**LIEGE**

LIEGE, formerly a bishopric of Germany, in the circle of Westphalia; bounded to the north by Brabant, to the south by Champagne and Luxemburg, to the east by Limburg and Juliers, and to the west by Brabant, Namur, and Hainault. It is very unequal both in length and breadth; the former being in some places above 50 miles, in others not half so much; and the latter in some places 45, in others hardly 25. The air here is very temperate; and the soil fruitful in corn, wine, wood, and pasture. Here also are mines of lead and iron, pits of coal, quarries of marble and stone, and some celebrated mineral waters, as those of Spa and Chaufontaine. The principal rivers are, the Maas and Sambre. The manufactures and commodities of the country are chiefly beer, arms, nails, serge; leather, with the products have we just mentioned. The states of the bishopric are composed of three bodies: the first is the chapter of Liege; the second, the nobility of the country; and the third, the deputies of the capital and the other towns. The three estates are seldom called together, except to raise taxes for the service of the province, or upon some particular emergency; but there is a committee of the states, who meet thrice a-week, and in time of war daily. They are always about the prince-bishop, to make remonstrances, and demand the redress of grievances. The bishop is spiritual and temporal lord of the whole country; but, as bishop, is suffragan to the archbishop of Cologne. He styles himself, by the grace of God, bishop and prince of Liege, duke of Bouillon, marquis of Franchinmont, count of Loes, Hoorn, &c. His arms for Liege are, a pillar argent, on a pedestal of the same, with a crown or, in a field ruby. In the matricula he was formerly rated at 50 horse and 170 foot; or 1280 florins monthly, in lieu of them, but now only at 826. An abatement of one-third has also been granted of the ancient assessment to the chamber-court, which was 360 rix-dollars 62½ krutzers for each term. Here are several colleges which sit at Liege, for the government of the country, and the decision of causes, civil, criminal, spiritual, and feudal, and of such also as relate to the finances. The chapter consists of 60 persons, who must either prove their nobility for four generations, both by father and mother, before they can be admitted; or, if they cannot do that, must at least have been doctors or licentiates of divinity for seven years, or, of law, for five years, in some famous university. The bishopric is very populous and extensive, containing 1000 parishes, in which are 24 walled towns, besides others, 52 baronies, besides counties and seignories, 17 abbey's for men, who must be all gentlemen, and 11 for ladies, exclusive of others.

LIEGE, the capital of the bishopric of the same name, stands upon the Maes, in a fine valley surrounded with woods and hills, being a free imperial city, and one of the largest and most eminent in Europe. Though it is 100 miles from the sea by water, the Maes is navigable up to it. The city has 16 gates; 17 bridges, some of them very handsome; 154 streets, many of them straight and broad; a fine episcopal palace; a very large stately cathedral, in which, besides five great silver coffers full of relics, are several silver statues of saints, and a St George on horseback of marly gold, presented to the cathedral by Charles the Bold, by way of atonement for using the inhabitants cruelly in the year 1468. Of the other churches, that of St Paul is the most remarkable, both for its structure and fine ornaments in painting and marble. The city is well fortified, and there are also two castles on the mountain of the Holy Walburg for its defence. Besides a great number of other convents of both sexes, here is a college of English Jesuits, founded in the year 1616, and a fine nunnery of English ladies. Indeed, churches, convents, and other religious foundations, take up the greater part of it. The reader, therefore, no doubt, will take it for granted, that it is a most blessed, holy, and happy city. But however it may fare with the profane, unhallowed laity, it is certainly the paradise of priests, as it is expressly called, by way of eminence. It is divided into the old and new, or the upper and lower; and the latter again into the island, and the quarter beyond the Maes. The houses are high, and built of bluish marble. In the town and suburbs are 12 public places or squares, 10 hospitals, a beguin-house, and two fine quays, planted with several rows of trees, for the burghers to take the air; but a great part of that within the walls is taken up with orchards and vineyards. The manufactures of this city are arms, nails, leather, serje, and beer. In St William's convent, without the city, is the tomb of the famous English traveller Sir John Mandeville, with an inscription in barbarous French, requesting those who read it to pray for his soul. Near it are kept the saddle, spurs, and knife, that he made use of in his travels. A† After
After having seen most of the cities of any note in the world, he made choice of this to spend the eve of his life in. A little way from the city, on the other side of the Meuse, stands the episcopal palace of Seraing, in which the bishops generally reside during the summer. The population is estimated at 80,000. N. Lat. 50. 36. E. Long. 5. 40. Some disturbances took place here in the year 1789, in consequence of certain disputes that had arisen between the prince-bishop and the inhabitants. The latter having demanded certain privileges, which he did not think proper to grant, they took up arms, and compelled him and his chapter to comply with their request. The prince, together with many of the clergy, nobility, and citizens, alarmed by this commotion, and dreading the consequences of popular fury, which when once roused seldom knows any bounds, sought safety by a voluntary exile. They then appealed to the imperial chamber; and this tribunal, instead of acting the part of arbiter, decided as a sovereign, and ordered the circles of the Lower Rhine and Westphalia to execute the sentence.

The king of Prussia, at whose court one of the chiefs of the insurrection had resided, and who wished to gain a party at Liege, became mediator; and seemed to favour the Liegeois, many of whose claims were just, though they attempted to enforce them by violence and the most illegal steps. Intoxicated with this protection, the people of Liege treated the remonstrances of their bishop, the decrees of the imperial chamber, and the resolutions of the directory of the two circles, with the utmost contempt; and proceeded so far as even to dethrone their prince, by appointing a regent in the person of a French prelate. The electoral college having deliberated on the best means of putting an end to these disturbances, its propositions, though modified by M. Dohm the Prussian plenipotentiary, made the insurgents break out into open sedition. Defied by their leaders, they gave themselves up every day to new excesses; the effects of the citizens were exposed to pillage, and their persons to insult. The king of Prussia, who was of opinion to bring matters to an accommodation, and not to instigate the Liegeois to become independent, finding that the efforts of his minister were not attended with the desired success, seemed unwilling to interfere any farther in an affair which might have led him into a quarrel with the empire. The executive troops, at the same time, remained almost in a state of inactivity; and seemed rather to guard the frontiers of this petty state, than to make any attempt to reduce it to obedience. Neither this conduct, however, nor the exhortations of Prussia, added to the moral certainty of their being soon compelled to lay down their arms, made any change in the conduct of the malcontents. They declared openly, in the face of all Europe, that they would either conquer or die; and they persisted in this resolution, while commerce, manufactures, and the public revenues, were going daily to decay.

Having at length openly attacked the executive forces without the territories of their city, the emperor could no longer remain an indifferent spectator. It was now full time to put a period to that madness to which the people had abandoned themselves; and to accomplish this in an effectual manner, the imperial chamber at Wetzlar requested the emperor, as a member of the ancient circle of Burgundy, to execute its orders respecting this object. In consequence of this measure, Baron Alvinzi, who commanded a body of Austrians cantoned in Limburg and the confines of Brabant, notified, by order of Marshal Bender, to the states and municipality of Liege, that the emperor intended to send troops into their city and territories, for the purpose of restoring tranquillity and good order. The states had already been informed of this resolution by their agent at Wetzlar. They therefore wrote to Marshal Bender, to assure him of the respectful confidence which they placed in the justice and magnanimity of the emperor, and to request that the Austrian troops might enter alone, without those of the electors; and that they might be confined to occupy the gates and the suburbs only. To this letter, which was carried to Brussels by a deputation of the states, Marshal Bender returned a very satisfactory answer, relating to the dispatch of the imperial troops; but Baron Alvinzi, in a note which he wrote to the states, insisted among other articles, that all the citizens should throw down their arms; that proper accommodations should be prepared for the officers and men; that the warlike stores, collected for making resistance, should be removed; and that cockades, and every other distinctive mark of the like kind, should be laid aside before the arrival of the imperial troops. However humiliating these preliminaries might be, especially that of a general disarmament, the states and municipalities acquiesced without the least reserve; and their submission, as sudden as complete, was communicated to the people, with an exhortation to follow their example.

Notwithstanding this pacific appearance, two days before the entrance of the imperial troops, the municipal council of Liege, flattering themselves, perhaps, with the hopes of assistance from Prussia, assured the inhabitants that they would remain unabashed in their post, and that they had sworn never to desert the cause in which they were engaged. This, however, did not prevent the Austrian troops, to the number of 6000, from penetrating, without opposition, into the heart of the city; where they occupied every post; made the citizens lay aside their arms, uniforms, and cockades; and in a single hour, dethroned so many sovereigns of a year. The greater part of the municipal officers, who two days before had solemnly promised such great things, betook themselves to flight, and retired either to France or Wesel; while the ancient magistracy, which had been expelled in the month of August 1789, was provisionally reinstated by the directorial commissioners. The decrees of the imperial chamber at Wetzlar have since been executed in their utmost extent. The ancient magistracy was restored; and the prince himself returned. The French took this city in 1792, were driven out in 1793, but occupied it again in 1794. From this time they retained possession of it till 1815, when it was annexed to the kingdom of the Netherlands.

LIENTERY, a flux of the belly, in which the alimenta are discharged as they are swallowed, or very little altered either in colour or substance. See Medicine.

LIEVEN, John or Jan, a celebrated painter, was born
born at Leyden in 1607. He discovered an early inclination for the arts, and was the disciple first of Joris van Schooten, and afterwards of Peter Lastman. He excelled principally in painting portraits; but he also executed several historical subjects with great success. He came over to England, where he resided three years, and painted the portraits of Charles I. the queen, the prince of Wales, and several of the nobility; after which he returned to Antwerp, where he met with full employment for his pencil. We have several etchings by this master, which are performed in a slight but masterly manner. His chiaro scuro is very skilfully managed in them, so as to produce a most powerful effect. His style of etching bears some resemblance to that of Rembrandt; but it is coarser in general, and less finished.

LIEOU-KIEOU, or LOO-CHOO, the name of certain islands of Asia, subject to China; but hitherto little known to geographers, who have been satisfied with marking their existence and latitude in their charts. They, however, form a considerable empire, the inhabitants of which are civilized, and ought not to be confounded with other savage nations dispersed throughout the islands of Asia. Father Gabil, a Jesuit, has furnished us with some interesting details respecting these islanders; and the journals of the officers who visited Loo-choo in 1817, in the Alcete and Lyra, have made us well acquainted with their manners and situation. Father Gabil informs us, that the emperor Kang-hi having resolved, in 1719, to send an ambassador to the king of Lieou-kieou, chose for this purpose one of the great doctors of the empire, named Supe-Kaung. This learned man departed from China in 1719, and returned to Peking in 1720, where, in the year following, he caused a relation of his voyage to be published in two volumes. It is in the first of these that he gives an accurate and particular description of the islands of Loo-choo; and of the history, religion, manners, and customs, of the people who inhabit them.

These isles, situated between Corea, Formosa, and Japan, are in number 36. The principal and largest is called Loo-choo; the rest have each a particular denomination. The largest island extends from south-west to north-east about 56 miles, with a breadth of 11 miles. According to the Chinese account, the south-east part of the island, where the court resides, is called Cheou-li; and it is there that Kin-ting, the capital city, is situated. The king's palace, which is reckoned to be four leagues in circumference, is built on a neighbouring mountain. The existence of these islands was not known in China before the year 605 of the Christian era. It was in the course of that year that one of the emperors of the dynasty of Soui, having heard of these isles, was desirous of knowing their situation. This prince at first sent some Chinese thither; but their expedition proved fruitless, as the want of interpreters prevented them from acquiring that knowledge which was the object of their voyage. They only brought of the islanders with them to Sigan-fou, the capital of the province of Chen-si, which was the usual residence of the emperors of the dynasty of Soui. It fortunately happened, that an ambassador of the king of Japan was then at court. This ambassador and his attendants immediately knew the strangers to be natives of Loo-choo; but they spoke of these islands as of a miserable and wretched country, the inhabitants of which had never been civilized. The emperor of China afterwards learned, that the principal island lay to the east of a city called at present Fou-tehoo-poo, which is the capital of the province of Fokien; and that, in a passage of five days, one might reach the large island where the king kept his court.

On this information, the emperor Yang-ti sent skilful men, accompanied by interpreters, to summon the prince to do homage to the emperor of China, and to pay him tribute. This proposal was very ill received. The king of Lieou-kieou sent back the Chinese, telling them sternly, that he acknowledged no prince to be his superior. This answer irritated the emperor, who, to obtain revenge, caused a fleet to be immediately equipped in Fokien, in which he embarked 10,000 men. This fleet set sail, and arrived in safety at the port of Napa-kiang. The army, in spite of every effort made by the natives, landed on the island; and the king, who had put himself at the head of his troops to oppose the enemy, having fallen in battle, the Chinese pillaged, sacked, and burnt the royal city, made more than 5000 slaves, and returned to China.

It was only in 1732, under the reign of Hong-vou, founder of the dynasty of Ming, that these islands submitted voluntarily to the Chinese government. Hong-vou had sent one of the grandees of his court to Tsay-tou, who was then reigning at Lieou-kieou, to inform him of his accession to the throne. The Chinese nobleman had received particular instructions respecting this commission, and he acquitted himself of it with all the prudence and address of an able minister. In a private audience which he had with Tsay-tou, he exhorted this prince to declare himself a tributary of the empire, and laid before him the advantages he would derive from this step. His reasoning, supported by the power of his natural eloquence, made so much impression on the mind of Tsay-tou, that he embraced the proposal made him, and sent immediately to the emperor to demand the investiture of his state.

Hong-vou received his envoys in a magnificent manner, and loaded them with presents. He solemnly declared Tsay-tou a vassal of the empire; and, after having received his first tribute (which consisted in valuable horses, aromatic wood, sulphur, copper, tin, &c.) he sent to this prince a golden seal, and confirmed the choice he had made of one of his sons for successor. The emperor afterwards sent 36 families, almost all from the province of Fokien, to Loo-choo. Tsay-tou received them, assigned them lands near the port of Napa-kiang, and appointed certain revenues for their use, at the same time that Hong-vou made them considerable remittances. These families first introduced into Loo-choo the learned language of the Chinese, the use of their characters, and the ceremonies practised in China in honour of Confucius. On the other hand, the sons of several of the grandees of the court of Tsay-tou were sent to Nan-kiang, to study Chinese in the imperial college, where they were treated with distinction, and maintained at the emperor's expense.

The isles of Lieou-kieou had neither iron nor porcelain. Hong-vou supplied this want; he caused a great number of utensils of iron and instruments to be made, which
which he sent thither, together with a quantity of porcelain vessels. Commerce, navigation, and the arts soon began to flourish. These islanders learned to cast bells for their temples, to manufacture paper and the finest stuffs, and to make porcelain, with which they had been supplied before from Japan.

The celebrated revolution which placed the Tartars on the imperial throne of China, produced no change in the conduct of the kings of Lieou-kicou. Chang-tché, who was then reigning, sent ambassadors to acknowledge Chou-tchi, and received a seal from him, on which were engraved some Tartar characters. It was then settled, that the king of Loo-Choo should pay his tribute only every two years, and that the number of persons in the train of his envoys should not exceed five.

A very interesting account of the manners of the inhabitants is given by Captain Hall. Their manners, he says, are remarkably gentle and massoming. They are observant, and not without curiosity; but they require encouragement to induce them to come forward, being restrained, it would seem, by a genteel self-denial, from gratifying curiosity, lest it might be thought offensive. Their dress is singularly graceful; it consists of a loose flowing robe, with very wide sleeves, tied round the middle by a broad rich belt or girdle of wrought silk, a yellow cylindrical cap, and a neat straw sandal, over a short cotton boot or stocking. Two of the chiefs wore light yellow robes, the other dark blue, streaked with white, all of cotton. The cap is flat at top. They all carry fans, which they stick in their girdles when not in use; and each person has a short tobacco-pipe in a small bag, hanging along with the pouch, at the girdle. Many wear printed cottons, others have cotton dresses with the pattern drawn on it by hand, instead of being stamped; but blue, in all its shades, is the prevalent colour, though there were many dresses resembling in every respect Highland tartans. The children, in general, wear more showy dresses than the men; and of the dress of the women we can say nothing, as none have yet been seen. Every person has one of the girdles before described, which is always of a different colour from the dress, and is, in general, richly ornamented with flowers in embroidered silk, and sometimes with gold and silver threads. This dress is naturally so graceful, that even the lowest boatmen have a picturesque appearance. Their hair, which is of a glossy black, is shaved off the crown; but the bare place is concealed by their mode of dressing the hair in a close knot over it. Their beards and mustachios are allowed to grow, and are kept neat and smooth. They are rather low in stature, but are well formed, and have an easy graceful carriage, which suits well with their flowing dress. Their colour is not good, some being very dark and others nearly white; but in most instances they are of a deep copper. This is fully compensated for by the sweetness and intelligence of their countenance. Their eyes, which are black, have a placid expression, and their teeth are regular and beautifully white. In deportment they are modest, polite, timid, and respectful; and, in short, appear to be a most interesting and amiable people. They were accommodated in the gardens of a temple or place of worship, of which the natives appeared to make very little use, and where they were treated with the kindest and most unwearying attention by all classes of the inhabitants. Milk, eggs, meat, and vegetables, were brought to them every day; and whenever they felt disposed to walk, they were accompanied by one or two of the natives, who took their arms on coming to much ground, and often helped them up the steep side of the hill behind the hospital, to a pleasant grassy spot on the summit, where the natives lighted pipes for them.

The rest of the crew, however, and even the officers, were a good deal restricted in their communications with the interior, being specially interdicted from entering the town or large village near the landing place, and generally confined, indeed, either to a walk along the beach, or to the top of a small eminence in the neighbourhood.

Every person of rank, says Captain Hall, is attended by a lad, generally his son, whose business it is to carry a little square box, in which there are several small drawers, divided into compartments, filled with rice, sliced eggs, small squares of smoked pork, cakes, and fish; and in one corner a small metal pot of sackee, besides cups and chopsticks. By having this always with them, they can dine when and where they choose. They frequently invite us to dine with them; and, if we agree to the proposal, the generally ask any one of the chiefs whom they meet to be of the party, and join dinners. The place selected for these picnics is commonly under the trees, in a cool spot, where a mat is spread on the grass; and every thing being laid out in great order, the party lies down in a circle, and seldom breaks up till the sackee pot is empty.

But it is not only their manners and tempers that are thus singularly agreeable;—their dispositions seem to be thoroughly amiable and gentle, and their honesty and integrity without blemish. During six weeks continual intimacy, the British officers never saw any thing approaching to a quarrel or affray, nor any punishment inflicted beyond an angry look, or the tap of a fan; and not an article of any kind was stolen, or suspected to be stolen, though every thing was exposed in a way that might have tempted persons, in whose eyes most of them must have been less rare and precious. To complete this picture of the golden age, it is stated, that the chiefs never once appeared to treat the inferior people with harshness or severity; that there was nothing like poverty or distress of any kind to be seen,—no deformed persons,—and very little appearance of disease; and finally, that they have no arms of any sort for offence or defence, and positively denying having any knowledge of war, either by experience or tradition. It is at least equally certain, that they have no knowledge of, or regard for money; as they appeared to set no value whatever either on the dollars or gold pieces that were offered them by the navigators.

As to their knowledge and attainments, they manufacture salt—build stone arches—cultivate their fields, both for rice, millet, sugar, and other crops, with great neatness—weave and stain their cotton cloths with singular taste,—and embroider their girdles and pouches with a great deal of fancy and elegance. Their silks and woolens are said to be brought from China; and the latter, Captain Hall conceives, from their appearance, to have come originally from England. The most remarkable person that appeared, was a chief of the
LIEUTENANT-Colonel. See COLONEL.
LIEUTENANT-General. See GENERAL.
LIEUTENANT, in the land service, is the second commissioned officer in every company of both foot and horse, and next to the captain, and who takes the command upon the death or absence of the captain.

LIEUTENANT of Artillery. Each company of artillery hath four; 1 first and 3 second lieutenants. The first lieutenant hath the same detail of duty with the captain, because in his absence he commands the company: he is to see that the soldiers are clean and neat; that their clothes, arms, and accoutrements, are in good and serviceable order; and to watch over everything else which may contribute to their health. He must give attention to their being taught the exercise, see them punctually paid, keep their messes regularly kept, and to visit them in the hospitals when sick. He must assist at all parades, &c. He ought to understand the doctrine of projectiles, and the science of artillery, with the various effects of gunpowder, however managed or directed; to enable him to construct and dispose his batteries to the best advantage; to plant his cannon, mortars, and howitzers, so as to produce the greatest annoyance to an enemy. He is to be well skilled in the attack and defence of fortified places; and to be conversant in arithmetic, mathematics, mechanics, &c.

Second LIEUTENANT in the Artillery, is the same as an ensign in an infantry regiment, being the youngest commissioned officer in the company, and must assist the first lieutenant in the detail of the company's duty. His other qualifications should be equal with those of the first lieutenant.

LIEUTENANT of a Ship of War, the officer next in rank and power to the captain, in whose absence he is accordingly charged with the command of the ship, as also the execution of whatever orders he may have received from the commander relating to the king's service. The lieutenant who commands the watch at sea, keeps a list of all the officers and men thereto belonging, in order to muster them when he judges it expedient, and report to the captain the names of those who are absent from their duty. During the night watch, he occasionally visits the lower decks, or sends thither a careful officer, to see that the proper sentinels are at their duty, and that there is no disorder amongst the men; no tobacco smoked between decks, nor any fire or candles burning there, except the lights which are in lanterns, under the care of a proper watch, on particular occasions. He is expected to be always upon deck, in his watch, as well to give the necessary orders with regard to trimming the sails and superintending the navigation, as to prevent any noise or confusion; but he is never to change the ship's course without the captain's directions, unless to avoid an immediate danger.

The lieutenant, in time of battle, is particularly to see that all the men are present at their quarters where they have been previously stationed according to the regulations made by the captain. He orders and exhort...
Lieutenant sorts them everywhere to perform their duty, and acquaints the captain at all other times of the misbehaviour of any person in the ship, and of whatever else concerns the service or discipline.

The youngest lieutenant in the ship, who is also styled lieutenant at arms, besides his common duty, is particularly ordered, by his instructions, to train the seamen to the use of small arms, and frequently to exercise and discipline them therein. Accordingly his office, in time of battle, is chiefly to direct and attend them; and at all other times to have a due regard to the preservation of the small arms, that they be not lost or embezzeled, and that they are kept clean and in good condition for service.

Lieutenant Reformed, whose company or troop is broke or disbanded, but continued in whole or half pay, and still preserves his right of seniority and rank in the army.

LIFE, is peculiarly used to denote the animated state of living creatures, or the time that the union of the soul and body lasts.

The Prolongation of Life is made by Lord Bacon one of the three branches of medicine; the other two relating to the preservation of health, and the cure of diseases. See Medicine.

The theory of prolonging life by numbers among the desiderata. Some means or indications that seem to lead to it, he lays down as follow:

Things are preserved in two manners; either in their identity, or by reparation. In their identity; as a fly or ant in amber; a flower, fruit, or wood, in a conservatory of snow; a dead carcass in balsams. By reparation; as a flame, or a mechanical engine, &c.

To attain to the prolongation of life, both these methods must be used. And hence, according to him, arise three intentions for the prolongation of life; Retardation of consumption, proper reparation, and renovation of what begins to grow old.

Consumption is occasioned by two kinds of depredation; a depredation of the innate spirit, and a depredation of the ambient air. These may be each prevented two ways; either by rendering those agents less predatory, or by rendering the passive parts (viz. the juices of the body) less liable to be preyed on. The spirit will be rendered less predatory, if either its substance be condensed, as by the use of opiates, grief, &c.; or its quantity diminished, as in spare and monastic diets; or its motion calmed, as in idleness and tranquillity.

The ambient air becomes less predatory, if it be either less heated by the rays of the sun, as in cold climates, in caves, mountains, and anchorites cells; or be kept off from the body, as by a dense skin, the feathers of birds, and the use of oils and unguenets without aromatics. The juices of the body are rendered less liable to be preyed on, either by making them harder, or more moist and oily; harder, as by a coarse sharp diet, living in the cold, robust exercises, and some mineral baths: moister, as by the use of sweet foods, &c. abstaining from salts and acids; and especially by such a mixture of drink as consists wholly of fine subtle particles, without any acrimony or acidity.

Reparation is performed by means of aliment; and alimentation is promoted four ways: By the concoction of the viscer, so as to extrude the aliment: By exciting the exterior parts to the attraction of the aliment; as in proper exercises and frications, and someunctions and baths: By the preparation of the food itself, so as it may more easily assimilate itself, and in some measure anticipate the digestion; as in various ways of dressing meats, mixing drinks, fermenting breads, and reducing the virtues of these three into one: By promoting the act of assimilation itself, as in seasonal sleep, some external application, &c.

The renovation of what begins to grow old, is performed two ways: By the incanescence of the habit of the body; as in the use of emollients, emplasters, ointments, &c. of such a nature, as do not extract but impress: Or by purging off the old juices, and substituting fresh ones; as in seasonable evacuations, attenuating diets, &c.

The same author adds these three axioms: That the prolongation of life is to be expected, rather from some stated diets, than either from any ordinary regimen or any extraordinary medicines; more from operating on the spirits, and mollifying the parts, than from the manner of feeding; and this mollifying of the parts without is to be performed by substantial, imprints, and occults. See Longevity.

Life-Boat, a most important invention, consisting in an improvement of the ordinary construction of a boat, by which it cannot be sunk in the roughest sea; so that it is peculiarly fitted for bringing off mariners from wrecks during a storm, and thus saving many valuable lives. The life-boat was first conceived at South Shields, in the county of Durham. A committee of the inhabitants of that town, who had often been the sad witnesses of many melancholy shipwrecks, in which by the ordinary means no relief could be given, in a public advertisement requested information on this subject, with models of boats which would be most proper for the purpose of saving persons from shipwreck. The committee, it would appear, employed Mr Greathead, a boat-builder in South Shields, who had with others presented the model of a boat for this purpose, to build the first boat, which upon trial was found fully to answer the purpose. Two claimants have since appeared for the honour of the invention, which according to Mr Farles, the chairman of the committee, in his letter to Mr Hails the supporter of one claim, belong to two of the members themselves, namely Mr Farles himself and Mr Rockwood. The claimants above alluded to are Mr Greathead, and a Mr Wouldhave a painter in South Shields, and a very ingenious man, who also presented a model to the committee. The claim of the latter is keenly supported by Mr Hails, in a pamphlet published in 1806, two years after Mr Greathead's pamphlet containing the history and progress of the invention, and of the boats which he had built for the purpose, his application to parliament, and the premium of 1200l. which he received for the invention, &c. and four years after this application to parliament. It is true that in 1802, Mr Wouldhave and his friends asserted his claim in the Monthly Magazine, and in some provincial newspapers; but still this was one year after Mr Greathead's application for reward was made to parliament. But, without being at all understood to decide to whom the merit of the invention is due, we shall leave it to our readers to examine the evidence for themselves, and shall now proceed to give an account of the construction of the life-boat, of which 31 have been built.
lively and quick disposition to recover from any sudden
liveliness or lurch which she may receive from the stroke of
a heavy wave; but, exclusive of the cork, the admira-
able construction of this boat gives it a decided pre-
eminence. The ends being similar, the boat can be
rowed either way, and this peculiarity of form allevi-
ates her in rising over the waves; the curvature of the
keel and bottom facilitates her movement in turning,
and contributes to the ease of the steeringage, as a single
stroke of the steering oar has an immediate effect, the
boat moving as it were upon a centre; the fine en-
trance below is of use in dividing the waves, when
rowing against them; and combined with the convexi-
ty of the bottom and the elliptical form of the stem,
admits her to rise with wonderful buoyancy in a high
sea, and to launch forward with rapidity, without ship-
ping any water, when a common boat would be in dan-
ger of being filled. The launching or spreading form
of the boat, from the floor heads to the gunwale, gives
her a considerable bearing; and the continuation of the
breadth well forward, is a great support to her in the
sea: and it has been found by experience that boats of
this construction are the best sea boats for rowing
against the turbulent waves. The internal shallowness
of the boat from the gunwale down to the platform, the
convexity of the form, and the bulk of cork within,
leave a very diminished space for the water to occupy;
so that the life-boat, when filled with water, contains a
considerably less quantity than the common boat, and
is in no danger either of sinking or overturning.

It may be presumed by some, that in cases of high
wind, agitated sea, and broken waves, a boat of such
a bulk could not prevail against them by the force of
the oars; but the life-boat, from her peculiar form,
may be rowed a-head, when the attempt in other boats
would fail (a). Boats of the common form, adapted
for speed, are of course put in motion with a small
power; but for want of buoyancy and bearing, are
overrun by the waves and sunk, when impelled against
them: and boats constructed for burthen, meet with
too much resistance from the wind and sea, when op-
posed to them, and cannot in such cases be rowed from
the shore to a ship in distress. An idea has been enter-
tained that the superior advantages of the life-boat are
to be ascribed solely to the quantity of cork affixed;
but this is a very erroneous opinion, and I trust has
been amply refuted by the preceding observations on
the construction of this boat. It must be admitted that
the application of cork to common boats would add to
their buoyancy and security; and it might be a useful
expedient, if there was a quantity of cork on board of
ships, to prepare the boats with, in cases of shipwreck,
as it might be expeditiously done in a temporary way,
by means of clamps, or some other contrivance. The
application of cork to some of the boats of his majesty's
ships (the launches) might be worthy of consideration,
more particularly, as an experiment might be made at
a little expense, and without injury to the boats.

The life-boat is kept in a boat-house, and placed
upon

(a) The short oar is more manageable, in a high sea, than the long oar, and its stroke is more certain.
(b) An extraordinary case might certainly happen, when a forcible combination of the wind, the waves, and
the tide, might render it impracticable to row the life-boat from the shore.
LIFE

Upon four low wheels, ready to be moved at a moment's notice. These wheels are convenient in conveying the boat along the shore to the sea; but if she had to travel upon them, on a rough road, her frame would be excessively shaken; besides, it has been found difficult and troublesome to replace her upon these wheels, on her return from sea.

Another plan has therefore been adopted: two wheels of 12 feet diameter, with a moveable arched axis, and a pole fixed thereto, for a lever, have been constructed. The boat is suspended, near her centre, between the wheels, under the axis; toward each extremity of which is an iron pin. When the pole is elevated perpendicularly, the upper part of the axis becomes depressed, and a pair of rope slings, which go round the boat, being fixed to the iron pins, she is raised with the greatest facility, by means of the pole, which is then fastened down to the stem of the boat."

