tive country, lamenting this stroke so deeply, that it occasioned her death; but it is better authenticated that she was carried off by an epidemic fever, which raged so violently that it did not leave a sufficient number of men in health to get in the harvest. She had long, however, been a prey, if not to remorse, yet to disappointment and chagrin, arising from various cross accidents, such as want of children, and the absence and unkindness of Philip consequent thereupon. Her death happened Nov. 7. 1558, in the 43d year of her age, after a reign of five years, four months, and eleven days. There are some things of her writings still extant. Strype has preserved three prayers or meditations of hers: the first, "Against the Assaults of Vice;" the second, "A Meditation touching Adversity;" the third, "A Prayer to be read at the Hour of Death." In Fox's "Acts and Monuments" are printed eight of her letters to King Edward and the lords of the council, on her nonconformity, and on the imprisonment of her chaplain Dr Mallet. In the *Sylloge epistolarum* are several more of her letters, extremely curious: one of her delicacy in never having written but to three men; one of affection for her sister; one after the death of Anne Boleyn; and one very remarkable of Cromwell to her. In "Haynes's State Papers," are two in Spanish to the emperor Charles V. There is also a French letter, printed by Strype from the Cottonian library, in answer to a haughty mandate from Philip, when he had a mind to marry the Lady Elizabeth to the duke of Savoy, against the queen's and princess's inclination: it is written in a most abject manner, and a wretched style.

MARY of Medicis, wife of Henry IV. king of France, was declared sole regent of the kingdom in 1610, during the consternation which the assassination of that beloved king had occasioned. By her ambitious intrigues, the nation lost all its influence abroad, and was torn to pieces at home by contending factions. After several vicissitudes of fortune, she was abandoned by her son Louis XIII. whose reign had been constantly disturbed by the civil commotions she had occasioned; and died in indigence at Brussels in 1642, aged 68. She built the superb palace of Luxembourg at Paris, and embellished that city with aqueducts and other ornaments.

MARY queen of Scotland, daughter of James V. was born in the royal palace of Linlithgow on the 8th of December 1542. Her mother was Mary, the eldest daughter of Claude duke of Guise, and widow of Louis duke of Longueville. Her father dying a few days after her birth, she scarcely existed before she was hailed queen.

The government of a queen was unknown in Scotland; and the government of an infant queen could not command much respect from martial and turbulent nobles, who exercised a kind of sovereignty over their own vassals; who looked upon the most warlike of their monarchs in hardly any other light than as the chief of the aristocracy; and who, upon the slightest disgusts, were ever ready to fly into rebellion, and to carry their arms to the foot of the throne. James had not even provided against the disorders of a minority, by committing to proper persons the care of his daughter's education, and the administration of affairs in her name. The former of these objects,

however,

Mary.

Mary. however, was not neglected, though the regency of the kingdom was intrusted to very feeble hands. At six years of age *Mary* was conveyed to France, where she received her education in the court of Henry II. The opening powers of her mind, and her natural dispositions, afforded early hopes of capacity and merit. After being taught to work with her needle and in tapestry, she was instructed in the Latin tongue; and she is said to have understood it with an accuracy, which is in this age very uncommon in persons of her sex and elevated rank, but which was not then surprising, when it was the fashion among great ladies to study the ancient languages. In the French, the Italian, and the Spanish tongues, her proficiency was still greater, and she spoke them with equal ease and propriety. She walked, danced, and rode with enchanting gracefulness; and she was qualified by nature, as well as by art, to attain to distinction in painting, poetry, and music. To accomplish the woman was not, however, the sole object of her education. Either she was taught, or she very early discovered, the necessity of acquiring such branches of knowledge as might enable her to discharge with dignity and prudence the duties of a sovereign; and much of her time was devoted to the study of history, in which she delighted to the end of her life.

Whilst *Mary* resided in the court of Henry II. her personal charms made a deep impression on the mind of the Dauphin. It was in vain that the constable Montmorency opposed their marriage with all his influence. The importance of her kingdom to France, and the power of her uncles the princes of Lorraine, were more than sufficient to counteract his intrigues; and the Dauphin obtained the most beautiful princess in Christendom.

Though this alliance placed the queen of Scotland in the most conspicuous point of view, in the politest court of Europe, and drew to her those attentions which are in the highest degree pleasing to a female mind in the gaiety of youth; it may yet be considered as having accidentally laid the foundation of the greatest part of her future misfortunes. Elizabeth, who now swayed the sceptre of England, had been declared illegitimate by an act of parliament: and though the English Protestants paid no regard to a declaration which was compelled by the tyrannic violence of Henry VIII. and which he himself had indeed rendered null by calling his daughter to the throne after her brother and elder sister; yet the papists both at home and abroad had objections to the legitimacy of Elizabeth's birth, founded on principles which with them had greater weight than the acts of any human legislature. *Mary* was unquestionably the next heir in regular succession to the English throne, if Elizabeth should die without legitimate issue; and upon her marriage to the Dauphin, she was induced by the persuasion of her uncles, by the authority of the French king, and no doubt partly by her own ambition, to assume the title and arms of queen of England and Ireland. These, indeed, she forebore as soon as she became her own mistress; but the having at all assumed them was an offence which Elizabeth could never forgive, and which rankling in her bosom made her many years afterwards pursue the unhappy queen of Scots to the block.

Henry II. dying soon after the marriage of the

Dauphin and *Mary*, they mounted the throne of France. In that elevated station, the queen did not fail to distinguish herself. The weakness of her husband served to exhibit her accomplishments to the greatest advantage; and in a court where gallantry to the sex, and the most profound respect for the person of the sovereign, were inseparable from the manners of a gentleman, she learned the first lessons of royalty. But this scene of successful grandeur and unmixed felicity was of short duration. Her husband Francis died unexpectedly after a short reign of sixteen months. Regret for his death, her own humiliation, the disgrace of her uncles the princes of Lorraine, which instantly followed, and the coldness of Catharine of Medicis the queen mother, who governed her son Charles IX. plunged *Mary* into inexpressible sorrow. She was invited to return to her own kingdom, and she tried to reconcile herself to her fate.

She was now to pass from a situation of elegance and splendour to the very reign of incivility and turbulence, where most of her accomplishments would be utterly lost. Among the Scots of that period, elegance of taste was little known. The generality of them were sunk in ignorance and barbarism; and what they termed religion, dictated to all a petulant rudeness of speech and conduct to which the queen of France was wholly unaccustomed. During her minority and absence, the Protestant religion had gained a kind of establishment in Scotland; obtained, indeed, by violence, and therefore liable to be overturned by an act of the sovereign and the three estates in parliament. The queen, too, was unhappily of a different opinion from the great body of her subjects, upon that one topic, which among them actuated almost every heart, and directed almost every tongue. She had been educated in the church of Rome, and was strongly attached to that superstition: Yet she had either moderation enough in her spirit, or discretion enough in her understanding, not to attempt any innovation in the prevailing faith of Protestantism. She allowed her subjects the full and free exercise of their new religion, and only challenged the same indulgence for her own. She contrived to attach to her, whether from his heart or only in appearance, her natural brother, the prior of St Andrew's; a man of strong and vigorous parts, who, though he had taken the usual oath of obedience to the pope, had thrown off his spiritual allegiance, and placed himself at the head of the reformers. By his means she crushed an early and formidable rebellion, and in reward for his services conferred upon him a large estate, and created him earl of Murray. For two or three years her reign was prosperous, and her administration applauded by all her subjects except the Protestant preachers; and had she either remained unmarried, or bestowed her affections upon a more worthy object, it is probable that her name would have descended to posterity among those of the most fortunate and the most deserving of Scottish monarchs.

But a queen, young, beautiful, and accomplished, an ancient and hereditary kingdom, and the expectation of a mightier inheritance, were objects to excite the love and ambition of the most illustrious personages. *Mary*, however, who kept her eye steadily fixed on the English succession, rejected every offer of a foreign alliance; and, swayed at first by prudential motives,

Mary.

Mary. motives, and afterwards by love the most excessive, she gave her hand to Henry Stuart Lord Darnley, the son of the earl of Lenox. This nobleman was, after herself, the nearest heir to the crown of England; he was likewise the first in succession after the earl of Arran to the crown of Scotland; and it is known that James V. had intended to introduce into his kingdom the Salique law, and to settle the crown upon Lenox in preference to his own daughter. These considerations made Mary solicitous for an interview with Darnley; and at that interview love stole into her heart, and effaced every favourable thought of all her other suitors. Nature had indeed been lavish to him of her kindness. He was tall of stature; his countenance and shapes were beautiful and regular; and, amidst the masks and dancing with which his arrival was celebrated, he shone with uncommon lustre. But the bounty of nature extended not to his mind. His understanding was narrow; his ambition excessive; his obstinacy inflexible; and under the guidance of no fixed principle, he was inconstant and capricious. He knew neither how to enjoy his prosperity nor how to ensure it.

On the 29th of July 1565, this ill-fated pair were married; and though the queen gave her husband every possible evidence of the most extravagant love; though she infringed the principles of the constitution to confer upon him the title of king; and though she was willing to share with him all the offices, honours, and dignities of royalty—he was not satisfied with his lot, but soon began to clamour for more power. He had not been married seven months, when he entered into a conspiracy to deprive Mary of the government, and to set himself on her throne. With this view he headed a band of factious nobles, who entered her chamber at night; and though she was then far advanced in her pregnancy, murdered her secretary in her presence, whilst one of the ruffians held a cocked pistol to her breast. Such an outrage, together with his infidelity and frequent amours, could not fail to alienate the affections of a high spirited woman, and to open her eyes to those defects in his character which the ardours of love had hitherto prevented her from seeing. She sighed and wept over the precipitation of her marriage: but though it was no longer possible to love him, she still treated him with attention and respect, and laboured to fashion him to the humour of her people.

This was labour in vain. His preposterous vanity and aspiring pride roused the resentment and the scorn of the nobles: his follies and want of dignity made him little with the people. He deserted the conspirators with whom he had been leagued in the assassination of the secretary; and he had the extreme imprudence to threaten publicly the earl of Murray, who, from his talents and his followers, possessed the greatest power of any man in the kingdom. The consequence was, that a combination was formed for the king's destruction; and, on the 10th day of February 1567, the house in which he then resided was early

in the morning blown up with gunpowder, and his dead and naked body, without any marks of violence, was found in an adjoining field. Mary

Such a daring and atrocious murder filled every mind with horror and astonishment. The queen, who had been in some measure reconciled to her husband, was overwhelmed with grief, and took every method in her power to discover the regicides; but for some days nothing appeared which could lead to the discovery. Papers indeed were posted on the most conspicuous places in Edinburgh, accusing the earl of Bothwell of the crime; and rumours were industriously circulated that his horrid enterprise was encouraged by the queen. Conscious, it is to be presumed, of her own innocence, Mary was the less disposed to believe the guilt of Bothwell, who was accused of having only acted as her instrument; but when he was charged with the murder by the earl of Lenox, she instantly ordered him on his trial. Through the management of the earl of Morton and others, who were afterwards discovered to have been partners in his guilt, Bothwell was acquitted of all share and knowledge of the king's murder; and what is absolutely astonishing, and shows the total want of honour at that time in Scotland, this flagitious man procured, by means of the same treacherous friends, a paper signed by the majority of the nobles, recommending him as a fit husband for the queen!

Armed with this instrument of mischief, which he weakly thought sufficient to defend him from danger, Bothwell soon afterwards seized the person of his sovereign, and carried her a prisoner to his castle at Dunbar. It has indeed been alleged by the enemies of the queen, that no force was employed on the occasion; that she was seized with her own consent; and that she was even privy to the subscribing of the bond by the nobles. But it has been well observed by one of her ablest vindicators (A), that "her previous knowledge of the bond, and her acquiescence in the seizure of her person, are two facts in apparent opposition to each other. Had the queen acted in concert with Bothwell in obtaining the bond from the nobles, nothing remained, but, under the sanction of their unanimous address, to have proceeded directly to the marriage. Instead of which, can we suppose her so weak as to reject that address, and rather *choose* that Bothwell should attempt to seize and carry her off by violence?—an attempt which many accidents might frustrate, and which at all events could not fail to render him or both of them odious to the whole nation. Common sense, then, as well as candour, must induce us to believe, that the scheme of seizing the queen was solely the contrivance of Bothwell and his associates, and that it was really by force that she was carried to Dunbar." Being there kept a close prisoner for 12 days; having, as there is reason to believe, actually suffered violence on her person; perceiving no appearance of a rescue; and being shown the infamous bond of the nobles; Mary promised to receive her ravisher for a husband, as in her opinion the only refuge for

(A) *Tytler's Dissertation on the Marriage of Queen Mary with the earl of Bothwell*: Transactions of the Society of Antiquaries of Scotland, vol. i.

Mary. for her injured honour. Without condemning with asperity this compliance of the queen, it is impossible not to recollect the more dignified conduct which Richardson attributes in similar circumstances to his *Clarissa*; and every man who feels for the sufferings, and respects the memory of *Mary*, must regret that she had not fortitude to resist every attempt to force upon her as a husband the profligate and audacious villain who had offered her such an insult as no virtuous woman ought ever to forgive. This, however, is only to regret that she was not more than human; that she who possessed so many perfections, should have had them blended with one defect. "In the irretrievable situation of her affairs, let the most severe of her sex say what course was left for her to follow? Her first and most urgent concern was to regain her liberty. That probably she attained by promising to be directed by the advice of her council, where *Bothwell* had nothing to fear." The marriage, thus inauspiciously contracted, was solemnized on the 15th of May 1567; and it was the signal for revolt to *Morton*, *Lethington*, and many of the other nobles, by whose wicked and relentless policy it had been chiefly brought about, and who had bound themselves to employ their swords against all persons who should presume to disturb so desirable an event.

As *Bothwell* was justly and universally detested, and as the rebels pretended that it was only against him and not against their sovereign that they had taken up arms, troops flocked to them from every quarter. The progress and issue of this rebellion will be seen in our history of *SCOTLAND*: suffice it to say here, that upon the faith of promises the most solemn, not only of personal safety to herself, but of receiving as much honour, service, and obedience, as ever in any former period was paid by the nobility to the princes her predecessors, the unhappy queen delivered herself into the hands of the rebels, and persuaded her husband to fly from the danger which in her apprehension threatened his life. These promises were instantly violated. The faithless nobles, after insulting their sovereign in the cruellest manner, hurried her as a prisoner to a castle within a lake, where she was committed to the care of that very woman who was the mother of her bastard brother; who, with the natural insolence of a whore's meanness, says *Mr Whitaker*, asserted the legitimacy of her own child and the illegitimacy of *Mary*; and who actually carried the natural vulgarity of a whore's impudence so far, as to strip her of all her royal ornaments, and to dress her like a mere child of fortune in a coarse brown cassoc.

In this distress the queen's fortitude and presence of mind did not forsake her: she contrived to make her escape from her prison, and soon found herself at the head of 6000 combatants. This army, however, was defeated; and, in opposition to the advice and entreaties of all her friends, she hastily formed the resolution of taking refuge in *England*. The archbishop of *St Andrew's* in particular accompanied her to the border; and when she was about to quit her own kingdom, he laid hold of her horse's bridle, and on his knees conjured her to return: but *Mary* proceeded, with the utmost reliance on the friendship of *Elizabeth*, which had been offered to her when she was a

prisoner, and of the sincerity of which she harboured not a doubt. *Mary.*

That princess, however, who had not yet forgotten her assumption of the title and arms of queen of *England*, was now taught to dread her talents, and to be envious of her charms. She therefore, under various pretences, and in violation not only of public faith, but even of the common rights of hospitality, kept her a close prisoner for 19 years: encouraged her rebellious subjects to accuse her publicly of the murder of her husband: allowed her no opportunity of vindicating her honour: and even employed venal scribblers to blast her fame. Under this unparalleled load of complicated distress, *Mary* preserved the magnanimity of a queen, and practised with sincerity the duties of a Christian. Her sufferings, her dignified assiduity, and her gentleness of disposition, gained her great popularity in *England*, especially among the Roman Catholics; and as she made many attempts to procure her liberty, and carried on a constant correspondence with foreign powers, *Elizabeth* became at last so much afraid of her intrigues, that she determined to cut her off, at whatever hazard. With this view she prevailed upon her servile parliament to pass an act which might make *Mary* answerable for the crimes of all who should call themselves her partizans; and upon that flagitious statute she was tried as a traitor concerned in the conspiracy of *Babington*: (See *SCOTLAND*). Though the trial was conducted in a manner which would have been illegal even if she had been a subject of *England*, and though no certain proof appeared of her connexion with the conspirators, she was, to the amazement of Europe, condemned to suffer death.

The fair heroine received her sentence with great composure; saying to those by whom it was announced, "The news you bring cannot but be most welcome, since they announce the termination of my miseries. Nor do I account that soul to be deserving of the felicities of immortality, which can shrink under the sufferings of the body, or scruple the stroke that sets it free." On the evening before her execution, for which, on the succeeding morn, she prepared herself with religious solemnity and perfect resignation, she ordered all her servants to appear before her, and drank to them. She even condescended to beg their pardon for her omissions or neglects; and she recommended it to them to love charity, to avoid the unhappy passions of hatred and malice, and to preserve themselves steadfast in the faith of Christ. She then distributed among them her money, her jewels, and her clothes, according to their rank or merit. She wrote her will with her own hand, constituting the duke of *Guise* her principal executor; and to the king and queen of *France* she recommended her son, provided he should prove worthy of their esteem.—In the castle of *Fotheringay* she was beheaded on the 8th of February 1587, in the 45th year of her age; and her body, after being embalmed and committed to a leaden coffin, was buried with royal pomp and splendour in the cathedral of *Peterborough*. Twenty years afterwards her bones were, by order of her son and only child *King James I.* removed to *Westminster*, and deposited in their proper place among the kings of *England*.

Mary.

The general character of Mary, which in the regular order of biography should now be laid before the reader, has furnished matter of controversy for 200 years.—She is universally allowed to have had considerable talents, and a mind highly cultivated. By one party she is painted with more virtues and with fewer defects than almost any other woman of the age in which she lived. By another, she is represented as guilty of the grossest crimes which a woman can commit—adultery and the murder of her husband. By all it is confessed, that, previous to her connexion with the earl of Bothwell, her life as a Christian was exemplary, and her administration as a queen equitable and mild; and it has never been denied that she bore her tedious sufferings with such resignation and fortitude as are seldom found united with conscious guilt. These are strong presumptions of her innocence. The moral characters of men change by degrees; and it seems hardly consistent with the known principles of human nature, that any person should at once plunge deliberately from the summit of virtue to the depths of vice; or, when sunk so low, should by one effort recover his original state of elevation. But in this controversy presumptions must go for nothing. The positive evidences which were brought against the queen of Scots are so conclusive, that if they be genuine she must have been guilty; and if they be spurious there can be no doubt of her innocence. They consisted of a box with letters, contracts, and sonnets, said to be written by herself and sent to the earl of Bothwell. In addition to these, the supposed confessions of the criminals who had suffered for the king's murder were originally urged as proofs of her guilt: but those confessions are now admitted by all parties to be either wholly forged, or so grossly interpolated, that no stress whatever can be laid upon them; and during Mary's life it was affirmed by her friends, and not sufficiently contradicted by her enemies, that the persons who had accused Bothwell, and were doubtless his accomplices, instead of criminating the queen, had openly protested her innocence in their dying moments.

Stuart's
History of
Scotland.

This box then, with its contents, was the evidence upon which her accusers had the chief and indeed the only reliance; and it is upon this evidence, whatever it be, that the guilt or innocence of the Scottish princess must finally be determined. It is uniformly affirmed upon the part of the earl of Murray and his faction, that the casket with the letters and the sonnets had been left by Bothwell in the castle of Edinburgh; that this nobleman, before he fled from Scotland, sent a messenger to recover them; and that they were found in the possession of this person. The 20th day of June 1567 is fixed as the date of this remarkable discovery. The governor of the castle at that time was Sir James Balfour. George Dalgleish, a servant of Bothwell's, is named as his messenger upon this errand. He was seized, it is said, by the domestics of the earl of Morton; and it was the earl of Morton himself who made the actual production of the casket and its contents.

This story is unsupported by vouchers, contains improbabilities, and cannot be reconciled with history and events. There remains not any authentic or unsuspecting evidence that the queen had dishonoured the bed of Lord Darnley; and there is the most satisfactory evidence*, that though Bothwell was intrusted

Mary.

with the defence of the borders on account of his tried courage and loyalty, he was privately disliked by Mary for his uncommon zeal in the cause of Protestantism. At the very time when the queen is said to have had the most violent love for that nobleman, and with him to have been carrying on the most criminal intercourse against her husband, we know both from Randolph and from Knox, that Bothwell refused to gratify her by the smallest compliance with the ceremonies of her religion, though many of the other Protestant peers scrupled not to accompany her to the celebration of the mass. That the villain who could deliberately commit murder, should be so scrupulously conscientious with respect to modes of faith and worship, as to stand forward with a peculiar strain of bravery to oppose, in a favourite measure, the queen, who was then admitting him to her bed, and actually forming plans for raising him to her throne, is surely, to say the least of it, extremely improbable.

But let us suppose this non-compliance on the part of Bothwell to have been a measure concerted between the queen and him to conceal more effectually from the eyes of the public the criminal intercourse in which they were engaged; is it not very surprising, that of such politicians, the one should have written those letters, and the other have left them in the power of their enemies? The earl of Bothwell was exposed to more than suspicions of a concern in the murder of the king. These papers contained manifest proofs of his guilt. It evidently was not his interest to preserve them: or admitting, that till his marriage was solemnized with the queen he might look upon them as his best security for the realizing of his ambitious hopes, yet, after that event, when all his former friends had deserted him, he must have felt the strongest inducements to destroy such a criminal correspondence; and Mary must have been ardently animated with the same wish. The castle of Edinburgh, where the box is said to have been lodged, was at this time entirely at their command; and Sir James Balfour, their deputy, was the creature of Bothwell. If his enemies, who were now in arms against him, should possess themselves of this box and its contents, his destruction was inevitable. From his marriage till the 5th day of June, it was in his power to have destroyed the fatal papers; and if they had existed, it is not to be imagined that he would have neglected a step so expedient, not only for his own security and reputation, but also for those of the queen. During all this time, however, he made no effort to recover his box and letters: he had lodged them in the castle of Edinburgh; and there he chose to leave them in the custody of a man in whom he could not have one particle of assurance. This was excessively foolish; but his subsequent conduct was still more so. Upon the 6th day of June, it is evident that he had reason to suspect the fidelity of Sir James Balfour, since he avoided to take refuge in the castle of Edinburgh and fled to Dunbar. He returned, however, with an army in order to fight the rebels. The balance of empire might then seem to hang suspended between himself and his enemies: and in that state of things, a man of such commodious principles as Balfour appears to have been, might be inclined to do his old friend and patron a secret service, both to efface his former perfidy and

* Whittaker's
Vindication, &c.

Mary.

and to create himself a new interest with him in case he should be victorious over the rebels. Yet in these critical moments Bothwell neglected to make any application to him for the casket and the letters! On the 15th of June, all his towering imaginations were at once dashed to the ground. He had come to Carberry hill, followed by an army and accompanied by a queen; but he fled from it attended only by a single servant, and was glad to shelter himself in the castle of Dunbar, from the vengeance due to his crimes. Yet in this extremity of distress he is represented as trying a bold experiment, which he had not courage to try when he was fortified with the authority of his sovereign, and when he was facing the rebels in the field. In the very hour when almost every friend had deserted him, he expected a return of friendship from a man who had deserted him at first only because he suspected him to be in danger. At this period he sent his servant George Dalgleish to wait upon Balfour, the acting governor of the castle of Edinburgh, with a requisition for the box of letters, and to bring back the important charge, through ten thousand dangers, to Dunbar. Though this man was one of his agents in the murder of the king, and might therefore have been safely intrusted with any secret, he did not order him, as common sense requires he should have done, to destroy the letters as soon as he should get them into his possession. No! he sent him to fetch them from the castle, as if there was no danger in going thither, no doubt of receiving them there, and no difficulty in carrying them back. * To a traveller in an easy chair, all roads are smooth, and all days are fine. Accordingly this same Dalgleish, though the well-known servant of Bothwell, makes good his entrance at the gates of the city, though these were guarded by 450 harquebusiers all hostile to his master, finds his way to the castle, and delivers his message. But what is more astonishing than all, he actually receives the box of letters from Sir James Balfour. This indeed, says Mr Whitaker, "is o'er-doing Termagant; it out-herods Herod." Balfour was the ductile slave of selfishness. He had with infinite perfiduousness turned against his friend, his patron, and his queen, only because he saw them opposed by a party which he thought would prove too strong for them; but now when they were both plunged into the lowest state of distress, and branded with the appellation of regicides, his selfishness was suddenly changed into generosity, his meanness gave place to exalted sentiments, and, at the peril of his own life, he performed an heroic act of kindness! "In such circumstances (asks a contemporary writer), is it to be thought, either that the earl would send to the said Sir James, or that the said Sir James would send any thing to the earl? Is it likely? Is it credible?" No matter: Bothwell is made to send for his papers at a time when his difficulties and his despair render it *improbable* that he could think of them, and when it was absolutely *impossible* that he could recover them. His messenger accordingly is intercepted with the casket; and the adversaries of the queen, upon the 20th day of June, became possessed of vouchers with which they might operate her destruction. These inconsistencies are glaring, and of a force not easily to be controuled; and the story is open to other objec-

* Whitaker's Vindication.

tions, which are, if possible, greater, and altogether insurmountable.

Mary.

By comparing different proclamations of the rebels with the several despatches of Throgmorton, who was then Elizabeth's resident in Scotland, Mr Whitaker has made it appear in the highest degree probable, that Dalgleish was *not* seized till the 17th of July; that he was then, in consequence of an order issued by the court of session, apprehended, together with Powrie, another of Bothwell's servants, in that nobleman's lodgings in the palace of Holyroodhouse; and that therefore he could not be the bearer of the letters intercepted by the earl of Morton on the 20th of June. What adds greatly to this probability is the account which the rebels themselves give of his examination. A few days after he was taken, he was examined, say they, judicially, in a council where the earls of Morton and Athol are marked as present. It was natural upon this occasion to make inquiries about the casket and the papers. No questions, however, were put to him on that subject. He was not confronted with Sir James Balfour, from whom he had received the casket; nor with the domestics of the earl of Morton, by whom it was said that he had been apprehended. He was kept in prison many months after this examination; and during a period when the rebels were infinitely pressed to apologize for their violence against the queen, there were opportunities without number of bringing him to a confession. These opportunities, however, were avoided; and there exists not the slightest evidence that the casket and the papers had ever been in his possession. Is it then to be supposed, that if the casket and the papers had really been discovered with him, the establishment of a fact so important would have been neglected by the adversaries of the queen? No! they would have established it by the most complete evidence; which they were so far from attempting to do, that the earliest account which they give of their pretended seizure of the letters is dated *fifteen months* after the event itself, and nearly *nine months* after the death of Dalgleish. To have blazoned their discovery at the time they pretend it was made, might have been attended with very disagreeable consequences: for Dalgleish, who at his execution, asserted the innocence of the queen, and actually charged the earls of Murray and Morton as the contrivers of the murder, might have found proof that the casket could not possibly have been intercepted in his custody.

The 20th of June 1567 is fixed as the æra of the discovery of the letters. If this discovery had been real, the triumph of the enemies of the queen would have been infinite. They would not have delayed one moment to proclaim their joy, and to reveal to her indignant subjects the fulness and the infamy of her guilt. They preserved, however, a long and a profound silence. It was not till the 4th of December 1567 that the papers received their first mark of notice or distinction; nor till the 16th of September 1568, that the earl of Morton was said to have intercepted them with Dalgleish. From the 20th day of June to the 4th day of December, many transactions and events of the highest importance had taken place; and the most powerful motives that have influence with men had called upon them to publish their discovery.

Mary. covery. They yet made no production of the papers, and ventured not to appeal to them. In the proclamation which they issued for apprehending Bothwell, they inveigh against his guilt, and express an anxious desire to punish the regicides: yet though this deed was posterior to the 20th of June, there is no assertion in it to the dishonour of the queen; and it contains no mention of the box and the letters. An ambassador arrived in this interval from France, to inquire into the rebellion and the imprisonment of the queen; yet they apologized not for their conduct by communicating to him the contents of the casket. To Throgmorton, who had instructions to act with Mary as well as with her adversaries, they denied the liberty of waiting upon her at Lochleven, where she was detained a close prisoner; and they were earnest to impress him with the idea that her love of Bothwell was incurable. He pressed them on the subject of their behaviour to her. At different times they attempted formally to vindicate themselves; and they were uniformly vehement on the topic of the love which she bore to that nobleman. Yet they abstained from producing the letters to him. "They even spoke of her to him with *respect* and *reverence*;" which surely they could not possibly have done had they been then in possession of the letters. They were solicitous to divide the faction of the nobles who adhered to the queen; and there could not have been a measure so effectual for this end as the production of the casket and its contents; yet they called no convention of her friends, to surprise and disunite them with this fatal discovery. They flattered the Protestant clergy, attended assemblies of the church, instilled into them a belief of the queen's being guilty of murder and adultery, and incited Mr Knox to "inveigh against her vehemently in his sermons, to persuade extremities towards her, and (as Throgmorton continues) to threaten the great plague of God against the whole country and nation if she should be spared from her *condign punishment*;" but they ventured not to excite the fury of these ghostly fathers by exhibiting to them the box and the letters. They compelled the queen to subscribe a resignation of her crown; and they had the strongest reason to be solicitous to justify this daring transaction. The box and the letters would have served as a complete vindication of them; yet they neglected to take any notice of these important vouchers; and were contented with resting on the wild and frivolous pretence that the queen, from sickness and fatigue, was disgusted with the care of her kingdom.

To the irrefragable proof of the forgery of the letters arising from their having been so long concealed, it has been replied, that the rebels could not produce them sooner with any regard to their own safety. "A considerable number of their fellow subjects, headed by some of the most powerful noblemen in the kingdom, was combined against them. This combination they could not hope to break or to vanquish without aid either from France or England. In the former kingdom, Mary's uncle, the duke of Guise and the cardinal of Lorraine, were at that period all-powerful, and the king himself was devotedly attached to her. The loading the queen, therefore, with the imputation of being accessory to the murder of her

Mary. husband, would be deemed such an inexpiable crime by the court of France, as must cut off every hope of countenance or aid from that quarter. From England, with which the principal confederates had been long and intimately connected, they had many reasons to expect more effectual support; but to their astonishment, Elizabeth condemned their proceedings with asperity. Her high notions of royal authority, and of the submission due by subjects, induced her on this occasion to exert herself in behalf of Mary, not only with sincerity but with zeal: she negotiated, she solicited, she threatened. From all these circumstances, the confederates had every reason to apprehend that Mary would soon obtain her liberty, and by some accommodation be restored to the whole, or at least to a considerable portion, of her authority as sovereign; and therefore they were afraid of the consequences of accusing her publicly of crimes so atrocious as adultery and murder."

This apology for the rebels consists of assertions for which there is no evidence, and of arguments which are wholly untenable. There is no evidence that Elizabeth exerted herself in behalf of Mary with sincerity and with zeal. If she had, she would have done more than threaten. An English army of 3000 men, aided by the Scottish combination which continued faithful to the queen, would have overturned the rebel government in the space of a month. It is inconceivable that the rebels were prevented by any apprehension of the queen's restoration from accusing her of the crimes of murder and adultery; for we learn from a despatch of Throgmorton's, dated the 19th of July 1567, that "men of good regard did then boldly and overtly by their speech, utter great rigour and extremity against their sovereign; saying, it shall not be in the power of any *within* this realm, neither *without*, to keep her from condign punishment for her notorious crimes." From another despatch of the same ambassador's, dated five days after the former, we learn, that through him they *actually did* accuse her to Elizabeth of "incontinency, as well with the earl of Bothwell as with others, and likewise of the murder of her husband, of which, they said, they had as apparent proof against her as might be; as well by the testimony of *her own hand writing*, which they had recovered, as also by sufficient witnesses." This testimony, however, was not produced till more than four months afterwards; a certain proof, that though it was now in the hands of the manufacturers, it was not yet ready for inspection.

But let us take the facts of this ablest antagonist of Mary as he has stated them, and consider the argument which they are made to support. It is apparent, from the last quoted despatch of Throgmorton's, that it could not be unknown, either to the court of France ^{or} or the court of England, that the rebels were at all events determined to crown the prince, and either to put the queen to death or to keep her a close prisoner for life. These desperate enterprises, however, could not, it seems, be carried into effect without the countenance and aid of Elizabeth or Charles: but Elizabeth's notions of regal authority, and of the submission due by subjects, were high; and the French king was devotedly attached to the dethroned queen. If this was so, common sense says, that the business of the confederates, since they expected aid from these princes,

* Robert-son's Disquisition, 13th edit.

Mary.

princes, was to charge Mary at once with the murder and adultery, and support the charge with the most convincing evidence which they had to produce. No! says this apologist of theirs, Charles IX. would have considered such conduct as a crime inexpiable, though he might *reasonably* be expected to give them his countenance in putting to death, or keeping in perpetual prison, for a comparatively venial offence, the queen to whom he was devotedly attached! This is strange reasoning; but it seems not to have occurred to the rebels themselves. The letters made their first appearance in a secret council assembled by the earl of Murray on the 4th of December 1567; and the reason there assigned by the confederates for their unwillingness to produce them was, "That luif they beare unto hir person, wha sometime was thaire sovereigne, and for the reverence of his majestie, whais moder she is, as alsua thay many gude and excellent gifts and vertues quherewith God sometimes indowit hir." And they proceed to say, that they would not have produced them at all, "gif otherwise the sinceritie of their intentions and proceedings from the beginninge myht be knowne to forrein nacions and the inhabitants of this ile (of whome many yet remains in suspence in judgement) satisfiet and resolvit of the richtnessness of thaire quarrel, and the securitie of them and their posteritie be ony other meane might be providit and established." So far were they from dreaming that the production of the letters would injure their cause in the court of France, that we see they frankly acknowledged that the sincerity and rectitude of their proceedings could not otherwise be manifested to foreign nations. In this instance they think and talk like reasonable men; but they do not long preserve the same consistency.

In this act of council the rebels discover the greatest anxiety for their pardon and security: And "the matter being largelic and with gude deliberacion resonit at great length, and upon sundry daies; at last all the said lords, barrones, and others above exempt, can find no ither way or moeyn how to find or make the said securitie but be oppyngyng and reveling of the truth and *grunde of the hail matter fre the beginninge*, plainlie and uprightlie, &c. Therefore the lords of secrete council, &c. desires it to be found and declarat be the estates and hail body of the parliament, that the cause and occasion of the tacking of the queen's person upon the 15th daie of Junii, last by past, and holding and detaining of the same within the hous and place of Lochlevin continewallie sensyne, presentlie, and in *all tymes comyng*; and generally all others things *inventit*, spoken, writtin, or donne be them or onny of them, sen the tent daie of February last by past unto the daie and date *keirof*, towiching the saied queen hir person: that caus, and all things depending theiron or that onie wise maie apperteine thcirto, &c. was in the said queen's awin default, in as far as be **DIVERS HER PRIVIE LETTERS WRITTEN AND SUBSCRIVIT WITH HIR AWIN HAND**, and sent by her to James Erll Bothwell, &c.—and be her ungodlie and dishonourable proceedinge in a privat marriage, soddanlie and unprovisitly, it is most certain, that she was previe, art and part, and of the actual devise and deid of the for-mencionit murder of the king, her lawchful husband, our sovereigne lord's

father, committit be the said James Erll Bothwell, &c."

Mary.

Had the letters been really genuine, into the absurdity of this declaration no man of common sense could possibly have fallen. Truth is always consistent with itself: but in a series of forgeries contradictions are scarcely avoidable. The confederates rose in rebellion against the queen on the 10th of June: they faced her in rebellion at Carberry hill on the 15th; they sent her away into prison on the 16th: yet they afterwards justified *all* that they had done since the *tenth of February* by letters, which, they *said*, they had not till the *twentieth of June*! "This (says Mr Whitaker) if we consider it as folly, is one of the most striking and eminent acts of folly that the world has ever beheld. But it ought to be considered in a light much more dishonourable to the rebels; and as knavery, it is one of the rankest that has ever been attempted to be imposed upon the sons of men." On the 4th of December, it must be remembered that they had not fixed *any day* for the discovery of the letters. The story of the seizure of Dalgleish with the casket was not thought of till near a year afterwards; and when it was invented, they had certainly forgotten the date of their act of council. In that act, therefore, they were free to rove at large; but they roved very uncautiously. By grounding upon the letters, proceedings prior to the 10th of June, they plainly declare the discovery of these fatal papers to have been *antecedent to the twentieth*. By grounding upon them their secret messages for sedition, their private conventions for rebellion, and "every thing inventit, spokin, written, or done, be them, or anny of them, respecting the queen, Bothwell, or Darnley, sen the *tent daie of February* last by past," they even intimate the discovery to have been previous to the murder of the king; and yet by their own accounts some of the letters were then *actually unwritten*. This is astonishing; and shows the extreme difficulty of carrying to any length a consistent series of falsehoods. Even Murray, Morton, and Lethington, could not do it. They knocked down one ninepin in endeavouring to set up another; and they finally threw down all, by making them mutually and successively to strike one another.

We have not yet done with this act of council. It was with a view to the approaching convention of the estates that it had been formed and managed. It was a preparation for the parliament in which the conspirators had secured their fullest sway, and where they proposed to effectuate their pardon and security, and to establish the letters as decisive vouchers against the queen. Accordingly, upon the 15th day of December 1567, the three estates were assembled. The conspirators invited no candid or regular investigation. The friends of the nation and of the queen were overawed. Every thing proceeded in conformity to the act of council, the conspirators, by a parliamentary decree, received a full approbation of all the severities which they had exercised against the queen. A pardon by anticipation was even accorded to them for any future cruelty they might be induced to inflict upon her.—The letters were mentioned as the cause of this singular law; and this new appeal to them may be termed the second mark of their distinction. But, amidst the plenitude

Mary. plenitude of their power, the conspirators called not the estates to a free and honest examination of them. This, indeed, had the letters been genuine, would have annihilated for ever all the consequence of the queen. Upon this measure, however, they ventured not. The letters were merely produced in parliament, and an act founded on them; but the queen was not brought from her confinement to defend herself, nor was any advocate permitted to speak for her. We learn from a paper of unquestionable authenticity*, that "sindrie nobilmen that was her Grace's favouraris then present, buir with all (the rebel proceedings in this parliament), maist principellie for safety of hir Grace's lyfe, quhilk, or thair coming to parliament, was concluded and subscrivit be ane greit part of hir takeris, to be taken frae hir in meist crewel manner, as is notourlie known." By the power of this magic, the friends of Mary were bound fast. They durst not venture to question publicly the authenticity of the letters, from the dread of exposing the queen to the dagger of the assassin. The parliament, therefore, sustained these forgeries as vouchers of her guilt, without scrutiny or debate of any kind. The conspirators, who were themselves the criminals, were her accusers and her judges, and passed a law exactly in the terms in which the act of secret council had before drawn it up.

* See Whitaker's Vindication.

It was necessary to describe the letters both in the act of council and in the ordination of parliament; and these deeds having fortunately descended to posterity, it is apparent, from a comparison of them, that between the 4th and the 15th days of December, the letters must have undergone very essential alterations under the management of the conspirators. In the act of council the letters are described expressly as "written and *subscrivit* with the queen's awin hand;" but in the act of parliament they are said to be only "*written helilie* with hir awin hand," and there is no intimation that they were *subscribed* by her. Whence arises this difference? From a *blunder* in the clerk penning the act of council, says one: From a habit contracted by the same clerk, which made him *mechanically* add *subscribed* to *written*, says another: From the *carelessness* of the writer who transcribed the copy of the act of council which has descended to us, says a third. These subterfuges have been exposed in all their weakness by Messrs Tytler and Whitaker: but in this abstract it is sufficient to observe, that they are mere suppositions, supported by no evidence; and that the copy of the act of council which we have was given to the ministers of Elizabeth by the leaders of the faction, who were neither blundering clerks, nor under the habit of mechanically adding *subscribed* to *written*. Under one form, therefore, the letters were certainly exhibited before the council, and under another form they were produced in parliament; but had they been genuine, they would have appeared uniformly with the same face. The clerk of the council was Alexander Hay, a notary public accustomed to draw up writings and to attest them; and what puts his accuracy with respect to the letters beyond all possibility of doubt, his description of them is authenticated in the fullest manner by the signatures of Murray, Morton, and a long train of others who formed the secret council. The letters, therefore, were actually presented to the

secret council with the customary appendage of subscription to them. But when these artificers of fraud came to reflect more closely on the approach of parliament, and to prepare their letters for the inspection of the friends of Mary, they began to shrink at the thoughts of what they had done. To substantiate the charge by letters under her own hand, they had naturally annexed her own subscription, a letter *unsubscribed* being a solecism in evidence. But most unfortunately for the cause of *complete* forgery, Mary was still in possession of her own *seal*, and he who fabricated the letters was not an engraver. For this reason, "the allegit writings in form of missive letters or epistles," says the bishop of Ross, in an address to Elizabeth, "are not *sellit* or *signetit*." They were neither attested by her subscription at the bottom, nor secured by her seal on the outside. In the secret council, where all were equally embarked in rebellion, these omissions were of no importance. But that letters containing intimations of adultery and of murder, should be sent by the queen to the earl of Bothwell, with her *subscription* to them, and yet without any guard of a *seal* upon them, so far exceeds all the bounds of credibility, that they could not expect it to gain the belief of parliament. They were struck with the absurdity of their plan, and dreaded a detection. They were under the necessity of altering it; but they could not supply the defect of the seal. They, therefore, wrote over the letters anew, and withheld the subscription.

Mary.

These letters were now as complete as the conspirators wished them; yet in this state, while they were unsubscribed and unsealed, they wanted other formalities which are usual in despatches. They were without directions, and they had no dates. They must, therefore, have been sent by the queen to Bothwell as *open and loose papers*; yet they contained evidence against herself, and against him, of the most horrid wickedness; and Nicholas Hubert, the person who is said to have carried most of them, was of the lowest condition, and, as Dr Robertson characterizes him, "a foolish talkative fellow." He would, therefore, surely read those papers, which are polluted from end to end with open and uncovered adultery, and as surely report their contents to others. These are most incredible circumstances, on the supposition that the letters are authentic, unless the queen was, what none of her enemies ever represented her, an absolute idiot.

The letters in their composition bear no resemblance to the other writings of the queen. They have a vulgarity, an indelicacy, and a coarseness of expression and manner, that by no means apply to her. They breathe nothing of the passion of love besides the impulses of the sensual appetite; and they represent a queen, highly accomplished, in love with one of her subjects, as acting with all the sneaking humility of a cottager to a peer*. A few instances will show this. "The devil sinder us," she is made to exclaim, "and God knit us togidder for ever for the maist faithful coupill that ever he unitit: *this is my feith; I will die in it.*" "I am," she says in another place, "varrey glad to write unto you zow quhen the rest are sleipand; fen I cannot sleip as they do, and *as I wold desyre, that is, in your arms, my dear lufe.*" "Seeing to obey zow, my dear lufe, I spare *nother honour, conscience, haerde,*

* See Whitaker's Vindication.

Mary. *hasarde, nor greatness quhatsumever; tak it, I pray zow, in gude part, as from the maist faithful luifer that ever ze had, or ever sail have.*" Se not hir (his wife), qubais fenzeit teires suld not be sa mikle preisit nor estemit as the trew and faithful trevellis quhilk I susteine for to *merite her place.*" "God give zow, my ony lufe, the hap and prosperitie quilk your *humble* and faithful lufe desyres unto zow, who *hopis to be schortly another thing to you* for the reward of my irksome travelles." "When I will put you out of dout, and cleir myselfe, *refuse it not*, my dear lufe; and suffer me to mak zow some prufe be *my obedience*, my faithfulness, constancie, and *voluntary subjection*, quhilk I tak for the *pleasandest gude* that I might resseif, *if ze will except it.*" "Such (says Mr Whitaker) was the coarse *kirtle*, and the homely *neckatie*, in which these wretched representers of Mary dressed themselves up, for the exhibition of a queen dignified, refined, and elegant;—a queen whom, according to their own account, "God had indowit with mony gude aud excellent gifts and virtues!"

The evidence which points to the forgery of the letters is profuse and instructive. In its separate parts, it is powerful and satisfactory*. When taken together, and in the union of its parts, it is invincible. But, amidst all its cogency and strength, there is a circumstance most peculiarly in its favour, and of which it required no aid or assistance. By this peculiarity, it is cased completely in steel, and armed at every point. The letters have come down to us in the French, the Scottish, and the Latin languages. Now, the conspirators affirmed, that they were written by the queen in the French language. But by a critical examination of them in these different languages, Mr Goodall demonstrated, that the pretended French originals are a translation from the Latin of Buchanan, which is itself a version from the Scotch. This is indeed acknowledged by Dr Robertson, the ablest and most persevering of all Mary's enemies, who pretends, that, so far as he knows, it never was denied. Determined, however, to support the authenticity of the letters at all events, the same elegant and ingenious writer supposes †, that the French originals are now lost, but that two or three sentences of each of those originals were retained, and prefixed to the Scottish translation; and that the French editor observing this, foolishly concluded, that the letters had been written partly in French and partly in Scottish. In support of this singular hypothesis, he proceeds to affirm, that "if we carefully consider those few French sentences of each letter which still remain, and apply to them that species of criticism by which Mr Goodall examined the whole, a clear proof will arise, that there was a French copy, not translated from the Latin, but which was itself the original from which both the Latin and Scottish have been translated." He accordingly applies this species of criticism, points out a few variations of meaning between what he calls the remaining sentences of the original French and the present Latin; and thinks, that in the former he has discovered a spirit of elegance which neither the Latin nor the Scottish have retained. His critical observations have been examined by Mr Whitaker; who makes it apparent as the noon-day sun, that the doctor has occasionally mistaken the sense of the Latin, the French,

and even the Scotch; and that he has *forgotten* to point out either the elegance or the spirit of any particular clauses in his pretended originals. The same masterly vindicator of Mary then turns his antagonist's artillery against himself; and demonstrates, that such variations as he has thought sufficient to prove the existence of a former French copy, are not confined to the first sentence of each of the three first letters, but are extended to other sentences, and diffused over all the letters. Hence he observes, that this mode of proving will demonstrate the *present* French, and *every* sentence in it, to be that very original, which it primarily pretended to be, which Mr Goodall has so powerfully proved it not to be, and which even the doctor himself dares not assert it is. Our limits will not admit of our transcribing the observations of these two illustrious critics; nor is it necessary that we should transcribe them. By acknowledging that "Buchanan made his translation, not from the French but from the Scottish copy (of which he justly observes, that, were it necessary, several critical proofs might be brought)," Dr Robertson, in effect, gives up his cause. Had there been any other French letters than the present †, what occasion had Buchanan for the Scotch, when he himself must have had possession of the originals? It is evident from Mr Anderson's account, that those letters were translated by Buchanan at London during the time of the conferences. He was one of the assistants appointed to the rebel commissioners, and intrusted with the whole conduct of the process against the queen. By him, with Lethington, Macgill, and Wood, the original letters were exhibited, and their contents explained to the English commissioners; and we know from the authentic history of those papers, that they were neither lost nor mislaid for many years afterwards. It cannot be pretended that Buchanan did not understand the French; for he past most of his life in that country, and taught a school there. He was, indeed, a daring zealot of rebellion; but, with all its audacity, he must have felt the task in which he was engaged a very ungracious one. When he sat down to defame, in the eyes of all Europe, a queen to whom he owed not only allegiance but also personal gratitude, it is not conceivable that he could have translated from a *Scotch translation*, had he known any thing of a *French original*; and if the rebel commissioners, who were said to produce them, knew nothing of such originals, certainly nobody else ever did: if they existed not with Buchanan, they existed nowhere.

Dr Robertson, however, has another argument against Mr Goodall, which he thinks conclusive. Of the eight letters "the five remaining (he says) never appeared in Latin: nor is there any proof of their ever being translated into that language. Four of them, however, are published in French. This entirely overturns our author's hypothesis concerning the necessity of a translation into Latin."—An authentic fact will indeed overturn any hypothesis; but, most unluckily for this argument, the doctor advances the hypothesis, and the fact rests with Mr Goodall. It is indeed true that Buchanan *published* only the three first letters in Latin at the end of his Detection; but it does not therefore follow, that the other five were never *translated into that language*. Indeed Mr Whitaker has made

* Stuart.

† Dissertation.

† Tytler's Inquiry.

Mary. made it as apparent as any thing can be, that the whole eight were turned into Latin for the use of the French translator, who, by his own account, understood not the Scotch. He has made it in the highest degree probable, that this translator was one *Camus*, a French refugee; and he has demonstrated, that the translation was made in London under the eye of Buchanan himself. We do not quote his arguments, because they consist of a great number of observations which cannot be abridged; and because the translator himself confesses every thing which is of importance to the cause maintained by Mr Goodall. "Au reste (he tells us) epistras misas sur la ain," which were all but the eighth, "avaient esté escrites par la Roynne, partie en François, partie en Escossois; et depuis traduictes ENTIEREMENT en LATIN: mais n'ayant cognoissance de la langue Escossoise, j'ay mieux aimé exprimer TOUT ce, que j'ay trouve en LATIN, que, &c." This confession (says Mr Whitaker) takes a comprehensive sweep. It makes all the seven letters at least, and the whole of each, to have been translated into Latin, and from thence to have been rendered into French. It starts no piddling objections about sentences or half sentences, at the head or at the tail of any. It embraces all within its wide-spread arms. And it proves the fancied existence of a French copy at the time to be all a fairy vision; the creation of minds that have subjected their judgments to their imaginations; the invited dreams of self-delusion."

The letters, so weak on every side, and so incapable of sustaining any scrutiny, give the marks of suspicion and guilt in all the stages of their progress. Even with the parliamentary sanction afforded to them by the three estates, which the earl of Murray assembled upon the 15th day of December 1567, he felt the delicacy and the danger of employing them *openly* to the purposes for which they were invented. For while he was scheming with Elizabeth his accusation of the queen of Scots, he took the precaution to submit privately the letters to that princess by the agency of his secretary Mr Wood. The object of this secret transaction, which took place early in the month of June 1568, was most flagitious, and presses not only against the integrity of Murray, but also against that of the English queen. Before he would advance with his charge, he solicited from her an assurance that the judges to be appointed in the trial of Mary would hold the letters to be true and probative.

By the encouragement of Elizabeth, the earl of Murray was prevailed upon to prefer his accusation*. He was soon to depart for England upon this business. A privy council was held by him at Edinburgh. He took up in it with formality the letters of the queen from the earl of Morton, and gave a receipt for them to that nobleman. That receipt is remarkable and interesting. It is dated upon the 16th of September 1568, and contains the first mention that appears in history of the discovery of the letters as in the actual possession of Dalgleish upon the 20th of June 1567. This, as we have already noticed, is a very suspicious circumstance; but it is not the only suspicious circumstance which is recorded in the receipt. In the act of secret council, and in the ordination of parliament, in December 1567, when the earl of Murray and his associates were infinite-

ly anxious to establish the criminality of the queen, the only vouchers of her guilt to which they appealed were the letters; and at that time, doubtless, they had prepared no other papers to which they could allude. But in Murray's receipt in September 1568 there is mention of other vouchers beside the letters. He acknowledges, that he also received from the earl of Morton contracts or obligations, and sonnets or love verses. These remarkable papers, though said to have been found upon the 20th of June 1567, appeared not till September 1568; and this difficulty is not to be solved by those who conceive them to be genuine. The general arguments which affect the authenticity of the letters apply to them in full force; only it must be observed, that as the original letters were undoubtedly in Scotch, the original sonnets were as certainly written in French. This has been completely proved by Dr Robertson, and is fully admitted by Mr Whitaker, who has made it in the highest degree probable that Lethington forged the letters and Buchanan the sonnets. Be this as it may, the sonnets have every external and internal evidence of forgery in common with the letters, and they have some marks of this kind peculiar to themselves. In particular, they make the love of Mary still more grovelling than the letters made it; and with a degree of meanness, of which the soul of Lethington was probably incapable, the author of the sonnets has made the queen consider it as "na lytill honour to be maistres of her subjects gudis!" In this the dignified princess is totally lost in "the maid Marien" of her pretended imitators; and Buchanan, who in his commerce with the sex was a more sensualist, forgot on this occasion that he was personating a lady and a queen.

There is, however, in these sonnets, one passage of singular importance, which we must not pass wholly unnoticed. The queen is made to say,

*Pour luy aussi j'ay jetté mainte larme
Premier qu'il fust de ce corps possesseur,
Duquel alors il n'avoit pas le cœur.
Puis me donna un autre dur alarme,
Quand il versa de son sang mainte dragme.*

For him also I powrit out mony teiris,
First quhen he made himself possessor of this body,
Of the quhilk then he had not the heart.
Efter he did give me an uther hard charge,
Quhen he bled of his blude great quantitie, &c.

If these sonnets could be supposed to be genuine, this passage would overthrow at once all the letters and both the contracts which were produced; and would prove, with the force of demonstration, that the seizure of Mary by Bothwell was *not* with her own consent; that he actually committed a *rape* upon her; that she had for him *no love*; and that she married him merely as a *refuge to her injured honour*. The sonnets, however, are undoubtedly spurious; but, considered in this light, the verses before us prove with equal force the full conviction in the minds of the rebels of what in an unguarded moment they actually confessed to Throgmorton, and was manifest to all the world; viz. that "the queen their sovereign was *led captive*, and by FEAR, FORCE, and (as by many conjectures may be well suspected) others EXTRAORDINARY and

more

* Stuart.

Mary. more UNLAWFUL means COMPELLED to become bed-fellow to another wife's husband." They prove likewise, that after the rape, finding Mary highly indignant at the brutality done her, Bothwell actually stabbed himself; not, we may believe, with any intention to take away his own life, but merely that by shedding many a "drachm" of blood he might mollify the heart of the queen.

But we mean not to pursue the history of the sonnets any farther. Though they were undoubtedly invented in aid of the letters, to prove that fundamental principle of the conspirators,—that the love of Mary to Bothwell was inordinate; yet they are so incompatible with history, and with one another, that they demonstrate the spuriousness of themselves, and of the evidence which they were intended to corroborate. By thus endeavouring to give an air of nature and probability to their monstrous fictions, the rebels at once betrayed the fabrication of the whole. They have themselves supplied us with a long and particular journal, to show the true dates of facts; and by that journal have their letters and their sonnets been demonstrated to be spurious. "The makers of these papers (says Mr Whitaker) have broken through all the barrier of their own history. They have started aside from the orbit of their own chronology. They have taken a flight beyond the bounds of their own creation, and have there placed themselves conspicuous in the PARADISE OF FOOLS."

This mass of forgery was clandestinely shown to Elizabeth's commissioners during the conferences at York: (See SCOTLAND). It was shown again to the same commissioners and others during the conferences at Westminster. But neither Mary nor her commissioners could ever procure a sight of a single letter or a single sonnet. By the bishop of Ross and the lord Herries, she repeatedly demanded to see the papers said to be written by her; but that request, in itself so reasonable, Elizabeth, with an audacity of injustice of which the history of mankind can hardly furnish a parallel, thought fit to refuse. Mary then instructed her commissioners to demand copies of the letters and sonnets; and offered even from these to demonstrate in the presence of the English queen and parliament, and the ambassadors of foreign princes, that the pretended originals were palpable forgeries. Even this demand was denied her; and there is undoubted evidence still existing, that neither she nor her commissioners had so much as a copy of these criminal papers till after those important conferences had for some time been at an end. This last demand perplexed Elizabeth; the conferences were suddenly broken up; Murray was dismissed with his box to Scotland; and the letters were seen no more!

But the letters, we are told, were at Westminster compared with letters of the queen's, and found to be in the same Roman hand. They were indeed compared with other writings; but with what writings? This question let Elizabeth's commissioners themselves answer. They collated them, they say, "with others her letters, which were showed yesternight, and avowed by THEM (the rebel commissioners) to be written by the said queen" This was such a collation as must have pronounced them to be idiots*, if we had not known them to be otherwise; and such as must pronounce them to be knaves, as we know them to

VOL. XII. Part II.

Mary. have been men of sense. Like persons totally incompetent to the management of business, but in truth acting ministerially in the work of profligacy, they compared the letters produced, NOT with letters furnished by Mary's commissioners, NOT with letters furnished even by indifferent persons, BUT with letters presented by the producers themselves.—"This (says Mr Whitaker) is such an instance of imposition upon Mary and the world, as can scarcely be paralleled in the annals of knavery. Many instances of imposition, indeed, occur in the wretched history of our race; but we can hardly find one, in which the imposition was so gross, so formal, so important, and so clear. It was very gross, because it has not a shred of artifice to cover its ugly nakedness. It was very formal, because it was done by men some of whom were of the first character in their country; and all were bound by honour, and tied down by oaths, to act uprightly in the business. It was very important, because no less than the reputation of a queen, and the continuance of an usurpation, depended upon it. And it is very clear, because we have the fact related to us by the commissioners themselves, recorded to their shame in their own journal, and transmitted by their own hands to posterity with everlasting infamy on their heads."

When Tytler's *Inquiry into the Evidence produced by the Earls of Murray and Morton against Mary Queen of Scots* was first published, it was reviewed in the Gentleman's Magazine by Dr Johnson. The review, which consists of a brief analysis of the work, with reflections interspersed on the force of the evidence, concludes thus:—"That the letters were forged is now made so probable, that perhaps they will never more be cited as testimonies." Subsequent experience has shown, that the great critic's knowledge of human nature had not deserted him when he guarded his prediction with the word *perhaps*. Few authors possess the magnanimity of Fenelon: and it is not to be expected that he who has once maintained the letters to be genuine, should by reasoning or criticism be compelled to relinquish them: but we are persuaded, that, after the present generation of writers shall be extinct, these letters and sonnets will never be cited as evidence, except of the profligacy of those by whom they were fabricated.

Such is a view (partial it may be deemed by some) of this remarkable controversy previous to the publication of Mr Laing's History of Scotland. But, in opposition to all these arguments against the genuineness and authenticity of the letters and sonnets attributed to Mary, this historian observes that it is impossible to fix the supposed forgery on any one of the different persons to whom it has been ascribed, which, if true, renders it abundantly evident, that they must have been the genuine productions of the ill-fated Mary. According to Mr Laing, it was necessary for Mary to disavow the letters; and consequently her commissioners were instructed to affirm that they were forged, and that there were diverse of each sex in Scotland, particularly of those in company with her adversaries, who could counterfeit and write the queen's hand, as well as herself. This strange assertion, so apparently false, is repeated in Lesly's memorial to Elizabeth; but of those who could write and counterfeit the queen's hand, none were ever named, even in his defence of her honour; and the supposed forgery could

4 L

be

* Whitaker.

Mary. be fixed on no particular person during Mary's life, which, it must be confessed, renders their forgery extremely suspicious. The writings suppressed in England were Lesly's and other anonymous vindications of Mary, in which there is no intimation whatever, of Lethington's confession, *that he had frequently forged the queen's hand*. The letters are those in the Cecil collection, and the Cotton library, which are equally silent; and we must conclude, that the author, whether Cotton, James, or Camden, improving on Norfolk's apology, that Lethington *wooed* him to consider the queen as not guilty, asserted gratuitously that Lethington acknowledged the whole forgery, as he had already done, that Buchanan frequently repented on his deathbed, of those calumnies which he reprinted in his history, at that time in the press. He who examines with care, Camden's mutilated account of the conferences in England, must be satisfied that the evidence of the Cecil and Cotton papers, which he confessedly examined, has been suppressed in his annals, in which Norfolk's letters from York are industriously concealed. Mr Laing is of opinion, that the sonnets ascribed to Mary, are as certainly the productions of her pen, and that the grossness of some of them can only be a prevailing argument for their forgery with those who are ignorant of the grossness of the age, or foolish enough to believe with Goodall, that Mary never once betrayed a single foible from the cradle to the grave.

As to the three contracts of marriage between the queen and Bothwell, reckoned forgeries by some authors, Mr Laing is also of opinion that they are the genuine productions of Mary, who was glad to get rid of a husband whose dissolute manners had rendered him odious in her eyes; and she expressed no genuine sorrow after his extraordinary and atrocious murder. He thinks that there is not to be found in any authentic history of those times, a single convincing argument of their being forgeries. In a word, after much ingenious criticism on the merits of the contracts, he concludes by saying, that the private, instead of being a copy or abstract from the public contract, is evidently the original from which the latter was formed; and it is observable that the two first contracts written by Mary, or under her inspection, are far superior in delicacy to the last: a circumstance in vain imputed to the art of the forgers, who, in fact, were more desirous to aggravate than to extenuate the grossness of her guilt (B.)

She wrote, 1. Poems on various occasions, in the Latin, French, and Scotch languages. One of her poems is printed among those of A. Blackwood; another in Brantome's *Dames illustres*, written on the

death of her first husband Francis. 2. Consolation of her long imprisonment, and royal advice to her son. 3. A copy of verses, in French, sent with a diamond ring to Queen Elizabeth. There is a translation of these verses among the Latin poems of Sir Thomas Chaloner. 4. Genuine Letters of Mary Queen of Scots, to James earl of Bothwell; translated from the French, by E. Simmonds, 1726. There are, besides, many other of her epistles to Queen Elizabeth, Secretary Cecil, Mildmaye, &c. which are preserved in the Cottonian, Ashmolean, and other libraries.

MARY II. queen of England, eldest daughter of James II. by his first wife, was born at St James's in 1662. She was bred up a Protestant, and married to William Henry of Nassau, then prince of Orange, afterwards king of England, in the 16th year of her age. She staid in Holland with her husband till February 12. 1689, when she came over, and was solemnly proclaimed queen of England, &c. She was an equal sharer with her husband in all the rights belonging to the crown; but the administration and execution thereof, were lodged solely in the king. She was a princess endowed with the highest perfections both of body and mind: she loved history, as being proper to give her useful instructions; and was also a good judge as well as a lover of poetry. She studied more than could be imagined, and would have read more than she did, if the frequent returns of ill humours in her eyes had not forced her to spare them. She gave her minutes of leisure to architecture and gardening; and since it employed many hands she said, she hoped it would be forgiven her. She was the most gracious of sovereigns to her subjects, and the most obliging of wives to her husband, as well as the most excellent of mistresses to her servants: she ordered good books to be laid in the places of attendance, that persons might not be idle while they were in their turns of service. She was exceeding zealous for a reformation of manners; charitable in the highest degree, without the least ostentation. This excellent queen died on the 28th of December 1695, at Kensington, of the smallpox, in the 33d year of her age. In her arts lost a protectress, the unfortunate a mother, and the world a pattern of every virtue. As to her person she was tall, of a majestic graceful mien, her countenance serene, her complexion ruddy, and her features beautiful.

MARY Magdalen's Day, a festival of the Romish church, observed on the 22d of July.

MARY-Gerane's-House, a name given to Dunmorehead in the parish of Dunqueen, county of Kerry, and province

(B) This article stands in need of an apology; but whether for its length or its shortness, our readers may perhaps differ in opinion. If it be considered as a piece of common biography, and compared with the limits which we have prescribed to our other articles of the same kind, it has swelled to an extent beyond all proportion. But as a piece of common biography it ought not to be considered: it is intimately connected with the history of Scotland at a very interesting period; and it has been justly observed, by one of the ablest writers of the age, that "the fact under dispute in the life of Mary, is a fundamental and essential one; and that, according to the opinion which the historian adopts with regard to it, he must vary and dispose the whole of his subsequent narration." Viewed in this light, our abstract of the evidence which has been urged on both sides of this controversy will by many be deemed too short. To such as wish for complete satisfaction, we can only recommend the unbiassed study of the writings of Buchanan, Leslie bishop of Ross, Goodall, Robertson, Hume, Tytler, Sir David Dalrymple, Stuart, Whitaker, and Laing.

Mary province of Munster, in Ireland. It is the most western **Maryland.** point of all Europe, and called by the Irish *Ty Vorney Geerone*. It is a point as much celebrated by them as John-of-Groat's house by the Scots, which is the utmost extremity of North Britain.

MARYBOROUGH, a borough, market, and post town, and the assizes town to Queen's county, in the province of Leinster, in Ireland; so called in honour of Mary queen of England, who reduced this part of the country to shire-ground by act of parliament 6th and 7th Philip and Mary. It is governed by a burgomaster and bailiffs, and has a barracks for a troop of horse. It formerly returned two members to parliament. It is distant from Dublin 40 miles. N. Lat. 53. 0. W. Long. 7. 20.

French MARYGOLD. See *TAGETES*, *BOTANY Index*.

MARYLAND, one of the United States of America. It received that name in honour of Henrietta Maria, the consort of King Charles I. who made a grant of this country, with very extraordinary powers, to Lord Baltimore. It lies between 38 and 40 degrees north latitude, and in longitude from 74 to 78 degrees west from London. It is bounded on the north by Pennsylvania; on the east by the Delaware state; on the south-east and south by the Atlantic ocean, and a line drawn from the ocean over the peninsula (dividing it from Accomack county in Virginia) to the mouth of Patomack river, thence up the Patomack to its first fountain, thence by a due north line till it intersects the southern boundary of Pennsylvania, in Lat. 39° 43' 18"; so that it has Virginia on the south, south-west, and west. It contains about 10,800 square miles, of which about one-fifth is water. It is divided into 28 counties, 10 of which are on the western and 8 on the eastern shore of Chesapeake bay. Each of the counties sends four representatives to the house of delegates; besides which, the city of Annapolis and town of Baltimore send each two, making in the whole 76 members. The climate is generally mild and agreeable, suited to agricultural productions and a great variety of fruit trees. In the interior hilly country the inhabitants are healthy; but in the flat country, in the neighbourhood of the marshes and stagnant waters, they are, as in the other southern states, subject to intermittents. Chesapeake bay divides this state into the eastern and western divisions. It affords several good fisheries; and, in a commercial view, is of immense advantage to the state. It receives a number of the largest rivers in the United States. From the eastern shore in Maryland, among other smaller ones, it receives Pokomoke, Choptank, Chester and Elk rivers; from the north the rapid Susquehannah; and from the west Patapsco, Severn, Patuxent, and Patomack, half of which is in Maryland and half in Virginia. Except the Susquehannah and Patomack, these are small rivers. East of the Blue ridge of mountains, which stretches across the western part of this state, the land, like that in all the southern states, is generally level and free of stones. Wheat and tobacco are the staple commodities of Maryland. The growth of tobacco in 1816 was estimated at

19,000 hogsheads. In the interior country, on the up-lands, considerable quantities of hemp and flax are raised. **Maryland.**

The number of inhabitants in this state, in 1810, was 380,546, of which 111,502 were slaves, and 33,927 free blacks. Maryland is the eighth state in the union in point of population. The militia of this state in 1814 amounted to 41,000. The inhabitants, except in the populous towns, live on their plantations, often several miles distant from each other. To an inhabitant of the middle, and especially of the eastern states, which are thickly populated, they appear to live very retired and unsocial lives. The effects of this comparative solitude are visible in the countenances as well as in the manners and dress of the country people; there being among them very little of that cheerful sprightliness of look and action which is the invariable and genuine offspring of social intercourse; nor do they pay that attention to dress which is common, and which decency and propriety have rendered necessary, among people who are liable to receive company almost every day. As the negroes perform all the manual labour, their masters are left to saunter away life in sloth, and too often in ignorance. These observations, however, must in justice be limited to the people in the country, and to those particularly whose poverty or parsimony prevents their spending a part of their time in populous towns or otherwise mingling with the world. The value of lands and houses in this state in 1799, was 32,372,290 dollars; and in 1814 it had increased to 122,577,572 dollars.

The chief towns in this state are Annapolis and Baltimore.—*Annapolis*, the capital, and the wealthiest town of its size in America, is situated just at the mouth of Severn river, 30 miles south of Baltimore, and contained 2000 inhabitants in 1810. The houses are generally large and elegant; and the stadthouse is the noblest building of the kind in America.—*Baltimore* has had the most rapid growth of any town on the continent, and is the fourth in size and the fifth in trade in the United States. It lies in Lat. 39. 21. on the north side of Patapsco river, around what is called the Basin. The situation of the town is low. The houses were numbered in 1787, and found to be 1955; about 1200 of which were in the town, and the rest at Fell's point. The number of stores was 152; and of churches 9, which belong to German Calvinists and Lutherans, Episcopalians, Presbyterians, Roman Catholics, Baptists, Methodists, Quakers, Nicolites or New Quakers. The number of inhabitants was 46,555 in 1810, and in 1817 had increased to 55,000. They bear a high character in the United States for hospitality, liberality, and commercial enterprise. The trade of Maryland is principally carried on from Baltimore, with the other states, with the West Indies, and with some parts of Europe. The exports in 1817, amounted to 8,933,930 dollars, of which 5,887,884 dollars were domestic, and 3,046,046 foreign produce. The exports are wheat, flour, corn, tobacco, flax-seed, beans, pork, and timber, which are sent to the West Indies, to England, France, and the north of Europe. The imports are dry goods, hardware, wines, rum, sugar, &c. In 1815, 222,000 barrels of flour were exported to foreign places, besides 140,000 sent coastwise. The amount of manufactures in 1810, was 11,468,794 dollars.

Maryland.

The Roman Catholics, who were the first settlers in Maryland, are the most numerous religious sect. Besides these, there are Protestant Episcopalians, English, Scots, and Irish Presbyterians, German Calvinists, German Lutherans, Friends, Papists, Methodists, and Nicolites or New Quakers. The clergymen are supported by voluntary contributions. The colleges in this state have all been founded since the year 1782, and are yet in their infancy. The names of the several seminaries are, Washington College at Chestertown, instituted in 1782; St John's College at Annapolis, founded in 1784 (these two united form the university of Maryland, and include a Medical Institution); Cakesbury College at Abingdon, instituted by the Methodists in 1785; and a college founded by the Roman Catholics at Georgetown. There are a few other literary institutions, of inferior note, in different parts of the state. In 1811 the sum of 25,000 dollars a year was appropriated by the legislature for the support of common schools, which are established in every county.

The legislature of this state is composed of two distinct branches, a senate and house of delegates; and styled *The General Assembly of Maryland*. The senate consists of 15 members, chosen every five years. Nine of these must be residents on the western shore and six on the eastern; they must be more than 25 years of age, must have resided in the state more than three years next preceding the election, and have real and personal property above the value of 1000l. The house of delegates is composed of four members for each county, chosen annually on the first Monday in October. The city of Annapolis and town of Baltimore send each two delegates. The qualifications of a delegate, are full age, one year's residence in the county where he is chosen, and real or personal property above the value of 500l. Every free white male citizen above 21 years of age, and who has resided 12 months in the city or county, has a vote in the election of senators and delegates.

On the second Monday of November annually, a governor is appointed by the joint ballot of both houses. The governor cannot continue in office longer than three years successively, nor be elected until the expiration of four years after he has been out of office. The qualifications for the chief magistracy are 25 years of age, five years residence in the state next preceding the election, and real and personal estate above the value of 5000l.; 1000l. of which must be freehold estate. This constitution was established by a convention of delegates at Annapolis in 1776, and has since received some amendments.

Maryland was granted, as has been already noticed, by King Charles I. to Cecilius Calvert, baron of Baltimore in Ireland, June 20. 1632. The government of the province was by charter vested in the proprietary; but it appears that he either never exercised these powers alone, or but for a short time. The honourable Leonard Calvert, Esq. Lord Baltimore's brother, was the first governor or lieutenant general. In 1638, a law was passed, constituting the first regular house of assembly, which was to consist of such representatives, called *burgesses*, as should be elected pursuant to writs issued by the governor. These burgesses possessed all the powers of the persons electing them; but any other freemen, who did not assent to the elec-

tion, might take their seats in person. Twelve burgesses or freemen, with the lieutenant general and secretary, constituted the assembly or legislature. This assembly sat at St Mary's, one of the southern counties, which was the first settled part of Maryland. In 1687, the government was taken out of the hands of Lord Baltimore by the grand convention of England. Mr Copley was appointed governor by commission from William and Mary in 1692, when the Protestant religion was established by law. In 1716, the government of this province was restored to the proprietary, and continued in his hands till the late revolution; when, being an absentee, his property in the lands was confiscated, and the government assumed by the freemen of the province, who formed the constitution now existing. At the close of the war, Henry Harford, Esq. the natural son and heir of Lord Baltimore, petitioned the legislature of Maryland for his estate; but his petition was not granted. Mr Harford estimated his loss of quit-rents, valued at 20 years purchase, and including arrears, at 259,488l. 5s.—dollars at 7s. 6d. and the value of his manors and reserved lands at 327,441l. of the same money. See UNITED STATES, SUPPLEMENT.

MARYPORT, a sea port town of Cumberland, situated at the mouth of the Elne. It has a good harbour; and has 70 or 80 sail of shipping from 30 to 250 tons burden, principally employed in the coal trade; some of them sail up the Baltic for timber, flax, iron, &c. They have a furnace for cast iron and a glass-house. The population in 1811 was 3124.

MAS, LEWIS DU, natural son to Jean Louis de Montcalm Seigneur de Candiac, and a widow of rank of Rouergue, was born at Nismes in 1676. His first attention was bestowed on jurisprudence; but afterwards he was altogether occupied with mathematics, philosophy, and the study of the languages. Father Malebranche cultivated his acquaintance and esteemed his virtues. His first appearance was severe, his general temper tranquil; yet he had a lively and fertile imagination. His mind was active, full of resources, and methodical. We are indebted to his industry for the Typographical Bureau. This invention is the more ingenious, as it presents the tedious parts of education, namely, reading, writing, and the elements of languages, to the youthful mind as a delightful entertainment; and many people in France, both in the capital and in the provinces, have adopted it with success. After he had conceived the idea of this invention, he made the first trial of it on the young Candiac, who was remarkable for his understanding in his earliest years. Du Mas conducted his pupil to Paris and the principal cities in France, where he was universally admired. This prodigy was carried off in the year 1726 before he was seven years of age, and his loss had nearly deprived Du Mas of his reason. A dangerous illness was the consequence of his vexation; and he would have died of want, if a gentleman had not taken him from his garret and entertained him in his own house. Du Mas afterwards retired with Madame de Vaujour within two leagues of Paris, and died in the year 1774, aged 68. He was a philosopher both in genius and character. His works are, 1. *L'Art de transposer toutes sortes de Musiques sans etre obligé de connoître, ni le temps, ni le mode*, published at Paris in

410.

Mas
||
Masbothæi.

4to. 1711. This work is extremely curious, but of no advantage to the study of music. 2. A volume in quarto, printed at Paris 1733, in four parts, entitled, *Bibliothèque des enfans*. In this treatise he has placed in a clear point of view, the system and economy of his Typographical Bureau. This invention, like every thing new, was censured by some and admired by others. The author himself defended it with much success in the journals and in several occasional pamphlets. This collection, however, is become exceedingly scarce. The Typographical Bureau was brought to perfection by M. Reybert a citizen of Avignon, who enriched it with many articles containing useful and agreeable information in geography, history, fable, &c. &c. 3. *Memoires de l'Ecosse sous le regne de Marie Stuart*, by Crawford, and translated from the English. This translation was found in manuscript in the library of the marquis d'Aubais, with whom De Mas had lived in the most intimate habits of friendship.

Mas Planta, a plant which upon the same root produces male flowers only. See *MASCULUS FLOS*, *BOTANY Index*.

MASAFUERO, an island of the South sea, lying in S. Lat. 33. 45. W. Long. 80. 46. It is very high and mountainous, and at a distance seems to consist of one hill or rock. It is of a triangular form, and seven or eight leagues in circumference. There is such plenty of fish, that a boat with a few hooks and lines may very soon catch as many as will serve 100 people. Here are coal-fish, cavilliers, cod, halibut, and cray-fish. Captain Carteret's crew caught a king-fisher that weighed 87 pounds, and was five feet and a half long. The sharks were here so ravenous, that, in taking soundings, one of them swallowed the lead, by which they hauled him above water; but he regained his liberty by disgorging his prey. Seals are so numerous here, that Captain Carteret says, if many thousands were killed in a night, they would not be missed next morning. These animals yield excellent train oil; and their hearts and plucks are very good food, having a taste something like those of a hog: their skins are covered with a very fine fur. There are many birds here, and some very large hawks. Of the pintado bird one ship caught 700 in one night. Commodore Byron landed here with difficulty in 1765, in order to take in wood and water, of both which he found plenty. He found also great numbers of goats, whose flesh tasted as well as venison in England.

MASBOTHÆI, or *MESBOTHÆI*, the name of a sect, or rather of two sects; for Eusebius, or rather Hegesippus, whom he cites, makes mention of two different sects of Masbothæans. The first was one of the seven sects that rose out of Judaism, and proved very troublesome to the church; the other was one of the seven Jewish sects before the coming of Jesus Christ.

The word is derived from the Hebrew שָׁבַת, *shabat*, "to rest or repose;" and signifies *idle easy indolent people*. Eusebius speaks of them as if they had been so called from one Masbothæus their chief: but it is much more probable that their name is Hebrew, or at least Chaldaic, signifying the same thing with a Sabbatarian in our language; that is, one who makes profession of keeping Sabbath. Valesius will not allow the two

sects to be confounded together: the last being a Masbothæan sect of Jews before, or at least contemporary with Christ; and the former a sect of heretics descended from them.

MASCULINE, something belonging to the male, or the stronger of the two sexes. See *MALE*.

MASCULINE, is more ordinarily used in grammar to signify the first and worthiest of the genders of nouns. See *GENDER*.

The masculine gender is that which belongs to the male kind, or something analogous to it.

Most substances are ranged under the heads of masculine or feminine.—This, in some cases, is done with show of reason; but in others is merely arbitrary, and for that reason is found to vary according to the languages, and even according to the words introduced from one language into another.—Thus the names of trees are generally feminine in Latin and masculine in the French.

Farther, the genders of the same word are sometimes varied in the same language. Thus *alvus*, according to Priscian, was anciently masculine, but is now become feminine. And *navire*, "a ship," in French, was anciently feminine, but is now masculine.

MASCULINE Rhyme, in the French poetry, is that made with a word which has a strong, open, and accented pronunciation; as all words have, excepting those which have an *e* feminine in their last syllable. For instance, *amour* and *jour*, *mort* and *sort*, are masculine rhymes; and *perce* and *mere*, *gloire* and *memoire*, are feminine. Hence also verses ending with a masculine rhyme, are called *masculine verses*, and those ending with a feminine rhyme, *feminine verses*. It is now a rule established among the French poets never to use the above two masculine or two feminine verses successively, except in the looser kind of poetry. Marot was the first who introduced this mixture of masculine and feminine verses, and Ronsard was the first who practised it with success. The masculine verses should always have a syllable less than the feminine ones.

MASCULINE Signs. Astrologers divide the signs into masculine and feminine; by reason of their qualities, which are either active, and hot or cold, accounted masculine; or passive, dry and moist, which are feminine.—On this principle they call the Sun, Jupiter, Saturn, and Mars, *masculine*; and the Moon and Venus *feminine*. Mercury, they suppose, partakes of the two. Among the signs, Aries, Libra, Gemini, Leo, Sagittarius, Aquarius, are masculine: Cancer, Capricornus, Taurus, Virgo, Scorpio, and Pisces, are feminine.

MASCULUS FLOS. See *FLOS*, *BOTANY Index*.

MASH, a drink given to a horse, made of half a peck of ground malt put into a pail, into which as much scalding hot water is poured as will wet it very well: when that is done, stir it about, till, by tasting, you find it as sweet as honey; and when it has stood till it is lukewarm, it is to be given to the horse. This liquor is only used after a purge, to make it work the better: or after hard labour, or instead of drink in the time of any great sickness.

MASK. See *MASQUE*.

MASINISSA, a king of a small part of Africa, who at first assisted the Carthaginians in their wars against Rome;

Mash.
Mason.

Rome; but afterwards joined the Romans, and became their firm ally. See NUMIDIA.

MASON, a person employed under the direction of an architect, in the raising of a stone building. The chief business of a mason is to make the mortar; raise the walls from the foundation to the top, with the necessary retreats and perpendiculars; to form the vaults, and employ the stones as delivered to him. When the stones are large, the business of hewing or cutting them belongs to the stonemasons, though these are frequently confounded with masons; the ornaments of sculpture are performed by carvers in stones or sculptors.

MASON, William, an English poet of distinction, born in 1725, was the son of a clergyman who held the living of Hoth. He took his first degrees at St John's college, Cambridge in 1745, whence he removed to Pembroke college, of which he was admitted a fellow in 1747. He was M. A. in 1749, a minister in 1754. The earl of Holderness presented him to the valuable rectory of Aston in Yorkshire, and procured for him the office of chaplain to his majesty. His ode on the installation of the duke of Newcastle as chancellor of the university of Cambridge was the first specimen of his poetical talents, which gained him considerable reputation, although the subject was not popular. His monody to the memory of Pope, and Isis, an elegy, added to his fame, which was still farther increased by his dramatic poem of Elfrida in 1752, and *Caractacus* in 1759.

He did not succeed in writing tragedy, as he did not compose for the modern stage, but wished to revive the manner of the ancients. He published a small collection of odes in 1756, intended as an imitation of his dear friend Gray. He gave the world some elegies in 1763, which in general are marked with the simplicity of language proper to this species of composition, breathing noble sentiments of freedom and of virtue. In point of morality he may justly be considered as the purest of poets, and one of the warmest friends of civil liberty by which the age he lived in was distinguished. The first book of his *English Garden* made its appearance in 1772, a didactic poem in blank verse, of which the fourth and last book was printed in the year 1781. Some good critics consider this poem as rather stiff, and the dry minuteness of the preceptive part, prevented it from bringing the author any great degree of popularity. In 1775 he published the poems of Mr Gray, to which he prefixed memoirs of his life and writings. His observations on the character and genius of his friend did honour to his taste and feelings, and of consequence the volume was favourably received.

At the place of his residence he acted with the friends of reform, and the enemies of such measures as were deemed incompatible with the liberties of freemen. During the continuance of the American war, he addressed an ode to the naval officers of Great Britain, on the acquittal of Admiral Keppel in 1779, in which he decidedly execrated the war carrying on against the people of America. When Mr Pitt rose to power in 1782, Mason addressed an ode to him, which contained patriotic and manly sentiments, but his lyric imagery did it considerable injury. He published in 1783 a poetical translation of Fresco's Latin poem on the art of painting, which unites great elegance of

language and verification with a correct representation of a difficult original.

Besides the living with which he was presented soon after taking orders, he obtained the preferments of precentor and canon residentiary of the cathedral of York. At that church he preached an occasional discourse in 1788 on the subject of the slave-trade, full of animated declamation against the inhumanity of the traffic. The centenary commemoration of the revolution in that year produced his secular ode, which breathed his usual spirit of freedom. An additional volume of his poems was given to the world in 1797, consisting of miscellaneous pieces, the revised productions of his youth, and the effusions of his old age. In his *Palinody to Liberty* we behold the change wrought in his political principles by the melancholy events of the French revolution.

Mr Mason died in April 1797, at the age of 72, in consequence of a mortification by a hurt in his leg. He had married an amiable lady, who died of a consumption in 1767, and was buried at Bristol cathedral, under a monument on which are inscribed some very tender and beautiful lines by her husband. The character of Mason in private life was exemplary for worth and active benevolence. A tablet has been placed to his memory in Poets Corner in Westminster abbey. Some satirical pieces of merit have been ascribed to him, but some are of opinion that the internal evidence is sufficient to decide against his title to them; yet it must be allowed that he could write with energy and simplicity, and the objects of satire in these pieces are such as it was extremely probable that he would fix upon.

MASONRY, in general, a branch of architecture, consisting in the art of hewing or squaring stones, and cutting them level or perpendicular, for the uses of building: but, in a more limited sense, masonry is the art of assembling and joining stones together with mortar.

Hence arise as many different kinds of masonry as there are different forms and manners for laying or joining stones. Vitruvius mentions several kinds of masonry used among the ancients; three of hewed stone, viz. that in form of a net, that in binding, and that called the *Greek masonry*; and three of unhewed stones, viz. that of an equal course, that of an unequal course, and that filled up in the middle; and the seventh was a composition of all the rest.

Net masonry, called by Vitruvius *reticulatum*, from its resemblance to the meshes of a net, consists of stones squared in their courses, and so disposed as that their joints go obliquely; and their diagonals are the one perpendicular and the other level. This is the most agreeable masonry to the eye, but it is very apt to crack.

Bound masonry, is that in which the stones were placed one over another, like tiles; the joints of their beds being level, and the mounters perpendiculars, so that the joint that mounts and separates two stones always falls directly over the middle of the stone below. This is less beautiful than the net work; but it is more solid and durable.

Greek masonry, according to Vitruvius, is that where after we have laid two stones, each of which makes a

Mash.
Masonry.

Masonry. course, another is laid at the end, which makes two courses, and the same order is observed throughout the building; this may be called *double binding*, in regard the binding is not only of stones of the same course with one another, but likewise of one course with another course.

Masonry by equal courses, called by the ancients *isodomum*, differs in nothing from the bound masonry, but only in this, that its stones are not hewn.

Masonry by unequal courses, called *pseudisodomum*, is also made of unhewed stones, and laid in bound work; but then they are not of the same thickness, nor is there any equality observed excepting in the several courses, the courses themselves being unequal to each other.

Masonry filled up in the middle, is likewise made of unhewed stones, and by courses: but the stones are only set in order as to the courses.

Compound masonry is of Vitruvius's proposing, as **Masonry.** called as being formed of all the rest. In this the courses are of hewed stone; and the middle being left void, is filled up with mortar and pebbles thrown in together: after this the stones of one course are bound to those of another course with iron cramps fastened with melted lead.

All the kinds of masonry now in use may be reduced to these five, viz. bound masonry; that of brick work, where the bodies and projectures of the stones enclose square spaces or pannels, &c. set with bricks; that de moilon, or small work, where the courses are equal, well squared, and their edges or beds rusticated; that where the courses are unequal; and that filled up in the middle with little stones and mortar.

MASONRY, FREE,

DENOTES the rule or system of mysteries and secrets peculiar to the society of free and accepted masons.

Cause of the separation of professions.

1. When men are in a state of barbarity, and are scattered over the surface of a country in small and independent tribes, their wants are as small in magnitude, as they are few in number. It is in the power, therefore, of every individual, to perform for himself and his family, every work of labour which necessity or comfort requires; and while, at one time, he equips himself for the chase or the combat, at another he is rearing a habitation for his offspring, or hollowing his canoe to surmount the dangers of the sea. But as soon as these tribes associate together, for the purposes of mutual protection and comfort, civilization advances apace; and, in the same proportion, the wants and desires of the community increase. In order to gratify these, the ingenuity of individuals is called forth; and those, who, from inability or indolence, cannot satisfy their own wants, will immediately resort to the superior skill of their neighbours. Those members of the community, who can execute their work with the greatest elegance and celerity, will be most frequently employed; and, from this circumstance, combined with the principle of emulation, and other causes, that distinction of professions will arise, which is found only among nations considerably advanced in civilization and refinement.

Reasons why architecture must have been the first profession.

2. One of the first objects of man, in a rude state, is to screen himself and his family from the heat of the tropic sun, from the inclemency of the polar regions, or from the sudden changes of more temperate climates. If he has arrived at such a degree of improvement, as to live under the dominion of a superior, and under the influence of religious belief, the palace of his king, and the temple of his gods, will be reared in the most magnificent style which his skill can devise and his industry accomplish, and decked with those false ornaments which naturally catch the eye of unpolished men. From that principle which impels the lower orders to imitate the magnificence and splendour of their superiors, a foundation will be laid for improvement in the art of building; and it is extremely probable, from the

circumstances which have been mentioned, as well as from others which the slightest reflection will suggest, that architecture will be the first profession to which men will exclusively devote their attention, and for which they will be trained by an established course of preparatory education.

3. Nor is it from this ground only, that masonry derives its superiority as a separate profession. While many other arts administer to our luxury and pride, and gratify only those temporary wants and unnatural desires which refinement has rendered necessary, the art of building can lay claim to a higher object. The undertakings of the architect, not only furnish us with elegant and comfortable accommodation from the inclemency of the seasons, from the rapacity of wild beasts, and the still more dangerous rapacity of man; they contribute also to the ornament and glory of nations, and it is to them that we are indebted for those fortresses of strength which defend us from the inroads of surrounding enemies. Nor can the works of the architect be ranked among those objects which furnish amusement and accommodation for a few years, or at most during the short term of human life; they descend unimpaired from generation to generation; they acquire additional grandeur and value from an increase of age; and are the only specimens of human labour which in some measure, survive the revolutions of kingdoms, and the waste of time. The splendid remains of Egyptian, Grecian, and Roman architecture, which, in every age, have attracted the attention of the learned, and excited the astonishment of the vulgar, are standing monuments of the ingenuity and power of man; and, in ages yet to come, they will reflect a dignity on the art of building, to which no other profession can arrogate the slightest claim.

4. But there is still another consideration, which entitles architecture to a decided pre-eminence among other arts. It is itself the parent of many separate professions; and requires a combination of talents, and an extent of knowledge, for which other professions have not the smallest occasion. An acquaintance with the sciences

Masonry. sciences of geometry and mechanical philosophy, with the arts of sculpture and design, and other abstruse and elegant branches of knowledge, are indispensable requisites in the education of a good architect; and raise his art to a vast height above those professions, which practice alone can render familiar, and which consist in the mere exertion of muscular force. It appears, then, from these considerations, that there is some foundation in the very nature of architecture, for those extraordinary privileges to which masons have always laid claim, and which they have almost always possessed—privileges, which no other artists could have confidence to ask, or liberty to enjoy; and there appears to be some foundation for that ancient and respectable order of free masons, whose history we are now to investigate.

5. But, that we may be enabled to discover free masonry under those various forms which it has assumed in different countries, and at different times, before it received the name which it now bears, it will be necessary to give a short description of the nature of this institution, without developing those mysteries, or revealing those ceremonial observances which are known only to the brethren of the order.

Description of the institution of free masonry.

6. Free masonry is an ancient and respectable institution, embracing individuals of every nation, of every religion, and of every condition in life. In order to confirm this institution, and attain the ends for which it was originally formed, every candidate comes under a solemn engagement never to divulge the mysteries of the order, nor communicate to the uninitiated the secrets with which he may be entrusted, and the proceedings and plans in which the fraternity may be engaged. After the candidate has undergone the necessary ceremonies, and received the usual instructions, appropriate words and significant signs are imparted to him, that he may be enabled to distinguish his brethren of the order from the uninitiated vulgar, and convince others that he is entitled to the privileges of a brother, should he be visited by distress or want, in a distant land. If the newly admitted member be found qualified for a higher degree, he is promoted, after due intervals of probation, till he has received that masonic knowledge, which enables him to hold the highest offices of trust to which the fraternity can raise its members. At regular and appointed seasons, convivial meetings of the fraternity are held in lodges constructed for this purpose: temperance, harmony, and joy, characterise these mixed assemblies. All distinctions of rank seem to be laid aside, all differences in religious and political sentiments are forgotten: and those petty quarrels which disturb the quiet of private life, cease to agitate the mind. Every one strives to give

happiness to his brother; and men seem to recollect, for once, that they are sprung from the same origin, that they are possessed of the same nature, and are destined for the same end.

7. Such are the prominent features of an institution, which has of late produced so great division in the sentiments of the learned, respecting its origin and tendency. While a certain class of men (A), a little over-anxious for the dignity of their order, have represented it as coeval with the world; others, influenced by an opposite motive, have maintained it to be the invention of English Jesuits, to promote the views of that intriguing and dangerous association (B). Some philosophers, among whom we may reckon the celebrated Chevalier Ramsay, have laboured to prove, that free masonry arose during the crusades; that it was a secondary order of chivalry; that its forms originated from that warlike institution, and were adapted to the peaceful habits of scientific men (C). Mr Clinch (D) has attempted, with considerable ingenuity and learning, to deduce its origin from the institution of Pythagoras. M. Barruel (E) supposes it to be a continuation of the society of knights templars; while others, with a degree of audacity and malice rarely to be found in the character of ingenuous men, have imputed the origin of free masonry to secret associations, averse to the interests of true government, and pursuing the villanous and chimerical project of levelling the distinctions of society, and freeing the human mind from the sacred obligations of religion and morality.

8. Without adopting any of these untenable opinions, or attempting to discover the precise period when free masonry arose, it may be sufficient to establish its claim to an early origin, and to shew that it has existed in different ages of the world under different forms and appellations (F). In the execution of this task, the candid inquirer will be satisfied with strong and numerous resemblances, as the nature of the subject excludes the possibility of rigid demonstration. Every human institution is subject to great and numerous variations; the different aspects under which they appear, and the principles by which they are regulated, depend upon the progress of civilization, upon the nature of the government by which they are protected, and on the peculiar opinions and habits of their members. If therefore, in comparing free masonry with other ancient associations, we should find it coincide with them in every circumstance, there would be strong reasons for suspecting, that the imagination of the writer had counterfeited resemblances when destitute of authentic information; or that the order had adopted the rites and ceremonies of antiquity, to cloak the recency of their origin,

(F) M. Mounier observes, that if the order of free masons existed among the ancients, it would have been mentioned by cotemporary writers. This argument, however, for the recency of their origin, is far from being conclusive. For though it is allowed by all, that free masonry has existed in this country for at least 300 years, yet the association is never *once* mentioned in any of the histories of England.

Masonry. origin, to command the veneration and excite the notice of the public. Against free masonry, however, this charge cannot be preferred: we shall have occasion to consider it when connected with the idolatry of the heathens, when devoted to the church of Rome, and when flourishing under the milder influence of the reformed religion.

Reasons why the knowledge of architecture would be confined to a few.

9. As men, in the early ages of society, were destitute of those methods of diffusing knowledge which we now enjoy, and even of those which were used in Greece and Rome, when the art of printing was unknown; the few discoveries in art and science which were then made, must have been confined to a small number of individuals. In these ages, the pursuit of science must have been a secondary consideration, and those who did venture to explore the untrodden regions of knowledge, would overlook those unsubstantial speculations, which merely gratify the curiosity of philosophers; and would fix their attention on those only which terminate in public utility, and administer to the necessities of life. As architecture could only be preceded by agriculture, it must have been in this science that the first efforts of human skill were tried; and in which man must have first experienced success in extending his dominion over the works of nature. The first architects, therefore, would be philosophers. They alone required the assistance of art; and they alone would endeavour to obtain it. The information which was acquired individually, would be imparted to others of the same profession; and an association would be formed for the mutual communication of knowledge, and the mutual improvement of its members. In order to preserve among themselves that information which they alone collected; in order to excite amongst others a higher degree of respect for their profession, and prevent the intrusion of those who were ignorant of architecture, and, consequently, could not promote the object of the institution, appropriate words and signs would be communicated to its members; and significant ceremonies would be performed at their initiation, that their engagement to secrecy might be impressed upon their minds, and greater regard excited for the information they were to receive. Nor is this mere speculation; there exist at this day, in the deserts of Egypt, such monuments of architecture, as must have been reared in those early ages which precede the records of authentic history; and the erection of these stupendous fabrics, must have required an acquaintance with the mechanical arts, which is not in the possession of modern architects. It is an undoubted fact, also, that there existed, in these days, a particular association of men, to whom scientific knowledge was confined, and who resembled the society of free masons in every thing but the name,

Causes of the union of religious rites with the mysteries of free masonry.

10. In Egypt, and those countries of Asia which lie contiguous to that favoured kingdom, the arts and sciences were cultivated with success, while other nations were involved in ignorance: it is here, therefore, that free masonry would flourish, and here only can we

VOL. XII. Part II.

discover marks of its existence in the remotest ages. It is extremely probable, that the first and the only object of the society of masons, was the mutual communication of knowledge connected with their profession; and that those only would gain admittance into their order, whose labours were subsidiary to those of the architect. But when the ambition or vanity of the Egyptian priests prompted them to erect huge and expensive fabrics, for celebrating the worship of their gods, or perpetuating the memory of their kings, they would naturally desire to participate in that scientific knowledge, which was possessed by the architects they employed; and as the sacerdotal order seldom fail, among a superstitious people, to gain the objects of their ambition, they would, in this case, succeed in their attempts, and be initiated into the mysteries, as well as instructed in the science of free masons. These remarks will not only assist us in discovering the source from which the Egyptian priests derived that knowledge for which they have been so highly celebrated; they will aid us also in accounting for those changes which were superinduced on the forms of free masonry, and for the admission of men into the order whose professions had no connection with the royal art.

Masonry.

11. When the Egyptian priests had, in this manner, procured admission into the society of free masons, they connected the mythology of their country, and their metaphysical speculations, concerning the nature of God and the condition of man, with an association formed for the exclusive purpose of scientific improvement, and produced that combination of science and theology which, in after ages, formed such a conspicuous part of the principles of free masonry.

12. The knowledge of the Egyptians was carefully concealed from the vulgar; and when the priests did condescend to communicate it to the learned men of other nations, it was conferred in symbols and hieroglyphics, accompanied with particular rites and ceremonies, marking the value of the gift they bestowed. What those ceremonies were, which were performed at initiation into the Egyptian mysteries, we are unable, at this distance of time, to determine. But as the Eleusinian and other mysteries had their origin in Egypt, we may be able, perhaps, to discover the qualities of the fountain, by examining the nature of the stream.

13. The immense population of Egypt, conjoined with other causes, occasioned frequent emigrations from that enlightened country. In this manner it became the centre of civilization, and introduced into the most distant and savage climes the sublime mysteries of its religion, and those inventions and discoveries which originated in the ingenuity of its inhabitants. The first colony of the Egyptians that arrived in Greece, was conducted by Inachus, about 1970 years before the Christian era; and about three centuries afterwards, he was followed by Cecrops, Cadmus, and Danaus (G). The savage inhabitants of Greece beheld with astonishment the magical tricks of the Egyptians; and regarded as gods those skilful adventurers, who communicated

to

(G) Voyage du Jeune Anacharsis en Grece, 4to. tom. i. p. 2. Cecrops arrived in Attica in 1657 B. C. Cadmus came from Phenicia to Bœotia in 1593 B. C. and Danaus to Argolis in 1586 B. C.

Masonry. to them the arts and sciences of their native land (H). In this manner were sown those seeds of improvement, which, in future ages, exalted Greece to such pre-eminence among the nations.

Institution of the Eleusinian mysteries.

14. After the Egyptian colonies had obtained a secure settlement in their new territories, and were freed from those uneasy apprehensions which generally trouble the invaders of a foreign land, they instituted, after the manner of their ancestors, particular festivals or mysteries, in honour of those who had benefited their country by arts or by arms. In the reign of Erichonius, (A. C. 1500), the mysteries of the Egyptian Isis were established at Eleusis under the name of the Eleusinia. They were instituted in honour of Ceres, who having come to Greece in quest of her daughter Proserpine, resided with Triptolemus at Eleusis, and instructed him in the knowledge of agriculture, and in the still more important knowledge of a future state (I).

Institution of the Panathenea and Dionysian mysteries. Resemblance between the Eleusinian and Dionysian mysteries.

15. About the same time, the Panathenea were instituted in honour of Minerva, and the Dionysian mysteries in honour of Bacchus, who invented theatres (K), and instructed the Greeks in many useful arts, but particularly in the culture of the vine (L). That the Eleusinian and Dionysian mysteries were intimately connected with the progress of the arts and sciences, is manifest from the very end for which they were formed; and that they were modelled upon the mysteries of Isis and Osiris, celebrated in Egypt, is probable from the similarity of their origin, as well as from the consent of ancient authors (M). If there be any plausibility in our former reasoning concerning the origin of knowledge in Egypt, it will follow, that the Dionysia and the mysteries of Eleusis, were, like the societies of free masons, formed for scientific improvement, though tinged with the doctrines of the Egyptian mythology.

Similarity between the Eleusinian mysteries and free masonry.

16. But it is not from conjecture only that this conclusion may be drawn. The striking similarity among the external forms of these secret associations, and the still more striking similarity of the objects they had in view, are strong proofs that they were only different streams issuing from a common fountain. Those who were initiated into the Eleusinian mysteries, were bound

by the most awful engagements, to conceal the instructions they received, and the ceremonies that were performed (N). None were admitted as candidates, till they arrived at a certain age; and particular persons were appointed, to examine and prepare them for the rites of initiation (O). Those, whose conduct was found irregular, or who had been guilty of atrocious crimes, were rejected as unworthy of initiation; while the successful candidates were instructed, by significant symbols, in the principles of religion (P), were exhorted to quell every turbulent appetite and passion (Q), and to merit, by the improvement of their minds, and the purity of their hearts, those ineffable benefits which they were still to receive (R). Significant words were communicated to the members: grand officers presided over their assemblies (S): Their emblems were exactly similar to those of free masonry (T); and the candidate advanced from one degree to another, till he received all the lessons of wisdom and of virtue which the priests could impart (U). But besides these circumstances of resemblance, there are two facts, transmitted to us by ancient authors, which have an astonishing similarity to the ceremonies of the third degree of free masonry. So striking is the resemblance, that every brother of the order who is acquainted with them, cannot question, for a moment, the opinion which we have been attempting to support (X).

17. Having thus mentioned some features of resemblance between the mysteries of Eleusis, and those of free masonry, let us now attend to the sentiments of contemporaries, respecting these secret associations, and we will find, that they have been treated with the same illiberality and insolence. That some men, who, from self-sufficiency, or unsocial dispositions, have refused to be admitted into these orders, should detract from the character of an association, which pretends to enlighten the learned, and expand the affections of narrow and contracted minds, is by no means a matter of surprise; and it is equally consistent with human nature, that those, whose irregular conduct had excluded them from initiation, should calumniate an order, whose blessings they were not allowed to participate, and whose honours they

Masonry they were prohibited to share. Men of this description represented the celebration of the Eleusinian mysteries, as scenes of riot and debauchery; and reproached the members of the association, that they were not more virtuous and more holy than themselves (Y). But it is the opinion of contemporary writers, that these rumours were completely unfounded, and arose from the silence of the initiated, and the ignorance of the vulgar. They even maintain, that the mysteries of Eleusis produced sanctity of manners, attention to the social duties, and a desire to be as distinguished by virtue, as by silence. See ELEUSINIA. The illustrious Socrates could never be prevailed upon to partake of these mysteries (Z); and Diogenes, upon receiving a similar solicitation, replied, "That Pataecion, a notorious robber, obtained initiation; and that Epaminondas and Agosilaus never desired it (A)." But did not these men know, that in all human societies, the virtuous and the noble must sometimes associate with the worthless and the mean? Did they not know that there often kneel in the same temple, the righteous and the profane; and that the saint and the sinner frequently officiate at the same altar? Thus did the philosophers of antiquity calumniate and despise the mysteries of Eleusis; and, in the same manner, have some philosophers of our own day, defamed the character, and questioned the motives of free masons.

Masonry. fices, purifications, and other tokens of their humility and gratitude. But when revelation had disclosed to man more amiable sentiments concerning the Divine Being, the society of free masons banished from their mysteries those useless rites, with which the ancient brethren of the order attempted to appease and requite their deities; and modelled their ceremonies upon this foundation, that there is but one God, who must be worshipped in spirit and in truth.

19. The mysteries of Ceres were not confined to the city of Eleusis; they were introduced into Athens about 1356 B. C. (B); and, with a few slight variations, were observed in Phrygia, Cyprus, Crete, and Sicily (C). They had reached even to the capital of France (D): and it is highly probable that, in a short time after, they were introduced into Britain, and other northern kingdoms (E). In the reign of the emperor Adrian (F), they were carried into Rome, and were celebrated, in that metropolis, with the same rites and ceremonies which were performed in the humble village of Eleusis. They had contracted impurities, however, from the length of their duration, and the corruption of their abettors; and though the forms of initiation were still symbolical of the original and noble objects of the institution; yet the licentious Romans mistook the shadow for the substance; and, while they underwent the rites of the Eleusinian mysteries, they were strangers to the object for which they were framed.

