarii for the debt; and such subsidiary action is supported by the execution of the messenger, employed by the creditor, expressing that they were charged to concur, and would not. Letters of caption contain an express warrant to the messenger, in case he cannot get access, to break open all doors and other lock-fast places.

What persons secured against personal execution by caption.

9. Law secures peers, married women, and pupils, against personal execution by caption upon civil debts. Such commoners also as are elected to serve in parliament, are secured against personal execution by the privilege of parliament. No caption can be executed against a debtor within the precincts of the king's palace of Holyroodhouse; but this privilege of sanctuary afforded no security to criminals, as that which was by the canon law conferred on churches and religious houses. Where the personal presence of a debtor, under caption, is necessary in any of our supreme courts, the judges are empowered to grant him a protection, for such time as may be sufficient for his coming and going, not exceeding a month. Protection from diligence is also granted by the court of session under the bankrupt statute, where it is applied for, with concurrence of the trustee, or a certain number of the creditors, at the case may require.

10. After a debtor is imprisoned, he ought not to be indulged the benefit of the air, not even under a guard; for creditors have an interest, that their debtor be kept under close confinement, that, by the aequor cecretis, they may be brought to pay their debt: and any magistrate or jailer, who shall suffer the prisoner to go abroad, without a proper attestation, upon oaths, of the dangerous state of his health, is liable subditiarii for the debt. Magistrates are in like manner liable if they shall suffer a prisoner to escape through the insufficiency of their prison: but if he shall escape under night, by the use of instruments, or by open force, or by any other accident which cannot be imputed to the magistrates or jailers, they are not chargeable with the debt; provided they shall have immediately after his escape, made all possible search for him. A case lately occurred where a messenger having apprehended a person for a debt, upon letters of caption, delivered him over to the provost of the burgh, and took a receipt for him. The provost allowed him to remain at the inn all night, and afterwards allowed him what is called open goal, by which he had access to the court-house, under the same roof with the prison, where he transacted business. As the person at whose instance he was apprehended upon the caption, considered that the magistrates had not kept the debtor in prison as commanded by the letters, he brought an action against them for the debt, although the debtor had not so much as attempted to make his escape. It was contended by the magistrates, that they were not liable, having only followed the usual practice of the burgh: but the court of session, considering the magistrates as principal keepers of the prison, and as having no discretionary power, were of opinion, that the debtor had never been imprisoned in the eye of law, and therefore found the magistrates liable; and their judgment was affirmed upon an appeal. Regularly, no prisoner for debt upon letters of caption, though he should have made payment, could be released without letters of subscription, containing a charge to the jailer to set him at liberty; because the creditor's discharge could not take off the penalty incurred by the debtor for contempt of the king's authority: but to save unnecessary expense to debtors in small debts, jailers are empowered to let go prisoners where the debt does not exceed 200 merks Scots, upon production of a discharge in which the creditor consents to his release.

11. Our law, from a consideration of compassion, Liberaion allows insolvent debtors to apply for a release from prison upon a cessio bonorum, i.e. upon their making over to the creditors all their estate real and personal. This must be insisted for by way of action, to which all the creditors of the prisoner ought to be made parties. The prisoner must, in this action, which is cognizable only by the court of session, exhibit a particular inventory of his estate, and make oath that he has no other estate than that therein contained, and that he has made no conveyance of any part of it, since his imprisonment, to the harm of his creditors. He must also make oath, whether he has granted any disposition of his effects before his imprisonment, and descend on the persons to whom, and on the cause of granting it; that the court may judge, whether, by any collusive practice, he has forfeited his claim to liberty.

12. A fraudulent bankrupt is not allowed this privilege; nor a criminal who is liable in any way to indemnification to the party injured or his executors. Debtors, though the crime itself should be extinguished by a pardon. A disposition granted on a cessio bonorum is merely in further security to the creditors, not in satisfaction or in solutum of the debts. If, therefore, the debtor should acquire any estate after his release, such estate may be attached by his creditors, as if there had been no cessio, except in so far as is necessary for his subsistence. Debtors, who are set free on a cessio bonorum, are obliged to wear a habit proper to dyemakers or bank-dyers. The lords are prohibited to dispense with this habit, mark of ignominy, unless, in the summons and process of cessio, it be libelled, sustained, and proved, that the bankruptcy proceeds from misfortune. And bankrupts are condemned to submit to the habit, even where no suspicion of fraud lies against them, if they have been dealers in an illicit trade.

13. Where a prisoner for debt declares upon oath before the magistrates of the jurisdiction, that he has, not wherewith to maintain himself, the magistrate may set him at liberty, if the creditor, in consequence of whose diligence he was imprisoned, does not alienate him within ten days after intimation made for that purpose. But the magistrate may, in such case, detain him in prison, if the creditor chooses to bear the burden of the aliment rather than release him. The statute an Act of authorizing this release, which is usually called the act of grace, is limited to the case of prisoners for civil debts.

14. Decrees are executed against the moveable estate Execution of the debtor by arrestment or sequestration; and against the his heritable estate, by inhibition, or adjudication. If the debtor's estate be condemned, in a removing or other process, to quit the possession of lands, and refuses, notwithstanding
LAW.

Part:

15. A decree arbitral, which is a sentence proceeding on a submission to arbiters, has some affinity with a judicial sentence, though in most respects the two differ. A submission is a contract entered into by two or more parties who have disputable rights or claims, whereby they refer their differences to the final determination of an arbiter or arbiters, and oblige themselves to acquiesce in what shall be decided. Where the day within which the arbiters are to decide, is left blank in the submission, practice has limited the arbiters power of deciding to a year. As this has proceeded from the ordinary words of style, empowering the arbiters to determine betwixt and the day of next to come; therefore, where a submission is indefinite, without specifying any time, like all other contracts or obligations, it subsists for 40 years. Submissions, like mandates, expire by the death of any of the parties submitters before sentence. As arbiters are not vested with jurisdiction, they cannot compel witnesses to make oath before them, or havers of writings to exhibit them; but this defect is supplied by the court of session, who, at the suit of the arbiters, or of either of the parties, will grant warrant for citing witnesses, or for the exhibition of writing. For the same reason the power of arbiters is barely to decide; the execution of the decree belongs to the judge. Where the submitters consent to the registration of the decree arbitral, performance may be enforced by summary diligence.

Powers of arbiters. 16. The power of arbiters is wholly derived from the consent of parties. Hence where their powers are limited to a certain day, they cannot pronounce sentence after that day. Nor can they subject parties to a penalty higher than that which they have agreed to in the submission. And where a submission is limited to special claims, sentence pronounced on subjects not specified in the submission is null, as being ultra vires compromissi.

Decrees arbitral, how far reducible. 17. But, on the other hand, as submissions are designed for a most favourable purpose, the amicable composing of differences, the powers thereby conferred on arbiters receive an ample interpretation. Decrees arbitral are not reducible upon any ground, except corruption, bribery, or falsehood.

Sect. IV. Of Crimes.

Crime. 1. The word crime, in its most general sense, includes every breach either of the law of God or of our country; in a more restricted meaning, it signifies such transgressions of law as are punishable by courts of justice.

Public. Crimes were, by the Roman law, divided into public and private. Public crimes were those that were expressly declared such by some law or constitution, and which, on account of their more atrocious nature and hurtful consequences, might be prosecuted by any member of the community. Private crimes could be pursued only by the party injured, and were generally punished by a pecuniary fine to be applied to his use. By law, the law of Scotland, no private party, except the person injured, or his next of kin, can accuse criminally; but the king's advocate, who in this question represents the community, has a right to prosecute all crimes vindictam publicam, though the party injured should refuse to concur. Smaller offences, as petty riots, injuries, &c. which do not demand the public vengeance, pass generally by the appellation of delicts, and are punished either by fine or imprisonment.

2. The essence of a crime is, that there be an intention in the actor to commit; for an action in which the will of the agent has no part is not a proper object either of rewards or punishments; hence arises the rule, crimen dolio contrahitur. Simple negligence does not therefore constitute a proper crime. Yet where it is extremely gross, it may be punished arbitrarily. Far less can we reckon in the number of crimes, those committed by an idiot or furious person: but lesser degree of fatuity, which only darkens reason, will not afford a total defense, though they may save from the peses ordinarias. Actions committed in drunkenness are not to be considered as involuntary, seeing the drunkenness itself, which was the first cause of the action, is both voluntary and criminal.

3. On the same principle, such as are in a state of infancy, or in the confines of it, are incapable of a criminal action, done not being incident to that age; but the precise age at which a person becomes capable of dolc, being fixed neither by nature nor by statute, is by our practice to be gathered by the judge, as he best can, from the understanding and manners of the person accused. Where the guilt of a crime arises chiefly from statute, the actor, if he is under puberty, can hardly be found guilty; but, where nature itself points out its deformity, he may, if he is proximus pater, be more easily presumed capable of committing it: yet, even in that case, he will not be punished peses ordinarias.

4. One may be guilty of a crime, not only by premeditating it himself, but being accessory to a crime, he committed by another, which last is by civilians styled opere et consilio, and, in our law phrase, as and part. A person may be guilty, as and part, either by giving advice or counsel to commit the crime; or, 2. By giving warrant or mandate to commit it; or, 3. By actually assisting the criminal in the execution. It is generally agreed by doctors, that, in the more atrocious crimes, the adviser is equally punishable with the criminal; and that, in the slighter, the circumstances arising from the adviser's lesser age, the jocular or careless manner of giving advice, &c. may be received as pleas for softening the punishment. One who gives mandate to commit a crime, as he is the first spring of action, seems more guilty than the person employed as the instrument in executing it; yet the actor cannot excuse himself under the pretense of orders which he ought not to have obeyed.

5. Assistance may be given to the committer of a crime, not only in the actual execution, but previous to it, by furnishing him, intentionally, with means, arms, or the other means of perpetrating it. That sort of assistance which is not given till after the criminal act, and which is commonly called abertering, though it be of itself criminal, does not infer art and part of the principal.
Chap. III.

Law of Scotland.

Punishment of crimes.

6. Those crimes that are in their consequences most hurtful to society, are punished capitally, or by death; others escape with a lesser punishment, sometimes fixed by statute, and sometimes arbitrary, i.e. left to the discretion of the judge, who may exercise his jurisdiction, either by fine, imprisonment, or a corporal punishment. Where the punishment is left, by law, to the discretion of the judge, he can in no case extend it to death. The single escheat of the criminal falls on conviction, in all capital trials, though the sentence should not express it.

Blasphemy.

7. Certain crimes are committed more immediately against God himself; others, against the state; and a third kind, against particular persons. The chief crime in the first class, cognizable by temporal courts, is blasphemy, under which may be included atheism. This crime consists in the denying or vilifying the Deity by speech or writing. All who curse God or any of the persons of the blessed Trinity, are to suffer death, even for a single act; and those who deny him, if they persist in their denial. The denial of a Providence, or of the authority of the holy Scriptures, is punishable capitally for the third offence.

8. No prosecution can now be carried on for witchcraft or conjuration. But all who undertake from their skill in any occult science, to tell fortunes, or discover stolen goods, are to suffer imprisonment for a year, stand in the pillory four times in that year, and find surety for their future good behaviour.

Treason.

9. Some crimes against the state are levied directly against the supreme power, and strike at the constitution itself: others discover such a contempt of law, as tends to baffle authority, or slacken the reins of government. Treason, crimen majestatis, is that crime which is aimed against the majesty of the state; and can be committed only by those who are subjects of that state either by birth or residence. Soon after the union of the two kingdoms in 1707, the laws of treason, then in force in England, were made ours by 7 Ann. c. 21. both with regard to the facts constituting that crime, to the forms of trial, the corruption of blood, and all the penalties and forfeitures consequent on it.

10. It is high treason, by the law of England, to imagine the death of the king, queen consort, or of the heir apparent to the crown; to levy war against the king, or adhere to his enemies; to counterfeit the king's coin, or his great or privy seal; to kill the chancellor, treasurer, or any of the 12 judges of England, while they are doing their offices: which last article is by the forenamed act 7 Ann. applied to Scotland, in the case of slaying any judge of the session or of justiciary sitting in judgment. Those who wash, clip, or lighten, the proper money of the realm; who advisedly affirm by writing or printing, that the pretended has any right to the crown, that the king and parliament cannot imitate the succession to it, or who hold correspondence with the pretended, or any person employed by him, are also guilty of treason.

11. The forms of proceedings in the trial of treason, whether against peers or commoners, are set forth in a small treatise, published by order of the house of lords.

12. Misprision of treason, from mepren dre, is the Misprision overlooking or concealing of treason. It is inferred by of treason, one's bare knowledge of the crime, and not discovering it to a magistrate or other person entitled by his office to take examination; though he should not in the least degree assent to it. The foresaid act 7 Ann. makes the English law of misprision ours. Its punishment is, by the law of England, perpetual imprisonment, together with the forfeiture of the offender's moveable and immoveable property, and of the profits of his heritable estate, during his life; that is, in the style of our law, his single and different escheat.

13. The crime of sedition consists in the raising com- motions or disturbances in the state. It is either verbal or real. Verbal sedition, or leasing-making, is inferred from the uttering of words tending to create discord between the king and his people. It is punished either by imprisonment, fine, or banishment, at the discretion of the judge. Real sedition is generally committed by convocating together any considerable number of people, without lawful authority, under the presence of redressing some public grievances, to the disturbing of the public peace. Those who are convicted of this crime are punished by the confiscation of their goods; and their lives are at the king's will. If any persons, to the number of 12, shall assemble, and being required by a magistrate or constable to disperse, shall nevertheless continue together for an hour after such command, the persons disobeying shall suffer death and confiscation of moveables.

14. Judges, who, wilfully or through corruption, use their authority as a cover to injustice or oppression, are punished with the loss of honour, fame and dignity. Under this head may be classed the libelle (from libido, 'compensation'), which is the taking a consideration in money or goods from a thief to exempt him from punishment, or cause his escape from justice. A sheriff or other judge, guilty of this crime, forfeits his life and goods. And even a private person, who takes the libelle, suffers as the principal thief. The buying of disputed claims, concerning which there is a pending process, by any judge or member either of the session or of an inferior court, is punished by the loss of the delinquent's office, and all the privileges thereto belonging.

15. Deference is the opposition given, or resist-Deference made, to messengers or other officers, while they are employed in executing the law. The court of session is competent to this crime. It is punishable with the confiscation of moveables, the one half to the king, and the other to the creditor at whose suit the diligence was
LAW.

16. Breach of arrestment (see No. lxxxviii. 5.) is a crime of the same nature with defacement, as it importa a contempt of the law and of our judges. It subjects to an arbitrary corporal punishment, and the eschat of moveables; with a preference to the creditor for his debt, and for such farther sum as shall be modified to him by the judge. Under this head of crimes against good government and police, may be reckoned the forestalling of markets; that is, the buying of goods intended for a public market, before they are carried there; which for the third criminal act infers the eschat of moveables; as also slaying salmon in forbidden time, destroying plough grash in time of tillage, slaying or boughing horses or cows in time of harvest and destroying or spoiling growing timber; as to the punishment of which, see statutes 1503, c. 72. 1587, c. 82. and 1689, c. 16.—1 Geo. L. St. 2. c. 48.

17. Crimes against particular persons may be directed either against life, limb, liberty, chastity, goods, or reputation. Murder is the wilful taking away of a person's life, without a necessary cause. Our law makes no distinction between premeditated and sudden homicide: both are punished capitally. Casual homicide, where the actor is in some degree blameable; and homicide in self-defence, where the just bounds of defence have been exceeded, are punished arbitrarily: but the slaughter of night thieves, housebreakers, assistants in masterful depredations, or rebels denounced for capital crimes, may be committed with impunity. The crime of dememoratio, or the cutting off a member, is joined with that of murder: but in practice its punishment has been restricted to the eschat of moveables, and an asmenty or indemnification to the party. Mastillation, or the disabling of a member, is punished at the discretion of the judge.

18. Self-murder is as highly criminal as the killing our neighbours; and for this reason, our law has, contrary to the rule, crima morte causata, allowed a proof of the crime, after the offender's death, that his single eschat might fall to the king or his donatory. To this end, an action must be brought, not before the justiciary, but the session, because it is only intended ad civilum effectum, for proving and declaring the self-murder; and the next of kin to the deceased must be made a party to it.

19. The punishment of parricide, or of the murder of a parent, is not confined, by our law, to the criminal himself. All his posterity in the right line are declared incapable of inheriting; and the succession devolves on the next collateral heir. Even the curving or beating of a parent infers death, if the person guilty be above 16 years; and an arbitrary punishment, if be be under it. A presumptive or statutory murder is constituted by 1690, c. 21. by which any woman who shall conceal her pregnancy, during its whole cause, and shall not call for, or make use of, help in the birth, is to be reputed the murderer, if the child be dead, or assisting. This act was intended to disencourage the unnatural practice of women making away their children begetten in fornication, to avoid such censures.

20. Duelling, is the crime of fighting in single combat, on previous challenges given and received. Fighting in a duel, without license from the king, is punishable by death; and whatever person, principal or second, shall give a challenge to fight a duel, or shall accept a challenge, or otherwise engage therein, is punished by banishment and eschat of moveables, though no actual fighting should ensue.

21. Hainsmucklen (from hain "home," and soca "to seek or pursue") is the assaulting or beating of a person in his own house. The punishment of this crime is nowhere defined, except in the books of the Majesty, which makes it the same as that of a rape; and it is, like rape, capital by our practice. The assault must be made in the proper house of the person assaulted, where he lies and rises daily and nightly; so that neither a public house, nor even a private, where one is only transiently, falls within the law.

22. Any party to a law suit, who shall slay, wound, or otherwise invade his adversary, at any period of time between executing the summons and the complete execution of the decree, shall be accessory to such infliction, shall lose his cause. The sentence pronounced at this trial, against him who has committed the battery, is not subject to reduction, either on the head of minority, or on any other ground whatever: and if the person prosecuted for this crime shall be denounced for not appearing, his litigant, as well as single eschat, falls upon the denunciation.

23. The crime of wrongful imprisonment is inferred by granting warrants of commitment in order to trial proceedings on informations not subscribed, or without expressing the cause of commitment; by receiving or detaining prisoners on such warrants; by refusing to prisoner a copy of the warrant of commitment; by detaining him in close confinement, above eight days after his commitment; by not releasing him on bail, where the crime is bailable; and by transporting persons out of the kingdom, without either their own consent, or a lawful sentence. The persons guilty of a wrongful imprisonment are punished by a pecuniary mulct, from 600l. down to 400l. Scots, according to the rank of the person detained; and the judge, or other person guilty, is over and above subjected to pay to the person detained a certain sum per diem proportioned to his rank, and is declared incapable of public trust. All these penalties may be insisted for by a summary action before the session, and are subject to no modification.

24. Adultery, is the crime by which the marriage bed is polluted. This crime could neither by the Roman nor Jewish law be committed, but where the guilty woman was the wife of another: by ours, it is adultery, if either the man or woman be married. We distinguish between simple adultery, and that which is notorious or manifest. Open and manifest adulterers, who continue incorrigible, notwithstanding the censures of the church, are punished capitally. This crime is distinguished by one or other of the following characters: where there is issue proceeded between the adulterers; or where they keep bed and company together notoriously; or where they give scandal to the
the church, and are, upon their obstinate refusing to
listen to its admonitions, excommunicated. The puni-
ishment of simple adultery, not being defined by sta-
tute, is left to the discretion of the judge; but custom
has made the falling of the single eachact one of its pe-
nalties.

Bigamy.

25. Bigamy is a person's entering into the engage-
ments of a second marriage, in violation of a former
marriage vow still subsisting. Bigamy, on the part of
the man, has been tolerated in many states, before
the establishment of Christianity, even by the Jews
themselves; but it is prohibited by the precepts of the
gospel; and it is punished by our law, whether on the
part of the man or of the woman, with the pains of
perjury.

26. Incest, is committed by persons who stand with-
in the degrees of kindred forbidden in Lev. xviii. and
is punished capital. The same degrees are pro-
hibited in affinity, as in consanguinity, Lev. xviii. 13.
et seq. As this crime is repugnant to nature, all chil-
dren, whether lawful or natural, stand on an equal
footing: civilis ratio civilia iura corrumpere potest, non
evernaturalia. It is difficult indeed to bring a legal
proof of a relation merely natural, on the side of the
father; but the mother may be certainly known with-
out marriage.

Rape.

27. There is no explicit statute making rape, or the
ravishing of women, capital; but it is plainly supposed
in act 1612, c. 4. by which the raverisher is exempted
from the pains of death, only in the case of the wo-
man's subsequent consent, or her declaration that she
went off with him of her own free will; and even then,
be it to suffer an arbitrary punishment, either by im-
prisonment, confiscation of goods, or a pecuniary fine.

Theft.

28. Theft is defined. A fraudulent intermeddling with
the property of another, with a view of making gain.

29. Theft may be aggravated into a capital crime,
though the value of the thing stolen be trifling; as
theft twice repeated, or committed in the night, or by
landed men; or of things set apart for sacred uses.
The receivers and concealers of stolen goods, knowing
them to be such, suffer as thieves. Those who barely
harbour the person of the criminal within 48 hours
either before or after committing the crime, are punished
as partakers of the theft. Such as sell goods belong-
ing to thieves or lawless persons who dare not them-
selves come to market, are punished with banishment
and the eschat of moveables.

30. Theft attended with violence is called robbery,
and in our old statutes, rieft or stouthrift; under which
class may be included sorning, or the taking of meat
and drink by force, without paying for it. Stouthrift came
at last to be committed so audaciously, by bands of men
associated together, that it was thought necessary to vest
all our freeholders with a power of holding courts up
on sorners and rievers, and condemning them to death.
Nay, all were capital punishment, who, to secure their
lands from depredation, paid to the rievers a yearly
contribution, which got the name of black mail. An
act also passed, commanding to banishment a band of
sorners, who were originally from Egypt, called gypsies,
and adjudging to death all that should be reputed Egyp-
tians, if found thereafter within the kingdom. Rob-
bery committed on the seas is called piracy, and is
punished capital by the high admiral. Several of the
facts which constitute this crime are set forth in a Brit-
ish statute, 8 Geo. I. c. 24.

31. Falsehood, in a large sense, is the fraudulent imi-
tation or suppression of truth, to the damage of another.
The lives and goods of persons convicted of using false
weights or measures were, by our old law, in the king's
mercy: and their heirs could not inherit but upon a
remission. The latest statute against this crime pun-
ishes it by confiscation of moveables. That particular
species of falsehood, which consists in the falsifying of
writings, passes by the name of forgery. Our practice for-
gray, has now of a long time, agreeably to the Roman law,
made this crime capital; unless the forgery be of execu-
tions, or other writings of smaller moment; in which
case, it is punished arbitrarily.

32. The writing must not only be fabricated, but
put to use or founded on, in order to infer this crime.
And though it be strictly criminal, yet the trial of it
is proper to the court of session; but where improba-
tion is moved against a deed by way of exception, the
inferior judge, before whom the action lies, is competent
to it ad civilsem effectum. When it is pleaded as an ex-
ception, our practice, to discourage affected delays,
omeans the defender, who moves it, to ensign 40l.
Scots; which be forfeits, if his plea shall appear calum-
nious.

33. Where a person, found guilty of forgery by the
court of session, is by them remitted to the justiciary,
an indictment is there exhibited against him, and a
jury sworn, before whom the decree of session is pro-
duced, in place of all other evidence of the crime, in re-
spect of which the jury find the pannel guilty; so that
that decree being pronounced by a competent court, is
held as full proof, or, in the style of the bar, as proba-
tio probata.

34. Perjury, which is the judicial affirmation of a Psnyr.
falsehood on oath, really constitutes the crimen falsi;
for he who is guilty of it does, in the most solemn
manner, substitute falsehood in the place of truth. To
constitute this crime, the violation of truth must be
deliberately intended by the swearer; and therefore
reasonable allowances ought to be given to forgetful-
ness or misapprehension, according to his age, health,
and other circumstances. The breach of a promissory
oath does not infer this crime; for he who promises on
oath may sincerely intend performance when he swears,
and so cannot be said to call on God to attest a false-
hood. Though an oath, however false, if made upon
reference in a civil question, concludes the cause, the
person perjured is liable to a criminal trial; for the ef-
fecr of the reference can go no further than the private
right of the parties.

35. Notwithstanding the mischievous consequences
of perjury to society, it is not punished capitally, but by confiscation of moveables, imprisonment for a year, and infamy. The court of session is competent to perjury incidenters, when, in any examination upon oath, taken in a cause depending before them, a person appears to have sworn falsely: but in the common case, that trial is proper to the justiciary. Subornation of perjury consists in tampering with persons who are to swear in judgment, by directing them how they are to depose: and it is punished with the pains of perjury.

Stellonate. 5. The crime of stellonate, from stello, includes every fraud which is not distinguished by a special name; but is chiefly applied to conveyances of the same numerical right, granted by the proprietor to different disponees. The punishment of stellonate must necessarily be arbitrary, to adapt it to the various natures and different aggravations of the fraudulent acts. The persons guilty of that kind of it, which consists in granting double conveyances, are by law declared infamous, and their lives and goods at the king’s mercy. The cognizance of fraudulent bankruptcy is appropriated to the court of session, which may inflict any punishment on the offender that appears proportioned to his guilt, death excepted.

Usury. 37. The crime of usury, before the Reformation, consisted in the taking of any interest for the use of money; and now in taking a higher rate of interest than is authorized by law. It is divided into usura manifesta, or direct; and usura coverta, or covered. One may be guilty of the first kind, either where he covenants with the debtor for more than the lawful interest on the loan-money: or where one receives the interest of a sum before it is due, since thereby he takes a consideration of the use of money before the debtor has really got the use of it. Where a debt is clogged with an uncertain condition, by which the creditor runs the hazard of losing his sum, he may covenant for a higher interest than the legal, without the crime of usury: for there the interest is not given merely in consideration of the use of the money, but of the danger undertaken by the creditor.

38. Covered usury, is that which was committed under the mask, not of a loan, but of some other contract; e.g. a sale or an improper wadset. And in general, all obligations entered into with an intention of getting more than the legal interest for the use of money, however they may be disguised, are usurious. As a farther guard against this crime, the taking more than the legal interest for the forbearance of payment of money, merchandise, or other commodities, by way of loan, exchange, or other contrivance whatever, or the taking a bribe for the loan of money, or for delaying its payment when lent, is declared usury. Where usury is proved, the usurious obligation is not only declared void, but the creditor, if he has received any unlawful profits, forfeits the treble value of the sums or goods lent. Usury when it is to be pursued criminally, must be tried by the justiciary: but where the libel concludes only for voiding the debt, or restitution, the session is the proper court.

Injury. 39. Injury, in its proper acceptation, is the reproaching or affronting our neighbor. Injuries are either verbal or real. A verbal injury, when directed against a private person, consists in the uttering contumelious words, which tend to expose our neighbor's character by making him little or ridiculous. It does not seem that the twitting one with natural defects — without any sarcastical reflections, though it be inhuman, falls under this description, as these imply no real reproach in the just opinion of mankind. Where the injurious expressions have a tendency to blacken one's moral character, or fix some particular guilt upon him, and are deliberately repeated in different companies, or handed about in whispers to confidants, it then grows up to the crime of slander: and where a person's moral character is thus attacked, the omission injuriosa is commonly inferred from the injurious words themselves, unless special circumstances be offered to take off the presumption, e.g. that the words were uttered in judgment in one's own defense, or by way of information to a magistrate, and had some foundation in fact. Though the cognizance of slander is proper to the commissioners, who, as the justices Christianitatis, are the only judges of scandal; yet, for some time past, bare verbal injuries have been tried by other criminal judges, and even by the session. It is punished either by a fine, proportioned to the condition of the persons injuring and injured, and the circumstances of time and place; or if the injury import scandal, by publicly acknowledging the offence; and frequently the two are conjoined. The calling one a bankrupt is not, in strict speech, a verbal injury, as it does not affect the person's moral character; yet, as it may hurt his credit in the way of business, it founds him in an action of damages, which must be brought before the judge-ordinary. A real injury is inflicted by any fact, by which a person's honour or dignity is affected; as striking one with a cane, or even aiming a blow without striking; spitting in one's face; assuming a coat of arms, or any other mark of distinction proper to another, &c. The composing and publishing defamatory libels may be reckoned of this kind. Real injuries are tried by the judge-ordinary, and punished either by fine or imprisonment, according to the demerit of the offender.

40. After having shortly explained the several crimes punishable by our law, this treatise may be concluded with a few observations on criminal jurisdiction, the forms of trial, and the methods by which crimes may be extinguished. Criminal jurisdiction is founded, 1. Ratione domicilii, if the defender dwells within the district of the judge. Vagabonds, who have no certain domicile, may be tried wherever they are apprehended. 2. Ratione defectis, if the crime was committed within the territory. Treason is triable, by the English law, in any county that the king should appoint; and, by a temporary act now expired, treason committed in certain Scots counties was made triable by the court of justiciary, wherever it should sit.

41. No criminal trial can proceed, unless the person accused is capable of making his defence. Absentia sunt, therefore cannot be tried; nor fatuoous nor foreivor persons, durante foro, even for crimes committed while they were in their senses. For a like reason, minors who had no curators, could not, by the Roman law, be tried criminally; but our practice considers every person who is capable of doing, to be also sufficiently qualified for making his defence in a criminal trial.

42. No person can be imprisoned in order to stand committed.
When the trial proceeds upon criminal letters, the private prosecutor must give security, at raising the letters, that he will report them duly executed to the justiciary, in terms of 1535, c. 35.; and the defender, if he be not already in prison, is, by the letters, required to give caution, within a certain number of days after his citation, for his appearance upon the day fixed for his trial: And if he gives none within the days of the charge, he may be denounced rebel, which infers the forfeiture of his moveables.

45. That part of the indictment, or of the criminal letters, which contains the ground of the charge against the defender, and the nature or degree of the punishment he ought to suffer, is called the libel. All libels must be special, setting forth the particular facts inferring the guilt, and the particular place where these facts were done. The time of committing the crime may be libelled in more general terms, with an alternative as to the month, or day of the month: but as it is not practicable, in most cases, to libel upon the precise circumstances of accession that may appear in proof, libels against accessories are sufficient, if they mention, in general, that the persons prosecuted are guilty art and part.

46. The defender in a criminal trial may raise letters of exculpation, for citing witnesses in proof of his defences against the libel, or of his objections against any of the jury or witnesses; which must be executed to the same day of appearance with that of the indictment or criminal letters.

47. The diets of appearance, in the court of justiciary, are peremptory: the criminal letters must be called on the very day on which the defender is cited: and hence, if no accuser appears, their effect is lost, instanitia perit, and new letters must be raised. If the libel, or any of the executions, shall to the prosecutor appear informal, or if he be diffident of the proof, from the absconding of a necessary witness, the court will, upon a motion made by him, desert the diet pro loco et tempore; after which new letters become also necessary. A defender, who does not appear on the very day in which he is cited, is declared fugitive; in consequence of which his single escheat falls. The defender, after his appearance in court, is called the pannel.

48. The two things to be chiefly regarded in a criminal libel, are, 1. The relevancy of the facts, i.e. their appearance-sufficiency to infer the conclusion; 2. Their truth and force. The consideration of the first belongs to the judge of the court; that of the other, to the jury or assize. If the facts libelled be found irrelevant, the pannel is dismissed from the bar; if relevant, the court remits the proof thereof to be determined by the jury; which must consist of 15 men picked out by the court from a greater number, not exceeding 45, who have been all summoned, and given in list to the defender at serving him with a copy of the libel.

49. Crimes cannot, like debts, be referred to the probation of the defender's oath; for no person is compellable to swear against himself, where his life, limb, liberty, or estate is concerned, nor even in crimes which infer infamy; because one's good name, is, in right estimation, as valuable as his life. There is one exception however to this rule in trying the crime of usury, which may be proved.
proven by the user's own oath, notwithstanding the rule, Nemo tenetur jurare in suam turpitudinem. Crimes therefore are in the general case proveable only by the defender's free confession, or by writing, or by witnesses. No extrajudicial confession, unless it is adhered to by the pannel in judgment, can be admitted as evidence.

Soci crimenis. 50. All objections relevant against a witness in civil cases are also relevant in criminal. No witness is admitted, who may gain or lose by the event of the trial. Soci crimenis, or associates in the same crime, are not admitted against one another, except either in crimes against the state, as treason; in occult crimes, where other witnesses cannot be had, as forgery; or in theft, or depredations committed in the Highlands. The testimony of the private party injured may be received against the pannel, where the king's advocate is the only prosecutor, if from the nature of the crime, there must needs be a penury of witnesses, as in rape, robbery, &c.

Verdict of assize. 51. After all the witnesses have been examined in court, the jury are shut up in a room by themselves, where they must continue, excluded from all correspondence, till their verdict or judgment be subscribed by the foreman (or chancellor) and clerk; and according to this verdict the court pronounces sentence, either absolving or condemning. It is not necessary, by the law of Scotland, that a jury should be unanimous in finding a person guilty; the narrowest majority is as sufficient against the pannel, as for him. Juries cannot be punished on account of an erroneous verdict, either for or against the pannel.

Powers of a jury. 52. Though the proper business of a jury be to inform into the truth of the facts found relevant by the court, for which reason they are sometimes called the inquest; yet, in many cases, they judge also in matters of law or relevancy. Thus, though an objection against a witness should be repelled by the court, the jury are under no necessity to give more credit to his testimony than they think just: And in all trials of art and part, where special facts are not libelled, the jury, if they return a general verdict, are indeed judges not only of the truth, but the relevancy of the facts that are sworn to by the witnesses. A general verdict, is that which finds in general terms, that the pannel is guilty or not guilty, or that the libel or defences are proved or not proved. In a special verdict, the jury finds certain facts proved, the import of which is to be afterwards considered by the court.

Sentences. 53. Criminal judges must now suspend for some time the execution of such sentences as affect life or limb, that so condemned criminals, whose cases deserve favour, may have access to apply to the king for mercy. No sentence of any court of judicature, south of the river Forth, importing either death or demembration, can be executed in less than 30 days; and, if north of it in less than 40 days, after the date of the sentence. But corporal punishments, less than death or dismembering, e. g. whipping, pillory, &c. may be inflicted eight days after sentence on this side Forth, and twelve days after sentence beyond it.

Estimation of crimes. 54. Crimes are extinguished, 1. By the death of the criminal: both because a dead person can make no defence, so that his trial is truly a judging upon the hearing of one side; and because, though his guilt should be ever so notorious, he is after death carried beyond the reach of human penalties: Such trials therefore can have no effect, but to punish the innocent heir, contrary to that most equitable rule, Cusp tenet suos accusatores. 2. Crimes may be extinguished by a remission from the sovereign. But a remission, though it secures the delinquent from the public resentment, the exercise of which belongs to the crown, cannot cut off the party injured from his claim of damage, over which the crown has no prerogative. Wherever therefore founds on a remission, is liable in damages to the private prosecutor, in the same manner as if he had been tried and found guilty. Even general acts of indemnity passed in parliament, though they secure against such penalties as law inflicts upon the criminal merely per modum poenae, yet do not against the payment of any pecuniary fine that is given by statute to the party injured, nor against the demand of any claim competent to him in name of damages.

55. Lesser injuries, which cannot be properly said to affect the public peace, may be extinguished, either by the private party's expressly forgiving him, or by his being reconciled to the offender, after receiving the injury. Hence arise the rule, Dissimulatio tollit injuria. But where the offence is of a higher nature, the party injured, though he may pass from the prosecution, in so far as his private interest is concerned, cannot preclude the king's advocate, or procurator-fiscal, from insisting ad vindicatam publicam.

56. Crimes are also extinguished by prescription, from which operates by the mere lapse of time, without any act either of the sovereign or of the private sufferer. Crimes prescribe in 20 years; but in particular crimes, the prescription is limited by statute to a shorter time. No person can be prosecuted upon the act against wrongs imprisonment, after three years. High treason, committed within his majesty's dominions, suffers likewise a triennial prescription, if indictment be not found against the traitor within that time. All actions brought upon any penal statute made or to be made, where the penalty is appropriated to the crown, expires in two years after committing the offence; and where the penalty goes to the crown or other prosecutor, the prosecutor must sue within one year; and the crown within two years after the year ended. Certain crimes are, without the aid of any statute, extinguished by a shorter prescription than twenty years. By our old law, in the cases of rape, robbery, and hameseknow, the party injured was not heard after a silence of twenty-four hours; from a presumption, that persons could not be so grossly injured, without immediately complaining: And it is probable, that a prosecution for these crimes, if delayed for any considerable time would be cast even at this day, or at least the punishment restricted. Lesser injuries suffer also a short prescription; law presuming forgiveness, from the nature of the offence, and the silence of the party. The particular space of time sufficient to establish this presumption must be determined by the judge, according to circumstances.

LAW.

Law-Language. In England all law proceedings were formerly written, as indeed all public proceedings were, in Norman or law French, and even the arguments of the counsel and decisions of the court were in the same barbarous dialect:—An evident and shameful badge, it must be owned, of tyranny and foreign servitude; being introduced under the auspices of William the Norman, and his sons: whereby the observation of the Roman satirist was once more verified, that Gallia causidica docuit facunda Britannos. This continued till the reign of Edward III.; who, having employed his arms successfully in subduing the crown of France, thought it unseeming the dignity of the victors to use any longer the language of a vanquished country. By a statute, therefore, passed in the 36th year of his reign, it was enacted, that for the future all pleas should be pleaded, shown, defended, answered, debated, and judged, in the English tongue; but be entered and enrolled in Latin: In like manner as Don Alonso X. king of Castile (the great-grandfather of our Edward III.) obliged his subjects to use the Castilian tongue in all legal proceedings; and as, in 1286, the German language was established in the courts of the empire. And, perhaps, if our legislature had then directed that the writs themselves, which are mandates from the king to his subjects to perform certain acts, or to appear at certain places, should have been framed in the English language, according to the rule of our ancient law, it had not been very improper. But the record or enrolment of these writs and the proceedings thereon, which was calculated for the benefit of posterity, was more serviceable (because more durable) in a dead and immutable language than in any flux or living one. The practisers, however, being used to the Norman language, and therefore imagining they could express their thoughts more aptly and more concisely in that than in any other, still continued to take their notes in law French; and, of course, when those notes came to be published, under the denomination of reports, they were printed in that barbarous dialect; which, joined to the additional errors of a Gothic black letter, has occasioned many a student to throw away his Plowden and Littleton, without venturing to attack a page of them. And yet in reality, upon a nearer acquaintance, they would have found nothing very formidable in the language; which differs in its grammar and orthography as much from the modern French, as the diction of Chaucer and Gower does from that of Addison and Pope. Besides, as the English and Norman languages were concurrently used by our ancestors for several centuries together, the two idioms have naturally assimilated, and mutually borrowed from each other: for which reason the grammatical construction of each is so very much the same, that I apprehend as
Englishman (with a week’s preparation) would under-
stand the laws of Normandy, collected in their grand
consuetudine, as well, if not better, than a Frenchman bred
within the walls of Paris.

The Latin, which succeeded the French for the en-
try and enrolment of pleas, and which continued in
use for four centuries, answers so nearly to the English
(oftentimes word for word) that it is not at all surpris-
ing it should generally be imagined to be totally fab-
ricated at home, with little more art or trouble than
by adding Roman terminations to English words.

Whereas in reality it is a very universal dialect, spread
throughout all Europe at the irruption of the northern
nations; and particularly accommodated and moulded
to answer all the purposes of the lawyers with a peculiar
exactness and precision. This is principally owing to
the simplicity, or (if the reader pleases) the poverty
and baldness of its texture, calculated to express the
ideas of mankind just as they arise in the human mind,
without any rhetorical flourish, or perplexed orna-
ments of style: for it may be observed, that those laws
and ordinances, of public as well as private communi-
cies, are generally the most easily understood, where
strength and perspicuity, not harmony or elegance of
expression, have been principally consulted in compi-
ling them. These northern nations, or rather their
legislators, though they resolved to make use of the Latin
tongue in promulgating their laws, as being more du-
ramble and more generally known to their conquered
subjects than their own Teutonic dialects, yet (either
through choice or necessity) have frequently intermix-
ed therein some words of a Gothic original: which is,
more or less, the case in every country of Europe, and
therefore not to be imputed as any peculiar blemish in
our English legal latinity. The truth is, what is
generally denominated law-Latin is in reality a mere
technical language, calculated for eternal duration, and
easy to be apprehended both in present and future times;
and on those accounts best suited to preserve those me-
norials which are intended for perpetual rules of ac-
tion. The rude pyramids of Egypt have endured from
the earliest ages, while the more modern and more ele-
gant structures of Attica, Rome, and Palmyra, have
 sunk beneath the stroke of time.

As to the objection of looking up the law in a strange
and unknown tongue, this is of little weight with re-
gard to records; which few have occasion to read, but
such as do, or ought to, understand the rudiments of
Latin. And besides, it may be observed of the law-
Latin, as the very ingenious Sir John Davis observes
of the law-French, "that it is so very easy to be
learned, that the meanest wit that ever came to the
study of the law doth come to understand it almost per-
factly in ten days without a reader."

It is true, indeed, that the many terms of art, with
which the law abounds, are sufficiently harsh when
Latinized (yet not more so than those of other sciences),
and may, as Mr Selden observes, give offence "to
some grammarians of squeamish stomachs, who would
rather choose to live in ignorance of things the most
useful and important, than to have their delicate ears
wounded by the use of a word unknown to Cicero,
Sallust, or the other writers of the Augustan age."

Yet this is no more than must unavoidably happen when
things of modern use, of which the Romans had no
idea, and consequently no phrases to express them,
come to be delivered in the Latin tongue. It would
puzzle the most classical scholar to find an appellation,
in his pure Latinity, for a constable, a record, or a
deed of secolement: it is therefore to be imputed as
much to necessity as ignorance, that they were styled
in our forensic dialect, constabularius, recordum, and
secolementum. Thus again, another uncouth word of
our ancient laws (for I defend not the ridiculous bar-
barisms sometimes introduced by the ignorance of mo-
dern practisers), the substantive murdrum, or the verb
murdrare, however harsh and unclassical it may seem,
was necessarily framed to express a particular offence;
since no other word in being, occider, interficere, necare,
or the like, was sufficient to express the intention of
the criminal, or quo animo the act was perpetrated;
and therefore by no means came up to the notion of
murder at present entertained by law; viz. a killing
with malice aforethought.

A similar necessity to this produced a similar effect
at Byzantium, when the Roman laws were turned into
Greek for the use of the oriental empire; for without
any regard to Attic elegance, the lawyers of the im-
perial courts made no scruple to translate fidei commis-
sionis, patria communitas; cubiculum; habitatio; familia;
filialis; sex; filius; filius; captivum; exubium; compromit-
s; oppugnans; revocet et obsequium; cum loco et; and the like. They studied more the exact and
precise import of the words, than the neatness and deli-
cacy of their cadence. And it may be suggested, that
the terms of the law are not more numerous, more un-
couth, or more difficult to be explained by a teacher,
than those of logic, physics, and the whole circle of
Aristotle’s philosophy; nay, even of the politer art
of architecture and its kindred studies, or the science
of rhetoric itself. Sir Thomas More’s famous legal
question contains in it nothing more difficult, than the
definition which in his time the philosophers currently
gave of their materia prima, the groundwork of all na-
tural knowledge; that it is neque quid, neque quantum,
neque quale, neque aliquid forum quius est determina-
tur; or its subsequent explanation by Adrian Heere-
board, who assures us, that materia prima non est corpus,
neque per formam corporatis, neque per simplicem es-
tentionem: est tamen ens, et quidem substantia, licet in-
completa; habetque actum ex se et situtatum, et simul est
potestas subjectivae. The law, therefore, with regard to
its technical phrases, stands upon the same footing with
other studies, and requests only the same indulgence.

This technical Latin continued in use from the time
of its first introduction, till the subversion of our an-
cient constitution under Cromwell: when, among many
other innovations in the law, some for the better and
some for the worse, the language of our records was
altered and turned into English. But, at the restoration
of King Charles, this novelty was no longer coun-
ternanced; the practisers finding it very difficult to ex-
press themselves so concisely or significantly in any
other language but the Latin. And thus it continued
without any sensible inconvenience till about the year
1730, when it was again thought proper that the pro-
cedings at law should be done into English, and it
was accordingly so ordered by statute 4 Geo. II. c 26.

This was done, in order that the common people
might have knowledge and understanding of what
of law was not only permitted, as it is in criminal cases, unless the fact be extremely clear against the prisoner; but was also absolutely required, in many civil cases: which an author of their own very justly says, were being the source of frequent perjury. This, he tells us, was owing to the Popish ecclesiastics, who introduced this method of purgation from their canon law; and, having grown a plentiful crop of oaths in all judicial proceedings, resorted after this an ample harvest of perjuries: for perjuries were punished in part by pecuniary fines, payable to the coffers of the church. But with us in England wager of law is never required; and then only admitted, where an action is brought upon such matters as may be supposed to be privately transacted between the parties, and wherein the defendant may be presumed to have made satisfaction without being able to prove it. Therefore it is only in actions of debt upon simple contract, or for amercement, in actions of delinquency, and of account, where the debt may have been paid, the goods restored, or the account balanced, without any evidence of either. And by such wager of law (when admitted) the plaintiff is perpetually barred; for the law, in the simplicity of the ancient times, presumed that no one would forswear himself for any worldly thing. Wager of law, however, lieth in a real action, where the tenant alleges he was not legally summoned to appear, as well as in mere personal contracts.

The wager of law was never permitted but where the defendant bore a fair and unexceptionable character; and it was also confined to such cases where a debt might be supposed to be discharged, or satisfaction made in private, without any witnesses to attest it: and many other prudential restrictions accompanied this indulgence. But at length it was considered, that (even under all its restrictions) it grew too great a temptation in the way of indigent and profligate men: and therefore by degrees new remedies were devised, and new forms of actions were introduced, wherein as defendant is at liberty to wage his law. So that now, not being discharged or satisfaction made, the plaintiff is entitled to recover the debt, and is not liable to a new action. Therefore, one shall simply hear at present of an action of debt brought upon a simple contract, or a trespass on the case for the breach of a promise or assumption; wherein, though the specific debt cannot be recovered, yet damages may, equivalent to the specific debt. And, being a trespass, no law can be wagered therein. So, instead of an action of detinue to recover the very thing detained, an action of trespass on the case in trover and conversion is usually brought; wherein the horse or other specific chattel cannot be had, yet the defendant shall pay damages for the conversion, equal to the value of the chattel; and for this trespass no wager of law is allowed. In the room of actions of account, a bill in equity is usually filed; wherein, though the defendant answers upon his oath, yet such oath is not conclusive to the plaintiff; but he may prove every article by other evidence, in contradiction to what the defendant has sworn. So that wager of law is quite out of use, being avoided by the mode of bringing the action; but still it is not out of use.
And therefore, when a new statute inflicts a penalty, and gives an action of debt for recovering it, it is usual to add, "in which no wager of law shall be allowed:" otherwise a hardy delinquent might escape any penalty of the law, by swearing he had never incurred, or else had discharged it.

Custom-house Laws. The expedient of exacting duties on goods imported, or exported, has been adopted by every commercial nation in Europe. The attention of the British legislature has not been confined to the object of raising a revenue alone, but they have attempted by duties, exemptions, drawbacks, bounties, and other regulations, to direct the national trade into those channels that contribute most to the public benefit. And, in order to obtain every requisite information, all goods, exported or imported, whether liable to duty or not, are required to be entered at the respective custom-houses; and, from these entries, accounts are regularly made up of the whole British trade, distinguishing the articles, their quantity and value, and the countries which supply or receive them.

The objects of the British legislature may be reduced to the following heads.

First, To encourage the employment of British shipping and seamen, for the purpose of supplying our navy when public exigencies require.

Secondly, To increase the quantity of money in the nation, by prohibiting the exportation of British coin, by encouraging exportation, and discouraging importation, and by promoting agriculture, fisheries, and manufactures. For these purposes, it is penal to entice certain manufacturers abroad, or export the tools used in their manufactures; the exportation of raw materials is, in most instances, prohibited; and their importation permitted free from duty, and sometimes rewarded with a bounty. The exportation of some goods, manufactured to a certain length only (for example white cloth), is loaded with a duty, but permitted duty free when the manufacture is carried to its full extent. The importation of rival manufactures is loaded with heavy duties, or absolutely prohibited. These restrictions are most severe towards nations with which the balance of trade is supposed against us, or which are considered as our most formidable rivals in power or commerce. Upon this principle the commerce with France, till lately, laboured under the heaviest restrictions.

Thirdly, To secure us plenty of necessaries for subsistence and manufactures, by discouraging the exportation of some articles that consume by length of time, and regulating the corn trade according to the exigencies of the seasons.

Fourthly, To secure the trade of the colonies to the mother country, and preserve a mutual intercourse, by encouraging the produce of their staple commodities, and restraining their progress in these commodities, which they receive from us in exchange.

The foundation of our commercial regulations is the famous act of navigation, which was first enacted during the time of the Commonwealth, and adopted by the first parliament after the Restoration. The substance of this act, and subsequent amendments, is as follows:

1. Goods from Asia, Africa, and America, may not be imported, except in British ships duly navigated; or ships belonging to the British plantations; and they can only be imported from the place of their production or manufacture, or the port where they are usually first shipped for transportation. Goods of the Spanish or Portuguese plantations, imported from Spain and Portugal in British ships, bullion, and some other inconsiderable articles, are excepted.

The restriction on European goods is not universal, but extends to several of the bulkiest articles. Russian goods, masts, timber, boards, salt, pitch, resin, tar, hemp, flax, raisins, figs, prunes, oranges, olives, corn, sugar, potatoes, wine, and vinegar, may not be imported, except in ships belonging to Great Britain or Ireland, legally manned; nor Turkey goods and curants, except in ships British built; or in ships belonging to the country where these goods are produced or manufactured, or first shipped for exportation, and, if imported in foreign ships, they pay alien's duty.

In order to entitle a ship to the privileges of a British ship, it must be built in Britain, and belong entirely to British subjects; and the master, and three-fourths of the mariners, must be British subjects, except in case of death, or unavoidable accidents. In time of war, the proportion of British mariners required is generally confined to one-fourth; and the same proportion only is required in the Greenland fishery.

No goods may be imported into, or exported from, the plantations in Asia, Africa, or America, except in ships built in Britain, Ireland, or the plantations, or prize ships, manned by British subjects, duly registered, and legally navigated.

The following goods, enumerated in the act of navigation and subsequent acts, may not be exported from the plantations, except to some other plantation, or to Britain: Tobacco, cotton wool, indigo, ginger, fustic, and other dying wood, molasses, hemp, copper ore, beaver skins and other furs, pitch, tar, turpentine, masts, yards, and boltsprits, coffee, pimento, cocoa-nuts, whale fins, raw silk, pot and pearl ashes. Rice and sugar were formerly comprehended in this list, but their exportation is now permitted under certain restrictions.

Iron may not be imported to Europe, except to Ireland; and none of the non-enumerated may be imported to any country north of Cape Finisterre, except the bay of Biscay and Ireland.

2. For the more effectual prevention of smuggling, no goods may be imported in vessels belonging to British subjects, and no wine, in any vessel whatever, unless the master have a manifest on board, containing the name, measure, and built of the ship, the place to which it belongs, and a distinct enumeration of the goods on board, and places where they were laden. If the ship be cleared from any place under his majesty's dominions, the manifest must be attested by the chief officer of the customs, or chief magistrate, who is required to transmit a copy thereof to the place of destination. Shipmasters must deliver copies of this manifest to the first customhouse officer who goes on board within four leagues of the shore, and also to the first who goes on board within the limits of any port, and must deliver the original manifest to the customhouse at their arrival, and make report of their cargo upon
LAW [ 708 ]

3. The importation of cattle, beef, mutton, and pork, except from Ireland, woollen cloths, mait, and various articles of hardware, cutlery, and earthen ware, is prohibited: Also the following goods from Germany and the Netherlands; olive oil, pitch, tar, potashes, resin, salt, tobacco, wines, except Rhénish wine, and Hungary wines from Hamburg.

4. The importation of various other goods is restricted by particular regulations, respecting the time and place of importation, the packages, the burden of the ship, the requisition of a license, and other circumstances.

To guard more effectually against clandestine trade, the importation of some articles is only permitted in ships of a certain burden, whose operations are not easily concealed. Spirits must be imported in ships of 700 tons or upwards, except rum, and spirits of British plantations, which are only restricted to 70 tons; wine, 60 tons; tea, tobacco, and snuff, 50 tons; salt, 40 tons. Wine, spirits, and tobacco are also restricted in respect of the packages in which they may be imported.

5. Diamonds and precious stones, flax, flax seed, linen rags, beaver wool, wool for clothiers, linen yarn unbleached, and most drugs used in dyeing, may be imported duty free.

6. All goods imported are liable to duties, except such as are expressly exempted. The revenue of customs is of great antiquity in Britain, but was new-modelled at the restoration of Charles II. A subsidy of tonnage on wines, and of poundage, or 15. per pound value of other goods, was granted during the king’s life, and, after several prolongations, rendered perpetual. A book of rates was composed for ascertaining these values; and articles not rated paid duty according to the value, as affirmed upon oath by the importers. If the goods be valued too low by the importers, the customhouse officer may seize them, upon paying to the proprietor the value he swore to, and 10 per cent. for profit; such goods to be sold, and the overplus paid into the customs. Various additional duties have been imposed; some on all goods, some on particular kinds; some according to the rates, some unconnected with the rates; some with an allowance of certain abatements, some without any allowance; the greater part to be paid down in ready money, and a few for which security may be granted; often with variations, according to the ship’s place and circumstances of importation. The number of branches amounted to upwards of 50; and sometimes more than 10 were chargeable on the same articles. By this means, the revenue of the customs has become a subject of much intricacy. The inconveniences which this gave rise to are now removed by the consolidation act; which appoints one fixed duty for each article free from fractions, instead of the various branches to which they were formerly subject.

7. Goods of most kinds may be exported duty free when regularly entered; and those that have paid duty on importation are generally entitled to drawback of part, sometimes of the whole, when re-exported within three years, upon certificate that the duties were paid on importation, and oath of their identity. In some cases, a bounty is given on manufactured goods, when the materials from which they are manufactured have paid duty on importation; and manufactures subject to excise, have generally the whole or part of the excise duties returned.

8. The following goods are prohibited to be exported; white asbes, horns, unwrought hides of black cattle, tallow, corn, brass, copper, engines for knitting stockings, tools for cotton, linen, woollens, silk, iron and steel manufactures, wool, woollens, woollen yarn, fullers earth, FULLING CLAY, and tobacco-pipe clay.

9. The object of the laws respecting the corn trade is to encourage agriculture, by not only permitting the free exportation, but rewarding it with a bounty when the prices are low, and checking the importation by a heavy duty; and to prevent scarcity, by prohibiting the exportation when the prices are high, and permitting importation at an easy duty. Various temporary laws have been enacted for these purposes, and sometimes other expedients employed in times of scarcity, such as prohibiting the distillery from corn, and manufacture of starch.

10. Bounties are allowed on the exportation of refined sugar, sail-cloth, linen under limited prices, silk stuffs of British manufacture, cordage, spirits when barley is under 24s. per ton, and the following kinds of fish, salmon, herrings, pilchards, cod, ling, flake, and sprats.

Various other bounties are allowed for the encouragement of our fisheries. Ships from 150 to 300 tons employed in the Greenland whale fishery, and conforming to the regulations prescribed, are allowed 30s. per ton. Vessels employed in the herring fishery receive 20s. per ton, besides a bounty on the herrings caught and cured, amounting in some cases to 4s. per barrel. Other bounties are granted to a limited number of the most successful vessels employed in the herring and Newfoundland fisheries, and in the southern whale fishery.

It is unnecessary and impracticable, in this place, to enter into a full detail of our customhouse laws. Indeed, all that can be admitted into a work of this kind, must convey but very imperfect information; and even that little becomes useless in a short time from alterations in the law. We have therefore only marked the general outlines in the present article; which, however, will be sufficient to enable the reader to judge of the principles upon which the British legislature has acted. How far the means employed have contributed to the ends proposed, and how far the ends themselves are always wise; or whether a trade encouraged by fewer restrictions would not prove more extensive and beneficial; has often been a subject of discussion.

Mercantile Laws. The laws relating to commercial
and maritime affairs approach nearer to uniformity through the different countries of Europe, than those on other subjects. Some of the fundamental regulations have been taken from the Roman law; others have been suggested by experience, during the progress of commerce; and the whole have been gradually reduced to a system, and adopted into the laws of trading nations, but with some local varieties and exceptions.

The British legislature has enacted many statutes respecting commerce; yet the greater part of our mercantile law is to be collected from the decisions of our courts of justice, founded on the custom of merchants. A proof of such custom, where no direct statute interferes, determines the controversy, and becomes a precedent for regulating like cases afterwards. The existence of a custom not formerly recognized, is, in England, determined by a jury of merchants.

The most common mercantile contracts are those between buyer and seller; between factor and employer; between partners; between the owners, masters, mariners, and freighters of ships; between insurers and the owners of the subject insured; and between the parties concerned in transacting bills of exchange. See Factorage, Sale, Partnership, Insurance, Bill, &c. and the next article.

Maritime Laws. The most ancient system of maritime laws is that of Rhodes, which was in force during the time of the Grecian empire, and afterwards incorporated into the Roman law. Although, in some parts, not applicable to the present state of trade, and, in others, now hardly intelligible, it contains the groundwork of the most equitable and beneficial rules observed in modern commerce. A like system was set forth by Richard L. of England, called the Statutes of Ole-ron; and another, by the town of Wisby, in the island of Gothland. From these systems, improved and enlarged in the course of time, our general maritime law is derived. The jurisdiction of masters purely maritime belongs, in England, to the court of admiralty, which proceeds on the civil law; but their proceedings are subject to the control, and their decisions to the review, of the superior courts.

We shall here consider the obligations which subsist between the masters or owners of ships, the freighters, and the furnishers of provisions or repairs.

1. Masters and Freighters. A charter party is a contract between the master and freighters, in which the ship and voyage is described, and the time and conditions of performing it are ascertained.

The freight is most frequently determined for the whole voyage, without respect to time. Sometimes it depends on the time.

In the former case, it is either fixed at a certain sum for the whole cargo; or so much per ton, barrel, bulk, or other weight or measure, or so much per cent. on the value of the cargo. This last is common on goods sent to America; and the invoices are produced to ascertain the value.

The burden of the ship is generally mentioned in the contract, in this manner, one hundred tons, or thereby; and the number mentioned ought not to differ above five tons, at most, from the exact measure. If a certain sum be agreed on for the freight of the ship, it must all be paid, although the ship, when measured, should prove less, unless the burden be warranted. If the ships be freighted for transporting cattle, or slaves, at so much a head, and some of them die on the passage, freight is only due for such as are delivered alive; but, if for lodging them, it is due for all that were put on board.

When a whole ship is freighted, if the master suffers any other goods besides those of the freighter to be put on board, he is liable for damages.

It is common to mention the number of days that the ship shall continue at each port to load or unload. The expression used is, work weather days; to signify, that Sundays, holidays, and days when the weather stops the work, are not reckoned. If the ship be detained longer, a daily allowance is often agreed on, in name of demurrage.