Temporary Life-Boat,—an invention by the reverend Mr. Brenner, minister of Wallis and Flota in Orkney, by which any ordinary ship's boat may be converted into a life-boat, so that in cases of shipwreck, the crew may be saved by means of their own boats. Mr. Brenner states, in describing his design to the Highland Society of Scotland, that he had received the approbation of the Trinity Houses of London and Leith, of the Royal Humane Society of London, and of many captains of merchantmen. An experiment was made in the port of Leith under the superintendence of Mr. Brenner himself, and in presence of a committee of the directors of the society. This experiment proved satisfactory to the committee, whose favourable report to the directors induced them to present Mr. Brenner with a piece of plate in testimony of their approbation of his scheme. The following is a general description of the method of preparing a boat for this purpose.

The dimensions of the sloop's boat, with which the experiment was tried, were 14 feet in length, 5 feet 4 inches in width, and 2 feet 2 inches in depth. The only addition or preparation of the boat, was four ring bolts in the inside, and two auger bores or holes in the outside of the keel, as points of security for fixing the necessary seizing ropes (c). The ring bolts, within side the keel, were placed, the one forward, one-third from the stem, the other aft, one-third from the stern; the other two, the one directly at the stern, the other at the stern. The auger bores, outside the keel, being half way betwixt the rings, viz. the one betwixt the two rings forward, the other betwixt the two rings aft.

Two empty hogheads were then placed in the fore part of the boat, parallel and close to each other, and laid lengthways, fore and aft. These were secured in their places by passing the seizing ropes round all, that is, over the gunwales and through the auger bores in the keel, as also from the ring bolt in the stem to that next it in the keel, taking care in doing this, to pass the rope also through eyes on the slings of the casks, which have been previously prepared. The same process was observed in the after part of the boat. And

(c) It is probable, that ring bolts fixed in the gunwales, might answer as well as passing the ropes round the bottom of the boat and through the auger bores in the keel.
previously ready, it is certain that the necessary fixing of the casks will not take up above ten or twelve minutes, and it is obvious the cork can be fixed in a much shorter period. It is also completely ascertained, that a boat so prepared, though full of water, will not sink, but on the contrary be extremely buoyant, and will easily go a-head: That it would be next to impossible the boat should overset; but, in case of this at any time happening, she would instantly return to her proper position on her keel. Though the experiment was tried only with casks, with but a small quantity of cork, as before stated, yet it is generally believed, and Mr. Bremner himself is of the same opinion, that it might answer equally well, and perhaps better, to have the cork or casks stowed in midships, leaving an empty space in each end, by which means the management of the boat by the helm or rudder would be preserved, though the other plan seems better, in the view of using ears.

*Vegetable Life.* See Plats.

*Life-Rent,* in Scots Law. When the use and enjoyment of a subject is given to a person during his life, it is said to belong to him in life-rent.

**Ligament,** in its general sense, denotes any thing that ties or binds one part to another.

**Ligament,** in Anatomy, a strong compact substance, serving to join two bones together. See Anatomy, No. 7.

**Ligarius,** Quintus, a Roman proconsul in Africa, 49 B. C. Taking part with Pompey, he was forbid by Julius Caesar to return to Rome: to obtain his pardon, Cicero made that admired oration in his defence, which has immortalized the memory of the client with that of his celebrated advocate.

**Ligature,** in Surgery, is a cord, band, or string; or the binding any part of the body with a cord, band, fillet, &c. whether of leather, linen, or any other matter.

Ligatures are used to extend or replace bones that are broken or dislocated; to tie the patients down in lithotomy and amputations; to tie upon the veins in phlebotomy, on the arteries in amputations, or in large wounds; to secure the splints that are applied to fractures; to tie up the processes of the peritoneum with the serous vessels in castration; and, lastly, in taking off warts or other excrescences by ligature.

**Ligature,** is also used to signify a kind of bandage or fillet, tied round the neck, arm, leg, or other part of the bodies of men or beasts, to divert or drive off some disease, accident, &c.

**Ligature,** is also used for a state of impotency, in respect to venery, pretended to be caused by some charm or witchcraft.

Dr. R. Kempler tells of an uncommon kind of ligature or knotting, in use among the people of Macasars, Java, Malacca, Siam, &c. By this charm or spell, a man binds up a woman, and a woman a man, so as to put it out of their power to have to do with any other person; the man being thereby rendered impotent to any other woman, and all other men impotent with respect to the woman.

Some of their philosophers pretend, that this ligature may be effected by the shutting of a lock, the drawing of a knot, or the sticking of a knife in the

**Vol. X.** Part I.
among other things he observed, that change of air was not necessary to the maintenance of this light; for it continued a long time when a piece of the wood was put into a very small glass hermetically sealed, and it made no difference when this tube which contained the wood was put into an exhausted receiver. This he also observed with respect to a luminous fish, which he put into water, and placed in the same circumstances. He also found, that the light of shining fishes had other properties in common with that of shining wood; but the latter, he says, was presently quenched with water, spirit of wine, a greater variety of salines mixtures, and other fluids. Water, however, did not quench all the light of some shining veal on which he tried it, though spirit of wine destroyed its virtue presently.

Mr Boyle's observation of light proceeding from flesh meat was quite casual. On the 15th of February 1662, one of his servants was greatly alarmed with the shining of some veal, which had been kept a few days, but had no bad smell, and was in a state very proper for use. The servant immediately made his master acquainted with this extraordinary appearance; and though he was then in bed, he ordered it to be immediately brought to him, and he examined it with the greatest attention. Suspecting that the state of the atmosphere had some share in the production of this phenomenon, he takes notice, after describing the appearance, that the wind was south-west and blustering, the air hot for the season, the moon was past its last quarter, and the mercury in the barometer was at 29°5″ inches.

Mr Boyle was often disappointed in his experiments on shining fishes; finding that they did not always fish shine in the same circumstances, as far as he could judge, with others which had shone before. At one time that they failed to shine, according to his expectations, he observed that the weather was variable, and not without some days of frost and snow. In general he made use of whittings, finding them the fittest for his purpose. In a discourse, however, upon this subject at the Royal Society in 1681, it was asserted, that, of all fishy substances, the eggs of lobsters, after they had been boiled, shone the brightest. Olig, Jacobus observes, that, upon opening a sepulchrous, it was so luminous as to startle several persons who saw it; and he says, that the more putrid the fish was, the more luminous it grew. The nails also, and the fingers of the persons who touched it, became luminous; and the black liquor which issued from the animal, and which is its bile, shone also, but with a very faint light.

Mr Boyle draws a minute comparison between the light of burning coals and that of shining wood or fish, showing in what particulars they agree, and in what they differ. Among other things he observes, that extreme cold extinguishes the light of shining wood, as appeared when a piece of it was put into a glass tube, and held in a frigoric mixture. He also found that rotten wood did not waste itself by shining, and that the application of a thermometer to it did not discover the least degree of heat.

There is a remarkable shell-fish called Pholas, which reforms for itself holes in various kinds of stone, &c. This fish is luminous, was noticed by Pliny; who observes,
Light—observes, that it shines in the mouth of the person who eats it, and, if it touch his hands or clothes, makes them luminous. He also says that the light depends upon its moisture. The light of this fish has furnished matter for various observations and experiments to M. Reaumur, and the Bolognian academicians, especially Beccarius, who took so much pains with the subject of phosphoreal light.

M. Reaumur observes, that, whereas other fishes give light when they tend to putrescence, this is more luminous in proportion to its being fresh; that when they are dried, their light will revive if they be moistened either with fresh or salt water, but that brandy immediately extinguishes it. He endeavoured to make this light permanent, but none of his schemes succeeded.

The attention of the Bolognian academicians was engaged in this subject by M. F. Marsilius, in 1724, who brought a number of these fishes, and the stones in which they were inclosed, to Bologna, on purpose for their examination.

Beccarius observed, that though this fish ceased to shine when it became putrid; yet that in its most putrid state, it would shine, and make the water in which it was immersed luminous, when it was agitated. Galeatius and Montius found, that vine or vinegar extinguished this light; that in common oil it continued some days; but in rectified spirit of wine or urine, hardly a minute.

In order to observe in what manner this light was affected by different degrees of heat, they made use of a Reaumur's thermometer, and found that water rendered luminous by these fishes increased in light till the heat arrived to 45 degrees; but that it then became suddenly extinct, and could not be revived.

In the experiments of Beccarius, a solution of salt increased the light of the luminous water; a solution of nitrine did not increase it quite so much. Sal ammoniac diminished it a little, oil of tartar per dilutionem nearly extinguished it, and the acids entirely. This water poured upon fresh calcined gypsum, rock crystal, ceruse, or sugar, became more luminous. He also tried the effects of it when poured upon various other substances, but there was nothing very remarkable in them. Afterwards, using luminous milk, he found that oil of vitriol extinguished the light, but that oil of tartar increased it.

This gentleman had the curiosity to try how differently coloured substances were affected by this kind of light; and having, for this purpose, dipped several ribbons in it, the white came out the brightest, next to this the yellow, and then the green; the other colours hardly could be perceived. It was not, however, any particular colour, but only light that was perceived in this case. He then dipped boards painted with the different colours, and also glass tubes, filled with substances of different colours, in water rendered luminous by the fishes. In both these cases the red was hardly visible, the yellow was the brightest, and the violet the dullest. But on the boards the blue was nearly equal to the yellow, and the green more languid; whereas in the glasses, the blue was inferior to the green.

Of all the liquors into which be put the pholadice, milk was rendered the most luminous. A single pholas made seven ounces of milk so luminous, that the faces of persons might be distinguished by it, and it looked as if it was transparent.

Air appeared to be necessary to this light; for when Beccarius put the luminous milk into glass tubes, no agitation would make it shine, unless bubbles of air were mixed with it. Also Montius and Galeatius found, that, in an exhausted receiver, the pholas lost its light, but the water was sometimes made more luminous; which they ascribed to the rising of bubbles of air through it.

Beccarius, as well as Reaumur, had many schemes to render the light of these pholadice permanent. For this purpose he kneaded the juice into a kind of paste, with flour, and found that it would give light when it was immersed in warm water; but it answered best to preserve the fish in honey. In any other method of preservation, the property of becoming luminous would not continue longer than six months, but in honey it had lasted above a year; and then it would, when plunged in warm water, give as much light as ever it had done.

Similar, in some respects, to those observations on Aega Conus, the light of the pholas, was that which was observed in Glaucus, to proceed from wood which was moist, but not in a putrid state, which was very conspicuous in the dark.

That the sea is sometimes luminous, especially when Light from it is put in motion by the dashing of oars or the beating of it against a ship, has been observed with admiration by a great number of persons. Mr. Boyle, after reciting all the circumstances of this appearance, as far as he could collect them from the accounts of navigators; as its being extended as far as the eye could reach, and at other times being visible only when the water was dashed against some other body; that, in some seas, this phenomenon is accompanied by some particular winds, but not in others; and that sometimes one part of the sea will be luminous, when another part, not far from it, will not be so; concludes with saying, that he could not help suspecting that these odd phenomena, belonging to great masses of water, were in some measure owing to some cosmical law or custom of the terrestrial globe, or at least of the planetary vortex.

Phil Trans. vol. lix. p. 450. By observations on the shining of some Dr Beale's fishes, and the pickle in which they were immersed, experiments were made by Dr Beale, in May 1665; and had they been properly attended to and pursued, might have led to the discovery of the cause of this appearance. Having put some boiled mackerel into water, together with salt and sweet herbs; when the cook was, some time after, stirring it, in order to take out some of the fishes, she observed, that, at the first motion, the water was very luminous; and that the fish shining through the water added much to the light which the water yielded. The water was of itself thick and blackish, rather than of any other colour; and yet it shined on being stirred, and at the same time the fishes appeared more luminous than the water. Wherever the drops of this water, after it had been stirred, fell to the ground, they shined; and the children in the family diverted themselves with taking the drops, which were as broad as a penny, and running with them about the house. The cook observed, that, when she turned up that side of the fish that was lowest, no light came from it.
Light and that, when the water had settled for some time, it did not shine at all. The day following, the water gave but little light, and only after a brisk agitation, though the fishes continued to shine as well from the inside as the outside, and especially about the throat, and such places as seemed to have been a little broken in the boiling.

When in the light of the sun, he examined, with a microscope, a small piece of a fish which had shined very much the night before, he found nothing remarkable on its surface, except that he thought he perceived what he calls a steam, rather dark than luminous, arising like a very small dust from the fish, and here and there a very small and almost imperceptible sparkle. Of the sparkles he had no doubt; but he thought it possible that the steam might be a deception of the light, or some dust in the air.

Finding the fish to be quite dry, he moistened it with his spittle; and then observed that it gave a little light, though but for a short time. The fish at that time was not fertil, nor yet insipid to the best discerning palate. Two of the fishes he kept two or three days longer for farther trial: but, the weather being very hot, they became fétid: and, contrary to his expectations, there was no more light produced either by the agitation of the water or in the fish.

Father Bourer, in his voyage to the Indies in 1704, took particular notice of the luminous appearance of the sea. The light was sometimes so great, that he could easily read the title of a book by it, though he was nine or ten feet from the surface of the water. Sometimes he could easily distinguish, in the wake of a ship, the particles that were luminous from those that were not; and they appeared not to be all of the same figure. Some of them were like points of light, and others such as stars appear to the naked eye. Some of them were like globes, of a line or two in diameter; and others as big as one's head. Sometimes they formed themselves into squares of three or four inches long, and one or two broad. Sometimes all these different figures were visible in the same time; and sometimes they were what he calls corvites of light, which at one particular time appeared and disappeared immediately like flashes of lightning.

Nor did only the wake of the ship produce this light, but fishes also, in swimming, left so luminous a track behind them, that both their size and species might be distinguished by it. When he took some of the water out of the sea, and stirred it ever so little with his hand, in the dark, he always saw in it an infinite number of bright particles, and he had the same appearance whenever he dipped a piece of linen in the sea, and wrung it in a dark place, even though it was half dry; and he observed, that when the sparkles fell upon anything that was solid, it would continue shining for some hours together.

After mentioning several circumstances which did not contribute to this appearance, this father observes, that it depends very much upon the quality of the water; and he was pretty sure that this light is the greatest when the water is fattest, and fullest of foam. For in the main sea, he says, the water is not everywhere equally pure; and that sometimes, if linen be dipped in the sea, it is clammy when it is drawn up again; and he often observed, that when the wake of the ship was the brightest, the water was the most fat and glutinous, and that linen moistened with it produced a great deal of light, if it were stirred or moved briskly. Besides, in some parts of the sea, he saw a substance like saw dust, sometimes red and sometimes yellow; and when he drew up the water in those places, it was always viscous and glutinous. The sailors told him that it was the spawn of whales; that there are great quantities of it in the north; and that sometimes, in the night, they appeared all over of a bright light, without being put in motion by any vessel or fish passing by them.

As a confirmation of this conjecture, that the more glutinous the sea water is, the more it is disposed to become luminous, he observes, that one day they took a fish which was called a bowler, the inside of the mouth of which was so luminous, that without any other light, he could read the same characters which he had before read by the light in the wake of the ship; and the mouth of this fish was full of a viscid matter, which, when it was rubbed upon a piece of wood, made it immediately all over luminous; though, when the moisture was dried up, the light was extinguished.

The abbé Nollet was much struck with the luminousness of the sea when he was at Venice in 1749. Let's theory and, after taking a great deal of pains to ascertain the circumstances of it, concluded that it was occasioned by a shining insect; and having examined the water very often, he at length did find a small insect, which he particularly describes, and to which he attributes the light. The same hypothesis had also occurred to M. Vianelli, professor of medicine in Chioggia near Venice; and both he and M. Grizzellini, a physician in Venice, have given drawings of the insects from which they imagined this light to proceed.

The abbé was the more confirmed in his hypothesis, by observing, some time after, the motion of some luminous particles in the sea. For, going into the water, and keeping his head just above the surface, he saw them dart from the bottom, which was covered with weeds, to the top, in a manner which he thought very much resembled the motions of insects; though, when he endeavored to catch them, he only found some luminous spots upon his handkerchief, which were enlarged when he pressed them with his finger.

M. le Roi, making a voyage on the Mediterranean, observed presently after the abbé Nollet made his observations at Venice, took notice, that in the day time, the prow of the ship in motion threw up many small particles, which, falling upon the water, rolled upon the surface of the sea for a few seconds before they mixed with it; and in the night the same particles, as he concluded, had the appearance of fire. Taking a quantity of the water, the same small sparks appeared whenever it was agitated; but, as was observed with respect to Dr Beale's experiments, every successive agitation produced a less effect than the preceding, except after being suffered to rest a while; for then a fresh agitation would make it almost as luminous as the first. This water, he observed, would retain its property of shining by agitation a day or two; but it disappeared immediately on being set on the fire, though it was not made to boil.

This gentleman, after giving much attention to this phenomenon, concludes, that it is not occasioned by any
Light any shining insects, as the abbé Nollot imagined; especially as, after carefully examining some of the luminous points, which he caught upon a handkerchief, he found them to be round like large pins heads, but with nothing of the appearance of any animal, though he viewed them with a microscope. He also found, that the mixture of a little spirit of wine with water just drawn from the sea, would give the appearance of a great number of little sparks, which would continue visible longer than those in the ocean. All the acids, and various other liquors, produced the same effect, though not quite so conspicuously; but no fresh agitation would make them luminous again. M. le Boi is far from asserting that there are no luminous insects in the sea. He even supposes that the abbé Nollot and M. Vianelli had found them. But he was satisfied that the sea is luminous chiefly on some other account, though he does not so much as advance a conjecture about what it is.

M. Ant. Martin made many experiments on the light of fishes, with a view to discover the cause of the light of the sea. He thought that he had reason to conclude, from a great variety of experiments, that all sea fishes have this property; but that it is not to be found in any that are produced in fresh water. Nothing depended upon the colour of the fishes, except that he thought that the white ones, and especially those that had white scales, were a little more luminous than others. This light, he found, was increased by a small quantity of salt; and also by a small degree of warmth, though a greater degree extinguished it. This agrees with another observation of his, that it depends entirely upon a kind of moisture which they had about them, and which a small degree of heat would expel, when an oligosine remained which did not give this light, but would burn in the fire. Light from the flesh of birds or beasts is not so bright, he says, as that which proceeds from fish. Human bodies, he says, have sometimes emitted light about the time that they began to putrefy, and the walls and roof of a place in which dead bodies had often been exposed, had a kind of dew or clamminess upon it, which was sometimes luminous; and he imagined that the lights which are said to be seen in burying-grounds may be owing to this cause.

By Mr. Canton.

From some experiments made by Mr. Canton, he concludes, that the luminousness of sea water is owing to the saline and other putrescent substances it contains. On the evening of the 14th of June 1768, he put a small fresh whiting into a gallon of sea water, in a pan which was about 14 inches in diameter, and took notice that neither the whiting nor the water, when agitated, gave any light. A Fahrenheit's thermometer, in the cellar where the pan was placed, stood at 54°. The 15th, at night, that part of the fish which was even with the surface of the water was luminous, but the water itself was dark. He drew the end of a stick through it, from one side of the pan to the other; and the water appeared luminous behind the stick all the way, but gave light only where it was disturbed. When all the water was stirred, the whole became luminous, and appeared like milk, giving a considerable degree of light to the sides of the pan; and it continued to do so for some time after it was at rest. The water was most luminous when the

He then put a gallon of fresh water into one pan, and an equal quantity of sea water into another; and into each pan he put a fresh herring of about three ounces. The next night the whole surface of the sea water was luminous without being stirred; but it was much more so when it was put in motion; and the upper part of the herring, which was considerably below the surface of the water, was also very bright; while at the same time the fresh water, and the fish that was in it, were quite dark. There were several very bright luminous spots on different parts of the surface of the sea water; and the whole, when viewed by the light of a candle, seemed covered with a greasy acum. The third night, the light of the sea water, while at rest, was very little, if at all less than before; but when stirred, its light was so great as to discover the time by a watch, and the fish in it appeared as a dark substance. After this, its light was evidently decreasing, but was not quite gone before the 7th night. The fresh water and the fish in it were perfectly dark during the whole time. The thermometers was generally above 68°.

The preceding experiments were made with sea water: but he now made use of other water, into which he put common or sea salt, till he found, by an hydrometer, that it was of the same specific gravity with the sea water; and, at the same time, in another gallon of water, he dissolved two pounds of salt; and into each of these waters he put a small fresh herring. The next evening the whole surface of the artificial sea water was luminous without being stirred; but gave much more light when it was disturbed. It appeared exactly like the real sea water in the preceding experiment; its light lasted about the same time, and went off in the same manner: while the other water, which was almost as salt as it could be made, never gave any light. The herring which was taken out of it the seventh night, and washed from its salt, was found firm and sweet; but the other herring was very soft and putrid, much more so than that which had been kept as long in fresh water. If a herring, in warm weather, be put into 10 gallons of artificial sea water, instead of one, the water, he says, will still become luminous, but its light will not be so strong.

It appeared by some of the first observations on this subject, that least extinguishes the light of putrescent substances. Mr. Canton also attended to this circumstance; and observes, that though the greatest summer heat is well known to promote putrefaction, yet 20 degrees more than that of the human body seems to hinder it. For putting a small piece of a luminous fish into a thin glass ball, he found, that water of the heat of 118 degrees would extinguish its light in less than half a minute; but then, on taking it out of the water, it would begin to recover its light in about 10 seconds; but it was never afterwards so bright as before.

Mr. Canton made the same observation that Mr. Ant. Martin had done, viz. that several kinds of river fish could not be made to give light, in the same circumstances in which any sea fish became luminous. He says, however, that a piece of carp made the water very luminous,
L luminescent, though the outside, or scaly part of it, did not shine at all.

For the sake of those persons who may choose to repeat his experiments, he observes, that artificial sea-water may be made without the use of a hydrometer, by the proportion of four ounces of mustard oil to seven pints of water, wine measure.

A very elaborate paper on the subject by Dr Hulme appeared in the Philosophical Transactions for 1800, to which we refer our readers, and to Chemistry, p. 471.

From undoubted observations, however, it appears, that in many places of the ocean it is covered with luminous insects to a very considerable extent. M. Dagelet, a French astronomer who returned from the Terra Australis in the year 1774, brought with him several kinds of worms which shine in water when it is set in motion; and M. Rigaud, in a paper inserted (if we are not mistaken) in the Journal des Scavans for the month of March 1770, affirms, that the luminous surface of the sea, from the port of Brest to the Antilles, contains an immense quantity of little, round, shining polyposes of about a quarter of a line in diameter. Other learned men, who acknowledge the existence of these luminous animals, cannot, however, be persuaded to consider them as the cause of all that light and scintillation that appear on the surface of the ocean: they think that some substance of the phosphorus kind, arising from putrefaction, must be admitted as one of the causes of this phenomenon. M. Godfroy has published curious observations on a kind of fish called in French bonite, already mentioned; and though he has observed, and accurately described, several of the luminous insects that are found in sea-water, he is, nevertheless, of opinion, that the scintillation and flaming light of the sea proceed from the oily and greasy substances with which it is impregnated.

The abbé Nollet was long of opinion, that the light of the sea proceeded from electricity (A); though he afterwards seemed inclined to think, that this phenomenon was caused by small animals, either by their luminous aspect, or at least by some liquor or effluvia which they emitted. He did not, however, exclude other causes; among these, the spawn or fry of fish deserves to be noticed. M. Dagelet, sailing into the bay of Antongil, in the island of Madagascar, observed a prodigious quantity of fry which covered the surface of the sea above a mile in length, and which he at first took for banks of sand on account of their colour; they exhaled a disagreeable odour, and the sea had appeared with uncommon splendour some days before. The same accurate observer, perceiving the sea remarkably luminous in the road of the Cape of Good Hope during a perfect calm, remarked, that the ears of the canoes produced a whitish and pearly kind of lustre; when he took in his hand the water which contained this phosphorus, he discerned in it, for some minutes, globules of light as large as the heads of pins. When he pressed these globules, they appeared to his touch like a soft and thin pulp; and some days after the sea was covered near the coasts with whole banks of these little fish in innumerable multitudes.

To putrefaction, also, some are willing to attribute that luminous appearance which goes by the name of ignis fatus, to which the credulous vulgar ascribe very extraordinary and especially mischievous powers. It is most frequently observed in boggy places and near rivers, though sometimes also in dry places. By its appearance benighted travellers are said to have been sometimes misled into marshy places, taking the light which they saw before them for a candle at a distance; from which seemingly mischievous property it has been thought by the vulgar to be a spirit of a malignant nature, and been named accordingly Will with a whip, or Jack with a lantern; for the same reason also it probably had its Latin name ignis fatus.

This kind of light is said to be frequent about burying places and dung-hills. Some countries are also remarkable for it, as about Bologna in Italy, and some parts of Spait and Ethiopia. Its forms are so uncertain and variable that they can scarce be described, especially as few philosophical observers ever had the good fortune to meet with it. Dr Derham, however, happened one night to perceive one of them, and got so near that he could have a very advantageous view of it. This is by no means easy to be obtained; for among other singularities of the ignis fatus, it is observed to avoid the approach of any person, and fly from place to place as if it was animated. That which Dr Derham observed was in some boggy ground between two rocky hills; and the night was dark and calm; by which means, probably, he was enabled to advance within two or three yards of it. It appeared like a complete body of light, without any division, so that he was sure it could not be occasioned by insects, as some have supposed; the separate lights of which he could not have failed to distinguish, had it been occasioned by them. The light kept dancing about a dead thistle, till a very slight motion of the air, occasioned, as he supposed, by his near approach to it, made it jump to another place; after which it kept flying before him as he advanced. M. Beccaria endeavoured to procure all the intelligence he could concerning his phenomenon, by inquiring of all his acquaintance who might have had an opportunity of observing it. Thus he obtained information that two of these lights appeared in the plains about Bologna, the one to the north, and the other to the south, of that city, and were to be seen almost ever dark night, especially that to the eastward, giving a light equal to an ordinary faggot. The latter appeared to a gentleman of his acquaintance as he was travelling; moved constantly before him for about a mile; and gave a better light than a torch which was carried before him. Both these appearances gave a very strong light, and were constantly in motion, though this various and uncertain. Sometimes they would rise, sometimes sink; but commonly they would hover about six feet from the ground; they would also frequently disappear on a sudden.

(A) This hypothesis was also maintained in a treatise published at Venice in 1746, by an officer in the Austrian service, under the title Dell' Elettrostomo.
den, and appear again in some other place. They differed also in size and figure, sometimes spreading pretty wide, and then contracting themselves; sometimes breaking into two, and then joining again. Sometimes they would appear like waves, at others they would seem to drop sparks of fire: they were but little affected by the wind; and in wet and rainy weather were frequently observed to cast a stronger light than in dry weather: they were also observed more frequently when snow lay upon the ground, than in the hottest summer; but he was assured that there was not a dark night throughout the whole year in which they were not to be seen. The ground to the eastward of Bologna, where the largest of these appearances was observed, is a hard chalky soil mixed with clay, which will retain the moisture for a long time, but breaks and cracks in hot weather. On the mountains, where the soil is of a looser texture, and less capable of retaining moisture the ignes fatui were less.

From the best information which M. Beccaria was able to procure, he found that these lights were very frequent about rivers and brooks. He concludes his narrative with the following singular account: “An intelligent gentleman travelling in the evening, between eight and nine, in a mountainous road about ten miles south of Bologna, perceived a light which shone very strangely upon some stones which lay on the banks of the river Ravevera. It seemed to be about two feet above the stones, and not far from the water. In size and figure it had the appearance of a parallipiped, somewhat more than a foot in length, and half a foot high, the longest side being parallel to the horizon. Its light was so strong, that he could plainly discern by it part of a neighbouring hedge and the water of the river; only in the east corner of it the light was rather faint, and the square figure less perfect, as if it was cut off or darkened by the segment of a circle. On examining it a little nearer, he was surprised to find that it changed gradually from a bright red, first to a yellowish, and then to a pale colour, in proportion as he drew nearer; and when he came to the place itself, it quite vanished. Upon this he stepped back, and not only saw it again, but found that the farther he went from it, the stronger and brighter it grew. When he examined the place of this luminous appearance, he could perceive no smell nor any other mark of fire.” This account was confirmed by another gentleman, who informed M. Beccaria, that he had seen the same light five or six different times in spring and in autumn; and that it always appeared of the same shape, and in the very same place. One night in particular, he observed it come out of a neighbouring field to settle in the usual place.

A very remarkable account of an ignis fatuus is given by Dr Shaw in his Travels to the Holy Land. It appeared in the valleys of Mount Ephraim, and attended him and his company for more than an hour. Sometimes it would appear globular, or in the shape of the flame of a candle; at others it would spread to such a degree as to involve the whole company in a pale offensive light, then contract itself, and suddenly disappear; but in less than a minute would appear again; sometimes running swiftly along, it would expand itself at certain intervals over more than two or three acres of the adjacent mountains. The atmosphere from the beginning of the evening had been remarkably thick and hazy; and the dew, as they felt it on the bridles of their horses, was very clammy and unctuous.

Lights resembling the ignis fatuus are sometimes observed at sea, skipping about the masts and rigging of ships; and Dr Shaw informs us, that he has seen these in such weather as that just mentioned when he saw the ignis fatuus in Palestine. Similar appearances have been observed in various other situations; and we are told of one which appeared about the bed of a woman in Milan, surrounding it as well as her body entirely. This light fled from the hand which approached it; but was at length entirely dispersed by the motion of the air. Of the same kind also, most probably, are those small luminous appearances which sometimes appear in houses or near them, called in Scotland elf-candles, and which are supposed to portend the death of some person about the house. In general these lights are harmless, though not always; for we have accounts of some luminous vapours which would encompass stacks of hay and corn, and set them on fire; so that they became objects of great terror and concern to the country people. Of these it was observed, that they would avoid a drawn sword, or sharp-pointed iron instrument, and that they would be driven away by a great noise; both which methods were made use of to dissipate them: and it was likewise observed, that they came from some distance, as it were upon purpose to do mischief.