Objection answered. 18. This similarity of treatment, which the mysteries of Ceres and free masonry have received, is no small proof of the similarity of their origin, and their object. To this conclusion, however, it may be objected, that though the points of resemblance between these secret societies are numerous, yet there were circumstances in the celebration of the Eleusinian mysteries, which have no counterpart in the ceremonies of free masonry. The sacrifices, purifications, hymns, and dances, which were necessary in the festival of Ceres, have, indeed, no place in the society of free masons. But these points of dissimilarity, instead of weakening, rather strengthen our opinion. It cannot be expected, that in the reign of Polytheism, just sentiments of the deity should be entertained; and much less, that the adherents of Christianity should bend their knees to the gods of the heathens. The ancients worshipped those beings, who conferred on them the most signal benefits, with sacri-

Abolition of the Eleusinian mysteries in the reign of Theodosius. 20. About the beginning of the fifth century, Theodosius the Great prohibited, and almost totally extinguished the Pagan theology in the Roman empire (G); and the mysteries of Eleusis suffered in the general devastation (H). It is probable, however, that these mysteries were secretly celebrated, in spite of the severe edicts of Theodosius; and that they were partly continued during the dark ages, though stripped of their original purity and splendour. We are certain, at least, that many rites of the Pagan religion were performed, under the dissembled name of convivial meetings, long after the publication of the emperor's edicts (I); and Psellus (K), informs us, that the mysteries of Ceres subsisted in Athens till the eighth century of the Christian era, and were never totally suppressed.

Masonry.

21. Having thus considered the origin and decline of the mysteries of Eleusis, and discovered in them numerous and prominent features of resemblance to those of free masonry; we may reasonably infer, that the Egyptian mysteries which gave rise to the former, had a still nearer affinity to the latter; and, from this conclusion, the opinions that were formerly stated, concerning the antiquity of the order, and the origin of Egyptian knowledge, will receive very considerable confirmation.

Origin and history of the Dionysian mysteries.

22. Let us now direct our attention to the Dionysia, or mysteries of Bacchus, which were intimately connected with those of Ceres, and, perhaps, still more with the mysteries of free masonry. Herodotus (L) informs us that the solemnities, in honour of Dionysius or Bacchus, were originally instituted in Egypt; and were transported from that country into Greece, by one Melampus. But not only did the mysteries of Ceres and Bacchus flow from the same source; the one was in some measure interwoven with the other, and it is almost certain, from what we are now to mention, that those who were initiated into the former, were entitled to be present at the celebration of the latter. The sixth day of the Eleusinian festival was the most brilliant of the whole. It received the appellation of Bacchus, because it was chiefly, if not exclusively, devoted to the worship of that god. His statue, attended by the initiated and the ministers of the temple, was conducted from Athens to Eleusis, with much pomp and solemnity (M). And after it had been introduced into the temple of Ceres, it was brought back to Athens with similar ceremonies. The connection between the Eleusinian and Dionysian mysteries is manifest, also, from the common opinion, that Ceres was the mother of Bacchus (N). And Plutarch assures us, that the Egyptian Isis was the prototype of Ceres; that Osiris was the same with Bacchus; and that the Dionysia of Greece was only another name for the Pamyria of Egypt (O). As Bacchus was the inventor of theatres, as well as of dramatical representations, that particular class of masons, who were employed in the erection of these extensive buildings, were called the Dionysian artificers (P), and were initiated into the mysteries of their founder, and consequently into those of Eleusis (Q). But, from the tendency of the human mind to embrace the ceremonial, while it neglects the substantial part of an institution, the Dionysian festival, in the degenerate ages of Greece, was more remarkable for inebriation and licentiousness, than for the cul-

tivation of virtue and of science; and he who was at first celebrated as the inventor of arts, was afterwards worshipped as the god of wine. Those who were desirous of indulging secretly in licentious mirth and unhallowed festivity, cloaked their proceedings under the pretence of worshipping Bacchus; and brought disgrace upon those mysteries, which were instituted for the promotion of virtue, and the improvement of art.

23. About 200 years B. C. an illiterate and licentious priest came from Greece to Tuscany, and instituted the Bacchanalia, or feast of the Bacchanals (R). From Tuscany they were imported to Rome; but the promoters of these midnight orgies having proceeded to the farthest extremity of dissipation and disloyalty, they were abolished throughout all Italy, by a decree of the senate (S). It has been foolishly supposed that the Bacchanalia were similar to the Dionysian mysteries, merely because they were both dedicated to Bacchus. The Liberalia of Rome was the festival corresponding to the Dionysia of Greece (T); and it is probable that this feast was observed throughout the Roman empire, till the abrogation of the Pagan theology in the reign of Theodosius. The opinion which an impartial inquirer would form, concerning the nature and tendency of the mysteries of Bacchus, would not be very favourable to the character of the institution. But it should be remembered that deviations from the intentions and form of any association, are no objection to the association itself. They are rather proofs of its original purity and excellence; as it is not from the paths of vice, but from those of virtue, that we are accustomed to stray.

24. Hitherto we have considered the Dionysian mysteries under an unpropitious aspect; let us now trace them in their progress from Europe to Asia, where they retained their primitive lustre, and effectually contributed to the rapid advancement of the fine arts.

25. About 1000 years B. C. (U), the inhabitants of Attica, complaining of the narrowness of their territory, and the unfruitfulness of its soil, went in quest of more extensive and fertile settlements. Being joined by a number of the inhabitants of surrounding provinces, they sailed to Asia Minor, drove out the inhabitants, seized upon the most eligible situations, and united them under the name of Ionia, because the greatest number of the refugees were natives of that Grecian province (X). As the Greeks, prior to the Ionic migration,

Masonry. gration, had made considerable progress in the arts and sciences (Y), they carried these along with them into their new territories; and introduced into Ionia the mysteries of Minerva and Dionysius (Z), before they were corrupted by the licentiousness of the Athenians. In a short time the Asiatic colonies surpassed the mother-country in prosperity and science. Sculpture in marble, and the Doric and Ionian orders, were the result of their ingenuity (A). They returned even into Greece; they communicated to their ancestors the inventions of their own country; and instructed them in that style of architecture which has been the admiration of succeeding ages. For these improvements the world is indebted to the *Dionysian artificers*, an association of scientific men, who possessed the exclusive privileges of erecting temples, theatres, and other public buildings in Asia Minor (B). They supplied Ionia, and the surrounding countries, as far as the Hellespont, with theatrical apparatus by contract; and erected the magnificent temple at Teos, to Bacchus, the founder of their order (C). These artists were very numerous in Asia, and existed, under the same appellation, in Syria, Persia, and India (D). About 300 years before the birth of Christ a considerable number of them were incorporated, by command of the kings of Pergamus, who assigned to them Teos as a settlement, being the city of their tutelary god (E). The members of this association, which was intimately connected with the Dionysian mysteries, were distinguished from the uninitiated inhabitants of Teos, by the science which they possessed, and by appropriate words and signs, by which they could recognize their brethren of the order (F). Like free masons they were divided into lodges, which were distinguished by different names (G). They occasionally held convivial meetings in houses erected and consecrated for this purpose; and each separate association was under the direction of a

History of the Dionysian artificers.

Their resemblance to free masons.

master, and presidents or wardens (H). They held a general meeting once a-year, which was solemnized with great pomp and festivity; and at which the brethren partook of a splendid entertainment, provided by the master, after they had finished the sacrifices to their gods, and especially to their patron Bacchus (I). They used particular utensils in their ceremonial observances; some of which were exactly similar to those that are employed by the fraternity of free masons (K). And the more opulent artists were bound to provide for the exigencies of their poorer brethren (L). The very monuments which were reared by these masons, to the memory of their masters and wardens, remain to the present day in the Turkish burying grounds, at Siverhissar and Eraki (M). The inscriptions upon them express, in strong terms, the gratitude of the fraternity, for their disinterested exertions in behalf of the order; for their generosity and benevolence to its individual members; for their private virtues, as well as for their public conduct. From some circumstances which are stated in these inscriptions, but particularly from the name of one of the lodges, it is highly probable, that Attalus, king of Pergamus, was a member of the Dionysian fraternity.

Masonry.

26. Such is the nature of that association of architects, who erected those splendid edifices in Ionia, whose ruins even afford us instruction, while they excite our surprise. If it be possible to prove the identity of any two societies, from the coincidence of their external forms, we are authorised to conclude, that the fraternity of the Ionian architects, and the fraternity of free masons, are exactly the same; and as the former practised the mysteries of Bacchus and Ceres, several of which we have shown to be similar to the mysteries of masonry; we may safely affirm, that, in their internal, as well as external procedure, the society of free masons resembles the Dionysiasts of Asia Minor (N).

27. The

(Y) According to the author of Anacharsis's Travels, the arts took their rise in Greece about 1547, B. C.

(N) Dr Robison, who will not be suspected of partiality to free masons, ascribes their origin to the Dionysian artists.

Masonry.
The existence of free masonry at the building of Solomon's temple not improbable.

27. The opinion, therefore, of free masons, that their order existed and flourished at the building of Solomon's temple, is by no means so pregnant with absurdity as some men would wish us to believe. We have already shown, from authentic sources of information, that the mysteries of Ceres and Bacchus were instituted about 400 years before the reign of Solomon (O); and there are strong reasons for believing, that even the association of the Dionysian architects existed before the building of the temple. It was not, indeed, till about 300 years before the birth of Christ, that they were incorporated at Teos, under the kings of Pergamus; but it is universally allowed, that they arose long before their settlement in Ionia, and, what is more to our present purpose, that they existed in the very land of Judea (P). It is observed by Dr Robison (Q), that this association came from Persia into Syria, along with that style of architecture which is called Grecian: And since we are informed by Josephus (R), that that species of architecture was used at the erection of the temple; there is reason to infer, not only that the Dionysiacs existed before the reign of Solomon, but that they assisted this monarch in building that magnificent fabric, which he reared to the God of Israel. Nothing, indeed, can be more simple and consistent than the creed of the fraternity, concerning the state of their order at this period. The vicinity of Jerusalem to Egypt; the connection of Solomon with the royal family of that kingdom (S); the progress of the Egyptians in architectural science; their attachment to mysteries and hieroglyphic symbols; and the probability of their being employed by the king of Israel, are additional considerations, which corroborate the sentiments of free masons, and absolve them from those charges of credulity and pride with which they have been loaded.

Objection answered.

28. To these opinions, it may be objected, that if the fraternity of free masons flourished during the reign of Solomon, it would have existed in Judea in after ages, and attracted the notice of sacred or profane historians. Whether or not this objection is well founded, we shall not pretend to determine; but if it can be shown, that there did exist, after the building of the temple an association of men, resembling free masons,

Masonry.
in the nature, ceremonies, and object of their institution; the force of the objection will not only be taken away, but additional strength will be communicated to the opinion which we have been supporting. The association here alluded to, is that of the Essenes, whose origin and sentiments have occasioned much discussion among ecclesiastical historians. They are all of one mind, however, respecting the constitution and observances of this religious order.

29. When a candidate was proposed for admission, History of the strictest scrutiny was made into his character (T). the Essenes. If his life had hitherto been exemplary; and if he appeared capable of regulating his conduct according to the virtuous though austere maxims of their order, he was presented at the expiration of his noviciate, with a white garment, as an emblem of the correctness of his conduct and the purity of his heart (U). A solemn oath was then administered to him, that he would never, even at the risk of his life, divulge the mysteries of the order; that he would make no innovations on the doctrines of the society; and that he would continue in that honourable course of piety and virtue which he had begun to pursue (X). Like free masons, they instructed the young member in the knowledge which they derived from their ancestors (Y). They admitted no women into their order (Z). They had particular signs for recognizing each other, which have a strong resemblance to those of free masons (A). They were divided into separate lodges or colleges (B). They had different places of meeting, where they practised their rites, and settled the affairs of the society; and, after the performance of these duties, they assembled in a large hall, where an entertainment was provided for them by the president, or master of the college, who allotted a certain quantity of provisions to every individual (C). They abolished all distinctions of rank; and, if preference was ever given, it was given to piety, liberality, and virtue (D). Stewards were appointed in every town, to supply the wants of indigent strangers (E). The Essenes pretended to higher degrees of piety and knowledge, than the uninitiated vulgar; and though their pretensions were high, they were never questioned by their enemies. Austerity of manners was one of the chief characteristics of the Essenian fraternities:

(O) According to Playfair's Chronology, the temple of Solomon was begun in 1016, and finished in 1008, B. C. The Eleusinian mysteries were introduced into Athens in 1356 B. C. a considerable time after their institution.

Masonry. ties: They frequently assembled, however, in convivial parties; and relaxed for a while the severity of those duties which they were accustomed to perform (F). This remarkable coincidence between the chief features of the masonic and Essenian fraternities, can be accounted for only by referring them to the same origin. Were the circumstances of resemblance either few or fanciful, the similarity might have been merely casual. But when the nature, the object, and the external forms of two institutions are precisely the same, the arguments for their identity are something more than presumptive. There is one point, however, which may, at first sight, seem to militate against this supposition. The Essenes appear to have been in no respects connected with architecture, nor addicted to those sciences and pursuits which are subsidiary to the art of building. That the Essenes directed their attention to particular sciences, which they pretended to have received from their fathers, is allowed by all writers; but, whether or not these sciences were in any shape connected with architecture, we are, at this distance of time, unable to determine. Be this as it may, uncertainty upon this head, nay, even an assurance that the Essenes were unconnected with architectural science, will not affect the hypothesis which we have been maintaining. For there have been, and still are, many associations of free masons, where no architects are members, and which have no connection with the art of building. But if this is not deemed a sufficient answer to the objection, an inquiry into the origin of the Essenes will probably remove it altogether, while it affords additional evidence, for the identity of the masonic and Essenian associations.

The Es- 30. Sacred and profane historians have entertained
sanes origi- different opinions concerning the origin of the Essenes.
nated from They all agree, however, in representing them as an
the Kasi- ancient association, originating from particular fraterni-
deans, who ties, which formerly existed in the land of Judea (G).
were bound Pliny refers them to such a remote antiquity (H) that
to preserve they must have existed during the reign of Solom-
the temple on; and even Basnage, who is the only writer that
of Jeru- seems disposed to consider them as a recent association,
salem. confesses that they existed under Antigonus, about 300
years before the Christian era (I). Scaliger contends,
with much appearance of truth, that the Essenes were
descended from the Kasideans, who make such a con-
spicuous figure in the history of the Maccabees (K).
The Kasideans were a religious fraternity, or an order

Masonry. of the *Knights of the Temple of Jerusalem*, who bound themselves to adorn the porches of that magnificent structure, and to preserve it from injury and decay (L). This association was composed of the greatest men of Israel, who were distinguished for their charitable and peaceful dispositions (M); and always signalized themselves by their ardent zeal for the purity and preservation of the temple (N). From these facts it appears, that the Essenes were not only an ancient fraternity, but that they originated from an association of architects, who were connected with the building of Solomon's temple. Nor was this order confined to the Holy Land. Like the fraternities of the Dionysiacs and free masons, it existed in all parts of the world (O); and though the lodges in Judea were chiefly, if not wholly, composed of Jews, yet the Essenes admitted into their order men of every religion, and every rank in life (P). They adopted many of the Egyptian mysteries (Q); and, like the priests of that country, the magi of Persia, and the gymnosophists in India, they united the study of moral with that of natural philosophy (R). Although they were patronized by Herod, and respected by all men for the correctness of their conduct, and the innocence of their order (S), they suffered severe persecutions from the Romans, till their order was abolished, about the middle of the fifth century (T); a period extremely fatal to the venerable institutions of Egypt, Greece, and Rome.

31. Connected with the Essenian and Masonic fraternities, was the institution of Pythagoras at Crotona. After of Pythagoras at Crotona. this philosopher, in the course of his travels through Egypt, Syria, and Ionia, had been initiated into the mysteries of these enlightened kingdoms, he imported into Europe the sciences of Asia, and offered to the inhabitants of his native soil, the important benefits which he himself had received (U). The offers of the sage having been rejected by his countrymen of Samos (X), he settled at Crotona, in Italy, where more respect was paid to his person, and more attention to his precepts (Y). When the kindness of the Crotonians, and their solicitude to obtain scientific information, had inspired Pythagoras with some hopes of success, he selected a number of his disciples, who from the similarity of their characters, the mildness of their dispositions, and the steadiness of their conduct, seemed best adapted for forwarding the purposes he had in view (Z). These he formed into a fraternity, or separate order of men, whom

Masonry. whom he instructed in the sciences of the east (A), and to whom he imparted the mysteries and rites of the Egyptian, Syrian, and Ionian associations. Before any one was received into the number of his disciples, a minute and diligent enquiry was made into his temper and character (B). If the issue of this inquiry was favourable to the candidate, he bound himself by a solemn engagement, to conceal, from the uninitiated, the mysteries which he might receive, and the sciences in which he might be instructed (C). The doctrines of charity, of universal benevolence, and especially of affection to the brethren of the order, were warmly recommended to the young disciples (D); and such was the influence which they had upon their minds, that discord seemed to have been banished from Italy (E) and the golden age to have again returned. Strangers of every country, of every religion, and of every rank in life, were received, if properly qualified, into the Pythagorean association (F). Like free masons they had particular words and signs, by which they might distinguish each other, and correspond at a distance (G). They wore white garments as an emblem of their innocence (H). They had a particular regard for the east (I). They advanced from one degree of knowledge to another (K). They were forbidden to commit to writing their mysteries, which were preserved solely by tradition (L). The Pythagorean symbols and secrets were borrowed from the Egyptians, the Orphic and Eleusinian rites, the Magi, the Iberians, and the Celts (M). They consisted chiefly of arts and sciences, united with theology and ethics, and were communicated to the initiated in cyphers and symbols (N). An association of this nature, founded upon such principles, and fitted for such ends, did not remain long in obscurity. In a short time it extended over the kingdoms of Italy and Sicily, and was diffused even through ancient Greece, and the islands of the Egean sea (O). Like other secret societies, it was vilified by malicious men, who were prohibited from sharing its advantages, from the weakness of their minds and the depravity of their hearts (P.) Chagrined with disappointment, and inflamed with rage, they often executed vengeance upon the innocent Pythagoreans, and even set fire to the lodges in which they

Resemblance between the Pythagoreans and free masons.

were assembled (Q). But the disciples of the sage persisted in that honourable cause in which they had embarked; and, though the persecution of their enemies drove them from their native land, they still retained for each other the sympathy of brothers, and often suffered death in its most agonizing form, rather than violate the engagements into which they had entered (R). An attempt, like this, against the society of free masons, has been witnessed in our own day. It has not, indeed, proceeded to such an extremity of violence. The spirit of extirpation, however, existed in sentiment, though it had not the courage to display itself in action. Disaffection to government, and disrespect to religion, were charged upon them with all the confidence of truth: And, had the governments of Europe been weak enough to credit the fancies of a few political enthusiasts, their subjects might, at this moment, have been armed against each other, and the nations of the world embroiled in discord.

32. From these observations, it is manifest, that the Pythagorean and Masonic institutions were similar in their external forms, as well as in the objects which they had in view; and that both of them experienced, from contemporaries, the same unmerited reproach. Mr Clinch, in his *Essays on Free Masonry* (S) has enumerated, at great length, all the points of resemblance between these two institutions. He attempts to prove, that free masonry took its rise from the Pythagorean fraternity; but though he has been successful in pointing out a remarkable coincidence between these associations, he has no authority for concluding that the former originated from the latter. In a masonic manuscript, preserved in the Bodleian library, in the handwriting of King Henry VI. it is expressly said, that Pythagoras learned masonry from Egypt and Syria, and from those countries where it had been planted by the Phenicians; that the Pythagoreans carried it into France; and that it was, in the course of time, imported from that country into England (T). This, indeed, is no direct proof of our opinion; it shews us, at least, that the same sentiments have been entertained about four hundred years ago by the fraternity in England. It has been supposed by some philo-

Masonry. phers (u), that Pythagoras derived his mysteries chiefly from the Essenes, who were at that time much respected and very numerous in Egypt and Syria. The wonderful similarity, indeed, between these societies, both in the forms which they had in common with free masonry, and in those lesser customs and ceremonies, which were peculiar to themselves, render such a supposition extremely probable. It is remarked by all ecclesiastical historians, that the Essenes were Pythagoreans, both in discipline and doctrine (x); without every considering that the former existed some hundred years before the birth of Pythagoras (y). The Pythagoreans, therefore, were connected with the Essenes, and the Essenes with the Kasideans, who engaged to preserve and adorn the temple of Jerusalem.

Objection answered.

33. There is one objection to the view which we have taken of this subject, which, though it has already been slightly noticed, it may be necessary more completely to remove. Although it will be acknowledged by every unbiassed reader, that free masonry has a wonderful resemblance to the Eleusinian and Dionysian mysteries, the fraternity of Ionian architects, and the Essenian and Pythagorean associations; yet some may be disposed to question the identity of these institutions, because they had different names, and because some usages were observed by one, which were neglected by another. But these circumstances of dissimilarity arise from those necessary changes, which are superinduced upon every institution, by a spirit of innovation, by the caprice of individuals, and by the various revolutions in civilized society. Every alteration or improvement in philosophical systems, or ceremonial institutions, generally produces a corresponding variation in their name, deduced from the nature of the improvement, or from the name of the innovator. The different associations for example, whose nature and tendency we have been considering, received their names from circumstances merely casual, and often of trifling consideration; though all of them were established for the same purpose, and derived from the same source. When the mysteries of the Essenes were imported by Pythagoras into Italy, without undergoing much variation, they were there denominated the mysteries of Pythagoras; and in our own day, they are called the secrets of free masonry, because many of their symbols are derived from the art of building, and because they are believed to have been invented by an association of architects, who were anxious to preserve, among themselves, the knowledge which they had acquired (z). The difference in the ceremonial observances of these institutions may be accounted for nearly upon the same principles. From the ignorance, or superior sagacity of those who presided over the ancient fraternities, some ceremonies would be insisted upon more than others,

Vol. XII. Part II.

some of less moment would be exalted into consequence, while others of greater importance would be depressed into obscurity. In process of time, therefore, some trifling changes would be effected upon these ceremonies, some rites abolished, and some introduced. The chief difference, however, between the ancient and modern mysteries, is, in these points which concern religion. But this arises from the great changes which have been produced in religious knowledge. It cannot be supposed that the rites of the Egyptian, Jewish, and Grecian religions, should be observed by those who profess only the religion of Christ; or that we should pour out libations to Ceres and Bacchus, who acknowledge no heavenly superior, but the true and the living God.

Masonry.

34. It may be proper here to take notice of an objection urged by M. Barruel, against the opinion of those, who believe that the mysteries of free masonry are similar to the mysteries of Egypt and Greece (A). From the unfairness with which this writer has stated the sentiments of his opponents on this subject; from the confidence and triumph with which he has proposed his own; and, above all, from the disingenuity with which he has supported them, many inattentive readers may have been led to adopt his notions, and to form as despicable an idea of the understandings as he would wish them to form of the character of masons. He takes it for granted, that all who embrace the opinion which we have endeavoured to support, must necessarily believe, that a unity of religious sentiments, and moral precepts, was maintained in all the ancient mysteries; and that the initiated entertained just notions of the unity of God, while the vulgar were addicted to the grossest polytheism. Upon this gratuitous supposition, which we completely disavow, because it has no connection with our hypothesis, does Barruel found all his declamations against the connection of our order with the Pythagorean and Eleusinian institutions. If this supposition, indeed, were true, his opinion would be capable of proof. But he is all the while combating the dogmas of Warburton, while he thinks he is overturning the antiquity of our order. There is perhaps in no language such a piece of downright sophistry as this portion of Barruel's work. He seems to scruple at no method, however base or dishonourable, that can bring discredit upon free masonry, and every thing connected with it. After having overturned the opinion of Warburton, he then attacks us on our ground, and stiles us the children of sophistry, deism, and pantheism, who deduce our origin from associations of men that were enemies to Christianity (B), and followed no guide but the light of nature. But this writer should recollect, that the son is not accountable for the degeneracy of his parents; and, if the ancient mysteries were the nurseries of such dangerous opinions, as this writer, in opposi-

tion to authentic history, lays to their charge, it is to the glory of their posterity, that they have shaken off the yoke, and embraced that heavenly light which their ancestors affected to despise.

Modern history of free masonry.

35. Having finished what may be properly denominated the ancient history of free masonry, we are now to trace its progress from the abolition of the heathen rites, in the reign of Theodosius, to the present day; and, though the friends and enemies of the order seem to coincide in opinion upon this part of its history, the materials are as scanty as before, and the incidents equally unconnected. In those ages of ignorance and disorder which succeeded the destruction of the Roman empire, the minds of men were too much debased by superstition, and contracted by bigotry, to enter into associations for promoting mental improvement and mutual benevolence. The spirit which then raged, was not a spirit of inquiry. The motives which then influenced the conduct of men, were not those benevolent and correct principles of action which once distinguished their ancestors, and which still distinguish their posterity. Sequestered habits and unsocial dispositions characterized the inhabitants of Europe, in this season of mental degeneracy; while free masons, actuated by very different principles, inculcate on their brethren the duties of social intercourse, and communicate to all within the pale of their order, the knowledge which they possess and the happiness which they feel. But, if science had existed in these ages, and if a desire of social intercourse had animated the minds of men, the latter must have languished for want of gratification, as long as the former was imprisoned within the walls of a convent, by the tyranny of superstition, or the jealousy of power. Science was in these days synonymous with heresy; and had any bold and enlightened man ventured upon philosophical investigations, and published his discoveries to the world, he would have been regarded by the vulgar as a magician, and punished as a heretic by the church of Rome. These remarks may be exemplified and confirmed by an appropriate instance of the interfering spirit of the Romish church, even in the sixteenth century, when learning had made considerable advancement in Europe. The celebrated Baptista Porta having, like the sage of Samos, travelled into distant countries for scientific information, returned to his native home, and established a society which he denominated the academy of secrets. He communicated the information which he had collected to the members of this association; who, in their turn, imparted to their companions the knowledge which they had individually obtained. But this little fraternity, advancing in respectability and science, soon trembled under the rod of ecclesiastical oppression; and experienced in its dissolution, that the Romish hierarchy was determined to check the ardour of investigation, and retain the human mind in its former fetters of ignorance and superstition. How then could free masonry flourish, when the minds of men had such an unfortunate propensity to monkish retirement, and when every scientific and

The academy of secrets established by Baptista Porta.

secret association was overawed and persecuted by the rulers of Europe? Masonry.

36. But, though the political and intellectual condition of society was unfavourable to the progress of free masonry; and, though the secret associations of the ancients were dissolved in the fifth century, by the command of the Roman emperor, yet there are many reasons for believing that the ancient mysteries were observed in private, long after their public abolition, those enemies of Christianity who were still attached to the religion of their fathers. Some authors (c) even inform us, that this was actually the case, and that the Grecian rites existed in the eighth century, and were never completely abolished, (Art. 20.). These considerations enable us to connect the heathen mysteries, with that trading association of architects, which appeared, during the dark ages, under the special authority of the see of Rome. It is probable that the ancient mysteries were observed privately after their abolition.

37. The insatiable desire for external finery, and gaudy ceremonies, which was displayed by the catholic priests in the exercise of their religion, introduced a corresponding desire for splendid monasteries, and magnificent cathedrals. But as the demand for these buildings was urgent, and continually increasing, it was with great difficulty that artificers could be procured, even for the erection of such pious works. In order to encourage the profession of architecture, the bishops of Rome, and the other potentates of Europe, conferred on the fraternity of free masons the most important privileges; and allowed them to be governed by laws, customs and ceremonies, peculiar to themselves. The association was composed of men of all nations, of Italian, Greek, French, German, and Flemish artists, who were denominated free masons, and who, ranging from one country to another, erected those elegant churches and cathedrals, which, though they once gratified the pride and sheltered the rites of a corrupted priesthood, now excite the notice of antiquarians, and administer to the grandeur of kingdoms. The government of this association was remarkably regular. Its members lived in a camp of butts, reared beside the building in which they were employed. A surveyor, or master, presided over and directed the whole. Every tenth man was called a warden, and overlooked those who were under his charge; and such artificers as were not members of this fraternity, were prohibited from engaging in those buildings which free masons alone had a title to rear (D). It may seem strange, and perhaps inconsistent with what we have already said, that the fraternity of free masons should have been sanctioned, and even protected by the bishops of Rome. Secret associations, indeed, are always a terror to temporal and spiritual tyranny. But the church of Rome, instead of approving of the principles of free masonry, by the encouragement and patronage which they gave to architects, only employed them as instruments for gratifying their vanity, and satiating their ambition. For in after ages, when masons were more numerous, and when the demand for religious structures was less urgent than before, the bishops of Rome deprived the fraternity of those Trading association of architects during the dark ages.

any investigation, in order to prove, that the order of the knights templars was a branch of free masonry. This fact has been invariably acknowledged by free masons themselves; and none have been more zealous to establish it than the enemies of their order (F). The former have admitted the fact, not because it was creditable to them, but because it was true; and the latter have supported it, because by the aid of a little sophistry, it might be employed to disgrace their opponents.

Masonry.

Introduction of free masonry into Scotland.

38. Wherever the catholic religion was taught, the meetings of free masons were sanctioned and patronized. The principles of the order were even imported into Scotland (E), where they continued, for many ages, in their primitive simplicity, long after they had been extinguished in the continental kingdoms. In this manner, Scotland became the centre from which these principles again issued, to illuminate, not only all the nations on the continent, but every civilized portion of the habitable world. What those causes were which continued the societies of free masons longer in Britain than in other countries, it may not, perhaps, be easy to determine; but as the fact itself is unquestionable, it must have arisen, either from some favourable circumstances in the political state of Britain, which did not exist in the other governments of Europe; or from the superior policy, by which the British masons eluded the suspicion of their enemies, and the superior prudence with which they maintained the primitive simplicity and respectability of their order. The former of these causes, had, without doubt, a considerable share, in producing the effect under consideration; and we know for certain, that, in our own days, the latter has preserved free masonry in a flourishing condition throughout these united kingdoms, while, in other countries, the imprudence and foolish innovations of its members, have exposed it to the severest and justest censure, and, in many cases, to the most violent persecutions. It is a fact, requiring no confirmation, and resulting from the most obvious causes, that free masonry never flourishes in seasons of public commotion; and even in Great Britain, though the seat of war is commonly in foreign countries, it has universally declined. But in those lands which are the theatre of hostilities, it will be neglected in a still greater degree; and, if these hostilities are long continued, or frequently recur, the very name and principles of the order must be soon extinguished. Amid those continual wars, therefore, which, during the middle ages, distracted and desolated the continent of Europe, the association of architects would be soon dissolved; while in the humble village of Kilwinning, on the western coast of Scotland, they found a safe retreat from the violent convulsions of continental wars.

40. The order of the knights templars was instituted during the crusades, in the year 1118, by Hugo de Pagania, and Geoffrey of St Omers. It received this appellation because its members originally resided near the church in Jerusalem, which was dedicated to our Saviour. Though the professed object of this religious association was to protect those Christian pilgrims, whose mistaken piety had led them to the holy city; yet it is almost beyond a doubt, that its chief and primary intention, was to practise and preserve the rites and mysteries of masonry. We know at least, that the knights templars, not only possessed the mysteries, but performed the ceremonies, and inculcated the duties of free masons; and it is equally certain, that the practising of these rites could contribute nothing to the protection and comfort of the Catholic pilgrims. Had the templars publicly avowed the real object of their institution, instead of that favour which they so long enjoyed, they would have experienced the animosity of the church of Rome. But as they were animated with a sincere regard for the Catholic religion, and with a decided abhorrence for the infidel possessors of Judea, it was never once suspected that they transacted any other business at their secret meetings, but that which concerned the regulation of their order, the advancement of religion, and the extirpation of its enemies. The many prodigies of valour which they exhibited against the infidels; the many charitable deeds which they performed towards the distressed pilgrims; and the many virtues which adorned their private character, procured them, from the rulers of Europe, that respect and authority to which they were so justly entitled, and which they so long maintained. But respect and authority were not the only rewards which they purchased by their virtues and military prowess. From the munificence of the popes, the generosity of the pious princes and nobles of Europe, and from the gratitude of those opulent pilgrims, who, in the moments of distress, had experienced their kind assistance, the knights templars had acquired such immense possessions in every kingdom of Europe, but particularly in France, that their revenues often exceeded those of the secular princes. Thus independent in their circumstances, and being fatigued with those unsuccessful struggles against the infidels, which they had maintained with such manly courage, they returned to their native land to enjoy,

History of the knights templars.

Connection between free masons and the knights templars.

39. Before we detail the progress of free masonry, after its importation into Britain, it will be necessary to give some account of the knights templars, a fraternity of free masons whose affluence and virtues often raised the envy of contemporaries, and whose unmerited and unhappy end must have often excited the compassion of posterity. It would be needless labour to enter into

As Barruel, however, was unacquainted with the observances of the templars and masons, he has attributed to both many absurd rites which probably never existed but in his own mind. For the same reason he has omitted many points of resemblance which would have established the common opinion upon an immovable foundation.

Masonry

in peace and quiet, the recompense of their toils. But, like all men who are suddenly transported from danger and fatigue, to opulence and ease, many of the templars deviated from that virtuous course which they had hitherto pursued, and indulged too freely in those luxuries and fashionable amusements to which they were invited by opulence, and impelled by inactivity. Thus, from the indiscretions of a few, did the knights templars lose a considerable share of those honours, and that celebrity, which they had long enjoyed. But this relaxation of discipline, and attachment to luxurious indolence, were the only crimes of which the templars were guilty; and to men of honour and spirit like them, the forfeiture of popularity, which was the consequence of their apostasy, would be a sufficient punishment. This, however, was not the sentiment of Philip the Fair. That barbarous monarch, instigated by private revenge against some individuals of the order; encouraged by the prospect of sharing in their ample revenues; and spurred on by a spirit which seldom resides in a human breast, imprisoned in one day all the templars in France, merely at the instance of two worthless members of the order, who had been disgraced and punished by their superiors, for the enormity of their crimes. It was pretended by these base accusers, that the templars abjured our Saviour, that they spit upon his cross, that they burned their children, and committed other atrocious crimes, from which the human mind recoils with horror, and which could have been perpetrated only by men so completely abandoned as the informers themselves. Under the pretence of discovering what degree of credit might be attached to these accusations, the templars were extended on the rack till they confessed the crimes with which they were charged. Several of the knights, when stretched on this instrument of agony, made every acknowledgement which their persecutors desired. But others, retaining on the rack that fortitude and contempt of death which they had exhibited in the field, persisted in denying the crimes laid to their charge, and maintained with their latest breath, the innocence of their order. Many of those, even, who had tamely submitted to their persecutors, retracted those ignominious confessions which the rack had extorted; and maintained their integrity in the midst of those flames which the barbarous Philip had kindled for their destruction. Fifty-nine of these unhappy men were burnt alive at Paris, by a slow fire; and the same vindictive and inhuman spirit was exhibited in the other provinces of France, and in the other nations of Europe. The fortitude which, in every country, was displayed by these unfortunate sufferers, could have been inspired by innocence alone; and is a strong proof, that their minds were not so enervated by indolence, nor their bodies so enfeebled by luxury, as has been generally believed. The only murmurs which parted from their lips, were those which expressed their anguish and remorse, that they had betrayed, in the hour of pain, the interests of their order, and had confessed themselves guilty of crimes unworthy of a templar and a man.

41. But the atrocious scene was yet to come which was

Death of the grand master and other dignitaries.

to complete the ruin of the templars, and satiate the vengeance of their enemies. Their grand master Molay, and other dignitaries of the order, still survived: and, though they had made the most submissive acknowledgements to their unrelenting persecutors, yet the influence which they had over the minds of the vulgar, and their connection with many of the princes of Europe, rendered them formidable and dangerous to their oppressors. By the exertion of that influence, they might restore union to their dismembered party, and inspire them with courage to revenge the murder of their companions; or, by adopting a more cautious method, they might repel, by uncontrovertible proofs, the charges for which they suffered; and, by interesting all men in their behalf, they might expose Philip to the attacks of his own subjects, and to the hatred and contempt of Europe. Aware of the dangers to which his character and person would be exposed by pardoning the surviving templars, the French monarch commanded the grand master and his brethren to be led out to a scaffold, erected for the purpose, and there to confess before the public, the enormities of which their order had been guilty, and the justice of the punishment which had been inflicted on their brethren. If they adhered to their former confessions, a full pardon was promised to them; but if they should persist in maintaining their innocence, they were threatened with destruction on a pile of wood, which the executioners had erected in their view, to awe them into compliance. While the multitude were standing around in awful expectation, ready, from the words of the prisoners, to justify or condemn their king, the venerable Molay, with a cheerful and undaunted countenance, advanced, in chains, to the edge of the scaffold; and, with a firm and impressive tone, thus addressed the spectators. "It is but just, that in this terrible day, and in the last moments of my life, I lay open the iniquity of falsehood, and make truth to triumph. I declare, then, in the face of heaven and earth, and I confess, though to my eternal shame and confusion, that I have committed the greatest of crimes; but it has been only in acknowledging those that have been charged with so much virulence upon an order, which truth obliges me to pronounce innocent. I made the first declaration they required of me, only to suspend the excessive tortures of the rack, and mollify those that made me endure them. I am sensible what torments they prepare for those that have courage to revoke such a confession. But the horrible sight which they present to my eyes is not capable of making me confirm one lie by another. On a condition so infamous as that, I freely renounce life which is already but too odious to me. For what would it avail me to prolong a few miserable days, when I must owe them only to the blackest of calumnies (G)." In consequence of this manly revocation, the grand master and his companions were hurried into the flames, where they retained that contempt of death which they had exhibited on former occasions. This mournful scene extorted tears from the lowest of the vulgar. Four valiant knights, whose charity and valour had procured them the gratitude and applause of mankind, suffering, without

Masonry.

Masonry. without fear, the most cruel and ignominious death, was indeed a spectacle well calculated to excite emotions of pity in the hardest hearts; and, whatever opinion we may entertain concerning the character of that unhappy order, every mind of sensibility will compassionate the fate of the templars, and curse the inhuman policy of Philip the Fair.

The innocence of the knights templars considered.

42. From this short and imperfect account of the origin and ruin of the knights templars, the reader will be enabled to understand the merits of the question, respecting the innocence of that order, which it will be necessary here to consider. The opinions of contemporary writers were too much influenced by party spirit, and religious zeal, to deserve any regard in this investigation. All those writers (H), however, who are generally deemed impartial historians, and who were in no respects interested, either in the condemnation or acquittal of the templars, have, without hesitation, pronounced them innocent of the crimes laid to their charge, and imputed their destruction to the avarice and private resentment of Philip. In the decision of these historians, the public had, in general, acquiesced, till their sentiments were unsettled by the bold pretensions, and the sophistical reasoning of Barruel. This writer has charged upon the templars all those crimes with which their enemies had formerly loaded them: he has attempted to justify the severity of the French king, and has reproached, with the bitterest invective, the society of free masons, because they were once connected with a fraternity, which, in his opinion, was so wicked and profane. While we endeavour, therefore, to defend the templars against these recent calumnies, we shall, at the same time, be maintaining the respectability of the masonic institution, by vindicating its members from that imputed depravity, which, according to Barruel, they have inherited from their fathers.

43. In order to form an impartial judgment respecting any sentence which has been passed, without proper evidence, either against individuals or associations, it is necessary to be acquainted with the motives and character of the accusers, and with the benefits which might accrue to them and the judges, by the punishment or liberation of the accused. In the case before us, the accusers had been disgraced and imprisoned by the accused, for their villany and crimes. Their chief prosecutor and judge was actuated by motives of avarice and private resentment; and many rival orders who had been languishing in obscurity and indigence, propagated with assiduity the slanderous tale, in hopes of sharing in those ample possessions, and that public favour, which had been acquired by the superior abilities of the knights templars. To all ranks of men, indeed, the veneration which the name of a templar inspired, was an object of envy: their opulent revenues were calculated to give trouble to a covetous mind, and the remarkable regularity of their conduct was no small incitement to the exercise of detraction. Such were the motives and prospects of their judges and accusers. Let us attend now to the accusations which were

brought against them, and we shall find that these could scarcely come under the cognizance of law, as their pretended crimes were committed against themselves and not against society. Did they perpetrate murder upon any of their fellow-citizens?—This was never laid to their charge. Did they purloin any man's treasures?—Of theft they were never accused. Did they instigate to rebellion the subjects of any government, or plot destruction against the person of any king?—Under such a character they were never known, till Barruel called them traitors and regicides; because, forsooth, it was his opinion, that their successors, the free masons in France, were accessory to the murder of their king. What then were their crimes? it was said, that they burned their own infants! and yet an instance was never produced, in which the child of a templar had disappeared, and in which the tenderness of a mother, as would certainly have happened, remonstrated against the murder of her child. They were said to have committed the most unnatural of all crimes! and yet no individual produced a specific instance which he could corroborate by indubitable proof. They were accused of insulting the cross of Christ; and yet they had shed their blood in the defence of his religion. Of crimes like these, one may conceive a depraved individual to have been guilty; but to believe, that a respectable fraternity, consisting of thousands of members, could be capable of such enormities, requires a degree of faith to which the most credulous will scarcely attain.

44. The innocence of the templars, and the injustice of Philip, will be still more apparent, by considering the conduct of the latter, as related even by Barruel. This writer observes, "That two men, who had been imprisoned for their crimes, declared that they had some important discoveries to make concerning the knights templars, and that this declaration, though entitled to little credit, made the king determine on the dissolution of the order, and arrest on one day all the templars in his kingdom (I)." Here then was the most flagrant injustice in the very threshold of the whole affair. Without summoning a single witness; without examining a single templar; without consulting a single friend; without even knowing what the important discoveries were which the criminals had to make; the French king *determined* on the destruction of the templars, on the destruction of an order whose grand master had been his particular friend, and even the godfather of one of his children (K). This latter circumstance, indeed, is brought forward by Barruel, to justify the conduct of Philip, because he sacrificed the duties of friendship to the principles of justice. But, when we take it in connection with the rest of his conduct, it must inspire every honest mind with a more degrading opinion of the head and heart of that persecuting monarch.

45. Such being the premature and precipitant determination of Philip, we may consider the order of the templars as at that time dissolved, and regard all those examinations,

(H) Among these we may reckon Hume, History of England, vol. ii. p. 373. Henry, History of Britain, vol. viii. p. 43. and Vertot, *ut supra*.

(I) Memoirs of Jacobinism, vol. ii. p. 364.

(K) Id. Id. p. 366.

Masonry. examinations, inquiries, confessions, trials, and councils which succeeded, as mere phantoms of justice, conjured up by that crafty prince, to dazzle the eyes of his subjects, and sanctify the depravity of his own conduct. By keeping this circumstance in view, the intelligent reader will be enabled to understand the minute, though sometimes contradictory, details of historians, respecting the trial and confessions of the knights templars; and, notwithstanding the veil of justice with which the judges attempted to cover their proceedings, he will be enabled to develop the detestable principles upon which their trial was conducted, and the still more detestable motives which invited Clement V. to partake in the guilt of Philip the Fair.

46. The most formidable, and indeed the only plausible argument by which Barruel supports his opinion, is drawn from the confessions of the templars. He maintains that the avowals of the knights were free from compulsion, and that no set of men could be so base as to accuse their brethren of crimes, of which they believed them to be entirely innocent. But the fallacy of his reasoning will appear from the slightest reflection. It is a curious, though unquestionable fact, that, when an avowal must be made, men are more ready to accuse themselves of crimes of which they have never been guilty, than to confess those which they have actually committed. Such as have attended to the operation of their own minds, particularly in the earlier part of life, will acquiesce in this extraordinary truth; and those who have not had occasion to observe it, will find, upon consideration, that it is consonant to the constitution of the human mind. When a man confesses himself guilty of a crime which he has really perpetrated, he is exposed, not only to the reproaches of his own conscience, but to those of the world; and, should he, at any time, retract his confessions, he must be aware that every subsequent inquiry would only confirm the truth of his first deposition. But when a man, from a principle of fear, acknowledges the truth of accusations with which he has been unjustly loaded, a sense of his integrity and innocence supports him under the opprobrium of the world, and he is conscious that his character will be vindicated by every investigation, and that the confessions which he himself made, may at any time be proved to have been the offspring of necessity. Such undoubtedly were the feelings by which the templars were actuated. Convinced, that the crimes which they were desired to acknowledge, were of such an unnatural kind, that they could never be imputed, by any reasonable man, to a numerous and hitherto respectable fraternity, they yielded to the solicitations of their persecutors; with the well-grounded hope that future inquiry would remove the stain which the irresistible desire of self-preservation had prompted them to throw upon their character. From this very consideration, indeed, namely from the nature of the crimes charged upon the templars, have many eminent historians maintained the innocence of that unhappy order. But were we even to allow with Barruel, in opposition to all history, that the avowals of the knights

were free and numerous; by an application of the principles already laid down, we would from that circumstance, prove the innocence, and not the guilt of the templars. **Masonry.**

47. It is not, however, upon speculative principles alone, that we can account for the confessions and subsequent recantations of the knights. There are, fortunately, some historical facts which furnish a rational explanation of their conduct; but which Barruel, either from ignorance or design, has totally overlooked. About the commencement of the whole affair, Molay the grand master of the order, had been examined at Paris. From the causes already explained, but particularly from a dread of those torments, to which an obstinate avowal of his innocence would expose him, he made every confession which his persecutors demanded; but he at the same time transmitted circular letters to an immense number of his brethren, requesting them to make the same confessions with himself (L); for it was only by submissive conduct, that they could hope to disarm the fury of their enemies, and avert the blow which was threatened to their order. Agreeably to the request of Molay, many of the templars made the same acknowledgments; while others with a morality more inflexible, and courage more undaunted, disdained to do evil that good might come, and persevered unto death in the avowal of their own innocence, and that of their order. Molay, however, and those knights who had followed his example, soon perceived that though their submissions had protected them from injury as individuals, they had nevertheless rather inflamed the rage of Philip against the order; and being now convinced that their acknowledgements of guilt had produced an effect opposite to what they expected, they boldly retracted their former avowals, and adopted that intrepid conduct of which we have already given a short account. There is another circumstance connected with this part of our subject, which, though not taken notice of by historians, is well deserving of the reader's attention. It is asserted by all contemporary writers, whether the friends or adversaries of the templars, that all those knights who maintained their innocence, were condemned either to death, or to a punishment equally severe; while all who confessed, and adhered to their confessions, were either completely acquitted, or sentenced to a few days fasting and prayer, or a short imprisonment (M). It is allowed also by these historians, and even by Barruel, that a very considerable number of the templars were altogether ignorant of the crimes perpetrated by the rest, and that some who were privy to them, were not partakers in their guilt. In which class then are we to rank these innocent men? among those who suffered or among those who were saved? If among the former, their enemies were guilty of the most flagrant injustice and cruelty, in consigning the innocent on the same pile with the guilty. If among the latter, they must have been compelled to confess themselves guilty of crimes of which they were completely innocent.

48. In order to show that the confessions of the templars

(L) *Histoire de Chevaliers Hospitaliers*, par Abbé Vertot, tom. ii. p. 86.

(M) Some of them even received pensions for their confessions. See Vertot, tom. ii. p. 91.

Masonry. plars were voluntary, and not extorted by the rack. Barruel is obliged to deny facts which are admitted by every historian. But, lest his readers should not be so sceptical on this point as himself, he takes care to inform them, that the bishops declared, that all whose confessions were extorted by the rack, should be regarded as innocent, and that no templar should be subject to it; that Clement V. rather favoured the templars, and that he sent the most venerable persons to interrogate those whose *age and infirmities* prevented them from appearing before him. But who were those aged and infirm templars to whom Clement is so compassionate? Were they men smarting under diseases inflicted by the hand of heaven? Were they men whose aged limbs were unfit for the fatigues of a journey, or whose gray hairs had excited the pity of the Roman pontiff? No—they were a few undaunted knights whom the blood-extorting screws of their tormentors had tortured and disabled; whose flesh had been lacerated on the rack, and whose bones had been disjunct or broken on the wheel. These are the men, who, in the language of the above writer, were prevented by *their age and infirmities* from travelling to Poitiers, or who, in the more simple style of the Pope himself, were unable *to ride on horseback, or to bear any other method of conveyance whatsoever.*

49. Having thus endeavoured to vindicate the character of the templars from the accusations of their enemies, it will be necessary to make a few remarks respecting the ceremonial observances which are attributed to them and their posterity, by the author of the memoirs of Jacobinism. But this, our enemies well know, is forbidden ground, on which free masons are prohibited to enter by the laws of their order. It is here, consequently, that the most numerous, and apparently the most successful attacks have been made, for we can be provided with no means of defence without laying open the mysteries of the fraternity. Conscious of the disadvantages under which free masons labour, their adversaries have fabricated the most frightful and foolish ceremonies, and imposed them upon the world as the ceremonies of masonry. Among this number, may be reckoned those rites and oaths which Barruel ascribes to the templars and their posterity, but which, we solemnly aver, have no connexion either with the one or the other; and, were we permitted to divulge to the world the whole of our ritual system, many who have duped the public by deceitful information, would stand abashed at their conduct; while others, who have confided in such information, would be astonished at the extent of their credulity. Then might free masons defy, as they have done in every other point, the fabrications of the malicious, and the conjectures of the ignorant: then, too, might they mock at the ingenuity of the wise. But, as they are bound to preserve from public view the rites of their order, it is highly disingenuous to assail them in a quarter where resistance is impossible, and where every unprincipled man may triumph with impunity. Is not this to assassinate an enemy with his hands tied behind his back? Is not this to reproach a foe who is deprived of the organs of utterance?

50. But there is another important consideration, which, while it points out in a more striking manner the disingenuity of such conduct, should, at the same

Masonry. time, incite the candid inquirer to reject every calumny against secret associations, arising from reports concerning their rites and ceremonies. If ever the secrets of free masonry were betrayed, they must have been betrayed by men who were completely destitute of religious principle; who paid no respect to those ties which unite the members of civil, as well as secret associations; who, in short, neither feared God, nor regarded man. Suppose, then, that a person, pretending to be a free mason, offered to communicate, either to an individual, or to the public, the rites and ceremonies of his order. What degree of credit should men of probity attach to the information thus received? A person addresses them under the character of a perjurer, offering to violate the most solemn engagements, and to divulge mysteries which have been concealed for ages. He may give them accurate information, or he may not. If the secrets which he offers to betray have been hitherto unknown, there is no possible way of ascertaining the truth of his deposition. And it is rather to be suspected, than he will dupe his auditors by false information, than trample upon an engagement, guarded by the most awful sanctions. He might, indeed, confirm by an oath, the truth of his asseveration; but, as he must have violated an oath equally solemn, no man of sense will give him the smallest credit. But, supposing that he really divulges the secrets and ceremonies of free masonry, it is clear, that he has not understood their true import, or, at least, that they have made no impression upon his mind. It is almost certain, therefore, that, from ignorance, or misapprehension of their meaning, he will exhibit, under an aspect calculated to excite ridicule, those rites and ceremonies, which, if properly explained, would command admiration. If then it be so difficult for the uninitiated to discover the secrets of free masonry, and still more so to ascertain their signification, if they should discover them; what must we think of those men who open their ears to every slanderous tale against free masons, which unprincipled men may impose upon their credulity? What must we think of those who reproach and vilify the order, upon the uncertain reports of cunning and interested men? We appeal to the impartial reader, if they are not equally base with the informers themselves.

51. Such are the considerations by which we would attempt to repel those charges and distorted facts, with which Barruel has calumniated the character, and disfigured the history of the templars. They will be sufficient, we hope, to remove those erroneous impressions which the perusal of the Memoirs of Jacobinism may have left upon the reader's mind. Although we have adopted the opinion of those who maintain the innocence of that unfortunate order, we cannot coincide with them in believing, that, as individuals, they were free from blame. The templars were possessed of the same nature, and influenced by the same passions as their fellow men; and they were, unquestionably, exposed to more strong and numerous temptations. Some of the knights therefore, may have been guilty of crimes, and these too of an aggravated kind, which, by a strange, though not uncommon mistake, might have been transferred to their order. But it was never proved that they were traitors, child-murderers, regicides, and infidels. A certain class of historians, indeed,

Masonry.

deed, have imputed to them such iniquities; and, when unable to establish their assertions, have fixed upon their order the more probable crimes of drunkenness and debauchery. But amidst all these accusations, we hear nothing of that valour which first raised the templars to pre-eminence; nothing of that charity and beneficence which procured them the respect of contemporaries; nothing of that fortitude and patience which most of them exhibited on the rack, and in the flames. In their case it has been too true, that

The evil which men do lives after them:
The good is often interred with their bones.

52. But allowing the templars to be as guilty as their enemies have represented them; upon what principles of sound reasoning, or of common sense, does Barruel transfer their guilt to the fraternity of free masons? Is it absolutely necessary, that the son should inherit the bodily diseases, and the mental debility of his forefathers? or is it fair, that one order, proposing to itself the same object, and instituted upon the same principles as another, should be charged also with the same crimes? certainly not. If virtue and vice were hereditary qualities, free masons might arrogate to themselves much honour from their connection with the templars; but, as we have not been applauded for a templar's virtues, we should not be reproached for a templar's crimes. But the reasoning of Barruel is as repugnant to the dictates of experience, as it is to those of common sense. Were not the inhabitants of England, at one period, fanatics, rebels, and regicides? But where now is the nation that is more liberal in its religion, and more steady in its loyalty! Did not the French, at one time, torture, burn, and massacre their fellow citizens, from the fury of their religious zeal, and the strength of their attachment to the Catholic communion? But what nation under heaven was a few years ago less influenced by religious principles, and less attached to the church of Rome! Did not the rulers of France, at one time, torment and assassinate hundreds of the templars, because they deemed them infidels, traitors, and regicides? And have we not seen, in these latter days, the very rulers of France themselves, infidels, traitors, and regicides! But if the impartial reader should, upon farther inquiry, give credit to the guilt of the templars; in order to remove the imputed stain which has been transferred to free masons, it may be sufficient to address him in the words of the poet,

Tempora mutantur, et nos mutamur in illis.

Origin and advantages of chivalry.

53. About the time of the knights templars, chivalry had arrived at its highest perfection. It had its existence, indeed prior to this period, but as it continued to influence the minds of men long after the destruction of that unhappy order, it was thought proper to defer its consideration till the present stage of our history. When chivalry made its first appearance, the moral and political condition of Europe was in every respect de-

plorable. The religion of Jesus existed only in name. A degrading superstition had usurped its place, and threatened ruin to the reason and the dignity of man. The political rights of the lower orders were sacrificed to the interest of the great. War was carried on with a degree of savage cruelty, equalled only by the sanguinary contentions of the beasts of prey; no clemency was shown to the vanquished, and no humanity to the captive. The female sex, even, were sunk below their natural level: they were doomed to the most laborious occupations, and were deserted and despised by that very sex, on whose protection and sympathy they have so natural a claim. To remedy these disorders, a few intelligent and pious men formed an association, whose members swore to defend the Christian religion, to practise its morals, to protect widows, orphans, and the weaker sex; and to decide judicially, and not by arms, the disputes that might arise about their goods or effects. It was from this association, undoubtedly, that chivalry arose (N); and not, as some think, from the public investiture with arms which was customary among the ancient Germans. But, whatever was its origin, chivalry produced a considerable change in the manners and sentiments of the great. It could not, indeed, eradicate that ignorance and depravity which engendered those awful evils which we have already enumerated. It has softened, however, the ferocity of war. It has restored the fair sex to that honourable rank which they now possess, and which at all times they are entitled to hold. It has inspired those sentiments of generosity, sympathy, and friendship, which have contributed so much to the civilization of the world; and has introduced that principle of honour, which, though far from being a laudable motive to action, often checks the licentious, when moral and religious considerations would make no impression upon their minds.

54. Such was the origin of chivalry, and such the blessing which it imparted. That it was a branch of free masonry, may be inferred from a variety of considerations, from the consent of those who have made the deepest researches into one, and who were intimately acquainted with the spirit, rites, and ceremonies of the other. They were both ceremonial institutions. Important precepts were communicated to the members of each, for the regulation of their conduct as men, and as brethren of the order (O). The ceremonies of chivalry, like those of free masonry, though unintelligible to the vulgar, were always symbolical of some important truths (P). The object of both institutions was the same, and the members bound themselves, by an oath, to promote it with ardour and zeal (Q). In chivalry there were also different degrees of honour, through which the youths were obliged to pass before they were invested with the dignity of knighthood (R); and the knights, like free masons, were formed into fraternities or orders, distinguished by different appellations (S).

and other
considerations.

55. From these circumstances of resemblance, we do not mean to infer that chivalry was free masonry under another name; we mean only to show that the two institutions were intimately connected; that the former took its origin from the latter, and borrowed from it, not only some of its ceremonial observances, but the leading features and the general outline of its constitution. These points of similarity, indeed, are in some cases so striking, that several learned men have affirmed that free masonry was a secondary order of chivalry, and derived its origin from the usages of that institution (r). From what reasons these authors deduce the forms of free masonry from the ceremonies of chivalry, it is difficult to conjecture. The only argument which they adduce, is the similarity of the institutions; but they do not consider, that this proves, with equal force, that free masonry is the parent of chivalry. We have already shown, that there were many secret institutions among the ancients, but particularly the fraternity of Dionysian architects, which resembled free masonry in every thing but the name; and it requires no proof that these fraternities arose many hundred years before the existence of chivalry. If then there be any resemblance between the institutions which we have been comparing, we must consider free masonry as the fountain, and chivalry only as the stream. The one was adapted to the habits of intelligent artists, and could flourish only in times of civilization and peace; the other was accommodated to the dispositions of a martial age, and could exist only in seasons of ignorance and war. With these observations, indeed, the history of both fraternities entirely corresponds. In the enlightened ages of Greece and Rome, when chivalry was unknown, free masonry flourished under the sanction of government, and the patronage of intelligent men. But during the reign of Gothic ignorance and barbarity, which followed the destruction of imperial Rome, free masonry languished in obscurity, while chivalry succeeded in its place, and proposed to accomplish the same object by different means, which, though more rough and violent, were better suited to the manners of the age. And when science and literature revived in Europe, and scattered those clouds of ignorance and barbarism with which she had been overshadowed, chivalry decayed along with the manners that gave it birth, while free masonry arose with increasing splendour, and advanced with the same pace as civilization and refinement.

The connexion of chivalry and free masonry exemplified in the society of the templars.

56. The connexion between chivalry and free masonry, is excellently exemplified in the fraternity of the knights templars. It is well known that this association was an order of chivalry, that the templars performed its ceremonies, and were influenced by its precepts; and we have already shown, that the same association was initiated into the mysteries, and practised

VOL. XII. Part II.

the rites of free masonry (Art. 39, 40.): But, though they then existed in a double capacity, it must be evident to all who study the history of the templars, that their masonic character chiefly predominated, and that they deduced the name of their institution, and their external observances, from the usages of chivalry, to conceal from the Roman pontiff the primary object of their order, and to hold their secret meetings free from suspicion or alarm. About this time, indeed, the church of Rome sanctioned the fraternity of operative masons, and allowed them to perform their ceremonies without molestation or fear. But this clemency, as we have already shown, was the offspring of necessity (Art. 37.); and the same interested motive which prompted his holiness to patronize that trading association, could never influence him to countenance the duplicity of the templars, or permit them to exist in their masonic capacity. It was the discovery, indeed, of their being free masons, of their assembling secretly, and performing ceremonies to which no stranger was admitted, that occasioned those awful calamities which befel their order. It will, no doubt, appear surprising to some readers, that such zealous defenders of the Catholic religion should practise the observances of an association, which the church of Rome has always persecuted with the bitterest hostility. But their surprise will cease, when it is recollected, that even about the middle of the 18th century, when free masonry was prohibited in the ecclesiastical states, by a papal bull, the members of the Romish church adopted the same plan. So much attached were they to the principles and practice of the fraternity, that they established a new secret association similar to that of free masonry, into which they professed to admit none but zealous abettors of the papal hierarchy. In this manner, by flattering the pride of the church, they eluded its vigilance, and preserved the spirit of free masonry, by merely changing its name, and professing to make it subservient to the interest of the pontificate.

Masonry.

57. Before leaving this subject, it may be interesting to some readers, and necessary for the satisfaction of others, to show in what manner the knights templars became depositaries of the masonic mysteries. We have already seen, that almost all the secret associations of the ancients either flourished or originated in Syria, and the adjacent countries. It was here that the Dionysian artists, the Essenes, and the Kasideans arose. From this country also came several members of that trading association of masons, which appeared in Europe during the dark ages (v); and we are assured, that, notwithstanding the unfavourable condition of that province, there exists, at this day, on Mount Libanus, one of these Syriac fraternities (x). As the order of the templars, therefore, was originally formed in Syria, and existed there for a considerable time, it would be

The templars were initiated by Syriac fraternities.

Masonry.

no improbable supposition that they received their masonic knowledge from the lodges in that quarter. But we are fortunately in this case not left to conjecture, for we are expressly informed by a foreign author (Y), who was well acquainted with the history and customs of Syria, that the knights templars were actually members of the Syriac fraternities.

History of free masonry in Britain.

58. Having thus compared free masonry with those secret associations which arose during the dark ages; let us now direct our attention to its progress in Britain, after it was extinguished in the other kingdoms of Europe. We have already seen that a trading fraternity of free masons existed in Europe during the middle ages; that many special favours were conferred upon it by the Roman see; that they had the exclusive privilege of erecting those magnificent buildings, which the pride of the church of Rome, and the misguided zeal of its members, had prompted them to rear; and that several masons travelled into Scotland, about the beginning of the 12th century, and imported into that country the principles and ceremonies of their order. And we have illustrated several causes which preserved this association in Britain after its total dissolution on the continent.

Free masonry introduced into Scotland.

59. That free masonry was introduced into Scotland by those architects who built the abbey of Kilwinning, is manifest, not only from those authentic documents, by which the existence of the Kilwinning lodge has been traced back as far as the end of the 15th century, but by other collateral arguments, which amount almost to a demonstration. In every country where the temporal and spiritual jurisdiction of the pope was acknowledged, there was a continual demand, particularly during the 12th century, for religious structures, and consequently for operative masons, proportional to the piety of the inhabitants, and the opulence of their ecclesiastical establishment; and there was no kingdom in Europe where the zeal of the inhabitants for popery was more ardent than in Scotland, where the kings and nobles were more liberal to the clergy, and where, of consequence, the church was more richly endowed (Z). The demand, therefore, for elegant cathedrals and ingenious artists, must have been proportionably greater than in other countries, and that demand could be supplied only from the trading association on the continent. When we consider, in addition to these facts, that this association monopolized the building of religious structures in Christendom; we are authorised to conclude, that those numerous and elegant ruins, which still adorn the villages of Scotland, were erected by foreign masons, who introduced into this island the customs of their order.

And also into England.

60. It was probably about this time, also, that free masonry was introduced into England; but whether the English received it from the Scotch masons at Kilwinning, or from other brethren who had arrived

from the continent, there is no method of determining. The fraternity in England, however, maintain, that St Alban, the proto-martyr, who flourished about the end of the third century, was the first who brought masonry to Britain; that the brethren received a charter from King Athelstane, and that his brother Edwin summoned all the lodges to meet at York, which formed the first grand lodge of England (A). But these are merely assertions, not only incapable of proof from authentic history, but inconsistent also with several historical events which rest upon indubitable evidence (B). In support of these opinions, indeed, it is alleged, that no other lodge has laid claim to greater antiquity than that of York, and that its jurisdiction over the other lodges in England has been invariably acknowledged by the whole fraternity. But this argument only proves that York was the birthplace of free masonry in England. It brings no additional evidence in support of the improbable stories about St Alban, Athelstane, and Edwin. If the antiquity of free masonry in Britain can be defended only by the forgery of silly and uninteresting stories, it does not deserve to be defended at all. Those who invent and propagate such tales, do not, surely, consider that they bring discredit upon their order by the warmth of their zeal; and that, by supporting what is false, they prevent thinking men from believing what is true.

61. After the establishment of the Kilwinning and York lodges, the principles of free masonry were rapidly diffused throughout both kingdoms, and several lodges were erected in different parts of the island. As all these derived their existence and authority from the two mother lodges, they were likewise under their jurisdiction and controul; and when any differences arose, that were connected with the art of building, they were referred to the general meetings of the fraternity, which were always held at Kilwinning and York. In this manner did free masonry flourish for a while in Britain, after it was completely abolished in every part of the world. But even here it was doomed to suffer a long and serious decline, and to experience those alternate successions of advancement and decay, which mark the history of every human institution. And though during several centuries after the importation of free masonry into Britain, the brethren of the order held their public assemblies, and were sometimes prohibited from meeting by the interference of the legislature, it can scarcely be said to have attracted general attention till the beginning of the 17th century. The causes of this remarkable retardation which the progress of masonry experienced, it is by no means difficult to discover. In consequence of the important privileges which the order received from the church of Rome, many chose the profession of an architect, which, though at all times an honourable employment, was particularly in high request during the middle ages. On this account, the

Masonry the body of operative masons increased to such a degree, and the rage, as well as the necessity for religious edifices, was so much diminished, that a more than sufficient number of hands could, at any time, be procured for supplying the demands of the church, and of pious individuals. There being now no scarcity of architects, the very reason which prompted the church to protect the fraternity, ceased to exist; they, therefore, withdrew from them that patronage, which they had spontaneously proffered, and denied them even the liberty of holding their secret assemblies. But these were not the only causes which produced such a striking change in the conduct of the church, to the masonic order. The spirit of free masonry, as we have already said, was hostile to the principles of the church of Rome. The intention of the one was to enlighten the mind; the object and policy of the other to retain it in ignorance. When free masonry flourished, the power of the church must have decayed. The jealousy of the latter, therefore, was aroused; and, as the civil power in England and Scotland was almost always in the hands of ecclesiastics, the church and the state were combined against the principles and practice of free masonry (C). Along with these causes, the domestic and bloody wars, which convulsed the two kingdoms from the 13th to the 17th century, conspired in a great degree, to produce that decline of the fraternity for which we have been attempting to account.

Causes of its subsequent decline.

Free masonry flourishes in the reign of Henry VI.

62. But notwithstanding these unfavourable circumstances, free masonry seems to have flourished, and attracted the attention of the public in the reign of Henry VI. who, when a minor, ascended the throne of England in 1422. In the third year of his reign, indeed, the parliament passed a severe act against the fraternity, at the instigation of Henry Beaufort, bishop of Winchester, who was then entrusted with the education of the young king. They enacted that the masons should no longer hold their chapters and annual assemblies; that those who summoned such chapters and assemblies should be considered as felons; and that those who resorted to them should be fined and imprisoned (D). But it would appear that this act was never put in execution; for, in the year 1429, about five years after it was framed, a respectable lodge was held at Canterbury under the patronage of the archbishop himself (E). When King Henry was able to take into his own hands the government of his kingdom, and to form an opinion of his own respecting the use and tendency of the masonic fraternity, in order to atone for

the rigorous conduct of his parliament, he not only permitted the order to hold their meetings without molestation, but honoured the lodges by his presence as a brother. Before he was initiated, however, into the mysteries of the order, he seems to have examined, with scrupulous care, the nature of the institution, and to have perused the charges and regulations of the fraternity, as collected from their ancient records. These facts are contained in a paper written in the reign of his successor, Edward IV. and confirmed by a manuscript in King Henry's own hand-writing, which is familiar to every person who has studied the history of the order. This manuscript consists of questions and answers respecting the nature and tendency of free masonry, and seems to be the result of the king's examination of some of the brethren before he became a member of the fraternity. It was first procured from the Bodleian library by the celebrated Mr Locke, who transmitted it to the earl of Pembroke, accompanied with explanatory notes (F). In the title of the manuscript, it is said to have been faithfully copied from the hand-writing of King Henry VI. by John Leland, antiquarian, who, according to Mr Locke, was the celebrated antiquary of that name who lived in the 16th century, and was appointed by King Henry VIII. at the dissolution of monasteries, to search for, and save such books as were worthy of preservation. As this manuscript was originally printed at Frankfort, I was led to inquire what grounds there were for believing that the explanatory notes, and the letter to the earl of Pembroke which accompany it, were the production of Mr Locke. But I found that this had been uniformly taken for granted by every writer upon the subject, though the circumstance is not mentioned in the large edition of Mr Locke's works. The style of the letter, however, and the acuteness of the annotations, resemble so much that philosopher's manner of writing, and the letter is so descriptive of Mr Locke's real situation at the time when it was written, that it is almost impossible to deny their authenticity. In the letter itself, which is dated 6th May 1696, Mr Locke remarks that he composed the notes for the sake of Lady Masham, who was become very fond of masonry, and that the manuscript had so much excited his own curiosity, that he was determined to enter into the fraternity the next time he went to London, which, he adds, will be very soon. Now Mr Locke was at this time residing at Oates, the country seat of Sir Francis Masham, as appears from one of his letters to Mr Molyneux,

Masonry

Account of a curious masonic manuscript.

4 O 2 which

(C) As a proof of the hostility of the church of Rome to secret associations which pretended to enlighten the mind, we mentioned (p. 53. supra) its treatment of the academy of secrets, instituted in the 16th century for the advancement of physical science. When a local and temporary institution drew down the vengeance of the Roman see, what must have been its conduct to a lodge of masons? A farther account of the academy of secrets may be found in Priestley's History of Vision, vol. ii.

(D) 3 Henry VI. cap. 2. A. D. 1425, see Ruff head's Statutes. Dr Plot's Natural History of Staffordshire, chap. viii. p. 318.

(E) Manuscript Register of William Morlat, prior of Canterbury, p. 28. entitled, *Liberatio generalis Domini Gulielmi prioris Ecclesie Christi Cantuarensis, erga festum natalis Domini* 1429. In this Register are mentioned the names of the masters, wardens, and other members of the lodge.

(F) This manuscript was first printed at Frankfort in 1748, and afterwards reprinted in the London and Gentleman's Magazines for 1735. It may be seen in the lives of Leland, Hearne, and Wood, 8vo. Oxford, 1772, vol. i. pp. 96, 104. Appendix, N^o viii.; and in Preston's Illustrations of Masonry, p. 110.

Masonry. which is dated Oates, March 30. 1696; and it appears, that he actually went to London, a short time after the 6th of May; for another letter to the same gentleman is dated, London, 2d July 1696 (G). Notwithstanding these facts, Dr Plot maintains that free masonry was not patronised by King Henry VI. (H), and that those who have supported a different opinion, were ignorant of the laws and chronicles of their own country. Dr Plot may have been a good chemist and natural historian, but when our readers hear upon what foundation he has established his opinion, they will agree with us in thinking that he was a bad logician. He observes, that an act was passed in the king's minority, prohibiting all general assemblies and chapters of free masons, and that as this act was not repealed till 1562, by 5th Elizabeth, cap. 4. it was impossible that free masonry could be patronised in the same reign in which it was prohibited. The fact is, that the act was not repealed by 5th Elizabeth, cap. 4. which does not contain a single word about free masons. If Dr Plot's argument, therefore, proves any thing, it would prove that free masonry has not been patronised since the reign of Henry VI. for that act has never yet been repealed. But supposing that it was repealed, the prohibitory statute in Henry's reign might never have been put in execution, as very often happens; and Dr Plot himself remarks, that the act 5th Elizabeth was not observed. It is plain, therefore, that instead of being impossible, it is highly probable that King Henry patronised the fraternity. When they were persecuted by his parliament, he was only three years of age, and could neither approve nor disapprove of its sentence; and it was very natural, that when he came to the years of maturity, he should undo a deed which his parliament had dishonourably done.

Free masonry patronised in Scotland by King James I.

63. While free masonry was flourishing in England under the auspices of Henry VI. it was at the same time patronised, in the sister kingdom, by King James I. By the authority of this monarch, every grandmaster who was chosen by the brethren, either from the nobility or clergy, and approved of by the crown, was entitled to an annual revenue of four pounds Scots from each master mason, and likewise to a fee at the initiation of every new member. He was empowered to adjust any differences that might arise among the brethren, and to regulate those affairs, connected with the fraternity, which it was improper to bring under the cognizance of the courts of law. The grandmaster also appointed deputies or wardens, who resided in the chief towns of Scotland, and managed the concerns of the order, when it was inconvenient to appeal to the grandmaster himself (I).

And by King James II.

64. In the reign of James II. free masonry was by no means neglected. The office of grandmaster was granted by the crown to William St Clair, earl of Orkney and Caithness, baron of Roslin, and founder of the much admired chapel of Roslin. On account of

the attention which this nobleman paid to the interests of the order, and the rapid propagation of the royal art under his administration, King James II. made the office of grandmaster hereditary to his heirs and successors in the barony of Roslin; in which family it continued till the institution of the grand lodge of Scotland. The barons of Roslin, in the capacity of hereditary grandmasters, held their principal annual meetings at Kilwinning, the birthplace of Scottish masonry, while the lodge of that village granted constitutions and charters of erection to those brethren of the order, who were anxious that regular lodges should be formed in different parts of the kingdom. These lodges all held of the lodge of Kilwinning; and, in token of their respect and submission, joined to their own name, that of their mother lodge, from whom they derived their existence as a corporation (K).

65. During the reigns of the succeeding Scottish monarchs, free masonry still flourished, though very little information can be procured respecting the state of the fraternity. In the privy seal book of Scotland, however, there is a letter dated at Holyroodhouse, 25th September 1590, and granted by King James VI. "to Patrick Copland of Udaught, for using and exercising the office of wardaunrie over the art and craft of masonrie, over all the boundis of Aberdeen, Banff, and Kincardine, to had warden and justice courts within the said boundis, and there to minister justice (L)." This letter confirms what has already been said concerning the state of masonry in Scotland. It proves beyond dispute, that the kings of Scotland nominated the office-bearers of the order; that these provincial masters, or wardens, as they were then called, administered justice in every dispute which concerned the "art and craft of masonrie;" that lodges were established in all parts of Scotland, even in those remote, and, at that time, uncivilized counties of Aberdeen, Banff, and Kincardine; and it completely overturns the unfounded assertion of Dr Robison, who maintains (M), that the celebrated antiquary Elias Ashmole, who was initiated in 1646, is the only distinct and unequivocal instance of a person being admitted into the fraternity who was not an architect by profession.

66. The minutes of St Mary's chapel, which is the ^{Minutes of} oldest lodge in Edinburgh, extend as far back as the ^{St Mary's} year 1598; but as they contain only the ordinary proceedings of the lodge, we can derive from them no particular information respecting the customs and condition of the fraternity. It appears, however, from these minutes, that Thomas Boswell, Esq. of Auchinleck, was made a warden of the lodge in the year 1600; and that the honourable Robert Moray, quartermaster-general to the army in Scotland, was created a master mason in 1641. These facts are deserving of notice, as they show, in opposition to Dr Robison, that persons were early admitted into the order, who were not architects by profession.

Masonry.
The Sinclairs of Roslin appointed hereditary grand masters.

67. When James VI. ascended the throne of England, he seems to have neglected his right of nominating the office-bearers of the craft. In Hay's manuscript in the advocate's library, there are two charters granted by the Scottish masons, appointing the Sinclairs of Roslin their hereditary grandmasters. The first of these is without a date, but signed by several masons who appoint William St Clair of Roslin, his heirs and successors, their "patrons and judges." The other is, in some measure, a ratification of the first, and dated 1630, in which they appoint Sir William St Clair of Roslin, his heirs and successors, to be their "patrons, protectors, and overseers, in all time coming." In the first of these deeds, which seems to have been written a little after the union of the crowns, it is stated, that for some years the want of a protector had engendered many corruptions among the masons, and had considerably retarded the progress of the craft; and that the appointment of William Sinclair, Esq. was, with the advice and consent of William Shaw, master of work to his majesty. After presiding over the order for many years, William St Clair went to Ireland, where he continued a considerable time; and, in consequence of his departure, the second charter was granted to his son Sir William St Clair, investing him with the same powers which his father enjoyed. It deserves also to be remarked, that in both these deeds, the appointment of William Sinclair, earl of Orkney and Caithness, to the office of grandmaster, by James II. of Scotland, is spoken of as a fact well known, and universally admitted. These observations will set in a clear point of view what must hitherto have appeared a great inconsistency in the history of Scottish masonry. In the deed by which William Sinclair, Esq. of Roslin, resigned the office of hereditary grandmaster in 1736, it is stated that his ancestors, William and Sir William St Clair of Roslin, were constituted patrons of the fraternity by the Scottish masons themselves; while it is well known, that the grant of hereditary grandmaster was originally made by James II. of Scotland, to their ancestor, William Sinclair, earl of Orkney and Caithness. But, when we consider that James VI. by not exercising his power, virtually transferred to the craft the right of electing their office-bearers, the inconsistency vanishes; for Mr Sinclair and his predecessors, as far back as the date of these charters, held their office by the appointment of the fraternity itself. Lest any of Mr Sinclair's posterity, however, might, after his resignation, lay claim to the office of grandmaster, upon the pretence that this office was bequeathed to them by the grant of James II. to the earl of Caithness and his heirs; he renounces not only the right to the office which he derived from the brethren, but any right also, which as a descendant of the earl of Caithness, he might claim from the grants of the Scottish monarchs.

68. Notwithstanding those civil commotions which disturbed Britain in the 17th century, free masonry flourished in Scotland, under the auspices of the Sinclairs of Roslin. No particular event, however, which is worthy of notice, occurred during that time, or even

during the remainder of the century. The annual assemblies of the fraternity were still held at Kilwinning, and many charters and constitutions were granted by the lodge of that village, for the erection of lodges in different parts of the kingdom.

69. In the year 1736, William St Clair of Roslin, who was then grandmaster of Scotland, was under the necessity of disposing his estate, and, as he had no children of his own, he was anxious that the office of grandmaster should not be vacant at his death. Having, therefore, assembled the Edinburgh and neighbouring lodges, he represented to them the utility that would accrue to the order, by having a gentleman or nobleman, of their own choice, as grandmaster of masonry in Scotland; and, at the same time, intimated his intention to resign into the hands of the brethren, every title to that office which he at present possessed, or which his successors might claim from the grants of the Scottish kings, and the kindness of the fraternity. In consequence of this representation, circular letters were dispatched to all the lodges of Scotland, inviting them to appear, either by themselves or proxies, on next St Andrew's day, to concur and assist in the election of a grandmaster. When that day arrived, about 32 lodges assembled, and, after receiving the deed of resignation from William Sinclair, proceeded to the election of another grandmaster; when, on account of the zeal which William Sinclair of Roslin had always shown for the honour and prosperity of the order, he was unanimously elected to that high office, and proclaimed grandmaster mason of all Scotland. Thus was instituted the grand lodge of Scotland, which continues to flourish at the present day.

70. We have already brought down the history of masonry in England to the end nearly of the 15th century. During the whole of the 16th, and the beginning of the 17th century, no events occurred which can be inserted in a general history of the order. The lodges continued to meet, but seem neither to have attracted the notice, nor excited the displeasure of the legislature.

71. During the civil wars, however, between the Free masonry and the parliament, the fraternity appears to have been better known; and many were initiated into its mysteries, who were equally distinguished by their literary talents, and their rank in life. Elias Ashmole informs us, that he and Colonel Mainwaring were admitted into the order at Warrington, in October 1646 (N). This gentleman was the celebrated antiquarian who founded the Ashmolean museum at Oxford. His attachment to the fraternity is evident from his diligent inquiries into its origin and history, and his long and frequent attendance upon its meetings (O). Charles II. too, was a member of the fraternity, and frequently honoured the lodges with his presence (P). From this fact, chiefly, Dr Robison asserts, that free masonry was employed by the royalists for promoting the cause of their sovereign, and that the ritual of the masters degree seems to have been formed, or twisted from its original institution, in order to sound the political principles

(N) Ashmole's Diary, p. 15.
(P) Proofs of a Conspiracy, p. 22.

Masonry
ples of the candidate (q). The strained and fanciful analogy by which this opinion is supported, is perhaps one of the most striking instances that could be adduced to show, to what peurile arguments the most learned will resort, when engaged in the defence of a desperate cause. But though Dr Robison maintains, that all who witnessed the ceremonies of the master's degree during the civil wars, could not fail to show, by their countenances, to what party they belonged, yet he observes, in another part of his work, that the symbols of masonry seemed to be equally susceptible of every interpretation, and that none of these were entitled to any decided preference (r). Such inconsistencies as these it is not easy to explain.

Free masonry is supposed by some to have originated in the time of the commonwealth.
Aburdity of this opinion.
72. An opinion of an opposite nature, though equally extravagant, has been maintained by Pivati (s), and the author of "Free Masonry Examined." These writers assert, that free masonry originated in the time of the English commonwealth; that Oliver Cromwell was its inventor; and that the level was the symbol of republican equality; and that the other signs and ceremonies were merely arbitrary, and formed for concealing their political designs. It would be ridiculous to enter into a serious refutation of such opinions as these, which are founded on the most unpardonable ignorance. That free masonry existed before the time of Cromwell is as capable of demonstration, as that Cromwell himself ever existed. It is really entertaining to observe, what inconsistent and opposite opinions are formed upon the same subject. According to one writer, free masonry was invented and employed by the adherents of the king; according to another, it was devised by the friends of the parliament. In the opinion of some it originated among the Jesuits, who used it for the promotion of their spiritual tyranny and superstition; while others maintain, that it arose among a number of unprincipled sceptics, who employed it for destroying the spiritual tyranny and superstition of the Jesuits!

73. It was about this time, according to Dr Robison, that free masonry was introduced among the continental kingdoms. After James II. of England had abdicated the throne, and taken refuge in France with several of his adherents, it is probable that they would communicate additional spirit to the French lodges; but that the English refugees were the first who exported masonry from Britain, or that they employed it for re-establishing the Stuart family on the English throne, it is impossible to prove. Such assertions Dr Robison has not only hazarded, but has employed them also as the foundation of defamatory conclusions, without adducing a single proof in their support. Notwithstanding the difficulty, however, of determining the precise period when the principles of free masonry were

Masonry
imported into France, it is manifest, from the universal consent of the continental lodges, that it was of British origin; and it is more than probable, that the French received it from Scotland about the middle of the 16th century, during the minority of Queen Mary. It is well known, that there was at that time a freer intercourse between Scotland and France than at any other period. Mary queen of Scots was then married to the heir-apparent of France; and Mary of Guise, sister to the French king, was at the same time regent of Scotland. In consequence of this intimate connection between the two kingdoms, French troops were sent to the assistance of the Scots, who, having resided many years in the kingdom, and habituated to the manners and customs of their allies, would naturally carry along with them into their native country, those customs which afforded them pleasure; and none we know could be more congenial to the taste and dispositions of Frenchmen, than the ceremonial observances of free masonry. But it is not upon these considerations merely that our opinion depends. It receives ample confirmation from a fact, of which Dr Robison seems to have been totally ignorant. In the year 1645, a particular jurisdiction for masons, called *maçonnerie*, or *masonry*, was established in France. All differences which related to the art of building, were decided by particular judges, who were called overseers of the art of masonry; and several counsellors were appointed for pleading the causes, which were referred to their decision (t). This institution has such a striking resemblance to the warden courts which existed in Scotland in the 16th century, art 65. that it must have derived its origin from these. In both of them, those causes only were decided which related to masonry, and overseers were chosen in both for bringing these causes to a decision (u). But as similar tribunals were held in no other part of the world, and as the warden courts were first established in Scotland, it is almost certain, that the French borrowed from the Scots the idea of their masonic tribunal, as well as free masonry itself, at that particular period when there was such a free communication between the two kingdoms. That the French received free masonry from Scotland, may be presuned also from the singular pre-eminence which was always given by foreigners to Scottish masonry, and from the degree of *Chevalier Maçon Ecossois*; which, as a mark of respect to Scotland, the French had added to the three symbolical degrees of masonry about the beginning of the 18th century. Had free masonry not been introduced into France till after the revolution in 1688, as Dr Robison affirms; it is wonderful how such a fact should have been so quickly forgotten; for it was unknown about 30 or 40 years afterwards, at what period the French received

(u) See Appendix, N^o ii.

Masonry. received it from Britain; and, if the exiled family had employed free masonry, for overturning the Hanoverian succession, it is still more strange that such a circumstance should be unknown in a country, where concealment was certainly unnecessary. When any new custom is introduced into a nation, the time of its introduction may be remembered for 70 to 80 years by one individual, without being committed to writing; and, though it be not of sufficient importance, tradition will preserve it from oblivion for a much greater length of time. If free masonry, therefore, never existed in France till after the revolution in 1688, is it not absurd to suppose, that the period when such a singular institution was established, should be utterly forgotten at the distance of 30 or 40 years from its establishment, though, during that time, it was never persecuted by the French government?

Innovation upon free masonry in France.

74. But, at whatever period, and from whatever source free masonry was introduced into France, it assumed there a very remarkable form. The attachment of that people to innovation and external finery, produced the most unwarrantable alterations upon the principles and ceremonies of the order. A number of new degrees were created; the office-bearers of the craft were arrayed in the most splendid and costly attire; and the lodges were transformed into lecturing rooms, where the wiser brethren supported the most extravagant opinions, discussed the abstrusest questions in theology and political economy, and broached opinions hostile to the interests of true religion and sound government. In the other countries of the continent, similar innovations, in a greater or less degree, prevailed, while the British lodges preserved the principles of the craft in their primitive simplicity and excellence. Such dangerous innovations have not the smallest connection with the principles of free masonry. They are unnatural excrescences formed by a warm imagination, and fostered by the interference of designing men. Those who reprehend free masonry, therefore, for the changes which it underwent in the hands of foreigners, may throw equal blame upon religion, because it has been a cloak for licentiousness and hypocrisy; or, upon science, because it has been converted into an instrument of iniquity. The changes of which we have been treating, arose altogether from the political condition of the countries where they were made. In France, and the other kingdoms of Europe, where popery was the ecclesiastical establishment, or where absolute power was in the hands of their monarchs, the most slavish restraints were imposed upon the conduct and conversation of the people. None durst utter his own sentiments, or converse upon such metaphysical subjects as militated against the theology and politics of the times. Under such restraints speculative men, in particular, were highly dissatisfied. Those powers which heaven had bestowed, and on the exercise of which their happiness depended, were fettered by human laws, and that liberty of speech restrained which tyranny had no right to controul. For these reasons, the lodges were frequented by men of philosophical habits, who eagerly embraced an opportunity of publishing their sentiments, and discussing the favourite objects of their study, without dreading the threats of government, or the tortures of the inquisition. In this view, the lodges may be compared to little republics, enjoying the rational liberties of human nature,

in the midst of an extensive empire, enslaved by despotism and superstition. In the course of time, however, that liberty was abused, and doctrines were propagated in the French and German lodges, which it is the duty and policy of every government to discourage and suppress. But these corruptions had by no means a necessary connection with free masonry: they arose wholly from the political condition of the continental kingdoms. In Britain, where the order subsisted much longer than in any other country, its history is stained by no glaring corruptions or offensive innovations; more attention was paid to the intrinsic value of the order, than to its external observances; and the British lodges had a greater resemblance to charitable meetings, than to pompous and splendid assemblies. Blessed with a free constitution, and the enjoyment of every liberty which does not approach to licentiousness, the British masons were under no temptation to introduce into their lodges religious and political discussions. The liberty of the press enables them to give the widest circulation to their opinions, however new or extravagant; and they are liable to no punishment, by publicly attacking the established religion of their country. The British lodges, therefore, have retained their primitive purity; they have been employed in no sinister cause; they have harboured in their bosom neither traitors, nor atheists, nor French philosophers.

Causes of the purity of the British lodges.

75. While the French were busily engaged in the decoration of their lodges, and in the invention of new degrees and trifling ceremonies, the masons in England were more wisely employed in extending the boundaries of the royal art. About the beginning of the 18th century, during the reign of Queen Anne, free masonry seems to have rapidly declined in the south of England. Four lodges only existed in the south, and few hopes could be entertained of revival, while the seat of the grand lodge was at such a distance as the city of York. In such circumstances the four lodges met in 1717, and, in order to give vigour to their declining cause, and advance the interests of the fraternity in the south, they elected themselves into a grand lodge, and chose Anthony Sayer, Esq. for their first grandmaster. Thus was instituted the grand lodge of England, which has now attained to such a pitch of prosperity and splendour. The motive which suggested this institution, was certainly laudable and useful; but every person must be aware, that the four lodges were guilty of a considerable impropriety in omitting to request the countenance of the grand lodge of York. Notwithstanding this negligence, the greatest harmony subsisted between the two grand lodges till 1734; and under the auspices of both, the order flourished in every part of the kingdom, but particularly in the south of England, where it had formerly been in such a languishing condition. In the year 1734, however, the grand lodge of England having granted constitutions to lodges within the district of York, without the consent of their grand lodge, incurred to such a degree the displeasure of the York masons, that the friendly intercourse which had formerly subsisted between them, was completely broken off; and the prosperity of the one was always viewed by the other with a suspicious eye. In 1739 also some trifling innovations upon the ancient customs of the order, having been imprudently sanctioned by the grand lodge of England, several of the old London

Institution of the Grand Lodge of England in 1717.

Masonry. masons were highly offended, and, after seceding from the grand lodge, and pretending to act under the York constitution, they gave themselves the appellation of *Ancient Masons*, while they attached to those connected with the grand lodge the odious appellation of *Moderns*, who, in their opinion, never existed till the year 1717. The ancient masons, after their secession, continued to hold their meetings, without acknowledging a superior, till the year 1772, when they chose for their grandmaster the duke of Athol, who was then grandmaster elect for Scotland. Since that period both the grand lodges of England have attained to a high degree of prosperity; but such is their mutual antipathy, that the members of the one have no correspondence or communion with those of the other. The Irish and Scottish masons, however, who seem rather to favour the ancients, hold communion with both the grand lodges, and are allowed to be present at all their meetings. It is much to be regretted, that such respectable bodies as the two grand lodges of England, should retard the progress of masonry by their mutual jealousies and dissensions. Schisms in societies generally arise from misconduct on both sides, which was certainly the case in the schisms under consideration. The moderns undoubtedly departed from their usual caution and propriety of conduct, by authorising the slightest innovations upon the ceremonies of an ancient institution. But the ancients have been guilty of a greater impropriety by being the active promoters of the schism; and still more, by holding up the moderns to the ridicule of the public. If these errors, however, were mutually acknowledged, and buried in oblivion, that breach would soon be repaired which has so long separated the two lodges, and which the Scottish and Irish masons have always regarded with pity and indignation.

Free masonry introduced into different parts of the world. 76. After the institution of the grand lodge of England in 1717, free masonry assumed a bolder and a more independent aspect. It was no longer confined to the British isles, or to the capital of France, but was destined to irradiate every portion of the globe; and while the grand lodges of Scotland and England contemplated with pleasure the propagation of the royal art, their diligence was fully rewarded by the gratitude and liberality of the foreign lodges, for the gift which they received.

Into the East Indies, America, Germany, Africa, &c. 77. In the year 1729 free masonry was introduced into the East Indies; and, in a short time after, a provincial grandmaster was appointed to superintend the lodges in that quarter. In 1730 the grand lodge of Ireland was instituted; lodges were erected in different parts of America; and a provincial deputation granted to M. Thuanus, for the circle of Lower Saxony. A patent was sent from England in 1731, to erect a lodge at the Hague, in which Francis Stephen, duke of Lorraine, and afterwards emperor of Germany, was initiated into the order; and provincial grandmasters were appointed for Russia, and Andalusia in Spain. In 1736 lodges were erected at Cape Coast, in Africa, and at Geneva; and provincial deputations were granted for Upper Saxony and the American islands. In 1738, a lodge was instituted at Brunswick, under the patronage of the grand lodge of Scotland, in which the late king of Prussia was initiated when prince royal. His majesty was so pleased with the maxims and ceremonies of the order, that he, ever afterwards, was its most zealous

partizan, and even requested that a lodge should be established in the capital of his own dominions. In this lodge many of the German princes were initiated, who afterwards filled the office of grandmaster, with much honour to themselves, and advantage to the fraternity.

78. But while free masonry flourished in these different parts of the world, and in many other places which it would be tedious to enumerate, it was doomed to undergo a variety of persecutions from the unfounded jealousies of a few despotic rulers, and the deep-rooted superstition of a few Catholic priests. These persecutions took their rise in Holland in the year 1735. The States-General were alarmed at the rapid increase of free masons, who held their meetings in every town under their government; and as they could not believe that architecture and brotherly love were their only objects, they resolved to discountenance their proceedings. In consequence of this determination, an edict was issued by government, stating, that though they had discovered nothing in the practices of the fraternity, either injurious to the interests of the republic, or contrary to the character of good citizens; yet, in order to prevent any bad consequences which might ensue from such associations, they deemed it prudent to abolish the assemblies of free masons. Notwithstanding this prohibition, a respectable lodge continued to meet privately at Amsterdam; but intelligence having been communicated to the magistrates, all the members were arrested and brought before the court of justice. At this tribunal, in presence of all the magistrates of the city, the masters and wardens boldly defended themselves; and declared upon oath, that they were loyal subjects, faithful to their religion, and zealous for the interests of their country; that free masonry was an institution venerable in itself, and useful to society; and that though they could not reveal the secrets and ceremonies of their order, they could assure the judges that they were contrary to the laws neither of God nor man, and that they would willingly admit into their order any individual in whom the magistrates could confide, and from whom they might receive such information as would satisfy a reasonable mind. In consequence of these declarations, the brethren were dismissed, and the town secretary requested to become a member of the fraternity. After initiation he returned to the court of justice, and gave such a favourable account of the principles and practice of the society, that all the magistrates became brethren of the order, and zealous patrons of free masonry.

79. After free masonry had thus honourably triumphed over her persecutors in Holland, she had to contend in France with prejudices equally inveterate though less insuperable. Although many persons of distinction defended the fraternity, and expostulated with the court on the impropriety of severe measures, their assemblies were abolished in 1737, under the common pretext that some dreadful design was concealed beneath their inviolable secrets, hostile to religion, and dangerous to the kingdom. But when these ebullitions of party spirit and private malice had subsided, the prohibition of government was gradually forgotten, and the fraternity in France recovered their former prosperity and splendour.

80. In Germany too, the tranquillity of the order was

Masonry. was disturbed by the intrigues of some ignorant females. Some German ladies, who possessed more curiosity than is common to their sex, were anxious to discover the secrets of free masonry. Having been baffled in all their attempts on the fickleness of their husbands, and the fondness of their admirers, they converted their curiosity into revenge, and attempted to inflame the mind of Maria Theresa, the empress queen, against the lodges in Vienna. Their attempt was in some measure successful, as they persuaded her to issue an order for surprising all the masons in the city when assembled in their lodges. This plan, however, was frustrated by the intervention of the emperor Joseph I. who being himself a mason, pledged himself for the good conduct of his brethren, and showed the ladies and their friends, that their charges against the order were false and defamatory.

they might preserve the mysteries of free masonry from such of the members as were not masons, they rejected from their ritual all the masonic signs and ceremonies; and in order to escape the vengeance of the church of Rome, they converted the oath of secrecy into a simple promise, and admitted women into their new association. The mopses were patronised by the most illustrious characters in Germany, and several princes of the empire were grand masters of the order. The hostility of the Roman see to the protestants in Germany induced the mopses to exclude them from their fraternity; but this was merely a pretence to deceive his holiness, for they afterwards admitted men of every religion and of every country.

Free masons persecuted in Italy,

81. When the flame of persecution is once kindled, its devastations are seldom confined to the spot where it originated. The example of one nation is urged as an excuse for the conduct of another; and like the storm on the sandy desert, its effects are ruinous in proportion to its progress. In Holland and France the hostility of the government against free masonry was soon disarmed. But when the flame reached the ecclesiastical states of Italy, its effects were more baneful and its duration more lengthened. In the year 1738, a formidable bull was thundered from the conclave, not only against free masons themselves, but against all those who countenanced a set of men who, in the opinion of his holiness, were enemies to the tranquillity of the state, and hostile to the spiritual interests of souls. This bull was followed by an edict dated 14th January 1739, in which the servitude of the galleys, the tortures of the rack, and a fine of 1000 crowns in gold, were threatened to persons of every description who breathed the infectious air of a masonic assembly. A few weeks afterwards a decree was issued by his holiness condemning a French book, entitled An Apology for the Society of Free Masons, and ordering it to be burnt by the ministers of justice, in one of the best frequented streets of Rome.

84. As the authority of the pope did not extend to Switzerland, free masonry flourished in that republic till 1741, when the council of Berne issued an edict prohibiting under the severest penalties the assemblies of free masons. No reason was assigned for this conduct, and no charges advanced against the order. The council of Berne are terrified for secret associations, and therefore they must oppress and persecute them. Not satisfied with abolishing the lodges in the republic, they decreed that every free mason must accuse himself before the magistrates of the district, that he must renounce his obligations to secrecy, and swear in the presence of the Almighty, to trample upon those engagements, which before the same Being they had sworn to revere. Such an instance of tyranny over the minds and consciences of men, is a remarkable fact in the history of a republic where the reformed religion had been practised from its infancy, and where free masons had always conducted themselves with exemplary propriety.

and in Holland.

82. In consequence of these enactments at Rome, the catholic clergymen in Holland attempted in 1740 to enforce obedience to the decrees of their superiors. In examining the religious qualifications of those who required a certificate to receive the holy sacrament, the priests took occasion to refuse the certificate to such as were free masons, and expelled them for ever from the communion table. Having exerted their authority in the expulsion of several respectable characters, the attention of the public was roused by such arbitrary proceedings, and after the publication of several pamphlets by the adherents of both parties, the states general interfered, and prohibited the exercise of that spiritual power, which, instead of suppressing immorality, had excited divisions among their fellow subjects.

85. The persecutions which free masonry encountered were hitherto confined to the continent. The tide of religious frenzy, however, now rolled to the shores of Britain. In the year 1745, the Associate Synod attempted to disturb the peace of the fraternity; and had they been possessed of half the power of the church of Rome or the council of Berne, their proceedings, prompted by equal fanaticism, would have been marked with the same severity; but, fortunately for the order, their power extended only to the spiritual concerns of those delinquents who were of the same sect with themselves. In the beginning of the year 1745, an overture was laid before the synod of Stirling, stating that many improper things were performed at the initiation of masons, and requesting that the synod would consider whether or not the members of that order were entitled to partake in the ordinances of religion. The synod remitted this overture to all the kirk-sessions under their inspection, allowing them to act as they thought proper. In 1755, however, they appointed all their kirk-sessions to examine every person who was suspected to be a free mason, and to demand an explicit answer to any question which they might ask, concerning the administration of the mason oath. In the course of these examinations, the kirk session discovered, (for they seem hitherto to have been ignorant of it) that men who were not architects were admitted into the order. On this account the synod, in the year 1757, thought it necessary to adopt stricter measures. They drew up a list of questions, which they appointed every kirk-session to put to those under their charge. These questions related

Free masonry persecuted in Scotland.

Institution of the association of the mopses.

83. In order to preserve the order from that ruin to which it seemed fast approaching, several free masons of distinction in Germany who were friendly to the church of Rome, instituted a new association formed on the same principles, and proposing to itself the same object as free masonry. The members were denominated *mopses*, from the German word *mops*, signifying a young mastiff, which was deemed a proper emblem of the mutual fidelity and attachment of the brethren. But that

Masonry.

lated to what they thought were the ceremonies of free masonry; and those who refused to answer them were debarred from religious ordinances. The object of these proceedings was not, certainly, as is pretended, to make the abettors of the Associate Synod more holy and upright, by detaching them from the fraternity. This could have been effected without that species of examination which they authorised. The church of Rome were contented with dispersing the fraternity, and receiving its repentant members into their communion. The council of Berne went no farther than abolishing the society, and compelling the brethren to renounce their engagements, lest they should be inconsistent with the duties of citizens. But a synod of Scottish dissenters, who cannot imitate in these points the church of Rome and the council of Berne, must compel the free masons of their congregation to give them an account of those mysteries and ceremonies, which they durst not obtain by regular initiation.

Free masonry flourishes on the continent.

86. Notwithstanding these persecutions, free masonry flourished, and was in the highest estimation in Great Britain, France, Germany, and several other kingdoms of Europe. In 1743, it was exported from Scotland to Denmark; and the lodge which was then instituted is now the grand lodge of that kingdom. The same prosperity has attended the first lodge in Sweden, which was erected at Stockholm in 1754, under a patent from Scotland. In 1765, a splendid apartment was erected at Marseilles for the accommodation of the brethren. It was adorned with the finest paintings, representing the most interesting scenes that occur in the history of the Old and New Testament, and calculated to remind the spectator of his various duties as a man, a subject, and a Christian. The representation of Joseph and his brethren, of the Samaritan and Jew, of Lot and the Angels, must have reminded every brother of the beauty of charity and forgiveness, which are the first principles of masonry, as they are the first duties of man. The picture of Peter and the Apostles paying tribute to Caesar, must have recalled to every individual his obligations, as a citizen, to revere and support the constituted authorities. And the representation of Job in his misfortunes, lifting up his hands to heaven, must have forced upon the minds of the most inconsiderate, this important reflection—that fortitude and resignation to the will of God are the duties of all in distress, and that the divine blessing will ultimately attend those who bear, without murmuring, the chastisements of their father, and preserve, amidst the severest trials, their patience and virtue unimpaired (x). These observations, apparently trifling, are important in one respect, as they show that the French lodges had not at that time fostered in their bosom the votaries of scepticism and disloyalty. The other lodges in France were at this time numerous and magnificent. The grand lodge contained about twenty offices, which were all filled by noblemen of the highest rank. They had provincial grand masters similar to those of Scotland, and the insignia and jewels of all those office-bearers, were as rich and splendid as the lodges where they assembled.

87. In the year 1767, a lodge under an English

constitution was established at Berlin, under the appellation of *Le Royale York*, in honour of the duke of York, who was initiated into the fraternity by that lodge while he was travelling on the continent. In 1768, the free masons of Germany were authorised to hold their assemblies, by a charter granted by the king of Prussia, the elector of Saxony, and the queen of Hungary and Bohemia, and afterwards by the emperor of Germany himself. By another charter from England, in 1769, a lodge was erected at Brunswick, which, a short time after, received a provincial deputation from England, for superintending the lodges of Lower Saxony. In the year 1773, a compact was entered into between the grand lodge of England, under Lord Petre, and the grand lodge at Berlin, under the prince of Hesse Darmstadt, which had a few years before been duly erected into a grand lodge, at a meeting of the masters and wardens of twelve regular lodges. In this compact it was stipulated, that the grand lodge of Berlin should be acknowledged as the grand lodge of the whole empire of Germany, including the dominions of his Prussian majesty; that it should exercise no masonic power out of the empire of Germany, or within the district under the authority of the grand lodge of Brunswick; that the electorate of Hanover should be free to both the grand lodges in Germany; and that the contracting parties should unite their efforts to counteract all innovations in masonry, and particularly the proceedings of a set of masons in Berlin, who, under the denomination of *Stricte Observantz.* had annihilated their former constitutions, erected themselves into a grand lodge, and sanctioned very improper innovations upon the principles and ceremonies of the fraternity. This compact was highly approved of by the king of Prussia, who immediately erected the grand lodge of Berlin into a corporate body. In 1777, the king of Prussia was protector of all the masons in Germany. Ferdinand, duke of Brunswick and Lunenburgh, was grand master of all the united lodges in Germany; and the other offices were filled by the most able and illustrious princes of the empire. Under the auspices of such distinguished personages, and the jurisdiction of the grand lodges of Berlin and Brunswick, free masonry has flourished to the present day in that extensive empire.

88. In Germany, Denmark, and Sweden, charity schools were erected by the lodges, for educating the children of free masons, whose poverty debarred them from this advantage. In that which was formed at Brunswick, they were instructed even in classical learning, and various branches of the mathematics; and were regularly examined by the duke of Brunswick, who rewarded the most deserving with suitable donations. At Eisenach several seminaries of this kind were established. The teachers were endowed with fixed salaries; and, in a short time after their institution, they had sent into the world 700 children, instructed in the principles of science, and the doctrines of Christianity. In 1771, an establishment of a similar kind was formed at Cassel, in which the children were maintained and educated till they could provide for themselves.

(x) For a further account of this building, see Smith's Use and Abuse of Free Masonry, p. 165.