If the voyage be completed in terms of the agreement, without any misfortune, the master has a right to demand payment of the freight before he deliver the goods. But if the safe delivery be prevented by any fault or accident, the parties are liable, according to the following rules.

If the merchant do not load the ship within the time agreed on, the master may engage with another, and recover damages.

If the merchant load the ship, and recall it after it has set sail, he must pay the whole freight; but if he unload it before it sets sail, he is liable for damages only.

If a merchant loads goods which it is not lawful to export, and the ship be prevented from proceeding on that account, he must pay the freight notwithstanding.

If the shipowner be not ready to proceed on the voyage at the time agreed on, the merchant may load the whole, or part of the cargo, on board another ship, and recover damages; but chance, or notorious accident, by the marine law, releases the master from damages.

If an embargo be laid on the ship before it sails, the charter-party is dissolved, and the merchant pays the expense of loading and unloading; but if the embargo be only for a short limited time, the voyage shall be performed when it expires, and neither party is liable for damages.

If the shipowner sails to any other port than that agreed on, without necessity, he is liable for damages; if through necessity, he must sail to the port agreed on, at his own expense.

If a ship be taken by the enemy, and retaken or ransomed, the charter-party continues in force.

If the master transfer the goods from his own ship to another, without necessity, and they perish, he is liable for the value; but if his own ship be in imminent danger, the goods may be put on board another ship at the risk of the owner.

If a ship be freighted out and home, and a sum agreed on for the whole voyage, nothing is due until it return; and the whole is lost if the ship be lost on the return.

If a certain sum be specified for the homeward voyage, it is due, although the factor abroad should have no goods to send home.

In the case of a ship freighted to Madeira, Carolinas, and home, a particular freight fixed for the homeward
ward voyage, and an option reserved for the factor at Carolina to decline it, unless the ship arrived before 1st of March: the shipmaster, foreseeing he could not arrive there within that time, and might be disappointed of a freight, did not go there at all. He was found liable in damages, as the obligation was absolute on his part, and conditional only on the other.

If the goods be damaged without fault of the ship or master, the owner is not obliged to receive them and pay freight, but he must either receive the whole, or abandon the whole; he cannot choose those that are in best order, and reject the others. If the goods be damaged through the insufficiency of the ship, the master is liable for the same; but, if it be owing to stress of weather, he is not accountable. It is customary for shipmasters, when they suspect damage, to take a protest against wind and weather, at their arrival. But as this is the declaration of a party, it does not bear credit, unless supported by collateral circumstances.

If part of the goods be thrown overboard, or taken by the enemy, the part delivered pays freight.

The shipmaster is accountable for all the goods received on board, by himself or mariners, unless they perish by the act of God, or of the king’s enemies.

Shipmasters are not liable for leakage on liquors; nor accountable for the contents of packages, unless packed and delivered in their presence.

Upon a principle of equity, that the laborer is worthy of his hire, differences arising with regard to freight, when the case is doubtful, ought rather to be determined in favour of the shipmaster.

2. Ship and Owners with Creditors. When debts are contracted for provisions or repairs to a ship, or arise from a failure in any of the above-mentioned obligations, the ship and tackle, and the owners, are liable for the debt, as well as the master.

By the mercantile law, the owners are liable in all cases, without limitation; but by statute, they are not liable for embezzlement beyond their value of ship, tackle, and freight.

A shipmaster may pledge his ship for necessary repairs during a voyage; and this hypothecation is implied by the maritime law when such debts are contracted. This regulation is necessary, and is therefore adopted by all commercial nations; for, otherwise, the master might not find credit for necessary repairs, and the ship might be lost. If repairs be made at different places, the last are preferable.

The relief against the ship is competent to the court of admiralty in England, only when repairs are furnished during the course of a voyage; for the necessity of the case extends no further. If a ship be repaired at home (e.g. upon the river Thames), the creditor is only entitled to relief at common law.

The creditor may sue either the master or owners; but if he undertook the work on the special promise of the one, the other is not liable.

If the master buys provisions on credit, the owners are liable for the debt, though they have given him money to pay them.

If a ship be mortgaged, and afterwards lost at sea, the owners must pay the debt; for the mortgage is only an additional security, though there be no express words to that purpose in the covenant.

If a ship be taken by the enemy, and ransomed, the owners are liable to pay the ransom, though the ransomer die in the hands of the captors.

3. Owners of ship and cargo with each other. There is a mutual obligation which subsists between all the owners of a ship and cargo. In time of danger, it is often necessary to incur a certain loss of part for the greater security of the rest; to cut a cable; to lighten the ship, by throwing part of the goods overboard; to run it ashore; or the like: and as it is unreasonable that the owners of the thing exposed for the common safety should bear the whole loss, it is defrayed by an equal contribution among the proprietors of the ship, cargo, and freight. This is the famous Lex Rhodia de jactu, and is now called a general average.

The custom of valuing goods which contribute to a general average, is not uniform in all places. They are generally valued at the price they yield at the port of destination, charges deducted; and goods thrown overboard are valued at the price they would have yielded there. Sailors wages, clothes and money belonging to passengers, and goods belonging to the king, pay no general average; but proprietors of gold and silver, in case of goods being thrown overboard, contribute to the full extent of their interest.

The following particulars are charged as general average: Damage sustained in an engagement with the enemy; attendance on the wounded, and rewards given for service in time of danger, or gratuities to the windows or children of the slain; ransom; goods given to the enemy in the nature of a ransom; charges of bringing the ship to a place of safety when in danger from the enemy, or waiting for convoy; charges of quarantine; goods thrown overboard; maats or rigging cut; holes cut in the ship to clear it of water; pilotage, when a leak is sprung; damage, when voluntarily run aground, and expenses of bringing it afloat; goods lost by being put in a lighter; the long boat lost in lighting the ship in time of danger; hire of cables and anchors; charges of laying in ballast, victualing, and guarding the ship when detained; charges as law, in reclaiming the ship and cargo; interest and comission on all these disbursements.

Though goods put on board a lighter, and lost, are charged as a general average; yet if the lighter be saved, and the ship with the rest of the goods be lost, the goods in the lighter belong to their respective proprietors, without being liable to any contribution.

If part of the goods be plundered by a pirate, the proprietor or shipmaster is not entitled to any contribution.

The essential circumstances that constitute a general average are these; the loss must be the effect of a voluntary action; and the object of that action the common safety of the whole. Quarantine, which is allowed, seems not to fall within this description.

5. Wrecks. See WRECK.

6. Impress. See IMPRESSING.

7. Insurance. See INSURANCE.
Sir William Blackstone, treating of the alterations in our laws, and mentioning franchises granted of chase and free warren, as well to preserve the breed of animals, as to indulge the subject, adds, "From a similar principle to which, though the forest laws are now mitigated, and by degrees grown entirely obsolete; yet from this root has sprung a bastard slip, known by the name of the game law, now arrived to and wanting in its highest vigour; both founded upon the same unreasonable notion of permanent property in wild creatures; and both productive of the same tyranny to the commons; but with this difference, that the forest laws established only one mighty hunter throughout the land; the game laws have established a little Nimrod in every manor. And in one respect the ancient law was much less unreasonable than the modern; for the king's grantee of a chase or free warren, might kill game in every part of his franchise; but now, though a freeholder of less than 100l. a year is forbidden to kill partridge upon his own estate, yet nobody else (not even the lord of the manor, unless he hath a grant of free warren) can do it without committing a trespass and subjecting himself to an action.

Under the article GAME, the destroying such beasts and fowls as are ranked under that denomination, was observed (upon the old principles of the forest law) to be a trespass and offence in all persons alike, who have not authority from the crown to kill game (which is royal property) by the grant of either a free warren, or at least a manor of their own. But the laws called the game laws have also inflicted additional punishments (chiefly pecuniary) on persons guilty of this general offence, unless they be people of such rank or fortune as is therein particularly specified. All persons, therefore, of what property or distinction soever, that kill game out of their own territories, or even upon their own estates, without the king's licence expressed by the grant of a franchise, are guilty of the first original offence of encroaching on the royal prerogative. And those indigent persons who do so, without having such rank or fortune as is generally called a qualification, are guilty, not only of the original offence, but of the aggravations also created by the statutes for preserving the game: which aggravations are so severely punished, and those punishments so implacably inflicted, that the offence against the king is seldom thought of, provided the miserable delinquent can make his peace with the lord of the manor. The only rational footing upon which this offence, thus aggravated, can be considered as a crime, is, that in low and indigent persons it promotes idleness, and takes them away from their proper employments and callings: which is an offence against the public police and economy of the commonwealth.

The statutes for preserving the game are many and various, and not a little obscure and intricate; it being remarked, that in one statute only, 5 Ann. c. 14. there is false grammar in no fewer than six places, besides other mistakes: the occasion of which, or what denomination of persons were probably the penners of these statutes, it is unnecessary here to inquire. It may be in general sufficient to observe, that the qualifications for killing game, as they are usually called, or more properly the exemptions from the penalties inflicted by the statute law, are.

1. The having a freehold estate of 100l. per annum: there being fifty times the property required to enable a man to kill a partridge, as to vote for a knight of the shire.
2. A leasehold for 99 years of 150l. per annum.
3. Being the son and heir apparent of an esquire (a very loose and vague description) or person of superior degree. — 4. Being the owner or keeper of a forest, park, chase, or warren. For unqualified persons transgressing these laws, by killing game, keeping engines for that purpose, or even having game in their custody, or fer persons (however qualified) that kill game or have it in possession, at unreasonable times of the year, or unreasonable hours of the day or night, on Sundays or on Christmas day, there are various penalties assigned, corporal and pecuniary, by different statutes (after mentioned), on any of which, but only on one at a time, the justices may convict in a summary way, or (in most of them) prosecutions may be carried on at the assizes.

And, lastly, by statute 28 Geo. II. c. 12. no person, however qualified to kill, may make merchandise of this valuable privilege, by selling or exposing to sale any game, on pain of like forfeiture as if he had no qualification.

The statutes above referred to are as follow: No person shall take pheasants or partridges with engines in another man's ground, without license, on pain of 10l. stat. 11 Hen. VIII. c. 13. If any person shall take or kill any pheasants or partridges with any net in the night time, they shall forfeit 20s. for every pheasant, and 10s. for every partridge taken: and hunting with spaniels in standing corn, incurs a forfeiture of 40s. 23 Eliz. c. 10. Those who kill any pheasant, partridge, duck, heron, hare, or other game, are liable to a forfeiture of 20s. for every fowl and hare; and selling or buying to sell again, any bare, pheasant, &c. the forfeiture is 10s. for each bare, &c. 1 Jac. I. c. 77. Also pheasants or partridges are not to be taken between the first of July and the last of August, on pain of imprisonment for a month, unless the offenders pay 20s. for every pheasant, &c. killed: and, if any person, by a justice of peace, or by a warrant, may search for game and nets, in the possession of persons not qualified by law to kill game or to keep such nets, 1 Jac. I. c. 11. Constables, by a warrant of a justice of peace, are to search houses of suspected persons for game: and if any game be found upon them, and they do not give a good account how they came by the same, they shall forfeit for every hare, pheasant, or partridge, not under 5s. nor exceeding 20s. And inferior tradesmen hunting, &c. are subject to the penalties of the act, and may likewise be sued for trespass. If officers of the army or soldiers kill game without leave, they forfeit 5l. an officer, and 10s. a soldier; 4 and 5 W. and M. c. 23. Higgler, chapmen, carriers, innkeepers, victuallers, &c. having in their custody hare, pheasant, partridge, heath game, &c. (except sent by some person qualified to kill game), shall forfeit for every hare and fowl 5l. to be levied by distress and sale of their goods, being proved by one witness, before a justice; and for want of distress shall be committed to the house of correction for three months: one moiety of the forfeiture to the informer, and the other to the poor. And selling game, or offering the same to sale, incurs the like penalty; whereas
in hare and other game found in a shop, &c. is adjudged an exposing to sale; killing hares in the night is liable to the same penalties; and if any persons shall drive wild fowls with nets, between the first day of July and the first of September, they shall forfeit 5s. for every fowl; 5 Ann. c. 14. 9 Ann. c. 25. If any unqualified person shall keep a gun, he shall forfeit 10l.; and persons being qualified may take guns from those that are not, and break them; 21 and 22 Car. II. c. 25, and 33 Hen. VIII. c. 6. One justice of peace, upon examination and proof of the offence, may commit the offender till he hath paid the forfeiture of 10l. And persons, not qualified by law, keeping dogs, nets, or other engines to kill game, being convicted thereof before a justice of peace, shall forfeit 5l. or be sent to the house of correction for three months; and the dogs, game, &c. shall be taken from them, by the statute 5 Ann. If a person hunt upon the ground of another, such other person cannot justify killing of his dogs, as appears by 2 Roll. Abr. 567. But it was otherwise adjudged, Mich. 33 Car. II. in C. B. 2 Cro. 44, and see 3 Lev. xxviii. In actions of debt, qui tam, &c. by a common informer on the statute 5 Ann. for 15l. wherein the plaintiff declared on two several counts, one for 10l. for killing two pheasants, the other for 5l. for keeping an engine to destroy the game, not being qualified, &c. the plaintiff had a verdict for 5l. only: this action was brought by virtue of the stat. 8 Geo. I. See stat. 9 Geo. I. c. 22. See likewise 24 Geo. II. c. 34. for the better preservation of the game in Scotland. By the stat. 26 Geo. II. c. 2. all suits and actions brought by virtue of stat. 8 Geo. I. c. — for the recovery of any pecuniary penalty, or sum of money, for offences committed against any law for the better preservation of the game, shall be brought before the end of the second term after the offence committed.

By 28 Geo. II. c. 12. persons selling, or exposing to sale, any game, are liable to the penalties inflicted by 5 Ann. c. 14. on biggers, &c. offering game to sale: and game found in the house or possession of a poacher, salesman, fishmonger, cook, or pastry cook, is deemed exposing thereof to sale.

By 2 Geo. III. c. 19. after the first June 1762, no person may take, kill, buy or sell, or have in his custody, any partridge between 12th February and 1st September, or pheasant between 1st February and 1st October, or heath fowl between 1st January and 20th August, or grouse between 1st December and 25th July, in any year; pheasants taken in their proper season, and kept in mews or breeding places, excepted: and persons offending in any of the cases aforesaid, forfeit 5l. per bird, to the prosecutor, to be recovered, with full costs, in any of the courts at Westminster. By this act, likewise, the whole of the pecuniary penalties under the 8 Geo. I. c. 19. may be sued for, and recovered to the sole use of the prosecutor, with double costs; and no part thereof to go to the poor of the parish.

By 3 Geo. III. c. 14. persons convicted of entering warrens in the night-time, and taking or killing conveys there, or aiding or assisting therein, may be punished by transportation, or by whipping, fine, or imprisonment. Persons convicted on this act, not liable to be convicted under any former act. This act does not extend to the destroying conveys in the day time, on the sea and river banks in the county of Lincoln, &c. No satisfaction to be made for damages occasioned by entry, unless they exceed 1s. It may not be improper to mention an act lately made, and not yet repealed, viz. 10 Geo. III. c. 19. for preservation of the game, which shows the importance of the object. It is thereby enacted, That if any person kill any hare, &c. between sunsetting and surprising, or use any gun, &c. for destroying game, he shall for the first offence be imprisoned for any time not exceeding six nor less than three months; if guilty of a second offence, after conviction of a first, to be imprisoned for any time not exceeding 12 months nor less than six; and shall also within three days after the time of his commitment, either for the first or for any other offence, be once publicly whipped.

By 25 George III. c. 50. and 31 George III. c. 21. every person in Great Britain (the royal family excepted), who, shall, after July 1. 1785, use any dog, gun, net, or other engine, for the taking or destruction of game (not acting as gamekeeper), shall deliver in a paper or account in writing, containing his name and place of abode, to the clerk of the peace or his deputy, and annually take out a certificate thereof; and every such certificate shall be charged with a stamp duty of 2s. 2d. (and an additional 1s. 1d. by 31 George III. c. 21.) making in the whole 3l. 3s.—Every deputation of a gamekeeper shall be registered with the clerk of the peace, and such gamekeeper shall annually take out a certificate thereof; which certificate shall be charged with a stamp duty of 10s. 6d. (and an additional 10s. 6d. by 31 Geo. III. c. 21.), making in the whole 1l. 1s.—The duties to be under the management of the commissioners of the stamp office.

From and after the said 1st of July 1785, the clerk of the peace shall annually deliver to persons requiring the same, duly stamped, a certificate or license according to the form herein mentioned, for which he shall be entitled to demand 1s. for his trouble; and on refusal or neglect to deliver the same, forfeit 20l.—Every certificate to bear date the day when issued, and to continue in force to the 1st day of July then following, on penalty of 20l.

After the 1st day of July 1785, any person that shall use any greyhound, hound, pointer, setting dog, spaniel, or other dog, or any gun, net, or engine, for taking or killing of game, without a certificate, is liable to the penalty of 20l. And if any gamekeeper shall, for the space of 20 days after the said 1st day of July, or if any gamekeeper thereafter to be appointed shall, for the space of 20 days after such appointment, neglect or refuse to register his deputation and take out a certificate thereof, he is liable to the penalty of 20l.

The clerks of the peace are to transmit to the stamp office in London alphabetical lists of the certificates granted in every year before the first day of August under penalty of 20l. These lists are to be kept at the stamp office in London, and there to be inspected on payment of 1s.: And the commissioners of the stamp duties are, once or oftener in every year, as soon as such lists are transmitted to them, to cause the same to be published in the newspapers circulating in each county, or such public paper as they shall think most proper.
Gamekeepers were first introduced by the qualification act, 22 and 23 Car. II. c. 25, and subsequent statutes have made a number of various regulations respecting them. This authorises lords of manors of the degree of esquire, to appoint gamekeepers, who shall have power, within the manor, to seize guns, nets, and engines, kept by unqualified persons to destroy game.

By 5 Ann. c. 14. s. 14, lords and ladies of manors are authorised to empower their gamekeepers to kill game; but prohibited the latter, under pain of three months imprisonment, from selling or disposing of the game so killed, without the consent of the lord or lady, under whose appointment they acted.

By 3 Geo. I. c. 11, no lord of a manor is to appoint any person to be a gamekeeper with power to take and kill game, unless such person be qualified by law so to do, or be truly and properly a servant to the lord, or immediately employed to take or kill game, for the sole use or benefit of the said lord. Offences against this act to be punished with pecuniary fines.

Gamekeepers are enumerated among the different descriptions of servants chargeable with the duty under 25 Geo. III. c. 43.

If any gamekeeper, who shall have registered his in the stead, the first certificate is declared null and void, and the person acting under the same, after notice, is liable to the penalty of 20l. And any person in pursuit of a false or fictitious name or place of abode to any person seeking the same, who shall have obtained a certificate, is liable to the penalty of 50l.

The certificates are not to authorise persons to kill game at any time prohibited by law, nor to give any person any right to kill game, unless such person shall be qualified so to do by the laws now in being, but shall be liable to the same penalties as if this act had not passed. [So that though by this act qualified and unqualified persons are equally included, yet having a certificate does not give an unqualified person a right to kill game.

Witnesses refusing to appear on justices summons, or appearing and refusing to give evidence, forfeit 10l. The certificates obtained under depositions, not to be given in evidence for killing of game by a gamekeeper out of the manor, in respect of which such deposition or appointments was given and made. Persons counterfeiting stamps to suffer death as felons.

Penalties exceeding 20l. are to be recovered in any of his majesty's courts of record at Westminster; and penalties not exceeding 20l. are recoverable before two justices, and may be levied by distress. The whole of the penalties go to the informer.

By 40 Geo. III. c. 50, persons to the number of two or more, found in any field, &c. or other open or inclosed ground, between eight at night and six in the morning, from the first day of October to the first of February, or between the hours of ten at night and four in the morning, from 1st February to first Octo.

Military Law. See Military and Marine.

LAW, John, the famous projector, was the eldest son of a goldsmith in Edinburgh, by Elizabeth Campbell, heiress of Laurieston near that city; and was born about the year 1681. He was bred to no business; but possessed great abilities, and a very fertile invention. He had the address, when but a very young man, to recommend himself to the king's ministers in Scotland to arrange the revenue accounts, which were in great disorder at the time of settling the equivalent before the union of the kingdoms. The attention of the Scottish parliament being also turned to the contrivance of some means for supplying the kingdom with money, and facilitating the circulation of specie, for want of which the industry of Scotland languished; he proposed to them, for these purposes, the establishment of a bank of a particular kind, which he seems to have imagined might issue paper to the amount of the whole value of all the lands in the country: but this scheme the parliament by no means thought it expedient to adopt.

His father dying about the year 1704, Law succeeded to the small estate of Laurieston; but the rents being insufficient for his expenses, he had recourse to gaming. He was tall and graceful in his person, and much addicted to gallantry and finery; and giving a sort of ton at Edinburgh, he went commonly by the name of Beau Law. He was forced to fly his country, however, in the midst of his career, in consequence of having fought a duel and killed his antagonist; and in some of the French literary gazettes it is said that he ran off with a married lady. In his flight from justice he visited Italy; and was banished from Venice and Genoa, because he contrived to drains the youth of these cities of their money, by his superiority in calculation, that is, by being a cheat and a sharper. He wandered over all Italy, living on the event of the most singular bets and wagers, which seemed to be advantageous to those who were curious after novelty; but which were always of the most certain success with regard to him. He arrived at Turin, and proposed his system to the duke of Savoy, who saw at once, that, by deceiving his subjects, he would in a short time have the whole money of the kingdom in his possession: but that sagacious prince asking him how his subjects were to pay their taxes when all their money should be gone, Law was disconcerted, not expecting such a question.

Having been banished from Italy, and thus repulsed at Turin, Law proceeded to Paris, where he was already known as a projector. In the lifetime of Louis XIV. he had transmitted his schemes to Desmarets and to Chamillard, who had rejected them as dangerous innovations. He now proposed them to the Duc d'Orleans, who desired Nouilles to examine them, to be as favourable in his report as possible, and
Noailles called in the assistance of several merchants and bankers, who were averse to the system. Law then proposed the establishment of a bank, composed of a company, with a stock of six millions. Such an institution promised to be very advantageous to commerce. An act of the 2d March 1716 established this bank, by authority, in favour of Law and his associates; two hundred thousand shares were instituted of one thousand livres each; and Law deposited in it the value of two or three thousand crowns which he had accumulated in Italy, by gaming or otherwise. This establishment very much displeased the bankers, because at the beginning business was transacted here at a very small premium, which the old financiers had charged very highly. Many people had at first little confidence in this bank; but when it was found that the payments were made with quickness and punctuality, they began to prefer its notes to ready money. In consequence of this, shares rose to more than 20 times their original value; and in 1719 their valuation was more than 80 times the amount of all the current specie in the kingdom. But the following year, this great fabric of false credit fell to the ground, and almost overthrew the French government, robbing thousands of families; and it is remarkable, that the same desperate game was playing by the South sea directors in England, in the same fatal year, 1720. Law being exiled as soon as the credit of his projects began to fail, retired to Venice, where he died in 1729.

The principles upon which Law's original scheme was founded, are explained by himself in A Discourse concerning Money and Trade, which he published in Scotland where (as we have seen) he first proposed it. "The splendid but visionary ideas which are set forth in that and some other works upon the same principles (Dr Adam Smith observes), still continue to make an impression upon many people, and have perhaps in part contributed to that excess of banking which has of late been complained of both in Scotland and in other places."

LAW, EDMUND, D. D. bishop of Carlisle, was born in the parish of Carmel in Lancashire, in the year 1752. His father, who was a clergyman, held a small chapel in that neighbourhood; but the family had been situated at Askham, in the county of Westmoreland. He was educated for some time at Cartmel school, afterwards at the free grammar school at Kendal; from which he went, very well instructed in the learning of grammar schools, to St John's college in Cambridge.

Soon after taking his first degree, he was elected fellow of Christ college in that university. During his residence in which college, he became known to the public by a translation of Archbishop King's Essay upon the Origin of Evil, with copious notes; in which many metaphysical subjects, curious and interesting in their own nature, are treated of with great ingenuity, learning, and novelty. To this work was prefixed, under the name of a preliminary dissertation, a very valuable piece, written by the reverend Mr Gay of Sidney college. Our bishop always spoke of this gentleman in terms of the greatest respect. In the Bible, and in the writings of Mr Locke, no man, he used to say, was so well versed.

He also, whilst at Christ college, undertook and went through a very laborious part in preparing for the press an edition of Stephen's Thesaurus. His acquaintance, during this his first residence in the university, was principally with Dr Waterland, the learned master of Magdalen college; Dr Jortin, a name known to every scholar; and Dr Taylor, the editor of the Demosthenes.

In the year 1737 he was presented by the university to the living of Graystock in the county of Cumberland, a rectory of about 300l. a year. The advowson of this benefice belonged to the family of Howards of Graystock, but devolved to the university; but, in this turn, by virtue of an act of parliament, which transfers to these two bodies the nomination to such benefices as appertain, at the time of the vacancy, to the patronage of a Roman Catholic. The right, however, of the university was contested; and it was not till after a law suit of two years continuance that Mr Law was settled in his living. Soon after this, he married Mary the daughter of John Christian, Esq. of Unerryg, in the county of Cumberland; a lady whose character is remembered with tenderness and esteem by all who knew her.

In 1743, he was promoted by Sir George Fleming, bishop of Carlisle, to the archdeaconry of that diocese; and in 1746 went from Graystock to reside at Salkeld, a pleasant village upon the banks of the river Eden, the rectory of which is annexed to the archdeaconry. Mr Law was not one of those who lose and forget themselves in the country. During his residence at Salkeld, he published Considerations on the Theory of Religion: to which were subjoined, Reflections on the Life and Character of Christ; and an Appendix concerning the use of the words Soul and Spirit in holy Scripture, and the state of the dead there described.

Dr Keene held at this time, with the bishops of Chester, the manship of Peterhouse in Cambridge. Desiring to leave the university, he procured Dr Law to be elected to succeed him in that station. This took place in the year 1756, in which year Dr Law resigned his archdeaconry in favour of Mr Eyre, a brother-in-law of Dr Keene. Two years before this, he had proceeded to his degree of doctor of divinity: in his public exercise for which, he defended the doctrine of what is usually called the "sleep of the soul."

About the year 1760, he was appointed head librarian of the university; a situation which, as it procured an easy and quick access to books, was peculiarly agreeable to his taste and habits. Some time after this, he was also appointed casuistical professor. In the year 1762, he suffered an irreparable loss by the death of his lady; a loss in itself every way affliction, and rendered more so by the situation of his family, which then consisted of eleven children, many of them very young. Some years afterwards, he received several preferments, which were rather honourable expressions of regard from his friends, than of much advantage to his fortune.

By Dr Cornwallis, then bishop of Litchfield, afterwards archbishop of Canterbury, who had been his pupil at Christ college, he was appointed to the archdeaconry of Staffordshire, and to a prebend in the church of Litchfield. By his old acquaintance Dr Green, bishop of Lincoln, he was made a prebendary...
of that church. But in the year 1757, by the intervention of the duke of Newcastle, to whose interest in the memorable contest for the high stewardship of the university, he had adhered in opposition to some temptations, he obtained a stall in the church of Durham. The year after this, the duke of Grafton, who had a short time before been elected chancellor of the university, recommended the master of Peterhouse to his majesty for the bishopric of Carlisle. This recommendation was made not only without solicitation on his part or that of his friends, but without his knowledge, until the duke's intention in his favour was signified to him by the archbishop.

About the year 1777, Bishop Law gave to the public a handsome edition, in three volumes quarto, of the works of Mr Locke, with a Life of the Author, and a Preface. Mr Locke's writings and character he held in the highest esteem, and seems to have drawn from them many of his own principles: He was a disciple of that school. About the same time he published a tract, which engaged some attention in the controversy concerning subscription; and he published new editions of his two principal works, with considerable additions, and some alterations.

Dr Law held the see of Carlisle almost 19 years; during which time he twice only omitted spending the summer months in his diocess at Rose Castle, a situation with which he was much pleased, not only on account of the natural beauty of the place, but because it restored him to the country in which he had spent the best part of his life. In the year 1787 he paid this visit in a state of great weakness and exhaustion: and died at Rose Castle about a month after his arrival there, on the 14th day of August, and in the 84th year of his age.

The life of the bishop of Carlisle was a life of incessant reading and thought, almost entirely directed to metaphysical and religious inquiries. Besides the works already mentioned, he published, in 1734 or 1735, a very ingenious Inquiry into the Ideas of Space and Time, &c. in which he combats the opinions of Dr Clarke and his adherents on these subjects: but the tenet by which his name and writings are principally distinguished, is "that Jesus Christ, at his second coming, will, by an act of his power, restore to life and consciousness the dead of the human species, who by their own nature, and without this interposition, would remain in the state of insensibility to which the death brought upon mankind by the sin of Adam had reduced them."

He interpreted literally that saying of St Paul, 1 Cor. xv. 21, "As by man came death, by man came also the resurrection of the dead." This opinion had no other effect upon his own mind than to increase his reverence for Christianity, and for its divine Founder. He retained it, as he did his other speculative opinions, without laying, as many are wont to do, an extravagant stress upon their importance, and without pretending to more certainty than the subject allowed. No man formed his own conclusions with more freedom, or treated those of others with greater candour and equity. He never quarrelled with any person for differing from him, or considered that difference as a sufficient reason for questioning any man's sincerity, or judging meanly of his understanding. He was zealously attached to religious liberty, because he thought that it leads to truth; yet from his heart he loved peace. But he did not perceive any repugnancy in these two things. There was nothing in his elevation to his bishopric which he spoke of with more pleasure, than its being a proof that decent freedom of inquiry was not discouraged.

He was a man of great softness of manners, and of the mildest and most tranquil disposition. His voice was never raised above its ordinary pitch. His countenance seemed never to have been ruffled; it preserved the same kind and composed aspect, truly indicating the calmness and benignity of his temper. He had an utter dislike of large and mixed companies. Next to his books, his chief satisfaction was in the serious conversation of a literary companion, or in the company of a few friends. In this sort of society he would open his mind with great unreservedness, and with a peculiar turn and sprightliness of expression. His person was low, but well formed: his complexion fair and delicate. Except occasional interruptions by the gout, he had for the greatest part of his life enjoyed good health; and when not confined by that distemper, was full of motion and activity. About nine years before his death, he was greatly enfeebled by a severe attack of the gout in his stomach; and a short time after that, lost the use of one of his legs. Notwithstanding his fondness of exercise, he resigned himself to this change, not only without complaint, but without any sensible diminution of his cheerfulness and good humour. His fault (for we are not writing a panegyric) was the general fault of retired and studious characters, too great a degree of inaction and facility in his public station. The modesty, or rather bashfulness of his nature, together with an extreme unwillingness to give pain, rendered him sometimes less firm and efficient in the administration of authority than was requisite. But it is the condition of human mortality. There is an opposition between some virtues which seldom permits them to subsist together in perfection.

The bishop was interred in his cathedral church, in which a handsome monument is erected to his memory.

LAWBURROWS, in Scots Law. See Law, Part III. No clxxviii. 16.

LAWENBURG, Duchy of, a territory of Germany, in the circle of Lower Saxony, bounded by the duchy of Holstein on the north and west, by the duchy of Mecklenburg on the east, and by the duchy of Luneburg, from which it is separated by the river Elbe, on the west; being about 85 miles long, and 20 broad. The chief towns are Lawenburg, Moen, Wittemburg, and Ratzenburg. It came into the possession of Denmark in 1815.

LAWENBURG, a city of Germany in the circle of Lower Saxony, and capital of a duchy of the same name. It is a small but populous town, situated on the Elbe, under the brow of a very high hill, from whence there is a delightful prospect over the adjacent country. It has a castle on an eminence, and is convenient for trade. E. Long. 10. 43. N. Lat. 53. 22.

LAWENBURG, a town of Germany in Further Pomerania, and the chief place to the territory of the same name belonging to the elector of Brandenburg.

LAWLESS court, a court said to be held annually on the King's Hill at Rochford in Essex, on the 4th of October.
Lawless

Wednesday morning after Michaelmas day at cock-crowing, where they whisper, and have no candle, nor any pen and ink, but only a coal. Persons who owe a suit, or service, and do not appear, forfeit double their rent every hour they are missing.

This servile attendance, Camden informs us, was imposed on the tenants for conspiring at the like unseasonable hour to raise a commotion. The court belongs to the honour of Raleigh, and to the earl of Warwick; and is called lawless, from its being held at an unlawful hour.

Lawingen, a town of Germany, in the circle of Suzia; formerly imperial, but now subject to the duke of Neuburg. Here the duke of Bavaria, in 1704, fortified his camp to defend his country against the British forces and their allies commanded by the duke of Marlborough, who forced their intrenchments. It is seated on the Danube, in E. Long. 10. 29. N. Lat. 48. 32.

Lawn, a spacious plain in a park, or adjoining to a noble seat. As to the dimensions of a lawn: In a large park, it should be as extensive as the ground will permit; and, if possible, it should never be less than 50 acres: but in gardens of a moderate extent, a lawn of 10 acres is sufficient: and in those of the largest size 15 acres. The best situation for a lawn is in the front of the house: and here, if the house front the east, it will be extremely convenient; but the most desirable aspect for a lawn is that of the south-east. As to the figure of the lawn, some recommend an exact square, others an oblong square, some an oval, and others, a circular figure: but neither of these are to be regarded. It ought to be so contrived, as to suit the ground; and there should be trees planted for shade on the boundaries of the lawn, so the sides may be broken by irregular plantations of trees, which, if there are not some good prospects beyond the lawn, should bound it on every side, and be brought round pretty near to each end of the house. If in these plantations round the lawn, the trees are placed irregularly, some breaking much forward on the lawn than others, and not crowded too close together, they will make a better appearance than any regular plantations can possibly do; and if there are variety of trees, properly disposed, they will have a good effect; but only those which make a fine appearance, and grow large, straight, and handsome, should be admittance here. The most proper trees for this purpose, are the elm, oak, chestnut, and beech; and if there are some clumps of evergreen trees intermixed with the others, they will add to the beauty of the whole, especially in the winter season; the best sorts for this purpose are Lord Weymouth's pine, and the silver and spruce firs.

Lawn, in manufactures, a fine sort of linen, remarkable for being used in the sleeves of the clerical dress of bishops.

Lawrence, 85, the largest river in North America, proceeding from Lake Ontario, from which it runs a course of 400 miles to the Atlantic ocean.

From Lake Ontario to Montreal, this river has the name of Iroquois, and after taking a north-east course it embosoms the island of Montreal, above which it receives Ottawas from the west, forming several islands of great fertility. From Montreal it takes the name of St. Lawrence, and passing by Quebec, it meets the tide more than 400 miles from the sea, and is so far navigable for large vessels. Having received in its course St. John's, Seguins, Lesprairies, Trois Rivières, and numberless other smaller streams, it falls into the ocean at Cape Rosières, by a mouth about 90 miles broad. The principal entrance into the gulf of St. Lawrence from the Atlantic ocean, is between Capes Ray and Breton. It contains a number of islands, viz. St. John's, at its southern extremity, on the coast of New Brunswick and Nova Scotia; Anticosti, at the mouth of the St. Lawrence, besides a number of small islands.

Prince Edward's island, about 200 miles in length, with a population of 8000 persons, is also in the gulf of St. Lawrence. Here a new settlement was made by Lord Selkirk, in 1803, composed of a colony of emigrants amounting to 800, from the Highlands of Scotland.

Lawsonia, Egyptian Privet, a genus of plants belonging to the octandria class; and in the natural method ranking with those of which the order is doubtful. See Botany Index.

Lawyer, a counsellor, or one who is learned or skilled in the law. See Counsellor, Barrister, and Serjeant.

Lay, a kind of ancient poem among the French, consisting of very short verses.

There were two sorts of lays; the great, and the little. The first was a poem consisting of twelve couples of verses, of different measures. The other was a poem consisting of sixteen or twenty verses, divided into four couples.

These lays were the lyric poetry of the old French poets, who were imitated by some among the English. They were principally used on melancholy subjects, and are said to have been formed on the model of the trochaic verses of the Greek and Latin tragedies.

Father Morgues gives us an extraordinary instance of one of these ancient lays, in his Treatise of French Poetry.

Sur l'appas du monde
Que fait il qu'on fonde
D'espior ?
Cette mer profonde
En drbris seconde
Exit voir
Colne au matin, londe
Et l'orage y grande
Le soir.

Lay-Brothers, among the Romanists, those pious but illiterate persons, who devote themselves at some convent to the service of the religious. They wear a different habit from that of the religious; but never enter into the choir, nor are present at the chapters; nor do they make any other vow except of constancy and obedience. In the nunneries there are also lay sisters.

Lay-Man, one who follows a secular employment, and has not entered into holy orders.

Layers, in Gardening, are tender shoots or twig of trees, laid or buried in the ground, till, having struck root, they are separated from the parent tree, and become distinct plants.—The propagating trees by layers is done in the following manner: The branches of the trees are to be slit a little way, and laid under the
the mould for about half a foot; the ground should be first made very light, and after they are laid they should be gently watered. If they will not remain easily in the position they are put in, they must be pegged down with wooden hooks: the best season for doing this is, for evergreens, toward the end of August, and, for other trees, in the beginning of February. If they are found to have taken root, they are to be cut off from the main plant the succeeding winter, and planted out. If the branch is too high from the ground, a tub of earth is to be raised to a proper height for it. Some pare off the wind, and others twist the branch before they lay it, but this is not necessary. The end of the layer should be about a foot out of the ground; and the branch may be either tied tight round with a wire, or cut upwards from a joint, or cut round for an inch or two at the place, and it is a good method to pierce several holes through it with an awl above the part tied with the wire.

LAYING THE LAND, in Navigation, the state of motion which increases the distance from the coast, so as to make it appear lower and smaller, a circumstance which evidently arises from the intervening convexity of the surface of the sea. It is used in contradistinction to raising the land, which is produced by the opposite method of approaching towards it. See LAND.

LAZAR HOUSE, or LAZARETTO, a public building, in the nature of an hospital, to receive the poor, and those afflicted with contagious distempers. In some places, lazarettos are appointed for the performance of quarantine; in which case, those are obliged to be confined in them who are suspected to have come from places infected with the plague.

LAYSTOFF, or LOWESTOFF, a town of Suffolk, 117 miles from London, seems to hang over the sea, and its chief business is fishing for cod in the North sea, and for herring, mackerel, and sprats, at home. The church is at some distance, but there is a chapel in the town. Having been a part of the ancient demesnes of the crown, this town has a charter and a seal, by the former of which the inhabitants are exempted from serving on juries. Some take this to be the most eastern part of Britain.

LAZULI, LAZULITE, or Lapis Lazuli, a species of mineral belonging to the silicious genus. See LAZULITE, MINERALOGY Index.

LEACHLADE, a town of Gloucestershire, 12 miles east from Cirencester, 29 miles from Gloucester, and 77 from London. The river Thames waters it on the south and east sides, and divides it from Wiltshire and Berkshire. The Leach runs through the north side of the parish. The Thames river is navigable for barges of 50 tons burden, but want of water during part of the year makes the navigation very uncertain.

The church is a large handsome building with double aisles, supported by two rows of fluted pillars.

LEAD, one of the metals, of a white colour inclining to blue, the least ductile, the least elastic, and the least sonorous, of the whole, but possessing a considerable degree of specific gravity. See CHEMISTRY and MINERALOGY Index.

White Lead, or Ceruse. See CHEMISTRY Index.

Black Lead, or Plumbago, a species of mineral belonging to the class of Inflammables. See GRAPHITE, MINERALOGY Index.

Milled Lead. See CHEMISTRY Index.

Poison of Lead. See Poison.

Sheet Lead. See PLUMBERY.

LEAF, a part of a plant extended into length and breadth, in such a manner as to have one side distinguishable from the other. This is Miller's definition. Linnaeus denominated leaves "the organs of motion, or muscles of the plant."—The leaves are not merely ornamental to plants; they serve very useful purposes, and make part of the organs of vegetation.

The greater number of plants, particularly trees, are furnished with leaves: in mushrooms, and shrubby horse tail, they are totally wanting. Ludwic defines leaves to be fibrous and cellular processes of the plant, which are of various figures, but generally extended into a plain membranaceous or skinny substance. They are of a deeper green than the footstalks on which they stand, and are formed by the expansion of the vessels of the stalk, among which, in several leaves, the proper vessels are distinguished by the particular taste, colour, and smell, of the liquors contained within them.

By the expansion of the vessels of the stalk, are produced several ramifications or branches, which, crossing each other mutually, form a kind of net: the meshes or interstices of which are filled up with a ten der cellular substance, called the pulp, pith, or parenchyma. The pulpy substance is frequently consumed by certain small insects, whilst the membranous net remaining untouched exhibits the genuine skeleton of the leaf.

The net in question is covered externally with an epidermis or scarf skin, which appears to be a continuation of the scarf skin of the stalk, and perhaps of that of the stem. M. de Saussure, a judicious naturalist, has attempted to prove, that this scarf skin, like that of the petals, is a true bark, composed itself of an epidermis and cortical net; these parts seem to be the organs of perspiration, which serve to dissipate the superfluous juices.

The cortical net is furnished, principally on the surface of the leaf, with a great number of suckers or absorbent vessels, destined to imbibe the humidity of the air. The upper surface, turned towards heaven, serves as a defence to the lower, which looks downward; and this disposition is so essential to the vegetable economy, that, if a branch is overturned in such a manner as to destroy the natural direction of the leaves, they will, of themselves, in a very short time, resume their former position: and that as often as the branch is thus overturned.

Leaves, then, are useful and necessary organs; trees perish when totally divested of them. In general, plants stripped of any of their leaves, cannot shoot vigorously: witness those which have undergone the depredations of insects; witness, likewise, the very common practice of stripping off some of the leaves from plants, when we would suspend their growth, or diminish the number of their shoots. This method is sometimes observed with corn and the esculent grasses; and, in cold years, is practised on fruit trees and vines, to render the fruit riper and better coloured: but in this.
this case it is proper to wait till the fruits have acquired their full bulk, as the leaves contribute greatly to their growth, but hinder, when too numerous, that exquisite rectifying of the juices, which is so necessary to render them delicious and palatable.

When vegetation ceases, the organs of perspiration and inspiration become superfluous. Plants, therefore, are not always adorned with leaves: they produce new ones every year; and every year the greater part are totally diestved of them, and remain naked during the winter.

LEAF Insect. See CIXTE, ENTOMOLOGY Index.

LEAF Skeletons. One help for acquiring a knowledge of the anatomy of plants is the art of reducing leaves to skeletons, which may be done by exposing the leaves to decay for some time soaked in water, by which means the softer will be separated from the internal harder parts. By carefully wiping, pressing, and raining them, the harder parts may be obtained from the rest alone natural. Some have been able to separate the outer covering on both sides from the woody net, and even to split the latter into two. A naturalist in the year 1645 first conceived the idea of making leaf-skeletons by employing decomposition for that purpose, assisting it by several ingenious operations of art. When the method of producing these skeletons was publicly known, numberless preparations of them were everywhere attempted. So much did leaf-skeletons afterwards engage the attention of philosophers, that one Seligmann wrote a treatise on the various methods which may be employed in their preparation.

The art of raising trees from leaves has been long known, the first account of which was published by Agostino Mandriola, an Italian of the Franciscan order, who assures us that he produced trees from the leaves of the cedar and lemon tree. In the garden of Baron de Munthuschauss, a young tree was obtained from a leaf of the lemon of the River, which yielded fruit the second year: it is more than probable that the multiplication of the opuntia or Indian fig, first suggested the idea of such experiments, for every joint of that plant when stuck into the earth, and properly nurtured, throws out roots and grows.

LEAF, in clocks and watches, an appellation given to the notches of their pinions.

Gold LEAF, usually signifies fine gold beaten into plates of exceeding thinness, which are employed in the arts of gilding, &c. See Gold Leaf.

LEAGUE, a measure of length, containing more or fewer geometrical paces, according to the different usages and customs of countries. A league at sea, where it is chiefly used by us, being a land measure mostly peculiar to the French and Germans, contains 3000 geometrical paces, or three English miles. The French league sometimes contains the same measure, and in some parts of France it consists of 3500 paces: the mean or common league consists of 2400 paces, and the little league of 2000. The Spanish leagues are larger than the French, 17 Spanish leagues making a degree, or 20 French leagues, or 695 English statute miles. The Dutch and German leagues contain each four geographical miles. The Persian leagues are pretty near of the same extent with the Spanish; that is, they are equal to four Italian miles, which is pretty near to what Herodotus calls the length of the Persian purasang, which contained 30 stadia, eight whereof, according to Strabo, make a mile. The word comes from leuce or leuge, an ancient Gaulish word for an itinerary measure, and retained in that sense by the Romans. Some derive the word leuce from leucos, "white," as the Gauls, in imitation of the Romans, marked the spaces and distances of their roads with white stones.

LEAGUE also denotes an alliance or confederacy between princes and states for their mutual aid, either in attacking some common enemy, or in defending themselves. The word comes from liga, which, in the corrupt Latin, was used for a confederacy: Quo quis cum alterius vetat.

Leagues, among the Greeks, were of three sorts:
1. Συνήγημα, Συνόρια, or Σύμφωνα, whereby both parties were obliged to cease from hostilities, without even molesting the allies of each other; 2. Επιφανεία, whereby they engaged to lend assistance to each other in case of invasion; and 3. Συμμαχία, whereby they engaged to have the same friends and enemies, and to assist each other upon all occasions. All these leagues were confirmed with oaths, and imprecations, and sacrifices. The victims most generally used were a boar, ram, or goat, sometimes all three; and sometimes bulls and lambs. They cut out the testicles of the animal, and stood upon them while they swore; and some of the hair of the victim was distributed to all present. Then they cut the animal's throat, which was called opus scissum, in Latin, ferire fusum. This done, they repeated their oaths and imprecations, calling the gods to witness the honesty of their intentions. A libation was then made of wine, which at this time was mixed, to imply their conjunction and union; while this was pouring out, they prayed that the blood of him who should break the treaty might be poured out in like manner. Upon these occasions no part of the victim was eaten. Still further to increase the solemnity of this obligation, the league was engraved upon brass, fixed up in places of public concourse, and sometimes read at the solemn games. Some exchanged certain omeni, or tesserae, upon the occasion, and frequently sent ambassadors on some appointed day, to keep them in mind of their engagements to each other.

The ceremonies of the Romans in making leagues were performed by the Peciales. See PECIALES.

LEAGUES OF THE GRINIONS, are a part of Switzerland, consisting of three subdivisions, viz. the upper league, the league of the house of God, and the league of the ten jurisdictions. See the article GRINIONS.

The LEAGUE, by way of eminence, denotes that famous one on foot in France, from the year 1576 to 1593. Its intent was to prevent the succession of Henry IV, who was of the reformed religion, to the crown; and it ended with his abjuration of that faith.

The leagues, or confederates, were of three kinds. The zealous leagues aimed at the utter destruction not only of the Huguenots, but also of the ministry. The Spanish leagues had principally in view the transferring the crown of France to the king of Spain, or the infants his daughter. The moderate leagues aimed only at the extirpation of Calvinism, without any alteration of the government.

LEAK, at sea, is a hole in the ship, through which the water comes in. A ship is said to spring a leak when
LEAKE, Richard, master gunner of England, was born at Harwich in 1629, and was bred to the sea. At the Restoration, he was made master gunner of the Princess, a frigate of 50 guns; and in the first Dutch war distinguished himself by his skill and bravery in two extraordinary actions; one against 15 sail of Dutch men of war; and another in 1667 against two Danes in the Baltic, in which the commanding officers of the Princess being killed or desperately wounded, the command, according to the rules of war at that time, fell to the gunner. In 1668, he was promoted to be gunner of the Royal Prince, a first-rate man of war. He was engaged, with his two sons, Henry and John, in the battle against Van Tromp, in 1673; when the Royal Prince had all her masts shot away, near 400 of her men killed and disabled, and most of her upper tier of guns dismounted. As she lay thus like a wreck, a great Dutch man of war came down upon her with two fire ships, either to burn or carry her off; and Captain Rooke, afterwards Sir George, thinking it impossible to defend her, ordered the men to save their lives, and the colours to be struck. Mr Leake hearing this, ordered the lieutenant off the quarter deck, and took the command upon himself, saying, "The Royal Prince shall never be given up to the enemy while I am alive to defend her." The undaunted spirit of the brave gunner inspired the small residue of the ship's company with resolution; they returned with alacrity to the fight, and under the direction of this valiant gunner and his two sons sunk both the fire ships, and obliged the man of war to sheer off; and having thus saved the Royal Prince, he brought her into Chatham. But Mr Leake's joy in obtaining this victory was damped by the loss of Henry, his eldest son, who was killed near him. Soon after, Mr Leake was preferred to the command of a yacht, and also made gunner of Whitehall. In 1677, he obtained a grant for life of the office of master gunner of England, and storekeeper of the ordnance at Woolwich. By this post he had full scope for his genius.

He accordingly, among other things, invented the sushee piece; and contrived to fire a mortar by the blast of a piece, which has been used ever since. He was also the principal contriver of what the French call "infernals," used at the bombardment of St Malo's in 1693. Mr Leake had a surprising genius for all inventions of this kind; and had frequent trials of skill with French and Dutch gunners and engineers in Woolwich, at which King Charles II. and the duke of York were often present, and he never failed to excel all his competitors: nor was he less skilled in the art of making compositions for fireworks; of which he likewise made frequent trials with equal success.

LEAKE, Sir John, an English admiral, distinguished by his bravery and success, was born in 1650, and was taught mathematics and gunnery by Mr Richard Leake his father, who was master gunner of England. Entering early into the navy, he distinguished himself under his father in 1673, in the memorable engagement between Sir Edward Spragg and Van Tromp, when but 16 years of age; and being afterwides made captain, he signified himself, among other occasions, by executing the desperate attempt of conveying some victuallers into Londonderry, which obliged the enemy to raise the siege; and at the famous battle of La Hogue. In 1702, being made commodore of a squadron, he destroyed the French trade and settlements at Newfoundland, and restored the English to the possession of the whole island. On his return he was created rear admiral; soon after, he was made vice admiral of the blue, and was afterwards knighted. He was engaged with Admiral Rooke in taking Gibraltar: soon after which, he particularly distinguished himself in the general engagement off Malcolm; when commanding the leading squadron of the van, consisting only of six ships, he drove that of the enemy, consisting of 13, out of the line of battle, so disabled that they never returned to the fight. In 1705, he relieved Gibraltar, which the French had besieged by sea, and the Spaniards by land, so seasonably, that the enemy was to have attacked the town that very night in several places, and would undoubtedly have made themselves masters of it. Five hundred Spaniards had, by the help of rope ladders, climbed up the rocks by a way that was thought inaccessible. At the same time they had got a great number of boats to land 3000 men at the New Mole, who, by making a vigorous assault on the side next the sea, were to draw the garrison to oppose the attack, while the 500 concealed men rushed into the town. These being the next day drawn by hunger out of their ambuscade, were discovered; on which Sir John assisting the garrison with sailors and marines, they were attacked with such vigour, that, though they had taken an oath not to surrender to the English, 150 common soldiers and 35 officers took quarter: 200 were killed on the spot; and the rest, who endeavoured to make their escape, fell headlong down the rock. He was soon after made vice admiral of the white, and then twice relieved that fortress. The last time, he attacked five ships of the French fleet coming out of the bay, of whom two were taken, and two run ashore and were destroyed: Baron Pointi died soon after, of the wounds he received in the battle; and in a few days the enemy raised the siege.

Leak
LEASING, among sportsmen, denotes three creatures of any kind; but chiefly grebes, foaxes, hawks, and harriers.

The term "leasing" also signifies a line to hold in a hunting dog; and a small long thong of leather, by which a falconer holds his hawk.

LEASING-MAKING, in Scott's Law, the uttering of words tending to excite discord between the king and his people; also called verbal sedition.

LEATHER, the skin of several sorts of beasts dressed and prepared for the use of various manufacturers, whose business it is to make them up.

Dyeing of LEATHER, Skins, &c. Blue is given by steeping the subject a day in urine and indigo, then boiling it with alum: or it may be given by tempering the indigo with red wine, and washing the skins therewith. Red is given by washing the skins, and laying them two hours in galls, then wringing them out, dipping them in a liquor made with leghorn, alum, and verdigris in water; and lastly, in dye made of Brazil wood, boiled with ley. Purple is given by wetting the skins with a solution of roche alum in warm water; and, when dry again, rubbing them with the hand with a decoction of logwood in colder. Green is given by smearing the skin with sap-green and alum-water boiled. Dark green is also given with steel filings and sal ammoniac steeped in urine till soft, then smeared over the skin; which is to be dried in the shade. Sky colour is given with indigo steeped in boiling water, and the next morning warmed and smeared over the skin. Yellow, by smearing the skin over with sloes and limed oil dissolved and strained; or by infusing it in wort. Orange colour is given by smearing with succulent berries boiled in alum water; or, for a deep orange, with turmeric.

Processes for Dyeing LEATHER Red and Yellow as practised in Turkey, with directions for Preparing and Tanning the Skins; as communicated by Mr. Philippo, a native of Armenia, who received from the Society for the Encouragement of Arts, &c. one hundred pounds, and also the gold medal of the Society, as a reward for discovering this secret.

1. First Preparation of the Skins, both for Red and Yellow Leather, by dressing them in Lime. Let the skins, dried with the hair on, be first laid to soak in clean water for three days; let them then be broken over the flesh side, put into fresh water for two days longer, and afterwards hung up to drain half an hour. Let them now be broken on the flesh side, lined in cold lime on the same side, and doubled together with the grain side outward. In this state they must be hung up within doors over a frame for five or six days, till the hair be loose; which must then be taken off, and the skins returned into the lime pit for about three weeks. Take them out, and let them be well worked flesh and grain, every sixth or seventh day during this time. After which, let them be washed ten times in clear water, changing the water at each washing. They are next to be prepared in drench, as below mentioned.

2. Second Preparation of the Skins for both the Red and Yellow Dyes by drenching. After squeezing the water out of the skins, put them into a mixture of bran and water, warm as new milk, in the following proportions; viz. about three pounds of bran for five skins, and water sufficient to make the mixture moderately fluid, which will be about a gallon to each pound of bran. In this drench let the skins lie three days; at the end of which time they must be well worked, and afterwards returned into the drench two days longer. They must then be taken out and rubbed between the hands; the water squeezed from them, and the bran scraped off, and some of the skins. After this they must be again washed ten times in clear water, and the water squeezed out of them.

Thus far the preparatory process of all the skins, whether intended to be dyed red or yellow, is the same; but afterwards those which are to be dyed red, must be treated as follows.

3. Preparation in Honey and Bran of Skins that are to be dyed Red. Mix one pound of honey with three pints of lukewarm water, and stir them together till the honey is dissolved. Then add two handfuls of bran; and taking four skins (for which the above quantity of the mixture will be sufficient), work them well in it one after another. Afterwards fold up each skin separately into a round form, with the flesh side inward; and lay them in an earthen pan, or other proper vessel; if in the summer, by the side of each other; but in the winter, on the top of each other. Place the vessel in a sloping position, so that such part of the fluid as may spontaneously drain from the skins, may pass from them. An acid fermentation will then rise in the liquor, and the skins will swell considerably. In this state they must continue for seven or eight days; but the moisture that drains from them must be poured off, once or twice a-day, as occasion may require. After this a further preparation in salt is necessary; and which must be performed in the following manner.

4. Preparation in Salt, of the Skins to be dyed Red. After the skins have been fermented in the honey and bran, as above mentioned, let them be taken out of that mixture on the eighth or ninth day, and well rubbed with dry common sea salt, in the proportion of about half a pound to each skin; the salt must be well rubbed and worked with them. This will make them contract again, and part with a further considerable quantity of moisture; which must be squeezed out by drawing each skin separately through the hands. They must next be scraped clean on both sides from the bran, superfuse salt, and moisture that may adhere to them. After which, dry salt must be strewn over the grain-side, and well rubbed in with the hand. They are then to be doubled with the flesh side outwards, lengthwise from neck to tail, and a little more dry salt must be thinly strewn over the flesh side, and rubbed in; for the two last operations, about a pound and a half of salt will be sufficient for each skin. They must then be put, thus folded on each other, between two clean boards, placed sloping, breadthwise; and a heavy weight laid on the upper board, in order gradually to press out what moisture they will thus part with. In this state of pressure, they must be continued two days...
5. Preparation of the Red Dye, in a proper proportion for four Skins. Put eight gallons of water into a copper, with seven ounces of shenan (A) tied up in a linen bag. Light a fire under a copper; and when the water has boiled a quarter of an hour, take out the bag of shenan, and put into the boiling fluid or lixivium, 1st, Two drams of alum; 2dly, Two drams pomegranate bark; 3dly, Three quarters of an ounce of turmeric; 4thly, Three ounces of cochineal; 5thly, Two ounces of loaf sugar. Let the whole mixture boil about six minutes, then cover the fire, and take out a quart of liquor, putting it into a flat earthen pan; and when it is as cold as new milk, take one skin, folded lengthwise, the grain side outwards, and dip it in the liquor, rubbing it gently with the hands. Then taking out the skin, hang it up to drain, and throw away the superfluous dye. Proceed in the same manner with the remaining three skins; repeating the operation of each skin separately, eight times, squeezing the skins by drawing them through the hands before each fresh dipping. Lay them now on one side of a large pan, set seeping, to drain off as much of the moisture as will run from them without pressure, for about two hours, or till they are cold; then tan them as below directed.

6. Tanning the Red Skins. Powder four ounces of the best white galls in a marble mortar, sifting it through a fine sieve. Mix the powder with about three quarts of water, and work the skins well in this mixture for half an hour or more, folding up the skins fourfold. Let them lie in this tan for 24 hours; when they must be worked again as before; then taken out, scraped clean on both sides from the first galls, and put into a like quantity of fresh galls and water. In this fresh mixture they must be again well worked for three quarters of an hour; then folded up as before, and left in the fresh tan for three days. On the fourth day they must be taken out, washed clean from the galls in seven or eight fresh quantities of water, and then hung up to dry.

7. Manner of Dressing the Skins after they are tanned. When the skins have been treated as above, and are very near dry, they should be scraped with the proper instrument or scraper on the flesh side, to reduce them to a proper degree of thickness. They are then to be laid on a smooth board, and glazed by rubbing them with a smooth glass. After which they must be oiled, by rubbing them with olive oil, by means of a linen rag, in the proportion of one ounce and a half of oil for four skins: they are then to be grained on a graining board, lengthwise, breadthwise, and cornerwise, or from corner to corner.

8. Preparations with Gallic, for the Skins to be dyed Yellow. After the four skins are taken out of the drench of bran, and clean washed as before directed in the second article, they must be very well worked, half an hour or more, in a mixture of a pound and a half of the best white galls, finely powdered, with two quarts of clean water. The skins are then to be separately doubled lengthwise, rolled up with the flesh side outwards, laid in the mixture, and close pressed down on each other, in which state they must continue two whole days. On the third day let them be again worked in the tan; and afterwards scraped clean from the galls, with an ivory or brass instrument (for no iron must touch them). They must then be put into a fresh tan, made of two pounds of galls finely powdered, with about three quarts of water, and well worked therein 15 times. After this they must be doubled, rolled up as before, and laid in the second tan for three days. On the third day a quarter of a pound of white sea-salt must be worked into each skin; and the skins doubled up as before, and returned into the tan, till the day following, when they are to be taken out, and well washed six times in cold water, and four times in water lukewarm. The water must then be well squeezed out, by laying the skins under pressure, for about half an hour, between two boards, with a weight of about 200 or 300 pounds laid upon the uppermost board, when they will be ready for the dye.