Several philosophers have endeavoured to account for these appearances, but hitherto with no great success; nor indeed does there seem to be sufficient data for solving all their phenomena. Willoughby, Ray, and others, have imagined that the light was occasioned by a number of shining insects; but this opinion was never supported in such a manner as to gain much ground. The ignis fatuus seen by Dr Derham above mentioned, as well as all the other instances we have related, seem to demonstrate the contrary. Sir Isaac Newton calls it a vapour shining without heat; and supposes that there is the same difference between the vapours’ ignis fatuus and flame, that there is between the shine of rotten wood and burning coal. But though this seems generally to be the case, there are still some exceptions, as has been instanced in the vapours which set fire to the stacks of corn. Dr Priestley supposes that the light is of the same nature with that produced by putrescent substances; and others are of opinion, that the electrical fluid is principally concerned; but none have attempted to give any particular solution of the phenomena.

From the frequent appearance of the ignis fatuus in marshes, moist ground, burying-places, and dung-hills, we are naturally led to conclude, that putrefaction is concerned in the production of it. This process, we know, is attended with the emission of an aqueous steam, together with a quantity of fixed, inflammable, and azotic airs, all blended together in the form of vapour. It is likewise attended with some degree of heat; and we know that there are some vapours that of sulphur particularly, which become luminous, with a degree of heat much less than that sufficient to set fire to combustible bodies. There is no inconsistency, therefore, in supposing that the putrid vapour...
On this principle we may account for the light which surrounded the woman at Milan, but fled from the hand of any other person. On the same principle may we account for those mischievous vapours which set fire to the hay and corn stacks, but were driven away by presenting to them a pointed iron instrument, or by making a noise. Both these are known to have a great effect upon the electric matter; and by means of either, even lightning may be occasionally be made to fall upon or to avoid particular places, according to the circumstances by which the general mass happens to be affected at that time.

On the whole, therefore, it seems most probable, that the ignis fatuus is a collection of vapour of the putrescent kind, very much affected by electricity; according to the degree of which, it will either give a weak or strong light, or even set fire to certain substances disposed to receive its operation. This opinion seems greatly to be confirmed from some luminous appearances observed in privies, where the putrid vapours have even collected themselves into balls, and exploded violently on the approach of a candle. This last effect, however, we cannot so well ascribe to the electricity, as to the accession of the inflammable air which frequently abounds in such places.

In the appendix to Dr Priestley's third volume of Experiments and Observations on Air, Mr Warlire gives an account of some very remarkable ignis fatuus, which he observed on the road to Bromsgrove, about five miles from Birmingham. The time of observation was the 12th of December 1776, before daylight. A great many of these lights were playing in an adjacent field, in different directions; from some of which there suddenly sprang up bright branches of light, something resembling the explosion of a rocket that contained many brilliant stars, if the discharge was upwards, instead of the usual direction; and the hedge and trees on each side of the hedge were illuminated. This appearance continued but a few seconds, and then the jack-a-lanterns played as before. Mr Warlire was not near enough to observe if the apparent explosions were attended with any报告.

Cromstedt gives it as his opinion, that ignis fatuus, as well as the meteors called falling stars, are owing to collections of inflammable air raised to a great height in the atmosphere. But, with regard to the latter, the vast height at which they move evidently shows that they cannot be the effect of any gravitating vapour whatever; for the lightest inflammable air is one-twelfth of that of the common atmosphere; and we have no reason to believe, that at the distance of 40 or 50 miles from the earth, the latter has near one-twelfth of its weight at the surface. From the account given by Mr Warlire, we should be apt to conclude, that there is a strong affinity between the ignis fatuus and fire balls, insomuch that the one might be very easily converted into the other. From this then we must ascribe an electrical origin to the one as well as the other. Electricity, we know, can assume both these appearances, as is evident in the case of points; or even when the atmosphere is violently electrified, as around the string of an electrical kite, which always will appear to be surrounded with a blue flame in the night, if the electricity be very strong.

On the whole, it appears, that electricity acting up-
When the solid phosphorus is quite immersed in water, he observes that it ceases to shine; but that if any part of it chance to emerge, or get into the air, it will shine though the glass be hermetically sealed. In a large glass he kept it without water for several days; and yet it continued shining with very little diminution of its light or weight. If the letters that were written with this phosphorous were warmed by the fire, they presently became dark lines, which continued upon the paper, like ink. To try how much light was given by a small quantity of this phosphorous, he observed that it continued to flame in the open air for seven or eight days; the light being visible whenever he shut his window.

As air was generally thought to contain the **pabulum** of flame, Dr Slare was determined to try this with respect to phosphorus; and for this purpose he placed a large piece of it in a receiver; but upon exhausting it, he perceived that it became more luminous, and that, upon admitting the air, it returned to its former state. This property of the light of phosphorus, which is the very reverse of that of shining wood and fishes, was also ascertained by several very accurate experiments of Mr Haukhee's.

Endeavouring to blow the phosphorus into a flame with a pair of bellows, Dr Slare found that it was presently blown out, and that it was a considerable time before the light revived again. All liquors would extinguish this light when the phosphorus was put into them; nor would it shine or burn, though it was even boiled in the most inflammable liquors, as oil of olives, spirit of turpentine, or even spirit of wine.

In order to keep his phosphorus from consuming, he used to put it in a glass of water; and sometimes he has seen it, when thus immersed in water, make such bright and vigorous coruscations in the air, as, he says, would surprise and frighten those who are not used to the phenomenon. This fiery meteor, he says, is contracted in its passage through the water, but expands as soon as it gets above it. If any person would make this experiment to advantage, he informs them that the glass must be deep and cylindrical, and not above three quarters filled with water. This effect he perceived in warm weather only, and never in cold.

The phosphorus of which we have been treating is prepared from urine; but in some cases the sweat, which is similar to urine, has been observed to be phosphorescent, without any preparation. This once happened to a person who used to eat great quantities of salt, and who was a little subject to the gout, after sweating with violent exercise. Stripping himself in the dark, his shirt seemed to be all on fire, which surprised him very much. Upon examination, red spots were found upon his shirt; and the physician who was present perceived an unusual smell, though it had nothing in it of volatile alkali, but of the muriatic acid; the same, he says, that issues from cabbage much salted, and strongly fermented.

The easiest method of accounting for all these kinds of lights, perhaps, is from electricity. If light consists in a certain vibration of the electric fluid, then it is accounted for by means of that in whatever substances such a vibration takes place, their light must appear, whether in putrescent or other animals, sea water, phosphorus, or any thing else. We know that the electric matter pervades all terrestrial and subterranean substances; being, with very little diminution of its light or weight. If the letters that were written with this phosphorous were warmed by the fire, they presently became dark lines, which continued upon the paper, like ink. To try how much light was given by a small quantity of this phosphorous, he observed that it continued to flame in the open air for seven or eight days; the light being visible whenever he shut his window.

As air was generally thought to contain the **pabulum** of flame, Dr Slare was determined to try this with respect to phosphorus; and for this purpose he placed a large piece of it in a receiver; but upon exhausting it, he perceived that it became more luminous, and that, upon admitting the air, it returned to its former state. This property of the light of phosphorus, which is the very reverse of that of shining wood and fishes, was also ascertained by several very accurate experiments of Mr Haukhee's.

Endeavouring to blow the phosphorus into a flame with a pair of bellows, Dr Slare found that it was presently blown out, and that it was a considerable time before the light revived again. The easiest method of accounting for all these kinds of lights, perhaps, is from electricity. If light consists in a certain vibration of the electric fluid, then it is accounted for by means of that in whatever substances such a vibration takes place, their light must appear, whether in putrescent or other animals, sea water, phosphorus, or any thing else.
Light.

Light from Diamonds. Among luminous bodies the diamond is to be reckoned; as some diamonds are known to shine in the dark. But on account of the feebleness of their splendour, it is necessary for the person who is to observe them, previously to stay in the dark at least a quarter of an hour; that the pupil of the eye may be dilated and enlarged, and so rendered capable of receiving a large quantity of the rays of light. M. du Fay has also observed, that the eyes ought to be shut for this time, or at least one of them; and that, in that case, the light of the diamond is afterwards only seen by that eye which has been shut. Before the diamond is brought into the dark room, it must be exposed to the sunshine, or at least to the open daylight, to imbibe a sufficient quantity of rays; and this is done in one minute, or even less; eight or ten seconds having been found to furnish as much light as a stone is capable of receiving: and when brought into the dark, its light continues about twelve or thirteen minutes, weakening all the while by insensible degrees. It is very remarkable, that in bodies so extremely similar to each other as diamonds are, some should have this property of imbibing the sun’s rays, and shining in the dark, and that others should not; yet so it is found to be by experiment, and the most nearly resembling stones shall be found one to have this property, and another to be destitute of it; while many of the most dissimilar have the property in common. There seems to be no rule, nor even the least traces of any imperfect rule of judging, which diamonds have, and which have not this property; their natural brightness, their purity, their size, or their shape, contribute nothing to it: and all that has been yet discovered of the least regularity among them, is, that all yellow diamonds have this property. This is supposed to arise from their having more sulphur in their composition, and therefore illuminating more readily, or emitting a more visible flame.

The burning of diamonds is a term used among the jewellers, for putting them into a fierce fire, as they frequently do, when they are fouled with brown, or yellow, or the like; this always divests them of their colour, without doing them the least sensible injury. M. du Fay, having been informed of this common practice, formed a conjecture, that the difference of diamonds in their shining or not shining in the dark, was owing to it; and that either all those which had been burnt, or all those which had not, were those which alone shone in the dark. But this was found an erroneous conjecture; for two diamonds, one lucid in the dark, the other not, were both burnt, and afterwards both were found to retain the same properties they had before. It is not only the open sunshine, or open daylight, which gives to these diamonds the power of shining in the dark: they receive it in the same manner even if laid under a glass, or plunged in water or in milk.

M. du Fay tried whether it was possible to make the diamond retain, for any longer time, the light it naturally parts with so soon; and found, that if the diamond, after being exposed to the light, be covered with black wax, it will shine in the dark, as well six hours afterwards as at the time it was first impregnated with the light.

The imbibing light, in this manner, being so nice a property as not to be found in several diamonds, it was not to be supposed that it would be found in any other stones: accordingly, on trial, the ruby, the sapphire, and the topaz, were found wholly destitute of it; and among a large number of rough emeralds, one only was found to possess it. Such is the strange uncertainty of these accidents.

All the other less precious stones were tried, and found not to possess this property of imbibing light from the daylight or sunshine, but they all became luminous by the different means of heating or friction: with this difference, that some acquired it by one of these methods, and others by the other; each being unaffected by that which gave the property to the other. The diamond becomes luminous by all these ways.

Beccaria also discovered, that diamonds have the property of the Bolognian phosphorus, about the same time that it occurred to M. du Fay. Com. Bonon. vol. ii. p. 276. M. du Fay likewise observed, that the common topaz, when calcined, had all the properties of this phosphorus; and pursuing the discovery, he found the same property in a great degree, in the blemmites, gypsum, limestone, and marble: though he was obliged to dissolve some very hard substances of this kind in acids, before calcination could produce this change in them; and with some substances he could not succeed even thus; especially with flint stones, river sand, jaspers, agates, and rock crystal.

Light from Plants. In Sweden a very curious phenomenon has been observed on certain flowers by M. Haggner, lecturer in natural history. One evening he perceived a faint flash of light repeatedly dart from a marigold. Surprised at such an uncommon appearance, he resolved to examine it with attention; and, to be assured it was no deception of the eye, he placed a man near him, with orders to make a signal at the moment when he observed the light. They both saw it constantly at the same moment.

The light was most brilliant on marigolds of an orange or flame colour; but scarcely visible on pale ones.

The flash was frequently seen on the same flower two or three times in quick succession; but more commonly at intervals of several minutes: and when several flowers in the same place emitted their light together, it could be observed at a considerable distance.

This phenomenon was remarked in the months of July and August at sunset, and for half an hour, when the atmosphere was clear; but after a rainy day, or when
when the air was loaded with vapours, nothing of it was seen.

The following flowers emitted flashes, more or less vivid, in this order:
1. The marigold, calendula officinalis.
2. Monkshood, Aconitum napellus.
3. The orange lily, lilium bulbiferum.
4. The Indian pink, tagetes patula et creta.

To discover whether some little insects or phosphoric worms might not be the cause of it, the flowers were carefully examined, even with a microscope, without any such thing being found.

From the rapidity of the flash, and other circumstances, it may be conjectured that there is something of electricity in this phenomenon. It is well known, that when the pistil of a flower is impregnated, the pollen bursts away by its elasticity, with which electricity may be combined. But M. Hagera, after having observed the flash from the orange lily, the anther of which is a considerable space distant from the petals, found that the light proceeded from the petals only; whence he concludes, that this electric light is caused by the pollen, which, in drying off, is scattered on the petals. Whatever be the cause, the effect is singular and highly curious.

Lights, in Painting, are those parts of a piece which are illuminated, or that lie open to the luminous by which the piece is supposed to be enlightened; and which, for this reason, are painted in bright vivid colours.

In this sense light is opposed to shadow.

Different lights have very different effects on a picture, and occasion a difference in the management of every part. A great deal therefore depends on the painter’s choosing a proper light for his piece to be illuminated by; and a great deal more, in the conduct of the lights and shadows, when the luminous is pitched upon.

The strength and relievo of a figure, as well as its gracefulness, depend entirely upon the management of the lights, and the joining of those to the shadows.

The light a figure receives is either direct or reflected; to each of which special regard must be had. The doctrine of lights and shadows makes that part of painting called clair-obscur.

Light-Horse, an ancient term in our English customs, signifying an ordinary cavalier or horseman lightly armed, and so as to enter a corps or regiment; in opposition to the men-at-arms, who were heavily accoutred, and armed at all points. See Light-Horse.

Light-House, a building erected upon a cape or promontory on the sea-coast, or upon some rock in the sea, and having on its top in the night-time a great fire, or light forced by candles, which is constantly attended by some careful person, so as to be seen at a great distance from the land. It is used to direct the shipping on the coast, that might otherwise run ashore, or steer an improper course, when the darkness of the night and the uncertainty of currents, &c. might render their situation with regard to the shore extremely doubtful. Lamp-lights are, on many accounts, preferable to coal fires or candles; and the effect of these may be increased by placing them either behind glass hemispheres, or before properly disposed glass or metallic reflectors, which last method is now very generally adopted. See Beacons.

Light-Room, a small apartment, enclosed with glass windows, near the magazine of a ship of war. It is used to contain the lights by which the gunner and his assistants are enabled to fill cartridges with powder to be ready for action.

Lighter, a large, open, flat-bottomed vessel, generally managed with oars, and employed to carry goods to or from a ship when she is to be laden or delivered. There are also some lighters furnished with a deck throughout their whole length, in order to contain those merchandises which would be damaged by rainy weather: these are usually called close lighters.

Lightfoot, John, a most learned English divine, was the son of a divine, and born in March 1602, at Stoke upon Trent in Staffordshire. After having finished his studies at a school on Morton-green near Congleton in Cheshire, he was removed in 1617 to Cambridge, where he applied himself to eloquence, and succeeded so well in it as to be thought the best orator of the under graduates in the university. He also made an extraordinary proficiency both in Latin and Greek; but neglected the Hebrew, and even lost that knowledge he brought of it from school. His taste for the oriental languages was not yet excited; and as for logic, the study of it as managed at that time among the academicks, was too quarrismoe and fierce for his quiet and meek disposition. As soon as he had taken the degree of B. A. he left the university, and became assistant to a school at Repton in Derbyshire. After he had supplied this place a year or two, he entered into orders, and became curate of Norton under Hales in Shropshire. This curacy gave him an occasion of awakening his genius for the Hebrew tongue. Norton lies near Bellaport, then the seat of Sir Rowland Cotton; who was his constant bearer, made him his chaplain, and took him into his house. This gentleman, being a perfect master of the Hebrew language, engaged Lightfoot in that study; who, by conversing with his patron, soon became sensible, that without that knowledge it was impossible to attain an accurate understanding of the scriptures. He therefore applied himself to it with extraordinary vigour, and in a little time made a great progress in it: and his patron removing with his family to reside in London, at the request of Sir Alland Cotton his uncle, who was lord-mayor of that city, he followed his preceptor thither. But he did not stay long there: for, having a mind to improve himself by travelling abroad, he went down into Staffordshire, to take leave of his father and mother. Passing through Stone in that county, he found the place destitute of a minister: and the pressing instances of the parishioners prevailed upon him to undertake that cure. Hereupon, laying aside his design of travelling abroad, he began to turn his thoughts upon settling at home. During his residence at Bellaport, he had fallen into the acquaintance of a gentlewoman who was daughter of William Crompton of Stonepark, Esq. and now, being in possession of that living, he married her in 1628. But notwithstanding this settlement, his unquenchable thirst after rabbinical learning would not suffer him to continue there. Sion-college library at London, he knew,
Lightfoot was well stocked with books of that kind. He therefore quitted his charge at Stone, and removed with his family to Hornsey, near the city; where he gave the public a notable specimen of his advancement in those studies, by his "Erubim, or Miscellanies Christian and Judaic," in 1629. He was at this time only 27 years of age; and appears to have been well acquainted with the Latin and the Greek fathers, as well as the ancient heathen writers. These first fruits of his studies were dedicated to Sir Rowland Cotton, who, in 1631, presented him to the rectory of Ashley-staffordshire.

He seemed now to be fixed for life: Accordingly, he built a study in the garden, to be out of the noise of the house; and applied himself with indefatigable diligence in searching the scriptures. Thus employed, the days passed very agreeably; and he continued quiet and unmolested, till the great change which happened in the public affairs brought him into a share of the administration relating to the church; for he was nominated a member of the memorable assembly of divines for settling a new form of ecclesiastical polity. This appointment was purely the effect of his distinguished merit; and he accepted it purely with a view to serve his country, as far as lay in his power. The non-residence which this would necessarily occasion, apparently induced him to resign his rectory: and having obtained the presentation for a younger brother, he set out for London in 1642. He had now satisfied himself in clearing up many of the abstrusest passages in the Bible, and therein had provided the chief materials, as well as formed the plan, of his "Harmony:" and an opportunity of inspecting it at the press was, no doubt, an additional motive for his going to the capital: where he had not been long before he was chosen minister of St. Bartholomew's, behind the Royal Exchange. The assembly of divines meeting in 1643, our author gave his attendance diligently there, and made a distinguished figure in their debates; where he used great freedom, and gave signal proofs of his courage as well as learning, in opposing many of those tenets which the divines were endeavouring to establish. His learning recommended him to the parliament, whose visitors, having ejected Dr. William Spurstow from the mastership of Catharine-hall in Cambridge, put Lightfoot in his room, this year 1653; and he was also presented to the living of Much-Munden in Hertfordshire, by the death of Dr. Samuel Ward, Margaret-professor of divinity in that university, before the expiration of this year. Meanwhile he had his turn with other favours in preaching before the house of commons, most of which sermons were printed; and in them we see him warmly pressing the speedy settlement of the church in the Presbyterian form, which he cordially believed to be according to the pattern in the Mount. He was all the while employed in preparing and publishing the several branches of his Harmony; all which were so many excellent specimen of the usefulness of human learning to true religion: and he met with great difficulties and discouragements in that work, chiefly from that antirevolutionary spirit which prevailed, and even threatened the destruction of the universities. In 1655 he entered upon the office of vice-chancellor of Cambridge, to which he was chosen that year, having taken the degree of doctor of divinity in 1652. He performed all the regular exercises for his degree with great applause, and executed the vice-chancellor's office with exemplary diligence and fidelity; and, particularly at the commencement, supplied the place of professor of divinity, then undisposed of, as an act which was kept for a doctor's degree in that profession. At the same time he was engaged with others in perfecting the Polyglott Bible, then in the press. At the Restoration he offered to resign the mastership of Catharine-hall: But, as what he had done had been rather in compliance with the necessity of the times than from any zeal or spirit of opposition to the king and government, a confirmation was granted him from the crown, both of the place and of his living. Soon after this he was appointed one of the assistants at the conference upon the Liturgy, which was held in the beginning of 1661, but attended only once or twice; probably disgraced at the beat with which that conference was managed. However, he stuck close to his design of perfecting his Harmony: and being of a strong and healthy constitution, which was assisted by an exact temperance, he prosecuted his studies with unabated vigour to the last, and continued to publish, notwithstanding the many difficulties he met with from the expense of it. However, not long before he died, some booksellers got a promise from him to collect and methodise his works, in order to print them; but the execution was prevented by his death, which happened December 6, 1675. The doctor was twice married: his first wife, already mentioned, brought him four sons and two daughters. His second wife was likewise a widow, and relict of Mr. Austin Brograve, uncle of Sir Thomas Brograve, Bart. of Hertfordshire, a gentleman well versed in rabbinical learning, and a particular acquaintance of our author. He had no issue by her. She also died before him, and was buried in Munden church; where the doctor was himself likewise interred near both his wives. Dr. Lightfoot's works were collected and published first in 1684, in two volumes folio. The second edition was printed at Amsterdam, 1686, in two volumes folio, containing all his Latin writings, with a Latin translation of those which he wrote in English. At the end of both these editions there is a list of such pieces as he left unfinished. It is the chief of these, in Latin, which make up the third volume, added to the former, in a third edition of his works, by John Leusden, at Utrecht, in 1699, folio. They were communicated by Mr. Strype, who, in 1700, published another collection of these papers, under the title of "Some genuine remains of the late pious and learned Dr. John Lightfoot."

LIGHTING OF STREETS. This invention, which is generally considered as of modern date, contributes greatly to the convenience and safety of the inhabitants of large cities, as well as to the ornament of their streets. It is not probable that the streets of ancient Rome were lighted, since the Romans considered the use of flambeaux and lanterns to be so necessary in returning home from their nocturnal visits. It appears that such as walked the streets without these went home in darkness; and the return of Cato in the night-time, of which Petronius makes mention, clearly proves that the streets of Naples were not lighted. Such as have ascribed a remote antiquity to the lighting of streets, seem
Lighting. seem to have mistaken it for what are called illuminations, which indeed are of great antiquity. Egyptians, Jews, Greeks, and Romans, during the celebration of memorable festivals, were in the habit of illuminating their houses; but this is entirely different from the practice which we are now considering.

Paris was probably the first city in modern times, the streets of which were lighted, about the beginning of the 16th century, as they were very much infested by robbers and incendiaries. This occasioned an edict, issued in 1524, commanding the inhabitants, whose windows fronted the street, to keep lights burning after nine o'clock at night. In 1559, these were changed for lanterns, of a similar construction with those used at present. In 1671, the lanterns were ordered to be lighted every year from the 20th October to the end of March the ensuing year. Some time after this a premium was offered for a dissertation on the best means of improving the lighting of the streets, when a journeyman glazier obtained a premium of 200 livres, and Meursilly, le Roy, and Bourgeois de Chateaublanc, 2000 livres. The lamps of Paris amounted to 1772 in the year 1721, and, in 1771, to 6232. The city of Nantz was lighted in 1777, and had no fewer than 500 lamps in the year 1780.

The inhabitants of the city of London were ordered, in 1668, to hang out lanterns dully at the accustomed time, which was renewed in 1690; and in 1716 it was enacted, that all those whose houses fronted any street, lane, or public passage, should hang out one or more lights, which were to burn from 6 o'clock to 11. By another act, the lamps were increased from 1000 to 4769, and afterwards to 5000. But as these were confined to the city and liberties, about one-fifth of the whole of London, the number of lamps could not be less than 15,000. The continuance of their burning was also increased from 750 to 5000 hours. In 1744, another act was obtained to regulate still farther the lighting of the city, and it was placed on the footing on which it stands at present. These are now so numerous, that Oxford street alone is said to contain more lamps than the whole city of Paris. Birmingham was lighted for the first time in 1733, with 700 lamps.

In 1669, Amsterdam was lighted by lanterns; the Hague in 1755 was lighted in a particular manner, but lamps were not fixed up in all the streets till the year 1678. The streets of Copenhagen were lighted in 1681, the plan of which was much improved in 1683. Berlin at present has 2354 lamps, kept lighted from September to May, at the expense of the sovereign. Vienna began to be lighted in 1687, and lamps were introduced in 1704. In 1776 their number amounted to 2000, which was increased to 3000, to be lighted at the annual expense of 30,000 florins. Leipzig was lighted in 1702, Dresden in 1705, Cassel in 1721, and Gottingen in 1735. A practice so beneficial to the safety and convenience of mankind, has been very laudably imitated by almost every city and town in Europe. Beckman. Hist. of Invent.

By far the greatest improvement that has been made in the lighting of cities, is the application of coal gas to this purpose. Gas lights were used so far back as 1792, but they were not employed for lighting streets till 1811. In 1818 they were first used on a limited extent in the streets of Edinburgh. The light the gas gives is much more powerful and steady than is given by oil, and on a large scale it is also more economical.

See GAS LIGHTS, Supplement.

LIGHTNING, a bright and vivid flash of fire, suddenly appearing in the atmosphere, and commonly disappearing in an instant, sometimes attended with clouds and thunder, and sometimes not. For an account of the phenomena of lightning, and of the opinions concerning it, see ELECTRICITY Index.

Artificial LIGHTNING. Before the discoveries of Dr Franklin concerning the identity of electricity and lightning, many contrivances were invented in order to represent this terrifying phenomenon in miniature: the coruscations of phosphorus in warm weather, the accension of the vapour of spirit of wine evaporated in a close place, &c. were used in order to support the hypothesis which at that time prevailed; namely, that lightning was formed of some sulphurous, nitrous, or other combustible vapours, floating in long trains in the atmosphere, which by some unaccountable means took fire, and produced all the destructive effects of that phenomenon. These representations, however, are now no more exhibited; and the only true artificial lightning is universally acknowledged to be the discharge of electric matter from bodies in which it is artificially set in motion by machines.

LIGHTNING was looked upon as sacred both by the Greeks and Romans, and was supposed to be sent to execute vengeance on the earth: Hence persons killed with lightning, being thought hateful to the gods, were buried apart by themselves, lest the ashes of other men should receive pollution from them. Some say they were interred upon the very spot where they died; others will have it that they had no interment, but were suffered to rot where they fell, because it was unlawful for any man to approach the place. For this reason the ground was hedged in, lest any person answers should contract pollution from it. All places struck with lightning were carefully avoided and fenced round, out of an opinion that Jupiter had either taken offence at them, and fixed upon them the marks of his displeasure, or that he had, by this means, pitched upon them as sacred to himself. The ground thus fenced about was called by the Romans sidentul. Lightning was much observed in augury, and was a good or bad omen, according to the circumstances attending it.

LIGNICENCIS TERRA, in the Materia Medica, the name of a fine yellow bole found in many parts of Germany, particularly about Emeric in the circle of Westphalia, and used as an astringent.

LIGNUM VITE. See Guaiacum, Botany and Materia Medica Index.

Lignum Alœs. See Exocoecaria, Botany Index.

Lignum Nephrécticum. See Guilandina, Botany Index.

Lignum Rhodium, or Rosewood, in the Materia Medica; a wood, or root, chiefly brought from the Canary islands.

The taste of this wood is lightly bitterish, and somewhat pungent; its smell is very fragrant, resembling that
that of roses; long kept, it seems to lose its smell; but on cutting, or rubbing one piece against the other, it smells as well as at first. Distilled with water, it yields an odoriferous cascatial oil, in very small quantity. Rhodium is at present in esteem only upon account of its oil, which is employed as a high and agreeable perfume.

- Lignum Compressenum. See Hematoxylum, Botany Index.
- Lignum Cotulastrum. See Ophiomiza.

LIGULATED, among botanists, an appellation given to such floccules as have a straight end turned downwards, with three indentures, but not separated into segments.

LICURIA, in Ancient Geography, a country of Italy, bounded on the south by the Mediterranean sea, on the north by the Apennine mountains, on the west by part of Transalpine Gaul, and on the east by Etruria. There is a great disagreement among authors concerning the origin of the Ligurians, though most probably they were descended from the Gauls. Some carry up their origin so far as the fabulous heroes of antiquity; while others trace them from the Ligyes, a people mentioned by Herodotus as attaining Xerxes in his expeditions against Greece. These Ligyes are by some ancient geographers placed in Colchis; by others in Albania.—According to Diodorus Siculus, the Ligurians led a very wretched life; their country being entirely overgrown with woods, which they were obliged to pull up by the root, in order to cultivate their land, which was also encumbered with great stones, and, being naturally barren, made but very poor returns for all their labour. They were much addicted to hunting; and, by a life of continual exercise and labour, became so strong, that the weakest Ligurian was generally an overmatch for the strongest and most robust among the Gauls. The women are said to have been almost as strong as the men, and to have borne an equal share in all laborious enterprises. With all their bravery, however, they were not able to resist the Roman power; but were subdued by that warlike nation about 211 B.C.

LACUS TICUM, Voyage; a genus of plants belonging to the pentandria class; and in the natural method ranking under the 43rd order, Umbellata. See Botany Index.

LACUSTRUM, Privet; a genus of plants belonging to the diandria class; and in the natural method ranking under the 44th order, Separiata. See Botany Index.

LILBURNE, John, an enthusiastic demagogue, who was tyrannically punished by the star-chamber court, being put in the pillory, whipped, fined, and imprisoned, for importing and publishing seditious pamphlets, which he had got printed in Holland; they chiefly reflected on the church of England and its bishops. He suffered in 1637, and in prison was doubly looted with irons. In 1641, he was released by the long parliament; and from this time he had the address to make himself favourable to all parties, by his bold, aspiring genius. He signalized himself in the parliament army; and was at one time the secret friend and confidant of Cromwell, and at another his avowed enemy and accuser; so that, in 1650, Cromwell found it to be his interest to silence him, by a grant of some forfeited estates. But after this, he grew outrageous against the protector’s government; became chief of the levellers; and was twice tried for high treason, but acquitted by the juries. The last was for returning from exile (having been banished by the parliament) without a pass. He died in 1657, aged 88.

LILACEOUS, in Botany, an appellation given to Such flowers as resemble those of the lily.

LILIAM, the Lily; a genus of plants belonging to the hexandria class; and in the natural method ranking under the 10th order, Coronaria. See Botany Index.