Masonry. selves. In 1773 the united lodges of Dresden, Leipzig, and Gortitz, erected at Frederickstadt a seminary of learning for children of every denomination in the electorate of Saxony. The masonic subscriptions were so numerous that the funds of the institution were sufficient for its maintenance; and in the space of five years, above 1100 children received a liberal education. In the same year, an extensive workhouse was erected at Prague in which the children were not only initiated into the first principles of learning, but into those branches of the useful and fine arts which might qualify them for commercial and agricultural situations. It deserves to be remarked, that the founders of these institutions, amid their anxiety for the public prosperity, never neglected the spiritual interests of the children. They saw that early piety is the foundation of all that is useful and honourable in life; and that without this, speculative knowledge and practical skill are of little avail.—How inconsistent are such facts with those fabulous accounts of the German lodges, which have been published in England by a few party-men.

Free masonry persecuted in Portugal.

89. While these things were going on in Germany, the brethren in Portugal were exposed to the persecution of its bigotted rulers. Major François d'Alincourt, a Frenchman, and Don Oyres de Ornellas Praeao, a Portuguese nobleman, were in 1766 imprisoned by the governor of Madeira for their attachment to their order. Being afterwards carried to Lisbon, they were confined for fourteen months, till they were released by the generous intercession of the brethren in that city. In the following year several free masons were confined at Naples, but soon liberated by the intercession of foreign princes, and the eloquence of an Italian advocate.

90. Notwithstanding the persecutions which the fraternity experienced in Holland, free masonry was flourishing in that republic in 1779. At that time a compact was entered into between the grand lodge of Holland, held at the Hague, and that of England. In this compact it was stipulated that the grand lodge of Holland should be permitted to erect lodges within her territories, both at home and abroad, and to appoint provincial grand masters over each district. In consequence of this accession of power to the grand lodge of Holland, free masonry flourished, under its auspices, in the Dutch settlements in India, Africa, and South America.

Origin and history of the illuminati.

91. Let us now direct our attention to a new secret association which about this time arose in Germany, and which was imagined to have taken its rise from free masonry, and to have planned a diabolical conspiracy against every religious and political establishment in Europe. In 1775 the order of the illuminati was founded by Dr Adam Weishaupt, professor of canon law in the university of Ingolstadt. In this association speculative opinions were inculcated, which were certainly inconsistent with the principles of sound religion and social order. But that illuminism originated from free masonry; that it brought about the French revolution, or even planned any dangerous conspiracy, are circumstances for which the shadow of a proof has not yet been adduced. Dr Robison indeed

expressly affirms, that illuminism “took its rise among the free masons, but was totally different from free masonry;” and by a deceitful anachronism, he represents Weishaupt as an active member in the German lodges, before he acquaints his readers that he was the founder of the illuminati, for no other reason than to make them believe that Weishaupt was a free mason before he planned his new association (Y). Now the case was very different indeed. Barruel himself asserts, “that it is a fact demonstrated beyond a doubt, that Weishaupt became a mason in 1777 only; and that two years before this, when he established illuminism, he was totally unacquainted with the mysteries of free masonry (Z).” Here then is an important fact which strikes at the root of all Dr Robison’s reasoning against free masonry. Barruel maintains, that Weishaupt was not a mason till two years after the organization of his new institution; and Dr Robison allows, that illuminism was totally different from free masonry. The two institutions, therefore, were totally unconnected; for the members of the one were never admitted into the lodges of the other, without being regularly initiated into the mysteries of both. Upon these simple facts we would arrest the attention of every reader, and those in particular who have been swindled out of their senses, by the united exertions of a priest and a philosopher.

Masonry.

92. After Weishaupt had organized his institution, he exerted every nerve to disseminate its principles. For this purpose he became a free mason in 1777; and by means of emissaries, he attempted to circulate his opinions among the French and German lodges. In these attempts, indeed, he was sometimes successful. But it should be recollected by those who, on this account, calumniate free masonry, that the same objection may be urged against Christianity, because impostors have sometimes gained proselytes, and perverted the wavering minds of the multitude. These doctrines, however, were not merely circulated by Weishaupt in a few of the lodges, and taught at the assemblies of the illuminati. They were published to the world in the most fascinating form, by the French encyclopedists; and were inculcated in all the eloquence, with which some of the most celebrated philosophers on the continent could adorn them. It can only be said of Weishaupt, therefore, that he was not just such a determined infidel as Voltaire and his associates.—Such is a short, and it is hoped, an impartial view of the origin and progress of the illuminati. It may be now proper to attend to the causes from which this association arose, and the advantages and disadvantages which it may have engendered.

93. About the middle of the eighteenth century the literati on the continent were divided into two great parties. The one may be considered as ex-jesuits, or adherents to the Catholic superstition, who were promoters of political and religious despotism, and inculcated the doctrines of non-resistance and passive obedience. The other party was composed of men who were friends to the reformed religion, enemies of superstition and fanaticism, and supporters of the absurd doctrine of the infinite perfectibility of the human mind. They were

Causes from which illuminism rose.

(Y) Proofs of a Conspiracy, Introduction, p. 15. and p. 101.

(Z) Memoirs of Jacobinism, Part iii. Preliminary Observations, p. 15. and p. 12.

Masonry. dissatisfied with that slavery which was imposed by the despotism of the continental rulers, and the superstition of the church of Rome; and many of them entertained opinions adverse to the Christian religion, and to every existing form of government. Between these two parties there was a perpetual struggle for power. The ex-jesuits accused their opponents as heretics and promoters of jacobinism and infidelity; while the others were constantly exposing the intrigues of priests, and the tyranny of despots. To this latter class belonged Weishaupt and his associates, who instituted the order of the illuminati for no other purpose than to oppose those corrupted priests, who would have degraded them as Christians, and those tyrannical despots who have enslaved them as citizens. The collision of these parties was certainly productive of the greatest advantages. While the Jesuits restrained the inclination of one part of the community, to overrate the dignity of the human mind, and anticipate ideal visions of religious and political perfection; the illuminati counteracted those gloomy opinions which debase the dignity of our nature, which check the energies of the mind, and impose the most galling yoke of religious and political servitude.

94. After the French revolution, which, as Mounier has well shown, arose from other causes than those to which Barruel and Robison ascribe it, the plans of these parties were not carried on in Germany so systematically as before; and notwithstanding the fabrications with which Barruel has calumniated the lodges in that country, free masonry prevails to this day, respected by the most virtuous and scientific members of the community, and patronized by the most distinguished princes of the empire.

Respectability of free masons in Germany.

95. In Germany the qualifications for a free mason

are great and numerous. No person is initiated into the order without the consent of every member of the lodge; and it frequently happens, that a German even is excluded by a single dissentient voice. On this account the lodges of that country are filled with persons of the first rank and respectability; and every thing is conducted with the greatest decorum and solemnity. As masonry is there held in the highest estimation, an Englishman will obtain an easier introduction to the chief nobility and literati of Germany in a mason lodge than in any other place; and will never repent of having been initiated into the order in his native country (A).

Masonry.

96. After the publication of the works of Barruel and Robison, the progress of free masonry in Britain was retarded by an act of parliament in 1799 for the suppression of seditious societies, by which the fraternity were virtually prohibited from erecting new lodges in the kingdom. But this act was not promoted by the calumnies of these writers. It became necessary from the political condition of the kingdom; and the exceptions which it contained in favour of free masons, completely prove that government never credited the reports of these alarmists, but placed the most implicit confidence in the loyalty and prudence of British masons. The private characters, indeed, as well as the public situations of those individuals who are now grand masters of the order, are a sufficient pledge to the legislature and the uninitiated public, that free masonry will preserve in these kingdoms its ancient purity and simplicity, and that it will ever continue to be the foe of despotism and oppression, the enemy of superstition and fanaticism, the promoter of civilization and good order, and the friend of true benevolence and unaffected piety.

M A S

Masora.

MASORA, a term in the Jewish theology, signifying a work on the Bible, performed by several learned rabbins, to secure it from any alterations which might otherwise happen.

Their work regards merely the letter of the Hebrew text, in which they have, first, fixed the true reading by vowels and accents: they have, secondly, numbered not only the chapters and sections, but the verses, words, and letters of the text: and they find in the Pentateuch 5245 verses, and in the whole Bible 23,206. The masora is called, by the Jews, the *hedge or fence of the law*, because this enumeration of the verses, &c. is a means of preserving it from being corrupted and altered. They have, thirdly, marked whatever irregularities occur in any of the letters of the Hebrew text; such as the different size of the letters, their various positions and inversions, &c. and they have been fruitful in finding out reasons for these irregularities and mysteries in them. They are, fourthly, supposed to be the authors of the Keri and Chetibh, or the marginal corrections of the text in our Hebrew Bibles.

The text of the sacred books, it is to be observed,

M A S

Masora.

was originally written without any breaks or divisions into chapters or verses, or even into words; so that a whole book, in the ancient manner, was but one continued word; of this kind we have still several ancient manuscripts, both Greek and Latin. In regard, therefore, the sacred writings had undergone an infinite number of alterations, whence various readings had arisen, and the original was become much mangled and disguised, the Jews had recourse to a canon, which they judged infallible, to fix and ascertain the reading of the Hebrew text; and this rule they call *masora*, "tradition," from מָסָרָה, *tradidit*, as if this critique were nothing but a tradition which they had received from their forefathers. Accordingly they say, that when God gave the law to Moses at Mount Sinai, he taught him, first, the true reading of it; and, secondly, its true interpretation; and that both these were handed down by oral tradition, from generation to generation, till at length they were committed to writing. The former of these, viz. the true reading, is the subject of the masora; the latter, or true interpretation, that of the mishna and gemara.

According

(A) Dr Render's Tour through Germany, Introduction to vol. i. p. 30. and 33. Dr Render maintains, that free masonry has greatly improved the manners and disposition of the Germans. See vol. ii. p. 200. *Note.*

Masora,
Masque.

According to Elias Levita, they were the Jews of a famous school at Tiberias, about 500 years after Christ, who composed, or at least began, the masora; whence they are called *masorites*, and *masoretic doctors*. Aben Ezra makes them the authors of the points and accents in the Hebrew text, as we now find it; and which serve for vowels.

The age of the masorites has been much disputed, Archbishop Usher places them before Jerome; Capel, at the end of the fifth century; Father Morin, in the tenth century. Basnage says, that they were not a society, but a succession of men; and that the masora is the work of many grammarians, who, without associating and communicating their notions, composed this collection of criticisms on the Hebrew text. It is urged that there were masorites from the time of Ezra and the men of the great synagogue, to about the year of Christ 1030: and that Ben Asher and Ben Naphtali, who were the best of the profession, and who, according to Basnage, were the inventors of the masora, flourished at this time. Each of these published a copy of the whole Hebrew text, as correct, says Dr Prideaux, as they could make it. The eastern Jews have followed that of Ben Naphtali, and the western that of Ben Asher; and all that has been done since is to copy after them, without making any more corrections or masoretical criticisms.

The Arabs have done the same thing by their Koran that the masorites have done by the Bible; nor do the Jews deny their having borrowed this expedient from the Arabs, who first put it in practice in the seventh century.

There is a great and little Masora printed at Venice and at Basil, with the Hebrew text in a different character. Buxtorf has written a masoretic commentary, which he calls *Tiberius*.

MASQUE, or MASK, a cover for the face, contrived with apertures for the eyes and mouth; originally worn chiefly by women of condition, either to preserve their complexion from the weather, or out of modesty to prevent their being known. Poppæa, wife of Nero, is said to be the first inventor of the *masque*; which she did to guard her complexion from the sun and weather, as being the most delicate woman, with regard to her person, that has been known.

Theatrical masques were in common use both among the Greeks and Romans: Suidas and Athenæus ascribe the invention of them to the poet Chœrilus, a contemporary of Thespis: Horace attributes them to Æschylus; but Aristotle informs us, that the real inventor, and consequently the time of their first introduction and use, were unknown. Brantome observes, that the common use of modern masques was not introduced till towards the end of the sixteenth century.

MASQUE is also used to signify any thing used to cover the face, and prevent a person's being known. The penitents of Lyons and Avignon hide their faces with large white veils, which serve them for masques.

The *Iron MASQUE* (*Masque de Fer*), or *Man with the Iron Masque*, a remarkable personage so denominated, who existed as a state prisoner in France during the latter part of the 17th century. As the circumstances of this person form a historical problem which has occasioned much inquiry, and given rise to many conjectures, as well as of late, in consequence of the destruction of the Bastille, excited in a particular manner

the curiosity of the public, it shall be endeavoured to condense in this article the substance of every thing material that has been published on the subject. We shall first relate such particulars concerning this extraordinary prisoner as appear to be well authenticated; and shall afterwards mention the different opinions and conjectures that have been entertained with regard to his real quality, and the causes of his confinement.

I. The authenticated particulars concerning the *Iron Masque* are as follows: A few months after the death of Cardinal Mazarine, there arrived at the isle of Sainte Marguerite, in the sea of Provence, a young prisoner whose appearance was peculiarly attracting: his person was above the middle size, and elegantly formed, his mien and deportment were noble, and his manners graceful; and even the sound of his voice, it is said, had in it something uncommonly interesting. On the road he constantly wore a masque made with iron springs, to enable him to eat without taking it off. It was at first believed that this masque was made entirely with iron; whence he acquired the name of "the Man with the iron mask." His attendants had received orders to despatch him if he attempted to take off his masque or discover himself. He had been first confined at Pignerol, under the care of the governor M. de St Mars; and upon being sent from thence to Sainte Marguerite, he was accompanied thither by the same person, who continued to have the charge of him. He was always treated with the most marked respect: he was served constantly in plate; and the governor himself placed his dishes on the table, retiring immediately after and locking the door behind him. He *tu-to'yoit* (thee'd and thou'd) the governor; who, on the other hand, behaved to him in the most respectful manner, and never wore his hat before him, nor sat down in his presence unless he was desired. The marquis de Louvois, who went to see him at St Marguerite, spoke to him standing, and with that kind of attention which denotes high respect.

During his residence here, he attempted twice, in an indirect manner, to make himself known. One day he wrote something with his knife on a plate, and threw it out of his window towards a boat that was drawn on shore near the foot of the tower. A fisherman picked it up and carried it to the governor. M. de St Mars was alarmed at the sight; and asked the man with great anxiety, whether he could read, and whether any one else had seen the plate? The man answered, that he could not read, that he had but just found the plate, and that no one else had seen it. He was, however, confined till the governor was well assured of the truth of his assertions.—Another attempt to discover himself proved equally unsuccessful. A young man who lived in the isle, one day perceived something floating under the prisoner's window; and on picking it up, he discovered it to be a very fine shirt written all over. He carried it immediately to the governor; who, having looked at some parts of the writing, asked the lad, with some appearance of anxiety, if he had not had the curiosity to read it? He protested repeatedly that he had not; but two days afterwards, he was found dead in his bed.

The *Masque de Fer* remained in this isle till the year 1698, when M. St Mars being promoted to the government of the Bastille, conducted his prisoner to that fortress. In his way thither, he stopt with him at his estate

Masque.

^{Masque.} estate near Palteau. The Masque arrived there in a litter, surrounded by a numerous guard on horseback. M. de St Mars ate at the same table with him all the time they resided at Palteau; but the latter was always placed with his back towards the windows; and the peasants, who came to pay their compliments to their master, and whom curiosity kept constantly on the watch, observed that M. de St Mars always sat opposite to him with two pistols by the side of his plate. They were waited on by one servant only, who brought in and carried out the dishes, always carefully shutting the door both in going out and returning. The prisoner was always masked, even when he passed through the court; but the people saw his teeth and lips, and also observed that his hair was gray.—The governor slept in the same room with him, in a second bed that was placed in it on that occasion. In the course of their journey, the Iron Mask was one day heard to ask his keeper whether the king had any design on his life? “No, prince,” he replied; “provided that you quietly allow yourself to be conducted, your life is perfectly secure.”

The stranger was accommodated as well as it was possible to be in the Bastile. An apartment had been prepared for him by order of the governor before his arrival, fitted up in the most convenient style; and every thing he expressed a desire for was instantly procured him. His table was the best that could be provided; and he was ordered to be supplied with as rich clothes as he desired: but his chief taste in this last particular was for lace, and for linen remarkably fine. It appears that he was allowed the use of such books as he desired, and that he spent much of his time in reading. He also amused himself with playing upon the guitar. He had the liberty of going to mass; but was then strictly forbid to speak or uncover his face: orders were even given to the soldiers to fire upon him if he attempted either; and their pieces were always pointed towards him as he passed through the court. When he had occasion to see a surgeon or a physician, he was obliged, under pain of death, constantly to wear his mask. An old physician of the Bastile, who had often attended him when he was indisposed, said, that he never saw his face, though he had frequently examined his tongue, and different parts of his body; that there was something uncommonly interesting in the sound of his voice; and that he never complained of his confinement, nor let fall from him any hint by which it might be guessed who he was. It is said that he often passed the night in walking up and down his room.

This unfortunate prince died on the 19th of November 1703, after a short illness; and was interred next day in the burying-place of the parish of St Paul. The expence of his funeral amounted only to forty livres. The name given him was *Marchiali*: and even his age, as well as his real name, it seemed of importance to conceal; for in the register made of his funeral, it was mentioned that he was about forty years old; though he had told his apothecary, some time before his death, that he thought he must be sixty.—It is a well-known fact, that immediately after the prisoner's death, his apparel, linen, clothes, mattresses, and in short every thing that had been used by him, were burnt; that the walls of his room were scraped,

the floor taken up, evidently from the apprehension that he might have found means of writing any thing that would have discovered who he was. Nay, such was the fear of his having left a letter or any mark which might lead to a discovery, that his plate was melted down; the glass was taken out of the window of his room and pounded to dust; the window-frame and doors burnt; and the ceiling of the room, and the plaster of the inside of the chimney, taken down. Several persons have affirmed, that the body was buried without a head; and Monsieur de Saint Foix informs us*, that “a gentleman having bribed the sexton, had the body taken up in the night, and found a stone instead of the head.” ^{In his Est. a sais Hist. riques.}

The result of these extraordinary accounts is, that the Iron Masque was not only a person of high birth, but must have been of great consequence; and that his being concealed was of the utmost importance to the king and ministry. We come now, therefore, to notice,

II. The opinions and conjectures that have been formed concerning the real name and condition of this remarkable personage. Some have pretended that he was the duke of Beaufort; others, that he was the count de Vermandois, natural son to Louis XIV. by the duchess de la Valliere. Some maintain him to have been the duke of Monmouth, natural son of Charles II. of England by Lucy Walters; and others say, that he was Gerolami Magni, minister to the duke of Modena.

Besides these conjectures, none of which possesses sufficient probability to entitle them to consideration, a fifth has been advanced; namely, That the Iron Masque was a son of Anne of Austria, queen to Louis XIII. and consequently that he was a brother of Louis XIV.; but whether a bastard brother, a brother-german, or a half-brother, is a question that has given rise to three several opinions, which we shall state in the order of time in which the respective transactions to which they allude happened.

1. The first opinion is, that the queen proved with child at a time when it was evident it could not have been by her husband, who for some months before, had never been with her in private. The supposed father of this child is said by some to have been the duke of Buckingham, who came to France in May 1625, to conduct the Princess Henrietta, wife of Charles I. to England. The private letters and memoirs of those times speak very suspiciously of the queen and Buckingham; his behaviour at Amiens, whither the queen and queen-mother accompanied the princess in her way to Boulogne, occasioned much whispering: notwithstanding the pains that have been taken by La Porte in his *Memoires* to excuse his mistress, it appears that the king, on this occasion, was extremely offended at her, and that it required all the influence and address of the queen-mother to effect a reconciliation. It is said, that this child was privately brought up in the country; that when Mazarine became a favourite, he was intrusted with the care of him; and that Louis XIV. having discovered the secret on the death of the cardinal, thought it necessary to confine him in the manner that has been related. ^{Hist. of the Bastile, No 6.}

But it may be observed, that this secret could scarcely have escaped the vigilance of the cardinal de P.³⁴³

Richlieu;

Masque. Richlieu; and it is not improbable, that a minister so little scrupulous, if inclined to save the honour of a queen, would have removed a child, who, if he lived, might have been made use of to disturb the tranquillity of the kingdom. After this supposed birth, the queen had frequent quarrels with the king, and what was more dangerous, with the cardinal; who even used every means in his power to inquire into her most private transactions. It was on a memorable occasion of this kind, that her servant La Porte was thrown into the Bastile; and it can scarcely be imagined she would have had the firmness she then displayed, while conscious of so much guilt, and under the risk of having it discovered. The prisoner with the masque appears, by several accounts, to have been a youth of a handsome figure in the year 1661; and in 1703, when he died, to have been above sixty; but had he been a son of Buckingham, he would have been about thirty-six in 1661, when he could not be said to have been a youth; and in November 1703, about seventy-eight.

2. The second opinion is, that he was the twin brother of Louis XIV. born some hours after him. This first appeared in a short anonymous work published without date, and without the name of place or printer. It is therein said, "Louis XIV. was born at St Germain en Laye, on the 5th of September 1638, about noon; and the illustrious prisoner, known by the appellation of the *Iron Masque*, was born the same day, while Louis XIII. was at supper. The king and the cardinal, fearing that the pretensions of a twin brother might one day be employed to renew those civil wars with which France had been so often afflicted, cautiously concealed his birth, and sent him away to be brought up privately. Having but an imperfect knowledge of the circumstances that followed, I shall say nothing more, for fear of committing errors; but I firmly believe the fact I have mentioned; and time will probably prove to my reader, that I have ground for what I have advanced."

This opinion has been more noticed since the publication of a work called *Memoires du Marechal Duc de Richlieu*, written by the abbé Soulavie; concerning which it may be proper to premise, that the present duke of Richlieu, son of the marechal, disavows this work, while the abbé Soulavie, who had been employed by the marechal, insists on the authenticity of his papers (A). He informs us that the duke of Richlieu was the lover of Mademoiselle de Valois, daughter of the regent duke of Orleans, and afterwards duchess of Modena, who in return was passionately fond of him; that the regent had something more than a paternal affection for his daughter; and that, though she held his sentiments in abhorrence, the duke of Richlieu made use of her influence with her father to discover the secret of the prisoner with the masque; that the regent, who had always observed the most profound silence on this subject, was at last persuaded to intrust her with a manuscript, which she immediately sent to her lover, who took a copy of it. This manuscript is

supposed to have been written by a gentleman on his deathbed, who had been the governor of the prisoner. The following is an extract of it, from what the abbé Soulavie has told us.

"The birth of the prisoner happened in the evening of the 5th of September 1638, in presence of the chancellor, the bishop of Meaux, the author of the manuscript, a midwife named Peronéte, and a sieur Honorat. This circumstance greatly disturbed the king's mind; he observed that the Salique law had made no provision for such a case; and that it was even the opinion of some, that the last born was the first conceived, and therefore had a prior right to the other. By the advice of Cardinal de Richlieu, it was therefore resolved to conceal his birth, but to preserve his life, in case by the death of his brother it should be necessary to avow him. A declaration was drawn up, and signed and sworn to by all present, in which every circumstance was mentioned, and several marks on his body described. This document being sealed by the chancellor with the royal seal, was delivered to the king; and all were commanded and took an oath never to speak on the subject, not even in private and among themselves. The child was delivered to the care of Madame Peronéte the midwife, to be under the direction of Cardinal de Richlieu, at whose death the charge devolved to Cardinal de Mazarine. Mazarine appointed the author of the manuscript his governor, and intrusted to him the care of his education. But as the prisoner was extremely attached to Madame Peronéte, and she equally so to him, she remained with him till her death. His governor carried him to his house in Burgundy, where he paid the greatest attention to his education.

"As the prisoner grew up, he became impatient to discover his birth, and often importuned his governor on that subject. His curiosity had been roused by observing that messengers from the court frequently arrived at the house: and a box, containing letters from the queen and the cardinal, having one day been inadvertently left out, he opened it, and saw enough to guess at the secret. From that time he became thoughtful and melancholy; 'which (says the author) I could not then account for. He shortly after asked me to get him a portrait of the late and present king; but I put him off by saying that I could not procure any that were good. He then desired me to let him go to Dijon; which I have known since was with an intention of seeing a portrait of the king there, and of going secretly to St John de Lus, where the court then was on occasion of the marriage with the infanta. He was beautiful; and love helped him to accomplish his wishes. He had captivated the affections of a young housekeeper, who procured him a portrait of the king. It might have served for either of the brothers; and the discovery put him into so violent a passion, that he immediately came to me with the portrait in his hand, saying, *Voilà mon frere, et voilà que je suis*, showing me at the same time a letter of the cardinal de Mazarine that he had taken out of the box.' Upon this discovery his governor immediately sent an express to court

(A) A letter from the duke of Richelieu, and answer from the abbé Soulavie, appeared in the Journal de Paris.

Masque. court to communicate what had happened, and to desire new instructions; the consequence of which was, that the governor and the young prince under his care were arrested and confined."

This memoir, real or fictitious, concludes with saying, "I have suffered with him in our common prison: I am now summoned to appear before my judge on high; and for the peace of my soul I cannot but make this declaration, which may point out to him the means of freeing himself from his present ignominious situation, in case the king his brother should die without children. Can an extorted oath compel me to observe secrecy on a thing so incredible, but which ought to be left on record to posterity."

3. The third opinion is, that he was a son of the queen by the cardinal de Mazarine, born about a year after the death of her husband Louis XIII.; that he was brought up secretly; and that soon after the death of the cardinal, which happened on the 9th of March 1661, he was sent to Pignerol. To this account Father Griffet * objects, "that it was needless to masque a face that was unknown; and therefore that this opinion does not merit discussion." But in answer it has been observed, That the prisoner might strongly resemble Louis XIV. which would be a sufficient reason to have him masked. This opinion is supposed to have been that entertained by Voltaire, who asserts his thorough knowledge of the secret, though he declined being altogether explicit. The abbé Soulavie, author of *Memoirs of the Marechal de Richlieu*, speaking on this subject, says, "That he once observed to the marechal, that he certainly had the means of being informed who the prisoner was; that it even seemed that he had told Voltaire, who durst not venture to publish the secret; and that he at last asked him, whether he was not the elder brother of Louis XIV. born without the knowledge of Louis XIII.? That the marechal seemed embarrassed, but afterwards said, that he was neither the bastard brother of Louis XIV. nor the duke of Monmouth, nor the count of Vermandois, nor the duke of Beaufort, as different authors had advanced; that their conjectures were nothing but reveries; but added, that they however had related many circumstances that were true; that in fact the order was given to put the prisoner to death if he discovered himself; and that he finished the conversation by saying, All I can tell you on the subject is, that the prisoner was not of such consequence when he died at the beginning of the present century as he had been at the beginning of the reign of Louis XIV. and that he was shut up for important reasons of state." The abbé Soulavie tells us, that he wrote down what had been said, and gave it to the marechal to read, who corrected some expressions. The abbé having proposed some further questions, he answered. "Read what Voltaire published last on the subject of the prisoner with the masque, especially at the end, and reflect on it."—The passage of Voltaire alluded to, is as follows:

"The *man with the masque*, (says he), is an enigma of which every one would guess the meaning. Some have said that it was the duke of Beaufort; but the duke of Beaufort was killed by the Turks in the defence of Candy in 1669, and the prisoner with the masque was at Pignerol in 1661. Besides, how could

the duke of Beaufort have been arrested in the midst of his army, and brought to France, without any one knowing it? and why confine him? and why that masque?—Others have dreamed that he was the count de Vermandois, natural son of Louis XIV. who died publicly at the army in 1683 of the smallpox, and was buried at the little town of Aire and not Arras; in which Father Griffet was mistaken, but in which to be sure there is no great harm. Others have imagined, that it was the duke of Monmouth, who was beheaded publicly in London in the year 1685. But for this he must have risen again from the dead, and he must have changed the order of time, and placed the year 1662 in the room of the year 1685. King James, who never forgave any one, and who on that account deserved all that happened to him, must have pardoned the duke of Monmouth, and got another to die in his stead, who perfectly resembled him. This *Sosia* must first have been found, and then he must have had the goodness to let his head be cut off in public, to save the duke of Monmouth. It was necessary that all England should be mistaken; and that King James should beg of Louis XIV. to be so obliging as to be his gaoler; that Louis XIV. after having shown this trifling piece of civility to King James, should not have been wanting in the same attention to his friend King William and to Queen Anne (with both of whom he was engaged in war), and to please them, retained the dignity of gaoler, with which James had honoured him.

"All these illusions being dissipated, it then remains to know who this prisoner was, and at what age he died. It is clear, that if he was not permitted to cross the court of the Bastile, or to speak to his physician, except covered with a masque, it must have been from the apprehension that his features and countenance might have discovered some resemblance. He could show his tongue but not his face. He said himself to the apothecary of the Bastile, a few days before his death, that he believed he was about 60. Mr Marsoban, who was son-in-law to this apothecary, and surgeon to the marechal de Richlieu, and afterwards to the regent duke of Orleans, told me this frequently. Why give him an *ITALIAN* name?—They always called him *Marchiali*. He who writes this article perhaps knows more than Father Griffet, but he will say nothing farther."

This opinion has been lately resumed, illustrated, and enforced, by M. de Saint Mibiel, in a work entitled *Le Veritable Homme, &c.* "The real Man with the Iron Masque." The author, in support of his idea, attempts to prove that Anne of Austria and Cardinal Mazarine were married. This, says he, the duchess of Orleans assures us of in three of her letters. In the first, dated Sept. 13. 1713, she expresses herself as follows: "Old Beauvais, who was first lady of the bedchamber to the queen dowager, was acquainted with the secret of the ridiculous marriage; this rendered it necessary for the queen to do every thing that her confidant wished; and this circumstance has given rise in this country to an extension of the rights of first ladies of the bedchamber." In the second of these letters, dated Nov. 2. 1717, she says, "The queen-mother, widow of Louis XIII. did worse than love Cardinal Mazarine; she married him, for he was not

* *Traité de la vérité de l'Histoire*, p. 318. n.

Masque. a priest: he was not even in orders; and who could have hindered her? He was most horribly tired of the good queen-mother, and lived on very bad terms with her, which is the reward that people deserve for entering into such marriages." In her third letter, dated July 2. 1719, speaking of the queen, the duchess says, "She was perfectly easy respecting Cardinal Mazarine; he was not a priest, and therefore nothing could prevent their being married. The secret passage through which the cardinal went every evening to the queen's apartment is still to be seen at the Palais royal." Among other proofs besides the above, which M. de St Mihiel brings to substantiate this marriage, he observes, that Mazarine held all councils of state in his apartment whilst he was shaving or dressing; that he never permitted any person to sit down in his presence, not even the chancellor nor marshal de Villeroy; and that while they were deliberating with him on state affairs, he would be often playing with his monkey or linnet. What man (continues the author) would have subjected to such humiliations a chancellor, who holds the first office in the kingdom since that of constable has been suppressed, and a marshal who was governor to the king, had he not been in reality a sovereign himself, in virtue of his being husband to the queen-regent? He therefore concludes, that the man with the iron masque was son to Anne of Austria and Cardinal Mazarine; and endeavours to justify this assertion by a variety of conjectural proofs. Of some of these we shall give a short sketch:—

1. No prince, or person of any consideration, after the year 1644, at which time the man with the iron masque was born, until the time when his existence was known, disappeared in France. This personage, therefore, was not a prince or great lord of France known at that time.

2. The man with the iron masque was not a foreigner; for foreigners, even of the highest distinction, did not at that period study the French language in such a manner as to attain so great perfection in it as to pass for Frenchmen. If this prisoner had spoken with the least foreign accent, the officers, physicians, surgeons, apothecaries, confessors, and others employed in the prisons where he was, and especially the prisoners with whom he conversed at St Margaret, would not have failed to discover it. From all this M. de St Mihiel infers that he must have been a Frenchman.

3. The existence of the man with the iron masque has been known for upwards of 90 years. Had any person of high rank disappeared at an anterior period, his friends, relations, or acquaintances, would not have failed to claim him, or at least to suppose that he was the man concealed by this masque. But no one disappeared, nor was any one claimed: the man with the iron masque was therefore a person unknown.

4. This man was not torn away from society on account of any criminal action; for when he was arrested, it was foreseen that he would cause much embarrassment, and occasion great expences. He was therefore not a criminal, else means would have been pursued to get rid of him; and consequently all the importance of his being concealed was attached solely to his person.

5. This stranger must have been a person of very
VOL. XII. Part II. †

high birth; for the governor of the prison, St Mars, behaved always to him with the greatest respect. **Masque.**

6. Louis XIII. played on the guitar; Louis XIV. did the same in a very masterly manner; and the man with the iron masque played also on that instrument: which gives us reason to believe that his education was directed by the same persons who had presided over that of Louis XIV. and who appear to have been the particular choice of Anne of Austria.

7. This stranger died on the 19th of November 1703; and a few days before his death, he told the apothecary of the Bastille, that he believed he was about 60 years of age. Supposing that he was then 59 and a half, he must have been born towards the end of May 1644; and if he was 60 wanting three months, he must have been born in the end of August, or the beginning of September, of the same year; a period when the royal authority was in the hands of Anne of Austria, but in reality exercised more by Mazarine than by her. "I have already proved (continues the author), that from the first day of the regency of Anne of Austria, the greatest friendship, and even intimacy, subsisted between this princess and the cardinal; and that these sentiments were changed into a mutual love, and that they were afterwards united by the bonds of marriage. They might, therefore, well have a son about the month of September 1644, as Louis XIII. had been then dead more than 15 months, having died on the 15th of May the year preceding. But nothing of what I have related, or of what has been written, and acknowledged as fact, respecting the man with the iron masque, can be applied, except to a son of Mazarine and Anne of Austria. The man with the iron masque, was indebted, therefore, for his existence to Cardinal Mazarine and the regent widow of Louis XIII."—To account for the manner in which the queen was able to conceal her pregnancy and delivery, Madame de Motteville is quoted: who relates, under the year 1644, that Anne of Austria quitted the Louvre, where she had resided for 29 years, because her apartments there displeased her: that she went to reside at the Palais Royal, which Richlieu, when he died, bequeathed to the deceased king: that when she first occupied this lodging, *she was dreadfully afflicted with the jaundice*: that the physicians ascribed this disorder to her dejection and application to business, which gave her much embarrassment: but that being cured of her melancholy, as well as of her malady, she resolved to think only of enjoying tranquillity; which she did, by communicating to her minister the burden of public affairs.

8. As it is necessary that some name should be given to every man, in order to distinguish him from another, that of *Marchiali* was given to the man with the iron masque: a name which evidently shows, that it had been invented by an Italian. [Cardinal Mazarine was a native of Piscina in the Abruzzo.]

9. Anne of Austria was remarkably delicate respecting every thing that touched her person. It was with great difficulty that cambric could be found fine enough to make shifts and sheets for her. Cardinal Mazarine once rallying her on this subject, said, *That if she should be damned, her punishment in hell would be to sleep in Holland sheets.* The predominant taste of the man with the iron masque, was to have lace and linen

Masque.

of the most extraordinary fineness. "Who (says the author) does not perceive, in this similarity of tastes, the maternal tenderness of Anne of Austria, who would have thought her son a great sufferer had he not been indulged with fine linen?"

"Louis XIII. (continues M. de St Mibiel) was a husband of a gloomy disposition, and an enemy to pleasure: while the queen, on the contrary, was fond of social life; and introduced at the court of France, especially after she became free, that ease and politeness which distinguished it under Louis XIV. from all the other courts of Europe. Louis XIII. had also a disagreeable countenance, and a breath so offensive, that it was a punishment for Richlieu to remain near him. It is clear, therefore, that she could not be much pleased with such a husband. When she became regent of the kingdom by the king's death, which happened on the 14th of May 1643, as she had not enjoyed that happiness which arises from a close union of hearts, it will not appear extraordinary that she should indulge the affection she entertained for Cardinal Mazarine, and that she should marry him. Every circumstance that could tend to favour such a marriage will be found united in her situation. She was at a distance from her family; absolute mistress of all her actions; and had, besides, a heart formed for love. Mazarine, though a cardinal, had never entered into orders; he gave out that he was descended from a great family; he was handsome and well made; he was of a mild, insinuating disposition, and remarkably engaging in conversation; and his office, as prime minister, afforded him every opportunity of visiting and conversing with the queen whenever he thought proper. Is it, therefore, so very astonishing, that, with so many advantages he was able to captivate the queen so far as to induce her to marry him? Such a marriage was not, indeed, according to the usual course of things. Yet it was not without many precedents, particularly among sovereigns of the other sex, who had given their hands to persons of inferior rank. As the women, however, are not forgiven so readily as the men for entering into such marriages, Anne of Austria kept hers a secret from this motive, and because she would have been in danger of losing the regency of the kingdom had it been known."

The reasoning of M. de St Mibiel is both ingenious and plausible; though the probability of the account is somewhat diminished by considering what must have been the queen's age at this period, after she had been Louis's wife for 29 years before his death.—The account immediately preceding, without this objection, seems abundantly credible. But, whether, upon the whole, either of them can be received as decisive, or, whether the mystery of the iron masque remains still to be unravelled, we must leave to the reader to determine.

MASQUE, in *Architecture*, is applied to certain pieces of sculpture, representing some hideous forms, grotesque, or satyr's faces, &c. used to fill up and adorn vacant places, as in friezes, the pannels of doors, keys of arches, &c. but particularly in grottos.

MASQUERADE, or MASCARADE, an assembly of persons masqued or disguised, meeting to dance and divert themselves. This was much in use with us, and has been long a very common practice abroad, especially in carnival time. The word comes from the Italian

mascarata, and that from the Arabic *mascara*, which signifies "raillery, buffoonery." Grauacci, who died in 1543, is said to have been the first inventor of masquerades.

MASRAKITHA, a pneumatic instrument of music among the ancient Hebrews, composed of pipes of various sizes, fitted into a kind of wooden chest, open at the top, and stopped at the bottom with wood covered with a skin. Wind was conveyed to it from the lips, by means of a pipe fixed to the chest: the pipes were of lengths musically proportioned to each other, and the melody was varied at pleasure, by stopping and unstopping with the fingers the apertures at the upper extremity. See Plate CCXCVIII.

MASS, in *Mechanics*, the matter of any body cohering with it, i. e. moving and gravitating along with it. In which sense, *mass* is distinguished from bulk, or volume, which is the expansion of a body in length, breadth, and thickness. The mass of any body is rightly estimated by its weight; and the masses of two bodies of the same weight are in a reciprocal ratio of their bulks.

MASS, *Missa*, in the church of Rome, the office or prayers used at the celebration of the eucharist; or in other words consecrating the bread and wine into the body and blood of Christ, and offering them so transubstantiated as an expiatory sacrifice for the quick and the dead. As the mass is in general believed to be a representation of the passion of our blessed Saviour, so every action of the priest, and every particular part of the service, is supposed to allude to the particular circumstances of his passion and death.

Nicod, after Baronius, observes that the word comes from the Hebrew *missach* (*oblatum*); or from the Latin *missa missorum*; because in the former times, the catechumens and excommunicated were sent out of the church, when the deacons said *Ite, missa est*, after sermon and reading of the epistle and gospel; they not being allowed to assist at the consecration. Menage derives the word from *missio*, "dismissing;" Others from *missa*, "missing, sending;" because in the mass, the prayers of men on earth are sent up to heaven.

The general division of masses consists in high and low. The first is that sung by the choristers, and celebrated with the assistance of a deacon and sub-deacon; low masses are those in which the prayers are barely rehearsed without singing.

There are many different or occasional masses in the Romish church, some of which have nothing peculiar but the name: such are the masses of the saints; that of St Mary of the snow, celebrated on the fifth of August; that of St Margaret, patroness of lying-in-women; that of the feast of St John the Baptist, at which are said three masses; that of the innocents, at which the gloria in excelsis and the hallelujah are omitted, and it being a day of mourning, the altar is of a violet colour. As to ordinary masses, some are said for the dead, and, as is supposed, contribute to fetch the soul out of purgatory: at these masses the altar is put in mourning, and the only decorations are a cross in the middle of six yellow wax-lights; the dress of the celebrant, and the very mass-book, are black; many parts of the office are omitted, and the people are dismissed without the benediction.

If

Masque

||

Massachu-
setts.

If the mass be said for a person distinguished by his rank or virtues, it is followed with a funeral oration; they erect a *chappelle ardente*, that is, a representation of the deceased with branches and tapers of yellow wax, either in the middle of the church, or near the deceased's tomb, where the priest pronounces a solemn absolution of the deceased. There are likewise private masses said for stolen or strayed goods or cattle, for health, for travellers, &c. which go under the name of *votive masses*. There is still a further distinction of masses denominated from the countries in which they were used; thus the Gothic mass, or *missa mosarabum*, is that used among the Goths when they were masters of Spain, and which is still kept up at Toledo and Salamanca; the Ambrosian mass is that composed by St Ambrose, and used only at Milan, of which city he was bishop; the Gallic mass, used by the ancient Gauls; and the Roman mass, used by almost all the churches in the Romish communion.

Mass of the Presanctified (*missa presanctificatorum*), is a mass peculiar to the Greek church, in which there is no consecration of the elements; but after singing some hymns, they receive the bread and wine which was before consecrated. This mass is performed all Lent, except on Saturdays, Sundays, and the annunciation. The priest counts upon his fingers the days of the ensuing week on which it is to be celebrated, and cuts off as many pieces of bread at the altar as he is to say masses; and after having consecrated them, steepes them in wine, and then puts them in a box; out of which, upon every occasion, he takes some of it with a spoon, and putting it on a dish sets it upon the altar.

MASSA, a town of Italy, in the kingdom of Naples, and in the Terra di Lavoro, with a bishop's see; seated on a mountain near the sea, in E. Long. 10. 0. N. Lat. 43. 5.

MASSA, an ancient, populous, and handsome town of Italy, and capital of a small territory of the same name, with the title of a principality, and a strong castle. It is famous for quarries of fine marble, and is situated in E. Long. 14. 23. N. Lat. 40. 40.

MASSACHUSETTS, one of the United States of North America. This is one of the five states included under the name of NEW ENGLAND; and a pretty full account having been given, under that article, of the situation, soil, productions and population of the whole, we shall confine ourselves here, to the leading facts connected with this particular state.

Massachusetts has the state of New York on the west, the sea on the east, New Hampshire and Vermont on the north, and Connecticut and Rhode Island on the south. Its area is about 6250 square miles. It is rather a hilly country, and not generally fertile, though some of the valleys are very rich. The climate is variable and the winter long. The mean temperature of the year is 49°, though the latitude is only 42. The annual quantity of rain at Cambridge is 47½ inches; the number of rainy days in the year, 88.

This is the most densely peopled state in the Union, the population in 1810, being 472,040, which is about 75 persons to each square mile. There are no slaves in this state. The principal town is Boston, which in 1818 had a population of 40,000 (Fearon's Travels). It is a place of great commercial activity; its tonnage

in 1815 was 137,008. The tonnage of the whole state was 454,205, which was greater than that of any other state in the Union. The exports, in 1817, were 11,927,997 dollars, of which 5,908,416 were domestic, and 6,009,581 foreign produce. The whale fishery is a leading branch of this commerce. In 1811 there were 1200 sailors in this trade, belonging to the small island of Nantucket, which is its principal seat. Ship-building is carried on in this state to a great extent. The whole value of the manufactures for the year 1810 was 18,536,933 dollars. The principal domestic articles exported are flour, corn, rice, tobacco, cotton, beef, pork, cheese, butter, oil, whalebone, lumber, naval stores, &c. The foreign articles imported are piece goods, hardware, wines, spirits, teas, sugar, cocoa, &c. A canal 25 miles in length, connects the harbour of Boston with the river Merrimack. Agriculture is conducted with much skill. The principal productions are India corn, rye, oats, barley, potatoes, hemp, flax. Wheat is but little cultivated, being subject to blight.

The inhabitants of this state are generally well educated, industrious, temperate, persevering, shrewd and resolute; but they are charged with hypocrisy, craft, obstinacy, a spirit parsimonious and selfish, and a temper severe and contentious. They are generally decent in their manners, and capital crimes are rare.

The legislative power resides in a senate and house of representatives. The senators and representatives are elected annually by all persons who have freehold estates of the annual value of three pounds, or any estate to the value of sixty pounds. The governor is also chosen annually. The judges hold their office during good behaviour. There is no state religion. The Congregationalists are the most numerous sect, the Baptists next. There are some Episcopalians, Methodists, and Quakers.

The district of MAINE, which extends along the Atlantic to the British colony of New Brunswick, is united with the state of Massachusetts. It covers an area of 32,628 square miles. It is similar in soil to Massachusetts, but rather more hilly and barren. It only contains about 1500 families. See UNITED STATES, SUPPLEMENT.

MASSACRE, a term used to signify the sudden and promiscuous butchery of a multitude. The most atrocious example of this kind upon record is that called the *Parisian MASSACRE*, or *Massacre of St Bartholomew's Day*. The Parisian massacre was carried on with such detestable perfidy, and executed with such a bloody cruelty as would surpass all belief, were it not attested by the most undeniable evidence. In the year 1572, in the reign of Charles IX. many of the principal Protestants were invited to Paris, under a solemn oath of safety, upon occasion of the marriage of the king of Navarre with the French king's sister; viz. the king of Navarre's mother, Coligni admiral of France, with other nobles. The queen-dowager of Navarre, a zealous Protestant, was poisoned by a pair of gloves before the marriage was solemnized; and on the 24th of August 1572, being Bartholomew's day, about daybreak, upon the toll of the bell of the church of St Germain, the butchery began. The admiral was basely murdered in his own house; and then thrown out of the window, to gratify the malice of the duke of Guise; his head was af-

Massachu-
setts,
Massacie.

Massacre. afterwards cut off, and sent to the king and queen-mother; and his body, after a thousand indignities offered to it, hung up by the feet on a gibbet. After this, the murderers ravaged the whole city of Paris, and butchered in three days above ten thousand lords, gentlemen, presidents, and people of all ranks. An horrible scene of things, says Thuanus, when the very streets and passages resounded with the noise of those that met together for murder and plunder; the groans of those who were dying, and the shrieks of such as were just going to be butchered, were everywhere heard; the bodies of the slain thrown out of the windows; the courts and chambers of the houses filled with them; the dead bodies of others dragged through the streets, their blood running down the channels in such plenty, that torrents seemed to empty themselves in the neighbouring river; and in a word, an innumerable multitude of men, women with child, maidens, and children, were all involved in one common destruction; and the gates and entrances of the king's palace all besmeared with their blood.

From the city of Paris the massacre spread almost throughout the whole kingdom. In the city of Meaux they threw above two hundred into jail; and after they had ravished and killed a great number of women, and plundered the houses of the Protestants, they executed their fury on those they had imprisoned, and calling them out one by one, they were killed, as Thuanus expresses, like sheep in a market; the bodies of some were flung into ditches, and of others into the river Maine. In Orleans they murdered above five hundred men, women, and children, and enriched themselves with their spoil. The same cruelties were practised at Angers, Troyes, Bourges, La Charité, and especially at Lyons, where they inhumanly destroyed above eight hundred Protestants; children hanging on their parents necks; parents embracing their children; putting ropes about the necks of some, dragging them through the streets, and throwing them, mangled, torn, and half dead, into the river.

It would be endless to mention the butcheries committed at Valence, Romaine, Rouen, &c. We shall, therefore, only add, that, according to Thuanus, above thirty thousand Protestants were destroyed in this massacre, or as others with greater probability affirm, above one hundred thousand. Yet medals were struck at Paris in honour of it.

But how were the news of this butchery received at Rome, that faithful city, that holy mother of churches! How did the vicar of Christ, the successor of Peter, and the father of the Christian world, relish it? Let Thuanus tell the horrid truth. When the news, says he, came to Rome, it was wonderful to see how they exulted for joy. On the 6th of September, when the letters of the pope's legate were read in the assembly of the cardinals, by which he assured the pope that all was transacted by the express will and command of the king, it was immediately decreed that the pope should march with his cardinals to the church of St Mark, and in the most solemn manner give thanks to God for so great a blessing conferred on the see of Rome and the Christian world; and that on the Monday after, solemn mass should be celebrated in the church of Minerva; at which the pope, Greg. XIII. and cardinals were present; and that a jubilee should

be published throughout the whole Christian world, and the cause of it declared to be, to return thanks to God for the extirpation of the enemies of the truth and church in France. In the evening the cannon of St Angelo were fired, to testify the public joy; the whole city illuminated with bonfires; and no one sign of rejoicing omitted that was usually made for the greatest victories obtained in favour of the Roman church.

MASSAGETÆ, an ancient people about whose seat there is as much doubt as about that of the Amazons; Tibullus and Ammian place them near Albania, beyond the Araxes, which sometimes denotes the Oxus; it is probable they dwelt to the east of Sogdiana, (Dionysius Periegetes, Herodotus, Arrian).

MASSALIANS, a set of enthusiasts who sprang up about the year 361, in the reign of the emperor Constantius, who maintained that men have two souls, a celestial and a diabolical, and that the latter is driven out by prayer.

MASSANIELLO. See *History of NAPLES*.

MASSETER, in *Anatomy*. See there (*Table of the Muscles*).

MASSICOT. See **MASTICOT**.

MASSIEU, WILLIAM, a learned French writer, member of the Academy of Belles Lettres, and of the French Academy, was born at Caen in Normandy in 1665, and completed his studies at Paris, when he entered amongst the Jesuits; but afterwards left them, that he might follow his inclination to polite literature with the greater freedom. In 1710 he was made Greek professor in the royal college; and enjoyed that post till his death, which happened at Paris in 1722. He wrote, 1. Several curious dissertations in the *Memoirs of the Academy of Inscriptions*. 2. *A history of the French poetry*, in 12mo, &c.

MASSILIA, in *Ancient Geography*, a town of Gallia Narbonensis, peopled by a colony of Phocæans, from Phocæa, a city of Ionia, universally celebrated, not only for its port, commerce, and strength, but especially for its politeness of manners and for its learning. Now *Marsilles*, a city of Provence.

MASSILLON, JEAN BAPTISTE, son of a notary at Hieres in Provence, was born in 1663, and entered into the congregation of the oratory in 1681. He gained the affections of every person in the towns to which he was sent, by the charms of his genius, the liveliness of his character, and by a fund of the most delicate and unaffected politeness. His first attempts in the art of eloquence were made at Vienne, while he was professor of theology. His funeral oration on Henry de Villars, archbishop of that city, received universal approbation. This success induced Father de la Tour, who was at that time general of the congregation, to call him to Paris. After he had been there for some time, he was asked what he thought of the preachers who made a figure on that great theatre?—"I find them possessed of great genius and abilities (answered he); but if I preach, I will not preach like them." He in fact kept his word, and struck out a new path in this great field of eloquence. P. Bourdaloue was excepted from the number of those whom he proposed not to imitate. If he did not take him for a model in every thing, the reason was, that his genius led him to a different species of eloquence.—

His

Massillon. His manner of composing, therefore, was peculiar to himself, and in the opinion of men of taste and judgement, was superior to that of Bourdaloue. The affecting and natural simplicity of the father of the oratory, (said a great man), appears fitter to bring home the truths of Christianity to the heart than all the dialectics of the Jesuit. We must seek for the logic of the gospel in our own breasts; and the most powerful reasonings on the indispensable duty of relieving the distressed, will make no impression on that man who has beheld without concern the sufferings of his brother. If logic is necessary, it is only in matters of opinion; and these are fitter for the press than for the pulpit, which ought not to be the theatre of learned discussions. The truth of these reflections was clearly perceived when he appeared at court. Upon preaching his first Advent sermon at Versailles, he received this eulogium from the mouth of Louis XIV. "Father, when I hear others preach, I am very well pleased with them; but whenever I hear you, I am dissatisfied with myself." The first time he preached his famous sermon *on the small number of the elect*, the whole audience were, at a certain place of it, seized with a sudden and violent emotion, and almost every person half rose from his seat by a kind of involuntary movement. The murmur of acclamation and surprise was so great that it threw the orator into confusion; but this only heightened the impression of that pathetic discourse. What was most surprising in Massillon, were his descriptions of the world, which were so sublime, so delicate, and so striking in the resemblance. When he was asked, whence a man, like him, whose life was dedicated to retirement, could borrow them; he answered "From the human heart; however little we examine it, we will find in it the seeds of every passion. When I compose a sermon (added he), I imagine myself consulted upon some doubtful piece of business. I give my whole application to determine the person who has recourse to me, to act the good and proper part. I exhort him, and urge him, and I leave him not till he has yielded to my persuasions." His declamation did not fail to be accompanied with success. "We think we see him in our pulpits (say those who had the pleasure of hearing him), with the simple air, the modest carriage, the downcast and humble looks, the easy gesture, the affecting tone, and the countenance of a man deeply penetrated with his subject, conveying the clearest information to the understanding, and raising the most tender emotions in the heart." Baron, the famous comedian, having met him one day in a house which was open for the reception of men of letters, paid him this compliment: "Continue to deliver as you do. Your manner is peculiar to yourself; leave the observance of rules to others." When this famous actor came from hearing one of his sermons, truth drew from him the following confession, which is so humiliating to his profession: "Friend (said he to one of his companions who accompanied him), here is an *orator*; we are only *actors*."

In 1704, Massillon made his second appearance at court, and displayed still more eloquence than before. Louis XIV. after expressing his satisfaction to him, added, in the most gracious tone of voice, *Et je veux, mon pere, vous entendre tous les deux ans.* These flat-

tering encomiums did not lessen his modesty. When **Massillon.** one of his fellows was congratulating him upon his preaching admirably, according to custom; Oh! give over, Father (replied he), the devil has told me so already, much more eloquently than you." The duties of his office did not prevent him from enjoying society; and in the country he forgot that he was a preacher, but always without trespassing against decency. One day when he was at the house of M. de Crozat, the latter said to him, "Father, your doctrine terrifies me, but I am encouraged by your life." He was chosen on account of his philosophical and conciliatory disposition of mind, to reconcile the cardinal de Noailles with the Jesuits. All he gained by his attempts was the displeasure of both parties; and he found that it was easier to convert sinners than to reconcile theologians. In 1717, the regent, personally acquainted with his merit, appointed him to the bishopric of Clermont. The next year, being destined to preach before Louis XV. who was only nine years of age, he composed in six weeks those discourses which are so well known by the name of *Petit Careme*. These are the chef d'œuvre of this orator, and indeed of the oratorical art. They ought continually to be read by preachers as models for the formation of their taste, and by princes as lessons of humanity.

Massillon was admitted into the French academy a year afterwards, in 1719. The abbacy of Savigny becoming vacant, the cardinal du Bois, to whom he had been weak enough to give an attestation for being a priest, procured it for him. The funeral oration of the duchess of Orleans, in 1723, was the last discourse he pronounced in Paris. He never afterwards left his diocese, where his gentleness, politeness, and kindness, had gained him the affection of all who knew him. He reduced the exorbitant rights of the episcopal roll to moderate sums. In two years, he caused 20,000 livres to be privately conveyed to the Hotel Dieu of Clermont. His peaceable disposition was never more displayed than while he was a bishop. He took great pleasure in collecting the fathers of the oratory and the Jesuits at his country house, and in making them join in some diversion. He died on the 28th of September 1742, at the age of 79. His name has become that of eloquence itself. Nobody ever knew better how to touch the passions. Preferring sentiment to every thing else, he communicated to the soul that lively and salutary emotion which excites in us the love of virtue. What pathetic eloquence did his discourses display! what knowledge of the human heart! what constant disclosing of a mind deeply affected with his subject! what strain of truth, philosophy and humanity! what imagination, at once the most lively, and guided by the soundest judgment! Just and delicate thoughts; splendid and lofty ideas; elegant, well chosen, sublime, and harmonious expressions; brilliant and natural images; true and lively colouring; a clear, neat, swelling and copious style, equally suited to the capacity of the multitude, and fitted to please the man of genius, the philosopher, and the courtier, form the character of Massillon's eloquence, especially in his *Petit Careme*. He could at once think, describe, and feel. It has been justly observed concerning him, that he was to Bourdaloue what Racine was to Corneille. To give the finishing stroke

Massillon. stroke to his eulogium, Of all the French orators, he is the most esteemed by foreigners.

An excellent edition of Massillon's works was published by his nephew at Paris in 1745 and 1746, in 14 vols. large 12mo, and 12 vols. of a small size.— Among them we find, 1. Complete sets of Sermons for Advent and Lent. It is particularly in his moral discourses, such as are almost all those of his sermons for Advent and Lent, that Massillon's genius appears. He excels, says M. d'Alembert, in that species of eloquence, which alone may be preferred to all others, which goes directly to the heart, and which agitates without wounding the soul. He searches the inmost recesses of the heart, and lays open the secret workings of the passions, with so delicate and tender a hand, that we are hurried along rather than overcome. His diction, which is always easy, elegant, and pure, everywhere partakes of that noble simplicity, without which there can be neither good taste nor true eloquence; and this simplicity is, in Massillon, joined to the most attractive and the sweetest harmony, from which it likewise borrows new graces. In short, to complete the charm produced by this enchanting style, we perceive that these beauties are perfectly natural; that they flow easily from this source, and that they have occasioned no labour to the composer. There even occur sometimes in the expressions, in the turns, or in the affecting melody of his style, instances of negligence which may be called happy, because they completely remove every appearance of labour. By thus abandoning himself to the natural current of thought and expression, Massillon gained as many friends as hearers. He knew, that the more anxious an orator appears to raise admiration, he will find those who hear him the less disposed to bestow it. 2. Several Funeral Orations, Discourses, and Panegyrics, which had never been published. 3. Ten discourses, known by the name of *Petit Careme*. 4. The *Conferencés Ecclesiastiques*, which he delivered in the seminary of St Magloire upon his arrival at Paris; those which he delivered to the curates of his diocese; and the discourses which he pronounced at the head of the synods which he assembled every year. 5. Paraphrases on several of the Psalms. The illustrious author of these excellent tracts wished that they had introduced into France a practice which prevails in England, of reading sermons instead of preaching them from memory; a custom which is very convenient, but by which all the warmth and fervour of eloquence are lost. He, as well as two others of his brethren, had stopt short in the pulpit exactly on the same day.— They were all to preach at different hours on Good-Friday, and they went to hear one another in succession. The memory of the first failed; which so terrified the other two, that they experienced the same fate. When our illustrious orator was asked, what was his best sermon? he answered, "That which I am most master of." The same reply is ascribed to Bourdaloue. The celebrated P. la Rue was of the opinion of Massillon, that getting by heart was a slavery which deprived the pulpit of a great many orators, and which was attended with many inconveniences to those who dedicated themselves to it. The abbé de la Porte has collected into one vol. 12mo, the most striking ideas, and the most sublime strokes, which occur in the works

of the celebrated bishop of Clermont. This collection, which is made with great judgment, appeared at Paris in 1748, 12mo, and forms the 15th volume of the large edition in 12mo, and the 13th of the small in 12mo. It is entitled, *Pensées sur differens sujets de morale et de pieté, tirées, &c.*

MASSINGER, PHILIP, an English dramatic poet, was born at Salisbury about the year 1581, and was educated at Oxford. He left the university without taking any degree; and went to London to improve his poetical genius by polite conversation. There he wrote many tragedies and comedies, which were received with vast applause, and were greatly admired for the economy of the plots and the purity of the style. He was at the same time a person of the most consummate modesty; which rendered him extremely beloved by the poets of his time, particularly by Fletcher, Middleton, Rowley, Field, and Decker, who thought it an honour to write in conjunction with him. He was as remarkable for his abilities as his modesty. He died suddenly at his house on the Bank-side in Southwark, near the playhouse; and was interred in St Saviour's churchyard, in the same grave with Mr Fletcher the poet.

MASSIVE, among builders, an epithet given to whatever is too heavy and solid: thus a massive column is one too short and thick for the order whose capital it bears; and a massive wall is one whose openings or lights are too small in proportion.

MASSON, PAFIRIUS, a French writer, was the son of a rich merchant, and born in the territory of Forez, May 1544. After studying the belles lettres and philosophy, and travelling to different places, he came to Paris, where he was made librarian to the chancellor of the duke of Anjou, in which place he continued ten years. In 1576, he was made an advocate of parliament; yet never pleaded but one cause, which, however, he gained with universal applause.— When the troubles of France were at an end, he married the sister of a counsellor in parliament, with whom he lived thirty-four years, but had no issue by her.— The infirmities of age attacked him some time before his death, which happened Jan. 9. 1611. He wrote four books of French annals in Latin, first printed at Paris 1577, and afterwards in 1598, 4to. The second edition, more enlarged than the first, deduces things from Pharamond to Henry II. Masson considered this as his principal performance; yet he is now chiefly known by his *Elogia virorum clarissimorum*, although he published several other works.

MASSON, John, a reformed minister in Holland some years ago. He was originally of France, but fled into England, to enjoy that liberty in religion which his country refused him. He wrote, 1. *Histoire critique de la republique des lettres*, from 1712 to 1717, in 15 vols 12mo. 2. *Vite Horatii, Ovidii, et Plinii junioris*, 3 vols small 8vo, and printed abroad, though dedicated to Englishmen of rank: the first at Leyden, 1708, to Lord Harvey; the second at Amsterdam, 1708, to Sir Justinian Isham; the third at Amsterdam, 1709, to the bishop of Worcester. These lives are drawn up in a chronological order, very learnedly and very critically; and serve to illustrate the history, not only of those particular persons, but of the times also in which they lived. 3. *Histoire de Pierre Bayle et des ses ouvrages*; Amsterdam, 1716, in 12mo. This

Masson, at least is supposed to be his, though at first it was given to M. la Monnoye.

MASSON, *Antony*, an eminent French engraver, who flourished towards the conclusion of the last century, and resided chiefly at Paris. It appears that he sometimes amused himself with painting portraits from the life, some of which he also engraved. We have no account of the life of this extraordinary artist; nor are we even informed from what master he learned the principles of engraving. He worked entirely with the graver, and handled that instrument with astonishing facility. He seems to have had no kind of rule to direct him with respect to the turning of the strokes; but twisted and twirled them about, without the least regard to the different forms he intended to express, making them entirely subservient to his own caprice. Yet the effect he has produced in this singular manner (Mr Strutt observes), is not only far superior to what one could have supposed, but is often very picturesque and beautiful. It was not in historical engraving that his greatest strength consisted. He could not draw the naked parts of the human figure so correctly as was necessary; but where the subject required the figures to be clothed, he succeeded in a wonderful manner. Among the most esteemed works by this admirable artist, may be reckoned the following: The assumption of the Virgin, a large upright plate from Rubens; a holy family, a middling-sized plate, lengthwise, from N. Mignard; Christ with the pilgrims at Emaus, a large plate, lengthwise, from Titian, the original picture of which is in the cabinet of the king of France. This admirable print is commonly known by the name of *the table cloth*: for the cloth, with which the table is covered, is executed in a very singular style. Also the following portraits, among others: The Comte de Harcourt, a large upright plate, reckoned a masterpiece in this class of subjects; Guillaume de Brisacier, secretary to the queen of France; and a middling-sized upright plate: usually known in England by the name of *the Gray-headed Man*, because the hair in this print is so finely executed.

MASSUAH, a small island in the Red sea, near the coast of Abyssinia, about three quarters of a mile long, and half as broad, one-third of which is occupied by houses, another by cisterns for receiving rain-water, and one reserved for a burial place. It has an excellent harbour, with water sufficiently deep for ships of any size to the very edge of the island; and so well secured, that they may ride in safety, let the wind blow from what quarter or with what degree of strength it will. By the ancients it was called *Sebasticum Os*, and was formerly a place of great consequence on account of its harbour, from whence a very extensive commerce was carried on, and possessed a share of the Indian trade in common with other ports of the Red sea near the Indian ocean.—A very considerable quantity of valuable goods was also brought thither from the tract of mountainous country behind it, which in all ages has been accounted very inhospitable, and almost inaccessible to strangers. The principal articles of exportation were gold, ivory, elephants and buffaloes hides; but above all, slaves, who, on account of their personal qualifications, were more esteemed than those from any other quarter.

Pearls of a considerable size, and of a fine water, are likewise found along the coast; from the abundance of all which valuable commodities, the great defect, a want of water, was forgot, and the inhabitants cheerfully submitted to such a great inconvenience. The island of Massuah fell under the power of the Turks in the time of the emperor Selim, soon after the conquest of Arabia Felix by Sinan Basha, and was for some time governed by an officer from Constantinople. From thence the conquest of Abyssinia was for some time attempted, but always without success. Hence it began to lose its value as a garrison for troops, as it had done in the commercial way after the discovery of the passage to India by the Cape of Good Hope.—Being thus deprived of its importance in every respect, the Turks no longer thought it worth while to send a bashaw thither as formerly, but conferred the government upon the chief of a tribe of Mahometans named *Belowie*, who inhabit the coasts of the Red sea under the mountains of Habab, in the latitude of about 14° north. On this officer they conferred the title of *Naybe*; and on the removal of the bashaw, he remained in fact master of the place, though, to save appearances, he pretended to hold it from the Ottoman Porte, by a firman from the Grand Signior for that purpose, and the payment of an annual tribute.

The Turks had originally put into the town of Massuah a garrison of Janizaries; who, being left there on the withdrawing of the bashaw, and intermarrying with the natives, soon became entirely subjected to the naybe's influence. The latter finding himself at a great distance from his protectors the Turks, whose garrisons were everywhere falling into decay, and that in consequence of this he was entirely in the power of the emperor of Abyssinia, began to think of taking some method of securing himself on that side. Accordingly it was agreed that one half of the customs should be paid to the Abyssinian monarch; who in return was to allow him to enjoy his government unmolested. Having thus secured the friendship of the emperor of Abyssinia, the naybe began gradually to withdraw the tribute he had been accustomed to pay to the bashaw of Jidda, to whose government Massuah had been assigned; and at last to pay as little regard to the government of Abyssinia; and in this state of independence he was when Mr Bruce arrived there in 1769 on his way to Abyssinia. This gentleman found both the prince and his people extremely inhospitable and treacherous; so that he underwent a variety of dangers during his residence there, nor was it without great difficulty that he could get away from thence at last.

The island of Massuah, as we have said, is entirely destitute of water; nor can it be supplied with provisions of any kind but from the mountainous country of Abyssinia on the continent. It is consequently in the power of the emperor of that country, or of his officer the baharnagash, to starve Massuah and Arkeeko, by prohibiting the passage of any provisions from the Abyssinian side of the mountains.

The houses of Massuah are generally constructed of long poles and bent grass, as is usual with other towns of Arabia: only about 20 are of stone, and six or eight of these two stories high. The stones which they are built have been drawn out of the sea; and

Massuah
||
Mast.

and in them the bed of that curious muscle found embodied in the solid rock at Mahon is frequently to be seen. These are called *dattoli da mare*, or sea dates: but our author never saw any of the fish themselves, though he has no doubt that they may be met with in the rocky islands of Massuah, if they would take the trouble of breaking the rocks for them. All the necessaries of life are very dear in this place; and their quality is also very indifferent, owing to the distance from whence they must be brought, and the danger of carrying them through the desert of Sambar, as well as to the extortions of the naybe himself, who, under the name of *customs*, takes whatever part of the goods he thinks proper; so the profit left to the merchant is sometimes little or nothing.

Though Massuah has now lost very much of its commercial importance, a considerable trade is still carried on from the place. From the Arabian side are imported blue cotton and other cloths; some of them from India being very fine. Other articles are Venetian beads, crystal, looking and drinking glasses, with cohol or crude antimony. These three last articles come in great quantity from Cairo, first in the coffee ships to Jidda, and then in small barks to the port of Massuah. Old copper is also a valuable article of commerce. The Galla and all the various tribes to the westward of Gondar wear bracelets of this metal, which in some parts of that barbarous country is said to sell for its weight of gold. Here is also a shell, an univalve of the species of volutes, which sells at a high price, and passes for money among the various tribes of Galla. The Banians were once the principal merchants of Massuah; but their number is now reduced to six, who are silversmiths, and subsist by making ornaments for the women on the continent. They likewise essay gold, but make a poor livelihood.

MASSUET, RENE, or RENATUS, a very learned Benedictine of the congregation of St Maur, was born at S. Owen de Macelles, in 1665. He is chiefly known for the new edition of St Irenæus, which he published in 1710. He consulted several manuscripts, which had never been examined for that purpose, and made new notes and learned prefaces. He died in 1716, after having written and published several other works.

MAST, a long round piece of timber, elevated perpendicularly upon the keel of a ship, to which are attached the yards, the sails, and the rigging. A mast, with regard to its length, is either formed of one single piece, which is called a *pole-mast*, or composed of several pieces joined together, each of which retains the name of mast separately. The lowest of these is accordingly named the *lower mast*, *a* fig. 1.; the next in height is the top-mast, *b*, fig. 2. which is erected at the head of the former; and the highest is the top-gallant-mast, *c*, fig. 3. which is prolonged from the upper end of the top-mast. Thus the two last are no other than a continuation of the first upwards.

The lower-mast is fixed in the ship by an apparatus described in the articles HULK and SHEERS: the foot, or heel of it rests in a block of timber called the *step*, which is fixed upon the *keelson*: and the top-mast is attached to the head of it by the *cap* and the *trestle-trees*. The latter of these are two strong bars of timber, sup-

ported by two prominences, which are as shoulders on the opposite sides of the mast, a little under its upper end: athwart these bars are fixed the *cross-trees*, upon which the frame of the top is supported. Between the lower mast head and the foremost of the cross-trees, a square space remains vacant, the sides of which are bounded by the two trestle-trees. Perpendicularly above this is the foremost hole in the cap, whose after hole is solidly fixed on the head of the lower-mast. The top-mast is erected by a tackle, whose effort is communicated from the head of the lower-mast to the foot of the top-mast; and the upper end of the latter is accordingly guided into and conveyed up through the holes between the trestle-trees and the cap, as above mentioned. The machinery by which it is elevated, or according to the sea phrase, *swayed up*, is fixed in the following manner: the top rope *d*, fig. 4. passing through a block *e*, which is hooked on one side of the cap, and afterwards through a hole, furnished with a sheave or pulley *f*, on the lower end of the top-mast, is again brought upwards on the other side of the mast, where it is at length fastened to an eye-bolt in the cap *g*, which is always on the side opposite to the top-block *e*. To the lower end of the top-rope is fixed the top-tackle *h*, the effort of which being transmitted to the top-rope *d*, and thence to the heel of the top-mast *f*, necessarily lifts the latter upwards, parallel to the lower-mast. When the top-mast is raised to its proper height, the lower end of it becomes firmly wedged in the square hole above described, between the trestle-trees. A bar of wood or iron called the *fid*, is then thrust through a hole *i* in the heel of it, across the trestle-trees, by which the whole weight of the top-mast is supported.

In the same manner as the top-mast is retained at the head of the lower-mast, the top-gallant-mast is erected, and fixed at the head of the top-mast.

Besides the parts already mentioned in the construction of masts, with respect to their length, the lower masts of the largest ships are composed of several pieces united into one body. As these are generally the most substantial parts of various trees, a mast, formed by this assemblage, is justly esteemed much stronger than one consisting of any single trunk, whose internal solidity may be very uncertain. The several pieces are formed and joined together, as represented in the section of a lower-mast of this sort, fig. 5. where *a* is the shaft, or principal piece into which the rest are fixed, with their sides or faces close to each other. The whole is secured by several strong hoops of iron, driven on the outside of the mast, where they remain at proper distances.

The principal articles to be considered in equipping a ship with masts are, 1st, the number; 2d, their situation in the vessel; and, 3d, their height above the water.

The masts being used to extend the sails by means of their yards, it is evident, that if their number were multiplied beyond what is necessary, the yards must be extremely short, that they may not entangle each other in working the ship, and by consequence their sails will be very narrow, and receive a small portion of wind. If, on the contrary, there is not a sufficient number of masts in the vessel, the yards will be too large

if wishball set.

Mast. large and heavy, so as not to be managed without difficulty. There is a mean between these extremes, which experience and the general practice of the sea have determined; by which it appears, that in large ships every advantage of sailing is retained by three masts and a bowsprit.

The most advantageous position of the masts is undoubtedly that from whence there results an equilibrium between the resistance of the water on the body of the ship on the one part, and of the direction of their effort on the other. By every other position this equilibrium is destroyed, and the greatest effort of the masts will operate to turn the ship horizontally about its direction; a circumstance which retards her velocity. It is counterbalanced indeed by the helm; but the same inconvenience still continues; for the force of the wind having the resistance of the helm to overcome, is not entirely employed to push the vessel forward. The axis of the resistance of the water should then be previously determined, to discover the place of the *main-mast*, in order to suspend the efforts of the water equally, and place the other masts so as that their particular direction will coincide with that of the main-mast. The whole of this would be capable of a solution, if the figure of the vessel were regular, because the point, about which the resistance of the water would be in equilibrio, might be discovered by calculation.

But when the real figure of the ship is considered, these flattering ideas will instantly vanish. This observation induced M. Saverien to employ a mechanical method to discover the axis of resistance of the water, which he apprehended might be used with success in the manner following:

Fig. 6.

When the vessel is launched, before the places of the masts are determined, extend a rope AB, fig. 6. from the head to the stern. To the extremities A and B attach two other ropes, AD, BC, and apply to the other ends of these ropes two mechanical powers, to draw the ship according to the direction BC, parallel to itself. The whole being thus disposed, let a moveable tube Z, fixed upon the rope AB, have another rope ZR attached to it, whose other end communicates with a mechanical power R, equal to the two powers D and C. This last being applied to the same vessel, in such manner as to take off the effects of the two others by sliding upon the rope AB, so as to discover some point Z, by the parallelism of the ropes AD, BC feebly extended with the rope ZR; the line ZR will be the axis of the equilibrium of the water's resistance, and by consequence the main mast should be planted in the point Z.

The figures E, E, E, are three windlasses on the shore, by which this experiment is applied.

With regard to the situation of the other masts, it is necessary, in the same manner, to discover two points; so that the direction of the two mechanical powers operating, will be parallel to the axis of resistance RZ already found.

The exact height of the masts, in proportion to the form and size of the ship, remains yet a problem to be determined. The more the masts are elevated above the centre of gravity, the greater will be the surface of sail which they are enabled to present to the wind; so far an additional height seems to have been advantageous. But this advantage is diminished by the cir-

cular movement of the mast, which operates to make the vessel stoop to its effort; and this inclination is increased in proportion to the additional height of the mast, an inconvenience which it is necessary to guard against. Thus what is gained upon one hand is lost upon the other. To reconcile these differences, it is certain that the height of the mast ought to be determined by the inclination of the vessel, and that the point of her greatest inclination should be the term of this height above the centre of gravity. See the article TRIM.

With regard to the general practice of determining the height of the masts, according to the different rates of the ships in the royal navy, the reader is referred to the article SAIL.

In order to secure the masts, and counterbalance the strain they receive from the effort of the sails impressed by the wind, and the agitation of the ship at sea, they are sustained by several strong ropes, extended from the upper ends to the outside of the vessel, called *shrouds*, marked 5, 5, 5, in fig. 4. and 5. They are further supported by other ropes, stretched from their heads towards the fore part of the vessel.

The mast, which is placed at the middle of the ship's length, is called the *main-mast*; that which is placed in the fore part, the *fore-mast*; and that which is towards the stern, is termed the *mixen-mast*.

N. B. *Mixen* is applied to this mast by all the nations of Europe, except the French, who alone call the fore-mast *misaine*.

MASTER, a title given to several officers and persons of authority and command; particularly to the chiefs of the orders of knighthood, &c.—Thus we say the grand master of Malta; of St Lazarus; of the Golden Fleece; of the Free Masons, &c.

MASTER (*Magister*), was a title frequent among the Romans: they had their master of the people, *magister populi*, who was the dictator. Master of the cavalry, *magister equitum*, who held the second post in an army after the dictator. Under the later emperors there were also masters of the infantry, *magistri peditum*. A master of the census, *magister census*, who had nothing of the charge of a censor, or subcensor, as the name seems to intimate; but was the same with the *præpositus frumentariorum*.

MASTER of the Militia (*magister militia*), was an officer in the lower empire, created, as it is said, by Dioclesian, who had the inspection and government of all the forces, with power to punish, &c. somewhat like a constable of France. At first there were two of these officers instituted, the one for the infantry, and the other for the cavalry; but the two were united into one under Constantine. Afterwards, as their power was increased, so was their number also; and there was one appointed for the court, another for Thrace, another for the East, and another for Illyria. They were afterwards called *comites*, *counts*, and *clarissimi*. Their power was only a branch of that of the *præfectus prætorii*, who by that means became a civil officer.

MASTER of Arms (*magister armorum*), was an officer or comptroller under the master of the militia.

MASTER of the Offices (*magister officiorum*), had the superintendance of all the officers of the court; he was also called *magister officii palatini*, simply *magister*; and

Master. his post *magisteria*.—This officer was the same in the western empire with the *curopalates* in the eastern.

MASTER at Arms, among us, is an officer appointed to teach the officers and crew of a ship of war the exercise of small arms; to confine and plant centinels over the prisoners, and superintend whatever relates to them during their confinement. He is also to observe that the fire and lights are all extinguished as soon as the evening gun is fired, except those which are permitted by proper authority, or under the inspection of centinels. It is likewise his duty to attend the gangway when any boats arrive aboard, and search them carefully, together with their rowers, that no spirituous liquors may be conveyed into the ship unless by permission of the commanding officers. In these several duties he is assisted by proper attendants, called his *corporals*, who also relieve the centinels and one another at certain periods.

MASTER of Arts, the first degree taken up in foreign universities, but the second in ours; candidates not being admitted to it till they have studied in the university seven years.

MASTER-Attendant, is an officer in the royal dockyards, appointed to hasten and assist at the fitting out or dismantling, removing, or securing vessels of war, &c. at the port where he resides. He is particularly to observe, that his majesty's ships are securely moored, and for this purpose he is expected frequently to review the moorings which are sunk in the harbour, and observe that they are kept in proper repair. It is also his duty to visit all the ships in ordinary, and see that they are frequently cleaned and kept in order; and to attend at the general musters in the dockyards, taking care that all the officers, artificers, and labourers, registered in the navy-books, are present at their duty.

MASTER of the Ceremonies, is an officer instituted by King James I. for the more solemn and honourable reception of ambassadors, and strangers of quality, whom he introduces into the presence.—The badge of this office is a gold chain and medal, having on one side an emblem of peace, with King James's motto; and on the reverse the emblem of war, with *Dieu et mon droit*. He is always supposed to be a person of good address, and a master of languages, and has an appointment of 300l. a-year: he is constantly attending at court, and hath under him an assistant master, or deputy, at 6s. 8d. a-day, who holds his place during the king's pleasure.

There is also a third officer, called *marshal of the ceremonies*, with 100l. a-year, whose business is to receive and distribute the master's orders, or the deputy's, for the service; but without their order he can do nothing. This is the king's gift.

MASTERS of Chancery are usually chosen out of the barristers of the common law; and sit in chancery, or at the rolls, as assistants to the lord chancellor and the master of the rolls. All these, so late as the reign of Queen Elizabeth, were commonly doctors of the civil law.—To them are also committed interlocutory reports, examination of bills in chancery, stating of accounts, taxing costs, &c. and sometimes, by way of reference, they are empowered to make a final determination of causes.

They have, time out of mind, had the honour to sit

in the house of lords, though they have neither writs nor patent to empower them; but they are received as assistants to the lord chancellor and master of the rolls. They had anciently the care of inspecting all writs of summons, which is now performed by the clerk of the petty bag. When any message is sent from the lords to the commons, it is carried by the masters of chancery. Before them also affidavits are made, and deeds and recognizances acknowledged.

Besides these, who may be called *masters of chancery ordinary*, (being 12 in number, whereof the master of the rolls is reputed the chief), there are also masters of chancery extraordinary, appointed to act in the several counties of England beyond 10 miles distance from London, by taking affidavits, recognizances, &c. for the ease of the suitors of the court.

MASTER of the Faculties, an officer under the archbishop of Canterbury, who grants licenses and dispensations: he is mentioned in the statute 22 and 23 Car. II. See *COURT of Faculties*.

MASTER Gunner. See *GUNNER*.

MASTER of the Horse is reckoned the third great officer of the court, and is an office of great honour and antiquity, and always (when not put in commission), filled by noblemen of the highest rank and abilities. He has the management and disposal of all the king's stables and bred horses. He has authority over the equerries and pages, coachmen, footmen, grooms, riders of the great horse, farriers, and smiths. He appoints all the other tradesmen who work for the king's stables; and by his warrant to the avenor, makes them give an oath to be true and faithful. In short, he is intrusted with all the lands and revenues appropriated for the king's breed of horses, the expences of the stable, and of the coaches, litters, &c. He alone has the privilege of making use of any of the king's horses, pages, footmen, &c.; and at any solemn cavalcade he rides next the king, and leads a horse of state. His salary is 1276l. 13s. 4d. per annum. There is also a master of the horse in the establishment of her majesty's household, with a salary of 800l. a-year.

MASTER of the Household, is an officer under the treasurer of the household, in the king's gift: his business is to survey the accounts of the household.—He has 66l. 13s. 4d. a-year wages, and 433l. 6s. 6d. board wages.

MASTER of the Mint, was anciently the title of him who is now called *warden of the mint*; whose office is to receive the silver and bullion which comes to the mint to be coined, and to take care thereof. The office of master and worker is now distinct: and this officer is allowed for himself and three clerks 560l. a-year.

MASTER of the Ordnance. See *ORDNANCE*.

MASTER of the Revels, an officer with an appointment of 100l. a-year, whose business is to order all things relating to the performance of plays, masques, balls, &c. at court. Formerly he had also a jurisdiction of granting licenses to all who travel to act plays, puppet shows, or the like diversions; neither could any new play be acted at either of the two houses till it had passed his perusal and license; but these powers were afterwards much abridged, not to say annihilated, by a statute for regulating playhouses, till the licensing plays by the lord chamberlain was established.

Master.

Master. established. This officer has a yeoman with 46l. 11s. 8d. a-year.

MASTER of the Rolls, a patent officer for life; who has the custody of the rolls and patents which pass the great seal, and of the records of the chancery.

In the absence of the lord chancellor or keeper, he also sits as judge in the court of chancery; and is by Sir Edward Coke called his *assistant*.

At other times he hears causes in the rolls chapel, and makes orders and decrees. He is also the first of the masters of chancery, and has their assistance at the rolls: but all hearings before him are appealable to the lord chancellor.

He has also his writ of summons to parliament, and sits next to the lord chief justice of England on the second woolpack. He has the keeping of the parliament rolls, and has the rolls-house for his habitation; as also the custody of all charters, patents, commissions, deeds and recognisances, which being made of rolls of parchment gave rise to the name. Anciently he was called *clerk of the rolls*.

The authority of the master of the rolls to hear and determine causes, and his general power in the court of chancery, were the subject of divers questions and disputes which were very warmly agitated; to quiet which it was declared by stat. 3 Geo. II. cap. 30. that all orders and decrees by him made, except such as by the course of the court were appropriated to the great seal alone, should be deemed to be valid; subject nevertheless to be discharged or altered by the lord chancellor, and so as they shall not be enrolled till the same are signed by his lordship.

In his gift are the six clerks in chancery, the examiners, three clerks of the petty-bag, and the six clerks of the rolls chapel where the rolls are kept. See **ROLLS, CLERK, &c.**

The master of the rolls is always of the privy council; and his office is of great profit, though much short of what it has been.

MASTER of a Ship, an officer to whom is committed the direction of a merchant vessel, who commands it in chief, and is charged with the merchandises on abroad.

In the Mediterranean the master is frequently called *patron*, and in long voyages *captain*.

It is the proprietor of the vessel that appoints the master; and it is the master who provides the equipage, hires the pilots, sailors, &c. The master is obliged to keep a register of the seamen and officers, the terms of their contract, the receipts and payments, and, in general, every thing relating to his commission.

MASTER of a Ship of War, is an officer appointed by the commissioners of the navy, to take charge of navigating a ship from port to port under the direction of the captain. The management and disposition of the sails, the working of a ship into her station in the order of battle, and the direction of her movements in the time of action, and in other circumstances of danger, are also more particularly under his inspection. It is likewise his duty to examine the provisions, and accordingly to admit none into the ship but such as are sound, sweet, and wholesome. He is moreover charged with the stowage; and for the performance of these services

he is allowed several assistants who are properly termed *mates* and *quartermasters*.

MASTER of the Temple. The founder of the order of the templars, and all his successors, were called *magni templi magistri*; and ever since the dissolution of the order, the spiritual guide and director of the house is called by that name. See **TEMPLE** and **TEMPLAR**.

There were also several other officers under this denomination, as master of the wardrobe, with a salary of 2000l. a-year; master of the harriers, with 2000l. a-year; master of the staghounds, with 800l. a-year; master of the jewel-office, &c. all now abolished.

MASTER and Servant; a relation founded in convenience, whereby a man is directed to call in the assistance of others, where his own skill and labour will not be sufficient to answer the cares incumbent upon him. For the several sorts of servants, and how that character is created or destroyed, see the article **SERVANT**. In the present article, we shall consider, first, the effect of this relation with regard to the parties themselves; and, secondly, its effects with regard to others.

1. The manner in which this relation affects either the master or servant. And, first, by hiring and service for a year, or apprenticeship under indentures, a person gains a settlement in that parish wherein he last served 40 days. In the next place, persons serving seven years as apprentices to any trade have an exclusive right to exercise that trade in any part of England. This law, with regard to the exclusive part of it, has by turns been looked upon as a hard law, or as a beneficial one, according to the prevailing humour of the times: which has occasioned a great variety of resolutions in the courts of law concerning it; and attempts have been frequently made for its repeal, though hitherto without success. At common law every man might use what trade he pleased; but this statute restrains that liberty to such as have served as apprentices: the adversaries to which provision say, that all restrictions (which tend to introduce monopolies) are pernicious to trade; the advocates for it allege, that unskilfulness in trades is equally detrimental to the public as monopolies. This reason indeed only extends to such trades, in the exercise whereof skill is required: but another of their arguments goes much farther; viz. that apprenticeships are useful to the commonwealth, by employing of youth, and learning them to be early industrious; but that no one would be induced to undergo a seven years servitude, if others, though equally skilful, were allowed the same advantages without having undergone the same discipline: and in this there seems to be much reason. However, the resolutions of the courts have in general rather confined than extended the restriction. No trades are held to be within the statute, but such as were in being at the making of it: for trading in a country village, apprenticeships are not requisite, and following the trade seven years is sufficient without any binding; for the statute only says, the person must serve as an apprentice, and does not require an actual apprenticeship to have existed.

A master may by law correct his apprentice for negligence

Master. negligence or other misbehaviour, so it be done with moderation: though, if the master or master's wife beats any other servant of full age, it is good cause of departure. But if any servant, workman, or labourer, assaults his master or dame, he shall suffer one year's imprisonment, and other open corporal punishment, not extending to life or limb.

By service all servants and labourers, except apprentices, become entitled to their wages; according to agreement, if menial servants; or according to the appointment of the sheriff or sessions, if labourers or servants in husbandry; for the statutes for regulation of wages extend to such servants only; it being impossible for any magistrate to be a judge of the employment of menial servants, or of course to assess their wages.

2. Let us now see how strangers may be affected by this relation of master and servant; or how a master may behave towards others on behalf of his servant, and what a servant may do on behalf of his master.

And, first, the master may *maintain*, that is, abet and assist, his servant in any action at law against a stranger: whereas, in general, it is an offence against public justice to encourage suits and animosities, by helping to bear the expence of them, and is called in law *maintenance*. A master also may bring an action against any man for beating or maiming his servant: but in such case he must assign, as a special reason for so doing, his own damage by the loss of his service; and this loss must be proved upon the trial. A master likewise may justify an assault in defence of his servant, and a servant in defence of his master: the master, because he has an interest in his servant, not to be deprived of his service; the servant, because it is part of his duty, for which he receives his wages, to stand by and defend his master. Also if any person do hire or retain my servant, being in my service, for which the servant departeth from me and goeth to serve the other, I may have an action for damages against both the new master and the servant, or either of them; but if the new master did not know that he is my servant, no action lies; unless he afterwards refuse to restore him upon information and demand. The reason and foundation upon which all this doctrine is built, seem to be the property that every man has in the service of his domestics; acquired by the contract of hiring, and purchased by giving them wages.

As for those things which a servant may do on behalf of his master, they seem all to proceed upon this principle, that the master is answerable for the act of his servant, if done by his command, either expressly given or implied: *nam qui facit per alium, facit per se*. Therefore, if the servant commit a trespass by the command or encouragement of his master, the master shall be guilty of it: not that the servant is excused, for he is only to obey his master in matters that are honest and lawful. If an innkeeper's servants rob his guests, the master is bound to restitution; for as there is a confidence reposed in him, that he will take care to provide honest servants, his negligence is a kind of implied consent to the robbery; *nam qui non prohibet, cum prohibere possit, jubet*. So likewise if the drawer at a tavern sells a man bad wine, whereby his health is injured, he may bring an action against the master; for although the master did not expressly order the ser-

vant to sell it to that person in particular, yet his permitting him to draw and sell it at all is implied a general command. **Master.**

In the same manner, whatever a servant is permitted to do in the usual course of his business, is equivalent to a general command. If I pay money to a banker's servant, the banker is answerable for it: If I pay it to a clergyman's or a physician's servant, whose usual business it is not to receive money for his master, and he embezzles it, I must pay it over again. If a steward lets a lease of a farm, without the owner's knowledge, the owner must stand to the bargain: for this is the steward's business. A wife, a friend, a relation, that use to transact business for a man, are *quoad hoc* his servants; and the principal must answer for their conduct: for the law implies, that they act under a general command; and without such a doctrine as this no mutual intercourse between man and man could subsist with any tolerable convenience. If I usually deal with a tradesman by myself, or constantly pay him ready money, I am not answerable for what my servant takes up upon trust; for here is no implied order to the tradesman to trust my servant: but if I usually send him upon trust, or sometimes on trust and sometimes with ready money, I am answerable for all he takes up; for the tradesman cannot possibly distinguish when he comes by my order and when upon his own authority.

If a servant, lastly, by his negligence does any damage to a stranger, the master shall answer for his neglect: if a smith's servant lames a horse while he is shoeing him, an action lies against the master, and not against the servant. But in these cases the damage must be done while he is actually employed in the master's service; otherwise the servant shall answer for his own misbehaviour. Upon this principle, by the common law, if a servant kept his master's fire negligently, so that his neighbour's house was burned down thereby, an action lay against the master; because this negligence happened in his service: otherwise, if the servant, going along the street with a torch, by negligence sets fire to a house; for there he is not in his master's immediate service, and must himself answer the damage personally. But now the common law is, in the former case, altered by statute 6 Ann. c. 3. which ordains, that no action shall be maintained against any in whose house or chamber any fire shall accidentally begin; for their own loss is sufficient punishment for their own or their servant's carelessness. But if such fire happens through negligence of any servant (whose loss is commonly very little), such servant shall forfeit 100l. to be distributed among the sufferers; and, in default of payment, shall be committed to some workhouse, and there kept to hard labour for 18 months. A master is, lastly, chargeable if any of his family layeth or casteth any thing out of his house into the street or common highway, to the damage of any individual, or the common nuisance of his majesty's liege people; for the master hath the superintendance of all his household. And this also agrees with the civil law; which holds, that the *pater familias*, in this and similar cases, *ob alterius culpam tenetur, sive servi, sive liberi*.

We may observe, that in all the cases here put, the master may be frequently a loser by the trust reposed in

Master
||
Mastiff.

in his servant, but never can be a gainer: he may frequently be answerable for his servant's misbehaviour, but never can shelter himself from punishment by laying the blame on his agent. The reason of this is still uniform and the same; that the wrong done by the servant is looked upon in law as the wrong of the master himself; and it is a standing maxim, that no man shall be allowed to make any advantage of his own wrong.

MASTER Load, in mining, a term used to express the larger vein of a metal, in places where there are several veins in the same mountain. Thus it happens, that there are seven, sometimes five, but more usually three veins or loads, parallel to each other, in the same mountain. Of these the middle vein is the largest, and is called the *master load*.

MASTER Wort. See IMPERATORIA, BOTANY *Index*.

MATIFICATION, the action of chewing, or of agitating the solid parts of our food between the teeth, by the motion of the jaws, the tongue, and the lips, whereby it is broken into small pieces, impregnated with saliva, and so fitted for deglutition and a more easy digestion. See ANATOMY, N^o 104.

MASTICH, a kind of resin exuding from the lenticus tree; and brought from Chio, in small yellowish transparent grains or tears of an agreeable smell, especially when heated or set on fire. See PISTACHIA.

This resin is recommended in old coughs, dysenteries, hemoptoës, weakness of the stomach, and in general in all debilities and laxity of the fibres. Geoffroy directs an aqueous decoction of it to be used for these purposes: but water extracts little or nothing from this resin. Rectified spirit almost entirely dissolves it, and the solution is very warm and pungent. Mastich is to be chosen in drops, clear, well-scented, and brittle.

We meet with a kind of cement sometimes kept in the shops under the name of mastich. It is composed of this gum, and several other ingredients, and is formed into cakes for use. This is intended for the service of lapidaries, to fill up cracks in stones, &c. but is by no means to be used for any medicinal purposes.

MASTICOT, **MASSICOT**, or **YELLOW LEAD**, is the calx or ashes of lead, gently calcined, by which it is changed to yellow of lighter or deeper tint, according to the degree of calcination. Masticot is sometimes used by painters, and it serves medicinally as a drier in the composition of ointments or plasters. The masticot which is used by the Dutch as the ground of their glazing, is prepared by calcining a mixture of one hundred weight of clean sand, forty-four pounds of soda and barilla, and thirty pounds of pearl ashes.

MASTIFF DOG, **BAND DOG**, (*canis villaticus*, or *catenarius*), is a species of great size and strength, and a very loud barker. Manwood says, that it derives its name from *masc thefesc*, being supposed to frighten away robbers by its tremendous voice. Great Britain was formerly so noted for its mastiffs, that the Roman emperors appointed an officer in this island, with the title of *Procurator Cynegii*, whose sole business was to breed, and transmit from hence to the amphitheatre, such as would prove equal to the combats of the place. Strabo, lib. iv. tells us, that the mastiffs of Britain were

trained for war, and used by the Gauls in their battles. See CANIS, MAMMALIA *Index*.

MASTIGADOUR, or **SLABBERING-BIT**, in the manege, a snaffle of iron, all smooth, and of a piece, guarded with paternosters, and composed of three halves of great rings, made into demi-ovals, of unequal bigness; the lesser being enclosed within the greater, which ought to be about half a foot high.

MASULAPATAN, a populous town of Asia in the East Indies, and on the coast of Coromandel, in the dominions of the Great Mogul. It carried on a great trade, and most nations in Europe had factories here; but the English have now left it, and even the Dutch themselves have not above a dozen people here to carry on the chintz trade. The inhabitants are Gentoos, who will not feed on any thing that has life; and they had a famous manufacture of chintz, which is greatly decayed since the English left off buying. The Great Mogul has a customhouse here; and the adjacent countries abound in corn, tobacco, and timber for building. It is seated on the west side of the bay of Bengal, 200 miles north of Fort St George. E. Long. 81. 25. N. Lat. 16. 30.

MATAKA, or **MANTACA**, a commodious bay in America, on the north coast of the island of Cuba. Here the galleons usually come to take in fresh water in their return to Spain. It is 35 miles from the Havannah. W. Long. 85. 6. N. Lat. 25. 0.

MATAMAN, a country of Africa, bounded by Benguela on the north, by Monomotapa on the east, by Caffraria on the south, and by the Atlantic ocean on the west. There is no town in it, and the inhabitants live in miserable huts, it being a desert country, and but little visited by the Europeans.

MATAN, or **MACTAN**, an island of Asia in the East Indian sea, and one of the Philippines. The inhabitants have thrown off the yoke of Spain; and it was here that Magellan was killed in April 1521.

Cape MATAPAN, the most southern promontory of the Morea, between the gulf of Coran and that of Colo-China.

MATARAM, a large town of Asia, formerly the capital of an empire of that name in the island of Java. It is strong by situation, and is seated in a very fertile, pleasant, and populous country, surrounded with mountains. E. Long. 111. 25. S. Lat. 7. 55.

MATARO, a town of Spain, in Catalonia; seated on the coast of the Mediterranean, 15 miles north-east of Barcelona, and 35 south-west of Gironne. It is a small town, but industrious and well-peopled; and the environs abound in vineyards, which produce wine much famed for its flavour. It likewise contains several manufactories, and is considered as one of the richest and most active towns in Catalonia. E. Long. 2. 35. N. Lat. 41. 30.

MATCH, a kind of rope slightly twisted, and prepared to retain fire for the uses of artillery, mines, fireworks, &c.

It is made of hempen tow, spun on the wheel like cord, but very slack; and is composed of three twists, which are afterwards again covered with tow, so that the twists do not appear: lastly, it is boiled in the lees of old wines. This, when once lighted at the end, burns on gradually and regularly, without ever going out

Mastiff
||
Match.

Match
||
Mate.

out till the whole be consumed : the hardest and driest match is generally the best.

Quick-MATCH. See *QUICK-MATCH.*

MATCHING, in the wine trade, the preparing vessels to preserve wines and other liquors, without their growing sour or vapid. The method of doing it is as follows : Melt brimstone in an iron ladle, and when thoroughly melted, dip into it slips of coarse linen cloth ; take these out, and let them cool ; this the wine-coopers call a *match*. Take one of these matches, set one end of it on fire, and put it into the bung-hole of a cask ; stop it loosely, and thus suffer the match to burn nearly out ; then drive in the bung tight, and set the cask aside for an hour or two. At the end of this time examine the cask, and you will find that the sulphur has communicated a violent pungent and suffocating scent to the cask, with a considerable degree of acidity, which is the gas and acid spirit of the sulphur. The cask may after this be filled with a small wine which has scarce done its fermentation ; and bunging it down tight, it will be kept good, and will soon clarify : this is a common and very useful method ; for many poor wines could scarce be kept potable even a few months without it.

MATE of a SHIP of WAR, an officer under the direction of the master, by whose choice he is generally appointed, to assist him in the several branches of his duty. Accordingly, he is to be particularly attentive to the navigation in his watch, &c. to keep the *log* regularly, and examine the line and glasses by which

the ship's course is measured, and to adjust the sails to the wind in the fore part of the ship. He is to have a diligent attention to the cables, seeing that they are well *coiled* and kept clean when laid in the *tier*, and sufficiently *served* when employed to ride the ship. Finally, he is to superintend and assist at the stowage of the hold, taking especial care that all the ballast and provisions are properly stowed therein.

MATE of a Merchant Ship, the officer who commands in the absence of the master thereof, and shares the duty with him at sea ; being charged with every thing that regards the internal management of the ship, the directing her course, and the government of her crew.

The number of mates allowed to ships of war and merchantmen is always in proportion to the size of the vessel. Thus a first-rate man of war has six mates, and an East-Indiaman the same number ; a frigate of 10 guns, and a small merchant ship, but only one mate in each ; and the intermediate ships have a greater or smaller number, according to their several sizes, or to the services on which they are employed.

DURA and PIA MATER, the names given by anatomists to the two membranes which surround the brain. See **ANATOMY**, N^o 129, 130.

MATERA, a considerable town of Italy, in the kingdom of Naples, and in the Terra d'Otranto, with a bishop's see, seated on the river Canapro. E. Long. 16. 43. N. Lat. 40. 51.

Materia.

MATERIA MEDICA AND PHARMACY.

INTRODUCTION.

¹
Definition
of materia
medica ;

THAT department of medical science which treats of the nature, effects, and uses of those remedies that are employed for the prevention or removal of disease is called **MATERIA MEDICA**. It comprises the *natural history* of the articles, or an account of those circumstances by which they may be distinguished, and of the means of procuring and preserving them ; their *chemical history*, or an account of the changes which they undergo from the action of various reagents, the mode of analyzing them, of separating their most useful principles, and of ascertaining their purity ; and their *medical history*, or an account of their sensible effects on the animal system both in the healthy and morbid state, with their application to the practice of medicine.

²
and of
pharmacy.

The art of collecting, and preserving the various substances employed in medicine, and of reducing them to those forms that are best suited to the various purposes for which they are exhibited, is called **PHARMACY**. This art is practised by the trading chemist and the apothecary ; and at least the principles of it form a necessary part of education to every member of the medical profession.

In the present edition of our **ENCYCLOPÆDIA**, it is proposed to treat of these two subjects together, since

they are intimately connected, and when considered under the same treatise, will occupy much less room.

We shall divide this article into four parts ; in the first of which we shall briefly treat of those articles that are employed to support life, or of diet ; in the second we shall treat of remedies in general, and shall arrange them into classes according to their action on the animal economy ; in the third we shall consider the methods of preparing them for exhibition, or shall lay down the general principles of pharmacy ; and in the fourth we shall briefly notice each of the articles employed in medicine, whether simple or officinal, and mention the most important circumstances necessary to be known respecting them.

As the limits which have been assigned to this article are extremely confined, it cannot be expected that the subject will be treated at any great length. Contrary to usual practice, we shall dwell most on the general circumstances of materia medica and pharmacy, and shall be as brief on the individual articles as is consistent with perspicuity and practical utility.

We shall not at present enter on a historical account of the writers on the materia medica and pharmacy. If we find room for such an account, we shall introduce it at the end of this article, where we conceive it would be most properly placed. It will be expected, however, that we should mention some of the most approved

proved works on these subjects, and this we shall here do very briefly.

As one of the principal modern writers on the materia medica, it will be sufficient to mention the name of Cullen. His work is still considered as classical, and is in the hands of every medical man. Whatever we may think of the reasoning and hypothesis which it contains, and however much we may be fatigued with the prolixity of some parts of the work, we shall always set a just value on the useful facts and practical remarks with which it abounds. It is to be regretted that Dr Cullen did not prepare a second edition of the materia medica before the infirmities of age had rendered him less qualified for the work, as in many respects the first edition is preferable to the second.

There are three works which Dr Cullen warmly recommended, and which he thought so excellent that he wished them to be in the hands of all his readers. These are Dr Lewis's "Experimental History of the Materia Medica," as published in 8vo by Dr Aikin; Bergius's "Materia Medica è regno Vegetabili;" and the "Apparatus Medicaminum" of Professor Murray of Gottingen.

Soon after Dr Cullen published the second edition of his Materia Medica, a new edition of Lewis by Aikin appeared, superior to the former chiefly in containing the improvements made by the London college in their Pharmacopœia in 1788. Dr Lewis's work is still valuable for the facts which it contains relative to the natural history of the substances, and the action of several chemical agents on them; but from the late changes that have been made in chemical nomenclature, the language in which it is written has already become obsolete.

Professor Murray had published but a small part of his "Apparatus Medicaminum," when the last edition of Cullen's Materia Medica appeared. He, however, lived to complete that part of his work which treats of vegetable substances, of which five volumes were published during his life, and a sixth after his death, by Dr Althof. In this last volume an account is given of columba root, angustura bark, myrrh, and several other medicines, which could not properly be introduced into the general arrangement, as the plants from which they are procured were not certainly known.

A continuation of Murray's Apparatus Medicaminum in two volumes, containing an account of mineral substances, was published by Professor Gmelin in 1795. It is very good, but will scarcely now be consulted when the improved state of modern chemistry has given rise to the production of so many excellent works on the same subject.

In 1788 Dr Donald Munro published a work on chemistry, pharmacy, and the materia medica, in three volumes 8vo, under the title of "Medical and Pharmaceutical Chemistry." At the time of its publication, it was the best work of the kind in our language; and it is still very valuable, though the late improvements in chemistry have in some measure diminished the utility of the chemical part of the work.

About ten years ago was published the first volume

of a small work, entitled, A Practical Synopsis of the Materia Alimentaria and Materia Medica, by an anonymous author, who had also some time before published the *Thesaurus Medicaminum*. After an interval of ten years, this synopsis is at length completed by the publication of the second part of the second volume; and we consider it as one of the most useful works on the subjects on which it treats. Both it and the *Thesaurus* abound with excellent practical observations, but the arrangement adopted will in some respects be considered as antiquated. Of this more hereafter. As these two works are intimately connected, it is to be wished, that in a subsequent edition they should be united into one, in which form they would make two moderate 8vo volumes.

In 1804 Mr Murray, lecturer on chemistry and materia medica in Edinburgh, published his Elements of Materia Medica and Pharmacy, in two volumes, of which the second is chiefly a translation of the new edition of the Edinburgh Pharmacopœia, with some useful remarks. In his first volume, Mr Murray has made some ingenious observations on the general action of medicines, which, independently of the theory he adopts, we consider among the most valuable parts of his work.