9. Preparation of the Yellow Dye, in the proper proportion for four Skins. Mix six ounces of cassiari gebira (b), or dgebir, or the berries of the eastern rhamnus, with the same quantity of alum; and pound them together till they be fine, in a marble or brass mortar, with a brass pestle. Then dividing the materials, thus powdered, into three equal parts of four ounces each, put one of those three parts into a pint and a half of water, in a china or earthen vessel, and stir the mixture together. Let the fluid stand to cool, till it will not scald the hand. Then spreading one of the skins flat on a table, in a warm room, with the grain-side uppermost, pour a fourth part of the tinging liquor, prepared as above directed, over the upper or grain-side, spreading it equally over the skin with the hand, and rubbing it well in. Afterwards do the like with the other three skins, for which the mixture first made will be sufficient.

This operation must be repeated twice more on each skin.

---

(A) Shenen is a drug much used by dyers in the east; and may easily be procured at any of the parts of Syria and Africa, in the Levant. It is the eastern jointed-kali, called by botanists salicornia; and grows in great plenty in those and other parts of the east. There is a lesser species of the salicornia on our coast, which, from its great affinity with the shenan, might be presumed to have the same qualities. On some trials, however, it has not appeared to answer the intention of the shenan; but it will be prudent to pursue the examination of this further, as some unknown circumstances in the collecting or using the English salicornia might occasion the miscarriage. But be this as it may, the eastern shenan may, at all events, be easily procured in any quantity, at a very trifling expense, by any of the captains of Turkey ships, at Aleppo, Smyrna, &c.

(b) The cassiari gebira is the berries of an eastern rhamnus, or buckthorn tree; and may be had at Aleppo, and other parts of the Levant, at a small price. The common Arvignon or yellow berries may be substituted, but not with so good an effect; the cassiari gebira being a stronger and brighter yellow dye, both for this use and also that of colouring paper hangings, &c.
LEA skin separately, with the remaining eight ounces of the powder of the berries, and alum, with the above-said proportion of hot water, put to them as before directed.

The skins, when dyed, are to be hung up on a wooden frame, without being folded, with the grain side outwards, about three quarters of an hour to drain; when they must be carried to a river or stream of running water, and well washed therein six times or more. After this, they must be put under pressure for about an hour, till the water be well squeezed out; afterwards the skins must be hung up dry in a warm room.

This being done, the skins are to be dressed and grained as before directed for those dyed red; except the oiling, which must be omitted.

Blacking Leather. In the tanning of leather it is so much impregnated with the astringent parts of oak bark, or with that matter which strikes a black with green vitriol, that rubbing it over three or four times with a solution of the vitriol, or with a solution of iron made in vegetable aces, is sufficient for staining it black. Of this we may be convinced by dropping a little of the solution on the unbleached side of common shoe leather. This operation is performed by the dyer; who, after the sharpening, gives a gloss to the leather with a solution of gum arabic and size made in vinegar. Where the previous astringent impregnation is insufficient to give due colour, and for those sorts of leather which have not been tanned, same galls or other astringents are added to the solution of iron; and in many cases, particularly for the finer sorts of leather, and for renewing the blackness, ivory or lampblack is used. A mixture of either of these with linseed oil makes the common oil blacking. For a shining blacking, small beer or water is taken instead of oil, in the quantity of about a pint to an ounce of the ivory black, with an addition of half an ounce of brown sugar and as much gum arabic. The white of an egg, substituted for the gum, makes the black more shining, but is supposed to hurt the leather, and make it apt to crack. It must be obvious, however, that all these compositions admit of a great many variations.

Gilding of Leather. Take glair of the whites of eggs, or gum water, and with a brush rub over the leather with either of them: then lay on the gold or silver, and, letting it dry, burnish them. See the articles GILDING and BURNISHING.

To dress or cover Leather with Silver or Gold. Take brown-red; grind or move it on a stone with a muller, adding water and chalk; and when the latter is dissolved, rub or lightly daub the leather over with it, till it looks a little whitish; and then lay on the leaf-silver or gold before the leather is quite dry, laying the leaves a little over each other, that there may not be the least part uncovered; and when they have well closed with the leather, and are sufficiently dried on and hardened, rub them over with an ivory polisher, or the forehead of a horse.

By several statutes, regulations are made for the tanning and manufacturing of leather; and by the 27th Geo. III. c. 13. a duty is laid upon all hides and skins imported, and drawbacks allowed on the exportation thereof. Several duties are also imposed on hides and skins tanned in Great Britain, of what kindsoever, as set forth in schedules annexed to the said act. By the 23 Geo. III. c. 37. further regulations are made respecting the said duties, which are under the management of the officers of excise.

LEAVEN, a piece of sour dough, used to ferment and render light a much larger quantity of dough or paste. See BREAD, BARK, and BAKING.

Leaven was, strictly forbidden by the law of Moses during the seven days of the passover; and the Jews, in obedience to this law, very carefully purled their houses from all leaven as soon as the vigil of the feast began. Nothing of honey or leaven was to have place in any thing presented to the Lord, upon his altar, during this solemnity. If, during the feast, the least particle of leaven was found in their houses, they imagined the whole was polluted, for a little leaven leaventh the whole lump. Leaven, in its figurative sense, signifies the bad passions of envy and malice, and rancour, which sour the temper, and extend their ferment over the social affections; whereas unleavened bread implies sincerity and truth. It is frequently used for any kind of moral contagion.

LEAVES OF PLANTS. See LEAF. See COLOUR-MAKING, No. 37.

LEBADIA, or LEBADIA, an ancient town of Eocnia, on the borders of Phocis, situated between Helicean and Chersonia, still called Livadia. In it stood the oracle of Jupiter Trophonius, which whoever went to consult descended into a subterraneous gulf.

LEBEDA, an ancient sea port town of Africa, in the kingdom of Tripoli, with a pretty good harbour, and an old castle, seated on the Mediterranean sea; in E. Long. 14° 50′. N. Lat. 32° 10′.

LEBEDOS, reckoned among the twelve ancient cities of Ionia, was situated to the south of Smyrna. It was the residence of stage-players, and the place where they met from all parts of Ionia, as far as the Hellespont, and celebrated annual games in honour of Bacchus, (Strabo). It was overthrown by Lydians, who removed the inhabitants to Ephesus; scarce ever after recovering itself, and becoming rather a village than a town, (Horace).

LEBEN, or LEBENA, in Ancient Geography, one of the port towns of the Gortynthians, near the promontory Leon, on the south-east side of Crete; famous for a temple of Aesculapius in imitation of that of Cyrene.

LEBRICA, an ancient, strong, and pleasant town of Spain, in Andalusia; seated in a territory abounding in corn, wine, and a great number of olive trees, of whose fruit they make the best oil in Spain. W. Long. 5° 32′. N. Lat. 36° 52′.

LEBUS, a town of Germany, in the circle of Upper Saxony, and in the marquisate of Brandenburg, with a bishop's see, secularized in favour of the house of Brandenburg. It is seated on the river Oder, in E. Long. 14° 44′. N. Lat. 52° 28′.

LECCE, a rich populous, and most beautiful town of Italy, in the kingdom of Naples and in the Terra d'Otranto, of which it is the chief place, and the see of a bishop. E. Long. 18° 28′. N. Lat. 40° 40′.

LECCO, a town of Italy in the duchy of Milan, seated on the eastern side of the lake Como. E. Long. 9° 23′. N. Lat. 45° 5′.
inhabitants of the parish, supported by voluntary subscriptions and legacies, and are usually the afternoon preachers in the Sunday service. The term is also more generally applied to those who preach on Sunday, or on any stated day of the week, in churches or other places of public worship. By 13 and 14 Car. II. cap. 4, lecturers in churches, unlicensed, and not conforming to the liturgy, shall be disabled, and shall also suffer three months imprisonment in the common gaol; and two justices, or the mayor in a town corporate, shall, upon certificate from the ordinary, commit them accordingly. Where there are lectures founded by the donations of pious persons, the lecturers are appointed by the founders without any interposition or consent of rector or curate of the church, &c. through the leave and approbation of the bishop; such is that of Lady Mayer’s at St. Paul’s. But the lecturer is not entitled to the pulpit, without the consent of the rector or vicar, who is possessed of the freehold of the church.

LEDA, in fabulous history, a daughter of King Theopius and Eurythemis, who married Tyndarus king of Sparta. She was seen bathing in the river Eurus by Jupiter, when she was some few days advanced in her pregnancy, and the god, struck with her beauty, resolved to deceive her. He persuaded Venus to change herself into an eagle, while he assumed the form of a swan, and after this metamorphosis Jupiter, as if fearful of the tyrannical cruelty of the bird of prey, fled through the air into the arms of Leda, who willingly sheltered the trembling swan from the assaults of his superior enemy. The cares with which the naked Leda received the swan, enabled Jupiter to avail himself of his situation, and nine months after this adventure the wife of Tyndarus brought forth two eggs, one of which sprang Pollux and Helen, and of the other Castor and Clytemnestra. The two former were deemed the offspring of Jupiter, and the others claimed Tyndarus for their father. Some mythologists attribute this amour to Nemesis and not to Leda; and they farther mention, that Leda was intrusted with the education of the children which sprang from the eggs brought forth by Nemesis. To reconcile this diversity of opinions, others maintain that Leda received the name of Nemesis after death. Homer and Heid make no mention of the metamorphosis of Jupiter into a swan, whereas some have imagined that the fable was unknown to those two ancient poets, and probably invented since their age.

LEDESMAN, an ancient and strong town of Spain, in the kingdom of Leon, seated on the river Tone, in W. Long. 5° 25. N. Lat. 47° 2.

LEDGER, the principal book wherein merchants enter their accounts. See Book-keeping.

LEDUM, Marsh Cistus, or Wild Rosemary; a genus of plants belonging to the decandria class; and in the natural method ranking under the 18th order, Bicornes. See Botany Index.

L.E.E., an epithet used by seamen to distinguish that part of the hemisphere to which the wind is directed, from the other part whence it arises; which latter is accordingly called windward. This expression was chiefly
Lee was particularly fortunate in the character of the Macedonian hero.

Lee-Penny, or Lee-stone, a curious piece of antiquity belonging to the family of Lee in Scotland, and of which the following account has been given in the Gentleman’s Magazine for December 1787.

It is a stone of a dark red colour and triangular shape, and its size about half an inch each side. It is set in a piece of silver coin, which, though much defaced, by some letters still remaining is supposed to be a shilling of Edward I. the cross being very plain, as it is on his shillings. It has been, by tradition, in the Lee family since the year 1320; that is, a little after the death of King Robert Bruce, who having ordered his heart to be carried to the Holy Land, there to be buried, one of the noble family of Douglas was sent with it, and it is said got the crowned heart in his arms from that circumstance: but the person who carried the heart was Simon Locard of Lee, who just about this time borrowed a large sum of money from Sir William de Lendsay, prior of Air, for which he granted a bond of annuity of ten pounds of silver, during the life of the said Sir William de Lendsay, out of his lands of Lee and Cartland. The original bond, dated 1323, and witnessed by the principal nobility of the country, is still remaining among the family papers.

As this was a great sum in those days, it is thought it was borrowed for that expedition; and from his being the person who carried the royal heart, he changed his name to Lockhart, as it is sometimes spelled, or Lockhart, and got a heart within a look for part of his arms, with the motto Corda serata pando. This Simon Lockhart having taken prisoner a Saracen prince or chief, his wife came to ransom him; and on counting out the money or jewels, this stone fell out of her purse, which she hastily snatched up; which Simon Lockhart observing, insisted to have it, else he would not give up his prisoner. Upon this the lady gave it him, and told him its many virtues, viz. that it cured all diseases in cattle, and the bite of a mad dog both in man and beast. It is used by dipping the stone in water, which is given to the diseased cattle to drink; and the person who has been bit, and the wound or part infected, is washed with the water. There are no words used in the dipping of the stone, or any money taken by the servants, without incurring the owner’s displeasure. Many are the cures said to be performed by it, and people come from all parts of Scotland, and even as far up in England as Yorkshire, to get the water in which the stone is dipped, to give their cattle, when ill of the murrain especially, and black-leg. A great many years ago, a complaint was made to the ecclesiastical courts against the laird of Lee, then Sir James Lockhart, for using witchcraft. It is said, when the plague was last at Newcastle, the inhabitants sent for the Lee-penny, and gave a bond for a large sum in trust for the loan; and that they thought it did so much good, that they offered to pay the money, and keep the Lee-penny: but the gentleman would not part with it. A copy of this bond is very well attested to have been among the family papers, but supposed to have been spoiled, along with many more valuable ones, 50 years ago, by rain getting into the charter room, during a long minority, and no family residing at Lee.
LEE

We have given this history, not on account of the utility of the information, but as a proof of the superstition of the times. None of the virtues which the stone was formerly supposed to possess, are now ascribed to it, excepting, we believe, in the case of some of the diseases of cattle; and even these in more enlightened times will become daily less numerous and less powerful.

**LEECH**, in Zoology. See **Hirudo, Helminthology Index**.

Leeches, in a ship, the borders or edges of a sail which are either sloping or perpendicular.

The leeches of all sails whose tops and bottoms are parallel to the deck, or at right angles to the mast, are denominated from the ship's side, and the sail to which they belong; as the *starboard* leech of the main-sail, the *lee* leech of the fore-top sail, &c. But the sails which are fixed obliquely on the masts have their leeches named from their situation with respect to the ship's length, as the *fore* leech of the mizen, the *after* leech of the jib or fore-stay sail, &c.

**Leek Lines**, certain ropes fastened to the middle of the leeches of the main-sail and fore-sail, and communicating with blocks under the opposite sides of the top, whence they pass downward to the deck, serving to press up those sails to the yard as occasion requires. See **BRAILS**.

Leech-Rope, a name given to that part of the belting rope to which the border or skirt of a sail is sewed. In all sails whose opposite leeches are of the same length, it is terminated above the cornering, and below the clew. See **BOLT-Rope, CLUE, and EARING**.

**LEEDS**, a town of the west riding of Yorkshire, 156 miles from London, has a magnificent stone bridge over the river Aire to the suburbs. It was incorporated by King Charles I. with a chief alderman, nine burgesses, and 20 assistants; and by Charles II. with a mayor, 12 aldermen, and 24 assistants. It has been a long time famous for the woollen manufacture, and is one of the largest and most flourishing towns in the country, yet had but one church till the reign of Charles I. By means of inland navigation, it has communication with the rivers Mersey, Dee, Ribble, Ouse, Trent, Darwent, Severn, Humber, Thames, Avon, &c.; which navigation, including its windings, extends above 900 miles in the counties of Lincoln, Nottingham, Lancaster, Westmoreland, Chester, Stafford, Warwick, Leicester, Oxford, Worcester, &c. Here is a long street full of shops, and a hall for the sale of cloth, built in 1758. The merchants of this place, York, and Hull, ship them off at the latter port, for Holland, Hamburg, and the north. After ringing of the market-bell at six or seven in the morning, the shopmen come and match their patterns, when they treat for the cloth with a whisper, because the clothiers' standing are so near each other; and perhaps 20,000l worth of cloth is sold in an hour's time. At half an hour after eight the bell rings again, when the clothiers make room for the linemen, dressers, hardmen, shoemakers, fruiterers, &c. At the same time the shambles are well stocked with all sorts of fish and flesh; and 400 horse loads of apples have been counted here in a day. There is a magnificent hall, where they also sell great quantities of white cloth; and here is a noble guidehall, with fine marble statues of Queen Anne, erected about the year 1714.

Its river being navigable by boats, they send other goods, besides their cloth, to Wakefield, York, and Hull, and furnish York with coal. There is a house called *Red hall*, because it was the first brick building in the town, and King Charles I. had an apartment in it, which is ever since called the *King's chamber*. There is another place called *Tower hill*, on which there was once a tower; besides which, there was a castle which King Stephen besieged in his march to Scotland. Here was also a park, where are now inclosures. There is a workhouse here of free stone, where poor children are taught to mix wool, and perform other easy branches of that manufacture, and a part of it has been used many years as an hospital for the reception of the aged poor. Here are three alms houses, and two charity schools of blue coat boys to the number of 100. In the ceiling of St Peter's, its only parochial church, the delivery of the law to Moses is finely painted in fresco by Parmentier. It is a venerable free-stone pile built in the cathedral fashion, and seems to have been the patch work of several ages. The increase of building in Leeds in the year 1786, was nearly 400 houses. The population is 1801 amounted to 50,669. There is a Presbyterian meeting-house here, erected in 1697, called the *new chapel*, which is the stateliest, if not the oldest, of that denomination in the north of England: and in the town and its suburbs are several other meeting-houses, as is always observable in towns of great trade and manufacture. It is noted for some medicinal springs; one of which, called *St Peter's*, is very cold, and has been found very beneficial in rheumatism, rickets, &c. Here is an hospital for relief of the poor who had been honest and industrious, endowed with 80l. a-year, besides 10l. a-year for a master to read prayers and instruct them; also a free school. Its markets are Tuesdays and Saturdays, and the market-laws are more strictly observed here than anywhere. It has two fairs in the year. Leeds, though a large town, sends no members to parliament.

**LEEK**, See **Allium, Botany Index**; and for its culture, see **GARDENING**.

**LEEK**, a town of Staffordshire in England, 155 miles from London. It lies among the barren moorlands, has a manufacture of buttons, a market on Wednesday, and seven fairs in the year. In the churchyard, at the south-east corner of the chancel, are the remains of a Danish cross, now upright, and 10 feet high from the ground, beneath which are three steps. In Blue-hills in the neighbourhood are coal mines; and a salt stream comes from thence, which tinges the stones and earth through which it runs with a muddy colour; and, with the infusion of galls, turns as black as ink. Here are rocks of a most surprising height, without any turf or moorland upon them.

**LEER**, in glass-making, a sort of third furnace, intended to anneal and cool by proper degrees the vessels when made. This properly comprehends two parts, the tower and leer. The tower is that part which lies directly above the melting furnace, with a partition between them of a foot thick, in the midst whereof there is a round hole, placed exactly over the furnace, through which the flame and heat pass into the tower: on the floor of this tower the vessels are set to anneal. There are two openings by which the vessels are put into this tower; and after standing there...
Some time, they are put into iron pans, which by degrees are drawn out all along that part of this furnace, which is properly called the leer; which is five or six yards long, that the vessels may cool by degrees. This leer is continued to its tower and arched all along, and is about four feet wide, and high within. The glasses are cool by that time they are brought to the mouth of this, which enters into a room where the glasses are placed when taken out.

LEES, the grossest and most ponderous parts of liquors, which, being separated by fermentation, fall to the bottom. The word comes from the French lie; and that either from lune, "mud," or from Lyrea, one of the surnames of Bacchus; or, according to Du Cange, from lia, a corrupt Latin word signifying the same. The vinegar-makers make a great trade of the lees of wine dried and made into cakes, after having squeezed out the remains of the liquor in presses.

LEET, or COURT LEET (leta viaus franci plegit), is a court of record, ordained for punishing offences against the crown; and is said to be the most ancient court of the land. It inquires of all offences under high treason; but those who are to be punished with loss of life or member, are only inquired and presentable here, and to be certified over to the justices of assize, (Stat. 1. Edw. III.). And this court is called the view of frank pledge, because the king is to be there certified by the view of the steward, how many people are within every leet, and have an account of their good manners and government; and every person of the age of 12 years, who hath remained there for a year and a day, may be sworn to be faithful to the king, and the people are to be kept in peace, &c. A leet is incident to a hundred, as a court baron to a manor: for by grant of a hundred, a leet passeth; and a hundred cannot be without a leet.—The usual method of punishment in the court leet, is by fine and amercement; the former assessed by the steward, and the latter by the jury.

LEETAKOO, a considerable town in southern Africa, situated in 26° 30' S. Lat. and 27° E. Long. A river runs through the midst of it, which from the extent of the channel must be sometimes of considerable magnitude. This town, which was discovered by a mission from the Cape of Good Hope in 1801 and 1802, is computed to be fully of an great extent as Cape Town; but the exact number of the houses, says Mr Barrow, could not be ascertained, owing to the irregularity of the streets and the lowness of the buildings. It contains, according to some, about 10,000 inhabitants of all descriptions, while others make them amount to nearly 15,000. The ground plan of every house is a complete circle, from 12 to 15 feet diameter; the floor consists of hard beaten clay, raised four inches above the surface of the inclosure. One-fourth of it, commonly facing the east, is entirely open, the other three-fourths walled up with clay and stones, to the height of about five feet. The people deposit their valuable articles in another apartment described with the same radius as the former, such as skin clothing, ivory ornaments, knives and other articles, which to them are of essential service. In this also the elder part of the family take their repose, and the children sleep in the half-closed ciranda.

The whole house is covered with a roof in the form of a tent, supported by poles built into the wall. The roof is thatched with reeds, boxed together with leathern thongs. The inhabitants preserve their grain and pulse in large clay vessels adjacent to the house, exhibiting the appearance of large oil jars, and some of them containing about 200 gallons.

The regularity and decorum with which the people of Leetakoo conduct themselves, give a very favourable opinion of them, as being greatly superior to savages, and evince them to be bordering on a state of civilization, which it would be no difficult matter to introduce among them. They are friendly, penceable, and inoffensive, and appear to live under a government which may be denominated purely patriarchal, and the chief of consequence must be the idol of the people. They do not appear to have any particular form of religious worship, in the common acceptation of that word, yet they circumcise all male children, and dance in a circle the whole night of the full moon. They seem also to believe that there is a power directing the operations of nature, who is infinitely superior to themselves, and to whose influence they are subject. Barrow's Travels to Cochín China. Appendix.

LEEWARD Ship, a vessel that falls much to leeward of her course, when sailing close hauled, and consequently loses much ground.

To leeward, that part of the horizon which lies under the lee, or whither the wind bloweth. Thus, "We saw a fleet under the lee," and, "We saw a fleet to leeward." are synonymous expressions.

LEG, in Anatomy, the whole lesser extremity from the acetabula of the osa innominata, commonly divided into three parts, viz. the thigh, the leg properly so called, and the foot. See Anatomy, No 60.

LEGACY, in Scots Law, a donation by one person to another, to be paid by the giver's executor after his death. See Law, No clxxxvii. 3.

LEGATE, a cardinal or bishop, whom the pope sends as his ambassador to sovereign princes. See Ambassador.

There are three kinds of legates, viz. legates à laetré, legates de latere, and legates by office, or legati noti: of these the most considerable are the legates à latem, the next are the legates de latere. See the article Latere.

Legates by office are those who have not any particular legation given them; but who, by virtue of their dignity and rank in the church, become legates: such are the archbishop of Rheims and Arles: but the authority of these legates is much inferior to that of the legates à latere.

The power of a legate is sometimes given without the title. Some of the nuncios are invested with it. It was one of the ecclesiastical privileges of England from the Norman conquest, that no foreign legate should be obstructed upon the English, unless the king should desire it upon some extraordinary emergency, as when a case was too difficult for the English prelates to determine.

The term legate comes from legatus, which Varro derives from legere, "to choose;" and others from legare, delegare, "to send, delegate."

Court of the Legate, was a court obtained by Cardinal Wolsey of Pope Leo X. in the ninth year of Henry VIII. wherein he, as legate of the pope, had power...
power to prove wills, and dispense with offences against
the spiritual laws, &c. It was of short continu-
ance.

LEGATEE. in Scots Law, the person to whom a
legacy is provided.

LEGATIO LIBERA, was a privilege frequently
obtained of the state, by senators of Rome, for going
into any province or country, upon their own private
business, in the quality of legati or envoys from the
senate, that the dignity of this nominal office might
secure them a good reception, and have an influence
on the management of their concerns. The cities and
towns through which they passed were obliged to de-
fray their expenses.—This was called legata legatio,
because they might lay aside the office as soon as they
pleased, and were not encumbered with any actual
trust.

LEGATUS, a military officer amongst the Romans,
who commanded as deputy of the commander in chief.
The legati, at their first institution, were not so much
to command as to advise. They were generally chosen
by the consuls, with the approbation of the senate. As
to the number of the legati, we have no certain infor-
mation, though we may upon good grounds assign one
to every legion. In the absence of the consul or pro-
consul, they had the honour to use the fæces.

Under the emperors there were two sorts of legati;
consulares and praetores. The first commanded whole
armies, as the emperors lieutenant-generals; and the
other had the command of particular legions.

The legati under the proconsuls in the provinces,
served for judging inferior causes, and management of
smaller concerns, remitting things of great moment to
the governor or president himself. This was the origi-
nal office of the legati, as was hinted above; though,
as we have seen, they were afterwards admitted to com-
mand in the army.

LEGEND, any idle or ridiculous story told by the
Romanists concerning their saints, and other persons,
in order to support the credit of their religion.

The legend was originally a book used in the old
Romish churches, containing the lessons to be read at
divine service; hence the lives of the saints and mar-
tyrs came to be called legends, because chapters were
read out of them at matins, and at the refectories of
religious houses. Among these the golden legend,
which is a collection of the lives of the saints, was re-
cieved in the church with great applause, which it
maintained for 200 years; though it is so full of ridic-
ulous and romantic stories, that the Romanists them-
selves are now ashamed of it.

LEGEND is also used by authors to signify the word
or letters engraved about the margin, &c. of coins.
Thus the legend of a French crown is, SIT NOMEN DE-
MINI BENEDICTVM; that of a moidore, in hoc sig:
no vinces: on those of the last emperors of Consta-
tinople, we find IEVS CHRISTVS BASILEVS BASILEVS,
IHS XPS NIKA, IEVS CHRISTVS VINCIT.

LEGEND is also applied to the inscription of medals,
which serves to explain the figures or devices represen-
ted on them. In strictness, the legend differs from the
inscription; this last properly signifying words placed
on the reverse of a medal, in lieu of figures.

It seems as if the ancients had intended their medals
should serve both as images and as emblems; the for-
er for the common people, and the other for person
of taste and parts; the images to represent the faces
of princes; emblems their virtues and great actions;
so that the legend is to be looked on as the soul of the
medal, and the figures as the body.

Every medal has properly two legends; that on the
front, and that on the reverse. The first generally
serves only to distinguish the person by his name, title,
offices, &c.: the latter is intended to express his noble
and virtuous sentiments, his good deeds, and the ad-
vantages the public has reaped by him. This, how-
ever, does not hold universally; for sometimes we find
the titles shared between both sides, and sometimes also
the legend.

In the medals of cities and provinces, as the head
is usually the genius of the place, or at least some
deity adored there, the legend is the name of the city,
province, or deity, or of both together; and the re-
verse is some symbol of the city, &c. frequently with-
out a legend, sometimes with that of one of its mag-
istrates.

Legends generally commemorate the virtues of
princes, their honour and consecrations, signal events,
public monuments, deities, vows, privileges, &c. which
are either in Latin or Greek, or a mixture of both, and
are intended to eternize their names, and the bene-
dons done by them to the empire.

LEGERDEMAIN,
OR SLEIGHT OF HAND,

A DENOMINATION given to certain deceptive
performances, which either depend altogether on
dexterity and address, or derive but a small degree of
aid from philosophical principles. Of these we shall pre-
sent our readers with a selection of the best that have
been either explained in books or publicly exhibited.

SECT. I. Performances with Cups and Balls.

The following method of exercising this simple and
ingenious amusement is that practised by one Mr Kopp
a German, whose performances are deservedly prefer-
ed to those of former artists. In this, however, as
in all the other branches belonging to the art of leg-
dermain, it is not sufficient that a person has the requi-
site dexterity or sleight of hand; it is necessary also
to take off the attention of the spectators by some es-
teraining discourse; which not only prevents dis-
couray, but adds greatly to the amusement of the com-
pany; for which reason, such discourse is inserted in
this article.

To play this part properly, the performer on cups
and
and balls ought to provide himself with a bag about 12 inches long, and from eight to ten in depth. The inside must be furnished with a number of pockets, for holding the several articles necessary in the amusement; and this bag the performer must hang before him.

The materials necessary for the performer are,

1. Three white polished tin cups, represented by A, B, and C (fig. 1.) in the shape of a truncated cone with a double ledge D towards the base. This ledge, which is about half an inch in breadth, serves to raise the cups easily by, admitting also the hand to pass a small cork ball (see fig. 5.). The upper part E of the cup ought to be hollowed in the form of a sphere, sufficient to contain the balls without their appearing above the upper edge of the cups.

2. It is also necessary to have a small rod, called Jacob’s staff; which is usually made of ebony, and neatly tinted with ivory at both ends. This is frequently used for striking on the cups; and being held in the hand where the balls are also kept, it gives the operator an opportunity of keeping that hand generally shut, or of varying its position, in order to avoid being discovered. The balls are made of cork, blackened by slight burning on the outside.

The dexterity in performing this operation consists in artfully secreting a ball in a right hand, and making it to appear or disappear in the same hand. The secreting it between the fingers is called conjuring the ball; at which time the spectators are to suppose that it is kept in the other hand, or that it was passed under a cup; but if it is made to reappear when held secretly in the hand, they must believe that it came out of the place last touched by the fingers.

Conjuring the ball is performed by putting it between the place of the thumb A and the finger B (fig. 2.), conveying it with the thumb, by rolling it upon the fingers the length of the line BC, moving the middle finger D to a distance, and placing the ball at the junction of the fingers C (fig. 3.); but in this part of the operation it is necessary to hold the ball rather tight, lest it should fall down and discover the secret. In order to make it appear, we must bring back the ball the same way from C to D; and every time that it is conjured, or made to disappear, as well as when it is made to reappear, the palm of the hand should be turned from the side of the table on which the operator is playing.

While this part of the trick is performing, the operator must let the spectators know that the ball has been passed under a cup, or into another hand; and in the first case he makes a motion with the hand (as represented fig. 4.), indicating that he had thrown it through the cup; at which time also he conjures it, approaching the two fingers of the right hand towards the left, which last he holds open, and makes a motion as if the ball had been placed there, shutting the left hand instantly. It is also to be supposed, at every time when a ball seems to be placed below a cup, that it has been held in the left hand; and when he raises the cup with the right hand, as in fig. 5., the left hand must be opened, and he rests the ball at that instant upon the hollow of the other, sliding it along the fingers.

At the time the ball is to be put secretly under the cup, it should lie between the two fingers of the right hand (fig. 5.). With this hand he raises the cup; and placing it on the table, lets go the ball, which, according to its position in fig. 6., should be found near the edge of the cup when taken into the hand. If he would put the ball secretly between the two cups, it must be let go by jerking it towards the bottom of the cup which he holds, and placing it very quickly on that in which the ball is to be found. When the ball is in this situation, if the operator should want it to disappear, he must raise the two cups with his right hand, and draw out hastily that under which the ball is placed; at the same instant lowering with his left hand the other cup, under which he places it.

In speaking of the tricks which follow, terms are made use of which explain whether what is said be feigned or true; of which terms explanations are given, and numbers adapted to the explanations of the different operations which follow.

I. To put the ball under the cup: Really done, with the fingers of the right or left hand.

II. To put the ball under the cup, or in the hand. A feigned conjuration; pretending to shut it up in the left hand, which is afterwards opened, in order to have it supposed that the ball is under the cup or elsewhere. See fig. 5.

III. To pass the ball under the cup.—The ball supposed to be conjured is to be really introduced.

IV. To pass the balls between the cups, is likewise real.

V. To make the ball which is between the cups disappear.—This is likewise real; and performed, as has already been described, by drawing back with much precipitation and dexterity the cup on which it is placed, and lowering upon the table that which is above, and under which the ball must of consequence be found.

VI. To take the ball. Real. — It is taken between two fingers of the right hand, and shown before conjuration.

VII. To take away the ball from under the cup. This is done by taking it away in the sight of the spectators.

VIII. To draw the ball. Feigned; or by pretending to draw it from the end of the rod, from the cup, or any other place, by bringing into the fingers the ball which was secreted.

IX. To throw the ball through the cup, is to conjure it in pretending to throw it.

X. To raise up the cups. This is really done in three ways; viz. either with the right hand, the rod, or the left hand. The first is when the ball is to be secretly inserted in returning the cup to its place. In the second, the rod is to be put on the tops of the cups to turn them over again, so that the balls may be shown which were to be passed into them. The third is when the operator intends to show that no balls are in the cups, or that there are some.

XI. To cover a cup. This is really done, by taking with the right hand that which is to be put over another, and introducing at the same time a ball between the two.

XII. To recover a cup. It is done by taking with the left hand the cup to be put over or above, without introducing any thing into it.
The Performances.

1. To put a ball under each cup, and take it out again.

Having placed on the table the three cups and little rod, as shown in fig. 1, the performer must begin his manoeuvres, by endeavouring to amuse the spectators with some kind of entertaining discourse. Nothing can be more apropos than the origin of the little rod and cups; and he must be very assiduous in this sort of discourse, to take off the eyes of the spectators as much as possible. The following may be a specimen of the manner in which he ought to address his audience: "There are many persons who meddle with the play of the cups and balls, and yet know nothing about them. This is by no means extraordinary; even I who now play before you, pretend to know but little. Nay, some time ago, I was such a novice as to think of playing before a numerous assembly with glass cups, in which you may guess I did not meet with great applause. I do not indeed practise this method but before such as are actually blind; neither do I play with China cups, lest, through awkwardness in feigning to break their handles, I should do so in reality. These are the cups which answer my purposes. They are made of such metal as the alchemists attributed to Jupiter and Mars, or, to speak more properly and intelligibly, they are made of tin. Behold and examine these cups (showing the cups to the company, and putting them on the table): All my science, and it is in that in which it is admirable, consists in deceiving the eyes, and passing the balls into the cups without your perceiving how it is done. I advise you therefore to pay no attention to my words, but to examine well my hands, (showing his hands). If there is in this company any person who has the misfortune to use spectacles, he may retire; but the most clear sighted will see nothing there.

Here is the little Jacob's rod (showing the rod with the left hand); that is to say, the magazine from which I take all my balls (taking secretly with the other hand a ball from his bag, which he hides between his fingers). There is not one in England so well furnished. Observe, that the more I take from it the more remain: I draw from it (VIII.) this ball (showing it, and placing it upon the table, I.). Observe that there is nothing under the cups (showing the outside of the cups), and that I have no other ball in my hands, (showing his hands). I take (VI.) this ball. I put it (II.) under the first cup. I draw (VIII.) a second ball from my little rod, and I put it under this second cup (actually done). It is proper here to tell you, that the generality of those who play the cups only feign to put the balls there; but I do not deceive you, and I actually put them there. (He raises the cup B, and taking the ball which he has put under it into his right hand fingers, shows it to the company). I return it (II.) under the same cup. I take (VIII.) this third, and put it (II.) in the same way under this last cup. You are about to say that this is not very extraordinary, and that you could do it as well yourselves. I agree with you; but the difficulty consists in taking out these balls again through the cups, (striking the first cup with the rod). I take (VIII.) this first ball (showing it). I put it (II.) into my hand, and send it to Constantinople, (he opens the left hand). I take (VIII.) this (striking with the rod on the second cup). Per I put it (II.) into my hand, and I send it to the Eastern Indies, (opening his left hand). I take (VIII.) the last and I put it (I.) on the table: Observe that there are no more under any of these cups (turning down the cups with the rod).

2. With the single ball remaining on the table to pass a ball through each of the cups, and to take it off from the same.

I return the cups to their places, and take (VI.) this ball, and I put it under this first cup. I take it back again (VIII.): observe that it is not there now, (raising X.) the cup with the left hand). I put it (II.) under this other cup: I take it out again (VIII.) in the same manner, (raising X.) the cup. I put it (II.) under the last cup, and take it out again (VIII.) (raising the last cup with the left hand, and placing the ball on the table).

3. With the single ball remaining on the table, to take away a ball through two or three cups. In this performance the three cups are distinguished by A, B, C, as in fig. 1.

I never have any ball secreted in my hands, as the greatest part of them who play at the cups and balls have (showing his hands). I take (VI.) this ball, and I put it (II.) under this cup B. I cover it (XII.) with this cup C, and I take again (VIII.) this ball through the two cups (shows the ball placing it on the table, returns afterwards the cup C to its place, and raises X.) the cup B to show that there is nothing there. I take again (VI.) this same ball. I put it (II.) under the same cup B: I cover it (XII.) with the two other cups C and A; and I take out (VIII.) this ball through the three cups (showing it and placing it on the table).

4. With the single ball remaining on the table, to pass the same ball from cup to cup.—I now beg of you to pay every possible attention, and you will distinctly see this ball pass from one cup into the other (putting the cups at a greater distance from each other).

I take (VI.) this ball, and I put it (II.) under the cup C: there is nothing under this cup B (raising it, introducing the ball and taking the rod in his hand). I command that which I have put under the cup to pass under that B. You see it (moving the end of the rod from one cup to the other, as if he followed the ball): observe that it is passed (raising the cup with his left hand, and taking the ball with his right, shows it to the company). I return it (II.) under this cup B; there is nothing under this A (raising the cup with his right hand, and introducing the ball there). I am going to pass it under this last cup A. Look well; come near: (making as if seeing it he would show with the end of the rod the path that it took). You did not see it pass? I am not much surprised: I did not see it myself; however, here it is under the cup (raising the cup A, and placing it on the table).

5. With the same ball remaining on the table. The cups being covered, to pass a ball from one into the other, without raising them up.—I was very right in telling you, that the most clear sighted would not see very much; but for your comfort, here is a trick in which you will see nothing at all. I take this ball, and put it (II.) under this cup B. I cover it (XII.) with the two other cups (taking one in each hand, and introducing the ball upon the cup B): pay attention, that there
is absolutely nothing in my hands (showing them). I command this ball to mount up upon the first cup (taking up the two cups, and putting them in their places, he shows that it has mounted). I return (II.) this ball under the same cup B. I cover it as before (covers it in taking a cup in each hand, and introducing a ball between the second and third cup). I take (the only ball with which he plays being under the third cup, he cannot show it, but acts as if he had taken it out, and puts it into the fingers of his left hand, which he holds in the air, in conducting the hand from one side to the other). I take the ball, which is under these three cups; and I throw it through the first cup (feigning to throw it): observe that I have not conjured the ball, having nothing in my hands (showing them); it is passed, however, (raising the first cup with the left hand, putting the ball upon the table and the cups in their places).

6. With the single ball remaining on the table, to pass a ball through the table and two cups. — "You are undoubtedly surprised, that, having but a single ball, I have been able, after having shown it to you, to pass it under this cup without raising it; but let not that astonish you: I have secrets much more wonderful. I convey, for example, the steeple of one village into another: I have sympathetic quadrants, with which a conversation may be held at 200 leagues distance: I have a flying chariot which can conduct me to Rome in three days. I will show all these curiosities as soon as my machines are entirely completed; that is to say, in a few centuries: but to amuse you till the arrival of all these prodigies, I now continue the entertainment of the cups and balls. I put (II.) this ball under the cup A. I take it away again (VIII.) (showing it, and feigning to put it into his left hand fingers). I cover (XL.) this cup with the two other B and C (introducing the ball between these two cups, using always the right hand, and feigning still to hold it in his left), and I pass this same ball through the table and the two cups (putting the left hand under the table). There it is passed (raising the first cup).

7. With the same ball. A ball having been put under a cup, to take it away again, and to pass it between two others. — "Here is again a very pretty trick: I take this ball, and I put it (II.) under this cup A. Observe, that there is nothing under the other cups (showing them and introducing the ball under the cup C), nor in my hands: I take this ball, which is under the cup A (feigning to take it out, and raising the bottom of the cup so that the spectators may not attend to his fingers). I cover this cup C with the two others A and B, and I throw it (IX.) through these two cups (raising them, and showing them that the ball is passed there).

8. With this single ball and a shilling; to pass a ball from one hand into the other. — "I take this ball; I put it (II.) into this hand, and I put into the other the shilling. In which hand do you think the ball is? or in which do you think the shilling may be? (Whatever answer the spectator makes, the performer shows him that he is mistaken, and that the whole is in the right hand; and this truth serves as a pretence to take a ball from the bag in putting the shilling back into it).

The performer may, however, without breaking the connexion of these operations, dispose with this trick, and feign to drop the balls he plays with, which affords him a pretext for taking another.

9. With the ball remaining on the table, and that which is secretly taken out of the bag; to pass under the cup the two balls put under the others. — The operator goes on with his discourse: "In order to give you still farther amusement, I take this ball and cut it in two (taking it in his left hand, and holding the rod with his right; feigning to cut it, he puts afterwards the rod on the table, and brings back to his fingers ends the ball which he took out of the bag). Nothing is so commodious as to be able in this manner to multiply the balls. When I am in want of money, I cut them again and again, until I may have had five or six bushels (placing the two balls on the table). Observe that there is nothing under this cup A. I put there (II.) this first ball: there is nothing more under the two other cups (introducing the ball under the cup B). I take this second ball, and I put it (II.) under the cup C: there is now a ball under these two cups A and C. I take away (VIII.) from this cup C this ball, and I throw it (IX.) through the middle cup B: observe that it is passed (raising the cup B, and introducing there the second ball). I command this, which is under the other cup A, to pass under the same cup B (raising this cup, and showing that they are both there, and placing them on the table).

10. With the two balls which are upon the table. Two balls having been put under the same cup, to pass them under two others. — "When I was at college, the tutor told me, it was necessary to know how to do my exercise in two ways. I have just now passed these two balls into the middle cup; I am now to make them go out; the one is not more difficult for me than the other. I take therefore these two balls, and place them under this cup B (putting one ball under the cup, and conjuring the other); observe that there is nothing under the cup A, nor under the other C (introducing into this last the ball that he conjured): I command one of these balls, which are under the middle cup, to pass under the one or the other of these two cups A and C. Behold it already gone (raising the cup B to show that there is no more than a single ball; and taking, with the right hand, the ball which is underneath, he shows it, and puts it (II.) under the same cup B). Let us see into which cup it has passed (raising immediately the cup A, and introducing the ball that he took from the cup B); here it is under this cup C (raising the cup); I command the other ball to pass under this cup A (he raises it, and shows that it passed there)." This trick is frequently done with three balls, but it appears much more extraordinary with two.

11. With these two balls, a third which he shows, and a fourth secreted in his hands; to pass three balls under the same cup. — "All this is but a trifle; I am going to show you another trick with three balls (taking out of the bag a third ball, and placing it on the table, secretly at the same time a fourth in his hand). Observe that there is nothing under any of these cups (raising them, and introducing them under the cup C). I take this first ball, and throw it (IX.) through this cup C. Observe that it is passed (raising (X.) the cup with the right hand); I take this second ball, and throw it (XI.) through the same cup. There it is passed (raising (X.) again the cup); I take the third, and I make it pass the
same (raising (X.) the cup, and showing that these are passed under all the three).

12. With the three balls remaining under the cup, and that held secretly in the hand; to pass two balls from one cup into another, at the choice of a person, without touching any of the cups.—"Here is another in which I have never been able to comprehend any thing; but it will astonish you much (raising the cup C, and taking away the three balls from their places, he puts them under each cup, and in raising the cup C introduces there the fourth ball which he held secretly in his hand). I take this ball (that which is under the cup B), and I put it (II.) under the same cup. I take this (the ball from the cup A), and I place it (I.) under the same cup (putting there also that which was secreted in his hand): I take this last, and I throw it (IX.) through the cup C; and to .ow that I do not deceive you, behold it passed (raising (X.) the cup that has been fixed upon, which suppose to be C, and showing that there are two). I take again these two balls, and put them under the cup C (putting really but one): observe that there is no more under this cup B (introducing there the ball that he had just taken away, and showing that he had no other in his hand); I command one of these balls, which are under this cup C, to go and join that which is under this A. Observe that it is passed. There! (raising the cup C, and returning the two balls under the same cup, and raising C, in order to show that there is but a single one; and he places it again under the same cup: he does not raise the cup B under which a ball remains.

13. With the three balls that were placed upon cups, and that which remains hidden under the middle cup; to pass under the same cup the balls put under the others.—"I take this ball (that which is upon the cup C), and I put it (II.) under the same cup C; and I order it to pass into this cup B: there it is passed (in raising this cup he introduces a third ball). I take this third ball, and put it (II.) under this cup C; and I command it to pass into the cup B along the table, and in the sight of the spectators (taking the rod in his left hand, feigning to show the way that it passed between the two cups). You did not see it then? Here it is (He draws it (VIII.) from the end of the rod, which appears to show it). Go quickly (throwing it (IX.) through the cup B; and showing that they are all three there, and that there is nothing under the other two; placing afterwards three of the balls on the table, and secreting the fourth in his hand).

14. With the three balls remaining upon the table, and that which is held secretly in his hand.—Multiplication of the balls.

For this trick there must be a tin vase (see fig. 8.), at the bottom of which there must be contrived a false bottom A, which will fall down at pleasure; that is to say, in reversing it upon the table, by means of a small trigger placed at the base of one of the handles B, introducing previously between the false and true bottoms a dozen of balls. The operator goes on with his discourse. "If any of the company believe in witches, I would give my advice that they should believe in them no longer; as what I am about to do is much more surprising than the feats of any witch.—I put (I.) these three balls under the three cups you see on the table: I take away (VII.) this first ball (that which is under the cup C), and I put it (II.) into this vase. I take this, and I also put it (II.) into the vase. I take away (VIII.) this third (that which is under the cup A), and (IX.) I throw it (II.) the same way." (Every time that he raises one of the cups to take away the ball, he introduces that which always remains secreted in his right hand; and this he repeats, constantly taking out one ball and putting in another, till he has introduced all the twelve balls; after which he resumes his discourse.) "You imagine, perhaps, that I always make use of the same balls; but to prove the contrary, here they are, (inverting the vase so as to turn them all out).

In this trick, if the vase be well made, the inside may be shewn, and it may even be previously inverted; in which case, it will not be supposed that any balls have been put into it.

15. With the three balls remaining under each of the cups, and that which is hidden in his hand; to pass one ball under each of the three cups.

"I put all these balls into my pocket. I take (VI.) the (one secreted in his hand), and I make it pass through the table under this first cup C, (conjurings it). I take another from my bag, (showing the same ball). I make it pass in the same manner through this B, (conjurings it again). I take a third (showing still the same), and I make it pass under this last cup A (conjurings it). Here are all the three passed (turning over the cups, and in taking them up again introduces the ball that he has in his hand under the cup B, and puts the three balls upon the three cups.

16. With the three balls put upon each cup, and that which was introduced under the middle cup; to draw two balls through the same cup.—"There will be wasted now only two balls." Here the operator takes that which is under the cup C, and puts it (II.) into his bag. He takes in the fingers of his right hand the ball which is on the cup B, showing it; and with the other covers the cup B, with that passing (IV.) there the ball which he feigned to put into his bag. He then takes the ball which is under the cup A with the right hand; and, showing a ball in each hand, tells the company that he put them (II.) under the cup A; though he actually puts but one, which he hides in his left. He then draws one of these balls through the same cup A, showing it, and placing it upon the cup C. He then raises the cup A, and takes the ball which is under with his right hand, adding, "There remains but one more." While pronouncing these words, he puts it (II.) under the cup. "I take (adds he) the other ball," (raising the cup, and showing that it is there no longer); then, taking one of the two balls which seemed to remain alone, he puts it (II.) into his bag, saying, "I return this into my bag."

17. With a ball which is hidden under the middle cup, another hidden under that which covers it, that which remains in the hand, and a fourth which is upon the table, to pass the same ball successively through the three cups.—The preceding trick was only on purpose to prepare the spectators for this; as they now imagine that the performer played only with one ball. He may now address them in the following manner:

"I am now going to make a very pretty trick with this single ball. I forgot to show it to you at the beginning: I cover (XI.) these cups (putting the cup
A upon C and B. I take (VI.) this ball, and I throw it (IX.) through the first cup;" (raising (X.) the cup A with the right hand). He then shows that it is passed between C and A; and, putting it in its place, he introduces there that which he has in his hand. "I take (says he) (VI.) this same ball, and I throw it through the other cup C;" and while he says so, he raises (X.) the cup C, showing that it has passed, introducing there that which he has in his hand, and putting it in the place of the former. "I take again (continues he) (VI.) this same ball, and I throw it (IX.) through that last cup C." (raising (X.) the cup B). During which time he takes away the ball from under it with his left hand, then places it on the table, and returns the cup to its place, introducing there the ball which he has in his left hand.

18. With the three balls which are under the cups, that which is on the table, and two which he takes from the bag, to pass under a cup the balls put under the two others without raising these last.—The performer may proceed in his discourse in the following manner:

"Let us now return to the order of the entertainment which I have interrupted, and continue to play with three balls." He now takes two balls from his bag, by which means he is in fact playing with six balls, though hepretends to play only with three. These two balls, together with that which remains on the table, he puts on the top of each cup. "I take (says he) (VI.) this ball, (that which is on the cup C). I throw it (IX.) through that cup: there it is passed." He now raises (X.) the cup, shows it; and thus has an opportunity of introducing the ball which he has in his hand. "I take (VI.) this (the ball which is under the cup B), and throw it (IX.) through the cup B." At this he raises the cup with his left hand, showing that it has passed, and covering it again. "I take again (VIII.) this ball from the same cup, and throw it (IX.) through that C: observe that it is passed." Then, raising up (X.) the cup C, showing that there are then two there, he introduces other two which he had in his hand. "I take (says he) (IV.) this ball (that which is under the cup A), and I throw it (IX.) through the same cup A. There! it is passed," (raising the cup C); after which he shows the three balls, and introduces there that which was in his hand, putting the three balls upon the table.

19. With the three balls which remain under the cups, and the three others which remain upon the table; to pass separately the three balls through each cup. In this manoeuvre the performer puts again the three balls which are upon the table upon the top of each cup. He takes that which is on the cup C, and throws it (IX.) through the same cup; and while he announces this to the company, he raises (X.) the cup: taking away (VIII.) the ball, showing that it has passed, introducing there that which was in his hand, and putting the same ball upon the same cup. He then takes that which is upon the cup B, and throws it (IX.) through the same cup; shows that it is passed, taking it away (VII.) and introduces the ball that was in his hand under this cup, putting it in like manner on the cup. Then he takes the ball which is on the cup A, and throws it (IX.) through the same cup A. As he announces its passage he raises the cup, taking away (VII.) and showing the ball; introducing in the same manner that which was in his hand.

20. With the three balls remaining upon the table, and those which are under each cup. Having put the balls into the bag, to make them return under the cups.—"I take these three balls, and I return them into my bag, (keeping one in his hand). Behold to what all is reduced that I had to show you for your amusement. I did know some more very pretty tricks, but I have forgotten them. (Pretending to muse for a moment): Ah! I still remember two or three very pleasing ones. Come, my little balls! Return under the cups, (turning over the cups). See how nimble they are, and obedient at the same time;" (covering them again with the cups).

21. With the three balls which are under the cups, and that in his hand; to pass the balls through the two cups.—Here the operator begins with taking away (VII.) the ball which is under the cup C; he covers it with the cup B, and passes (III.) the other ball which he has in his right hand between the two cups. He then takes (VI.) the ball which he had in his left hand, and throws it (IX.) between the two cups B and C. In announcing its passage he raises the cup (X.), shows that it is passed, and introduces the ball in his hand. He then takes the ball under the cup B, and throws it (IX.) through the two cups C and B. Announcing to the company its passage, he raises (X.) the cup, and shows that there are two balls, introducing (III.) at the same time the third. He then takes the last ball, viz. that which is under the cup A, covers again with the left hand the two cups B and C, and throws (IX.) the third ball through these two cups. He then announces their passage, raises the two cups, and shows the three balls, covering again the cup C with the two others.

22. With the three balls which are upon the cup C, and the one in his hand; to take out the three through two cups.—"I take (says the performer) (VIII.) the first ball, and put it (II.) into my bag. I take (VIII.) the same manner the second, and I put it also into my bag. I take (VIII.) the third, and I put it into my bag, (putting in really that which he had in his hand). While he desires the spectators to observe that there are no more in the cups, he raises the cup A with the left hand, and, putting it in its place, raises with the right hand the cup C. In supporting it with the cup B, he puts it down quietly, and a little on the side of B, and at the same time places C on the table, under which will be found the three balls, which had not time to separate.

23. With the three balls remaining under the middle cup, and three others taken out of the bag; to pass, in one action, three balls through a cup.—This trick is begun by the performer taking three balls from his bag, and putting them on the top of the cup B, which he covers with the cup A. Ordering them to disappear and to pass under the cup C, he takes away very suddenly with the left hand the cup B, as is done in the preceding trick, leaving in the middle of the play the cup C, under which the balls are found. Taking them then away, and replacing them on the same cup, he makes them return again in the same manner under the cup.
LEGERDEMAIN.

24. With the black ball remaining on the table, two other white balls, and a black one which he holds secretly in his hand; to pass three balls from one cup into another.

N.B. To make the balls white, they are rubbed with a little chalk instead of being blackened with the candle.

"Let us now (says the operator) have a trick to prove that I do not conjure the balls. There is nothing under this cup C, (introducing the black ball that was in his hand). There is no great thing under this B. I place these three balls, (the three which are upon the table, of which he conjures the white one). There is nothing more under this third cup A, (introducing the white ball). I order these two white balls which are under the cup B, to pass under this A. While these words he raises the cup B; and taking the white ball in the fingers of his left hand, and the black one in those of the right, he shows them, saying, "Observe that there is but one white one. I put again these two balls under the cup B." While speaking thus he puts the white one under the cup, and conjures the other, while feigning to put it in with that of the left hand. He then announces its passage; and while he does so, raises the cup A, and introduces the black ball. Commanding then the black ball to pass under the cup A, he raises the cup B, takes in his right hand fingers the ball which is there, and shows it. "I put it again (says he) (II.) under this cup (conjuring it); and I show you that it is passed under this A, (introducing there the white ball). I order at last the white ball, which is under this cup B, to pass into this A." While telling the company that it is passed, he raises the cup A, and puts the three balls upon each cup, the black one upon the middle.

25. With the three balls put at the top of the cups, and that which has been inserted under one of them in the preceding trick; to change the colour of the balls. The operator goes on with his discourse: "If there is any one here who knows how to play the cups and balls, he will do well to observe, that it is not possible to do this trick by the common method, and with three balls only. However I have no more, (showing his hands). I take this white ball (that which is upon the cup C), and I throw it (IX.) through this cup (the same under which he left a black ball in the preceding trick.) I take this black ball (with the left hand fingers); there is nothing under this cup B, (introducing there the white ball). I throw it (IX.) through this cup B, (taking again the ball into his right hand fingers). I take this other white ball, (with his left hand fingers). There is nothing under this cup A, (introducing the black ball): I throw it (IX.) through the cup A, (taking it again into his right hand fingers to conjure it). Observe that they have all changed their colour," (covering each of them with their cups).

26. With the three balls which are left under the cups, two white balls, and a black one that he took trick by trick from his bag; to change the sizes of the balls.—In performing this trick the operator takes away the white ball which is under the cup C with his left hand fingers, and raising the cup with his right, introduces there a white ball which he took out of his bag. The white ball which he introduces is kept in his hand with the fourth and little finger; and he raises the cup in the same manner as when he introduces the balls. In turning over the cup afterwards, he advances his hand to introduce this ball. These balls should be filled with horse hair or paper, so that they may be very light, and make no noise. The operator then tells his company, that he makes the ball pass through the table under the same cup; and while he speaks thus, he takes the ball again in his right hand, and while putting his hand under the table, he takes a black ball out of the bag. He then takes away the ball from the cup B, introducing the black one in its stead. He then tells the spectators, that he makes it re-pass through the table; and, while he tells them so, he takes a white ball; then, while taking away that which is under the cup A, he introduces that ball, making it re-pass in the same manner through the table, and at last shows them to the company, and covers them with their cups.

27. With the three balls which are under the cups, two other black balls, and a white one that was taken trick by trick from his bag; to pass the balls from one cup into another.—"Observe well (says the operator), that there are two white balls under these two cups A and C, and a black one under this (raising the cups). I cover again these three balls (covering each of them with a cup). I make to pass out through the table the white ball which is under the cup C." Here he takes a white ball from his bag; and in order not to fail, the black and white balls should be in separate pockets. Having taken out the ball, he puts the first into his bag, telling the company that there is now nothing under the cup C; and while he says so, he raises it, holding the ball with his little finger, proceeding in his discourse as follows: "I take away this ball (that which is under the cup A), and I pass it through the table under the cup C (taking a black ball from his bag)." While the passage of this ball is announced, he raises the cup C to take it away and show it; introducing there this black ball, "I put it again (says he) this other white ball into my bag; and I command the black one which is under the cup B to pass under this. It is no longer under this cup;" and while he says so, he raises the cup B, in supporting with his little finger the ball which remains there. Announcing its passage, he raises the cup C and shows the ball; taking it afterwards into the left hand, throws it into the air; returning it into his right hand, and fingering to throw it into the air a second time, he lets it fall into his bag; casting his eyes upwards and downwards as if he saw it fall upon the cup B; he raises this cup, and shows it to the spectators, as the former, passed through the cup.

Sect. II. Performances with the Cards.

Previous to the performances with cards, it will be necessary to explain the method of making the pass; that is, bringing a certain number of cards from the bottom.
LEGERDEMAIN.

735

1. Hold the pack of cards in your right hand, so that the palm of your hand may be under the cards; place the thumb of that hand on one side of the pack, the first, second, and third fingers on the other side, and your little finger between those cards that are to be brought to the top and the rest of the pack. Place your left hand over the cards, in such a manner that the thumb may be at C (fig. 20, 21.), the fore finger at A, and the other fingers at B.

The hands and the two parts of the cards being thus disposed, you draw off the lower cards confined by the little finger and the other parts of the right hand, and place them, with an imperceptible motion, on the top of the pack.

It is quite necessary, before you attempt any of the experiments that depend on making the pass, that you can perform it so dexterously that the eye cannot distinguish the motion of your hand; otherwise, instead of deceiving others, you will expose yourself. It is also proper that the cards make no noise, as that will occasion suspicion. This dexterity is not to be attained without some practice.

There is a method of preparing a pack of cards by inserting one or more that are a small matter longer or wider than the rest; which preparation will be necessary in several of the following experiments.

2. Have a pack in which there is a long card; open the pack at that part where the long card is, and present the pack to a person in such a manner that he will naturally draw that card. He is then to put it into any part of the pack, and shuffle the cards. You take the pack, and offer the same card in like manner to a second or third person; observing, however, that they do not stand near enough to see the card each other draws. You then draw several cards yourself, among which is the long card, and ask each of the parties if his card be among these cards, and he will naturally say Yes, as they have all drawn the same card. You then shuffle all the cards together, and cutting them at the long card, you hold it before the first person, so that the others may not see it, and tell him that is his card. You then put it again into the pack, and shuffling them a second time, you cut again at the same card, and hold it in like manner to the second person, and so of the rest (A).

If the first person should not draw the long card, each of the parties must draw different cards; when cutting the pack at a long card, you put those they have drawn over it; and seeming to shuffle the cards indiscriminately, you cut them again at the long pack and show one of them his card. You then shuffle and cut again, in the same manner, and show another person his card, and so on: remembering, that the card drawn by the last person is the first next the long card, and so of the others.