LILLO, George, an excellent dramatic writer, was born at London in 1603. He was a jeweller by profession, and followed his business for many years in that neighbourhood with the fairest reputation. He was at the same time strongly attached to the muses, yet seemed to have laid it down as a maxim, that the devotion paid to them ought always to tend to the promotion of virtue, morality, and religion. In pursuance of this aim, Lilly was happy in the choice of his subjects, and showed great power of affecting the heart, by working up the passions to such a height as to render the distresses of common and domestic life equally interesting to the audiences as that of kings and heroes, and the ruin brought on private families by an indulgence of avarice, lust, &c. as the havoc made in states and empires by ambition, cruelty, or tyranny. His “George Barnwell,” “Fatal Curiosity,” and “Arden of Feversham,” are all planned on common and well known stories; yet they have perhaps more frequently drawn tears from an audience than the mere pompous tragedies of Alexander the Great, All for Love, &c. In the prologue to “Elméric,” which was not acted till after the author’s death, it is said, that when he wrote that play, he “was depressed by want,” and afflicted by disease; but in the former particular there appears to be evidently a mistake, as he died possessed of an estate of 60l. a-year, besides other effects to a considerable value. His death happened in 1739, in the 47th year of his age. His works have been collected, and published, with an account of his life, in 2 vols 12mo.

LILLY, John, a dramatic poet, was born in the Wealds of Kent, about the year 1553, and educated in Magdalen-college, Oxford, where he took the degree of bachelor of arts in 1569, and that of master in 1572. From Oxford he removed to Cambridge; but how long he continued there is uncertain. On his arrival in London, he became acquainted with some of Queen Elizabeth’s courtiers, by whom he was caressed, and admired as a poet and a wit; and his majesty, on particular festivals, honoured his dramatic pieces with her presence. His plays are nine in number. His first publication, however, printed in 1580, was a romance called Euphues, which was universally read and admired. This romance, which Blount, the editor of six of his plays, says introduced a new language, especially among the ladies, is, according to Berkenhout, in fact a most contemptible piece of affectation and nonsense: nevertheless it seems very certain, that it was in high estimation by the women of fashion of those times, who, we are told by Whalley, the editor of Ben Johnson’s works, had all the phrases by heart:
and those who did not speak Euphues were as little regarded at court as if they could not speak French.

"He was (says Oldys) a man of great reading, good memory, ready faculty of application, and uncommon eloquence; but he ran into a vast excess of allusion." When or where he died is not known. Anthony Wood says he was living in 1657, when his last comedy was published. After attending the court of Queen Elizabeth 13 years, notwithstanding his reputation as an author, he was under the necessity of petitioning the queen for some small stipend to support him in his old age. His two letters or petitions to her majesty on this subject are preserved in manuscript.

LILY, William, a noted English astrologer, born in Leicestershire in 1602; where his father not being able to give him more learning than common writing and arithmetick, he resolved to seek his fortune in London. He arrived in 1620, and lived four years as a servant to a matrona-maker in the parish of St. Clement Danes; but then moved a step higher to the service of Mr. Wright, master of the Salters company in the Strand, who not being able to write, Lily among other offices kept his books. In 1627, when his master died, he paid his addresses to the widow, whom he married with a fortune of £1,000. Being now his own master, he followed the parochial preachers; and, turning his mind to judicial astrology, became pupil to the Evans, a prodigal Welsh person, in that pretended art. Getting a M.S. of the Arcanum of Corn. Agrippa, with alterations, he drank in the doctrine of the magic circle, and the invocation of spirits, with great eagerness. He was the author of the Merlinus Anglicus junior; The Supernatural Sight; and the White King's Prophecy. In him we have an instance of the general superstition and ignorance that prevailed in the time of the civil war between Charles I. and his parliament: for the kind consulted this astrologer to know in what quarter he should conceal himself, if he could escape from Hampton court; and General Fairfax, on the other side, sent for him to his army, to ask him if he could tell by his art, whether God was with them and their cause? Lily, who made his fortune by favourable predictions to both parties, assured the general that God would be with him and his army. In 1648, he published his Treatise of the Three Suns seen the preceding winter; and also an astrological judgment upon a conjunction of Saturn and Mars. This year the council of state gave him in money £100 and a pension of 100l. per annum, which he received for two years, and then resigned on some disgust. In June 1660, he was taken into custody by order of the parliament, by whom he was examined concerning the person who cut off the head of King Charles I. The same year he sued out his pardon under the great seal of England. The plague raging in London, he removed with his family to his estate at Hersham; and in October 1666 was examined before a committee of the house of commons concerning the fire of London, which happened in September that year. After his retirement to Hersham, he applied himself to the study of physic, and, by means of his friend Mr. Ashmole, obtained from Archbishop Sheldon he worked for the practice of it. A little before his death he adopted for his son, by the name of Merlin junior, one Thomas Cotton, a tailor by trade; and at the same time gave him the impression of his almanack, after it had been printed for 36 years. He died in 1681 of a dead palsy. Mr. Ashmole set a monument over his grave in the church of Walton upon Thames. His "Observations on the Life and Death of Charles, late king of England," if we overlook the astrological nonsense, may be read with as much satisfaction as more celebrated histories; Lily being not only very well informed, but strictly impartial. This work, with the Lives of Lily and Ashmole, written by themselves, were published in one vol. 8vo, in 1774, by Mr. Burman.

LILY. See LILIJUM, BOTANY INDEX.

LILY of the Valley. See CONVALLARIA, BOTANY INDEX.

LILYBYÆUM, in Ancient Geography, a city of Sicily, situated on the most westerly promontory of the island of Sicily, and said to have been founded by the Carthaginians on their expulsion from Motya by Dionysius, tyrant of Syracuse. It is remarkable for three sieges it sustained; one against Dionysius the tyrant, another against Pyrrhus, king of Epirus, and the third against the Romans. The two first failed in their attempts, but the Romans, with great difficulty made themselves masters of it. No remains of this once stately city are now to be seen, except some aqueducts and temples; though it was standing in Strabo's time.

LILY, William, the grammarian, was born in the year 1466 at Oldham in Hampshire; and in 1486 was admitted a semi-commoner of Magdalen college in Oxford. Having taken the degree of bachelor of arts, he left the university, and travelled to Jerusalem. Returning from thence, he continued five years in the island of Rhodes, where he studied the Greek language, several learned men having retired thither after the taking of Constantinople. From Rhodes he travelled to Rome; where he improved himself in the Greek and Latin languages, under Sulpius and P. Sabinus. He then returned to London, where for some time he taught a private grammar-school, being the first person who taught Greek in the metropolis. In 1510, when Dr. Colet founded St. Paul's school, Lily was appointed the first master; at which time, it seems, he was married and had many children. In this employment he had laboured 12 years, when, being seized by the plague, which then ravaged London, he died in February 1532, and was buried in the north yard of St. Paul's. He had the character of an excellent grammarian, and a successful teacher of the learned languages. His principal work is Brevisissima Institution, seu ratio grammaticos cognoscendi; Lond. 1512. Reprinted times without number, and commonly called Lily's grammar. The English rudiments were written by Dr. Colet, dean of St. Paul's; and the preface to the first edition, by Cardinal Wolsey. The English syntax was written by Lily; also the rules for the genders of nouns, beginning with proprius quaeque auctoris; and those for the preterperfect tenses and supines, beginning with As in presenti. The Latin syntax was chiefly the work of Erasmus. See Ward's preface to his edition of Lily's Grammar, 1732.

LIMA, the metropolis of Peru, contains 200 squares of buildings, which comprise 82,22 doors of dwelling houses and shops, and these are branched out into 355 streets. In order to maintain peace and tranquility among.
among the inhabitants, and for the accommodation of
the police, the city is divided into four quarters, con-
taining 35 districts, each of which there presides an
alcalde, who is always elected from among the people of
the most distinguished rank. The population, accord-
ing to estimate made at different periods, is as follows.

<table>

By this table it appears, that from 1746 to 1755, the
population suffered a diminution of 6000, which was
owing to an earthquake that happened at the former
period;—a calamity with which that city is often vi-
sited. Were it not for this circumstance, Lima would
be a perfect paradise, as the adjacent country abounds
with corn, wine, oil, sugar, fruits, and flax. Such
abundance of wealth do the inhabitants enjoy, that
when the despot of Acla was sent from Spain as vice-
roy to Peru, they paved the streets through which he
was to pass with ingots of silver. Libertinism and de-
bauchery are the distinguishing characteristics of the
people of Lima, for which even the nuns are as notorious
as the rest of the females, seldom being free from
venereal complaints.

In the month of March 1543, the emperor Charles V.
established an audience at Lima, in consequence of which
the inhabitants were freed from the painful necessity of
seeking a redress of their grievances at so great a dis-
tance as Panama. Among the excellent institutions
by which the Peruvian capital is distinguished, we may
rank the provincial councils, which shew the constant
zeal of the sovereigns of Spain for the defence of reli-
gion and preservation of discipline. The prelates, by
their pastoral vigilance, spare neither pains nor labour
to promote their views, to accomplish their sacred and
interesting purposes.

By a decree of the Spanish emperor, which reached
Lima in 1553, a university was begun in a central spot
of the capital, called the university of St Mark, which
is now in a most flourishing condition. Don Francisco
Toledo assigned 20,312 piastras as a fund for the main-
tenance of the professors, arising from the tributes paid
by the Indians. Two lectures are given daily on
grammar, one on the Indian language, three on philo-
sophy, three on theology, three on law, two on canons,
and two on medicine. In the year 1790 an amphithe-
tre was erected for the use of the anatomical stu-
dents.

The college for female orphans was founded by
Mateo Pastor de Valesco, not at the hour of death,
which often gives to charitable endowments an air of
suspicion, but when he was in the full possession of per-
fected health. In 1597 a pious philosopher founded a
charitable institution for the support of such helpless
children as were laid down in the streets by their un-
feeling parents. This building was destroyed by the
earthquake of 1687, which laid in ruins the greater
part of the city. It was afterwards rebuilt, and is at
present in a flourishing condition. In 1599 an hospital
was erected for the relief of the unfortunate sick, who
might otherwise have perished for want of medical aid,
and obtained the name of the Fellowship of Charity and
Compassion. A general hospital for the poor was be-
gun about 1738, but not completed till 1770, which
in 1750 afforded a comfortable asylum to 29 poor
people. The asylum for penitent females was founded
in 1669. It has been said that there is not a city in
the world in which so many alms are distributed as in
Lima.

In the centre of the great square there is a fountain
of bronze, the ornaments of which are conformable to
the rules of the Composite order. It has an elevation
of 1 ½ yards to the helmet of Fame, from which de-
ducting 1 ½ yards for the height of that figure, the re-
mainder gives the part to which the water rises in
order to diffuse itself. This production of art, combin-
ing magnificence in every part of it with fine architec-
tural taste, is surrounded by 24 pieces of artillery, and
16 iron chains, a narrow space being left for access to
the inhabitants.

Coffe-houses were not known in Lima till the year
1771, when one was opened in the street of Santo Do-
mingo, and another the year following. A third was
established in 1775, a fourth in 1782, and a fifth in
1788, in each of which there is a billiard table for the
amusement of the inhabitants. We are sorry to say
that the barbarous practice of cock-fighting obtains in
Lima, for which purpose a building was erected in the
year 1762. The tennis court is open to the public,
and affords the spectator an agreeable hour of relaxa-
tion from more serious pursuits. Lima is situated in
W. Long. 76. 44. S. Lat. 12. 1.

LIMASSOL, or LIMISIO, a town of Cyprus, in the Maritie's
south of the island. Of the ancient city nothing but
ruins now remain; though it was a celebrated place,
even under the government of the dukes. King Rich-
ard, the conqueror of the last of these vassals of the
empire, razed it in 1191, and it was never afterwards
rebuilt. This city originally was the same as AMA-
THUS, or Amathonte; and—as Pausanias tells us,
its temple erected in honour of Venus and Adonis.
Amathus was the residence of the first nine kings of
the island; and, amongst others of Oneistus, who was
subjected afterwards by the arms of Artabanes, the
Persian general. This city, erected into an archbishop-
ric in the time of the Christians, has produced a num-er of personages celebrated for their knowledge and
the sanctity of their lives. In the neighbourhood there
are several copper mines, which the Turks have been
forced to abandon. The following lines, in the tenth
book of Ovid's Metamorphoses, prove that they were
known in the time of that poet:

Epta viri forma, non iam Cytherea curat
Littora, non alto repetit Paphon aequore cinetam,
Piscosamque Gnision, graviamque Amathuntae metallis.

The place where the new Limassol now stands, formerly
had the name of Nemeosis, from the multitude of
woods by which it was surrounded. Richard, king of
England, having destroyed Amathonte, Guy de Lusig-
man, in the 12th century, laid the foundation of that
new city which the Greeks called Neoptolemos. The fa-
mily of Lusignan, who continued to embellish and for-
tify it, built there palaces, and Greek and Latin
churches; and made it the seat of a bishop. When the
the island was taken by the Turks in 1572, the Ottoman army entered this city on the 2d of July, and ravaged it without mercy. It was then destroyed by the flames; and at present it is only a wretched place, in which one can scarcely distinguish any remains of its ancient edifices. It is governed by a comissary and a cadi: the latter judges cases only provisionally, before they are carried to the superior tribunal of Nicosia. The harbour is very commodious; and being sheltered from impetuous winds, it affords a safe and calm asylum to vessels when overtaken by a storm. The carob tree is here more abundant than anywhere else; and it is from the port of Limassol that the greatest quantity of its fruit is exported. The inhabitants export also salt, procured from a lake near Salines. Cotton, wheat, barley, and mulberry trees, are both plentiful and well cultivated in this part of the island: the ground also produces all kinds of garden stuffs. The best Cyprus wine is made from the vines that grow on the hills of Limassol. All the wines of the country are collected in this city to be transported to Larnica, where there are the largest cellars, and which on that account becomes the natural centre of commerce.

LIMAX, the Slug, or Naked Snail; a genus of animals belonging to the class Vermes. See Helminthology Index.

LIMB, in general, denotes the border or edge of a thing; but we say, the limb of a quadrant, of the sun, of a leaf, &c.

LIMB, in Anatomy, an appellation given to the extremities of the body, as to the arms and legs.

LIMBO, Limbus, in the church of Rome, is used in two different senses. 1. The limb of the patriarchs is said to be the place where the patriarchs waited the redemption of mankind: in this place they suppose our Saviour's soul continued from the time of his death to his resurrection. 2. The limb of infants dying without baptism, is a place supposed to be distinct both from heaven and hell; since, says they, children dying innocent of any actual sin, do not descend into hell; and, by reason of their original sin, cannot be admitted into heaven.

LIMBAT, the name of a periodical wind common in the island of Cyprus, and of great service in moderating the heats of the climate, which would otherwise be intolerable.

According to the abbe Mariu, it begins to blow at eight in the morning the first day; increases as the sun advances till noon; then gradually weakens, and at three falls entirely. On the second day it arises at the same hour; but it does not attain its greatest strength till about one in the afternoon, and ceases at four precisely. On the third day it begins as before; but it falls an hour later. On the five succeeding days, it follows the same progression as on the third; but it is remarked, that a little before it ceases, it becomes extremely violent. At the expiration of five days it commences a new period like the former. By narrowly observing the sea on that side from which it is about to blow, a little before it arises, one may determine what degree of strength it will have during the day. If the horizon is clear, and entirely free from clouds, the wind will be weak, and even almost insensible; but if it be dark and cloudy, the wind will be strong and violent. This limbat wind, notwithstanding its utility in moderating the excessive heat, often becomes the cause of fever, especially to Europeans, from their being less habituated to the climate, and more apt than the natives to suffer themselves to be surprised by the cool air when in a state of perspiration. This wind, the falling of which happens an hour sooner or later, is succeeded by a calm, accompanied by a certain moisture that renders the air somewhat heavy. This moisture disappears in the evening, being dissipated by a wind which arises every day at that period. This wind is considered as a land breeze by the inhabitants of the southern and eastern parts of the island; but it is called a sea breeze by those in the northern and western, who indeed receive it immediately from the sea. In summer it blows till four o'clock in the morning, and when it ceases, it leaves a profound calm, which continues till the hour when the limbat commences. In autumn and winter it never falls till daybreak, when it is succeeded by other winds, which proceed from the irregularities of the season. In spring it does not continue longer than midnight; and is then succeeded by that happy calm, during which those refreshing dews are formed that moisten the earth at sunrise. The limbat winds, which arise in the beginning of summer, cease about the middle of September; and this is the period when the most insupportable heats commence, because their violence is not moderated by the smallest breeze. They are, however, luckily not of long duration; and about the latter end of October they decrease sensibly, as the atmosphere begins to be loaded with watery clouds.

LIMBORCH, PHILIP, a learned writer among the remonstrants, born at Amsterdam in 1633. After having made great proficiency in his studies, he was, in 1595, admitted to preach in public, which he did first at Haerlem. His sermons had in them no affected eloquence; but were solid, methodical, and edifying. He was chosen minister of Gouda; from whence he was called to Amsterdam, where he had the professorship of divinity, in which he acquitted himself with great reputation till his death, which happened in 1712. He had an admirable genius, and a tenacious memory. He had many friends of distinction in foreign parts as well as in his own country. Some of his letters to Mr. Locke are printed with those of that celebrated author. He had all the qualifications suitable to the character of a sincere divine, lived an example of every virtue, and preserved the vigour of his body and mind to a considerable age. He wrote many works, which are esteemed; the principal of which are, 1. Amica colloctio de veritate religionis Christianæ cum eruditio Judææ, in 12mo. 2. A Complete Body of Divinity, according to the opinions and doctrines of the Remonstrants. 3. A History of the Inquisition; which has been translated into English by Dr. Samuel Chandler. Limborch also published the works of the famous Episcopi, who was his great-uncle by the mother's side.

LIMBURGH DUCHY, a province of the Austrian Netherlands, bounded by the duchy of Juliers on the north and east, by Luxemburg on the south, and by the bishopric of Liége on the west. It is about 30 miles in length, and 25 in breadth; and consists of good arable and pasture land, with plenty of wood, and some iron mines.

LIMBURGH, the capital city of the duchy of Limbourgh
Limerick, a county of Ireland, in the province of Munster, is bounded on the east by Tipperary, on the west by Kerry, on the north by the river Shannon, and on the south by Cork. It is a fruitful and populous tract, the soil requiring little or no manure in most places; besides rich pasture for sheep and cows, it produces rich crops of all kinds of corn and rape, with some hemp. It gave title of earl to the family of Donegal. It contains 375,320 Irish plantation acres, about 56 church livings, though a much greater number of parishes, 10 baronies, three boroughs; and formerly sent eight members to parliament. It now sends two members to the British parliament. It has some clay, furze, fern, and mountain lands, and is famous for good cyder; it has been much benefited by the Palatines, who settled there and increased its population; they are a laborious independent people, mostly employed in their own farms. This county is well watered by large and small rivers; the Shannon runs at the north side of the county, and fertilizes its banks. The firing of the inhabitants is chiefly turf. At Loughill in the west of the county, there is a mine of coal or culm, but it is more used in kilns than houses. There are few lakes except Lough Gur; and the principal hills are Knockgery, Knockany, Knockfiring, and Tornyhill. The mountains lie westward, the highest being Knockpatrick or St. Patrick's hill. This county is about 45 miles long and 42 broad.

Limerick, or Lough-Meath, a market town, a borough, and a bishop's see, now the metropolis of the province of Munster. It is situated on the river Shannon, 94 miles from Dublin; and was the strongest fortress in the kingdom. Its ancient name was Lunnach; and during the first ages it was much frequented by foreign merchants, and after the arrival of the Danes was a place of considerable commerce until the 12th century. It was plundered by Mahon, brother of Brian Borum, after the battle of Sulchoil, in 970; and Brian, in a future period, exacted from the Danes of this city 352 tons of wine as a tribute, which shows the extensive traffic carried on by those people in that article. About the middle of the 6th century, St. Munchin erected a church and founded a bishopric here; which, however, was destroyed by the Danes on their taking possession of this port in 853, and remained in ruins until their conversion to the Christian faith in the 10th century; at which period the church of St. Munchin was rebuilt, and the bishopric established.

Donald O'Brien, about the time of the arrival of the English, founded and endowed the cathedral; and Donat O'Brien, bishop of Limerick, in the 13th century, contributed much to the opulence of the see. About the close of the 12th century, the bishopric of Inniscathy was united to that of Limerick. It was besieged by King William III. in the year 1690, and though there was no army to assist it, the king was obliged to raise the siege. In the year 1691, it was again besieged by the English and Dutch on the 21st of September; and it was obliged to surrender on the 13th of October following, not without the loss of abundance of men; however, the garrison had very honourable and advantageous conditions, and the Roman Catholics by these articles were to be tolerated in the free exercise of their religion. Within a century this place was reckoned the second city in Ireland: at present it has lost its rank; not because it thrives less, but because Cork thrives more. It is composed of the Irish and English town; the latter stands on the King's island, formed by the river Shannon. The town is three miles in circumference, having weekly markets on Wednesday and Saturday, and fairs on Easter Tuesday, 1st July, 4th August, and 12th December. There is a privilege annexed to the fair held on 4th August, that, during 15 days, no person can be arrested in the city or liberties, on any process issuing out of the tholsel court of Limerick. Ardfer and Achadoe, in the county of Kerry, are united to the bishopric of Limerick. This city formerly returned two members to parliament; and now sends one to the British parliament. It gives title of viscount to the family of Hamilton. It is governed by a mayor, sheriffs, recorders, aldermen, and burgesses; there is also a barracks and a military governor and town major: it had some time the privilege of coinage; and different parliaments have been held there. The town was formerly entirely walled, and in 1762, there were 17 of the city gates standing; but to the great improvement of the place they are now all demolished, except the water-gate of King John's castle. The linen, woollen, and paper manufactures, are carried on here to great extent, and the export of provisions is very considerable. Here are many charitable hospitals, and handsome public buildings, besides the cathedral and other churches. A charter was granted to this city by King John, and confirmed in succeeding reigns. Dr. Campbell observes, that as you approach Limerick, the grounds grow rich and exquisitely beautiful; the only disagreeable matter is, that the situation renders the air moist, and consequently rather unwholesome to strangers. About six miles from this is the famous Castleconnel Gap. Limerick is 50 miles from Cork, 50 from Galway, and 73 from Waterford. It appears that Limerick obtained the privilege of burials 10 years before that right was allowed to the citizens of London. It was before governed by provosts, of which the first was John Spafford in 1195 and 1197; during the provostship of Henry Troy a charter was granted, 9 Richard I. whereby the citizens were allowed to choose mayors and bailiffs, Adam Servant, in 1198, being the first mayor. It continued to be governed by mayors and bailiffs, until the office of bailiff was changed into that of sheriff in 1659.
LIMINGTON, a town of Hampshire in England.

LIMIT, in a restrained sense, is used by mathematicians for a determined quantity to which a variable one continually approaches; in which sense, the circle may be said to be the limit of its circumscribed and inscribed polygons. In Algebra, the term limit is applied to two quantities, one of which is greater and the other less than another quantity; and in this sense it is used in speaking of the limits of equations, whereby their solution is much facilitated.

LIMITED PROBLEM, denotes a problem that has but one solution, or some determinate number of solutions; as to describe a circle through three given points that do not lie in a right line, which is limited to one solution only; to divide a parallelogram into two equal parts by a line parallel to one side, which admits of two solutions, according as the line is parallel to the length or breadth of the parallelogram; or to divide a triangle in any ratio by a line parallel to one side, which is limited to three solutions, as the line may be parallel to any of the three sides.

LIME, a town of Kent, in England, near Hito, and four miles from Romney, was formerly a port, till choked up by the sands; and though it is thereby become a poor town, yet it has the horn and mace and other tokens left of its ancient grandeur, and used to be the place where the lord warden of the cinque ports was sworn at his entrance upon his office. The Roman road from Canterbury, called Stane-street, ended here; and from the brow of its hill may be seen the ruined Roman walls almost at the bottom of the marshes. Here formerly was a castle, now converted into a farm-house. When or by whom this edifice was erected is not known. It has, however, great marks of antiquity; as has also the adjoining church, on which are several old tombstones with crosses on them.

LINNING, the art of painting in water colours, in contradistinction to painting which is done in oil-colours.

Limning is much the more ancient kind of painting. Till a Flemish painter, one John van Eyck, better known by the name of John of Bruges, found out the art of painting in oil, the painters all painted in water and in fresco, both on their walls, on wooden boards, and elsewhere. When they made use of boards, they usually glued a fine linen cloth over them, to prevent their opening; then laid on a ground of white; lastly, they mixed up their colours with water and size, or with water and yolks of eggs, well beaten with the branches of a fig tree, the juice whereof thus mixed with the eggs; and with this mixture they painted their pieces.

In limning, all colours are proper enough, except the white made of lime, which is only used in fresco. The azure and ultramarine must always be mixed with size or gum; but there are always applied two layers of hot size before the size colours are laid on: the colours are all ground in water, each by itself; and, as they are required in working, are diluted with size water. When the piece is finished, they go over it with the white of an egg well beaten; and then with varnish, if required.

To limn, or draw a face in colours: Having all the materials in readiness, lay the prepared colour on the card even and thin, free from hairs and spots, over the place where the picture is to be. The ground being laid, and the party placed in a due position, begin the work, which is to be done at three sittings. At the first you are only to dead-colour the face, which will require about two hours. At the second sitting, go over the work more curiously, adding its particular graces or deformities. At the third sitting, finish the whole; carefully remarking whatever may conduces to render the piece perfect, as the cast of the eyes, moles, scars, gestures, and the like.

LIMOGES, an ancient town of France, in the late province of Guienne, and capital of the department of Upper Vienne, with a bishop's see. It is a trading place, and its horses are in great esteem. It is seated on the river Vienne, in E. Long. 1. 20. N. Lat. 45. 50.

LIMOSIN, a late province of France, now the department of Upper Vienne, bounded on the north by La Marche, on the east by Auvergne, on the south by Quercy, and on the west by Perigord and Angoumois. One part is very cold, but the other more temperate. It is covered with forests of chestnut trees; and contains mines of lead, copper, tin, and iron; but the principal trade consists in cattle and horses.

LIMPET, a genus of shell-fish. See Patella, Conchology Index.

LIMPURG, a barony of Germany, in the circle of Franconia, included almost entirely within Suabia, and seated to the south of Hall in Suabia. It is about 15 miles long, and eight broad. Gaishofen and Limpurg, near which is the castle of Limpurg, are the principal places.

LIMPURG, a town of Germany, in the electorate of Trier or Treves, and in Wetteravia, formerly free and imperial, but now subject to the electorate of Treves. It is seated on the river Lahn. E. Long. 8. 13. N. Lat. 50. 18.

LINACRE, Thomas, physician, was born at Canterbury about the year 1460, and there educated under the learned William Silling: thence he removed to Oxford, and in 1484 was chosen fellow of All-Souls' college. Tilly, alias Silling, his former instructor, being at this time appointed ambassador from King Henry VII. to the court of Rome, Mr Linacre accompanied him to Italy, where he attained the highest degree of perfection in the Greek and Latin languages. At Rome, he applied himself particularly to the study of Aristotle and Galen, in the original. On his return to Oxford, he was incorporated doctor of physic, and chosen public professor in that faculty. But he had not been long in England, before he was commanded to court by King Henry VII. to attend the young prince Arthur as his tutor and physician. He was afterwards appointed physician to the king, and after his death, to his successor Henry VIII. Dr Linacre founded two medical lectures at Oxford, and one at Cambridge; but that which most effectually immortalized his name among the faculty, is his being the first founder of the college of physicians in London. He beheld with veneration the wretched state of physic in those times; and,
L I N A C R I

Linacre by an application to Cardinal Wolsey, obtained a patent in 1518, by which the physicians of London were incorporated. The intention of this corporation was to prevent illiterate and ignorant medics from practising the art of healing. Dr Linacre was the first president, and held the office as long as he lived. Their meetings were in his own house in Knights-rider street, which house he bequeathed to the college. But our doctor, when he was about the age of 50, took it into his head to study divinity; entered into orders; and was collated, in 1509, to the rectory of Mersham. In the same year he was installed prebendary of Wells, in 1518 prebendary of York, and in the following year was admitted precentor of that cathedral. This, we are told, he resigned for other preferments. He died of the stone in the bladder in October 1524, aged 64; and was buried in St Paul's. Thirty-three years after his death, Doctor John Caius caused a monument to be erected to his memory, with a Latin inscription, which contains the outlines of his life and character. He was a man of great natural sagacity, a skilful physician, a profound grammarian, and one of the best Greek and Latin scholars of his time. Erasmus in his epistles speaks highly of the Doctor's translations from Galen, preferring them even to the original Greek. His works are, 1. De emendatione structura Latini sermonis, libri sex; London, printed by Pynson, 1524, 8vo, and by Stephens, 1527, 1532. 2. The Rudiments of Grammar, for the use of the princes Mary, printed by Pynson. Buchanan translated it into Latin; Paris, 1536. He likewise translated into very elegant Latin several of Galen's works, which were printed chiefly abroad at different times. Also Procli Diadachii sphera, translated from the Greek; Venet. 1490, 1500.

LINARIA. See FRINGILLA, ORNITHOLOGY INDEX.

LINCOLN, a city of England, and capital of a county of the same name, is distant 132 miles from London. It stands on the side of a hill; at the bottom of which and near the centre is a triangular piece of water, over which are several bridges. The old LINDUM of the Britons, which stood on the top of the hill, as appears from the vestiges of a rampart, and deep ditches still remaining, was taken and demolished by the Saxons; who built a town upon the south side of the hill down to the river side, which was several times taken by the Danes, and as often retaken by the Saxons. In Edward the Confessor's time, it appears, from Doomsday book, to have been a very considerable place; and in the time of the Normans, Malmesbury says, it was one of the most populous cities in England. William I. built a castle upon the summit of the hill above the town. The diocese, though the bishopric of Ely was taken out of it by Henry II. and those of Peterborough and Oxford by Henry VIII., is still vastly large, containing the counties of Leicester, Huntingdon, Bedford, and part of Bucks, making 1255 parishes. Though the other churches are mean, the cathedral or minster is a most magnificent piece of Gothic architecture. Here is a prodigious large bell, called Tom of Lincoln, which is near five tons in weight, and 23 feet in compass. The hill on which the church stands is so high, and the church itself so lofty, that it may be seen 50 miles to the north and 30 to the south. Besides other tombs, it contains one of brass, in which are the entrails of Queen Eleanor, wife to Edward I. It is said there were anciently 15 churches, which are now reduced to 14. Such is the magnificence and elevation of the cathedral, that the monks thought the sight of it must be very mortifying to the devil; whence it came to be said of one who was displeased, that he looked like the devil over Lincoln. The declivity on which the city is built being steep, the communication between the upper and lower town is very troublesome, and coaches and horses are obliged to make a compass.