Few works have had a more extensive circulation than the Edinburgh New Dispensatory, a work which was founded on the New Dispensatory of Dr Lewis published in 1753. Of this dispensatory several successive editions were published under the direction of Dr Webster, Dr Duncan, and Dr Rotheram, till in 1803 a new work, under the same title, was published by Dr Andrew Duncan, junior. Of this improved Dispensatory we need say little; the rapid sale of three large editions, and the call which has been made for a fourth, sufficiently evince the opinion which the public has formed of its utility and execution. It is perhaps the most complete guide to the practical apothecary which we have in any language.

In 1805 was published a small volume containing a tabular view of the Materia Medica by Dr Kirby. This little work is intended as a manual to the young practitioner, and comprehends all the articles of the materia medica that are received into the Pharmacopœias of Edinburgh, London, and Dublin, arranged into classes; and the mode of prescribing them is illustrated by appropriate formulæ. Owing to the indifferent state of the author's health when this volume was printed, it is disfigured by numerous typographical errors; but these are in general only literal; and such as might mislead the practitioner are corrected in the table of *Errata*.

Among the best foreign publications on materia medica and pharmacy we may enumerate

- Arnemann's *Therapeia Generalis*;
- Mirabelli's *Apparatus Medicaminum*;
- Bouillon Lagrange *Manual de Pharmaciën*;
- Swediaur's *Materia Medica*;
- Swediaur's *Pharmacopœia*; and the foreign Pharmacopœias referred to in Duncan's Dispensatory.

PART I. DIETETICS.

¹⁵
Dietetics.

THE subject of diet and regimen was much more attended to by the ancient physicians than it has been by those of modern times. In the writings of Hippocrates and Celsus we find some excellent remarks both on diet in general and on the particular diet that is suitable to sick people; and for many centuries these authors formed our only guides. Of late, indeed, this necessary branch of the healing art has been very successfully cultivated, and several valuable works have been published on the subject. Of these we shall here enumerate a few of the more respectable.

¹⁶
Writers on
Diet.

Cullen's *Materia Medica*, vol. i.
Plenk's *Bromatologia*;
Synopsis of Materia Alimentaria and Materia Medica,
vol. i.
Fordyce on *Digestion*;
Nisbet on *Diet*;
Halle's *Articles on Diet in Encyclopédie Methodique*;
Dictionary of Medicine;
Beddoes's *Hygeia*;
Sir John Sinclair's *Code of Health and Longevity*.

In the brief sketch that we can here give of dietetics, we shall first treat of food in general, and then mention most of the animal and vegetable substances that have been or may be employed to support life.

¹⁷
Of food in
general.

All food is either of an animal or vegetable origin. The former is, no doubt, more allied to our nature, and most easily assimilated to its nourishment; the latter, though digested with more difficulty, is the foundation of the former, as vegetables are the nourishment of animals, and all food is therefore properly derived from this source. In many respects, however, vegetable and animal food differ; and this difference it is proper to remark, according to the various effects it displays on different parts of the human system. In the choice of vegetable food, a much nicer selection is made by man than by any other animal; and his choice is chiefly confined to those of a *mild, bland nature*, and of an agreeable taste. When any other substances are selected, it is entirely for the purpose of condiment or medicine. The first difference to be observed between animal and vegetable food, is with respect to their effects on the stomach and bowels. In the stomach, vegetable food always displays a tendency to acescency, while animal food, on the contrary, tends towards putrefaction. Hence the former is apt to produce symptoms of uneasiness, while the latter in moderate quantity is almost never felt. In the same way, facility of solution belongs to vegetable food; while from greater firmness of texture, and viscosity, animal food is apt to oppress. Nor does the latter, from its oily texture, always mix easily in the stomach with other matters; while vegetables unite readily, but frequently continue long on the stomach for want of a proper stimulus. Similar effects are produced in the bowels by these different kinds of food, as well as in the stomach. The acescency of vegetable food is at all times apt to induce looseness; while the same effect is never known to arise from animal food, except in a

very advanced state of putrefaction. On the contrary, the body is generally kept by it in a regular state; while vegetables, from the lesser portion of them going into chyle, produce a larger proportion of feculent matter, and lie longer in the bowels from their inactive nature before being expelled.

The nourishment conveyed by both kinds of food is much the same; but the animal product is in greater quantity, and more easily digested, while the vegetable retains its more watery nature, with a portion of unassimilating saline matter, which, though introduced, is again expelled by some of the excretions. The animal blood is then richer, more elaborated and stimulating, and excites a stronger action of the system than that produced from vegetables. Both products, however, equally take on an alkalescent nature in the circulation; for the acescency of the vegetable is confined entirely to its action on the stomach and bowels. Thus, from animal food a greater supply of nourishment is received for the wants of the system, depending on its greater quantity of oil, and its longer retention in the body than vegetable food. Agreeably to these different effects of animal and vegetable food, it is farther to be observed, that the latter is more quickly perspirable than the former. Hence the tendency to obesity, which arises from animal food; while part of the vegetable aliment is very quickly carried off by urine.

The combination of a vegetable and animal diet, is certainly best suited to preserve a proper state of health and strength. There are few who subsist entirely upon vegetables, and of these few, the constitutions are generally feeble, sickly, and weak, and they are the constant victims to complaints of the stomach and bowels. Where this method of life is at all practised, it is confined to hot climates, where vegetable diet may no doubt be carried to a greater extent without injury. Some nations also have gone to the other extreme, and live entirely on animal food; and in a very cold atmosphere, this may be indulged beyond what would otherwise be safe for the health of the body, so that a mixture of vegetable and animal nourishment seems best fitted for the health of man. But the proportion in which these ought to be used, is a point equally necessary to be inquired into. The benefits that attend animal food are clearly the giving a superior strength and vigour; but, in proportion as it carries this to excess, it exposes the body to dangerous consequences, and to the production of various diseases. Hence those who exceed in the animal, or what we may term the athletic diet, are soon worn out, and fall the victims of the over proportion of strength which such living bestows.

The advantages again of vegetable food, are mostly of the passive kind, and though it is difficult of assimilation, yet under certain circumstances, a tolerable degree of strength and vigour may be acquired from it. It is more favourable for the appetite than animal food, and little injury can arise from too much repletion with it. It has many advantages over animal food, as it in-

Dietetic. introduces no improper acrimony into the system, and counteracts the baneful effects of animal diet. It is to this preference of vegetable food that the French owe their freedom from disease in a greater degree than the English: and the best rule to secure health, perhaps, is to confine infancy and youth mostly to a vegetable diet; manhood, and the decay of life, to animal food; while near the end of life, the vegetable system should again be returned to. But, whatever kind of diet we adopt, a variety in the form of our food, as well as the nature of it, should be attended to. Thus the constant use of solid nourishment, however wholesome and nutritious, by giving the stomach more to do than is necessary, must be attended with hurtful consequences. In the same way a perseverance in the liquid aliment, however fit by its qualities for conveying chyle into the system, could not fail to prove an improper diet, by depriving the stomach of that necessary stimulus from its form, which solid food conveys. A mixture, therefore, of solid and fluent nourishment is absolutely necessary, whatever the nature of that nourishment may be, and this proportion must be regulated by the different situations of different individuals. A man who is subjected to much bodily exertion, requires certainly the proportion of solid food to exceed, and likewise to be taken in the most permanent and nutritive state. A man again accustomed to little bodily labour, and subjected to the ease and inactivity of a sedentary life, should reverse this plan, and the proportion of liquid should be increased. In the use of the different kinds of food, the same regulations are proper. Where, along with a sedentary life, the stomach rejects much vegetable food, and a tendency to acidity renders its use improper, the bad consequences of an excess of animal diet must be corrected by giving it in the most soluble and diluted form. Thus the use of soups and broths becomes highly proper, as giving the sufficient stimulus of animal food to the stomach, and at the same time presenting it in a form by which a considerable part quickly passes off, and the excess of nourishment which constant animal food would produce is greatly counteracted. It is to this cause that we may attribute the little injury which animal food is known to produce in Scotland, and also in France, where soups are much used.

²¹
Proper quantity of food. With respect to the quantity of food to be actually taken, this must be regulated much by the appetite and the supply required. The appetite is the great indication of health; and where the stomach is in a healthy state, it relishes almost every kind of nourishment that is presented. This being the case, we are entirely to be regulated in the quantity taken in by the appetite. Satiety is the natural consequence of repletion, and before this takes place, the stomach itself gives the alarm.

Among popular writers it has been a common axiom that a small quantity of food is most easily digested, and that we should rise from table with an appetite. This idea proceeds entirely from the opinion that digestion is effected by the muscular power of the stomach. But it is a truth sufficiently established that this is not the case. It depends entirely on the fluid of the stomach, or gastric secretion, and is performed by the application of this fluid equally well out of the body as within the organ. Indeed we may suppose that a con-

Vol. XII. Part II.

siderable quantity of food, when taken, by producing a greater stimulus or irritation of the stomach, will increase the gastric fluid, and thus accelerate the process of digestion. At the same time it must be observed that there is in infancy a proper foundation for this restriction. The gastric fluid in children is more active, and their stomach yields more readily to distention; the appetite, therefore, will continue longer before the sense of satiety takes place: but even here, as the diet is mostly of a diluted kind, and soon passes off, we believe that more has been attributed to the effects of repletion, as the cause of disease in children, than what it deserves.

The proper rule, in all cases, is that the body should be sufficiently nourished, whatever the nature or the quantity of the nourishment employed may be, and this is best determined by the apparent state of the body, and what is again lost by it, or the quantity of its different discharges. The body also, we may observe, is at all times under the influence of habit, and where it is accustomed to be circumscribed, it is often amazing to find what small quantities of nourishment will suffice, and even health be preserved. Of this we have a number of remarkable instances brought forward by medical writers. Nor is this confined solely to man; the inferior animals show that their bodies can accommodate themselves to similar circumstances. This being the case, the constitution of man is limited in this respect less, even in civilized life, than what has been alleged. The chief point in health is to guard against extremities; for a uniform mode of life, even where errors are conspicuous, is always less dangerous than sudden excess, either of one kind or another.

²²
Dietetic. The manner of taking food also requires attention. In all solid nourishment a proper chewing should take place; this is a preparatory and necessary step to the action of the fluid in the stomach; but this chewing should not be carried, as some have advised, too far. Something should be left for the stomach to do, and this organ will be found improved by exercise and by increasing its active powers, as well as any other part of the body. Hence substances rather of difficult digestion may be at times properly presented to it.

²³
Manner of taking food. In his choice of food man is not circumscribed like the other animals. Its respective salubrity or perniciousness he can in general judge of only by its taste. Hence, that his taste may be as little deceived as possible, most nourishing substances, we observe, are of a bland, mild nature, and contain nothing offensive to this organ. Hence too there is a certain pleasure conjoined with the gratification of appetite, which is meant both as an incentive to our taking nourishment, and also to direct us in the selection of it.

From the constitution, however, of man, experience shows that any nourishment, however unfit, may be assimilated by habit, and that wholesome and unwholesome are often merely relative terms, regulated by the existing circumstances in which individuals are placed.

The desire for solid food, is much seldomer carried to excess than that for fluids. Both, where they occur, are not the effect of a natural appetite, but rather of that artificial one which is created by the use of stimulants increasing the relish of food to the palate, or its stimulant effect on the stomach. This excess becomes

Dietetics. comes increased by indulgence; and a habit, of course, comes to prevail, which distends the stomach, relaxes its tone, and destroys its elasticity; in consequence of which disorders of this organ arise, and a general fulness and corpulency in the whole system take place.

The manner of taking food, as well as the quantity and quality, requires some attention. All extremes in taking food should be carefully avoided; it should pass into the stomach in a slow and regular manner, blended by the process of chewing with a sufficient quantity of saliva to promote its dissolution in the stomach. If hurried over without attention to this, the difficulty of solution is increased, and the stomach is suddenly distended, and satiety produced before it is filled. The meal, therefore, becomes both deficient in quantity, and the food, from the digestive organs having more to do, remains longer on the stomach than is either necessary or proper*.

* See *Nidict on Diet.*

For more on this subject, see the articles ALIMENT, FOOD, and DRINK, in this work, and the article DIETETICS, SUPPLEMENT.

After these general observations on diet, we shall take a brief survey of the principal articles employed as food, under the general heads of SOLID FOOD, DRINK, and CONDIMENTS.

A. SOLID FOOD.

I. FROM THE ANIMAL KINGDOM.

CLASS I. MAMMALIA. Order 1. PRIMATES.

²⁴ Food derived from quadrupeds. THERE are few animals of this order employed as food. In some countries, however, several species of the genus simia or ape, are eaten, particularly

²⁵ Apes. Simia inuus, *the Barbary ape*. S. Beelzebul, *the preacher monkey*. S. Paniscus, *the four-fingered monkey*.

²⁶ Bats. Some species of the bat tribe are occasionally eaten by the natives of warm climates, especially *Vespertilio vampyrus, the vampyre bat*.

Order 2. BRUTA.

Several tribes of this order afford nourishment to uncivilized nations.

²⁷ Ant-eater. The great ant-eater (*myrmecophaga jubata*) is frequently eaten by the American Indians; but its flesh has a strong and disagreeable flavour.

²⁸ Armadillo. Most species of dasypus or *armadillo* form an article of diet among the Indians.

²⁹ Rhinoceros. The flesh of the rhinoceros bicornis, or *two-horned rhinoceros*, is eaten in Abyssinia; but its flesh is very sinewy.

³⁰ Elephant. The flesh of the elephant is often eaten, both by the Abyssinians and Hottentots. See ELEPHANT, MAMMALIA *Index*.

Several species of trichecus, or *walrus*, are eatable, especially

³¹ Walrus. *Trichecus rosmarus, or arctic walrus*.

Order 3. FERÆ.

From this order mankind have long derived part of their nourishment, especially in the earlier periods of society.

³² Seal. The flesh of the common seal (*phoca vitulina*) was,

a few centuries ago, served up at the tables of the great Dietetics. in this country; and it still forms the principal subsistence of the Greenlanders, Icelanders, and Kamtschadales.

The brown or black bear (*ursus arctos*) is eaten by Bear. the common people in Norway, Russia, and Poland. It is difficult of digestion, and is generally salted and dried before being used.

Of the dog tribe few species have been employed for Dog. the food of man, though the common dog is greedily eaten by the inhabitants of the South-sea islands, and is sometimes used as food in more civilized societies. See DOG, MAMMALIA *Index*.

Of the cat tribe, the flesh of the lion is considered as Lion. excellent food by several nations of Africa, and Kolben prefers it to most other animal food.

The common otter (*lutra vulgaris*) is eaten in several Roman Catholic countries, and considered as nearly allied to fish. See OTTER, MAMMALIA *Index*.

The young of the sea otter (*lutra marina*) are said to be delicate eating, not easily to be distinguished from lamb.

Several species of *didelphis* or opossum are considered Opossum. by the natives of South America as equally good food with the flesh of the hare or rabbit, especially

Didelphis Virginiana, the Virginian opossum.

The kangaroo (*macropus major*) forms a chief part Kangaroo. of the animal food used by the natives of New Holland; but the flesh is very coarse.

The common hedgehog (*erinaccus europæus*) is occasionally used as food; and its flesh is said to be extremely delicate.

Order 4. GLIRES.

The common porcupine (*hystrix cristata*) is eaten in Porcupine. Sicily and Malta, and is frequently introduced to the politest tables at the Cape of Good Hope.

Several species of *cavia* are used as food in Guiana, Cavia. Brazil, and other parts of South America, especially *Cavia cobaya, the Guinea pig*. *C. paca, the spotted cavy*. *C. aguti, the long-nosed cavy*, and *C. aperca, the rock cavy*.

The flesh of the beaver (*castor fiber*) is employed as Beaver. food in America, and is said to be good eating. It is preserved by drying it in the smoke.

The alpine marmot (*arctomys marmota*) affords nourishment to the poorer inhabitants of the Tyrol, Savoy, and other parts of the Alps; and, besides this, three other species are eatable, viz.

Arctomys monax, the Maryland marmot. A *bobac, bobak*; and *A. citellus, the casan or earless marmot*.

Several species of sciurus, or *squirrel*, may be eaten, Squirrel. especially the common squirrel (*sciurus vulgaris*), which is much used in Sweden and Norway, and its flesh is said to resemble that of a barn-door fowl.

The common jerboa (*dipus jaculus*) is eaten by the Jerboa. Arabs, who esteem its flesh among their greatest delicacies.

Most species of lepus, or the hare tribe, are used as Hare and rabbit. common food, especially

Lepus timidus, the common hare, and *L. cuniculus, the rabbit*.

Of these the flesh of the rabbit is softer and more digestible than that of the hare; but it is not so nourishing.

Dietetics. *ing.* Wild rabbits are both more digestible and more palatable than such as are domesticated.

Order 5. PECORA.

It is from this order that the principal part of animal food, in civilized countries, is derived. Almost all the animals contained in this order form excellent food.

⁴⁷ Camelus. Some species of *camelus*, or the camel tribe, are eaten, especially

Camelus dromedarius, the *Arabian camel*. *C. glama*, the *glama*, whose flesh is said to resemble mutton.

Of the genus *cervus*, the following species are most used, viz.

⁴⁸ Elk. *Cervus alces*, the *elk*, eaten in Norway, Lapland, and Sweden, where its flesh is much esteemed. It is very nourishing, but lies long on the stomach.

⁴⁹ Stag. *C. elaphus*, the *common stag*. The flesh of this animal, when full grown, is well known under the name of *venison*, and is very digestible, wholesome, and nourishing. The animal should not be killed till he is above four years old, and the flesh is fattest and best flavoured in the month of August.

⁵⁰ Rein deer. *C. tarandus*, the *rein deer*. The flesh of this species forms the principal nourishment of the Laplanders; the tongues are excellent when salted and smoked, and the milk is sweet and nourishing.

⁵¹ Fallow deer. *C. dama*, the *fallow-deer*. The flesh of this species is a variety of venison, and nearly resembles that of the stag. The buck is preferred.

⁵² Roebuck. *C. capreolus*, the *roebuck*. The flesh of the roebuck is considered as inferior to that of the last species.

Of the genus antelope, almost all the species afford excellent food; but the following is most generally employed, viz.

⁵³ Chamois. *Antelope rupicapra*, the *chamois*.

The flesh of the young ibex (*capra ibex*) is said to be excellent food.

⁵⁴ Goat. Of the common goat (*capra hircus*) only the young are employed as food; and a roasted kid is a very common dish in America and the West Indies. Of goat's milk we shall speak hereafter.

⁵⁵ Sheep. *Ovis aries*, the *common sheep*. Mutton is well known to be a highly nutritious and wholesome meat. It is perhaps more universally used than any other animal food. *Tup-mutton* has such a strong smell and disagreeable taste, and is, besides, so exceedingly tough and difficult of digestion, that it is never eaten but by those who cannot afford to purchase mutton of a better quality. *Ewe mutton*, if it be more than between two and three years old, is likewise tough and coarse. *Wedder-mutton*, or the flesh of the castrated animal, is most esteemed, and is by far the sweetest and most digestible. *Lamb* being less heating and less dense, is better suited to weak stomachs; but this applies only to the flesh of lambs that have not been robbed of their blood by repeated bleedings, or reared by the hand with milk adulterated with chalk, in order to make the meat appear white. Such practices to render the food pleasing to the eye, at the expence of its alimentary properties, cannot be too much reprobated.

⁵⁶ *Bos taurus*, the *common bull and cow*. The flesh of the bull has a strong disagreeable smell, and is dry, tough, and difficult of solution in the stomach. Bull-beef is rarely eaten. But the flesh of the ox, or cas-

trated animal, called *ox-beef*, is a highly nourishing and wholesome food, readily digested by healthy persons, and constituting a principal part of the common diet of the inhabitants of this and many other countries. It is the most strengthening of all kinds of animal food. Cow-beef is not so tender nor so nourishing, nor so digestible as ox-beef. Veal is tender and nourishing; but not so easily digested, nor so well suited to weak stomachs, as is commonly imagined. It is matter of just complaint, that the same injurious methods are practised in the rearing and management of calves, as have been already noticed under the article LAMB. By such treatment the quality of the flesh is much depraved. What is called *beef-tea*, is prepared by putting a pound of the lean part of beef, cut into very thin slices into a quart of water, and boiling it over a quick fire about five minutes, taking off the scum. The liquor is afterwards poured off clear for use. This makes a light and pleasant article of diet for weak and delicate people. On some occasions spices may be advantageously added to it. Gravy soup is very nourishing, but is heavy and heating. It is used as a clyster, as well as taken into the stomach. Calves-feet jelly is highly nutritious and demulcent.

Besides the common ox, the following species are employed as food, viz.

Bos americanus, the *American bison*. *B. moschatus*, the *musk bull*. *B. bubalus*, the *buffalo*. *B. caffer*, the *cape ox*, and *B. grunniens*, the *yak*.

Order 6. BELLUÆ.

The flesh of the horse may be eaten, but is very ⁵⁷ coarse. Mare's milk is often used medicinally, but is considered as inferior to that of the ass.

Asses milk is light, and well suited to weak sto- ⁵⁸ machs. It is commonly employed in consumptive cases; and Hoffman recommends it in gout, rheumatism, jaundice, debility of the bowels, disorders of the urinary passages, and in fluor albus.

The flesh of the tapir (*taper americanus*) is much ⁵⁹ esteemed by the inhabitants of South America, but is inferior to our beef.

⁶⁰ The flesh of the wild boar is dense, but sufficiently Hog. tender, very nourishing, and more savoury than that of the domestic hog. But as the general properties of both are the same, they will be here noticed together. The flesh of the wild boar is in season in the month of October. The head is esteemed the finest part. The flesh of the young animal is reckoned a great delicacy. *The common or domestic boar. The sow.* The flesh of the sow is strong, and makes bad bacon. It is the flesh of the castrated animal that is in common use, and that is known by the name of *pork*. On account of the fat or lard with which it abounds, it is not very easily digested. It is a very savoury food, and affords a strong nourishment, suited to persons who lead an active or laborious life. The too frequent and long continued use of this meat favours obesity, produces foulness of the stomach and bowels, and occasions disorders of the skin. The flesh of the *sucking pig* is reckoned a great delicacy, is very nourishing; but by reason of the thick and slimy juice with which it abounds, it is not very readily dissolved in the stomach, and therefore is by no means a proper food for weak and sickly persons. Bacon is a coarse and heavy, but ⁶⁰ nutritive

Dietetics. nutritive food, only fit to be taken in considerable quantity by robust and labouring people. When it constitutes a principal part of the daily diet, it brings on disorders similar to those which arise from the immoderate use of pork. In consequence of the fat or lard with which it abounds, the flesh of the swine tribe is more or less laxative. Upon the whole, it may be said of pork, that the occasional and sparing use of it is sufficiently salutary; but that it cannot be made a principal part of the daily diet, without producing disorder in many constitutions, and particularly in those who are of a melancholic temperament, and lead a sedentary life.

The flesh of the different species of this genus is edible, especially that of the *sus tajassu* and *S. babyrussa*.

61
Food from
birds.

CLASS II. BIRDS. Order 2. PICÆ.

62
Picæ.

Of this order only two species are generally used as food.

Corvus frugilegus, the rook. The young of this bird is very similar to the pigeon, but is rather inferior in flavour and digestibility.

P. viridis, the green woodpecker. The flesh of this and some other species is palatable, but of difficult solution.

63
Anseres.

Order 3. ANSERES.

Of this order the principal species that are eaten belong to the genus *anas*, of which all the species may be used for food; but the following are most generally employed, viz. *anas cygnus*, the wild swan. *A. olor*, the tame swan. *A. anser*, the goose. *A. bernicla*, the brent goose. *A. moschata*, the Muscovy duck. *A. penelope*, wigeon. *A. ferina*, pochard. *A. crecca*, teal. *A. boschas*, wild duck. *A. domestica*, the tame or common duck.

Alea arctica, puffin. *A. tarda*, the razor-bill. *A. cirrhata*, the tufted auk.

Pelicanus bassanus, the soland goose.

Larus marinus, the black-backed gull.

Of these the swan, the goose, the wigeon, the teal, the wild and tame duck, are the most digestible; the barnacle, the puffin, the soland goose, and the black-backed gull, are very fat, heavy, and have generally a fishy taste.

64
Grallæ.

Order 4. GRALLÆ.

Of this order most of the genera furnish very good and savoury food. The following are most commonly used, viz.

Scolopax rusticola, the woodcock. *S. gallinago*, the snipe. *S. gallinula*, the jack snipe. *S. glottis*, the great plover, or green-shank. *S. tetanus*, the spotted snipe. *S. limosa*, the stone plover. *S. lapponica*, the red god-wit.

Tringa pugnax, the ruff and recve. *T. vanellus*, the lapwing or bastard plover. *T. cinchus*, the purre. *T. squatarra*, the gray plover, or sandpiper.

Charadrius marinellus, the dotterel. *C. pluvialis*, the green plover. *C. œdicnemus*, the thick-kneed bustard. *C. hemantopus*, the long-legged plover.

Fulica fusca, the brown gallinule. *F. chloropus*, the

common water-hen. *F. porphyrio*, the purple water-hen.

Order 5. GALLINÆ.

This order furnishes the principal part of the food which we derive from the class of birds. The following species afford excellent nourishment, viz.

Pavo cristatus, the peacock.

Meleagris gallipavo, the turkey.

Penelope cristata, the quhan.

Crax alector, the crested curassow.

Phasianus gallus, the common fowl. *Ph. colchicus*, common pheasant.

Numida meleagris, the Guinea hen.

Tetrao urogallus, the wood grouse. *T. tetrix*, the black cock, or black game. *T. lagopus*, red game. *T. perdix*, the common partridge. *T. coturnix*, the quail.

Order 6. PASSERES.

The following species of this order may be employed as food, viz.

Columba domestica, the common pigeon, and *C. palumbus*, the ring dove.

Alauda, the lark. All the species.

Turdus viscivorus, the missel thrush. *T. pilaris*, the fieldfare. *T. merula*, the blackbird.

Loxia curvirostra, the sheldapple or crossbill. *L. cochothraustes*, the grsbeak or hawfinch. *L. chloris*, the green finch.

Emberiza nivalis the snow bunting. *E. miliaria*, the bunting. *E. hortulana*. *E. citrinella*, or yellow hammer.

Fringilla celebs, the chaffinch. *F. montifringilla*, the brambling, or bramble-finch. *F. domestica*, the house sparrow. *F. montana*, the tree sparrow.

Motacilla modularis, the hedge sparrow. *M. ficedula*, the epicurean warbler. *M. cenanthe*, the wheat-ear. *M. rubitra*, the whin-chat. *M. rubicula*, the stonechat. *M. phœnicurus*, the redstart. *M. erithalus*, the redtail.

Hirundo esculenta, the esculent swallow.

After this enumeration of birds, we must say something respecting the nutritious properties of eggs.

It is probable that the eggs of all the birds which we have mentioned, and perhaps of most others, might be employed as food; but custom and convenience have given the preference to those of the common hen, the guinea hen, and the duck. The fluid contents of an egg consist of the white and the yolk. The former very much resembles the lymph of the blood, or the coagulable part of milk. The latter, viz. the yolk, is an animal mucilage, composed of oil, coagulable lymph and water. It is miscible with cold water, so as to form an emulsion. The oil is separable from the yolk, boiled till it becomes hard, by means of pressure.*

The eggs of all granivorous birds, and especially of the domestic fowl, yield a mild demulcent and strengthening aliment, well suited to consumptive persons, and such as are exhausted by immoderate evacuations. Raw eggs are gently laxative, and are found to be serviceable in cases of jaundice and obstructed liver. A nutritive restorative drink is prepared by rubbing the yolks of two or three eggs, and a little white sugar, with a

Dietetics. pint or two of cold water, adding to it afterwards a glass of Rhenish or any other light wine, and a little lemon juice, to give it a flavour. This egg-emulsion without the wine, is a good remedy in coughs, hoarsenesses, spitting of blood, costiveness, &c.

Both the white and yolk of eggs are very indigestible when boiled to hardness. Eggs should be subjected to as little of the art of cookery as possible. The lightest as well as the simplest mode of preparing them for the table, is to boil them only as long as is necessary to coagulate slightly the greatest part of the white, without depriving the yolk of its fluidity. This is what is called poaching them; and in this way they sit well upon most stomachs.

68
Food from
reptiles.

CLASS III. AMPHIBIA. Order 1. REPTILES.

This class furnishes but few articles of food, and of these the following are the most usually employed, viz.

Testudo mydas, the green turtle, T. ferox. T. græca, the land turtle.

Rana esculenta, the edible frog, or green water-frog. Lacerta agilis, common green lizard. L. scincus, the scink.

69
From ser-
pents.

Order 2. SERPENTS.

Coluber viper, the viper. C. perus, the adder.

Of these the turtle is well known as a most nourishing and palatable food. The esculent frog, though not very nutritious, tastes much like chicken; the viper and adder are chiefly used in soups, which are considered as great restoratives.

70
Food from
fishes.

CLASS IV. FISHES.

It is probable that almost all the different species of fish might be employed as food, but the following are chiefly eaten, viz.

71
Apodes.

Order 1. APODES.

Muraena anguilla, the common eel. M. conger, the conger eel. Ammodytes tobianus, the sand lance, or sand eel.

72
Jugulares.

Order 2: JUGULARES.

Callyonimus lyra, the gemmous dragonet. C. draconculus, the sordid dragonet.

Trachinus draco, the weaver.

Gadus aeglefinus, the haddock. G. catlarias, the torsk, G. morrhua, the cod-fish. G. barbatus, the pont. G. merlangus, the whiting. G. pollachius, the pollack. G. molva, the ling. G. lota, the barbot.

73
Thoracici.

Order 3. THORACICI.

Zeus faber, the dory.

Pleuronectes hippoglossus, the halibut. P. platessa, the plaise. P. flesus, the flounder. P. limanda, the dab. P. solea, the sole. P. maximus, the turbot.

Chaetodon rostratus, the jaculator. C. imperator, the emperor of Japan.

Sparus mæna, Perca fluviatilis, the perch. Scomber, the mackerel.

Mullus barbatus, the red surmullet. M. surmulletus, the striped surmullet. Trigla lyra, the piper.

Dietetics.

Order 4. ABDOMINALES.

Cobitis barbetula, the loach, or groundling.

Salmo salar, the salmon. S. trutta, the sea trout. S. fario, the trout. S. alpinus, the charr. S. salvelinus, the salmon trout. S. umbla. S. eperlanus, the smelt. S. albulæ, the whiting. S. thymallus, the grayling.

Esox lucius, the pike.

Mugil cephalus, the mullet.

Clupea harengus, the herring. C. sprattus, the sprat. C. alosa, the shad. C. encrasicolus, the anchovy.

Cyprinus barbus, the barbel. C. carpio, the carp. C. gobio, the gudgeon. C. tinca, the tench. C. cephalus, the chub. C. leuciscus, the dace. C. rutilus, the roach. C. erythrophthalmus, the rud. C. alburnus, the bleak, and C. brama, the bream.

Order 6. CHONDROPTERYGII.

Accipenser sturio, the sturgeon. A. ruthenus, the starlet. A. huso, the isinglass fish.

Raia batis, the skate.

Petromyzon marinus, the lamprey. P. fluviatilis, the lesser lamprey. P. branchialis, the lampern or pride.

The wholesomeness of fish in diet has been much disputed. According to some, it is the most delicious food of any; and according to others, it is without strength or substance. It is certainly not adapted to be the sole diet of the laborious class, but it makes an excellent addition to vegetable food; for instance, with potatoes, or other roots, what can be more acceptable than a salted or smoked herring, to give a relish to such insipid diet? It is said, indeed, that one barrel of salted herrings will, in this way, go as far as three barrels of salted beef. Fresh fish is certainly well calculated for sedentary people, and those who reside in towns; and at all events, it is fortunate to have such a resource for food in a populous country, to be made use of when any exigency requires such aid.

The texture of fish, in general, is more tender than that of flesh. They have nothing of a fibrous structure, like flesh; of course, they are more easily digested than meat, especially such as are not of a viscid nature.

It is a singular circumstance regarding fish, that, though we require vegetables with our meat, we hardly ever take them with fish. Cullen says, that by way of experiment he has taken apples along with fish, but found them to disturb digestion.

The objections to fish, however, are numerous. The nourishment derived from them it is said, is incomplete; not so stimulating, nor so congenial to the nature of man, as either birds or quadrupeds; some classes of them also, as shell-fish, salmon, &c. are more indigestible than meat; and fish, in general, has a stronger tendency to putrefaction than meat. But the faults of fish are somewhat corrected by the manner in which they are commonly eaten. In a fresh state, sauces and pickles of an acid nature are employed with them, and when dried, the action of the stomach is promoted by salt and spices. Fish, compared with flesh, is less nourishing, and the more viscid sorts harder

* Code of Health and Longevity, vol. i.

P. 407.

77
Food from insects.

Of insects properly so called, none are used in substance as food, except various species of cancer, viz.

Cancer mænas, *the common crab*. C. pagurus, *the black-clawed crab*. C. gammarus, *the lobster*. C. astiscus, *the craw fish*. C. serratus, *the prawn*. C. crangon, *the shrimp*, and C. squalla, *the white shrimp*.

Under this class we may rank *honey*, the produce of the bee, which in its general elementary properties agrees with sugar, to be afterwards noticed. It is, however, rather more heating, and will not agree with many stomachs. It is best eaten from the comb, as the wax seems to correct its unpleasant effects.

78
Food from worms.

CLASS VI. VERMES. Order 2. MOLLUSCA.

The *sepia sepiola*, and the *echinus esculentus*, are the only edible genera of this order of worms, and even these are a coarse and by no means a nourishing food.

Order 3. TESTACEA.

Cardium edule, *the common cockle*.

Ostrea edulis, *the common oyster*.

Mytilus edulis, *the edible muscle*.

Helix pomatia, *the common snail*.

Of these, the oyster and the snail are the most wholesome and digestible.

As occupying a middle rank between animal and vegetable food, we shall here notice *milk* and its various products.

79
Milk.

MILK is the proper and natural food of the young of all animals of the mammalia class; and cows milk makes a principal part of the daily diet of a great proportion of the human race, both in the infant and adult state. On account of the abundance of oily and cheesy matter which it contains, cow's milk is to infants by no means so well suited as human milk; but as the mode of living in civilized society often depraves the quality of woman's milk, or prevents its secretion, cows milk in too many instances becomes a necessary substitute. On such occasions, as it is too heavy to be given alone, it should be diluted with water: and as it is disposed to become more acescent than human milk, and from that cause to produce gripings and other disorders of the bowels in young children, it will often be useful to mix with it decoctions of animal substances, such as chicken or veal broth, or decoction of hartshorn shavings; of which last two ounces should be boiled in a quart of water, over a gentle fire, till the whole is reduced to a pint; when, after it is become cold, it will be of the consistence of a light jelly. This, mixed with about twice its quantity of cows milk, with the addition of a little sugar, forms for young subjects a proper aliment, approaching nearly to the nature of human milk.

Milk is used medicinally in consumptions, especially in their early stage; in gouty affections, after the paroxysm is gone off, in smallpox, diluted with water, as the common drink; in measles, especially the malignant kind, diluted in the same manner; in gonorrhœa,

lues venerea, and during a mercurial salivation in cancerous affections; in cases where mineral and animal poisons, have been swallowed; in cases of stranguy and dysury from the absorption of cantharides, &c.; in fluor albus; in many spasmodic and nervous disorders.

When milk is used medicinally, it is often serviceable to dilute it with Pyrmont, Seltzer, or some other proper mineral water; and to prevent acidity, and make it sit easier on the stomach, lime water, and some of the distilled aromatic waters, are occasionally mixed with it. To obviate costiveness, which milk is apt to induce, it is often proper to mix brown sugar, or magnesia with it, to boil it with oatmeal, veal broth, &c.

In general, milk is improper in inflammatory fevers, unattended with pustulous eruptions; in bilious fevers; in scrophulous cases; and in rickets.

The following are the principal products and preparations of milk in dietetic and medicinal use; cream and butter are well known; nor can it be necessary to notice how much they disorder the stomach and bowels when taken too freely.

Curds taken in considerable quantity, are highly oppressive to the stomach, and not unfrequently prove the cause of obstructions and inflammations of the bowels.

Cheese varies according to the kind of milk from which it is prepared, according to the quantity of oil and whey which the coagulable matter contains, and lastly according to its age. In general, it is an aliment suited only to strong stomachs, and to such persons as use great and constant exercise. In the higher orders of society, it is used chiefly as a condiment. Toasted cheese is not easily digested by weak stomachs; and for those who can be hurt by indigestion, or heated by a heavy supper, it is a very improper diet*.

Butter-milk is milk which has been deprived of its oily matter by churning or agitation. It is nourishing, cooling, and diluent. It is used in cachexies, atrophies, consumptions, &c.

Whey is the watery, saccharine part of milk, freed in a great measure from the butyraceous and caseous matter. It is lightly nutritive, diluent, aperient, and diuretic. It is given in consumptions, dysenteries, jaundice, &c. alone, or mixed with mineral waters, and sometimes impregnated with the juices of medicinal herbs. Wine whey, tartar whey, mustard whey, will be particularly noticed in their proper places.

Sugar of milk is a saline substance, obtained from the whey by evaporation. It has been properly called the essential salt of milk. It has been much extolled by some writers as a remedy in consumptions; but as it is contained in whey, it is evident that preparation must possess all its virtues, and therefore that the trouble of obtaining it separate must be unnecessary†.

II. FROM THE VEGETABLE KINGDOM.

Vegetable food is more ancient than any other. As forming the food of animals, it is the foundation of all our nourishment, for by it those animals are nourished, which in turn afford sustenance to man. Indeed there are no circumstances under which a diet of animal food should be solely employed. This has been confirmed by every experiment made; and the confinement of a person only for a few days to this mode of living, has induce †

† Synopsis of Mat. Aliment. and Med. vol. i.

Of vegetable food in general.

Dietetics. induced such symptoms as obliged him to desist. Besides this, by stimulating to an extreme degree, the springs of life are by animal diet urged on too fast; and preternatural, and of course weakening exertions of the system ensue, which induce, from their excess, an early decay. Thus childhood is prematurely ushered by it into manhood; and the powers of manhood, soon exhausted display the infirmities and progress of age, at a period when vigour and strength should still be in perfection. A diet of vegetable food is, on the contrary, conducive to long life. It neither accelerates the vital energy, nor ripens the fruit before its time, but with a slow and regular step brings forwards the different stages in their due season, and with all the advantages which their proper maturity ought to confer on them. At the same time, while we thus point out the good effects of a vegetable diet, in arresting the progress of life, and giving a greater permanence to existence, we by no means approve of it as a diet to be entirely trusted to.

Declaimers on the exclusive use of vegetable diet have not taken into view the various and new circumstances of situation in which man is now placed. He is no longer the child of nature, nor the passive inhabitant of one genial spot, as when he was first formed. He is now a citizen of the world at large; exertion and toil are his constant attendants, and he requires a more ready and assimilated nourishment than vegetable food can convey. In many situations also, the vigour of his system is weakened by extremes of temperature, which demand, to counteract them, the most stimulant and invigorating food he is capable of acquiring. The excellence of vegetable food used alone is therefore confined to a mild temperature and a passive state, and there it certainly deserves that preference which humanity and philosophy have bestowed upon it. Considering vegetable food as conveying a nourishment insufficient for our present civilized situation, we shall next state the inconveniences that attend its being used in excess. The first inconvenience of vegetable food already noticed, is its constant tendency to acescency; but this is hurtful only when it takes place to a morbid degree. If a natural tendency to acescency prevails in the stomach, as a step towards assimilation, it cannot fail to be noxiously increased by the sole use of vegetables; and the counteracting of this state, or checking the tendency to fermentation, must be the great secret in the regulation of vegetable diet. This secret no doubt depends on the preventing, by our choice of vegetables, excess in the proportion of fermentable or saccharine matter, and in exciting the action of the stomach, so that the vegetable food may not be too long retained upon it.

The next inconvenience alleged against vegetable diet is its difficulty of assimilation. That vegetable aliment is more difficult in being reduced to nourishment, seems generally admitted, and in the end it produces a greater quantity of fæces. When received into the stomach it is likewise specifically lighter than the gastric fluids. Hence it floats near the top of the stomach, and causes irritations. This uneasiness is not felt for some time after its reception, but afterwards it begins to operate on the upper orifice of the stomach. The difficulty, however, of assimilation that attends vegetable food, may be got the better of by a proper se-

lection of it; and it will also be chiefly felt in weak stomachs, and will by no means affect the vigorous and robust. **Dietetics.**

A third inconvenience of vegetable food is its extrication of a considerable quantity of air, by which the stomach becomes distended, often to an enormous degree; and much uneasiness is produced in the adjacent organs. This extrication of air is common to all vegetables; it varies, however, extremely in different kinds of them; and it is from this circumstance that the flatulence and torpor is experienced, which succeeds a full meal of them. Hence all vegetables that contain much of it should undergo a previous preparation before being used as food.

These, then, are the chief inconveniences attending a vegetable regimen: while on the contrary, to counterbalance them, this species of diet is always found to promote or sharpen the appetite, and to keep the stomach in an active state. Neither are any constitutional disorders the consequence of it, as happens from animal food, for whatever morbid symptoms arise under its use are confined almost entirely to the stomach and bowels, and seldom carry any hurtful effects to the system at large. Neither do any evils arise from occasional excesses in its use; and the mischiefs of repletion or overfulness are avoided by it, unless in cases of extreme indolence, or where a continued course of intemperance is pursued as to the quantity taken. By its moderate stimulus it counteracts the disposition to an inflammatory state, and in many cases proves highly serviceable, in checking the violence, and arresting the progress of many constitutional diseases. Independently of its nature, it is of great importance to the stomach, by giving that proper distention which this organ requires in order to its healthy action.

The wisdom of nature has provided that the extent of vegetable food should be much greater than that of animal food, as the former is the foundation of nourishment for all the animated creation. Hence we find that there is scarcely any vegetable that does not afford nourishment to some animal; and there are many which, though naturally of a deleterious quality, can, by proper preparation, be converted into nourishment to man. Man, more than any other animal, is distinguished as to the choice of food which he makes; and in this selection he is generally determined by his taste, between which and the stomach nature has established such a sympathy, that what is disagreeable to the one, is seldom very digestible by the other. Hence inclination is to be particularly studied in every case of weakness of the stomach.

Among the other properties of vegetable food, it has been especially considered by all authors as having most influence on the powers of the mind, and in preserving a delicacy of feeling, a liveliness of imagination, and an activeness of judgment; but in proportion to these superior qualities, it must be observed, this state of body is equally the attendant of timidity, fluctuation, and doubt. Animal food, in the other extreme, gives a strong vigour and firmness of purpose, fitted for the most active exertions of life. By a mixture of diet these two extremes come to be counteracted; the body possesses a proper share of vigour; and, correspondent to it, the mind displays a firmness and capacity suited to every valuable purpose. The diet, then,

Dietetics. then producing this state may be properly called temperance, without limiting the individual to an exact portion of either kind of food, or tying him up by the absurd and sickly system of Cornaro; and this state will be properly regulated by the experience and feelings of each individual, both in regard to the quantity and quality of his nourishment.

In the use of vegetable food, as well as animal, attention must be paid both to the proportion of it taken, and also to the state in which it is used. The first of these must be regulated by the three circumstances of season, way of life, and climate. With respect to the first—in summer the quantity of vegetable food should be always increased, whatever our habits may be; the propriety of this is evidently pointed out by nature, from its abundance at this period. This increase of vegetable food is also the more necessary if the appetite is naturally keen and healthy, as a more strongly nourishing aliment would at this time expose to all the effects of putrescency, which the increase of the vegetable diet will, on the contrary, counteract.

The way of life must also regulate a good deal the proportion of vegetable nourishment. An essential circumstance in the use of all diet, as we formerly remarked, is the production of such a distention of the stomach and bowels as may enable them to act properly on their contents. In the sedative and inactive, it is particularly desirable that this distention should be produced by food of a less nourishing kind, and that no more nourishment be received than what the wants of the system require. Hence in these cases, a vegetable diet is to be preferred, while, in the active and laborious, the plan should be reversed.

It is fact sufficiently established, that the proportion of vegetable food should be in a great measure regulated by the climate, as there is no doubt that the mortality of warm climates is aggravated by the use of too much animal food; and that a diet of a vegetable and acescent nature with a large proportion of condiment, such as we find used by the inhabitants of those countries, is best suited to the preservation of health; for by this excess of condiment, the morbid effects on the stomach and bowels, natural to vegetable food, are counteracted, and the chyle formed from them passes into the circulation in a proper state for supporting the body in such a situation. On the other hand, in a colder region a permanence of nourishment is required, which animal food particularly conveys; and as this nourishment is less apt to disorder the stomach or bowels, no great portion of condiment is necessary—either as a stimulus to the organ, or in order to avoid any hurtful consequences that may arise. The proportion, therefore, of vegetable food is clearly pointed out to be small, and chiefly of the farinaceous or least acescent kind.

The state in which vegetable food is used is of equal importance with the proportion of it taken. Thus vegetable food particularly requires to be used in a fresh state; for, by being kept, many kinds of vegetable lose their peculiar flavour, their taste and smell, and in consequence of this become indigestible; this is particularly the case with the pulses, with herbs, and with

 Anethum fœniculum, *common fennel*. A. dulce, *sweet fennel*.
 Brassica oleracea, *cabbages*. B. napus, *colewort*.
 Chenopodium bonus henricus, *English mercury*.
 Cnicus oleraceus, *round-leaved meadow thistle*.
 Corchorus olitorius, *common Jews mallow*.
 Crambe maritima, *sea colewort*.
 Jatropha maniot, *cassava*.
 Malva rotundifolia, *dwarf mallow*.
 Mentha viridis, *spearmint*. See Sect. i.
 Phytolacca decandra, *American nightshade*.
 Ranunculus ficaria, *pilewort*.
 Raphanus sativus, *common radish*.
 Salvia sclarea, *garden clary*.
 Spinacia oleracea, *common spinach*. S. O. glabra, *smooth spinach*.
 Thea bohea, *bohea tea*. T. viridis, *green tea*.
 Urtica dioica, *common stinging nettle*.

Sect. 3. POT HERBS.

Apium graveolens, *celery*. A. petroselinum, *parsley*.
 Allium porrum, *leeks*.
 Brassica oleracea, *cabbages*.
 Beta vulgaris alba, *white beet*.
 Crithmum maritimum, *rock samphire*.
 Hyssopus officinalis, *common hyssop*.
 Oxalis acetosella, *wood sorrel*.
 Ozymum basilicum, *sweet-scented basil*.
 Origanum marjorana, *common marjoram*. O. marjorana tenuifolia, *fine-leaved sweet marjoram*. O. heracleoticum, *winter sweet marjoram*. O. onites, *pot marjoram*.
 Picris echioides, *common ox-tongue*.
 Rosmarinus officinalis, *common rosemary*. R. hortensis, *garden rosemary*.
 Salvia officinalis, *green and red sage*. S. minor, *tea sage*.
 Satureja hortensis, *summer savory*. S. montana, *winter savory*.
 Scandix cerefolium, *common chervil*. S. odorata, *sweet cicely*.
 Sonchus oleraceus, *common sow-thistle*.
 Thymus vulgaris, *common thyme*. T. mastichinus, *mastic thyme*.

arbor, Swedish juniper.

Ribes rubrum et album, red and white currants.
R. nigrum, black currants. *R. grossularia*, gooseber-
 ries.

Rosa canina, dog's rose, or hep-bush.

Rubus idæus, raspberry. *R. I. albus*, white rasp-
 berry. *R. I. lævis*, smooth-stalked raspberry. *R. cæ-*
sius, dewberry. *R. fruticosus*, common bramble. *R.*
chamæmorus, cloudberry. *R. arcticus*, shrubby straw-
 berry.

Vaccinium myrtillus, blackworts, or bilberry. *V.*
vitis idæa, redworts. *V. oxycoccus*, cranberry.

Sect. 2. Foreign BERRIES, often raised in gardens
and stoves.

Annona muricata, sour sop. *A. reticulata*, custard
 apple. *A. squamosa*, sweet sop.

Bromelia ananas, pine apple. *B. ananas pyramida-*
to fructu, sugar-loaf pine-apple. *B. karatas*, the pen-
 guin.

Cactus opuntia, prickly pear. *C. triangularis*, true
 prickly pear.

Capsicum annuum, annual Guinea pepper. *C. fru-*
tescens, perennial Guinea pepper.

Carica papaya, the papaw or popo. *C. posoposa*, pear-
 shaped papaw.

Chrysophyllum caineto, star-apple. *C. glabrum*, sa-
 padillo, or Mexican medlar.

Citrus medica, common citron. *C. limon*, common
 lemon. *C. americana*, the lime tree. *C. aurantium*,
 common orange. *C. decumanus*, shaddock orange.

Crateva marmelos, Bengal quince.

Diospyros lotus, Indian date plum. *D. virginiana*,
 pishamin plum.

Ficus carica, common fig. *F. humilis*, dwarf fig.
F. caprificus, hermaphrodite-fruited fig. *F. fructu fusco*,
 brown-fruited fig. *F. Fructu violaceo*, purple-fruited
 fig. *F. sycamorus*, sycamore, or Pharaoh's fig.

Garcinia mangostana, mangosteen.

Morus nigra, black-fruited mulberry. *M. rubra*, red-
 fruited mulberry. *M. alba*, white-fruited mulberry.

Musa paradisaica, plantain tree. *M. sapientum*, ba-
 nana, or small-fruited plantain.

Mespilus germanica, medlar.

Mammea americana, the mammee.

Malpighia glabra, smooth-leaved Barbadoes cherry.

M. puniceifolia, pomegranate-leaved malpighia.

Passiflora maliformis, apple-shaped granadilla. *P.*
laurifolia, bay-leaved passion-flower.

Psidium pyrifera, pear guava, or bay plum. *P.*
pomiferum, apple guava.

Solanum lycopersicum, love apple. *S. melongena*,
 mad apple. *S. sanctum*, Palestine nightshade.

Sorbus domestica, true service apple.

Trophis americana, red-fruited bucephalon.

Vitis vinifera, common grapes. *V. apyrena*, Corin-
 thian currants.

VI. ESCULENT STONE FRUIT.

89
Esculent
stone-fruit

Sect. 1. STONE FRUIT of Europe.

Amygdalus persica, the peach. *A. nucipersica*, the
 nectarine.

Cornus mascula, male cornel, or cornelian cherry.

Olea Europea, manured olive. *O. sylvestris*, wild
 olive.

Prunus armeniaca, the apricot. *P. cerasus*, wild red
 cherry. *P. domestica*, the plum tree. *P. insititia*, the
 bullace tree.

Rhamnus zizyphus, common jujube.

Sect. 2. STONE FRUIT exotic.

Chrysobalanus icaco, cocoa plum.

Coccoloba uvifera, sea-side grape.

Cordiamyxa, clustered sebesten, or Assyrian plum.
C. sebestena, rough-leaved sebesten.

Corypha umbraculifera, umbrella palm.

Elais guineensis, oil palm.

Eugenia jambos, Malabar plum.

Grias cauliflora, anchovy pear.

Laurus perseæ, avigato pear.

Mangifera indica, mango tree.

Phoenix dactylifera, common date.

Rhamnus jujuba, Indian jujube.

Spondias lutea, yellow Jamaica plum.

VII. ESCULENT APPLES.

90

apples

Sect. 1. APPLES of Herbaceous Plants.

Cucumis melo, musk melon. *C. melo albus*, Spanish
 white melon. *C. M. lævis*, smooth green-fleshed mel-
 on. *C. M. flavus*, yellow white melon. *C. M. par-*
vus, small Portugal musk melon. *C. M. pilosus*, hairy-
 skinned melon. *C. M. reticulatus*, netted-skinned melon.
C. M. striatus, late small striated melon. *C. M. tibe-*

rosus,

Dietetica. *rosus*, *warted cantaloupe*. *C. M. turbinatus*, *top-shaped melon*. *C. M. virens*, *green-rinded melon*.

Cucumis chale, *Egyptian melon*. *C. sativus*, *common prickly cucumber*. *C. sativus albus*, *white prickly cucumber*. *C. S. longus*, *long prickly cucumber*. *C. flexuosus*, *green Turkey cucumber*.

Cucurbita lagenaria, *bottle gourd*. *C. citrullus*, *water melon*. *C. pepo*, *common pompion*. *C. P. oblongus*, *long pompion*. *C. verrucosa*, *warted gourd*. *C. melopepo*, *Spanish melon*.

Melothria pendula, *small creeping cucumber*.

Sect. 2. APPLES of Trees.

Achras sapota, *oval-fruited sapota*.

Averrhoa carambola, *goa apple*. *A. bilimbi*, *bilimbia*.

Punica granatum, *pomegranate tree*.

Pyrus communis, *pear-tree*. *P. malus*, *the crab-tree*.

P. cydonia, *quince-tree*.

⁹¹
Legumin-
ous plants.

VIII. LEGUMINOUS PLANTS.

Sect. 1. PODS and SEEDS of Herbaceous Plants.

Arrachis hypogæa, *American ground nut*.

Cicer arietinum, *the chick pea*.

Dolichos soja, *East India kidney bean*.

Ervum lens, *lentil*.

Lotus edulis, *incurved podded bird's-foot trefoil*. *L. tetragonolobus*, *square-podded crimson pea*.

Lupinus albus, *white flowering lupine*.

Phaseolus vulgaris, *common kidney bean*. *P. V. coccineus*, *scarlet-flowering kidney bean*. *P. albus*, *white-flowering kidney bean*.

Pisum sativum, *common garden pea*. *P. umbellatum*, *crown pea*. *P. quadratum*, *angular-stalked pea*. *P. maritimum*, *sea pea*.

Vicia faba, *common garden bean*.

Sect. 2. PODS and SEEDS of Trees.

Cassia fistula, *sweet cassia*, or *pudding-pipe tree*.

Ceratonia siliqua, *carob*, or *St John's bread*.

Coffea Arabica, *Arabian coffee*. *C. occidentalis*, *American C.*

Cytisus cajan, *pigeon pea*.

Epidendrum vanilla, *sweet-scented vanilla*.

Hymenæa courbaril, *bastard locust tree*.

Tamarindus indica, *the tamarind*.

⁹²
Esculent
grains and
seeds.

IX. ESCULENT GRAINS AND SEEDS.

Triticum æstivum, *summer or spring wheat*. *T. hybernum*, *winter or common wheat*. *T. turgidum*, *short thick-spiked wheat*. *T. polonicum*, *Poland wheat*. *T. spelta*, *German or spelt wheat*. *T. monococcum*, *St Peter's corn*.

Avena sativa, *manured black oat*. *A. nuda*, *naked oat*.

Hordeum vulgare, *common barley*. *H. distichon*, *long-eared barley*. *H. hexastichon*, *square barley*. *H. zeocriton*, *battledore or sprat barley*.

Secale cereale. *Common rye*.

Coix lachryma jobi, *Job's tears*.

Cynosurus cerocanus, *Indian cock's-foot grass*.

Festuca fluitans, *stote fescue grass*.

Holcus sorghum, *Guinea corn*, or *Indian millet*.

Nymphaea nelumbo, *Egyptian bean*.

Oryza sativa, *rice*.

Panicum miliaceum, *common millet*. *P. Italicum*, *Italian millet*.

Phalaris canariensis, *canary grass or canary seed*.

Polygonum fagopyrum, *buck wheat*.

Quercus esculus, *cut-leaved Italian oak*. *Q. phellos*, *carolinian willow-leaved oak*.

Sesamum orientale, *eastern sesamum*. *S. Indicum*, *Indian sesamum*.

Sinapis nigra, *black mustard*. *S. arvensis*, *wild mustard or charlock*.

Zea mays, *Maize*, or *Indian wheat*.

Zezanea aquatica, *water zezania*.

X. ESCULENT NUTS.

Amygdalus communis, *sweet and bitter almond*.

Anacardium occidentale, *cashew nut*.

Avicenna tomentosa, *eastern anacardium*, or *Malacca bean*.

Corylus avellana, *hazel nut*.

Cocos nucifera, *cocoa nut*.

Fagus castanea, *common chesnut*.

Juglans regia, *common walnut*. *J. nigra*, *black Virginian walnut*.

Jatropha curcas, *Indian physic nut*. *J. multifida*, *French physic nut*.

Pinus pinea, *stone or manured pine*.

Pistacia vera, *pistachia nut*. *P. narbotensis*, *trifoliate-leaved turpentine tree*.

Theobroma cacao, *chocolate nut*.

Trapa natans, *Jesuit's nut*.

XI. ESCULENT FUNGUSES.

Agaricus campestris, *common mushroom*. *A. pratensis*, *the champignon*. *A. chantarelus*, *chantarelle agaric*. *A. deliciosus*, *orange agaric*. *A. cinnamomeus*, *brown mushroom*. *A. violaceus*, *violet mushroom*.

Lycoperdon tuber, *the truffle*.

Phallus esculentus, *the morel*.

For the botanical arrangement and characters of these plants, see the article BOTANY. For a particular account of the individuals as articles of diet, we must refer our readers to Bryant's Flora Dietetica, Cullen's Materia Medica, vol. i. the synopsis of Materia Alimentaria and Materia Medica, and Sir John Sinclair's Code of Health and Longevity, vol. i. The preparation and use of bread have already been treated of at considerable length under that article. The use and best methods of preparing potatoes are given under AGRICULTURE, N° 288, &c.

B. DRINKS.

DRINKS may be divided into common water, vegetable infusions or decoctions, fermented liquors, animal fluids, and animal infusions or decoctions. The two last have been already spoken of, and water will be considered hereafter. We shall here only make a few observations on the second and third heads.

The vegetables employed for infusions or decoctions used as drink, are chiefly tea, coffee, and chocolate.

All the various kinds of tea imported into this country,

⁹⁶

Dietetics. try, come under the denominations of bohea and green; and even these are supposed to be the produce of the same species of plant; though Linnæus has described them as specifically different, founding the distinction on the number of their petals. Others have observed a difference in the leaves. Still, however, it is uncertain whether these are not merely accidental differences, occasioned by diversity of soil, situation, and culture. While the present narrow and jealous policy of the Chinese continues, many interesting particulars respecting the natural history of this plant must remain unknown to Europeans.

It had been well for the inhabitants of Great Britain, if the tea-leaf had never found its way to this country; they would not then have been tormented, as thousands of them now are, with an incurable train of nervous symptoms, with stomachic and bowel complaints, with headach, &c. To the abuse of tea-drinking may be ascribed, in a great measure, the increased frequency of consumptions; and many of the disorders of children, and especially hydrocephalus, tabes mesenterica, rickets, &c. may be traced to the same source.

The tea-leaf, when fresh from the tree, is evidently poisonous. It is true that it loses some of its acrimony by drying: but even in the state in which it is sent to this country, it retains much of its narcotic nature. What serious mischief, then, are they bringing upon themselves, who, as is the case with too many of the lower class of society, make it a principal part of their daily subsistence! The money which should go to purchase wholesome and substantial food, is squandered away in procuring what of itself affords no nourishment at all; for whatever nourishment is derived from the infusion of tea, is owing to the sugar and milk which are added to it; and were it not for these additions, its deleterious effects would be much sooner and much more powerfully felt.

The time, it is to be hoped, is not far distant, when the poor shall be enlightened upon this important point. The next generation will hardly believe that their predecessors lavished away so much money, and took such extraordinary delight in defrauding their bodies of their proper and natural aliment, and in bringing upon themselves infirmity and disease. Let the rich and the intemperate indulge, if they choose, in the narcotic draught; to their heated and oppressed stomachs it may not do harm; it may even afford momentary relief. But let the poor abstain from it. They are not surcharged with high-seasoned food. They have no feverish thirst, no feverish heat to allay, after their noon-day repast. To them it is totally unnecessary as a help to digestion, and as an article of sustenance it is worthless and improper. They would, therefore, be better, infinitely better, without it.

Besides its narcotic quality, there is another property of the tea-leaf which renders its continued use injurious to the constitution; we mean its astringency. Add to these the warm water, and we have, in this unna-

tural beverage, the infusion of tea, three different powers concurring to disorder first the organs of digestion, and ultimately the whole system. **Dietetics.**

If it be asked, what are they who have been long accustomed to tea to substitute in its place; we answer milk, milk-porridge, gruel, broth, cocoa, or the like for breakfast; and in the afternoon, milk and water, orgeat, or lemonade in the summer, and coffee in the winter.

It should be understood, that the preceding remarks apply to the general abuse of tea as an article of sustenance; for its occasional employment in a dietetical and medicinal way in some kinds of sickness, is often of use. Thus, the simple infusion, without sugar or milk, is a good diluent and sedative in ardent fevers; and as it promotes perspiration and urine, it is frequently drunk with advantage in colds, catarrhs, rheumatism, headach, &c. It is also serviceable in cases of surfeit and indigestion.* **Synopsis of Medicinal Aliments.**

For the use and abuse of coffee, see the article **CORFEE.**

Chocolate is more nourishing and less heating than coffee. It is commonly made too thick, but when of a proper degree of strength, it is a very palatable and wholesome beverage, though on account of its oily quality it proves oppressive and cloying to some stomachs. See **CHOCOLATE.** **97**

Cocoa is in fact only a weak chocolate; and being less pure than the former, weak chocolate might properly be substituted for it. **98**

Of fermented liquors we shall mention only malt liquors, wine, and ardent spirits.

Well fermented malt liquors, whether from barley or other grain, provided they be not too strong, are wholesome, refreshing, and strengthening drinks. As these liquors are very nutritious, they are chiefly suited to persons who lead a busy and active life. With sedentary and bilious persons they do not agree so well; and they are improper for the corpulent and asthmatic, and those who are liable to giddiness or other complaints of the head. They are better when of a middle age, than when kept very long. Beer made from the infusion of malted groats, or malted rye, is lighter and more diuretic than the common barley beer. Spruce beer is a powerful diuretic and antiscorbutic; it is, however, too cold for some constitutions. Bottled-beer is, on account of the fixed air which it contains, more refreshing than the barrelled. It is frequently prescribed as an antiseptic and restorative in low fevers and convalescencies; but care must be taken, during the use of it, that it do not operate too freely by stool. London porter, with the common properties of malt-liquor, possess such stomachic and diuretic qualities, as give it a preference over common beer and ale, in many cases. Being strongly impregnated with bitters of a narcotic kind, it is apt to induce drowsiness, and consequently is improper wherever there is a tendency to cephalalgia, apoplexy, or other affections of the head (A). **99**

A

(A) We cannot pretend to decide whether the prejudices that have for some time prevailed against the wholesomeness of London porter are well founded or not; but if its composition be such as given under the article **BREWING**, we are decidedly of opinion that it is a liquor quite unfit for constant drink.

¹⁰⁰ **Dietetics.** A temperate use of wine is conducive to the health. All the functions, both of body and mind, are roused and facilitated by it. It has a powerful effect upon the organs of digestion, upon the circulation, and upon the nervous system, promoting digestion, strengthening the action of the heart and arteries, and raising the spirits. Such is its beneficial operation, when taken sparingly. In excessive quantities it has opposite effects, destroying the stomach, inducing emaciation and debility, and occasioning inflammation and obstruction in the liver, lungs, &c. whence gout, palsy, dropsy, consumptions, diabetes, &c.

In a dietetical view, wines are to be considered as they are, either acid or sweet, soft or austere. The acid wines, of which the Rhenish and Hock are the most noted, are the least heating, and the most diuretic. The sweet, such as the Frontinac, Malaga, Tent, Cape, are heating and sudorific. The soft, or acidodulcescent wines, such as Champagne, Claret, Burgundy, Madeira, &c. are less stimulating than the sweet, and more cordial than the acid wines. Of the austere and astringent, that which is most used in this country is the red Port, which, when it has not been mixed with too large a proportion of brandy, is a generous and stomachic wine, well suited to the generality of British constitutions.

¹⁰¹ **Perry and cyder.** Perry and cyder hold a middle place between wine and malt liquor. They are less nutritious than the latter, and less cordial than the former.

¹⁰² **Ardent spirits.** In small quantities ardent spirits are a powerful cordial and corroborant, raising the pulse, strengthening the stomach, promoting digestion, and preventing flatulence. Taken sparingly, and diluted with water, they supply the place of wine, and with some constitutions agree better, as they are not like wine, disposed to create acidity. The abuse of them is productive of the same pernicious effects as those which arise from an excessive indulgence in wine, but in a greater degree. French brandy is the most bracing and stomachic; gin and rum the most diuretic and sudorific. Arrak, which is distilled from rice, is more heating than the two last. Whisky is considered as a lighter spirit than any of the former, from its containing less essential oil, and it therefore agrees better with most stomachs. The qualities of all these several sorts of spirits are improved by long keeping*.

* *Practical Synopsis of the Materia Alimentaria.* On the general subject of drink, see the article **DRINK.**

¹⁰³ **CONDIMENTS.**

CONDIMENTS are those substances which are taken with our food, to promote digestion, or to correct some hurtful property in the food taken. They are usually divided into saline, saccharine, aromatic, and oleaginous.

Of the saline condiments, the principal are common salt and vinegar.

¹⁰⁴ **Salt.** Common salt, by its stimulant action on the throat, gullet, and stomach, seems to promote the secretion of saliva and of the gastric juice, and thereby facilitates digestion. It also appears, when taken in small quantity, to increase the solubility of most foods, but when taken too plentifully, it renders the food hard and dif-

ficult of solution. Salted meats and fish are unwholesome when made a constant article of diet.

Vinegar in small quantities is a grateful and salutary stimulus to the stomach, correcting the putrescency of animal food, and the flatulency of vegetable. Its use is improper in many valetudinary cases, especially for calculous and gouty persons; in consumption and chlorosis; to rickety patients and young children.

Pickles may be considered as merely receptacles for vinegar, except in as far as the vegetables of which they are composed are in their nature warm and aromatic, as the onion.

¹⁰⁶ **Sugar.** Sugar is nutritious, antiseptic and laxative, and is considered as promoting the solution of fat in the stomach; but as it is very fermentable, it is apt, in many constitutions, to produce flatulence, heat, and thirst. Its unlimited use seems to be one cause of the increased and increasing frequency of bilious and hypochondriacal disorders. Chlorotic girls, rickety children, hysterical women, and all who are troubled with acidity in the stomach and bowels, should abstain from it; and those who are anxious to preserve their teeth white and sound, should not make free with it. To these observations, however, there are some constitutions which furnish exceptions. Thus we are told that one of the dukes of Beaufort took, for the space of 40 years, nearly a pound of sugar every day; yet it neither disordered any of the viscera, nor injured the teeth, and he lived to attain the age of 70.

¹⁰⁷ **Spices.** The aromatic condiments consist chiefly of the foreign spices, as pepper, Cayenne pepper, cinnamon, nutmeg, cloves, ginger, and a few garden roots and seeds, such as garlick, leek, onion, horse-radish, and mustard. Of these we shall take notice under their proper heads in the *Materia Medica*.

The oleaginous condiments consist merely of olive oil and butter.

¹⁰⁸ **Oil.** Oil when used as a seasoning to raw vegetables, checks their fermentation in the stomach, and thereby prevents them from proving too flatulent. Used in this manner, in small quantities, it proves a help to digestion; but when taken in considerable quantities, it has an opposite effect, and lays the foundation for bilious complaints.

¹⁰⁹ **Melted butter.** The moderate use of melted butter with boiled vegetables, is, in general, by no means unwholesome; but it frequently disagrees with bilious and hypochondriacal people.

The proper method of preparing food, constitutes the art of cookery, on which we shall present our readers with the following general remarks, taken from Sir John Sinclair's Code of Health and Longevity.

¹¹⁰ **Cookery.** The primeval inhabitants of the earth certainly ate both their vegetable and animal food raw; and to this day some of the African nations, the Esquimaux Indians, the Patagonians and Samoeides, devour raw flesh and fish, and drink the blood of the animals. Raw flesh produces great bodily vigour, ferocity of mind, and love of liberty.

In general, however, animal food undergoes some preparation before it is consumed. It is hardly to be credited the shifts which some tribes have been put to, in order to obtain that object, as putting heated stones in

Dietetics. in the bellies of pigs to roast them, or burning the straw in order to parch the grain. From these humble attempts, the great refinements of cookery, which is properly a branch of chemistry, originated.

It is certain that cookery is an useful art. By it many articles are rendered wholesome, which could not otherwise have been eaten; but by it, at the same time, it must be acknowledged, that some articles are rendered unwholesome, which would otherwise have produced nourishing food.

By cookery, our foods are rendered more palatable and digestible, and when prepared in a simple manner, more conducive to health.

Cookery may be considered under two general heads, the simple, and the refined or compound.

111
Simple
cookery.

The first, though apparently easy, requires a considerable degree of attention and experience; and the second is an art of so diversified and extensive a nature, that it is rarely carried to any considerable degree of perfection, and it would have been no loss to human nature if it had never been invented.

Simple cookery includes the following modes of dressing meat: 1. Roasting. 2. Boiling. 3. Stewing. 4. Broiling. 5. Frying. 6. Baking; and, 7. Digesting.

112
Roasting.

1. *Roasting* was certainly the first mode invented to prepare animal food; for boiling is a more complicated process, and required the art of manufacturing vessels that could withstand the effect of heat. Roasting, it is well known, requires a greater proportion of heat than boiling, and more skill in the preparation. By the application of fire, a considerable proportion of watery substance is exhaled from the meat. In order to be done properly, the roasting should be conducted in a gradual manner, and the heat moderately but steadily applied, otherwise exsiccation rather than roasting, takes place. Roasted meat is certainly the best means of consuming the flesh and tasting the natural juices of the meat. It is also peculiarly calculated for birds of every sort, and for young and tender meat, taking off its viscosity, and giving it a firmness and dryness that otherwise it would not possess.

Roasted meat, at least of the larger kinds, as beef, mutton, and venison, is preferred in England, and boiled or baked meat in France. The meat of England has not, perhaps, the same flavour as that of France, but it is larger, richer, and fatter, and appears to more advantage in a roasted state. Besides, coal fires are better adapted for that process of cookery than wood or peat. It is found, indeed, that meat, roasted by a fire of peat or turf, is more sodden than when coal is employed for that purpose.

Our meat in England (Cadogan asserts) is generally over-done, and particularly over-roasted. In regard to over-roasting, the action of fire, if continued too long, has a tendency to change mild animal flesh into something of another quality; the fat in particular, becomes bitter and rancid. The less, therefore, that all flesh meat undergoes the power of the fire, the milder and wholesomer it is. This doctrine, however, is denied by Falconer. He admits, that meat little done is the most soluble, but at the same time contends, that it is exceedingly alkaliescent, and runs quickly into putrefaction. Hence the French, who live in a warm climate, find it necessary not only to eat a great quan-

ty of bread, to prevent the putrefying effect of animal food, but also to have their meat thoroughly boiled and roasted. **Dietetics.**

2. *Boiling* is also an excellent mode of preparing animal food, rendering it more soluble, without destroying, if properly done, its nutritious qualities, and being peculiarly calculated for weak stomachs. But however useful moderate boiling may be in these respects, yet, when carried to an extreme, every thing soluble is extracted, the nutritious parts are conveyed to the liquor, and the meat itself is left behind insipid, dense, and unfit for nourishment.

Young and viscid food, as veal, chickens, partridges, &c. are more wholesome when roasted than boiled, and easier digested; but beef and mutton are easier digested when boiled than roasted; consequently boiling such meat is better calculated for weak stomachs. Boiling is particularly applicable to vegetables, rendering them more soluble in the stomach, and depriving them of a considerable quantity of air, so injurious to weak stomachs.

The usual mode of preparing fish for the table is by boiling, roasting rendering them more indigestible.

It is proper to observe, that those who are trained to athletic exercises, have their meat roasted or broiled, and not boiled; as it is supposed, that, when boiled, a great part of the nutritive juices of the meat is lost in the water.

3. *Stewing* is reckoned the mode by which the greatest quantity of nourishment is derived from the meat. By this plan the texture of the meat is rendered more tender, its soluble parts are not fully extracted, and it is left in a state abundantly sapid and nourishing, while the soup also, or fluid, contains a sufficient proportion of the animal extract.

4. *Broiling*, consists in exposing meat to the near application of a naked fire, by which means its outer surface immediately hardens, before the heat has penetrated the whole. This prevents any excess of exhalation; and the meat, when done, is rendered sufficiently tender. It is peculiarly suited for steaks, which are, comparatively speaking, eaten in a juicy and almost in a raw state.

5. *Frying* is a process that renders meat more indigestible than any other, and indeed, might be included under the head of compound cookery. It is performed by cutting meat into thin slices, and putting it into a vessel over the naked fire. As the lower surface of the meat would thus be burnt or hardened, some fluid matter, generally of an oily nature, is introduced, which acquires, from the heat, a burnt or empyreumatic taste, and becomes hardly miscible with the fluids in the stomach. It requires, therefore, the addition of stimulants to enable the stomach to digest it.

6. *Baking* consists in the application of heat in a dry form, but in a vessel covered with a paste instead of its being exposed to the open air. Any considerable exhalation is thus prevented, and the meat, by the retention of all its juices, is rendered more sapid and tender. But baked meat sits heavy on some stomachs, from the greater retention of its oils, which are in a burnt state. It requires, therefore, the additional stimulus of spices and aromatics, to render it lighter, and to increase the power of the stomach to digest it.

7. *Digesting* is the last discovered process of simple cookery.

Dietetics. cookery. It is performed in a close vessel, and resembles boiling, being conducted in a very high temperature, while, from the closeness of the vessel, the advantages of stewing are procured. It is not, however, much in use.

119
Jellies.

Besides these various simple modes of preparing animal food, there is another, which it may here be proper to take notice of, namely, when animal food is dissolved in water, and formed into a gelatinous solution or jelly. This substance is of a viscid nature, and though it contains much nourishment, yet is difficult of digestion, and of course less calculated for diseased or weak stomachs than is commonly imagined. Nor are those jellies, which are the mucilaginous extracts of certain parts of animals, as hartshorn, very digestible; indeed, a too liberal use of them has often proved injurious. They can only be recommended for the sick, accompanied with a quantity of stale bread. To those who require an article of that sort, more especially if their stomachs are weak, simple beef tea, properly prepared, is the most nutritive balsam that can be administered.

It may also be proper to observe, that even after provisions have been dressed in the kitchen, they have often to undergo some operations of cookery at the table; this is principally by the addition of some of the various sorts of seasoning or condiments.

120
Compound cookery.

One would imagine that all the various modes of preparing food above enumerated, might satisfy the most luxurious appetite; but, instead thereof, the ingenuity of man has been exerted to discover a number of other preparations. Hence, a system of refined or compound cookery has been invented, more flattering to the palate than favourable to the health.

It would be improper to touch upon processes which it is impossible for any writer on dietetics to mention with any degree of approbation. Some dishes may be prepared, variously compounded, which may occasionally be tasted, and plain sauces may be a useful addition to fish and vegetables; but the generality of ragouts, made dishes, and the like, are of a poisonous quality, and cannot be too anxiously avoided by those who entertain any anxiety for the preservation of their health*.

* Code of Health and Longevity, vol. i.

The foregoing observations on diet are adapted chiefly to persons in health; but it is of great importance for a medical man to know what is the most proper diet for the sick and for convalescents. To treat this subject properly would occupy more room than we can allot to it; we shall, therefore, only insert here the following remarks by the late Dr Heberden, with which we shall conclude this part of the article.

121
Diet of sick and convalescent persons.

"Many physicians appear to be too strict and particular in the rules of diet and regimen, which they deliver as proper to be observed by all who are solicitous either to preserve or recover their health. The common experience of mankind will sufficiently acquaint any one with the sorts of food which are wholesome to the generality of men; and his own experience will teach him which of these agrees best with his particular constitution. Scarcely any other directions besides these are wanted, except that, as variety of food at the same meal, and poignant sauces, will tempt most persons to eat more than they can well digest; they ought therefore to be avoided by all who are afflicted with

any chronic disorders, or wish to keep from them. **Dietetics.** But whether meat should be boiled or roasted, or dressed in any other plain way, and what sort of vegetables should be eaten with it, we never yet met with any person of common sense who did not appear fitter to choose for himself than we could direct him. Small beer, where it agrees, or water alone, are the properest liquors at meals. Wine or spirits mixed with water have gradually led on several to be sots, and have ruined more constitutions than ever were hurt by small beer from its first invention.

"In fevers a little more restraint is necessary, but not so much as is often enjoined. The stronger sorts of meat and fish are most usually loathed by the sick themselves, nor could they be eaten without offending the stomach, and increasing the distemper, while it is at all considerable; but in its decline the sick are often desirous of some of the milder sorts of meat, and no harm follows from indulging their desire. The English are said to eat more meat when they are well than most other nations; but were remarkable, so long ago as the time of Erasmus, for avoiding it more scrupulously when they are sick than any other people. How high soever the fever be, the sick may be safely nourished with weak broths and jellies, and with any vegetable substances, if we except the acid and aromatic, or with the infusions or decoctions prepared from them; and we know no reason for preferring any of these to the rest. Eggs and milk have been, we know not by what authority, forbidden in all fevers; but as far as our experience goes, they both afford innocent food in the worst, where they are grateful to the patients.

"The feverish thirst is best allayed by pure water, which may be drunk either warm or cold, at the option of the sick person, and he may drink as much as he pleases; but we see no advantage in persuading him to gorge himself with liquids, as is often done, against his inclination and stomach. If water be deemed too insipid, currant jelly, and a variety of syrups, may be dissolved in it; or apples sliced or roasted, tamarinds, sage, or baum, or toasted bread, may be infused in it; or decoctions may be made of oatmeal, barley, or rice; or the water may be made into an emulsion with the oily seeds; all which, with a variety of similar substances, merely correct its insipidness, but in other respects leave it just what it was.

"There is scarcely any distemper, in every stage of which it may not be safely left to the patient's own choice, if he be perfectly in his senses, whether he will sit up or keep his bed. His strength and his ease are chiefly to be attended to in settling this point; and who can tell so well as himself, what his ease requires, and what his strength will bear?

"Doubts are often raised about the propriety of changing the linen in sickness, just as there have been about changing the foul air of the sick chamber by any of the means which could purify and refresh it. There can be very little reason to fear any mischief from the cold which the sick may feel while their clean linen is putting on; for their attendants, with common care, will do this as safely as many other things which must necessarily be done for them. But some have a strange opinion of harm from the smell of the soap perceivable in linen after it has been washed, and therefore allow not their patients, when they change their linen, even

Therapen-
tica

to put on fresh, but such only as have been worn, or lain in, by other persons. By this contrivance indeed the smell of the soap might be taken off; but few cleanly people would think they gained any advantage by the change. Now, if a faint smell of soap were noxious, then soap-makers and laundry servants must be

remarkably unhealthy, which is contrary to experience; nor is it less so, that the sick are injured by the cleanliness of what they wear; on the contrary, the removing of their foul things has often diffused over them a sense of ease and comfort, which has soon lulled them into a quiet and refreshing sleep*.”

den's Com-
mentaries.

PART II. OF THE GENERAL ACTION OF REMEDIES AND THEIR CLASSIFICATION.

122
Action of
remedies.

WE shall not attempt any new or original disquisition on the action of remedies, but shall merely state the most generally received opinions on the subject. We shall begin with the doctrine of the disciples of Cullen, which has been well expressed by Dr Percival in the following propositions.

123
Medicines
act by an
immediate
and pecu-
liar impres-
sion on the
alimentary
canal.

1. *Medicines may act on the human body by an immediate and peculiar impression on the stomach and bowels, either in their proper form, in a state of decomposition, or a change in the arrangement of their parts.*—The sympathy of the stomach with the whole animated system is so obvious to our daily experience, that it cannot require much illustration. After fasting and fatigue, we feel that a moderate quantity of wine instantly exhilarates the spirits, and gives energy to all the muscular fibres of the body. It has been known even to produce a sudden and large augmentation of weight, after much depletion, by rousing the absorbent system to vigorous action. Such power is peculiar to living mechanism; and is properly denominated by physicians, the *vis medicatrix naturæ*. But apparent as is the sympathy of the stomach, the laws by which it is governed are very insufficiently understood; and we have hitherto learned only from a loose induction of facts, that the nerves of this delicate organ seem to be endowed with diversified sensibilities; that impressions made by the same or different substances, have their appropriate influence on different and distant parts; and that the stomach itself undergoes frequent variations in its states of irritability. A few grains of *sulphate of copper*, taken internally, excite instantly the most violent contractions of the abdominal and other muscles concerned in vomiting. A dose of *ipecaquanha*, as soon as it produces nausea, abates both the force and velocity of the heart, in its vital motion; and affects the whole series of blood vessels, from their origin to their minutest ramifications, as is evident by the paleness of the skin under such circumstances, and by the efficacy of emetics in stopping hæmorrhages. The head, when disordered with vertigo, sometimes derives sudden relief from a tea-spoonful of ether, administered in a glass of water. An incessant cough has been known to attack the lungs, in consequence of the stimulus of a pin, which had been unwarily swallowed. Of the action of medicines on the stomach, under decomposition or recombination, we have an example familiar to every one, in *carbonate of magnesia*. For this earth, by neutralizing the acid in the *primæ viæ*, acquires a purgative quality, and at the same time yields a gas of great salubrity, as an antiemetic, tonic, and antiseptic.

2. *Medicines may pass into the course of circulation in one or other of the states above described, and being con-*

veyed to different and distant parts, may there produce certain appropriate effects.—Chemistry furnishes us with numberless cases in which substances undergo changes, and take new forms more remarkable than can be effected by digestion, retaining still the *materia prima*, and the being capable of resuming the original arrangement of their particles, and consequently their original qualities. Now, a body altered in its texture by digestion, and carried into the system with aliment, may acquire specific powers of acting on particular sound or diseased parts. Thus, if we suppose cantharides to be changed in form and texture, when mixed with the chyle, the lymph, or the blood, they may still, in that form and texture, be peculiarly adapted to excite strangury in the urinary passages, or, we may conceive that this new modification of their particles may again be altered, and their original composition restored by a subsequent chemical change in the kidneys. The sensible qualities of any body are no certain marks of its medicinal action. Peruvian bark does not owe its efficacy in fevers to its bitterness, for stronger bitters are not possessed of its febrifuge powers. Antimony, though insipid, produces a violent action on the nerves of the stomach, and yet if applied to the eye, an organ equally sensible, it is altogether inert. To what perceptible property in opium are we to ascribe its narcotic powers? or is there in the sweet taste of acetate of lead, any indication of a deadly poison? Numberless instances may be adduced to prove the uncertainty of reasoning otherwise than from observation, concerning the action of medicines, and the peculiar sensibility of different parts of our system to their impression. Following experience, therefore, as our guide, let us notice a few facts that may elucidate the subject before us. It is well known that madder root, when taken by an animal, carries its tinging qualities to the bones, affecting neither the skin, the muscles, the ligaments, nor the fat. Consequently this tinging quality is left unchanged by digestion; or perhaps it is again recovered, when arrived at the bones, by some new arrangement of parts produced by the chemistry of nature. Extract of logwood, taken internally, sometimes gives a bloody hue to the urine. But the astringency of it does not seem to accompany its colouring matter. We recollect no instance where- in the milk either of a nurse, or of an animal, was tinged with madder or logwood. This affords some presumption, that the pigment does not subsist in its proper form, in the blood; but that it is recovered by a subsequent change in the disposition of its constituent particles. And if one substance stain the bones, by being carried into contact with them, another may, in an analogous manner, produce in them fragility or dissolution.

Therapeutics. solution. In the disease termed by the French *ergot*, and which, with some probability is ascribed to the use of a species of unsound corn, the bones lose the earthy matter that enters into their texture; the gums become soft, and are easily broken. This effect is gradual, and probably arises from some unknown quality in the corn, which is either not taken away by digestion, or is resumed in the juices that circulate through the osseous vessels. A change in the process of vegetation may communicate a solvent power to an esculent seed. Mustard acquires this by its natural growth, and is capable of rendering even ivory soft and fragile. How far it would produce such an effect on the bones of a living body, if used as the chief article of diet, we have no experience on which to ground any satisfactory conclusion.

Sulphur, whether externally or internally used, produces a cure in the itch. In each way, therefore, we may presume its operation to be similar. But when taken into the stomach, there can be no doubt that it undergoes a change in the modification of its parts, and that it does not circulate through the blood vessels either in the form or with the properties of sulphur. Yet when conveyed to the surface of the body, it evidently appears to recover its original powers, communicating its peculiar odour to the perspiration, tinging silver, and curing cutaneous defoedations. The same holds true of the sulphuric acid, when administered in large doses. It seems to lose oxygen in the animal body, and to pass off by the pores, as hepatic air, or as volatilized sulphur. Even when given to nurses, it proves an effectual remedy for the itch, both in them and the children whom they suckle. Mercury combined with sulphur into the black sulphuret, has frequently been regarded as inert. Instances, however, have occurred in which, under this form, though accurately prepared, it has produced salivation; an evident proof, according to Dr Percival, of a chemical change in the sulphuret, by which the mercury was restored to its original powers. That mercury is capable of being reduced to the metallic form, and of collecting in considerable quantity in the human body, is proved by the concurrent testimony of many authors, who inform us that fluid mercury has been found in the carious bones of venereal patients. A salivation is sometimes produced by antimony. Dr James assured Sir George Baker, that he knew six instances of its being produced by his febrile powder, though he had left mercury out of its composition long before they occurred. Indeed, as the patients thus affected had neither their teeth loosened, nor their breath rendered offensive, there is no reason to suppose that the salivation was owing to a mixture of mercury in the powder.

Most persons have experienced the effects of asparagus on the urine. This takes place very speedily and strongly, though only a small quantity has been eaten. The smell is much more disagreeable than asparagus itself; and as the odorous particles conveyed to the kidneys must be greatly diluted in their passage, it is probable that a new combination of particles takes place in the urinary organs; and that the odorous part of the secretion differs in its form and quality from what subsisted both in the chyle and in the blood.

There are certain medicines which, when swallowed, quickly manifest themselves in the discharges, with

some of their original qualities. A strong solution of potash, when taken in considerable quantities, renders the urine alkaline and lithontriptic, and the same excretion becomes impregnated with carbonic acid, if water impregnated with that acid be drunk freely. Dr Percival speaks of a patient to whom six grains of balsam of Tolu were given thrice a day, and whose urine was strongly scented by this small quantity. Garlick affects the breath, though it be applied only about the wrists; and the milk of a nurse is easily tainted with it. A purgative given to a woman that suckles will sometimes produce no effect on her bowels, but will operate strongly on those of her infant. A still more convincing proof that there may be a renovation of the original qualities of a body, after it has undergone the process of digestion, and other subsequent changes, is deducible from these facts; that butter is often impregnated with the taste and smell of certain vegetables on which the cows have pastured; that the milk of such cows discovers no disagreeable flavour, any more than the whey or cheese prepared from it. Now, butter is formed, first by a spontaneous separation of cream, and secondly, by a fermentation of it; that is, by a twofold and successive new arrangement of its elementary parts. By these changes, the originally offensive materials in the food of the cow seem to reassume their proper form and nature.

After venesection the serum of the blood has sometimes appeared as white as milk, while the crassamentum retained its natural colour. This whiteness has been shewn to arise from oleaginous particles floating in the circulating fluids, and may serve to explain a fact recorded by a writer of good authority, on the natural history of Aleppo, that in certain seasons when oil is plentifully taken, the people become disposed to fevers, and infarctions of the lungs, which symptoms wear off by retrenching this indulgence. Some years ago cod-liver oil was annually dispensed amongst the sick of the Manchester hospital, to the amount of 50 or 60 gallons. The taste and smell are extremely nauseous, and it leaves upon the palate a savour like that of putrid fish. This remedy is more salutary when it operates by perspiration; and the sweat of those to whom it is administered, always becomes strongly tainted with it. An oil of the same kind forms no inconsiderable part of the food of many northern nations; and it is said to penetrate and imbue the deepest recesses of the body.

Dr Wright relates an experiment to prove that chalybeates do not enter the blood. He forced a dog that had fasted 66 hours, to swallow a pound of bread and milk, with which had been mixed an ounce and a half of sulphate of iron. An hour afterwards he opened the dog, and collected from the thoracic duct about half an ounce of chyle, which assumed no change of colour when tincture of galls was dropped into it, though it acquired from the same tincture a deep purple, when a quarter of a grain of sulphate of iron was dissolved in it. This experiment is usually deemed decisive in support of the opinion that chalybeates exert their operation solely on the stomach, and that the vigour they communicate to the system arises exclusively from their tonic powers on the alimentary canal, and from the sympathy of the stomach with various other parts of the body. Dr Percival was of opinion, that the tonic action and sympathy above mentioned, did

Therapeutics

not preclude the immediate agency of the steel on the remote parts of the human frame, as this remedy, in other forms capable of being introduced into the circulation, may exert considerable energy as a stimulant or astringent; and in his opinion, the experiment adduced proves that the iron did not exist in the chyle, in the state of a salt capable of striking a black colour with galls. Neither does the oxide of iron, nor the glass of iron, possess this power, yet, though changed, they are both capable of being restored to the metallic state. Perhaps with equal reason it might be presumed by one ignorant of chemistry, that the sulphate of iron contains no iron, because it is not acted on by the magnet.

With the foregoing experiments of Dr Wright, Dr Percival contrasts those made by the celebrated Dr Musgrave, who injected into the jejunum of a dog that had, for a day before, but little meat, about 12 ounces of a solution of indigo in fountain water, and, after three hours, opening the dog a second time, he observed several of the lacteals of a bluish colour, which on stretching the mesentery, did several times disappear, but was most easily discerned when the mesentery lay loose; an argument that the bluish colour was not properly of the vessels, but of the liquors contained in it. A few days after this, repeating the experiment in another company, with a solution of stone blue in fountain water, and on a dog that had been kept fasting 36 hours, he saw several of the lacteals become of a perfect blue colour, within very few minutes after the injection. For they appeared before he could sew up the gut.

About the beginning of March following, having kept a spaniel fasting 36 hours, and then syringing a pint of deep decoction of stone blue with common water, into one of the small guts; and after three hours, opening the dog again, he saw many of the lacteals of a deep blue colour: several of them were cut, and afforded a blue liquor, some of the decoction running forth on the mesentery. After this he examined the ductus thoracicus, and saw the receptaculum chyli, and that ductus, of a bluish colour; not so blue indeed as the lacteals, from the solution mixing, in or near the receptaculum, with lymphæ, but much bluer than the ductus used to be, or than the lymphatics under the liver were, with which he compared it.

Stone blue is a preparation of cobalt, potash, and white lead, which being converted into glass, is ground into fine powder. If such a substance can pervade the lacteals, we may conclude that they are permeable to other bodies, besides those designed for nutrition, and capable of assimilation with the blood. This argument from analogy, receives great additional force from the known fact, that mercury, and various other active remedies, may be conveyed into the body through the absorbents of the skin, a system of vessels similar to those above mentioned, in their structure, uses, and termination. In a case of hydrocephalus internus, on which Dr Percival was consulted, a child under one year of age, received, by successive frictions, 4 ounces 6 drams and 2 scruples of strong mercurial ointment between the 8th of February and the 7th of April 1786. One scruple was administered each time; the operation took up more than half an hour, and the part to which the ointment was applied, was always previously bathed

with warm water; precautions which seemed to secure the full absorption of the mercury. The child recovered without any symptoms of salivation, and continued perfectly well. The doctor repeatedly observed, that very large quantities of mercurial ointment may be used in infancy and childhood, without affecting the gums, notwithstanding the predisposition to a flux of saliva, at a period of life incident to dentition.

Whence is it that a medicine so irritating as mercury, can be conveyed into the course of circulation, when even milk, or the mildest liquors, if transfused into the blood vessels, have been found to produce convulsions and death? Is it that what passes by the lymphatics and lacteals is carried into the thoracic duct, and there mixed with a large portion of the chyle and lymph, by which its acrimony is sheathed and diluted, or its chemical properties changed, before it enters the mass of blood? For the absorbents of the skin, and of the intestines, seem to require a capacity to bear the stimulus of these extraneous bodies to which, in both situations, they are exposed.

3. Medicines introduced into the course of circulation may affect the general constitution of the fluids; produce changes in their particular qualities; superadd new ones; or counteract the morbid matter with which they may be occasionally charged.—By observations on the hæmorrhages which have been sustained without destruction to life; from experiments made on animals, by drawing forth all their blood; and by a computation of the bulk of the arteries and veins, the mass of circulating fluids has been estimated at 50 pounds in a middle-sized man, of which 28 pounds are supposed to be red blood. Fluids bearing so large a proportion to the weight of the whole body, have assuredly very important offices in the animal economy. Endued with the common properties of other fluids, they are subject to mechanical laws; being variously compounded, they are incident to chemical changes; and, as they are contained in a living vascular system, their motions become subject to the influence of nervous energy.*

The followers of Dr Brown explain the operation of medicines on the principle of their all acting as stimulants in a greater or less degree. This doctrine, with some modification, is thus detailed by Mr Murray. "Medicines, in general, operate by stimulating the living fibre, or exciting it to motion. This proposition has even been stated as universal, and was received as an axiom, in a system superior, perhaps, to any, in conveying just and precise ideas on the nature of life, and the affections to which it is subject. Medicines, in common with all external agents, are, according to this system, incapable of directly altering the state of the vital power: they can only excite the parts possessed of that power to action; and however diversified their effects may appear to be, such diversities are to be referred merely to the different degrees of force in which they exert the general stimulant power they possess.

"This proposition cannot, however, be received in an unlimited sense. From the exhibition of different medicines, very different effects are produced, which cannot be satisfactorily explained from the cause assigned,—the difference in the degree of stimulant operation. They differ in kind so far, that even in the greater number of cases, one remedy cannot by any management of

Therapeutics

125

act on the

Murray's

account of

the action

of medi-

cines

dose

Therap- dose or administration, be made to produce the effects
tics which result from the action of another.

"It is therefore necessary to admit of some modifications of the general principles above stated, and the following are perhaps sufficient to afford grounds for explaining the operation of remedies, and for establishing a classification of them sufficiently just and comprehensive.

"1. Stimulants are not to be regarded as differing merely in the degree of the stimulant operation which they exert. An important distinction exists between them, as they are more or less diffusible and permanent in their action. A stimulus is termed diffusible, which, whenever it is applied, or at least in a very short time after, extends its action over the whole system, and quickly produces its full exciting effect. A diffusible stimulus is generally also transient in its action; in other words, the effect, though soon produced, quickly ceases. There are others, on the contrary, which, though equally powerful stimulants, are slow and permanent. These varieties, which are sufficiently established, serve to explain the differences in the power of a number of the most important medicines; and they lay the foundation for the distinction of two great classes, narcotics and tonics, with their subordinate divisions of antispasmodics and astringents, both consisting of powerful stimulants; the one diffusible and transient, the other slow and permanent in their operations.

"There is a difference between stimulants, in their actions being directed to particular parts. Some, when received into the stomach, quickly act upon the general system; others have their action confined to the stomach itself, or at least, any farther stimulant effect they may occasion, is slow and inconsiderable; while a third class consists of those which operate on one part, often without producing any sensible effect on the stomach or general system. Some thus act on the intestinal canal, others on the kidneys, bladder, vessels of the skin, and other parts; the affection they excite in these, being the consequence, not of any stimulant operation equally extended over every part, but of one more particularly determined. This difference in the action of stimulants is the principal foundation of the distinctions of medicines into particular classes. Cathartics, for instance, are those medicines which, as stimuli, act peculiarly on the intestinal canal; diuretics, those which act on the secreting vessels of the kidneys; emmenagogues, those which act on the uterine system; diaphoretics, those which exert a stimulant action on the vessels of the skin. With these operations, medicines, at the same time, act more or less as general stimulants, by which each individual belonging to any class is thus rendered capable of producing peculiar effects; and many of them, by a peculiarity of constitution in the patient, or from the mode in which they are administered, frequently act on more than one part of the system, by which their effects are still farther diversified. Medicines, when thus determined to particular parts, are sometimes conveyed to those parts in the course of the circulation; more generally their action is extended from the stomach, or part to which they are applied, by the medium of the nervous system*."

Whatever medical system we may adopt, it is obvious that medicines can act on the human system only in two general modes; either as it is composed of inert

Therap- matter, or as it forms a living organised system. In the first mode, medicines may act either mechanically or chemically; in the second, they act entirely through the medium of the vital principle.

The order in which the several subjects of the materia medica have been considered, is very different in different writers; and which is the most proper, has been disputed about, while many are of opinion that it is of little consequence which of them is followed. It has been generally thought proper to follow a plan, in which the subjects are, according to a certain affinity, brought together, so that a number of them might be, for the purpose of medicines, considered under the same view. Thus, Dr Boerhaave considered them in the order of the botanical system he had formed, and Linnaeus in the order of his own system, in which he is followed by Bergius.

It has been thought proper to follow the botanical affinities, in so far only as they can be thrown into natural orders; and, this, therefore, has been attempted by the learned Professor Murray of Gottingen: but from the imperfection of the botanical affinities in pointing out a similarity of medicinal virtues, this plan will not always unite subjects in the latter point of view; and when we consider that there are yet many plants which do not enter into any natural order, these must be disposed of in an arbitrary manner, and probably in an unconnected state. It must be owned, however, that though the scheme of botanical affinities does not entirely answer the purpose, yet it will still go a certain length, and ought not to be neglected in the subdivision of any general plan that may be assumed.

It has been supposed by some to be a more eligible plan to unite the several substances, as they happen to be related by their sensible qualities; this method Cartheuser and Gleditsch have attempted. This certainly may have its use; but from what is said above respecting the imperfection of this scheme for investigating virtues, it will appear that it will not always unite subjects that ought to be united under the same view; and it will be found, that in the authors mentioned, who have executed it in the best manner possible, the desired effect is by no means produced.

From the difficulty of rendering any of those plans tolerably exact and perfect, some writers have deserted all of them, and thought it best to throw the several articles into an alphabetical order, as Newmann and Lewis have done. If, however, there can be any advantage from bringing subjects of some affinity together, this alphabetical order is the most unfit for the purpose, as by separating similar substances, it must be perpetually distracting to the student. It can therefore have no advantage but that of a dictionary, in referring readily to any particular subject that may be inquired after; but this advantage can be obtained in every plan by means of an index, which cannot be saved even in an alphabetical work, as the different names under which the same substances are known necessarily requires an index comprehending all those different names.

Similar to those of the alphabetical order, are those plans which, after arranging the several articles of the materia medica according to the part of the plant employed, as roots, leaves, &c. have thrown these again into an alphabetical order, as Alston and Vogel have done;

Therapeu-
tics

done; but it is obvious that this establishes no connexion between the subjects that follow one another, and can have no advantage over the alphabetical order. Further, by separating the consideration of the several parts of vegetables, it will both separate subjects that ought to be considered together, and will occasion unnecessary repetition.

137
Arrangement according to medical effects.

Dr Cullen was of opinion that, as the study of the materia medica is truly the study of the medicinal virtues, so the plan that arranges the several substances according to their agreeing in some general virtues, will be the best adapted to acquiring the knowledge of these, and will most readily inform the practitioner what different means he can employ for his general purpose. It will also inform him how far the several similar substances may differ in their degree of power, or how far, from the particular qualities assigned to each, he may be directed or limited in his choice.

As it seems proper that every practitioner ought, as far as possible, to practise upon general indications; so it is evident that his study of the materia medica is especially to know the several means that can answer these. Such a plan, therefore, must be the most proper for giving a student instruction; and if, while medicines are arranged according as they answer general indications, the particulars be likewise thrown together as far as possible according to their sensible qualities and botanical affinities, this plan will have the advantage of any other that has been proposed for presenting together the subjects that ought to be considered at one and the same time, and give the best means of recollecting every thing that relates to them.

134
Cullen's arrangement.

Dr Cullen's plan of arrangement is as follows. He first divides all the substances contained in the materia medica into two general heads, the first comprising alimentary substances, or meats, drinks, and condiments; the second comprising medicines properly so called. These latter he considers as they act on the solids or the fluids. Those which act on the solids he distinguishes into such as act on the simple solids, under which he ranks astringents, tonics, emollients, and escharotics; and those which act on the living solids, under which he classes stimulants, sedatives, including narcotics, refrigerants, and antispasmodics. Of those medicines which act on the fluids, he conceives that some operate by producing a change on their fluidity, as attenuants and inspissants; or, on the mixture of their component parts, by correcting acrimony, either in general, as demulcents, or in particular as antacids, antalkalines, and antiseptics. Others he supposes to act by producing an evacuation of superabundant fluids; and under this head he includes errhines, sialagogues, expectorants, emetics, cathartics, diuretics, diaphoretics, and emmenagogues.

In his general classification, Dr Cullen has been followed by several writers on the materia medica and therapeutics. Some of the titles of his classes have indeed become obsolete, and his order has been almost totally changed by succeeding writers.

Of those who have copied Dr Cullen's arrangement with some modification, there is perhaps none that deserves more attention than the anonymous author of the "Thesaurus Medicaminum," and a "Practical synopsis of the materia alimentaria and materia medica." This

author distributes the articles of the materia medica into 12 classes; 1 Evacuants, comprising errhines, sialagogues, expectorants, emetics, cathartics, diuretics, diaphoretics, emmenagogues; 2. Emollients, comprising diluents and emulcents; 3. Absorbents; 4. Refrigerants; 5. Antiseptics; 6. Astringents; 7. Tonics; 8. Stimulants; 9. Antispasmodics; 10. Narcotics; 11. Anthelmintics; and, 12. Heteroclitics: this last being formed to include those articles that could not properly be reduced under the former heads.

On this classification we may remark, that the general term of evacuants might have been omitted, and its subdivisions might have properly been made distinct classes, as the articles they contain frequently act a more important part, than merely producing an evacuation of fluids. The class of *absorbents* includes those which Cullen calls *antacids*, and perhaps this latter term is to be preferred, as it is more explicit and better understood. The class *antiseptics* might also have been omitted, and the substances it contains might more properly have been arranged under other heads.

Mr Murray's arrangement, which is very ingenious, is founded principally on the doctrine of universal stimulus, and he thus explains the principles on which it is established.

"Those stimulants, which exert a general action on the system, may first be considered. Of these there are two well-marked subdivisions, the diffusible and the permanent; the former corresponding to the usual classes of narcotics and antispasmodics; the latter, including likewise two classes, tonics and astringents. In these there is a gradual transition passing into the one from the other, from the most diffusible and least durable stimulus, to the most slow and permanent in its action.

"The next general division is that comprising local stimulants; such are the classes of emetics, cathartics, expectorants, sialagogues, errhines, and epispastics. These all occasion evacuation of one kind or other, and their effects are in general to be ascribed, not to any operation exerted on the whole system, but to changes of action induced in particular parts.

"After these, those few medicines may be considered whose action is merely mechanical or chemical. To the former belong diluents, demulcents, and emollients. Anthelmintics may perhaps be referred with propriety to the same division. To the latter, or those which act chemically, belong antacids or absorbents, litho-triptics, escharotics, and perhaps refrigerants.

"Under these classes may be comprehended all those substances capable of producing salutary changes in the human system. Several classes are indeed excluded which have sometimes been admitted; but these have been rejected, either as not being sufficiently precise or comprehensive, or as being established only on erroneous theory.

"The subdivisions of these classes may sometimes be established on the natural affinities existing among the substances arranged under each; on their chemical composition; their resemblance in sensible qualities; or, lastly, on distinctions in their medicinal virtues, more minute than those which form the characters of the class. In different classes one of these methods will frequently be found preferable to any of the others."

Mr

Therapeutic. Mr Murray's arrangement will be best understood from his own table.

* Murray's Elements.

¹³⁵ Darwin's arrangement.

It would be improper here to omit the classification of the ingenious Dr Darwin, which was published in his *Zoonomia*. He distributes the articles of the materia medica under seven heads, according to his opinion of their mode of operation. They are as follows.

1. *Nutrientia*, or those things which preserve in their natural state the due exertions of all the irritative motions.

2. *Incitantia*, or those things which increase the exertions of all the irritative motions.

3. *Secernentia*, or those things which increase the irritative motions which constitute secretion.