This experiment may be performed without the long card, in the following manner. Let a person draw any card whatever, and replace it in the pack; you then make the pass, and bring the card to the top of the pack, and shuffle them without losing sight of that card. You then offer that card to a second person, that he may draw it, and put it in the middle of the pack. You make the pass and shuffle the cards a second time in the same manner, and offer the card to a third person, and so again to a fourth or fifth, as is more fully explained further on.

3. You let a person draw any four cards from the pack, and tell him to think on one of them. When he returns you the four cards, you dexterously place two of them under the pack and two on the top. Under those at the bottom you place four cards of any sort; and then, taking eight or ten from the bottom cards, you spread them on the table, and ask the person if the card he fixed on be among them. If he say No, you are sure it is one of the two cards on the top. You then pass those two cards to the bottom, and drawing off the lowest of them, you ask him if that is not his card. If he again say No, you take that card up, and bid him draw his from the bottom of the pack.

If the person say his card is among those he first drew from the bottom, you must dexterously take up the four cards that you put under them, and, placing those on the top, let the other two be at the bottom cards of the pack, which you are to draw in the manner before described.

4. After a card has been drawn, you place it under Divination the long card, and by shuffling them dexterously you bring it to the top of the pack. Then lay or throw the pack on the ground, observing where the top card lies. A handkerchief is then bound over your eyes, in such a manner however that you can see the ground, which may be easily done. A sword is then put into your hand, with which you touch several of the cards, seemingly in great doubt, but never losing sight of the top card, in which at last you fix the point of the sword, and present it to him who drew it. Two or three cards may be discovered in the same manner, that is, by placing them under the long card, and then bringing them to the top of the pack.

5. You must have in the pack two cards of the same The trans- sort, suppose the king of spades. One of these is to be mutable placed next the bottom card, which may be the seven cards, of hearts, or any other card. The other is to be placed at top. You then shuffle the cards without displacing those three cards, and show a person that the bottom card is the seven of hearts. Then drawing that card privately aside with your finger, which you have wetted for that purpose, you take the king of spades from the bottom, which the person supposes to be the seven of hearts, and lay it on the table, telling him to cover it with his hand. You then shuffle the cards again, without displacing the first and last card, and passing the other king of spades at the top to the bottom, you show it to another person. You then draw that

(A) There is frequently exhibited another experiment, similar to this, which is by making a person draw the long card; then giving him the pack, you tell him to place his card where he pleases and shuffle them, and you will then name his card or cut the pack where it is. You may also tell him to put the pack in his pocket, and you will draw the card; which you may easily do by the touch.
LEGERDEMAIN.

You then command the seven of hearts, which is supposed to be under the hand of the first person, to change into the king of spades; and the king of spades, which is supposed to be under the hand of the second person, to change into the seven of hearts; and when the two parties take their hands off, and turn up the cards, they will see to their no small astonishment, after having so carefully observed the bottom cards, that your commands are punctually observed.

6. Take a card, the same as your long card, and rolling it up very close, put it in an egg, by making a hole as small as possible, and which you are to fill up carefully with white wax. You then offer the long card to be drawn; and when it is replaced in the pack, you shuffle the cards several times, giving the egg to the person who drew the card, and, while he is breaking it, you privately withdraw the long card, that it may appear, upon examining the cards, to have gone from the pack into the egg. The experiment may be rendered more surprising by having several eggs, in each of which is placed a card of the same sort, and then giving the person the liberty to choose which egg he thinks fit.

This deception may be still further diversified, by having, as most public performers have, a confederate, who is previously to know the egg in which the card is placed; for you may then break the other eggs, and show that the only one that contains a card is that in which you directed it to be.

7. Divide a piquet pack of cards into two parts by a long card. Let the first part contain a quint to a king in clubs and spades, the four eights, the ten of diamonds, and ten of hearts; and let the other part contain the two quart majors in hearts and diamonds, the four sevens, and the four nines (a).

Then shuffle the cards, but observe not to displace any of those cards of the last part which are under the long card. You then cut at that card, and leave the pack in two parts. Next, present the first of those parts to a person, and tell him to draw two or three cards, and place the remainder on the table. You present the second parcel in like manner to another. Then having dexterously placed the cards drawn by the first person in the second parcel, and those drawn by the second person in the first parcel, you shuffle the cards, observing to displace none but the upper cards. Then spreading the cards on the table, you name those that each person drew; which you will very easily do, by observing the cards that are changed in each parcel.

8. On the ace of spades fix, with soap, a heart, and on the ace of hearts, a spade, in such a manner that they will easily slip off.

Show these two aces to the company; then taking the ace of spades, you desire a person to put his foot upon it, and as you place it on the ground, draw away the spade. In like manner you place the seeming ace of hearts under the foot of another person. Then command the two cards to change their places; and that they obey your command, the two persons, on taking up their cards, will have equal demonstration. A deception similar to this is sometimes practiced with one card, suppose the ace of spades, over which a heart is placed slightly. After showing a person the card, you let him hold one end of it, and you hold the other, and while you amuse him with discourse, you slide off the heart. Then laying the card on the table, you bid him cover it with his hand. You then knock under the table and command the heart to turn into the ace of spades. By deceptions like these, people of little experience and much conceit are frequently deprived of their money, and renders ridiculous.

9. You must be prepared with two cards, like those represented by fig. 22. and with a common ace and five of diamonds.

The five of diamonds and the two prepared cards are to be disposed as in fig. 23. and holding them in your hand, you say, "A certain Frenchman left 15,000 livres, which are represented by these three cards, to his three sons. The two youngest agreed to leave their 5000 each of them, in the hands of the elder, that he might improve it." While you are telling this story, you lay the 5 on the table, and put the ace in its place; and at the same time artfully change the position of the other two cards, that the three cards may appear as in fig. 24. You then resume your discourse, "The eldest brother, instead of improving the money, lost it all by gaming, except 3000 livres, as you have seen." You then lay the ace on the table, and, taking up the 5, continue your story: "The eldest, sorry for having lost the money, went to the East Indies with these 3000, and brought back 15,000." You then show the cards in the same position as at first, in fig. 22.

To render this deception answerable, it must be performed with dexterity, and should not be repeated, lest the cards immediately fall in the pocket; and you should have five common cards in your pocket, ready to show, if any one should desire to see them.

10. Take a parcel of cards, suppose 40, among which insert two long cards: let the first be, for example, the 15th, and the other the 26th, from the top. Seem to shuffle the cards, and then cutting them at the first long card, cut those you have cut off into your hand, and say, "There should be here 15 cards." Cut them again at the second long card, and say, "There are here only 11 cards." Then poising the remainder, you say, "Here are 14 cards."

11. Several different cards being shown to different persons, that each of them may fix on one of those cards to name that on which each person has fixed. There must be as many different cards shown to each person, as there are persons to choose from; therefore, suppose there should be three persons, then to each of them you must show three cards; and telling the first person to retain one in his memory, you lay those three cards down, and show three others to the second person, and so on to the third.

(a) The cards may be divided in any other manner that is easy to be remembered.
Third. You then take up the first person's cards, and lay them down one by one, separately, with their faces upward. You next place the second person's card over the first, and in like manner the third person's card over the second's; so that in each parcel there will be one card belonging to each person. You then ask of each of them in which parcel his card is; and when you know that, you immediately know which card it is; for the first person's card will always be the first, the second person's the second, and the third person's the third, in that parcel where they each say his card is.

This experiment may be performed with a single person, by letting him fix on three, four, or more cards. In this case you must show him as many parcels as he is to choose cards, and every parcel must consist of that number, out of which he must fix on one; and you then proceed as before, he telling you the parcel that contains each of the cards.

12. Make a ring large enough to go on the second or third finger (fig. 15) in which let there be set a large transparent stone, to the bottom of which must be fixed a small piece of black silk, that may be either drawn aside or expanded by turning the stone round. Under the silk is to be the figure of a small card.

Then make a person draw the same sort of card as that at the bottom of the ring, and tell him to burn it in the candle. Having first shown him the ring, you take part of the burnt card, and reducing it to powder, you rub the stone with it, and at the same time turn it artfully about, so that the small card at bottom may come in view.

13. To change one card into another.—Provide a mahogany tea caddy about four or five inches deep, and long enough to admit a common sized playing card: (see fig. 9). This caddy must be furnished with a moving false bottom B, moveable upon hinges on the inside edge of the front A. This bottom may be made of brass, tin, or lead; and the false bottom must be so exactly fitted, that it cannot, from a slight view, be distinguished from the other. The inside of both caddy and false bottom ought to be lined with black or other dark-coloured cloth or velvet, so that it may not make any noise in falling down. It would be proper that the false bottom should rise with a spring towards the front, and it must be kept tight with a brass spring catch (a, fig. 10), screwed to the left side of the box near the top, and which is hid by the cloth covering. The end of this spring projects a little into the front. It is driven back, to let go the false bottom by means of a small bent wire b6 let into the front of the caddy; and this pin is moved by the bolt c, which, when the box is locked, shoots out against it, by reason of the spring being driven in; by which means the bottom springs down, and covers the card placed in the box.

Before you attempt to show any trick with this caddy, a card must be placed, in the inside between the front A and the false bottom B, springing up the bottom afterwards against the front; after which it is ready for use, and shown openly to the company without any danger of a discovery.

Two persons may now be desired to draw two different cards from a pack, one of which must be the same with the one concealed in the caddy. Taking this card from the person who drew it, you put it in such a way with the pack, pretend to shuffle it, but keep the card either uppermost or undermost, so that you can easily find it afterwards. Desiring then the other person to come forward and put his card very attentively into the caddy, you in the mean time secretly convey away from the pack the card drawn by the other; then, giving him the key, you desire the caddy to be locked up. After some pretended conjurings, lead him to unlock it again and take out the card; which he will find not to be his, but that drawn by his neighbour: his card being apparently vanished from the caddy, as the other is from the pack.

14. Provide two pieces of pasteboard A and B (fig. 11) of equal dimensions, \( \frac{3}{2} \) inches long and three inches broad. Place these beside one another, as shown in the figure. Take then a very smooth silk ribbon, and put a band of it from C to E towards the edge of the pasteboard A, and another from D to F in such a manner as to come beyond the pasteboard, and to admit of being folded over at the two ends. This must be glued on the back of the board A at the places C and D, and at the back of the board B at the places E and F. Place two other bands in a similar manner on the pasteboard B, turning them over on the back of the same board at the places I and L, and at the back of A at the places G and H. These two bands should fall in the inside of the pasteboard, according to the breadth of the ribbons. The two pasteboards being now placed one upon the other, will form a kind of port-folio, one of the sides of which will always be hinged when the other is opened. Four small bands of the same ribbon are to be put at the four extremities of the sides MNQR of the two pieces of pasteboard; observing that they pass below the bands already placed. Glue their ends in the same manner as their ends at the back of the boards, ornamenting also the two sides O and P of the pasteboard B with pieces of the same ribbon; but these last six bands are of no use in the performance.

Two pieces of paper folded like the cover of a letter must now be provided, large enough to cover the two ribbons GI and HL, as well as the space contained within them. Glue one of these upon the two ribbons, and apply the other below this; so that the uppermost of these two wrappers may fall exactly over the other, enclosing and hiding the two ribbons entirely. A second port-folio similarly constructed is now to be provided, and both of them covered with coloured paper from the sides where the ribbons are glued and folded.—The deceptions with these portfolios are as follows:

(1.) Two cards, chosen at random, having been shut up in two separate places; to make them pass reciprocally from the one into the other.—The portfolios being constructed in the manner above described; if you open one of them either on the one side or on the other, one of the paper wrappers will always be visible; and thus it will naturally be supposed that there is no more but one. Having then secretly exchanged a card in each of the wrappers of the port-folio, procure a set of cards that has but two sorts, and cause two persons fairly draw two cards similar to the first. Present then a port-folio, open, to the first person who drew a card similar...
similar to that which was placed in the second, desiring him to place it in the wrapper which he finds vacant.

Take back then the port-folio; and, in placing it on the table, artfully turn it over: having placed likewise in the vacant wrapper of the second port-folio the card drawn by the second person; and putting it in the same way upon the table, command the cards reciprocally to pass from the one port-folio into the other; and open them so that each of the persons may take out the card which the other inserted.

(2.) A card being shut up in the port-folio; to make it return into the pack.—To perform this, procure a pack which has two cards of the same kind. One of these is to be openly drawn, and the person who has done so must be told to shut it up under the wrapper of one of the portfolios; and inform him that you will make it return into the pack. Give him the port-folio to blow upon; and on opening it, present him with the empty wrapper, to show him that his card is not there; after which, presenting him with the pack, he will find there the other card, which he will naturally imagine to be the one he put into the wrapper.

(3.) To make an answer appear to a question secretly written. —Transcribe on different cards a certain number of questions, and on others the same questions with their answers; taking care to have the handwriting as much alike as possible, so that no difference can easily be perceived. The same caution must be observed with regard to the cards themselves; which, for that reason, ought to be plain ones. Having written with a pencil at the bottom of the first questions their corresponding answers, shut up one of them secretly in the port-folio; and presenting them to any person, let him draw as by chance that which is similar to the one thus shut up. Make him then place in the other wrapper the question which he had drawn; and telling him that you are about to write an answer even through the port-folio, take a glass, and pretend to read in it the answer to the question. Open it afterwards, so that he may take out the other card himself, and he will imagine it to be the one he selected.

In performing this trick, it will be proper to have a port-folio of the same kind with the two described, which opens only at one side, and which consequently has but one wrapper. This must be shown to such as seem to be too inquisitive, and will be of use to prevent them from entertaining any idea that the foil opens upon both sides. The former must therefore be immediately put into the pocket, in order to give an opportunity of drawing out the other in case the port-folio should be asked for.

The card in the mirror. Plate CCXCl.

15. Provide a mirror, either round, as A (fig. 18.) or oval, the frame of which must be at least as wide as a card. The glass in the middle must be made to move in the two grooves CD and EF, and so much of the quicksilver must be scraped off as is equal to the size of a common card. You will observe that the glass must likewise be wider than the distance between the frame by at least the width of a card.

Then paste over the part where the quicksilver is rubbed off a piece of pasteboard, on which is a card that must exactly fit the space, which must at first be placed behind the frame.

This mirror must be placed against a partition, through which is to go two strings, by which an assistant in the adjoining room can easily move the glass in the grooves, and consequently make the card appear or disappear at pleasure (c).

Matters being thus prepared, you contrive to make a person draw the same sort of card with that fixed to the mirror, and place it in the middle of the pack; you then make the pass, and bring it to the bottom; you then direct the person to look for his card in the mirror, when the confederate behind the partition is to draw it slowly forward, and it will appear as if placed between the glass and the quicksilver. While the card is drawing forward, you slide off the card from the bottom of the pack, and convey it away.

The card fixed to the mirror may easily be changed each time the experiment is performed. This experiment may also be made with a print that has a glass before it and a frame of sufficient width, by making a slit in the frame through which the card is to pass; but the effect will not so striking as in the mirror.

16. Place a vase of wood or pasteboard AB (fig. 17.) on a bracket L, fixed to the partition M. Let with the inside of this vase be divided into five parts, e, d, c, f, g; and let the divisions c and d be wide enough to admit a pack of cards, and those of e, f, g, one card only.

Fix a thread of silk at the point H, the other end of which passing down the division d, and over the pulley I, runs along the bracket L, and goes out behind the partition M.

Take three cards from a piquet pack, and place one of them in each of the divisions e, f, g, making the silk thread or line go under each of them. If in the division c, put the pack of cards from which you have taken the three cards that are in the other divisions.

Then take another pack of cards, at the top of which are to be three cards of the same sort with those in the three small divisions; and making the pass, bring them to the middle of the pack; let them be drawn by three different persons. Then give them all the cards to shuffle; after which place the pack in the division d, and tell the parties they shall see the three cards they drew come, at their command, separately out of the vase.

An assistant behind the partition then drawing the line with a gentle and equal motion, the three cards will gradually rise out of the vase. Then take the cards out of the division c, and show that those three cards are gone from the pack.

(c) This experiment may be performed without an assistant, if a table be placed against the partition, and the string from the glass be made to pass through a leg of it, and communicate with a small trigger, which you may easily push down with your foot; and at the same time wiping the glass with your handkerchief, as if to make the card appear the more conspicuous. It may also be diversified, by having the figure of a head, suppose that of some absent friend, in the place of the card.
LEGERDEMAIN.

The vase must be placed so high that the inside cannot be seen by the company. You may perform this experiment also without an assistant, by fixing a weight to the end of the silk line, which is to be placed on a support, and let down at pleasure by means of a spring in the partition.

37. Let a small perspective glass be made, that is wide enough, at the end where the object glass is placed, to hold a table similar to the following.

<table>
<thead>
<tr>
<th>1:131</th>
<th>10:132</th>
<th>19:133</th>
</tr>

</table>

Take a pack of cards that consists of 27 only, and giving them to a person, desire him to fix on any one, then shuffle them, and give the pack to you. Place the 27 cards in three heaps, by laying down one alternately on each heap; but before you lay each card down, show it to the person, without seeing it yourself; and when the three heaps are finished, ask him at what number, from 1 to 27, he will have his card appear, and in which heap it then is? Then look at the heap through the glass, and if the first of the three numbers which stands against that number it is to appear at be 1, put that heap at top; if the number be 2, put it in the middle; and if it be 3, put it at bottom. Then divide the cards into three heaps, in the same manner, a second and third time, and his card will then be at the number he chose.

For example: Suppose he desire that his card shall be the 20th from the top, and the first time of making the heaps he says it is in the third heap; you then look at the table in the perspective, holding it at the same time over that heap, and you see that the first figure is 2; you therefore put that figure in the middle of the pack. The second and third times you in like manner put the heap in which he says it is, at the bottom, the number each time being 3. Then looking at the pack with your glass, as to discover which the card was, you lay the cards down one by one, and the 20th card will be that he fixed on.

You may show the person his card in the same manner, without asking him at what number it shall appear, by fixing on any number yourself.

The foregoing experiments with the cards will be found sufficient to explain most others of a similar nature that have or may be made: the number of which is very great. To perform those we have described requires no great practice; the two principal points are, the making the pass in a dexterous manner, and aments with certain address by which you influence a person to draw the card you present. Those that are performed by the long card are in general the most easy, but they are confined to a pack of cards that is ready prepared; whereas those which depend on making the pass, may be performed with any pack that is offered.

SECT. III. Experiments with Sympathetic Inks.

[See Sympathetic Ink.]

EXPERIMENTS WITH CLASS I.

1. Make a book of 70 or 80 leaves; and in the cover at the end of it let there be a case which opens next of the binding, that it be not perceived.

At the top of each right hand page write any question you please; and at the beginning of the book let there be a table of all those questions, with the number of the page where each is contained. Then write with common ink on separate papers, each about half the size of the pages in the book, the same questions that are in the book, and under each of them write, with the ink made of the impregnation of saturn, or the solution of bismuth, the answer.

Soak a double paper in the vivifying liquor made of quicklime and opimint, or the phlegm of the liver of sulphur, and place it, just before you make the experiment, in the case that is in the cover of the book.

Then deliver some of the papers on which the questions are wrote to the company; and, after they have chosen such as they would have answered, they put them in those leaves where the same questions are contained, and, shutting the book for a few minutes, the sulphurous spirit with which the paper in the cover of the book is imbied, will penetrate the leaves, and make the answers visible, which will be of a brown colour and more or less deep in proportion to the time the book has been closed (D).

2. Make a box about four inches long, and three wide, as ABCD, and quite shallow. Let it shut with yellow perkinges and fasten with a book; and let it have two bottoms, the lowest of wood, that draws out by a groove, and the uppermost of pasteboard. Between these two bottoms is to be placed a paper dipped in the vivifying liquor mentioned in the last experiment. Let there be also a board of the same size with the inside of the box, which being placed in it may press a paper against the pasteboard bottom.

Then take several pieces of paper of the same size with the inside of the box, and draw in them the figures of men and women, in different attitudes and employments, as walking, riding, reading, writing, &c. These figures must be drawn with a new pen, or pencil, dipped in the impregnation of saturn.

Being thus provided, and having privately placed the paper dipped in the vivifying liquor between the two bottoms, you tell a person you will show him what an

5 | A | 2

absent

If a weight be placed upon the book, the effect will be the sooner produced. Or you may put the book in a box that will press it close down.
absent friend of his is doing at the present hour. You then give him the paper adapted to the employment you intend, and tell him to write his friend's name at the bottom, that you may not change the paper. Then placing the paper next the pasteboard bottom, and putting the piece of wood over it, you shut the box. After amusing him with discourse for three or four minutes, you take out the paper, when he will see his friend in the employment you have assigned him.

3. Let a workman make a hand of wood, as in fig. 16, fixed at the end next the elbow to the piece E, the ends of which go through the screws CD and EF. The fore and middle fingers, and the thumb, are to be moveable at their joints. There must go a wire through the arm, that is fixed at one end to the fore finger, and at the other to the piece E, round which it is to move: under the two joints of the two fingers are also placed two small springs, which are to raise it up.

To the fore finger and thumb fix two small rings, through which a pin may be put, so as not to impede their motion. Under the arm at the point I, place a small brass roller, which serves to sustain the arm.

The pedestal on which this hand is placed must be at least a foot long, if the hand be of a natural size, and about eight inches wide. The pedestal must be hollow, and at the part ST there must be an opening about three inches long and two inches wide; the whole pedestal may be covered with a thin stuff, by which the hole will be concealed. There is to be a valve, or sort of trap door, on the inside of the pedestal, which is to fasten against the opening.

Over the hand and pedestal place a glass frame, as in the figure; cover the hand with fine leather of flesh colour, and decorate the arm with a ruffle and cuff, which will entirely conceal the machinery.

Then take a number of cards, and write on them different questions; and on the same number of papers write, with the imprecation of lead, the answers. Give the cards to any one, and let him choose a question; and you place the paper with the answer under the pen in the hand, letting him first see there is no writing on it (e). Now the pedestal being placed against a partition, the end F is to go through it. Therefore an assistant upon a signal given, turns a handle fixed to F; and, as the piece E turns round, the wires that move the fingers and thumb are alternately lengthened and shortened, by which their joints are kept in continual motion; and the screw at the same time turning gently from F towards G, gives the whole arm a motion which very much resembles that of nature (f).

The hand and pen serve here merely to assist the il-

lusion: but if a bit of sponge, dipped in the vivifying liquor, be placed at the end of the pen, as it goes over meets with the writing on the paper, it will make it become grad-

ually visible, and in this case the trap door and dip-
paper may be omitted (g).

DECEPTION with Class II.

4. Take several pieces of paper, of a size that you can put in any book that will go into your pocket, and tie against the hand to the inside of the wall.

As the gold ink will sometimes give a yellow cast to the paper, you may previously give a slight tincture of that kind to the papers you use for this purpose.

DECEPTION with Class III.

5. On different papers draw the figures of several Magical leaves or flowers with one of the colourless juices men-
tioned: then take one of the corresponding leaves or flowers, and laying it on an iron plate, over a chafing-dish of hot coals, let it burn to ashes. Put these ashes into a sieve, in which there is some very fine steel filings, and sift them over the paper on which the flower is drawn, when they will adhere to the glutinous li-

DECEPTIONS with Class IV.

6. Make a little triangular box, each side of which is to be about five inches, and let its inside be divi-
ded into three parts. The first part A, which makes the bottom of the box, it to be covered by the second part B, in form of a case, and let the top C exactly cover the part B, as is expressed in the figure and the profile.

Upon the bottom of the box let there be a plate of copper about one-twentieth of an inch thick, on which let there be a number of hieroglyphic characters contiguous to each other, and cut in different sorts of metal.

On the top of the cover place a knob O, that goes through it, and to which the copper triangle Q is to be fixed occasionally, in such a manner as it may go into the case B. There must be a space of one quarter of an inch between the triangle Q and the bottom of the case B; into which another plate of copper, of that thickness, may be placed.

The outside of this talisman may be decorated with

uncommon
uncommon figures or characters, to give it the appearance of greater mystery.

On several pieces of paper, of the same size with the inside of the talisman, write different questions in common ink, and write the answers in those different sorts of sympathetic ink that appear when heated, observing that each word of the answer is to be written in a different ink.

Having properly heated the triangle, and placed it under the cover, you introduce the talisman, and tell any one of the company to choose one of the papers on which the questions are written, and place it in the talisman, and he will immediately have an answer written on that paper, the words of which will be of different colours, according to the different metals of which the talisman is composed. The paper being placed in the talisman, and the cover placed over it, the heat of the triangle will make the answer visible in a few moments. This experiment may be repeated if the triangle be made sufficiently hot; and two papers may be placed in the talisman at the same time.

This deception, when well executed, occasions a surprise that cannot be conceived by a mere description.

The sibyls.

7. Make a wooden pedestal AB, about ten inches long, eight wide, and one deep: and at one end erect a box C, about ten inches high, eight broad, and two and a half deep.

The top of the pedestal must slide in a groove, on which inscribe a dial M, of six inches diameter, and which is to be divided into nineteen equal parts, in twelve of which write the names of the months, and mark the respective signs of the zodiac; and in the seven other divisions, which must be next the end B, write the days of the week, and mark the figures of the planets. Next the inner circle NO, make an opening into the box, of about one-tenth of an inch. On the centre of the dial place an index that turns freely on its centre.

Within the pedestal place a pulley P, about four inches diameter, which is to turn on an axis that is directly under the centre of the dial; and on the upper part of that axis fix a bent index R, which comes out at the opening made by the inner circle (n), and passes over those seven divisions only on which are written the days of the week.

Within the box C, let there be two rollers S and T, as in the figure: let that of S contain a spring; and at the end of T let there be a pulley V, of three quarters of an inch diameter, round which goes a string or thread that passes under the small pulley X, and is fastened to that of P: so that when the last pulley makes about one-third of a turn, that of V may make three or four turns.

There must also be a scroll of paper, about two feet long, and each end of which must be fasted to one of the rollers. In the front of the box, between the two rollers, make an aperture D, about four inches long and one inch and a half wide: to this opening let there be a little flap or slider, by which it may be closed at pleasure.

The apparatus being thus disposed, place the index R successively against each of the divisions marked with one of the planets; and as the paper is gradually wound up the rolller, mark, against that part which is at the aperture D, the name of one of the following sibyls:

The Hellespontian
Cumean
Artemision
Phrygian
Albunean
Persian
Libyan

On each of the seven cards write a different question, and draw one of the seven planets. Next take a memorandum book that contains seven leaves, and on each of them write the name of one of the foregoing sibyls; in each of the leaves place several pieces of paper; and on each of them write, with the sympathetic ink that does not appear till the paper is heated, different answers to the same question.

Then give a person the seven cards on which the questions are wrote, and tell him to choose one of them privately, and conceal the rest, so that it cannot possibly be known which of them he has chosen.

Next, tell him to place the index that points to the month against that in which he was born (t), and to place the index of the planets against that which is on the card he has chosen, and which is to preside over the answer: you tell him to do this privately, that no one may see him, and after that to cover the dial with his handkerchief. Then let him open the door that is before the aperture in the box, and tell you the name of the sibyl there visible.

You then open the memorandum book, and taking out the papers that are in the leaf where the name of the sibyl just mentioned is wrote, you desire him to choose any one of them he thinks proper. The talisman used in the last experiment being properly heated, is then to be introduced, when you direct the person to put the blank paper into it; and taking it out a few moments after, he will find the answer to his question.

To make this operation appear the more extraordinary, it will be proper to have a small press or cupboard, at the back of which there is a door that opens into an adjoining room, by which means an assistant having prepared the talisman, may place it in the cupboard the moment before it is wanted. This contrivance will be useful on many other occasions.

8. Provide an urn of wood or metal about six inches high, and two and a half diameter in the widest part, and of such figure in other respects as you think proper (see fig. 9.). Let there be a cylinder of copper C (fig. 10.) of about one-eighth of an inch diameter,

If the axis be made to pass through the top of the pedestal, this opening will not be necessary.

These months and the index are of no other use than to give the experiment an air of greater mystery.
Experiments with Sympathetic Inks.

The top of this cylinder is to be in the top of the urn, so that it may be easily taken out. To this urn there must be a cover D, which fits it exactly.

On a small square piece of paper draw the figure of a flower or leaf, with that sort of sympathetic ink whose colour most resembles it. You then present several sorts of flowers or leaves; and a person, and desire him to choose any one of them. Then put that flower on a chafing dish of hot coals; and taking the paper on which it is secretly drawn, you give it to the person to examine, and then put it in the urn, having previously heated the cylinder (K). Then taking some of the ashes of the burnt flower, you strew them over the paper, after which you take it out and show the company the figure of that flower. While the flower is burning, you may sprinkle some powder over it, suppose that of saltpetre; and by that, mixed with the ashes of the flower, the company may imagine the effect is produced.

The press or cupboard mentioned in the preceding experiment, will be here very convenient for heating the cylinder and placing it in the urn. A similar deception may be performed by putting the paper in a copper vessel, that may be placed on an iron plate over the chafing dish in which the flower is burnt. But this method has not so mysterious an appearance as the other, and in some persons may cause a suspicion that the effect is produced by heat.

9. To perform this experiment, you must observe, that there are several letters which may be changed into others, without any appearance of the alteration; as, the a into d, the c into a, e, d, g, o, or q, the i into b, d, or l, the i into t, the o into a, d, g, or q, or the v into y, &c.

Take a parcel of cards, suppose 20, and on one of them write, with the ink of the fourth class, the word love (L), and on the other, with the same ink, the words old woman; then holding them to the fire, they will both become visible. Now you will observe, that by altering the a in the word love into d, and adding o before the l, and oman after the o, it becomes old woman. Therefore, you make those alterations with the invisible ink, and let it remain so. On the rest of the cards you write any words you think fit.

Present the cards in such a manner to two persons, that one of them shall draw the word love, and the other the word old woman. You then tell the person who drew the word love, that it shall disappear, and the words on the other card shall be written in its place; and that you may not change the cards, desire each of the parties to write his name on the cards. Then putting the cards together, and holding them before the fire, as if to dry the names just wrote, the word love will presently change into old woman.

This experiment may be varied by fixing on a word that may be changed into three other words, and making four persons draw the cards on which those words are wrote; and it may be further diversified by choosing three such words, so that the first can be changed into the second, and the second into the third. You then tell him who drew the first word, that it shall be changed into that drawn by the second person; and him you tell, that his word shall be changed into that of the third person.

10. Write on several slips of paper different questions, and such as may be answered by the name of some person; for example, Who is the merriest man in the company? Answer, Mr. Mr. Mr. To whom will Miss Miss Miss be married? Answer, To Mr. Mr. Mr. These questions are to be wrote in the sympathetic ink of this class, and exposed to the fire, and the answers wrote in the same ink, and left invisible. The papers are to be folded in form of letters, and in such manner that the part where the name is wrote shall be directly under the seal, and the heat of the wax will make it visible. Then give the letter to the person who requires the answer, and he will find it plainly wrote.

A deception similar to this may be made with a number of blank cards, on each of which an ace of spades is drawn with the invisible ink; then let a person choose any one of them, and enclose it in a letter-case, prepared in such a manner that the figure of the ace shall be directly under the seal, and on opening the letter it will be immediately visible.

Deceptions with Class V.

11. Have a box that is divided into three parts after the same manner as the talisman in the 21st experiment, except that, instead of being triangular, it must be of a long square, (see fig. 14.). Divide its top into two equal parts D and E, as in fig. 13., and to the part D adjust a plate of copper L about one quarter of an inch thick, and under both the plate L, and the opening E place a cloth. The upper part C must have a button by which it may be fixed on the cover B, as to appear of one piece with it.

At the bottom of the box place a piece of cloth, or other stuff, on which you may stamp certain mysterious characters, and observe that the bottom of the cover must rest upon the cloth.

Then provide a slip of paper GH (fig. 12.) of the same size with the bottom of the box; and at each end of it write, with the green sympathetic ink, the name of a different card, and make some private mark by which you can tell at which end each name is wrote (M).

Take a parcel of cards, and offer those two of them whose names are wrote on the paper to the two persons, that they may draw them. You tell the parties to keep their cards to themselves, and you propose to make the names of those cards appear upon a slip of paper, which you put into the box. You then ask which name of the two cards shall appear first. The copperplate being previously heated and placed in the cover,

(K) There are some sorts of sympathetic inks that require much more heat than others.
(L) These letters should not be joined.
(M) That there may be no suspicion of the paper being prepared, you may cut it from a whole sheet, before the company, having previously wrote the names.
LEGERDEMAIN.

SECT. IV. Miscellaneous Performances.

15. A person having an even number of counters in one hand, and an odd number in the other, to tell in six events which hand holds the odd or even number is:—Let the persons multiply the number in his right hand by an odd number, and the number in his left hand by an even number, and tell you if the sum of the products added together be odd or even. If it be even, the even number is in the right hand; but if it be odd, the even number is in the left hand.

Example.

1. Number in the right hand
   Multipliers
   18
   3
   54
   14
   Their sum 68

2. Number in the right hand
   Multipliers
   7
   3
   2
   36
   Their sum 57

16. To tell, by the dial of a watch, at what hour any person intends to rise. Let the person set the hand what hour of the dial to any hour he pleases, and tell you what any person hour is; and to the number of that hour you add 3, and 3 to 5, and tell him to count 17 on the dial, first reckoning 5, the hour at which the index stands, and counting backwards, first reckoning the number of the hour at which he has placed the hand. An example will make this plain.

Suppose the hour at which he intends to rise be 8, and that he has placed the hand at 5. You add 12 to 5, and tell him to count 17 on the dial, first reckoning 5, the hour at which the index stands, and counting backwards from the hour at which he intends to rise; and the number 17 will necessarily end at 8, which shows that to be the hour he chose.

That the hour at which the counting ends must be that on which he proposed to rise, will be evident on a little reflection; for if he had begun at that hour, and counted 12, he would necessarily have come to it again; and calling the number 17, by adding 5 to it, only serves

---

(W) The liquor should be put in a sort of jar, with a narrow neck, that it may not be seen by the company; and you should draw the flowers gently out that the liquor may drop if thin, and they may have time to acquire their colours.

(O) The sponge should be well cleaned immediately after the experiment.
Legerdemain.

17. If the number 11 be multiplied by any one of the nine digits, the two figures of the products will always be similar. As follows:

<table>
<thead>
<tr>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>
<th>6</th>
<th>7</th>
<th>8</th>
<th>9</th>
</tr>
</thead>
<tbody>
<tr>
<td>11</td>
<td>22</td>
<td>33</td>
<td>44</td>
<td>55</td>
<td>66</td>
<td>77</td>
<td>88</td>
<td>99</td>
</tr>
</tbody>
</table>

Place a parcel of counters on a table, and propose to any one to add, alternately, a certain number of those counters, till they amount to 100, but never to add more than 10 at a time. You tell him, moreover, that, if he staked first, he shall never make the next century, but you will. In order to which, you must first stake 1, and remembering the order of the above series, 11, 22, 33, etc., you constantly add to what he stakes, as many as will make one more than the numbers of that series, that is, will add 1, 2, 3, etc., till you come to 89, after which the other party cannot make the century himself, nor prevent you from making it.

If the other party has no knowledge of numbers, you may stake any other number first, under 10, provided you take care to secure some one of the last terms, as 56, 67, 78, etc.

This deception may be performed with other numbers; and in order to succeed, you must divide the number to be attained by a number that has one digit more than what you will attain each time, and the remainder will be the number you must first stake. Observe, that, to be sure of success, there must be always a remainder. Suppose, for example, the number to be attained is 52, making use of a pack of cards instead of counters, and that you are never to add more than 5; then divide 52 by the next number above 5, that is, by 7, and the remainder, which is 3, will be the number you must stake first; and whatever other stakes you must add as much to it as will make it equal to the number by which you divided, that is 7. Therefore, if his first stake be 1, you must stake 6, etc., so that your second stake will make the heap 10, your third stake will make it 17, and so on till you come to 45, when, as he cannot make more than 6, you must make the number 52.

In this, as the former case, if the other person has no knowledge of numbers, you may stake any number first under 7; or you may let him stake first, only taking care to secure either of the numbers 10, 17, 24, 31, etc., after which he cannot make 52, if you constantly add as much to his stake as will make it 7.

18. A person privately fixing on any number, to tell him that number. — After the person has fixed on a number, bid him double it and add 4 to that sum, then multiply the whole by 5; to the product let him add 12, and multiply the amount by 10. From the sum of the whole let him deduct 320, and tell you the remainder; from which, if you cut off the last two figures, the number that remains will be that fixed on.

Example.

Let the number chosen be 7

Which doubled is 14

And 4 added to it, makes 18

Misses.

Which multiplied by 5, makes 90

To which 12 being added, it is 102

That multiplied by 10, makes 1020

From which deducting 320, the remainder is 700

And by striking off the two cyphers, it becomes the original number 7

19. Three dice being thrown on a table, to tell the number of points in each of them, and the order in which they stand. — Let the person who has thrown the dice double the number of that next his left hand, and add 5 to by 3 dice, that sum; then multiply the amount by 5, and to the without product add the number of the middle die; then let them be subtracted 250, and the figures of the number that remains will answer to the points of the three dice as they stand on the table.

Example. Suppose the points of the three dice thrown on the table to be 4, 6, and 2.

Then the double of the first die will be 8

To which add 5

That sum multiplied by 5 will be 65

To which add the number of the middle die 6

And multiply the sum by 71

To that product add the number of the third die 2

From the total 712

Subtract 250

And the three remaining figures 462 will answer to the numbers on the dice, and show the order in which they stand.

20. Some person in company having put a ring privately on one of his fingers; to name the person, the hand, the finger, and the joint, on which it is placed. —

Let a third person double the number of the order in which he stands who has the ring, and add 5 to that number; then multiply that sum by 5, and to the product add 10. Let him next add 1 to the last number if the ring be on the right hand, and 2 if on the left, and multiply the whole by 10: to this product he must add the number of the finger (counting the thumb as the first finger), and multiply the whole again by 10. Let him then add the number of the joint; and, lastly, to the whole add 35.

He is then to tell you the amount of the whole, from which you are to subtract 3535, and the remainder will consist of four figures, the first of which will express the rank in which the person stands, the second the hand (the number 1 signifying the right hand, and 2 the left), the third number the finger, and the fourth the joint.

Example. Suppose the person who stands the third in order has put the ring upon the second joint of the thumb of his left hand; then

The
Sect. IV. Legerdemain.

The double of the rank of the third person is 6, the writing on which he will readily acknowledge to be his.

22. Take two guineas and two shillings, and grind part of them away, on one side only, so that they may be but of half the common thickness; and observe that they must be quite thin at the edge: then rivet a gui-
ness and a shilling together. Lay one of these double pieces with the shilling upwards, on the palm of your hand, at the bottom of your three first fingers; and lay the other piece, with the guinea upwards, in like manner, in the other hand. Let the company take notice in which hand is the guinea, and in which the shilling. Then as you shut your hands, you naturally turn the pieces over; and when you open them again, the shilling and the guinea will appear to have changed their places.

23. Provide a round tin box, of the size of a large snuff box; and in this place eight other boxes, which will go easily into each other, and let the least of them be of a size to hold a guinea. Each of these boxes should shut with a hinge: and to the least of them there must be a small lock, that is fastened with a spring, but cannot be opened without a key: and observe that all these boxes must shut so freely, that they may be all closed at once. Place these boxes in each other, with their tops open, (see fig. 12.) in the drawer of the table on which you make your experiments; or, if you please, in your pocket, in such a manner that they cannot be displaced.

Then ask a person to lend you a new guinea, and desire him to mark it, that it may not be changed. You take this piece in one hand, and in the other you have another of the same appearance; and putting your hand in the drawer you slip the piece that is marked into the least box, and shutting them all at once, take them out. Then showing the piece you have in your hand, and which the company suppose to be the same that was marked, you pretend to make it pass through the box, and dexterously convey it away.

You then present the box, for the spectators do not yet know there are more than one, to any person in company; who, when he opens it, finds another, and another, till he comes to the last, but that he cannot open without the key (see fig. 13.) which you then give him, and retiring to a distant part of the room, you tell him to take out the guinea himself, and see if it be that he marked.

This deception may be made more surprising, by putting the key into the bottom box of one of the company; which you may do by asking him for a pinch of his snuff, and at the same time conceal the key, which must be very small, among the snuff: and when the person who is to open the box asks for the key, you tell him that one of the company has it in his snuff box. This part of the deception may likewise be performed by means of a confederate.

24. AB, fig. 75. represents a small wooden box. The three small, eight inches long, two and a half broad, and magic piece, half an inch deep; the bottom of which, by means of two cross pieces, is divided into three equal parts. 

Plate 

G. C. X. C.

Fig. 14. 15.

EFGH represents the lid, which is fastened to the bottom by a hinge, and has in front a small plate shaped like a lock, and two small keys for hooks which serve to fasten it when it is shut. 

ILM are three small flexible 5 B springs.
LEGERDEMAIN.

Miscellaneous Performance.

springs, flat, and about ¼ inch long. NOP are three wooden tablets of the same size, upon which are marked the figures 2, 4, and 5. The tablets are of different thicknesses, and the difference is so small as not to be perceived by the eye. The outside of the box is covered with shagreen or morocco leather, and on the inside with silk taffeta; these coverings being indispensably necessary to hide the three small springs above mentioned. Fig. 14 shows the two hinges E and F best close to the top of the lid ABCD; the piece of brass G, similar to a lock, being also curved to the lid. A small brass stud is rivetted upon the end of each of these springs inserted into the lid, and passes through the curved part of each of the hinges and the lock; so that on the outside they appear as the heads of small pins which fasten them upon the lid. These small studs will be elevated more or less according to the thicknesses of the tablets, that they may be shuf up in each of the partitions in which they may be found placed; so that the tablet N elevates them more than the tablet O, and the latter less than P; though these elevations are but barely sensible to the sight or touch, and that by a person accustomed to look at or handle them. Thus it may be easily known in whatever order the tablets are placed, however carefully shut; and consequently the number named as enclosed.

Give now the box to any indifferent person, leave him at liberty to form with the tablets any number he pleases, desiring him to return the box well shut up; then seeking the box, and determining by the touch or rather by the eye, what order the tablets are in, it will be very surprising to hear you declare the number without seeing it.

N.B. It will still be equally possible to discover the number, though the tablets should be returned with the bottom upwards, or even though one should be withdrawn in order to defeat your design; particularly if care had been taken to make the studs remain even with the plates when a number is omitted.

25. To discover any particular counter which has been secretly placed within a box that turns upon it.—This table, which is made of wood, is represented by A, fig. 16. It is of a hexagonal shape, and about three or four inches diameter. For the sake of neatness in appearance, a proportionably sized pillar with a foot is fixed to it. Round a centre there turns a small round box B of about ¼ inch diameter in the inside, the lid of which takes off at B. At the bottom of this box, near the circumference in the inside, is fixed a brass pin to fit a hole made in a flat ivory counter shown at b, fig. 17. The pin and counter are represented in fig. 18, which is a flat view of fig. 19, with the lid of the box B taken off. Opposite to the pin b, in the same figure, D represents a fine dot designed as a secret mark on the outside of the box, which serves always as a guide to the number of the counter privately placed in the inside of the box, as is afterwards particularly explained. Upon one of the corners of the table is an ivory mark C, fig. 16. and 18, which serves to place the spot a upon the counters in its proper position. See fig. 17. There are 12 counters fitted to the box B, marked 10, 20, &c. as far as 120, on the middle of each. On each of these counters is the hole b, fig. 17, and 18, which goes over the pin in the bottom of the box; and on one side of this hole a red or black spot is placed in the following manner. When No. 10 is put into the box, the spot must be so far to the left of the hand of the hole, that when it is brought to the mark C, fig. 18, the hole b will be opposite to the side marked 1. When No. 20 is put in, the spot being brought to the mark C will carry the hole to the corner marked 2. When No. 30 is put in, and the spot brought opposite to C, the hole will be brought against the side marked 3, as is shown in the figure, and so on for the rest. Therefore, as opposite to the brass pin, or hole on the counter on the outside of the box B, there is a secret mark D already mentioned, this must serve as an index to the number contained in the box, according as it is opposite to a side or corner of the table.

Give now the table with the box and the 12 counters to any person, and desire him to put one of the counters secretly into the box, keeping the rest to himself; and after having placed the hole over the pin in the box, to place particularly, by turning the box round, the spot a against the mark C on the table. Let him then cover the box, give you the table, and keep the counters himself. Observe then privately what side or corner the secret outside marked D stands against, reckon the tens accordingly, and tell him the number.

26. To draw out of the well with a bucket any one of four liquors which have been previously mixed and put into it.—Provide two tin cylinders of seven or eight inches height; the diameter of the largest, represented by AB, fig. 19, to be four inches, and that of the least, CD, two inches. Place the small one within the larger, and connect them together by soldering to them four tin partitions, making the equal spaces e, f, g, h. Turn a piece of wood three inches thick, hollow within, and lined with tin, of which a section is given, fig. 20. Into this the exterior cylinder should be closely fitted at a and b. Another circle of wood (of which a section is given fig. 21.), hollowed at a, b, and c, is also to be procured, and which may cover exactly the space between the two cylinders; and, lastly, let the whole be constructed in such a manner, that when these separate pieces are placed together, they may represent a well, as in fig. 22. The two brass or wooden pillars AA, with the axis and handle C, serve to let down and draw up a small glass bucket B, an inch and a half in diameter. Make also four tin reservoirs of the same height with the cylinder, and so shaped as to fill the four spaces e, f, g, h, (fig. 19.) which must be well closed at their extremities B and C. On the top of each make a small hole about the tenth part of an inch diameter, and solder at the base C a small tube D, the end of which should be bent towards the inside of the well when the reservoir is placed in it. Solder on the top of each reservoir a small spring lever and prop ABDE, fig. 23. The spring will serve always to press the end of the lever D down and open a hole at the top of the reservoir B; and in order to cover it more perfectly, a small piece of leather is to be closed on to the end of the lever D. Lastly, A small peg or stud C is placed at the end of each of the levers, and which must be close to the under part of the wooden circle which covers the reservoirs. To conceal these studs, and at the same time to be able to press upon them with the fingers, circular apertures, as shown in fig. 21. must be made in the piece of wood, the top covered

Sect. IV.
covered with a piece of vellum, and the whole neatly painted with oil colour.

If now you plunge one of these reservoirs perpendicularly into any liquor, in pressing on the stud, so as to uncover the hole at the top, it will be filled with the liquor in proportion to the depth to which it is immersed; and as long as the lever continues to press upon the hole by means of the spring, the liquor cannot run out for want of air, though it will do so the moment the stud is pressed upon and the air admitted. If the reservoir is properly placed, then the liquor will flow out of it into the glass bucket when let down to a proper depth.

Fill now the four reservoirs with the four different liquors; putting them in their places, and covering them with the circular top. Take a quantity of the same liquor, mix them well together, and pour the whole into the well; after which you may draw out any one which the company desires, by letting down the bucket, and pressing secretly upon the stud belonging to the reservoir which contains it, and which will thus discharge the liquor it contains.

27. Provide a small tin mortar, that is double, as A (fig. 8.), whose bottom B turns round on an axis, by means of a spring which communicates with the piece C. There must be a hollow space under the false bottom. To the under side of the bottom fasten, by a thread of fine silk, a flower, with its stalk and leaves.

Then take a flower that exactly resembles the other, and plucking it from the stalk, and all the leaves from each other, put them into the mortar, and pound them with a small pestle; after which you show the mortar to the company, that they may see the parts are all bruised.

Then taking the mortar up in your hands, you hold it over the flame of a lamp or candle, by whose warmth the flower is supposed to be restored; and at the same time pressing the piece at C, the bottom will turn round, the bruised parts descend into the space under the bottom, and the whole flower will be at top: you then put your hand into the mortar, and easily breaking the silk thread, which may be very short as well as fine, you take the flower out and present it to the company.

There is an experiment similar to this, in which a live bird is concealed at the bottom of the mortar, and one that is dead is pounded in it: after which, by the motion of the bottom, the live bird is set at liberty. But surely the pounding a bird in a mortar, though it be dead, must produce, in persons of any delicacy, more disgust than entertainment.

28. Procure a tin box ABCD (fig. 1.) about eight inches high, four wide, and two deep, and let it be fixed on the wooden stand E. On two of the sides let there be a groove FG; and in the front an opening I., three inches wide and one high.

At the back of the box let there be a little tin door, that opens outward, by which two wax candles M may be put in. Let the top of the box have a cover of the same metal, in which there are several holes, and which may be taken off at pleasure.

Provide a double glass OP (fig. 2.) constructed in the same manner as that in the last experiment. On one of its sides you are to paste a black paper, the length of which is to be divided into three parts, and the breadth into fifteen; in every two of these fifteen divisions you cut out letters, which will make in the whole three answers to three questions that may be proposed. On the other side of the glass paste a very thin paper, and to the top fasten a small cord, by which they may be made to rise or descend in the groove FG.

Then take a slip of pasteboard RS (fig. 3.) one inch and a half wide and three inches long, which is to be divided into fifteen equal parts similar to those of the paper OP, and cut out spaces, as in the figure, so that this paper sliding horizontally before OP, will either cover or conceal the papers cut in that.

This pasteboard is to slide between two brass wires, and is to be fastened to one side of the box, by a string that communicates with a small brass spring; and to the other side, by a string fastened to the box by a small piece of wax, so situated that the string may be easily set at liberty by the heat of the candles placed in the box.

Take a parcel of cards, and write on them different questions, three of which are to correspond with the answers on the glass. Shuffle these cards, and let a person draw any one of the three questions. Then by raising the glass, you bring the answer against the hole in the front of the box. You next place the candles in the box, the heat of which will melt the wax that holds the paper RS, which being then drawn by the spring, the answer will be visible; and in proportion as the composition between the glasses becomes diluted by the increase of the heat, the letters will become more strongly illuminated.

The letters cut in the paper may be made to answer several different questions, as has been explained in other experiments; and the whole parcel of cards may consist of questions that may be answered by one or other of the three divisions of the paper.

29. Make a thin box ABCD (fig. 4.), with a cover A flower M, that takes off. Let this box be supported by the pedestal FGHI, of the same metal, and on which there is a little door L. In the front of this box is to be a glass O.

In a groove, at a small distance from O, place a double glass of the same sort with that in the last experiment. Between the front and back glasses place a small upright tin tube supported by the cross piece R. Let there be also a small chafing-dish placed in the pedestal FGHI, The box is to be open behind. You privately place a flower (a) in the tin tube R; and presenting one that resembles it to any one (a), desire him to burn it on the coals in the chafing-dish.

You then strew some powder over the coals, which may be supposed to aid the ashes in producing the flower: and then put the chafing-dish on the pedestal under.

(a) This flower must not be placed so near as to make it in the least degree visible.
(b) You may present several flowers, and let the person choose any one of them. In this case, while he is burning:

L E G E R L I N E, in Music, one added to the staff of five lines, when the ascending or descending notes run very high or low; there are sometimes many of these lines both above and below the staff, to the number of four or five.

LEGHORN, anciently called Liburnus Portus, but by the modern Italians Livorno, a handsom town of Italy, in the duchy of Tuscany, and a free port, about 30 miles south-west from Florence, in the territory of Pisa. The only defect of the harbour is its being too shallow for large ships. Cosimo I. had this town in exchange for Sarzana, from the Genoese; and it is the only sea port in the duchy. It was then but a mean unhealthy place; but is now very handsome, and well built, with broad, straight, parallel streets. It is also well fortified; but wants good water, which must be brought from Pisa, 14 miles distant. It is about two miles in circuit, and the general form of it is square. Part of it has the convenience of canals; one of which is five miles in length, and, joining the Arno, merchandise and passengers are thus conveyed to Pisa. The port, consisting of two havens, one for the duke's galleys, and the other for merchant ships, is surrounded with a double mole, above a mile and a half in length, and defended, together with the town, by a good citadel, and 12 forts. Roman Catholics, Jews, Greeks, Armenians, Mahometans, and even the English factory, are indulged in the public exercise of their religion; but other Protestants must be satisfied with the private. The trade carried on here is very great, and most of it passes through the hands of the Jews. Though only two piastras, or scudi, are paid for every hale, great or small, imported or exported, yet the duties on all provisions and commodities brought from the continent to the town are very heavy. The number of the inhabitants in 1810 was about 60,000; and one-third of these are Jews, who live in a particular quarter, but without any mark of distinction, and have a fine synagogue. They have engrossed the coral manufacture, have a considerable trade, and possess the chief riches of the place. The garrison consists of 2000 men. The walks on the ramparts are very agreeable. There is good anchorage in the road; but ships riding there are much exposed to the weather and the Barbary corsairs. The number of English families in Leghorn, some years ago, amounted to about 36; and they were formerly much favoured by the government. The power of the inquisition is limited to ecclesiastical matters and Roman Catholics. There are a great many Turkish slaves here, brought in by the duke's galleys, who are often sent out on a cruise against the corsairs of Barbary. The lighthouse stands on a rock in the sea; near which is the lazaretto, where quarantine is performed. Another source, from which the duke draws a great revenue, is the monopoly of brandy, tobacco, and salt; but that, with the heavy duties, makes provisions dear. The Turks, who are not slaves, live in a particular quarter, near that of the Jews. The common prostitutes also have a particular place assigned them, out of which they must not be seen, without leave from the commissary. The number of the rowers in the galleys, whether Turkish slaves, criminals, or volunteers, is about 2000. In the area before the darsena or inner harbour, is a fine statue of Duke Ferdinand, with four Turkish slaves, in bronze, chained to the pedestal. The ducal palace is one of the finest structures in the town, and the ordinary residence of the governor. Leghorn is the see of a bishop, and has a noble cathedral; but the other churches are not remarkable. Leghorn did not escape those changes in which the French revolutionary war involved the towns and states of Italy. E. Long. 10. 6. N. Lat. 43° 32'.

LEGIO VII. GEMINA, in Ancient Geography, a town or station of that legion in Asturias. Now Leon, capital of the province of that name in Spain. W. Long. 6. 5'. N. Lat. 43° — Another LEGIO, a town of Galilee; from which Jerome determines the distances of the places in Galilee, not a bare enumeration, though the name might originally be owing to that circumstance. It lay 13 miles to the west of Nazareth, between Mount Tabor and the Mediterranean. Now thought to be Leganea.

LEGION, in Roman antiquity, a body of foot which consisted of different numbers at different periods of time. The word comes from the Latin legere, to choose; because, when the legions were raised, they made choice of such of their youth as were most proper to bear arms.

In the time of Romulus the legion consisted of 3000 foot and 500 horse; though, after the reception of the Sabines, it was augmented to 4000. In the war with Hannibal, it was raised to 5000, after this it sunk to 4000 or 4500; this was the number in the time of Polybius. The number of legions kept in pay together, differed according to times and occasions. During the consular

burning the flower, you fetch the box from another apartment, and at the same time put in a corresponding flower, which will make the experiment still more surprising.

LE I

Legion, consul state four legions were fitted up every year, and divided between the two consuls; yet we meet with the number of 16 or 18, as the situation of affairs required. Augustus maintained a standing army of 23 or 25 legions; but this number in after times is seldom found. The different legions borrowed their names from the order in which they were raised; hence we read of legio prima, secunda, tertia; but as there might be many primae, secundae, tertiae, &c. they were named from the emperors, as Augusta, Claudiana, Galbiana, Flavia, Ulpia, Trajana, Antoniana, &c. or from the provinces which had been conquered by their means, as Parthica, Scythica, Gallica, Arabica, &c. or from the deities under whose protection the commanders had particularly placed themselves, Minerva, Apsalinaris, &c. or from the regions where they were quartered, as Creteonius, Cyrenaica, Britannica, &c. or from particular accidents, as adjutarii, martius, fulmin-vitrix, rapax, victrix.

Each legion was divided into 10 cohorts, each cohort into 10 companies, and each company into 2 centuries. The chief commander of the legion was called legatus, i.e. lieutenant.

The standards borne by the legions were various; at first, the standard was a wolf, in honour of Romulus's nurse; afterwards a hog, which animal was usually sacrificed at the conclusion of a treaty, to indicate that war is undertaken with a view to peace; sometimes a minotaur, to remind the general of his duty of secrecy, of which the labyrinth was an emblem, and consequently the minotaur; a horse was also borne, also a boar; and Marius, we are told, was the first who changed all these for the eagle.

LEGISLATOR, a lawyer, or person who establishes the polity and laws of a state. Such was Moses, among the Jews; Lycurgus, among the Lacediemenians, &c. See MOSAIC LAW.

The first laws amongst the Athenians seem to have been those of Theseus; for what we can find earlier than this period is involved in fable. After Theseus came Draco the Archon, whose laws were said, for their severity, to have been written with blood; by his laws every offence was punished with death; so that stealing an apple, and betraying their country, were treated as equal crimes. These laws were afterwards repealed by Solon, except such as related to murder: By way of distinction, Draco's laws were called dèmës, and Solon's hémës.

The laws of Solon were in a great measure suspended during the usurpation of Pisistratus; but, after the expulsion of his family, were revived with some additions by Clisthenes. After this, the form of government was again changed, first by the four hundred, and afterwards by the thirty tyrants; but these storms being over, the ancient laws were again restored in the archonship of Euclides, and others established at the instances of Diocles, Aristophon, and last of all, of Demetrius the Phalerian. This is a short sketch of the history of the Athenian legislation, before that state submitted to the Roman yoke. But many laws were enacted by the suffrages of the people on particular exigencies; the decrees of the senate continued to have the force of laws no longer than a year. If a new law was to be proposed, it was necessary to write it upon a white tablet, and fix it up some days before the meeting, lest their judgment should be caught by surprise. The laws were carefully revised every year; and if any of them, from a change of circumstances, were found unsuitable or prejudicial, they were repealed: This was called οἰκείωσις τοῦ νόμου, because the suffrages were given by holding up of hands. The first laws amongst the Grecians were unwritten and composed in verse, that the common people might with more ease commit them to memory.

SOLON penned his laws upon wooden tablets, called Αἴτημα; and some authors with great probability assert that they were written in the manner called Συγράφω, from left to right, and from right again to left, in the same manner as oxen walk the furrows in plowing, thus,

ΕΚ ΔΙΟΣ ΑΡ
·ΩΘΕΝΩΣ

It was against the law for any person to erase a decree; and certain persons, called Ἐρρημένοι, were appointed to prevent any corruption; whose business it was also to transcribe the old and enter the new ones.

At Rome the people were in a great measure their own legislators; though Solon may be said, in some sense, to have been their legislator, as the decemviri, who were created for the making of laws, borrowed a great number from those of Solon. See LEX.

With us the legislative power is lodged in the king, lords, and commons assembled in parliament. See LAW and PARLIAMENT.

LEGITIMATION, an act whereby illegitimate children are rendered legitimate. See BASTARD.

LEGITIME, in Scots Law, that share of the moveable effects belonging to a husband and wife, which upon the husband's death falls to the children. See LAW INDEX.

LEGUMEN, or Pod, in Botany; a species of seed-vessel which has two valves or external openings enclosing a number of seeds that are fastened along one suture only. In this last circumstance the seed vessel in question differs from that described by botanists solapum, in which the enclosed seeds are fastened alternately to both the sutures or joinings of the pod.

The seed-vessel of all the pea-bloom or butterfly-shaped flowers, the diádelphia of Linnaeus, is of this pod kind. Such, for instance, is the seed-vessel of the pea, vetch, lupine, and broom.