King Edward III. made this city a staple for wool, leather, lead, &c. It was once burnt; once besieged by King Stephen, who was here defeated and taken prisoner; and once taken by Henry III. from his rebellious barons. It abounded heretofore with monasteries and other religious houses. There is a great pool here, formed by the river on the west side of it, called Swan Pool, because of the multitude of swans on it. The Roman north gate still remains entire, by the name of Newpope Gate. It is one of the noblest of this sort in Britain. It is a vast semicircle of stones of very large dimensions laid without mortar, connected only by their uniform shape. This magnificent arch is 16 feet in diameter, the stones are four feet thick at the bottom. It seems to have a joint in the middle, not a keystone; and on both sides, towards the upper part, are laid horizontal stones of great dimensions, some 10 or 12 feet long. This arch arises from an impost of large mouldings, which are not perceivable now; there are also divers fragments of the old Roman wall. Over against the castle is an intrenchment cast up by King Stephen; and here are carved the arms of John of Gaunt, duke of Lancaster, who lived here like a king, and had a mint. The city has a communication with the Trent, by a canal called the Foss-dyke. In the centre of the old ruined castle there is a handsome modern structure for holding the assizes. Its walls are almost entire, and very substantial: the keep or principal tower is situated on the high and west slope, which yet continues in its original state, but the remains of the tower on it are only five or six yards high. The outer walls of the castle are of very considerable height, which appear still higher than they really are from their lofty situation and the moat below them. The great gateway is still entire. This city is a county of itself, and has a viscountial jurisdiction, for 20 miles round, which is a privilege that no other city in England can equal. It now consists principally of one street above two miles long, well paved, besides several cross and parallel streets well peopled. Here are some very handsome modern buildings, but more antique ones; upon the whole, it has an air of ancient greatness, arising in a great measure from the number of monastic remains, most of which are now converted into stables, out-houses, &c. Upon the hill, in the castle, are the ruins of the bishop's palace, and other ruins of ancient grandeur and magnificence. The city is supplied with water by several conduits, among which is a modern one, somewhat in the pyramidal style, enriched with sculpture. It is governed by a mayor, twelve aldermen, two sheriffs, a recorder, four chamberlains, a swordbearer, four coroners, and above forty common-council men. Here are four char-
the widows of clergymen. The neighbouring course is noted for its frequent horse-races. On the down of Lincoln, towards Boston, that rare fowl the bustard is sometimes seen, as well as on Salisbury plain. Lincoln-Heath extends above 50 miles, viz. from Sleaford and Ancaster south to the Humber north, though it is but three or four miles over where broadest. Five miles from Boston, on this extensive heath, Lord le Despenser built a tower for the direction of strangers. It is a lofty square building with a staircase, terminating in a flat roof, and round the base is a square court-yard. Great part of this extensive heath has been enclosed. We read that David king of Scots met King John here, on the 22d of November, in the third year of his reign, and performed homage to him on a hill without the city, for his English territories, in presence of the archbishops of Canterbury, York, and Ragnall, 13 bishops, and a vast number of temporal lords and knights. King Henry VII. kept his court here at Easter in 1486. The population of Lincoln in 1811 was 8861.

Lincoln-Shire, a maritime county of England, 77 miles in length and 48 in breadth, is bounded on the east by the German ocean, on the west by Nottinghamshire, on the north by Yorkshire, on the south by Rutlandshire, Northamptonshire, and Cambridgeshire. It contains 631 parishes, and 51 market towns, and returns 12 members to parliament. The principal rivers are the Humber, the Trent, the Witham, the Nene, the Welland, the Anckham, and the Dune. It is divided into three parts, Lindsey, Kesteven, and Holland; the air of which last is unhealthy and foggy, on account of the fens and large marshes. The soil of the north and west parts is very fertile, and abounds in corn and pastures. The east and south parts are not so proper for corn; but then they supply them with fish and fowl, in great plenty, particularly ducks and geese. Lincoln is the principal town. By inland navigation, this county has communication with the rivers Mersey, Dee, Riber, Ouse, Darwen, Severn, Thames, Avon, &c.; which navigation, including its windings, extends above 500 miles through different counties.

This county, in 1811, contained 46,368 houses; and the total number of inhabitants amounted to 237,891.

LINDESFARN, or LANDISFARN. See HOL-HOLAND.

LINDSAY, SIR DAVID, a celebrated Scots poet, was descended of an ancient family, and born in the reign of King James IV. at his father's seat, called the Mount, near Cuper, in Fifeeshire. He was educated at the university of St Andrews; and, after making the tour of Europe, returned to Scotland in the year 1514. Soon after his arrival, he was appointed gentleman of the bedchamber to the king, and tutor to the young prince, afterwards James V. From the verses prefixed to his dream, we learn that he enjoyed several other honourable employments at court: but, in 1533, he was deprived of all his places, except that of Lyon king at arms, which he held to the time of his death. His disgrace was most probably owing to his invectives against the clergy, which are frequent in all his writings. After the decease of King James V., Sir David became a favourite of the earl of Arran, regent of Scotland; but the abbot of Paisley did suffer him to continue long in favour with the earl. He then retired to his paternal estate, and spent the remainder of his days in rural tranquility. He died in the year 1553. His poetical talents, considering the age in which he wrote, were not contemptible; but he treats the Romish clergy with great severity, and writes with some humour: but whatever merit might be formerly attributed to him, he takes such licentious liberties with words, stretching or carving them for measure or rhyme, that the Scots have a proverb, when they hear an unusual expression, that, There is nac i a word in a Davie Lindsay. Mackenzie tells us, that his comedies were so facetious, that they afforded abundance of mirth. Some fragments of these comedies are still preserved in manuscript. He is said to have also written several tragedies, and to have first introduced dramatic poetry into Scotland. One of his comedies was played in 1515. Mackenzie says, he understood nothing of the rules of the theatre. He was contemporary with John Heywood, the first English dramatic poet. His poems are printed in one small volume; and fragments of his plays, in manuscript, are in Mr William Carmichael's collection.

LINDSEY, the third and largest division of the county of Lincolnshire in England. On the east and north it is washed by the sea, into which it runs out with a large front; on the west it has Yorkshire and Nottinghamshire, from which it is parted by the rivers Trent and Dun; on the south it has Kesteven, from which it is separated by the river Witham and the Foss-nyke, which is seven miles long, and was cut by Henry I. between the Witham and the Trent, for the convenience of carriage in those parts. It had its name from Lincoln, the capital of the county, which stands in it, and by the Romans called Lindum, by the Britons Lincoice, by the Saxons Lindo-collune, probably from its situation on a hill, and the lakes or woods that were anciently thereabouts; but the Normans called it Nichol. It gives title of earl and marquis to the duke of Ancaster.

LINDUS, in Ancient Geography, a town of Rhodes, situated on a hill on the west side of the island. It was built by Telephus, the son of Hercules, according to Diodorus Siculus; by one of the Heliades, grandsons of the Sun, named Lindus, according to Strabo. It was the native place of Cleobulus, one of the wise men. Here we see the famous temple of the Lindian Minerva, which was built by the daughters of Danaus. Cadmus enriched this temple with many splendid offerings. The citizens dedicated and hung up here the seventh of Findar's Olympic odes, written in letters of gold. The ruins of that superb edifice are still to be seen on the top of a high hill which overlooks the sea. Some remains of the walls, consisting of stones of an enormous size, still show it to have been built in the Egyptian style. The pillars and other ornaments have been carried off. On the most elevated peak of the rock are the ruins of a castle, which may have served as a fortress to the city. Its circumference is very extensive, and is filled with rubbish.
Lindo, the modern city, stands at the foot of the hill. A bay of considerable wideness and depth serves as a harbour to the city. Ships find good anchorage there in 20 fathoms water. They are safely sheltered from the south-west winds, which constantly prevail through the severest season of the year. In the beginning of winter, they cast anchor off a small village named Massary. Before the building of Rhodes, Lindus was the harbour which received the fleets of Egypt and Tyre. It was enriched by commerce. Mr. Savy observes, that a judicious government, by taking advantage of its harbour and happy situation, might yet restore it to a flourishing state.

LINE, in Geometry, a quantity extended in length only, without any breadth or thickness. It is formed by the flux or motion of a point. See Fluxions, and Geometry.

Line, in the art of war, is understood of the disposition of an army ranged in order of battle, with the front extended as far as may be, that it may not be flanked.

Line of Battle, is also understood of the disposition of a fleet in the day of engagement; on which occasion the vessels are usually drawn up as much as possible in a straight line, as well to gain and keep the advantage of the wind as to run the same board. See Naval Tactics.

Horisontal Line, in Geography and Astronomy, a line drawn parallel to the horizon of any part of the earth.

Equinocial Line, in Geography, is a great circle on the earth’s surface, exactly at the distance of 90° from each of the poles, and of consequence bisecting the earth in that part. From this imaginary line, the degrees of longitude and latitude are counted. In astronomy, the equinocial line is that circle which the sun seems to describe round the earth on the days of the equinox in March and September. See Astronomy and Geography.

Meridian Line, is an imaginary circle drawn through the two poles of the earth and any part of its surface. See Geography Index.

Ship of the Line, a vessel large enough to be drawn up in the line, and to have a place in a sea-fight.

Line, in Genealogy, a series or succession of relations in various degrees, all descending from the same common father. See Descent.

Line, also denotes a French measure containing the 12th part of an inch, or the 144th part of a foot. Geometricians conceive the line subdivided into six points. The French line answers to the English barley-corn.

Fishing Line. See Fishing Line.

Lines, in Heraldry, the figures used in armories to divide the shield into different parts, and to compose different figures. These lines, according to their different forms and names, give denomination to the pieces or figures which they form, except the straight or plain lines. See Heraldry.

Linea alba, in Anatomy, the concourse of the tendons of the oblique and transverse muscles of the abdomen; dividing the abdomen in two, in the middle. It is called linea, line, as being straight; and alba, from its colour, which is white.—The linea alba receives a twig of a nerve from the intercostals in each of its digitations or indentings, which are visible to the eye, in lean persons especially.

Lineament, among painters, is used for the outlines of a face.

Linear Numbers, in Mathematics, such as have relation to length only; such is a number which represents one side of a plain figure. If the plain figure be a square, the linear figure is called a root.

Linear Problem; that which may be solved geometrically by the intersection of two right lines. This is called a simple problem, and is capable but of one solution.

Linen, in commerce, a well known kind of cloth, chiefly made of flax.—Linen was not worn by the Jews, Greeks, or Romans, as any part of their ordinary dress. Under-tunics of a finer texture supplied the place of shirts: Hence the occasion for frequent bathing. Alexander Severus was the first emperor who wore a shirt: but the use of so necessary a garment did not become common till long after him.

The linen manufacture was probably introduced into Britain with the first settlement of the Romans. The flax was certainly first planted by that nation in the British soil. The plant itself indeed appears to have been originally a native of the east. The woollen drapery would naturally be prior in its origin to the linen; and the fibrous plants from which the threads of the latter are produced, seem to have been more respected and worked by the inhabitants of Egypt. In Egypt, indeed, the linen manufacture appears to have been very early: for even in Joseph’s time it had risen to considerable height. From the Egyptians the knowledge of it proceeded probably to the Greeks, and from them to the Romans. Even at this day the flax is imported among us from the eastern nations; the western kind being merely a degenerate species of it.

In order to succeed in the linen manufacture, one set of people should be confined to the ploughing and preparing the soil, sowing and covering the seed, to the weeding, pulling, rippling, and taking care of the new seed, and watering and dressing the flax till it is lodged at home: others should be concerned in the drying, breaking, scutching, and heckling the flax, to fit it for the spinners; and others in spinning and reeling it, to fit it for the weaver: others should be concerned in taking due care of the weaving, bleaching, beating, and finishing the cloth for the market. It is reasonable to believe, that if these several branches of the manufacture were carried on by distinct dealers in Scotland and Ireland, where our home-made linens are manufactured, the several parts would be better executed, and the whole would be afforded cheaper, and with greater profit.

Staining of Linien. Linen receives a black colour with much more difficulty than woollen or cotton. The black struck on linen with common vitriol and galls, or logwood, is very perishable, and soon washes out.—Instead of the vitriol, a solution of iron in sour strong beer is to be made use of. This is well known to all the calico-printers; and by the use of this, which they call their iron-liquor, and madder root, are the blacks and purples made which we see on the common printed linens.
LIN

The method of making this iron liquor is as follows: A quantity of iron is put into the sour strong beer; and, to promote the dissolution of the metal, the whole is occasionally well stirred, the liquor occasionally drawn off, and the rust beat from the iron, after which the liquor is poured on again. A length of time is required to make the impregnation perfect; the solution being reckoned unfit for use till it has stood at least a twelve-month. This solution stains the linen of a yellow, and different shades of buff-colour; and is the only known substance by which these colours can be fixed in linen. The cloth stained deep with the iron-liquor, and afterwards boiled with madder, without any other addition, becomes of the dark colour which we see on printed linens and cottons; which, if not a perfect black, has a very near resemblance to it. Others are stained paler with the same liquor diluted with water, and come out purple.

Linen may also be stained of a durable purple by means of solution of gold in aqua regia. The solution for this purpose should be as fully saturated as possible; it should be diluted with three times its quantity of water; and if the colour is required deep, the piece, when dry, must be repeatedly moistened with it. The colour does not take from the linen as the other does, sometimes several days, after the liquor has been applied: to hasten its appearance, the subject should be exposed to the sun and free air, and occasionally removed to a moist place, or moistened with water. -

When solution of gold in aqua regia is soaked up in linen cloths, the metal may be recovered by drying and burning them.

Linen flowered with Gold-leaf. Dr Lewis mentions a manufacture established in London for embellishing linen with flowers and ornaments of gold-leaf. The linen, he says, looks whiter than most of the printed linens; the gold is extremely beautiful, and bears washing well. The doctor informs us, that he has seen a piece which he was credibly informed had been washed three or four times, with only the same precaution which are used for the finer printed linens; and on which the gold continued entire, and of great beauty. Concerning the process used in this manufacture, he gives us no particulars.

Fossil Linen, is a kind of amiantus, which consists of flexible, parallel, soft fibres, and which has been celebrated for the use to which it has been applied, of being woven, and forming an incombustible cloth. Paper also, and wicks for lamps, have been made of it. See AMIANTHUS, ASCESTOS, and MINERALOGY INDEX. LING, a species of fish belonging to the genus Gadus, which see in Ichthyology Index. LINGEN, a strong town of Germany, in the circle of Westphalia, and capital of a county of the same name. It belongs to the king of Prussia; and is situated on the river Embs, in E. Long. 7° 30'. N. Lat. 52° 32'. LINIMENT, in Pharmacy, a composition of a consistence somewhat thinner than an unguent, and thicker than an oil. See MATERIA MEDICA INDEX. LINLITHGOW, the chief town of West Lothian in Scotland. It is supposed to be the Lindum of Ptolemy; and to take its name from its situation on a lake, which the word Lin or Lym signifies. It is distant 16 miles from Edinburgh, and is a royal borough and seat of a presbytery. Here is carried on a considerable trade in dressing of white leather, which is sent abroad to be manufactured; and many hands are employed in dressing of flux; also in wool-combing, the wool for which is brought from the borders. Its port, was formerly Blackness; but since the decline of that place, Borrowstounness, about two miles distant from Linlithgow. The town consists of one open street, from whence lanes are detached on both sides; the houses are built of stone, tolerably neat and commodious; and the place is adorned with some stately public edifices. The palace, built, as Sibald supposed, on the seat of a Roman station, forms a square with towers at the corners, and stands on a gentle eminence, with the beautiful loch behind it to the west. It was one of the noblest of the royal residences; and was greatly ornamented by James V. and VI. Within the palace is a handsome square; one side of which is more modern than the others, having been built by James VI. and kept in good repair till 1746, when it was accidentally damaged by the king's forces making fires on the hearths, by which means the joists were burnt. A stone ornamented fountain in the middle of the court was destroyed at the same time. The other sides of the square are more ancient. In one is a room ninety-five feet long, thirty feet six inches wide, and thirty-three high. At one end is a gallery with three arches, perhaps for music. Narrow galleries run quite round the old part, to preserve communication with the rooms; in one of which the unfortunate Mary Stuart first saw light. On the north side of the high street, on an eminence east of the palace, stands St Michael's church; a handsome structure, where James V. intended to have erected a throne and twelve stalls for the sovereign and knights of the order of St. Andrew. In the market-place is another fountain, and surmounted like the former with an imperial crown. In one of the streets is shown the gallery where the regent Murray was shot. Here was a house of Carmelites, founded by the town people in 1290, destroyed by the Reformers 1539. The family of Livingston, who took the title of earl from this place, were hereditary keepers of the palace, as also bailiffs of the king's bailiffy, and constables of Blackness castle; but by their present owner, the Marquess of Huntly, all these honours with their estate were forfeited to the crown. Sir James Livingston, son of the first earl by marriage with a daughter of Callendar, was created earl of Callendar by Charles I. 1641, which title sunk into the other. Population, in 1811, 4032.

LINLITHGOWSHIRE, or WEST LOTHIAN, nearly approaches in form to a parallelogram, about 20 miles long from east to west, and from 10 to 13 broad, from north to south. It is bounded by the river Forth on the north; by the river Amond on the southeast; by Lanarkshire on the south-west, and by the river Avon on the west. It is allowed to be one of the richest counties in Scotland, the soil in general being a rich loam, in a high state of cultivation and improvement. Its surface is diversified by gentle swells and fertile plains; and the number of elegant seats almost everywhere to be met with, gives it both a rich and delightful appearance. The whole is a composition of all that is great and beautiful; towns, villages, seats, and ancient towers, decorate each bank of that fine expanse of water, the frith of Forth. The lofty moun-
The Highlands form a distant, but august boundary towards the north-west, and the eastern view is enlivened with ships perpetually appearing or vanishing amidst the numerous islands. Hopetoun-house, Barnbougle-castle, Calder-house, Craigie-hall, and the seat of General Dundas, are some of the principal ornaments of this county. It contains two royal boroughs, Linlithgow and Queensferry, besides the towns of Borrowstounness, Bathgate, and Kirklistoun. It is poorly supplied with running water, the Avon and Amond being the only streams which are deserving of notice. There are many valuable minerals found in it in abundance, such as coal, limestone, and some lead ore. In the reign of James VI., a vein of lead was discovered, so rich in silver, that it was thought worthy of being wrought for the sake of that metal alone. Almost every parish abounds with ironstone, which is extensively wrought in the parish of Bathgate. In many places there are appearances of whinstone or basalt, particularly at Dundas-hill, in the parish of Dalmeny, where there is a solid front of basaltic rock, exhibiting in some places regular columns. The population of this county in 1801 amounted to 17,844, and in 1811 19,451. The following is the population of the parishes according to the Statistical History.

LINNÉUS, Sir Charles, a celebrated botanist and natural historian, was born on May 24, 1707, in a village called Roseshule in Småland, where his father, Nicholas Linnæus, was then vicar, but afterwards preferred to the curacy of Stenbrohult. We are told, that on the farm where Linnæus was born, there yet stands a large lime tree, from which his ancestors took the surnames of Tiliaer, Lindelius, and Linnæus; and that this origin of surnames, taken from natural objects, is not uncommon in Sweden.

This eminent man, whose talents enabled him to reform the whole science of natural history, accumulated, very early in life, some of the highest honours that await the most successful proficients in medical science; since we find that he was made professor of physic and botany, in the university of Upsal, at the age of 34; and six years afterwards, physician to Adolphus king of Sweden; who in the year 1753 honoured him still farther, by creating him knight of the Order of the Polar Star. His honours did not terminate here: for in 1757 he was ennobled; and in 1776 the king of Sweden accepted the resignation of his office, and rewarded his declining years by doubling his pension, and, by a liberal donation of landed property settled on him and his family.

It seems probable, that Linnæus's taste for the study of nature was caught from the example of his father; who, as he has himself informed us, cultivated, as his first amusement, a garden plentifully stored with plants. Young Linnæus soon became acquainted with these, as well as with the indigenous ones of his neighbourhood. Yet, from the strictness of his father's income, our young naturalist was on the point of being destined to a mechanical employment; fortunately, however, this design was overruled. In 1717 he was sent to school at Wezioio; where, as his opportunities were enlarged, his progress in all his favourite pursuits was proportionately extended. At this early period he paid attention to other branches of natural history, particularly to the knowledge of insects.

The first part of his academical education Linnæus received under Professor Stohems, at Lund, in Scania, who favoured his inclinations to natural history. After a residence of about a year, he removed in 1728 to Upsal. Here he soon contracted a close friendship with Artedi, a native of the province of Angermania, who had been already four years a student in that university, and, like himself, had a strong bent to the study of natural history in general, but particularly to ichthyology. Soon after his residence at Upsal, our author was also happy enough to obtain the favour of several gentlemen of established character in literature. He was in a particular manner encouraged in the pursuit of his studies by the patronage of Dr Olaus Celsius, at that time professor of divinity, and the restorer of natural history in Sweden; who, being struck with the diligence of Linnæus in describing the plants of the Upsal garden, and his extensive knowledge of their names, not only patronized him in a general way, but admitted him to his house, his table, and his library. Under such encouragement it is not strange that our author made rapid progress, both in his studies and the esteem of the professors: in fact, we have a very striking proof of his merit and attainments; since we find, that, after only two years residence, he was thought sufficiently qualified to give lectures occasionally from the botanic chair, in the room of Professor Rudbeck.

In the year 1731, the Royal Academy of Sciences at Upsal having for some time meditated the design of improving the natural history of Sweden, at the instance particularly of Professors Celsius and Rudbeck, deputed Linnæus to make the tour of Lapland, with the sole view of exploring the natural history of that arctic region; to which undertaking, his reputation, already high as a naturalist, and the strength of his constitution, equally recommended him. He left Upsal the 13th of May, and took his route to Gevelia or Gevels, the principal town of Gestrizia, 45 miles distant from Upsal. Hence he travelled through Helsingland into Medelpad, where he made an excursion, and ascended a remarkable mountain before he reached Hudviksvald, the chief town of Helsingland. From hence he went through Angermanland to Hernoand.
he returned to Torneå in September. He did not take the same route from Torneå as when he came into Lapland, having determined to visit and examine the country on the eastern side of the Bothnian gulf: his first stage, therefore, was to Ula in East Bothnia; from thence to Oid and New Carlsebay, 84 miles south from Ula. He continued his route through Wasa, Christianstad, and Birnaburgh, to Abo, a small university in Finland. Winter was now setting in space; he therefore crossed the gulf by the island of Aland, and arrived at Uspal in November, after having performed, and that mostly on foot, a journey of ten degrees of latitude in extent, exclusive of those deviations which such a design rendered necessary.

In 1733 he visited and examined the several mines in Sweden; and made himself so well acquainted with mineralogy and the docimastic art, that we find he was sufficiently qualified to give lectures on those subjects upon his return to the university. The outlines of his system on mineralogy appeared in the early editions of the *Systema Naturæ*; but he did not exemplify the whole until the year 1768.

In the year 1734 Linnaeus was sent by Baron Reuterholm, governor of Dalecarlia, with several other naturalists in that province, to investigate the natural productions of that part of the Swedish dominions; and it was in this journey that our author first laid the plan of an excellent institution, which was afterwards executed, in a certain degree at least, by himself, with the assistance of many of his pupils, and the result published under the title of *Pam Saccus*, in the second volume of the *Acanthites Academice*.

After the completion of this expedition, it appears that Linnaeus resided for a time at Fablon, the principal town in Dalecarlia; where he tells us that he taught mineralogy and the docimastic art, and practised physic; and where he was very hospitably treated by Dr. More, the physician of the place. It also appears, that he contracted at this time an intimacy with one of that gentleman's daughters, whom he married about five years afterwards upon his settling as a physician at Stockholm.—In this journey he extended his travels quite across the Dalecarlian Alps into Norway; but we have no particular account of his discoveries in that kingdom. In 1735 Linnaeus travelled over many other parts of Sweden, some parts of Denmark and Germany, and fixed in Holland, where he chiefly resided until his return to Stockholm, about the year 1739. In 1735, the year in which he took the degree of M. D. he published the first sketch of his *Systema Naturæ*, in a very comprehensive way, and in the form of tables only, in 12 pages in folio. By this it appears that he had made at a very early period of his life (certainly before he was 24 years old), laid the basis of that great structure which he afterwards raised, not only to the increase of his own fame, but to that of natural science.

In 1736, Linnaeus came into England, and visited Dr. Dillenius, the learned professor at Oxford, whom he justly considered as one of the first botanists in Europe. He mentions with particular respect the civilities he received from him, and the privileges he gave him of inspecting his own and the Sherardian collections of plants. It is needless to say, that he visited Dr. Martyn, Mr. Rand, and Mr. Miller, and
that he was in a more singular manner indebted to the friendship of Dr Isaac Lawson. He also contracted an intimate friendship with Mr Peter Collinson, which was reciprocally increased by a multitude of good offices, and continued to the last without any diminution. Dr Boerhaave had furnished him with letters to our great naturalist Sir Hans Sloane; but, it is with regret that we must observe, they did not procure him the reception which the warmth of his recommendation seemed to claim.

One of the most agreeable circumstances that happened to Linnaeus during his residence in Holland, arose from the patronage of Mr Clifford, in whose house he lived a considerable part of his time, being now as it were the child of fortune:—Erivi patri! triginta sex! susceps aurei dives—are his own words. With Mr Clifford, however, he enjoyed pleasures and privileges scarcely at that time to be met with elsewhere in the world; that of a garden excellently stored with the finest exotics, and a library furnished with almost every botanic author of note. How happy he found himself in this situation, those only who have felt the same kind of ardour can conceive. Whilst in Holland, our author was recommended by Boerhaave to fill the place, then vacant, of physician to the Dutch settlement at Surinam; but he declined it on account of his having been educated in so opposite a climate.

Besides being favoured with the particular patronage and friendship of Boerhaave and Mr Clifford, as is above mentioned, our author had also the pleasure of being contemporary with, and of reckoning among the number of his friends, many other learned persons who have since proved ornaments to their profession, and whose merit has most deservedly raised them to fame and honour. Among these we may properly mention Dr John Burman, professor of botany at Amsterdam, whose name and family are well known in the republic of letters, and to whom our author dedicated his Bibliotheca Botanica, having been greatly assisted in compiling that work by the free access he had to that gentleman’s excellent library; John Frederick Gronovius of Leyden, editor of Clayton’s Flora Virginica, and who very early adopted Linnaeus’s system, Baron Van Swieten, physician to the empress queen Isaac Lawson, before mentioned, afterwards one of the physicians to the British army, who died much regretted at Oosterhout in the year 1747, and from whom Linnaeus received singular and very important civilities; Kramer, since well known for an excellent treatise on the docimastic art; Van Royen, botanic professor at Leyden; Lieberkun of Berlin, famous for his skill in microscopic instruments and experiments. To these may be added also the names of Albinaeus and Gauhius, and of others, were it requisite to show that our author’s talents had very early rendered him conspicuous, and gained him the regard of all those who cultivated and patronized any branch of medical science; and to which, doubtless, the singular notice with which Boerhaave honoured him did not a little contribute.

Early in the year 1738, after Linnaeus had left Mr Clifford, and, as it should seem, when he resided with Van Royen, he had a long and dangerous fit of sickness; and upon his recovery went to Paris, where he was properly entertained by the Jussiens, at that time the first botanists in France. The opportunity this gave him of inspecting the Herbaria of Royen and Tournefort, and those of the above-named gentlemen, afforded him great satisfaction. He had intended to have gone from thence into Germany, to visit Ludvig and the celebrated Haller, with whom he was in close correspondence; but he was not able to complete this part of his intended route, and was obliged to return without this gratification.

Our author did not fail to avail himself of every advantage that access to the several museums of this country afforded him, in the branch of natural history; and the number and importance of his publications, during his absence from his native country, sufficiently demonstrate that fund of knowledge which he must have imbibed before, and no less testify his extraordinary application. These were Systema Naturae, Fundamenta Botanica, Bibliotheca Botanica, and Genera Plantarum; the last of which is justly considered as the most valuable of all the works of this celebrated author. What immense application had been bestowed upon it, the reader may easily conceive, on being informed, that before the publication of the first edition the author had examined the characters of 8000 flowers. The last book of Linnaeus’s composition, published during his stay in Holland, was the Classes Plantarum, which is a copious illustration of the second part of the Fundamenta.

About the latter end of the year 1738, or the beginning of the next, our author settled as a physician in Stockholm; where he seems to have met with considerable opposition, and was troubled with many difficulties; but all of these at length he overcame, and got into extensive practice; and soon after his settlement married the lady before spoken of. By the interest of Count Tessin, who was afterwards his great patron, and even procured medals to be struck in honour of him, he obtained the rank of physician to the fleet, and a stipend from the citizens for giving lectures in botany. And what at this time especially was highly favourable to the advancement of his character and fame, by giving him an opportunity of displaying his abilities, was the establishment of the Royal Academy of Sciences at Stockholm; of which Linnaeus was constituted the first president, and to which establishment the king granted several privileges, particularly that of free postage to all papers directed to the secretary. By the rules of the academy, the president held his place but three months. At the expiration of that term, Linnaeus made his Oratio de memorabilibus in Insectis, Oct. 3. 1739, in which he endeavours to excite an attention and inquiry into the knowledge of insects, by displaying the many singular phenomena that occur in contemplating the nature of those animals, and by pointing out, in a variety of instances, their usefulness to mankind in particular, and to the economy of nature in general.

During all this time, however, Linnaeus appears to have had his eye upon the botanic and medical chair at Upsal, at this time occupied by Rudbeck, who was far advanced in life. We learn indeed that he was so intent on pursuing and perfecting his great designs in the advancement of his favourite study of nature, that he had determined, if he failed in procuring the
Linnaeus, the professorship at Upsal, to accept the offer that had been made to him by Haller of filling the botanic chair at Gottingen. However, in course of time, he obtained his wish. In the year 1741, upon the resignation of Roberg, he was constituted joint professor of physic, and physician to the king, with Rosen, who had been appointed in the preceding year on the death of Rudbeck. These two colleagues agreed to divide the medical departments between them; and their choice was confirmed by the university. Rosen took anatomy, physiology, pathology, and the therapeutic part; Linnaeus, natural history, botany, materia medica, the dietetic part, and the diagnosis morborum.