4. *Sorbentia*, or those things which increase the irritative motions which constitute absorption.

5. *Invertentia*, or those things which invert the natural order of the successive irritative motions.

6. *Revertentia*, or those things which restore the natural order of the inverted irritative motions.

7. *Torquentia*, those things which diminish the exertions of all the irritative motions.

¹³⁶ Nutrientia. The *nutrientia* he thus enumerates according to what he conceives to be their degree of nourishing power.

I. 1. Venison, beef, mutton, hare, goose, duck, woodcock, snipe, moor-game.

2. Oysters, lobsters, crabs, shrimps, mushrooms, eel, tench, barbolt, smelt, turbot, sole, turtle.

3. Lamb, veal, sucking-pig.

4. Turkey, partridge, pheasant, fowl, eggs.

5. Pike, perch, gudgeon, trout, grayling.

II. Milk, cream, butter, butter-milk, whey, cheese.

III. Wheat, barley, oats, pease, potatoes, turnips, carrots, cabbage, asparagus, artichoke, spinach, beet, apple, pear, plum, apricot, nectarine, peach, strawberry, grape, orange, melon, cucumber, dried figs, raisins, sugar, honey. With a great variety of other roots, seeds, leaves, and fruits.

IV. Water, river-water, spring-water, calcareous earth.

V. Air, oxygen, azote, carbonic acid gas.

VI. Nutritive baths and clysters, transfusion of blood.

VII. Condiments.

Under *incitantia* (or stimulants) he ranks the following articles. ¹³⁷ Incitantia.

I. *Papaver somniferum*, poppy, opium.

Alcohol, wine, beer, cyder.

Prunus lauro-cerasus, laurel; distilled water from the leaves.

Prunus cerasus, black cherry; distilled water from the kernels.

Nicotiana tabacum, tobacco; the essential oil, decoction of the leaf.

Atropa belladonna, deadly nightshade; the berries.

Datura stramonium, thorn apple; the fruit boiled in milk.

Hyoscyamus reticulatus, henbane; the seeds and leaves.

Cynoglossum, hounds-tongue.

Menispermum, cocculus, Indian berry.

Amygdalus amarus, bitter almond.

Cicuta, hemlock. *Conium maculatum*?

Strychnos nux vomica?

Delphinium staphisagria?

II. Externally, heat, electricity.

III. Ether, essential oils.

IV. Oxygen gas.

V. Passions of love, joy, anger.

VI. Labour, play, agitation, friction.

The *secernentia* he distinguishes into diaphoretics, sialagogues, mild diuretics, mild cathartics, mild errhines, which, as they will be enumerated presently, it is unnecessary to mention here; and besides these, he enumerates the following circumstances acting on the other secretions. ¹³⁸ Secernentia.

Secretion of mucus of the rectum is increased by cantharides, by spirit of turpentine.

Secretion of subcutaneous mucus is increased by blisters of cantharides, by application of a thin slice of the fresh root of white briony, by sinapisms, by root of horse-radish, cochlearia armoracia, volatile alkali.

Secretion of tears is increased by vapour of sliced onion, of volatile alkali. By pity, or ideas of hopeless distress.

Secretion of sensorial power in the brain is probably increased by opium, by wine, and perhaps by oxygen gas added to the common air in respiration.

The *sorbentia* he divides into those which affect the skin, as sulphuric or muriatic acids, various acid fruits, and opium; and the oxides of lead, zinc, and mercury, applied externally. ¹³⁹ Sorbentia.

II. Such as affect the mucous membranes, as the juice of sloes and crab-apples, cinchona, and opium, internally; and externally the sulphate of copper.

III. 1. Such as affect the cellular membrane, as Peruvian bark; wormwood, *artemisia maritima*, *artemisia absinthium*; worm-seed, *artemisia santonicum*; chamomile, *anthemis nobilis*; tansy, *tanacetum*; bogbean, *menyanthes trifoliata*; centaury, *gentiana centaurum*; gentian

Therapeu-
tics.

tian, *gentiana lutea*; artichoke leaves, *cynara scolymus*; hop, *humulus lupulus*.

2. Orange peel, cinnamon, nutmegs, mace.

3. Vomits, squill, digitalis, tobacco.

4. Bath of warm air, of steam.

IV. Such as affect the veins, as water-cress, *sisymbrium nasturtium aquaticum*; mustard, *sinapis*; scurvy-grass, *cochlearia hortensis*; horse radish, *cochlearia armoracia*; cuckoo flower, *cardamine*; dog's grass; dandelion, *leontodon taraxacon*; celery, *apium*; cabbage, *brassica*. Chalybeates, bitters, opium, after sufficient evacuation; and externally vinegar, friction, and electricity.

V. Such as affect the intestines, including several astringents, and of the antacid earths,

VI. Such as affect the liver, stomach, and other viscera, as oxide of iron, filings of iron, sulphate of iron, sulphate of copper, sulphate of zinc, calomel, tartrate of antimony and potash, acetate of lead, and white arsenic.

VII. Such as affect venereal ulcers, including various preparations of mercury.

VIII. Such as affect the whole system, as evacuations by venesection and cathartics, followed by the exhibition of opium.

IX. External *sorbentia*, as solutions of mercury, zinc, lead, copper, iron, arsenic, or metallic oxides applied in dry powder. Bitter vegetables in decoctions and in dry powers, applied externally; as Peruvian bark, oak bark, leaves of wormwood, of tansey, chamomile flowers or leaves. Electric sparks or shocks.

X. Bandage spread with *emplastrum à minio*, or with carpenter's glue mixed with one-twentieth part of honey.

XI. Portland's powder, and the use of hops in beer, both of which, when continued, are pernicious.

Under the class of *invertentia* Dr Darwin ranks the ordinary emetics, violent cathartics, violent errhines and sialagogues; violent diuretics, and cold-sudorifics, such as poisons, fear, and approaching death.

His catalogue of *revertentia* is as follows:

I. Inverted motions which attend the hysteric disease, are reclaimed, 1. By musk, castor. 2. By asafoetida, galbanum, sagapenum, ammoniacum, valerian. 3. Essential oils of cinnamon, nutmeg, cloves, infusion of pennyroyal, *mentha pulegium*, peppermint, *mentha piperita*, ether, camphor. 4. Spirit of hartshorn, *oleum animale*, sponge burnt to charcoal, black snuffs of candles, which consist principally of animal charcoal, wood-soot, oil of amber. 5. The *incitantia*, as opium, alcohol, vinegar. 6. Externally the smoke of burnt feathers, oil of amber, volatile salt applied to the nostrils, blisters, sinapisms.

II. Inverted motions of the stomach are reclaimed by opium, alcohol, blisters, crude mercury, sinapism, camphor and opium externally, clysters with asafoetida.

III. Inverted motions of the intestinal lymphatics are reclaimed by mucilaginous diluents, and by intestinal *sorbentia*, as rhubarb, logwood, calcined hartshorn, Armenian bole; and, lastly, by *incitantia*, as opium.

IV. Inverted motions of the urinary lymphatics are reclaimed by cantharides, turpentine, rosin, the sorben-

tia, and opium, with calcareous earth, and earth of alum, by oil externally, warm bath.

V. Inverted motions of the intestinal canal are reclaimed by calomel, aloë, crude mercury, blisters, warm bath, clysters with asafoetida, clysters of ice waters: or of spring water further cooled by salt dissolved in water contained in an exterior vessel? Where there exists an intromission of the bowel in children, could the patient be held up for a time with his head downwards, and crude mercury be injected as a clyster to the quantity of two or three pounds?

The *torpentia* he divides into 13 general heads. 1. Torpentia. Venesection and arteriotomy; 2. Cold water, cold air, and the respiration of air with a diminished proportion of oxygen; 3. Vegetable mucilages; 4. Vegetable acids; 5. Animal mucus, hartshorn jelly, veal and chicken broth, and perhaps oil, fat and cream? 6. Mineral acids; 7. Silence and darkness; 8. Invertentia in small doses, as nitre, emetic tartar, and ipecacuanha, given so as to induce nausea; 9. Antacids, as soap, alkalies, and earths; 10. Medicines preventive of fermentation, as sulphuric acid; 11. Anthelmintics; 12. Lithontriptics; and, 13. Various external remedies, as the warm bath, poultices, oil, fat, wax, plasters, oiled silk, and carbonic acid gas on cancers and other ulcers.

We were for some time at a loss what arrangement we should follow in the present article. It was evidently necessary to adopt one that should, as much as possible, prevent repetition; and it therefore appeared improper to treat particularly of the articles of the materia medica under the usual classes. The alphabetical order would prevent repetition; but it seemed little adapted to the plan of a systematic treatise. On the whole, we have judged it best to arrange the individual articles in two methods; 1st, Into classes according to their supposed operation on the system; and in this view consider their general uses; and, 2dly, To treat of them more particularly under an arrangement similar to that of Linnæus. In the remainder of this part of the article, we shall therefore consider the general action and use of the various classes of remedies, adopting, with the exclusion of *emmenagogues*, the arrangement followed in Dr Kirby's Tables of the Materia Medica; and in a succeeding part we shall consider the individual articles under the four heads of animal, vegetable, mineral, and gaseous substances.

CLASS I. EMETICS.

Emetics are such medicines as are calculated to excite vomiting, and thus discharge the contents of the stomach.

TABLE OF EMETICS.

I. ANIMAL PRODUCTS.

Murias ammoniæ, *muriate of ammonia*.

Aqua carbonatis ammoniæ, *water of carbonate of ammonia*.

II. VEGETABLE PRODUCTS.

Acetum scillæ maritimæ, vinegar of squills.
Sinapis alba, mustard.

III. MINERAL PRODUCTS.

Sulphas cupri, sulphate of copper.
Sulphuretum antimonii, sulphuret of antimony.
*Oxidum antimonii cum sulphure vitrificatum, vitri-
 fied oxide of antimony with sulphur.*
Vinum antimonii, antimonial wine, L.
Tartaris antimonii, tartrite of antimony.
*Vinum tartritis antimonii, wine of tartarised anti-
 mony.*
Sulphas zinci, sulphate of zinc.

145
Effects and
uses of
emetics.

The general effects produced by emetics are, a sensation of uneasiness in the stomach, followed by sickness, retching and vomiting. During the nausea, the pulse is feeble, quick, and sometimes irregular, and the countenance is pale; but when the vomiting comes on, the pulse grows quicker, and the face flushed. After the vomiting has ceased, the sickness or nausea commonly goes off entirely, though it sometimes remains in a distressing degree. The patient feels languid, heavy, and disposed to sleep. The skin usually feels moist, and the pulse continues weak for some time, but gradually grows fuller and slower.

To consider emetics merely as evacuants of the stomach, would be to take a very contracted and imperfect view of their effects; for if traced through the whole of their operation in the various diseases in which they are employed, their influence over the human body appears so manifold and extensive, that they may be justly reckoned amongst the most powerful instruments which the Materia Medica affords. Hence, besides their use as cleansers of the alimentary canal, they serve to induce sweating in fevers; to favour expectoration in disorders of the lungs; to promote absorption in cases of dropsy; and to remove certain obstructed conditions of the viscera, such as jaundice and suppression of the menses; also in cases of glandular and lymphatic obstructions, and in some cases of pulmonary consumption. By means of their peculiar action on the nervous and vascular system, they allay the spasms in asthma, and check the discharge of blood in hæmorrhages from the lungs and uterus. In the first of these, viz. in spitting of blood, they have been given with advantage by Dr Robinson, and still more lately by Dr Stoll of Vienna; who says, that in such cases ipecacuanha sometimes acts like a charm, seeming to close the open vessels of the lungs sooner and more effectually than any other remedy. In the other, viz. in uterine hæmorrhagy, small doses only of these medicines, so as to excite sickness, but not vomiting, are found to answer best. But in both these instances they should be administered with caution, since it sometimes happens that they do more harm than good. Dr Cullen once met with an accident of this kind, in which the vomiting increased the hæmorrhagy to a great and dangerous degree.

Dysentery is to be added to the number of diseases in which emetics have a peculiarly beneficial effect. Therapeu-
tics.

When there is much visceral inflammation; where there are symptoms of great accumulation in the vessels of the head; in the advanced stages of pregnancy, and in cases of intestinal hernia, medicines of this class are to be avoided. And, in general, persons who have weak and delicate stomachs should be cautious of employing them too freely, since, as Dr Cullen has remarked, frequent vomiting renders the stomach less fit to retain what is thrown into it, and even weakens its powers of digestion *.

p. 32.

146

Definition of expecto-
rants.

CLASS II. EXPECTORANTS.

Those medicines are called expectorants, that are employed to promote the excretion of pus or mucus from the windpipe and lungs. In general they are emetics given in smaller doses, though there are several medicines, especially some of the gum resins, that are considered to act in this way, without any tendency to excite vomiting.

The following articles are usually employed in this country as expectorants.

147
Table of
expecto-
rants.

I. VEGETABLE PRODUCTS.

Cephaelis ipecacuanha, ipecacuanha.
Nicotiana tabacum, tobacco.
Scilla maritima, squill.
Acetum scillæ maritimæ, vinegar of squill.
Syrupus scillæ maritimæ, syrup of squills.
Oxymel scillæ, oxymel of squill.
Tinctura scillæ, tincture of squill.
Pilulæ scilliticæ, squill pills.
Conserva scillæ, conserve of squills.
Allium sativum, garlic.
Syrupus allii, syrup of garlic.
Ammoniacum, gum ammoniac.
Lac ammoniaci, milk of ammoniac.
Arum maculatum, wake-robin.
Conserva ari, conserve of arum.
Colchicum autumnale, meadow saffron.
Syrupus colchici autumnalis, syrup of colchicum.
Oxymel colchici, oxymel of colchicum.
Ferula asafœtida, asafœtida.
Lac asafœtida, milk of asafœtida.
Hyssopus officinalis, hyssop.
Marrubium vulgare, horehound.
Myrrha, myrrh.
Pimpinella anisum, aniseed.
Oleum volatile pimpinellæ anisi, oil of aniseed.
Polygala senega, seneka root.
Decoctum polygalæ senegæ, decoction of seneka.
Styrax benzoin, benjamin.
Acidum benzoicum, benzoic acid.
Tinctura benzoës composita, compound tincture of benjamin.
Alcohol, spirit of wine.
Æther sulphuricus, sulphuric æther.

II. MINERAL PRODUCTS.

Sulphuretum antimonii, sulphuret of antimony.

Sulphur sublimatum lotum, *washed flowers of sul-
phur*.

Oleum sulphuratum, *sulphurated oil*.

Petroleum sulphuratum, *sulphurated petroleum*.

Trochisci sulphuris, *sulphur lozenges*.

III. GASEOUS PRODUCTS.

Gas hydrogenium, *hydrogen gas*.

Gas hydrogenium carbonatum, *carbonated hydro-
gen gas*.

Vaporis aquæ calidæ inhalatio, *inhaling the steams
of warm water*.

148
Effects and
uses of ex-
pectorants.

The mode in which expectorants promote the excretion of pus or mucus from the lungs, does not appear to be well understood. Some suppose that those which are properly emetic, operate by the sympathy that exists between the stomach and lungs, and that the rest operate by some specific action. Mr Murray supposes that there are various modes of operation by which certain remedies will appear to promote expectoration, and which will give them a claim to the title of expectorants.

Thus, in certain diseases the exhalant vessels in the lungs seem to be in that state, by which the exhalation of fluid is lessened, or nearly stopped, and in such cases expectoration must be diminished. Any medicine capable of removing that constricted state, will appear to promote expectoration, and will at least relieve some of the symptoms of the disease. It is apparently by such a mode of operation, that antimony, ipecacuanha, squill, and some others, promote expectoration in pneumonia, catarrh, and asthma, the principal diseases in which expectorants are employed.

There is a case of an opposite kind, that in which there is a redundancy of mucus in the lungs, as occurs in humoral asthma, and *catarrhus senilis*. In these affections, certain expectorants are supposed to prove useful. If they do so, it is probably by being determined more particularly in their action to the pulmonary vessels, and by their moderate stimulus diminishing the secretion, or increasing the absorption, thus lessening the quantity of fluid, and thereby rendering the expectoration of the remainder more easy. The determination of these substances to the lungs is often perceptible by their odour in the air expired. A similar diminution of fluid in the lungs may be effected by determining to the surface of the body; and those expectorants which belong to the class of diaphoretics probably act in this manner.

Expectorants, then, are to be regarded, not as medicines which directly assist the rejection of a fluid already secreted, but rather as either increasing the natural exhalation where it is deficient, or diminishing the quantity of fluid where it is too copious, either by stimulating the pulmonary vessels, or by determining to the surface. In both cases expectoration will appear to be promoted or facilitated*.

* Murray's
Elements,
vol. i.
p. 326.

The definition of these remedies points out the cases to which they are applicable, viz. those in which an accumulation of pus or mucus takes place in the bronchial cells, as catarrh, pneumonia in its suppurative stage, peripneumonia notha, asthma, and phthisis pulmonalis or consumption.

CLASS III. DIAPHORETICS.

Diaphoretics are those remedies that are intended to promote, keep up, or restore the excretion of perspirable matter from the skin; and of these some act feebly, and only increase the insensible perspiration, while others act more powerfully, and under favourable circumstances, excite sweating. Hence we may divide them into two orders.

A. THE MILDER DIAPHORETICS.

I. ANIMAL PRODUCTS.

Murias ammoniac.

Aqua carbonatis ammoniac.

Carbonas ammoniac, *carbonate of ammonia*.

Alcohol ammoniatum, *ammoniated alcohol*.

II. VEGETABLE PRODUCTS.

Anthemis nobilis, *chamomile tea*.

Centaurea benedicta, *holy thistle tea*.

Myrrha.

Allium sativum.

Acidum acetosum, *acetic acid or vinegar*.

Acidum acetum destillatum, *distilled vinegar*.

Aqua acetitis ammoniac, *water of acclated ammonia*.

Arctium lappa, *burdock decoction*.

Artemisia abrotanum, *southern-wood tea*.

Aristolochia serpentaria, *snake-root*.

Tinctura aristolochiæ serpentariæ, *tincture of snake-root*.

Daphne mezereum, *mezereum*.

Decoctum daphnes mezerei, *decoction of mezereum*.

Dorstenia contrayerva, *contrayerva*.

Pulvis contrayervæ compositus, *compound powder of contrayerva*.

Fumaria officinalis, *fumitory*.

Laurus sassafras, *sassafras tea*.

Salvia officinalis, *sage tea*.

Sambucus nigra, *elder*.

Succus bacci sambuci spissatus, *inspissated juice of elder*.

Smilax sarsaparilla, *sarsaparilla*.

Decoctum smilacis sarsaparillæ, *decoction of sarsaparilla*.

Solanum dulcamara, *bitter sweet decoction*.

Supertartaras potassæ, *supertartrate of potash or cream of tartar*.

B. STRONGER DIAPHORETICS, OR SUDORIFICS.

I. ANIMAL PRODUCTS.

Moschus moschiferus, *musk*.

Mistura moschata, *musk mixture*.

II. VEGETABLE

Therapeu-
tics.

II. VEGETABLE PRODUCTS.

Aconitum neomontanum, *aconite*.Succus spissatus aconiti napelli, *inspissated juice of aconite*.Guaiacum officinale, *guaiacum wood and resin*.Decoctum guaiaci officinalis compositum, *compound decoction of guaiacum*.Tinctura guaiaci officinalis, *tincture of guaiacum*.Tinctura guaiaci ammoniata, *ammoniated tincture of guaiacum*.Laurus camphora, *camphor*.Mistura camphorata, *camphorated mixture*.Emulsio camphorata, *camphorated emulsion*.Papaver somniferum, *opium*.Tinctura opii, *tincture of opium*.Tinctura opii camphorata, *camphorated tincture of opium*.Tinctura opii ammoniata, *ammoniated tincture of opium*.Pulvis ipecacuanhæ et opii, *powder of ipecacuan and opium*.Rhododendron chrysanthum, *yellow-flowered rhododendron*.

III. MINERAL PRODUCTS.

Sulphuretum antimonii, *sulphuret of antimony*.Tartris antimonii, *in small doses*.

Vinum tartritis antimonii.

Sulphuretum antimonii præparatum.

Sulphur stibii fuscum, *brown sulphuret of antimony*.Oxidum antimonii cum phosphate calcis, *oxide of antimony with phosphate of lime, or James's powder*.Antimonium calcinatum, *white oxide of antimony*.Calx stibii præcipitatum. D. *Precipitated oxide of antimony, or powder of Algaroth*.Sulphur sublimatum, *flowers of sulphur*.

Sulphur sublimatum lotum.

Sulphur præcipitatum, *precipitated sulphur, or milk of sulphur*.Hydrargyrum, *mercury*.Hydrargyrum purificatum, *purified mercury*.Submurius hydrargyri, vel calomelas, *submuriate of mercury, or calomel*.Balneum calidum, *hot bath*.Balneum vaporis, *vapour bath*.151
Effects and
uses of dia-
phoretics.

Diaphoretics act in one of two ways; some by exciting an increased action of the exhalant vessels of the skin immediately, or by sympathy with other parts, as the application of heat, the warm bath, friction, &c.; while others promote perspiration, by increasing the general force of the circulating system, and thus acting on the exhalant vessels of the skin.

The action of diaphoretics is assisted by moderate warmth and by tepid diluent liquors frequently taken.

The immediate effects of these medicines are partly a diminution of the quantity of fluids in the body, but principally a change of the determination of blood from other parts to the surface. They perhaps also in-

Vol. XII. Part II.

crease the action of the absorbents, and thus remove the spasmodic constriction of the subcutaneous vessels.

The cases to which diaphoretic medicines are best adapted, are inflammatory fevers, rheumatism, asthma, dyspepsia, obstinate diarrhoea, and protracted dysentery. They are injurious in typhus fever, especially towards its commencement.

Where the force of the circulation is very great, it is proper, before the exhibition of diaphoretics, to premise the use of some other evacuation, as bleeding or purging.

CLASS IV. DIURETICS.

These are such medicines as promote or increase the excretion of urine.

The principal diuretics are these.

I. ANIMAL PRODUCTS.

Lytta vesicatoria, *cantharides*.Tinctura meloes vesicatorii, *tincture of cantharides*.Oniscus asellus, *millepedes, or wood-lice*.

Effects and
uses of diu-
retics.

The operation of diuretics is greatly promoted by plentiful dilution, which should by no means be withheld from dropsical patients, though, for many years past, the contrary method has too much prevailed. The medical world is much indebted to Sir F. Milman, for the pains he has taken to show the propriety of indulging such patients in the free use of liquids. In confirmation of the propriety of this method, the observation of the late Dr Cullen may be added. He has remarked that he always thought it absurd in physicians to employ diuretics while they enjoined an abstinence from drink, which is almost the only means of conveying these diuretics to the kidneys. Whenever, therefore, he employed diuretics, he at the same time advised drinking freely; and he was persuaded that drinking largely often contributed to the cures he made.

It is obvious, says Mr Murray, that a diuretic effect will be produced by any substance capable of stimulating the secreting vessels of the kidneys. All the saline diuretics seem to act in this manner. They are received into the circulation, and passing off with the urine, stimulate the vessels, and increase the quantity secreted.

There are other diuretics, the effect of which appears to arise not from direct application, but from an action excited in the stomach, and propagated by nervous communication to the secreting urinary vessels. The diuretic operation of squill, and of several other vegetables, appears to be of this kind.

There is still, perhaps, another mode in which certain substances produce a diuretic effect, that is, by promoting absorption. When a large quantity of watery fluid is introduced into the circulating mass, it stimulates the secreting vessels of the kidneys, and is carried off by the urine. If, therefore, absorption be promoted, and if a portion of serous fluid, perhaps previously effused, be taken up, the quantity of fluid secreted by the kidneys will be increased. In this way digitalis seems to act. Its diuretic effect, it has been said, is greater when exhibited in dropsy, than it is in health.

On the same principle may probably be explained the utility of mercury in promoting the action of several diuretics.

The action of these remedies is promoted by drinking freely of mild diluents. It is also influenced by the state of the surface of the body. If external heat be applied, diuresis is frequently prevented, and diaphoresis produced. Hence the doses of them should be given in the course of the day, and the patient, if possible, be kept out of bed.

The direct effects of diuretics are sufficiently evident. They discharge the watery part of the blood, and by that discharge they indirectly promote absorption over the whole system*.

*Murray's
Elements.

Diuretics are now seldom employed, except in cases of dropsy, and here they not unfrequently fail of success. They are, however, occasionally used in calculous or gravelly complaints, in gonorrhœa, to diminish plethora, or check profuse perspiration.

CLASS V. CATHARTICS.

Cathartics are those medicines which promote or increase the evacuation of excrementitious matter, or of serous fluids, from the bowels.

There are two principal objects which modern physicians have in view in the administration of cathartics; one is, merely to empty the bowels, and bring off the excrementitious matter contained in them, which is already out of the course of circulation; the other, to stimulate the exhalant vessels of the bowels, and thus promote an increased secretion of serous fluids which they pour into the alimentary canal; in this way, diminishing the general mass of fluids in the body. Hence these medicines are naturally divided into laxatives and purgatives, the latter of which are often termed drastic purgatives. It is true that these orders of cathartics differ only in degree of power, as such a quantity of a laxative may be given as to induce purging, while the dose of a purgative may be so diminished as to prove only gently laxative. As, however, the division is useful in some respects, we shall here preserve it, and shall distribute our list of cathartics into laxatives and purgatives.

A. LAXATIVES.

I. ANIMAL PRODUCTS.

Mel, *honey*.Mel despumatum, *clarified honey*.

II. VEGETABLE PRODUCTS.

Anthemis nobilis, *clysters of chamomile decoction*.Olea europæa, *olive oil*.Supertartras potassæ, *supertartrate of potash*.Tartras potassæ, *tartrate of potash*.Tartras potassæ et sodæ, *tartrate of potash and soda, or Rochelle salt*.

Cassia fistula.

Electuarium cassiæ, *electuary of cassia*.Cassia senna, *senna*.Pulvis sennæ compositus, *compound powder of senna*.Electuarium cassiæ sennæ, *electuary of senna*.Infusum sennæ simplex, *simple infusion of senna*.Infusum sennæ tartarizatum, *tartarised infusion of senna*.Infusum tamarindi cum senna, *infusion of tamarinds with senna*.Tinctura sennæ composita, *compound tincture of senna*.Ficus carica, *figs*.Fraxinus ornus, *manna*.Syrupus manniæ, *syrup of manna*.Prunus domestica, *prune*.Rosa damascena, *damask rose*.Syrupus rosæ centifoliæ, *syrup of damask roses*.Saccharum officinarum, *brown sugar*.

cathartics.

Therapeu-
tics.

Tamarindus indica, *tamarinds*.
Viola odorata, *sweet violet*.
Syrupus violæ odoratæ, *syrup of violets*.

III. MINERAL PRODUCTS.

Sulphur sublimatum, *flowers of sulphur*.
Sulphur sublimatum lotum.
Sapo hispanus, *Castile soap*.

B. PURGATIVES.

I. ANIMAL PRODUCTS.

Cervus elaphus, *hartshorn*.
Phosphas sodæ, *phosphate of soda*.

II. VEGETABLE PRODUCTS.

Nicotiana tabacum, *clysters of tobacco, or of tobacco smoke*.

Sambucus nigra, *elder*.
Pinus sylvestris, } *clysters of turpentine*.
larix, }

Aloe perfoliata, *soccotrine aloes*.

Pulvis aloes cum canella, *powder of aloes with canella*.

Pilulæ aloeticæ, *aloetic pills*.

Pilulæ aloes cum colocynthide, *pills of aloes with colocynth*.

Vinum aloes soccotrinæ, *aloes wine*.

Tinctura aloes soccotrinæ, *tincture of soccotrine aloes*.

Bryonia alba, *bryony*.

Convolvulus jalapa, *jalap*.

Pulvis jalapæ compositus, *compound powder of jalap*.

Extractum jalapæ, *extract of jalap*.

Tinctura convolvuli jalapæ, *tincture of jalap*.

Convolvulus scammonia, *scammony*.

Pulvis scammonii compositus, *compound powder of scammony*.

Pulvis scammonii cum aloes, *powder of scammony with aloes*.

Electuarium scammonii, *electuary of scammony*.

Cucumis colocynthis, *wild cucumber*.

Extractum colocynthis compositum, *compound extract of colocynth*.

Gratiola officinalis, *hedge hyssop*.

Helleborus niger, *black hellebore*.

Extractum hellebori nigri, *extract of black hellebore*.

Helleborus scetidus, *stinking hellebore*.

Iris pseudacorus, *common flag*.

Linum catharticum, *purging flax*.

Momordica elaterium, *wild cucumber*.

Succus spissatus momordici elaterii, *elaterium*.

Rhamnus catharticus, *buckthorn*.

Syrupus rhamni cathartici, *syrup of buckthorn*.

Rheum palmatum, *rhubarb*.

Infusum rhei palmati, *infusion of rhubarb*.

Vinum rhei palmati, *rhubarb wine*.

Tinctura rhei palmati, *tincture of rhubarb*.

Tinctura rhabarbari composita, *compound tincture of rhubarb*.

Tinctura rhei et aloes, *tincture of rhubarb and aloes*.

Tinctura rhei et gentianæ, *tincture of rhubarb and gentian*.

Ricinus communis, *castor oil*.

Stalagmitis cambogioides, *gamboge*.

III. MINERAL PRODUCTS.

Sulphuretum antimonii, *sulphuret of antimony*.

Tartris antimonii, *in very small doses*.

Hydrargyrum, *mercury*.

Submuriæ hydrargyri, *submuriate of mercury*.

Submuriæ hydrargyri præcipitatus, *precipitated submuriate of mercury*.

Pilulæ hydrargyri, *mercurial pills*.

Nitras potassæ.

Sulphas potassæ, *sulphate of potash*.

Murias sodæ, *sea salt*.

Sulphas sodæ, *sulphate of soda, or Glauber's salt*.

Sulphas magnesiæ, *sulphate of magnesia, or Epsom salt*.

The operation of a purgative medicine on the intestinal canal, may be considered as threefold: First, it stimulates the muscular fibres of the intestines, quickens their action, and thus increases the natural peristaltic motion of the bowels, in consequence of which their contents are more quickly discharged. Secondly, the exhalant vessels are stimulated by it, which terminate in the inner coat of the intestines, and it excites them to pour forth a greater discharge of fluids, as well as the mouths of the excretory ducts of the mucous glands, by which the natural mucus of the intestines is greatly augmented; and hence the evacuations by stool are not only quicker, but the excrementitious matter is thinner and more copious. Thirdly, the stools are rendered still more abundant, by an additional portion of the fluids furnished by the neighbouring viscera, the liver pancreas, &c. to which the stimulus of a purgative, of the more active sort in particular, extends. It is probable that these effects are communicated to the whole range of the intestinal canal, from the upper orifice of the stomach to the lower extremity of the rectum, or anus.

From the view we have now taken of the primary effects of cathartics on the bowels, we may easily understand how far they may prove useful in some diseases, and injurious in others; and how we may vary the degree of their activity under different circumstances.

When we consider the great length of the alimentary canal, with the numerous vessels and mucous follicles, as well as the hepatic and pancreatic ducts, which open on its internal surface, it will be evident that purgatives, even though they be not very stimulant, may occasion a great general evacuation, and consequent diminution of the mass of fluids, by opening at once all those outlets. From this it appears, that, next to blood-letting, purging will form one of the most active remedies in acute inflammatory diseases, where we wish to avoid an over distension of the vessels, and restrain the preternatural increase of the powers of the circulating system. Accordingly, purging constitutes a principal part of what is termed the *cooling regimen*. In these cases the more drastic purgatives are to be avoided, as their

Therapeu-
tics.

their use would be attended with so much stimulating effect on the system in general, as to counterbalance the advantage we should derive from their diminishing the mass of fluids. Again, the change in the distribution of the blood from other parts of the system to the bowels, is another circumstance attending the use of purgatives, which renders them of considerable importance in several diseases. It seems to follow, that if an evacuation be made from one set of vessels, the afflux of fluids to these will be increased in order to supply it, and, consequently, the afflux to other parts of the system will be diminished. Upon this principle, Dr Cullen explains the utility of purgatives in disorders of the head, which originate from over-fulness or over-activity, and in mental affections, mania, phrensy, headach, &c. The afflux of fluids in the vessels of the abdomen, which supply the intestines, being increased by purging, the afflux will be proportionally diminished in the vessels which carry blood to the head, and both the quantity and impetus of the blood in the head will thus be lessened.

The good effects of cathartics in the small pox, and some other inflammatory affections of the skin, are probably to be attributed chiefly to their removing local irritation, and producing a considerable depletion, and thus diminishing the general fever that usually attends those diseases.

When the contents of the bowels are morbidly retained, either in consequence of their peristaltic motion being unusually slow from a torpid state of the muscular fibres, or from a relaxed state of the bowels, favouring an accumulation of feces, from a deficiency of bile, or from habitual neglect, the use of cathartics is indicated, to prevent more serious complaints that may be the consequence of this costiveness. The kind of cathartics to be employed depends on the nature of the cause producing the constipation, or particular circumstances attending it. If, for example, the costiveness be attended with a debilitated habit, with symptoms of great nervous mobility, flatulence, or other signs of a debilitated state of the alimentary canal, some of the warmer aromatic cathartics will be proper, as aloes, rhubarb, or such preparations of these as contain an aromatic in their composition. If the costiveness seems to arise from a deficiency of bile, the aloetic and mercurial purgatives are indicated.

In cases where the costiveness has arisen from some accidental cause, as in colic, dysentery, enteritis, it will be necessary to vary the cathartics according to the nature of the affection, or the cause by which it has been produced. See COLIC, DYSENTERY, and ENTERITIS, *MEDICINE Index*.

Cathartics exert a particular action on the absorbent vessels, by which these are enabled to take up a greater quantity of fluid than in their natural state. Hence the use of drastic purgatives in dropsy. The action of cathartics in this way does not appear to be well understood. Dr Cullen, treating of this subject, observes that, as in every cavity of the body there is an inhalation and exhalation constantly going on, it is presumed that there is some balance constantly preserved between the secretory and absorbent powers; so that if the former are increased, the latter will be also; and, therefore, that when the secretions are, upon occasion, much

increased, the action of the absorbents may be particularly excited. This explains, why purging often excites the action of the absorbents, to take up more copiously the fluids that were otherwise stagnant in the adipose membrane, or other cavities of the body, and thereby often proves a cure of dropsy. This explanation is perhaps little more than an implicit statement of the fact. It is certain, however, that ascites, or dropsy of the abdomen, has been often affected by means of acrid drastic purgatives, such as gamboge, scammony, &c. when diuretic remedies have failed. But it is obvious that these remedies can only be administered to those who retain considerable strength of constitution, debilitated neither by inveterate intemperance, old age, nor a long disease.

The attention of practitioners has been lately particularly directed to the use of purgatives in several diseases, in which they were formerly either not employed at all, or not used to any extent, in consequence of a valuable publication by Dr James Hamilton, senior physician of the Edinburgh infirmary. Dr Hamilton having observed that in several spasmodic diseases, especially in chorea, or St Vitus's dance, there was commonly a considerable collection of black offensive faeces in the bowels, was led to conceive that this must prove a very powerful irritating cause in protracting these diseases; and as, in common with other practitioners, he had experienced great want of success from the usual administration of tonic medicines in these affections, he was led to try the effect of purgatives given to such an extent as to produce complete evacuation of the bowels. The plan succeeded entirely to his satisfaction, and by this treatment he finds chorea is speedily cured, generally in 10 days or a fortnight. Besides chorea, Dr Hamilton has been very successful in the administration of purgatives in cases of typhus, scarlatina, fever, marasmus, chlorosis, hæmæmus, hysteria, tetanus, and several other chronic affections. He was originally induced to pursue his new method of treating typhus, by observing that the antimonials, which were formerly so largely employed in this disease, appeared to be most serviceable when they operated upon the bowels. This led him to suspect, that any purgative medicine might be substituted in their place, and that the debilitating effect of vomiting and sweating might thus be avoided. Experience has fully confirmed these conjectures, and after a trial of some years he is thoroughly persuaded, that the full and regular evacuation of the bowels relieves the oppression of the stomach, and mitigates the other symptoms of fever. He has accordingly almost entirely given up the administration of other remedies, and trusts to the exhibition of frequent and copious purgatives. It might have been apprehended, that this plan of treatment would have aggravated the debility, which constitutes a striking symptom of typhus; but ample experience has proved that this is not the case. The purgatives which Dr Hamilton * has employed in * See Ho-
fever are calomel, calomel and jalap, jalap and crystals *milten on*
of tartar, aloes, solutions of mild neutral salts, infusion *of Purgative*
senna, and sometimes the two last medicines conjoined. *Medicines*

Cathartics are among the most efficacious remedies that are employed with a view to promote or restore the menstrual evacuation; and accordingly they form the chief part of those remedies that are commonly call-

ed

^{Therap.} ed emmenagogues. With this view the drastic purgatives are chiefly given, as aloes, bryony, black hellebore, and some of the preparations of mercury.

There is another use of cathartics that may be referred to a mechanical operation, viz. their expelling worms from the bowels. See ANTHELMINTICS.

CLASS VI. ERRHINES.

¹⁵⁸ Definition of errhines. Those medicines are termed errhines that are employed to promote an increased discharge of mucus from the nostrils. The principal errhines are the following.

I. VEGETABLE PRODUCTS.

Asarum europæum, *asarabacca*.

Pulvis asari europæi compositus, *compound powder of asarabacca*.

Cephalic snuff.

Nicotiana tabacum, *tobacco*.

The ordinary snuffs.

Iris florentina, *Florentine orris*.

Lavandula spica, *lavender flowers*.

Origanum majorana, *sweet marjoram*.

Rosmarinus officinalis, *rosemary*.

Teucrium marum, *mastich*.

Veratrum album, *white hellebore*.

II. MINERAL PRODUCTS.

Hydrargyrum, *mercury*.

Subsulphas hydrargyri flavus, *yellow subsulphate of mercury, or turbeth mineral*.

¹⁶⁰ Effects and uses of errhines. The evacuation produced by the action of errhines is sometimes procured without any sneezing, but frequently attended with it. This, however, implies no difference, but merely that of stronger or weaker stimulus in the medicine employed. The sneezing that occurs may have particular effects by the concussion it occasions; but it does not vary the evacuation induced by the medicine, excepting that with sneezing there is commonly a larger evacuation produced.

This evacuation often goes no further than to restore the natural evacuation when interrupted; but it commonly goes farther, and increases the evacuation beyond its usual measure; and that not only for some time after the medicine has been applied, but also for some following days.

This evacuation not only empties, but also produces a larger excretion from the mucous follicles of the schneiderian membrane; but, agreeably to the laws of the circulation, this must produce an afflux of fluids from the neighbouring vessels, and in some measure empty these. By this it often removes rheumatic congestions in the neighbouring vessels, and particularly those in which the toothach often consists.

But not only the more nearly adjoining vessels are thus relieved, but the effect may extend further to the whole of the branches of the external carotid; and we have known instances of headachs, pains of the ear, and ophthalmias, cured or relieved by the use of errhines. How far their effects may extend, cannot be exactly determined; but it is probable that they may operate more or less on the whole vessels of the head, as even a branch of the internal carotid passes into the nose; and independent of this, it is not improbable

that our errhines may have been of use in preventing apoplexy and palsy; which at least is to be attended to so far, that whenever any approach to these diseases is suspected, the drying up of the mucous discharge should be attended to, and if possible restored.*

Therap. tics.

* Cullen's *Materia Medica*, vol. ii.

P. 35.

161

Definition of sialagogues.

CLASS VII. SIALAGOGUES.

These are employed either to promote an increased flow of saliva, or to produce such an action on the gums, as shall indicate their having been received in sufficient quantity into the circulation. Under the former division are ranked several vegetable substances; under the latter are included only mercury and its preparations.

I. VEGETABLE PRODUCTS.

Daphne mezereum, *mezereum*.

Amomum zinziber, *ginger*.

Anthemis pyrethrum, *pellitory of Spain*.

Pistacia lentiscus, *mastich*.

II. MINERAL PRODUCTS.

Hydrargyrum, *mercury*.

Hydrargyrum purificatum, *purified mercury*.

Submurias hydrargyri, *submuriate of mercury*.

Murias hydrargyri, *muriate of mercury*.

Submurias hydrargyri præcipitatus, *precipitated submuriate*.

Pilulæ hydrargyræ, *mercurial pills*.

Oxidum hydrargyri cinereum, *cinereous oxide of mercury*.

Unguentum hydrargyrum, *mercurial ointment*.

Hydrargyrus calcinatus, *red oxide of mercury*.

Acetis hydrargyri, *acetate of mercury*.

Hydrargyrus sulphuratus ruber, *red sulphurate of mercury*.

Sulphuretum hydrargyri nigrum, *black sulphuret of mercury*.

The vegetable sialagogues are commonly called masticatories, because they produce their effect by being chewed in the mouth. They are employed in similar cases with the errhines, more especially in toothach. The use of the mercurial sialagogues will be explained hereafter in our account of mercury.

163

Uses of sialagogues.

CLASS VIII. EMOLLIENTS.

The medicines commonly called emollients consist either of diluting liquors, formed of simple water, or certain vegetable infusions, or mucilaginous and oily matters that have the mechanical property of defending the parts to which they are applied, from the action of acrimonious substances that pass over them; or of softening and relaxing the skin and other external parts. The first of these are commonly called *diluents*, the second *demulcents*, and the third simply *emollients*. We shall enumerate them together under the general term of emollients, reserving an account of their particular uses for the individual articles.

164

Definition of emollients.

I. ANIMAL PRODUCTS.

Accipenser huso, sturio, &c. *isinglass*.

Ovis aries, *mutton suet*.

Physeter macrocephalus, *spermaceti*.

Sus scrofa, *hogs-lard*.

165

Table of emollients.

Linimentum

Therapeu-
tics.

Linimentum simplex, *simple liniment*.
 Unguentum simplex, *simple ointment*.
 Unguentum adipis suillæ, *ointment of hog's-lard*.
 Unguentum spermatis ceti, *spermaceti ointment*.
 Unguentum ceræ, *wax ointment*.
 Ceratum simplex, *simple cerate*.
 Ceratum spermatis ceti, *spermaceti cerate*.

II. VEGETABLE PRODUCTS.

Cera alba et flava, *white and yellow wax*.
 Olea Europæa.
 Althea officinalis, *marshmallow*.
 Decoctum altheæ officinalis, *decoction of marsh-
 mallow*.
 Syrupus altheæ, *syrup of marshmallow*.
 Amygdalus communis, *almonds and oil of almonds*.
 Emulsio amygdali communis, *almond emulsion*.
 Oleum amygdali communis, *oil of almonds*.
 Astragalus tragacantha, *gum tragacanth*.
 Mucilago astragali tragacanthi, *mucilage of tra-
 gacanth*.
 Pulvis tragacanthi compositus, *compound powder
 of tragacanth*.
 Avena sativa, *oat meal*.
 Cocos butyracea, *palm oil*.
 Eryngium maritimum, *eryngo root*.
 Glycyrrhiza glabra, *liquorice root, and extract*.
 Trochisci glycyrrhizæ, *liquorice lozenges*.
 Hordeum distichon, *barley*.
 Decoctum hordei distichi, *barley water*.
 Decoctum hordei compositum, *compound decoction
 of barley*.
 Liliium candidum, *white lily root*.
 Linum usitatissimum, *lintseed*.
 Oleum lini usitatissimi, *lintseed oil*.
 Malva sylvestris, *common mallow*.
 Decoctum pro enemate, *decoction for clysters*.
 Melissa officinalis, *balm*.
 Mimosa nilotica, *gum arabic*.
 Mucilago mimosæ niloticæ, *mucilage of gum arabic*.
 Emulsio mimosæ niloticæ, *common emulsion*.
 Trochisci gummosi, *gum lozenges*.
 Penæa sarcocolla, *sarcocolla*.
 Pyrus cydonia, *quince seed*.
 Mucilago seminis cydonii mali, *mucilage of quince
 seed*.
 Triticum hibernum, *wheat and starch*.
 Mucilago amyli, *mucilage of starch*.
 Trochisci amyli, *starch lozenges*.
 Vitis vinifera, *raisins*.

166
Uses of
emollients.

Diluents are chiefly employed to abate thirst in fe-
 ver and inflammatory affections, or to promote the ac-
 tion of other remedies, particularly diaphoretics and
 diuretics. Demulcents are chiefly used in catarrh,
 pneumonia, dysentery, diarrhoea, gonorrhoea; and ex-
 ternal emollients are employed chiefly in case of sprains
 and bruises, or to defend the surface of ulcers from the
 dressings and bandages.

CLASS IX. REFRIGERANTS.

167
Definition
of refrige-
rants.

Under this term are comprehended those remedies
 which are employed with a view to diminish the pre-
 ternaturally increased heat that takes place in the body
 during fevers and several inflammatory affections.

The following are the principal refrigerants enu-
 merated by the various writers on the materia medica.

Therapeu-
tics.168
Table of
refrige-
rants.

I. VEGETABLE PRODUCTS.

Acidum acetosum, *acetous acid*.
 Acetis potassæ, *acetate of potash*.
 Aqua acetitis ammoniæ, *water of acetate of ammo-
 nia*.
 Supertartras potassæ, *supertartrate of potash*.
 Tamarindus indica, *tamarinds*.
 Berberis vulgaris, *barberry*.
 Citrus medica, *lemon*.
 Syrupus citri medicæ, *syrup of lemon juice*.
 Citrus aurantia, *orange*.
 Cochlearia officinalis, *scurvy grass*.
 Succus cochleariæ compositus, *compound juice of
 scurvy-grass*.
 Morus nigra, *mulberry*.
 Syrupus fructus mori, *syrup of mulberry juice*.
 Oxalis acetosella, *wood sorrel*.
 Conserva acetosellæ, *conserve of sorrel*.
 Ribes nigrum, *black currants*.
 Succus spissatus ribis nigri, *inspissated juice of
 black currants*.
 Syrupus succi ribis nigri, *syrup of black currant
 juice*.
 Ribes rubrum, *red currants*.
 Rosa canina, *dog rose or hips*.
 Conserva rosæ caninæ, *conserve of hips*.
 Rubus idæus, *raspberry*.
 Syrupus fructus rubi idæi, *syrup of raspberry juice*.
 Rumex acetosa, *common sorrel*.
 Veronica beccabunga, *brooklime*.

II. MINERAL PRODUCTS.

Sulphas zinci, *sulphate of zinc*.
 Nitras potassæ, *nitrate of potash*.
 Acidum nitrosum, *nitrous acid*.
 Spiritus ætheris nitrosi, *spirit of nitrous ether*.
 Trochisci nitratis potassæ, *nitre lozenges*.
 Murias sodæ, *muriate of soda*.
 Acidum muriaticum, *muriatric acid*.
 Acidum sulphuricum, *sulphuric acid*.
 Acidum sulphuricum dilutum, *diluted sulphuric
 acid*.
 Plumbum, *lead*.
 Superacetas plumbi, *superacetate or sugar of lead*.
 Aqua lithargyri acetati, *water of acetated litharge,
 or Goulard's extract*.
 Aqua lithargyri acetati composita, *compound wa-
 ter of acetated litharge*.
 Unguentum acetitis plumbi, *ointment of acetate of
 lead*.
 Ceratum lithargyri acetati compositum, *compound
 cerate of acetated litharge*.
 Affusio of cold water.

Refrigerants appear to act chemically, but in what precise
 manner they diminish the heat of the human bo-
 dy, is not well understood. On this subject Mr Mur-
 ray expresses himself in the following manner.

“ Keeping in view the very inconsiderable action of
 those remedies, it may perhaps be possible from the
 consideration of the mode in which animal temperature
 is

169

Effects and
uses of re-
frigerants.

Therapeu- is generated, to point out how their trivial refrigerant
tica. effects may be produced.

“It has been sufficiently established, that the consumption of oxygen in the lungs is materially influenced by the nature of the ingesta received into the stomach; that it is increased by animal food and spirituous liquors, and in general by whatever substances contain a small quantity of oxygen in their composition. But the temperature of animals is derived from the consumption of oxygen by respiration. An increase of that must occasion a great evolution of caloric in the system, and increase of temperature, while a diminution in the consumption of oxygen must have an opposite effect. If, therefore, when the temperature of the body is morbidly increased, substances be introduced into the stomach containing a large proportion of oxygen, especially in a state of loose combination, and capable of being assimilated by the digestive powers, the nutritious matter received into the blood must contain a larger portion of oxygen than usual; less of that principle will be consumed in the lungs, by which means less caloric being evolved, the temperature of the body must be reduced; and this operating as a reduction of stimulus, will diminish the number and force of the contractions of the heart.

“It might be supposed that any effect of this kind must be trivial, and it actually is so. It is, as Cullen has remarked, not very evident to our senses, nor easily subjected to experiment, and is found only in consequence of frequent repetitions *.”

* Murray's
Elements. Refrigerants are considered by Mr Murray as acting chemically, but we are not certain how far his opinion is correct. That some of them do operate in cooling the human body, merely as chemical agents, cannot be denied; but several seem to produce this effect by some particular action on the nervous system, that is not well understood.

CLASS X. ASTRINGENTS.

170
Definition
of astring-
gents.

Astringents are defined by Dr Cullen to be such substances as when applied to the human body produce a condensation and contraction of the soft solids, and thereby increase their density and force of cohesion. If they are applied to longitudinal fibres, the contraction is made in the length of these; but if applied to circular fibres, the diameters of the vessels, or the cavities which these surround, are diminished.

The principal substances that act in this way are taken from vegetables, and consist of the barks of several trees, certain roots and inspissated juices; but a few of them are derived from minerals, especially the stronger mineral acids, a few metallic and earthy salts, and, according to some writers, alcohol. We shall enumerate the following.

171
Table of
astringents.

I. VEGETABLE PRODUCTS.

Hæmatoxyllum campechianum, *logwood*.

Extractum ligni hæmatoxyli campechiani, *extract of logwood*.

Juglans regia, *walnut*.

Eucalyptus resinifera, *kino*.

Tinctura kino, *tincture of kino*.

Mimosa catechu, *catechu*, or *Japan earth*.

Infusum mimosæ catechu, *infusion of catechu*.

Tinctura mimosæ catechu, *tincture of catechu*.

Electuarium catechu, *electuary of catechu*.

Polygonum bistorta, *bistort*.

Potentilla reptans, *potentilla*.

Prunus spinosa, *sloe*.

Conserva pruni sylvestris, *conserve of sloes*.

Pterocarpus draco, *dragon's blood*.

Punica granatum, *pomegranate, balaustines*.

Quercus cerris, *gull nut*.

Quercus robur, *common oak*.

Rosa gallica, *red rose*.

Infusum rosæ gallicæ, *infusion of roses*.

Conserva rosæ gallicæ, *conserve of red roses*.

Syrupus rosæ gallicæ, *syrup of red roses*.

Mel rosæ, *honey of roses*.

Tormentilla erecta, *tormentil root*.

Vitis vinifera, *red Port wine*.

II. MINERAL PRODUCTS.

Acidum sulphuricum, *sulphuric acid*.

Acidum muriaticum, *muriatic acid*.

Ferrum, *iron*.

Tinctura muriatis ferri, *tincture of muriated iron*.

Plumbum, *lead*.

Superacetates plumbi, *superacetate of lead*.

Sulphas cupri, *sulphate of copper*.

Solutio sulphatis cupri, *solution of sulphate of copper*.

Liquor cupri ammoniati, *liquor of ammoniated copper*.

Sulphas zinci, *sulphate of zinc*.

Aqua zinci vitriolati cum camphora, *water of vitriolated zinc with camphor*.

Solutio acetitis zinci, *solution of acetate of zinc*.

Supersulphas aluminæ et potassæ, *supersulphate of alumina and potash, or alum*.

Sulphas aluminæ exsiccatus, *dried sulphate of alumina*.

Pulvis sulphatis aluminæ compositus, *compound powder of sulphate of alumina*.

Aqua aluminis composita, *compound alum water*.

Cataplasma aluminis, *cataplasm of alum*.

It is of some consequence that the precise meaning of the term astringent, used as a medicine, should be understood.

The usual method of detecting astringency is, by the Nature of corrugating of the tongue, and the peculiar rough and astringents harsh sensation communicated to the palate by the touch of an astringent substance; and in general, all bodies may be called astringents, that have the property of communicating these sensations. Most of the vegetable astringents have besides the property of striking a black colour when mixed with a solution of sulphate of iron, and this property has been constantly considered as one of the surest tests of astringency in vegetable substances. Now modern chemistry has shewn, that this property is owing to a peculiar acid, viz. the gallic, and not to tannin or the astringent principle properly so called. It so happens that in most vegetable astringents the gallic acid and tannin are found united; but in a few, especially catechu, the astringent principle exists without the gallic acid, and consequently no black colour is produced when a solution of catechu is mixed with a solution of iron. Hence the pharmaceutic chemist should be

Therapeutics.

be aware that the above property is not a sure test of vegetable astringency. A more certain chemical test is animal jelly; for, when a solution of this is added to a solution of vegetable astringent, a copious precipitate is produced, which in fact is leather.

Astringents appear to act nearly in a similar manner on the dead animal fibre as on the living solid, in both cases thickening and hardening: when applied to the living solid, they produce increase of tone and strength, restrain inordinate actions, and check excessive discharges from any of the vessels or cavities; and to the dead fibre occasion density, toughness, imperviousness to water in a greater or less degree, and insusceptibility to the common causes of putrefaction. See TANNING.

173
Effects and uses.

Astringents are largely employed in medicine, and their use is attended with considerable advantage. The cases in which they are most beneficial, and in which their effect seems most unequivocally owing to the astringent principle, are diarrhoeas, leucorrhœa, and gleet. They have also been employed with success for restraining profuse evacuations where they could not be immediately applied to the affected part, as in the above cases; for example, in hæmoptysis and epistaxis; but here their operation seems to be less attributable to their astringency than to their tonic power.

Such astringents as are employed externally to check hæmorrhage from divided vessels, are usually called styptics.

CLASS IX. TONICS.

174
Definition of tonics.

Tonics are those medicines which are suited to counteract debility, or to give strength and energy to the moving fibres. They are taken partly from vegetables, and partly from minerals.

175
Table of tonics.

I. VEGETABLE PRODUCTS.

Anthemis nobilis, chamomile flowers.

Centaurea benedicta, holy thistle.

Marrubium vulgare, horehound.

Myrrha, myrrh.

Pulvis myrrhæ compositus, compound powder of myrrh.

Dorstenia contrayerva, *contrayerva*.

Pulvis contrayervæ compositus, compound powder of *contrayerva*.

Vitis vinifera.

Vinum rubrum lusitanum, red port wine.

Æsculus hippocastanum, horse-chestnut bark.

Angustura, *angustura* bark.

Chironia centaureum, lesser centaurry.

Cinchona officinalis, Peruvian bark.

Infusum cinchonæ officinalis, infusion of *cinchona*.

Decoctum cinchonæ officinalis, decoction of *cinchona*.

Tinctura cinchonæ officinalis, tincture of *cinchona*.

Tinctura cinchonæ composita, compound tincture of *cinchona*.

Tinctura cinchonæ ammoniata, ammoniated tincture of *cinchona*.

Extractum cinchonæ officinalis, extract of *cinchona*.

Cinchona caribæa, Caribbean *cinchona*.

Colomba, *colomba* root.

Tinctura colombæ, tincture of *colomba*.

Croton eleutheria, *cascarilla* bark.

Tinctura cascarillæ, tincture of *cascarilla*.

Extractum cascarillæ, extract of *cascarilla*.

Gentiana lutea, *gentian* root.

Infusum gentianæ compositum, compound infusion of *gentian*.

Tinctura gentianæ composita, compound tincture of *gentian*.

Vinum gentianæ compositum, compound wine of *gentian*.

Extractum gentianæ, extract of *gentian*.

Menyanthes trifoliata, marsh trefoil.

Quassia excelsa, *quassia*.

Quassia simaruba, *simarouba*.

Salix fragilis, fragile willow bark.

Salix alba, white willow bark.

Swietenia mahagoni, mahogany tree bark.

Swietenia febrifuga, febrifuge *swietenia*.

Tanaetum vulgare, common tansey.

II. MINERAL PRODUCTS.

Sulphas cupri, sulphate of copper.

Ammoniaretum cupri, ammoniaret of copper.

Pilulæ ammoniaretum cupri, pills of ammoniaret of copper.

Zincum, zinc.

Sulphas zinci, sulphate of zinc.

Solutio sulphatis zinci, solution of sulphate of zinc.

Oxidum zinci, oxide or flowers of zinc.

Nitras potassæ, nitrate of potash.

Acidum nitrosum, nitrous acid.

Ferrum, iron.

Carbonas ferri, carbonate of iron.

Carbonas ferri præcipitatus, precipitated carbonate of iron.

Aqua ferri aëratæ, water of aerated iron.

Sulphas ferri, sulphate of iron.

Vinum ferri, wine of iron.

Tinctura muriatis ferri, tincture of muriate of iron.

Sulphas ferri exsiccatus, dried sulphate of iron.

Oxidum ferri rubrum, red oxide of iron.

Emplastrum oxidi ferri rubri, plaster of red oxide of iron.

Ferri limaturæ purificatæ, purified filings of iron.

Oxidum ferri nigrum purificatum, purified black oxide of iron.

Murias ammoniæ et ferri, muriate of ammonia and iron.

Tinctura ferri ammoniacalis, tincture of ammoniacal iron.

Tartras ferri et potassæ, tartrate of iron and potash.

Tinctura ferri acetati, tincture of acetated iron.

Acidum sulphuricum, sulphuric acid.

Acidum sulphuricum dilutum, diluted sulphuric acid.

Acidum

Therapeu-
tics.Acidum sulphuricum aromaticum, *aromatic sulphuric acid*.Argentum, *silver*.Nitras argenti, *nitrate of silver*, or *lunar caustic*.Arsenicum, *arsenic*.Carbonas barytæ, *carbonate of baryta*.Carbonas calcis, *carbonate of lime or chalk*.Solutio muriatis calcis, *solution of muriate of lime*.Sulphas barytæ, *sulphate of baryta*.Murias barytæ, *muriate of baryta*.Solutio muriatis barytæ, *solution of muriate of baryta*.Aquæ minerales ferrum continentes, *chalybeate mineral waters*.

III. GASEOUS PRODUCTS.

Gas oxigenum, *oxygen gas*.Balneum frigidum, *cold bath*.Equitatio, *riding on horseback*.176
Effects and
uses of to-
nics.

Most tonics act immediately on the stomach, and hence on the system at large. They increase the appetite, quicken digestion, and add vigour to the body. Hence they are useful in most cases of debility; but when used improperly or for too long a time, they predispose to apoplectic and paralytic disorders.

CLASS XII. STIMULANTS.

177
Definition
and effects
of stimu-
lants.

Most of the articles of the Materia Medica might, in an extended sense, be called *stimulants*; but this term is, by the general consent of physicians, restrictively applied to those medicines which possess the power of sustaining or increasing the vital energies—of raising and invigorating the action of the heart and arteries—and of restoring to the muscular fibre, when affected with torpor, its lost sensibility and power of motion. Hence the use, under proper regulations, of the various articles belonging to this class in cases of gout, palsy, and malignant typhoid fever: but let it be repeated, under proper regulations; for we cannot but remark that medicines which give additional activity to the circulation, and which augment the heat and sensibility of the system throughout, are often abusively employed, being administered too early, as well as too freely in the above-mentioned and some other similar disorders. In the beginning of typhus fever, in particular, it cannot be doubted that a hasty and lavish exhibition of such medicines has, in numerous instances, aggravated every symptom, and brought the patient, who would otherwise have had the disease in its mildest form, into considerable danger*.

* Synopsis
of Materia
Medica,
vol. ii.
p. 154.

The class of stimulants is exceedingly numerous, and might, perhaps, with advantage, be subdivided into sections; but as this subdivision would admit of much dispute from the different acceptance of the term *stimulant*, we shall here only give a table of stimulants distributed as usual, into animal, vegetable, and mineral products.

I. ANIMAL PRODUCTS.

Murias ammoniæ, *muriate of ammonia*.Aqua ammoniæ, *water of ammonia*.Alcohol ammoniatum, *ammoniated alcohol*.178
Table of
stimulants.

Tinctura

Therapeu-
tics.

Tinctura opii, *tincture of opium*.
 Tinctura opii camphorata, *camphorated tincture of opium*.
 Tinctura opii ammoniata, *ammoniated tincture of opium*.
 Confectio opiata, *opiate confection*.
 Cochlearia armoracia, *horse radish*.
 Copaifera officinalis, *balsam of copaiba*.
 Pinus sylvestris, } *turpentine and rosin*.
 Pinus larix, }
 Oleum volatile pini purissimum, *purified oil of turpentine*.
 Unguentum resini flavi, *ointment of yellow rosin*.
 Ceratum resini flavi, *cerate of yellow rosin*.
 Emplastrum ceræ, *wax plaster*.
 Unguentum picis, *pitch plaster*.
 Unguentum picis burgundicæ, *ointment of burgundy pitch*.
 Arnica montana, *leopard's bane*.
 Bubon galbanum, *galbanum*.
 Pilulæ galbani compositæ, *compound pills of galbanum*.
 Emplastrum galbani compositum, *compound plaster of galbanum*.
 Juniperus sabina, *savine*.
 Oleum juniperi sabinæ, *oil of savine*.
 Juniperus Lycia, *olibanum*.
 Pastinaca opoponax, *opoponax*.
 Veratrum album, *white hellebore*.
 Unguentum hellebori albi, *ointment of white hellebore*.
 Decoctum hellebori albi, *decoction of white hellebore*.
 Acorus calamus, *calamus aromaticus, or sweet flag*.
 Amomum zingiber, *ginger*.
 Syrupus amomi zingiberis, *syrup of ginger*.
 Tinctura amomi zingiberis, *tincture of ginger*.
 Amomum repens, *lesser cardamom seeds*.
 Tinctura amomi repentis, *tincture of cardamom*.
 Tinctura cardamomi composita, *compound tincture of cardamom*.
 Amyris gileadensis, *balm of gilead*.
 Amyris elemifera, *gum elemi*.
 Unguentum elemi, *elemi ointment*.
 Anethum fœniculum, *sweet fennel seed*.
 Oleum volatile fœniculi dulcis, *oil of fennel*.
 Aqua fœniculi dulcis, *fennel water*.
 Anethum graveolens, *dill seed*.
 Aqua anethi, *dill water*.
 Angelica archangelica, *angelica*.
 Apium petroselinum, *parsley root and seed*.
 Arbutus uva ursi, *whortle berry*.
 Artemisia maritima, *sea wormwood*.
 Conserva absinthii maritimi, *conserve of sea wormwood*.
 Decoctum pro fomento, *decoction for fomentation*.
 Canella alba, *white canella*.
 Capsicum annuum, *capsicum, Cayenne pepper*.
 Carum carvi, *caraway seeds*.
 Oleum carvi, *oil of caraway*.

Therapeu-
tics.

Spiritus cari carvi, *spirit of caraway*.
 Cistus creticus, *ladanum*.
 Emplastrum ladani, *ladanum plaster*.
 Citrus aurantium, *Seville orange-peel*.
 Oleum volatile citri aurantii, *essence of orange-peel*.
 Aqua citri aurantii, *orange-peel water*.
 Tinctura aurantii corticis, *tincture of orange-peel*.
 Syrupus citri aurantii, *syrup of orange-peel*.
 Conserva citri aurantii, *conserve of orange-peel*.
 Coriandrum sativum, *coriander seed*.
 Crocus sativum, *saffron*.
 Syrupus croci, *syrup of saffron*.
 Tinctura croci, *tincture of saffron*.
 Cuminum cyminum, *cumin seed*.
 Cataplasma cumini, *cumin cataplasm*.
 Emplastrum cumini, *cumin plaster*.
 Curcuma longa, *turmeric*.
 Daucus carota, *wild carrot seed, carrot root*.
 Dianthus caryophyllus, *clove July flower*.
 Syrupus caryophylli rubri, *syrup of cloves*.
 Eugenia caryophyllata, *cloves*.
 Oleum volatile caryophylli aromatici, *oil of cloves*.
 Hypericum perforatum, *St John's wort*.
 Inula helenium, *elecampane root*.
 Kæmpferia rotunda, *sedoary*.
 Lavandula spica, *lavender flowers*.
 Oleum volatile lavandulæ spicæ, *oil of lavender*.
 Spiritus lavandulæ spicæ, *spirit of lavender*.
 Spiritus lavandulæ compositus, *compound spirit of lavender*.
 Laurus cinnamomum, *cinnamon*.
 Oleum volatile lauri cinnamomi, *oil of cinnamon*.
 Aqua lauri cinnamomi, *cinnamon water*.
 Spiritus lauri cinnamomi, *spirit of cinnamon*.
 Tinctura lauri cinnamomi, *tincture of cinnamon*.
 Tinctura cinnamomi composita, *compound tincture of cinnamon*.
 Pulvis aromaticus, *aromatic powder*.
 Electuarium aromaticum, *aromatic electuary*.
 Laurus cassia, *cassia bark*.
 Aqua lauri cassiæ, *cassia water*.
 Laurus nobilis, *bay tree*.
 Lobelia syphilitica, *blue cardinal flower*.
 Melaleuca leucadendron, *cajeput oil*.
 Mentha viridis, *spearmint*.
 Oleum menthæ sativæ, *oil of mint*.
 Aqua menthæ sativæ, *mint water*.
 Spiritus menthæ sativæ, *spirit of mint*.
 Mentha piperita, *peppermint*.
 Oleum volatile menthæ piperitæ, *oil of peppermint*.
 Aqua menthæ piperitæ, *peppermint water*.
 Spiritus menthæ piperitæ, *spirit of peppermint*.
 Mentha pulegium, *pennyroyal*.
 Oleum volatile menthæ pulegii, *oil of pennyroyal*.
 Aqua menthæ pulegii, *pennyroyal water*.
 Spiritus menthæ pulegii, *spirit of pennyroyal*.

Myristica

Therapeu-
tics.

Myristica moschata, *nutmeg*.
 Spiritus myristicæ moschatæ, *spirit of nutmeg*.
 Myroxylon Peruiferum, *balsam of Peru*.
 Tinctura balsami Peruviani, *tincture of balsam of Peru*.
 Myrtus pimenta, *pimento*, or *Jamaica pepper*.
 Oleum volatile myrti pimentæ, *oil of pimento*.
 Aqua myrti pimentæ, *pimento water*.
 Spiritus myrti pimentæ, *spirit of pimento*.
 Origanum vulgare, *origanum*.
 Oleum origani, *oil of origanum*.
 Panax quinquefolium, *ginseng*.
 Parietaria officinalis, *pellitory of the wall*.
 Pinus balsamea, *balsam of Canada*.
 Piper nigrum, *black pepper*.
 Piper cubeba, *cubebs*.
 Piper longum, *long pepper*.
 Pistacia terebinthus, *Chio turpentine*.
 Rhus toxicodendron, *poison oak*.
 Styrax officinale, *storax*.
 Styrax purificata, *strained storax*.
 Toluifera balsamum, *balsam of Tolu*.
 Tinctura toluiferæ balsami, *tincture of balsam of Tolu*.
 Syrupus toluiferæ balsami, *syrup of balsam of Tolu*.
 Trigonella fœnum græcum, *fœnugreek seed*.
 Urtica dioica, *stinging nettle*.
 Wintera aromatica, *winter's bark*.

III. MINERAL PRODUCTS.

Hydrargyrum, *mercury*.
 Unguentum oxidi hydrargyri rubri, *ointment of red oxide of mercury*.
 Unguentum nitratis hydrargyri, *ointment of nitrate of mercury*.
 Unguentum nitratis hydrargyri mitius, *milder ointment of nitrate of mercury*.
 Nitræs potassæ, *nitrate of potash*.
 Acidum nitrosum, *nitrous acid*.
 Acidum nitricum, *nitric acid*.
 Unguentum acidi nitrosi, *ointment of nitrous acid*.
 Sapo Hispanus, *Castile soap*.
 Tinctura saponis, *tincture of soap*.
 Tinctura saponis et opii, *tincture of soap and opium*.
 Ceratum saponis, *soap cerate*.
 Emplastrum saponis, *soap plaster*.
 Murias sodæ, *muriate of soda*.
 Murias sodæ exsiccatus, *dried muriate of soda*.
 Acidum sulphuricum, *sulphuric acid*.
 Acidum arseniosum, *arsenious acid*.
 Bitumen petroleum, *petroleum*.
 Oleum petrolei, *oil of petroleum*.
 Subboras sodæ, *subborate of soda*, or *borax*.
 Subacetæ cupri, *subacetate of copper*, or *verdigrise*.
 Oxymel seruginis, *oxymel of verdigrise*.
 Unguentum acetitis cupri, *ointment of subacetate of copper*.
 Calx, *quicklime*.
 Linimentum aquæ calcis, *liniment of lime water*.

IV. GASEOUS PRODUCTS.

Gas oxygenium, *oxygen gas*.
 Gas oxidum azotii, *gaseous oxide of azote*.
 Electrisatio et galvanisatio, *electricity and galvanism*.

Balneum calidum, *the hot bath*.

The substances enumerated in the above table have been variously denominated, according to their real or supposed medical virtues. Of the internal stimulants, most have been called cordials, from the effect they have in raising the spirits; some have been termed carminatives, (see *carminatives*), under which head rank most of the aromatic herbs, roots, and seeds. Of the external stimulants many are called rubefacients, from the effect they have in irritating and consequently reddening the skin; and of these the principal are mustard, cantharides, and the stinging nettle.

CLASS XIII. ANTISPASMODICS.

Those medicines which have been found by experience to put a stop to convulsive motions, or spasmodic contractions of the muscular fibres, are called *antispasmodics*. Most of them are stimulants, some narcotics, and some are considered as specific antispasmodics.

TABLE of ANTISPASMODICS.

I. ANIMAL PRODUCTS.

Murias ammoniæ, *muriate of ammonia*. See table
of Stimulants.
 Moschus moschiferus, *musk*.
 Mistura moschata, *musk mixture*.
 Cervus elaphus.
 Oleum animale, *animal oil*.
 Castor fiber, *castor*.
 Tinctura castorei, *tincture of castor*.
 Tinctura castorei composita, *compound tincture of castor*.

II. VEGETABLE PRODUCTS.

Cephaelis ipecacuanha, *ipecaquanha*.
 Nicotiana tabacum, *tobacco smoke*.
 Ferula asafoetida, *asafoetida*.
 Alcohol ammoniatum foetidum, *fetid ammoniated alcohol*.
 Pilulæ asafoetidæ compositæ, *compound pills of asafoetida*.
 Emplastrum asafoetidæ, *asafoetida plaster*.
 Alcohol.
 Æther sulphuricus, *sulphuric æther*.
 Laurus camphora, *camphor*.
 Emulsio camphorata, *camphorated emulsion*.
 Mistura camphorata, *camphorated mixture*.
 Tinctura camphoræ, *tincture of camphor*.
 Linimentum camphoræ compositum, *compound liniment of camphor*.
 Papaver somniferum, *opium*.
 Tinctura opii, *tincture of opium*.
 Tinctura opii camphorata, *camphorated tincture of opium*.

Therapeu-
tics.

Tinctura opii ammoniata, *ammoniated tincture of opium*.
 Electuarium opiatum, *opiate electuary*.
 Pilulæ opii, *opium pills*.
 Bubon galbanum, *galbanum*.
 Tinctura galbani, *tincture of galbanum*.
 Pilulæ galbani compositæ, *compound pills of galbanum*.
 Vitis vinifera.
 Vinum rubrum lusitanum, *red Port wine*.
 Citrus aurantium, *orange leaves*.
 Artemisia absinthium, *common wormwood*.
 Sub-carbonas potassæ impurus, *impure subcarbonate of potash*.
 Aqua potassæ, *water of potash*, or *soap ley*.
 Cardamine pratensis, *ladies smock*.
 Conium maculatum, *hemlock*.
 Succus spissatus conii maculati, *inspissated juice of hemlock*.
 Fuligo ligni combusti, *wood soot*.
 Hyoscyamus niger, *henbane*.
 Succus spissatus hyoscyami nigri, *inspissated juice of henbane*.
 Valeriana officinalis, *valerian*.
 Tinctura valerianæ, *tincture of valerian*.
 Tinctura valerianæ ammoniata, *ammoniated tincture of valerian*.
 Extractum valerianæ sylvestris resinum, *resinous extract of wild valerian*.

III. MINERAL PRODUCTS.

Hydrargyrum, *mercury*.
 For most preparations of mercury, see table of *Sialagogues*.
 Bitumen petroleum, *petroleum*.
 Oleum petrolei, *oil of petroleum*.
 Succinum, *amber*.
 Oleum succini, *oil of amber*.
 Oleum succini purissimum, *purified oil of amber*.
 Sal succini, *salt of amber*.
 Spiritus ammoniæ succinatus, *succinated spirit of ammonia*.

181
Effects and
uses of anti-
spasmodics.

All those substances which, whether introduced into the body or applied to its surface, have been found by experience to put a stop to convulsive movements or rigid contractions of the muscular fibres, are termed antispasmodics. Of these substances there are many which differ from each other very widely, both in respect of sensible qualities and chemical composition; which indeed is not surprising, when it is considered that spasmodic affections occur in various and even opposite states of the body; a circumstance which calls for nice discrimination on the part of the practitioner in the use of these remedies. Some of them being considerably stimulant in their operation, aggravate rather than alleviate spasm, when associated with plethora or obstruction. It is therefore of great importance to attend carefully to the state of the patient's body, previously to the exhibition of these medicines; to premise and accompany their use in epilepsy, chorea, and hysteria, by proper evacuations; and to select from the great variety of articles which this class contains, such

as are best adapted to the particular form of spasm which it is our business to cure.

Therapeu-
tics.

CLASS XIV. NARCOTICS.

This term has been usually applied to those remedies which are calculated to relieve pain and procure sleep. They have also been termed anodynes and hypnotics, and most of them were formerly ranked in the class of sedatives.

TABLE OF NARCOTICS.

I. VEGETABLE PRODUCTS.

Nicotiana tabacum, *tobacco*.
 Vinum nicotianæ tabaci, *tobacco wine*.
 Aconitum neomontanum, *aconite*.
 Succus spissatus aconiti napelli, *inspissated juice of aconite*.
 Papaver somniferum, *opium*; *white poppy heads*.
 Tinctura opii, *tincture of opium*.
 Tinctura opii camphorata, *camphorated tincture of opium*.
 Syrupus opii, *syrup of opium*.
 Extractum papaveris somniferi, *extract of white poppy heads*.
 Pulvis opiatus, *opiate powder*.
 Electuarium opiatum, *opiate electuary*.
 Pilulæ opii, *opium pills*.
 Rhododendron chrysanthum, *yellow-flowered rhododendron*.
 Digitalis purpurea, *foxglove*.
 Tinctura digitalis purpureæ, *tincture of foxglove*.
 Arnica montana, *leopard's bane*.
 Rhus toxicodendron, *poison oak*.
 Conium maculatum, *hemlock*.
 Succus spissatus conii maculati, *inspissated juice of hemlock*.
 Hyoscyamus niger, *henbane*.
 Succus spissatus hyoscyami nigri, *inspissated juice of henbane*.
 Tinctura hyoscyami nigri, *tincture of henbane*.
 Atropa belladonna, *deadly nightshade*.
 Datura stramonium, *thorn-apple*.
 Humulus lupulus, *hop*.
 Lactuca virosa, *wild lettuce*.
 Papaver rhœas, *wild poppy*.
 Syrupus papaveris erratici, *syrup of wild poppy*.
 Sium nodiflorum, *creeping skerrit*.

There is no class of medicines in the administration of which more judgment and discrimination are requisite than in the administration of those which are termed narcotics. When given in full doses, much good or much mischief is sure to follow, according as they are prudently or mistakingly prescribed. What a common practice it is to give them whenever a patient complains of pain, without duly investigating the cause of that pain; whether it be the consequence of high inflammatory action, of a plethoric condition, or of a suppression of some periodical or habitual discharge! In these cases to prescribe any of the medicines belonging to this class,

Therap- class, in a full or considerable dose, before the remedies
tica. suited to remove inflammation, plethora, and obstruction,
had been resorted to, would only serve to aggravate the
disease. And even where there is no condition of the
body which contraindicates the use of narcotics, it is of
great importance to adapt the doses not only to the age
and constitution of the patients, but likewise to the par-
ticular form of the disease. For instance, in tetanus,
hemiplegia, and colica pictonum, opium, and other
narcotic medicines, may be given in large doses with
excellent effect; but in phthisis pulmonalis, typhus fe-
ver, and some other states of debility, small doses, re-
peated at proper intervals, are found to answer best.

In the administration of narcotics, it is moreover pro-
per to consider whether in the particular case in which
they appear to be indicated, they should be prescribed
alone, or in combination with other medicines; and if
in the manner last mentioned, with what sort of ad-
juncts. Thus, in cases of synochus, acute rheumatism,
and the early stage of dysentery, they should be given
in combination with calomel and antimonials; in cases
of asthma and phthisis pulmonalis, with ammoniacum,
squill, and other expectorants; in cases of cholera, with
diluent and demulcents; in cases of diarrhoea, with
astringents and aromatics; in hemorrhagic cases, with
sulphate of zinc and other styptics; in hysteria, with
the volatile alkali, ether, and fetids; in convulsive af-
fections, especially such as occur in children, with mag-
nesia and other antacids*.

Definition
of anthel-
mintics.

CLASS XV. ANTHELMINTICS.

Those medicines which are employed with a view to
expel worms from the bowels, are called *anthelmin-*
tics.

TABLE of ANTHELMINTICS.

I. ANIMAL PRODUCTS.

Murias ammoniæ, *muriate of ammonia.*

Aqua carbonatis ammoniæ, *water of carbonate of*
ammonia.

II. VEGETABLE PRODUCTS.

Anthemis nobilis, *chamomile flowers.*

Extractum anthemidis nobilis, *extract of chamo-*
mile.

Nicotiana tabacum, *tobacco* in clysters.

Olea europæa, *olive oil* in clysters.

Allium sativum, *garlic.*

Ferula asafoetida, *asafoetida* in clysters.

Convolvulus jalapa, *jalap.*

Convolvulus scammonia, *scammony.*

Pulvis scammonii compositus, *compound powder of*
scammony.

Helleborus foetidus, *stinking hellebore.*

Rheum palmatum, *rhubarb* in small doses.

Ricinus communis, *castor oil.*

Stalagmitis cambogioides, *gamboge.*

Ruta graveolens, *rue.*

Oleum volatile rutæ, *oil of rue.*

Juglans regia, *walnut rind.*

Tanacetum vulgare, *tansy.*

Valeriana officinalis, *valerian.*

Artemisia santonica, *worm-seed.*

3

Dolichos pruriens, *cowhage.*

Geoffræa inermis, *cabbage-tree bark.*

Polypodium filix mas, *male fern root.*

Spigelia marilandica, *Carolina pink.*

III. MINERAL PRODUCTS.

Hydrargyrum, *mercury.*

Submuriæ hydrargyri, *submuriate of mercury.*

Murias sodæ, *muriate of soda.*

Ferrum, *iron.*

Carbonæ ferri, *carbonate of iron.*

Sulphas ferri, *sulphate of iron.*

Ferri limaturæ purificatæ, *purified iron filings.*

Tartris ferri et potassæ, *tartrate of iron and*
potash.

Calx, *lime.*

Aqua calcis, *lime water* in clysters.

Stannum, *tin.*

Stanni pulvis, *powder of tin.*

Of the medicines which belong to this class, some ¹⁸⁷ Effects and
destroy the different species of worms which breed in uses of an-
the alimentary canal, by their chemical, others by their thelmintics.
mechanical action upon those animals; but by far the
greater number of anthelmintic or vermifuge medi-
cines operate in no other manner than as drastic purges,
bringing away the morbid accumulation of slime from
the intestines, and with the slime, the worms which
were lodged in it. After the worms have been brought
away by these remedies, the bowels should be strength-
ened by bitters and other tonic medicines; and the use
of green vegetables, or much garden stuff of any kind,
and of malt liquor, should be forbidden.

CLASS XVI. CHEMICAL REMEDIES.

Several of the substances that have been enumerated ¹⁸⁸ Chemical
in the foregoing tables, act also on the animal system remedia-
merely as chemical re-agents, either by counteracting
acidity, dissolving calculous concretions, destroying fun-
gous excrescences, &c. We shall here enumerate all
the substances that may be considered as chemical reme-
dies, and shall afterwards class them according to their
particular action.

TABLE of CHEMICAL REMEDIES.

I. ANIMAL PRODUCTS.

Murias ammoniæ, *muriate of ammonia.*

Aqua ammoniæ, *water of ammonia.*

Carbonas ammoniæ, *carbonate of ammonia.*

Aqua carbonatis ammoniæ, *water of carbonate of*
ammonia.

Sal cornu cervi, *salt of hartshorn.*

Cervus elaphus, *hartshorn.*

Phosphas calcis, *phosphate of lime.*

Cornu cervi ustum præparatum, *burnt hartshorn.*

Cancer astacus, *crabs eyes.*

Cancer pagurus, *crabs claws.*

Chelæ cancrorum præparatæ, *prepared crabs*
claws.

Pulvis è chelis cancrorum compositus, *compound*
powder of crabs claws.

Gorgonia nobilis, *red coral.*

Corallium rubrum præparatum, *prepared red co-*
ral.

chemical
remedia.

Ostrea

Ostrea edulis, oyster shells.
Testæ ostreæ præparatæ, prepared oyster shells.
Spongia officinalis, sponge.
Spongia usta, burnt sponge.

II. VEGETABLE PRODUCTS.

Carbonas potassæ, carbonate of potash.
Aqua potassæ, water of potash, or caustic ley.
Potassa, potash.
Potassa cum calce, potash with lime.
Carbonas potassæ, carbonate of potash.
Carbonas potassæ purissimus, purified carbonate of potash.
Aqua carbonatis potassæ, water of carbonate of potash.
Aqua supercarbonatis potassæ, water of carbonate of potash.

III. MINERAL PRODUCTS.

Sulphas cupri, sulphate of copper.
Sulphuretum antimonii, sulphurate of antimony.
Murias antimonii, muriate of antimony.
Sulphur sublimatum, flowers of sulphur.
Sulphuretum potassæ, sulphuret of potash.
Hydrosulphuretum ammoniæ, hydrosulphuret of ammonia.
Nitras potassæ, nitrate of potash.
Acidum nitrosum, nitrous acid.
Acidum nitricum, nitric acid.
Sapo hispanus, Castile soap.
Murias sodæ, muriate of soda.
Acidum muriaticum, muriatic acid.
Sulphas magnesiæ, sulphate of magnesia.
Carbonas magnesiæ, carbonate of magnesia.
Magnesia, magnesia.
Trochisci magnesiæ, lozenges of magnesia.
Acidum sulphuricum, sulphuric acid.
Acidum sulphuricum dilutum, diluted sulphuric acid.
Supersulphas aluminæ et potassæ, supersulphate of alumina and potash, or alum.
Sulphas aluminæ exsiccatus, dried sulphate of alum.
Argentum, silver.
Nitras argenti, nitrate of silver.
Oxidum arseniosum, arsenious acid.
Calx, quicklime.
Aqua calcis, lime water.
Bolus gallicus, French bole.
Carbonas calcis, carbonate of lime, chalk.
Carbonas calcis præparatus, prepared carbonate of lime.
Pulvis carbonatis calcis compositus, compound powder of carbonate of lime.
Trochisci carbonatis calcis, lozenges of carbonate of lime.
Potio carbonatis calcis, potion of carbonate of lime.
Aqua aëris fixi, water of fixed air.
Carbonas sodæ impurus, impure carbonate of soda.
Carbonas sodæ, carbonate of soda.
Aqua supercarbonatis sodæ, water of supercarbonate of soda.

Of the substances above enumerated, some act as antacids, correcting morbid acidity in the stomach and bowels; as most of the preparations of ammonia, burnt hartshorn, crabs eyes and claws, coral, egg shells, carbonates of potash and soda with their preparations, magnesia, lime, and carbonate of lime. These have been often called *absorbents*.

Several of the chemical remedies act in a greater or less degree as lithontriptics, or such medicines as are capable of dissolving urinary calculi. The principal lithontriptics are, solutions of caustic potash, soap, sulphuric and muriatic acids, and carbonate of soda.

"From the exhibition of alkaline remedies," says Mr Murray, "the symptoms arising from a stone in the bladder are very generally alleviated; and they can be given to such an extent that the urine becomes sensibly alkaline, and is even capable of exerting a solvent power on these concretions. Their administration cannot, however, be continued to this extent for any considerable length of time, from the strong irritation they produce on the stomach and urinary organs. The use, therefore, of the alkalies as solvents, or lithontriptics, is now scarcely ever attempted; they are employed merely to prevent the increase of the concretion, and to palliate the painful symptoms, which they do, apparently by preventing the generation of lithic acid, or the separation of it by the kidneys; the urine is thus rendered less irritating, and the surface of the calculus is allowed to become smooth.

"When the alkalies are employed with this view, they are generally given saturated, or even super-saturated with carbonic acid. This renders them much less irritating. It at the same time diminishes, indeed, their solvent power; for the alkaline carbonates exert no action on the urinary calculi; but they are still equally capable of correcting that acidity in the *primæ viæ*, which is the cause of the deposition of lithic acid from the urine, and therefore serve equally to palliate the disease. And when their acrimony is thus lessened, their use can be continued for any length of time."

From the inconsiderable action which most of the lithontriptics can with safety be made to exert, when given by the mouth, it was some years ago proposed to apply them directly to the calculus, by injecting them through the urethra into the bladder. In this way it is evident that their action must be much greater, and when the substances are used in a state of sufficient dilution, the practice is said to be perfectly safe.

Several of the chemical remedies are employed externally as caustics or escharotics, to destroy fungous or callous parts of the body; to open an ulcer, or to change the diseased surface of a sore. The principal escharotics are, sulphuric and muriatic acid when concentrated; pure potash, nitrate of silver, muriate of antimony, sulphate and subacetate of copper, corrosive muriate of mercury, and arsenious acid.

A few are employed both externally and internally, to check putrefaction, or to correct the unpleasant smell of particular secretions, or of ulcers. The principal of these are charcoal and carbonic acid, though the mineral acids have also this effect.

PART III. PRINCIPLES OF PHARMACY.

CHAP. I. *General Operations of Pharmacy.*

THE operations of pharmacy are either mechanical or chemical. By the first the various articles employed in medicine are reduced to a proper state for exhibition, by cutting, rasping, grinding, pounding, &c.; and by the second they are subjected to various complex operations, which produce certain chemical changes in their nature and properties.

To the first of these heads we may refer the collection and preservation of simples. This chiefly refers to those articles that are of a vegetable nature, and which are either used fresh, or in a dried state.

194
Collection
and preser-
vation of
simples.

Vegetables should be gathered chiefly from those soils in which they naturally delight, or in which they are found most commonly to rise spontaneously; for though many of them may be raised, and made to grow with vigour in very different soils, their virtue generally suffers by the change. A variation of seasons occasions also differences considerable enough to require often an allowance to be made in the quantity; plants in general proving weaker, though more luxuriant, in rainy than in dry seasons. Herbs and flowers are to be gathered in a clear dry day, after the morning dew is gone off from them. Leaves, for the most part, are in their greatest perfection, when come to their full growth, just before the flowers appear: flowers, when moderately expanded; seeds, when they begin to grow dry, before they fall spontaneously; woods and barks, as is supposed, in the winter; annual roots, before the stalks begin to rise; biennial roots, in the autumn of the first year: perennial roots, in the autumn after the leaves have fallen, or early in the spring before they begin to vegetate.

Of the vegetables which lose their virtue in being dried, the greater number, perhaps all, may be preserved for a considerable length of time, by impeding the exhalation of their natural moisture; for so long as they retain this, they seem to retain also their medical activity. Thus, roots have their virtue preserved by being buried in sand, which should be dry, that they may not vegetate; leaves and flowers, of a more corruptible nature than roots, by being beaten with about thrice their weight of fine sugar to prevent their corruption, and kept in a close vessel.

Plants which bear drying, are commonly hung in a warm airy place, defended from the sun. The colours of herbs and flowers are for the most part changed or destroyed in drying, by the sun's beams; but that their medicinal virtue suffers a like diminution, does not appear. This much is certain, that the heat of a culinary fire, equal to that of the sun in summer, does them no injury in either respect; and that both flowers and leaves, when thus hastily dried by fire, preserve the liveliness of their colour, and their smell and taste, more perfectly than by slow drying. The leaves of moderately juicy plants are reduced, by drying, to about one-fourth of their original weight.

Some roots, and some other parts of vegetables, how thoroughly soever they have been dried, are liable, in keeping, to grow mouldy and carious. This inconvenience might probably be obviated by dipping them, when dried, in boiling spirit of wine, or exposing them to its vapour in a close vessel. It is said, that some of the oriental spices are made less perishable, by being dipt in a mixture of lime and water*.

The drawers in which vegetable drugs are kept, should be made of such materials as are not likely to impart to them any unpleasant taste or smell; and the better to avoid this, they should be lined with paper. Such matters as are volatile, or which are likely to suffer from exposure to the air, or from insects, should be kept in glass vessels well stopp'd. Such fruits and oily seeds as are liable to become rancid, by being too warm, should be preserved in a dry cool place.

* Lewis's
*Materia
Medica.*

As most vegetable substances lose much of their sensible properties by long keeping, or acquire others which render them less proper for being used as internal medicines, they should be frequently replaced.

One of the most common operations to which dry Pulveriza-¹⁹⁵tion. drugs are subjected, is that of being reduced to powder, by which they are rendered more efficacious, and are more conveniently exhibited. The pulverization of these matters is usually performed by means of pestles and mortars. These should be made of such materials as are not likely to impart to the powdered substance any noxious properties, and should at the same time be sufficiently hard, not to be broken or worn away during the operation. For the powdering of barks, roots, and similar substances, cast-iron mortars are the most convenient; and for such articles as are of a more brittle nature, mortars of glass or marble are commonly employed. All those made of copper, or any of its alloys, should be carefully avoided, as when the substance is very hard, or of such a nature as to act chemically on the metal, some portion of copper may be mixed with the medicine, and render it a virulent poison. For many purposes mortars made of common stoneware answer very well; but the best mortars of this kind are those made of well-baked clay, commonly called *Wedgwood's mortars*. The bottom of all these mortars should be hollow on the inside, and flat on the outside, and their sides should be moderately inclined. Those which are employed for reducing to powder such substances as produce much dust, should be provided with covers, both to prevent the lighter parts of the powder from being lost, and to defend the operator from being injured by such substances as are of a corrosive or poisonous nature. In general, wooden covers that have a rim to prevent their sliding off, and a hole sufficiently large to admit of the introduction of the pestle, answer very well; but where it is of consequence that no part of the article should escape, it is better to tie round the mouth of the mortar, and round the pestle, a piece of pliable leather, sufficiently large to admit of the free motion of the latter. Where this is not done, it will be proper for the operator to cover his mouth and nose with a handkerchief

Principles
of Pharm-
macy.

chief or wet cloth, and to stand in such a situation as that a current of air shall direct the acrid powder from him.

To avoid losing much of these light dry powders, a little spirit of wine, or oil, is sometimes put into the mortar, to prevent the lighter parts of the powder from rising. Care should, however, be taken, that the substance is of such a nature as not to be dissolved by the spirit, nor injured by the rancidity that the oil is likely to acquire; and in every case, as little as possible of either should be employed.

It is obvious that in reducing drugs to powder, too much of the article should not be put at once into the mortar.

Several substances require previous preparation before powdering; barks, woods, roots, should be perfectly dry, and should be either sliced or rasped before putting into the mortar; and such roots as are covered with a very fibrous bark, should be shaved after this has been removed, to take away such hairy filaments as are usually found between the bark and the wood. Gummy resinous substances, such as myrrh, which are liable to become soft when heated, should be powdered in very cold weather; and it is better, first to reduce them to a coarse powder, and expose this to the air for a day or two, before completing the pulverization, which will then be more easily effected. Some substances cannot be reduced to powder without the addition of some other matter; thus, camphor requires a little alcohol or oil; the emulsive seeds require the addition of some dry powder, and for aromatic oily substances, the addition of a little sugar is proper.

196
Sifting.

In order to separate the finer powder from the rest of the substance, apothecaries employ sieves of various forms. For such articles as require to be kept close, the sieve is composed of three parts; a middle part, which is properly the sieve for separating the finer part of the powder, a bottom for receiving the powder, and a top for preventing the escape of the finer dust.

When as much of the powder as is sufficiently fine, has passed through the sieve, the rest is to be returned into the mortar, and the pulverization continued and repeated, till as much as possible has passed the sieve. All the parcels of powder are then to be intimately mixed together, by rubbing them for a considerable time in the mortar.

197
Trituration.

Trituration consists in rubbing dry substances that are already pretty small in order to reduce them to a very fine powder, or to mix them intimately together. In the small way it is performed in the usual mortars; in the large way by means of a roller moved by water or by horses.

198
Levigation.

When it is required to reduce dry substances to a very fine, or what is called an *impalpable powder*, recourse is had to the operation called *levigation*, which is nothing more than rubbing the substance for a long time in a broad flat mortar, or upon a hard stone, with a muller, adding from time to time a little water or alcohol, so as to reduce the substance operated on to a kind of paste. This paste is rubbed till it is as smooth as possible, and is then spread on a stone or flat cake of chalk, till it is sufficiently dried. Sometimes levigated powders are made up into little conical lumps, and dried in that form. The substances on which levi-

gation is performed are chiefly earths and metallic oxides.

Principles
of Pharm-
macy.

For the purpose of reducing metals into minute particles, they are either filed or granulated. It would not be improper that apothecaries should always prepare their own iron filings, as those procured from a smith's shop are generally very impure. The granulation of metals is effected by melting the metal, and either stirring it briskly with an iron rod till it is cold, or pouring it into water and stirring it as before; or lastly, by pouring it into a covered box, having its inside well rubbed with chalk, in which it is well shaken till cold, when the adhering chalk is to be washed away.

Another mode of procuring the finest particles of such substances as are not soluble in water, is by what is termed *elutriation*, which is performed by diffusing in water the powder or paste to which they have been reduced by pulverization or levigation, and after the coarser particles have subsided, pouring off the water that holds in suspension the finer parts. The operation of levigation and subsequent diffusion is repeated, till as much as is required of the fine powder is obtained. This is afterwards to be separated from the water, either by decantation or filtration.

When the powder is so heavy as readily to fall to the bottom of the vessel, it is most conveniently separated by decanting off the water, either by pouring it gently off as long as it comes over clear, or by means of a crooked glass syphon fixed in a board that goes over the mouth of the vessel to keep it steady, as represented at fig.

When the powder does not readily subside, it is best separated by filtration, which is performed by means of a cone of common blotting paper, inserted into a funnel, or by means of a cloth or flannel bag. After all the fluid has passed through the filter, the powder that remains on the paper is to be carefully dried.

Decantation and filtration are more commonly employed to obtain any liquor clear from the powdery or other matters with which it is mixed.

For obtaining the juices of vegetables or fruits, or the oils of seeds, &c. recourse is had to *expression*. The plants or fruits are put into bags or wrappers made of haircloth, and subjected to strong pressure by means of a screw press, the plates of which should be made of wood or tin, and by no means of lead. The pressure employed should at first be gentle, and should be increased gradually. The oily seeds or nuts are pressed between iron plates, which are usually warmed; but when used cold, the oil is milder and not so liable to become rancid.

Besides the mortars mentioned above, there are several other instruments employed in the operations of pharmacy, on which it is proper to make a few remarks.

Funnels ought to be made of tinned iron, or of glass; or of the same sort of baked earth or clay as the mortars, or of silver, or of block tin.

Vessels used for preparing infusions, or for evaporating liquors, or for putting decoctions or other liquors into, to cool, ought to be made either of porcelain, or of stoneware, or of baked clay, or of earth such as the mortars are made of, or of glass; or such vessels as are not acted upon either by acid or alkaline liquors.

For

Principles
of Phar-
macy.

For the same reasons, measures of all sorts, from the dram to a quart, ought to be made of tinned iron, or of stoneware, or of the baked earth or clay, or of glass; silver might be employed for the smaller measures of drams and ounces, and if taken care of, would in the end prove cheaper than the others; if other metallic vessels are used, the metal ought to be of such a sort as not to be affected by acid or alkaline, or other liquors; and they ought at all times to be kept extremely clean.

In distilling, in melting, and in calcining different bodies, no vessels ought to be employed which may be acted upon by, and give a noxious quality to, the substances to be prepared.

Most colleges of physicians in Europe formerly directed, that both weights and measures should be employed for dispensing medicines, ordering solid substances to be prepared by weight, fluid by measure; and they gave tables of the weights and measures they wished should be used, in the beginning of their different dispensatories: but it having been found that the promiscuous use of weights and measures gave sometimes occasion to mistakes, the colleges of Edinburgh and of Stockholm have, in the last edition of their pharmacopœias, rejected entirely the use of measures, and ordered both fluid and solid substances to be prepared by weight. It is to be wished that all the colleges in Europe would follow their example.

206
Measures
and
weights.

Measures made to contain a certain determined weight of water are certainly very useful in pharmacy; but if such are allowed they ought to be employed only for measuring watery liquors, as the specific gravities of other fluids differ so much from one another.

In every country, all weights and measures used for the preparation of medicines ought to be made according to the directions of the college of physicians; standards of them ought to be kept in proper places, and all those ought to be stamped, to shew that they were made according to the standard.

The principal *chemical* operations of pharmacy may be arranged under the following heads.

07
Infusing.

1. The infusing certain substances in cold or in hot water, or in wine, to extract their saline or light gummy parts, together with some of their fine volatile principles, which are miscible with water.

208
Boiling.

2. The boiling them in water to extract the same principles, together with others that are more fixed, or which are capable of being dissolved by heat, and afterwards of being kept suspended by the gummy and mucilaginous parts which have been dissolved in the water; thus a certain proportion of resin is found to be suspended in decoctions of the bark, of opium, and of other drugs.

209
Evapora-
ting.

3. The evaporating watery infusions and decoctions, and the expressed juices of many vegetables, to obtain their fixed parts which have been dissolved in a watery menstruum. In this manner jellies, robs, and extracts, are prepared.

210
Digesting.

4. The infusing or digesting certain vegetable substances in pure vinous spirit to extract their fine volatile oils and their resinous parts; or in spirit mixed with water, called proof-spirit, to extract, along with those principles, some of their gummy parts.

5. The evaporating of such tinctures to obtain their resinous and more fixed parts; in which way resinous

VOL. XII. Part II.

extracts are got from bark, jalap, from opium, and from other substances.

Principles
of Phar-
macy.

6. The distilling fragrant vegetable substances with water, in order to procure their fine volatile principles, which come over with the water into the vessels placed to receive it. In this manner the simple distilled waters (as they are called), which have the flavour and taste of the substances from which they are distilled, are prepared; and the fine essential oils of the plants which have been distilled are found either floating on the top of the water, or sunk to the bottom of it, according as they are specifically lighter or heavier than water.

7. The distilling of the same substances in vinous spirit to obtain the same fragrant volatile parts, intimately united with the spirit; in which manner are made the spirituous liquors improperly called spirituous waters.

In distilling, care ought to be taken to make the vapours which arise condense properly in the vessels set to receive them when they have assumed the form of a liquor; which is to be effected, 1. By regulating the fire, and never raising the degree of heat beyond what is necessary; and, 2. By making the vapours pass through such a cool medium, as will condense them into a liquid.

1. The degree of heat is regulated by the figure of the furnace in which the fire is placed, and by the quantity of wood or of coal that is used. Where a great degree of heat is wanted, the vessels are put in an open fire, placed in a reverberatory furnace. Where a less degree of heat is sufficient, they are put into sand contained in an iron pot, below which the fire is lighted in a common furnace. Where a still smaller degree is required, the vessel is put into a pot with sand, and a lamp in place of coals fixed below it. At other times the retort, or vessel with the liquor to be distilled, is put into a vessel full of water or other liquor, set over a fire, so that it cannot be heated beyond a certain degree.

2. The condensation of vapours arising from substances subjected to distillation is effected, as before observed, by making the vapour pass through such a cool medium, as will condense it into a liquor before it reaches the bottom of the vessels set to receive it.

In distilling medicated waters or spirits, the herbs or other vegetable substances, and the water or the spirit, are put into a still placed in a proper furnace, on which is fixed a large head, with a long crane-necked or curved tube coming from the top of it, which after descending and going off a little to one side, enters into the upper end of a long spiral pipe, called a worm, which is fixed in a large cask, called the worm-tub or refrigerator, with its two ends piercing the cask; and to its lower end is fixed a proper vessel for receiving the distilled liquor. The worm-tub, which has a cock at the lower part of it for letting out water occasionally, is filled with cold water before the distillation begins, and is renewed in the course of the distillation if it begins to heat, by drawing it off by means of the cock, and pouring fresh cold water into the worm-tub. After every thing is fitted, the fire is lighted, and the distillation is continued so long as the water comes over sufficiently impregnated with the vegetable substances put into the still.

In the distillation of vegetable or animal substances

†

4 Z

with

Principles
of Phar-
macy.

with water, or with spirit, it ought to be observed, 1. That there ought to be put into the still such an additional quantity of water as will prevent the solid substances which are subject to the distillation from being burnt, as this additional water does not at all weaken the produce; for the most volatile parts of the subject rise first, and impregnate the liquor which first comes over, and the water remains behind in the still. 2. That a gentle fire, such as is just capable of keeping the liquor boiling, is preferable to a strong fire, particularly towards the end of the process. 3. That the distillation is to be continued so long as the liquor comes over fully impregnated with the volatile parts of the vegetable substances which are the subjects of the distillation; but is to be put an end to, so soon as it is perceived to become weak, which is known by tasting from time to time the liquor which comes over.

8. The distilling of vegetables or animal substances in retorts without water, in order to make them rise, and bring over by the force of fire, their watery parts, an acid, or volatile alkaline salt, according to what nature the substances are of, and an empyreumatic oil, into the receiver; and to get the more fixed, earthy, and oily parts, which are left behind in the retort.

In distilling substances which require a greater degree of heat to raise their volatile parts, than the liquors above mentioned, or which are of such a nature as to act upon, and corrode the vessels employed in these processes just mentioned, it is necessary to use the vessels made of glass or of earth, which have been called retorts, from their neck being bent on one side. Such retorts are employed in pharmacy for distilling the mineral and the vegetable acids, and the preparations made from them; in distilling animal and vegetable substances by themselves to procure their watery, saline, or oily parts; for purifying quicksilver, and preparing the *muriate of antimony*, &c. and they may be used as subliming glasses for making mercurial and other preparations.

In distilling with retorts, the matter to be distilled is put into the retort which is commonly placed in sand, contained in an iron pot, fixed above a furnace, into which the fire is put; but on some particular occasions, where only a small degree of heat, not exceeding that of boiling water, is wanted, the retort is placed in a water bath.

After the retort containing the matter to be distilled is fixed, the end of it is either put immediately into the mouth of another long-necked vessel called a receiver (from its being placed to receive the distilled liquor), and the two vessels are luted together by means of a proper cement; or it is first put into the end of a long glass tube called an adopter, which is luted to it, and the other end of the tube is put into the mouth of the receiver, and fixed to it by means of a cement.

The receivers are either made round like a decanter, without any other opening than the mouth; or they are made with a tube coming out from their bottom, or from the side near it, to which another receiver may be fixed, and when they are thus made they are called tubulated receivers, and are very convenient for performing processes where the matter put into the retort yields products of different kinds, as in the distillation of spirit with the mineral acids; for the receiver or bottle fixed to the tube may be changed as the differ-

ent products come over, so that each of them may be obtained separately. And in distilling substances which yield very volatile products, one tubulated retort may be put after another so as to enlarge the space for the condensation of vapours; and in distilling these very volatile substances it is sometimes necessary to make a small puncture into the lutes between the retort and the receiver, to allow some of the vapour to escape to prevent its bursting the vessels.