LEGUMINOUS, an appellation given to all plants whose fruit is a legumen.

LEIBNITZ, GODFREY WILLIAM DE, an eminent mathematician and philosopher, was born at Leipsic in Saxony in 1646. At the age of 15 years, he applied himself to mathematics at Leipsic and Jena; and in 1663, maintained a thesis de Principis Individuationis. The year following he was admitted master of arts. He read with great attention the Greek philosophers; and endeavoured to reconcile Plato with Aristotle, as he afterwards did Aristotle with Des Cartes. But the study of the law was his principal view; in which faculty he was admitted bachelor in 1665. The year following he would have taken the degree of doctor; but was refused it on pretence that he was too young, though in reality because he had raised himself several enemies by rejecting the principles of Aristotle and the scholastics. Upon this he went to Alterf, where he maintained a thesis de Canibus Perplexis, with such applaus,
Leibnitz, planose, that he had the degree of doctor conferred on Leibnitzian him. He might have settled to great advantage at Philosophy, Paris; but as it would have been necessary to have embraced the Roman Catholic religion, he refused all offers. In 1673, he went to England; where he became acquainted with Mr. Oldenburg, secretary of the Royal Society, and Mr. John Collins, fellow of that society. In 1676, he returned to England, and thence went into Holland, in order to proceed to Hanover, where he proposed to settle. Upon his arrival there, he applied himself to enrich the duke's library with the best books of all kinds. The duke dying in 1679, his successor Ernest Augustus, then bishop of Osnaburg, showed our author the same favour as his predecessor had done, and ordered him to write the history of the house of Brunswick. He undertook it, and travelled over Germany and Italy in order to collect materials. The elector of Brandenburg, afterwards king of Prussia, founded an academy at Berlin by his advice; and he was appointed perpetual president, though his affairs would not permit him to reside constantly at Berlin. He projected an academy of the same kind at Dresden; and this design would have been executed, if it had not been prevented by the confusions in Poland. He was engaged likewise in a scheme for a universal language. His writings had long before made him famous over all Europe. Beside the office of privy counsellor of justice, which the elector of Hanover had given him, the emperor appointed him in 1711 audie counsellor; and the czar made him privy counsellor of justice, with a pension of 2000 ducats. He undertook at the same time the establishment of an academy of science at Vienna; but the plague prevented the execution of it. However, the emperor, as a mark of his favour, settled a pension on him of 2000 florins, and promised him another of 4000 if he would come and reside at Vienna. He would have complied with this offer, but he was prevented by death in 1716. His memory was so strong, that in order to fix any thing in it, he had no more to do but to write it once; and he could even in his old age repeat Virgil exactly. He professed the Lutheran religion, but never went to sermon; and upon his deathbed, his coachman, who was his favourite servant, desiring him to send for a minister, he refused, saying he had no need of one. Mr Locke and Mr Moynieux plainly seem to think that he was not so great a man as he had the reputation of being. Foreigners ascribed to him the honour of an invention, of which, it is said, he received the first hints from Sir Isaac Newton's letters, who had discovered the method of fluxions in 1664 and 1665. But it would be tedious to give a detail of the dispute concerning the right to that invention. See Fluxions.

LEIBNITZIAN PHILOSOPHY, or the philosophy of Leibnitz, is a system of philosophy formed and published by its author in the last century, partly in emendation of the Cartesian, and partly in opposition to the Newtonian. The basis of Mr. Leibnitz's philosophy was that of Des Cartes; for he retained the Cartesian subtle matter, with the universal plenitude and voids; and represented the universe as a machine that should proceed for ever by the laws of mechanism, in the most perfect state, by an absolute inviolable necessity, though in some things he differs from Des Cartes. After Sir Isaac Newton's philosophy was published in 1687, he printed an essay on the celestial motions. Act. Erod. 1689, where he admits of the circulation of the ether with Des Cartes, and of gravity with Sir Isaac Newton: though he has not reconciled these principles, nor shown how gravity arose from the impulse of this ether, nor how to account for the planetary revolutions, and the laws of the planetary motions in their respective orbits. That which he calls the harmonical circulation is the angular velocity of any one planet, which decreases from the perihelion to the aphelium in the same proportion as its distance from the sun increases; but this law does not apply to the motions of the different planets compared together; because the velocities of the planets, at their mean distances, decrease in the same proportion as the square roots of the numbers expressing those distances. Besides, his system is defective, as it does not reconcile the circulation of the ether with the free motions of the comets in all directions, or with the obliquity of the planes of the planetary orbits; nor resolve other objections to which the hypothesis of the plenum and vortices is liable. Soon after the period just mentioned, the dispute commenced concerning the invention of the method of fluxions, which led Mr. Leibnitz to take a very decided part in opposition to the philosophy of Sir Isaac Newton. From the wisdom and goodness of the Deity, and his principle of a sufficient reason, he concluded that the universe was a perfect work, or the best that could possibly have been made; and that other things, which were inconvenient and evil, were permitted as necessary consequences of what was best: the material system, considered as a perfect machine, can never fall into disorder, or require to be set right; and to suppose that God interposes in it, is to lessen the skill of the Author, and the perfection of his work. He expressly charges an impious tendency on the philosophy of Sir Isaac Newton, because he asserts, that the fabric of the universe and course of nature could not continue for ever in its present state, but would require, in process of time, to be re-established or renewed by the hand of its Former. The perfection of the universe, by reason of which it is capable of continuing for ever by mechanical laws in its present state, led Mr. Leibnitz to distinguish between the quantity of motion and the force of bodies; and, whilst he owns, in opposition to Des Cartes, that the former varies, to maintain that the quantity of force is for ever the same in the universe, and to measure the forces of bodies by the squares of their velocities.

This system also requires the utter exclusion of atoms, or of any perfectly hard and inflexible bodies. The advocates of it allege, that according to the law of continuity, as they call a law of nature invented for the sake of the theory, all changes in nature are produced by insensible and infinitely small degrees; so that no body can, in any case, pass from motion to rest, or from rest to motion, without passing through all possible intermediate degrees of motion: whence they conclude, that atoms or perfectly hard bodies are impossible: because if two of them should meet with equal motions, in contrary directions, they would necessarily stop at once, in violation of the law of continuity.

Mr. Leibnitz proposes two principles as the foundation of all our knowledge; the first, that it is impossible
Leibnitzian sensible for a thing to be and not to be at the same time, Philosophy, which, he says, is the foundation of speculative truth: the other is, that nothing is without a sufficient reason why it should be so rather than otherwise; and by this principle, according to him, we make a transition from abstracted truths to natural philosophy. Hence he concludes, that the mind is naturally determined, in its volitions and elections, by the greatest apparent good, and that it is impossible to make a choice between things perfectly like, which he calls indiscernible; from whence he infers, that two things perfectly like could not have been produced even by the Deity: and he rejects a vacuum, partly because the parts of it must be supposed perfectly like to each other. For the same reason he also rejects atoms, and all similar particles of matter, to each of which, though divisible in infinitum, he ascribes a monad (Act. Lippis 1698, p. 435.) or active kind of principle, ended, as he says, with perception and appetite. The essence of substance he places in action or activity, or, as he expresses it, in something that is between acting and the faculty of acting. He affirms absolute rest to be impossible, and builds motion, or a sort of nuxus, to be essential to all material substances. Each monad he describes as representative of the whole universe from its point of sight; and after all, in one of his letters he tells us, that matter is not a substance, but a substantiatum, or phenomenon bien fonde. He frequently urges the comparison between the effects of opposite motives on the mind, and of weights placed in the scales of a balance, or of powers acting upon the same body with contrary directions. His learned antagonist Dr Clarke denies that there is a similitude between a balance moved by weights, and a mind acting upon the view of certain motives; because the one is entirely passive, and the other not only is acted upon, but acts also. The mind, he owns, is purely passive in receiving the impression of the motive, which is only a perception, and is not to be confounded with the power of acting after, or in consequence of, that perception. The difference between a man and a machine does not consist only in sensation and intelligence, but in this power of acting also. The balance, for want of this power, cannot move at all when the weights are equal; but a free agent, he says, when there appear two perfectly alike reasonable ways of acting, has still within itself a power of choosing; and it may have strong and very good reasons not to forbear.

The translator of Mosheim's Ecclesiastical History observes, that the progress of Arminianism has declined in Germany and several parts of Switzerland, in consequence of the influence of the Leibnitzian and Woffian philosophy. Leibnitz and Wolf, by attacking that liberty of indifference, which is supposed to imply the power of acting not only without, but against, motives, struck, he says, at the very foundation of the Arminian system. He adds, that the greatest possible perfection of the universe, considered as the ultimate end of creating goodness, removes from the doctrine of predestination these arbitrary procedures and narrow views with which the Calvinists are supposed to have loaded it, and gives it a new, a more pleasing, and a more philosophical aspect. As the Leibnitzians laid down this great end as the supreme object of God's universal dominion, and the hope to which all his dispensations are directed; so they concluded, that if this end was proposed, it must be accomplished. Hence the doctrine of necessity, to fulfil the purposes of predestination founded in wisdom and goodness; a necessity, physical and mechanical, in the motions of material and inanimate things, but a necessity moral and spiritual in the voluntary determinations of intelligent beings, in consequence of propellant motives, which produce their effects with certainty, though these effects be contingent, and by no means the offspring of an absolute and essentially immutable fatality. These principles, says the same writer, are evidently applicable to the main doctrines of Calvinism; by them predestination is confirmed, though modified with respect to its reasons and its end: by them irresistible grace (irresistible in a moral sense) is maintained upon the hypothesis of propellant motives and a moral necessity: the perseverance of the saints is also explicable upon the same system, by a series of moral causes producing a series of moral effects.

LEICESTER, the capital of a county of the same name in England, upon the river Leice, now called Soce. From its situation on the Fosse way, and the many coins and antiquities discovered here, it seems probable that it was a place of some note in the time of the Romans. In the time of the Saxons it was a bishop's see, and afterwards so repaired and fortified by Edelshida, that it became, according to Matthew Paris, a most wealthy place, having 32 parish churches; but in Henry the Second's reign it was in a manner quite ruined, for joining in rebellion against him with Robert earl of Leicester. In the reign of Edward III. however, it began to recover by the favour of his son Henry Plantagenet, duke and earl of Lancaster, who founded and endowed a collegiate church and hospital here. It is a borough and corporation, governed by a mayor, recorder, steward, bailiff, 24 aldermen, 48 common council men, a solicitor, a town clerk, and two chamberlains. It had its first charter from King John. The freemen are exempt from paying toll in all the fairs and markets of England. It has three hospitals; that mentioned above, built by Henry Plantagenet duke of Lancaster, and capable of supporting 100 aged people decently; another erected and endowed in the reign of Henry VIII. for 12 poor lazar; and another for six poor widows. The castle was a prodigious large building, where the duke of Lancaster kept his court. The hall and kitchen still remain entire, of which the former is very spacious and lofty; and in the tower over one of the gates is kept the magazine for the county militia. There was a famous monastery here, anciently called from its situation in the meadows, St Mary de Pratiss or Press. In these meadows is now the course for the horse race. It is said that Richard III. who was killed at the battle of Bosworth, lies interred in St Margaret's church. The chief business of Leicester is the stocking trade, which employs about 7000 or 8000 persons. In a parliament held here in the reign of Henry V. for the first law for the burning of heretics was made, levied against the followers of Wickliffe, who was rector of Letterworth in this county, and where his pulpit is said still to remain. The town suffered greatly in the civil wars, by two successive sieges. It has given the title of earl to several noble families. The present earl was created in 1784, and
and is the marquis of Townshend's son. Its market on Saturday is one of the greatest in England for provisions, especially for corn and cattle. The population in 1811 was estimated at 23,146.

Leicestershire, an inland county of England, in form almost circular. It has Nottinghamshire and Derbyshire to the north; Rutlandshire and Lincolnshire to the east; Warwickshire on the west, from which it is parted by the Roman military way called Watling-street; and by Northamptonshire on the south; and is about 70 miles in circumference. As it lies at a great distance from the sea, and is free from bogs and marshes, the air is sweet and wholesome. It is a champaign country in general, and abundantly fertile in corn and grass, being watered by several rivers, as the Soar, or Sare, which passes through the middle of it, and abounds in excellent salmon and other fish; the Wreke, Trent, Eye, Sense, Auker, and Aven. These rivers being mostly navigable, greatly facilitate the trade of the county. In some parts there is a great scarcity of fuel, both wood and coal; but in the more hilly parts there is plenty of both, together with great flocks of sheep. Besides wheat, barley, oats, and pease, it produces the best beans in England. They grow so tall and luxuriant in some places, particularly about Barton in the Beans, that they look, towards the harvest time, like a forest; and the inhabitants eat them not only when they are green as in other places, but all the year round; for which reason their neighbours nickname them bean bellies. They have plenty of good wool, of which they not only make great quantities of stockings, but send a great quantity unmanufactured into other parts of England. They make great profit of their corn and pulse; and likewise breed great numbers of coaches and dray horses. It is not uncommon to rent grass farms from 500l. to 2000l. a-year. It is in the midland circuit, and diocese of Lincoln; and sends four members to parliament, two for Leicester, and two for the county. It contains 200 parishes; and had 150,419 inhabitants in 1811.

Leigh, Sir Edward, a very learned Englishman, was born at Shawell in Leicestershire, and educated at Magdalen hall, Oxford. He was a member of the long parliament, and one of the members of the house of commons who were appointed to sit in the assembly of divines. He was afterwards colonel of a regiment for the parliament; but in 1648 was numbered among the Presbyterians who were turned out, and in December he was imprisoned. From this period to the Restoration he employed himself in writing a considerable number of learned and valuable books, which showed profound learning, a knowledge of the languages, and much critical sagacity; and of which a list is given by Antony Wood. Sir Edward died at his house called Rushall Hall, in Staffordshire, June 2, 1671; and was buried in the chancel of Rushall church.

Leighlin, a town of Ireland, situated in the county of Carlow, and province of Leinster; about 43 miles from Dublin, near the river Barrow. It is a borough, and formerly returned two members to parliament; patronage in the bishop of the diocese, this being a bishopric united to Ferns. At the east end of the church of Old Leighlin is a famous well covered with great ash trees, and dedicated to St Lasarian. This place was formerly a city, though now a very mean village, and the cathedral has been kept in good repair.

It was a sole bishopric, founded in 632, and joined to Ferns in 1600. It is reported, that Gurnundus a Danish prince was buried in this church. The last bishop of Leighlin before its union with Ferns, was the right reverend Robert Grave, who coming by sea to be installed, suffered shipwreck in the harbour of Dublin, and perished in the waves. This cathedral was burnt to the ground, it is said, by lightning; and rebuilt, A. D. 1232, then dedicated to St Lasarian or Lazarinus, before mentioned; since the sees were joined, it is made use of as a parish church. Leighlin bridge is situated about two miles from this village; it was destroyed by the Irish in 1577. Here are the remains of a castle and of an old abbey. This is a post town, and has fairs in May, September, and October.

Leighton, Robert, archbishop of Glasgow. During Cromwell's usurpation, he was minister of a church near Edinburgh, and distinguished himself by his charity, and his aversion to religious and political disputes. The ministers were then called over yearly in the synod, and were commonly asked, Whether they had preached to the times? "For God's sake (answered Leighton), when all my brethren preach to the times, suffer me to preach about eternity." His moderation, however, giving offence, he retired to a life of privacy. But soon after, he was called by the unanimous voice of the magistrates, to preside over the college of Edinburgh; where, during ten years, he displayed all the talents of a prudent, wise, and learned governor. Soon after the Restoration, when the ill-judged affair of introducing Episcopacy into Scotland was resolved on, Leighton was consecrated bishop of Dunblane, and immediately gave an instance of his moderation: for when Sharp and the other bishops intended to enter Edinburgh in a pompous manner, Leighton remonstrated against it; but finding that what he said had no weight, he left them, and went to Edinburgh alone. Leighton, in his own diocese, set such a remarkable example of moderation, that he was revered even by the most rigid of the opposite party. He went about, preaching without any appearance of pomp; he gave all he had to the poor; and removed none of the ministers, however exceptionable he might think their political principles. But finding that none of the other bishops would be induced to join, as he thought, properly in the work, he went to the king, and resigned his bishopric, telling him he would not have a hand in such oppressive measures. Soon after, the king and council, partly induced by this good bishop's remonstrances, and partly by their own observations, resolved to carry on the cause of Episcopacy in Scotland on a different plan; and with this view, Leighton was persuaded to accept of the archbishopric of Glasgow, on which he made one effort more; but finding it not in his power to stem the violence of the times, he resigned his archbishopric, and retired into Sussex, where he devoted himself to acts of piety. He died in the year 1684. He was of a most amiable disposition, strict in his life, polite, cheerful, engaging in his manners, and profoundly learned. He left many sermons and useful tracts, which are greatly esteemed.

Leinster, the eastern province of Ireland, boun-
[ 753 ]

Leith. — Leister

ed by Ulster on the north; St George’s, or the Irish channel, on the east and south; and by the provinces of Connaught and Munster on the west. The capital city of this province and of the kingdom is Dublin. It contains 12 counties, viz. Carlow, Dublin, Kildare, Kilkenny, King’s county, Longford, Louth, Meath, Queen’s county, West Meath, Wexford, and Wicklow. It is the most level and best cultivated province in the kingdom; containing 2,642,958 Irish plantation acres, 8,148 parishes, 99 baronies, and 36 parishes; it is about 324 miles long and 74 broad, and extends from 51° 45′ to 55° 45′ north latitude. Desmond king of Leinster marrying his daughter Eva to Strongbow earl of Pembroke, on his death made him his universal heir; whereby the earl inherited the province of Leinster, and was afterwards enfeoffed of it by Henry II. He died in 1176, and left an only daughter Isabel, espoused to William Marshal earl of Pembroke; by her he had five sons, who succeeded to his great estates in Leinster. This province gives title of duke to the ancient and noble family of FitzGerald. In the early ages, this district was almost one continuous forest, and was principally the seat of the Kinseleighs.

LEIPSIC, a large, strong, and populous town of Saxony in Germany, with a castle, and a famous university. It is neat, and regularly built, and the streets are lighted in the night; it carries on a great trade, and has a right to stop and sell the merchandize designed to pass through it, and the country for 75 miles round has the same privilege. There are three great fairs every year, at the beginning of the year, Easter and Michaelmas, which last 51 days each. There are six handsome colleges belonging to the university, besides the private colleges. The townhouse makes an indifferent appearance, but the exchange is a fine structure. It is seated in a plain near the confluence of the Playse, the Elster, and the Barde. A battle was fought here on the 18th October 1813, between the French under Bonaparte, and the Russians, Austrians, and Prussians, which ended in the total defeat of the former. E. Long. 12. 55. N. Lat. 51. 19.

LEITH, (anciently called Inverleith), the port of Edinburgh, is seated on the banks of the Forth, about two miles from the capital. It is built on both sides of the harbour; by which it is divided into two parts, called North and South Leith. The communication between these was by a stone bridge of three arches founded by Robert Ballantine abbot of Holyroodhouse in 1493, but many years ago pulled down. The harbour is formed by the conflux of the rivulet called the Water of Leith with the frith of Forth. The depth of water, at neap tides, is about nine feet; but in high spring tides, it is about 16 feet. In the beginning of the 18th century, the town council of Edinburgh improved the harbour at an enormous expense, by extending a mole one a considerable way into the sea. In 1777, they erected an additional stone quay towards its west side. Upwards of 100 ships could then lie conveniently in this port; but it can now admit of a much greater number, in consequence of improvements. In order to enlarge it, the old bridge was pulled down, and a drawbridge erected a little to the eastward. A second drawbridge, lower down, and upon a more improved plan, has since been built. It is accommodated with wet and dry docks, and other conveniences for ship-building, which is there carried on to some extent, as vessels come to Leith to be repaired from many parts of Scotland. A new basin was completed and opened in 1805, which affords a safe and convenient station for trading vessels; and another of the same size was opened in 1817. The road of Leith affords good anchorage for ships of the greatest size.

About the close of the American war, when the people were alarmed by the appearance of Paul Jones in the frith with no more than three armed vessels, threatening to destroy all the ships in the roads and harbour, a battery was erected to the westward of the citadel. A party of artillery with a considerable park is constantly stationed at the battery. A martello tower, a quarter of a mile from the pier-end, has since been added.

The harbour of Leith was granted to the community of Edinburgh by King Robert in 1329; but the banks of the harbour belonged to Logan of Restalrig, a turbulent and ambitious baron, from whom the citizens were under the necessity of purchasing the bank or waste piece of ground between the houses and the rivulet above mentioned, for the purposes of wharfs, as well as for erecting shops and granaries, neither of which they could do before. As the situation of Leith, however, is much more convenient for trade than that of Edinburgh, which is two miles distant from the harbour, the inhabitants of the metropolis have fallen upon various methods of restraining the trade of Leith. They first purchased, from Logan of Restalrig, an exclusive privilege of carrying on every species of traffic in the town of Leith, and of keeping warehouses and inns for the entertainment of strangers in that place; and in 1483, the town council prohibited, under severe penalties, the citizens of Edinburgh from taking into partnership any inhabitant of Leith. To free themselves from this oppression, the people of Leith purchased the superiority of their town from Logan of Restalrig, for 300l. Scots, and it was erected into a burg of barony by the queen regent, Mary of Lorraine, who promised to erect it into a royal borough. She died, however, before this was accomplished; and upon her death, Francis and Mary, in violation of the private rights of the people of Leith, resolved the superiority to the town of Edinburgh, to whom it has since been confirmed by grants from successive sovereigns.

On the breaking out of the disturbances at the Reformation, the queen regent caused the whole town to be fortified, that the French troops might have a more ready inlet into the kingdom. It was accordingly surrounded with a wall, having eight bastions: but this wall went no farther than the street now called Bernard’s nook, because at that time the sea came up the length of that street; and even as late as 1623, a house situated exactly where the weigh-house is at present, is described as bounded on the east by the “sand of the sea-shore.” All that space, therefore, on which the row of houses nearest the harbour of Leith now stands, has been gained since that time from the sea.

In the time of Charles I. a fortification was erected at Leith by the Covenanters. Cromwell built a strong fort at the place still called the citadel in North Leith; but it was pulled down on the restoration of Charles II. by order of government. A gate with portcullis are the present remains of that fortification.—A pa.
Leith also appears to have formerly stood here, situated at the north-east boundaries of the former town, on the spot where the present weigh-house stands. It was destroyed by the English in the time of Henry VIII. The remains of this building, called the king's work, with a garden, and a piece of waste land that surrounded it, was erected into a barony by James VI. and bestowed upon Bernard Lindsay of Lochill, groom of the chamber to that prince. He is said to have fully repaired, and appropriated it to the recreations of the court; but it soon fell from its dignity, and became subservient to much more ignoble purposes. The tennis court was converted into a weigh-house; and the street which bounds it still bears the name of the founder, from whence it is called Bernard's nook.

As Leith lay within the parish of Restalrig, the church of Restalrig was of consequence the place of worship for the inhabitants of Leith; but in 1650 the Assembly ordered that church to be pulled down as a monument of idolatry, so that Leith wanted a parish church for upwards of 50 years. During that period they resorted for worship to a large and beautiful chapel already built, and dedicated to St Mary, which is now called South Leith Church; and in 1609 this chapel was by authority of parliament declared to be the parish church of the district: so that Restalrig is now in the parish of South Leith, as the latter was formerly in that of Restalrig. In 1772, a chapel of ease was erected by the inhabitants, as the parish church was insufficient to contain the number of hearers. There are also an Episcopal and several dissenting congregations in Leith. North Leith is a parish by itself; and a handsome new church was built there for the accommodation of the inhabitants in 1816. A new school was built by subscription in 1805.

Though a very great trade is carried on between Leith and many foreign ports, yet the articles of export and import fluctuate so much, that it would be useless to enter into any details either as to species or quantity. In general, the imports from France, Spain, and Portugal, are wines, brandy, and fruits; from the West Indies and America, rice, indigo, rum, sugar, and logwood. But the principal foreign trade of Leith is by the eastern seas, for the navigation of which it is most happily situated. To Germany, Holland, and the Baltic, it exports lead, glass ware, linen and woollen stuffs, and a variety of other goods; and from thence it imports immense quantities of timber, oak bark, hides, linen rags, pearl ashes, flax, hemp, tar, and many other articles. The Baltic trade was long carried on to a great extent, but has rather diminished. The number of vessels which entered inwards in 1818, was, in the foreign trade, 396 British, and 121 foreign; outwards, 281 British, and 49 foreign. Of coasting vessels there entered inwards 2115, outwards 1447. The coasting trade is a principal branch for the shipping at Leith, including those which belong to other ports on the Firth, which are said to make about one-fourth of the tonnage of the Leith vessels. The vessels employed in the London trade, which amount to 27, belonging to four companies, are in general of a large size, elegantly constructed, well manned, and furnished with excellent accommodations for passengers. During this year (1821) steam boats have begun to ply between Leith and London. These vessels carry passengers only, and make the voyage in about 60 hours. The largest ships in this port, however, are those employed in the Greenland fishery. The annual amount of shore dues averages £2,000l.; harbour dues, after deducting pilotage, about 2000l. and dock dues about 500l.

The shipping at Leith renders the demand for rope, sail cloth, and cordage, very considerable; and different companies carry on the manufactures, besides private persons who deal less considerably. The first of these companies was established in the beginning of the 18th century. This has proved a prosperous and lucrative concern.

In the middle of the 17th century, a manufactury of green glass was established at the citadel of Leith. Chopin bottles were sold at 4s. 6d. per dozen, and other bottles in proportion. Soon afterwards this article was manufactured also in North Leith; and in 1707, chopin bottles were sold at 2s. 6d. per dozen, and so on proportionably. That house being burnt down in 1746, a new house was built the following year on South Leith sands, and an additional one in 1754. Two companies are now engaged in the glass manufacture; the one for common bottles, and the other for window glass and crystal ware of all sorts. Manufacures of soft soap and candles were erected by St Clair of Roslin and some merchants; the former in 1735, and the latter in 1770; a manufactury of hard soap was also established in 1770.

There is, beside a branch of the British Linen Company, a banking house in Leith, called the Leith Banking Company, who issue notes, and carry on business of a considerable extent. An elegant building for the accommodation of this company was erected in 1807.

The inhabitants of Leith were divided into four classes; and these erected into corporations by the queen dowager, Mary of Lorraine. These were mariners, maltmen, trades, and traffickers. The first of these consisted of shipmasters and sailors; the second, of malt-makers and brewers; the third of cooperers, bakers, smiths, wrights, &c.; and the fourth, of merchants and shopkeepers. Of these corporations the mariners are the most considerable. They obtained from Mary of Lorraine a gift, afterwards ratified by William and Mary, of one penny duty on the ton of goods in the harbour of Leith, for the support of their poor. This duty, which not many years ago did not amount to 40l. a-year, now rises from 70l. to 120l. as trade flourishes. For the same purposes the shipmasters also pay 6d. a pound out of their own wages annually; and the like sum they give upon the wages of their sailors. From these and other donations, this corporation is enabled to pay from 600l. to 700l. a-year to their poor. Opposite to South Leith church there is a handsome building belonging to them, called the Charity Hospital, because originally consecrated to the Holy Trinity. In this house some of their poor used formerly to be maintained, but now they are all out-pensioners.

As the town of Leith was very ill supplied with water, and the streets were neither properly cleaned or whitened, an act for remedying these defects was passed in the year 1771, appointing certain persons from among
Leith, among the magistrates of Edinburgh, lords of session, inhabitants of Edinburgh and Leith, and members of the corporations of Leith, commissioners of police; empowering them to put this act in execution; and, for that purpose, to levy a sum not exceeding 6d. in the pound upon the valued rent of Leith. The great change which has since taken place on the streets of Leith shows the good effect of this act, and that it has both been judiciously prepared, and attentively executed. Leith, however, has never been well supplied with water: that brought in pipes from Lochend in the eastern part of the parish is not of a good quality, for it is not derived from springs.

In 1801, Leith contained 20,363 inhabitants; and by the returns in the present year (1821), the number is found to be 26,000.

Leitrim, a county of Ireland, situated in the province of Connaught, is bounded on the north by the bay of Donegal and part of Fermanagh, on the south and west by Sligo and Roscommon, and on the east by Fermanagh and Cavan. It is a fruitful county; and, though mountainous, produces great herds of black cattle; but has few places of note. It contains 206,830 Irish plantation acres, 21 parishes, 5 baronies, and 2 boroughs, and formerly seated six members to parliament; and is about 45 miles long, and 17 broad.

Leitrim, the shire town of the county of that name, is pleasantly situated on the banks of the river Shannon, about 80 miles from Dublin; and appears to have been formerly a place of some note. St Mac Ligue, son of Cernae, was bishop here; and his festival is observed on the 8th of February.

Leixlip, a post and fair town of Ireland, pleasantly situated in the county of Kildare, and province of Leinster, about eight miles from Dublin. Near it are the ruins of the church and castle of Confy. The castle of Leixlip is beautifully situated on the banks of the river Liffey: it is a fine edifice, with large and pleasant gardens, at one side of which is a fine waterfall called the Salmon leap, there being plenty of that species of fish hereabouts. A mile from this is Castletown, the magnificent seat of Mr Conolly.

Leland, John, a celebrated English antiquary, was born in London about the year 1507. Having lost his parents when a child, he had the good fortune to have a friend and patron in one Mr Thomas Miles, who placed him in St Paul's school, of which the grammarian Lily was master. From that school he was sent to Christ's college, Cambridge; whence, after some years residence, he removed to All-Souls, Oxford. From Oxford he went to Paris, chiefly with a design to study the Greek language, which at that time was but little understood in this kingdom. On his return to England he took orders, and was soon appointed chaplain to King Henry VIII. who also gave him the rectorcy of Poppeling, in the marshes of Calais, appointed him his librarian, and in 1533 granted to him, by commission under the great seal, the office of king's antiquary, an office never borne by any other person before or since. By this commission he was empowered to search for ancient writings in all the libraries of colleges, abbeys, priories, &c. in his majesty's dominions. We are told by his last biographer, that he denounced Popery soon after his return to England; but he quotes no authority. Be this as it may, in 1536 he obtained a dispensation to keep a curate at Poppeling, and set out on his journey in search of antiquities. In this employment he spent six years, during which time he visited every part of England where monuments of antiquity were to be expected. After his return, in the year 1542, he was presented by the king to the rich rectory of Haseley in Oxfordshire; and in the following year he gave him a prebend of King's college, now Christ's church, in Oxford, besides that of East and West Knowle, in the cathedral of Salisbury. Being thus amply provided for, he retired to a house of his own in the parish of St Michael le Querne in London, where he spent six years more in digesting the materials which he had collected. King Henry VIII. died in 1547; and in a short time after, poor Leland lost his senses. He was at first seized with a deep melancholy, which was succeeded by a total deprivation of his reason. In this dreadful state he continued till the beginning of the year 1552, when he was happily released by death. He was buried in the church of St Michael le Querne, which was destroyed by the fire in 1666. Mr Leland is remembered as a man of great learning, an universal linguist, an excellent Latin poet, and a most indefatigable and skilful antiquary. On his death, King Edward VI. gave all his papers to Sir John Cheke, his tutor and Latin secretary of state. The king dying, and Sir John being obliged to leave the kingdom, he gave four folio volumes of Leland's collections to Humphrey Purefoy, Esq. which in 1612, were by his son given to William Burton, author of the history of Leicestershire. This gentleman also became possessed of the Itinerary in 8 vols folio, which, in 1632, he deposited in the Bodleian library. Many other of Leland's manuscripts, after the death of Sir John Cheke, fell into the hands of Lord Paget, Sir William Cecil, and others, which at last fortunately came into the possession of Sir John Cotton. These manuscripts were of great use to all our subsequent antiquarians, particularly Camden, Sir William Dugdale, Stowe, Lambard, Dr Batteley, Ant. Wood, &c. His Itinerary throughout most parts of England and Wales was published by Mr Hearne, 9 vols 8vo, in 1710-11; as was also his Collectanea de rebus Britannicis, 6 vols 8vo, in 1715.

Leland, John, a distinguished writer in defence of Christianity, was born at Wigan in Lancashire in 1691, of eminently pious and virtuous parents. They took the earliest care to season his mind with proper instructions; but, in his sixth year, the smallpox deprived him of his understanding and memory, and expunged all his former ideas. He continued in this deplorable state near a twelvemonth, when his faculties seemed to spring up anew; and though he did not retain the least traces of any impressions made on him before the distemper, yet he now discovered a quick apprehension and strong memory. In a few years after, his parents settled in Dublin, which situation gave him an easy introduction to learning and the sciences. When he was properly qualified by years and study, he was called to be pastor to a congregation of Protestant dissenters in that city. He was an able and acceptable preacher, but his labours were not confined to the pulpit.
The many attacks made on Christianity, and by some writers of no contemptible abilities, engaged him to consider the subject with the exactest care, and the most faithful examination. Upon the most deliberate inquiry, the truth and divine original, as well as the excellence and importance of Christianity, appearing to him with great lustre, he published answers to several authors who appeared successively in that cause. He was indeed a master in this controversy; and his history of it, styled "A View of the Deistical Writers that have appeared in England in the last and present Century," &c. is very greatly and deservedly esteemed. In the decline of life he published another laborious work, entitled "The Advantage and Necessity of the Christian Revelation, shown from the State of Religion in the ancient Heathen World, especially with respect to the Knowledge and Worship of the One true God; a Rule of Moral Duty, and a State of Future Rewards and Punishments: to which is prefixed, a long and preliminary Discourse on Natural and Revealed Religion," 2 vols 4to. This noble and extensive subject, the several parts of which have been slightly and occasionally handled by other writers, Leland has treated at large with the greatest care, accuracy, and candour. And, in his "View of the Deistical Writers," his cool and dispassionate manner of treating their arguments, and his solid confession of them, have contributed more to depress the cause of atheism and infidelity, than the angry zeal of warm disputants. But not only his learning and abilities, but also his amiable temper, great modesty, and exemplary life, recommended his memory to general esteem and affection. He died in 1766.

LELEGIS, the ancient name of Miletus, from the Leleges, the first inhabitants of it.

LELEGES, anciently a people of Asia, of Greek original: the name denoting "a collection of people:" they first occupied the islands; then passing over to the continent, they settled partly in Mysia on the Sinus Adramyttium, and partly in that part of Ionia next Caria. There were Leleges also of Laconia. These went to the Trojan war with Altes their king. Achillies plundered their Leleges, and obliged them to retire to the neighbourhood of Halicarnassus, where they fixed their habitation. The inhabitants of Laconia and of Megara also bore this name for some time, from Lelex one of their kings.

LELEX, an Egyptian, who came with a colony to Megara, where he reigned about 200 years before the Trojan war. His subjects were called from him Leleges. Also the name of a Greek who was the first king of Laconia in Peloponnesus. His subjects were also called Leleges, and the country where he reigned Legislia.

LEY, Sir Peter, an eminent painter, was born in Westphalia in the year 1617. He was placed as a disciple with Peter Grebber at Haerlem; and in 1641 was induced, by the encouragement Charles I. gave to the fine arts, to come to England. He became state-painter to Charles II. who knighted him; and being as complete a gentleman as a painter, that king took pleasure in conversing with him. He practised portrait painting, and succeeded so well that he was preferred before all his contemporaries. Hence he became perpetually involved in business; so that he was thereby prevented from going into Italy to finish the course of his studies, which in his younger days he was very desirous of: however, he made himself amends, by getting the best drawings, prints, and paintings, of the most celebrated Italian masters. Among these were the better part of the Arundel Collection, which he had from that family, many whereof were sold after his death at prodigious rates, bearing upon them his usual mark of P. L. —The advantage he reaped from this collection, the best chosen of any one of his time, appears from that admirable style which he acquired by daily conversing with the works of those great masters. In his correct draught and beautiful colouring, but more especially in the graceful airs of his heads, and the pleasing variety of his postures, together with the gentle and loose management of the draperies, he excelled most of his predecessors. Yet the critics remark, that he preserved in almost all his female faces a drowsy sweetness of the eyes peculiar to himself; for which he is reckoned a mannerist. The hands of his portraits are remarkably fine and elegantly turned; and he frequently added landscapes in the back grounds of his pictures, in a style peculiar to himself, and better suited to his subject than most men could do. He excelled likewise in crayon painting. He was familiar with, and much respected by, persons of the greatest eminence in the kingdom. He became enamoured of a beautiful English lady, to whom he was some time after married; and he purchased an estate at Kew in the county of Surrey, to which he often retired in the latter part of his life. He died of an apoplectic fit in 1680 at London; and was buried at Covent Garden church, where there is a marble monument erected to his memory, with his bust, carved by Mr Gibbons, and a Latin epitaph, written, as is said, by Mr Flatman.

LEMNA, a town of Poland, capital of Red Russia, seated in the palatinate of Lemberg, on the river Peletu. It is pretty well fortified, and defended by two citadels, one of which is seated on an eminence without the town. The square, the churches, and the public buildings, are magnificent; and it is a large and rich trading place. It has a Roman Catholic archbishop, and an Armenian bishop. When the Turks advanced, the Protestants were not tolerated. The city was reduced to the last extremity by the rebel Cossacks and Tartars, and was forced to redeem itself with a great sum of money. In 1672, it was besieged in vain by the Turks; but in 1704, was taken by storm by Charles XII of Sweden. E. Long. 23. 59. N. Lat. 49. 51.

LEMERY, Nicholas, a celebrated chemist, born at Rouen in Normandy in 1645. After having made the tour of France, he, in 1672, commenced acquaintance with M. Martyn, apothecary to Monsieur the Prince; and performed several courses of chemistry in the laboratory of this chemist at the Hotel de Condé, which brought him to the knowledge and esteem of the prince. He provided himself at length with a laboratory of his own, and might have been made a doctor of physic; but he chose to continue an apothecary, from his attachment to chemistry, in which he opened public lectures; and his confluence of scholars was so great as scarcely to allow him room to perform his operations. The true principles of chemistry in his time were but ill understood; Lemery was the first who abolished the senseless jargon of barbarous terms,
LEMURS, a famous physician, born at Ziric Zee in Zealand, in 1505. He practised physic with applause; and after his wife's death being made priest, became canon of Ziric Zee, where he died in 1560. He left several works, the principal of which is entitled De occultis natura miraculis.

LEMNOS, in Ancient Geography, a noble island in the Egean sea, near Thrace, called also Dipolis, from its consisting of two towns. The first inhabitants were the Pelasi, or rather the Thracians, who were mur-

dered by their wives. After them came the children of the Lemnian widows by the Argonauts, whose descendants were at last expelled by the Pelasi, about 1100 years before the Christian era. Lemnos is about 112 miles in circumference according to Pliney; who says, that it is often shadowed by Mount Athos, though at the distance of 87 miles. It has been called Hipisi-ipy from Queen Hipissilde. It is famous for a certain kind of earth or chalk called terra Lemnica, or terra sigillata, from the seal or impression which it can bear, and which is used for consolidating wounds. As the inhabitants were blacksmiths, the poets have taken occasion to fix the forges of Vulcan in that island, and to consecrate the whole country to his divinity. Lemnos is also celebrated for a labyrinth, which, according to some traditions, surpassed those of Crete and Egypt. Some remains of it were still visible in the age of Pliny. The island of Lemnos was reduced under the power of Athens by Miltiades.

LEMÓN. See Citrus, Botany Index.

Lemon Island, one of the Skellig islands so called; situated off the coast of the county of Kerry, in the province of Munster in Ireland. It is rather a round rock, always above water, and therefore no way dangerous to ships. An incredible number of gannets and other birds breed here; and it is remarkable that the gannet nestsles nowhere on the southern coasts of Ireland but on this rock, though many of them are seen on all parts of our coast on the wing. There is another rock on the northern coast of Ireland remarkable for the same circumstance.

LEMONADE, a liquor prepared of water, sugar, and lemon or citron juice, which is very cooling and grateful.

LEMOVICES, a people of Aquitania, situated between the Bituriges Cubi to the north, the Arverni to the east, the Cadurci to the south, and the Pictenses to the west. Now the Limosin, and La Marche.

LEMUR, the Maquac, a genus of quadrupeds belonging to the order of primates. See Mammalia Index.

LEMURES, in antiquity, spirits or hobgoblins; restless ghosts of departed persons, who return to terrify and torment the living.

These are the same with larvae, which the ancients imagined to wander round the world, to frighten good people, and plague the bad. For which reason at Rome they had lemuria or feasts instituted to appease the manes of the defunct. See Lares.

Apuleius explains the ancient notion of manes thus: the souls of men released from the bands of the body, and freed from performing their bodily functions, become a kind of demons or genii, formerly called lemu-

res. Of these lemures, those that were kind to their families were called lares familiares; but those who, for their crimes, were condemned to wander continually, without meeting with any place of rest, and terrified good men, and hurt the bad, are vulgarly called larve.

An ancient commentator on Horace mentions, that the Romans wrote lemures for remures; which last word was formed from Remus, who was killed by his brother Romulus, and who returned to the earth to torment him.
LEN

But Apuleius observes, that in the ancient Latin tongue lemures signifies the soul of a man separated from the body by death.

LEMURIA, or LEMURALIA, a feast solemnized at Rome, on the 9th of May, to pacify the manes of the dead, or in honour of the lemures.—It was instituted by Romulus, to appease the ghost of his murdered brother Remus, which he thought was continually pursuing him to revenge the horrid crime.—The name lemuria is therefore supposed to be a corruption of Lemuris, i.e. the feast of Remus. Sacrifices continued for three nights, the temples were shut up, and marriages were prohibited during the solemnity. A variety of whimsical ceremonies were performed, magical words made use of, and the ghosts desired to withdraw, without endeavouring to hurt or allight their friends above ground. The chief formalities were ablation, putting black beans into their mouths, and beating kettles and pans, to make the goblins keep their distance.

LENA, a great river of Siberia in Asia, which takes its rise in N. Lat. 50. 30. and E. Long. 124. 30. from Ferro. After traversing a large tract of country, it divides itself into five branches about Lat. 73°. Three of these run westward, and two eastward, by which it discharges itself into the icy sea. Its three western mouths lie in 143° E. Long. from Ferro, but the eastern ones extend to 153°. The current is everywhere slow, and its bed entirely free from rocks. The bottom is sandy, and the banks are in some places rocky and mountainous. Sixteen large rivers fall into the Lena during its course to the northern ocean.

LENAEA, a festival kept by the Greeks in honour of Bacchus, at which there was much feasting and Bacchalian jollity, accompanied with poetical contentions, and the exhibition of tragedies. The poor goat was generally sacrificed on the occasion, and treated with various marks of cruelty and contempt, as being naturally fond of browsing on the vine shoots.

LENCICIA, a strong town of Poland, and capital of a palatinate of the same name, with a fort seated on a rock. The nobility of the province held their diet here. It stands in a morass on the banks of the river Baura, in E. Long. 19. 17. N. Lat. 51. 52.

LENDING-HOUSES. That it should have once been conceived unlawful to exact interest for the loan of money will not appear surprising, when it is considered, that at an early period the occupations by which a man could support his family were neither so numerous nor productive as in modern times. As money, therefore, was at that time sought to remove immediate necessity, those who advanced it were influenced by benevolence and friendship. But on the extension of trade, arts, and manufactures, money lent produced much more than what was adequate to the borrower's daily support, and therefore the lender might reasonably expect from him some remuneration. To the lending of money upon interest, according to the earliest accounts we have, succeeded the practice of establishing funds for the relief of the needy, on condition that they could deposit anything in value equal to double the sum borrowed, for which they were to pay no interest.

But as, on the one hand, the idea of exacting interest for the loan of money was odious to the members of the Popish church in general, and as, on the other, it appeared highly proper and even necessary, to pay interest for money to be employed in commerce, the pontiffs themselves at length allowed the lending-house to take a moderate interest; and in order not to alarm the prejudices of those to whom the measure was odious, it was concealed under the name of being paid pro indebitate, the expression made use of in the papal bull.

It appears that lending-houses, which gave money on the receipt of pledges, at a certain interest, were by no means of recent date; for many of the houses of this nature, in Italy at least, were established in the 15th century, by Marcus Bononienis, Michael a Carcena, Cherubinus Spoletanus, Antonius Vercellensis, Bernardinus Tomitano, and others.

The lending-house at Perugia, established by Barnabas Interamennis, was inspected by Bernardinus in 1485, who augmented its capital, and in the same year established one at Assisi, which was confirmed by Pope Innocent, and visited and improved by its founder in the year 1487. He likewise established one at Mantua after formidable opposition being made to the measure, procuring for it the sanction of the pope, as Wadding informs us. The same person also founded lending-houses at Florence, Parma, Chieli, and Piacenza, in doing which he was sometimes well received, while at others he frequently met with the most formidable opposition. A house of this kind was established at Padua in the year 1491, and another at Ravenna, which were approved of and confirmed by Pope Alexander VI.

Long after the above period, lending-houses were established at Rome and Naples, that of the former city having taken place in 1539, and that of the latter probably in the following year. A lending-house was established in Nuremberg in Germany about 1618, the inhabitants having obtained from Italy the regulations of different houses, in order to select the best. In France, England, and the Netherlands, lending-houses were first known under the denomination of Lombards. Similar institutions were formed at Brussels in 1619; at Antwerp in 1620, and at Ghent in 1622.

Although such houses must be allowed to be of considerable utility under certain circumstances, especially when the interest is not allowed to be exorbitant, yet they were always odious in France; but one was established at Paris in 1626, in the reign of Louis XIII, which the managers next year were obliged to abandon. The mont de piete at that city, which has sometimes had in possession 40 casks full of gold watches that were pledged, was established by royal authority in the year 1777, as we learn from the Table de Paris, published at Hamburg in 1781.—Beckman's Hist. of Inventions.

LENFANT, James, a learned French writer, was born in 1661. After studying at Saumur, he went to Heidelberg, where he received imposition of hands for the ministry in 1684. He discharged the functions of this character with great reputation there, as chaplain to the electress dowager Palatine, and pastor in ordinary to the French church. The descent of the French into the Palatinate obliged our author to depart from Heidelberg in 1687. He went to Berlin, where the elector Frederic, afterwards king of Prussia, appointed him one of the ministers. There he continued 39 years, distinguishing himself by his writings.
He was preacher to the queen of Prussia, Charlotte Sophia; and after her death, to the late king of Prussia. In 1707 he took a journey to England and Holland, where he had the honour to preach before Queen Anne; and might have settled in London, with the title of chaplain to her majesty. In 1712 he went to Helmstadt, in 1715 to Leipzig, and in 1725 to Breslau, to search for rare books and MSS. It is not certain whether it was he that first formed the design of the Bibliotheca Germanique, which began in 1720; or whether it was suggested to him by one of the society of learned men, which took the name of Anonymous, and who ordinarily met at his house. He died in 1728. His principal works are, 1. The History of the Council of Constance, 2 vols 4to. 2. A History of the Council of Pisa, 2 vols 4to. 3. The New Testament, translated from the Greek into the French, with Notes by Besusobre and Lenfant, 2 vols 4to. 4. The History of Pope Joan, from Spanheim's Latin Dissertation. 5. Several pieces in the Bibliotheca Choisie, La Republique des Lettres, La Bibliotheque Germanique, &c.

LENGET, Nicholas du Fresnoy, l'Abbe', born at Beauvais, France, 1744, was a most fertile and useful French author on a variety of subjects, historical, geographical, political, and philosophical. The following deserve particular notice: 1. A Method of Studying History, with a Catalogue of the Principal Historians of every Age and Country, published in 1713; a work which established his reputation as an historical writer: it was translated into most of the modern languages, particularly our own, with considerable improvements, by Richard Rawlinson, LL. D., and F. R. S. and published at London in 1730, in 2 vols 8vo. 2. A Copious Abridgement of Universal History and Biography, in chronological order, under the title of Tabletae Chronologicae; which made its first appearance at Paris in 1744, in 2 vols small 8vo, and was universally admired by the literati in all parts of Europe. The author attended with great candour, as every writer ought, to well-founded judicious criticisms. In future editions he made several alterations and improvements, and from one of these, we believe, that of 1759, an English translation was made, and published at London in 1762, in 2 vols large 8vo. Du Fresnoy died in 1765; the Paris edition of 1759 was printed from the author's corrected copy; but the impression being sold off, another edition appeared in 1763, with considerable improvements by an unknown editor: to the biographical part a great number of names of respectable persons are added, not to be found in the former edition; and it has this superior advantage in the historical parts, that the general history is brought down to the year 1762. Du Fresnoy, however, has loaded his work with catalogues of saints, martyrs, councils, synods, heresies, schisms, and other ecclesiastical matters, fit only for the libraries of Popish convents and seminaries.

LENGTH, the extent of any thing material from end to end. In duration, it is applied to any space of time, whether long or short.

LENGTHENING, in ship carpentry, the operation of cutting a ship down across the middle, and adding a certain portion to her length. It is performed by sawing her planks asunder in different places of her length, on each side of the midship frame, to prevent lengthening from being too much weakened in one place. The two ends are then drawn apart to a limited distance, which must be equal to the proposed addition of length. An intermediate piece of timber is next added to the keel, upon which a sufficient number of timbers are erected, to fill up the vacancy produced by the separation. The two parts of the keelson are afterwards united by an additional piece which is scored down upon the floor timbers, and as many beams as may be necessary are fixed across the ship in the new interval. Finally, The planks of the side are prolonged so as to unite with each other; and those of the ceiling refitted in the same manner; by which the whole process is completed.

LENNOX or DUNBARTONSHIRE, a county of Scotland. See Dunbartonshire. Among the rivers of this county is the Blane, which, though itself an inconsiderable stream, has been rendered famous by the birth of George Buchanan, the celebrated Latin poet and historian. The same part of the country gave birth to the great mathematician and naturalist, Baron Napier of Merchiston, inventor of the logarithms. The title of Lennox, with the property of great part of the shire, was heretofore vested in a branch of the royal family of Stuart, with which it was reunited in the person of King James VI, whose father, Henry Lord Darnley, was son of the duke of Lennox. This prince conferred the title upon his kinsman Esme Stuart, son of John Lord d'Aubigny in France; but his race failing at the death of Charles duke of Lennox and Richmond, and the estate devolving to the crown, King Charles II. conferred both titles on his own natural son by the duchess of Portsmouth; and they are still enjoyed by his posterity. The people of Lennox are chiefly Lowlanders, though in some parts of it divine service is performed in the Erse language. The most numerous clans in this district are the Macfarlans, the Colquhouns, and the Buchanans.

LENS, a piece of glass, or any other transparent substance, the surfaces of which are so formed, that the rays of light, by passing through it, are made to change their direction, either tending to meet in a point beyond the lens, or made to become parallel after being converging or diverging; or lastly, proceeding as if they had issued from a point before they fell upon the lens. Some lenses are convex, or thicker in the middle; some concave, or thinner in the middle; some plano-convex, or plano-concave; that is, with one side flat, and the other convex or concave; and some are called meniscuses, or convex on one side and concave on the other. See DIOPTRICS.

Lenses are of two kinds, either blown or ground.

Blown LENSES, are only made use of in the single microscope, and the common method of making them has been to draw out a fine thread of the soft white glass called crystal, and to convert the end of it into a spherule by melting it at the flame of a candle. Mr Nicholson observes that window glass affords excellent spherules. A thin piece from the edge of a pane of glass one-tenth of an inch broad was held perpendicularly, and the flame of a candle was directed against it by means of the blow-pipe, when it became soft, and the lower end descended by its own weight to the distance of about two feet, where it remained suspended by
by a thin thread of glass about \( \frac{7}{10} \) of an inch in diameter. A part of this thread was applied endwise to the lower blue part of the flame of the candle without the blow-pipe, when the end became instantly white-hot, and formed a globule, which was gradually thrust towards the flame till it became sufficiently large. A number of these were made and examined, by viewing their focal images with a deep magnifier, when they appeared bright, perfect, and round.

**Ground Lenses** are such as are rubbed into the shape required, and polished. Several shapes have been proposed, but the spherical has been found to be the most practically useful. Yet by various modes of grinding, the artificers can produce no more than an approximation to a figure exactly spherical, and men of letters or others must depend entirely on the care and integrity of workmen for the sphericity of the lenses of their telescopes. Mr. Jenkins has described a machine, which being so contrived as to turn a sphere at one and the same time on two axes, cutting each other at right angles, will produce the segment of a true sphere, merely by turning round the wheels, and that without any care or skill in the workmen. See **Mechanics**.

**LENT**, a solemn time of fasting in the Christian church, observed as a time of humiliation before Easter, the great festival of our Saviour’s resurrection. Those of the Roman church, and some of the Protestant communion, maintain, that it was always a fast of 40 days, and, as such, of apostolical institution. Others think it was only of ecclesiastical institution, and that it was variously observed in different churches, and grew by degrees from a fast of 40 hours to a fast of 40 days. This is the sentiment of Morton, Bishop Taylor, Du Moulin, Daille, and others.

Anciently the manner of observing Lent among those who were piously disposed, was to abstain from food till evening; their only refreshment was a supper; and then it was indifferent whether it was flesh or any other food, provided it was used with sobriety and moderation.

Lent was thought the proper time for exercising, more abundantly, every species of charity. Thus was a meal spared from their own bodies by abridging them of a meal, was usually given to the poor; they employed their vacant hours in visiting the sick and those that were in prison, in entertaining strangers, and reconciling differences. The imperial laws forbade all prosecution of men in criminal actions, that might bring them to corporeal punishment and torture, during the whole season. This was a time of more than ordinary strictness and devotion, and therefore in many of the great churches they had religious assemblies for prayer and preaching every day. All public games and stage plays were prohibited at this season; as also the celebration of all festivals, birth days, and marriages, as unsuitable to the present occasion.

The Christians of the Greek church observe four Lents: the first commences on the 11th of November; the second is the same with our Lent; the third begins the week after Whitsuntide, and continues till the festival of St Peter and St Paul; and the fourth commences on the first of August, and lasts no longer than till the 15th. These Lents are observed with great strictness and austerity; but on Saturdays and Sundays they indulge themselves in drinking wine and using oil, which were prohibited on other days.

**LENTIL.** See ERVUM, BOTANY INDEX.

**LENTINI.** See LEONTINI.

**LENTISCUS.** See PISTACIA, BOTANY INDEX.

**LEO.** See FELIS, MAMMALIA INDEX.

**Leo**, in Astronomy, the fifth of the 12 signs of the zodiac. The stars in the constellation Leo, in Ptolemy’s catalogue are 27, besides the unformed, which are 8; in Tycho’s 203, in the Britannic catalogue 95.

**Leo X. Pope**, second son of Lorenzo de Medici, was born at Florence in December 1475, and received the baptismal name of Giovanni, or John. He received the tontsure at seven years of age, his father having destined him for the church. Being about that early period declared capable of clerical preferment, he obtained two rich abbacies through the interest of his father with Louis XI. of France, and Pope Sixtus IV. At a very early period he held no fewer than 20 church preferments, a strong proof of the most scandalous corruption, as well as of the interest which his family enjoyed. In the time of Innocent VIII, he was promoted to the high rank of cardinal, when more than 13 years of age, which took place in the year 1488. If the great influence of his father was unquestionably censurable in promoting the rapid and illegal advancement of his son, it is but justice to admit that he employed all his efforts to qualify him for such premature dignity. The learned Angelo Poliziano had the care of his early education, which was greatly accelerated by the uncommon gravity and solidity of his disposition. He was invested with the purple in 1492, going afterwards to reside at Rome as one of the sacred college. Having opposed the election of Alexander VI. to the pontificate, he found it prudent to withdraw to Florence, in which place he acquired much personal esteem; but on the invasion of Italy by Charles VIII. of France, he was involved in the expulsion of his brother Piero, and took refuge at Bologna. In 1499 he made a tour through the states of Venice, Germany, and France, going afterwards to Rome, where he lived safe and respected during the pontificate of Alexander, in consequence of his prudent behaviour.

In 1505, when 30 years of age, he began to take an active part in public affairs, and Julius II. appointed him governor of Perugia. As he adhered with unshaken resolution to the interest of the pope, he acquired the confidence of his holiness, in so eminent a manner, that he was entrusted with the direction of the papal army against France; and if he was not competent to conduct the military operations, he was of singular service in maintaining good order in the camp. He was taken prisoner at the bloody battle of Ravena in 1512, and conveyed to Milan, where the dignity of his sacred office procured him respect. From this place he found means to escape, and returned to Bologna, assuming the government of the district in the capacity of the pope’s legate.

At the election of a new pope in the room of Julius II. he was chosen to the pontificate, being then only 33 years of age. Whatever might be the leading motives of
of the conclaves for electing such a young pope, it is
agreed on all hands, that it was not effected by those
corrupt practices too common on such occasions; and
he ascended the throne under the name of Leo X, with
greater proofs of affection on the part of both Italians
and foreigners than the greater part of his predecessors.
He displayed his love of literature by the nomination
of Bembo and Sadoleti to the office of papal secre-
taries.
One of his first attempts was to free Italy from the
dominion of foreign powers; and having taken into
pay a large body of Swiss, he gained a victory over
the French in the reign of Louis XII. at the bloody
battle of Novara, by which means they were driven
from Italy; and the king of France having incurred
ecclesiastical censure, submitted in form, and receiv-
ed absolution. Having thus secured internal tranquili-
ty, he turned his attention to the encouragement of
literature and men of genius. He affected the restora-
tion of the Roman university to its former splendour
by means of new grants and privileges, and by filling
the professorships with distinguished characters from
every quarter. A Greek press was established in the
city, and all Europe was informed that persons bring-
ing ancient manuscripts to the pope would be liberally
rewarded, besides having them printed at the expense
of the holy see. He also promoted the study of orien-
tal literature, and he had the honour of founding the
first professorship of the Syriac and Chaldaic languages
at Bologna.
On the death of Louis XII. of France, and the ac-
cession of Francis I. to the throne, it soon became ap-
parent that a new war was inevitable in the north of
Italy. Leo endeavoured to remain neutral, but with-
out success, in consequence of which he joined in a
league with the emperor, the king of Aragon, the
states of Milan and Florence, and the Swiss cantons,
against the French king and the state of Venice. But
he soon found it expedient to desert his allies, and
form a union with Francis, which took place in 1515,
at an interview between the two sovereigns.
In 1517, the duke of Urbino, whom he had expell-
ed, in order to make way for his nephew Lorenzo, col-
lected an army, and by rapid movements regained his
capital and dominions, which chagrined Leo to such a
degree, that he endeavoured to raise all the Christian
princes against him. He raised an army under the
command of his nephew, and the duke was finally com-
pelled to relinquish his dominions upon honourable
terms. In this year the life of Leo was in danger,
and all his moments embittered by a conspiracy against
him in his own court. Petrucci, the chief author of
it, had formed a plan of destroying the pope by
poison; but having failed in this attempt, he withdrew
from Rome, still, however, carrying on a correspon-
dence with his secretary. Some of his letters being in-
tercepted, he was arrested on his way to Rome, and
committed to prison. He was strangled, and his ac-
complices were put to death with the severest tortures.
To shelter himself from danger, whether real or ima-
ginary, Leo created 31 new cardinals in one day,
chiefly from among his own relations, and some of
them deserving of such dignity by their virtues and
talents.
Vol. XI. Part II.
LEO, [ 762 ]

Leo

LEOMINSTER, a town of Herefordshire, in England, seated on the river Lug, which waters the north and east sides of the town, and over which there are several bridges. It is a large, handsome, populous borough; and is a great thoroughfare between South Wales and London, from which last it is distant 113 measured miles. In King John's reign it was burnt, but soon rebuilt. It was incorporated by Queen Mary, and is governed by a high steward, bailiff, recorder, &c. The best flower is said to grow here, and it has been equally noted for the best wheat, barley, and the finest bread. The inhabitants have a considerable trade in wool, gloves, leather, hat-making, &c. and there are several rivers about the town on which they have machinery. Near its church are some remains of its priory; and on a neighbouring hill are the ruins of a palace, called to this day Comfort Castle. It sends two members to parliament; and had 3238 inhabitants in 1811. W. Long. 2. 36. N. Lat. 52. 20.