During the interval of his removal from Stockholm to Upsal in consequence of this appointment, our professor was deputed by the states of the kingdom to make a tour to the islands of Oeland and Gotland in the Baltic, attended by six of the pupils, commissioned to make such inquiries as might tend to improve agriculture and arts in the kingdom, to which the Swedish nation had for some time paid a particular attention. The result of this journey was very successful, and proved fully satisfactory to the states, and was afterwards communicated to the public. On his return he entered upon the professorship, and pronounced before the university his oration de Peregrinationum intra Patriam necessitate, October 17, 1741; in which he forcibly displays the usefulness of such excursions, by pointing out to the students that vast field of objects which their country held out to their cultivation, whether in geography, physics, mineralogy, botany, zoology, or economics, and by showing the benefit that must accrue to themselves and their country as rewards to their diligence. That animating spirit which runs through the whole of this composition, renders it one of the most pleasing and instructive of all our author's productions.

Linnaeus was now fixed in the situation that was the best adapted to his character, his taste, and abilities; and which seems to have been the object of his ambition and centre of his hopes. Soon after his establishment, he laboured to get the academical garden, which had been founded in 1657, put on a better footing, and very soon effected it; procuring also a house to be built for the residence of the professor. The whole had been in ruins ever since the fire in 1703; and at the time Linnaeus was appointed professor of botany, the garden did not contain above fifty plants that were exotic. His correspondence with the first botanists in Europe soon supplied him with great variety. He received Indian plants from Jussieu of Paris, and from Van Roven of Leyden; European plants from Haller and Ludwig; American plants from the late Mr Collinson, Mr Catesby, and others; and variety of annuals from Dictenius: in short, how much the garden owed to his diligence and care in a few years, may be seen by the catalogue published under the title of Hortus Upsaliensis, exhibens Plantas evertas Horti Upsaliani, administris Linnaeo illatus ab anno 1742, in annum 1748, addito diversis synonymis, habitatibus, hospitibus, rariorumque descriptionibus, in gratiam studiorum juventutis; Holm. 1748, 8vo. pp. 306. tab. 3. By this catalogue it appears, that the professor had introduced 1100 species, exclusively of all the Swedish plants and of varieties: which latter, in ordinary gardens, amount not unfrequently to one-third of the whole number. The preface contains a curious history of the climate at Upsal, and the progress of the seasons throughout the whole year.

From the time that Linnaeus and Rosen were appointed professors at Upsal, it should seem that the credit of that university, as a school of physic, had been increasing: numbers of students resorted thither from Germany, attracted by the character of these two able men; and in Sweden itself many young men were invited to the study of physic by the excellent manner in which it was taught, who otherwise would have engaged in different pursuits.

Whilst Linnaeus was meditating one of his capital performances, which had long been expected and greatly wished for, he was interrupted by a tedious and painful fit of the gout, which left him in a very weak and dispirited state; and, according to the intelligence that his friends gave of him, nothing was thought to have contributed more to the restoration of his spirits than the seasonable acquisition, at this juncture, of a collection of rare and undescribed plants.

The fame which our author had now acquired by his Systema Naturae, of which a sixth edition, much enlarged, had been published at Stockholm in 1748 in 8vo. pp. 232, with eight tables explanatory of the classes and orders (and which was also republished by Gronovius at Leyden), had brought, as it were, a conflux of every thing rare and valuable in every branch of nature, from all parts of the globe, into Sweden. The king and queen of Sweden had their separate collections of rarities: the former at Ulricksdahl; the latter, very rich in exotic insects and shells, procured at a great expense, at the palace of Drottningholm; both of which our author was employed in arranging and describing. Besides these, the museum of the Royal Academy of Upsal had been augmented by a considerable donation from the king, whilst hereditary prince, in 1746; by another from Count Gyllenborg the year before; by a third from M. Grill, an opulent citizen of Stockholm.

From this time we see the professor in a more elevated rank and situation in life. His reputation had already procured him honours from almost all the royal societies in Europe; and his own sovereign, truly sensible of his merit, and greatly esteeming his character and abilities, favoured him with a mark of his distinction and regard, by creating him a knight of the Polar Star. It was no longer laudatur et alget. His emoluments kept pace with his fame and honours; his practice in his profession became lucrative; and we find him soon after possessed of his country house and gardens at Hammarby, about five miles from Upsal. He had moreover received one of the most flattering testimonies of the extent and magnitude of his fame that perhaps was ever shown to any literary character, the state of the nation which conferred it, with all its circumstances, duly considered. This was an invitation to Madrid from the king of Spain, there to preside as a naturalist, with the offer of an annual pension for life of 2000 pistoles, letters of nobility, and the perfect free exercise of his own religion: But, after the most perfect acknowledgments of the siagular honour done him, he returned for answer, that
In the year 1755, the Royal Academy of Sciences at Stockholm honoured our professor with one of the first premiums, agreeably to the will of Count Sparre; who had decreed two gold medals, of ten ducats value each, to be annually given by the academy to the authors of such papers, in the preceding year’s Stockholm Acts, as should be adjudged most useful in promoting agriculture particularly, and all branches of rural economy. This medal bore on one side the arms of the count, with this motto, Superstes in scientiis amor Frederici Sparre. Linnæus obtained it in consequence of a paper De Plantis quae Alpium Sueciae indigene, magnae rei aconi aemine et medici emulamento fieri possint: and the ultimate intention was to recommend these plants as adapted to culture in Lapland. This paper was inserted in the Stockholm Acts for 1754, vol. xv. Linnæus also obtained the premium centum aurorum, proposed by the Imperial Academy of Sciences at Petersburg, for the best paper written to establish or disprove, by new arguments, the doctrine of the sexes of plants. It was, if possible, an additional glory to Linnæus, to have earned this premium from the Petersburg academy; insomuch as a professor of that society, a few years before, had with more than common zeal, although with a futility like that of the other antagonists of our author, endeavoured to overturn the whole Linnean system of botany, by attempting to show that the doctrine of the sexes of plants had no foundation in nature, and was unsupported by facts and experiments.

It appears that Linnæus, upon the whole, enjoyed a good constitution; but that he was sometimes severely afflicted with a scirrhus, and was not exempted from the gout. About the close of 1776, he was seized with an apoplexy, which left him paralytic; and at the beginning of the year 1777, he suffered another stroke, which very much impaired his mental powers. But the disease supposed to have been the immediate cause of his death, was an ulceration of the urinary bladder; of which, after a tedious indisposition, he died, January 13, 1783, in the 71st year of his age.

—His principal other works, beside those already mentioned, are, The Iter Oelandicum et Gotlandicum, Iter Scandinavian, Flora Suecica, Fauna Suecica, Materia Medica, Philop highly illustrious philosopher: His stature was diminutive, and poor; his head large, and its hinder part very high; his look was ardent, piercing, and apt to daunt the beholder; his ear not sensible to music: his temper quick, but easily appeased.

Nature had, in an eminent manner, been liberal in the endowments of his mind. He seems to have been possessed of a lively imagination, corrected however by a strong judgment, and guided by the laws of system. Add to these, the most retentive memory, an unremitting industry, and the greatest perseverance in all his pursuits; as is evident from that continued vigour with which he prosecuted the design, that he appears to have formed so early in life, of totally reforming and fabricating anew the whole science of natural history; and this fabric he raised, and gave to it a degree of perfection unknown before; and had moreover the uncommon facility of living to see his own structure rise above all others, notwithstanding every discouragement its author at first laboured under, and the opposition it afterwards met with. Neither has any writer more cautiously avoided that common error of building his own fame on the ruin of another man's. He everywhere acknowledged the several merits of each author's system; and no man appears to have been more sensible of the partial defects of his own. Those anomalies which had principally been the objects of criticism, he well knew every artificial arrangement must abound with; and having laid it down as a firm maxim, that every system must finally rest on its intrinsic merit, he willingly commits his own to the judgment of posterity. Perhaps there is no circumstance of Linnaeus's life which shows him in a more dignified light than his conduct towards his opponents. Disavowing controversy, and justly considering it as an unimportant and fruitless sacrifice of time, he never replied to any, numerous as they were at one season.

To all who see the aim this extraordinary man has brought to natural science, his plans must appear in a very illustrious point of view; but more especially to those who, from similarity of tastes, are qualified to see more distinctly the vast extent of his original design, the greatness of his labour, and the elaborate execution he has given to the whole. He had a happy command
steeped and bruised in water gives it very soon a thick mucilaginous nature, and communicates much of its emollient virtue to it. See LINUM.

LIN, in Surgery, is the scrappings of fine linen, used by surgeons in dressing wounds. It is made into various forms, which acquire different names according to the difference of the figures.—Lin made up in an oval or orbicular form is called a pledget; if in a cylindrical form, or in shape of a date, or olive-stone, it is called a dossier.

These different forms of lint are required for many purposes; as, 1. To stop blood in fresh wounds, by filling them up with dry lint before the application of a bandage: though, if scraped lint be not at hand, a piece of fine linen may be torn into small rags, and applied in the same manner. In very large hemorrhages the lint or rags should be first dipped in some styptic liquor, as alcohol, or oil of turpentine; or sprinkled with some styptic powder. 2. To agglutinate or heal wounds; to which end lint is very serviceable, if spread with some digestive ointment, balsam, or vulnerary liquor. 3. In drying up wounds and ulcers, and forwarding the formation of a cicatrix. 4. In keeping the lips of wounds at a proper distance, that they may not hastily unite before the bottom is well digested and healed. 5. They are highly necessary to preserve wounds from the injuries of the air.—Surgeons of former ages formed compresses of sponge, wool, feathers, or cotton; linen being scarce: but lint is far preferable to all these, and is at present universally used.

LINTERNUM, or Literum, in Ancient Geography, a city of Campania, situated at the mouth of the Clania, which is also called Litisnum, between Comas and Vulturnum. It received a Roman colony at the same time with Putolis and Vulturnum; was improved and enlarged by Augustus; afterwards forfeited its right of colonyship, and became a prefecture. Hither Scipio Africanus the Elder retired from the mean envy of his ungrateful countrymen; and here he died, and was buried: though this last is uncertain, he having a monument both here and at Rome. No vestige of the place now remains.

LINSTOCK, in military affairs, a wooden staff about three feet long, having a sharp point in one end and a sort of fork or crotch on the other; the latter of which serves to contain a lighted match, and by the former the lintstock is occasionally stuck in the ground, or in the deck of a ship during an engagement. It is very frequently used in small vessels, where there is commonly one fixed between every two guns, by which the match is always kept dry, and ready for firing.

LINZ, a very handsome town of Germany, and capital of Upper Austria, with two fortified castles; the one upon a hill, the other below it. Here is a ball in which the states assemble, a bridge over the Danube, a manufacture of gunpowder, and several other articles. It was taken by the French in 1741, but the Austrians retook it in the following year. E. Long. 14. 33. N. Lat. 48. 16.

LINZ, a town of Germany, in the circle of the Lower Rhine, and electorate of Cologne, subject to
that elector. It is seated on the river Rhine, in E.
Long. 7. 1. N. Lat. 50. 31.
LINUM, Flax; a genus of plants belonging to
the pentandria class; and in the natural method
ranked under the 14th order, Gravinales. See BOTANY
Index.
LINUS, in classical history, a native of Colchis,
contemporary with Orpheus, and one of the most an-
cient poets and musicians of Greece. It is impossible,
at this distance of time, to discover whether Linus
was the disciple of Orpheus, or Orpheus of Linus.
The majority, however, seem to decide this question
in favour of Linus. According to Archbishop Usher,
he flourished about 1280 B.C. and he is mentioned by
Eusebius among the poets who wrote before the time
of Moses. Diodorus Siculus tells us, from Dionysius of
Mitylene the historian, who was contemporary with Cí-
cero, that Linus was the first among the Greeks who in-
vented verses and music, as Cadmus first taught them
the use of letters. The same writer likewise attributes
to him an account of the exploits of the first Bac-
chus, and a treatise upon Greek mythology, written
in Pelasgian characters, which were also those used by
Orpheus, and by Pronapides the preceptor of Homer.
Diodorus says that he added the string tichamos to the
Mercurian lyre; and attributes to him the invention of
rhythm and melody; which Suidas, who regards him
as the most ancient of lyric poets, confirms. Mr
Marbury tells us, that Linus invented cat-gut strings
for the use of the lyre, which, before his time, was
only strung with thongs of leather, or with different
threads of flax strung together. He is said by many
writers to have had several disciples of great renown;
among whom were Hercules, Thamyris, and, accord-
ing to some, Orpheus.—Hercules, says Diodorus, in
learning from Linus to play upon the lyre, being ex-
tremely dull and obstinate, provoked his master to
strike him; which so enraged the young hero, that in-
stantly seizing the lyre of the musician, he beat out his
brains with his own instrument.
LION, in Zoology. See Felis, Mammalia Index.
LIONCELLES, in Heraldry, a term used for se-
ceral lions borne in the same coat of arms.
LIOTARD, called the Turk, an eminent painter,
was born at Geneva in 1702, and by his father was
designed for a merchant; but, by the persuasion of his
friends, who observed the genius of the young man, he
was permitted to give himself up to the art of painting.
He went to Paris in 1725, and in 1738 accompanied
the marquis de Puisieux to Rome, who was going am-
assador to Naples. At Rome he was taken notice of
by the earls of Sandwich and Besborough, then Lord
Duncannon, who engaged Liotard to go with them
on a voyage to Constantinople. There he became ac-
quainted with the late Lord Edgecumbe, and Sir Eve-
nard Fawkener, our ambassador, who persuaded him
to come to England, where he staid two years. In
his journey to the Levant he adopted the eastern
habit, and wore it here with a very long beard. It
contributed much to the portraits of himself, and some
thought to draw customers; but he was really a paint-
er of uncommon merit. After his return to the con-
inent, he married a young wife, and sacrificed his beard
to Hymen. He came again to England in 1772, and
brought a collection of pictures of different masters,
which he sold by auction, and some pieces of glass
painted by himself, with surprising effect of light and
shade, but a mere curiosity, as it was necessary to
darken the room before they could be seen to advan-
tage; he affixed, too, as usual, extravagant prices to
them. He died here about two years, as in his former
journey. He has engraved some Turkish portraits,
one of the empress, queen and the eldest archdeacon
in Turkish habits, and the heads of the emperor and
empress. He painted admirably well in miniature;
and finally in enamel, though he seldom practised it.
But he is best known by his works in crayons. His
likenesses were as exact as possible, and too like to
please those who sat to him; thus he had great busi-
ness the first year, and very little the second. Devoid
of imagination, and one would think of memory, he
could render nothing but what he saw before his eyes.
Freckles, marks of the smallpox, every thing found its
place; not so much from fidelity, as because he could
not conceive the absence of any thing that appeared
to him. Truth prevailed in all his works, grace in
very few or none. Nor was there any ease in his
outline; but the stiffness of a bust in all his por-
trats. Walpole.
LIP, in Anatomy. See there, No 102.
Hare-Lip, a disorder in which the upper lip is in a
more or less divided, so as to resemble the upper lip
of a hare, whence the name. See SURGERY.
LIPARI, in Ancient Geography, the principal
of the islands called Æolus, situated between Sicily and
Italy, with a cognominal town, so powerful as to have
a fleet, and the other islands in subjection to it. Ac-
cording to Diodorus Siculus, it was famous for ex-
cellent harbours and medicinal waters. He informs us
also, that it suddenly emerged from the sea about the
time of Hannibal's death. The name is Punica, ac-
cording to Bochart: and given it, because, being a
volcano, it shone in the night. It is now called Li-
pari, and gives name to nine others in its neighbour-
hood; viz. Stromboli, Pare, Rotto, Panaria, Salina,
Vulcano, Fenicusa, Alicor, and Ustica. These are
called, in general, the Lipari Islands. Some of these
are active volcanoes at present, though Lipari is not.
It is about 15 miles in circumference; and abounds in
corn, figs and grapes, bitumen, sulphur, alum, and
mineral waters.
LIPARI, an ancient and very strong town, and
capital of an island of the same name in the Medi-
terranean, with a bishop's see. It was ruined by
Barbarossa in 1544, who carried away all the in-
habitants into slavery, and demolished the place; but
it was rebuilt by Charles V. E. Long. 15. 50. N. Lat.
38. 35.
LIPARI, properly, is the general name of a cluster of
islands. These, according to M. Houel, are principally
ten in number, the rest being only uninhabitable rocks
of narrow extent. The largest and the most populous
of them, that above mentioned, communicates its name
to the rest. Vulcano is a desert but habitable island,
lying south from the large island of Lipari. Saltine,
which lies west-north-west from the same island; Fe-
ciulei, nearly in the same direction, but 20 miles farther
distant; and Alicudi, 10 miles south-west of Felicule;
are inhabited. Panarea is east of Lipari, the famous
Stromboli north-east, and both of them are inhabited.
The
The rest are in a desert state; such as Banuluzzo, which was formerly inhabited; Attalo, which might be inhabited; and L’Escambiana, on which some remains of ancient dwellings are still to be found. L’Escanera is nothing but a bare rock.

The Fermicoli, a word signifying ants, are a chain of small black cliffs which run to the north-east of Lipari, till within a little way of Exambiana and Escanera, rising more or less above the water, according as the sea is more or less agitated.

The ancient authors are not agreed with respect to the number of the Lipari islands. Few of those by whom they are mentioned appear to have seen them; and in places such as these, where subterraneous fires burst open the earth, and raise the ocean from its bed, terrible changes must sometimes take place. Volcanello and Volcano were once separated by a strait, so as to form two islands. The lava and ashes have filled up the intervening strait; and they are now united into one island, and have by this change become much more habitable.

The castle of Lipari stands upon a rock on the east quarter of the island. The way to it from the city leads up a gentle declivity. There are several roads to it. This castle makes a part of the city; and on the summit of the rock is the citadel, in which the governor and the garrison reside. The cathedral stands in the same situation. Here the ancients, in conformity to their usual practice, had built the temple of a tutelary god. This citadel commands the whole city; and it is accessible only at one place. Were an hostile force to make a descent on the island, the inhabitants might retreat hither, and be secure against all but the attacks of famine.

The ancient inhabitants had also fortified this place. Considerable portions of the ancient walls are still standing in different places, particularly towards the south; their structure is Grecian, and the stones are exceedingly large, and very well cut. The layers are three feet high, which shows them to have been raised in some very remote period. These remains are surrounded with modern buildings. The remains of walls which are still to be seen here, have belonged not only to temples, but to all the different sorts of buildings which the ancients used to erect. The vaults, which are in a better state of preservation than any of the other parts of these monuments, are now converted to the purpose of a prison.

In the city of Lipari there are convents of monks of two different orders; but there are no convents for women, that is to say, no clauseters in which women are confined; those, however, whose heads and hearts move them to embrace a state of pious celibacy, are at liberty to engage in a monastic life, with the concurrence of their confessors. They put on the sacred habit, and live a perpetual virginity, but they are not to live with their father and mother, and mix in society like other women. The vow and the habit even enlarge their liberty. This custom will, no doubt, M. Huet observes, appear very strange to a French woman; but this was the way in which the virgins of the primitive church lived. The idea of shutting them up together did not occur till the fifth century. The life of these religious ladies is less gloomy than that which those under the same vows lead in other countries. They wear clothes of particular colours, according as they belong to this or that order. Their dress gives them a right to frequent the churches at any hours; and the voice of censure, which takes particular pleasure in directing her attacks against pious ladies, goes so far as to assert that some young women assume the habit with no other views but that they may enjoy greater freedom.

In this island oxen of a remarkably beautiful species are employed in ploughing the ground. The ancient plough is still in use here. The mode of agriculture practised here is very expeditious. One man traces a furrow, and another follows to sow in it grain and pulse. The ploughman, in cutting the next furrow, covers up that in which the seed has been sown: and thus the field is both ploughed and sown at once. Nature seems to be here uncommonly vigorous and fertile. Vegetation is here more luxuriant, and animals gayer and more healthful, than almost anywhere else.

Near the city of Lipari, the traveller enters deep narrow roads, of a very singular appearance. The whole island is nothing but an assemblage of mountains, all of them consisting of ashes or lava discharged from the depths of the volcano by which it was at first produced. The particles of this puzzolana, or ashes, are not very hard; the action of the rain water has accordingly cut trenches among the mountains; and these trenches being perhaps less uneven than the rest of the surface, have of consequence been used as roads by the inhabitants, and have been rendered much deeper by being worn for so many ages by the feet of men and other animals. These roads are more than five or six fathoms deep, and not more than seven or eight feet wide. They are very crooked, and have echoes in several places. You would think that you were walking through narrow streets without doors or windows. Their depth and winding shelter the traveller from the sun while he is passing through them; and he finds them deliciously cool.

The first volcanic eruption in the Lipari islands mentioned in history, is that of which Callias takes notice in his history of the wars in Sicily. Callias was contemporary with Agathocles. That eruption continued without interval for several days and nights; and threw out great stones, which fell at more than a mile's distance. The sea boiled all around the island. The works of Callias are lost, and we know not whether he descended to a detail of particulars concerning the ravages produced by this eruption. Under the consulship of Aemilius Lepidus and L. Aurelius Orestes, 125 years before the Christian era, these islands were affected with a dreadful earthquake. The burning of Ætna was the first cause of that. Around Lipari and the adjacent islands, the air was all on fire. Vegetation was withered; animals died; and fusible bodies, such as wax and resin, became liquid. If the inhabitants of Lipari, from whom the author received these facts, and the writers who have handed down an account of them, have not exaggerated the truth, we must believe that the sea then boiled around the island; the earth became so hot as to burn the cables by which vessels were fixed to the shore, and consumed the planks, the oars, and even the small boats.

Pliny, the naturalist, speaks of another similar event which happened 30 or 40 years afterwards, in cap. 106.
the time of the war of the allied states of Italy against Rome. One of the Æolian islands, says he, was all on fire as well as the sea; and that prodigy continued to appear, till the senate appeared, by a deputation, the wrath of the gods. From the time of that war, which happened 86 years before the birth of our Saviour, till the year 144 of our era, we have no account of any eruption of these volcanoes: and from that period again, till the year 444, we hear of no explosion from them, that is, for the space of 1300 years. But at that time both Sicily and the Æolian isles were agitated by dreadful shocks of earthquakes: the volcano of these isles poured forth streams of lava with an awful violence, and emitted a volume of flame and smoke which rose to an amazing height. After that it discharged enormous stones which fell at the distance of more than six miles.

A century later, in the year 1550, the fury of this volcano was again renewed. The ashes and stones discharged from the crater filled up the strait between Volcano and Vulcanello.

About two centuries after that, in the year 1739, there was a sixth eruption. The bursting of the volcanic fire were attended with a noise so dreadful, that it was heard as far as Melazzo in Sicily.

Father Leandro Alberti says, that on one of those dreadful occasions, the women of Lipari, after imploRing in vain all the saints, vowed to drink no more wine if the volcano should spare them. Their giving up this small gratification was doubtless of great service; yet the eruptions still continue, and have even become more frequent since that time. Only 36 years intervened between this eruption and that which happened in the year 1775. The whole island was then shaken; subterraneous thunder was heard; and considerable streams of flame, with smoke, stones, and vitreous lava, issued from the crater. Lipari was covered over with ashes; and part of this was conveyed by the winds all the way into Sicily.

Five years after, however, in the month of April 1780, there issued a new explosion from Vulcano; the smoke was thick, the shocks constant, and the subterraneous noise very frequent. So great was the consternation among the inhabitants of Lipari on this occasion, that the commander Deodati Dolomieu, who visited these islands not long after that event, informs us, that the inhabitants in general, but especially the women, devoted themselves as slaves to the service of the blessed virgin; and wore on their arms, as tokens of their servitude, small iron chains, which they still continue to wear.

This act of piety, however, was not so efficacious as the deputation of the senate had been. For after that deputation, more than 200 years passed before the Æolian islands were affected by any other eruption, at least by any considerable one. Whereas, in three years after the ladies devoted themselves in submissive manner to the service of the virgin, the isles of Lipari were agitated anew by that fatal earthquake which ravaged Calabria and part of Sicily, on the 5th of February 1783.

The dry baths of St Calogero, in the island of Lipari, are stoves, where sulphureous exhalations, known to be of a salutary nature, ascend out of the earth by holes or spiracles. A range of apartments are built around the place where the exhalations arise. The heat is communicated through those apartments, in such a way, that when entering at one end, you advance towards the other, the heat still increases upon you till you gain the middle apartment, and again diminishes in the same manner as you proceed from the middle to the other end of the range of chambers. In consequence of this disposition of these apartments, the sick person can make choice of that temperature which best suits the nature of his disease. There are a few miserable huts and a small chapel for the accommodation of the people who repair to these baths. The people of the place are ready to attend them. Physicians likewise follow their patients thither, when the disease is of such a nature as to render their attendance requisite, and the patient rich enough to afford them handsome fees: but there is no physician settled in the place. Besides these dry baths, there are baths of hot water, distinguished by the name of St Calogero's Baths. There are around them buildings sufficient to lodge a considerable number of sick people with their necessary attendants. At present, however, these buildings are but in a bad condition.

The baths consist of two halls; one square, the other round. The former is antique; it has been built by the Romans; it is arched with a cupola, and 12 feet in diameter; it has been repaired: the other is likewise arched with a cupola both within and without. The water comes very hot into the first. It gushes up from among pieces of lava, which compose a part of the mountain at the foot of which these baths are built. Those stones remain in their natural state. All that has been done is the raising of a square building enclosing them. Within that building the sick persons either sit down on the stones, or immerse themselves in the interwoven cavities which are filled with water. They continue there for a certain time and approach nearer to, or remain at a farther distance from the spring, according as their physician directs. The place serves also as a stove. The hot vapours arising from the water communicate to the surrounding atmosphere a considerable degree of heat. It is indeed not inferior to that of the hot baths of Termini, which owe their heat to a similar cause. In these baths, therefore, a person can have the benefit either of bathing in the hot water, or of exposing himself to the vapour, the heat of which is more moderate. The bath before mentioned, under the appellation of dry bath, is also a stove; but the hot vapour with which it is filled issues directly from the volcano. The place of the bath is, however, at such a distance from the volcanic focus, that the heat is not at all intolerable.

The mountain at the foot of which these baths are situated is round, and terminates at the summit in a rock of petrified ashes, which are very hard and of a stone grain. This natric action consists of a vertical regular strata, and appears to have been greatly prior in its origin to the adjacent rocks; which consist likewise of ashes, but ashes that have been deposited at a much later period. From this rock there proceeds likewise a stream of hot water, by which some mills in the neighbourhood are moved.

It cannot but appear surprising that nature has placed nearly on the summit of a volcanic mountain...
This island likewise produces figs. There is some white malmsey and a little red wine exported from it.

About 60 or 80 years since, sulphur was one of the articles with which the inhabitants of this island supplied foreign merchants. But that trade has been given up, from an idea which the Liparians entertain, that sulphur infects the air so as to injure the fertility of the vines. The same prejudice prevails in Sicily, but it seems to be ill founded.

There are courts of justice in Lipari of the same powers and characters with those in the cities of Sicily. Causes of more than ordinary importance are carried to Palermo.

The island is entirely free from every kind of imposition. The king receives nothing from it; because Count Roger anciently bestowed on its bishop all his rights of royalty over Lipari. The bishop there received annually from the inhabitants a tenth part of the products of their lands. They afterwards, to prevent fraud, estimated the value of that tithe for one year; and on the condition of their paying in future a sum of money equal to what that year's tithe was valued at, he not only gave up his right to the tithe, but also ceded to them a considerable extent of land which belonged to him.

In the archiepiscopal palace, and in the palace of the Baron de Monizio, there are some noble pieces of painting by Sicilian painters: — A St Peter, a St Rosalia, Jesus disputing with the Jewish doctors, the adulterous woman, the incredulity of St Thomas.

LIPOTHYMIA, FAINTING, may arise from several causes; as too violent exercise, suppression of the menses or other accustomed evacuations, &c. See M. Medicine Index.

LIPPA, a town of Hungary, with a castle. It was taken by the Turks in 1552; by the Imperialists in 1688; and by the Turks again in 1691; who abandoned it in 1695, after having demolished the fortifications. It is seated on a mountain, in E. Long. 21. 55. N. Lat. 36. 5.

LIPPE, the capital of a county of the same name in Germany, and the circle of Westphalia. It is seated on a river of the same name, and was formerly the residence of the principal branch of the house of Lippe. It is now in the possession of the king of Prussia, and carries on a good trade in preparing timber for building vessels on the Rhine, with which it has a communication by the river Lippe. The country round it is unproductive and marshy. E. Long. 8. 12. N. Lat. 51. 42.

LIPPI, LORENZO, a painter of history and portraits, was born in 1606, and learned the principles of painting from Matteo Roselli. He had an exquisite genius for music and poetry, as well as for painting, and in the latter his proficency was so great, that some of his compositions in the historical style were taken for those of Roselli. However, growing at last dissatisfied with the manner of that master, he chose the manner of Santi di Tito, who was excellent both in design and invention, and appeared to have more of simple nature and truth in his compositions than any other artist of that time. At Florence Lippi painted many grand designs for the chapels and convents, by which he enlarged his reputation; and at the court of Innsbruck, he painted a great number of portraits of the first nobility,
bility, which were deservedly admired. Yet, although he was fond of imitating simple nature without any embellishments from invention, his works are held in the highest esteem for the graceful airs of the heads, for the correctness of his outline, and for the elegant disposition of the figures. He died in 1664.

LIPIUS, JUSTUS, a learned critic, was born at Iseh, a small village near Brussels, in 1547. After having distinguished himself in polite literature, he became secretary to Cardinal de Granvillan at Rome, where the best libraries were open to him; and he spent much labour in collating the MSS. of ancient authors. He lived 13 years at Leyden; during which he composed and published what he esteemed his best works; but settled at Louvain, where he taught polite literature with great reputation. He was remarkable for unsteadiness in religion, fluctuating often between the Protestants and Papists; but he became finally a bigotted catholic. He died at Louvain in 1606; and his works are collected in six volumes folio.

LIQUEFACTION, an operation by which a solid body is reduced into a liquid by the action of heat. See Fluidity, Chemistry Index.

LIQUID, a body which has the property of fluidity, as water, mercury, &c. See Fluid.

Liquid, among grammarians, is a name applied to certain consonants opposed to mutes. Thus l, m, n, and s, are liquids.

LIQUIDAMBAR, Sweet-gum-tree, a genus of plants, belonging to the moncezia class; and in the natural method ranking with those of which the order is doubtful. See Botany Index.

Liquor, means for any fluid substance of the aqueous or spirituous kind.

The principal beverage amongst the Jews, as well as the Greeks and Romans, in their early state, was water, milk, and the juices of various plants infused therein. For a long time, under the commonwealth of Rome, wine was so scarce, that in their sacrifices to the gods the libations were made with milk only. Wine did not become common there till A. U. C. 600, when vines began to be planted.