The use of the long intervening tube called an adopter, which is put often between the retort and the receiver, is to increase the distance from the retort (that is immediately exposed to heat) to the receiver; so that the receiver may be in less danger of being heated, and that the vapour may be cooled in its passage through this tube, and condense more readily in the receiver. It is likewise of another use, which is to give us an opportunity of seeing the vapour in its passage from the retort to the receiver, so that we may know how the distillation is going forward, and when it is proper to change the receivers, when the different liquors come over from materials which yield products of different kinds.

9. The burning vegetable substances in an open vessel to obtain a fixt alkaline salt. ²¹² Incineration.

10. The burning the bones of animals, or the shells of fishes, to procure their earthy parts; in which manner the calcined hartshorn, the powder of crabs claws, and of oyster shells, are procured.

11. The mixing acid and alkaline salts in a fluid state, to form the neutral salts, which may be separated from the water either by evaporating, with a slow heat, such a quantity of the water as to allow the salts to shoot into crystals when set in a cool place, or by continuing the evaporation till the salts become dry. ²¹³ Neutralization.

12. The dissolving certain metallic substances, or certain earths, in acid liquors, for obtaining metallic and earthy salts, which may be got in a solid form in the same manner as the neutral salts.

13. The evaporating the purified expressed juices of certain vegetable substances to the consistence of a cream, and then setting them by for months, in a cool place, to allow the essential acid salts to congregate into crystals. See CRYSTALLIZATION. ²¹⁴ Crystallization.

14. The distilling in proper vessels vitriol or other substances which contain the sulphuric acid, in order to get it separate from them; and the burning of sulphur mixed with a small portion of nitre, under particular vessels, so contrived, and so placed, as to collect the same acid.

15. The distilling nitre, or sea salt, mixed with a certain portion of the sulphuric acid, in order to obtain pure the nitric or muriatic acid.

16. The subliming certain substances that become volatile by the application of heat, into proper vessels; and either to unite two of them together for the formation of a third, as is done in the preparation of the corrosive sublimate of mercury, when the muriatic acid is united to the quicksilver, or to separate the volatile parts of any substance from the fixt, as is done in the sublimation of volatile alkaline salts and of the acid of benjamin. ²¹⁵ Sublimation.

17. The melting by the force of fire such substances as become fluid by the application of heat, so that they may be separated from or united to other bodies. Thus by ²¹⁶ Melting.

Principles
of Phar-
macy.

Principles
of Phar-
macy.

by particular management and the addition of certain substances, metals are separated from their ores. And rosin and bees-wax are intimately united together; or they are dissolved in fluid oils, for the preparation of plasters, ointments, liniments, &c. And sulphur is united to quicksilver for the making of a black or red sulphuret.

217
Oxidation.

18. The applying of heat to metals, either to oxidate them, or to separate certain volatile substances with which they are combined, or to purify them from more oxidable metals with which they are alloyed. Thus mercury is reduced to a red oxide merely by the continued application of heat and air; the sulphuret of antimony is deprived of its sulphur by roasting, and silver is separated from lead by being exposed to such a heat, as, while it only fuses the silver, reduces the lead to an oxide. See CHEMISTRY.

218
Roasting.

CHAP. II. Of the principal forms in which Medicines are exhibited.

219
Official
forms.

THE principal officinal preparations of the simple medicines, for the making of which directions are given in the Pharmacopœias, consist of *powders, pills, troches, electuaries, inspissated juices, extracts, infusions, decoctions, mucilages, emulsions and mixtures, syrups, tinctures, wines*, for internal exhibition; and *cataplasms, liniments, ointments, cerates, and plasters*, for external application.

220
Powder.

The form of *powder* is one of the most simple, and very convenient for the exhibition of a variety of medicines. It is of course adapted only to such substances as are easily reduced to powder, and such as are not too bulky to be taken in a moderate dose. Hence emollient and mucilaginous herbs and roots are improperly ordered in the state of powder, as they are too bulky; alkaline salts, whether fixed or volatile, are improper, as they in general either deliquesce in the air, or evaporate. Such articles as are of a very disagreeable taste, or offensive odour, are also more conveniently given in some other form.

In preparing compound powders, care should be taken that the several ingredients should be intimately mixed together. Some of them may in general be most properly powdered separately, but it is often of advantage to powder them together. They should be kept in a closely stopped phial, and such as are apt to lose part of their virtue by long keeping, should be prepared in small quantities.

The dose of powders should be so regulated as seldom to exceed a dram. The substance in which they are to be taken should be of such a nature as to mix properly with them, so that they neither float at the top, nor sink too rapidly to the bottom of the vessel.

221
Pill.

The form of *pill* is most convenient for such articles as do not require to be given in a large dose, and are so unpleasant in taste or smell, that they cannot be conveniently given in the form of a powder. As many patients can swallow pills, who cannot take medicines in a less solid form, those substances which are usually ordered in powder, are not unfrequently formed into pills, when their bulk is not so great as to render the pills too numerous for a single dose.

The most usual substances that enter into the composition of pills are resins, gum-resins, extracts, and

similar medicines. Deliquescent salts are usually improper except in small quantity, and then they should be combined with some gummy powder. Such salts as are efflorescent, as *carbonate of soda*, may enter into the composition of pills: but they should be previously exposed to the air, so as to fall into powder. The liquid substances employed to form the pills into a proper mass, must be varied according to the nature of the more solid ingredients. Powders require syrup, mucilage, balsams, soap, conserve, or honey. Gum resins and extracts are sometimes sufficiently soft without any addition; but when this is required, a little spirit or wine is the most proper. When the mass is to be composed of a mixture of gum resins and powders, the former should be first moistened with the prescribed liquid, then the powders added, and the whole beaten well together, till they are reduced into a uniform plastic mass.

A dram of the pilular mass is generally divided into about twelve pills, so that each pill may weigh about five grains.

The masses for pills should be kept in bladders, these should be moistened now and then, either with a little wine, or with some of the same liquid that was employed in forming the mass.

Troches or lozenges are hard, round, flat cakes, formed of such substances as are intended to be gradually dissolved in the mouth, and thus pass by degrees into the stomach, or in their passage thither act on the throat or larynx. They should be formed of such substances as are soluble in the saliva, and are not of a disagreeable taste. They usually contain a great deal of sugar, and some gummy matter to render them coherent.

Electuaries are less solid than pills, being of such a consistence that they may be rolled up into a bolus, so as to be easily swallowed. They are chiefly composed of powders mixed up with syrup or honey. The substances that enter into the composition of electuaries are chiefly the milder alterative medicines, or gentle laxatives. The stronger cathartics, emetics, and such substances as are of an unpleasant taste, such as bitters, the fetid gum-resins, and very heavy powders, are improper. The liquid employed to form electuaries is usually syrup or honey, the proportion of which is regulated by the nature of the more solid ingredients, but is usually of nearly equal weight.

Confections are now considered as synonymous with electuaries, as they differ from ordinary electuaries in nothing but being composed of more aromatic ingredients.

Conserves may be considered as electuaries formed of only two ingredients, one of which is sugar, and the other the pulp of some fruit, the petals of flowers, or the outer rind of Seville oranges.

Extracts and resins are pharmaceutical preparations, the rationale of which is very little understood. Dr. Andrew Duncan, junr. has given an excellent account of them, which we shall here copy.

“Extract in pharmacy has long been used, in the common and true acceptation of the term, to express a thing extracted, and therefore it was applied to substances of all kinds which were extracted from heterogeneous bodies, by the action of any menstruum, and again reduced to a consistent form, by the evaporation

Conserves.

226

Extracts
and resins.

Principles
of Phar-
macy.

of that menstruum. Lately, however, extract has been used in a different and much more limited sense, as the name for a peculiar principle, which is often indeed contained in extracts, and which before had no proper appellation. It is in the former sense that we employ it here, and in which we wish it to be only used, while a new word should be invented as the name of the new substance. Till a better be proposed, we shall call it *extractive*.

“Extracts are of various kinds, according to the nature of the substances from which they are obtained, and the menstruum employed; but they commonly consist of gum, sugar, extractive, tannin, cinchonin, gallic acid, or resin, or several of them mixed in various proportions. The menstrua most commonly employed are water and alcohol. The former is capable of extracting all the substances enumerated, except the resin, and the latter all except the gum. Wine is also sometimes employed, but very improperly; for as a solvent it can only act as a mixture of alcohol and water, and the principles which it leaves behind on evaporation are rather injurious than of advantage to the extract.

“Water is the menstruum most commonly employed in making extracts, as it is capable of dissolving all the active principles except resin, and can have its solvent powers assisted by a considerable degree of heat.

“Watery extracts are prepared by boiling the subject in water, and evaporating the strained decoction to a thick consistence.

“It is indifferent with regard to the medicine, whether the subject be used fresh or dry; since nothing that can be preserved in this process will be lost by drying. With regard to the facility of extraction, however, there is a very considerable difference; vegetables in general giving out their virtues more readily when moderately dried than when fresh.

“Very compact dry substances should be reduced into exceedingly small parts, previous to the affusion of the menstruum.

“The quantity of water ought to be no greater than is necessary for extracting the virtues of the subject. This point, however, is not very easily ascertained; for although some of the common principles of extracts be soluble in a very small proportion of water, there are others, such as tannin, of which water can dissolve only a small proportion, and cannot be made to take up more by any length of boiling; besides we have no very good method of knowing when we have used a sufficient quantity of water; for vegetable substances will continue to colour deeply successive portions of water boiled with them, long after they are yielding nothing to it but colouring matter. Perhaps one of the best methods is to boil the subject in successive quantities of water, as long as the decoctions form a considerable precipitate with the test which is proper for detecting the substance we are extracting, such as a solution of gelatin for tannin, of alum for extractive, &c.

The decoctions are to be depurated by colature, and afterwards suffered to stand for a day or two, when a considerable quantity of sediment is usually found at the bottom. If the liquor poured off clear be boiled down a little, and afterwards suffered to cool again, it will deposit a fresh sediment, from which it may be decanted before you proceed to finish the evaporation. The de-

coctions of very resinous substances do not require this treatment, and are rather injured by it, the resin subsiding along with the active dregs.

“We would advise the decoctions to be evaporated after they have been filtered boiling hot, without any further depuration; because some of the most active principles of vegetable substances, such as tannin, are much more soluble in boiling than in cold water, and because almost all of them are very quickly affected by exposure to the atmosphere. Therefore, if a boiling decoction, saturated with tannin, be allowed to cool, the greatest part of the very principle on which the activity of the substance depends will separate to the bottom, and according to the above directions, will be thrown away as sediment. The same objection applies more strongly to allowing the decoction to cool, and deposit fresh sediment, after it has been partially evaporated. Besides, by allowing the decoctions to stand several days before we proceed to their evaporation, we are in fact allowing the active principles contained in the decoction to be altered by the action of the air, and to be converted into substances, perhaps inactive, which also are thrown away as sediment.

“The evaporation is most conveniently performed in broad shallow vessels; the larger the surface of the liquor, the sooner will the aqueous parts exhale. This effect may likewise be promoted by agitation.

“When the matter begins to grow thick, great care is necessary to prevent its burning. This accident, almost unavoidable if the quantity be large, and the fire applied as usual under the evaporating bason, may be effectually prevented, by carrying on the inspissation, after the common manner, no further than to the consistence of a syrup, when the matter is to be poured into shallow tin or earthen pans, and placed in an oven, with its door open, moderately heated; which acting uniformly on every part of the liquid, will soon reduce it to any consistence required. This may likewise be done, and more securely, by setting the evaporating vessel in boiling water; but the evaporation is in this way very tedious.

“Alcohol is by far too expensive to be employed as a menstruum for obtaining extracts, except in those cases where water is totally inadequate to the purpose. These cases are,

“1. When the nature of the extract is very perishable when dissolved in water, so that it is liable to be decomposed before the evaporation can be completed, especially if we cannot proceed immediately to the evaporation.

“2. When water is totally incapable of dissolving the substance to be extracted, and

“3. When the substance extracted can bear the heat of boiling alcohol without being evaporated, but would be dissipated by that of boiling water; that is, when it requires a heat greater than 176°, and less than 212°, for its vaporization.

“In the last case, the alcohol must be perfectly free from water, because the heat necessary to evaporate it at the end of the process would frustrate the whole operation. Hence, also, the subject itself ought always to be dry; those substances which lose their virtue by drying, lose it equally on being submitted to this treatment with the purest alcohol.

“In this way the alcoholic extract of some aromatic substances.

Principles
of Phar-
macy.

Principles
of Pharm-
macy.

substances, as cinnamon, lavender, rosemary, retain a considerable degree of their fine flavour.

"In the second case, the alcohol need not be so very strong, because it is still capable of dissolving resinous substances, although diluted with a considerable proportion of water.

"In the first case, the alcohol may be still much weaker, or rather, the addition of a small proportion of alcohol to water will be sufficient to retard or prevent the decomposition of the decoction.

"The alcohol employed in all these cases should be perfectly free from any unpleasant flavour, lest it be communicated to the extract.

"The inspissation should be performed, from the beginning, in the gentle heat of a water-bath. We need not suffer the alcohol to evaporate in the air; the greatest part of it may be recovered by collecting the vapour in common distilling vessels. If the distilled spirit be found to have brought over any flavour from the subject, it may be advantageously reserved for the same purposes again.

"When diluted alcohol is employed, the distillation should only be continued as long as alcohol comes over; and the evaporation should be finished in wide open vessels.

"Pure resins are prepared, by adding to spirituous tinctures of resinous vegetables, a large quantity of water. The resin, incapable of remaining dissolved in the watery liquor, separates and falls to the bottom; leaving in the menstruum such other principles of the plant as the spirit might have extracted at first along with it."

* *Duncan's New Dispensatory*, chap. xxxv. 227
Mucilages.

But this is only practised for the purpose of analysis *." Of infusions and decoctions it is unnecessary for us to make any farther remarks, after what was observed in N^o 200 and 201.

Mucilages are solutions of the pure gums, or of similar substances, in water. They should not be made too thin, as they are then more readily decomposed on exposure to the air.

228
Mixtures and emulsions.

Mixtures are liquid preparations composed of substances that are not soluble in water, as various powders, barks, roots, &c. Emulsions differ from mixtures in being composed of oily or resinous ingredients, suspended in water by means of yolk of egg, honey, or mucilage. Both these preparations should be made as they are required, as few of them keep well.

229
Syrups.

Syrups are solutions of sugar, either in plain water, in the juice of some fruit, or in some vegetable infusion or decoction. They are employed chiefly to render mixtures or other liquid medicines more palatable, or to mix up powders and other solid ingredients into pills, electuaries, or troches. The proportion of sugar employed in the making of syrups should be so regulated, as to preserve the syrup in the same state as when first made. If too little sugar has been employed, the syrup will suffer decomposition, and ferment; if too much, part of the sugar will separate in crystals, leaving the remainder too weak.

230
Tinctures.

Formerly the term tincture was employed to denote any transparent solution, whether in water or spirit, that was coloured. At present it is commonly applied to solutions made by digestion in alcohol, or in proof spirit, though it is frequently extended to solutions in ether,

or in ammoniated alcohol. For the action of alcohol as a menstruum, see CHEMISTRY.

In making alcoholic tinctures, we must observe that the virtues of recent vegetable matters are very imperfectly extracted by spirituous menstrea. They must therefore be previously carefully dried, and as we cannot assist the solution by means of heat, we must facilitate it by reducing the solvent to a state of as minute mechanical division as possible. To prevent loss, the solution is commonly made in a close vessel, and the heat applied must be very gentle, lest it be broken by the expansion of vapour.

The action of tinctures on the living system is always compounded of the action of the menstruum and of the matters dissolved in it. Now, these actions may either coincide with, or oppose each other; and as alcohol is at all times a powerful agent, it is evident that no substance should be exhibited in the form of a tincture, whose action is different from that of alcohol, unless it be capable of operating in so small a dose, that the quantity of alcohol taken along with it is inconsiderable.

Tinctures are not liable to spoil, as it is called, but they must nevertheless be kept in well closed phials, especially when they contain active ingredients, to prevent the evaporation of the menstruum.

They generally operate in doses so small, that they are rarely exhibited by themselves, but commonly combined with some vehicle. In choosing the latter, we must select some substance which does not decompose the tincture, or at least separate nothing from it in a palatable form.

The London college directs all tinctures, except that of muriate of iron, to be prepared in close phials.

The Dublin college explain, that when any other substances are to be digested, they mean it to be done with a low degree of heat; and when they are to be *macerated*, it is to be done with a degree of heat between 60° and 90° *.

Medicated wines and medicated vinegars differ from tinctures in nothing but the menstruum.

Of the external applications, the preparations of which are given in the Pharmacopœias, cataplasms or Catapoultices may be considered as extemporaneous, being never kept ready made.

Liniments, ointments, and cerates, are compositions of fatty matters, either animal or vegetable, or both, employed as external emollients. They differ only in consistence, liniments being very soft, or nearly fluid; ointments sufficiently hard not to melt in the ordinary temperature of the atmosphere; and cerates being of such a consistence as to be readily spread on cloth, &c. without the assistance of heat. These last commonly contain a considerable proportion of wax, whence their name.

Plasters are more solid than cerates, and usually require the aid of heat to spread them on the proper substance for application, which is usually leather. Plasters sometimes contain powders in their composition, and in preparing these it is proper first to melt the fatty ingredients, and sprinkle in the powder when the melted matter is beginning to cool.

PART IV. A BRIEF ACCOUNT OF THE ARTICLES OF THE MATERIA
MEDICA, WITH THEIR OFFICINAL PREPARATIONS.CHAP. I. *Animal Substances.*234
Phospho-
rus.1. PHOSPHORUS, see CHEMISTRY *Index*.

SOME daring practitioners have lately ventured to recommend the *internal* use of this active inflammable in the advanced state of typhus, in palsy and other cases of great debility. Taken into the stomach in a moderate quantity (below a grain) it produces heat in that organ, accelerates the pulse, promotes perspiration, and is said to give unusual vigour to the body. In larger quantity it produces inflammation of the stomach and bowels, followed by gangrene and death. Dose one-eighth to one-fourth of a grain in ether, or incorporated with mucilage.

The *internal* use of this substance appears to us to be more than *doubtful*; but we think we have experienced some benefit from it externally, when dissolved in oil, in paralytic and rheumatic cases.

235
Muriate of
ammonia.2. MURIAS AMMONIÆ, E. SAL AMMONIACUS, L. D. Muriate of ammonia. *Sal ammoniac* (D).

The purest muriate of ammonia of commerce is that prepared by sublimation, and which is formed of large convexo-concave cakes, firm and elastic, not easily broken, and difficult to be cut. It is of a yellowish white colour, of little smell, and of a very sharp saline taste.

It is found native in the neighbourhood of volcanoes; but is usually prepared for medical purposes either from the dung of animals that feed on salt marshes; or by decomposing sulphate of ammonia by muriate of soda, or by immediately combining ammonia with muriatic acid.

Internally it is sometimes given as a stimulant in typhus fevers in doses of 20 or 30 grains mixed with camphorated mixture; but it is principally employed externally in lotions and embrocations, either as a refrigerant to cool the surface in sprains and inflammations, or as a stimulant to disperse tumors or morbid accumulations of fluids, or to quicken the circulation, as in chilblains, &c.

*Officinal Preparations.*236
Water of
ammonia.

a. AQUA AMMONIÆ, E. AQUA AMMONIÆ PURÆ, L. LIQUOR ALKALI VOLATILIS CAUSTICUS, D. Water of Ammonia. *Water of Pure ammonia. Caustic solution of volatile alkali. Strong spirit of sal ammoniac.*

This is prepared by decomposing muriate of ammonia by means of quicklime with the addition of water, and afterwards distilling off the strongest portion with a gentle heat. The preparations of the different colleges vary a little, the Edinburgh Pharmacopœia ordering

one pound of muriate of ammonia to one pound and a half of quicklime; the London one pound to two pounds; and the Dublin 16 ounces to two pounds. No great quantity of water is necessary. The lime is first slaked with part of the water, and after it is cold, the salt and rest of the water are added, and the distillation carried on in well closed vessels. The Edinburgh college directs Woolf's apparatus to be employed as a receiver, and orders all the separate liquors to be mixed together.

The *solution of ammonia* should be perfectly limpid and transparent, should have an extremely pungent odour, should not effervesce with acids, and should produce no precipitate on the addition of alcohol or lime water. It should be kept in small bottles well stoppt with ground stoppers, and should stand in a very cool place.

This preparation is a very powerful stimulant, irritating and inflaming the skin and nostrils, when applied externally or snuffed up the nose. Hence its use as a rubefacient in rheumatism, ophthalmic, paralysis, and as a general stimulus in syncope, hysteria, &c. It is scarcely used internally. See below.

b. ALCOHOL AMMONIATUM, E. SPIRITUS AMMONIÆ, L. SPIRITUS ALKALI VOLATILIS, D. Ammoniated alcohol. *Spirit of Ammonia. Spirit of volatile alkali.*

This, as prepared by the Edinburgh Pharmacopœia, is merely a solution of ammonia in alcohol, and is prepared by decomposing eight ounces of muriate of ammonia by 12 ounces of quicklime, with the addition of eight ounces of water, and 32 ounces of alcohol, and distilling off the alcohol. The preparation of the London and Dublin colleges is made by mixing four ounces of muriate with six ounces of potashes and three pints of alcohol. The latter therefore contains much *carbonate of ammonia*, and is not so strong as the former.

c. CARBONAS AMMONIÆ, E. AMMONIÆ PREPARATA, L. ALKALI VOLATILE MITE, D. Carbonate of ammonia. *Prepared ammonia. Mild volatile alkali.*

This is prepared by mixing together one pound of muriate of ammonia, and twelve pounds of pure carbonate of lime or chalk, after being reduced to powder separately, and afterwards subliming.

This preparation, as it occurs in the shops, is composed of irregular masses of a very white, nearly opaque salt, of a strong pungent odour, and sharp alkaline taste. It requires to be kept closely stoppt from the air, by the action of which it crumbles into powder, and its volatile part is dissipated. When pure, it should be entirely volatilizable by heat, but if any thing remains,

(D) The letters E. L. D. affixed to the articles in this part denote that they are articles of the Edinburgh, London, or Dublin Pharmacopœias.

History of Simple and Official Medicines. mains, there is reason to suppose that carbonate of potash or of lime is mixed with it; and those impurities are most likely to be present if it is purchased in the form of a powder.

Carbonate of ammonia in its medical properties resembles the solution of ammonia, but it is not so strong. It is chiefly employed for smelling bottles, which are used in cases of hysteria or syncope, and is often formed into a neutral salt with the juice of lemons (*citrate of ammonia*), and given as a gentle diaphoretic. It is sometimes given alone, or mixed with aromatics, in the form of a bolus, as a diaphoretic or stimulant. Dose five to ten grains.

239
Water of carbonate of ammonia.

d. AQUA CARBONATIS AMMONIÆ, E. AQUA AMMONIÆ, L. LIQUOR ALKALI VOLATILIS MITIS, D. Water of carbonate of ammonia. *Liquor of mild volatile alkali.*

This is merely a solution of carbonate of ammonia in water, and might be properly prepared by dissolving a certain proportion of that salt in distilled water. The colleges of Edinburgh and Dublin direct it to be made by mixing together 16 ounces of muriate of ammonia, and the same quantity of carbonate of potash, pouring upon them two pounds of water, and distilling to dryness. In the London Pharmacopœia, the proportions are one pound of the muriate, a pound and a half of potashea, and four pints of water, drawing off two pints by distillation with a slow fire.

This solution should be transparent and colourless; should produce a strong coagulum on the addition of alcohol, and should effervesce with acids.

It is often employed in medicine, both internally and externally. Internally it is given, first as an emetic, in a dose of from 1 to 2 drams: secondly, as a diaphoretic; dose about 50 drops: thirdly, as a stimulant, 20 drops to a dram: fourthly, as an antispasmodic, in a similar dose: fifthly, as an antacid: and sixthly, as an anthelmintic combined with oil into an emulsion.

240
Water of acetate of ammonia.

e. AQUA ACETATIS AMMONIÆ, E. AQUA AMMONIÆ ACETATÆ, L. LIQUOR ALKALI VOLATILIS ACETATI, D. SPIRITUS MINDERERI. Water of acetate of ammonia. *Water of acetated ammonia. Liquor of acetated volatile alkali. Mindererus's spirit.*

This is a secondary salt, formed by neutralizing carbonate of ammonia with distilled acetic acid.

It forms a tolerably transparent solution, commonly of a greenish cast, of little smell, and of a weak saline taste. It should shew no signs of effervescence on the addition of either acetic acid or carbonate of ammonia.

This medicine acts as a gentle diaphoretic, of considerable use in low fevers, and several inflammatory complaints. It may be given in a dose of 3—6 drams, in the form of a draught or julep. It should be assisted by warm clothing, and warm diluent liquors.

241
Hydrosulphuret of ammonia.

f. HYDROSULPHURETUM AMMONIÆ, E. Hydrosulphuret of ammonia.

This preparation has been newly introduced into medical practice, by the Edinburgh college, who direct it to be prepared by subjecting 4 ounces of water of ammonia to a stream of gas arising from a mixture of

4 ounces of sulphuret of iron, and 8 ounces of muriatic acid, previously diluted with 2½ pounds of water.

This preparation forms a solution of a dark green colour and very fetid odour. It should more properly be called sulphureted hydrogenet of ammonia. It acts powerfully on the living system. It induces vertigo, drowsiness, nausea, and vomiting, and lessens the action of the heart and arteries. It therefore seems to be a direct sedative. According to the doctrine of the chemical physiologists, it is a powerful disoxygenizing remedy. It has only been used in diabetes by Dr Rollo and others, under the name of hepatized ammonia, in doses of five or ten drops twice or thrice a day*.

History of Simple and Official Medicines.

* Duncan's Dispensatory.

242
Ammoniated oil.

g. OLEUM AMMONIATUM, E. LINIMENTUM AMMONIÆ, L. D. LINIMENTUM VOLATILE. Ammoniated oil. *Liniment of ammonia. Volatile liniment.*

Ammoniated oil is properly a soap, formed by combining a solution of ammonia, or of carbonate of ammonia, with olive oil. The Edinburgh college directs it to be prepared by mixing together two ounces of olive oil and two drams of water of ammonia. The London college has two preparations of this kind; a stronger, formed of one ounce of water of pure ammonia, mixed with two ounces of olive oil; and a weaker, of half an ounce of water of ammonia and one ounce and a half of oil.

This preparation is seldom kept ready made, as by standing it becomes thick, and is diminished in strength. It is of a light yellow colour.

Ammoniated oil is a useful external application in cases of cynanche and rheumatism, being either rubbed on the affected part, or applied to it spread on flannel, and changed occasionally.

h. ALCOHOL AMMONIATUM AROMATICUM, E. SPIRITUS AMMONIÆ COMPOSITUS, L. SPIRITUS ALKALI VOLATILIS AROMATICUS, D. Aromatic ammoniated alcohol. *Compound spirit of ammonia. Aromatic spirit of volatile alkali. Sal volatile.*

243
Aromatic ammoniated alcohol.

This is a composition of *ammoniated alcohol* with various aromatic oils. In the Edinburgh Pharmacopœia it is prepared by dissolving one dram and a half of oil of rosemary, and one dram of oil of lemon peel, in eight ounces of ammoniated alcohol: by the London college we are directed to prepare it of two pints of spirit of ammonia, and two drams of oil of lemon, and of oil of cloves; and by that of Dublin, of two pounds of spirit, and of oil of lemon and oil of nutmeg, each two drams.

It is of a light amber colour, and of a very fragrant smell. It is more palatable and less acrimonious than the other preparations of ammonia, and is well suited to spasmodic complaints, faintness, and weakness of the stomach. Dose from twenty drops to a dram.

i. LINIMENTUM VOLATILE, D. Volatile Liniment of the Dublin college.

244
Volatile liniment.

A compound of one part of the above preparation and two parts of the Dublin soap liniment, of which hereafter. A stimulating external application.

k. SPIRITUS AMMONIÆ SUCCINATUS, L. Succinated spirit of ammonia.

245
Succinated spirit of ammonia.

This

History of Simple and Official Medicines. This is prepared by dissolving a scruple of rectified oil of amber, and ten grains of soap, in an ounce weight of alcohol, and then adding four measured ounces of water of pure ammonia.

It is at first of a milky colour, but gradually becomes more or less transparent by standing. It is considered as much the same with the French *cau de lucc*.

It is an useful antispasmodic, whether snuffed up the nose or rubbed on the temples.

²⁴⁶
Fetid ammoniated alcohol.

4. ALCOHOL AMMONIATUM FOETIDUM, E. SPIRITUS AMMONIÆ FOETIDUS, L. SPIRITUS ALKALI VOLATILIS FOETIDUS, D. Fetid ammoniated alcohol. *Fetid spirit of volatile alkali.*

A solution of asafœtida in spirit of ammonia, which is prepared, according to the Edinburgh college, by digesting half an ounce of asafœtida in eight ounces of spirit of ammonia for 12 hours, and distilling off the spirit. The London college directs six pints of proof spirits, a pound of sal ammoniac, four ounces of asafœtida, and a pound and a half of potash, to be mixed together, and five pints to be distilled off with a slow fire.

An excellent antispasmodic, particularly suited to hysterical cases. Dose from 30 drops to a dram.

Particular Animal Substances.

CLASS MAMMALIA. Order GLIRES.

²⁴⁷
Castor.

3. CASTOR FIBER, E. The beaver. CASTOREUM, L. D. *Castor.*

This is a substance secreted in a follicle situated near the anus of the beaver, perhaps the inguinal gland. It is of a dark brown colour, friable, of a pungent bitter taste, and a very strong unpleasant smell. It is contained in a roundish or flattened membranous bag. Bouillon la Grange has found by analysis, that it consists of mucilage, bitter extract, resin, a peculiar volatile oil, and a flaky crystalline substance resembling *adipocire*. Its volatile parts come over by distillation with water, and great part of the substance is soluble in alcohol.

The best castor comes from Russia, but a great deal is brought from Canada. The Russian castor is in larger rounder bags, and is of a much stronger smell than the Canadian.

Castor is one of our most established antispasmodics, and was much esteemed and extolled by Dr Cullen. It is chiefly prescribed in hysteria, but seldom alone or in substance. Dose from 10 to 30 grains in a bolus.

Official Preparations.

²⁴⁸
Tincture of castor.

a. TINCTURA CASTOREI. Tincture of castor.

The London and Dublin colleges direct two ounces of powdered Russian castor to be digested ten or seven days in two pints (London), or two pounds (Dublin), of proof spirit. According to the Edinburgh formula, an ounce and a half of Russian castor is to be digested for seven days in a pound of alcohol, and the tincture strained through paper.

This tincture is of a dark brown colour, and possesses all the valuable properties of the simple drug. Dose

from 30 drops to a dram. It is sometimes used as an external application in ear-ach; equal parts of this and tincture of opium being dropped into the ear.

b. TINCTURA CASTOREI COMPOSITA, E. Compound tincture of castor.

This is prepared by digesting an ounce of powdered Russian castor, and half an ounce of asafœtida, in a pound of ammoniated alcohol, for seven days, filtering the liquor through paper.

A more powerful antispasmodic than the former; dose from 20 to 40 drops.

4. MOSCHUS MOSCHIFERUS, E. The musk animal. ²⁴⁹ MOSCHUS, L. D. Musk.

Musk is a resinous matter secreted in a receptacle situated near the navel of the musk animal. See MAMMALIA *Index*.

This substance is, when dry, of a reddish brown or rusty black colour, somewhat unctuous, and of a more or less granulated appearance: it has a bitterish and rather acrid taste; a fragrant smell, agreeable at a distance, but so strong as to be highly unpleasant when smelt near to. So violent indeed is the smell of musk, when fresh taken from the animal, or from quantities put up by the merchants for sale, that it has been known to force the blood from the nose, eyes, and ears, of those who have imprudently inhaled its vapours; and we are assured by Chardin, that whenever he engaged in the purchase of musk, he found it always necessary to cover his face with several folds of a handkerchief, in order to be sufficiently secure against the sudden effects of the smell.

As musk is an expensive drug, it is frequently adulterated by various substances: and we are assured that pieces of lead have been found in some of the receptacles, inserted in order to increase the weight. The most usual mode of adulterating it is by taking the musk from the bag, and mixing it with dried blood coarsely powdered. This may in general be detected by observing that the bag has been opened; by the fetid smell which the substance emits when heated, and by the smell of ammoniacal gas which is perceived when the adulterated musk is rubbed with potash.

This substance is particularly efficacious, and there is scarcely any substitute for it in particular cases. When properly administered it sometimes succeeds in the most desperate cases. It raises the pulse without producing much heat; it removes spasmodic affections, and is found to have considerable effect on the nervous system, increasing the powers of thought, sensation, and voluntary motion.

It may be employed in all cases of typhus fevers; in particular, where there is much delirium, subsultus tendinum, &c. It is also employed in febrile eruptions, and in many spasmodic diseases, as the chincough, epilepsy, tetanus, &c.

Official Preparations.

a. TINCTURA MOSCHÆ, D. Tincture of musk.

This is prepared by macerating two drams of musk in a pound of rectified spirit of wine for seven days, and straining the liquor.

The tincture of musk may be given in doses of a dram

²⁵¹
Tincture of musk.

History of dram or two. It is best mixed with honey or syrup, as Simple and the addition of water renders it turbid.

Official Medicines.

b. MISTURA MOSCHATA, L. Musk mixture.

²⁵²
Musk mixture.

This is directed by the London college to be made by rubbing two scruples of musk, first with one dram of double refined sugar, then with the addition of the same quantity of powdered gum arabic, and six ounces of rose water, added by degrees.

The musk must be well rubbed with the sugar and gum, before the rose water be added, otherwise a separation will take place. It is best to make this preparation only when required, as it does not keep well.

Musk mixture is given in most of the cases in which the simple drug is indicated. Dose, an ounce or an ounce and a half.

²⁵³
Hartshorn.

5. CERVUS ELAPHUS, E. the Stag. CORNU CERVINUM, L. D. *Hartshorn.*

The horn of the stag differs little from bone, except in containing more cartilage. It was formerly employed in the preparation of ammonia, whence that alkali was denominated *hartshorn*, and at present there are two or three modifications of ammonia that are directed to be prepared from this substance. It is also burnt to form pure phosphate of lime.

Officinal Preparations.

²⁵⁴
Phosphate of lime.

a. PHOSPHAS CALCIS, E. CORNU CERVI, VEL CERVINUM USTUM, L. D. Phosphate of lime. *Burnt hartshorn.*

The Edinburgh college directs this to be prepared by burning pieces of hartshorn till they become perfectly white, and then reducing them to a fine powder.

Burnt hartshorn was formerly given as an antacid; but its efficacy in that way appears to be trifling, as the phosphoric acid is not easily separated from the lime, and of course the latter will not neutralise the acid morbidly secreted in the alimentary canal. Of late pure phosphate of lime has been recommended as a remedy for rickets, with the view of supplying solid matter to the bones. Dose about ten grains.

²⁵⁵
Volatile liquor of hartshorn.

b. LIQUOR VOLATILIS CORNU CERVI, L. D. Volatile liquor of hartshorn. *Spirit of hartshorn.*

²⁵⁶
Salt of hartshorn.

c. SAL CORNU CERVI, L. D. *Salt of hartshorn.*

²⁵⁷
Oil of hartshorn.

d. OLEUM CORNU CERVI, L. D. *Oil of hartshorn.*

These are all made from one chemical operation. A quantity of hartshorn is put into a retort, and submitted to a heat that is gradually increased. First the volatile liquor comes over, then the salt, and lastly the oil. After the salt and oil are separated from the liquor, this is distilled again two or three times with a moderate heat, by which it is rendered more pure.

The salt is purified by mixing it with an equal weight of prepared chalk, and then subliming.

The volatile liquor and salt of hartshorn differ little from the water of carbonate of ammonia, and the solid

carbonate, except in containing a quantity of empyreumatic oil. They are in fact less pure than the above-mentioned preparations of ammonia, and might be entirely set aside. They are chiefly used to smell to in cases of fainting or hysteria.

These preparations may be made from the bones or horns of any animal, where hartshorn cannot be conveniently procured.

c. OLEUM ANIMALE, L. OLEUM CORNU CERVINI RECTIFICATUM, D. Animal oil. *Rectified oil of hartshorn. Dippel's oil.*

This is made by distilling the oil of hartshorn that rises in the preceding operation, twice or three times, either by itself, or with the addition of water.

Animal oil was formerly much employed as a powerful antispasmodic. Dose 15—30 drops. When given six hours before the accession of a paroxysm of an intermitting fever, on an empty stomach, it is said to have kept off the paroxysm.

6. OVIS ARIES, E. the Sheep. SEVUM OVI-LUM, L. D. *Mutton suet.*

Mutton suet is employed in the preparation of several ointments and cerates, which will be mentioned hereafter.

Order 6. BELLUÆ.

7. SUS SCROFA, E. the Hog. ADEPS SUILLUS, L. D. *Hogs lard.*

Used also in the preparation of liniments, ointments, &c. and sometimes employed alone as an external emollient.

Order 7. CETÆ.

8. PHYSETER MACROCEPHALUS, E. Spermaceti Spermaceti. *Whale. Sperma Ceti, L. D.*

This is a white flakey substance, that is found in certain cells in the head of the spermaceti whale. See CETOLOGY, N^o 66, and CHEMISTRY, N^o 2860.

As an emollient, spermaceti is employed both internally and externally. Internally it is given in the form of emulsion mixed with mucilage or yolk of egg, or mixed with syrup into a linctus, in cases of catarrh, *ardor urinæ*, &c. As an external application, it enters into the composition of the following

Officinal Preparations.

a. UNGUENTUM SPERMATIS CETI, L. D. Spermaceti ointment.

This ointment is prepared by melting together six drams of spermaceti, two drams of white wax, and three ounces of olive oil, over a slow fire, stirring them constantly till they are cold.

b. CERATUM SPERMATIS CETI, L. D. CERA-TUM SIMPLEX, E. Spermaceti cerate. *Simple Cerate.*

In the preparations of this cerate, the proportions of the Edinburgh pharmacopœia differ from these directed by the colleges of London and Dublin. The former orders six parts of olive oil, three of white wax, and one of spermaceti; the two latter, half an ounce of spermaceti, two ounces of white wax, and four ounces

5 A of

History of of oil. They are made in a similar manner with the Simple and ointment.

Official Medicines. These preparations are used principally for dressing ulcers, or to form more compounded ointments or cerates.

264
Goose-
grease.

CLASS II. BIRDS. Order I. ANSERES.

9. ANAS ANSER, the goose. ADEPS ANSERINUS, D. Goose grease.

This fat is now rarely used in medicine, as it seems to possess no superior properties to hog's lard, which is more conveniently procured.

Order 2. GALLINÆ.

265
Egg.

10. PHASIANUS GALLUS, the domestic fowl. OVUM EJUSQUE PUTAMEN. Egg, and egg-shells.

The yolk of egg is employed in pharmacy for rendering oils and resins miscible in water. For this purpose it is scarcely preferable to common vegetable mucilage, and has the disadvantage of sooner becoming putrid, and the white is used in making *alum cataplasms*. Egg-shells prepared, i. e. levigated, are sometimes employed as an antacid, but they do not seem better in that respect than common carbonate of lime, or magnesia.

CLASS IV. FISHES. Order 6. CHONDROPTERYGII.

266
Isinglass.

11. ACCIPENSER HUSO, E. Isinglass fish. ICHTHYOCOLLA, L. D. *Isinglass*. See the article ICHTHYOCOLLA.

Employed as an emollient, and said to be the principal substance used in making *court plaster*.

CLASS V. INSECTS. Order I. COLEOPTERA.

267
Cantharides.

12. LYTTA VESICATORIA. MELOE VESICATORIUS, E. CANTHARIS, L. D. Cantharides. *Spanish flies*.

For the natural history of this insect, see ENTOMOLOGY, p. 169; and for its chemical analysis, see CHEMISTRY, N^o 2875.

Cantharides are stimulant and virulent to so great a degree, that their internal exhibition requires to be conducted with the utmost caution, otherwise inflammation in the stomach, intestines, or urinary passages, may be the consequence. When taken in considerable quantity, they produce inflammation and ulceration of the stomach and bowels, attended with mucous or purulent stools, fetid breath, violent pains in the belly; and these symptoms, if not timely relieved, are followed by faintness, giddiness, and death. Applied externally, they inflame and excoriate the skin, and if continued for a sufficient time, produce a large vesication, filled with acrid serum. Their external application is not unfrequently followed by distressing strangury.

Internally they have been exhibited as a diuretic in dropsical cases, in a dose from half a grain to a grain. They are frequently employed in weakness of the urinary organs: in incontinence of urine proceeding from paralysis vesicæ, in gleet, fluor albus, diabetes, and other diseases of the urinary passages, originating in, or connected with debility. Not only in the incontinency of urine which accompanies a palsy of the lower extre-

mities, but also in that which is occasioned by an over-distention of the bladder, these flies have been administered internally with evident relief. The same beneficial effects have followed their use in ischuria vesicalis, or suppression of urine from over-distention of the bladder. They are recommended as an excellent remedy in gleet by *Mead* and *Werlhof*, and the last-mentioned physician prescribed them in cases of hydrophobia.

The internal use of cantharides in gleet and leucorrhœa has of late been much extended by Dr John Robertson; but for an account of the circumstances which led him to such a free use of this medicine, and for his mode of exhibiting it, we must refer to his late work on the subject, and a paper published by him in the second volume of the Edinburgh Medical Journal.

When these stimulants are administered internally, they are prescribed either in powder or in tincture. The dose in substance (which is the most certain form of internal exhibition) is from half a grain to one or two grains every sixth hour, made into pills. Of the tincture, the dose is from 10 to 30 drops. During the use of either, the patient should be directed to drink of mucilaginous decoctions, emulsions, &c. Camphor is thought by some practitioners to moderate the too stimulating action of cantharides, and is accordingly combined with them or their tinctures whenever they are given internally. Others join nitre with them, as well as camphor.

Of the external use of cantharides by way of blister, we shall speak presently under the preparations that are employed for that purpose.

Official Preparations.

a. TINCTURA MELOES VESICATORII, E. TINCTURA CANTHARIDIS, L. T. CANTHARIDUM, D. Tincture of cantharides.

The Edinburgh tincture is directed to be made, by digesting for seven days a dram of powdered cantharides in a pound of diluted alcohol; and that of the Dublin college is prepared with the same proportions. The London tincture is made by digesting two drams of bruised cantharides, and half a pound of powdered cochineal, in a pint and a half of proof spirit for eight days.

These tinctures differ a little in point of strength. When given internally, the dose of the Edinburgh or Dublin tincture may be from 20 to 30 drops; that of the London tincture from 10 to 20 drops. They are employed externally as a *rubefacient* in cases of palsy, angina, gastritis, &c.

b. CERATUM CANTHARIDIS, L. D. Cerate of cantharides.

This cerate is prepared by mixing a dram, or four scruples, of powdered cantharides, with six drams, or an ounce, of spermaceti cerate.

It is chiefly employed to promote the running of issues.

c. EMPLASTRUM MELOES VESICATORII, E. EMPLASTRUM CANTHARIDIS, L. EMP. CANTHARIDUM, D. Plaster of cantharides. *Blistering plaster*.

According to the Edinburgh college, this plaster is to

History of Simple and Official Medicines. to be prepared by first melting together equal weights of mutton suet, yellow wax, and white rosin; and when these are removed from the fire, sprinkling in an equal proportion of powdered cantharides. The proportions of the London and Dublin colleges are 1 pound of finely powdered cantharides, 2 pounds of wax plaster, and half a pound of hog's lard, and the ingredients are mixed in a similar manner.

271
Compound plaster of cantharides.

d. EMPLASTRUM MELOES VESICATORII COMPOSITUM, E. Compound plaster of cantharides.

This is made of Burgundy pitch, Venice turpentine, cantharides, each 12 parts; yellow wax, 4 parts; subacetate of copper, 2 parts; mustard seed and black pepper, each 1 part. Having first melted the pitch and wax, the turpentine is to be added, and while these ingredients are still fluid, the other articles in fine powder are to be mixed with them, and the whole constantly stirred till cold.

This last-mentioned plaster of Spanish flies is too compound, and being of a corrosive quality, is rarely prescribed. The other more simple forms of cantharides plaster are in frequent use for exciting vesications in various acute and chronic diseases, particularly in internal inflammations and pains, as well as in many spasmodic affections. Blistering has been recommended by some physicians in the advanced and sinking stage of typhus fever; but the propriety of such a practice is extremely questionable. We would further remark, that in the febrile disorders of children, a good deal of caution is requisite in the application of blisters; a spreading erythematous inflammation, and even gangrene, being sometimes the consequence. In some of the above-mentioned disorders much benefit is obtained by keeping the blistered part open, or in an ulcerated state for a considerable length of time. This is done by any of the following ointments.

272
Ointment of cantharides.

e. UNGUENTUM CANTHARIDIS, L. UNG. CANTHARIDUM, D. Ointment of cantharides.

This is prepared by taking pulverized Spanish flies, two ounces; distilled water, eight ounces; ointment of yellow resin, eight ounces. The Spanish flies being boiled in the water, this is reduced to half the original quantity, the liquor is strained, and the ointment of yellow resin added. The mixture is then placed in a water bath, saturated with sea salt, and evaporated to the consistence of an ointment.

273
Ointment of infusion of cantharides.

f. UNGUENTUM INFUSI MELOES VESICATORII, E. Ointment of infusion of cantharides.

To prepare this ointment, the Edinburgh college directs one part of cantharides to be macerated for a night in four parts of boiling water; the express and strained liquor to be boiled with two parts of hogs lard till the water is evaporated, then one part of yellow wax, and the same proportion of white rosin to be added; and when the whole is melted, and removed from the fire, two parts of Venice turpentine are to be mixed with it, and the whole stirred till cold.

274
Ointment of cantharides powder.

g. UNGUENTUM PULVERIS MELOES VESICATORII, E. Ointment of cantharides powder.

This is prepared by mixing together seven parts of

resinous ointment, and one part of powdered cantharides.

All these ointments, besides being used for keeping open blisters, are occasionally employed for issue ointments.

For more on the subject of blisters, the reader is referred to Percival's Essays, vol. i. and Withers on the use and abuse of Medicines.

History of Simple and Official Medicines.

Order 2. HEMIPTERA.

13. COCCUS CACTI, E. COCCINELLA, L. D. ²⁷⁵ *Cochineal*. See ENTOMOLOGY *Index*.

This is employed in medicine merely as a colouring matter.

Order 5. HYMENOPTERA.

APIS MELLIFICA. The bee.

14. MEL. *Honey*.

²⁷⁶ *Honey*.

Besides being used as an article of diet, honey is often employed medicinally, either for the preparation of electuaries, or for making a kind of syrups, called *oxymels* or *medicated honeys*. It generally proves gently laxative, but is apt to disagree with the stomach, producing sickness and griping. It might probably be entirely superseded by sugar, which is not attended with those unpleasant effects.

Official Preparations.

a. MEL DESPUMATUM. Clarified honey.

²⁷⁷ *Clarified honey*.

For the purpose of clarifying honey, the colleges of London and Dublin direct that it should be melted in a water bath, removing the scum as it rises.

In this way the honey is rendered more beautiful to the eye, but is scarcely less liable to disagree with weak stomachs.

b. MEL ACETATUM, L. OXYMEL SIMPLEX. ²⁷⁸ *Acetated honey*. *Simple oxymel*.

Two pounds of clarified honey are boiled in a glass vessel over a gentle fire, with one pound of distilled vinegar, till they are reduced to the consistence of a syrup.

This is a useful remedy, diluted with water and employed as a gargle, in coughs and sore throats.

Order 7. APTERA.

15. ONISCUS ASELLUS, E. MILLEPEDA, L. ²⁷⁹ *Millepedes*. D. *Millepedes* or *Woodlice*.

Formerly employed as a diuretic in the form of pills, that were made either of the living animals, or of these killed by spirit of wine and powdered.

16. CANCER ASTACUS, E. The *craw-fish*. ²⁸⁰ *Can-* *crorum lapilli*. *Crabs eyes*. See CHEMISTRY, N^o 2882.

Official Preparation.

red coral. red coral.

As above.

290 Sponge. 21. **SPONGIA OFFICINALIS, E. SPONGIA, L. D.**
Sponge. See **HELMINTHOLOGY Index.**

In its natural state, sponge is employed by surgeons,
for cleansing wounds and ulcers, for making tents, and
for stopping hemorrhagies from small divided blood
vessels.

Official Preparation.

291 Burnt sponge. a. **SPONGIA USTA, L. D.** Burnt sponge.

Sponge is burnt in a close iron vessel, after being
cut into small pieces and bruised to free it from earthy
and stony matter. The burning is continued till the
sponge becomes black and friable, and it is then reduced
to a fine powder.

Burnt sponge has been long employed as a remedy
in scrophulous affections. It seems to owe its beneficial
operation (mostly slight and uncertain) in these dis-
orders, partly to its alkaline and partly to its carbona-
ceous nature. Perhaps the first-mentioned may contri-
bute to the solution and diffusion (in the human body)
of its coaly matter. It is given (made into a bolus, or
lozenge) in doses of a scruple, or half a dram, twice
a-day.

It is likewise said to be a remedy for the bronchocle,
in which cases it has been administered with success in
the following manner. The stomach and bowels hav-
ing been duly cleansed by a vomit and purge taken
two days before, the patient, on going to bed, is to
place a bolus consisting of half a dram of burnt sponge,
and as much honey as is necessary, in the mouth, under
the tongue, and as it gradually dissolves to swallow it.
This bolus is to be repeated for six nights. A bitter
powder made of five grains of chamomile flowers, gen-
tian root, and the lesser centaury tops, is to be taken
every seventh day during the use of the bolus, and on
the eighth day the purge is to be repeated. Others
have employed sponge in these cases in the form of a
lozenge, which is certainly more conveniently held in
the mouth than a bolus *.

* Throm-
rus Medi-
caminum.

CHAP. II. Vegetable Substances.

SECT. I. *Vegetable products that are procured from
plants in general, or from such as are imperfectly
known.*

22. **CARBO LIGNI, E.** Charcoal. See **CHEMI-**
STRY Index. Charcoal. 292

For medical purposes charcoal should be fresh burned,
or should be kept carefully excluded from the air. Its
chief use is as an antiseptic, correcting putridity; hence
it is employed as a tooth-powder, either alone or mixed
with astringents and aromatics, and is sometimes given
internally in diarrhoea and dysentery, where the matters
evacuated are very offensive. It is also said to act as
a gentle laxative.

23. **FULIGO LIGNI COMBUSTI.** Wood soot. 293

This differs from charcoal in containing a considerable
quantity of empyreumatic oil, to which the properties
attributed to it as an antispasmodic are to be ascribed.
It is now seldom used. Wood soot.

24. **ALCOHOL, E. SPIRITUS VINOSUS REC-**
TIFICATUS, L. SPIRITUS VINI RECTIFI-
CATUS, D. Alcohol. *Rectified spirit of wine.* 294

For the usual preparation, history, and chemical pro-
perties of alcohol, see **CHEMISTRY, Chap. xi. sect. i.**

The only certain mode of ascertaining the purity of
alcohol and its preparations is by taking their specific
gravity, for the manner of doing which see **HYDRODY-**
NAMICS. The specific gravity of rectified spirit should
be 835. Common alcohol.

Alcohol is one of the most violent stimuli with which
we are acquainted. Applied externally it corrugates
the solid parts of the body, and coagulates all the
albuminous and gelatinous fluids with which it comes in
contact. By violently contracting the smaller vessels, it
checks.

History of Simple and Official Medicines checks passive hemorrhagies, and by destroying the sensibility of the extremities of nerves it alleviates pain, and in some cases removes spasm. Taken undiluted into the stomach, it acts in a similar manner, contracting the solids and destroying nervous sensibility. If the quantity is considerable, it brings on apoplexy and palsy, followed by death. Sufficiently diluted alcohol acts as a tonic and gentle stimulus, exhilarating the spirits, increasing the appetite, and promoting digestion; but a too frequent use of ardent spirits is attended with dangerous consequences. See N^o 102. It is a useful application to recent burns and scalds, preventing vesication.

It must be remarked, that what the Edinburgh college have called alcohol is not pure alcohol.

Official Preparations.

a. ALCOHOL, L. D. Alcohol.

²⁹⁵
Pure alcohol.

The process for obtaining pure alcohol given by the London college is somewhat different from that of the Dublin college. The former directs a gallon of rectified spirit of wine to be mixed with an ounce of pure kali, and afterwards a pound of hot prepared kali to be added. The mixture is to be well shaken and set by for 24 hours, when the spirit is to be poured off, mixed with half a pound more prepared kali, and distilled in a water bath. The distilled alcohol should have the specific gravity of 815.

The process of the Dublin pharmacopœia is as follows. Five pounds of rectified spirit are mixed with one ounce of caustic vegetable alkali, and then with one pound of pearl ashes dried over the fire and still warm. This mixture is digested for three days, shaking it frequently; and then the spirit is poured off, and distilled till three pounds have come over. The Dublin alcohol has the specific gravity of 820, and is consequently weaker than that of the London pharmacopœia.

Pure alcohol is not employed in medicine, and therefore the college of Edinburgh have given no formula for its preparation.

b. LIQUOR ÆTHEREUS VITRIOLICUS, D. Vitriolic ethereal liquor.

²⁹⁶
Vitriolic ethereal liquor.

This is prepared by putting 32 ounces of rectified spirit of wine into a retort that is capable of supporting a sudden heat, and pouring on it in a continued stream 32 ounces of sulphuric acid, mixing them gradually; then placing the retort in heated sand, and distilling off 16 ounces into a cool receiver, taking care so to regulate the heat that the mixture may boil as soon as possible. The specific gravity should be about 753.

In a similar manner is prepared the

SPIRITUS ÆTHERIS VITRIOLICI, L. Spirit of vitriolic ether.

²⁹⁷
Spirit of vitriolic ether.

This preparation is an impure ether, and, when purified, as directed below, it forms the officinal *sulphuric ether*.

It is employed as a stimulant in low fevers and febrile eruptions. Dose from 60 to 100 drops.

c. ÆTHER SULPHURICUS, E. ÆTHER VITRIOLICUS, L. D. Sulphuric ether. *Vitriolic ether*.

²⁹⁸
Sulphuric ether

History of Simple and Official Medicines The colleges of London and Dublin direct their sulphuric ether to be prepared by rectifying the former preparation by means of potash. According to the former, two pounds of spirit of vitriolic ether are to be mixed with one measured ounce of water of pure kali, and the mixture distilled with a gentle heat, till 14 measured ounces have come over. In the Dublin formula 16 ounces of vitriolic ethereal liquor are mixed with two drams of powdered caustic vegetable alkali; and 10 ounces are distilled off.

The Edinburgh college direct 32 ounces of alcohol, and the same quantity of sulphuric acid, to be mixed together in a proper retort, and 16 ounces to be distilled over from a sand heat suddenly applied. To the distilled liquor are then to be added two drachms of potash, and from a very high retort 10 ounces are to be distilled with a gentle fire.

On the chemical nature and properties of sulphuric ether, see CHEMISTRY, Chap. XI. Sect. II. Its specific gravity should be about 739.

The medical uses of ether are thus described by Dr Duncan. "As a medicine taken internally, it is an excellent antispasmodic, cordial, and stimulant. In catarrhal and asthmatic complaints, its vapour is inhaled with advantage, by holding in the mouth a piece of sugar, on which ether has been dropt. It is given as a cordial in nausea, and in febrile diseases of the typhoid type, as an antispasmodic in hysteria, and in other spasmodic and painful diseases; and as a stimulus in soporose and apoplectic affections. Regular practitioners seldom give so much as half an ounce, much more frequently only a few drops, for a dose; but empirics have sometimes ventured upon much larger quantities, and with incredible benefit. When applied externally, it is capable of producing two very opposite effects, according to its management; for if it be prevented from evaporating, by covering the place to which it is applied closely with the hand, it proves a powerful stimulant and rubefacient, and excites a sensation of burning heat. In this way it is frequently used for removing pains in the head or teeth. On the contrary, if it be dropt on any part of the body exposed freely to the contact of the air, its rapid evaporation produces an intense degree of cold; and this is attended with a proportional diminution of bulk in the part to which it is applied: in this way it has frequently facilitated the reduction of strangulated hernia *."

* Duncan's Dispensatory.

d. ÆTHER SULPHURICUS CUM ALCOHOLE, E. Sulphuric ether with alcohol.

²⁹⁹
Sulphuric ether with alcohol.

This is prepared by mixing together one part of sulphuric ether, and two parts of alcohol. In nature and properties, it agrees with the *spiritus ætheris vitriolici* of the London Pharmacopœia.

e. OLEUM VINI, L. Oil of wine.

This preparation is made by mixing together one part of alcohol, and the same quantity of sulphuric acid, and distilling, taking care that no black froth pass into the receiver. The oily part of the distilled liquor is to be separated from the volatile acid; and to the former is to be added as much water and pure kali, as is sufficient to correct the sulphureous smell. Then a gentle heat is to be applied to distil off the little ether that

³⁰⁰
Oil of wine.

History of that the liquor contains; and the oil that floats on the Simple and remaining fluid is to be separated and preserved for Official use.

Medicines. This is employed chiefly as an ingredient in the following preparation; though it is sometimes given alone as a stimulus, in a dose from 10 to 20 drops.

³⁰¹ **f. SPIRITUS ÆTHERIS VITRIOLICI COMPOSITUS, L.** Compound spirit of vitriolic ether.

Prepared by mixing two pounds of spirit of vitriolic ether, and three drams of the oil of wine.

It is employed as an antispasmodic in similar cases, and doses, as sulphuric ether.

³⁰² **g. LIQUOR ÆTHEREUS OLEOSUS, D. LIQUOR HOFFMANNI ANODYNUS.** Oily ethereal liquor. *Hoffman's anodyne liquor.*

Made by distilling to one half the liquor that remains after preparing the Dublin vitriolic ether.

Similar in its properties to ether, but weaker. It is much the same as the former.

³⁰³ **h. ÆTHER SULPHURICUS CUM ALCOHOLE AROMATICUS, E.** Aromatic sulphuric ether with alcohol.

This is prepared by digesting, for seven days, an ounce of bruised cinnamon, an ounce of bruised lesser cardamom seeds, and two drams of powdered long pepper, in two pounds and a half of sulphuric ether with alcohol.

A powerful stimulant and tonic. Dose 30 drops to a dram.

³⁰⁴ **25. ALCOHOL DILUTUM, E. SPIRITUS VINOSUS TENUIOR, L. SPIRITUS VINI TENUIOR, D.** Diluted alcohol. *Weaker spirit of wine. Proof spirit.*

This is rectified spirit lowered with water to what is called *proof strength*, having a specific gravity of about 935. In all its essential properties it resembles common spirits, and either whisky or British spirit may be used for it. The proof spirit of commerce is usually distilled either from molasses or grain.

In pharmacy it is employed as a menstruum for making various tinctures.

³⁰⁵ **26. ACIDUM ACETOSUM IMPURUM. ACETUM VINI, D. ACETUM, L.** Impure acetous acid. *Vinegar.*

As the vinegar commonly met with is made from other fermented liquors besides the juice of the grape, we have inserted it here among the vegetable principles. On the production and properties of vinegar, see CHEMISTRY, N^o 649 and 2310. Common vinegar, besides diluted acetous acid, contains tartaric acid, tartrate of potash, supertartrate of potash, and mucilage. It should be transparent, of a pale yellow colour, fragrant pungent smell, and an agreeable sharp taste. It is seldom employed in medicine before it is purified by distillation or other processes to be immediately mentioned. Vinegar is a good family remedy as a refrigerant in fevers, as a stimulant external application in bruises, sprains, &c. and vinegar whey made by coagulating warm milk by means of good vinegar, is one of the best auxiliary diaphoretics with which we are acquainted.

Official Preparations.

a. ACIDUM ACETOSUM DESTILLATUM, E. ACETUM DISTILLATUM, L. D.

The Edinburgh college directs eight pounds of common acetous acid to be distilled in a glass vessel with a gentle heat, setting aside the first two pounds that come over, and preserving the next four pounds. The Dublin college directs 10 pounds of vinegar to be put into the still, and six pounds to be drawn off at once; and the London college, from five pounds, directs that there should be distilled off as much as comes over free from empyrum.

Distilled vinegar is freed from the salts and mucilage contained in common vinegar, and therefore is purer and keeps better; but it is much weaker than good vinegar. If it has been distilled in glass vessels it can have acquired no metallic impregnation; but it is sometimes, as well as common vinegar, adulterated with sulphuric acid to make it appear stronger. This fraud may be detected by adding *muriate of baryta*, which will produce a white precipitate if sulphuric acid be present.

It is employed for gargles, for preparing various acetates, and other officinal medicines. It is also given as a refrigerant diluted with water in feverish disorders, and is applied externally.

b. ACIDUM ACETOSUM FORTE, E. ACIDUM ACETOSUM, L. Strong acetous acid. *Radical vinegar. Acetic acid.*

By the Edinburgh process, a pound of dried sulphate of iron is to be rubbed with 10 ounces of acetate of lead; the mixture is then to be put into a retort, and distilled as long as any acid comes over. The London college directs two pounds of coarsely powdered verdigris, well dried by means of a water bath, saturated with sea salt, to be put into a retort and distilled, repeating the distillation with the liquor that comes over.

On the production and properties of this acid, see CHEMISTRY, N^o 652, *et seq.* Its specific gravity should be about 1060. It is sometimes contaminated with sulphurous acid or with lead. The former may be discovered by the unpleasant tickling cough it then occasions when snuffed up the nose; and the latter by adding sulphuret of ammonia, by which, if lead be present, the liquor will be tinged of a dark brown.

This preparation is employed chiefly as a stimulant to be snuffed up the nose in syncope, hysteria, and similar affections: externally it acts as a rubefacient. Both this and the two following may be used as fumigations to correct the bad smell of sick rooms.

c. ACETUM AROMATICUM, E. Aromatic vinegar. *Vinegar of the four thieves.*

Made by macerating four ounces of dried rosemary tops, four ounces of dried sage leaves, two ounces of dried lavender flowers, and two drams of cloves, in eight pounds of distilled acetous acid for seven days, and straining.

Sometimes given as a stimulus, diluted with water in typhus.

d. ACIDUM

History of
Simple and
Official
Medicines.

d. ACIDUM ACETOSUM CAMPHORATUM, E. Camphorated acetous acid.

309
Campho-
rated ace-
tous acid.

Prepared by dissolving half an ounce of camphor, reduced to powder by being rubbed with alcohol, in six ounces of strong acetous acid.

This should be kept in glass phials with ground stoppers. It is an excellent stimulus for snuffing up the nostrils.

310
Syrup of
acetous
acid.

e. SYRUPUS ACIDI ACETOSI, E. Syrup of acetous acid.

This is prepared by boiling together two pounds and a half of acetous acid (*common vinegar*), and three pounds and a half of double refined sugar.

Used in the same cases as acetated honey, (see N^o 277.) to which it is preferable.

311
Acetate of
potash.

f. ACETAS POTASSÆ, E. KALI ACETATUM, L. ALKALI VEGETABILE ACETATUM, D. SAL DIURETICUS. Acetate of potash. *Acetated kali. Acetated vegetable alkali. Diuretic salt.*

This salt is made by boiling any quantity of subcarbonate of potash with distilled acetous acid, first using about five times its weight, and, during the boiling, gradually adding more till all effervescence ceases, slowly evaporating to dryness, fusing the dry salt, then dissolving it in water, and slowly evaporating the solution till there remains a dry white saline mass, which is to be kept well stopt from the air, in which it deliquesces. See CHEMISTRY, N^o 987.

Acetate of potash is employed as a diuretic in a dose of from one to four scruples, and in a dilute solution as a refrigerant in fevers, &c.

312
Impure sub-
carbonate
of potash.

27. SUBCARBONAS POTASSÆ IMPURUS. CARBONAS POTASSÆ IMPURUS, E. CINERES CLAVELLATI, L. ALKALI FIXUM VEGETABILE, D. Impure subcarbonate of potash. *Potashes. Pearl ashes. Fixed vegetable alkali.*

For the production and nature of this alkaline substance, see CHEMISTRY, Chap. XII. Sect. I. It is seldom employed in pharmacy, except as the basis of some *official preparations*.

313
Subcarbo-
nate of pot-
ash.

a. SUBCARBONAS POTASSÆ. CARBONAS POTASSÆ, E. KALI PRÆPARATUM, L. ALKALI VEGETABILE MITE, D. Subcarbonate of potash. *Carbonate of potash. Prepared kali. Mild vegetable alkali.*

This is usually prepared from the former substance, which is purified by burning it in a crucible, then dissolving it in water, filtering and evaporating to dryness in a clean iron pot, stirring the mass as it dries, to prevent its coalescing into one cake.

This salt appears in small white grains of scarcely any perceptible smell, but of a hot alkaline taste. When pure, it should dissolve entirely in cold water, and should deliquesce in moist air into a limpid transparent fluid.

As usually made, it contains a considerable proportion of sulphate of potash, which may be separated from it by mixing it with its own weight of water, and al-

lowing it to stand till cold, when most of the sulphate of potash is separated in crystals.

This alkaline carbonate is employed as a diuretic, mixed with infusion of chamomile and spirit of juniper, in a dose of about a scruple repeated occasionally; and as an antacid. It is also employed in combination with citric acid, to relieve nausea and check vomiting.

History of
Simple and
Official
Medicines.

b. AQUA KALI PRÆPARATI, L. LIXIVIUM MITE, D. Water of prepared kali. *Mild ley.*

314
Water of
prepared
kali.

This is made by allowing subcarbonate of potash to deliquesce in a moist atmosphere, and straining it; or, by dissolving it in an equal weight of water.

It possesses the same properties as the dry carbonate, and is employed chiefly for decomposing other salts.

c. AQUA CARBONATIS POTASSÆ. AQUA SUPER-CARBONATIS POTASSÆ, E. LIQUOR ALKALI VEGETABILIS MITISSIMI, D. Water of carbonate of potash. *Solution of mildest vegetable alkali.*

315
Water of
carbonate
of potash.

This is properly a neutral salt, and is prepared by dissolving subcarbonate of potash in water, and saturating it with carbonic acid, by passing through it a stream of this gas, arising from the decomposition of carbonate of lime, by diluted sulphuric acid.

On the nature of this salt, see CHEMISTRY, N^o 109, 174.

By this means the alkaline carbonate is better adapted for internal use, as it is rendered not only more pleasant to the taste, but is less apt to offend the stomach. Indeed it is the only form in which we can exhibit potash in sufficient doses, and for a sufficient length of time, to derive much benefit from its use in calculous complaints. It has certainly been frequently of advantage in these affections, but probably only in those instances in which the stone consists of uric acid, or urate of ammonia; for though supersaturated with carbonic acid, yet the affinity of that acid for potash is so weak, that it really operates as an alkali.

Six or eight ounces may be taken two or three times a-day. It in general proves powerfully diuretic, and sometimes produces inebriation. This last effect is ascribed to the carbonic acid.

d. AQUA POTASSÆ, E. AQUA KALI PURI, L. LIXIVIUM CAUSTICUM, D. Water of potash. *Water of pure kali. Caustic ley.*

316
Water of
potash.

The following is the Edinburgh process for obtaining a solution of pure potash.

Take of newly prepared lime, eight ounces; carbonate of potash, six ounces. Put the lime into an iron or earthen vessel, with 28 ounces of warm water. After the ebullition is finished, instantly add the salt, and having thoroughly mixed them, cover the vessel till they cool. When the mixture has cooled, agitate it well, and pour it into a glass funnel, whose throat must be obstructed with a piece of clean linen. Cover the upper orifice of the funnel, and insert its tube into another glass vessel, so that the water of potash may gradually drop through the rag into the lower vessel. As

soon.

History of
Simple and
Official
Medicines.

soon as it ceases to drop, pour into the funnel some ounces of water, but cautiously, so that it may swim above the matter. The water of potash will again begin to drop, and the affusion of water is to be repeated in the same manner, until three pounds have dropped, which will happen in the space of two or three days; then mix the superior and inferior parts of the liquor together by agitation, and keep it in a well-stopped phial.

From this process those of the London and Dublin colleges do not materially differ. For other methods of procuring pure potash, see CHEMISTRY, N^o 905, *et seq.*

This preparation was formerly much employed in calculous disorders. From 10 to 40 drops were given in gruel, milk, or broth, twice or thrice a-day; but even in these doses it has often proved highly injurious, when long continued, to the organs of digestion. Hence it has been justly superseded by the solution of carbonate of potash above mentioned.

³¹⁷
Potash.

e. POTASSA, E. KALI PURUM, L. ALKALI VEGETABILE CAUSTICUM, D. LAPIS INFERNALIS. Potash. *Pure kali. Caustic vegetable alkali. Common stronger caustic.*

This is made by evaporating any quantity of the solution of potash in a very clean covered iron vessel, till on the ebullition ceasing, the saline matter flows like oil, which happens before the vessel becomes red. The mass is then to be poured out on a smooth iron plate, till it be divided into small pieces before it hardens, when it must be deposited in a well-stopt phial.

This has been long employed by surgeons as a caustic; but its use in this way is inconvenient, as from its rapid deliquescence it is not easily confined.

³¹⁸
Potash with
lime.

f. POTASSA CUM CALCE, E. CALX CUM KALI PURO, L. CAUSTICUM MITIUS, D. Potash with lime. *Lime with pure kali. Milder caustic.*

Made by evaporating in a covered iron vessel any quantity of solution of potash till it is reduced to a third, and then gradually adding as much newly slaked or powdered lime as is sufficient to form a thick mass, which is to be kept in a closely stopped vessel. This is employed as a caustic, and is milder in its operation, and more manageable than the last.

³¹⁹
Bees wax.

28. CERA. Bees wax.

Though wax is generally obtained from honey-combs, we have here introduced it as a vegetable principle, since modern chemistry has shown that it may be obtained by certain processes from most vegetables. See CHEMISTRY, N^o 2432.

Two varieties of wax are employed in medicine, *cera flava*, yellow wax, which is the wax as it is naturally procured from the comb, and *cera alba*, white wax, bleached by art. They do not differ in their sensible properties, and the white wax is only preferable to the yellow, from its making ointments, &c. of a more delicate colour.

Wax is seldom employed internally, though it is sometimes administered as an emollient by way of emulsion in diarrhœa and dysentery. It is used chiefly for preparing ointments, liniments, and cerates.

Official Preparations.

a. LINIMENTUM SIMPLEX, E. Simple liniment.

Made by melting together one part of white wax, and four of olive oil.

b. UNGUENTUM SIMPLEX, E. Simple ointment.

This differs from the last, only in its proportions, being composed of two parts of white wax, and four of olive oil.

c. UNGUENTUM CERÆUM, L. D. Wax ointment.

Made by melting together four ounces of white wax, three ounces of spermaceti, and a pint of olive oil.

d. EMPLASTRUM SIMPLEX, E. EMPLASTRUM CERÆ, D. EMPLASTRUM CERÆ COMPOSITUM, L. Simple plaster. *Wax plaster. Compound wax plaster.*

The Edinburgh preparation is composed of three parts of yellow wax, and of mutton suet and white rosin each two parts; that of the London and Dublin colleges is formed from yellow wax and mutton suet, each three pounds, and yellow rosin one pound.

29. AMMONIACUM. Gum ammoniac.

This is a common concrete, gummy, resinous juice from the East Indies, generally in large masses, composed of little lumps or tears, of a milky whiteness: the external parts of the mass are commonly yellowish or brownish, and the white tears change to the same colour on being exposed for some time to the air. Of the plant from which it is extracted, we have no further knowledge, than what is learnt from the seeds found among the tears, which resemble those of dill, except that they are larger, and apparently belong to a plant of the umbelliferous kind.

Ammoniacum has a strong smell, and a nauseous sweetish taste, which is followed by a bitter one. It is frequently made use of in asthmas, in menstrual suppressions, and cachectic indispositions. In obstructions of the breast it is accounted the most effectual of the aperient gums: in hysteric cases, some of the others are preferred or joined to it, on account, chiefly, of their more powerful smell. It is most commodiously taken in the form of pills; the dose is a scruple or half a dram every night or oftener; in larger doses, as a dram, it generally loosens the belly. Applied externally, it is supposed to discuss hard indolent tumours.

Official Preparations.

a. AMMONIACUM PURIFICATUM. Purified gum ammoniac.

Ammoniacum is purified by melting it in hot water, squeezing it through linen, and evaporating to a proper consistence.

b. LAC AMMONIACI, L. D. Emulsion of gum ammoniac.

Made by triturating two drams of ammoniac with half a pint of distilled water till an emulsion is formed.

Given in most cases where ammoniac is used as an expectorant. Dose an ounce or two, repeated occasionally.

c. EMPLASTRUM

castor. Simple and

Given as a stimulus in uterine obstructions. Dose from a scruple to a dram several times in the day. Official
Medicines.

31. SAGAPENUM. See CHEMISTRY, N^o 2495.

Sagapenum is employed as a stimulant and antispasmodic, chiefly in combination with other gum resins, to be mentioned hereafter.

32. ANGUSTURA. CORTEX ANGUSTURÆ. Angustura. Angustura bark.

This bark was some years ago introduced into this country from the West Indies. It is not certainly known of what tree it is the produce, but it is probable that it is a species of cinchona. It is thus described by Mr Brande. "There is a considerable variety in the external appearance of the angustura bark, owing, however, probably, to its having been taken from trees of different sizes and ages, or from various parts of the same tree, as the taste and other properties perfectly agree. Some parcels (says Mr Brande), which I have examined, consist chiefly of slips torn from branches which could not have exceeded the thickness of a finger. These are often smooth, three feet or more in length, and rolled up into small bundles. In others, the pieces have evidently been, for the greater part, taken from the trunk of a large tree, and are nearly flat, with quills of all sizes intermixed.

"The outer surface of the angustura bark, when good, is in general more or less wrinkled, and covered with a coat of a grayish-white, below which it is brown, with a yellow cast: the inner surface is of a dull brownish-yellow colour. It breaks short and resinous. The smell is singular and unpleasant, but not very powerful; the taste intensely bitter, and slightly aromatic; in some degree resembling bitter almonds, but very lasting, and leaving a sense of heat and pungency in the throat. This bark, when powdered, is not unlike the powder of Indian rhubarb. It burns pretty freely, but without any particular smell*."

It is employed as a tonic, generally in substance; dose from 15 to 30 grains. It may also be given in the form of infusion, decoction, tincture, or extract. It is well adapted to cases of debility of the alimentary canal.

33. COLOMBA. RADIX COLOMBÆ. Columbo Columbo root.

This root is brought from Columbo, a town in the island of Ceylon, to which it was originally transplanted from the continent of India. It is called by the Portuguese *Raijs de Mosambique*. We are as yet unacquainted with the vegetable of which it is a part.

Columbo root comes to us in circular pieces, which are from half an inch to three inches in diameter, and from two inches to a quarter of an inch in length. The sides are covered with a thick wrinkled bark, of a dark brown colour externally, but of a light colour within. The surfaces of the transverse sections appear very unequal, highest at the edges, with a concavity towards the centre. On paring off this rough surface, the root is seen to consist of three laminæ, the cortical, ligneous, and medullary. This last is much the softest, and, when chewed, seems very mucilaginous. A number of small fibres run longitudinally through it, and appear

5 B on

327
Myrrh.

30 MYRRHA. Myrrh.

Myrrh is a gum resin brought from the East Indies, or from Abyssinia. The best myrrh is in the form of tears. It should be of a yellow, or reddish yellow colour, becoming redder when breathed on, light, brittle, of an unctuous feel, pellucid, shining, presenting white semicircular striæ in its fracture; of a very bitter aromatic taste, and a strong, peculiar, not unpleasant odour. It is not good if whitish, dark coloured, black, resinous, ill smelled, or mixed with impurities, which is too commonly the case.

Neumann ascertained that water and alcohol are both of them capable of taking up the whole of the taste and smell of the myrrh, the extract made by either after the other being insipid. The alcohol distilled from the tincture elevated none of the flavour of the myrrh; but during the inspissation of the decoction a volatile oil arose, containing the whole of the flavour of the myrrh, and heavier than water, while the extract was merely bitter. From 7680 parts of myrrh he got 6000 watery extract, 180 volatile oil, and 720 alcoholic; and inversely, 2400 alcoholic, and 4200 watery. Dr Duncan junior has observed that the tincture is transparent, and when poured into water, forms a yellow opaque fluid, but lets fall no precipitate, while the watery solution is always yellow and opaque; and that myrrh is not fusible, and is difficultly inflammable. Mr Hatchett found it soluble in alkalies.

Myrrh is a heating stimulating medicine. It frequently occasions a mild diaphoresis, and promotes the fluid secretions in general. Hence it proves serviceable in cachectic diseases, arising from inactivity of the system, and is supposed to act especially upon the uterine system, and to resist putrefaction.

It is exhibited in substance; in the form of powder, or made up into pills, in doses of 10 to 60 grains; dissolved in water, as in Griffith's famous, but unchemical, myrrh mixture; and dissolved in alcohol*.

* Duncan's
Dispensatory.

Official Preparations.

328
Tincture of
myrrh.

a. TINCTURA MYRRHÆ. Tincture of myrrh.

This tincture is made by digesting three ounces of powdered myrrh in about 20 ounces of alcohol, mixed with 10 ounces of water, according to the Edinburgh process; half a pint of alcohol, with a pint and a half of proof spirit, according to the London college; or two pounds of alcohol according to that of Dublin, for seven or eight days.

Tincture of myrrh is seldom given internally, its principal use being as an external application, either as a gargle, or as a lotion for cleansing foul ulcers, and promoting the exfoliation of carious bones.

329
Compound
powder of
myrrh.

β. PULVIS MYRRHÆ COMPOSITUS, L. Compound powder of myrrh.

Made by rubbing together into a powder equal

Vol. XII. Part II.

History of Simple and Official Medicines. on the surface. The cortical and ligneous parts are divided by a circular black line. All the thicker pieces have small holes drilled through them, for the convenience of drying.

This root has an aromatic smell, but is disagreeably bitter and pungent to the taste, resembling mustard seed long kept.

This is an excellent bitter tonic, useful in debilities of the stomach and intestinal canal, in bilious diarrhoeas, in bilious fevers, in which it sometimes agrees when Peruvian bark fails; in the nausea and vomiting attending pregnancy. It is usually given in substance, in a dose from 15 grains to half a dram, or by way of infusion.

Official Preparation.

³³³ TINCTURA COLOMBÆ, E. L. Tincture of Columbo.

The Edinburgh college direct this tincture to be made, by digesting for eight days two ounces of columbo root in two pounds of diluted alcohol. The London tincture is stronger than this, being made with two ounces and a half of the root to two pints of proof spirit. This tincture may be given in a dose of a dram or two.

For some valuable observations on the nature and use of columbo root, see *Percival's Essays*, vol. ii.

SECT. II. Medicinal Vegetables, arranged according to the System of Linnæus.

CLASS I. MONANDRIA. Order I. MONOGYNIA.

³³⁴ 34. KÆMPFERIA ROTUNDA. ZEDOARIA, L. Round zedoary root.

This is a spicy root brought from the East Indies, in pieces about an inch long, rather rough on the surface, and commonly terminating in a point. It is seldom employed except as an ingredient in an aromatic electuary to be afterwards mentioned.

³³⁵ 35. CURCUMA LONGA. CURCUMA, L. Turmeric root.

This is brought from the East Indies, where it is employed as a spice. The roots are tuberous, long, knotty, and wrinkled; of a pale yellow colour externally, and a shining saffron brown within; of a weak aromatic smell, and a warm, slightly bitter taste.

Seldom employed in this country as a remedy, but much used in the composition of curry powder.

³³⁶ 36. AMOMUM ZINGIBER, E. ZINGIBER, L. D. Ginger root. See BOTANY, p. 76.

This is the least acrimonious of all the foreign aromatics. It may be taken in considerable quantities, either with food or as a medicine. It is an excellent stimulant, peculiarly suited to the constitutions of those whose stomachs are subject to flatulency, atonic gout, and other disorders marked by want of energy in the organs of digestion. In these cases it may be given either by itself, or combined with bitters and other tonics. It is also joined with antacids. It is a common and useful addition to cathartic medicines, particularly to infusions and tinctures of the vegetable cathartics, serving to moderate their irritating action on the bowels. The pulverized root may be given in doses from 10 to

30 grains. It has sometimes been used with advantage as a masticatory in strumous affections of the tonsils. It is often prescribed in the form of a watery infusion, made by steeping two ounces of the bruised root in one pint of boiling water. A small wine-glass-full of such an infusion, taken warm three or four times a day, has afforded great relief in many cases of gouty dyspepsia.

Official Preparations.

a. TINCTURA ZINGIBERIS, L. Tincture of ginger. ³³⁷

This is made by digesting two ounces of powdered ginger in two pounds of proof spirit for eight days. It may be given in a dose of two or three drams, mixed with water.

b. SYRUPUS AMOMI ZINGIBERIS, E. SYRUPUS ZINGIBERIS, L. Syrup of ginger. ³³⁸

The Edinburgh syrup is made by macerating three ounces of beaten ginger in four pounds of boiling water for 24 hours in a covered vessel, and then forming the syrup by adding seven pounds and a half of double refined sugar. The syrup of the London college is made with four ounces of bruised ginger to three pints of boiling distilled water, adding a sufficient quantity of double refined sugar to make a syrup.

A useful addition to stimulating mixtures, and employed in pharmacy as a constituent in several electuaries and pills.

37. AMOMUM ZEDOARIA, D. Long zedoary root. ³³⁹

A spicy root brought from the East Indies, especially from Ceylon, much resembling the kæmpferia in properties, but rather stronger.

38. AMOMUM CARDAMOMUM. AMOMUM REPENS, E. CARDAMOMUM MINUS, L. D. Lesser cardamom seeds. ³⁴⁰

It is uncertain whether these seeds are the produce of the *amomum cardamomum* or *repens*. They are brought from the East Indies, and form a very grateful aromatic, frequently employed in practice as a stimulant. They are brought to us in little whitish, roundish, triangular, pointed pods. The seeds are of a dark brown colour, of a fragrant smell, and pungent, rather saltish taste. The husks are separated from the rest by beating them in a mortar.

Official Preparations.

a. TINCTURA AMOMI REPENTIS, E. TINCTURA CARDAMOMI, L. D. Tincture of cardamom seeds. ³⁴¹

The Edinburgh tincture is made by digesting for seven days, four ounces of bruised cardamom seeds in two pounds and a half of diluted alcohol. In the London formula, three ounces of the seeds are digested for eight days in two pints of proof spirit. Dose two or three drams.

b. TINCTURA CARDAMOMI COMPOSITA, L. D. Compound tincture of cardamom seeds. ³⁴²

Made by digesting two drams of lesser cardamom seeds powdered, the same quantity of powdered cayenne

History of raway seeds (and in the London formula, of cochineal) Simple and half an ounce of bruised cinnamon, and four ounces Official of stoned raisins, in two pints, (or according to the Medicines. Dublin college, two pounds), of proof spirit for 14 days.

London college, a pound and a half, of rosemary tops, History of with a gallon of diluted alcohol, and a sufficient quan- Simple and tity of water to prevent burning, distilling off a gal- Official Medicines. lon.

A very grateful aromatic tincture, sometimes given alone as a cordial, in a dose of three or four drams, but more commonly added to stimulant draughts and juleps, to which it gives a fine rich colour.

Chiefly employed to form some compound tinctures, or as an external stimulant, in which way it is commonly used under the name of *Hungary water*.

³⁴³
Galangal root.

39. MARANTA GALANGA. GALANGA. Galangal root.

Sometimes employed as a warm aromatic, in a dose of about a scruple.

43. SALVIA OFFICINALIS, E. SALVIA, L. D. Sage. ³⁴⁹
Sage leaves.

An infusion of sage leaves is sometimes employed as a refreshing drink in fevers, and has been recommended as a tonic in nervous debilities and dyspepsia. It forms a good substitute for Chinese tea.

³⁴⁴
Olive oil.

CLASS II. DIANDRIA. Order I. MONOGYNIA.

40. OLEA EUROPEA, E. OLIVA, L. D. The olive tree. OLEUM OLIVÆ. Olive oil.

Pure olive oil should have a fine rich greenish yellow colour, with scarcely any perceptible taste or smell; should be perfectly transparent, and should congeal at about 38° of Fahrenheit. It is brought to us from the south of France, from Italy, and the Levant. The best is supposed to come from Florence.

Olive oil is chiefly employed as an emollient, both externally and internally. Internally it is sometimes employed as a gentle laxative, and to moderate the action of acrid substances, especially poisons. It has been given as an anthelmintic, either alone or formed into an emulsion with ammonia.

44. VERONICA BECABUNGA. BECABUNGA, L. Brooklime. ³⁵⁰
D. Brooklime. See BOTANY, p. 84.

A common succulent plant that has been recommended as an excellent antiscorbutic.

Order 3. TRIGYNIA.

45. PIPER NIGRUM. Black pepper. ³⁵¹

This is brought from the East Indies, being cultivated chiefly in Java and Malabar. White pepper is the same fruit, with the black bark taken off.

Pepper is one of the most heating spices, and is said sometimes to act violently on the kidneys, so as when taken in large quantities to excite nephritis. It is not unfrequently given internally as a stimulant, especially in the form of powder. A few grains of white pepper swallowed whole, are recommended by some practitioners, as a remedy in the debility of the digestive organs.

³⁴⁵
Hedge hyssop.

41. GRATIOLA OFFICINALIS, E. GRATIOLA, L. Hedge hyssop.

This plant, when dried, is sometimes employed as a drastic purgative and anthelmintic, given in substance, in a dose of from 20 to 30 grains, or by way of infusion, to the extent of 3 drams. Its use requires caution.

46. PIPER CUBEBA. CUBEBA, L. Cubebs. ³⁵²
Cubebs.

These are scarcely to be distinguished by the eye from common pepper, except in being furnished with a long slender stalk. They are brought from Java. In stimulating properties they resemble pepper, but are much weaker, and are seldom used.

³⁴⁶
Rosemary.

42. ROSMARINUS OFFICINALIS, E. ROSMARINUS, L. D. Rosemary.

The tops of rosemary are used as a stimulant, and form an ingredient in some tinctures. Rosemary owes its stimulating powers to its essential oil, which is very similar to camphor.

47. PIPER LONGUM. Long pepper. ³⁵³

Long pepper appears in small round grains, disposed spirally in a long cylindrical head. It is extremely pungent, and has a kind of saltish taste. It is employed chiefly as an ingredient in an aromatic clectuary and tincture.

³⁴⁷
Volatile oil of rosemary.

a. OLEUM VOLATILE ROSMARINI OFFICINALIS, E. OLEUM ROSMARINI, L. Volatile oil of rosemary.

This oil, like most of the other volatile oils of aromatic plants, is obtained by distilling the plant with a sufficient quantity of water to prevent burning, and separating the oil that floats on the surface of the distilled liquor, by means of a funnel with a long capillary tube.

Oil of rosemary is seldom employed alone, but it may be given in a dose of a few drops as a stimulant.

CLASS III. TRIANDRIA. Order I. MONOGYNIA.

48. VALERIANA OFFICINALIS, E. VALERIANA SYLVESTRIS, L. D. Valerian root. ³⁵⁴

This root consists of a number of strings or fibres, of a pale brownish colour, proceeding from a common stock, and matted together. It has a very strong unpleasant smell, and a warm, bitterish, acrid taste. It imparts its smell to water distilled from it, and most of its properties may be imparted to alcohol. Valerian grows commonly in Britain, and the best is that which grows in high, dry situations. The roots should be taken up in autumn or winter.

Valerian is a valuable antispasmodic, and is properly ranked among the most powerful of that class of remedies. It has been found efficacious in epilepsy, in which it should be given in substance, in large doses, to the extent

³⁴⁸
Spirit of rosemary.

b. SPIRITUS ROSMARINI OFFICINALIS, E. SPIRITUS ROSMARINI, L. Spirit of rosemary.

Made by distilling 2 pounds, or, according to the

History of extent of a dram or two several times a-day. It is Simple and useful in hysteria, and in cases of great nervous Official Medicines. sensibility. It is sometimes united with cinchona in the form of an electuary. The usual dose is from 15 to 30 grains. Its unpleasant flavour is most effectually concealed by the addition of a little mace.

Official Preparations.

³⁵⁵ Tincture of valerian. *a. TINCTURA VALERIANI, L.* Tincture of valerian.

This is made by digesting four ounces of valerian root in coarse powder in two pints of proof spirit for eight days, with a gentle heat.

This tincture is given in the same cases in which valerian is useful in substance, in a dose of from two to four drams; but it is not so efficacious as the powder, or the following tincture.

b. TINCTURA VALERIANI AMMONIATA, L. D. Ammoniated tincture of valerian.

Made by digesting for eight days, in a closely covered vessel, four ounces of powdered valerian root in two pints of compound spirit of ammonia.

This is perhaps the best form in which valerian can be given, as its antispasmodic virtues are much improved by the addition of ammonia. Dose a dram or two, which is best taken in water a little warmed.

³⁵⁶ Resinous extract of wild valerian. *c. EXTRACTUM VALERIANI SYLVESTRIS RESINOSUM, D.* Resinous extract of wild valerian.

This extract is made by digesting for four days a pound of powdered valerian in four pounds of rectified spirit of wine; then pouring off the tincture, and boiling the residuum in 12 pounds of water to two pounds. The two liquors are to be strained separately; the decoction is to be boiled, and the tincture distilled, till both are sufficiently thick, and they are then to be mixed together.

Of the effects of this extract we have had no experience; but we believe an extract made by inspissating the ammoniated tincture, has been given with success in the form of pills.

³⁵⁷ Saffron. *49. CROCUS SATIVUS, E. CROCUS, L. D.* Saffron.

Saffron is made from the stigmata of the above species of the crocus, which is cultivated for that purpose in some parts of England, especially in Essex. Saffron is also brought from abroad, but that of our own produce is considered as the best. See BOTANY, p. 100.

Official Preparations.

³⁵⁸ Syrup of saffron. *a. SYRUPUS CROCI, L.* Syrup of saffron.

This is made by infusing an ounce of saffron in a pint of boiling distilled water for 12 hours, and boiling the strained infusion with a sufficient quantity of double refined sugar to form a syrup.

Syrup of saffron is chiefly used as a pleasant addition to draughts and juleps, to which it imparts a fine yellow colour.

³⁵⁹ Tincture of saffron. *b. TINCTURA CROCI, E.* Tincture of saffron.

Made by digesting an ounce of English saffron cut

into shreds, in 15 ounces of diluted alcohol for seven days, and straining the tincture.

By some practitioners this is considered as a good remedy in chronic weakness, and is given in the dose of a table spoonful undiluted, every morning.

³⁶⁰ *50. IRIS FLORENTINA, E. IRIS, L.* Florentine orris.

This is brought from Italy in white, flattish, knotty pieces, that are very difficult to break or powder. It has an agreeable fragrant smell, and a slightly bitter taste. It is employed chiefly as a perfume.

³⁶¹ *51. IRIS PSEUDACORUS, IRIS, D.* Water flag. Water flag. See BOTANY, p. 100.

Order 2. DIGYNIA.

³⁶² *52. SACCHARUM OFFICINARUM, E. L. SACCHARUM NON PURIFICATUM, E. L. SACCHARUM RUBRUM, D.* Brown sugar. *SACCHARUM PURIFICATUM, L. D. SACCHARUM PURISSIMUM, E.* Refined sugar.

On the chemical properties of sugar, see CHEMISTRY. Brown sugar is sometimes employed as a gentle laxative, especially in clysters. Refined sugar is used chiefly in making syrups and conserves, and in giving an agreeable taste.

Official Preparation.

³⁶⁴ *a. SYRUPUS SIMPLEX, E.* Simple syrup. Simple syrup.

Made by dissolving 15 parts of double refined sugar in 8 of water, by a gentle heat.

³⁶⁵ *53. AVENA SATIVA, E. AVENA, L.* Oats. Oats.

Oats are employed in medicine chiefly to form gruel, which is made either from groats or oatmeal, and is an useful diluent in febrile and inflammatory affections, and is also used in clysters as an emollient. Poultices are sometimes made of oatmeal, mixed with other substances according to the nature of the case.

³⁶⁶ *54. TRITICUM {ÆSTIVUM, D. } Common wheat. Common wheat. FARINA. Flour. AMYLUM. Starch.*

Flour and starch are sometimes used as emollients, especially the latter, in the form of clysters or troches, in cases of diarrhœa, dysentery, &c.

Official Preparations.

³⁶⁸ *a. MUCILAGO AMYLI, E. L.* Mucilage of starch. Mucilage of starch.

Made by triturating half an ounce of starch with one pound of water, and then boiling the liquor till it be sufficiently thick.

³⁶⁹ *b. TROCHISCI AMYLI, L.* Troches of starch. Trochet of starch.

Composed of an ounce and a half of starch, six drams of extract of liquorice, half an ounce of powdered Florentine orris root, and one pound and a half of double refined sugar, made into a mass for troches, with mucilage of gum tragacanth.

These troches are employed as demulcents, to allay the irritation of tickling coughs.

³⁶⁹ *55. HORDEUM*

History of Simple and Official Medicines. 55. HORDEUM DISTICHON, E. D. HORDEUM, L. Common barley.

Common barley freed from the husks, and formed into what is called *pearl barley*, is used in medicine as an emollient in the form of decoction, or barley water.

370
Common
barley.

Official Preparations.

371
Decoction
of barley. a. DECOCTUM HORDEI DISTICHI, E. DECOCTUM HORDEI, L. Decoction of barley.

The making of barley water requires more nicety than is usually supposed. The following is the method directed in the Edinburgh Pharmacopœia.

Take of pearl barley two ounces; water five pounds.

First wash off the mealy part which adheres to the barley with some cold water; then extract the colouring matter by boiling it a little with about half a pound of water. Throw this decoction away, and put the barley thus purified into five pounds of boiling water, which is to be boiled down to one-half, and strain the decoction.

372
Compound
decoction
of barley. b. DECOCTUM HORDEI COMPOSITUM, L. Compound decoction of barley.

Made by boiling two pints of the decoction of barley, two ounces of sliced figs, half an ounce of liquorice root sliced and bruised, two ounces of stoned raisins, in one pint of distilled water, boiled to two pints and strained.

These decoctions may be used as common drink, in pneumonia, and similar affections of the breast.

CLASS IV. TETRANDRIA. Order I. MONOGYNIA.

373
Sarcocol. 56. PENÆA SARCOCOLLA. SARCOCOLLA, L. Sarcocol. See CHEMISTRY, N^o 2493.

374
Madder
root. 57. RUBIA TINCTORUM, E. RUBIA, L. D. Madder root.

This root has been long reputed a specific in uterine obstructions, but we believe without any good foundation. It is recommended in the atrophy of children, given in substance, in doses of a scruple or half a dram several times a-day. Its property of tinging the bones of animals has been already mentioned.

375
Contra-
yerva. 58. DORSTENIA CONTRAJERVA, E. CONTRAJERVA, L. Contrayerva root.

The root of this plant is knotty, an inch or two long, about half an inch thick, of a reddish brown colour externally, and pale within. From all sides of it there shoot out long, rough, slender fibres, generally loaded with knots. It has a peculiar kind of aromatic smell, and its taste is somewhat astringent and bitterish, with a light sweetish kind of acrimony, when chewed for a considerable time. The fibres have little or no taste or smell, therefore the tuberos parts alone should be chosen.

This plant is perennial, and grows in South America and some of the Caribbee islands.

Contra-*yerva* has been employed as a stimulant diaphoretic, in typhus fever, given in substance, in a dose

of from 30 to 40 grains; and a decoction of it, used as a gargle, has been recommended in putrid sore throat.

History of Simple and Official Medicines.

Official Preparation.

a. PULVIS CONTRAJERVÆ COMPOSITUS, L. Compound powder of contrayerva.

376
Compound
powder of
contra-

This is made by mixing together five ounces of powdered contrayerva, and one pound and a half of powder of crabs claws. Dose about a dram, repeated every three or four hours.

CLASS V. PENTANDRIA. Order I. MONOGYNIA.

59. ANCHUSA TINCTORIA, E. ANCHUSA, D. Alkanet root.

377
Alkanet
root.

This root is employed merely to give colour to an ointment.

60. SPIGELIA MARYLANDICA, E. SPIGELIA, L. D. Carolina pink root.

378
Carolina
pink root.

From 10 to 20 grains of the root of this plant have been given twice a-day to children between 2 and 12 years of age, when troubled with worms. It generally operates as a purgative; but when it does not produce this effect in a sufficient degree, proper doses of rhubarb, jalap, or calomel, should be given with it. As the spigelia may be easily overdosed, and in that case produces alarming symptoms, it should perhaps be erased from the catalogue of vermifuge medicines, of which there is a sufficient number without it, that are at least equally efficacious, and much safer in their operation.

61. MENYANTHES TRIFOLIATA, E. TRIFOLIUM PALUDOSUM, L. D. Marsh trefoil.

379
Marsh
trefoil.

This plant operates by purging and vomiting, in a dose of a dram. It has been recommended in fevers and intermittents, but is seldom employed.

62. CONVULVULUS SCAMMONIA, E. SCAMMONIUM, L. D. Scammony.

380
Scammony.

This is a gum resin which is brought from Syria, Mysia, and Cappadocia. The roots of this plant, which are very long and thick, when fresh contain a milky juice. To obtain this, the earth is removed from the upper part of the roots, and the tops of these are cut obliquely off. The milky juice which flows out, is collected in a small vessel sunk in the earth at the lower end of the cut. Each root furnishes only a few drams, but it is collected from several vessels, and dried in the sun. This is the true and unadulterated scammony. It is light, of a dark gray colour, but becomes of a whitish yellow when touched with the wet finger, is shining in its fracture; has a peculiar nauseous smell, and bitter acrid taste, and forms with water a greenish milky fluid, without any remarkable sediment. In this state of purity it seldom reaches us, but is commonly mixed with the expressed juice of the root, and even of the stalks and leaves, and often with flour, sand, or earth. The best to be met with in the shops comes from Aleppo, in light spongy masses, having a heavy disagreeable smell; friable, and easily powdered; of a shining ash colour, verging to black; when powdered of

History of a light gray or whitish colour. An inferior sort is Simple and brought from Smyrna in more compact ponderous pieces, not so friable, with less smell, and less easily Official Medicines. powdered, of a darker colour, not so resinous, and full * Dr Duncan's Dispensatory. of sand and other impurities *. See CHEMISTRY, N^o 2488.

Scammony is one of the most drastic purgatives, and as such is sometimes given in dropsy, in a dose of from 5 to 15 grains. It is also one of the most common anthelmintics; but in this latter case is generally combined with a mercurial.

Official Preparations.

³⁸¹
Compound powder of scammony.

a. PULVIS SCAMMONIÆ COMPOSITUS, L. E. D. Compound powder of scammony.

The London powder is composed of scammony, hard extract of jalap, of each two ounces; ginger, half an ounce: powdered separately, and then mixed together.

This powder in the Edinburgh Pharmacopœia is directed to be composed of scammony, supertartrate of potash, equal parts, rubbed together to a fine powder. The Dublin formula directs of scammony and vitriolated vegetable alkali, each two ounces, and ginger half an ounce, powdered separately, and then mixed together.

As the strength of these powders is different, their doses must vary: from 10 to 30 grains of the Edinburgh powder, and from 8 to 15 of the others, may be given for a dose.

³⁸²
Compound powder of scammony with aloes.

b. PULVIS SCAMMONII COMPOSITUS CUM ALOE, L. Compound powder of scammony with aloes.

This is composed of six drams of scammony, hard extract of jalap, socotorine aloes, of each one ounce and a half, of ginger half an ounce, powdered separately and mixed together.

Dose from 5 to 15 grains.

³⁸³
Powder of scammony with calomel.

c. PULVIS SCAMMONII CUM CALOMELANE, L. Powder of scammony with calomel.

This is composed of scammony half an ounce, calomel, double refined sugar, of each two drams, powdered separately and then mixed together.

This is well suited to cases of worms, and may be given from 12 to 20 grains.

³⁸⁴
Electuary of scammony.

d. ELECTUARIUM SCAMMONII, L. D. Electuary of scammony.

Prepared of an ounce and a half of powdered scammony, cloves, ginger, of each six drams, essential oil of caraway half a dram, and syrup of roses or orange peel, a sufficient quantity to form an electuary.

A brisk warm purgative, dose from 15 to 30 grains.

³⁸⁵
Jalap.

63. CONVULVULUS JALAPA, E. JALAPIUM, L. JALAPA, D. Jalap root.

The botanical and medical history of this simple has been already sufficiently detailed under the article BOTANY, p. 132. It remains here only to notice the

Official Preparations.

a. PULVIS JALAPÆ COMPOSITUS, E. Compound powder of jalap.

This is prepared by grinding together one part of powdered jalap and two parts of supertartrate of potash into a fine powder.

The supertartrate of potash in this preparation is useful chiefly for assisting in reducing the jalap to a finer powder, and thus rendering its operation milder. Dose from half a dram to one dram.

b. EXTRACTUM CONVULVULI JALAPÆ, E. EXTRACTUM JALAPII, L. EXTRACTUM JALAPÆ, D. Extract of jalap.

This extract, according to the Edinburgh process, is made by digesting one pound of powdered jalap in four pounds of alcohol for four days, pouring off the liquor, and boiling the residuum for 15 minutes in five pounds of distilled water, filtering the decoction while boiling hot through linen. This decoction is to be repeated with the same quantity of water, and both decoctions, when filtered, are to be boiled to the consistency of honey. In the mean time the spirit is to be drawn off from the tincture by distillation, till this also becomes thick, when it is to be mixed with the watery extract, and both evaporated in a bath of boiling water saturated with muriate of soda, till there is formed a mass of a proper consistence for making pills.

This extract is a powerful purgative; it may be given in a dose of from 5 to 15 grains.

c. TINCTURA CONVULVULI JALAPÆ, E. TINCTURA JALAPII, L. TINCTURA JALAPÆ, D. Tincture of Jalap.

This tincture is made by digesting three ounces (according to the Edinburgh college) or eight ounces according to the colleges of London and Dublin, of powdered jalap, in 15 ounces (or two pints London, or two pounds Dublin), of diluted alcohol, for seven or eight days, and straining the liquor through paper.

The dose of the Edinburgh tincture may be from three to six drams; that of the others from two to four drams.

64. DATURA STRAMONIUM, E. STRAMONIUM, L. Thorn apple. See BOTANY, p. 137.

65. HYOSCYAMUS NIGER, E. HYOSCYAMUS, L. Black henbane.

This plant grows commonly on dunhills and uncultivated places in several parts of Britain. It produces large, dark-coloured, woolly, jagged leaves, of a very strong and peculiar smell, sparkling when burnt, as if impregnated with nitre. These leaves are the principal part employed in medicine, acting as a narcotic. The seeds are also employed, and when smoked like tobacco, are said to be an excellent remedy in toothach.

Wherever an anodyne is wanted, and opium disagrees, this herb, and the preparations from it, may be prescribed. It is especially suited to spasmodic and colic affections, and to cases of chronic rheumatism and arthritis.

History of Simple and Official Medicines.

³⁸⁶
Compound powder of jalap.

³⁸⁷
Extract of jalap.

³⁸⁸
Tincture of jalap.

³⁸⁹
Thorn apple.

³⁹⁰
Black henbane.

History of Simple and Official Medicines. **arthritis.** Instances are also recorded of its beneficial effects in mania and melancholy; but in the last mentioned disorders, it has at least as often failed as it has succeeded, and is, on the whole, a doubtful remedy in diseases belonging to the order of *vesaniæ*. It does not occasion costiveness like opium, and forms one of the best substitutes for this expensive narcotic. Given in large doses, it produces great debility, delirium, remarkable dilatation of the pupils of the eyes, convulsions, and death. It is usually given in the form of extract, but the leaves are sometimes applied fresh by way of cataplasm to schirrous tumours and cancerous ulcers.

Official Preparations.

³⁹¹ **a. SUCCUS SPISSATUS HYOSCYAMI NIGRI, E.** In-
 inspissated juice of henbane.