LEON, an ancient town of France, in Lower Bretagne, and capital of the Leonois, with a bishop's see. It is seated near the sea, in W. Long. 3. 55. N. Lat. 48. 41.

LEON, a province of Spain, with the title of a kingdom; bounded on the north by Asturias; on the west by Galicia and Portugal; and on the south by Estremadura and Castile, which also bounds it on the east. It is about 125 miles in length, and 100 in breadth; and is divided into two almost equal parts by the river Duero, or Douro. It produces all the necessaries of life, and Leon is the capital town.

LEON, an ancient and large episcopal town of Spain, and capital of the kingdom of that name, built by the Romans in the time of Calga. It has the finest cathedral church in all Spain. It was formerly more rich and populous than at present, and had the honour of being the capital of the first Christian kingdom in Spain. It is seated between two sources of the river Esla, in W. Long. 5. 37. N. Lat. 42. 36.

LEON, Peter Cicca De, author of the history of Peru. He left Spain, his native country, at 13 years of age, in order to go into America, where he resided 17 years; and observed so many remarkable things, that he resolved to commit them to writing. The first part of his history was printed at Seville in 1553. He began it in 1541, and ended it in 1550. He was at Lima, the capital of the kingdom of Peru, when he gave the finishing stroke to it, and was then 32 years of age.

LEON DE NICARAGUA, a town of North America, in New Spain, and in the province of Nicaragua; the residence of the governor, and a bishop's see. It consists of about 1000 houses, and has several monasteries and nunneries belonging to it. At one end of the town is a lake which ebbs and flows like the sea. The town is seated at the foot of a volcano, which renders it subject to earthquakes. It was taken by the buccaneers in 1685, in sight of a Spanish army who were six to one. W. Long. 86. 56. N. Lat. 12. 25.

LEONARD DE NOBLE, St., an ancient town of France in the province of Guienne and territory of Limosin, with a considerable manufactory of cloth and paper. It is seated on the river Vienne, in E. Long. 1. 35. N. Lat. 45. 50.

LEONARDO DA VINCI. See VINCI.

LEONCLAUSIUS, John, one of the most learned men of the 16th century, was a native of Westphalia. He travelled into Turkey, and collected excellent materials for composing the Ottoman History; and it is to him the public is indebted for the best account we have of that empire. To his knowledge in the learned languages he had added that of the civil law; whereby he was very well qualified to translate the Basilica. His other versions were esteemed, though critics pretend to have found many faults in them. He died in 1593, aged 60.

LEONIDAS I, king of Sparta, a renowned warrior, slain in defending the straits of Thermopylae against Xerxes, 480 B. C. See SPARTA.

LEONINE, in poetry, is applied to a kind of verse which rhymes at every hemistich, the middle always chiming to the end. Of which kind we find several ancient hymns, epigrams, prophecies, &c.—For instance, Muretus speaking of the poetry of Lorenzo Gambara of Bresia, says,

Brixia, vestritas merdosa columna sentis,
Non sunt nostrates tergere digna natis.

The following one is from the school of Salernum:

Ut vites ponsam de potibus incipe cenum.

The origin of the word is somewhat obscure: Pasquier derives it from one Leoninus or Leonius, who excelled in this way; and dedicated several pieces to Pope Alexander III.; others derive it from Pope Leo; and others from the beast called lion, by reason it is the loftiest of all verses.

LEONTICA, feasts or sacrifices celebrated among the ancients in honour of the sun.—They were called Leontica, and the priests who officiated at them Leons, because they represented the sun under the figure of a lion radiant bearing a tiara, and gripping in his two fore paws the horns of a bull, who struggled with him in vain to disengage himself.

The critics are extremely divided about this feast. Some will have it anniversary, and to have made its return not in a solar but in a lunar year; but others hold its return more frequent, and give instances where the period was not above two hundred and twenty days.

The ceremony was sometimes also called Mithraeum, Mithras being the name of the sun among the ancient Persians. There was always a man sacrificed at these feasts, till the time of Hadrian, who prohibited it by a law. Commodus introduced the custom a little after whose time it was again exploded.

LEONTICE, LION's LEAF, a genus of plants belonging to the hexandria class; and in the natural method ranking under the 24th order, Corydaceae. See BOTANY INDEX.

LEONTINI, or LEONTIUM, in Ancient Geography, a town of Sicily on the south side of the river Erias, 20 miles north-west of Syracuse. The territory, called Campi Leontini, was extremely fertile (Cicero): those were the Campi Leucis, the ancient Leucis, according to the commentators on the poets. The name Leontini is from Leo, the impression
LEP [ 763 ]

LEONTIUM, one of the twelve towns of Achaia, whether on, or more distant from, the bay of Corinth, is uncertain. *Leontium* of Sicily. See *Leontini*.

LEONTODON, DANDELION, a genus of plants belonging to the syngenesia class, and in the natural method ranking under the 49th order, *Compositae*. See *Botany Index*.

LEONURUS, LION'S-TAIL, a genus of plants belonging to the didynamia class, and in the natural method ranking under the 42d order, *Verticillatae*. See *Botany Index*.

LEOPARD. See Felis, *Mammalia Index*.

LEOPARD'S BANE. See *Doronicum, Botany Index*.

LEPANTO, a strong and considerable town of Turkey in Europe, and in Livadia, with an archbishop's see and a strong fort. It is built on the top of a mountain, in form of a sugar-loaf; and is divided into four towns, each surrounded by walls, and commanded by a castle on the top of the mountain. The harbour is very small, and may be shut up by a chain, the entrance being but 50 feet wide. It was taken from the Turks by the Venetians in 1678; but was afterwards evacuated, and the castle demolished in 1699, in consequence of the treaty of Karlowitz. It was near this town that Don John of Austria obtained the famous victory over the Turkish fleet in 571. The produce of the adjacent country is wine, oil, corn, and rice. Turkey leather is also manufactured here. The wine would be exceedingly good if they did not pitch their vessels on the inside, but this renders the taste very disagreeable to those who are not accustomed to it. The Turks have six or seven mosques here, and the Greeks two churches. It is seated on a gulf of the same name, anciently called the gulf of Corinth. E. Long. 22° 11'. N. Lat. 38° 34'.

LEPAS, the ACON, a genus of shell-fish belonging to the order of vermes testaceae. See *Conchology Index*.

LEPIDIDUM, DITTANDER, or Pepperwort, a genus of plants belonging to the tetradynamia class, and in the natural method ranking under the 39th order, *Siliquose*. See *Botany Index*.

LEPIDOPTERA, in Zoology, an order of insects, with four wings, which are covered with imbricated scales. See *Entomology*.

LEPSMA, a genus of insects belonging to the order of *Aptera*. See *Entomology Index*.

LEPROMY, a foul cutaneous disease, appearing in dry, white, thin scurfy scabs, either on the whole body, or only some parts of it, and usually attended with a violent itching and other pains. See *Medicine Index*.

The leprosy is of various kinds, but the Jews were particularly subject to that called *Elephantiasis*. Hence the Jewish law excluded lepers from communion with mankind, banishing them into the country or uninhabited places, without excepting even kings. When a leper was cleansed, he came to the city gate, and was there examined by the priests; after which he took two live birds to the temple, and fastened one of them to a wisp of cedar and hyssop tied together with a scarlet ribbon; the second bird was killed by the leper, and the blood of it received into a vessel of water; with this water the priest sprinkled the leper, dipping the wisp and the live bird into it: this done, the live bird was let go; and the leper, having undergone this ceremony, was again admitted into society and to the use of things sacred. See Levit. xiii. 46, 47. and Levit. xiv. 1, 2. &c.

LEPTOCEPHALUS, a genus of fishes, belonging to the order of *Apodes*. See *Ichthyology Index*.

LEPTOPOLYGINGLIMI, in *Natural History*, a genus of fossil shells, distinguished by a number of minute teeth at the hinge. Specimens of these are found at Harwich cliff, and in the marl pits of Sussex.

LEPTUM, in antiquity, a small piece of money, which, according to some, was only the eighth part of an obolus; but others will have it to be a silver or brass denariu.

LEPTURA, a genus of insects belonging to the order of coleoptera. See *Entomology Index*.

LEPUS, a genus of quadrupeds belonging to the order of glires. See *Mammalia Index*.

LEPUS, the hare, in *Astronomy*, a constellation of the southern hemisphere; whose stars in Ptolemay's catalogue are 120; in that of Tycho's 13; and in the Britannic 19.

LERCHEA, a genus of plants belonging to the monadelphia class. See *Botany Index*.

LERIA, or LEIRIA, a strong town of Portugal, in Estremadura, with a castle and bishop's see. It contains about 3500 inhabitants, and was formerly the residence of the kings of Portugal. W. Long. 8° 34'. N. Lat. 39° 40'.

LERIDA, an ancient, strong, and large town of Spain, in Catalonia, with a bishop's see, an university, and a strong castle. This place declared for King Charles after the reduction of Barcelona in 1705; but it was retaken by the duke of Orleans in 1707, after the battle of Almanza. It is seated on a hill near the river Segra, and in a fertile soil, in E. Long. 3° 25'. N. Lat. 41° 31'.

LERINA, or PLANASIA, in *Ancient Geography*, one of the two small islands over against Antipolis, called also LERINAS and LERINUS. Now St Honorat, on the coast of Provence, scarce two leagues to the south of Antibes.

LERINS, the name of two islands in the Mediterranean sea, lying on the coast of Provence in France, five miles from Antibes; that near the coast, called St Margaret, is guarded by invalids, state prisoners being sent here. It was taken by the English in 1746; but Marshal Belleisle retook it in 1747. The other is called St Honorat; and it is less than the former, but has a Benedictine abbey.

LERMA, a town of Spain in Old Castile, seated on the river Arianz, with the title of a duchy. W. Long. 3° 5'. N. Lat. 42° 2'.

LERNA, in *Ancient Geography*, not far from Argos, on the confines of Lacoenia; supposed to be a town of Lacoenia, but on the borders of Argolis; the position of Pausanias allots it to, near Temenium, on the sea; without adding whether it is a town, river, or lake. According to Strabo, it is a lake, situated between the territories of Argos and Mycene, in contradiction to Pausanias. If there was a town of this name, it

5 D 2

seems
seems to have stood towards the sea, but the lake to have been more inland. Mela calls it a well known town on the Sinus Argolicus; and Statius by Lerna seems to mean something more than a lake. This, however, is the lake in which, as Strabo says, was the fabled Hydra of Hercules: therefore called Lerna An-guidera (Statius). The lake runs in a river or stream to the sea, and perhaps arises from a river (Virgil). From the lake the proverb, Lerna Malorum, took its rise; because, according to Strabo, religious purgations were performed in it; or, according to Hesychius, because the Argives threw all their filth into it.

LERNEA, a genus of animals of the class of vermes. See Helminthology Index.

LERNICA, formerly a large city in the island of Cyprus, as appears from its ruins; but is now no more than a large village, seated on the southern coast of that island, where there is a good road, and a small fort for its defence.

LE ROI LE VEU, the king's assent to public bills. See the articles Bill, Statute, and Parliament.

LERWICK, a town on the Mainland of Shetland, and the seat of the courts of that stewartry. It is situated on the spacious harbour called Lerwick or Bressay sound, and derives its only importance from the courts of law, and the vessels employed in the whaling fisheries, which make a rendezvous of the bay. It contained 1949 inhabitants in 1811. The parish extends about six miles along the sea-coast, and is in no place more than a mile in breadth. On the north and east it is bounded by the sea, which separates it from Bressay island. The surface of the parish is rocky and mountainous, but there are a number of fine arable fields on the sea-coast, the soil of which is light and sandy, but fertile and productive. Near the north end of the town there is a small fortification, called Fort Charlotte, which commands the north entry to Bressay sound, and is garrisoned by a detachment of invalids. It was completely repaired by order of government in the year 1781. There are several large cannon for commanding the harbour and protecting the town. There is a straw-plaiting manufactory at Lerwick, furnishing upwards of 50 girls with employment, who have one penny per yard for their work: 20 yards of which can be made by some of them in the course of a day. It is carried on by a company in London. There are two chalybeate springs in the vicinity of the town, but neither of them is highly impregnated, although the one is stronger than the other. W. Long. 1. 30. N. Lat. 60. 20.

LESBO, a large island in the Egean sea, on the coast of Ætolia, about 168 miles in circumference. It has been severally called Pelasgia, from the Pelasgi, by whom it was first peopled; Macarea, from Macareus who settled in it; and Lesbos, from the son-in-law and successor of Macareus, who bore the same name. The chief towns of Lemnos were Methymna and Mytilene. It was originally governed by kings, but they were afterwards subjected to the neighbouring powers. The wine which it produced was greatly esteemed by the ancients, and is still in the same repute with the moderns. The Lesbians were so debauched and dissipated, that the epithet of Lesbian was often used to signify debauchery and extravagance. Lesbos has given birth to many illustrious persons, such as Arius, Terpander, Sappho, &c. See Mitylene.

LESCAILLE, JAMES, a celebrated Dutch poet and printer, was born at Geneva. He and his daughter Catherine Lescaillle have excelled all the Dutch poets. That lady, who was surnamed the Sappho of Holland, and the tenth Muse, died in 1711. A collection of her poems has been printed, in which are the tragedies of Genserick, Wenceslaus, Herod and Mariamne, Hercules and Dejanira, Nicomedes, Ariadne, Cassandra, &c. James Lescaillle, her father, deserved the poet's crown, with which the emperor Leopold honoured him in the year 1623; he died about the year 1677, aged 67.

LESCAR, a town of France, in the department of the Lower Pyrenees, with a bishop's seat; seated on a hill, in W. Long. 0. 30. N. Lat. 43. 23.

LESGUI, a people of Asia, whose country is differently called by the Georgians Lesquiatan and Daghestan. It is bounded to the south and east by Persia and the Caspian; to the south-west and west by Georgia, the Osi, and Kosti; and to the north by the Kosti and Tartar tribes. It is divided into a variety of districts, generally independent, and governed by chiefs elected by the people. Goldenstaedt has remarked, in the Lesguis language, eight different dialects, and has classified their tribes in conformity to the observation.

The first dialect comprehends 15 tribes, which are as follow: 1. Avar, in Georgia Chushagh. The chief of this district, commonly called Avar Khan, is the most powerful prince of Lesguatian, and resides at Kabuda, on the river Aseruk. The village of Aser is, in the dialect of Andi, called Harbali. 2. Kasrak, on the high mountains, extending along a breadth of the Kois, called Karkaz. This district is dependant on the khan of the Kast Kumiye. 3. Kale, on the Kois, joining on the Andi; subject to the Avar Khan. 4. Mukratle, situated on the Karkaz, and subject to the Avar Khan. 5. Onsekul, subject to the same, and situated on the Kois. 6. Karakhe, upon the Karkaz, below Kasrak, subject to the same. 7. Gumbet, on the river Gumbet, that joins the Kois, subject to the chief of the Comyks. 8. Atrak; and, 9. Burtuma, on the Kois. 10. Anas, on the Saruma, subject to Georgia. 11. Teb, on the same river, independent. 12. Tushur, or Tumural, on the same river. 13. Akhi; and, 14. Rutal, on the same. 15. Dahar, in a valley that runs from the Alazan to the Saruma. It was formerly subject to Georgia, but is now independent. In this district are seen remains of the old wall that begins at Derbent, and probably terminates at the Alazan. The inhabitants of Derbent believe that their town was built by Alexander, and that this wall formerly extended as far as the Black sea. It is, how-
ever, probable, from many inscriptions in old Turkish, Persia, Arabic, and Roubah characters, that the wall, and the aqueducts with their various subterraneous passages, many of which are now filled up, are of high antiquity. This town suffered greatly during its siege by Sultan Amurath, who entirely destroyed the lower quarter, then inhabited by Greeks. It was again taken by Sahah Abbas. (Gaerber.) This town is the old Pylos Caspius.

The second dialect is spoken in the two following districts: 1. Dido, or Didonlis, about the source of the Samara. This district is rich in mines; a ridge of uninhabited mountains divides it from Caket. 2. Unso, on the small rivulets that join the Samara. These two districts, containing together about 1000 families, were formerly subject to Georgia, but are now independent.

The third dialect is that of Kabutah, which lies on the Samara rivulet, east of Dido, and north of Caket.

The fourth dialect is that of Andi, situated on a rivulet that rises into the Koissu. Some of its villages are subject to the Avar Khan, but the greater part to the khan of Axti. The whole consists of about 800 families.

The fifth is common to four districts, namely, 1. Akusha, on the Koissu, subject to the Usmei, or khan of the Caitaks, and Kara Caitaks, containing about 1000 families. The following custom is attributed by Colonel Gaerber to the subjects of this prince: "Whenever the Usmei has a son, he is carried round from village to village, and alternately suckled by every woman who has a child at her breast until he is weaned. This custom, by establishing a kind of brotherhood between the prince and his subjects, singularly endears them to each other." 2. Balkar. 3. Zudakara, or Zudakh, down the Koissu, subject to the Usmei. 4. Kubesha, near the Koissu. Colonel Gaerber, who wrote an account of these countries in 1728, gives the following description of this very curious place: "Kubesha is a large strong town, situated on a hill between high mountains. Its inhabitants call themselves Franki (Franks, a name common in the east to all Europeans), and relate, that their ancestors were brought hither by some accident, the particulars of which are now forgotten. The common conjecture is, that they were mariners cast away upon the coast; but those who pretend to be better versed in their history, tell the story this way:—The Greeks and Genoese, say they, came, during several centuries, a considerable trade, not only on the Black sea, but likewise on the Caspian, and were consequently acquainted with the mines contained in these mountains, from which they drew by their trade with the inhabitants great quantities of silver, copper, and other metals. In order to work these upon the spot, they sent thither a number of workmen to establish manufactories, and instruct the inhabitants. The subsequent invasions of the Arabs, Turks, and Monguls, during which the mines were filled up, and the manufactures abandoned, prevented the strangers from effecting their return, so that they continued here, and erected themselves into a republic. What renders this account the more probable is, that they are still excellent artists, and make very good fire arms, as well rifled as plain; sabres, coats of mail, and several articles in gold and silver, for exportation. They have likewise, for their own defence, small copper cannon, of three pounds calibre, cast by themselves. They coin Turkish and Persian silver money, and even now, which pass current, because they are of the full weight and value. In their valleys they have pastures and arable lands, as well as gardens; but they purchase the greater part of their corn, trusting chiefly for support to the sale of their manufactures, which are much admired in Persia, Turkey, and the Crimea. They are generally in good circumstances, are a quiet inoffensive people, but highly spirited, and independent. Their town is considered as a neutral spot, where the neighbouring princes can deposit their treasures with safety. They elect yearly twelve magistrates, to whom they pay the most unlimited obedience; and as all the inhabitants are on a footing of perfect equality, each individual is sure to have in his turn a share in the government. In the year 1725, their magistrates, as well as the Usmei, acknowledged the sovereignty of Russia, but without paying any tribute." 5. Zudakara, or Zudakh, down the Koissu, subject to the Usmei. It contains about 2000 families.

The sixth dialect belongs to the districts on the eastern slope of Caucasus, between the Turk and Derben, which are, 1. Caitak; and 2. Tabasaran, or Kara Caitak, both subject to the Usmei.

The seventh dialect is that of Kasi-Coumyk, on a branch of the Koissu, near Zudakara. This tribe has a khan, whose authority is recognized by some neighbouring districts.

The eighth dialect is that of Kuraie, belonging to the khan of Cuban.

Besides these, there are some other Lequis tribes, whose dialects Mr. Golenstendt was unable to procure. From a comparison of those which he has obtained, it appears that the language of the Lequis has no kind of affinity with any other known language, excepting only the Samoyede, to which it has a remote resemblance.

This people is probably descended from the tribes of mountaineers, known to ancient geographers under the name of Lege, or Ligyis. The strength of their country, which is a region of mountains whose passes are known only to themselves, has probably at all times secured them from foreign invasion; but as the same cause must have divided them into a number of tribes, independent of each other, and perhaps always distinguished by different dialects, it is not easy to imagine any common cause of union which can ever have assembled the whole nation, and have led them to undertake very remote conquests. Their history, therefore, were it known, would probably be very uninteresting to us. They subsist by raising cattle, and by predatory expeditions into the countries of their more wealthy neighbours. During the troubles in Persia, towards the beginning of this century, they repeatedly sacked the towns of Shamachie and Ardebil, and ravaged the neighbouring districts; and the present wretched state of Georgia and of part of Armenia, is owing to the frequency of their incursions. In their persons and dress, and in their general habits of life, as far as these are known to us, they greatly resemble the Circassians.

LESKARD, a town in Cornwall, seated in a plain,
Leslie, John, bishop of Ross in Scotland, the
son of Gavin Leslie an eminent lawyer, was born in
the year 1526, and educated at the University of
Aberdeen; of which diocese he was made official, when
but a youth. He was soon after created doctor of
civil and canon law; but being peculiarly addicted to
the study of divinity, he took orders, and became par-
son of Urie. When the Reformation began to spread
in Scotland, and disputes about religion ran high, Dr
Leslie, in 1560, distinguished himself at Edinburgh as
a principal advocate for the Romish church, and was
afterwards deputed by the chief nobility of that reli-
gion to conduce with Queen Mary on the death of her
husband the king of France, and to invite her to re-
turn to her native dominions. Accordingly, after a
short residence with her majesty, they embarked to-
gether at Calais in 1561, and landed at Leith. She
immediately made him one of her privy council, and a
senator of the college of justice. In 1564, he was made
abbot of Lindores; and on the death of Sinclair was
promoted to the bishopric of Ross. These accumulated
honours he wished not to enjoy in luxurious indolence.
The influence derived from them, he exerted to the
prosperity of his country. It is to him that Scotland is
indebted for the publication of its laws, commonly cal-
ed "The black acts of parliament," from the Saxon
character in which they were printed. At his most
earnest desire, the revision and collection of them were
committed to the great officers of the crown. In 1568,
Queen Mary having fled to England for refuge, and
being there detained a prisoner, Queen Elizabeth ap-
pointed certain commissioners at York to examine into
the cause of the dispute between Mary and her subjects.
These commissioners were met by others from the Queen
of Scots. The bishop of Ross was of the number, and
pleaded the cause of his royal mistress with great energy,
though without success; Elizabeth had no intention to
release her. Mary, disappointed in her expectations
from the conference at York, sent the bishop of Ross
ambassador to Elizabeth, who paid little attention to
his complaints. He then began to negotiate a mar-
rriage between his royal mistress and the duke of Nor-
folk; which negotiation, it is well known, proved fa-
tal to the duke, and was the cause of Leslie's being sent
to the Tower. In 1573 he was banished the kingdom,
and retired to Holland. The two following years he
spent in fruitless endeavours to engage the powers of
Europe to espouse the cause of his queen. His last ap-
lication was to the pope; but the power of the heretic
Elizabeth had no less weight with his holiness than
with the other Roman Catholic princes of Europe.
Finding all his personal applications ineffectual, he had
recourse to his pen in Queen Mary's vindication; but
Elizabeth's ultima ratio regum was too potent for all
his arguments. Bishop Leslie, during his exile, was
made coadjutor to the archbishop of Rouen. He was
at Brussels when he received the account of Queen
Mary's execution; and immediately retired to the con-
vent of Guitermburg near that city, where he died in
the year 1596. It was during the long and unfortu-
captivity of Mary, that he amused himself in writ-
ing the History of Scotland, and his other works.
The elegance and charms of literary occupations serv-
ed to assuage the violence of his woes. His know-
ledge and judgment as an historian are equally to be
commended. Where he acts as the transcriber of
Boece, there may be distinguished, indeed, some of the
inaccuracies of that writer. But, when he speaks in
his own person, he has majesties, a candour, and a
moderation, which appear not always even in authors
of the Protestant persuasion. His works are, 1. Af-
siceti animi consolationes, &c., composed for the conso-
lation of the captive queen. 2. De origine, moribus, et
gesta Scotorum. 3. De titulo et jure serenissima Mariae
Scotorum reginae, quo regnui Angliae successionem subjici
vindicat. 4. Paraphiasis ad Anglicos et Scotia. 5. De il-
lust, seminorum in repub. administranda, &c. 6. Orato-
io ad regiam Elisabetham pro libertate impetranda.
7. Paraphiasis ad nobilitatem popularam Scotiae. 8.
An account of his proceedings during his embassy in
England from 1568 to 1572, manuscript, Oxon. 9.
Apology for the bishop of Ross, concerning the duke
of Norfolk ; manuscript, Oxon. 10. Several letters,
manuscript.

Leslie, Charles, a learned divine of Ireland, the
time and place of whose birth is uncertain. He was
educated at Inniskilling; and in 1664, was created fel-
low of Trinity-college, Dublin, where he continued
till he became A.M. At the decease of his father he
came over to England, and entered himself in the
Temple at London. The study of the law very soon
disgusted him, and he turned all his attention to theo-
logy, being admitted into holy orders in 1680. In
1687, he was chosen chancellor of the church and dio-
ce of Connor, at which time he made himself ex-
trmely unpopular by his determined opposition to the
tenets of the church of Rome. He imbibed the ab-
surd and pernicious doctrines of passive obedience
and non-resistance, by which his judgment was so much
biased, that he refused to take the oath of allegiance
to King William and Queen Mary, at the revolution.
He was a strenuous champion for the cause of the
nonjurors, in defence of which he published a work in
1692, being an answer to The State of Protestants in
Ireland under the late King James's Government, writ-
ten by Archbishop King. He also wrote a paper cal-
ed The Rehearsal, originally published once a-week, and
afterwards twice, in a folio half-sheet, consisting of a
dialogue on the affairs of the times. It lasted during
six
LESSON IV

LESSONS, among ecclesiastical writers, portions of the Holy Scripture, read in Christian churches, at the time of divine service.

In the ancient church, reading the Scriptures was one part of the service of the catechumens; at which all persons were allowed to be present, in order to obtain instruction.

The church of England, in the choice of lessons, proceeds as follows: for the first lesson on ordinary days, she directs, to begin at the beginning of the year with Genesis, and so continue on, till the books of the Old Testament are read over; only omitting the Chronicles, which are for the most part the same with the books of Samuel and Kings, and other particular chapters in other books, either because they contain names of persons, places, or other matters less profitable to ordinary readers.

The course of the first lessons for Sundays is regulated after a different manner. From Advent to Septuagesima Sunday, some particular chapters of Isaiah are appointed to be read, because that book contains the clearest prophecies concerning Christ. Upon Septuagesima Sunday Genesis is begun, because that book which treats of the fall of man, and the severe judgment of God inflicted on the world for sin, best suits with a time of repentance and mortification. After Genesis, follow chapters out of the books of the Old Testament, as they lie in order; only on festival Sundays, such as Easter, Whitsunday, &c. the particular history relating to that day is appointed to be read; and on the saints days, the church appoints lessons out of the moral books, such as Proverbs, Ecclesiastes, Ecclesiasticus, &c., containing excellent instructions for the conduct of life.

As to the second lessons, the church observes the same course both on Sundays and week days: reading the Gospels and Acts of the Apostles in the morning, and the Epistles in the evening, in the order they stand in the New Testament: excepting on saints days and holidays, when such lessons are appointed as either explain the mystery, relate the history, or apply the example to us.

LESTOFF, or LESTOFF, a town of Suffolk in England, seated on the sea shore, 117 miles north-east of London. It is concerned in the fisheries of the North sea, cod, herrings, mackerels, and sprats; has a church and a dissenting meeting-house; and for its security, six 18 pounders, which they can move as occasion requires; but it has no battery. The town contained 389 inhabitants in 1811. The streets, though tolerably paved, are narrow. The coast is there very dangerous for strangers.

LESTRANGE, Sir ROGER, a celebrated writer in the 17th century, was descended from an ancient family, seated at Hunstanton-hall in the county of Norfolk, where he was born in 1616, being the youngest son of Sir Hammond L'Estrange, Bart., a zealous royalist. Having in 1644 obtained a commission from King Charles I. for reducing Lynn in Norfolk, then in possession of the parliament, his design was discovered, and his person seized. He was tried by a court-martial at Guildhall in London, and condemned to die as a spy; but was reprieved, and continued in Newgate for some time. He afterwards went beyond sea; and in August 1653 returned to England, where he applied
L'Esteane applied himself to the protector Oliver Cromwell, and
having once played before him on the bass viol, he was
by some nicknamed Oliver's fiddler. Being a man of
parts, master of an easy humorous style, but withal in
narrow circumstances, he set up a newspaper, under
the title of The Public Intelligencer, in 1663; but
which he laid down, upon the publication of the first
London gazette in 1665, having been allowed, how-
ever, a consideration by government. Some time af-
after the Popish plot, when the Tories began to gain the
ascendancy over the Whigs, he, in a paper called the
Observer, became a zealous champion for the former.
He was afterwards knighted, and served in the para-
ment called by King James II. in 1685. But things
taking a different turn in that prince's reign, in point of
liberty of conscience, from what most people expect-
ed, our author's Observators were assiduous as not at all
suiting the times. However, he continued to be
the press till King William's accession, in whose reign
he met with some trouble as a suspected person.
However, he went to his grave in peace, after he had
in a manner survived his intellects. He published a
great many political tracts, and translated several
works from the Greek, Latin, and Spanish; viz. Jos-
phus's works, Cicero's Offices, Seneca's Morals, Zas-
mat's Colloquies, Aesop's Fables, and Bonas's Guide
to Eternity. The character of his style has been va-
iously represented; his language being observed by
some to be easy and humorous, while Mr Gordon says,
'As that his productions are not fit to be read by any
who have taste or good-breeding. They are full of
phrases picked up in the streets, and nothing can be
more loose or mean.'

LESTWEITHIL, a town of Cornwall in Eng-
land, about 239 miles distant from London. It is a
well-built town, where are kept the common gaol, the
weights and measures for the whole stannary, and the
court of assizes. It stands on the river Fowey, which
brought up vessels from Fowey, before it was choked up
with sand coming from the tin mines, and therefore
its once flourishing trade is decayed; but it holds the
basholage of coal, salt, malt, and corn, in the town
of Fowey, as it does the anchorage in its harbour. It
was made a corporation by Richard earl of Cornwall
when he was king of the Romans, and has had other
charter since. It consists of seven capital burgesses
(wherof one is a mayor), and 17 assistants or common
COUNCIL. It is part of the duchy of Cornwall, to which
it pays 111. 19s. 10d. a year for its liberties. Its chief
trade is the woolen manufactory. It first returned
members to parliament in the 33d of Edward I. They
are chosen by the burgesses and assistants. It was an-
ciently the shire town. The number of inhabitants in
1811 was 825.

LETCHELADE, a town of Gloucestershire, 90
miles from London, on the borders of Oxfordshire and
Berks, and the great road to Gloucester; had ancient-
ly a munery, and a priory of black canons. In this
parish is Clay-hill. The market is on Tuesday; and it
has two fairs. It is supposed to have been a Roman
town; for a plain Roman road runs from hence to Ci-
encester; and by digging in a meadow near it some
years ago, an old building was discovered, supposed to
be a Roman bath, which was 50 feet long, 40 broad,
and 4 high, supported with 100 brick pillars, curiously
inlaid with stones of divers colours of tessellated work.
The Leech, the Cohn, the Churn, and Isis, which all
rise in the Cotswold hills, join and become one river,
called the Thames, which begins here to be navigable;
and barges take in butter, cheese, and other goods, at
its quay, for London. Population 993 in 1811.

LETHARGY, in Medicine (from leth, oblivion, and
agrum, numbness, lossiness), a disease consisting of a
profound drowsiness or sleepiness, from which the patient
can scarce be awakened; or, if awakened, he remains stu-
pid, without sense or memory, and frequently sinks a-
ain into his former sleep. See MEDICINE INDEX.

LETHARY, in Farriery. See Farriery, No. 597.

LETHE, (from element, "I hide or conceal"), in
the ancient mythology, one of the rivers of hell,
signifying oblivion or forgetfulness; its waters hav-
ing, according to poetic fiction, the peculiar quality of
making those who drank them forget every thing that
was past.

LETI, GREGORIO, an eminent Italian writer,
was descended from a family which once made a consid-
able figure at Bologna: Jerom, his father, was page to
Prince Charles de Medici; served some time in the
armies of the grand duke as captain of foot; and set-
ting at Milan, married there in 1628. He was after-
wards governor of Almanza in Calabria, and died at
Salerno in 1639. Our author was born at Milan in
1630, studied under the Jesuits at Cosenza, and was
afterwards sent by an uncle to Rome, who would have
him enter into the church; but he being adverse to it,
got to Geneva, where he studied the government and
the religion there. Thence he went to Lausanne; and
contracting an acquaintance with John Anthony Gore-
in, an eminent physician, lodged at his house, made
profession of the Calvinist religion, and married his
daughter. He settled at Geneva; where he spent al-
much twenty years, carrying on a correspondence with
learned men, especially those of Italy. Some contents
obliged him to leave that city in 1679; upon which he
went to France, and then to England, where he was
received with great civility by Charles II. who, after
his first audience, made him a present of a thousand
crowns, with a promise of the place of historiographer.
He wrote there the History of England; but that work
not pleasing the court on account of his too great lib-
erty in writing, he was ordered to leave the kingdom.
He went to Amsterdam in 1682, and was honoured
with the place of historiographer to that city. He died
suddenly in 1701. He was a man of indefatigable
application, as the multiplicity of his works show. The
principal of these are, 1. The universal monarchy of
Louis XIV. 2. The Life of Pope Sixtus V. 3. The
Life of Philip II. King of Spain. 4. The Life of the
Emperor Charles V. 5. The Life of Elizabeth, Queen
The History of Great Britain, 3 vols 12mo. 8. The
History of Geneva, &c.

LETRIM, a county of Ireland. See LETTRIM.

LETTER, a character used to express one of
the simple sounds of the voice; and as the different
simple sounds are expressed by different letters, these, by
being differently compounded, become the visible sig-
s or characters of all the modulations and mixtures of
sounds used to express our ideas in a regular language.
See LANGUAGE. Thus, as by the help of speech we
render
They are also denominated from the shape and turn of the letters; and in writing are distinguished into different hands, as round text, German text, round hand, Italian, &c. and in printing, into Roman, Italic, and black letter.

The term LETTER, or Type, among printers, not only includes the CAPITALS, SMALL CAPITALS, and small letters, but all the points, figures, and other marks cast and used in printing; and also the large ornamental letters, cut in wood or metal, which take place of the illumined letters used in manuscripts. The letters used in printing are cast at the ends of small pieces of metal, about three quarters of an inch in length; and the letter being not indented, but raised, easily gives the impression, when, after being blacked with a glutinous ink, paper is closely pressed upon it. See the articles PRINTING and TYPE. A fount of letters includes small letters, capitals, small capitals, points, figures, spaces, &c.; but besides, they have different kinds of two-line letters, only used for titles, and the beginning of books, chapters, &c. See FOUNT.

LETTER is also a writing addressed and sent to a person. See EPISTLE.

The art of epistolary writing, as the late translator of Pliny's Letters has observed, was esteemed by the Romans in the number of liberal and polite accomplishments; and we find Cicero mentioning with great pleasure, in some of his letters to Atticus, the elegant specimen he had received from his son of his genius in this way. It seems indeed to have formed part of their education; and, in the opinion of Mr Locke, it well deserves to have a share in ours. "The writing of letters (as that judicious author observes) enters so much into all the occasions of life, that no gentleman can avoid showing himself in compositions of this kind. Occurrences will daily force him to make use of his pen, which lays open his breeding, and sense, and his abilities, to a severer examination than any oral discourse." It is to be wondered we have so few writers in our own language who deserve to be pointed out as models upon such an occasion. After having named Sir William Temple, it would perhaps be difficult to add a second. The elegant writer of Cowley's life mentions him as excelling in this uncommon talent; but as that author declares himself of opinion, "That letters which pass between familiar friends, if they are written as they should be, can scarce ever be fit to see the light," the world is deprived of what no doubt would have been well worth its inspection. A late distinguished genius treats the very attempt as ridiculous, and professes himself "a mortal enemy to what they call a fine letter." His aversion, however, was not so strong, but he knew to conquer it when he thought proper; and the letter which closes his correspondence with Bishop Atterbury is, perhaps, the most genteel and many address that ever was penned to a friend in disgrace. The truth is, a fine letter does not consist in saying fine things, but in expressing ordinary ones in an uncommon manner. It is the propriété communis dicere, the art of giving grace and elegance to familiar occurrences, that constitutes the merit of this kind of writing. Mr Gay's letter, concerning the two lovers who were struck dead with the same flash of lightning, is a masterpiece of the sort; and the specimen he has there given
Letter. Given of his talents for this species of composition make it much to be regretted we have not more from the same hand.

Math's Ordinary.

Of the Style of Epistolary Composition. Purity in the choice of words, and justness of construction, joined with perspicuity, are the chief properties of this style. Accordingly Cicero says: "In writing letters, we make use of common words and expressions." And Seneca more fully, "I would have my letters to be like my discourses, when we either sit or walk together, unstudied and easy." And what prudent man, in his common discourse, aims at bright and strong figures, beautiful turns of language, or laboured periods? Nor is it always requisite to attend to exact order and method. He that is master of what he writes, will naturally enough express his thoughts without perplexity and confusion: and more than this is seldom necessary, especially in familiar letters.

Indeed, as the subjects of epistles are exceedingly various, they will necessarily require some variety in the manner of expression. If the subject be serious, weighty, and momentous, the language should be strong and solemn; in things of a lower nature, more easy and free; and upon lighter matters, jocose and pleasant. In exhortations, it ought to be lively and vigorous; in consolations, kind and compassionate; and in advising, grave and serious. In narratives, it should be clear and distinct; in requests, modest; in commendations, friendly; in prosperity cheerful, and mournful in adversity. In a word, the style ought to be accommodated to the particular nature of the thing about which it is conversant.

Besides, the different character of the person, to whom the letter is written, requires a like difference in the modes of expression. We do not use the same language to private persons, and those in a public station; to superiors, inferiors, and equals. Nor do we express ourselves alike to old men and young, to the grave and facetious, to courtiers and philosophers, to our friends and strangers. Superiors are to be addressed with respect, inferiors with courtesy, and equals with civility; and every one's character, station, and circumstances in life, with the relation we stand to him, occasion some variety in this respect. But when friends and acquaintances correspond by letters, it carries them into all the freedom and goodhumour of conversation; and the nearer it resembles that the better, since it is designed to supply the room of it. For when friends cannot enjoy each others company, the next satisfaction is to converse with each other by letters. Indeed, sometimes greater freedom is used in epistles, than the same persons would have taken in discoursing together; because, as Cicero says, "A letter does not blush." But still nothing ought to be said in a letter, which, considered in itself, would not have been fit to say in discourse; though modesty perhaps, or some other particular reason, might have prevented it. And thus it frequently happens in requests, reproofs, and other circumstances of life. A man can ask that by writing, which he could not do by word, if present; or blame what he thinks amiss in his friend with greater liberty when absent, than if they were together. From hence it is easy to judge of the fitness of any expression to stand in an epistle, only by considering, whether the same way of speaking would be proper in talking with the same person. Indeed, this difference may be allowed, that as persons have more time to think, when they write, than when they speak; a greater accuracy of language may sometimes be expected in one, than the other. However, this make no odds as to the kind of style: for every one would choose to speak as correctly as he writes, if he could. And therefore all such words and expressions as are unbecoming in conversation, should be avoided in letters; and a manly simplicity, free of all affectation, plain, but decent and agreeable, should run through the whole. This is the usual style of Cicero's epistles, in which the plainness and simplicity of his diction is accompanied with something so pleasant and engaging, that he keeps up the attention of his reader, without suffering him to tire. On the other hand, Pliny's style is succinct and witty: but generally so full of terms and quibbles upon the sound of words, as apparently render it more stiff and affected than agrees with conversation, or than a man of ease would choose in discourse, were it in his power. You may in some measure judge of Pliny's manner, by one short letter to his friend, which runs thus: "How fare you? As I do in the country? pleasantly? that is, at leisure? For which reason I do not care to write long letters, but to read them; the one as the effect of niceness, and the other of idleness. For nothing is more idle than your nice folks, or curious than your idle ones. Farewell." Every sentence here consists of an antithesis, and a jingle of words, very different from the style of conversation, and plainly the effect of study. But this was owing to, the age in which he lived, at which time the Roman eloquence was sunk into panegyricks, and an affectation of wit; for he was otherwise a man of fine sense and great learning.

Letter of Attorney, in Law, is a writing by which one person authorizes another to do some lawful act in his stead; as to give seisin of lands, to receive debts, sue a third person, &c.

The nature of this instrument is to transfer to the person to whom it is given, the whole power of the maker, to enable him to accomplish the act intended to be performed. It is either general or special; and sometimes it is made revocable, which is when a bare authority is only given; and sometimes it is irrevocable, as where debts, &c. are assigned from one person to another. It is generally held, that the power granted to the attorney must be strictly pursued; and that where it is made to three persons, two cannot execute it. In most cases, the power given by a letter of attorney determines upon the death of the person who gave it. No letter of attorney made by any seaman, &c. in any ship of war, or having letters of marque, or by their executors, &c. in order to empower any person to receive any share of prizes or bounty-money, shall be valid, unless the same be made revocable, and for the use of such seamen, and be signed and executed before, and attested by, the captain and one other of the signing officers of the ship, or the mayor or chief magistrate of some corporation.

Letter of Marque or Marque. See MARQUE.

Letters Patent or Overt, are writings sealed with the great seal of England, whereby a man is authorized to do, or enjoy any thing, which, of himself, be
LEUCA, or LEUCATE, in Ancient Geography, a promontory of Leucadia, according to Strabo, a white rock projecting into the sea towards Cephallenia, on which stood a temple of Apollo surnamed Leucadius. At his festival, which was annually celebrated here, the people were accustomed to offer an expiatory sacrifice to the god, and to avert on the head of the victim all the calamities with which they might be threatened. For this purpose, they made choice of a criminal condemned to die; and leading him to the brink of the promontory, precipitated him into the sea amidst the loud shouts of the spectators. The criminal, however, seldom perished in the water: for it was the custom to cover him with feathers, and to fasten birds to his body, which by spreading their wings might serve to break his fall. No sooner did he touch the sea, than a number of boats stationed for the purpose flew to his assistance, and drew him out; and after being thus saved, he was banished for ever from the territory of Leucadia. (Strabo, lib. x. p. 453.)

According to ancient authors, a strange opinion concerning this promontory prevailed for some time among the Greeks. They imagined that the leap of Leucata was a potent remedy against the violence of love. Hence disappointed or despairing lovers, it is said, were often known to have come to Leucadia; and, having ascended the promontory, offered sacrifices in the temple, and engaged by a formal vow to perform the desperate act, to have voluntarily precipitated themselves into the sea. Some are reported to have recovered from the effects of the fall: and among others mention is made of a citizen of Bathrton, * Ptolemy in Epirus, whose passions always taking fire at new objets, he four times had recourse to the same remedy, and always with the same success. As those who p. 491 made the trial, however, seldom took any precaution to render their fall less rapid, they were generally destroyed; and women often fell victims to this act of desperation. At Leucata was shown the tomb of Artemisia, that celebrated queen of Caria, who gave so many proofs of courage at the battle of Salamis. * Herodot. Infamed with a violent passion for a young man who lib. viii. inflexibly refused her love, she surprised him in his sleep and put out his eyes. Regret and despair soon brought her to Leucata, where she perished in the waves notwithstanding every effort to save her. Such was the end of the unhappy Sappho. Forsaken by her lover Phoas, she came hither to seek relief from her sufferings, and found her death. (Menand. ap. Strabo, lib. x. p. 452.)

LEUCIPPUS, a celebrated Greek philosopher and mathematician; first author of the famous system of atoms and vacuums, and of the hypothesis of atoms; since attributed to the moderns. He flourished about 428 B.C.

LEUCOGÆUS, in Ancient Geography, a hill situated between Puteoli and Nespolia in Campania, abounding in sulphur; now l'Alumero. Whence there were also springs called Leucogæi fontes; the waters of which, according to Pliny, gave a firmness to the teeth, clearness to the eyes, and procured a cure in wounds.

LEUCOJUM, GREAT SNOW-DROP, a genus of plants belonging to the hexandria class; and in the natural method ranking under the ninth order, Spathacae. See Botany Index.

LEUCOMA, in antiquity, was a public register amongst the Athenians, in which were inserted the names of all the citizens, as soon as they were of age to enter upon their paternal inheritance.

LEUCOMA, in Surgery, a distemper of the eyes, otherwise called albugo. See ALBEGO and SURGERY.

LEUCOPETRA, in Ancient Geography, so called from its white colour; (Strabo); a promontory of the Bruttii, in the territory of Rhegium, the termination of the Apumnae; the utmost extremity of the Bruttii, or the modern Calabria Ultra; as the Japygium is of the ancient Calabria, or the modern Calabria Citra.

LEUCOPETRIANS, in ecclesiastical history, the name of a fanatical sect which sprang up in the Greek and eastern churches towards the close of the 12th century: the fanatics of this denomination professed to believe in a double Trinity, rejected wedlock, abstained from flesh, treated with the utmost contempt the sacraments of baptism and the Lord's supper, and all the various branches of external worship; placed the essence of religion in internal prayer alone; and main-
tained, as it is said, that an evil being, or genius, dwelt in the breast of every mortal, and could be expelled from thence by no other method than by perpetual supplication to the Supreme Being. The founder of this enthusiastic sect is said to have been a person called Leucopetmus, and his chief disciple Pythias, who corrupted, by fanatical interpretations, several books of Scripture, and particularly St. Matthew’s Gospel.

LEUCOPHLEGMATIA, in Medicine, a kind of dropsey, otherwise called anosarae. See LEUCOPATRIA, MEDICINE INDEX.

LEUCOTHOE, or Leucothea, in fabulous history, the wife of Athamas, changed into a sea deity; see INO. She was called Matuta by the Romans. She had a temple at Rome, where all the people, particularly women, offered vows for their brothers children. They did not entreat the deity to protect their own children, because Ino had been unfortunate in hers. No female slaves were permitted to enter the temple; or if their curiosity tempted them to transgress this rule, they were beaten with the greatest severity. To this supplicating for other people’s children, Ovid alludes in these lines,

Non tamen hanc pro stirpe sua pia mater adorat,
Ipsa parum felix visua suae parentis. Fast. vi.

LEUCTRA, in Ancient Geography, a town of Boeotia, to the west of Thebes, or lying between Platea and Thebes, where the Lacedaemonians had a great defeat given them by Epaminondas and Pelopidas, the Theban generals. The Theban army consisted at most but of 6000 men, whereas that of the enemy was at least thrice that number; but Epaminondas trusted most in his horse, wherein he had much the advantage, both in its quality and good management; the rest he endeavoured to supply by the disposition of his men, and the vigour of the attack. He even refused to suffer any to serve under him in the engagement, but such as he knew to be fully resolved to conquer or die. He put himself at the head of the left wing, opposite to Cleombrotus king of Sparta, and placed the main stress of the battle there; rightly concluding, that if he could break the body of the Spartans, which was but 12 men deep, whereas his own was 50, the rest would be soon put to flight. He closed his own with the sacred band, which was commanded by Pelopidas; and placed his horse in the front. His right, from which he had drawn so many men, he ordered to fall back, in a slanting line, as if they declined to fight, that they might not be too much exposed to the enemy, and might serve him for a corps of reserve in case of need. This was the wise disposition which the two Theban generals made of these few but resolute forces; and which succeeded in every part, according to their wish. Epaminondas advanced with his left wing, extending it obliquely, in order to draw the enemy’s right from the main body; and Pelopidas charged them with such desperate speed and fury, at the head of his battalion, before they could reunite, that his horse, not being able to stand the shock, were forced back upon their infantry, which threw the whole into the greatest confusion: so that though the Spartans were of all the Greeks the most expert in recovering from any surprise, yet their skill on this occa-

sion either failed them or proved of no effect; and the Thebans, observing the dreadful impression they had made on them, with their horse, pushed furiously upon the Spartan king, and opened their way to him with a great slaughter.

Upon the death of Cleombrotus, and several officers of note, the Spartans, according to custom, renewed the fight with double vigour and fury, not so much to revenge his death as to recover his body, which was such an established point of honour as they could not give up without the greatest disgrace. But here the Theban general wisely chose rather to gratify them in that point, than to hazard the success of a second onset; and left them in possession of their king, whilst he marched straight against their other wing, commanded by Archidamus, and consisting chiefly of such auxiliaries and allies as had not heartily engaged in the Spartan interest: these were so discouraged by the death of the king and the defeat of that wing, that they betook themselves to flight, and were presently followed by the rest of the army. The Thebans, however, pursued them so closely, that they made a second dreadful slaughter among them; which completed Epaminondas’s victory, who remained master of the field, and erected a trophy in memory of it. This was the conclusion of the famed battle of Leuctra, in which the Lacedaemonians lost 5000 men, and the Thebans but 300.

LEVEL is an instrument which enables us to find a line parallel to the horizon, or concentric with the circumference of the earth, and to continue it to any distance:—to form a surface exactly level, having all its parts at equal distances from the earth’s centre, or to find the difference of ascent between several places for the purpose of making roads, conducting water, draining low grounds, rendering rivers navigable, forming canals, &c. &c.

Among the great variety of instruments which have been invented for these purposes, the following are the most important and useful.

Air-Level, that which shows the line of level by means of a bubble of air inclosed with some liquor in a glass tube of an indeterminate length and thickness, whose two ends are hermetically sealed. When the bubble fixes itself at a certain mark, made exactly in the middle of the tube, the plane or ruler wherein it is fixed is level. When it is not level, the bubble will rise to one end. This glass tube may be set in another of brass, having an aperture in the middle, through which the bubble of air may be observed. The liquor with which the tube is filled is oil of tartar, or aqua secunda; these not being liable to freeze as common water, nor to rarefaction and condensation, as spirit of wine is. This application of a bubble of air was the invention of Dr. Hook.

There is one of these instruments made with sights, which is an improvement upon that last described; and which, by a little additional apparatus, becomes more commodious and exact. It consists of an air level (fig. 1.), about eight inches long, and seven or eight lines in diameter, set in a brass tube 2, with an aperture in the middle, C. The tubes are supported by a straight ruler a foot long; at whose end are fixed two sights, 3, 3, exactly perpendicular to the tubes, and of an equal height, having a square hole, formed by two fillets of
of brass crossing each other at right angles, in the middle of which is drilled a very small hole, through which a point on a level with the instrument is observed. The brass tube is fastened on the ruler by means of two screws; one of which, marked 4, serves to raise or depress the tube at pleasure, for bringing it towards a level. The top of the ball and socket is riveted to a little ruler that springs, one end whereof is fastened with a screw to the great ruler, and at the other end has a screw, 5, serving to raise and depress the instrument when nearly level.

The instrument just described, however, is still less commodious than the following one; for though the holes be ever so small, they will take in too great a space to determine the point of level precisely.

The instrument allowed to consist of an air-level, with telescopic sights. This level (fig. 2.) is like the last; with this difference, that, instead of plain sights, it carries a telescope to determine exactly a point of level at a great distance. The telescope is a little brass tube, about 1½ inches long, fastened on the same ruler as the level. At the end of the tube of the telescope, marked 1, enters the little tube 1, carrying the eyeglass and a hair placed horizontally in the focus of the object-glass, 2; which little tube may be drawn out, or pushed into the great one, for adjusting the telescope to different sights: at the other end of the telescope is placed the object-glass. The screw 3, is for raising or lowering the little fork, for carrying the hair, and making it agree with the bubble of air when the instrument is level; and the screw 4, is for making the bubble of air, D or E, agree with the telescope: the whole is fitted to a ball and socket. M. Huygens is said to be the first inventor of this level; which has this advantage, that it may be inverted by turning the ruler and telescope half round; and if then the hair cut the same point that it did before, the operation is just.

It may be observed, that one may add a telescope to any kind of level, by applying it upon, or parallel to, the base or ruler, when there is occasion to take the level of remote objects.

Dr Desaguliers contrived an instrument, by which the difference of level of two places, which could not be taken in less than four or five days with the best telescopic levels, may be taken in a few hours. The instrument is as follows. To the ball C (fig. 3.) is joined a recruse tube BA, with a very fine bore, and a small bubble at top A, whose under part is open. It is evident from the make of this instrument, that if it be inclined in carrying, no injury will be done to the liquor, which will always be right both in the ball and tube when the instrument is set upright. If the air at C be so expanded with heat, as to drive the liquor to the top of the tube, the cavity A will receive the liquor, which will come down again and settle at D, or near it, according to the level of the place where the instrument is, as soon as the air at C returns to the same temperament as to heat and cold. To preserve the same degree of heat, when the different observations are made, the machine is fixed in a tin vessel EE, filled with water up to G, above the ball, and a very sensible thermometer has also its ball under water, that one may observe the liquor at D, in each experiment, when the thermometer stands at the same height as before. The water is poured out when the instrument is carried; which one may do conveniently by means of the wooden frame, which is set upright by the three screws, S, S, S. (fig. 4.), and a line and Fig. 4. and plummet PP. (fig. 5.). At the back part of the wooden frame, from the piece at top K, hangs the plummet P, over a brass point at N; M M are brackets to make the upright board KN continue at right angles with the horizontal one at N. Fig. 6. represents a front view of the machine, supposing the fore part of the tin vessel transparent; and here the brass socket of the recurve-tube, into which the ball is screwed, has two wings at II, fixed to the bottom, that the ball may not break the tube by its endeavour to emerge when the water is poured in as high as g h.

After the doctor had contrived this machine, he considered, that as the tube is of a very small bore, if the liquor should rise into the ball at A (fig. 3.) in carrying the instrument from one place to another, some of it would adhere to the sides of the ball A, and upon its descent in making the experiment, so much might be left behind, that the liquor would not be high enough at D to show the difference of the level; therefore, to prevent that inconvenience, he contrived a blank screw, to shut up the hole at A, as soon as one experiment is made, that in carrying the machine, the air in A may balance that in C, so that the liquor shall not run up and down the tube, whatever degree of heat and cold may act upon the instrument, in going from one place to another. Now, because one experiment may be made in the morning, the water may be so cold, that when a second experiment is made at noon the water cannot be brought to the same degree of cold it had in the morning; therefore, in making the first experiment, warm water must be mixed with the cold, and when the water has stood some time, before it comes to be as cold as it is likely to be at the warmest part of that day, observe and set down the degree of the thermometer at which the spirit stands, and likewise the degree of the water in the barometer at D; then screw on the cape at A, pour out the water, and carry the instrument to the place whose level you would know; then pour in your water, and when the thermometer is come to the same degree as before, open the screw at top, and observe the liquor in the barometer.

The doctor's scale for the barometer is ten inches long, and divided into tenths; so that such an instrument will serve for any heights not exceeding ten feet, each tenth of an inch answering to a foot in height.

The doctor made no allowance for the decrease of density in the air, because he did not propose this machine for measuring mountains (though, with a proper allowance for the decreasing density of the air, it will do very well), but for heights that want to be known in gardens, plantations, and the conveyance of water, where an experiment that answers two or three feet in a distance of 20 miles, will render this a very useful instrument.

Artillery Foot-Level is in form of a square, having two legs or branches of an equal length; at a juncture, whereof is a little hole, whence hangs a thread and
and plummet playing on a perpendicular line in the middle of a quadrant. It is divided into twice 45 degrees from the middle. Fig. 7.

This instrument may be used on other occasions, by placing the ends of its two branches on a plane; for when the thread plays perpendicularly over the middle division of the quadrant, the plane is assuredly level. To use it in gunnery, place the two ends on the piece of artillery, which you may raise to any proposed height, by means of the plummet, whose thread will give the degree above the level.

Carpenters and Poivres Level, consists of a long ruler, in the middle of which is fitted, at right angles, another somewhat larger. At the top of this is fastened a thread, which, when it hangs over a fiducial line at right angles with the base, shows that the base is horizontal. Sometimes this level is composed of one board. See fig. 8.

Gunnery Level, see levelling cannons and mortars, consists of a triangular brass plate, about four inches high, (fig. 9.) at the bottom of which is a portion of a circle, divided only into 45 degrees; as this number is sufficient for the highest elevation of cannons and mortars, and for giving shot the greatest range. On the centre of this segment of a circle is screwed a piece of brass, by means of which it may be fixed or screwed at pleasure. The end of this piece of brass is made so as to serve for a plummet and index, in order to show the different degrees of elevation of pieces of artillery. This instrument has also a brass foot, to set upon cannons or mortars, so that when those pieces are horizontal, the instrument will be perpendicular. The foot of this level is to be placed on the piece to be elevated, in such a manner, as that the point of the plummet may fall on the proper degree; this is what they call leveling the piece.

Masons Level, is composed of three rules, so joined as to form an isosceles triangle somewhat like a Roman A. At the vertex of this triangle is fastened a thread, from which hangs a plummet, that passes over a fiducial line, marked in the middle of the base, so that the thing to which the level is applied is horizontal; but declines from the mark, when the thing is lower on the one side than on the other.

Plumb or Pendulum Level, that which shows the horizontal lines by means of another line perpendicular to that described by a plummet or pendulum. This instrument, (fig. 10.) consists of two legs or branches, joined together at right angles. The branch which carries the thread and plummet is about a foot and a half long; and the thread is hung towards the top of the branch, at the point 2. The middle of the branch where the thread passes is hollow, so that it may hang free everywhere; but towards the bottom, where there is a little blade of silver, on which is drawn a line perpendicular to the telescope, the said cavity is covered by two pieces of brass, making as it were a kind of case, lest the wind should agitate the thread. For this reason the silver blade is covered with a glass G, in order that it may be seen when the thread and plummet play upon the perpendicular. The telescope is fastened to the other branch of the instrument, and is about two feet long; having a hair placed horizontally across the focus of the object-glass, which determines the point of the level. The telescope must be fitted at right angles to the perpendicular. It has a ball and socket, by which it is fixed to the foot, and was invented by M. Picard.

Reflecting Level, that made by means of a pretty Mariotte's long surface of water representing the same object inverted which we see erected by the eye; so that the point where these two objects appear to meet is a level with the place where the surface of the water is found. This is the invention of M. Mariotte.

There is another reflecting level consisting of a mirror of steel, or the like, well polished, and placed a little before the object-glass of a telescope, suspended perpendicularly. This mirror must make an angle of 45° with the telescope; in which case the perpendicular line of the telescope is converted into a horizontal line, which is the same with the line of level. This is the invention of M. Cassini.

Water Level, that which shows the horizontal line water by means of a surface of water or other liquid; found, or rather, deduced from this principle, that water always places itself in the lowest part of the vessel.