Liquor of Flints. See Chemistry, No. 1450.

Smoking Liquor of Libavius. See Chemistry, No. 1809.

Mineral Anodyne Liquor of Hoffman. This is a composition of highly rectified spirit of wine, vitriolic ether, and a little of the dulcified oil of vitriol. See Chemistry, No. 849.

LIQUORICE. See Glycyrrhiza, Botany and Materia Medica Index.

LIRIODENDRON, the Tulip tree, a genus of plants belonging to the polyandria class, and in the natural method ranking under the 52d order, Caeconatae. See Botany Index.

LIS, or LIS, John Vander, painter of history, landscapes, and conversations, was born at Oldenburgh in 1570, but went to Haerlem to place himself as a disciple under Henry Goltzius; and as he was endowed with great natural talents, he soon distinguished himself in that school, and imitated the manner of his master with great success. He adhered to the same style till he went to Italy; where, having visited Venice and Rome, he studied the works of Titian, Tintoretto, Paolo Veronese, and Domenico Fetti, so effectually, that he improved his taste and judgment, and altered his manner entirely. He soon received marks of public approbation; and his compositions became universally admired for their good expression, for their lively and natural colouring, and the sweetness and delicacy of his pencil: although it must be acknowledged, that he could never totally divest himself of the ideas and taste peculiar to the Flemings. His subjects usually were histories taken from the sacred writings, or the representations of rural sports, marriages, balls, and villagers dancing, dressed in Venetian habits; all which subjects he painted in a small as well as a large size, with a number of figures, well designed, and touched with a great deal of delicacy. He was likewise accustomed to paint naked figures admirably, with natural and elegant attitudes, and a very agreeable turn of the limbs. A capital picture of this master is, Adam and Eve lamenting the death of Abel; which is extremely admired, not only for the expression, but also for the beauty of the landscape; and in the church of St Nicholas at Venice is another of his paintings, representing St Jerome in the desert, with a pen in his hand, and his head turned to look at an angel, who is supposed to be sounding the last trumpet. The colouring of this picture is rather too red; but it is designed in a fine style, and charmingly pencilled. The paintings of this master are very rarely to be purchased. He died in 1629.

Lis, John Vander, of Breda, historical painter, was born at Breda about the year 1601, and became a disciple of Cornelius Polemurb, whose manner he imitated with extraordinary exactness, in the tint of his colouring, his neatness of penciling, and the choice of his subjects. There are some paintings of this master’s hand which, though they appear to have somewhat less freedom and lightness of touch, are nearly equal to those of Polemurb, and are frequently taken to be his. At Rotterdam, in the possession of Mr Bisschop, there is a delicate painting representing Diana in the bath, attended by her nymphs; and his most capital performance, in England, is said to be in the possession of the viscount Middleton. The portrait of Vander Lis, painted by himself, is in the possession of Horace Walpole, Esq. which is described by that ingenious gentleman as being worked up equal to the smoothness of enamel.

LISBON, the capital of the kingdom of Portugal, situated in the province of Estremadura, on the banks of the river Tagus, in W. Long. 9°. 25. N. Lat. 38° 42. It was anciently called Olisipo, Ottoippo, and Ulyssipo. It first became considerable in the reign of King Emanuel; from that time it has been the capital of the kingdom, the residence of its monarchs, the seat of the chief tribunals and offices of the metropolis, a noble university, and the receptacle of the richest merchandise of the East and West Indies. Its air is excellent; being refreshed by the delightful sea breezes, and those of the Tagus. The city extends for about two miles along the Tagus; but its breadth is inconsiderable. Like old Rome, it stands on seven hills: but the streets in general are narrow and dirty, and some of them are very steep; neither are they lighted at night. The churches, in general, are very fine; but the magnificence of the chapel royal is amazing. Here is one of the finest harbours in the world; and there were a great number not.
not only of fine churches and convents here, but also of other public buildings, and particularly of royal palaces, and others belonging to the grandees; but the greatest part of them, and of the city, were destroyed by a most dreadful earthquake, on Nov. 1, 1755, from which it will require a long time to recover. The inhabitants, before the earthquake, did not at most exceed 150,000. The government of it is lodged in a council, consisting of a president, six councillors, and other inferior officers. The harbour has water enough for the largest ships, and room enough for 10,000 sail without being crowded. For its security, there is a fort at the mouth of the river, on each side, and a bar that runs across it, and is very dangerous to pass without pilots. Higher up, at a place where the river is considerably contracted, there is a fort called Torre de Belém, or the Tower of Belém, under whose guns all ships must pass in their way to the city; and on the other side are several more forts. Before the earthquake, most of the private houses were old and unsightly, with lattice windows; and the number of convents and colleges amounted to 50, namely, 32 for monks, and 18 for nuns. The king's principal palace stands on the river, and is large and commodious. Of the hospitals, that called the Greco, is obliged to receive all persons, of what degree, nation, or religionsoever, without exception. At the village of Belém, near Lisbon, is a noble hospital for decayed gentlemen who have served the king, and have not wherewithal to maintain themselves. That called the House of Mercy is also a noble charity. In the centre of the city, upon one of the highest hills, is the castle, which commands the whole, being large and ancient, and having always a garrison of four regiments of foot. The cathedral is a vast edifice of the Gothic kind, but heavy and clumsy: it contains, however, great riches. The whole city is under the ecclesiastical jurisdiction of the patriarch, who was appointed in the year 1717. Here is also an archbishop, who has, or at least had, before the erection of the patriarchate, a revenue of 40,000 cruzados, or 6000L. The university, which was removed for some time to Coimbra, but afterwards restored to its ancient seat, makes a considerable figure, though inferior to that of Coimbra. In November 1807 the Portuguese court retired from Lisbon to Brazil, and the city was occupied by the French, who retained possession of it till August 1808, when it was given up under the convention of Cintra.

LISBURN, a town of Ireland, in the county of Antrim and province of Ulster, 73 miles from Dublin. It was burnt down about 50 years ago; but is now rebuilt in a neat and handsome manner, and has a large linen manufactury. It is seated on the river Lagan, in W. Long. 6° 20' N. Lat. 54° 31'. It gives title of earl to the family of Vaughan, and formerly returned two members to parliament.

LISIEUX, a considerable town of France, in Upper Normandy, with a bishop's see. The churches and religious houses, and the bishop's palace, are all very handsome structures. It is a trading place; and is seated at the confluence of the rivers Arbeek and Gassi, in E. Long. 0° 20' N. Lat. 49° 11'.

LISLE, a large, rich, handsome, and strong town of French Flanders, of which it is the capital, with a strong castle, and a citadel built by Vauban, and said to be the finest in Europe, as well as the best fortified. The largest square, and the public buildings, are very handsome; and they have manufactures of silks, cambrics, and camlets, as well as other stuffs, which have been brought to great perfection. It was taken by the duke of Marlborough, after three months siege and the loss of many thousands of men, in 1708, but restored to the French by the treaty of Utrecht, in consideration of their demolishing the fortifications of Dunkirk. It was besieged by the Austrians in 1792, who on the 29th of September began a heavy cannonading against it, which continued incessant till the 6th of October, when they were obliged to raise the siege, after having thrown into the city about 30,000 red-hot balls, besides 6000 bombs. It is seated on the river Duele, 14 miles west of Tournay, 32 south-west of Ghent, 37 north-west of Mons, and 130 north of Paris.

Lisle, Joseph Nicholas de, an eminent astronomer and geographer, was born at Paris in the year 1688. His father having taught him the principles of grammar, he afterwards attended lectures in the Marais college, where he delivered his rhetorical exercises in 1706. A total eclipse of the sun having taken place on the 12th of March that year, his innate love of mathematics was thus discovered, and he was accordingly placed under a proper tutor, who taught him the elements of geometry, fortification and mechanics; but his favourite study was the science of astronomy.

In 1707 he was offered the place of an engineer at Martinico, which made him acquaint with the art of drawing, an acquisition which proved highly useful to him in his geographical labours, and also in the study of astronomy. His father having got a copy of An Account of a Voyage to the South sea from his son's master, young de Lisle was excited by the perusal of it to the study of natural history, and he began to make collections of insects, and sketch their varieties; but being afterwards persuaded that so extensive a study, requiring such immense collections to be made as he found in Aldrovandus, was wholly incompatible with that unremitting attention which his favourite science required, he relinquished it accordingly. The attention he paid to astronomy was so great, that he was considered as meriting the correspondence of some of the ablest astronomers of Europe at the early age of 21. In 1709 he made a wooden quadrant, which he divided with the utmost accuracy, and which answered the intended purpose in his early observations. He likewise constructed a table for M. Cassini, of the right ascensions and declinations, adapted to all the degrees of latitude and longitude of the planets, and the obliquity of the ecliptic; this table was made use of by M. Cassini in foretelling the occultations of the stars by the moon.

De Lisle being informed by Cassini in 1710 of his method of representing an eclipse of the sun, by the projection of a terrestrial parallel on a plane; he instantly conceived the idea of applying it to every part of the earth, by means of a globe mounted and prepared for that purpose. Such astronomers as he made acquainted with his project, conceived it to be impracticable; but when the machine was completed, they found the highest expectations on the noble instrument. The first memorable observation made by de Lisle was...
that of the moon, on the 23d of January 1712, after which he laboured experienced some interruption from bodily indisposition. About this time the situation of his father's numerous family rendered it necessary that he should provide for himself, so that he was obliged to make his astronomical knowledge subservient to the absurdities of astrology, receiving pecuniary presents from the regent for his services. He received also in 1715 the grant of a pension of 600 livres, on which occasion he calculated tables of the moon according to the Newtonian theory, prior to Halley's communications to him, which were printed in 1719. De Lisle was chosen a member of the Academy of Sciences in 1714, on which account his exertions were redoubled.

In 1720 he delivered a proposal to the academy for ascertaining in France the figure of the earth, a design which was carried into execution some years afterwards. In 1723 he delivered to the same academy a memoir on the transits of Mercury, wherein a method of calculating them was proposed by him, the way in which they were to be observed, and the inferences to be deduced from these observations. He proposed the use of the quadrant in observing the transits of Venus and Mercury, which has been found superior to any other instrument for that important purpose, and is sanctioned since his day by the practice of the ablest astronomers.

Our distinguished philosopher came over to England in the year 1724, where he became acquainted with Newton and Halley, and had the honour of obtaining their approbation. Newton made him a present of his own portrait, and Halley gave him a copy of the tables which he had published in 1719. He was also created a member of the Royal Society, and he enjoyed similar honours from every literary society in Europe before his death. In 1721 he received an invitation from Peter the Great to go to Petersburg, to fill the chair of astronomer in the Imperial Academy of Sciences. On the death of that emperor, his successor Catharine renewed the invitation, offering him a considerable pension, of which he accepted, and, in 1726, set out for Petersburg, accompanied by his brother Lewis and M. Vignon, who were to act as his assistants. He reached Petersburg in the month of October, and was established in the observatory erected by Peter the Great, which he occupied for 21 years. It was in every respect commodious, but extremely deficient in astronomical apparatus, which his own ingenuity and indefatigable application in a great measure supplied.

A transit of Mercury over the sun's disc was expected in the year 1740, which would not be visible in Europe, and therefore de Lisle undertook a journey to the distant regions of Asia; but after traveling through the hospitable wilds of Siberia, the cloudiness of the atmosphere prevented him from observing the transit,—a mortification which he endeavoured to support by his geographical and physical remarks, and in drawing up a description of the country. He constructed an interesting map of Russia, assisted by his brother Lewis, who was appointed to make observations in the most distant parts of that immense empire. He was occasionally employed for the long period of forty years, in making meteorological observations, which he executed with an accuracy almost incredible.

After a number of discouragements and difficulties, and the irregular payment of his pension, had been long experienced by de Lisle at Petersburg, he returned disgusted to his native place, and was chosen professor of mathematics at the college-royal, where he did the most essential service to the sciences, by the important instructions which he gave to his numerous pupils, many of whom became afterwards the most distinguished characters, such as M. M. de la Lande and Messier.

When the transit of Mercury over the sun was eagerly expected in 1753 by the greatest astronomers, de Lisle published an interesting map of the world, representing the effect of Mercury's parallaxes in different countries, that such places might be known as were proper for making those observations on the transit as might determine the distance of the sun. As the apparent orbit of the planet traversed nearly the centre of the sun, de Lisle made use of this circumstance to determine the diameter of that luminary. The last work of our author which was inserted in the volumes of the French academy, was a memoir on the comet which appeared in the year 1758, discovered by a peasant in the vicinity of Dresden.

It may perhaps be asserted with justice, that the most important service which this great man rendered to astronomers was, his correction of the double error of Halley respecting the transit of Venus, looked for in the year 1761, as by this means he prevented many learned men from undertaking long voyages in order to observe it. About the year 1754, de Lisle was appointed by the king of France, astronomical geographer to the marine, in which capacity he was to collect plans and journals of naval captains, to arrange them methodically, and to make extracts from them of whatever might be beneficial to the service. About the year 1758 he withdrew into quiet retirement at the abbey of St Genevieve, where much of his time was spent in devotional exercises, and in acts of charity and beneficence. Still, however, he continued to prosecute those studies which had been so dear to him during the earlier part of his life; but in 1758 he was seized with a scrobutic complaint, of which he was cured by his medical friends; but in the month of September the same year he was seized with a species of apoplexy, which carried him off on the 11th day of that month, in the 81st year of his age.

His extraordinary merit as a man of science may in some measure be gathered from this concise account of his life; and as a citizen of the world his piety was unaffected, his morals pure, his integrity undeviating, his spirit generous and disinterested, and his whole manners highly amiable. The only publication of our author, besides those already mentioned, consisted of "Memoirs illustrative of the History of Astronomy," in two volumes 4to.

Lisle, Sir John, a brave loyalist in the time of the civil wars, was the son of a bookseller in London, and received his education in the Netherlands. He signalled himself upon many occasions in the civil wars, particularly in the last battle of Newbury; where, in the dusk of the evening, he led his men to the charge in his shirt, that his person might be more conspicuous. The king, who was an eye-witness of his bravery, knighted him on the field of battle. In 1648, he rose for his majesty in Essex; and was one of the royalists who
LISMORE, one of the Western islands of Scotland, seated at the mouth of Loche Linne, an arm of the sea in Argyllshire, navigable for the largest ships to Fort William, which is in the country called Lochaber. This island is 10 miles in length by one in breadth; and contained, in 1811, 1323 inhabitants. It abounds in limestone, which forms a fine loamy and very fertile soil, yielding rich crops of barley. This island was formerly the residence of the bishop of Argyll, from which he was frequently named Episcopus Lismorensis. Great part of the cathedral yet remains, and part of it is still employed as the parish church. The bishop’s castle stands four miles from the cathedral; the walls are yet pretty entire. There are some vestiges of fortified towers, and an old bridge with a ditch and drawbridge, which, it is said, were erected by the Danes.

LISMORE, a borough town of Ireland, in the county of Waterford, and province of Munster, 100 miles from Dublin; N. Lat. 52° 5′. W. Long. 7° 50′. It was anciently called Lessmore or Lissmore, i.e. the great enclosure, or habitation; it is now a bishopric, united to Waterford, and formerly had an university. St Carthagh or Mochna, in the beginning of the seventh century, founded an abbey and school in this place, which in a short time was much resorted to, not only by the natives, but also by the Britons and Saxons, during the middle ages. According to an ancient writer of the life of St Carthagh, Lismore was in general inhabited by monks, half of it being an asylum into which no woman dared enter; consisting entirely of cells and monasteries, the ruins of which, with seven churches, are yet visible. A castle was built here by King John. The site of Lismore was in early ages demominated scotia, or the Scottish, and St Carthagh being the titular of a dun or fort of the ancient chieftains of the Deccies, one of whom granted it to St Carthagh on his expulsion from the abbey of Ratheny in Westmeath. On becoming an university, Math Siath obtained the name of Dunsginne, or the “fort of the Saxons,” from the number of Saxons who resorted thereto; but soon after, it was called Lio-mor or Less-more, and now Lispore; the bishopric of which was united to that of Waterford in 1365, being 730 years after its foundation. The public road to Cork was formerly through this place, and at that time it had a better face of business. St Carthagh, who retired to this place with some of his religious in 636, to avoid the fury of the then Irish monarch, tied his disciples to a most strict rule of life; they never were allowed the use of flesh, fish, or fowl; only the vegetables that the ground produced at the expense of their own labour. Father Daniel, in his Histoire Monastique, mentions one on the same foundation in France. The castle here, which, as we have formerly mentioned, was built by King John, was erected in 1195 on the ruins of the abbey of St Carthagh: it belonged to the duke of Devonshire, and gave birth to the great philosopher Robert Boyle. In 1189 it was demolished by the Irish, who took it by surprise. Being afterwards re-edified, it was for many years an episcopal residence, till Myler Magrath, archbishop of Cashel, and bishop of this see, granted the manor of Lispore to that noted scholar and soldier Sir Walter Raleigh, in the reign of Queen Elizabeth, at the yearly rent of 131 gs. 8d.; but that estate was stocked off with his head in the reign of King James I. After which it fell into the hands of Sir Richard Boyle, who purchased all Sir Walter’s lands; he beautified the whole, and added many buildings to it, most of which were burned down in the Irish rebellion; at the breaking out of which, it was closely besieged by 5000 Irish commanded by Sir Richard Belling, and was well defended by the young Lord Broghill, third son of the Earl of Cork, who obliged them to raise the siege. The castle is boldly seated on the verge of a rocky hill, rising almost perpendicular to a considerable height over the river Blackwater. The entrance is by an ancient and venerable avenue of trees. Over the gate are the venerable arms of the first earl of Cork. Opposite to the entrance is a modern portion of Bath stone of the Decorative order, designed by Luigi Jones. Most of the buildings have remained in ruins since the era of the rebellion; but the several offices that make up two sides of the square are kept in repair. At each angle is a tower, the chief remains of its former magnificence. In October 1783, the late duke of Rutland, then lord-lieutenant of Ireland, whilst on a tour in Munster, held a council in, and issued proclamations from this castle. The cathedral is still pretty well kept in repair. Here is a fine bridge over the river Blackwater, erected at a very great expense by the duke of Devonshire: this bridge is remarkable for the extent of the principal arch, the span of it being 102 feet. Below the town is a rich fishery for salmon, which is the greatest branch of trade here. Though this place is at present much reduced, yet Cambrensis informs us, that, not many years after the conquest, this was a very rich city, and held out some time against the English, who took it at a storm, and gained rich plunder here, enough to load 16 sail of ships.

LISSA, an island in the gulf of Venice, on the coast of Dalmatia, belonging to the Venetians, where they have a factory of saltine and anchovies. It produces excellent wine, and is 70 miles west of Ragusa. E. Long. 17° 10′ N. Lat. 43° 32′.

LISBA, a town of Poland, in the palatinate of Pozna, of which it is the capital. E. Long. 16° 0′ N. Lat. 32° 15′.

LIST, a village of Silesia, 16 miles from Breslau, remarkable for a battle fought between the Prussians and the Austrians on the 13th of December 1757, when the latter were entirely defeated.

LISTE, in commerce, the border of cloth or stuff; serving.
serving not only to show their quality, but to preserve them from being torn in the operations of fulling, dyeing, &c.—List is used on various occasions; but chiefly by gardeners for securing their wall trees.

List, in Architecture, a little square moulding, otherwise called a fillet, listel, &c. See Architecture.

List, is also used, to signify the enclosed field or plot of land on which the knight held his castle and comtes. It was so called, as being hemmed round with palest, barriers, or stakes, as with a list. Some of these were double, one for each cavalier; which kept them apart, so that they could not come nearer each other than a spear's length. See Just, Tournament, Duel, &c.

Civil List, in the British polity. The expences defrayed by the civil list are those that in any shape relate to civil government; as, the expences of the household; all salaries to officers of state, to the judges, and every one of the king's servants, the appointments to foreign ambassadors; the maintenance of the queen and royal family; the king's private expenses, or privy purse; and other very numerous outgoings, as secret service money, pensions, and other bounties: which sometimes have so far exceeded the revenues appointed for that purpose, that application has been made to parliament to discharge the debts contracted on the civil list; as particularly in 1724, when one million was granted for that purpose by statute 11 Geo. I. c. 17. and, in 1769, when half a million was appropriated to the like uses by the statute 9 Geo. III. c. 34.

The civil list is indeed properly the whole of the king's revenue in his own distinct capacity; the rest being rather the revenue of the public, or its creditors, though collected and distributed again in the name and by the officers of the crown; it now standing in the same place, as the hereditary income did formerly; and as that has gradually diminished, the parliamentary appointments have increased. The whole revenue of Queen Elizabeth did not amount to more than 600,000l. a-year: that of King Charles I. was 800,000l. and the revenue voted for King Charles II. was 1,200,000l. though complaints were made (in the first years at least) that it did not amount to so much. But it must be observed, that under these sums were included all manner of public expenses; among which Lord Clarendon, in his speech to the parliament, computed that the charge of the navy and land forces amounted annually to 800,000l. which was ten times more than before the former troubles. The same revenue, subject to the same charges, was settled on King James II.; but by the increase of trade, and more frugal management, it amounted on an average to 1,500,000l. per annum, (besides other additional customs granted by parliament, which produced an annual revenue of 400,000l.,) out of which his fleet and army were maintained at the yearly expense of 1,100,000l. After the Revolution, when the parliament took into its own hands the annual support of the forces both maritime and military, a civil list revenue was settled on the new king and queen, amounting, with the hereditary duties to 700,000l. per annum; and the same was continued to Queen Anne and King George I. That of King George II. was nominally augmented to 800,000l. *", and in fact was considerably more: but that of his present majesty is expressly limited to that sum; though 100,000l. hath been since added. And upon the whole, it is doubtless much better for the crown, and also for the people, to have the revenue settled upon the modern footing rather than the ancient. For the crown, because it is more certain, and collected with greater ease; for the people, because they are now delivered from the feudal hardships, and other odious branches of the prerogative. And though complaints have sometimes been made of the increase of the civil list, yet, if we consider the sums that have been formerly granted, the limited extent under which it is now established, the revenues and prerogatives given up in lieu of it by the crown, the numerous branches of the present royal family, and (above all) the diminution of the value of money compared with what it was worth in the last century, we must acknowledge these complaints to be void of any rational foundation; and that it is impossible to support that dignity, which a king of Great Britain should maintain, with an income in any degree less than what is now established by parliament. See Revenue.

To List or Enlist Soldiers, to retain and enroll men as soldiers, either as volunteers, or by a kind of compulsion. Persons listed must be carried within four days, but not sooner than 24 hours after, before the next justice of peace of any county, riding, city, or place, or chief magistrate of any city or town corporate (not being an officer in the army); and if before such justice or magistrate they dissent from such enlisting, and return the enlisting money, and also 20 shillings in lieu of all charges expended on them, they are to be discharged. But persons refusing or neglecting to return and pay such money within 24 hours, shall be deemed as duly listed as if they had assented thereto before the proper magistrate; and they shall, in that case, be obliged to take the oath, or, upon refusal, they shall be confined by the officer who listed them till they do take it.

LISTER, Dr Martin, an eminent English physician and naturalist, was born in 1638, and educated at Cambridge. He afterwards travelled into France; and at his return practised physic at York, and afterwards at London. In 1663, he was created doctor of physic, and became fellow of the College of Physicians in London. In 1668, he attended the earl of Portland in his embassy from King William III. to the court of France; of which journey he published an account at his return, and was afterwards physician to Queen Anne. He also published 1. Historia animalium, Anglica, quarto. 2. Conchyliorum synopsis, folio. 3. Cochlearum et limachum exercitatio anatomica, 4 vols. 8vo. 4. Many pieces in the Philosophical Transactions; and other works.

LISTOWEL, a parish, also a post and towne, of Ireland, in the county of Kerry and province of Munster, 131 miles from Dublin, anciently Lis Tuathal, i. e. "the fort of Tuathal," who was exiled in the first century, but returned; and his life forms a brilliant era in Irish history. Near this are the ruins of a castle, pleasantly situated on the river Feale: it was taken in November 1600, by Sir Charles Wilmot, being then held out for Lord Kerry against Queen Elizabeth. Five miles beyond Listowel are the ruins of a church. The fairs are three in the year.

LITANA SILVA, in Ancient Geography, a wood of
of the city is 10 or 12 miles in compass, which the sheriff rides yearly on the 8th of September, and then feasts the corporation and neighbouring gentry. The close is so called from its being enclosed with a wall and a deep dry ditch on all sides except towards the city, where it is defended by a great lake or marsh formed by its brook. The cathedral, which stands in the close, was originally built by Oswald king of Northumbeland about 700. It was rebuilt and enlarged by Offa king of Mercia in 766. In 1148 it was rebuilt, and greatly enlarged in 1296. In the civil wars its spire was destroyed, and it was converted to a stable. In 1776 a beautiful painted window, by the benefaction of Dr. Adenbrook, was set up at the western end of the cathedral. In the civil wars it was several times taken and retaken, and thereby suffered much; but was so repaired after the Restoration, at the expense of 20,000l. that it was one the fairest and noblest structures of the kind in England. It is walled in like a castle, and stands so high as to be seen 10 miles round. It is 450 feet long, of which the choir is 110, and the breadth in the broadest place 80. Its portico is hardly to be paralleled in England. There were, till lately, 26 statues of the prophets, apostles, kings of Judah, and some kings of this land, in a row above it, as big as the life; and on the top, at each corner of the portico, is a stately spire, besides a fine high steeple on the middle of the church. The choir is paved in great part with alabaster and cannel coal, in imitation of black and white marble. In 1789 it underwent a general repair, when the massive groined arch between the west end of the church and the transept, which had forced the side wall out of its perpendicular, was removed. The prebendary stalls, which are thought to be the best in England, were most of them re-erected at the charge of the country gentlemen, whose names and arms are painted at the top of the stalls. The north door is extremely rich in sculpture, but much injured by time. The body which is supported by pillars formed of numbers of slender columns, has lately had its decayed leaden roof replaced by a neat slated covering. The choir merits attention on account of the elegant sculpture about the windows, and the embattled gallery that runs beneath them; to which the altarpiece of Grecian architecture but ill corresponds; behind which is Mary's chapel, divided from it by a most elegant stone screen of beautiful workmanship. Here stood St. Chad's shrine, which cost 2000l. The charter house is an octagon room. In the same close are the palaces of the bishop and dean, and the prebendary houses in a court on the hill. Here are three other churches; one of which, St. Michael's, has a churchyard of 6 or 7 acres. There was a castle here, long since destroyed: and ancient camps have been discovered in its environs. In the neighbourhood are frequent horse races. The markets here are on Tuesday and Friday, and six fairs in the year. By inland navigation, this place has communication with the rivers Mersey, Dee, Ribble, Ouse, Trent, Darwent, Severn, Humber, Thames, Avon, &c.; which navigation, including its windings, extends above 500 miles in the counties of Lincoln, Nottingham, York, Lancaster, Westmoreland, Chester, Warwick, Leicester, Oxford, Worcester, &c. Litchfield:
LITTERARY, any thing belonging to LITERATURE.

LITERARY Property, or Copy Right. See COPY RIGHT.

LITERATI (literati, "lettered"), an epithet given to such persons among the Chinese as are able to read and write their language. The literati alone are capable of being made mandarins.

LITERATI, is also the name of a particular sect in religion, philosophy, or politics, consisting principally of the learned men of that country; among whom it is called "knowledge is with learned."

It had its rise in the year of Christ 1400, when the emperor, to awaken the native affection of the people for knowledge, which had been quite banished by the preceding civil wars among them, and to stir up emulation among the mandarins, chose out 42 of the ablest among the doctors, to whom he gave a commission to compose a body of doctrine agreeable to that of the ancients, which was then become the rule or standard of the learned. The delegates applied themselves to the business with very great attention: but some fancied them rather to have wrested the doctrine of the ancients, to make it consist with theirs, than to have built up theirs on the model of the ancients.

They speak of the Deity, as if it were no more than mere nature or the natural power or virtue that produces, dispenses, and preserves, the several parts of the universe. It is, they say, a pure, perfect principle, without beginning or end; it is the source of all things, the essence of everything, and that which determines it to be what it is. Thus "the soul of the world;" they say, he is diffused through all matter, and produces all the changes that happen there. In short, it is not easy to determine, whether they receive God into nature, or lift up nature into God; for they ascribe to it many of those things which we attribute to God.

This doctrine, in lieu of the idolatry that prevailed before, introduced a refined kind of atheism. The work, being composed by so many persons of learning and parts, and approved by the emperor himself, was received with infinite applause by all the people. Many were pleased with it, because it seemed to subvert all religion; others approved it, because the little religion that it left them could not give them much trouble. And thus was formed the sect of the Literati: which consists of the maintainers and adherents to this doctrine.

The court, the mandarins, and the persons of fortune and quality, &c. are generally retainers to it; but a great part of the common people still hold to their worship of idols.

The literati freely tolerate the Mahometans, because they adore, with them, the King of heavens, and Author of nature; but they bear a perfect aversion to all sorts of idolaters among them: and it was once resolved to exterminate them. But the disorder this would have occasioned in the empire prevented it; they now content themselves with condemning them, in general, as heresies: which they do solemnly every year at Pekin.

LITERATURE denotes learning or skill in letters.

LITERUM. See LINTERUM.

LITHANTHRAX, or Pix-Cool, is a black or brown, laminated, bituminous substance; not very easily inflammable, but, when once inflamed, burns longer: and more intensely than any other substance. See MINERALOGY INDEX.

LITARGY, a preparation of lead, usually in form of soft flakes, of a yellowish reddish colour. It calcined lead be urged with a hasty fire, it melts into the appearance of oil, and on cooling concrete into litcharge. Greatest part of the litcharge met with in the shops is produced in the purification of silver from lead, and the refining of gold and silver. By the means of this metal: according to the degree of fire and other circumstances, it proves of a pale or deep colour: the first has been commonly called litcharge of silver, the other litcharge of gold. See Lead, Chemistry INDEX.