This is made by bruising the fresh leaves, and putting them into a hempen bag, in which they are strongly compressed till the juice is extracted. This is evaporated in flat vessels heated with boiling water, saturated with muriate of soda, till it becomes of the consistence of thick honey; and after the mass has become cold, it is put into glazed earthen vessels sprinkled with alcohol, and closely covered.

Dose from two grains to 15 or 20, on extraordinary occasions; but if these large doses occasion unpleasant effects, as headach, vertigo, vomiting, or purging, the medicine must be discontinued.

³⁹² **b TINCTURA HYOSCYAMI NIGRI, E.** Tincture of
 henbane.

Made by digesting one ounce of the dried leaves of henbane in eight ounces of diluted alcohol for seven days, and straining. Dose from half a dram to a dram.

³⁹³ **66. NICOTIANA TABACUM, E. NICOTIANA,**
 L. D. Tobacco leaves. See BOTANY, p. 137.

Besides its ordinary narcotic virtues, the smoke of tobacco thrown up the bowels by way of clyster, has proved an effectual remedy in obstinate colic.

Official Preparations.

³⁹⁴ **a. VINUM NICOTIANÆ TABACI, E.** Tobacco wine.

Made by macerating one ounce of the dried leaves of tobacco in one pound of Spanish white wine for seven days, and straining the liquor.

This has been sometimes employed as a diuretic. Dose from 30 to 60 drops.

³⁹⁵ **67. CHIRCNIA CENTAURIUM, E. CENTAURIUM**
 MINUS, L. D. Lesser centaury.

A strong bitter, sometimes employed as a tonic in the form of an infusion of the tops.

³⁹⁶ **68. STRYCHNOS NUX VOMICA. Nux vomica.** The
 kernel.

The taste of this kernel is extremely bitter; it has little or no smell, and is so hard, that it cannot be reduced into powder by beating.

This nut is a very powerful narcotic, inducing even death by its sedative powder, as, on dissection, no marks of inflammation, or local affection, are to be discovered in the stomach.

As a narcotic, it has scarcely been used, though it has been recommended in mania, epilepsy, hysteria, &c. It has been given in dysentery and intermittent fever, in a dose of five grains twice a day; but it does not possess any superior medicinal powers*.

69. CAPSICUM ANNUM, E. PIPER INDICUM,
 L. D. Capsicum. Indian or Cayenne pepper. See BOTANY, p. 138.

It has been given with manifest advantage in cases of gouty dyspepsia, in some hydropic affections joined with paralytic symptoms, and in the advanced and sinking stage of typhus and the malignant endemic fever of the West Indies; also in the malignant sore throat, in which it has a good effect, both when taken into the stomach, and when used as a gargle. Bergius relates, that he prescribed the seeds with success in obstinate agues. Of the dried and pulverized capsules, the dose, internally, is from one to three grains. In the advanced stage of the yellow fever, double the last mentioned quantity has been given at a time. The gargle is prepared by macerating the powder first in warm vinegar, and afterwards adding a proper quantity of hot water, and continuing the maceration for a sufficient length of time. The proportions, two drams of the capsicum to half a pound of each menstruum*.

70. SOLANUM DULCAMARA. DULCAMARA, D.
 Bitter sweet. See BOTANY, p. 138.

71. ATROPA BELLADONNA. E. BELLADONNA,
 D. Deadly nightshade. See BOTANY, p. 138.

The whole plant is poisonous, and the berries, from their beautiful appearance, have sometimes proved fatal to children. The symptoms excited are, a dryness of the mouth, a trembling of the tongue, a very distressing thirst, a difficulty of swallowing, fruitless efforts to vomit, and great anxiety about the præcordia. Delirium then comes on, with gnashing of the teeth, and convulsions. The pupil remains dilated, and is not sensible even to the stimulus of light. The face becomes tumid, and of a dark red colour. The jaws are frequently locked. Inflammation attacks the œsophagus, stomach, and intestines, sometimes extending to the mesentery, lungs, and liver, accompanied with violent pains in the abdomen. The stomach is very insensible to stimulus, and the peristaltic motion of the intestines is destroyed. General relaxation, palsy, especially of the lower extremities, convulsions, vertigo, blindness, coma, and death succeed. The body soon putrifies, swells, and becomes marked with livid spots; blood flows from the nose, mouth, and ears, and the stench is insufferable. On dissection the blood is found to be fluid, the intestines are inflated and inflamed, or eroded and gangrenous. The best method of cure is to excite vomiting as soon as possible, by emetics, and tickling the fauces; to evacuate the bowels by purgatives and clysters, and to give largely, vinegar, honey, milk, and oil. In some children who recovered by this treatment, the delirium was succeeded by a profound sopor, accompanied with subsultus tendinum; the face and hands became pale and cold, and the pulse small hard, and quick. Their recovery was slow, and the blindness continued a considerable time, but at last went off†.

History of Simple and Official Medicines.

* Murray's Elements, vol. i.

397 Cayenne pepper.

* Practical Synopsis, vol. ii.

398 Bitter sweet.

399 Deadly nightshade.

† Duncan's Dispensatory.

History of Simple and Official Medicines. A medicine capable of producing such powerful effects, demands the utmost caution on the part of the prescriber. He should begin with the smallest doses, increasing them very gradually to a double, triple, or quadruple quantity (in which cases the intervals between the repetitions of the doses should be proportionably lengthened) and desisting as soon as dryness or stricture of the throat, or much diarrhoea, or great languor, with sickness and vomiting, or vertigo, and dimness of sight, come on.

It is best employed in substance, beginning with a grain for adults, and an eighth or a fourth of a grain for children.

It has been employed in a great variety of cases, as, 1. In several febrile diseases; in obstinate intermittents; and in the plague. 2. In inflammations; the gout. 3. In comatose diseases; in palsy, and loss of speech from apoplexy. 4. In spasmodic diseases; in chorea, epilepsy, chincough, hydrophobia, melancholy, and mania. 5. In cachectic affections; in dropsies, and obstinate jaundice. 6. In local diseases; in amaurosis, ophthalmia, in schirrhus, and cancer.

Official Preparations.

⁴⁰⁰ **a. SUCCUS SPISSATUS ATROPÆ BELLADONNÆ, E.** Inspissated juice of deadly nightshade.

This is made in the same way as the inspissated juice of henbane. See N^o 391. Dose from one to five grains.

⁴⁰¹ **72. CINCHONA OFFICINALIS, E. CINCHONA, L. CORTEX PERUVIANUS.** Cinchona bark. Peruvian bark. Jesuits bark.

The account of this valuable remedy already given under Botany, p. 133. and the article CINCHONA, has been so ample, that we shall add nothing to it in this place, but shall immediately proceed to notice the official preparations, referring our readers for further information on the simple, to Percival's Essays, the Synopsis *Materiæ Medicæ*, the *Thesaurus Medicaminum*, and Dr Duncan's Dispensatory.

Official Preparations.

⁴⁰² **a. INFUSUM CINCHONÆ OFFICINALIS, E.** Infusion of cinchona bark.

This is made by infusing an ounce of powdered cinchona bark in a pound of water for 24 hours, and filtering.

Dose from two to four ounces.

b. DECOCTUM CINCHONÆ OFFICINALIS, E. DECOCTUM CORTICIS PERUVIANI, L. D. Decoction of cinchona bark.

Prepared by boiling an ounce of powdered cinchona bark in about a pound and a half of water for 10 minutes, and straining the liquor while hot.

This is scarcely so good a preparation as the infusion. The ordinary dose is three or four ounces.

⁴⁰³ **c. TINCTURA CINCHONÆ OFFICINALIS, E. TINCTURA CORTICIS PERUVIANI, L. D.** Tincture of cinchona bark.

Made by digesting four or six ounces of powdered

cinchona bark in about two or two pounds and a half of diluted alcohol for seven or eight days, and straining the liquor through paper.

This is seldom given by itself, being generally added to the decoction or infusion. Dose three or four drams to an ounce.

d. TINCTURA CINCHONÆ COMPOSITA, L. D. Compound tincture of cinchona bark. *Haxham's tincture of bark.*

This is a very aromatic tincture of bark, made by digesting two ounces of powdered cinchona, from half an ounce to an ounce and a half of dried Seville orange peel, three drams bruised Virginian snake root, a dram of saffron, and two scruples of powdered cochineal, in 20 ounces or two pounds of proof spirit for 14 days, and straining.

Dose two or three drams.

e. TINCTURA CINCHONÆ AMMONIATA, L. Ammoniated tincture of cinchona.

Made by digesting four ounces of powdered cinchona in two pints of compound spirit of ammonia for 10 days in a close vessel.

As a preparation of cinchona bark, this is useless, and as a stimulus it is not preferable to the compound spirit of ammonia by itself.

f. EXTRACTUM CINCHONÆ OFFICINALIS, E. Extract of cinchona bark.

This is made in the same manner as extract of jalap, see N^o 387.

g. EXTRACTUM CINCHONÆ, L. Extract of bark.

The following is the process of the London college for making this extract.

Take of Peruvian bark, in coarse powder, one pound; distilled water, 12 pints. Boil for a hour or two, and pour off the liquor, which, while hot, will be red and pellucid, but, as it grows cold, will become yellow and turbid. The same quantity of water being again poured on, boil the bark as before, and repeat the boiling until the liquor, on becoming cold, remains clear. Then reduce all these liquors, mixed together and strained, to a proper thickness by evaporation. This extract must be prepared under two forms; one *soft*, and fit for making pills, and the other hard and pulverizable.

The Dublin college gives separate processes for making their hard and soft extract of cinchona; but they do not materially differ from the above.

All these extracts may be given in the form of pills, in a dose of from 10 to 20 grains, or by way of clyster in the quantity of a dram or two.

73. CINCHONA CARIBBÆA, E. Cinchona of the Caribbean isles.

This is a species of cinchona introduced here by Dr Wright. In medical properties it resembles the former, and may be substituted for it.

74. LOBELIA SYPHILITICA, E. Blue cardinal flower. See BOTANY, p. 133.

History of Simple and Official Medicines. 408
 75. **CÆPHAELIS IPECACUANHA, E. IPECACUANHA, L. D.** Ipecacuan root.

A pretty full account of ipecacuan has been already given in the article *BOTANY*, under *Psycotria Emetica*, p. 135.

It appears that this drug, or something very similar to the common ipecacuan, is the produce of several vegetables, which are enumerated by Dr Duncan in his *Dispensatory*.

Ipecacuan is given as an emetic, in full doses of a scruple or 25 grains; as an expectorant, in doses of one grain, repeated every three or four hours; as a diaphoretic, given in combination with opium; and as an antispasmodic, given from three to six grains.

When properly administered, it proves serviceable in the following diseases, viz. in intermittent fevers, a paroxysm of which has often been arrested by giving it as an emetic about an hour before the paroxysm was expected to come on; in continued fevers, given at the commencement as an emetic, and followed by a diaphoretic regimen; in several inflammatory diseases, as rheumatism, given as a diaphoretic; in pneumonia, exhibited to excite and keep up nausea without vomiting; in dysentery, in which it was formerly deemed a specific; in exanthematous diseases, especially where the eruption is disposed to recede; in hemorrhages, given in nauseating doses; in several spasmodic affections, as epilepsy, asthma, dyspnoea, chincough, chronic diarrhoea, hysteria; in mental alienation, as *melancholia* and *mania*, given in large doses; in some kinds of dropsy; in jaundice; in amaurosis.

Ipecacuan is best exhibited in substance; but it is often given in the form of a vinous infusion.

Official Preparations.

409
 Ipecacuan wine.
 a. **VINUM IPECACUANHÆ.** Wine of ipecacuan.

This is made by digesting two ounces of bruised ipecacuan root in about two pounds of Spanish white wine, for about a week, and straining.

This preparation being more palatable than the ipecacuan in substance, is well suited to delicate and squeamish patients. It may be given from an ounce to two ounces.

410
 Powdered ipecacuan and opium.
 b. **PULVIS IPECACUANHÆ ET OPII, E. PULVIS IPECACUANHÆ COMPOSITUS, L. D. PULVIS DOVERI.** Powder of ipecacuan and opium. *Compound powder of ipecacuan. Dover's powder.*

This powder is prepared by triturating eight parts of crystallized sulphate of potash, with one part of hard dry opium, and one part of powdered ipecacuan, till they are reduced to a very fine powder.

The crystallized salt in this process serves the purpose of reducing the opium and ipecacuan to a state of very minute division, and thus renders them more effectual. This is a valuable diaphoretic, and may be given from 10 to 20 grains; but where a long continued sweat is desired to be kept up, it is better to give 10 or 15 grains at first, and 10 or 5 grains more a few hours after.

411
 Buckthorn.
 76. **RHAMNUS CATHARTICUS, E. SPINA CERVINA, L.** Buckthorn. See *BOTANY*, p. 139.
 VOL. XII. Part II. †

Official Preparation.

a. **SYRUPUS RHAMNI CATHARTICI, E. SYRUPUS SPINÆ CERVINÆ, L.** Syrup of buckthorn.

The Edinburgh college directs this to be made with two parts of the depurated juice of ripe buckthorn berries, and one part of double refined sugar, boiled to the consistence of a syrup. The London process is more complex. It directs a gallon of the fresh juice of ripe buckthorn berries, an ounce of bruised ginger, an ounce and a half of powdered pimento, and seven pounds of double refined sugar. The juice is to be set aside for three days, and then strained from the feces. The ginger and pimento are to be macerated for four hours in a pint of the strained liquor. In the mean time the rest of the juice is to be boiled down to three pints; then the sugar and the pint of juice in which the spices had been macerated, are to be added, and the whole boiled to the consistence of a syrup.

This syrup is a good cathartic, but is seldom given alone, except to children. Dose from six drams to an ounce and a half.

77. **VITIS VINIFERA, E.** The vine.

The remedies drawn from the vine are wine, grapes, and supertartrate of potash.

The properties of wine as a stimulant and cordial, have been already mentioned. See N^o 100. The wines usually employed in medicine are,

Vinum album hispanum, *white Spanish wine.*

Vinum album rhenanum, *Rhenish wine.*

Vinum rubrum lusitanum, *red Port wine.*

The last, besides the stimulating power common to all wines, possesses much astringency, and is therefore better suited to cases of debility.

78. **UVÆ PASSÆ.** Raisins.

These are chiefly employed as emollients and demulcents.

79. **SUPERTARTRAS POTASSÆ. SUPERTARTRIS POTASSÆ. TARTARI CRYSTALLI, L. D. CREMOR TARTARI.** Supertartrate of potash. *Crystals of tartar. Cream of tartar.*

For the chemical nature of this salt, see *CHEMISTRY*.

This salt is employed in medicine chiefly as a gentle laxative and refrigerant. As a laxative, it may be given in the dose of from two drams to half an ounce, mixed with syrup or honey, or dissolved in a large quantity of barley water. In the latter way it has been found a good diuretic in dropsies. As a refrigerant, it is given in a diluted solution, sweetened with sugar, or some pleasant syrup.

Official Preparations.

a. **TARTRAS POTASSÆ. TARTRIS POTASSÆ, E. TARTARISATUM, L. ALKALI VEGETABILE TARTARISATUM, D.** Tartrate of potash. *Tartarised kali. Tartarised vegetable alkali. Soluble tartar.*

This salt is prepared by adding to a solution of supertartrate of potash, a sufficient quantity of subcarbonate

History of Simple and Official Medicines.
 nate of potash, to neutralize the excess of tartaric acid. For this purpose it usually requires about one part of the alkaline carbonate to three parts of supertartrate of potash. After neutralization, the liquor is filtered, and set by to crystallize.

This salt forms an excellent cooling purgative, and may be given in doses of from half an ounce to an ounce. It forms a good addition to rhubarb.

⁴¹⁷ Tartrate of potash and soda.
b. TARTRAS POTASSÆ ET SODÆ. TARTRIS POTASSÆ ET SODÆ, E. NATRON TARTARISATUM, L. SAL RUPELLENSIS, D. Tartrate of potash and soda. *Tartarized natron. Rochelle salt.*

Prepared by adding to a solution of supertartrate of potash, a sufficient quantity of carbonate of soda, to neutralize the excess of tartaric acid, filtering the liquor, and crystallizing.

This triple salt is a more agreeable laxative than the former, but is not so strong. Usual dose from one to two ounces.

⁴¹⁸ Purest subcarbonate of potash.
c. SUBCARBONAS POTASSÆ PURISSIMUS. CARBONAS POTASSÆ PURISSIMUS, E. SAL TARTARI. Purest subcarbonate of potash. *Salt of tartar.*

Prepared by burning all the tartaric acid from tartar, solution in water, filtration and crystallization.— Similar in its uses with N^o 313. which see.

⁴¹⁹ Sweet violet.
80. VIOLA ODORATA, E. VIOLA, L. D. Sweet violet. See BOTANY, p. 141.

Official Preparations.

⁴²⁰ Syrup of violets.
a. SYRUPUS VIOLÆ ODORATÆ, E. SYRUPUS VIOLÆ, L. D. Syrup of violets.

Made by macerating one pound or two pounds (L. D.) of the fresh petals of violets, in four pounds or five pints (L.) or six pounds (D.) of boiling water for 24 hours, straining the liquor without expression, and boiling it with a sufficient quantity of double refined sugar, to make a syrup.

A gentle laxative for young children.

⁴²¹ Red currants.
81. RIBES RUBRUM. Red currants.

The fruit of red currants is used as a refrigerant in febrile affections.

⁴²² Black currants.
82. RIBES NIGRUM. Black currants.

Also employed as a refrigerant; and the following preparations form a good domestic palliative in inflammatory affections of the throat, and in tickling coughs.

Official Preparations.

⁴²³ Inspissated juice of black currants.
a. SUCCUS SPISSATUS RIBIS NIGRI. Inspissated juice of black currants.

This is made by expressing and clarifying the juice of ripe black currants, and then evaporating it in a bath of water with muriate of soda, to a proper consistence.

⁴²⁴ Syrup of black currants.
b. SYRUPUS RIBIS NIGRI. Syrup of black currants.

Prepared by boiling the depurated juice of black currants with a sufficient quantity of sugar to make a Simple and Official Medicines.
 syrup.

Order 2. DIGYNIA.

⁴²⁵ **83. GENTIANA LUTEA, E. GENTIANA, L. D.** Gentian root.

The root of gentian is moderately long, slender, branched, brownish on the outside, of a reddish yellow or gold colour within. It is perennial, a native of the mountainous parts of Germany, &c. whence the shops are generally supplied with the dried roots.

Among the gentian brought to London, some years ago, a root of a different kind was mixed, the use of which occasioned violent disorders, and in some instances, as is said, proved fatal. This root is externally of a paler colour than gentian, and its longitudinal wrinkles finer and closer; on cutting the two roots, the difference is more remarkable, the poisonous root being white without any degree of the yellow tinge which is deep in gentian; nor is its taste bitter, like that of gentian, but mucilaginous.

Gentian root is a strong flavourless bitter; in taste less exceptionable than most of the other common strong bitters, and hence among us most generally made use of. The flavour and aromatic warmth wanting to render it grateful, and acceptable to the stomach, are supplied by additions.

The root of this plant is a valuable substance, very successfully and very generally employed as a stomachic and strengthening medicine. It is particularly useful in various chronic affections connected with debility, such as dyspepsia, diarrhoea, hysteria, chlorosis, dropsy. It has also been given with good effect in intermittent fevers, joined with the Peruvian bark; and in convalescencies from all fevers. In these and other cases it is combined with aromatics and chalybeates; sometimes with acids; at other times with alkaline salts, especially in dyspeptic and chlorotic affections, as also in certain disorders of the bowels; with absorbents and aromatics in cases of gout.

The use of this bitter, like that of many others, must not, however, be carried too far, as by weakening the energy of the nervous system, it predisposes to palsy and apoplexy.

Official Preparations.

⁴²⁶ **a. INFUSUM GENTIANÆ COMPOSITUM, E. L. D.** Compound infusion of gentian.
INFUSUM AMARUM. Compound infusion of gentian. *Bitter infusion.*

The Edinburgh infusion is made by steeping half an ounce of sliced gentian root, one dram dried peel of Seville oranges, half a dram of coriander seeds bruised, first in four ounces of diluted alcohol for three hours, and then adding one pound of water; macerating without heat for twelve hours, and then straining.

This infusion, according to the London Pharmacopœia, is made by macerating for an hour in boiling water, twelve ounces by measure, one dram of sliced gentian root, one dram and a half dried orange peel, half an ounce of fresh outer rind of lemons. The Dublin formula directs two drams of bruised gentian root, half an ounce fresh outer rind of lemons, one dram and

History of a half of dry orange peel, four ounces of diluted alcohol, and twelve ounces of boiling water; and the infusion is to be made first by alcohol and afterwards with the addition of water, nearly as in the Edinburgh process.

These infusions form a good tonic remedy in debility of the alimentary canal. A glass of them may be given twice or thrice a-day, either alone, or with the addition of some aromatic tonic tincture.

⁴²⁷
Compound
tincture of
gentian.

b. TINCTURA GENTIANÆ COMPOSITA, E. L. TINCTURA AMARA. ELIXIR STOMACHICUM. Compound tincture of gentian. *Bitter tincture. Stomachic elixir.*

The Edinburgh tincture is prepared by macerating two ounces of sliced and bruised gentian root, an ounce of dried and bruised Seville orange peel, half an ounce of bruised canella alba, and half a dram of powdered cochineal, in two pounds and a half of diluted alcohol for seven days. The tincture of the London college is made with two ounces of sliced and bruised gentian, one ounce of dried orange peel, half an ounce lesser cardamom seeds, husked and bruised, digested for eight days in two pints of proof spirit.

These tinctures are seldom given alone, but may be administered in a dose of two or three drams in a glass of water.

⁴²⁸
Compound
wine of
gentian.

c. VINUM GENTIANÆ COMPOSITUM, E. VINUM AMARUM. Compound wine of gentian. *Bitter wine.*

Prepared of half an ounce of gentian root, one ounce of cinchona bark, two drams of Seville dried orange peel, one dram of canella alba, four ounces diluted alcohol, two pounds and a half of Spanish white wine. The diluted alcohol is first poured on the root and bark sliced and bruised, and after 24 hours adding the wine, then macerating for seven days and straining. Dose from two drams to half an ounce.

⁴²⁹
Extract of
gentian.

d. EXTRACTUM GENTIANÆ LUTÆ, E. EXTRACTUM GENTIANÆ, L. D. Extract of gentian.

This is made by evaporating the saturated and strained decoction of the root to a consistence fit for being made into pills, under which form it is frequently prescribed in all those cases in which the infusion and tincture are employed. Dose of this extract from ten grains to half a dram. It is seldom given alone, but generally in combination with aromatic and aloeic powders, with myrrh, sulphate of iron, &c.

⁴³⁰
Elm bark.

84. ULMUS CAMPESTRIS, E. ULMUS, L. D. Elm bark.

The inner bark of the elm is frequently employed in cutaneous eruptions, as an alterative, or gentle diaphoretic, in the form of decoction.

⁴³¹
Decoction
of elm
bark.

Official Preparation.

α. DECOCTUM ULMI, L. Decoction of elm bark.

Made by boiling four ounces of the fresh inner bark of elm bruised, in four pints of water to two, and strain-
ing. Dose about four ounces, repeated several times a-day.

This medicine probably does not deserve the reputation it has acquired.

85. ERYNGIUM MARITIMUM. ERYNGIUM, L. ⁴³²
Eryngo root.

D. Eryngo root. See BOTANY, p. 144.

86. DAUCUS CAROTA, E. DAUCUS SYLVESTRIS, L. D. ⁴³³
Wild carrot seed.

The seeds are sometimes employed as a carminative, and have been recommended as a diuretic. They are seldom used.

The grated roots of cultivated carrot are frequently applied as a poultice to cancerous and ill-conditioned ulcers.

87. CONIUM MACULATUM, E. CICUTA, L. D. ⁴³⁴
Hemlock. See BOTANY, p. 145.

Hemlock has been employed chiefly in scrophulous and cancerous disorders, both internally and externally, and in many of these cases, with considerable benefit; in other instances, without any sensible relief, even after being continued for a great length of time. Like most proposers of new remedies, *Stoerck* has been too profuse in his encomiums on hemlock. It has been found useful in chronic rheumatism, and some cases of gout, where opium disagreed, and in that acutely painful complaint termed *tic doloureux*; as also in caries of the bones and bad venereal ulcerations. Dr *Butter* prescribed it with marked success in the whooping-cough; and being less stimulant than opium, and less liable to check expectoration, it generally answers better than the inspissated juice of the poppy, in cases of phthisis pulmonalis. The dried leaves may be given alone in doses of five to 15 grains. With the inspissated juice and powder are joined, according to the nature of the disorder in which they are given, calomel, guaiacum, ammoniacum, &c. In the administration of this, as of all other narcotic medicines, it is proper to begin with the smallest doses, afterwards gradually increasing them to as much as the patients can well bear. In this manner many instances are recorded where astonishing quantities of hemlock have been taken, in cancerous and other painful disorders, without disturbing the constitution. It is a sign that the medicine has been pushed to its utmost length, when it disorders the head, stomach, or bowels. For external use, fomentations, cataplasms, and plasters, are prepared from this vegetable*.

* *Practical Synopsis*, vol. ii.

Official Preparation.

a. SUCCUS SPISSATUS CONII MACULATI, E. SUCCUS SPISSATUS CICUTÆ, D. ⁴³⁵
Inspissated juice of hemlock.

This is made by expressing hemlock which is gathered when the flowers are beginning to appear, and allowing the juice to stand six hours until the feces subside, then reducing the decanted juice to dryness in a water bath.

History of Simple and Official Medicines. This extract may be given in a dose of two grains, increasing it gradually as long as seems prudent.

436 Creeping skirret. 88. SIUM NODIFLORUM. SIUM, L. Creeping skirret.

Formerly employed as an emmenagogue and lithon- triptic, but now seldom used.

437 Cummin seeds. 89. CUMINUM CYMINUM. CUMINUM, L. Cum- min seed. See BOTANY, p. 146.

Official Preparations.

438 Cataplasm of cummin. a. CATAPLASMA CUMINI, L. Cataplasm of cum- min seed.

This is made of cummin seed one pound; of bay ber- ries, dried leaves of water germander, virginian snake- root, each three ounces; cloves one ounce; rubbed to- gether into a powder, and formed into a cataplasm with three times their weight of honey.

439 Cummin plaster. b. EMPLASTRUM CUMINI, L. Cummin plaster.

This is composed of cummin seeds, carraway seeds, bay berries, each three ounces; Burgundy pitch three pounds, and yellow wax three ounces. The pitch and wax are first melted together, and the other ingredients in fine powder mixed with them.

Both these preparations are intended for external ap- plication to the belly, in some disorders of the stomach and bowels, which require such a stimulus.

440 Asafœtida. 90. FERULA ASAFOETIDA, E. ASAFOETIDA, L. D. Asafœtida. See BOTANY, p. 145. and CHE- MISTRY, N° 2490.

Official Preparations.

441 Purified asafœtida. a. ASAFOETIDA PURIFICATA. Purified asafœtida.

Asafœtida is purified in the same manner as gum am- moniac.

442 Emulsion of asafœtida. b. LAC ASAFOETIDÆ, L. Emulsion of asafœtida.

This is made in the same manner as the emulsion of gum ammoniac (See N° 336.), and is given in similar doses.

443 Tincture of asafœtida. c. TINCTURA FERULÆ ASAFOETIDÆ, E. TINC- TURA ASAFOETIDÆ, L. D. Tincture of asafœ- tida.

This tincture is prepared by digesting four ounces of asafœtida in two pounds and a half (E.), or two pounds (D.), or two pints (L.), of rectified spirit of wine, for about a week,

This is a good preparation of asafœtida, and may be given in doses of from 20 to 60 drops.

444 Compound pills of asa- fœtida. d. PILULÆ ASAFOETIDÆ COMPOSITÆ, E. Com- pound pills of asafœtida pills.

Made by beating together asafœtida, galbanum, and myrrh, of each eight parts, and one part of rectified oil of amber, into a mass with simple syrup. Dose 15 grains, or a scruple, three or four times a-day. Chiefly in hysteria.

e. EMPLASTRUM ASAFOETIDÆ, E. Plaster of asa- fœtida. History of Simple and Official Medicines.

Made by melting together plaster of semivitrified oxide of lead, asafœtida, of each two parts, and galba- num and yellow wax, of each one part.

Applied to the belly in hysteria.

91. BUBON GALBANUM, E. GALBANUM, L. D. Galbanum. See CHEMISTRY, N° 2494. 445 Plaster of asafœtida. 446 Galbanum.

Galbanum is employed in similar cases as asafœtida. It is seldom given alone.

Official Preparations.

a. GALBANUM PURIFICATUM. Strained galbanum. 447 Purified galbanum.

Galbanum is purified by melting it, inclosed in a bladder, by the heat of boiling water, and straining it through linen.

b. TINCTURA GALBANI, L. Tincture of galbanum. 448 Tincture of galbanum.

This is made by digesting two ounces of galbanum, cut into small pieces, in two pints of proof spirit, for eight days, with a gentle heat and straining. Dose from one to two drams.

c. PILULÆ GALBANI COMPOSITÆ, L. Compound 449 Compound galbanum pills. galbanum pills.

Prepared of opoponax, myrrh, sagapenum, of each an ounce, asafœtida half an ounce.

Similar to the asafœtida pills, and given in similar doses.

92. ANGELICA ARCHANGELICA, E. ANGELI- 450 Angelica. CA, L. D. Angelica.

An elegant aromatic, but seldom employed.

93. CORIANDRUM SATIVUM, E. CORIANDRUM. 451 Coriander seeds. See BOTANY, p. 147. Coriander seeds.

94. CARUM CARUI, E. CARUON, L. CARUI, 452 Carraway seeds. See BOTANY, p. 147. Carraway seeds.

Official Preparations.

a. OLEUM VOLATILE CARI CARUI, E. OL. CA- 453 Oil of car- RUI, L. D. Volatile oil of carraway. raway.

Prepared by distillation in the same manner as the oil of rosemary. A very warm stimulant. Dose two or three drops.

b. SPIRITUS CARI CARUI, E. SPIRITUS CARUI, 454 Spirit of carraway. L. D. Spirit of carraway.

Prepared by macerating half a pound of bruised car- raway seeds in eight or nine pounds of proof spirit for a day or two, and then with the addition of a suf- ficient quantity of water to prevent burning, distilling off the spirit.

A good dram, where drams are required, as in flatu- lent colic. Dose half an ounce to an ounce.

95. PASTINACA OPOPONAX. OPOPONAX, L. Opoponax. 455 Opoponax.

One of the gum-resins, brought from the East Indies and the Levant. It possesses properties similar to those of

History of of galbanum and asafoetida, and is usually employed in Simple and combination with them.

Official Medicines.

96. ANETHUM GRAVEOLENS, L. Dill-seed.

⁴⁵⁶
Dill seed.

This seed is of a nearly oval shape, convex on one side and flat on the other, of a yellowish colour, of a warm pungent taste and aromatic smell. Employed sometimes as a carminative.

Official Preparation.

⁴⁵⁷
Water of dill.

a. AQUA DISTILLATA ANETHI, L. Dill water.

A gallon of water distilled from a pound of bruised dill seeds.

⁴⁵⁸
Sweet fennel seed.

97. ANETHUM FOENICULUM, E. FOENICULUM, L. D. Sweet fennel seeds. See BOTANY, p. 147.

Official Preparations.

⁴⁵⁹
Water of sweet fennel.

a. AQUA DISTILLATA FOENICULI DULCIS, L. D. Sweet fennel water.

Prepared as dill water.

⁴⁶⁰
Oil of fennel.

b. OLEUM VOLATILE FOENICULI DULCIS, D. Oil of sweet fennel seeds. Prepared as the oil of rosemary, &c.

⁴⁶¹
Parsley.

98. APIUM PETROSELINUM, E. PETROSELINUM, L. Parsley.

The seeds of parsley are carminative, and the root is gently diuretic.

⁴⁶²
Aniseed.

99. PIMPINELLA ANISUM, E. ANISUM, L. D. Aniseeds.

This plant is cultivated in Asia, and in the south of Europe. The seeds have a peculiar grateful smell, and a sweet aromatic taste.

They are gently stimulant, carminative and expectorant.

Official Preparations.

⁴⁶³
Oil of aniseed.

a. OLEUM VOLATILE PIMPINELLÆ ANISI, E. OLEUM VOLATILE ANISI, L. D. Volatile oil of aniseed.

Prepared as the other volatile oils.

This oil freezes at no very low temperature. It is a powerful and grateful stimulant. Dose, a drop or two.

⁴⁶⁴
Compound spirit of aniseed.

b. SPIRITUS ANISI COMPOSITUS, L. Compound spirit of aniseed.

From aniseed and angelica seed, of each half a pound, proof spirit a gallon, and enough water to prevent burning, a gallon of spirit is distilled.

A very agreeable cordial in cases of flatulence.

Order 3. TRIGYNIA.

⁴⁶⁵
Elder.

100. SAMBUCUS NIGRA, E. SAMBUCUS, L. D. Elder leaves, bark, and berries. See BOTANY, p. 148.

Official Preparations.

a. SUCCUS SPISSATUS BACCÆ SAMBUCI, L. D. In-spissated juice of elder leaves.

Prepared in the same way as the juice of black currants. See N^o 422.

b. UNGUENTUM SAMBUCI, L. UNG. SAMBUCI-NUM, D. Elder ointment.

Prepared by boiling four pounds of elder flowers in three pounds of mutton suet and a pint of olive-oil till they are crisp, and then straining.

101. RHUS TOXICODENDRON, E. Poison oak.

⁴⁶⁸
Poison oak

The leaves of this shrub, which is a native of North America, are very acrid, and have lately been introduced into practice by Dr Alderson of Hull as a remedy for palsy. Dose half a grain or a grain. In Edinburgh it has been less successful than with Dr Alderson. See Alderson's "Essay on the Rhus Toxicodendron," and Duncan's Dispensatory.

102. LINUM USITATISSIMUM, E. LINUM, L. D. Lintseed. Common flax. Lintseed. See BOTANY, p. 149.

Official Preparations.

a. OLEUM LINI USITATISSIMI, E. Lintseed oil.

⁴⁷⁰
Lintseed oil.

Expressed from the seeds by inclosing them in a hempen bag after beating them in a stone mortar. It should be expressed without heat.

Emollient. Has been given with success in some cases of hæmoptysis, nephritis, colic, and some internal inflammations. Dose an ounce or two, made into an emulsion.

103. LINUM CATHARTICUM, D. Purging flax. See BOTANY, p. 149.

⁴⁷¹
Purging flax.

CLASS VI. HEXANDRIA. Order I. MONOGYNIA.

104. BERBERIS VULGARIS. BERBERIS, D. Bar-berberry.

⁴⁷²

The fruit is employed as a refrigerant. See BOTANY, p. 159.

105. ALLIUM SATIVUM, E. L. D. Garlic. See BOTANY, p. 156, where a long account is given of its nature and uses.

⁴⁷³

Official Preparations.

a. SYRUPUS ALLII, D. Syrup of garlic.

⁴⁷⁴
Syrup of garlic.

Prepared by macerating a pound of sliced garlic in two pounds of boiling water in a close vessel for 12 hours, and then adding to the strained liquor four pounds of double refined sugar.

106. ALLIUM CEPA. CEPA, D. Onion.

⁴⁷⁵
Onion.

A gentle diuretic when raw, but chiefly used roasted by way of a cataplasm.

107. ALOE PERFOLIATA, E. ALOE SOCOTRINA, L. D. Aloes.

⁴⁷⁶
Aloes.

So

History of Simple and Official Medicines. So full an account of the several varieties of aloes and their uses in medicine has been given under BOTANY, p. 158, that it is necessary for us here only to notice its

A powerful purgative, well suited to melancholia and similar diseases. Dose 10 to 20 grains. History of Simple and Official Medicines.

g. PILULÆ ALOES ET MYRRHÆ, E. L. PILULÆ RUFÆ. Pills of aloes and myrrh. Rufus's pills. 483

Prepared of four parts of socotorine aloes, two parts of myrrh, and two parts of saffron (one part L.), made into a mass with syrup of saffron. Pills of aloes and myrrh.

A good laxative and stomachic. Dose 15 or 20 grains.

h. EXTRACTUM ALOES, C. Extract of Aloes. 484

Prepared as *extract of gentian*.

i. TINCTURA ALOES SOCOTORINÆ, E. TINCTURA ALOES, L. D. Tincture of aloes. 485

Made by digesting half an ounce of powdered socotorine aloes and an ounce and a half of extract of liquorice, in four ounces of alcohol and a pound of distilled water (E.), or in eight ounces of proof spirit with the same quantity of distilled water (L.), for a few days, with a gentle heat and frequent agitation. Dose about an ounce. Tincture of aloes.

k. TINCTURA ALOES ET MYRRHÆ, E. TINCTURA ALOES COMPOSITA, L. Tincture of aloes and myrrh. 486

This tincture, according to the Edinburgh process, is prepared by first digesting two ounces of powdered myrrh in a pound and a half of alcohol mixed with half a pound of water, for four days; then adding an ounce and a half of powdered socotorine aloes, and an ounce of saffron; digesting for three days longer, and pouring off the tincture. The London tincture is made by digesting three ounces of socotorine aloes and the same quantity of saffron, in two pints of tincture of myrrh, for eight days, and straining it. Compound tincture of aloes.

These tinctures differ in strength; the Edinburgh tincture may be given in a dose of half an ounce or six drams; the London one in half that quantity.

l. TINCTURA ALOES ÆTHEREA, E. Etherial tincture of aloes. 487

This tincture is prepared by digesting socotorine aloes, and myrrh powdered, of each an ounce and a half, with an ounce of sliced saffron, in a pound of sulphuric ether with alcohol; first digesting the myrrh alone for four days, then adding the rest, digesting for four days longer, and straining.

More stimulating than the other tinctures. Dose two or three drams.

m. VINUM ALOES SOCOTORINÆ, E. VINUM ALOETICUM, D. VINUM ALOES, L. Wine of socotorine aloes. 488

The Edinburgh wine is prepared by digesting an ounce of powdered socotorine aloes, and lesser cardamom seed, and ginger bruised, of each a dram, in two pounds of Spanish white wine, for seven days, with occasional agitation and straining. The Dublin college directs four ounces of powdered socotorine aloes, and two ounces of powdered canella alba, in four pounds of Spanish white wine for fourteen days, with frequent agitation and then filtrating. In the London process, the proportions are, eight ounces of powdered aloes, two

Official Preparations.

477
Powder of aloes with canella.

a. PULVIS ALOES CUM CANELLA, L. HIERA PICRA. Powder of aloes with canella.

Prepared of a pound of socotorine aloes, and three pounds of white canella, powdered separately and then mixed together.

A warm stimulant cathartic. Dose 10 grains to 20. Best given in the form of pill.

478
Aloetic powder with guaiacum.

b. PULVIS ALOETICUS CUM GUAJACO, L. Aloetic powder with guaiacum.

Prepared by mixing together an ounce and a half of powdered socotorine aloes, an ounce of powdered resin of guaiacum, and half an ounce of aromatic powder. Dose as of the preceding.

479
Aloetic powder with iron.

c. PULVIS ALOETICUS CUM FERRO, L. Aloetic powder with iron.

Prepared of socotorine aloes, an ounce and a half, myrrh two ounces, dry extract of gentian and vitriolated iron, each an ounce, powdered separately, and mixed together.

This is considered as a good emmenagogue in a dose of 15 grains.

480
Aloetic pills.

d. PILULÆ ALOETICÆ, E. D. PILULÆ ALOES COMPOSITÆ, L. Aloetic Pills. Compound pills of aloes.

The Edinburgh aloetic pills are prepared by beating together into a mass equal parts of powdered aloes and soap. Those of the London college are made of an ounce of powdered socotorine aloes, half an ounce of extract of gentian, two scruples of oil of caraway seeds, and enough syrup of ginger to form a mass. The Dublin pills are made of an ounce of Barbadoes aloes, with half an ounce of extract of gentian, and two drams of powdered ginger, formed into a mass with soap jelly.

Any of these compositions forms a good cathartic for sedentary people. Dose 10 to 20 grains.

481
Pills of aloes and asafetida.

e. PILULÆ ALOES ET ASAFOETIDÆ, E. Pills of aloes and asafetida.

Prepared with equal parts of powdered aloes, asafetida and soap, made into a mass with mucilage of gum arabic.

A good remedy in dyspepsia, especially in females. Dose about 10 grains, twice a-day.

482
Pills of aloes and colocynth.

f. PILULÆ ALOES CUM COLOCYNTHIDE, E. Pills of aloes with colocynth.

These are formed of socotorine aloes, scammony, each eight parts, colocynth four parts, oil of cloves and sulphate of potash with sulphur, each one part. The aloes, scammony, and salt, are together reduced to powder, and mixed with the colocynth previously beat to a fine powder; then the oil is added, and the mass formed with mucilage of gum arabic.

History of two ounces of powdered canella, six pints of Spanish Simple and white wine, and two pints of proof spirit. Official Medicines.

This appears from long experience to be a medicine of excellent service. The dose as a purgative is from one to two ounces. It may be introduced into the habit, so as to be productive of excellent effects, as an alterant, by giving it in small doses, at proper intervals: thus managed, it does not for a considerable time operate remarkably by stool; but at length proves purgative, and occasions a lax habit of much longer continuance than that produced by other common cathartics.

⁴⁸⁹
Squill.

108. SCILLA MARITIMA, E. SCILLA, L. D. Squill. See BOTANY *Index*.

When the root of squill is taken in large doses, it produces a violent vomiting and purging, and sometimes strangury, bloody urine, and inflammation and erosion of the stomach or bowels; in moderate doses it proves emetic, without any farther consequence, and in small doses, it is a good expectorant and diuretic. It is chiefly employed as an expectorant in asthma and peripneumony, and as a diuretic in dropsy.

Official Preparations.

⁴⁹⁰
Dried
squill.

a. SCILLA MARITIMA EXSICCATA, E. SCILLA EXSICCATA, L. SCILLÆ PREPARATÆ, D. Dried squill.

Squill is dried by first removing its outer coat, then cutting it transversely into thin slices, and drying these with a gentle heat.

The sign of its being properly dried is that it be rendered friable without losing its bitterness and acrimony. This is an excellent mode of preparing squill, where it is to be given in substance. The dose of dried squill, when reduced to powder and given as an expectorant or diuretic, is from one grain to three.

⁴⁹¹
Vinegar of
squill.

b. ACETUM SCILLÆ MARITIMÆ, E. ACETUM SCILLÆ, L. ACETUM SCILLITICUM, D. Vinegar of squill.

This is made by macerating dried squill in vinegar or distilled vinegar, with a proportion of proof spirit. The proportions of the different colleges vary. The Edinburgh college directs two ounces of squill to two pounds and a half of distilled acetous acid, and three ounces of alcohol; that of London a pound of squill, six pints of vinegar, and half a pint of proof spirit; while the Dublin proportions are half a pound of squill, three pounds of vinegar, and four ounces of proof spirit. The squill is first macerated with the vinegar for some days with a gentle heat, then the liquor is expressed, and the spirit added to it. Dose from two drams to half an ounce, chiefly in composition.

⁴⁹²
Syrup of
squill.

c. SYRUPUS SCILLÆ MARITIMÆ, E. Syrup of squill.

This syrup is made with two pounds of vinegar of squill, and three pounds and a half of double refined sugar, dissolved in a gentle heat.

A good expectorant. Dose from half an ounce to an ounce.

d. OXYMEL SCILLÆ, L. Oxymel of squill.

Prepared by boiling three pounds of clarified honey, with two pints of vinegar of squill in a glass vessel, with a gentle heat, to the consistence of a syrup.

This is not so good a preparation as the syrup of squill, and is very apt to produce sickness. Dose three or four drams.

History of
Simple and
Official
Medicines.

⁴⁹³
Oxymel of
squill.

e. CONSERVA SCILLÆ, L. Conserve of squill.

⁴⁹⁴
Conserve of
squill.

This is made by beating together in a mortar, an ounce of fresh squill and five ounces of double refined sugar.

A very injudicious and nauseous preparation.

f. TINCTURA SCILLÆ, L. D. Tincture of squill. ⁴⁹⁵ Tincture of squill.

This tincture is prepared by digesting four ounces of fresh dried squill, in two pints, or two pounds, of proof spirit, for seven or eight days, and pouring off the clear liquor.

This is a good preparation of squill, especially when it is intended as a diuretic. Dose twenty or thirty drops.

g. MEL SCILLÆ, L. MEL SCILLITICUM, D. ⁴⁹⁶ Honey of squill.

Prepared by boiling together in a glass vessel, three pounds of clarified honey and two pints of the tincture of squill, to the consistence of a syrup. Dose, a dram or two.

h. PILULÆ SCILLÆ, L. PILULÆ SCILLITI- ⁴⁹⁷ Squill pills.
CÆ, E. D. Squill pills.

These, according to the London and Dublin colleges, are to be prepared by beating together a dram of fresh dried squill reduced to powder, three drams of powdered ginger, three drams of soap, and two drams of gum ammoniac, with a sufficient quantity of syrup of ginger, or jelly of soap, to form a mass fit for making pills. In the Edinburgh process a scruple of dried squill, in fine powder, a dram of gum ammoniac, a dram of powdered lesser cardamom seeds, and a dram of extracted liquorice, are beaten into a mass, with simple syrup.

This is a good form of squill, when intended as an expectorant. Dose from 10 to 15 grains.

109. LILIUM CANDIDUM. LILIUM ALBUM, ⁴⁹⁸ White lily.
D. White lily root. See BOTANY, p. 156.

110. ACORUS CALAMUS, E. CALAMUS ARO- ⁴⁹⁹ Calamus.
MATICUS, L. Sweet flag. See BOTANY, p. 159. aromaticus.

Order III. TRYGINIA.

111. COLCHICUM AUTUMNALE, E. COLCHICUM, ⁵⁰⁰ Colchicum.
L. D. Colchicum, or meadow saffron. See BOTANY, p. 161.

Official Preparations.

a. SYRUPUS COLCHICI AUTUMNALIS, E. Syrup of ⁵⁰¹ Syrup of
colchicum. colchicum.

Prepared by first macerating an ounce of fresh colchicum root, cut into thin slices, in 16 ounces of vinegar,

History of
Simple and
Official
Medicines.

gar for two days, with occasional agitation, and the boiling the expressed liquor with 26 ounces of double refined sugar into a syrup.

Employed as a diuretic, in a dose of from a dram to an ounce or more.

502
Oxymel of
colchicum.

b. OXYMEL COLCHICI, L. Oxymel of colchicum.

This is made in the same manner as the syrup, only that two pounds of clarified honey are used instead of sugar to the pint of vinegar of colchicum. It is given in similar doses with the former.

503
Sorrel.

112. RUMEX ACETOSA, E. ACETOSA PRATENSIS, L. ACETOSA, D. Sorrel. See BOTANY, p. 160.

CLASS VII. HEPTANDRIA. Order I. MONOGYNIA.

504
Horse-
chestnut.

113. ÆSCULUS HIPPOCASTANUM, E. HIPPOCASTANUM. Horse-chestnut bark and fruit.

The bark of horse-chestnut is a powerful astringent, and has lately been recommended as a substitute for opichona. It is certainly a good tonic, and may be given in powder from half a dram to a dram; or a dram of the extract of it may be mixed with an ounce of cinnamon water, and given in the dose of a tea spoonful three or four times a-day. A strong infusion of it, snuffed up the nose, has long been employed as an errhine.

CLASS VIII. OCTANDRIA. Order I. MONOGYNIA.

505
Elemi.

114. AMYRIS ELEMI, E. ELEMI, L. Resin of elemi. See BOTANY, p. 166.; and CHEMISTRY, N^o 2471.

Official Preparations.

506
Elemi oint-
ment.

a. UNGUENTUM ELEMI, D. UNG. ELEMI COMPOSITUM, L. Elemi ointment.

Prepared by first melting a pound of elemi with two pounds of mutton suet, and on removing them from the fire, immediately adding 10 ounces of turpentine and two ounces of olive oil, and straining the mixture.

A stimulating ointment, in much reputation with some surgeons for cleansing ulcers.

507
Balm of
Gilead.

115. AMYRIS GILEADENSIS, E. BALSAMUM GILEADENSE, L. Balsam or balm of Gilead. See BOTANY, p. 166.

508
Mezereon.

116. DAPHNE MEZEREUM, E. MEZEREUM, L. MEZEREON, D. Mezereon or *spurge laurel*. See BOTANY, p. 168.

Official Preparations.

509
Decoction
of meze-
reon.

a. DECOCTUM DAPHNES MEZEREI, E. Decoction of mezereon.

Prepared by boiling with a gentle heat two drams of the bark of mezereon root, and half an ounce of bruised liquorice root, in three pounds of water to two pounds.

Much recommended as a diaphoretic and stimulant, in rheumatic affections and in cutaneous eruptions. Dose from four to eight ounces twice a-day.

History of
Simple and
Official
Medicines.

117. POLYGONUM BISTORTA, E. BISTORTA, L. D. Great bistort or *snakeweed*. See BOTANY, p. 168.

CLASS IX. ENNEANDRIA. Order I. MONOGYNIA.

118. LAURUS CINNAMOMUM, E. CINNAMOMUM, L. D. Cinnamon. *The bark and its essential oil*. See BOTANY, p. 170. and 174. See also the article CEYLON.

Official Preparations.

a. AQUA LAURI CINNAMOMI, E. AQUA CINNAMOMI, L. D. Cinnamon water. *Barley cinnamon*.

A gallon of water distilled from a pound of bruised cinnamon.

An excellent cordial in a dose of two ounces.

b. SPIRITUS LAURI CINNAMOMI, E. SPIRITUS CINNAMOMI, L. D. Spirit of cinnamon.

A gallon of proof spirit distilled from a pound of bruised cinnamon.

Preferable to the former only where ardent spirits are required.

c. TINCTURA LAURI CINNAMOMI, E. TINCTURA CINNAMOMI, L. D. Tincture of cinnamon.

Made by digesting three ounces, or three ounces and a half of bruised cinnamon, in about two pounds of proof spirit, for about a week.

A better tonic than the spirit, as it contains the astringent as well as aromatic principle of cinnamon. Dose two or three drams.

d. TINCTURA CINNAMOMI COMPOSITA, E. TINCTURA AROMATICA, L. Compound tincture of cinnamon. *Aromatic tincture*.

Made by digesting an ounce (or six drams, L. D.) of bruised cinnamon, an ounce (or two drams, D. or three drams, L.) of bruised cardamom seeds, two drams of powdered long pepper, (and two drams of powdered ginger, L. D.) in two pounds and a half (or two pounds, D. or two pints, L.) of proof spirit, for seven days.

A very hot tincture, useful in asthenic atony of the stomach. Dose two or three drams.

e. PULVIS AROMATICUS, E. L. D. Aromatic powder.

The Edinburgh aromatic powder is prepared of equal parts of cinnamon, lesser cardamom seeds, and ginger, beaten together to a very fine powder. The proportions of the other colleges are cinnamon two ounces, lesser cardamom seeds, ginger and long pepper, of each an ounce. Dose 10 grains to a scruple.

f. ELECTUARIUM AROMATICUM, E. D. CONFECTIO AROMATICA, L. Aromatic electuary or *confection*. *Cordial confection*.

History of Simple and Official Medicines. The Edinburgh electuary is made by mixing one part of aromatic powder with two parts of syrup of orange peel. That of the Dublin college is prepared by mixing three ounces of conserve of orange peel with half an ounce of powdered cinnamon, half an ounce of powdered nutmeg, two drams of powdered ginger, and two drams of saffron, with an ounce of double refined sugar, and beating them together with a sufficient quantity of syrup of orange peel into an electuary. The London confection is made by first macerating half a pound of zedoary in coarse powder, and half a pound of saffron, in three pints of water for 24 hours, pressing out the liquor, and evaporating it to a pint and a half, and adding 16 ounces of compound powder of crabs claws, of cinnamon and nutmeg each two ounces, cloves an ounce, lesser cardamom seeds half an ounce, all in fine powder, and two pounds of double refined sugar, so as to form an electuary.

Of these compositions, the first is the best. Dose a scruple to half a dram.

⁵¹³ Cassia bark. 119. LAURUS CASSIA, E. CASSIA LIGNEA, D. Cassia bark. See BOTANY, p. 173.

This is commonly employed instead of cinnamon, and though not so delicate, is as efficacious as that expensive drug. The buds of cassia are, we believe, stronger than the bark.

Official Preparation.

⁵¹⁹ Cassia water. a. AQUA LAURI CASSIÆ, E. Cassia water.

Distilled like cinnamon water, for which it is commonly substituted.

⁵²⁰ Camphor. 120. LAURUS CAMPHORA, E. The camphor tree. CAMPHORA, L. D. Camphor or *Camphire*. See BOTANY, page 170. and 174; and CHEMISTRY, N^o 2441. See also the article CAMPHORA.

Internally camphor is administered as a diaphoretic in typhoid fevers, in rheumatism, in low eruptive fevers, in a dose of from five to 20 grains; and as an antispasmodic in hiccup, hysteria, epilepsy and in mania and melancholia, especially in that maniacal affection that sometimes takes place in lying-in women. It is applied externally in cases of gangrene, to discuss indolent tumours, and to disperse collections of milk in the breasts of women who are weaning their infants.

Official Preparations.

⁵²¹ Camphorated emulsion. a. EMULSIO CAMPHORATA, E. Camphorated emulsion.

Prepared by first beating together two drams of blanched sweet almonds, and a dram of double refined sugar, then rubbing with these a scruple of camphor, and gradually adding six ounces of water to make an emulsion. Dose two or three ounces.

⁵²² Camphorated mixture. b. MISTURA CAMPHORATA, L. Camphorated mixture.

Made by rubbing a dram of camphor, first with a little rectified spirit of wine, and then with half an ounce of double refined sugar, and adding gradually a pint of boiling distilled water, and straining off the clear liquor.

VOL. XII. Part II.

+

Scarcely so active as the foregoing. Dose much the same.

History of Simple and Official Medicines. c. TINCTURA CAMPHORÆ, E. SPIRITUS CAMPHORATUS, L. D. Tincture of camphor. Camphorated spirit. ⁵²³ Tincture of camphor.

A solution of camphor in rectified spirit. The several colleges direct very different proportions, viz. the Edinburgh an ounce, or two or three ounces, of camphor, to a pound of alcohol; the London four ounces to two pints; and the Dublin college half an ounce to eight ounces.

d. OLEUM CAMPHORATUM, E. Camphorated oil. ⁵²⁴ Camphorated oil.

A solution of camphor in oil olive, in the proportion of half an ounce of the former to two ounces of the latter, made by triturating them together in a glass or marble mortar.

e. LINIMENTUM CAMPHORÆ COMPOSITUM, L. ⁵²⁵ Camphorated liniment. LINIMENTUM CAMPHORÆ, D. Compound liniment of camphor.

Made by first mixing six ounces of water of pure ammonia (L.), or 10 ounces of water of carbonated ammonia (D.), with 16 ounces (or two pounds, D.) of spirit of lavender, and distilling off the spirit from a glass retort; then dissolving in the distilled spirit two ounces (L.) or three ounces (D.) of camphor.

These three last are intended for external application in the cases above mentioned, and the last is the most stimulating.

⁵²⁶ Bay. 121. LAURUS NOBILIS, E. LAURUS, L. Bay. See BOTANY, p. 171, and 172.

The leaves, berries, and expressed oil of the berries, are employed in medicine.

⁵²⁷ Sassafras. 122. LAURUS SASSAFRAS, E. SASSAFRAS, L. D. Sassafras wood, root, and bark. See BOTANY, p. 173.

Employed chiefly as a gentle diaphoretic or alterative in cutaneous eruptions, by way of decoction or infusion.

Official Preparations.

a. OLEUM VOLATILE LAURI SASSAFRAS, E. OLEUM SASSAFRAS, L. Oil of sassafras. ⁵²⁸ Oil of sassafras.

Distilled as the other volatile oils.

Order 2. TRIGYNIA.

⁵²⁹ Rhubarb. 123. RHEUM PALMATUM, E. RHABBARBARUM, L. D. Rhubarb. See BOTANY, p. 175.

Official Preparations.

a. INFUSUM RHEI PALMATI, E. Infusion of rhubarb. ⁵³⁰ Infusion of rhubarb.

Made by macerating half an ounce of bruised rhubarb in eight ounces of boiling water for 12 hours; then adding an ounce of spirit of cinnamon, and straining. Dose half an ounce to an ounce and a half.

b. VINUM RHEI PALMATI, E. VINUM RHABBARBARUM, L. Rhubarb wine. ⁵³¹ Rhubarb wine.

5 D

The

History of Simple and Official Medicines. The Edinburgh wine is prepared by infusing two ounces of sliced rhubarb and a dram of bruised canella alba in 15 ounces of Spanish white wine, and two ounces of diluted alcohol, for seven days, and straining through paper. The London formula directs two ounces and a half of sliced rhubarb, half an ounce of bruised lesser cardamom seeds, and two drams of saffron, to be digested in two pints of Spanish white wine, and half a pint of proof spirit, for 10 days.

The Edinburgh wine is the stronger, and may be given in the dose of an ounce. Dose of the London, about an ounce and a half, or a small wine glass full.

⁵³² Tincture of rhubarb. **c. TINCTURA RHEI PALMATI, E. TINCTURA RHABARBARI, L. D.** Tincture of rhubarb.

Prepared by digesting three ounces (E.) or two ounces (L. D.) of sliced rhubarb, half an ounce (E.) or two drams (L. D.) of bruised cardamom seeds, (and two drams of saffron (L. D.) in two pounds and a half (E.) or two pounds (D.) or two pints (L.) of proof spirit, for about a week, and straining.

As a purgative, this may be given in the dose of an ounce; as a stomachic from two to four drams.

⁵³³ Compound tincture of rhubarb. **d. TINCTURA RHABARBARI COMPOSITA, L.** Compound tincture of rhubarb.

Prepared of two ounces of sliced rhubarb, half an ounce of bruised liquorice root, two drams of powdered ginger, and two drams of saffron, digested for 14 days in 12 ounces of proof spirit mixed with a pint of distilled water.

Uses and doses as of the preceding

⁵³⁴ Tincture of rhubarb and aloes. **e. TINCTURA RHEI ET ALOES, E.** Tincture of rhubarb and aloes.

Made by digesting 10 drams of sliced rhubarb, six drams of powdered socotorine aloes, and half an ounce of bruised cardamom seeds, in two pounds and a half of diluted alcohol, for seven days.

Dose half an ounce to an ounce.

⁵³⁵ Tincture of rhubarb and gentian. **f. TINCTURA RHEI ET GENTIANÆ, E.** Tincture of rhubarb and gentian.

Made by digesting two ounces of sliced rhubarb, and half an ounce of sliced gentian root, in two pounds and a half of diluted alcohol, for seven days, and straining.

A good stomachic. Dose two or three drams.

CLASS X. DECANDRIA. Order I. MONOGYNIA.

⁵³⁶ Balsam of Peru. **124. MYROXYLON PERUIFERUM, E. BALSAMUM PERUVIANUM, L. D.** Balsam of Peru. See BOTANY, p. 182, and CHEMISTRY, N° 2484.

Official Preparation.

a. TINCTURA BALSAMI PERUVIANI, L. Tincture of balsam of Peru. **History of Simple and Official Medicines.**

Made by digesting four ounces of balsam of Peru in a pint of rectified spirit of wine till the balsam is dissolved. ⁵³⁷ Tincture of balsam of Peru.

Dose half a dram to a dram and a half as a stimulant.

125. TOLUIFERA BALSAMUM, E. BALSAMUM TOLUTANUM, L. D. Balsam of Tolu. See BOTANY, p. 182, and CHEMISTRY, N° 2483. ⁵³⁸ Balsam of Tolu.

Official Preparations.

a. TINCTURA TOLUIFERÆ BALSAMI, E. TINCTURA BALSAMI TOLUTANI, L. D. Tincture of balsam of Tolu. ⁵³⁹ Tincture of balsam of Tolu.

Made by digesting an ounce, or an ounce and a half (D.), of balsam of Tolu, in a pound, or a pint (L.), of alcohol, till the balsam is dissolved.

This is the best form of employing this balsam, and it may be given mixed with honey, or, as in the following preparation, with syrup. Dose, half a dram to two drams as an expectorant or stimulant.

b. SYRUPUS TOLUIFERÆ BALSAMI, L. SYRUPUS TOLUTANUS, L. Syrup of balsam of Tolu, or balsamic syrup. ⁵⁴⁰ Syrup of Tolu.

The Edinburgh college direct this syrup to be prepared by mixing an ounce of the above tincture with two pounds of common syrup. The London process is to boil eight ounces of balsam of Tolu with three pints of distilled water for two hours, strain the liquor, and boil it with a sufficient quantity of double refined sugar to make a syrup. The Edinburgh formula produces both a cheaper and a stronger syrup.

126. CASSIA FISTULA, E. CASSIA FISTULARIS, L. D. Cassia fruit. See BOTANY, p. 181. ⁵⁴¹ Cassia fistula.

Official Preparations.

a. ELECTUARIUM CASSIÆ FISTULÆ, E. ELECTUARIUM CASSIÆ, L. D. Electuary of cassia. ⁵⁴² Electuary of cassia.

This is prepared of four parts (E.), or half a pound (L.), of the pulp of cassia; one part (E.), or an ounce (L.), of the pulp of tamarinds; one part (E.), or two ounces (L.), of manna; and four parts or half a pound of syrup of damask roses. The manna is first dissolved in the syrup by a gentle heat, the pulps are then added, and the whole evaporated to the consistence of an electuary.

A gentle laxative. Dose two or three drams.

127. CASSIA SENNA, E. SENNA, L. D. Senna leaves. See Woodville, Lewis, and Duncan (c.) ⁵⁴³ Sen-Senna.

Official

(c) This volume is now drawing very near a close, and it is indispensable that the present article should not extend beyond it. It is therefore necessary that in the remaining part of the materia medica, we should be extremely concise, and should omit all the natural history, and much of the medical history, of the simple articles. Fortunately, in many cases, these circumstances have been anticipated under BOTANY; and where this has not been the

History of
Simple and
Official
Medicines.

Official Preparations.

544
Simple in-
fusion of
senna.

a. INFUSUM SENNÆ SIMPLEX, L. Simple infusion of senna.

Prepared by macerating an ounce and a half of senna, and a dram of powdered ginger, in a pint of boiling water, for an hour, in a covered vessel. Dose about two or three ounces.

545
Tartarized
infusion of
senna.

b. INFUSUM SENNÆ TARTARISATUM, L. Tartarized infusion of senna.

Instead of ginger, half an ounce of bruised coriander seeds and two drams of crystals of tartar are here added. Dose as of the above.

546
Infusion of
tamarinds
with senna.

c. INFUSUM TAMARINDI CUM SENNÆ, E. Infusion of tamarinds with senna.

Prepared by macerating an ounce of preserved tamarinds, a dram (or two, three, &c. drams) of senna, half a dram of bruised coriander seeds, and half an ounce of brown sugar, in eight ounces of boiling water, for four hours, in a glass vessel.

An excellent laxative. Dose from two or four ounces, according to the quantity of *senna*.

547
Compound
tincture of
senna.

d. TINCTURA SENNÆ COMPOSITA, E. TINCTURA SENNÆ, L. D. Compound tincture of senna.

The Edinburgh tincture is made by digesting two ounces of senna, an ounce of bruised jalap root, and half an ounce of bruised coriander seeds, in three pounds and a half of diluted alcohol, for seven days, straining the tincture, and adding four ounces of double-refined sugar. The London and Dublin tinctures are made by digesting a pound of senna, an ounce and a half of bruised caraway seeds, half an ounce of bruised cardamom seeds, and 16 ounces of stoned raisins, in a gallon or nine pounds (D.) of proof spirit, for 14 days. Dose half an ounce to an ounce and a half.

548
Electuary
of senna.

e. ELECTUARIUM CASSIÆ SENNÆ, E. ELECTUARIUM SENNÆ, L. D. Electuary of senna. *Lenitive electuary.*

The Edinburgh and London electuaries are composed of eight ounces of pounded senna, four ounces of powdered coriander seeds, three ounces of liquorice root, half a pound or a pound of figs, half a pound of pulp of tamarinds, half a pound of pulp of prunes (and half a pound of pulp of cassia (L.)), and two pounds and a half of double refined sugar. That of Dublin is made of four ounces of powdered senna, a pound of pulp of French prunes, two ounces of pulp of tamarinds, a pound and a half of molasses, and two drams of essential oil of caraway. Dose about half an ounce.

549
Extract of
senna.

f. EXTRACTUM CASSIÆ SENNÆ, E. EXTRACTUM SENNÆ, L. D. Extract of senna.

Made like other extracts that have been mentioned. Dose 10 to 30 grains. Not much used.

History of
Simple and
Official
Medicines.

g. PULVIS SENNÆ COMPOSITUS, L. Compound powder of senna.

Composed of senna, crystals of tartar, each two ounces, scammony half an ounce, and ginger two drams. Dose two or three scruples.

128. HÆMATOXYLON CAMPECHIANUM, E. HÆMATOXYLON, L. D. LIGNUM CAMPECHENSE. Logwood. See BOTANY, p. 183.

Official Preparation.

a. EXTRACTUM HÆMATOXYLI, L. Extract of logwood.

Made by boiling logwood in successive portions of water, and evaporating the mixed liquors to a proper consistence. Dose a scruple to two scruples.

129. SWIETENIA MAHAGONI, E. Mahogany tree bark.

130. SWIETENIA FEBRIFUGA, E. Febrifuge Swietenia bark.

These barks are good tonics, and may be used instead of the cinchona.

131. GUAIAECUM OFFICINALE, E. GUAIAECUM, L. D. Guaiacum wood, bark and resin. See BOTANY, p. 181.; and for an excellent account of the nature and chemical properties of the resin, see Phil. Trans. for 1806. p. 89.

Official Preparations.

a. DECOCTUM GUAIAECI COMPOSITUM, E. Compound decoction of guaiacum. *Decoction of the woods.*

Made by boiling three ounces of guaiacum raspings, and two ounces of stoned resins, in ten pounds of water to five pounds; adding, towards the end, of sliced sassafras and bruised liquorice root, each an ounce.

Given as a diet drink in cutaneous eruptions and rheumatism, to the extent of a pint in the day.

b. TINCTURA GUAIAECI OFFICINALIS, E. Tincture of guaiacum.

Made by digesting a pound of powdered resin of guaiacum in two pounds and a half of alcohol for ten days, and filtering.

A good diaphoretic. Dose, two or three drams mixed with honey or syrup.

c. TINCTURA GUAIAECI AMMONIATA, E. TINCTURA GUAIAECI VOLATILIS, D. TINCTURA GUAIAECI, L. Ammoniated tincture of guaiacum.

the case, we here make a general reference to Woodville's "Medical Botany," Lewis's "Experimental History," Duncan's "New Dispensatory," the "Practical Synopsis," and "Thesaurus Medicaminum."

History of
Simple and
Official
Medicines

This is made by digesting four ounces of powdered resin of guaiacum in about one pound and a half of ammoniated alcohol for seven days (three days L.), and filtering.

More stimulant than the last. Dose one or two drams.

559
Rue.

132. RUTA GRAVEOLENS, E. RUTA, L. D. Rue.
See BOTANY, p. 182.

Official Preparations.

560
Volatile oil
of rue.

a. OLEUM VOLATILE RUTÆ, D. Volatile oil of rue.

Distilled as other volatile oils. Used chiefly as an anthelmintic. Dose from three to six drops.

561
Extract of
rue.

b. EXTRACTUM RUTÆ GRAVEOLENTIS, E. EXTRACTUM RUTÆ, L. D. Extract of rue.

Made like other watery extracts. Dose about one scruple.

562
Simarouba.

133. QUASSIA SIMARUBA, E. SIMAROUBA, L. D. Simarouba, or mountain damson bark.

Used as a tonic in dysentery, obstinate diarrhoea, indigestion, and intermittent fevers. Dose about a dram in substance, or two drams in the form of decoction, which is the better mode of exhibition.

563
Quassia.

134. QUASSIA EXCELSA, E. QUASSIA, L. Quassia wood, bark, and root.

A strong bitter, and good tonic, generally given by way of infusion, in the proportion of one to two drams to a pint of water.

564
Yellow-
flowered
rhododen-
dron

135. RHODODENDRON CHRYSANTHUM, E. Yellow-flowered rhododendron. See BOTANY, p. 184. and Duncan's Dispensatory.

565
Whortle-
berry.

136. ARBUTUS UVA URSI, E. UVA URSI, L. D. Whortle-berry. See BOTANY, p. 184.

566
Storax.

137. STYRAX OFFICINALE, E. STYRAX, L. STYRAX CALAMITA, D. Storax. See BOTANY, p. 184. and CHEMISTRY, N° 2481.

Official Preparation.

567
Purified
storax.

a. STYRAX PURIFICATA, L. D. Purified storax.

Storax is purified by dissolving it in rectified spirit, straining the solution, and reducing it to a proper thickness by a gentle heat.

Employed chiefly as an ingredient in a tincture to be mentioned immediately.

568
Benzoin.

138. STYRAX BENZOIN, E. BENZOE, L. BENZOINUM, D. Benzoin or benjamim. See BOTANY, p. 184. and CHEMISTRY, N° 2480.

Official Preparations.

569
Compound
tincture of
benzoin.

a. TINCTURA BENZOES COMPOSITA, E. L. BALSAMUM TRAUMATICUM. Compound tincture of benzoin. *Traumatic vulnerary, or friars balsam.*

Prepared by digesting three ounces of powdered ben-

zoin (two ounces of strained storax, L.) an ounce of balsam of Tolu, and half an ounce of powdered socoto-rine aloes, in two pounds of alcohol, for seven days (or three days, L.), and straining.

This tincture forms a good expectorant, made into an emulsion with honey; and it has been long, though perhaps undeservedly, celebrated, as an external application to wounds.

b. ACIDUM BENZOICUM, E. SAL BENZOINI, D. FLORES BENZOES, L. Benzoic acid. *Salt acid of Benzoin. Flowers of benjamin.*

The Edinburgh process for obtaining this acid is, to triturate 24 ounces of benzoin with eight ounces of carbonate of soda; to boil this mixture in 16 pounds of water, constantly stirring, straining the decoction; repeat the boiling with six pounds of more water, straining, mixing the two decoctions, and evaporating till only two pounds remain, filtering again, and dropping into the fluid diluted sulphuric acid as long as there is any precipitation; then dissolving the precipitated acid in boiling water, straining the solution through linen, and setting it aside to crystallize; and, lastly, washing the crystals with cold water, and drying them.

For other methods of procuring this acid, and for an account of its chemical properties, See CHEMISTRY, N° 714 *et seq.*

Benzoic acid is employed as an expectorant, in a dose of a grain or two.

139. COPAIFERA OFFICINALIS, E. BALSAMUM COPAIVA, L. BALSAMUM COPAIBA, D. Balsam of COPAIVA. See BOTANY, p. 185.

Order 2. DIGYNIA.

140. DIANTHUS CARYOPHYLLUS, E. CARYOPHYLLUM RUBRUM, L. D. Clove julyflower. See BOTANY, p. 196.

Official Preparations.

a. SYRUPUS DIANTHÆ CARYOPHYLLÆ, E. SYRUPUS CARYOPHYLLI RUBRI, L. Syrup of clove julyflower.

Made by macerating a pound or two of the petals of clove julyflowers fresh gathered, and freed from the heels, in four pounds or six pints of boiling water for 12 hours in a glass vessel, straining the infusion, and adding of double refined sugar, seven pounds, or as much as is sufficient to form a syrup.

Order 4. PENTAGYNIA.

141. OXALIS ACETOSELLA, L. UJULA, L. A-CETOSELLA, D. Wood sorrel. See BOTANY, p. 187.

Official Preparations.

a. CONSERVA ACETOSELLÆ, D. Conserve of wood sorrel.

Made by beating the leaves of wood sorrel in a marble mortar with a wooden pestle, first by themselves, and then with three times their weight of double refined sugar, till they are thoroughly combined.

158. GEUM URBANUM. Avens or herb bennet. See BOTANY, p. 199. and the "Practical Synopsis." This is considered as a good substitute for cinchona.

CLASS XIII. POLYANDRIA. Order I. MONOGYNIA.

159. PAPAVER RHOEAS. PAPAVER ERRATICUM, L. Common red poppy. See BOTANY, p. 204.

Official Preparation.

a. SYRUPUS PAPAVERIS ERRATICI, L. Syrup of red poppy.

Four pounds of the fresh flowers of red poppy are gradually mixed with four pints and a half of boiling distilled water in a water bath, constantly stirring them; they are then suffered to macerate for 12 hours, the juice is pressed out and boiled with double refined sugar into a syrup.

Generally added to narcotic draughts, juleps, &c.

160. PAPAVER SOMNIFERUM, E. PAPAVER ALBUM, L. D. White poppy. *Opium*. See BOTANY, p. 204.

To dilate on any article, however important, is now out of our power; we must therefore, besides the above reference, refer our readers for the best accounts of opium, to Dr Crumpe's "Inquiry," Dr Duncan's Dispensatory, the "Practical Synopsis," and *Thesaurus Medicaminum*.

Official Preparations.

a. OPIUM PURIFICATUM, L. D. Purified opium.

A pound of opium, cut into small pieces, is digested with 12 pints of proof spirit, with a gentle heat, till as much as possible of the opium is dissolved. The tincture is then filtered and distilled to a consistence proper for making into pills or beating to powder.

Purified opium is commonly considered as rather weaker than crude opium; two grains of the softer mass, and one grain and a half of the harder, being an ordinary dose.

b. PULVIS OPIATUS, E. L. Opiate powder.

By the London process this is formed by mixing together a dram of hard purified opium in powder, and nine drams of burnt and prepared hartshorn. The Edinburgh powder is prepared of one part of opium, and nine parts of prepared carbonate of lime, rubbed together to a very fine powder.

Ten grains of these powders contain one grain of opium; but the Edinburgh powder is rather the stronger.

History of er. They are useful when it is required to administer Simple and opium in very small doses.

Official

Medicines.

615

Opiate pills.

c. PILULÆ OPII, L. PILULÆ OPIATÆ, E. Opiate pills. *Opiate or thebaic pills.*

The London pills are prepared of two drams of hard purified opium in powder, and one ounce of extract of liquorice, beaten together till they are perfectly united. The Edinburgh pills are formed of one part of opium, and seven of extract of liquorice, softened separately with diluted alcohol, beaten into a pulp and mixed, and then beaten with two parts of pounded Jamaica pepper into a uniform mass.

The London pills contain two grains of opium, and the Edinburgh one grain, in 10 of the mass.

616
Extract of opium.

d. EXTRACTUM OPII, D. Extract of opium.

Prepared by dissolving two ounces of purified opium in one pound of boiling water, straining the liquor, and adding, while warm, one pound of cold distilled water, exposing to the air for two days, filtering again, and evaporating to the proper consistence of an extract.

617
Troches of liquorice with opium.

e. TROCHISCI GLYCYRRHIZÆ CUM OPIO, E. TROCHISCI GLYCYRRHIZÆ COMPOSITI, D. Troches of liquorice with opium. *Compound troches of liquorice.*

The Edinburgh troches are formed by triturating two drams of opium, with half an ounce of tincture of tolu; then adding by degrees five ounces of extract of liquorice, softened in warm water, and eight ounces of common syrup; and lastly, five ounces of powdered gum arabic, and drying the mass till it is of a consistence to form troches, weighing ten grains each. The Dublin formula directs two drams of purified opium to be triturated with a dram of balsam of Peru, and three drams of tincture of myrrh, till they are intimately mixed; then to be added two drams of tincture of tolu, and nine ounces of extract of liquorice, softened in warm water; when the whole is to be well beaten together, and, with the addition of five ounces of powdered gum arabic, formed into troches, weighing ten grains each.

These troches are intended to allay irritation in tickling coughs. About seven and a half of the Edinburgh, and six of the Dublin troches, contain about one grain of opium.

618
Opiate electuary.

f. ELECTUARIUM OPIATUM, E. CONFECTIO OPIATA, L. Opiate electuary. *Opiate confection.*

The Edinburgh electuary is formed by mixing together six ounces of aromatic powder, three ounces of finely powdered snakeroot, half an ounce of opium, diffused in a sufficient quantity of Spanish white wine, and one pound of the syrup of ginger. The London confection is prepared of six drams of hard purified opium in powder; of long pepper, ginger, and caraway seeds powdered, each two ounces; and syrup of white poppy boiled to the consistence of honey, three times the weight of the other ingredients. The opium is first mixed with the syrup, then the other powders added, and the whole intimately blended.

These are intended as stimulating compositions of

opium. Thirty-six grains of the London, and 43 of the Edinburgh preparation, contain about one grain of opium.

History of Simple and Official Medicines.

g. ELECTUARUM MIMOSÆ CATECHU, E. ELECTUARIUM CATECHU COMPOSITUM, D. CONFECTIO JAPONICA. Electuary of catechu. *Japonic confection.*

These electuaries are prepared of four ounces of extract of catechu powdered, three ounces powdered kino, one ounce of cinnamon, and the same of nutmeg in powder, one dram and a half of opium, diffused in Spanish white wine, and two pounds and a quarter of syrup of red roses boiled to the consistence of honey (E.); or 14 ounces of syrup of ginger, and the same of the syrup of orange peel, boiled to the consistence of honey (D.).

Powerful astringents, given in diarrhœas. Ten scruples contain about one grain of opium, and the usual dose is a tea spoonful frequently repeated.

h. TINCTURA OPII, E. L. D. TINCTURA THEBAICA. Tincture of opium. *Thebaic tincture. Li- quid laudanum.*

The Edinburgh and Dublin tinctures are made by digesting two ounces of opium in two pounds of diluted alcohol, 14 days, and filtering. The London tincture is made by digesting ten drams of powdered purified opium in a pint of proof spirit for ten days.

These tinctures are considered as of nearly equal strength. Dose as narcotics, 25 or 30 drops; as antispasmodics, they are, like the solid opium, given in much larger doses.

i. TINCTURA OPII CAMPHORATA, L. D. ELIXIR PAREGORICUM. Camphorated tincture of opium. *Paregoric elixir.*

Prepared by digesting one dram of hard purified opium, one dram of flowers of benzoin, two scruples of camphor, and one dram of essential oil of aniseeds, in two pints of proof spirit, for ten days.

Half an ounce of this tincture contains about one grain of opium. Usual dose about one dram or two.

k. TINCTURA OPII AMMONIATA. Olim ELIXIR PAREGORICUM, E. Ammoniated tincture of opium. *Ammoniated tincture of opium.*

Made by digesting three drams of benzoic acid, three drams of sliced saffron, two drams of opium, and half a dram of volatile oil of aniseeds, in ten ounces of ammoniated alcohol, seven days, in a close vessel.

An excellent antispasmodic, stronger than the last. Dose about one dram.

l. SYRUPUS OPII, D. Syrup of opium.

Made by dissolving 48 grains of extract of opium in three pounds of boiling water, and adding a sufficient quantity of double refined sugar to make a syrup.

An excellent narcotic for children. According to Dr Duncan, an ounce of it contains about two grains and a half of opium.

m. SYRUPUS PAPAVERIS SOMNIFERI, E. SYRUPUS PAPAVERIS ALBI, L. Syrup of white poppies.

The Edinburgh syrup is made by macerating two pounds

History of Simple and Official Medicines. 625
 pounds of sliced white poppy heads, freed from the seeds, in 30 pounds of boiling distilled water for 12 hours, boiling it to a third, and pressing out the liquor, which is again boiled to one half, strained, and formed into a syrup with four pounds of double refined sugar. The proportions in the London process are, three pounds and a half of poppy heads, eight gallons of water, and six pounds of sugar.

A weak narcotic, not so certain as the last syrup.

625 Ladanum. 161. CISTUS CRETICUS, LADANUM, L. Ladanum. See CHEMISTRY, N^o 2466.

Official Preparation.

626 Compound ladanum plaster. a. EMPLASTRUM LADANI COMPOSITUM, L. Compound ladanum plaster.

Formed of three ounces of ladanum, one ounce of frankincense, powdered cinnamon and expressed oil of mace, each half an ounce, and one dram of essential oil of mint.

A warm stimulating plaster.

Order 3. TRIGYNIA.

627 Stavesacre. 162. DELPHINIUM STAPHISAGRIA. STAPHISAGRIA, L. D. Stavesacre.

Employed as an external application against vermin.

628 Blue monkshood. 163. ACONITUM NEOMONTANUM. ACONITUM NAPELLUS, E. ACONITUM, L. D. Blue monkshood, or aconite. See *Duncan's Dispensatory*.

Official Preparations.

629 Inspissated juice of aconite. a. SUCCUS SPISSATUS ACONITI NAPELLI, E. Inspissated juice of aconite.

Made from the fresh leaves of aconite in the usual manner. Dose from half a grain to three grains, twice or thrice a day.

marsh-
mallow.

b. SYRUPUS ALTHÆÆ OFFICINALIS, E. SYRU-
PUS ALTHÆÆ, L. Syrup of marshmallow.

Made by boiling one pound of fresh marshmallow
root, sliced or bruised, in ten pounds or a gallon of wa-
ter, to one half, and adding four pounds of double re-
fined sugar to make a syrup.

A good emollient and demulcent in coughs, &c.

CLASS XVII. DIADELPHIA. Order 2. HEX-
ANDRIA.

675
Common
fumitory.

189. FUMARIA OFFICINALIS. FUMARIA, D.
Common fumitory. See BOTANY, p. 237.

Order 3. OCTANDRIA.

190. POLYGALA SENEGA, E. SENEKA, L. D.
Seneka root. See BOTANY, p. 237.

Official Preparation.

a. DECOCTUM POLYGALÆ SENEGÆ E. Decoction
of seneka. Decoction
of seneka.

Made by boiling one ounce of seneka root in two
pounds of water to 16 ounces, and straining.

Used in dropsy and rheumatic or arthritic com-
plaints, and lately recommended in croup. Dose about
two ounces, three or four times a-day.

Order 4. DECANDRIA.

191. PTEROCARPUS SANTALINUS, E. SANTA-
LUM RUBRUM, L. D. Red sanders wood. Red san-
ders wood.

Employed chiefly to give colour to a tincture.

192. PTEROCARPUS DRACO, E. SANGUIS DRA-
CONIS, L. Dragon's blood. See CHEMISTRY, N^o
2467. Dragon's blood.

Employed as an astringent, but now seldom used.

193. SPARTIUM SCOPARIUM, E. GENISTA, L. D. Common
Common broom tops. See BOTANY, p. 237. Common
broom.

Official Preparation.

a. EXTRACTUM GENISTÆ, L. Extract of broom. Extract of
broom.

194. DOLICHOS PRURIENS, E. DOLICHOS, D. Cowhage.
Cowhage, or cow-itch. See BOTANY, p. 239. Cowhage.

195. ASTRAGALUS TRAGACANTHA, E. TRAGA-
CANTHA, L. D. Gum tragacanth, or gum dragant. Gum traga-
canth.

This gum is a mere mucilage, and is employed as a
demulcent.

Official Preparations.

a. MUCILAGO ASTRAGALI TRAGACANTHÆ, E. Mucilage of
MUCILAGO TRAGACANTHÆ, L. MUCILA- gum traga-
GO GUMMI TRAGACANTHÆ, D. Mucilage canth
of gum tragacanth.

Made by macerating one ounce of powdered gum
tragacanth in eight ounces of boiling water (E.), or
half an ounce in ten ounces (L.), or one dram in eight
ounces (D.), and dissolving by subsequent trituration.

b. PULVIS TRAGACANTHÆ COMPOSITUS, L. Com-
pound powder of tragacanth. Compound
powder of
tragacanth.

Prepared of powdered gum tragacanth, gum arabic,
and starch, of each half an ounce, rubbed into a pow-
der with three ounces of double refined sugar.

A demulcent powder, serviceable in tickling coughs,
strangury, ardor urinæ, violent mucous diarrhœa, and
similar diseases.

196. GLYCYRRHIZA GLABRA, E. GLYCYR-
RHIZA, root. Licurice
root.

History of **RHIZA, L. D.** Liquorice root and extract of liquorice.
 Simple and Official Medicines. Used as an emollient and demulcent, in substance, in decoction, pills, electuaries, &c.

687
 Extract of liquorice.

Official Preparation.
 a. **EXTRACTUM GLYCYRRHIZÆ GLABRÆ, E. EXTRACTUM GLYCYRRHIZÆ, L. D.** Extract of liquorice.

Prepared like other watery extracts.

688
 Cabbage-tree bark.

197. **GEOFFRÆA INERMIS, E. GEOFFRÆA, D.** Cabbage-tree bark.

Lately introduced into this country from the West Indies as an anthelmintic, in the form of decoction.

Official Preparation.

689
 Decoction of cabbage-tree bark.

a. **DECOCTUM GEOFFRÆÆ INERMIS, E. DECOCTUM GEOFFRÆÆ, D.** Decoction of cabbage-tree bark.

Made by boiling one ounce of powdered cabbage-tree bark with a gentle fire in two pounds of water to one pound, and straining. Dose to children a table spoonful, to adults four; giving castor oil, and diluting with acidulated driuks, if unpleasant symptoms should arise.

690
 Fenugreek seed.

198. **TRIGONELLA FOENUM GRECUM. FOENUM GRECUM, L.** Fenugreek seed. See BOTANY, p. 241.

CLASS XVIII. POLYADELPHIA. Order 3. ICOSANDRIA.

691
 Seville orange.

199. **CITRUS AURANTIUM, E. AURANTIUM HISPALENSE, L. D.** Seville orange juice, peel, and leaves. See BOTANY, p. 243.

Official Preparations.

692
 Syrup of orange peel.

a. **SYRUPUS CITRI AURANTII, E. SYRUPUS CORTICIS AURANTII, L. D.** Syrup of orange peel.

Prepared by macerating six ounces, or eight ounces (L. D.) of the fresh outer rind of Seville oranges, with three pounds or five pints (L. D.) of boiling water, for 12 hours in a close vessel, and adding to the filtered liquor of double refined sugar four pounds, or enough to make a syrup.

Used chiefly in composition.

693
 Orange peel water.

b. **AQUA CITRI AURANTII, E.** Orange peel water.

Ten pounds of water distilled from two pounds of fresh orange peel, after due maceration.

A pleasant cordial water. Dose two or three ounces.

694
 Tincture of orange peel.

c. **TINCTURA AURANTII CORTICIS, L. D.** Tincture of orange peel.

Made by digesting three ounces of fresh orange peel in two pints or two pounds of proof spirit for three days. Dose three or four drams to an ounce.

d. **CONSERVA CITRI AURANTII, E. CONSERVA CITRI AURANTII HISPALENSIS, L. CONSERVA CITRI AURANTII, D.** Conserve of orange peel.

Prepared by beating the fresh rind of Seville oranges first by itself, and then with three times its weight of double refined sugar.

200. **CITRUS MEDICA, E. LIMON, L. D.** Lemon juice, peel, and essential oil. See BOTANY, p. 242.

Official Preparations.

a. **AQUA CITRI MEDICÆ, E.** Lemon peel water.

A gallon of water distilled from two pounds of fresh lemon peel.

A pleasant aromatic water, similar to orange water.

b. **SYRUPUS CITRI MEDICÆ, E. SYRUPUS LIMONIS SUCCI, L. D.** Syrup of lemon juice.

Made by dissolving five parts (E.) or five pounds (L.) or four pounds (D.) of double refined sugar, in three parts or two pints (L.) or two pounds (D.) of filtered lemon juice.

A pleasant refrigerant syrup.

c. **SUCCUS LIMONIS SPISSATUS, L.** Inspissated lemon juice.

Prepared in the same manner as the inspissated juice of elder berries.

Employed chiefly as a refrigerant, especially in bilious or remittent fevers.

Order 4. POLYANDRIA.

201. **MELALEUCA LEUCODENDRON, E. CAJEPUTA, L.** Cajepu oil.

Used as an external stimulant in cases of luxation, sprains, and rheumatic and gouty affections.

202. **HYPERICUM PERFORATUM. HYPERICUM, L.** St John's wort. See BOTANY, p. 243.

CLASS XIX. SYNGENESIA. Order 1. POLYGAMIA ÆQUALIS.

203. **LEONTODON TARAXACUM, E. TARAXACUM, L. D.** Dandelion root and leaves.

Reputed a diuretic, but scarcely employed in modern practice.

204. **LACTUCA VIROSA, E.** Wild lettuce. See BOTANY, p. 248. and Duncan's Dispensatory.

Official Preparation.

a. **SUCCUS SPISSATUS LACTUCÆ VIROSÆ, E.** Inspissated juice of wild lettuce.

Prepared as other inspissated juices; employed as a narcotic and diuretic, principally in dropsies proceeding from visceral obstructions. Dose at first about three

History of three grains, gradually increased to 15 or more, twice Simple and or thrice a-day.

Official Medicines.

705
Burlock root.

205. ARCTIUM LAPPA, E. BARDANA, L. D. Burdock root.

Recommended as a diuretic, and given in the form of decoction in dropsics, &c.

706
Artichoke leaves.

206. CYNARA SCOLYMUS, E. CINARA SCOLYMUS, E. D. Artichoke leaves.

Employed as a diuretic.

Order 2. POLYGAMIA SUPERFLUA.

707
Southernwood.

207. ARTEMISIA ABROTANUM. ABROTANUM, L. Southernwood. See BOTANY, p. 251.

Official Preparation.

708
Decoction for fomentation.

a. DECOCTUM PRO FOMENTO, L. Decoction for fomentations.

Prepared by boiling for a little, of the dried leaves of southernwood, the dried tops of sea wormwood, and dried chamomile flowers, each an ounce, with half an ounce of dried bay leaves, in six pints of distilled water, and straining.

709
Sea wormwood.

208. ARTEMISIA MARITIMA. ABSYNTHIUM MARITIMUM, L. D. Sea wormwood. See BOTANY, p. 251.

Official Preparation.

710
Conserve of sea wormwood.

a. CONSERVA ABSYNTHII MARITIMI, L. Conserve of sea wormwood.

Prepared by beating the fresh tops of sea wormwood with three times their weight of double refined sugar into a conserve.

Employed as a tonic and stomachic in hypochondriasis, epilepsy, &c. and as an anthelmintic. Dose two drams to half an ounce, twice or thrice a-day.

711
Worm seed.

209. ARTEMISIA SANTONICA, E. SANTONICUM, L. D. Worm seed.

Employed as an anthelmintic. Dose from half a dram to a dram, twice a-day, in powder.

712
Common wormwood.

210. ARTEMISIA ABSINTHIUM, E. ABSINTHIUM VULGARE, L. D. Common wormwood. See BOTANY, p. 251.

713
Tansy.

211. TANACETUM VULGARE, E. TANACETUM, L. D. Tansy, leaves and flowers. See BOTANY, p. 251.

A good tonic and anthelmintic. Dose half a dram to four drams in substance, or a table spoonful of the expressed juice.

714
Leopard's bane.

212. ARNICA MONTANA, E. L. D. German leopard's bane. See BOTANY, p. 253, and Duncan's Dispensatory.

715
Elecampane.

213. INULA HELENIUM. INULA CAMPANA, L. D. Elecampane. See BOTANY, p. 253.

716
Golden rod.

214. SOLIDAGO VIRGA AUREA. VIRGA AUREA, D. Golden rod. See BOTANY, p. 253.

215. TUSSILAGO FARFARA, E. TUSSILAGO, L. D. Coltsfoot. See BOTANY, p. 252.

216. ANTHEMIS NOBILIS, E. CHAMÆMELUM, L. D. Chamomile flowers. See BOTANY, p. 254.

An excellent tonic and anthelmintic. Dose in substance about a scruple in powder, or one dram in infusion. Used externally as an emollient and discutient, in the form of clyster or fomentation.

Official Preparations.

a. DECOCTUM ANTHEMIDIS NOBILIS, E. DECOCTUM CHAMÆMELI, D. Decoction of chamomile.

Prepared by boiling an ounce of chamomile flowers, and half an ounce of bruised caraway seeds, in five pounds of water (E.), or half an ounce of chamomile flowers with two drams of sweet fennel seeds, in a pound of water (D).

Used as a carminative clyster, or stimulant fomentation.

b. EXTRACTUM ANTHEMIDIS NOBILIS, E. EXTRACTUM CHAMÆMELI, L. Extract of chamomile.

Prepared as other watery extracts. Dose from a scruple to a dram, as a tonic and anthelmintic.

217. ANTHEMIS PYRETHRUM, E. PYRETHRUM, L. D. Pellitory of Spain.

Used chiefly as a masticatory in toothach.

Order 3. POLYGAMIA FRUSTRANEA.

218. CENTAUREA BENEDICTA, E. CARDUUS BENEDICTUS, L. D. Blessed thistle. See BOTANY, p. 255.

CLASS XX. GYNANDRIA. Order 5. HEXANDRIA.

219. ARISTOLOCHIA SERPENTARIA, E. SERPENTARIA VIRGINIANA, L. D. Virginian snake-root. See Duncan's Dispensatory, and the Synopsis *Materiae Medicæ*.

Employed as a stimulant and tonic in low fevers, gangrene, &c. Dose in substance 10 grains to 3c.

Official Preparation.

a. TINCTURA ARISTOLOCHIAE SERPENTARIAE, E. TINCTURA SERPENTARIAE, L. D. Tincture of snakeroot.

Prepared by digesting two ounces of bruised Virginian snakeroot, and a dram of powdered cochineal, in two pounds and a half of diluted alcohol, for seven days (E.), or three ounces of snakeroot in two pints (L.) or two pounds (D.) of proof spirit, for seven or eight days. Dose from two drams to half an ounce.

Order 10. POLYANDRIA.

220. ARUM MACULATUM. ARUM, L. D. Arum, or wake robin.

Official

History of Simple and Official Medicines.

Official Preparations.

a. CONSERVA ARUM, L. Conserve of arum.

726
Conserve of arum.
Made by beating a pound and a half of the fresh root of arum bruised, with a pound and a half of double refined sugar, into a conserve. Dose about a dram.

CLASS XXI. MONOECIA. Order I. MONOGYNIA.

221. MYRISTICA MOSCHATA, E. MYRISTICA, L. D. Nutmeg tree.

727
Nutmeg tree
728
Oil of mace.

NUX MOSCHATA. Nutmeg. MACIS. Mace. OLEUM MACIS. Oil of Mace. See Duncan's Dispensatory.

Official Preparations.

a. SPIRITUS MYRISTICÆ MOSCHATÆ, E. SPIRITUS NUCIS MOSCHATÆ, L. D. Spirit of nutmeg.

729
Spirit of nutmeg.

A gallon of spirit distilled from two ounces of well-bruised nutmegs. A good cordial. Dose about half an ounce.

Order 4. TETRANDRIA.

222. BETULA ALBA, D. Birch juice.

730
Birch juice.

A gentle diuretic.

223. MORUS NIGRA. MORUS, L. Mulberries.

731
Mulberries.

Official Preparation.

a. SYRUPUS SUCCI FRUCTUS MORI, L. Syrup of mulberry juice.

732
Syrup of mulberry juice.

Prepared in the same manner as the syrup of black currant juice.

Employed as a refrigerant and demulcent.

224. URTICA DIOICA. URTICA, L. Common stinging nettles.

733
Common stinging nettle.

Used as a rubefacient to paralytic limbs, which are whipped with nettles.

Order 8. POLYANDRIA.

225. QUERCUS ROBUR, E. QUERCUS, L. D. Oak bark.

734
Oak bark.

A powerful astringent, employed in passive hemorrhages, diarrhoea, leucorrhoea, and similar cases. Dose in substance 15 grains to half a dram of the powdered bark. Used externally by way of gargle, or lotion.

Official Preparation.

a. EXTRACTUM QUERCUS, D. Extract of oak bark.

735
Extract of oak bark.

Prepared like other watery extracts. Dose 10 grains to a scruple.

226. QUERCUS CERRIS, E. L. D. GALLA. Gall-nuts. See Duncan's Dispensatory.

736
Gall-nuts.

This is perhaps a more powerful astringent than oak bark, and is employed in similar cases.

227. JUGLANS REGIA. JUGLANS, L. Unripe walnuts.

History of Simple and Official Medicines.

Employed as a tonic and anthelmintic.

Order 10. MONADELPHIA.

228. PINUS ABIES. The fir tree.

737
Walnut.
738
Fir tree.
739
Burgundy pitch.

PIX BURGUNDICA, E. D. Burgundy pitch.

Official Preparation.

a. EMPLASTRUM PICIS BURGUNDICÆ, D. EM-Compound PLASTRUM PICIS COMPOSITUM, L. Com-Burgundy pound Burgundy pitch plaster. pitch plaster.

740
Compound Burgundy pitch plaster.

Prepared of two pounds of Burgundy pitch, one pound of ladanum (L.) or of galbanum (D.), four ounces of yellow wax, the same of yellow resin, and one ounce of expressed oil of mace.

A stimulating plaster.

229. THUS, L. Frankincense.

741
Frankincense.

Official Preparation.

a. EMPLASTRUM THURIS COMPOSITUM, L. Com-Compound pound plaster of frankincense. plaster of frankincense.

Prepared of half a pound of frankincense, three ounces of dragon's blood, and two pounds of litharge plaster, adding the resins in powder to the melted litharge plaster.

230. PINUS BALSAMEA. Hemlock fir.

BALSAMUM CANADENSE, E. L. D. Balsam of Canada.

743
Balsam of Canada.

231. PINUS LARIX. The larch.

744
Larch.

TEREBINTHINA VENETA, E. D. Venice turpentine. OLEUM VOLATILE PINI, E. OLEUM TEREBINTHINÆ, L. D. Oil of turpentine.

745
Venice turpentine.

The oil of turpentine is directed by the London college to be prepared by distillation from common turpentine.

746
Oil of turpentine.

Official Preparation.

OLEUM VOLATILE PINI PURISSIMUM, E. OLEUM TEREBINTHINÆ RECTIFICATUM, L. D. Purified oil of turpentine. Spirit of turpentine.

747
Purified oil of turpentine.

Distilled with the addition of water in well luted vessels till the purest part of the oil has come over.

Stimulant and diuretic. Dose from 10 to 30 drops. Mixed with an equal proportion of ether, it is much recommended in calculus. It is an excellent application to chilblains and recent burns.

232. PINUS SYLVESTRIS.

A. PIX LIQUIDA, E. D. Tar.

748
Tar.

Official Preparation.

a. UNGUENTUM PICIS, E. L. D. Tar ointment. Prepared by melting together equal parts of tar and mutton

746
Tar ointment.

History of mutton suet (L. D.), or five parts of tar and two parts Simple and of yellow wax (E.).
 Official Esteeemed a good application in cutaneous diseases, especially *tinea capitis*.
 Medicines.

⁷⁵⁰ Common B. TEREBINTHINA VULGARIS, L. D. Common turpentine.

This, like other turpentines, is a stimulant and diuretic.

⁷⁵¹ Yellow C. RESINA FLAVA, L. RESINA ALBA, D. Yellow rosin. *White rosin*.

Employed chiefly in making stimulating ointments and plasters.

Official Preparations.

⁷⁵² Resinous a. UNGUENTUM RESINOSUM, E. UNGUENTUM ointment. RESINÆ FLAVÆ, L. D. Resinous ointment. *Yellow basilicon*.

Prepared by melting together eight parts of hog's lard, five of white rosin, and two of yellow wax (E.); or by melting together, of yellow rosin and yellow wax, each one pound, over a slow fire, adding a pint or seven ounces of olive oil, and straining the mixture while hot (L. D.).

⁷⁵³ Cerate of b. CERATUM RESINÆ FLAVÆ, L. D. Cerate of yellow rosin.

Prepared by melting together half a pound of the preceding ointment, and one ounce of yellow wax.

These are intended as stimulating applications to ulcers that do not heal or suppurate properly.

⁷⁵⁴ Resinous c. EMPLASTRUM RESINOSUM, E. EMPLASTRUM LYTHARGYRI CUM RESINA, L. EMPLASTRUM ADHESIVUM. Resinous plaster. *Litharge plaster with rosin. Adhesive plaster*.

Prepared by melting five parts (E.), or three pounds (L.), of plaster of semivitrified oxide of lead (*litharge plaster*), and adding one part (E) or half a pound (L.) of white or yellow rosin powdered.

Employed, spread on linen, to form adhesive plasters, for keeping the edges of ulcers or recent wounds together; for giving mechanical support to ulcerated limbs, or keeping on other dressings.

⁷⁵⁵ Palma christi seeds. 233. RICINUS COMMUNIS, E. L. D. Palma christi seeds. See BOTANY, p. 271.

Official Preparation.

⁷⁵⁶ Castor oil. a. OLEUM RICINI, L. Castor oil.

Expressed in the usual manner from the husked seeds.

Castor oil is seldom prepared in this country, being brought chiefly from the West Indies. When cold drawn, it is milder, and less subject to become rancid, but it requires a larger dose than the common oil. It is an excellent purgative, well suited to cases of colic and worms, given either by the mouth, or by way of clyster. Dose in the former case about one ounce, and in the latter about two ounces.

234. CROTON ELEUTHERIA, E. CASCARILLA, History of L. D. Cascarilla bark. Official Medicines.

An excellent aromatic tonic. Dose about half a dram, or two scruples, two or three times a-day.

Official Preparations.

a. TINCTURA CASCARILLÆ, L. D. Tincture of Cascarilla.

Prepared by digesting four ounces of powdered cascarrilla bark in two pints or two pounds (D.) of proof spirit for about a week, with a gentle heat. Dose about one ounce; best in composition with decoction or infusion of cinchona.

b. EXTRACTUM CASCARILLÆ, L. D. Extract of Cascarilla.

Prepared in the usual way of making extracts. Dose from 10 to 30 grains.

Order 10. SYNGENESIA.

235. MOMORDICA ELATERIUM, E. CUCUMIS Wild cucumber. AGRESTIS, L. D.

Official Preparation.

a. SUCCUS SPISSATUS MOMORDICÆ ELATERII, E. ELATERIUM, L. Inspissated juice of wild cucumber. *Elaterium*.

This is prepared by slicing ripe wild cucumbers, expressing the juice very gently, and straining it through a very fine hair sieve; boiling it a little, and setting it by for some hours, till the thicker part has subsided. The supernatant fluid is then poured off, and separated by filtering from the thicker matter, which is to be dried and kept for use.

A violent cathartic, employed in dropsy. Dose half a grain to one grain.

236. CUCUMIS COLOCYNTHIS, E. COLOCYNTHIS, L. D. Colocynth or bitter apple. See BOTANY, p. 271.

Official Preparation.

a. EXTRACTUM COLOCYNTHIDIS COMPOSITUM, L. Compound extract of colocynth.

Prepared by digesting six drams of the pith of colocynth, cut small, in a pint of proof spirit, with a gentle heat for four days, then dissolving in the expressed tincture one ounce and a half of powdered scotorine aloes, and half an ounce of powdered scammony; and lastly drawing off the spirit, and adding to the inspissated extract, a dram of husked cardamom seeds in powder.

A strong cathartic and anthelmintic. Dose from 5 to 30 grains.

237. BRYONIA ALBA. BRYONIA, D. Bryony root. See BOTANY, p. 271. where it is described under the name of *Bryonia dioica*.

History of
Simple and
Official
Medicines.

CLASS XXII. DICECIA. Order 2. DIANDRIA.

228. SALIX FRAGILIS. SALIX, D. Crack wil-
low bark.

⁷⁶⁵ Crack wil-
low bark. A good tonic, employed as a substitute for Peruvian
bark. Dose about one dram.

⁷⁶⁶ Chio tur-
pentine.

Order 5. PENTANDRIA.

239. PISTACIA TEREBINTHUS. TEREBINTHI-
NA CHIA, L. Chio turpentine.

Not materially different from the other turpentines.

⁷⁶⁷ Mastich.

240. PISTACIA LENTISCUS, E. MASTICHE, L.
Mastich. See BOTANY, p. 276, and CHEMISTRY, N^o
2464.

⁷⁶⁸ Hop.

241. HUMULUS LUPULUS. Hop.

A good narcotic, which has been found an excellent
substitute for opium. See an *Inaugural dissertation de*
Humulo Lupulo, lately printed at Edinburgh by Dr de
Roches; and Kirby's Tables, p. 94.

Order 6. HEXANDRIA.