The most simple water level is made of a long wooden trough or canal, whose sides are parallel to the base; so that being equally filled with water, its surface shows the line of level. This is the chorobates of the ancients. See Chorobata.

It is also made with two cups fitted to the two ends of a pipe, three or four feet long, about an inch in diameter, by means of which the water communicates from the one to the other cup; and this pipe being moveable on its stand by means of a ball and socket, when the two cups become equally full of water, their two surfaces mark the line of level.

This instrument, instead of cups, may also be made with two short cylinders of glass three or four inches long, fastened to each extreme of the pipe with wax or mastic. Into the pipe is poured some common or coloured water, which shows itself through the cylinders, by means of which the line of level is determined; the height of the water, with respect to the centre of the earth, being the same in both cylinders. This level, though very simple, is yet very commodious for levelling at small distances.

De la Hove's level consists of two vessels filled with porphyry or polished metal, and communicating with each other by means of two tubes. A small cylindrical box made of metal, with thin copper or platinised tin, and terminating below in an obtuse cone, floats in each of these boxes, which are kept in a vertical position by introducing into the cone a ball of lead or a quantity of mercury. One of the boxes carries the object-glass; and the eye-glass along with the cross wires are fastened into the other, but in such a manner as to be elevated or depressed by sliding in two grooves, in order that the axes of the lenses may be exactly level, which is effected by measuring a base. See Traite du Nivellement par M. Picard. The inconveniences attending this instrument arise from the difficulty of bringing the floating eye into the same line with the axis of the object-glass, and of making the boxes settle in such a position that distinct vision may be procured through the telescope; for if the wires in the focus of the eye-glass be out of the axis, or at the smallest distance from the focus of the object-glass, the image will be both indistinct and deformed. In order that De la Hove's level may
may be perfect, it is necessary that the boxes should be of the same weight and magnitude, that the boxes which contain the water should be put nearly on a level by means of a plummet, that the same quantity of water should be introduced, and that the object-glass should be kept at the same height with the eye-glass. These conditions, which are requisite to the perfection of the level, are too numerous and difficult to be attained, to render this instrument of any use where accurate results are required.

These defects in De la Hire's level were partly remedied by M. Couplet, by inserting the object-glass and eye-glass into the same tube, and by placing this telescope loosely on two boxes which formerly floated at random on the fluid. He equalized the weight of these boxes by means of a quantity of small shot, and verified the instrument by putting one of the boxes beneath the object-glass, and the other beneath the eye-glass of the telescope. It is evident, however, that the accuracy of Couplet's level depends upon the equal distribution of the weight of all shot contained in the boxes; for if it is distributed unequally, the box will be more depressed on one side than another, and consequently the intersection of the cross wires in the focus of the eye-glass, will either recede from, or approach to the surface of the water, according as the small shot is unequally distributed in the box which supports the eye-glass, or in that which carries the object-glass. Besides this source of error, considerable inconvenience must arise in practice from the want of connection between the telescope and the two boxes upon which it floats.

The level of Deparcieux is properly an improvement upon that of Couplet. It consists of two parts, a box ABCD of light wood, in which are placed two vessels of tin EFG, EFG filled with water. These vessels are each 10 inches long, 7 inches wide, and 4½ deep, and communicate by one or more tubes GE. The other part is composed of three tubes M, M, M, and of two boxes L, L, enclosed on all sides, having 8½ inches of length, 6 of breadth, and 4 of depth, and above these are soldered the three tubes. (Fig. 1 is a vertical section, and Fig. 2 a horizontal section of the instrument). The two outermost tubes are telescopes from 18 to 36 inches long, pointed in opposite directions to prevent the necessity of changing the level, and are necessary for its adjustment and verification. A piece of lead weighing about two pounds is soldered to the bottom of each box L, L, and a weight half a pound is made to move towards Q or R by the screw RQ, in order to adjust the level by making one of the floating boxes sink deeper in the water than the other. This weight should be fixed to a small tin tube which can move easily within the greater one, and the screw is turned by means of a handle similar to that which is used for winding up a clock. The whole instrument is thus covered with a case a b to prevent the wind from agitating the water.

Method of adjusting it upon a table, and elevate one end or another by means of wedges till the intersection of the two cross wires in the focus of the eye-glass of one of the telescopes seems to fall upon a very remote object, each of these wires being moveable by screws so that their point of intersection can be varied. Then take the level out of the box ABCD, and invert its position, so that one of the two boxes EF may occupy the position which the other had before, and look through the other telescope. If the intersection of the wires falls upon the same object, their position is correct, and the axes of the telescopes are parallel; but if it falls at a distance from the object, the point of intersection must be shifted one-half of that distance towards the object, and the same operation repeated till the intersection of the hairs of one of the telescopes covers the same point of the object that is hid by the intersection of the hairs of the other telescope. When this happens, the axes of the telescopes will be exactly parallel.

The level is then placed upon its stand, which is fastened to the box at K, and a very remote object is examined with one of the telescopes, so as to find the point of it which is hid by the intersection of the wires. The level is then inverted, and the object examined with the other telescope. If the intersection of the wires covers the same point of the object as before, the level is situated, and the object is in the line of apparent level passing through the intersection of the wires. But if this is not the case, the weight P towards Q or towards R, according as the point of the object first examined is above or below the intersection of the wires, in order to make the image of the object rise or fall one-half of the distance between the points that are covered by the intersection of the wires in each observation. The operation is then repeated, till the intersection of the wires in both telescopes falls upon the same point of the object, in which case the axes of the telescopes will be exactly level, and the instrument properly adjusted. It is obvious that by moving the weight P from the position which it has when the level is adjusted, the axes of the telescopes will be inclined to the line of the level, either above or below it according as the weight is moved to one side or another. Hence, by measuring a base with a vertical object at its remote extremity, it may be easily found how many minutes or seconds correspond with a given variation in the position of the weight, merely by measuring the tangents on the vertical object; so that a scale may be engraved on the tube. TT which will exhibit the angles of inclination to the line of apparent level, formed by the axes of the telescopes when the weight P has different positions.

The mercurial level lately invented by the ingenious Keith Alexander Keith, of Pavelston, is founded on the mercurial same principle as the levels of De la Hire, Couplet, and Deparcieux, with this difference, that mercury is employed instead of water. A section of the mercurial level is represented in Fig. 3, where A, A are two oblong square cavities communicating by means of the channel MN. BB are two grooves hollowed out of the wood which contain the sights D, D', fig. 4, when the instrument is not in use. The sight D has a small hole in it, and the other is furnished with a cross hair. They are fixed into two pieces of ivory or hard wood, which are nearly of the same form as the cavities A, A, but a little smaller, so that they may go into these cavities without touching the sides. A quantity of mercury is then introduced into the communicating vessels A, A till they be about half full. The two sights are then placed in the cavities, and float on the horizontal surface of the mercury; consequently (Hydrodynamics, art. 34, 37) if the sights be of the same dimension and weight, a line joining the cross-hair in D' and the small
small hole in D will be level or parallel with the horizontal surface of the mercury. The instrument completely fitted up is represented in fig. 5, where D, D' are the sights, D' being the sight to which the eye is applied. When there is a strong wind the level is covered with a case, in which two holes are left opposite to the sights.—The preceding level might be improved by making the cross hair move up and down with a screw, and by engraving a scale on the side of the square aperture at D', whose divisions being subdivided by a scale on the circumference of the nut that moves the screw, would indicate to great accuracy the angle of inclination.

The following mode of constructing a level upon a new principle has occurred to the writer of this article.

Let AB be a reflecting surface either of glass or water, and let MN be a straight ruler held above this surface; thus it follows from optical principles that the line MN will be perpendicular to the plane AB when the object MN and its image NM' appear in the same straight line to the eye placed at M. Hence, by the eye, we may ascertain the error of a square, by placing one of its sides upon the surface of a looking glass, and applying the eye to its extremity M; for if it is inaccurate, the image of the side MN will form an angle with MN, thus if mN be the side of the square, its image will be Nm'.

Now let VV be a vessel containing either water or mercury, and let VV be the surface of the fluid. This vessel must be firmly connected with the base CD and also with the vertical plane EF perpendicular to CD by means of the cross bars ab, cd. The telescope AB is fastened to MN, another plane which rises perpendicular to the plane EF, and the plane MN is so connected with EF by means of screws, that its side MN may be made to vary its angle with the horizon, in any direction. The vessel VV, therefore, and the planes EF, CD remain fixed, while the telescope AB and the plane MN can vary their position relative to the other parts of the level. The telescope AB should be so constructed as to answer the purpose of two telescopes. It has an object-glass both at A and B, and also an eye-glass with cross wires at A and B; and these are so fitted into the tube, that when the eye is applied to the end B, the object-glass at B, and the eye-glass at A with its cross hairs, must be turned to one side so as to have distinct vision with the remaining eye-glass at B and the object-glass at A. When the eye is applied to A, the eye-glass at B and the object-glass at A are moved out of the axis of the telescope for the same reason. This contrivance is for the purpose of avoiding the necessity of having two telescopes. The cross hair in the focus of each eye-glass must be made capable of varying their position, so that the point of intersection may be shifted for the purposes of adjustment.

In order to adjust the instrument, place its base CD, upon a table, and move the telescope of the index MN till the image NM' is in the same straight line with MN. Then look through the extremity B at a distant object, and mark the point of it which is covered by the intersection of the wires. Insert the whole instrument so that the end A may be at B, adjust the index MN as before, and look through the telescope at the same object. If the intersection of the wires falls upon the same point of the object as formerly, the instrument is properly adjusted. But if not, the intersection of the cross wires in one of the eye-pieces must be varied, as in the adjustment of Deparcieux's level, till it coincides with the same point of the object that was covered at the first observation. When this happens, the instrument is duly adjusted, and may be used by placing the base CD upon a stand, and adjusting the index MN; for when this is done, the axis of the telescope will be in a line accurately horizontal.

**Level of Mr Huygens's invention, consists of a telescope a, (fig. 11) in form of a cylinder, going through a ferril, in which it is fastened by the middle. This ferril has two flat branches bb, one above, and the other below; at the ends whereof are fastened little moving pieces, which carry two rings, by one of which the telescope is suspended to a hook at the end of the screw s, and by the other a pretty heavy weight is suspended in order to keep the telescope in equilibrium. This weight hangs in the box s, which is almost filled with linseed oil, oil of walnuts, or other matter that will not easily coagulate, for more aptly settling the balance of the weight and telescope. The instrument carries two telescopes close and parallel to each other; the eye-glass of the one being against the object-glass of the other, that one may see each way without turning the level. In the focus of the object-glass of each telescope must a little hair be strained horizontally, to be raised and lowered as occasion requires by a little screw. If the tube of the telescope be not found level when suspended, a ferril or ring a, is put on it, and is to be slid along till it fixes to a level. The hook on which the instrument is hung is fixed to a flat wooden cross; at the ends of each arm whereof there is a hook serving to keep the telescope from too much agitation in using or carriage. To the said flat cross is applied another hollow one, that serves as a case for the instrument; but the two ends are left open, that the telescope may be secured from the weather and always in a condition to be used. The foot of this instrument is a round brass plate, to which are fastened three brass ferrils, moveable by means of joints whereby are put staves, and on this foot is placed the box.

Fig. 12. marked I, is a balance-level; which being suspended by the ring, the two sights, when in spirit, will be horizontal.

**Spirit-Level.** The most accurate levelling instrument, and that possessed of the greatest essential advantages in use, is the spirit-level; which was first constructed by Mr Sisson, and to which some small additions and improvements have been since made. The following is a description of one of the best of these levels, as made by the principal mathematical-instrument makers.

Fig. 3 is a representation of the instrument mounted on its complete staves. The telescope, ABC, is made of glass from 15 inches to two feet in length, as may be required. It is achromatic, of the best kind, and shows the objects clear. In the focus of the eye-glasses are exceedingly fine cross wires, the intersection of which is evidently shown to be perfectly in the axis of the tube; for by turning it round on its two supports DE, and looking through the telescope, the intersection of the wires will constantly cut the same part of the object viewed. By turning the screw s at the side of the telescope, the object-glass at a is moved; and thus the telescope is exactly...
ly adapted to the eye. If these cross wires are at any
time out of their adjustment, which is discovered by
their intersection not cutting the same part of the ob-
ject during the revolution of the telescope on its axis,
they are easily adjusted by means of the four screws
b b b, placed on the telescope about an inch from the
end for the eye. These screws act in perpendicular di-
rections to one another, by unscrewing one and tight-
ing the other opposite to the wire, so that if connect-
ed with it, it may be moved either way at pleasure;
and in this manner the other wire perpendicular to it
may be moved, and thus the intersection of the wires
brought exactly in the axis of the tube.

To the telescope is fixed, by two small screws c c,
the level tube containing the spirits, with a small bub-
ble of air. This bubble of air, when the instrument is
well adjusted, will settle exactly in the same place, in
or near the middle of its tube, whether the telescope
be reversed or not on the supporters, which in this case
are kept unmoved.

It is evident, that the axis of the telescope, or the
intersection of the wires, as before shown, must in this
case be truly level. In this easy mode of adjustment
consists the improvement of the instrument; and it is
thereby capable of being adjusted by only one station
and one object, which will at the same time determine
it to be in a true level. If by change of weather, ac-
cident, or any other cause, the instrument should have
lost its level or adjustment, it may thus be readily re-
stored and readjusted at the first station; which is an
advantage possessed by none of the instruments formerly
made. The two supporters DE, on which the level rests
and turns, are shaped like the letter Y. The telescope
rests within the upper part of them; and the inner
sides of each of these Y's are tangents to the cylindric
tube of the telescope, which is turned to a true cylin-
der, and each touches it only at one place.

The lower ends of these supporters are inserted into
a strong brass plate FE, so as to stand perpendicularly
on it. One of these is kept fast by a tightening screw
G, and to the other is applied a fine threaded screw
H, to adjust the tube, when on its supporters, to a true
level. To the supporter D is sometimes applied a line of
tangents as far as 12 degrees, in order to take
an angle of depression or elevation to that extent. Be-
tween the supporters is also sometimes fixed a compass-
box I, divided into 360 degrees, and again into four
90°; having a centre pin and needle, and trigger, at d,
to throw off the needle from the centre when not used;
so as to constitute a perfect circumferentor, connected
with all the foregoing improvements. This plane is fix-
ed on a conical brass ferrule K, which is adapted to the
bell-metal frustum of a cone at top of the brass head of
the staves, having a ball and socket, with three bell-
metal joints, two strong brass parallel plates LL, four
screws e e e e for adjusting the horizontal motion, a
regulating screw M to this motion, and a fastening screw
N to tighten it on the cone when necessary. The fast-
ening screw N, and the regulating screw M, by which
the whole instrument is moved with accuracy through
a small space in a horizontal direction, was an addition
of Mr Ramsden's.

The manner of adjusting the spirit-level at the first
station.—The whole level being now placed steadily on
its staves, it must be rendered parallel to the axis of
Vol. XI. Part II. the telescope before you adjust the horizontal motion.
For this purpose the telescope must be placed in a line
with two of the screws c c, and then levelled by these
till the bubble of air in the spirit-tube keeps its position
in the middle, while turned about to three points, mak-
ing nearly right angles at the centre to one another.

The horizontal motion being thus adjusted, the rings
ff of the Y's are to be opened, the telescope taken off
and laid the contrary way upon the supporters. If the
bubble of air then rests exactly the same, the level and
telescope are adjusted rightly to one another; but if
the bubble does not remain the same, the end to which
the air bubble goes must be noticed, and the distance
of it from the telescope altered; correcting one half
the error by the screws c c, and the other half by the
screws c c.

Now the intersection of the wires being directed
to any distant object, it may be one of the vanes of
the staves hereafter described: if they continue to be
against it precisely while the telescope is turned round
on its Y's, it proves, as before mentioned, that the axis
of the telescope coincides with the intersection of the
wires, and that the instrument will give the true level
direction.

The operation of levelling being of a very accurate
and important nature, and the best instrument when
out of its adjustment being of little use, it is quite ne-
necessary that every person using such an instrument
should have it readily in his power to correct it; and
the one above described appears to be the best adapted
for that purpose of any hitherto described.

Theory of the Spirit Level.

Let ABC, fig. 3, be a vessel of glass hermetically
sealed, its upper surface ABC being the arch of a cir-
cle whose centre is O. This vessel contains a quantity
of spirit of wine or alcohol, whose level or surface is
NEN. The line VOT intersecting the arch N n in
B, and extending to T, which is supposed to be the
centre of the earth. Therefore, (Hydrodynamics,
art. 36.) the surface NE n is the arch of a circle whose
centre is T. XYZ is a right line fixed with respect
to the radius B, and consequently with regard to the
vessel ABCD. Now let the radius O = N = T = R,
and the arch B = m.

In the present situation of the vessel the vertical line
VT coincides with the radius BO; but if the position
of the vessel is altered till BO takes the situation b o, it
will then make with VT an angle O ε T, which we
shall suppose 10°, and which may be supposed equal to
the angle O b T, as BT may be considered as parallel
to b T. The angle XVT will now become X V T, and
will vary by a quantity equal to O b T. Then by tak-
ing N N', and n n' equal to B b, the points N', n'
will be determined, which in the new position of the
vessel become the points in which the superior surface
of the fluid meets the arch ABC.

Now, calling the angle BT b = φ, we have (Euclid,
book i. prop. 32.) BO b = φ + R, and φ + 1° = φ +
R φ = b T : b O = R : r, and consequently R φ =
φ + 1°, and substituting instead of 1° and φ arcs of the same value,
having unity for radius, the product R φ will be equal
to the arc E e, which for we may take B b or m, and
5 F since
Levels are commonly made of glass tubes in the state they are obtained at the glass-house. Of these the straightest and most regular are selected and examined, by filling them nearly with spirit of wine, and ascertainning by trial that side at which the bubble moves most regularly, by equal inclinations of the instrument upon a stage, called the bubble trial, which is provided with a micrometer screw, for that purpose. The most regular side is chosen for the upper part of the instrument, the others being of little consequence to its perfection. Spirit of wine is used, because it does not freeze, and is more fluid than water. Ether is better, because still more fluid (A). The tube and the bubble must be of considerable length. The longer the bubble, the more sensible it is to the smallest inclination. A very small bubble is scarcely sensible, appears as if attached to the glass, and moves but slowly.

In the use of a level of this kind, constructed by Sieur Langlois, it was remarked, than when it was properly set, in the cool of the morning, it was no longer in the middle of the day, when the weather became hot; and that when it was again rectified for the middle of the day it became false in the evening, after the heat had diminished. The bubble was much longer in cold than in hot weather, and when longer it was too much, and could not be kept in the middle of the tube, but stood a little on the one or the other side, though the inclination was precisely the same. These defects were small, and such as claim the notice of careful observers only; but they appeared of too much consequence not to produce a wish to remedy them. It was observed, that they arose from irregularities in the interior surface of the tube; and by examining a great number of tubes, selected for levels of the same kind, there was reason to conclude that all these levels would have more or less of the same defects, because there was not one tube of a regular figure within. They were at best no otherwise cylindrical than plates of glass from the glass-house can be said to be plane before they are ground. The irregularities were easily discernible.

It was therefore concluded, that it would be advisable to grind the inner surfaces of the tubes, and give them a regular cylindrical or rather spindle form, of which the two opposite sides should correspond with portions of circles of very long radius. To accomplish this, a rod of iron was taken, of twice the length of the glass tube, and on the middle of this rod was fixed a stout tube of copper (cuivre) of the same length as the tube of glass, and nearly equal in diameter to the bore. The rod was fixed between the centres of a lathe, and the glass gently rubbed on the copper cylinder, with fine emery and water, causing it to move through its whole length. The glass was held by the middle, in order that it might be equally ground, and was from time to time shifted on its axis, as was also the copper cylinder, in order that the wear might be everywhere alike. The operation had scarcely commenced, before

(A) If the ether be not well rectified, it is subject to two great inconveniences in this use. If the tube be very slightly agitated, the ether divides itself into several bubbles, which employ a considerable time before they unite. In the second place, as this ether is decomposed in the course of time, it deposit very small drops of oil, which adhere to the tube, stop the motion of the bubble, and render the level very faulty. The ether is besides more fluid when rectified and freed from a spontaneous matter which causes its bad effects.
before the tube broke; and several others experienced the same misfortune, though they had been well annealed. It was supposed that the emery which became fixed in the copper might contribute to split the glass, each grain continuing its impression with the same point, in the same right line, which in some instances might be as well disposed as the copper. A cylinder of glass was substituted instead of the copper, and the emery rolling itself on the surface of the last, instead of fixing itself, had better success; so that every part of the circumference of the tube and the cylinder touched each other through their whole length. The same operation was continued, using finer and finer emery to smooth the tube, and prepare it for polishing; after which the tube and cylinder having been well washed, thin paper was pasted round the cylinder, and the paper was very equally covered with a small quantity of Venice tripoli. The tube was then replaced and rubbed as before, till it had acquired a polish.

A level thus ground, may be either of the proper sensibility, or too much or too little sensible. It will be too sluggish, if before grinding, exclusive of the irregularities of the tube, its diameter should much exceed in the middle of the length the diameter of the extremities; or it will be too sensible if this diameter should not exceed the other, or highly, if the middle diameter be smaller than that of the extremes, the bubble will be incapable of continuing in the middle, but will, in every case, either run to one or the other end, or be divided into two parts.

To correct these defects, and to give the instrument the required degree of perfection, it is proper to examine its figure before the grinding is entirely finished. For this purpose, after cleaning it well, a sufficient quantity of spirit of wine must be put into it; and secured by a cork at each end. The tube must then be placed on the forks or Y’s of a bubble tryer, and its sensibility, or the magnitude and regularity of the space run over by the bubble by equal changes of the micrometer screw, must be ascertained. If the run or spaces passed over be too great, they may be rendered smaller by grinding the tube on a short cylinder; but if they be too short, they may, on the contrary, be enlarged, by grinding on a longer cylinder. It is necessary, therefore, to be provided with a number of these cylinders of the same length, but different length to bring to a first figure, by grinding them in a hollow half cylinder of brass. By means of these it will be easy to regulate the tube of the level of the same degree of sensibility, after which the tube may be very quickly smoothed and polished.

The level which was thus ground is one foot in length; and the cylinder on which it was first worked is of the same length. When it was finished it was found to be too sensible. It was therefore worked on another cylinder of between nine and ten inches long, which diminished its sensibility so far, that the bubble, which is nine inches and four lines long, at the temperature of 16° of Reaumur above freezing, is carried from the middle of the tube exactly one line for every second of a degree of inclination. This degree of sensibility was thought sufficient; but any greater degree which may be required may be obtained by the process here described.

It may be remarked that a glass tube is very subject to be split by grinding its inner surface; the same tube will not be endangered by grinding its external surface even with coarse emery; and when once the polish of the inside is grounded, the danger is over, and coarse emery may be used without fear. Thick glass is more subject to this misfortune than thinner. The coarsest emery might be used of in grinding the tube here spoken of was sufficiently fine to employ one minute in descending through the height of three inches in water.

LEVELLING may be defined, the art which instructs us in finding how much higher or lower any given point on the surface of the earth is than another; or, in other words, the difference in their distance from the centre of the earth.

The practice of levelling therefore consists, 1. In finding and marking two or more points that shall be in the circumference of a circle whose centre is that of the earth. 2. In comparing the points thus found with other points, to ascertain the difference in their distances from the earth's centre.

With regard to the theory of levelling, we must observe that a plumb line, hanging freely in the air, points directly towards the centre of the earth; and a line drawn at right angles, crossing the direction of the plumb line, and touching the earth's surface, is a true level only on that particular spot; but if this line which crosses the plumb be continued for any considerable length, it will rise above the earth's surface, and the apparent level will be above the true one, because the earth is globular; and this rising will be as the square of the distance to which the said right line is produced; that is to say, however much it is raised above the earth's surface at one mile's distance, it will rise four times as much at the distance of two miles, nine times at the distance of three, &c. This is owing to the globular figure of the earth; and this rising is the difference between the true and apparent levels, the real curve of the earth being the true level, and the tangent to it the apparent level. Hence it appears, that the less distance we take betwixt any two stations, the truer will be our operations in levelling; and so soon does the difference betwixt the true and apparent levels become perceptible, that it is necessary to make an allowance for it if the distance betwixt the two stations exceeds two chains in length.

Let BD, fig. 4, be a small portion of the earth whose difference of level is required, (HYDRODYNAMICS, art. 36,) all the between points of this arch will be on a level. But a horizontal line BC meeting the vertical line AD in C, will be the apparent level at the point B; and therefore DC is the difference between the apparent and true level at the point B. The distance CD, therefore, must always be deduced from the observed heights, before we can have the true differences of level, or the difference between the distances of two points from the surface of the earth, or from the centre of curvature A.

In order to find an expression of DC, we have (Euclid, book i. prop. 47,) \( AC^2 = AB^2 + CB^2 \), and calling \( AB = R, BC = m, \) and \( CD = x, \) and considering that \( AC^2 = R^2 + x^2 \), we have the equation \( R^2 + x^2 = m^2 + R^2 \). But as the value of the arc DB is always sufficiently small, that \( CD \) may be regarded as sufficiently small when compared with \( AD \) or \( AB \), we may safely consider \( x \) as nothing in the preceding equation, which in that case becomes \( x = \frac{m^2}{2R} \). The

\[ \text{The mean} \]
The preceding formula supposes the visual ray CB to be a straight line; whereas, on account of the unequal densities of the air at different distances from the earth, the rays of light are incurved by refraction. This effect has been considered in the following table, which contains the difference between the apparent and true level, both when the refraction of the atmosphere is omitted, and taken into account.

**Table showing the Difference between the True and Apparent Levels, whether taking the Terrestrial Refraction into account or not, and marking the Errors that arise when this Refraction is omitted.**

The
The following is a simple rule for determining the depression of the true level in the practice of leveling.

"Multiply the number of Gunter's decimal statute chains that are contained in length between any two stations, where the levels are to be taken by itself, and the product arising therefrom again by 124, which is a common multiplier for all manner of distances for this purpose on account of the Earth's curvature: then divide the second product arising therefrom by 100,000; or, which is also the same, with the dash of the pen cut off five figures on the right hand side of the product, and what remains on the left side is inches, and the five figures cut off decimal parts of an inch."

The following is a Table of Curvature of the Earth, and shows the quantity below the apparent level at the end of every number of chains to 100.

</table>

Levelling is either simple or compound. The former is when the level points are determined from one station, whether the level be fixed at one of the points or between them. Compound levelling is nothing more than a repetition of many simple operations.

An example of simple levelling is given Plate CCXCVI. fig. 1, where AB are the station points of the level; CD the two points ascertained. Let the height

\[
\text{From A to C be } \quad 0 \quad 0 \quad 0
\]

\[
\text{From B to D be } \quad 0 \quad 0 \quad 0
\]

The difference \(3 \quad 0 \quad 0\) shows that B is three feet lower than A.

If the station-points of the level are above the line of sight, as in fig. 2, and the distance from A to C be six feet, and from B to D nine feet, the difference will still be three feet which B is higher than A.

As an example of compound levelling, suppose it were required to know the difference of height between the point A on the river Zome, and N on the river Relona, fig. 3. (As our author could find no satisfactory examples in any English author, he copied this and the following ones from M. Le Fèbure). In this operation stakes should be driven down at A and N, exactly level with the surface of the water; and these stakes should be so fixed, that they may not be changed until the whole operation be finished: a plan of the ground between the two rivers should then be made, by which it will be discovered, that the shortest way between the rivers is by the dotted line AC, CH, HN; from whence also the number of stations necessary to be taken will be determined. The operator will also be able to distribute them properly according to the nature and situation of the ground. In the figure, 12 stations are marked. Stakes ought to be driven in at the limits of each station, as A, B, C, D, &c. They ought to be about two or three inches above the ground, and driven 18 inches into it. Stakes should also be driven in at each station of the instrument, as 1, 2, 3, 4, &c.

The operation may be begun in the following manner. Let the first station be at 1, equally distant from the two points A and B, which themselves are distant 166 yards. Write down then in one column the first limit A; in another, the number of feet, inches, and tenths; with the points of sight indicated on the station-staff at A, viz. 7. 6. 0. In the third column, the second limit B; in the fourth, the height indicated at the station-staff B, viz. 6. 0. 0. Lastly, in the fifth column, the distance from one station-staff to the other, which in this case is 166 yards. Remove now the level to the point marked 2, which is in the middle between B and C, the two places where the station-staves are to be held; observing that B, which was the second limit in the former operation, is in the first in this. Then write down the observed heights as before; in the first column B; in the second, 6. 6. 0.; in the third, C; in the fourth, 6. 6. 2.; in the fifth 360, the distance between B and C.

It being impossible, on account of the inequality of the ground at the third station, to place the instrument in the middle between the two station-staves, find the most convenient point as at 3; then measure exactly how far this is from each station-staff, and you will find that from 3 to C is 160 yards; from 3 to D 80 yards; and the remainder of the operation will be as in the preceding station.

In the fourth operation, we must endeavour to compensate for any error which might have happened in the last. Mark out, therefore, 80 yards from the station-staff D to the point 4; and 160 yards from 4 to E; and this must be carefully attended to, as by such compensations the work may be much facilitated. Proceed in the same manner with the eight remaining stations, observing to enter every thing in its proper column; and when the whole is finished, add the sums of each column together, and then subtract the lesser from the greater; the difference, which in the present case is 4. 8. 8 shows the ground at N to be thus much lower than the ground at A.

To obtain a section of this level, draw the dotted line 00, fig. 4, either above or below the plan; which may be taken for the level or horizontal line. Let fall then perpendiculars upon this line from all the station-points and places where the station-staves were fixed. Beginning now at A, set off 7 feet 6 inches upon the line from A to a; for the height of the level point determined on the staff at this place, draw a line through...
Levelling a parallel to the dotted line o o, which will cut the third perpendicular at b, the second station-staff. Set off from this point downwards six feet to B, which shows the second limit of the first operation; and that the ground at B is one foot six inches higher than at A: place your instrument between these two lines at the height of the level line, and trace the ground according to its different heights. Now set off, on the second station-staff B, four feet six inches to C, the height determined by the level at the second station: and from C draw a line parallel to o o, which will cut the fifth perpendicular at d, the third station-staff. From this point set off 5 feet 6 inches upwards to C, which will be our second limit with respect to the preceding one, and third with respect to the first. Then draw your instrument in the middle between B and C, and delineate the ground with its inequalities. Proceed in the same manner from station to station, till you arrive at the last N, and you will have the profile of the ground over which the level was taken.

This method answers very well where only a general profile of the different stations is required; but where it is necessary to have an exact detail of the ground between the limits, we must then go to work more particularly. Suppose, therefore, the level to have been taken from A to N by another route, but on more uniform ground, in order to form a canal marked O, P, Q, R, S, T, U, X, Y. Draw a line Z, Y, fig. 5, to represent the level; and regulate the rest; then let fall on this line perpendiculars to represent the stations at the limits of each station, taking care that they be fixed accurately at their respective distances from each other. The difference between the extreme limits, in this case, ought to be the same as in the former, viz. 5 feet 4 inches ½. Set off this measure upon the perpendicular o the first limit; and from o, prolonging the perpendicular, mark off at α the height determined at the first station-staff; then do the same with the second and third, and so on with the following, till this part of the work is finished; there remains only to delineate in detail the ground between the station-staves, the distances in this example being assumed larger on account of the detail.

To obtain the section of the ground between O and P, place your instrument at one of the limits, as P, fixing it so that the cross hairs may answer to the point C; then look towards the first limit o, raising or depressing the vane till it coincides with the intersection of the cross hairs; and the line of sight from one point to the other will mark the level or horizontal line.

To set off the height of the brink of the river above the first limit, drive a stake down close to the ground at a; and place your station-staff upon it, observing where the hairs intersect the vane, which will be at 4 feet 10 inches; then laying off upon the line o o the distance from the first to the last stake, let fall from thence a perpendicular, and set off thereon 4. 10. 0. 0. to a, which gives the height at the first stake; or, which is the same, the height from the edge of the river above the surface of the water, as is evident from the section. Drive a second stake at 6, in a line between the limits; place the station-staff upon this stake, and observe the height 4. 6. intersected by the cross hairs, the instrument still remaining in the same situation. Set off on the level line the distance from the first stake a to the second b; and then let fall a perpendicular, and mark upon it 4. 6. to b, which gives the height of the ground at this place.

The small hollow c is marked out by driving down a third stake even with the ground, in the middle of it at e; but the exact distance of the second stake b from the third c, must be marked upon the level line; then let fall a perpendicular from c, and set off upon it 6. 8. o, pointed out by the cross hairs on the staff, which determines the depth of the hollow, as appears from the figure. As the distances between the stakes are now very short, they can easily be marked by the operator, who can settle any little inequalities by a comparison with those already ascertained. Proceed thus with the other stations till you arrive at the last, and you will always obtain an accurate section of your work; by which it is easy to form a just estimation of the land to be dug away, in order to form the canal, by adding the depth to be given to it.

Fig. 6. gives an example of compound levelling, where the situation is so steep and mountainous, that the staves cannot be placed at equal distances from the instrument, or where it is even impossible to make a reciprocal levelling from one station to the other.—Thus suppose the point K to be the bottom of a basin where it is required to make a fountain, the reservoir being at A; so that, in order to know the height to which the jet d'eau will rise, it is necessary to know how high the point A is above K.

In great heights such as this, it will be necessary to proceed by small descents, as from A to D. The instrument must be adjusted with all possible care; and it will even be proper, in some part of the work, to use a smaller instrument. The following is a table of the different operations used in making this level, it having been taken from M. le Febure's practice.

<table>

</table>

In this case only two levellings are made between A and D, though more would have been necessary; but they are omitted to avoid confusion. In the fourth station the height found was 16 feet 8 inches; but on account of the great length, it was requisite to reduce the apparent level to the true one, which is always necessary where the length is considerable. At the last limit we get the height from N to o; then from o to i; from i to k, fig. 7, &c., all which added together, and then corrected for the curvature, gives 47 feet 3 inches. Now, by adding each column together, and subtracting one from the other, we have 51 feet 9 inches for the height which the point A is above the bottom of the basin, and which will cause the jet d'eau to rise about 45 feet. The general section of this operation is shown at fig. 7.
but an exact profile of the mountain is more difficult, as requiring many operations; though some of these might be obtained by measuring from the level line without moving the instrument.

The last example given by our author is likewise from M. le Febure, and includes a length of near five German miles (25 of ours) in a straight line, and 9 or 10 (45 or 50 English) including the turnings and windings. In this the declivity of the river Haywood was measured from Lignebruk to Villebouorg. The first operation was to drive stakes at several parts of the river even with the water's edge; the first of which a little above the mills of Lignebruk showed the upper water-mark, and another showed the lower water-mark at the same mills. Two stakes above and below the mills of Maxurene, somewhat more than half way between Lignebruk and Villebouorg, pointed out the difference between high and low water there, and formed likewise the third and fourth limits of the operation; while the stakes above and below the mills of Villebouorg pointed out the difference between high and low water, and likewise formed the last limits of the operation.

These marks were all made at the edge of the water, exactly even with its surface, and all made at the different parts of the river nearly at the same instant of time. "The principal limits of the levelling (says Mr. Adams) being now determined and fixed, it only remains to find the level between the limits, according to the method already pointed out, using every advantage that may contribute to the success of the work, and at the same time avoiding all obstacles and difficulties that may retard or injure the operations. The first rule is always to take the shortest possible way from one limit to another, though this rule ought not to be followed if there are considerable obstacles in the way, as hills, woods, marshy ground, or if, by going aside, any advantage can be obtained." In the present case it was found necessary to deviate very considerably from the general rule, in order to take in several ponds, the surfaces of which might all be taken for a perfect level; and thus levels were frequently taken across the instrument. The difference of height between the mills of Lignebruk and Villebouorg was at last found to be about 15 feet, indicating a descent of not quite a foot in a mile.

**Levelling Staves.** Instruments used in levelling, serving to carry the marks to be observed, and at the same time to measure the heights of those marks from the ground. They usually consist of two mahogany staves ten feet long, in two parts, that slide upon one another to about 5 1/2 feet, for the more portable carriage. They are divided into 1000 equal parts, and numbered at every tenth division by 10, 20, 30, &c. to 1000; and on one side the feet and inches are also sometimes marked.

A vane slides up and down upon each set of these staves, which by brass springs will stand at any part. These vanes are about 10 inches long and 4 inches broad; the breadth is first divided into three equal parts, the two extremes painted white, the middle space divided again into three equal parts, which are less; the middle one of them is also painted white, and the two other parts black; and thus they are suited to all the common distances. These vanes have each a brass wire across a small square hole in the centre, levelling which serves to point out the height correctly, by coinciding with the horizontal wire of the telescope of the level.

**LEVEN, a river of Lenox or Danbartonshire of Scotland. See Lenox.**

**LEVER, in Mechanics, is a bar of iron or wood, one part of which being supported by a prop, all other parts turn upon that prop as their centre of motion. This instrument is of two kinds. First, the common sort, where the weight we desire to raise rests at one end of it, our strength is applied at the other end, and the prop is between both. When we stir up the fire with a poker, we make use of this lever; the poker is the lever, it rests upon one of the bars of the grate as a prop, the incumbent fire is the weight to be overcome, and the other end held in the hand is the strength or power. In this, as in all the rest, we have only to increase the distance between the strength and prop to give the man that works the instrument greater power.**

The lever of the second kind has the prop at one end, the strength is applied to the other, and the weight to be raised rests between them. Thus in raising the water-plug in the streets, the workman puts his iron lever through the hole of the plug till he reaches the ground on the other side, and, making that prop, lifts the plug with his strength at the other end of the lever. In this lever also, the greater the distance of the prop from the strength, the greater is the workman's power.

These instruments, as we see, assist the strength; but sometimes a workman is obliged to act at a disadvantage, in raising either a piece of timber or a ladder upon one end. We cannot, with grammatical propriety, call this a lever, since such a piece of timber in fact in no way contributes to raise the weight. In this case, the man who is the strength or power, is in the middle, the part of the beam already raised is the weight, the part yet at the ground is the prop on which the beam turns or rests. Here the man's strength will be diminished in proportion to the weight it sustains. The weight will be greater the nearer it is from the prop, therefore the man will bear the greater weight, the nearer he is to the prop. See Mechanics.

**LEVERET, among sportsmen, denotes a hare in the first year of her age.**

**LEVIGATION, in Pharmacy and Chemistry, the reducing hard and ponderous bodies to an impalpable powder, by grinding them on a porphyry, or in a mill.**

**LEVITE, in a general sense, means all the descendants of Levi, among whom were the Jewish priests themselves, who, being descended from Aarón, were likewise of the race of Levi. In a more particular sense, Levite is used for an order of officers in that church, who were employed in performing the manual service of the temple. They were obedient to the priests in their ministration, and brought them wood, water, and other necessities for the sacrifice. They sung and played upon instruments in the temple and in other places. They applied themselves to the study of the law, and were the ordinary judges of the country, but always subordinate to the priests. Their subsistence was the tithes of corn, fruit, and cattle, throughout
throughout Israel: but the priests were entitled to a
tenth of their tithes, by way of first fruits to the Lord.
eight and forty cities were assigned for the residence
of the Levites, of which the priests claimed thirteen,
six whereof were chosen for cities of refuge. They
were consecrated, before they entered upon their mi-
nistry, by having their flesh, washing their clothes,
and sprinkling with the water of expiation. Imposition
of hands was used in consecration, and two bullocks were
offered at the door of the tabernacle. They waited
weekly, and by turns, in the temple, beginning their
attendance on one sabbath and ending the next: During
this time they were maintained out of the offer-
ings, &c. In the time of Solomon, the number of
Levites, from the age of 20, and capable of serving,
was 30,000.

LEVITICUS, a canonical book of the Old Testa-
ment, so called from its containing the laws and regu-
lations relating to the priests, Levites, and sacrifices.

LEVITY, in Physiology, the privation or want of
weight in any body when compared with another that
is heavier than it; in which sense it stands opposed to
gravity.

LEUK, a town of Switzerland, almost in the middle
of the Valais; remarkable for its natural strength, for
the assembly of the states that often meet there, and
for its baths, whose water is so hot that it will boil
eggs.

LEUSDEN, John, a celebrated philologer, born
in 1624. He studied the learned languages and ma-
thematics at Utrecht; and then went to Amsterdam,
to converse with the rabbis, and perfect himself in the
Hebrew tongue. After which he was professor of
Hebrew at Utrecht, where he acquired a great re-
putation, and died in 1699. He wrote many valuable
works; the principal of which are, 1. Onomasticum Sa-
erum, 8vo. 2. Clavis Hebraica et Philologia Veteris
Testamenti, 4to. 3. Novi Testamenti Clavis Graeca, cum
Annotationibus Philologis, 8vo. 4. Compendium Bibli-
icum Veternis Testamenti, 8vo. 5. Compendium Graecum
Novi Testamenti; the best edition of which is that of
London, in 1668, 12mo. 6. Philologus Hebraeus, 4to.
7. Philologus Hebreo mixtus, 4to. 8. Philologus He-
braeo-Graecus, 4to. 9. Notes on Jonas, Joel, Hosea,
&c. He also gave correct editions of several learned
works.

LEUTKIRK, a town of Germany in Slesia, seat-
ed on a rivulet that falls into the Illar. It is now
subject to Wurtemberg. E. Long. 10. 10. N. Lat. 47-
53.

LEUTMERITZ, a town of Bohemia, capital of a
circle of the same name, with a bishop's see, seated on
the river Elbe, in E. Long. 14. 25. N. Lat. 50. 34.

LEUWENHOEK, Antony, a celebrated Dutch
philosopher, was born at Delft in 1632, and acquired
an extensive reputation all over Europe, by means of
his discoveries and experiments in natural history, which
were made by him with the microscope. He par-
icularly excelled in making glasses for microscopes and
spectacles; and he was a member of most of the liter-
ary societies of Europe, to which he sent a number of
valuable memoirs. Those in the Philosophical Trans-
actions and in the Paris Memoirs, extend through many
volumes; the former were extracted and published at
Leyden, in 1722. He died in 1723, at 91 years of
age.

LEY, in Law, signifies to gather or collect; as to
levy money, and to levy a fine of lands in the passing
of a fine.

LEWARDEN, a handsome, rich, and strong town
of the United Provinces, capital of Ostergow, West-
gow, Sevenwolden, and West Friesland. It was the
usual place of residence of the stadholder; and in
buildings, as well public as private, is very magni-
cent. It has several canals running through the streets,
which are of great service to their trade, especially as
they are continued to the sea and to the most consid-
erable towns of the province. E. Long. 5. 42. E. Lat.
53. 12.

LEWDNESS. See FORNICATION. — Lewdness is
punishable by our law by fine, imprisonment, &c. And
Mich. 15 Car. II. a person was indicted for open lewd-
ness, in showing his naked body in a balcony, and
other misdemeanors; and was fined 200 merks, im-
prisoned for a week, and bound to his good behaviour
for three years. 1 Sid. 168. In times past, when any
man granted a lease of his house, it was usual to insert
an express covenant, that the tenant should not enter-
tain any lewd women, &c.

LEVENTZ, a town of Upper Hungary, in the
county of Gran, and on the river of the same name,
where the Turks were defeated in 1644. E. Long. 18.
16. N. Lat. 48. 15.

LEWES, a large well built town of Sussex, in Eng-
land, seated on an eminence on the banks of the Ouse,
50 miles from London. It is famous for a bloody
battle fought near it, wherein King Henry III. was
defeated and taken prisoner by the barons; and is so
ancient, that we read the Saxon king Athelstan ap-
pointed two mint-houses here, and that in the reign of
Edward the Confessor it had 127 burgesses. It is a
borough by prescription, by the style of constables
and inhabitants. The constables are chosen yearly.
It has handsome streets and two suburbs, with six
parish churches. It carries on a great trade; and the
river Ouse runs through it, which brings goods in
boats and barges from a port eight miles off. On this
river are several iron-works, where cannon are cast for
merchant ships, besides other useful works. A charity
school was opened here in 1711, where 30 boys are
taught, clothed, and maintained, at the expense of a
private gentleman, by whom they were also furnished
with books; and 8 boys more are taught here at the
expense of other gentlemen. Here are horse-races
almost every summer for the king's plate of 100.
The roads here are deep and dirty; but then it is the
richest soil in this part of England. The market here
is on Saturday; and the fairs May 6, Whitmon-
tuesday, and October 2. The timber of this part of the
county is prodigiously large. The trees are some-
times drawn to Maidstone and other places on the
Medway, on a sort of carriage called a tug, drawn by
22 oxen a little way, and then left there for other
tugs to carry it on; so that a tree is sometimes two
or three years drawing to Chatham; because, after
the rain is once set in, it stirs no more that year, and
sometimes a whole summer is not dry enough to make
the roads passable. It is cheap living here; and the
town not being under the direction of a corporation, but governed by gentlemen, it is reckoned an excellent retreat for half-pay officers who cannot so well confine themselves to the rules of a corporation. It sends two members to parliament. Population 6221 in 1811.

LEWIS, one of the largest of the Hebrides, or Western islands of Scotland, extending about 60 miles in length from north to south, and from 13 to 14 in breadth, consisting of a great number of isles and rocks, and parted by the sea into two divisions, called Lewis and Harries, the former lying to the westward of the other. Lewis belongs to the shire of Ross; is divided by several channels, distinguished by several names, and portioned out among different proprietors; but the Lewis, strictly so called, stretches about 36 miles in length, from the north point of Bowling-head to the southern extremity of Hushness in Harries. The air is temperately cold, moist, and healthy; great part of the low ground is flooded with lakes; the rest is arable in many places, and has been counted fruitful in oats, barley, rye, flax, and hemp. The soil in these parts is a light sand, which the inhabitants manure with soot and sea-ware: but great part of the island is covered with heath. The labouring people dig the land with spades, and break the clods with small harrows, the foremost teeth of which are made of wood, and the remainder of rough heath, which smooths what the others have broken; and this harrow is drawn by one man, having a strong trace of horse-hair across his breast. Of their corn they not only make malt for ale, but likewise a strong spirit called treasareg, which is the whisky, or usquebaugh, three times distilled. Lewis abounds with convenient bays and harbours, in which are caught, in great plenty, cod, ling, and herring: here are likewise whales of different sizes, which the natives drive into the bays, and kill with harpoons. These bays afford great plenty of shell-fish, such as clams, oysters, cockles, mussels, limpets, velks; and such a prodigious quantity of spout-fish is sometimes cast up from the sand off Lochtua, that they infect the air, and render it unhealthy to the neighbouring inhabitants, who are not able to consume them, either by eating, or using them as manure for the ground. Some of these lochs and bays likewise produce small coral and coralline. The fresh-water lakes are well stored with trout and eels, and the rivers yield plenty of salmon. Along the coast are found a great number of coves, which serve as shelter for the seals and otters, which are also eaten as dainties by the inhabitants; and vast numbers of sea-fowl build upon the rocks and promontories.

The land animals reared in this island, are cows, horses, sheep, goats, hogs, and deer; all these are of a diminutive size. The beef, mutton, and pork, are juicy and delicious; the horses are active and hardy; the deer, which are of the red kind, confine themselves to the chace of Oservoirn, about 15 miles in compass, which affords tolerable pasturage; but in the winter, when the ground is covered with frost and snow, these animals are forced to feed on sea-ware, and endure all the rigour of the season, without any shelter from wood or cove, for there is not a tree to be seen; nevertheless, the roots of very large trees, which have been cut by the axe, are found in different places.

There is likewise a small grove of birch and hazel on the south-west side of Loch Stornaway.

The inhabitants of Lewis are well-proportioned, tall, fair, sanguine, strong, and healthy. They are in general sober, circumspect, and hospitable; dexterous in shooting, swimming, and leaping; bold and skilful mariners; and so temperate, that they will tug at the oar all day, without any other provision than bread and water, with a snuff of tobacco.

Along this coast we see several natural monums, or forts, called Dun; such as Dun-rowly, Dun-Coradel, and Dun-eisten. There are also the remains of some old castles, and other monuments of antiquity. At Stornaway village we see the ruins of a fortress destroyed by the English garrison sent thither by Oliver Cromwell. To the northward of Brago there is round tower built of large stones, three stories high, tapering towards the top, with a double wall, and a circular staircase between, by which one may go quite round the building. On the heaths and summits of hills there are several cairns or heaps of stones, which served either for graves or beacons. In the parish of Barvas we see a single stone called the thrushel, standing upright, above 20 feet high, and almost as much in breadth. Three stones, about 12 feet high each, are seen standing on the north side of Loch Carlyv; and many others standing single at great distances, and in remote parts of the island. But the most remarkable monument of this kind appears by the village of Clasernw. Here we find 39 pyramidal stones standing upright, about six or seven feet high from the surface, each about two feet in breadth. They are placed in form of an avenue, eight feet wide; the distance between every stone amounting to six feet, and a single piece stands at the entrance. This avenue leads to a circle of 12 stones of the same dimensions, with one in the centre 13 feet in length, and shaped like a rudder: on the east, south, and west sides of this circle, are four stones, such as those that compose this round and avenue, forming three lines, or as it were rays from the body of the circle. This is supposed to have been a Druid temple; and tradition reports, that the chief Druid stood by the large stone in the centre, and harangued the audience. At the distance of a quarter of a mile there is another circle of the same nature; but without the range and avenue. In all probability, these, as well as the monuments we have described in our account of the Orkneys, and Stonehenge on Salisbury plain, were places of worship erected by the Druids in time of Pagan superstition. The chief town in Lewis is Stornaway.

There is a considerable number of inferior adjacent isles and rocks, some of which hardly deserve to be mentioned: such as the small island Carve at the mouth of Loch Carlyv, Berinsay, Fladda, Bernera Minor and Bernera Major, Kialaisay, Cavry, Carnay, Grummen, Pabay, Shirem, Vexay, Wyas the Larger and Lesser, and the Flannan islands, which the seamen denominate the northern hunters. These are visited every summer by the inhabitants of the Lewis, who go thither in quest of fows, eggs, down, quills, and feathers, as well as to shear or kill the sheep that are kept here for pasture. As these islands are very steep and rocky, the visitors, after having landed and climbed
climbed up the rock by a ladder, uncover their heads, and, making a turn sun-wise, thank God for having escaped the danger they have undergone. In the largest island are the ruins of a chapel dedicated to St Flanna, from whom the isles derive their name. Thither the fowlers repairing, strip themselves of their upper garments, which being laid upon a stone, they advance towards the altar, and repeat three prayers; an exercise which is performed every morning and evening. They observe many other superstitious customs during their residence on these rocks; and when they have landed their boat with their purchase, return to the larger islands. Among the islands belonging to the Lewis, we may likewise take notice of the small isle of Pigmies, so called, because, it is said, bones resembling those of human creatures, but of very small dimensions, have been dug out of the ground.

The island of Lewis is divided into the two parishes of Barra and Eay, and in each of these one minister is settled; but there is a great number of churches and chapels dedicated to different saints, in the different isles which compose this cluster. All these were sanctuaries before the Reformation, but now they are divested of that privilege. The people of these islands are Presbyterians, with a few Protestants of the English communion, and a still smaller number of Roman Catholics. The Protestants observe the festivals of Christmas, Good Friday, Easter, and Michaelmas; on the last of which the individuals of both sexes perform ananniversary cavalcade. Population 13,042.

Lewis, or Louis, the name of several kings of France. See France.

Louis VII. anno 1137, was the first who had the courage to oppose the encroachments of the popes on the regal authority: Pope Innocent II. excommunicated him for appointing an archbishop of Bourges; but Lewis defended his prerogatives, and put the priests to death who had been the authors of the quarrel. In 1147, he put himself at the head of an army of 80,000 men, and marched against the Saracens, in the second crusade, but was defeated; and returning into France by sea, was taken by the Greeks, but rescued by Roger king of Sicily. His queen Eleonora accompanied him in this expedition, and being suspected of infidelity with Saladin, a young Turk, Lewis divorced her, and she was married six weeks after to Henry duke of Normandy. (Henry II. king of England). Lewis died in 1180, aged 60.

Lewis IX. anno 1226 (canonized), was one of the greatest monarchs of France, equally memorable for his valour and his virtues; but, unfortunately misled by the superstition of the times, he sacrificed his own repose, and the welfare of his kingdom, to the folly of crusading. In 1248, leaving France to the care of his mother, he embarked for Egypt, attended by his queen, his three brothers, and the flower of the French nobility. At first his victories were rapid; he took Damietta in 1249; but the following year he was defeated and taken prisoner by the Turks, with all the nobility in his train, and the greatest part of his army. The sultan sent to him in prison, to demand an exorbitant sum for his ransom; and his answer being truly noble, deserves to be recorded: "Tell the sultan, that a king of France is not to be ransomed with money; I will give the sum required for my people, and Damietta for myself." These terms were accepted, and a peace of ten years ensued. Upon his return to France, he diminished the taxes, revoked those which the cupidity of the financiers had introduced; issued several salutary edicts; founded several churches and hospitals; and effectually overturned the ecclesiastical jurisdiction of the count of Rome, by his pragmatic sanction in 1269, which established the independency of the Gallican church. Thirteen years residence in his capital indemnified his subjects for his absence; but his pious zeal prevented the enjoyment of this happiness: he embarked for the sixth crusade in 1270; and died the same year, at the siege of Tunis, aged 55.

Lewis XI. anno 1461. His oppressions obliged his subjects to enter into a league against him, styled, "Ligue de bien public," in which his brother the duke of Berri and some of the principal nobility were concerned: they solicited succours from John duke of Calabria, who joined them with 500 Swiss (the first introduction of Swiss soldiers into the French armies). His reign was almost one continued scene of civil war; and it is computed, that 4000 of his subjects were executed in public and privately, either for being in arms against him, or suspected by him. In his last illness, he drank the warm blood of children, in the vain hope of restoring his decayed strength. He died in 1483, aged 62. The posts for letters were established in his reign, owing to his eagerness for news; the first institution of this nature in Europe.

Lewis XII. anno 1462, styled the Just, and the Father of his people; memorable for his valour in the field, and his wisdom in the cabinet. A great general; but unfortunate towards the end of his reign, when he did not command his troops in person: his orders transmitted from home were misunderstood, or willfully disobeyed; and he had the mortification, before he died, to see the total expulsion of the French from the possessions he had acquired for them by his personal bravery. At 53 years of age, he married the princess Mary of England, sister of Henry VIII. and being of a delicate constitution, fell a victim (according to the French historians) to amorous dalliance; for he died in about two months after his nuptials, in 1483.

Lewis XIII. anno 1610, increased the military reputation of his country, and made considerable additions to its domains. The beginning of his reign was occupied in civil wars with his mother and his Protestant subjects; in which he was excited to continue by his famous minister Cardinal Richelieu, who attended him to the siege of Rochelle, the bulwark of the Huguenot party. This place was reduced by famine to surrender, in 1628, after a siege of more than a year. Upon this and other occasions, the king gave proofs of great personal bravery. His attachment to his ally the duke de Nevers, who succeeded to the duchy of Mantua, but was refused the investiture by Charles VI. emperor of Germany, involved him in a war with that prince, the Spaniards, and the duke of Savoy; in which Lewis was victorious; and obtained a treaty of peace, by which the duke of Mantua was guaranteed in the possession of his dominions. In 1635, a new war broke out between France and Spain, and the emperor took part with the latter: it lasted, 13 years against the emperor, and 25 against Spain, with various
LEX [ 787 ]

LE Y

various success; and the different armies kept on foot in the Low Countries, on the frontiers of France, and in Italy, in the first years of this war, paved the way for the signal victories of Louis XIV. The campaigns of these armies being a military school of discipline and experience for the French officers, besides giving them a knowledge of the countries which became the seat of war in the next reign. Lewis XIII. died 1643, aged 41.

LEWIS XIV. le Grand (king at five years of age), anno 1643. He was at first styled Dieu-donné, because the French considered him as the gift of heaven granted to their prayers after the queen had been barren 22 years. This princess (Anne of Austria) was declared regent by Lewis XIII. and saw herself under a necessity to continue the war against Philip IV. king of Spain her brother. The duke d'Enghein was made general of the French armies; and so signal was the success of this renowned warrior (afterwards prince of Condé, and known by the style of the great Condé), that his victories brought on the advantageous treaties of Munster, in 1648, between France, the emperor Ferdinand III. and Christina queen of Sweden: See BRITAIN, United PROVINCES, &c. Lewis XIV. died in 1715, aged 77.

LEWIS XV. (his great-grandson) succeeded in 1715. He was styled, in the course of his reign, the well beloved, which he lost some years before he died; and was detested and despised by his subjects for his shameful attachment to a mistress, who, through her patron the duke d'Aiguillon, governed the kingdom, and invaded the ancient rights and privileges of the people. He died in 1774, in the 64th year of his age and 50th of his reign.

LEWIS XVI. the most unfortunate of his race, and perhaps the most enlightened and virtuous of all the sovereigns of France. He was guillotined 21st January 1793. For an account of his life and character, see the article FRANCE.

LEX, LAW. See LAW.—The Roman laws were of three kinds: 1st, Such as were made by their kings.
2d, the laws of the twelve tables brought by the Duces urbani from Athens, &c. And, 3. Such as were proposed by the superior magistrates in the times of the republic. The laws of this last class were enacted in the following manner.

No law could be proposed but by some of the following magistrates, viz. the praetor, the consuls, the dictator, the interrex, the decemviri, the military tribunes, triumviri, and tribunes of the people. If any of these proposed a law, it was first committed to writing, and privately examined as to its utility and probable consequences, by some persons well qualified for the task; sometimes it was referred to the whole senate for their sentiments. It was then hung up publicly for three market days, that all the people might have time to examine it, and consider its tendency: This was called leges promulgatio, quae promulgatio. If the person who framed the bill did not see cause in the mean time to drop it, the people were convened in comitia, and he addressed them in an oration, being also seconded by his friends, setting forth the expediency and probable utility of such a law: This was called rogatio legis, because the address was always prefixed with this petitionary form of words, Velitis jubemtione, Quirites? "Will you, O Romans, consent and order this law to pass?" This being done, those that disliked the motion delivered their sentiments in opposition to it. An urn was then brought to certain priests who attended upon the occasion, into which were cast the names of the tribes, centuries, or curia, as the comitia happened to be tributa, centuria, or curia. The names were shaken together; and the first-drawn tribe or century was called prærogativa, because their suffrages were first taken. The curia that was first drawn was called principium for the same reason. The other tribes, centuries, &c. were called tribus jure vocates, centuriarum jure vocates, &c.

Matters being in this situation, the veto or negative voice of the tribunes of the people might put an entire end to the proceedings, and dissolve the assembly. The tribune's interference was called intercessio. The consul also had it in his power to stop further proceedings, by commanding any of the holidays called feriae imperatives to be observed. The comitia would of course be dissolved also by any of the persons present being seized with the falling sickness, or upon the appearance of an unlucky omen. But supposing the business to meet with no interruption of this sort, the people were each of them presented with two tablets, on one of which was written in large characters A. on the other U. R. Their disapprobation of the bill was expressed by throwing into an urn the tablet inscribed A. signifying "I forbid it," antiquo, "I prefer the old." Their assent was signified by throwing in the tablet marked U. R. i.e. uti rogas, "be it as you desire." According to the majority of these tablets the law passed or not. If it passed, it was written upon record, and carried into the treasury; this was called legem ferre. Afterwards it was engraved upon plates of brass, and hung up in the most public and conspicuous places: this was termed legem figurare, and a future repeal of this law was legem refigere.

If a law passed in the comitia curiata, it was called lex curiata; if in the comitia centuriata, it had the name of lex centuriata; but if it passed in the comitia tributa, it was termed plebiscitum. The plebs, generally bore the names of the proposers, as lex Eligens, lex Faurio, &c.

Romulus used to make laws by his own single authority, but succeeding kings sought the approbation of the people.

LEXIARCHI, at Athens, six officers, assisted by 30 inferior ones, whose business it was to lay fines upon such as came not to the public assemblies, and also to make scrutiny among such as were present.

The lexiarci kept a register of the age, manners, and abilities of the citizens, who were always enrolled at the age of 20.

LEXICON, the same with dictionary. The word is chiefly used in speaking of Greek dictionaries: it is derived from the Greek λεξικ, word, diction; of λαμα, I speak.

LEXINGTON, a town of North America, and considered as the capital of Kentucky. It stands on the head-waters of Elkhorn river. Here the courts are held, and business regularly conducted. In 1818 it contained about 7000 inhabitants, and several stores, with a good assortment of dry goods. There are manufactories of cottons and woollens, flannels, blankets, &c.

LEYDEN, in Latin Lugdunum Batavorum, one of the largest and finest cities in Holland, abounds with canals,
canals, along which are rows of lofty trees that afford very pleasant walks. An arm or small branch of the Rhine runs through it. Over the canals are 745 bridges, most of them of stone or brick. The university here is the oldest in the United Provinces: it has large privileges; a library well furnished, and particularly rich in manuscripts; a physic-garden well stocked with all sorts of plants, many of which have been brought from the Cape of Good Hope and the East Indies; an anatomy hall, well provided with skeletons; and an observatory. The professors, who are generally very eminent, read public lectures four times a-week, for which they take no money, but about three guineas are paid for a course of private lectures, which lasts a whole year. The students have no distinct habit, but all wear swords, though they generally go to the public and private lectures in their night-gowns and slippers. The salaries of the professors are from 100l. to 200l. a-year: they wear gowns only when they preside at public disputations, read public lectures, or meet in the senate; and their lectures are always in Latin. The students do not lodge in the university, but where they please in the town. The cloth manufacture here is much decayed, which formerly flourished to such a degree, that 100,000 pieces, it is said, have sometimes been made in a year. The city is famous for the long and severe siege it maintained in 1573 against the Spaniards. We cannot help mentioning the reply of that illustrious magistrate, Adrian de Verf, when the citizens represented to him the havoc made by the famine during the siege, and insisted upon his surrendering: "Friends (said he), this is my body, divide it among you to satisfy your hunger, but banish all thoughts of surrendering to the cruel and perfidious Spaniards." They took his advice, in regard to their not surrendering, and never would listen to any overtures; but told the Spaniards, they would hold out as long as they had one arm to eat and another to fight. There are some fine churches here, and many long, broad, handsome, streets; but the Papists, as at Haarlem, are more numerous than the Protestants.

LEYDEN Phial, a phial coated on the inside and outside with tinfoil, or other proper conducting substance, and furnished with a brass wire and knob, for giving the electrical shock. See ELECTRICITY INDEX.

Lucas van Leyden. See Lucas.

LEYSSERA, a genus of plants belonging to the syn-genesis class; and in the natural method ranking under the 40th order, Compositae. See BOTANY INDEX.

LEYTE, one of the Philippine islands in the East Indies, situated in E. Long. 118°. N. Lat. 11°. Its greatest length is about 40 leagues, and its circumference about 90 or 100. Its soil on the east side is very fruitful; but there are very high mountains which cut it almost through the middle, and occasion so great an alteration in the air, that when it is winter on the north side, it is summer on the southern part of the island. Thus when the inhabitants of one half of the island reap the others sow; and they have two plentiful harvests in a year, to which the rivers running down from the above-mentioned mountains contribute not a little. The island contains about 9000 inhabitants, who pay tribute to the Spaniards in rice, wax, and quills.

LHUYD, or Lloyd, Humphrey, a learned antiquarian of the 16th century, born at Denbigh, who applied himself to the study of physic; and living mostly within the walls of Denbigh castle, practised there as a physician; and died in 1570, with the character of a well-bred gentleman. He wrote and translated several pieces relative to history and antiquities; in particular, The History of Cambria, now called Wales, from Caradoc of Langcarvan, &c. but died before it was finished: however, Sir Henry Sidney, lord president of Wales, employed Dr David Powel to finish it, who published it in 1584. A new and improved edition of this work was published in 1774.

Lhuyd, Edward, keeper of the museum at Oxford, was a native of South Wales, the son of Charles Lhuyd, Esq. of Llanvorde. He was educated at Jesus College, Oxford, where he was created M. A. July 21, 1701. He was bred under Dr Plot, whom he succeeded as keeper of the Ashmolean museum, and had the use of all Vaughan's collection. With incessant labour and great exactness he employed a considerable part of his life in searching into the Welsh antiques; and perused or collected a great deal of ancient and valuable matter from their MS.; transcribed all the old charts of the monasteries that he could meet with; travelled several times over Wales, Cornwall, Scotland, Ireland, Armoric Bretagne, countries inhabited by the same people; compared their antiquities, and made observations on the whole; but died in July 1709, before he had digested them into the form of a discourse, as he intended, on the ancient inhabitants of this island. The untimely death of this excellent antiquary prevented the completing of many admirable designs. For want of proper encouragement, he did very little towards understanding the British hard's, having seen but one of those of the sixth century, and not being able to procure access to two of the principal libraries in the country. He communicated many observations to Bishop Gibson, whose edition of the Britannia he revised; and published "Archaeologia Britannica, giving some account additional to what has been hitherto published of the languages, histories, and customs, of the original inhabitants of Great Britain, from collection and observations in travels through Wales, Cornwall, Bas Bretagne, Ireland, and Scotland, vol. i. Glossography, Oxford, 1707." fol. He left in MS. a Scottish or Irish-English Dictionary, proposed to be published in 1732 by subscription, by Mr David Malcom, a minister of the church of Scotland, with additions; as also the Elements of the said language; with necessary and useful informations for propagating more effectually the English language, and for promoting the knowledge of the ancient Scottish or Irish, and very many branches of useful and curious learning. Lhuyd, at the end of his preface to the Archaeologia, promises an historical dictionary of British persons and places mentioned in ancient records. It seems to have been ready for press, though he could not set the time of publication. His collections for a second volume, which was to give an account of the antiquities, monuments, &c. in the principality of Wales, were numerous and well chosen; but, on account of a quarrel between him and Dr Wynne, then fellow, afterwards principal of the college, and bishop of St Asaph, he was refused to buy them, and they were purchased by Sir Thomas Seabright, of Beachwood in Hertfordshire, in whose library the greatest
greatest part still remain, but so indigested, and written with so many abbreviations, that nobody can undertake to publish them. They consist of about 40 volumes in folio, 10 in quarto, and above 100 smaller, and all relate to Irish or Welsh antiquities, and chiefly in those languages. Carte made extracts from them about or before 1736; but these were chiefly historical. Sir John Seabright has given Mr Pennant 23 of Luyd's MSS. Latin and English. Many of his letters to Listen, and other learned contemporaries, were given by Dr Fothergill to the university of Oxford, and are now in the Ashmolean Museum. Luyd undertook more for illustrating this part of the kingdom than any one man besides ever did, or than any one man can be equal to.

LIBANIUS, a famous Greek rhetorician and sophist in the 4th century, was born at Antioch, and had a great share in the friendship of Julian the Apostate. That prince offered him the dignity of praefectus procura; but Libanius refused it, thinking the name of sophist, or professor of eloquence, much more honourable. There are still extant several of his letters and Greek orations, by which he acquired great reputation; but his style is somewhat affected and obscure. He was a Pagan. Basil and Chrysostom were his disciples about the year 360. His letters were published at Amsterdam in 1738; his orations at Venice, 1755.

LIBANOMANTIA, in antiquity, a species of divination performed with frankincense; which, if presently caught fire, and sent forth a grateful odour, was esteemed a happy omen, and vice versa.

LIBANUS, the name of a chain of mountains of Turkey in Asia, which lie between Proper Syria, and Palestine, extending from west to east, from the Mediterranean sea as far as Arabia. The summits of these mountains are so high, that they are always covered with snow; but below are very pleasant and fruitful valleys. They were formerly famous for the great number of cedar trees growing thereon; but now there are very few remaining. Geographers distinguish this chain into Libanum and Antilibanus; the latter of which lies on the south side of the valley, rising near the ruins of Sidon, and terminates at others in Arabia, in N. Lat. 34. They are separated from each other at an equal distance throughout, and form a basson, or country, called by the ancients Cela-Syria.

LIBATION, amongst the Greeks and Romans, was an essential part of solemn sacrifices. It was also performed alone, as a drink-offering, by way of procuring the protection and favour of the gods, in the ordinary affairs of life. Libations, according to the different natures of the gods in honour of whom they were made, consisted of different liquids, but wine was the most usual. The wine offered to the gods was always unmixed with water. We meet with libations of water, libations of honey, libations of milk, and libations of oil; these are called ἅγια ῥεῖα. The libation was made with a serious deportment and solemn prayer. At sacrifices, the libation, after it had been tasted by the priest, and handed to the bystanders, was poured upon the victim. At entertainments, a little wine was generally poured out of the cup, before the liquor began to circulate, to show their gratitude to the gods for the blessings they enjoyed.

Libations were also in use among the Hebrews, who poured a kind of wine on the victim after it was killed, and the several pieces of the sacrifice were laid on the altar, ready to be consumed in the flames.

LIBAW, a sea-port town of Courland, lying on the Baltic sea, consisting entirely of wooden houses. It belongs to Russia, and is situated in E. Long. 21. 27. N. Lat. 56. 27.

LIBEL, (libellus famosus), taken in its largest and most extensive sense, signifies any writing, picture, or the like, of an immoral or illegal tendency; but, in a peculiar sense, is used to denote a malicious defamation of any person, and especially a magistrate, made public by either printing, writing, signs or pictures, in order to provoke him to wrath, or expose him to public hatred, contempt and ridicule. The direct tendency of these libels is the breach of the public peace by stirring up the public to revenge, and perhaps to bloodshed. The communication of a libel to any one person is a publication in the eye of the law: and therefore the sending an abusive private letter to a man is as much a libel as if it were openly printed, for it equally tends to a breach of the peace.

With regard to libels in general, there are, as in many other cases, two remedies; one by indictment, and another by action. The former for the public offence; for every libel has a tendency to break the peace, or provoke others to break it: which offence is the same whether the matter contained be true or false; and therefore the defendant, on an indictment for publishing a libel, is not allowed to allege the truth of it by way of justification. But in the remedy by action on the case, which is to repair the party in damages for the injury done him, the defendant may, as for words spoken, justify the truth of the facts, and show that the plaintiff has received no injury at all. What was said with regard to words spoken, will also hold in every particular with regard to libels by writing or printing, and the civil actions consequent thereupon: but as to signs or pictures, it seems necessary always to show, by proper inuendos and avverments of the defendant's meaning, the import and application of the scandal, and that some special damage has followed; otherwise it cannot appear, that such libel by picture was understood to be levelled at the plaintiff, or that it was attended with any actionable consequences.

In a civil action, then, a libel must appear to be false, as well as scandalous; for, if the charge be true, the plaintiff has received no private injury, and has no ground to demand a compensation for himself, whatever offence it may be against the public peace: and therefore, upon a civil action, the truth of the accusation may be pleaded in bar of the suit. But, in a criminal prosecution, the tendency which all libels have to create animosities, and to disturb the public peace, is the sole consideration of the law. And therefore, in such prosecutions, the only points to be considered are, first, the making or publishing of the book or writing; and, secondly, whether the matter be criminal: and, if both these points are against the defendant, the offence against the public is complete.
The punishment of such libellers, for either making, repeating, printing, or publishing the libel, is a fine, and such corporal punishment as the court in its discretion shall inflict; regarding the quantity of the offence, and the quality of the offender. By the law of the twelve tables at Rome, libells, which affected the reputation of another, were made a capital offence: but, before the reign of Augustus, the punishment became corporal only. Under the emperor Valentinian it was again made capital, not only to write, but to publish, or even to omit destroying them. Our law, in this and many other respects, corresponds rather with the middle age of Romish jurisprudence, when liberty, learning, and humanity, were in their full vogue, than with the cruel edicts that were established in the dark and tyrannical ages of the ancient deccemviri, or the latter emperors.

In this, and other instances, where blasphemous, immoral, treasonable, schismatical, seditious, or scandalous libells are punished by the English law, some with a greater, others with a less degree of severity, the liberty of the press, properly understood, is by no means infringed or violated. See Liberty of the Press.

LIBELLA, a piece of money amongst the Romans, being the tenth part of the denarius, and equal in value to the as. It was called libella, as being a little pound, because equal to a pound of brass.—Its value in our money is 1 ob. 1 gr. or a halfpenny farthing. See Money.

LIBELLA, or Libellula, a genus of four-winged flies, called in English dragon-flies or adder-flies. See Entomology Index.

LIBELLI, was the name given to the bills which were put up amongst the Romans, giving notice of the time when a show of gladiators would be exhibited, with the number of combatants, and other circumstances. This was called manus pronunciare or proponere. —These bills were sometimes termed edicta. These public notices were given by the person who designed to oblige the people with the show, and were frequently attended with pictures representing the engagement of some celebrated gladiators. This custom is alluded to by Horace, lib. ii. sat. vii. 96, &c.

There was also the famous libellus, a defamatory libel. Seneca calls them contumeliosi libelli, infamous rhymes, which by a Roman ordinance were punishable with death. Libellus also in the civil law signifies the declaration, or state of the prosecutor's charge against the defendant; and it has the like signification in our spiritual courts.

LIBER, in vegetables, the bark or rind, principally of trees. This is to be conceived as consisting of a number of cylindric and concentric surfaces whose texture is reticular, and in some trees plainly extricable every way, by reason that the fibres are soft and flexible. While in this condition, they are either hollow regular canals, or, if not so, they have interstitial spaces which serve the office of canals. The nutritious juice which they are continually receiving, remains in part in them, makes them grow in length and thickness, and strengthens and brings them closer together; and by this means the texture which was before reticular becomes an assemblage of straight fibres ranged vertically and parallel to each other; that is, as they are thus al-

tered behind one another, they by degrees become a new substance, more woody, called beia. LIBERA, in Mythology, the name of a goddess, which Ciceron in his book Of the Gods, represents as the daughter of Jupiter and Cybe. Ovid in his Fasti says, that the name was given by Bacchus to Ariadne.

Libera is exhibited on medals as a kind of female Bacchus, crowned with vine leaves.

LIBERAL ARTS, are such as depend more on the labour of the mind than on that of the hands; or, that consist more in speculation than operation; and have a greater regard to amusement and curiosity than to necessity.

The word comes from the Latin liberalis, which among the Romans signified a person who was not a slave; and whose will, of consequence, was not checked by the command of any master.

Such are grammar, rhetoric, painting, sculpture, architecture, music, &c. The liberal arts used formerly to be summed up in the following Latin verse:

Lingua, Tropus, Ratio, Numerus, Torus, Angulus, Astr.

And the mechanical arts, which, however, are innumerable, under this:

Rus, Nemus, Arma, Faber, Vulnera, Lama, Ratis.

See Arts.

LIBERALIA, feast celebrated by the ancient Romans, in honour of Libor or Bacchus, the same with those which the Greeks called Dionysia, and Dionysian.

They took their name from libor, i.e. free, a title conferred on Bacchus in memory of the liberty or freedom which he granted to the people of Bosia; or perhaps, because wine, whereof he was the reputed deity, delivers men from care, and sets their mind at ease and freedom. Varro derives the name of this feast from libor, considered as a noun adjective, and signifying free; because the priests were free from their function, and eased of all care, during the time of the liberalia: as the old women officiated in the ceremonies and sacrifices of these feasts.

LIBERIA, in Roman antiquity, a festival observed on the 16th of the kalends of April, at which time the youth laid aside their juvenile habit for the toga virilis, or habit peculiar to grown men. See the article Toga.

LIBERTINES, Libertini, in ecclesiastical history, a religious sect, which arose in the year 1525, whose principal tenets were, that the Deity was the sole operating cause in the mind of man, and the immediate author of all human actions; that, consequently, the distinctions of good and evil, which had been established with regard to those actions, were false and groundless, and that men could not, properly speaking, commit sin; that religion consisted in the union of the spirit or rational soul with the Supreme Being; that all those who had attained this happy union, by sublime contemplation and elevation of mind, were then allowed to indulge, without exception or restraint, their appetites or passions; that all their actions and pursuits were then perfectly innocent, and that, after the death of the body, they were to be united to the Deity. They likewise said that Jesus Christ was nothing but a mere je ne sais quoi, composed of the spirit of God, and of the opinion of men.

These maxims occasioned their being called Libertines;
times; and the word has been used in an ill sense ever since.

The Libertini spread principally in Holland and Brabant. Their leaders were one Quintin a Picard, Pockelius, Ruffus, and another called Chopin, who joined with Quintin, and became his disciple.

This sect obtained a certain footing in France through the favour and protection of Margaret, queen of Navarre, and sister to Francis I. and found patrons in several of the reformed churches. This sect was probably a remnant of the more ancient Beguards or Brethren of the Free Spirit.

Libertines of Geneva, were a cabal of rakes rather than of fanatics; for they made no pretences to any religious system, but pleaded only for the liberty of leading voluptuous and immoral lives. This cabal was composed of a certain number of licentious citizens, who could not bear the severe discipline of Calvin, who punished with rigour not only dissolute manners, but also whatever bore the aspect of irreligion and impiety. In this turbulent cabal there were several persons who were not only notorious for their dissolve and scandalous manner of living, but also for their atheistical impiety and contempt of all religion. To this odious class belonged one Cruet, who denied the divinity of the Christian religion, the immortality of the soul, and difference between moral good and evil, and rejected with disdain the doctrines that are held most sacred among Christians; for which impieties he was at last brought before the civil tribunal, in the year 1550, and condemned to death. The Genevan spirit of reformation, improperly directed by the violence and zeal of Calvin, did at this time operate to a degree which has marked the character of this great reformer with reproach. For in 1544, Sebastian Castalio, master of the public school at Geneva, who was a man of probity, and distinguished by his learning and taste, was nevertheless deposed from his office, and banished the city, because he disapproved some of the measures that were pursued and some of the opinions entertained by Calvin and his colleagues, and particularly that of absolute and unconditional predestination. Jerome Bolsec also, a man of genius and learning, who became a convert to the Protestant religion and fled to Geneva for protection, was cast into prison, and soon after sent into banishment, because, in 1551, he imprudently and indecently declared, in full congregation and at the close of public worship, against the doctrine of absolute decrees.

LIBERTUS, or LIBERTINUS, among the Romans, a freedman, or a person set free from a legal servitude.

These still retained some mark of their ancient state; he who made a slave free having a right of patronage over the libertus: so that if the latter failed of showing due respect to his patron, he was restored to his servitude; and if the libertus died without children, his patron was his heir. See Slave.

In the beginning of the republic, libertinus denoted the son of a libertus or freedman; but afterwards, before the time of Cicero, and under the emperors, the terms libertus and libertinus, as Suetonius has remarked, were used as synonymous.

LIBERTY, denotes a state of freedom, in contradistinction to slavery or restraint; and may be considered as either natural or civil.

The absolute rights of man, considered as a free agent, endowed with discernment to know good from evil, and with power of choosing those measures which appear to him to be most desirable, are usually summed up in one general appellation, and denominated the natural liberty of mankind. This natural liberty consists properly in a power of acting as one thinks fit, without any restraint or control, unless by the law of nature; being a right inherent in us by birth, and one of the gifts of God to man at his creation, when he endowed him with the faculty of free-will. But every man, when he enters into society, gives up a part of his natural liberty, as the price of so valuable a purchase; and, in consideration of receiving the advantages of mutual commerce, obliges himself to conform to those laws which the community has thought proper to establish. And this species of legal obedience and conformity is infinitely more desirable than that wild and savage liberty which is sacrificed to obtain it. For no man, that considers a moment, would wish to retain the absolute and uncontrolled power of doing whatever he pleases, at the consequence of which is, that every other man would also have the same power; and then there would be no security to individuals in any of the enjoyments of life.

Political, therefore, or civil liberty, which is that of a member of society, is no other than natural liberty, so far restrained by human laws (and no farther) as is necessary and expedient for the general advantage of the public. Hence we may collect, that the law, which restrains a man from doing mischief to his fellow-citizens, though it diminishes the natural, increases the civil liberty of mankind: but every wanton and causeless restraint of the will of the subject, whether practised by a monarch, a nobility, or a popular assembly, is a degree of tyranny. Nay, that even laws themselves, whether made with or without our consent, if they regulate and constrain our conduct in matters of mere indifference, without any good end in view, are laws destructive of liberty: whereas, if any public advantage can arise from observing such precepts, the control of our private inclinations, in one or two particular points, will conduc to preserve our general freedom in others of more importance, by supporting that state of society which alone can secure our independence. Thus the statute of King Edward IV. which forbade the fine gentlemen of those times (under the degree of a lord) to wear pikes upon their shoes or boots of more than two inches in length, was a law that savoured of oppression; because, however ridiculous the fashion then in use might appear, the restraining it by pecuniary penalties could serve no purpose of common utility. But the statute of King Charles II. which prescribes a thing seemingly as indifferent, viz. a dress for the dead, who were all ordered to be buried in woollen, is a law consistent with public liberty; for it encourages the staple trade, on which in great measure depends the universal good of the nation. So that laws, when prudently framed, are by no means subversive, but rather introductory, of liberty; for (as Mr Locke has well observed) where there is no law there
Liberty, therefore, is no freedom. But then, on the other hand, that constitution or frame of government, that system of laws, is alone calculated to maintain civil liberty, which leaves the subject entire master of his own conduct, except in those points wherein the public good requires some direction or restraint.

The idea and practice of this political or civil liberty, flourish in their highest vigour in these kingdoms, where it falls little short of perfection, and can only be lost destroyed by the folly or demerits of its owner; the legislature, and of course the laws of Britain, being peculiarly adapted to the preservation of this inestimable blessing even in the meanest subject. Very different from the modern constitutions of other states on the continent of Europe, and from the genius of the imperial law; which in general are calculated to vest an arbitrary and despotic power, of controlling the actions of the subject, in the prince, or in a few grandees. And this spirit of liberty is so deeply implanted in our constitution, and rooted even in our very soil, that a slave or a negro, the moment he lands in Britain, falls under the protection of the laws, and so far becomes a freeman; though his master’s right to his service may possibly still continue.

The absolute rights of every Briton (which, taken in a political and extensive sense, are usually called their liberties), as they are founded on nature and reason, so they are coeval with our form of government; though subject at times to fluctuate and change, their establishment (excellent as it is) being still human. At some times we have seen them depressed by overbearing and tyrannical princes; at others, so luxuriant as even to tend to anarchy, a worse state than tyranny itself, as any government is better than none at all. But the vigour of our free constitution has always delivered the nation from these embarrassments: and, as soon as the convulsions consequent on the struggle have been over, the balance of our rights and liberties has settled to its proper level; and their fundamental articles have been from time to time asserted in parliament, as often as they were thought to be in danger:

First, By the great charter of liberties, which was obtained, sword in hand, from King John, and afterwards, with some alterations, confirmed in parliament by King Henry III. his son. Which charter contained very few new grants; but, as Sir Edward Coke observes, was for the most part declaratory of the principal grounds of the fundamental laws of England. Afterwards, by the statute called confirmatio cartarum, whereby the great charter is directed to be allowed as the common law; all judgments contrary to it are declared void; copies of it are ordered to be sent to all cathedral churches, and read twice a-year to the people; and sentence of excommunication is directed to be as constantly denounced against all those that by word, deed, or counsel, act contrary thereto, or in any degree infringe it. Next, By a multitude of subsequent corroborating statutes (Sir Edward Coke reckons 32), from the first Edward to Henry IV. Then, after a long interval, by another act (section of rights), which was a partial and temporary declaration of the liberties of the people, assented to by King Charles I. in the beginning of his reign. Which was closely followed by the still more ample concessions made by that unhappy prince to his parliament, before the fatal rupture between them; and by the many salutary laws, particularly the habeas corpus act, passed under Charles II. To these succeeded the bill of rights, or declaration delivered by the lords and commons to the prince and princess of Orange, 13th February 1688; and afterwards enacted in parliament, when they became king and queen: which declaration concludes in these remarkable words; “and they do claim, demand, and insist upon, all and singular the premises, as their undoubted rights and liberties.” And the act of parliament itself recognizes “all and singular the rights and liberties asserted and claimed in the said declaration to be the true, ancient, and indisputable rights of the people of this kingdom.” Lastly, These liberties were again asserted at the commencement of the last century, in the act of settlement, whereby the crown was limited to his present majesty’s illustrious house: and some new provisions were added, at the same fortunate era, for better securing our religion, laws, and liberties; which the statute declares to be “the birthright of the people of England,” according to the ancient doctrine of the common law.

Thus much for the declaration of our rights and liberties. The rights themselves, thus defined by these several statutes, consist in a number of private immunities; which will appear, from what has been promised, to be indeed no other, than either that residuum of natural liberty, which is not required by the laws of society to be sacrificed to public convenience; or else those civil privileges, which society hath engaged to provide, in lieu of the natural liberties so given up by individuals. These therefore were formerly, either by inheritance or purchase, the rights of all mankind; but, in most other countries of the world, being now more or less debased and destroyed, they at present may be said to remain, in a peculiar and emphatical manner, the rights of the people of Britain. And these may be reduced to three principal or primary articles; the right of personal security, the right of personal liberty, and the right of private property: because, as there is no other known method of compulsion, or of abridging man’s natural free-will, but by an infringement or diminution of one or other of these important rights, the preservation of these inviolate may justly be said to include the preservation of our civil immunities in their largest and most extensive sense. See the article RIGHTS.

In vain, however, would these rights be declared, ascertained, and protected by the dead letter of the laws, if the constitution had provided no other method to secure their actual enjoyment. It has therefore established certain other auxiliary subordinate rights of the subject, which serve principally as barriers to protect and maintain inviolate the three great and primary rights, of personal security, personal liberty, and private property. These are,

1. The constitution, powers, and privileges of parliament; for which see PARLIAMENT.
2. The limitation of the king’s prerogative, by bounds so certain and considerable that it is impossible he should exceed them without the consent of the people; as to which, see PREROGATIVE. The former of these keeps the legislative power in due health and vigour, so as to make it improbable that laws should
Liberty. be enacted destructive of general liberty: the latter is a guard upon the executive power, by restraining it from acting either beyond or in contradiction to the laws that are framed and established by the other.

3. A third subordinate right of every Briton is that of applying to the courts of justice for redress of injuries. Since the law is, in this realm, the supreme arbiter of every man's life, liberty, and property, courts of justice must at all times be open to the subject, and the law be duly administered therein. The emphatical words of magna charta, spoken in the person of the king, who in judgment of law (says Sir Edward Coke) is ever present and repeating them in all his acts, are these: Nulli vendemus, nulli negabimus, aut differemus rectum vel justitiam; and therefore every subject (continues the same learned author), for injury done to him in bonis, in terris, vel persona, by any other subject, be he ecclesiastical or temporal, without any exception, may take his remedy by the course of the law, and have justice and right for the injury done to him, freely without sale, fully without any denial, and speedily without delay. It was endless to enumerate all the affirmative acts of parliament, wherein justice is directed to be done according to the law of the land: and what the law is, every subject knows, or may know if he pleases: for it depends not upon the arbitrary will of any judge; but is permanent, fixed, and unchangeable, unless by authority of parliament. We shall however just mention a few negative statutes, whereby abuses, prevarications, or delays of justice, especially by the prerogative, are restrained. It is ordained by magna charta, that no Freeman shall be outlawed, that is, put out of the protection and benefit of the laws, but according to the law of the land. By 2 Edw. III. c. 5. and 11 Ric. II. c. 10. it is enacted, that no commands or letters shall be sent under the great seal, or the little seal, the signet or privy seal, in disturbance of the law; or to disturb or delay common right: and, though such commandments should come, the judges shall not cease to do right; which is also made a part of their oath by statute 18 Edw. III. stat. 4. And by 1 W. and M. st. 2. c. 2. it is declared, that the pretended power of suspending or dispensing with laws, or the execution of laws, by regal authority without consent of parliament, is illegal.

Not only the substantial part, or judicial decisions, of the law, but also the formal part, or method of proceeding, cannot be altered but by parliament: for, if once those outworks were demolished, there would be an inlet to all manner of innovation in the body of the law itself. The king, it is true, may erect new courts of justice: but then they must proceed according to the old established forms of the common law. For which reason it is declared in the statute 16 Car. I. c. 10. upon the dissolution of the court of star-chamber, that neither his majesty, nor his privy-councill, have any jurisdiction, power, or authority, by English bill, petition, articles, libel, (which were the course of proceeding in the star-chamber, borrowed from the civil law,) or by any other means. For, if he examine, or draw into question, determine, or dispose of the lands or goods of any subjects of this kingdom; but that the same ought to be tried and deter-
minded in the ordinary courts of justice, and by course of law.

4. If there should happen any uncommon injury, or infringement of the rights before mentioned, which the ordinary course of law is too defective to reach, there still remains a fourth subordinate right, appertaining to every individual, namely, the right of petitioning the king, or either house of parliament, for the redress of grievances. In Russia we are told that the czar Peter established a law, that no subject might petition the throne till he had first petitioned two different ministers of state. In case he obtained justice from neither, he might then present a third petition to the prince; but upon pain of death, if found to be in the wrong. The consequence of which was, that no one dared to offer such third petition; and grievances seldom falling under the notice of the sovereign, he had little opportunity to redress them. The restrictions, for some there are, which are laid upon petitioning in Britain, are of a nature extremely different; and while they promote the spirit of peace, they are no check upon that of liberty. Care only must be taken, lest, under the pretence of petitioning, the subject be guilty of any riot or tumult; as happened in the opening of the memorable parliament in 1640; and, to prevent this, it is provided by the statute 13 Car. II. st. 1. c. 5. that no petition to the king, or either house of parliament, for any alteration in church or state, shall be signed by above 30 persons, unless the matter thereof be approved by three justices of the peace, or the major part of the grand jury, in the county; and in London, by the lord mayor, aldermen, and common-council: nor shall any petition be presented by more than ten persons at a time. But, under these regulations, it is declared by the statute 1 W. and M. st. 2. c. 2. that the subject hath a right to petition; and that all commitments and prosecutions for such petitioning are illegal.

5. The fifth and last auxiliary right of the subject, that we shall at present mention, is that of having arms for their defence, suitable to their condition and degree, and such as are allowed by law. Which is also declared by the same statute 1 W. and M. st. 2. c. 2. and is indeed a public allowance, under due restrictions, of the natural right of resistance and self-preservation, when the sanctions of society and laws are found insufficient to restrain the violence of oppression.

In these several articles consist the rights, or, as they are frequently termed, the liberties of Britons: liberties more generally talked of than thoroughly understood; and yet highly necessary to be perfectly known and considered by every man of rank or property, lest his ignorance of the points whereon they are founded should hurry him into faction and licentiousness on the one hand, or a pusillanimous indifference and criminal submission on the other. And we have seen that these rights consist, primarily, in the free enjoyment of personal security, of personal liberty, and of private property. So long as these remain intact, the subject is perfectly free; for every species of compulsory tyranny and oppression must act in opposition to one or other of these rights, having no other object upon which it can possibly be employed.

5 H
To preserve these from violation, it is necessary that the constitution of parliaments be supported in its full vigour; and limits, certainly known, be set to the royal prerogative. And, lastly, To vindicate these rights, when actually violated or attacked, the subjects of Britain are entitled, in the first place, to the regular administration and free course of justice in the courts of law; next, to the right of petitioning the king and parliament for redress of grievances; and, lastly, to the right of having and using arms for self-preservation and defence. And all these rights and liberties it is our birthright to enjoy entire; unless where the laws of our country have laid them under necessary restraints: Restraints in themselves so gentle and moderate, as will appear upon farther inquiry, that no man of sense or probity would wish to see them slackened. For all of us have it in our choice to do everything that a good man would desire to do; and are restrained from nothing, but what would be pernicious either to ourselves or our fellow-citizens. So that this review of our situation may fully justify the observations of a learned French author, who indeed generally both thought and wrote in the spirit of genuine freedom; and who hath not scrupled to profess, even in the very bosom of his native country, that the British is the only nation in the world where political or civil liberty is the direct end of its constitution. Recommending, therefore, to the student in our laws a farther and more accurate search into this extensive and important title, we shall close our remarks upon it with the expression of the wishes of the famous Father Paul to his country, "ESTO PERPETUA." "

LIBERTY and Necessity. See Metaphysics.

LIBERTY of the Press. The art of printing, soon after its introduction, was looked upon in England, as well as in other countries, as merely a matter of state, and subject to the coercion of the crown. It was therefore regulated with us by the king's proclamations, prohibitions, charters of privilege and license, and finally by the decrees of the court of star-chamber, which limited the number of printers, and of presses which each should employ, and prohibited new publications unless previously approved by proper licensers. On the demolition of this odious jurisdiction in 1641, the long parliament of Charles I. after their rupture with that prince, assumed the same powers as the star-chamber had exercised with respect to the licensing of books; and in 1643, 1647, 1649, and 1652 (Scebell. i. 44, 134. ii. 88, 230.) issued their ordinances for that purpose, founded principally on the star-chamber decree of 1637. In 1662 was passed the statute 13 and 14 Car. II. c. 33. which, with some few alterations, was copied from the parliamentary ordinances. This act expired in 1679; but was revived by statute 1 Jac. II. c. 17. and continued till 1692. It was then continued for two years longer by statute 4 W. and M. c. 24. but though frequent attempts were made by the government to revive it in the subsequent part of that reign, (Com. Journ. 17 Feb. 1694, 26 Nov. 1695, 22 Oct. 1696, 9 Feb. 1697, 31 Jan. 1698), yet the parliament resisted it so strongly, that it finally expired, and the press became properly free in 1694, and has continued so ever since.

The liberty of the press, however, so essential to the nature of a free state, consists not in freedom from censure for any criminal matter that may be published, but in laying no previous restraints upon publications. Every freeman has undoubtedly a right to lay what sentiment he pleases before the public; to forbid this, is to destroy the freedom of the press: but if he publishes what is improper, mischievous, or illegal, he must take the consequence of his own temerity. To subject the press to the restrictive power of a licensor in the manner above mentioned, is to subject all freedom of sentiment to the prejudices of one man, and make him the arbitrary and infallible judge of all controverted points in learning, religion, and government. But to punish (as the law does at present) any dangerous or offensive writings which, when published, shall, on a fair and impartial trial, be adjudged of a pernicious tendency, is necessary for the preservation of peace and good order, of government and religion, the only solid foundations of civil liberty. Thus the will of individuals is still left free; the abuse only of that free will is the object of legal punishment. Neither is any restraint hereby laid upon freedom of thought or inquiry; liberty of private sentiment is still left; the disseminating or making public of bad sentiments, destructive of the ends of society, is the crime which society corrects. A man (says a fine writer on this subject) may be allowed to keep poisons in his closet, but not publicly to vend them as cordials. And to this we may add, that the only plausible argument heretofore used for restraining the just freedom of the press, "that it was necessary to prevent the daily abuse of it," will entirely lose its force, when it is shown (by a reasonable exertion of the laws) that the press cannot be abused to any bad purpose without incurring a suitable punishment: whereas it can never be used to any good one when under the control of an inspector. So true will it be found, that to censure the licentiousness, is to maintain the liberty of the press.

LIBERTY, in Mythology, was a goddess both among the Greeks and Romans. Among the former she was invoked under the title Eleutheria; and by the latter she was called Libertas, and held in singular veneration. Temples, altars, and statues, were erected in honour of this deity. A very magnificent temple was consecrated to her on Mount Aventine, by Tiberius Graccus, before which there was a spacious court, called atrium libertatis. The Romans also erected a new temple in honour of Liberty, when Julius Cesar established his empire over them, as if their liberty had been secured by an event which proved fatal to it. In a medal of Brutus, Liberty is exhibited under the figure of a woman, holding in one hand a cap, the symbol of liberty, and two poniards in the other, with the inscription LIBERVS MARTIS.

LIBETHTRA, in Ancient Geography, the fountain of song, was situated in Magnesia, a district of Macedonia, annexed to Thessaly, distinct from the town of Libethra, which stood on Mount Olympus, where it verges towards Macedonia: hence the muses are called Libethrides, (Virgil). Strabo places on Helicon, not only Hippocrene, and the temple of the Muses, but also the cave of the nymph Libethrides.

LIBETHRÍUS MONS, in Ancient Geography, a mountain of Boeotia, distant from Coronea 40 stadia; where
LIBRARIUM, among the ancients, were a sort of copyists who transcribed in beautiful or at least legible characters, what had been written by the notarii in notes and abbreviations.

LIBRARY, an edifice or apartment destined for holding a considerable number of books placed regularly on shelves; or the books themselves lodged in it.

Some authors refer the origin of libraries to the Hebrews; and observe, that the care these took for the preservation of their sacred books, and the memory of what contained the actions of their ancestors, became an example to other nations, particularly to the Egyptians. Osmandus, king of Egypt, is said to have taken the hint first; who according to Diodorus, had a library built in his palace, with this inscription over the door, ΣΥΧΕΣ ΙΑΤΡΕΙΟΝ. Nor were the Ptolemies, who reigned in the same country, less curious and magnificent in books.

The Scripture also speaks of a library of the kings of Persia, Ezra v. 17. vi. 1. which some imagine to have consisted of the historians of that nation, and of memoirs of the affairs of state; but, in effect, it appears rather to have been a depository of laws, charges, and ordinances of the kings. The Hebrew text calls it the house of treasures, and afterwards the house of the rolls, where the treasures were laid up. We may, with more justice, call that a library, mentioned in the second of Esdras to have been built by Nehemiah, and in which were preserved the books of the prophets, and of David, and of the letters of their kings.

The first who erected a library at Athens was the tyrant Pisistratus; and yet Strabo refers the honour of it to Aristotle. That of Pisistratus was transported by Xerxes into Persia, and was afterwards brought back by Seleucus Nicanor to Athens. Long after, it was plundered by Sylla, and re-established by Hadrian. Plutarch says, that under Eumenes there was a library at Pergamus, containing 200,000 books. Tyrannus, a celebrated grammarian, contemporary with Pompey, had a library of 30,000 volumes. That of Ptolemy Philadelphus, according to A. Gallus, contained 250,000, all in rolls, burned by Nero's soldiers. The Emperors Constantine, and his successors, erected a magnificent one at Constantinople; which in the eighth century contained 300,000 volumes, all burnt by order of Leo Isaurius; and, among the rest, one wherein the lliad and Odyssey were written in letters of gold, on the guts of a serpent.

The most celebrated libraries of ancient Rome, were the Ulpian, and the Palatine. They also boast much of the libraries of Paulus Emilius, who conquered Perus; of Lucullus Lucullus, of Asinius Pollio, Atticus, Julius Severus, Domitius Sertenus, Pamphilus Martyr, and the emperors Gordian and Trajan.

Anciently, every large church had its library; as appears by the writings of St Jerome, Anastasius, and others. Pope Nicholas laid the first foundation of that of the Vatican, in 1450. It was destroyed by the constable Bourbon, in the sacking of Rome, and restored by Pope Sixtus V. and has been considerably enriched with the ruins of that of Heidelberg, plundered by Count Tilly in 1622. One of the most complete libraries in Europe, was said to be that erected at Florence by Cosmo de Medicis, over the gate whereof is written LABOR ABSQUE LABORE; though it is now exceeded.
LIBRARY exceeded by that of the French king, begun by Francis I., augmented by Cardinal Richelieu, and completed by M. Colbert. The emperor’s library at Vienna, according to Lambeus, consists of 80,000 volumes, and 15,940 curious medals.

The Bodleian library at Oxford, built on the foundation of that of Duke Humphrey, exceeds that of any university in Europe, and even those of the sovereigns of Europe, except the emperor’s and French king’s, which are each of them older by 100 years. It was first opened in 1602, and has since found a great number of benefactors; particularly Sir Robert Cotton, Sir H. Savil, Archbishop Laud, Sir Kenelm Digby, Mr Allen, Dr Pococke, Mr Selden, and others. The Vatican, the Medici, that of Bessarion at Venice, and those just mentioned, exceed the Bodleian in Greek manuscripts: which yet outdoes them all in oriental manuscripts.

As to printed books, the Ambrosian at Milan, and that of Wolfenbüttel, are two of the most famous, and yet both inferior to the Bodleian.

King’s Library, at St James's was founded by Henry, eldest son of James I. and made up partly of books, and partly of manuscripts, with many other curiosities, for the advancement of learning. It has received many additions from the libraries of Isaac Casaubon and others.

Cottonian Library, originally consisted of 938 volumes of original charters, grants, instruments, letters of sovereign princes, transactions between this and other kingdoms and states, genealogies, histories, registers of monasteries, remains of Saxon laws, the book of Genesis, thought to be the most ancient Greek copy extant, and said to have been written by Origen in the second century, and the curious Alexandrian copy or manuscript in Greek capitals. This library is kept in the British Museum, with the large and valuable library of Sir Hans Sloane, amounting to upwards of 42,000 volumes, &c. There are many public libraries belonging to the several colleges at Oxford and Cambridge, and the universities in North Britain. The principal public libraries in London, besides that of the Museum, are those of the College of Heralds, of the College of Physicians, of Doctors Commons, to which every bishop, at the time of his consecration, gives at least 20l. sometimes 50l. for the purchase of books; those of Gray’s Inn, Lincoln’s Inn, Inner Temple, and Middle Temple; that of Lambeth, founded by Archbishop Bancroft in 1610, for the use of succeeding archbishops of Canterbury, and increased by the benefactions of Archbishops Abbot, Sheldon, and Tennison, and said to consist of at least 15,000 printed books, and 617 volumes in manuscript; that of Red-Cross street, founded by Dr Daniel Williams, a Presbyterian divine, and since enriched by many private benefactions; that of the Royal Society, called the Arundelian or Norfolk library, because the principal part of the collection formerly belonged to the family of Arundel, and was given to the Society by Henry Howard, afterwards duke of Norfolk, in 1665, which library has been increased by the valuable collection of Francis Aston, Esq. in 1715, and is continually increasing by the numerous benefactions of the works of its learned members, and others: that of St Paul’s, of Sion college; the Queen’s library, erected by Queen Caroline in 1737; and the Surgeons library, kept in their hall in the Old Bailey, &c.

In Edinburgh there is a good library belonging to the university, well furnished with books; but it is deficient in a catalogue. There is also a noble library of books and manuscripts belonging to the faculty of advocates. See Advocate. The library belonging to the society of writers to the signet, although of less extent, yet in the judicious selection of the best books, and the best editions, which by the attention of the society are now kept in excellent order, is inferior to none in the kingdom.

LIBRATION, in Astronomy, an apparent irregularity of the moon’s motion, whereby she seems to librate about her axis, sometimes from the east to the west, and now and then from the west to the east. See Astronomy Index.

LIBURNIA, in Ancient Geography, a district of Illyricum, extending towards the Adriatic between Istria on the west, Dalmatia on the east, and Mount Albus on the north. Liburni, the people. The appurtenances, who at the command of the magistrate summoned the people from the country, were called Liburni, because generally men of Liburnia.—Liburna, or Liburnia, (Horace), denoted a kind of light and swift skiff, by the Liburnians in their sea-roving or piracies, for which they were noted. Liburnum (Juvenal), was a species of litter made in form of Liburnian skiffs, wherein the noblemen of Rome were carried, and where they sat at their ease either reading or writing.

LIBYA, in general, according to the Greeks, denoted Africa. An appellation derived from lib, “thirst,” being a dry and thirsty country. See Africa.

Libya, in a more restrained sense, was the middle part of Africa, extending north and west, (Pliny); between the Mediterranean to the north, and Ethiopia to the east; and was twofold, the Hither or Exterior Libya; and the Further or Interior. The former lay between the Mediterranean on the north, and the Further Libya and Ethiopia beyond Egypt on the south, (Ptolemy). The Further or Interior Libya was a vast country, lying between the Hither Libya on the north, the Atlantic ocean on the west, the Ethiopian on the south, and Ethiopia, beyond Egypt on the east, (Ptolemy).

Libya, in a still more restrained sense, called, for distinction’s sake, Libya Propria, was a northern district of Africa, and a part of the Hither Libya; situated between Egypt to the east, the Mediterranean to the north, the Syris Major and the Regio Tripolitana to the west, the Garamantes and Ethiopia beyond Egypt to the south. Now the kingdom and desert of Barca. This Libya was again subdivided into Libya taken in the strictest sense of all, and Marmarica and Cyrenaica. Libya in the strictest sense, otherwise the Exterior, was the most eastern part of Libya Propria, next to Egypt, with Marmarica on the west, the Mediterranean on the north, and the Nubi, now called Nubia, to the south, (Ptolemy).

LICENSE,
LICENCE, in Law, an authority given to a person to do some lawful act.

LICENSER of BOOKS, has been an officer in almost every civilized country, till the close of the last century, when it was abolished in Great Britain. It has been proved by Beckmann, that such an office was established, not only in the Roman empire, but also in the republic and the states of Greece. All the copies of the works of Protagoras which could be procured, were burnt at Athens by the public crier, and the satirical works of Labienus shared the same fate under the reign of the emperor Augustus. Not long after the invention of printing, laws were enacted for subjecting books to examination; a regulation which was proposed even by Plato, and which many have since wished for. It appears that the liberty of the press is only a modern privilege, and that it has not been enjoyed in its utmost latitude in any country but Great Britain.

LICENSER of the Press. See LIBERTY of the Press.

LICENTIATE, one who has obtained the degree of a license.—The greatest number of the officers of justice in Spain are distinguished by no other title than that of licentiate. In order to pass licentiate in common law, civil law, and physic, they must have studied seven years, and in divinity ten. Among us a licentiate usually means a physician who has a license to practise, granted by the college of physicians.

LICETUS, a celebrated physician of Italy, was born at Rappollo, in the state of Genoa, 1577. He came, it seems, into the world, before his mother had completed the seventh month of her pregnancy; but his father, being an ingenuous physician, wrapped him up in cotton, and nurtured him so, that he lived to be 77 years of age. He was trained with great care, and became a very distinguished man in his profession; and was the author of a great number of works: his book De Monstris every body must have heard of. He was professor of philosophy and physic at Padua, where he died in 1655.

LICHEN, LIVERWORT, a genus of plants belonging to the natural order of algae, in the cryptogamia class. See BOTANY Index.

LICHFIELD. See LITCHFIELD.

LICHTENBERG, a castle of France, in Lower Alsace, and the chief place of the same name; seated on a rock, near the mountains Voges, and looked upon as impregnable. E. Long. 7. 35. N. Lat. 48. 15.

LICHTENFELS, a town of Germany, in the circle of Franconia, a bishopric of Bamberg, seated on the river Main, in E. Long. 11. 10. N. Lat. 50. 20.

LICHTENSTEIN, a town of Switzerland, in Tockernberg, seated on the river Thur. E. Long. 2. 15. N. Lat. 47. 25.

LICHTSTAL, a handsome town of Switzerland, in the county of Basel; seated on the river Ergitz, in E. Long. 7. 57. N. Lat. 47. 40.

LICINIIUS STOLO, a famous Roman tribune, styled Stolo on account of a law he made, while tribune, that no Roman citizen should possess more than 500 acres of land; alleging, that when they occupied more, they could not cultivate it with care, nor pull up the useless shoots (stolones) that grow from the roots of trees. He is memorable also for enacting, that one of the consuls should always be of a plebeian family. He lived about 362 B. B.

LICION, in the Dionysian solemnities, the mystical van of Bacchus; a thing so essential to all the solemnities of this god, that they could not be duly celebrated without it. See DIONYSIA.

LICOPHORI, in the Dionysian solemnities, those who carried the licenon.

LICOLA, or LAO DI LICOLA, a lake in the kingdom of Naples, formerly famous for plenty of excellent fish; but in the year 1538 an explosion of a volcano changed one part of it into a mountain of ashes, and the other into a morass. It was anciently known by the name of the Lucrine lake.

LICONIA, a genus of plants belonging to the pentandria class. See BOTANY Index.

LICTORS, among the Romans, were officers established by Rumulus, who always attended the chief magistrates when they appeared in public.

The duty of their office consisted in the following particulars: 1. Submutio, or clearing the way for the magistrate they attended: this they did by word of mouth; or, if there was occasion, by using the rods they always carried along with them. 2. Animadversio, or causing the people to pay the usual respect to the magistrate, as to a guest, or on horseback, or in a chariot; to rise up, uncover, make way, and the like. 3. Prætitio, or walking before the magistrates: this they did not confuse, or altogether, nor by two or three abreast, but singly, following one another in a straight line. They also preceded the triumphal car in public triumphs; and it was also part of their office to arrest criminals, and to be public executioners in beheading, &c. Their ensigns were the FASCE and SECURIS.

As to the number of lictors allowed each magistrate, a dictator had twenty-four, a master of the horse six, a consul twelve, a praetor six; and each vestal virgin, when she appeared abroad, had one.

LIDD, See LYDD.

LIDDEL, Dr. Duncan, professor of mathematics and of medicine in the university of Helmstald, was born in the year 1561 at Aberdeen, where he received the first part of his education in languages and philosophy. About the age of eighteen he repaired to the university of Francfort, where he spent three years in a diligent application to mathematics and philosophy. From Francfort he proceeded to Wratisslaw, or Breslaw, in Silesia, where he is said to have made uncommon progress in his favourite study of mathematics, under the direction of a very eminent professor, Paulus Wittichius. Having studied at Breslaw for the space of one year, he returned to Francfort and remained there three years, paying the most intense application to the study of physic. A contagious distemper having broken out at that place, the students were dispersed, and Liddel retired to the university of Rostock. Here he renewed his studies, rather as a companion than as a pupil of the celebrated Bucéus, who, though an excellent mathematician, did not scruple to confess that he was instructed by Liddel in the more perfect knowledge of the Copernican system, and other astronomical questions. In 1590 he returned once more to Francfort. But having heard of the increasing
creasing reputation of the Academia Julia, established at Helmsdale by Henry duke of Brunswick, Mr. Liddel removed thither; and soon after his arrival was appointed to the first or lower professorship of mathematics. From thence he was promoted to the second and more dignified mathematical chair, which he occupied for nine years, with much credit to himself and to the Julian Academy. In 1590 he obtained the degree of M. D., was admitted a member of that faculty, and began publically to teach physic. By his teaching and his writings he was the chief support of the medical school at Helmsdale; was employed as first physician at the court of Brunswick, and had much practice among the principal inhabitants of that country. Having been several times elected dean of the faculties both of philosophy and physic, he had in the year 1604 the honour of being chosen protector of the university. But neither academical honours, nor the profits of an extensive practice abroad, could make Dr. Liddel forget his native country. In the year 1660 he took a final leave of the Academia Julia; and after travelling for some time through Germany and Italy, he at length settled in Scotland. He died in the year 1613, in the 52d year of his age. By his last will he bestowed certain lands purchased by him near Aberdeen upon the university there, in all time coming, for the education and support of six poor scholars. Among a variety of regulations and injunctions for the management of this charity, he appoints the magistrates of Aberdeen his trustees, and solemnly denounces the cursed of any person on who shall abuse or misappropriate it. His works are: 1. Disputationes Medicinales, Helmsdale, 1653, 4to. 2. Ars Medica succincte et perspicue explicata, Hamburgi, 1607, 8vo. This performance is dedicated to King James VI. and is divided into five books, viz. Introductio in totam Medicinam; De Physiologia; De Pathologia; De Signorum doctrina; De Therapeutica. 3. De Fabris Libri tres, Hamburgi, 1610, 12mo. 4. Tractatus de dente aureo, Hamburgi, 1628, 12mo. This last performance Dr. Liddel published in order to refute a ridiculous story then current of a poor boy in Silesia, who, at seven years of age, having lost some of his teeth, brought forth, to the astonishment of his parents, a new tooth of pure gold. Jacobus Horstius, doctor and professor of medicine in the Academia Julia, at the same time with our author, had published a book, which he dedicated to the emperor Rudolphus II. to prove that this wonderful tooth was a prodigy sent from heaven to encourage the Germans then at war with the Turks, and foretelling, from this golden tooth, the future victories of the Christians, with the final destruction of the Turkish empire and Mahometan faith, and a return of the golden age in 1700, preparatory to the end of the world. The imposture was soon after discovered to be a thin plate of gold, skillfully drawn over the natural tooth by an artist of that country, with a view to excite the public admiration and charity. 5. Artis conservandi Sanitatem, libri duo, Abderdonie, 1651, 12mo; a posthumous work.

LIDFORD, a village of Devonshire in England, situated on the river Lid, two or three miles east of Brent Tor, was formerly a famous town, with a castle. It was much destroyed by the Danes in 997. The village is now small, but the lands in the parish are rich and fertile, the whole forest of Dartmoor being in the verge of it. The river here being pent up at the bridge with rocks, has made itself so deep a fall, that the noise of the water only is heard without being seen.

LIDNEY, a town of Gloucestershire in England, 71 miles from London, is seated on the west bank of the river Severn. In the neighbourhood are the remains of a large Roman encampment, with foundations of many ancient buildings, among which are the ruins of a Roman hypocaust of an oval form; and Roman antiquities and coins are often found. Mr. Bathurst has a fine seat here called Sydney-Park, in the midst of extensive woods. Population 820 in 1811.

LIE, in morals, denotes a criminal breach of veracity.—Archdeacon Paley, in treating of this subject, observes, that there are falsehoods which are not lies; that is, which are not criminal: and there are lies which are not literally and directly false.

I. Cases of the first class are those, 1. Where no one is deceived: as, for instance in parables, fables, novels, jests, tales to create mirth, or ludicrous embellishments of a story, in which the declared design of the speaker is not to inform, but to divert; compliments in the subscription of a letter; a prisoner's pleading not guilty; an advocate asserting the justice, or his belief of the justice, of his client's cause. In such instance no confidence is destroyed, because none was reposed; no promise to speak the truth is violated, because none was given or understood to be given. 2. Where the person you speak to has no right to know the truth, or more properly where little or no inconveniency results from the want of confidence in such cases; as where you tell a falsehood to a madman for his own advantage; to a robber, to conceal your property; to an assassin, to defeat or to divert him from his purpose. It is upon this principle, that, by the laws of war, it is allowed to deceive an enemy by feints, false colours, spies, false intelligence, and the like; but, by no means in treaties, truces, signals of capitulation, or surrender: and the difference is, that the former suppose hostilities to continue, the latter are calculated to terminate or suspend them.

Many people indulge in serious discourse a habit of fiction and exaggeration, in the accounts they give of themselves, of their acquaintance, or of the extraordinary things which they have seen or heard; and so long as the facts they relate are indifferent, and their narratives though false are inoffensive, it may seem a superstitions regard to truth to cease them merely for truth's sake. Yet the practice ought to be checked; for, in the first place, it is almost impossible to pronounce beforehand, with certainty, concerning any lie that it is inoffensive; or to say what ill consequences may result from a lie apparently inoffensive: And, in the next place, the habit, when once formed, is easily extended to serve the designs of malice or interest; like all habits, it spreads indeed of itself. Pious frauds, as they are improperly enough called, pretended inspirations, forged miracles, impostures of a more serious nature, are possible that they may sometimes, though seldom, have been set up and encouraged with a design to do good; but the good they aim at requires that the belief of them should
Liege

should be perpetual, which is hardly possible; and the
detection of the fraud is sure to disparage the credit of
all pretensions of the same nature. Christianity has
suffered more injury from this cause than from all other
causes put together.

II. As there may be falsehoods which are not lies,
so there may be lies without literal or direct falsehood.
An opening is always left for this species of prevarica-
tion, when the literal and grammatical signification of
a sentence is different from the popular and customary
meaning. It is the wilful deceit that makes the lie;
and we willfully deceive, when our expressions are not
tru, in the sense in which we believe the hearer ap-
prehends them. Besides, it is absurd to contend for
any sense of words, in opposition to usage; for all
senses of all words are founded upon usage, and upon
nothing else. Or a man may act a lie; as by pointing
his finger in a wrong direction, when a traveller in-
quires of him his road; or when a tradesman shuts up
his windows, to induce his creditors to believe that he
is abroad: for to all moral purposes, and therefore as
to veracity, speech and action are the same; speech
being only a mode of action.

LIECHTENNAU, a town of Germany, in the circle
of Franconia and margravate of Anspach, subject to
Nuremberg. E. Long. 9. 5. N. Lat. 48. 43.

LIEGE (Ligiius), in Law, properly signifies a vas-
sal, who holds a kind of fief, that binds him to a closer
obligation to his lord than other people.

The term seems to be derived from the French lieu,
"to bind;" on account of a ceremony used in render-
ing faith or homage: which was by locking the vassal’s
thumb or his hand in that of the lord, to show that he
was fast bound by his oath of fidelity. Cujus, Vigenere,
and Bignon, choose rather to derive the word from the
same source with leuus or leodi, “loyal, faithful.” But
Du Cange falls in with the opinion of those who derive
it from liti, a kind of vassals, so firmly attached to
their lord, on account of lands or fees held of him, that
they were obliged to do him all manner of service, as
liege.

If they were his domestics. He adds, this was formerly
called litium servitium, and the person ligia. In this
sense, the word is used, Leg. Edw. cap. 29. Judei
sub tutela regis ligia debent esse; that is, wholly under
his protection.

By liege homage, the vassal was obliged to serve his
lord towards all, and against all, excepting his father.
In which sense, the word was used in opposition to
simple homage; which last only obliged the vassal to
pay the rights and accustomed dues to his lord; and
not to bear arms against the emperor, prince, or other
superior lord: so that a liege man was a person wholly
devoted to his lord, and entirely under his command.

Omnibus, &c. Reginaldus, rex Insularum, salutem.
Sciatis quod deveni homo ligus domini regis Anglia
Johannis, contra omnes mortales, quamdiu vixeris; et
inde ci fidelitatem et sacramentum prestiti, &c. MS.
penes W. Dugdale.

But it must be observed, there were formerly two
kinds of liege homage: the one, by which the vassal
was obliged to serve his lord, against all, without ex-
ception even of his sovereign; the other, by which he
was to serve him against all, except such other lords as
he had formerly owed liege homage to.

In our old statutes lieges, and liege people, are
terms peculiarly appropriated to the king’s subjects; as
being ligia, ligi, or ligati, obliged to pay allegiance to
him; 8 Henry VI. 14 Hen. VIII. &c. though private
persons had their lieges too. Reginaldus, Dei gratia,
abbas Ramesie, proposito et hominius de Branestre,
et omnibus vicinis Franciis et Angliis salutem. Sciati
me dedisse terram Ulfe, in dependere (codie depedate)
uic Boschino, et usori ejus Alfrinie—ea conditione quod

LIEGE-Pouste, in Scots Law, is opposed to death-
bond; and signifies a person’s enjoying that state of
health in which only he can dispose of his property at
pleasure.