⁷⁶⁹ Sarsaparilla
root.

242. SMILAX SARSAPARILLA, E. SARSAPA-
RILLA, L. D. Sarsaparilla root.

A slight diaphoretic, of little efficacy.

Official Preparations.

⁷⁷⁰ Decoction
of sarsapa-
rilla.

a. DECOCTUM SMILACIS SARSAPARILLÆ, E. DE-
COCTUM SARSAPARILLÆ, L. D. Decoction
of sarsaparilla.

Prepared by digesting six ounces of sliced sarsaparilla
root in eight pints of distilled water, for two hours in
a heat of about 195°; then taking out the root and
bruising it, repeating the maceration; then boiling the
liquor down to four pints, pressing it out, and straining
the decoction.

⁷⁷¹ Compound
decoction
of sarsapa-
rilla.

b. DECOCTUM SARSAPARILLÆ COMPOSITUM, L. D.
Compound decoction of sarsaparilla.

Made by macerating six ounces of sliced and bruised
sarsaparilla root, one ounce of the bark of sassafras
root, in ten pints of distilled water, for six hours; then
boiling down to five pints, adding towards the end
three drams of mezereon, and straining the decoction.

A good diet drink, but scarcely superior to the com-
pound decoction of gnaiacum. Dose from four to
eight ounces, three or four times a-day.

Order 12. MONADELPHIA.

⁷⁷² Juniper
berries.

243. JUNIPERUS COMMUNIS, E. JUNIPERUS,
L. D. Juniper berries. See BOTANY, p. 278.

Official Preparations.

⁷⁷³ Oil of juni-
per.

a. OLEUM VOLATILE JUNIPERI COMMUNIS, E.
OLEUM JUNIPERI BACCÆ, L. OLEUM
BACCARUM JUNIPERI, D. Oil of juniper
berries.

Distilled in the same manner as other volatile oils.
Stimulant and diuretic. Dose from three to ten
grains.

History of
Simple and
Official
Medicines.

b. SPIRITUS JUNIPERI COMMUNIS COMPOSITUS, E.
SPIRITUS JUNIPERI COMPOSITUS, L. D.
Compound spirit of juniper.

⁷⁷⁴ Compound
spirit of ju-
niper.

Nine pounds or a gallon of diluted alcohol distilled
from one pound of well bruised juniper berries, one
ounce and a half of bruised carraway seeds, and the
same of sweet fennel seeds.

A good diuretic, but not superior to common gin.

244. JUNIPERUS LYCIA, E. OLIBANUM, L. Olibanum.
D. Olibanum. See CHEMISTRY, N^o 2487.

245. JUNIPERUS SABINA, E. SABINA, L. D. ⁷⁷⁶Savine.
Savine.

Reputed a specific in uterine obstructions, but gra-
dually losing its celebrity. Dose in substance from
fifteen grains to two scruples. Applied externally
as an escharotic to venereal warts and similar excres-
cences.

Official Preparations.

a. OLEUM VOLATILE JUNIPERI SABINÆ, E. O-⁷⁷⁷ Volatile oil
LEUM SABINÆ, D. Volatile oil of savine.

b. EXTRACTUM SABINÆ, L. D. Extract of savine. ⁷⁷⁸ Extract of
savine.

Made like other extracts. Dose from 10 to 30
grains twice or thrice a day.

c. TINCTURA SABINÆ COMPOSITA, L. ⁷⁷⁹ Compound
Compound tincture of savine.

Prepared by digesting one ounce of extract of savine
in a pint of tincture of castor, and half a pint of tinc-
ture of myrrh, till the extract is dissolved.

Given as an emmenagogue, and as an antispasmodic
in hypochondriac affections. Dose from 30 drops to a
dram twice or thrice a day.

246. CISSAMPELOS PAREIRA. PAREIRA BRA-⁷⁸⁰ Pareira
VA, L. Pareira brava root. See Duncan's Dispen-
satory.

CLASS XXIII. POLYGAMIA. Order 1. Mo-
NOECIA.

247. STALAGMITIS CAMBOGIODES. GAMBO-⁷⁸¹ Gamboge.
GIA, E. L. D. Gamboge. See Duncan's Dispen-
satory.

A violent cathartic and anthelmintic. Dose from 1
or 2 grains or 10 or 15 grains. The latter chiefly in
cases of tenia.

248. VERATRUM ALBUM, E. HELLEBORUS ⁷⁸² White hel-
ALBUS, L. D. White hellebore root. See Bo-
TANY, p. 281.

Official Preparations.

b. DECOCTUM HELLEBORI ALBI, L. Decoction of ⁷⁸³ Decoction
white hellebore. of white
hellebore.

Made by boiling an ounce of powdered white helle-
bore

History of Simple and Official Medicines. bore root in two pints of distilled water to one pint, and adding to the strained liquor when cold two ounces of rectified spirit of wine. Used as a lotion, diluted, if necessary, in the itch, and similar cutaneous affections.

⁷⁸⁴ Tincture of white hellebore. *b. TINCTURA VERATRI ALBI, E.* Tincture of white hellebore.

Prepared by digesting eight ounces of powdered white hellebore root in two pounds and a half of diluted alcohol for several days, and filtering through paper.

Employed occasionally to assist the operation of emetics and cathartics, in some apoplectic and paralytic cases, in mania; dose in these cases from half a dram to two drams. Employed also as a general stimulant or alterative in cutaneous diseases, beginning with about two drops twice or thrice a day, and gradually increasing the dose.

⁷⁸⁵ Ointment of white hellebore. *c. UNGUENTUM HELLEBORI ALBI, L. D.* Ointment of white hellebore.

Prepared by mixing four ounces of ointment of hogs lard, with one ounce of powdered white hellebore, and one scruple of essential oil of lemon.

Used in similar cases with the decoction.

⁷⁸⁶ Catechu. *249. MIMOSA CATECHU, E. CATECHU, L. D.* Catechu, or *Japan earth*. See BOTANY, p. 282.

A powerful astringent, employed in diarrhoeas, uterine hemorrhage; and externally by way of lotion, or lozenge, for exulcerations and apthous ulcers of the mouth. Dose internally from 15 grains to two scruples.

Official Preparations.

⁷⁸⁷ Infusion of catechu. *a. INFUSUM MIMOSÆ CATECHU, E. INFUSUM JAPONICUM.* Infusion of catechu.

Prepared by macerating two drams and a half of powdered extract of catechu, and half a dram of bruised cinnamon, in seven ounces of boiling water, for two hours, in a covered vessel, straining the liquor, and adding one ounce of simple syrup. Dose from one to two ounces.

⁷⁸⁸ Tincture of catechu. *b. TINCTURA MIMOSÆ CATECHU, E. TINCTURA CATECHU, L. TINCTURA JAPONICA.* Tincture of catechu.

Prepared by digesting three ounces of extract of catechu, and two ounces of bruised cinnamon, in two pounds and a half, or two pints (L.), of diluted alcohol, for seven or ten days, and straining through paper. Dose two or three drams.

c. ELECTUARIUM MIMOSÆ CATECHU, E. ELECTUARIUM CATECHU COMPOSITUM, D. CONFECTIO JAPONICA. Electuary of catechu. *Japanica Confection*. See preparations of opium.

⁷⁸⁹ Gum arabic. *250. MIMOSA NILOTICA, E. GUMMI ARABICUM, L. D.* Gum arabic.

A dry mucilage, very useful as an emollient and demulcent.

Official Preparations.

a. MUCILAGO MIMOSÆ NILOTICÆ, E. MUCILAGO ARABICI GUMMI, L. D. Mucilage of gum arabic.

Prepared by dissolving one part of powdered gum arabic in about two of boiling water, and straining.

b. EMULSIO MIMOSÆ NILOTICÆ, E. EMULSIO ARABICA, D. Arabic emulsion.

Prepared, according to the Edinburgh process, in the same manner as almond emulsion, with the addition of two ounces of gum arabic, added while beating the almonds. The Dublin emulsion is composed of two drams of powdered gum arabic, half an ounce of large almonds, three drams of double refined sugar, and one pound of decoction of barley.

Employed in the same cases as almond emulsion.

c. TROCHISCI GUMMOSI, E. Gum troches.

Prepared of four parts of gum arabic, one of powdered starch, and 12 of double refined sugar, made into a mass for troches with water.

Similar in uses to the lozenges of starch. See N^o 369.

251. PARIETARIA OFFICINALIS. PARIETARIA, L. Pellitory of the wall.

Order 2. DIOECIA.

252. FRAXINUS ORNUS, E. L. D. Manna-ash. *Manna*.

A mild purgative, well suited to children, but requiring some gentle aromatic to prevent griping. Dose from a dram to half an ounce. Best in composition with senna.

Official Preparation.

a. SYRUPUS MANNÆ, D. Syrup of manna.

Prepared by macerating half an ounce of senna in one pound of boiling water for twelve hours in a covered vessel, straining the liquor, and adding one pound of manna, and one pound of double refined sugar, to make a syrup.

This forms an excellent purgative for children.

253. PANAX QUINQUEFOLIUM. GINSENG, L. Ginseng root.

A Chinese root, formerly much in repute as a stimulant, but now out of fashion.

Order 3. TRIOECIA.

254. FICUS CARICA, E. CARICA, L. D. Figs. Figs. See BOTANY, p. 282.

A gentle laxative, used chiefly in composition.

CLASS XXIV. CRYPTOGRAMIA. Order 1. FICULICES.

255. POLYPODIUM FILIX MAS, E. FILIX, L. Male fern root.

History of **FILIX MAS, D.** Male fern root. See **BOTANY**, p. 285.

Simple and Official Medicines. This substance has been in great repute as an anthelmintic, especially in cases of tænia, given in doses of a dram or two, followed by a strong cathartic.

Order 3. **ALGÆ.**

⁷⁹⁹ Iceland liver-wort. **256. LICHEN ISLANDICUS.** Iceland liver-wort. This lichen has lately become a fashionable remedy as an emollient, in pulmonary consumption. It contains a great quantity of farinaceous and mucilaginous matter, and is therefore highly nutritious.

See Synopsis *Materia Medicæ*, and *Thesaurus Medicaminum*.

Order 4. **FUNGI.**

⁸⁰⁰ Female agarie. **257. BOLETUS IGNIARIUS, E. AGARICUS.** Female agarie.

This substance has been much celebrated as a styptic; and before ligatures were so much employed, was used to stop hæmorrhage from the mouths of bleeding vessels during surgical operations. It is now out of fashion.

Appendix. **PALMÆ.**

⁸⁰¹ Palm oil. **258. COCOS BUTYRACEA. PALMA, E.** Mackaw tree. *Palm oil.* See **BOTANY**, p. 289.

A vegetable oily matter, employed as an external emollient.

CHAP. III. **MINERAL SUBSTANCES:**SECT. I. *Water.*

⁸⁰² Water. **259. AQUA. Water.**

Though simple water forms no part of the *Materia Medica* in the *Pharmacopœias*, it is an article of so much importance, both in diet and medicine, that it ought not to be omitted here. We shall therefore make no apology for inserting the following neat account of it, given by Dr Duncan in the later editions of his *Dispensatory*.

⁸⁰³ Show or rain water purest. "The chemical properties of water have been already enumerated. (See *CHEMISTRY*, N^o 384, *et seq.*) The purest natural water is snow or rain water collected in the open fields; that which falls in towns, or is collected from the roofs of the houses, is contaminated with soot, animal effluvia, and other impurities; although, after it has rained for some time, the quantity of these diminishes so much, that Morveau says that it may be rendered almost perfectly pure by means of a little barytic water, and exposure to the atmosphere. Rain water, after it falls, either remains on the surface of the earth, or penetrates through it, until it meets with some impenetrable obstruction to its progress, when it bursts out at some lower part, forming a spring or well. The water on the surface of the earth, either descends along its declivities in streams, which gradually wearing channels for themselves, combine to form rivers, which at last reach the sea; or remains stagnant in cavities of considerable depth, forming lakes or ponds, or on nearly level ground, forming marshes.

VOL. XII. Part II.

"The varieties of spring water are exceedingly numerous; but they may be divided into soft, which are sufficiently pure to dissolve soap, and to answer the purposes of pure water in general; the hard, which contain earthy salts, and decompose soap, and are unfit for many purposes, both in domestic economy, and in manufactories; and the saline, which are strongly impregnated with soluble salts. When spring waters possess any peculiar character, they are called *mineral waters*. River water is in general soft, as it is formed of spring water, which, by exposure becomes more pure; and running surface water, which, although turbid from particles of clay suspended in it, is otherwise very pure. Lake water is similar to river water. The water of marshes, on the contrary, is exceedingly impure, and often highly fetid, from the great proportion of animal and vegetable matters which is constantly decaying in them.

"Mineral waters derive their peculiarity of character, in general, either from containing carbonic acid or soda not neutralized, sulphurated hydrogen, purging salts, earthy salts, or iron; or from their temperature exceeding in a greater or less degree that of other surrounding bodies. The following are the most celebrated.

⁸⁰⁴ "a. *Warm Springs.*—Bath, Bristol, Buxton, Matlock, Warm in England. Barege, Vichy, &c. in France. Aix-la-Chapelle, Borset, Baden, Carlsbad and Toeplitz in Germany; and Pisa, Lucca, Baia, and many others in Italy.

⁸⁰⁷ "b. *Carbonated Springs.*—Pymont, Seltzer, Spa, Carbonated springs. Cheltenham, Scarborough.

⁸⁰⁸ "c. *Alkaline.*—Carlsbad, Aix-la-Chapelle, Barege, Alkaline. Toeplitz.

⁸⁰⁹ "d. *Sulphureous.*—Enghien, Lu, Aix-la-Chapelle, Sulphureous. Kelburn, Harrowgate, Moffat, and many in Italy.

⁸¹⁰ "e. *Purging.*—Sea water, Lemington Priors, Harrowgate, Lu, Carlsbad, Moffat, Toeplitz, Epsom, Sedlitz, Kelburn, and all brackish waters.

⁸¹¹ "f. *Calcareous.*—Matlock, Buxton, and all hard waters.

⁸¹² "g. *Chalybeate.*—Hartfell, Denmark, Cheltenham, Chalybeate. Pymont, Spa, Tunbridge, Bath, Scarborough, Vichy, Carlsbad, Lemington Priors.

⁸¹³ "Medical use.—Water is an essential constituent in the organization of all living bodies; and as it is continually expended during the process of life, that waste must be also continually supplied; and this supply is of such importance, that it is not left to reason or to chance, but forms the object of an imperious appetite. When taken into the stomach, water acts by its temperature, its bulk, and the quantity absorbed by the lacteals. Water about 60 degrees, gives no sensation of heat or cold; between 60 degrees and 45, it gives a sensation of cold followed by a glow and increase of appetite and vigour; below 45, the sensation of cold is permanent and unpleasant, and it acts as an astringent and sedative; above 60, it excites nausea and vomiting, probably by partially relaxing the fibres of the stomach, for when mixed with stimulating substances it has not these effects. In the stomach and in the intestines it acts also by its bulk, producing the effects arising from the distension of these organs; and as the intestinal gases consist of hydrogen gas, either pure, or carbonated, or sulphurated, or phosphorated, it is probably in part decomposed in them. It likewise dilutes the contents of the stomach and intestines, thus often diminishing

History of
Simple and
Official
Medicines.

History of minishing their acrimony. It is absorbed by the lacteals, dilutes the chyle and the blood, increases their fluidity, lessens their acrimony, and produces *plethora ad molem*. Its effects in producing plethora and fluidity are, however, very transitory, as it at the same time increases the secretion by the skin and kidneys. Indeed the effects of sudorifics and diuretics depend in a great measure on the quantity of water taken along with them.

"Mineral waters have also a specific action, depending on the foreign substances which they contain. It is, however, necessary to remark, that their effects are in general much greater than might be expected from the strength of their impregnations, owing probably to the very circumstance of their great dilution, by which every particle is presented in a state of activity, while the lacteals admit them more readily than they would in a less diluted state.

"Carbonic acid gas gives to the waters which are strongly impregnated with it, a sparkling appearance, and an agreeable degree of pungency. In its effects on the body it is decidedly stimulant, and even capable of producing a certain degree of intoxication. It is of great service in bilious complaints, atony of the stomach, nausea, and vomiting, and in all fevers of the typhoid type.

"Alkaline waters produce also a tonic effect on the stomach, but they are less grateful. They are particularly serviceable in morbid acidity of the stomach, and in diseases of the urinary organs.

"Sulphureous waters are chiefly used in cutaneous and glandular diseases. Their effects are stimulant and heating, and they operate by the skin or bowels.

"Purging waters derive their effects from the neutral salts they contain, especially the muriates of soda, lime, and magnesia, and the sulphates of soda and magnesia. They are much more frequently used for a length of time to keep the bowels open by exciting the natural action, than to produce full purging. Used in this way, instead of debilitating the patient, they increase his appetite, health, and strength.

"Chalybeate waters are used as tonics. They stimulate considerably, and increase the circulation; but as they also generally contain neutral salts, they act as gentle laxatives. They are used in all cases of debility, cachexia, chlorosis, fluor albus, amenorrhœa; and, in general, in what are called nervous diseases.

814
External
use of wa-
ter.

"The external use of water depends almost entirely on its temperature, which may be

"1. Greater than that of the body, or above 97° Fahr. The hot bath.

"2. Below the temperature of the body.

a. From 97 to 85, the warm bath.

b. From 85 to 65, the tepid bath.

c. From 65 to 32, the cold bath.

815
Hot bath.

"The hot bath is decidedly stimulant in its action. It renders the pulse frequent, the veins turgid, the face flushed, the respiration quick; increases animal heat, and produces sweat. If the temperature be very high, the face becomes bathed in sweat, the arteries at the neck and temples beat with violence, anxiety and a sense of suffocation are induced; and if persisted in, vertigo, throbbing in the heart, and apoplexy, are the consequences. It is very rarely employed in medicine,

except where there are hot springs, as at Baden in Switzerland.

"The Russians and some other nations use the hot bath as an article of luxury.

"The effects of the affusion of hot water have not been ascertained; and it is probable, that when the heat is not so great as to destroy the organization of the skin, the very transient application of the water would be more than counteracted by the subsequent evaporation.

"With regard to the action arising from their temperature, all baths below 97° differ only in degree, as they all ultimately abstract caloric from the surface, but with a force inversely as their temperature.

"The warm bath excites the sensation of warmth, partly because our sensations are merely relative, and partly because its temperature, though less than that of the internal parts of the body, is actually greater than that of the extremities, which are the chief organs of touch. But as water is a much better conductor of caloric than air, and especially than confined air, as much caloric is abstracted from the body by water, which is a few degrees lower than the external temperature of the body, as by air of a much lower temperature. The warm bath diminishes the frequency of the pulse, especially when it has been previously greater than natural; and this effect is always in proportion to the time of immersion. It also renders the respiration slower, and lessens the temperature of the body, relaxes the muscular fibre, increases the bulk of the fluids by absorption, removes impurities from the surface, promotes the desquamation and renewal of the cuticle, and softens the nails and indurations of the skin.

"The stimulant power of the warm bath is therefore very inconsiderable, and its employment in disease will be chiefly indicated by preternatural heat of the surface, and frequency of the pulse, rigidity of the muscular fibre, and morbid affections of the skin. It has accordingly been found serviceable in many cases of pyrexia, both febrile and exanthematous, in many spasmodic diseases, and in most of the impetigines. It is contraindicated by difficulty of breathing and internal organic affections, and should not be used when the stomach is full.

"The affusion of warm water very generally produces a considerable diminution of heat, a diminished frequency of pulse and respiration, and a tendency to repose and sleep; but its effects are not very permanent, and its stimulus is weak. It is recommended in febrile diseases, depending on the stimulus of preternatural heat, and in those attended with laborious respiration, and in the paroxysms of hectic fever.

"As the tepid bath and affusion produce effects intermediate between those and cold water, it is unnecessary to enumerate them.

"The cold bath produces the sensation of cold, which gradually ceases, and is succeeded by numbness. It excites tremor in the skin, and shivering. The skin becomes pale, contracted, and acquires the appearance termed *cutis asserina*. The fluids are diminished in volume, the solids are contracted, the caliber of the vessels is lessened, and therefore numbness and paleness are induced, and the visible cutaneous veins become smaller. There is a sense of drowsiness and inactivity, the joints become rigid and inflexible, and the limbs

are

History of
Simple and
Official
Medicines.

are affected with pains and spasmodic contractions. The respiration is rendered quick and irregular, the pulse slow, firm, regular, and small; the internal heat is at first diminished, but gradually and irregularly returns nearly to its natural standard; the extremities, however, continue cold and numb, or swollen and livid; the perspiration is suppressed, and the discharge of urine is rendered more frequent and copious. If the cold be excessive on its application, long-continued violent shiverings are induced, the pulse ceases at the wrist, the motion of the heart becomes feeble and languid, there is a sensation of coldness and faintness at the stomach, and a rapid diminution of animal heat; and, at last, delirium, torpor, and death, are the consequences. If the application of the cold bath be not carried to an excessive length, on emerging from the water the whole body is pervaded by an agreeable sensation of warmth, and the patient feels refreshed and invigorated.

"The primary action of the cold bath is stimulant, and the degree of this action is in proportion to the lowness of its temperature. This opinion is indeed directly opposite to a theory of cold which has been advanced with the confidence of demonstration. "Heat is a stimulus, cold is the abstraction of heat; therefore cold is the abstraction of stimulus, or is a sedative." To this we might oppose another theory, equally syllogistic, and nearer the truth. Free caloric is a stimulus, cold is the sensation excited by the passage of free caloric out of the body; therefore cold is a stimulus. But, in fact, the action of cold is by no means so simple. It is complicated, and varies according to its intensity, duration, and the state of the system to which it is applied. It acts at first as a stimulant, in exciting sensation; then as a tonic, in condensing the living fibre; and, lastly, however paradoxical it may appear, as a sedative, by preventing that distribution of blood in the minute and ultimate vessels, which is necessary for the existence of sensibility and irritability, and by the abstraction of the stimulus of heat.

"The cold bath may be so managed as to procure any of these effects, by regulating the length of time for which it is applied.

319
Cold affu-
sion.

"Cold affusion, or the pouring of cold water over the body, is a very convenient way of applying the cold bath in many cases. In this way cold is very suddenly applied to the surface, its operation is instantaneous and momentary; but may be continued by repeated affusions for any length of time, and so as to produce its extreme effects. Where the effects of cold affusion may be thought too severe, sprinkling the body with cold water, or water and vinegar, may be substituted.

"The application of cold may be employed in fevers and febrile paroxysms, when the heat is steadily above the natural standard, and in many diseases arising from relaxation and debility. It is contraindicated when the heat of the body is below 97°, when there is any notable perspiration from the surface; and when there is general plethora. Debilitated habits should be defended from the violence of its action, by covering the body with flannel.

"In yellow fever, especially in those cases in which the heat of the skin is excessive, it is particularly useful, and ought to be long continued. In phrenitis and

other local inflammations, it promises to be of advantage. In gout its effects are doubtful, being in some instances salutary, in others destructive. A criterion to enable us to determine when it ought or ought not to be resorted to, is much wanted. In inflammatory rheumatism and rheumatic gout it is decidedly useful. It is of advantage in all the hemorrhagies and exanthemata; in tetanus, cholera, cholera, hysteria, mania, ischuria, and in burns; and, in general, in all those local diseases in which solutions of acetate of lead, of muriate of ammonia, &c. are usually employed; for the good effects of these depend entirely on the diminished temperature *."

History of
Simple and
Official
Medicines.

For more respecting the utility of the cold affusion, see Currie's "Medical Reports; and for an excellent account of the effects and uses of baths, see Marcard *de la Nature et de l'Usage des Bains*, and a Treatise on Cold and Warm Bathing, lately published at Edinburgh.

* *Duncan's Dispensatory*, 3d edit. p. 165.

Official Preparation.

a. AQUA DESTILLATA, E. AQUA DISTILLATA, L. D. Distilled water. 820
Distilled water.

From 10 gallons of spring water, the London college directs four gallons to be drawn off, throwing away the first four pints that come over. The Dublin college directs 10 pounds to be distilled from 20 pounds, throwing away the first pound; while the college of Edinburgh directs water to be distilled in very clean vessels till two-thirds have come over.

SECT. II. Inflammable Substances.

260. SULPHUR SUBLIMATUM, E. L. D. FLORES SULPHURIS. Sublimed sulphur. *Flowers of Sulphur.* 821
Sublimed sulphur.

For an account of the chemical nature and properties of sulphur, see CHEMISTRY, Chap. ix.

As a medicine, sulphur is employed both internally and externally. Internally it is given as a laxative, in the dose of a dram or two, and as a diaphoretic in smaller doses. Externally it is one of the most certain remedies for the itch, and some other cutaneous affections.

Official Preparations.

a. SULPHUR SUBLIMATUM LOTUM, E. D. FLORES SULPHURIS LOTI, L. Washed sublimed sulphur. *Washed flowers of sulphur.* 822
Washed sublimed sulphur.

Sublimed sulphur is freed from the sulphureous acid, which it has imbibed in the preparation, by boiling it for a little in four times its weight of water, and after pouring off the water in which it was boiled, washing it by repeated affusions of cold water, till it no longer imparts acidity to the water.

Sublimed sulphur should always be washed before being used internally, otherwise it is very apt to disorder the stomach and bowels.

b. OLEUM SULPHURATUM, E. L. Sulphurated oil. 823
Sulphurated oil.

Prepared by boiling one part of sublimed sulphur in eight of olive oil (E.), or one part to four parts (L.), in a large iron pot, till they are thoroughly united. Formerly

History of much used as an expectorant in coughs, in a dose of Simple and from 10 to 40 drops, but now seldom used, except as Official an external application to foul ulcers. Medicines.

⁸²⁴
Sulphurated petroleum.

⁸²⁵
Ointment of sulphur.

⁸²⁶
Sulphuret of potash.

* See *Kirby's Tables*, p. 43.

⁸²⁷
Precipitated sulphur.

⁸²⁸
Amber.

⁸²⁹
Succinic acid.

⁸³⁰
Oil of amber.

⁸³¹
Purified salt of amber.

c. PETROLEUM SULPHURATUM, L. Sulphurated petroleum.

Prepared in the same manner as the last, with oil of petroleum, and used for the same purpose.

d. UNGUENTUM SULPHURIS, E. L. D. Ointment of sulphur.

Prepared by mixing half a pound (L.) or five ounces (D.) of ointment of hog's-lard, with four ounces (L.) or three ounces (D.) of flowers of sulphur; or four parts of hog's-lard, with one of sublimed sulphur, adding to each pound of the ointment, half a dram of volatile oil of lemons, or volatile oil of lavender (E.).

An excellent application in the itch. Ordinary quantity for an adult about four ounces, which should be rubbed in at once.

e. SULPHURETUM POTASSÆ, E. KALI SULPHURATUM, L. ALKALI VEGETABILE SULPHURATUM, D. HEPAR SULPHURIS. Sulphuret of potash. *Sulphurated kali. Sulphurated vegetable alkali. Liver of sulphur.*

For the preparation and chemical properties of this substance, see CHEMISTRY, N^o 918.

Sulphuret of potash is seldom employed in medicine, except as a remedy in violent mercurial salivation, in which it is said to be very effectual*. It has lately been much recommended, dissolved in lime water, as an effectual external application in *tinca capitis*.

f. SULPHUR PRÆCIPITATUM, L. D. Precipitated sulphur.

Prepared by dissolving six ounces (L.) or four ounces (D.) of sulphuret of potash, in one pound and a half of distilled water, and adding diluted sulphuric acid (L.), or diluted nitrous acid (D.), as long as there is any precipitation. The precipitate is then to be separated by the filter, and washed till it has lost all acidity, and then dried.

Similar in its nature to washed sublimed sulphur, but considered as rather milder.

261. SUCCINUM, E. L. D. Amber. See CHEMISTRY, N^o 2476.

Amber in its natural state is not employed in medicine, except to make the following

Official Preparations.

a. ACIDUM SUCCINI, E. SAL SUCCINI, D. L. Succinic acid. *Salt of amber.*

b. OLEUM SUCCINI, E. L. D. Oil of amber.

For the preparation and chemical properties of these substances, see CHEMISTRY, N^o 724, *et seq.*

c. SAL SUCCINI PURIFICATUS, L. Purified salt of amber.

The London college directs this acid to be purified

by boiling half a pound of it in a pint of distilled water, and setting aside the solution to crystallize.

Succinic acid is now scarcely employed in medicine.

d. OLEUM SUCCINI PURISSIMUM, E. OLEUM SUCCINI RECTIFICATUM, L. D. Purified oil of amber.

The Edinburgh college directs oil of amber to be purified by distilling it in a glass retort with six times its quantity of water, till two-thirds of the water have passed into the receiver; when the pure volatile oil comes over, it is to be separated from the water, and preserved in vessels closely stopped. The processes of the other colleges do not materially differ from this.

Oil of amber is a powerful stimulant and antispasmodic, useful in hysterical and similar disorders. Dose 10 or 12 drops. Used also externally in paralysis and rheumatisms.

262. BITUMEN PETROLEUM, E. PETROLEUM, L. PETROLEUM BARBADENSE, D. Petroleum or rock oil. *Barbadoes tar.*

Official Preparation.

a. OLEUM PETROLEI, L. Oil of petroleum.

Prepared by distilling petroleum in a sand bath.

Employed as a stimulant and antispasmodic. Dose from 10 to 30 drops. Also used as an external stimulant in strains and rheumatisms.

SECT. III. Acids.

263. ACIDUM SULPHURICUM, E. ACIDUM VITRIOLICUM, L. D. Sulphuric acid. *Vitriolic acid. Oil of vitriol.*

For the preparation and chemical properties of sulphuric acid, see CHEMISTRY, Chap. x. Sect. 1.

Undiluted sulphuric acid is seldom employed in medicine, except as an external stimulant and rubefacient, in combination with fatty substances.

Official Preparations.

a. ACIDUM SULPHURICUM DILUTUM, E. ACIDUM VITRIOLICUM DILUTUM, L. D. Diluted sulphuric acid. *Diluted vitriolic acid. Spirit of vitriol.*

One part of sulphuric acid mixed with seven of water (E.), or one ounce with eight ounces of water (L.), or two ounces, with 14 ounces of water (D.).

Diluted sulphuric acid is employed as a refrigerant in fevers, astringent in hemorrhages, and tonic in dyspepsia. Dose from 20 drops to a dram.

b. ACIDUM SULPHURICUM AROMATICUM, E. Aromatic sulphuric acid. Elixir of vitriol.

Prepared by first mixing two pounds of alcohol with six pounds of sulphuric acid, by gradually dropping the acid into the alcohol; digesting this mixture with a very gentle heat in a close vessel, for three days; and adding one ounce and a half of bruised cinnamon, and one ounce of bruised ginger; digesting again in a close

History of close vessel, for six days, and filtering the tincture Simple and through paper in a glass funnel.

Official An excellent stimulant and tonic, well suited to dys- Medicines. peptic complaints. Dose from 15 to 40 drops.

⁸¹⁸
Sulphate of
potash.

c. SULPHAS POTASSÆ, E. KALI VITRIOLA-
TUM, L. ALKALI VEGETABILE VITRIO-
LATUM, D. Sulphate of potash. *Vitriolated kali.*
Vitriolated vegetable alkali. *Vitriolated tartar.*

For the nature and properties of this salt, see CHE-
MISTRY, N^o 925, *et seq.*

The Edinburgh college directs this salt to be pre-
pared by an immediate combination of sulphuric acid,
diluted with six times its weight of water, with as much
pure carbonate of potash, dissolved also in six times its
weight of water, as is sufficient to neutralize the acid.
The salt is procured from the solution by evaporation
and crystallization. The other colleges obtain this salt
by dissolving the saline mass that remains after the dis-
tillation of nitrous acid, filtering and crystallizing as
before.

Sulphate of potash is a mild purgative, and may be
given in a dose of four or five drams, but it requires a
large quantity of water for its solution. It is employ-
ed chiefly to assist in the pulverization of opium, scam-
mony, &c.

⁸³⁹
Sulphate of
potash with
sulphur.

d. SULPHAS POTASSÆ CUM SULPHURE, E. SAL
POLYCHRESTUS. Sulphate of potash with sulphur.
Sal polychrest.

Prepared by mixing together equal parts of powder-
ed nitrate of potash and sublimed sulphur; injecting the
mixture gradually into a red-hot crucible; and, when the
deflagration ceases, allowing the salt to cool, and
putting it into a vessel that is to be closely stopped.

Similar in its effects with the last, but more easily
prepared.

SECT. IV. *Alkalies and Alkaline Salts.*

⁸⁴⁰
Impure
carbonate
of soda.

264. CARBONAS SODÆ IMPURUS, E. BARYLLA,
L. D. Impure carbonate of soda. *Barilla.* *Fixed mi-
neral alkali.*

Official Preparations.

⁸⁴¹
Carbonate
of soda.

a. CARBONAS SODÆ, E. NATRON PREPARA-
TUM, L. ALKALI FOSSILE MITE, D. Car-
bonate of soda. *Vitriolated natron.* *Mild fossil al-
kali.*

Prepared by boiling impure carbonate of soda, bruise-
d or powdered barilla, till all the salt is dissolved,
then filtering the liquor, and setting it by to crystal-
lize.

For an account of the nature and properties of this
salt, see CHEMISTRY, N^o 1085.

Employed in medicine chiefly as an antacid and li-
thontriptic. Dose from 10 to 30 grains.

⁸⁴²
Water of
supercarbo-
nate of so-
da.

b. AQUA SUPERCARBONATIS SODÆ, E. Water of
supercarbonate of soda.

Prepared by passing a stream of carbonic acid gas
through a solution of carbonate of soda, as was di-
rected for preparing the water of carbonate of potash.
See N^o 315.

This preparation is supposed to be a powerful lithon-
triptic, and the occasional use of it certainly appears Simple and
to prevent the formation of uric acid. It may be drunk Official
in the quantity of half a pint or a pint during the day. Medicines.

c. PHOSPHAS SODÆ, E. Phosphate of soda.

⁸⁴³
Phosphate
of soda.

For the preparation and nature of this salt, see CHE-
MISTRY, N^o 1075, *et seq.*

An excellent laxative, preferable to most other saline
cathartics, from its taste being but little unpleasant.
Dose from one to two ounces, which is best taken dis-
solved in soup, beef tea, or gruel.

265. NITRAS POTASSÆ, E. NITRUM, L. D. Nitrate of potash. Nitre. *Salpêtre.* See CHEMISTRY, N^o 942, *et seq.*

⁸⁴⁴
Nitrate of
potash.

Nitrate of potash is used in medicine as a diaphore-
tic, diuretic, and refrigerant. Dose from five to 20
grains.

Official Preparations.

a. NITRUM PURIFICATUM, L. Purified nitre.

⁸⁴⁵
Purified
nitre.

Purified by solution in boiling water, filtration, and
crystallization.

b. ACIDUM NITROSUM, E. L. D. Nitrous acid. Nitrous acid.

⁸⁴⁶
Nitrous
acid.

Prepared by decomposing nitrate of potash by sul-
phuric acid, in the manner mentioned under CHEMIS-
TRY, Chap. x. Sect. 3.

It is in this state that the acid obtained from nitrate
of potash is generally employed in medicine, though
for certain purposes the nitric acid is to be preferred.
These acids are employed as refrigerants and diuretics,
largely diluted, and in small doses, viz. from five to 20
drops, and also as tonics and general stimulants, as
mentioned below. Externally they act as stimulants or
escharotics, according to their strength.

c. ACIDUM NITROSUM DILUTUM, E. L. D. Diluted nitrous acid. *Aqua fortis.*

⁸⁴⁷
Diluted ni-
trous acid.

Prepared by mixing equal weights of nitrous acid
and water, taking care to avoid the noxious fumes.
Uses the same as of the last; but the diluted acid is
better calculated for internal exhibition. Doses about
double those of nitrous acid.

d. ACIDUM NITRICUM, E. Nitric acid.

⁸⁴⁸
Nitric acid.

Prepared by redistilling nitrous acid in a retort with
an adapted receiver, with a very gentle heat, till the
red portion has passed over, and the remaining acid has
acquired the state of nitric acid. See CHEMISTRY as
above.

This is the acid which has been so much recommend-
ed of late as a cure for syphilis, in which it is admini-
stered, diluted with water in the proportion of a dram
to a pint, which is to be taken at intervals through the
day, sucking it through a quill or glass tube, to avoid
injuring the teeth, and gradually augmenting the
quantity as far as the stomach will bear. Though the
advantages of nitric acid in syphilitic complaints appear
to have been overrated, it is no doubt a valuable succe-
daneum to mercury, and has, we believe, been of ser-
vice in cases where mercurial preparations were inad-
missible, or unsuccessful. Nitric acid, in its nascent
state,

History of state, as procured by an extemporaneous decomposition of nitre by sulphuric acid, has been found of advantage as a fumigation in correcting putrid effluvia.

Official Medicines.

849
Ointment of nitrous acid.

c. UNGUENTUM ACIDI NITROSI, E. Ointment of nitrous acid. *Oxygenated ointment.*

Prepared by gradually mixing six drams of nitrous acid with one pound of melted hog's lard, and continually agitating the mixture as it cools.

A good remedy in herpes, lepra, and some other cutaneous affections, and said to have succeeded as a substitute for mercurial ointment.

850
Spirit of nitrous ether.

f. SPIRITUS ÆTHERIS NITROSI, E. L. LIQUOR ÆTHEREUS NITROSUS, D. Spirit of nitrous ether. *Ethereal nitrous liquor. Sweet spirit of nitre.*

About three parts of alcohol and one of nitrous acid, gradually mixed together, distilling over the spirit from a water bath.

Diuretic, stimulant, and tonic. Dose 20 drops to a dram.

851
Muriate of soda.

266. MURIAS SODÆ, E. SAL MURIATICUS, L. SAL COMMUNIS, D. SAL MARINUS. Muriate of soda. *Sea salt. Common salt.* See CHEMISTRY, N^o 1046.

Muriate of soda is employed as a laxative and anthelmintic. In the former way it is usually administered in clysters; in the latter it is given by the mouth, in the dose of half a dram to an ounce or more. Externally, when dried by heat, it is used as a stimulant and rubefacient.

Official Preparations.

852
Dried muriate of soda.

a. MURIAS SODÆ EXSICCATUS, E. SAL COMMUNIS EXSICCATUS, D. Dried muriate of soda.

Muriate of soda is dried by roasting it over the fire in a wide iron vessel, with occasional agitation, till it ceases to decrepitate.

853
Muriatic acid.

b. ACIDUM MURIATICUM, E. L. D. Muriatic acid. *Marine acid. Spirit of sea-salt.*

Prepared by decomposing muriate of soda by sulphuric acid, in the manner described under CHEMISTRY, Chap. x. Sect. 5.

Muriatic acid is used in medicine as a refrigerant, diuretic, and stimulant. Dose from 10 drops to 40 or 50. It is a good medicine in low fevers, largely diluted and sweetened with sugar. In its nascent state, as obtained by the extemporaneous decomposition of muriate of soda by sulphuric acid, it is an excellent fumigation, and in this respect is perhaps to be preferred to the nitric acid.

854
Sulphate of soda.

c. SULPHAS SODÆ, E. NATRON VITRIOLATUM, L. ALKALI FOSSILE VITRIOLATUM, D. SAL GLAUBERI. Sulphate of soda. *Vitriolated natron. Vitriolated mineral alkali. Glauber's salt.*

Usually prepared by dissolving and neutralizing the acidulous salt remaining after the preparation of muriatic acid, filtering the liquor, evaporating, and setting it aside to crystallize. See CHEMISTRY, N^o 1030.

A good purgative, but not suited to all stomachs. Dose from one to two ounces.

267. SUBBORAS SODÆ. BORAS SODÆ, E. BORAX, L. D. Subborate of soda. *Borax.* See CHEMISTRY, N^o 1067.

History of Simple and Official Medicines.

Sometimes given internally as a diuretic; but generally employed as a detergent to aphthous crusts and ulcerations in the mouth and fauces, either by way of lotion, or made into a linctus with syrup or honey.

855
Subborate of soda.

SECT. V. Soaps.

268. SAPO HISPANUS. SAPO, E. Spanish or Castile soap.

856
Castile soap.

The Edinburgh and London colleges particularize the soap that should be used in medicine, as prepared of olive oil and soda.

On the nature and properties of soap, see CHEMISTRY. Soap is employed both internally and externally. Internally it acts as a gentle laxative, and is supposed to possess lithontriptic powers. In this latter way it has been given in the quantity of from half an ounce to an ounce in the day. Excepting with this intention, it is seldom given alone. Externally it is used as a stimulant and detergent, under the various forms mentioned below.

Official Preparations.

a. TINCTURA SAPONIS, E. LINIMENTUM SAPONIS COMPOSITUM, L. LINIMENTUM SAPONACEUM, D. Tincture of soap. *Compound liniment of soap. Saponaceous liniment. Opodeldoc.*

857
Tincture of soap.

The Edinburgh tincture is prepared by digesting four ounces of soap shavings in two pounds of alcohol for three days; then adding to the filtered liquor two ounces of camphor, and half an ounce of volatile oil of rosemary, agitating them diligently. The London liniment is composed of three ounces of soap, one ounce of camphor, and one pint of spirit of rosemary; that of the Dublin college of two ounces of Castile soap, one ounce of camphor, eight ounces of alcohol, and the same of water, and two scruples of essential oil of rosemary.

b. TINCTURA SAPONIS ET OPII, E. LINIMENTUM ANODYNUM. Tincture of soap and opium. *Anodyne liniment.*

858
Tincture of soap and opium.

Prepared in the same manner as the last, with the addition, from the beginning, of one ounce of opium.

These tinctures or liniments are excellent stimulant applications in cases of sprains, rheumatic pains, and similar affections; and the latter of them has been found useful when applied to the tumid belly of children that are threatened with rickets.

c. CERATUM SAPONIS, L. D. Soap cerate.

859
Soap cerate.

Prepared by boiling one pound of powdered litharge with a gallon or eight pounds (D.) of vinegar, over a slow fire, with constant agitation, till the mixture combines and thickens; then adding eight ounces of soap, 10 ounces of yellow wax, and a pint or 14 ounces (D.) of olive oil, and continuing the heat and agitation till they are united to form a cerate.

d. EMPLASTRUM SAPONIS, L. EMPLASTRUM SAPONACEUM, E. D. Soap plaster.

860
Soap plaster.

Prepared by mixing one part of soap with six of melted

History of melted litharge plaster (L. D.), or one part of sliced Simple and soap, with four of plaster of semivitrified oxide of lead, and two parts of gum plaster melted together (E.).
 Official Medicines. These are intended as discutient applications.

SECT. VI. *Earths and Earthy Salts.*

861 Sulphate of baryta. 269. SULPHAS BARYTÆ, E. TERRA PONDEROSA VITRIOLATA. BARYTES. Sulphate of Baryta. *Vitriolated ponderous earth. Barytes.* See CHEMISTRY, N^o 1256, *et seq.*

Employed in medicine only for preparing the muriate of baryta.

862 Carbonate of baryta. 270. CARBONAS BARYTÆ, E. TERRA PONDEROSA. Carbonate of baryta. *Heavy spar.* See CHEMISTRY, as above.

Official Preparations.

863 Muriate of baryta. a. MURIAS BARYTÆ, E. Muriate of baryta.

Prepared by dissolving carbonate of baryta broken into small pieces in a mixture of one part of muriatic acid and three of water, filtering the liquor, evaporating and crystallizing. Where the carbonate of baryta cannot be procured, this salt is obtained from the sulphate, by a very complex process, for which see Duncan's Dispensatory, and CHEMISTRY as above.

864 Solution of muriate of baryta. b. SOLUTIO MURIATIS BARYTÆ, E. Solution of muriate of baryta.

Prepared by dissolving one part of crystallized muriate of baryta in three of water.

This has been recommended as a powerful stimulant and tonic, in a variety of diseases. We believe it has been of service in some cases of scrophula. Dose from five to ten drops, twice or thrice a-day.

865 Lime. 271. CALX, L. CALX VIVA, E. CALX RECENTIS USTA, D. Lime. *Quicklime.* See CHEMISTRY, Chap. xiii. Sect. 1.

Lime in substance is scarcely employed in medicine, except by way of caustic, mixed with soft soap or pot-ash.

Official Preparation.

a. AQUA CALCIS, E. L. D. Lime-water.

866 Lime-water. This is a saturated solution of fresh burnt quicklime in water. After being made, it should be kept in vessels that are not too large, and carefully stopped, that it may not imbibe carbonic acid from the air.

Lime-water is employed as an antacid and astringent, a tonic, and an anthelmintic. Dose internally from two to four ounces. As an anthelmintic it is used in the way of clyster, to destroy ascarides. It is also employed externally as a stimulant and detergent.

867 Liniment of lime-water. b. LINIMENTUM AQUÆ CALCIS. OLEUM LINICUM CALCE, E. Liniment of lime, or *Lintseed oil with lime.*

Prepared by mixing equal parts of lintseed oil and lime-water.

A useful application to recent scalds and burns.

272. CARBONAS CALCIS, E. Carbonate of lime. History of CARBONAS CALCIS MOLLIOR, E. CRETA, L. D. Simple and Chalk. CARBONAS CALCIS DURIOR, E. MARMOR. Official Medicines. Marble. See CHEMISTRY, N^o 1230, *et seq.*

Carbonate of lime in its soft state is much employed in medicine as an antacid, and when powdered or prepared, it is applied externally to scalds and burns, and to cancerous sores.

Official Preparations.

a. CARBONAS CALCIS PRÆPARATUS, E. CRETA PRÆPARATA, L. D. Prepared carbonate of lime. Prepared chalk.

This is chalk reduced to a very fine powder by trituration, levigation, diffusion in water, filtration, and drying. Ordinary dose, as an antacid, from 15 grains to a dram.

b. POTIO CARBONATIS CALCIS, E. MISTURA CRETACEA, L. D. Chalk potion.

Prepared, according to the Edinburgh college, by triturating an ounce of prepared carbonate of lime with two ounces of mucilage of gum arabic, and half an ounce of double-refined sugar; then adding gradually two pounds and a half of water, and two ounces of spirit of cinnamon.

The London and Dublin mixture is prepared by mixing one ounce of prepared chalk, six drams of double-refined sugar, one ounce of powdered gum arabic, with two pints or 30 ounces (D.), of distilled water.

Employed as an antacid, especially in diarrhœa, accompanied by acidity in the intestinal canal. It may be taken *ad libitum.*

c. TROCHISCI CARBONATIS CALCIS, E. TROCHISCI CRETÆ, L. Troches of carbonate of lime. Troches of chalk.

Prepared of four ounces of carbonate of lime, one ounce of gum arabic, one dram of nutmeg, and six ounces of double-refined sugar, powdered together, and formed into a mass with water (E.); or, of four ounces of prepared chalk, two ounces of prepared crabs claws, half an ounce of cinnamon, and three ounces of double-refined sugar, powdered and made into a mass with mucilage of gum arabic (L.). Used as the preceding.

d. PULVIS CARBONATIS CALCIS COMPOSITUS, E. PULVIS CRETÆ COMPOSITUS, L. Compound powder of carbonate of lime. Compound powder of chalk.

Prepared of four ounces of prepared carbonate of lime, half a dram of nutmeg, and half a dram of cinnamon powdered together (E.); or, of half a pound of prepared chalk, four ounces of cinnamon, three ounces of tormentil, and the same of gum arabic, and half an ounce of long pepper powdered separately, and mixed together (L.).

Used as antacids and tonics, in debility of the intestinal canal. Dose from 15 to 30 grains.

e. AQUA AERIS FIXI, D. Water impregnated with fixed air.

Prepared

History of
Simple and
Official
Medicines.

Prepared by passing a stream of carbonic acid gas arising from the decomposition of three ounces of powdered white marble, and one half pound of diluted vitriolic acid, mixed with an equal quantity of water, through six pounds of pure spring water, in a Nooth's apparatus, with occasional agitation.

An excellent tonic, refrigerant, and anti-emetic.

876
Solution of
muriate of
lime.

f. SOLUTIO MURIATIS CALCIS, E. Solution of muriate of lime.

Prepared by dissolving nine ounces of white marble broken to pieces, in sixteen ounces of muriatic acid, mixed with eight ounces of water; digesting for half an hour, pouring off the liquor, evaporating to dryness, dissolving the residuum in $1\frac{1}{2}$ times its weight of water, and filtering the solution.

An excellent tonic, useful in cases of scrofula and schirrus. Dose from 30 to 60 drops, twice or thrice a-day.

877
Sulphate of
magnesia.

273. SULPHAS MAGNESIÆ, E. MAGNESIA VI-TRIOLATA, L. D. SAL CATHARTICUS AMARUS. Sulphate of magnesia. *Vitriolated magnesia. Epsom salt.* See CHEMISTRY, Chap. xiii. Sect. 4.

Used as a purgative, in a dose of an ounce to an ounce and a half; as a tonic and gentle stimulant, in the dose of a dram or two diluted considerably, twice a-day.

Official Preparations.

878
Carbonate of magne-
sia.

a. CARBONAS MAGNESIÆ, E. MAGNESIA ALBA, L. D. Carbonate of magnesia. *White Magnesia.*

Prepared by decomposing sulphate of magnesia by an equal weight of carbonate of potash, each previously dissolved in twice its weight of warm water, strained, and then mixed, instantly adding eight times their weight of warm water; then boiling the liquor for a little with agitation, and when the heat is a little diminished, straining the liquor through linen, and well washing the powder that remains on the filter with warm water, and drying.

An excellent antacid, and in cases of acidity, a laxative; also a good anti-emetic, where the sickness is accompanied with acidity. Dose from half a dram to a dram.

879
Magnesia.

b. MAGNESIA, E. MAGNESIA USTA, L. D. Magnesia. *Burnt or calcined magnesia.*

This is pure magnesia, freed from carbonic acid, by keeping it in a red heat for two hours, and putting it up in closely stopped bottles.

Preferable to the former as an antacid, wherever the extrication of carbonic acid may be unpleasant, by producing flatulency, especially for children.

880
Troches of
magnesia.

c. TROCHISCI MAGNESIÆ, L. Troches of magnesia.

Prepared by triturating together four ounces of burnt magnesia, two ounces of double refined sugar, and a scruple of powdered ginger, and forming a mass for troches, with mucilage of gum arabic.

881
Supersul-
phate of a-
lumine and
potash.

274. SUPERSULPHAS ALUMINÆ ET POTASSÆ. SUL-

PHAS ALUMINÆ, E. ALUMEN, L. D. *See* History of persulphate of alumina and potash. *Alum.* See CHEMISTRY, N^o 1418, *et seq.* Simple and Official Medicines.

Alum is employed both externally and internally as an astringent and tonic. Internally it is given chiefly in hæmorrhages; dose from ten grains to a scruple.

Official Preparations.

a. ALUMEN PURIFICATUM, L. Purified alum. 882 Purified alum.

Prepared by boiling one pound of alum with one dram of chalk, in a pint of distilled water, straining and crystallizing.

b. SULPHAS ALUMINÆ EXSICCATUS, E. ALUMEN USTUM, L. Dried sulphate of alumina. *Burnt alum.* 883 Dried sulphate of alumina.

Alum is freed from its water of crystallization by melting it over the fire in an earthen or iron vessel, and keeping it there till it ceases to boil.

Employed as an escharotic, to destroy fungous excrescences.

c. AQUA ALUMINIS COMPOSITA, L. Compound alum water. 884 Compound alum water.

Prepared by dissolving half a dram of alum, and the same of vitriolated zinc, in four ounces of distilled water.

Employed externally as a stimulant or astringent, especially in ophthalmia, and as an injection in leucorrhœa.

d. PULVIS SULPHATIS ALUMINÆ COMPOSITUS, E. PULVIS STYPTICUS. Compound powder of sulphate of alumina. *Styptic powder.* 885 Compound powder of sulphate of alumina.

Composed of four parts of sulphate of alumina, and one part of kino, rubbed together to a fine powder.

Astringent. Dose from 15 to 30 grains.

e. CATAPLASMA ALUMINIS, L. COAGULUM ALUMINOSUM, D. Alum cataplasm. *Alum curd.* 886 Alum curd.

Prepared by shaking any quantity of the white of egg with a piece of alum till a curd is formed.

A useful application to sore and watery eyes, spread on linen, and applied at bed-time.

275. BOLUS GALLICUS, L. French bole. 887 French bole.

A clayey earth, formerly employed as an antacid or absorbent.

SECT. VII. *Metals and Metallic Preparations.*

275. ACIDUM ARSENIOSUM. OXIDUM ARSENIÆ, E. Arsenious acid. *Oxide of arsenic. White acid arsenic.* See CHEMISTRY, N^o 1536, *et seq.* 888 Arsenious acid.

For an excellent account of the effects of arsenic on the living body, the modes of obviating or counteracting them, and of its medical use, see Duncan's Dispensatory.

This substance is employed as a tonic in intermittent fever, but we consider it as a dangerous remedy. For the mode of preparing and exhibiting it, see Duncan's

History of Duncan's Dispensatory as above, and *Theaurus Medicinæ*.

Simple and Official Medicines.

276. SULPHURETUM ANTIMONII, E. ANTIMONIUM, L. STIBIUM, D. Sulphuret of antimony.

889 Sulphuret of antimony.

For the natural history and chemical nature of this substance, see *MINERALOGY Index*, and *CHEMISTRY*, Chap. xiv. Sect. 12.

In its natural state, sulphuret of antimony is not employed in human medicine, except to form the following

Official Preparations.

a. SULPHURETUM ANTIMONII PRÆPARATUM, E. ANTIMONIUM PRÆPARATUM, L. STIBIUM PRÆPARATUM, D. Prepared antimony.

890 Prepared sulphuret of antimony.

Reduced to a very fine powder in the same manner as chalk, &c.

b. OXIDUM ANTIMONII CUM SULPHURE PER NITRATUM POTASSÆ, E. CROCUS ANTIMONII, L. STIBIUM NITRO CALCINATUM, D. Oxide of antimony with sulphur. *Crocus of antimony.*

891 Oxide of antimony with sulphur.

Prepared by injecting into a red-hot crucible equal weights of sulphuret of antimony and nitrate of potash, powdered separately, and well mixed; separating the reddish matter that remains after the deflagration is over, from the whitish crust above it, and reducing the former to powder, which is to be well washed with hot water till it is tasteless. Scarcely employed in medicine, except as the basis of other preparations.

c. OXIDUM ANTIMONII CUM SULPHURE VITRIFICATUM, E. ANTIMONIUM VITRIFICATUM, L. Vitriified oxide of antimony with sulphur. *Vitriified antimony. Glass of antimony.*

892 Vitriified oxide of antimony with sulphur.

Prepared by gradually heating powdered sulphuret of antimony till it ceases to emit sulphurous fumes, and then melting it by an intense heat into a glass, which is to be poured out on a heated brass plate.

Employed by the London colleges as the basis of their antimonial wine.

d. OXIDUM ANTIMONII VITRIFICATUM CUM CERA, E. Vitriified oxide of antimony with wax.

893 Vitriified oxide of antimony with wax.

Made by adding to one part of melted yellow wax, eight parts of vitriified oxide of antimony with sulphur, and roasting the mixture over a gentle fire with continual agitation for about a quarter of an hour, then pouring out the mixture, and, when cold, grinding it to powder.

This is similar to a medicine that was much esteemed by Sir John Pringle, as a remedy in dysentery. Dose from two or three to 20 grains, according to the age and strength of the patient.

e. SULPHUR STIBIATUM FUSCUM, D. KERMES MINERALIS. Brown antimonial sulphur. *Kermes mineral.*

894 Brown antimonial sulphur.

For the preparations and nature of this substance, see *CHEMISTRY*, N° 1688.

f. SULPHURETUM ANTIMONII PRÆCIPITATUM, E. SULPHUR ANT. PRÆCIP. L. SULPHUR VOL. XII. Part II.

895 Precipitated sulphuret of antimony.

STIBIATUM RUFUM, D. Precipitated sulphuret of antimony.

History of Simple and Official Medicines.

Prepared by dissolving two pounds of prepared sulphuret of antimony in four pounds of water of potash, mixed with three pounds of water, adding more, if necessary, in a covered iron pot, over a slow fire for three hours, frequently stirring with an iron spatula, straining the liquor while hot, and precipitating the sulphuret by diluted sulphuric acid; then washing and drying the precipitate. See *CHEMISTRY*, N° 1688.

Employed like the last as a diaphoretic. Dose two or three grains.

g. MURIAS ANTIMONII, E. ANTIMONIUM MURIATUM, L. STIBIUM MURIATUM CAUSTICUM, D. Muriate of antimony. *Muriated antimony. Butter of antimony.* See *CHEMISTRY*, p. 638.

896 Muriate of antimony.

Employed sometimes as a caustic, and for preparing the following substance.

h. CALX STIBII PRÆCIPITATA, D. Precipitated calx of antimony. *Powder of algaroth.*

897 Precipitated calx of antimony.

Prepared by adding eight ounces of muriated antimony to a filtered solution of eight ounces of mild vegetable alkali, in 40 pounds of water, washing and drying the precipitated powder.

i. OXIDUM ANTIMONII CUM PHOSPHATE CALCIS, E. PULVIS ANTIMONIALIS, L. PULVIS STIBIATUS, D. Oxide of antimony with phosphate of lime. *Antimonial powder.*

898 Oxide of antimony with phosphate of lime.

For the preparation and nature of this substance, see *CHEMISTRY*, N° 1686. It is considered as nearly the same with *James's powder*.

An excellent diaphoretic. Dose from five to ten grains.

k. TARTRAS ANTIMONII ET POTASSÆ. TARTRIS ANTIMONII, E. ANTIMONIUM TARTARISATUM, L. TARTARUM STIBIATUM, D. Tartrate of antimony and potash. *Tartarized antimony. Stibiated tartar. Emetic tartar or tartar emetic.* See *CHEMISTRY*, N° 1687, and *Duncan's Dispensatory*.

899 Tartrate of antimony and potash.

The Edinburgh and London colleges direct this to be prepared by boiling together three parts of oxide of antimony with sulphur, (see N° 891.) and four parts of super-tartrate of potash, for a quarter of an hour, in a glass vessel, straining the liquor, and setting it by to crystallize.

Emetic; dose two or three grains at once, or better half a grain or a grain at short intervals. Expectorant; dose half a grain, repeated at long intervals of two or three hours. Diaphoretic, in similar doses, combined with opium, &c. Alterative, in still smaller doses. Externally stimulant and rubefacient.

l. VINUM TARTRITIS ANTIMONII, E. VINUM ANTIMONII TARTARISATI, L. VINUM TARTARI STIBIATI, D. Wine of tartrite of antimony. *Wine of tartarized antimony.*

900 Wine of tartrite of antimony.

Prepared by dissolving tartrite of antimony and potash either immediately in Spanish white wine, or first in boiling water, and then adding the wine. The proportions

History of Simple and Official Medicines.

portions of the colleges vary; those of Edinburgh being 24 grains of the salt to a pound of wine; of London and Dublin, 40 grains of salt to two ounces of boiling water, and eight ounces of wine; so that the former contains two grains in every ounce by weight, the latter four grains in every ounce by measure.

Doses of the Edinburgh wine as an emetic, an ounce, or an ounce and a half, or at intervals half an ounce; as an expectorant or diaphoretic, a dram or two. The London and Dublin wine may be taken in about half the above doses.

901 Antimonial wine.

m. VINUM ANTIMONII, L. Antimonial wine.

Prepared by digesting an ounce of vitrified antimony in powder, in a pint and a half of Spanish white wine, for 12 days, with frequent agitation and straining through paper.

This preparation might be omitted, as it is neither so easily prepared nor so certain as the last.

902 Calcined antimony.

n. ANTIMONIUM CALCINATUM, L. Calcined antimony. *Diaphoretic antimony.* See CHEMISTRY, N° 1690.

Formerly much employed as a diaphoretic in a dose of from five to 30 grains; but since the introduction of James's powder and the analogous preparations, nearly disused.

903 Compound antimonial pills.

o. PILULÆ STIBII COMPOSITÆ, D. PILULÆ PLUMMERI. Compound antimonial pills. *Plummer's pills.*

Prepared by triturating together three ounces of precipitated sulphur of antimony, and the same of mild muriate of mercury; then adding a dram of extract of gentian, and the same of hard Spanish soap, and forming a mass with soap jelly.

Formerly in great repute as an alterative.

904 Mercury.

277. HYDRARGYRUM, D. HYDRARGYRUS, E. L. ARGENTUM VIVUM. Mercury. *Quicksilver.*

For an account of the chemical nature and properties of mercury, and the modes of ascertaining its purity, see CHEMISTRY, p. 642.

We shall first notice the several officinal preparations of mercury, and then subjoin a sketch of its uses and the cases to which it is best adapted.

Officinal Preparations.

905 Purified mercury.

a. HYDRARGYRUM PURIFICATUM, D. HYDRARGYRUS PURIFICATUS, E. L.

The Edinburgh process is to rub together four parts of quicksilver, and one part of iron filings, and distil from an iron vessel.

906 Acetate of mercury.

b. ACETAS HYDRARGYRI. ACETIS HYDRARGYRI, E. HYDRARGYRUM ACETATUM, D. HYDRARGYRUS ACETATUS, L. Acetate of mercury. *Acetated mercury.* See CHEMISTRY, N° 1749.

Scarcely employed at present, except as an external stimulant or discutient.

907 Muriate of mercury.

c. MURIAS HYDRARGYRI, E. HYDRARGYRUM MURIATUM CORROSIVUM, D. HY-

DRARGYRUS MURIATUS, L. Muriate of mercury. *Corrosive muriated mercury.* *Corrosive sublimiate.* See CHEMISTRY, N° 1736.

Prepared by boiling two pounds of purified quicksilver in two pounds and a half of sulphuric acid, in a glass vessel, over a sand bath, to dryness, triturating the dried mass when cold with four pounds of dried muriate of soda, then subliming in a glass cucurbit with a heat gradually increased, and separating the sublimed matter from the scorix.

Used as a sialagogue; dose one-eighth to one-fourth of a grain; as an external stimulus or escharotic to venereal ulcers, chancres, and herpetic eruptions, in the proportion of about a grain or more to the ounce of liquid.

d. SUBMURIAS HYDRARGYRI, E. HYDRARGYRUM MURIATUM MITE SUBLIMATUM, D. CALOMELAS, L. Submuriate of mercury. *Sublimed mild muriate of mercury.* *Calomel.* See CHEMISTRY, N° 1742, where the process is much the same as that of the Edinburgh college.

Given in most cases where mercury is indicated. Dose, as a diaphoretic or alterative, about a grain; as a cathartic or anthelmintic, three to 10 grains; as a sialagogue, one or two grains twice a-day.

e. SUBMURIAS HYDRARGYRI PRÆCIPITATUS, E. HYDRARGYRUM MURIATUM MITE PRÆCIPITATUM, D. HYDRARGYRUS MURIATUS MITE, L. Precipitated submuriate of mercury. *Precipitated mild muriate of mercury.*

Procured by adding to a solution of half a pound of purified quicksilver in the same weight of diluted nitrous acid, a solution of four pounds and a half of muriate of soda in eight pounds of boiling water; washing and drying the precipitate.

Much the same in its effects and doses as the foregoing.

f. CALX HYDRARGYRI ALBA, L. White calx of mercury. *White precipitate.*

Prepared by dissolving first half a pound of sal ammoniac, and then half a pound of muriated mercury, in distilled water, adding to the mixed solution half a pound of water of prepared kali, filtering and washing and drying the precipitate. See Duncan's Dispensatory.

g. UNGUENTUM CALCIS HYDRARGYRI ALBÆ, L. Ointment of white calx of mercury.

Prepared by mixing a dram of the foregoing with an ounce and a half of ointment of hog's lard. Used to destroy vermin, and in some cutaneous eruptions.

h. OXIDUM HYDRARGYRI CINEREUM, E. PULVIS HYDRARGYRI CINEREUS, D. Cinereous oxide of mercury.

Prepared by dissolving four parts of purified quicksilver in five parts of diluted nitrous acid; then gradually adding 15 parts of distilled water, and pouring in a sufficient quantity of water of carbonate of ammonia to precipitate the whole of the oxide, which is to be washed and dried.

History of Simple and Official Medicines. A mild sialagogue and alterative. Dose from one to five grains. Used also as a fumigation in syphilitic eruptions, &c.

⁹¹³ **i. UNGUENTUM OXIDI HYDRARGYRI CINEREI, E.** Ointment of cinereous oxide of mercury.

Composed of one part of the foregoing, and three parts of hog's lard. Used for mercurial inunction.

⁹¹⁴ **k. HYDRARGYRUS CUM CRETA, L.** Quicksilver with chalk.

Prepared by triturating together three parts of purified quicksilver and five parts of prepared chalk, till the globules disappear.

A mild alterative. Dose from 10 to 30 grains.

⁹¹⁵ **l. HYDRARGYRUM CALCINATUM, D. HYDRARGYRUS CALCINATUS, L.** Calcined mercury. See CHEMISTRY, N^o 1709.

A violent sialagogue. Dose half a grain to a grain.

⁹¹⁶ **m. OXIDUM HYDRARGYRI RUBRUM PER ACIDUM NITRICUM, E. HYDRARGYRUS NITRATUS RUBER, L. HYDRARGYRUM SUBNITRATUM, D.** Red oxide of mercury by nitric acid. *Red nitrated mercury. Red precipitate.* See CHEMISTRY, N^o 1709.

Used as a stimulant or an escharotic in fungous ulcers, &c.

⁹¹⁷ **n. UNGUENTUM OXIDI HYDRARGYRI RUBRI, E.** Ointment of red oxide of mercury.

Composed of one part of the foregoing reduced to fine powder, and eight parts of hog's lard.

⁹¹⁸ **o. SUBSULPHAS HYDRARGYRI FLAVUS, E. HYDRARGYRUM SUBVITRIOLATUM, D. HYDRARGYRUS VITRIOLATUS, L.** Yellow sulphate of mercury. *Subvitriolated mercury. Turpeth mineral.* See CHEMISTRY, N^o 1720.

Employed chiefly as an errhine, mixed with liquorice powder or cephalic snuff.

⁹¹⁹ **p. SULPHURETUM HYDRARGYRI NIGRUM, E. HYDRARGYRUM SULPHURATUM NIGRUM, D. HYDRARGYRUS CUM SULPHURE, L.** Black sulphuret of mercury. *Mercury with sulphur. Ethiops mineral.*

Prepared by triturating together in a glass mortar with a glass pestle, equal weights of purified quicksilver, and sublimed sulphur, till the globules of the former disappear. See CHEMISTRY, N^o 1712.

Employed chiefly as an alterative in cutaneous diseases and glandular affections. Dose from five or 10 grains to a dram or more.

⁹²⁰ **q. HYDRARGYRUM SULPHURATUM RUBRUM, D. HYDRARGYRUS SULPHURATUS RUBER, L.** Red sulphuret of mercury. *Factitious cinnabar. Vermilion.* See CHEMISTRY, N^o 1713.

Used principally as a fumigation for venereal ulcers in the nose, mouth, and throat, and as an ingredient in an ointment for the itch.

r. PILULÆ HYDRARGYRI, E. L. D. Mercury pills. History of Simple and Official Medicines.

Prepared by triturating an ounce of purified quicksilver with the same weight of conserve of red roses in a glass mortar, till the globules completely disappear, adding occasionally a little mucilage of gum arabic, then adding two ounces of starch, and beating the whole with a little water into a mass, to be immediately divided into 480 equal pills (E). The London pills are composed of two drams of purified quicksilver, three drams of conserve of roses, and one dram of powdered liquorice; and the Dublin pills of three drams of quicksilver, the same of extract of liquorice, and a dram and a half of purified liquorice root.

Four grains of the Edinburgh mass, three of the London, and two and a half of the Dublin, contain about one grain of mercury, so that the last are nearly twice as strong as the first. Dose of the Edinburgh pills as a sialagogue, from three to six, once or twice a day.

⁹²¹ **s. UNGUENTUM HYDRARGYRI, E.** Mercurial ointment. *Blue ointment.* Mercurial ointment.

Prepared by triturating together one part of quicksilver with a little hog's lard, till the globules disappear; then adding one part of mutton suet, and as much hog's lard as with the first quantity, is equal to three parts. Also formed with double or treble the quantity of mercury.

Used for mercurial inunction. Quantity to be used at once about four scruples or drams every other night, or every night.

⁹²² **t. UNGUENTUM HYDRARGYRI FORTIUS, L. D.** Stronger mercurial ointment. Stronger mercurial ointment.

Composed of two pounds of purified quicksilver, 23 ounces of prepared hog's lard, and an ounce of prepared mutton suet.

Quantity used at once, about two scruples or a dram.

⁹²³ **u. UNGUENTUM HYDRARGYRI MITIUS, L. D.** Milder mercurial ointment. *Trooper's ointment.* Milder mercurial ointment.

Formed of one part of the foregoing, and two of prepared hog's lard. Used chiefly to destroy vermin, or for some cutaneous affections.

⁹²⁴ **v. EMPLASTRUM HYDRARGYRI, E.** Mercurial plaster. Mercurial plaster.

Formed by melting one part of olive oil, and the same of white rosin together; and when the mixture is cold, rubbing with it three parts of quicksilver till the globules disappear, afterwards adding by degrees six parts of melted plaster of semivitrified oxide of lead, and mixing the whole carefully together.

⁹²⁵ **w. EMPLASTRUM AMMONIACI CUM HYDRARGYRO, L.** Plaster of gum ammoniac with mercury. Plaster of gum ammoniac with mercury.

Prepared by triturating together three ounces of purified quicksilver, with about a dram of sulphurated oil, till the globules disappear, and then adding gradually one pound of strained gum ammoniac melted.

Oxide of
zinc.

x. EMPLASTRUM LITHARGYRI CUM HYDRARGYRO, L. Litharge plaster with mercury.

Composed of three ounces of purified quicksilver, about a dram of sulphurated oil, and a pound of melted litharge plaster.

These three last are employed as resolvents and discutients, in cases of venereal nodes and beginning indurations.

y. UNGUENTUM NITRATIS HYDRARGYRI, E. UNGUENTUM HYDRARGYRI NITRATI, L. D. UNGUENTUM CITRINUM. Ointment of nitrate of mercury. *Citrine ointment.*

Prepared by first dissolving one part of quicksilver in two of nitrous acid, and beating up the solution in a glass mortar, with nine parts of olive oil, and three of hog's lard, previously melted together (or with 12 parts of hog's lard, L. D.) till the whole is formed into an ointment.

A powerful stimulant and detergent ointment, useful in inflammation and ulceration of the eyelids, and in cutaneous affections.

z. UNGUENTUM NITRATIS HYDRARGYRI MITIUS, E. Milder ointment of nitrate of mercury.

Prepared in the same way as the last, except using three times the quantity of oil and lard.

Mercury, or some of its preparations, is exhibited, 1. As an emetic, the subsulphate of mercury; 2. As a sialagogue, mercury in almost any form; 3. As a cathartic, the submuriate of mercury; 4. As a diuretic, the oxides, the muriate, and the submuriate, combined with other diuretics; 5. As a sudorific, calomel conjoined with a sudorific regimen; 6. As an emmenagogue; 7. As an astringent, muriate of mercury; 8. As a stimulant, muriate of mercury; 9. As an antispasmodic; 10. As an anthelmintic.

With some of these views, mercury is frequently exhibited, 1. In febrile diseases; in obstinate agues. 2. In inflammatory diseases, in indolent and chronic inflammations, especially of the glandular viscera, as the liver, spleen, &c. 3. In exanthematous diseases, variola. 4. In profluvia; in dysentery. 5. In spasmodic diseases; tetanus, trismus, hydrophobia, &c. 6. In cachectic diseases; anasarca, ascites, hydrothorax, hydrocephalus, &c. 7. In impetigines, scrophula, syphilis, lepra, icterus, &c. 8. In local diseases; in caligo cornæ, amaurosis, gonorrhœa, obstipatio, amenorrhœa suppressionis, tumours of various kinds, herpes, tinea, psora, &c. *

For a more particular account of the medical effects and uses of mercury, we refer our readers to Cullen's *Materia Medica*, vol. ii. The *Practical Synopsis*, vol. i. The *Thesaurus Medicaminum*, and Murray's *Elements*, vol. i.

278. ZINCUM, E. L. D. Zinc. See CHEMISTRY, p. 649.

Official Preparations.

a. OXIDUM ZINCI, E. ZINCUM CALCINATUM, L. CALX ZINCI, E. FLORES ZINCI. Oxide of zinc. *Flowers of zinc.* See CHEMISTRY, N^o 1756.

Employed as a tonic and antispasmodic, chiefly in History of epilepsy. Dose from three to 10 grains, three or four Simple and times a day. *Official Medicines.*

b. UNGUENTUM OXIDI ZINCI, E. Ointment of oxide of zinc. ⁹³² Ointment of oxide of zinc.

Composed of one part of the foregoing, and six parts of simple liniment.

Applied to the eye as an astringent, in cases of ophthalmia, attended with debility and relaxation of the vessels.

c. SULPHAS ZINCI, E. ZINCUM VITRIOLA-TUM, L. D. Sulphate of zinc. *Vitriolated zinc.* ⁹³³ *White vitriol.* See CHEMISTRY, N^o 1764.

Employed internally as an emetic, in the dose of from 10 to 30 grains, and as an astringent and tonic in a dose of from two to five grains, several times a day. Externally as a stimulant and astringent, in the form of lotion, collyrium, or injection.

d. SOLUTIO SULPHATIS ZINCI, E. Solution of sulphate of zinc. ⁹³⁴ Solution of sulphate of zinc.

Prepared by dissolving 16 grains of sulphate of zinc in eight ounces of water; then adding 16 drops of diluted sulphuric acid, and filtering through paper.

Used in most cases where the sulphate of zinc is employed externally.

e. AQUA ZINCI VITRIOLATI CUM CAMPHORA, L. Water of vitriolated zinc with camphor. ⁹³⁵ Water of vitriolated zinc with camphor.

Composed of half an ounce of vitriolated zinc, half an ounce by measure of camphorated spirit, and two pints of boiling water, mixed together, and filtered through paper.

Used for an astringent lotion and collyrium.

f. SOLUTIO ACETITIS ZINCI, E. Solution of acetate of zinc. ⁹³⁶ Solution of acetate of zinc.

Prepared by mixing together a solution of one dram of sulphate of zinc, in 10 ounces of distilled water, and a solution of four scruples of acetate of lead in 10 ounces of distilled water, allowing them to stand for some time at rest, and filtering.

An excellent astringent collyrium.

279. OXIDUM ZINCI IMPURUM, E. TUTIA, L. Impure oxide of zinc. ⁹³⁷ *Tutty.* See MINERALOGY *Index.*

Official Preparations.

a. OXIDUM ZINCI IMPURUM PRÆPARATUM, E. TUTIA PRÆPARATA, L. D. Prepared impure oxide of zinc. ⁹³⁸ Prepared impure oxide of zinc. *Prepared tutty.*

Prepared in the same way as chalk, and other hard substances.

b. UNGUENTUM OXIDI ZINCI IMPURI, E. UNGUENTUM TUTIÆ, L. D. Ointment of impure oxide of zinc. ⁹³⁹ Ointment of impure oxide of zinc. *Tutty ointment.*

Composed of one part of the foregoing, and five parts of simple liniment (E.), or of any quantity of the foregoing, and as much ointment of spermaceti, or of hog's

History of hog's lard as is sufficient to form a soft ointment Simple and (L. D.)

Official Medicines. Used in similar cases with N^o 932.

⁹⁴⁰ Impure carbonate of zinc. **280. CARBONAS ZINCI IMPURUS, E. LAPIS CALAMINARIS, L. D.** Impure carbonate of zinc. *Calamine.* See MINERALOGY Index.

Official Preparations.

⁹⁴¹ Prepared impure carbonate of zinc. **a. CARBONAS ZINCI IMPURUS PRÆPARATUS, E. LAPIS CALAMINARIS PRÆPARATUS, L. D.** Prepared carbonate of zinc. *Prepared calamine.*

Prepared as chalk, &c.

⁹⁴² Cerate of impure carbonate of zinc. **b. CERATUM CARBONATIS ZINCI IMPURI, E. CERATUM LAPIDIS CALAMINARIS, L. D. CERATUM EPULOTICUM.** Cerate of impure carbonate of zinc. *Calamine cerate. Epulotic cerate. Brown cerate. Turner's cerate.*

Composed of one part of the foregoing, and five parts of simple cerate (E.), or of half a pound (L.), or one part (D.) of the foregoing, the same of yellow wax, and a pint (L.) or two parts (D.) of olive oil.

Employed chiefly as a dressing to sores and ulcers.

⁹⁴³ Tin. **281. STANNUM, E. L. D. Tin.** See CHEMISTRY, p. 653.

Official Preparations.

⁹⁴⁴ Powder of tin. **a. STANNI PULVIS, L. D.** Powder of tin.

Prepared by granulating melted tin by agitation in a covered wooden box rubbed with chalk; or by stirring while melted over the fire till it be reduced to a powder.

Employed as a mechanical anthelmintic, especially in cases of tenia and lumbricus. Dose from two drams to half an ounce.

⁹⁴⁵ Lead. **282. PLUMBUM, E. L. D. Lead.** See CHEMISTRY, p. 657.

⁹⁴⁶ White oxide of lead. **OXIDUM PLUMBI ALBI, E. CERUSSA, L. D.** White oxide of lead. *Ceruse. White lead.* See CHEMISTRY, N^o 1856.

Official Preparations.

⁹⁴⁷ Compound powder of ceruse. **a. PULVIS CERUSSÆ COMPOSITUS, L.** Compound powder of ceruse.

Composed of five ounces of ceruse, half an ounce of sarcocol, and half an ounce of gum-tragacanth, powdered together.

Intended as an external discutient, but inferior for that purpose to the solutions of the salts of lead.

⁹⁴⁸ Ointment of white oxide of lead. **b. UNGUENTUM OXIDI PLUMBI ALBI, E. UNGUENTUM ALBUM.** Ointment of white oxide of lead. *White ointment.*

Composed of five parts of simple ointment, and one of white oxide of lead.

A cooling desiccative ointment, forming a useful application in cases of excoriation.

⁹⁴⁹ Superacetate of lead. **c. SUPERACETAS PLUMBI. ACETIS PLUMBI, E. CERUSSA ACETATA, L. D. SACCHARUM**

SATURNI. Superacetate of lead. *Acetated ceruse.* History of *Sugar of lead.* See CHEMISTRY, N^o 1858. Simple and Official Medicines.

Chiefly employed in solution as an external refrigerant or astringent, by way of lotion, collyrium, or injection. Its external use being highly dangerous, ought to be entirely abandoned.

⁹⁵⁰ **d. UNGUENTUM ACETITIS PLUMBI, E. UNGUENTUM CERUSSÆ ACETATÆ, L. D. UNGUENTUM SATURNINUM.** Ointment of acetate of lead. *Ointment of acetated ceruse. Saturnine ointment.*

Composed of one part of the foregoing, and 20 parts of simple ointment (E.) or two drams of the foregoing, two ounces of white wax, and half a pint or half a pound of olive oil (L. D.).

A useful refrigerant ointment.

⁹⁵¹ **283. OXIDUM PLUMBI RUBRUM, E. MINIUM, L.** Red oxide of lead. *Red lead.* See CHEMISTRY, N^o 1832.

This is now scarcely employed in medicine.

⁹⁵² **284 OXIDUM PLUMBI SEMIVITREUM, E. LITHARGYRUS, L. D.** Semivitrified oxide of lead. *Litharge.* See CHEMISTRY, N^o 1834.

Official Preparations.

⁹⁵³ **a. LITHARGYRUS PRÆPARATUS, E. D.** Prepared litharge.

Reduced to an impalpable powder by levigation, &c. in the usual manner.

⁹⁵⁴ **b. AQUA LITHARGYRI ACETATI, L. LIQUOR LITHARGYRI ACETATI, D. EXTRACTUM SATURNI.** Water of acetated litharge. *Extract of lead.*

Prepared by mixing two pounds four ounces of litharge with a gallon of distilled vinegar, boiling to six pints with constant agitation, then setting it aside till the feces have subsided, and then straining.

⁹⁵⁵ **c. LIQUOR LITHARGYRI ACETATI COMPOSITUS, D. AQUA LITHARGYRI ACETATI COMPOSITA, L.** Compound water of acetated litharge.

Prepared by mixing a dram of the foregoing with a dram of proof spirit, and adding 14 ounces or a pint of distilled water.

This is intended as a refrigerant application, and is attended with effects similar to those of the superacetate of lead, from which it however differs in its chemical nature.

⁹⁵⁶ **d. CERATUM LITHARGYRI ACETATI COMPOSITUM, L. CERATUM LITHARGYRI ACETATI, D.** Compound cerate of acetated litharge.

Prepared by rubbing half a dram of camphor with a little olive oil, and in the mean time adding gradually two ounces and a half of acetated litharge to a melted mixture of four ounces of yellow wax, and nine ounces of olive oil, stirring it till cold; and lastly adding the camphorated oil. Formerly much employed as a refrigerant application, but differing in little, except in consistence,

History of consistence, from the other combinations of lead with Simple and fatty matters.

Official Medicines.

957 Plaster of semivitrified oxide of lead.

e. EMPLASTRUM OXIDI PLUMBI SEMIVITREI, E. EMPLASTRUM LITHARGYRI, L. D. EMPLASTRUM COMMUNE. Plaster of semivitrified oxide of lead. *Litharge plaster. Common plaster. Diaculum plaster.*

Prepared by boiling together over a slow fire, one part of semivitrified oxide of lead in powder, and about two parts of olive oil, adding a little hot water from time to time, and constantly agitating till the litharge and oil are uniformly mixed.

This plaster has been long employed to cover excoriated surfaces, and to form plasters for supporting the teguments in the neighbourhood of sores and ulcers.

For the ill effects of lead as a poison, see Fothergill's "Cautions concerning Poisons of Lead and Copper."

958 Iron.

285. FERRUM, E. L. D. Iron. See CHEMISTRY, p. 664.

Official Preparations.

959 Purified filings of iron.

a. FERRI LIMATURÆ PURIFICATÆ, E. Purified filings of iron.

Filings of iron are purified by placing a sieve over them, and attracting the purer particles through the sieve by means of a good magnet.

Sometimes employed internally as a tonic and anthelmintic, but their use is attended with an unpleasant extrication of hydrogenous gas.

960 Purified black oxide of iron.

b. FERRI OXIDUM NIGRUM PURIFICATUM, E. FERRI SQUAMÆ PURIFICATÆ. Purified black oxide of iron. *Purified scales of iron.*

This is a preparation of the scales of iron that collect about a smith's anvil, by the magnet.

A better medicine than the former, as it is not attended with the extrication of hydrogen gas. Dose from five grains to a scruple.

961 Carbonate of iron.

c. CARBONAS FERRI, E. FERRI RUBIGO, L. D. Carbonate of iron. *Rust of iron.* See CHEMISTRY, N° 1886, and 1929.

A good tonic, useful in general debility, and in uterine obstructions dependent on debility. Dose about a scruple, several times a day.

962 Water of aerated iron.

d. AQUA FERRI AERATI, D. Water of aerated iron.

This is an artificial chalybeate water, prepared in the same manner as N° 875. with the addition of a coil of fine iron wire suspended in the water.

An excellent tonic, forming a good substitute for the natural chalybeate waters. Dose a glass or two, twice or thrice a day.

963 Wine of iron.

e. VINUM FERRI, L. VINUM FERRATUM, D. Wine of iron. *Chalybeate wine.*

Prepared by digesting four ounces of iron filings in four pints of Spanish white wine, for a month, with frequent agitation, and then straining the liquor.

A tonic formerly much used in chlorotic cases. Dose from a dram to half an ounce.

f. SULPHAS FERRI, E. FERRUM VITRIOLATUM, L. D. SAL MARTIS. Sulphate of iron. *Vitriolated iron. Salt of steel.* See CHEMISTRY, N° 1903.

A good tonic, but apt to disagree with the stomach and bowels. Dose from half a grain to one grain several times a day.

g. TINCTURA MURIATIS FERRI, E. TINCTURA FERRI MURIATI, L. D. Tincture of muriate of iron.

The Edinburgh tincture is prepared by digesting three ounces of purified black oxide of iron in powder, and ten ounces of muriatic acid, with a gentle heat; then adding, after the powder is dissolved, as much alcohol as will make the whole liquor amount to two pounds and a half. The preparations of the other colleges do not materially differ from this. Dose from 10 to 20 drops, twice or thrice a day.

h. FERRUM TARTARISATUM, L. *Tartarized iron.*

Prepared by mixing one pound of iron filings, and two pounds of powdered crystals of tartar, into a thick mass with distilled water, exposing them to the air for eight days in a wide glass vessel, and then drying the matter in a sand bath, and grinding to a very fine powder. See CHEMISTRY, p. 671. Dose from 10 to 30 grains.

286. SULPHAS FERRI NATIVUS. Native sulphate of iron. *Green vitriol. Green copperas.*

Official Preparations.

a. SULPHAS FERRI EXSICCATUS, E. Dried sulphate of iron.

Prepared by exposing any quantity of sulphate of iron to the action of a moderate heat, in an unglazed earthen vessel, till it becomes white and perfectly dry.

b. OXIDUM FERRI RUBRUM, E. Red oxide of iron.

Prepared by exposing the foregoing preparation to an intense heat till it is converted into a very red matter.

c. EMPLASTRUM OXIDI FERRI RUBRI, E. EMPLASTRUM ROBORANS. Plaster of red oxide of iron. *Strengthening plaster.*

Prepared by grinding eight parts of red oxide of iron with three of olive oil; and then adding them to a melted mixture of 24 parts of plaster of semivitrified oxide of lead, six parts of white rosin, and three of yellow wax.

Used as an external application, spread on linen or leather, in weaknesses of the back and loins.

d. MURIAS AMMONIÆ ET FERRI, E. FERRUM AMMONIACALE, L. Muriate of ammonia and iron.

Prepared by mixing equal weights of red oxide of iron, washed and dried, and muriate of ammonia, and subliming, E. Dose from three to ten grains.

e. TINCTURA FERRI AMMONIACALIS, L. Tincture of ammoniacal iron.

Prepared

History of Simple and Official Medicines. Prepared by digesting four ounces of the preceding, with a pint of proof spirit, and straining. Used in similar cases with the tincture of muriate of iron, which is, however, to be preferred to it.

⁹⁷³ Tincture of acetated iron. *f. TINCTURA FERRI ACETATI, D.* Tincture of acetated iron.

Prepared by rubbing together in a glass mortar, acetated vegetable alkali, and vitriolated iron, of each an ounce, till the mass deliquesces, and then adding during the trituration two pounds of alcohol, and straining the solution.

A powerful astringent and tonic. Dose 20 or 30 drops.

The preparations of iron, given in a moderate dose, gradually raise the pulse, improve the colour of the face, and increase the alvine, urinary, and cuticular excretions. Their taking proper effect is denoted by fetid eructations and black stools.

These tonics are indicated chiefly in cases of preternatural discharges, or suppression of natural secretions or excretions, proceeding from a languor and sluggishness of the fluids, and general weakness of the solids. They are therefore useful in passive hæmorrhages, in dyspepsia, hysteria, and chlorosis; in most of the cachexiæ, in cancerous affections, and in the general debility that often remains after acute diseases or excessive hæmorrhages.

The preparations of iron, when given too largely, or improperly, produce headach, anxiety, heat of skin, and not unfrequently hæmorrhages or vomiting, pains in the stomach, and spasms and pains in the bowels. They are improper wherever the circulation is already too quick, the solids too tense and rigid; and where there is any stricture and spasmodic contractions of the vessels.

⁹⁷⁴ Copper. 287. *CUPRUM, E.L.D.* Copper. See CHEMISTRY, p. 674.

⁹⁷⁵ Subacetate of copper. *SUBACETAS CUPRI. SUBACETIS CUPRI, E. ÆRUGO.* Subacetate of copper. *Verdigris.* See CHEMISTRY, N^o 1995.

Employed chiefly as an escharotic, to destroy callous edges or fungous flesh, or as a stimulant to foul ulcers.

Official Preparations.

⁹⁷⁶ Prepared verdigris. *a. ÆRUGO PRÆPARATA, L. D.* Prepared verdigris.

Prepared like other substances not soluble in water.

⁹⁷⁷ Oxymel of verdigris. *b. OXYMEL ÆRUGINIS, L.* Oxymel of verdigris.

Prepared by dissolving one ounce of prepared verdigris in seven ounces of vinegar, straining through linen, and boiling with 14 ounces of clarified honey to a proper consistence.

Sometimes used as a detergent gargle to venereal ulcerations of the mouth and tonsils, but with much precaution. More generally employed, mixed with some stimulant ointment, as an external stimulant and escharotic.

c. UNGUENTUM SUBACETITIS CUPRI, E. Ointment of subacetite of copper. History of Simple and Official Medicines.

Prepared by mixing 15 parts of resinous ointment, and one part of subacetite of copper.

d. LIQUOR CUPRI AMMONIATI, D. AQUA CUPRI AMMONIATI, L. AQUA SAPPHARINA. Water of ammoniated copper. *Sapphire water.* ⁹⁷⁸ Ointment of subacetite of copper.

Prepared by the Dublin college, by mixing four grains of prepared verdigris, and two scruples of sal ammoniac, with eight ounces of fresh made lime water, digesting for 24 hours, and pouring off the clear liquor.

Used as a stimulant and detergent lotion.

288. *SULPHAS CUPRI, E. CUPRUM VITRIOLATUM, D. VITRIOLUM CÆRULEUM.* Sulphate of copper. *Vitriolated copper. Blue or Roman vitriol. Blue stone.* See CHEMISTRY, N^o 1972. ⁹⁸⁰ Sulphate of copper.

Sometimes given internally as an emetic, in the dose of from two to five grains, and as a tonic, a grain or two, several times a-day; but its internal use is dangerous. More frequently employed as an escharotic.

Official Preparations.

a. SOLUTIO SULPHATIS CUPRI COMPOSITA, E. AQUA STYPTICA. Compound solution of sulphate of copper. *Styptic water.* ⁹⁸¹ Compound solution of sulphate of copper.

Prepared by boiling three ounces of sulphate of copper, and the same of sulphate of alumina, in two pounds of water, till they are dissolved; then adding one ounce and a half of diluted sulphuric acid to the liquor previously filtered.

Employed chiefly as a styptic for stopping superficial hæmorrhages, or bleedings at the nose.

b. AMMONIARETUM CUPRI, E. CUPRUM AMMONIATUM, D. Ammonia ret of copper. *Ammoniated copper.* ⁹⁸² Ammonia ret of copper.

Prepared by the Edinburgh college, by rubbing two parts of the purest sulphate of copper with three parts of carbonate of ammonia carefully together, in a glass mortar, till the effervescence has entirely ceased, and they unite into a violet-coloured mass, which is to be wrapt up in blotting paper, and dried, first upon a chalk stone, and afterwards by a gentle heat, and put into a phial that is to be closely stopp'd.

Employed as a tonic and antispasmodic, chiefly in cases of epilepsy. Dose about half a grain or a grain, gradually increased to four or five grains, three or four times a-day.

c. PILULÆ AMMONIARETI CUPRI, E. Pills of ammonia ret of copper. ⁹⁸³ Pills of ammonia ret of copper.

Composed of 16 grains of ammonia ret of copper in fine powder, and four scruples of crumb of bread, beaten into a mass with a sufficient quantity of water or carbonate of ammonia, and immediately divided into 32 equal pills.

One or two of these pills is a moderate dose.

For an account of the ill effects arising from copper

History of as a poison, and the means of detecting and obviating Simple and there, see Fothergill's Cautions concerning the Poisons of Lead and Copper, and Duncan's Dispensatory.

⁹⁸⁴
Official
Medicines.

289. ARGENTUM, E. L. D. Silver. See CHEMISTRY, p. 681.

Official Preparation.

⁹⁸⁵
Nitrate of
silver.

a. NITRAS ARGENTI, E. ARGENTUM NITRATUM, L. D. CAUSTICUM LUNARE. Nitrate of silver. *Nitrated silver. Lunar caustic.*

Prepared by dissolving in a phial, with a gentle heat, four ounces of the purest silver flattened into plates, and cut into pieces, in eight ounces of diluted nitrous acid, mixed with four ounces of distilled water, and evaporating to a dry mass, which is to be put into a large crucible, and placed on a gentle fire, increased gradually till the mass flows like oil; then pouring it into iron pipes previously heated and anointed with tallow, and when cool, putting it into a glass vessel to be well stopped.

Employed chiefly as an escharotic, to destroy the callous edges of ulcers, warts, and other excrescences; but lately much recommended, and employed with some success, as a tonic in cases of epilepsy. It should be begun in very small doses, about one-eighth or one-fourth of a grain, dissolved in distilled water, or made into a pill with crumbs of bread, gradually increasing the dose to a grain or more, twice or three times a-day.

CHAP. IV. *Gaseous Substances.*

⁹⁸⁶
Oxygenous
gas.

290. GAS OXYGENUM. Oxygenous gas. *Vital air.*

On the nature and properties of this gas, see CHEMISTRY, N^o 341.

When air, with an increased proportion of oxygen, is respired, it acts as a powerful stimulus, increasing the circulation and animal heat, raising the spirits, and producing a temporary increase of vigour and activity, followed, however, in a short time, by corresponding languor and weariness. From its stimulant effects, the respiration of superoxygenated air has been much recommended in various cases of debility, as chlorosis, epilepsy, asthmatic and dropsical affections; but it seems now falling into disuse, from a conviction that practitioners were too sanguine in their expectations.

See *Alyon Essai sur les Proprietes Medicinales de l'Oxygene*, 8vo. Ward *Dissert. Inaug. de Medicina Pneumatica*, Edin. 1800. Hodge's *Dissert. Inaug. de Oxygeno*, Edin. 1801; and the Practical Synopsis.

⁹⁸⁷
Gaseous
oxide of
azote.

291. GAS AZOTI OXIDUM. OXIDUM NITROSUM. Gaseous oxide of azote. *Nitrous Oxide.* See CHEMISTRY, p. 493, 494. where the nature and effects of this gas are detailed at sufficient length.

As the respiration of this gas is not followed by the depression and debility consequent on the application of most other stimuli, it promises fair to become a useful remedy in some cases of debility and atony of the vital powers; but it is not yet much employed except by

way of philosophical experiment. See Davy's Researches on Nitrous Oxide.

292. GAS HYDROGENEUM. Hydrogen gas. *Inflammable air.* See CHEMISTRY, N^o 373, *et seq.*

Hydrogen gas diluted with about ten times its quantity of atmospheric air, has been recommended in asthmatic complaints; but its success has not equalled the expectations of physicians.

293. GAS HYDROGENUM CARBONATUM. Carbonated hydrogen gas. See CHEMISTRY, N^o 412.

This gas, which is so deleterious when respired in its pure state, has been strongly recommended when diluted with about 20 parts of atmospheric air, as a remedy in phthisis, in some cases of which it has evidently been of service, relieving the symptoms, and at least arresting the progress of the disease. It should, however, be employed with great caution, and at first largely diluted.

294. GAS ACIDUM CARBONICUM. Carbonic acid gas. *Fixed air.* See CHEMISTRY, N^o 595.

Besides the solution of this gas in water (see N^o 875.), used internally as a tonic and refrigerant, the gas itself, as evolved from fermenting substances, is a good stimulant or antiseptic application to foul ulcers and cancerous sores. The modification of this substance which is contained in yeast or harm, has been much employed of late in typhus, but we believe with no material benefit.

295. CALORICUM. Caloric. *Heat.* See CHEMISTRY, Chap. iii.

It would be in vain for us here to attempt any account of the effects of heat on the human body, and these have been amply detailed, both by chemical and physiological writers. It acts as a powerful stimulus, and as such is often employed, especially in the form of warm and vapour baths, in various cases of debility and atony of the system. The effect and uses of the warm and vapour baths have been already mentioned under WATER, as have the effects and uses of the cold bath.

296. LUMEN. Light. See CHEMISTRY, Chap. ii.

Besides its effect on the eye, in producing vision, light evidently acts as a general and powerful stimulus, raising the spirits, and increasing the vigour and activity of the body. See Rush's Lectures on Animal Life.

297. ELECTRICITAS. Electricity.

Common electricity acts as a powerful stimulus on the system, in proportion to the degree of concentration in which it is applied. When applied under the form of a stream, or continued discharge of electric fluid, its effects are the most gentle; but in general, when applied in the form of sparks, it is more active, but its effects are more confined; and when applied by way of a shock, it acts very powerfully, producing an agitation of the muscles of the part through which the shock is discharged; and if the shock is violent, the whole body partakes of the agitation.

History of lectrlicity has been found of service, chiefly in cases of Simple and paralysis, and of uterine obstruction dependent on debility.

Official Medines. For the mode of applying electricity to the body, under its various states, we must refer to Cavallo's Medical Electricity, and Cuthbertson's Practical Electricity and Galvanism.

994 Galvanism. 298. GALVANISMUS. Galvanism.

This modification of electricity is found to have produced still greater effects on the human body, when applied under particular circumstances, into which we have not now room to enter. Much has of late been written on the efficacy of this powerful agent in the cure of various diseases, but like most other new remedies, its powers have been greatly overrated. It appears to have been most successful in cases of local paralysis, or nervous atony. In particular, it has in several instances relieved deafness, especially that species which seems to arise from torpor of the auditory nerve.

For the effects of galvanism on the body, and its application in medicine, see Wilkinson's Elements of Galvanism, vol. ii. p. 441.; Cuthbertson's Electricity and Galvanism; the Edinburgh Medical and Surgical Journal, &c.

ADDENDUM.

The following was omitted among the preparations of iron.

g. CARBONAS FERRI PRÆCIPITATUS, E. Precipitated carbonate of iron.

History of Simple and Official Medicines.

995 Precipitated carbonate of iron.

Prepared by decomposing a solution of sulphate of iron by a solution of carbonate of soda; washing and drying the precipitate.

Similar in its virtues to 961. Dose five to 30 grains.

The space allotted to this article was so small, and the time for preparing it so short, that it is, of necessity, much less full and complete than it might otherwise have been. As it was impossible, under such circumstances, to produce any thing like an original and complete treatise, the compiler has endeavoured to render as useful as possible the selection that he found it necessary to make, and to supply the unavoidable deficiencies by a reference to the most respectable works on the subject.

precipitated,	909	<i>Thistle</i> , blessed,	722	<i>Toluifera balsamum</i> ,	538
<i>Subsulphate</i> of mercury, yellow,	918	<i>Thorn</i> apple,	389	<i>Tonics</i> ,	174
<i>Sugar</i> , uses of,	106, 362	<i>Tin</i> ,	943	<i>Tormentilla erecta</i> ,	607
of lead,	949	<i>Tincture</i> of castor,	248	<i>Tormentia</i> , catalogue of,	142
<i>Sulphate</i> of potash,	838	compound,	249	<i>Trituration</i> ,	197
with sulphur,	839	of musk,	251	<i>Troches</i> , general remarks on,	222
of soda,	854	cantharides,	268	of starch,	369
of baryta,	861	myrrh,	328	of liquorice with opium,	617
of magnesia,	877	columbo,	333	gum,	792
of alumina, dried,	883	ginger,	337	of carbonate of lime,	873
of zinc,	933	cardamom seeds,	341	chalk,	ib.
of iron,	904	compound,	342	magnesia,	880
dried,	968	valerian,	355	<i>Turmeric</i> root,	335
of copper,	980	ammoniated,	356	<i>Turpentine</i> , Venice,	745
<i>Sulphur</i> , sublimed,	821	saffron,	359	common,	750
precipitated,	827	jalap,	388	Chio,	766
antimonial brown,	894	henbane,	332	<i>Tutty</i> ,	937
<i>Sulphuret</i> of potash,	826	cinchona,	403		
of antimony,	889	compound,	403, d.	U.	
precipitated,	895	ammoniated,	404	<i>Valeriana officinalis</i> ,	354
of mercury, black,	919	of bark, Huxham's,	403, d.	<i>Veratrum album</i> ,	782
red,	920	compound, of gentian,	427	<i>Verdigris</i> ,	975
<i>Supercetate</i> of lead,	949	bitter,	ib.	<i>Vinegar</i> ,	105
<i>Supersulphate</i> of alumina and potash,	881	of assafœtida,	443	radical,	307
<i>Supertartrate</i> of potash,	415	galbanum,	448	aromatic,	308
<i>Swietenia</i> mahagoni,	553	aloes,	485	of squill,	491
febrifuga,	554	and myrrh,	486	<i>Viola odorata</i> ,	419
<i>Synopsis</i> of materia medica,	10	compound,	ib.	<i>Vitis vinifera</i> ,	413
of materia medica, arrange-		ethereal,	487	<i>Vitriol</i> , white,	933
ment of,	133	of squill,	495	green,	967
<i>Syrup</i> of acetous acid,	310	cinnamon,	514	blue,	980
ginger,	338	compound,	515	<i>Ulmus campestris</i> ,	430
saffron,	358	aromatic,	ib.	<i>Urtica dioica</i> ,	733
buckthorn,	412	camphor,	523		
violets,	420	rhubarb,	532	W.	
black currants,	424	compound,	533	<i>Wakerobin</i> ,	725
garlic,	474	and aloes,	534	<i>Walnut</i> ,	737
squill,	492	and gentian,	535	<i>Water</i> ,	802
colchicum,	501	of balsam of Peru,	537	of ammonia,	236
Tolu,	540	of Tolu,	539	pure ammonia,	ib.
clove julyflower,	573	compound, of senna,	547	carbonate of ammonia,	239
red roses,	597	of guaiacum,	557	acetate of ammonia,	240
damask roses,	602	ammoniated,	558	prepared kali,	314
raspberry,	606	compound, of benzoin,	569	carbonate of potash,	315
red poppy,	611	of kino,	586	potash,	316
opium,	623	opium,	620	pure kali,	ib.
white poppy,	624	camphorated,	621	Hungary,	348
marshmallow,	664	ammoniated,	622	barley,	371
orange peel,	692	thebaic,	620	dill,	457
lemon juice,	698	of black hellebore,	632	sweet fennel,	459
mulberries,	732	lavender, compound,	649	cinnamon,	512
manna,	795	foxglove,	659	cassia,	519
<i>Syrups</i> , general remarks on,	229	orange peel,	694	pimento,	581
		snakeroot,	724	rose,	601
		cascarilla,	758	mint,	636
T.		compound, of savine,	779	peppermint,	639
<i>Tamarindus indica</i> ,	669	of white hellebore,	784	pennyroyal,	643
<i>Tanacetum vulgare</i> ,	713	catechu,	788	orange peel,	693
<i>Tar</i> ,	748	soap,	857	lemon peel,	697
<i>Tartar</i> , crystals or cream of,	415	and opium,	858	snow or rain purest,	803
soluble,	416	of muriate of iron,	965	varieties of,	804
emetic,	889	ammoniacal iron,	972	medical use of,	813
<i>Tartrate</i> of potash,	416	acetated iron,	973	external use of,	814
and soda,	417	<i>Tinctures</i> , general remarks on,	230	distilled,	820
of antimony and potash,	889			<i>Water</i>	

Index.

MATERIA MEDICA, &c.

<i>Water</i> of supercarbonate of soda, N ^o 842	<i>Whortle</i> berry, N ^o 565	<i>Winters</i> aromatica, N ^o 630	799
lime, 866	<i>Willow</i> bark, 765	<i>Wormseed</i> , 711	
impregnated with fixed air, 875	<i>Wine</i> , uses of, 100, 413	<i>Wormwood</i> , sea, 709	
compound alum, 884	tobacco, 394	common, 712	
of vitriolated zinc with camphor, 935	ipecacuan, 409		
of acetated litharge, 954	compound, of gentian, 428		
compound, 955	bitter, ib. 488	<i>Zedoary</i> , round, 334	
of aerated iron, 962	of aloes, 488	long, 339	
of ammoniated copper, 979	rhubarb, 531	<i>Zinc</i> , 930	
sapphire, ib. 979	of tartrate of antimony, 900	calcined, 931	
<i>Waters</i> , mineral, 805	antimonial, 901	vitriolated, 933	
	of iron, 963