LITHGOW, William, a Scotman, whose sufferings by imprisonment and torture at Malaga, and whose travels, on foot, over Europe, Asia, and Africa, seem to raise him almost to the rank of a martyr and a hero, published an account of his peregrinations and adventures. Though the author doea much in the marvellous, the horrid account of the strange cruelties of which he tells us, he was the subject, have however, an air of truth. Soon after his arrival in England from Malaga, he was carried to theobald's on a feather-bed, that King James might be an eyewitness of his martyred anatomy, by which he means his wretched body, mangled and reduced to a skeleton. The whole court crowded to see him; and his majesty ordered him to be taken care of, and he was twice to make Bath at his majesty's command. He applied to Gondomar, the Spanish ambassador, for the recovery of the money and other things of value which the governor of Malaga had taken from him, and for 1000 for his support. He was promised a full reparation for the damage he had sustained: but the perfidious minister never performed his promise. When he was upon the point of leaving England, Lithgow upbraided him with the breach of his word in the presence-chamber, before several gentlemen of the court. This occasioned their fighting upon the spot; and the ambassador, as the traveller oddly expresses it, had his fistula (with which disorder he was afflicted) contrabanded with his fist. The unfortunate Lithgow, who was generally condemned for his spirited behaviour, was sent to the Marshalsea, where he continued a prisoner nine months. At the conclusion of the octavo edition of his Travels he informs us, that, in his three voyages, "his painful feet have traped over (besides passages of seas and rivers) 36,000 and odd miles, which draweth near to twice the circumfrence of the whole earth." Here the marvellous seems to rise to the incredible; and to set him, in point of veracity, below Cowper, whom it is nevertheless certain that he far outwalked. His description of Ireland is whimsical and curious. This, together with the narrative of his sufferings, is reprinted in Morgan's Phenis Britannicus.

LITHIASIS, or STONE. See Medicine INDEX.

LITHOMANTIA, in antiquity, a species of divination performed with stones. Sometimes the stone called siddon was used: this they washed in spring-water in the night by candle-light; the person that consulted
much neglected, provisions are exceeding cheap, and Lithuania money so scarce, that 10 per cent. is the common interest. The principal nobility have large estates, and live in great pomp and splendour, generally retaining some hundreds of those that are poor, in quality of domestics. The established religion is Popery; but Lutherans, Calvinists, Jews, Turks, Greeks, and Socinians are very numerous. Lithuania was governed by its own dukes till it was united to Poland, towards the end of the 14th century, when the great duke Jagello married Hedwig, the dowager of Louis king of Poland and Hungary. It had even dukes after that, but they were subordinate to the king; and at this day, though one diet serves for both countries, yet each has its peculiar laws, customs, dialect, and privileges. In a diet held at Lubin in 1569, it was enacted, that both countries, for the future, should form but one state under the same prince. As to their courts of justice, the tenth part of what is adjudged in all real actions goes always to the judge's box, and is immediately paid in court; and in personal actions he claims half the damages given. A nobleman is only fined for murder, as in Poland. The dialect is a language of the Slavonic; and they speak here, as in Poland, a barbarous kind of Latin. Lithuania was divided into nine palatines. In 1772 the Poles were compelled to cede a part of this province to Russia; and at the partition in 1793, this power acquired nearly the whole. In 1815 the kingdom of Poland was revived, the crown being united to that of Russia, but the part of Lithuania formerly disjoined from this kingdom still continues annexed to Russia.

LITMUS, or LACMUS, in the arts, is a blue pigment, formed from archil. It is brought from Holland at a cheap rate: but may be prepared by adding quicklime and putrefied urine, or spirit of urine distilled from lime, to the archil previously bruised by grinding. The mixture having cooled, and the fluid suffered to evaporate, becomes a mass of the consistence of a paste, which is laid on boards to dry in square lumps. It is only used in miniature paintings, and cannot be well depended on, because the least approach of acid changes it instantly from blue to red. The best litmus is very apt to change and fly.

LITTER (lectus), a kind of vehicle borne upon shafts; anciently esteemed the most easy and genteel way of carriage. Du Cange derives the word from the barbarous Latin lecterio, "straw or bedding for beasts." Others will rather have it come from lectus, "bed." Pliny calls the litter the traveller's chamber; it was much in use among the Romans, among whom it was borne by slaves kept for that purpose; as it still continues to be in the east, where it is called a polangrin.—The Roman lectus, made to be borne by four men, was called tetrophorum; that borne by six, hexorphorum; and that borne by eight, octorphorum.

The invention of litters, according to Cicero, was owing to the kings of Bithynia; in the time of Tiberius they became very frequent at Rome, as appears from Seneca; and even slaves themselves were borne in them, though never by more than two persons, whereas men of quality had six or eight.

LITTER also denotes a parcel of dry old straw put on the floor of a horse's stall for him to lie down and rest upon. When a horse comes tired into a stable, fresh litter...
litter has the virtue of making him stale immediately. This is known to be of very great advantage to a horse in a tired state; and when the litter is old and dirty, it never has any such effect upon him. If the owners knew how refreshing it is for a horse to discharge his urine on his return from labour, they would be more careful of giving them all means and occasions of it than they are. This stalling after fatigue prevents those obstructions in the neck of the bladder or urinary passages which horses are too subject to.

LITTLETON, Sir Thomas, judge of the common pleas, was the eldest son of Thomas Westcote, Esq. of the county of Devon, by Elizabeth, sole heiress of Thomas Littleton of Frankley in Worcestershire, at whose request he took the name and arms of that family. He was educated at one of our universities, probably at Cambridge. Thence he removed to the Inner-Temple, where he became one of the readers; and was afterwards, by Henry VI. made steward or judge of the court of the palace, or marshalsea of the king’s household. In 1455, the third year of that reign, he was appointed king’s serjeant, and rode the northern circuit as judge of assize. In 1462, the second of Edward IV., he obtained a pardon from the crown; and, in 1466, was appointed one of the judges of the common pleas, and rode the Northamptonshire circuit. In the year 1474 he was, with many of the first nobility, created knight of the Bath. He died in 1481; and was buried in the cathedral church of Worcester, where a marble tomb, with his statue upon it, was erected to his memory. As to his character as a lawyer, it is sufficient to inform the reader, that he was the author of the Treatise upon tenures, on which Sir Edward Coke wrote a comment, well known by the title of Coke upon Littleton.

LITTLETON, Adam, descended from an ancient family in Shropshire, was born in 1627, educated at Westminster school, and went to Oxford a student of Christ-church, whence he was ejected by the parliament visitors in 1648. Soon after, he became usher of Westminster school, and in 1658 was made second master of Westminster school. After the Restoration he taught a school at Chelsea in Middlesex, of which church he was admitted rector in the year 1664. In 1670 he accumulated the degrees in divinity, being then chaplain in ordinary to his majesty. In 1674, he became prebendary of Westminster, of which church he was afterwards sub-dean. Beside the well-known Latin and English Dictionary, he published several other works. He died in 1694, and was interred at Chelsea. He was an universal scholar; and extremely charitable, humane, and easy of access.

LITURGY, denotes all the ceremonies in general belonging to divine service. The word comes from the Greek λειτυργία, “service, public ministry;” formed of λειτυργος, “public,” and γίνεσθαι, “work.” In a more restrained signification, liturgy is used among the Romanists to signify the mass; and among us the common prayer.

All who have written on liturgies agree, that in the primitive days divine service was exceedingly simple, only clogged with a very few ceremonies, and consisting of but a small number of prayers; but, by degrees, they increased the number of external ceremonies, and added new prayers, to make the office look more awful and venerable to the people. At length things were carried to such a pitch, that a regulation became necessary; and it was found proper to put the service, and the manner of performing it, into writing; and this was what they called a liturgy.

Liturgies have been different at different times, and in different countries. We have the liturgy of St Chrysostom, that of St Peter, of St James, the liturgy of St Basil, the Armenian liturgy, the liturgy of the Maronites, of the Coptes, the Roman liturgy, the Gallican liturgy, the English liturgy, the Ambrosian liturgy, the Spanish and African liturgies, &c.

In the more early ages of the church, every bishop had a power to form a liturgy for his own diocese; and if he kept to the analogy of faith and doctrine, all circumstances were left to his own discretion. Afterwards the practice was for the whole province to follow the metropolitan church, which also became the general rule of the church: and this Lindwood acknowledges to be the common law of the church; intimating, that the use of several services in the same province, which was the case in England, was not to be warranted but by long custom. The liturgy of the church of England was composed in the year 1547, and established in the second year of King Edward IV. stat. 2. and 3. Ed. VI. cap. 1.

In the fifth year of this king it was reviewed; because some things were contained in that liturgy which showed a compliance with the superstition of those times, and some exceptions were taken against it by some learned men at home, and by Calvin abroad. Some alterations were made in it, which consisted in adding the general confession and absolution, and the communion to begin with the ten commandments. The use of oil in confirmation and extreme unction was left out, and also prayers for souls departed, and what tended to a belief of Christ’s real presence in the eucharist. This liturgy, so reformed, was established by the act of 5 and 6 Ed. VI. cap. 1. However, it was abolished by Queen Mary, who enacted that the service should stand as it was most commonly used in the last year of the reign of King Henry VIII. The liturgy of 5 and 6 Ed. VI. was re-established with some few alterations and additions, by 1 Eliz. cap. 2. Some farther alterations were introduced, in consequence of the review of the common-prayer book, by order of King James, in the first year of his reign; particularly in the office of private baptism, in several rubrics and other passages, with the addition of five or six new prayers and thanksgivings, and all that part of the catechism which contains the doctrine of the sacraments. The book of common-prayer, so altered, remained in force from the first year of King James to the fourteenth of Charles II. But the last revisions of the liturgy was in the year 1661, and the last act of uniformity enjoining the observance of it is 13 and 14 Car. II. cap. 4. See Common-Prayer. Many applications have been since made for a review, but hitherto without success.

LITUUS, among the Romans, was the staff made use of by the augurs in quartering the heavens. It bore a great resemblance to the crozier of a bishop, but was shorter. It was crooked at one end, and thickest
in the curved part, according to A. Gellius. We frequently meet with a representation of it upon medals, amongst other posthedral instruments. It was called Litus Quirinialis, from Quirinus, a name of Romulus, who was skilled in all the mysteries of augury.

Litius, was also an instrument of music in use in the Roman army. It was straight, excepting that it had a little bending at the upper end like a litus or sacred symbol of the augurs; and from the similitude it derived its name.

LIVADIA, ancienty Achaea and Hellas, or Greece properly so called; a province of Turkey in Europe, bounded on the north by Epirus and Thessaly, from which it is separated by Mount Oeta, now Banina, and by the Eupirus, now the strait of Negropont; on the east, by the Archipelago; on the south, by the gulf of Engia or Egina, the isthmus of Corinth, and the gulf of Lepanto; and on the west, by the Ionian sea and part of Epirus. Its extent is about 130 miles from north-west to south-east; but its greatest breadth is not above 36 miles. It is in general a mountainous country; but neither unpleasant nor unfruitful. The principal mountains are, Mount Oeta in Beotia, where is the famous pass of Thermopylae, not above 25 feet broad; and Parnassus, Helicon, and Cytheron in Phocis, which were sacred to Apollo and the muses, and consequently much celebrated by the poets. The rivers of most note are, the Nonapros, anciently the Achelous, the Cephissus, the Iamaus, and the Axios. This province is at present divided into Livadia proper, Stamulippa, and the duchy of Athens. The principal places are, Lepanto, anciently Naupactus; Livadia, anciently Libadia or Lebadia; the celebrated city of Athens, now Aetina; Thbes, now Stbes; Lepina, anciently Eleucus; Castri, formerly Delphi; and Megara.

LIVADIA, an ancient town of Turkey in Europe, and capital of a province of the same name in Greece. It is a large and populous place, seated on the gulf of Lepanto, about 25 miles from the city of that name. It has now a considerable trade in woollen stuffs and rice. Anciendy it was celebrated for the oracle of Trophonius, which was in a cavern in a hill above the town. E. Long. 23. 29. N. Lat. 38. 40.

LIVER, see Anatomy, No. 96.—Plato, and others of the ancients, fix the principle of love in the liver; whence the Latin proverb, Cogit amare facer: and in this sense Horace frequently uses the word, as when he says, Si torvere fecer quater Io темum. The Greeks, from its concave figure, called it 

LIVER of Antimony. See Chemistry Index.

LIVER of Arsenic, is a combination of white arsenic with potash. See Arsenic, Chemistry Index.

LIVER of Sulphur. See Potash, Sulphur of, Chemistry Index.

LIVER-Wort. See Marchantia and Lichen, Botany Index.

LIVERPOOL, a large, flourishing, and populous town of England, in the county of Lancaster, situated at the influx of the river Mersey into the sea, in North Lat. 53. 24. and West Long. 2. 50. This town was of little importance till the end of the 17th century, but from that time it has increased with extraordinary rapidity. In 1690 the population was about 5000, and in 1710, when the first dock was constructed, there were about 84 ships belonging to the port, averaging 70 tons and 11 men each. In 1725 an act was procured for opening an inland navigation with Manchester, and for improving the water communication with the Cheshire salt mines, both of which have been of immense advantage to Liverpool. In 1764 the population was 26,000, in 1790 it was 56,000, in 1801 it was 77,620, and in 1811 it was 94,376, exclusive of 7000 sailors. In 1793 she possessed 62,998 tons of shipping. In the year ending 5th July 1818, the number of ships that entered the port amounted to 6779, the tonnage to 754,690. The dock duties, which in 1724 amounted to 810l. 11s. 6d., were 75,915l. 8s. 3d. in 1815, when the official value of the imports was 8,000,000l. sterling, and of the exports 12,000,000l. In 1818 the dock duties amounted to 96,538l. 8s. 3d. It is by far the greatest sea-port in Britain, except London. It has been estimated that one twelfth of the shipping of Great Britain is furnished by Liverpool; that it has one fourth of her foreign trade, and one sixth of her general commerce; and that its exports and imports amount to not less than one half of those of London.

The Liverpool merchants have engaged eagerly in the trade to India since it was thrown open. One vessel was sent out in 1815; next year there were eight vessels in the trade; in 1817 they were increased to 17, with a tonnage of 7538; and from the commencement to September 1818, no fewer than 80 vessels have been employed in the Indian trade. The exports in this trade are chiefly broad cloths and woollens, Birmingham hardware and Sheffield cutlery, Manchester and Glasgow piece goods, Nottingham hosiery, Staffordshire earthen ware, Irish linens, iron, copper, lead, salt, glass, hats, malt liquors, and dollars. The imports are cotton, rice, indigo, sugar, salt petre, ginger, pimento, and other spices, turmeric, safflower, and other dyes.

The docks of Liverpool are upon a very extensive scale. When the new one begun in 1816 is finished, the total space occupied by the works will exceed 60 acres. They communicate with each other by tunnels, by which means the water of one is made to wash out the others, and carry off the mud. Along the docks are extensive warehouses, into which goods are removed from the ships with great ease.

There are few manufactories in Liverpool. The most considerable are those for articles connected with the shipping, such as cordage. There is also an extensive pottery, some salt-works, glass-houses, and upwards of 50 breweries, from some of which large quantities of malt liquor are sent abroad. Many of the buildings are elegant; but the old streets are narrow; which defect will soon be removed, as the
Liverpool. Corporation have lately obtained an act of parliament for the improvement of the town, which they have already begun to put in force with great spirit, having taken down the principal streets in the centre of the town, and rebuilt them in a spacious and most magnificent manner; so that in a few years it will be one of the handsomest towns in England. This town contains sixteen churches, namely, St. Peter's, St. Nicholas's, St. George's, St. Thomas's, St. Paul's, St. Anne's, St. John's, Trinity, St. James's, St. Catherine's, St. Mary's, St. Stephen's, St. Matthew's, St. Mark's, Christ Church, and All Saints. There are also meetings for Independents, Anabaptists, Quakers, Methodists, and Presbyterians. The exchange is a noble structure, built of white stone in the form of a square, and round it are piazzas where the merchants assemble to transact business. Its area is twice the extent of that of London. Above it are the mayor's offices, the sessions hall, the council-chamber, and two elegant ball-rooms. The expense of erecting this building amounted to nearly 100,000l. In its centre is a superb group of bronze statuary, representing the death of Nelson. The custom-house is situated at the head of the old dock, and is a handsome and convenient structure. Here are many charitable foundations, among which is an excellent grammar school well endowed, and many of the youth taught in it have exhibitions in the universities. The infirmary is a large edifice of brick and stone, situated on a hill in a very pleasant airy situation, at one end of the town. Above 1500 patients are admitted annually.

In the town is a charity-school, supported by voluntary subscriptions and contributions, for 50 boys and 12 girls, who are not only clothed and educated, but also provided with food and lodging; likewise several almshouses for the widows of seamen; and an excellent poor-house, superior to any in the kingdom, where upwards of 800 men, women, and children, are supported, many of whom are employed in spinning cotton and wool. The new prison is a noble edifice, and upon a very extensive scale. It is built entirely on the plan of the great and benevolent Mr Howard, for solitary confinement; and is perhaps the most convenient, airy, magnificent building of the kind of Europe.

Liverpool received its charter from King John; but it was a borough by prescription long before his reign. It is under the government of a recorder, mayor, and an unlimited number of aldermen, two bailiffs, and a common council of forty of the principal inhabitants, with a town-clerk and other proper officers. The town has a weekly market on Saturday, and is distant from London 204 miles. The income of the corporation is not less than £50,000 a-year. It sends two members to parliament, who are chosen like the magistrates, by the votes of all the free burgesses not receiving alms.

The number who polled at the general election in 1818 was 2905.

By means of inland navigation, Liverpool has communication with the rivers Dee, Ribble, Ouse, Trent, Darwent, Severn, Humber, Thames, Avon, &c.; which navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottingham, York, Westmorland, Chester, Stafford, Warwick, Leicester, Oxford, Worcester, &c. The Mersey, upon which the town is situated, abounds with salmon, cod, flounders, turbot, plaice, and smelts; and at full sea it is above two miles over. Fresh water is brought into the town by pipes, from some springs four miles off, pursuant to an act of parliament in the reign of Queen Anne. The dispensary of this town does honour to human nature, and has been of the most singular advantage to the afflicted, since 172,273 diseased persons were cured between the years 1778 and 1794, being on an average about 12,000 persons every year. The Union News Room was instituted on the 1st of January 1801; the Lyceum much about the same period, the erection of which cost the sum of 14,000l, and the Commercial News Room in 1813. The Liverpool institution for the promotion of science, literature, and the arts, was founded in 1817. The institution for restoring drowned persons is worthy of notice, as more than 400 people have become objects of it since it was founded, and more than one half of that number have been restored. The Athenaeum, which comprises a news room and library, was projected in 1798, and finished before the close of the year. There are four weekly papers published at Liverpool.

LIVERY, in matters of dress and equipage, a certain colour and form of dress, by which noblemen and gentlemen choose to distinguish their servants.

Liveries are usually taken from fancy, or continued in families by succession. The ancient cavaliers, at their tournaments, distinguished themselves by wearing the liveries of their mistresses: thus people of quality make their domestics wear their livery.

Father Menestrier, in his Treatise of Carousals, has given a very ample account of the mixtures of colours in liveries. Dion tells us, that Oenomaus was the first who invented green and blue colours, for the troops which, in the circus, were to represent land and sea fights.

The Roman church has also her several colours and liveries; white, for confessors and virgins, and in times of rejoicing; black, for the dead; red, for the apostles and martyrs; blue or violet, for penitents; and green, in times of hope.

Formerly, great men gave liveries to several, who were not of their family or servants, to engage them in their quarrels, for that year; but this was prohibited by the statutes 1 Rich. II. 1 Hen. IV. cap. 27. 2 and 7 Hen. IV. 8 Hen. VI. cap. 4. 8 Ed. IV. cap. 2.; and no man, of whatever condition, was allowed to give any livery, but to his domestic officers, and counsel learned in the law. However, most of the above statutes are repealed by 3 Car. I. cap. 4.

LIVERY OF SEASONS, in Law, signifies delivering the possession of lands, &c. to him who has a right to them.

LIVERYMEN of London, are a number of men chosen from among the freemen of each company. Out of this body the common-council, sheriff, and other superior officers for the government of the city, are elected; and they alone have the privilege of giving their votes for members of parliament, from which the rest of the citizens are excluded.

LIVICUS, Titus, the best of the Roman historians, as he is called by Mr Bayle, was born at Patavium or Padua. Few particulars of his life have been handed
handed down to us. Coming to Rome, he acquired the notice and favour of Augustus, and there he long resided. Some have supposed, (for there is not any proof of it), that he was known to Augustus before, by certain Philosophical Dialogues which he had dedicated to him. Seneca says nothing of the dedication: but mentions the dialogues, which he calls historical and philosophical; and also some books, written purposely on the subject of philosophy. Be this as it will, it is probable that he began his history as soon as he was settled at Rome; and he seems to have devoted himself so entirely to the great work he had undertaken, as to be perfectly regardless of his own advancement. The tumults and distractions of Rome frequently obliged him to retire to Naples; not only that he might be less interrupted in the pursuit of his destined task, but also enjoy that retirement and tranquillity which he could not have at Rome, and which yet he seems to have much sought after: for he was greatly dissatisfied with the manners of his age, and tells us, that "he should reap this reward of his labour, in composing the Roman history, that it would take his attention from the present numerous evils, at least while he was employed upon the first and earliest ages." He used to read parts of this history, while he was composing it, to Mecenas and Augustus; and the latter conceived so high an opinion of him, that he pitched upon him to superintend the education of his grandson Claudius, who was afterwards emperor. After the death of Augustus, Livy returned to the place of his birth, where he was received with all imaginable honours and respect; and there he died, in the middle year of the reign of Tiberius, aged above seventy. Some say, he died on the same day with Ovid: it is certain that he died the same year.

Scarcely any man was ever more honoured, alive as well as dead, than this historian. Pliny the younger relates, that "a native gentleman travelled from Cadiz, in the extreme parts of Spain, to see Livy: and, though Rome abounded with more stupendous and curious spectacles than any city in the world, yet he immediately returned: as if, after having seen Livy, nothing farther could be worthy of his notice. A monument was erected to this historian in the temple of Juno, where was afterwards founded the monastery of St Justinia. There, in 1413, was discovered the following epitaph upon Livy: Ossa Titi Livii Patavinii, omnium mortuorum judicis digni, cujus prope inicto cadam invicti populi Romani res gestae conscriberetur; that is, "the bones of Titus Livius of Patavium, a man worthy to be approved by all mankind, by whose almost invincible pen the acts and exploits of the invincible Romans were written." These bones are said to be preserved with high reverence to this day, and are shown by the Paduans as the most precious remains. In 1451, Alphonso, king of Arragon, sent his ambassador, Anthony Panormita, to desire of the citizens of Padua the bone of that arm with which this their famous countryman had written his history; and, obtaining it, caused it to be conveyed to Naples with the greatest ceremony as a most invaluable relic. He is said to have recovered from an ill state of health by the pleasure he found in reading this history: and therefore, out of gratitude, put upon doing extraordinary honours to the memory of the writer. Panormita also who was a native of Palermo in Sicily, and one of the ablest men of the 15th century, sold an estate to purchase this historian.

The history of Livy, like other great works of antiquity, is transmitted down to us exceedingly mutilated and imperfect. Its books were originally a hundred and forty-two, of which are extant only thirty-five. The epistles of it, from which we learn their number, all remain, except those of the 136th and 137th books. Livy's books have been divided into decades, which some will have to have been done by Livy himself, because there is a preface to every decade; while others suppose it to be a modern contrivance, since nothing about it can be gathered from the ancients. The first decade, beginning with the foundation of Rome, is extant, and treats of the affairs of 460 years. The second decade is lost; the years of which are seventy-five. The third decade is extant, and contains the second Punic war, including eighteen years. It is reckoned the most excellent part of the history, as giving an account of a very long and sharp war, in which the Romans gained so many advantages, that no arms could afterwards withstand them. The fourth decade contains the Macedonian war against Philip, and the Asiatic war against Antiochus, which take up the space of about 23 years. The five first books of the fifth decade were found at Worms, by Simon Grynaeus, in 1431, but are very defective; and the remainder of Livy's history, which reaches to the death of Drusus in Germany in 746, together with the second decade, are supplied by Freinshemius.

Never man perhaps was furnished with greater advantages for writing a history than Livy. Besides his own great genius, which was in every respect admirably formed for the purpose, he was trained as it were in a city, at that time the empress of the world, and in the poltiest reign that ever was; having scarcely had any other school than the court of Augustus. He had access to the very best materials, such as the Memoirs of Sylla, Cesar, Labicius, Pollio, Augustus, and others, written by themselves. "What writers of memorials (says Lord Bolingbrooke), what compilers of the Materia Historica, were these! What genius was necessary to finish up the pictures that such masters had sketched! Rome afforded men that were equal to the task. Let the remains, the precious remains, of Sallust, of Livy, and of Tacitus, witness this truth.—

What a school of public and private virtue had been opened to us at the resurrection of learning, if the latter historians of the Roman commonwealth, and the first of the succeeding monarchy, had come down to us entire! The few that are come down, though broken and imperfect, compose the best body of history that we have; nay, the only body of ancient history that deserves to be an object of study. It fails us indeed most at that remarkable and fatal period, where our reasonable curiosity is raised the highest. Livy employed forty-five books to bring his history down to the end of the sixth century, and the breaking out of the third Punic war: but he employed ninety-five to bring it down from thence to the death of Drusus; that is, through the course of 120 or 130 years. Appian, Dion Cassius, and others, nay, even Plutarch included, make us but poor amends for what is lost of Livy. Speaking then of Tully's orations and letters, as the
best adventitious helps to supply this loss, he says, that
the age in which Livy flourished, abounded with
such materials as these: they were fresh, they were au-
tentic: it was easy to procure them; it was safe to
employ them. How he did employ them in executing
the second part of his design, we may judge from his
execution of the first; and, I own, I should be glad
to exchange, if it were possible, what we have of this
history for what we have not. Would you not be glad
my Lord, to see, in one stupendous draught, the whole
progress of that government from liberty to servitude;
the whole series of causes and effects, apparent and real,
public and private?” &c.

The encomiums bestowed upon Livy, by both an-
cients and moderns, are great and numerous. He not
only entertains like Herodotus; he also instructs and
interests in the deepest manner. But his great probity,
candour, and impartiality, are what have distinguished
Livy above all historians; for neither complaisance to
the times, nor his particular connexions with the
emperor, could restrain him from speaking well of Pom-
pey; so well, as to make Augustus call him a Pom-
pelian. This was the reason Caecilius Cordus, Te-
cotius, who relate also a great deal to the emperor’s
honour, that this gave no interruption to their friend-
ship. But what else eulogies Livy may have received
as an historian, he has not escaped censure as a writer.
In the age wherein he lived, Asinius Pollio charged
him with Patavinity; which Patavinity has been var-
iously explained by various writers, but is generally sup-
posed to relate to his style. The most common is, that
this noble Roman, accustomed to the delicacy of the
language spoken in the court of Augustus, could not
bear with certain provincial idioms, which Livy, as a
Paduan, used in divers places of his history. Pignorius
is of another opinion, and believes that this Patavinity
regarded the orthography of certain words, wherein Livy
used one letter for another, according to the custom of
his country, writing sibc and quae for sibi and quasi;
which he attempts to prove by several ancient inscrip-
tions. The expressions, however, or the orthography of
words, are not loaded with obscurity, and the per-
fectedness of the language is not confused with the pro-
vincialisms as with the purest Latinity.—Livy
has been censured too, and perhaps with justice, for
being too cedulous, and burdening his history with vul-
gar notions and superstitious tales. He may disgust
when he mentions, that milk and blood were rained from
heaven, or that an ox spoke or a woman changed her
sex; yet he candidly confesses that he recorded only
what made an indelible impression upon the minds of
a cedulous age.

Is it worth while, to mention here the capricious and
tyrannic humour of the emperor Caligula, who accused
Livy of being a negligent and cowardly writer, and resol-
vred therefore to remove his works and statues out of all
libraries where he knew they were curiously preserved?
Or the same humour in Domitian, another prodigy of
nature, who put to death Metius Pomposianus, because
he made a collection of some orations of kings and ge-

eralists out of Livy’s history? Pope Gregory the Great,
also, would not suffer Livy in any Christian library,
because of the pagan supplication wherein he was indulged:
but the same reason held good against all ancient au-
thors; and indeed Gregory’s zeal was far from being
levelled at Livy in particular, the pontiff having de-
clared war against all human learning.

Though we know nothing of Livy’s family, yet we
learn from Quintilian, that he had a son, to whom he
addressed some excellent precepts in rhetoric. An an-
cient inscription speaks also of one of his daughters,
named Livia Quarta: the same, perhaps, that espoused
the orator Lucius Magnus, whom Seneca mentions;
and observes, that the applause he usually received
from the public in his barangues, were not so much
on his own account, as for the sake of his father-in-
law.

Our author’s history has been often published with
and without the supplement of Freinsheimus. The
best editions are, that of Gronovius, cum notis vario-
rum et suis, Lugd. Bat. 1679, 3 vols. 8vo; that of
Le Clerc at Amsterdam, 1709, 10 vols. 12mo; and that
of Crevier, at Paris, 1735, 6 vols. 4to. These have
the supplements.—Learning perhaps never sustained a
greater loss, in any single author, than by the destruc-
tion of the latter and more interesting part of Livy.
Several eminent moderns have indulged the pleasing ex-
pectation that the entire work of this noble historian
might yet be recovered, and exist in an Arabic version:
and even a complete copy of the orig-
inal is supposed to have been extant as late as the year
1631, and to have perished at that time in the plunder
of Magdeburg. The munificent patron of learning
Leo X. exerted the most generous zeal to rescue from
oblivion the valuable treasure, which one of his most
bigotted predecessors, above mentioned, had expelled
from every Christian library. Bayle has preserved,
under the article Leo, two curious original letters of that
pontiff, concerning his hopes of recovering Livy; which
afford most honourable proofs of his liberality in the
cause of letters.—A lately discovered fragment of Li-
vy’s history was published in 1773 by Dr. Bruns.

LIVIUS ANDRUSICUS, a comic poet who flourished at
Rome about 240 years before the Christian era. He
was the first who turned the personal satires and descen-
nine verses, so long the admiration of the Romans, in-
to the form of a proper dialogue and regular play.
Though the character of a player, so valued and ap-
plauded in Greece, was not uncommon among the Rom-
ans, Andronicus acted a part in his dramatical composi-
tions, and engaged the attention of his audience, by repeating what he had laboured
after the manner of the Greeks. Andronicus was the
freedman of M. Livius Salinator, whose children be-
educated. His poetry was grown obsolete in the age
of Cicero, whose nicety and judgment would not even
recommend the reading of it.

LIVONIA, a large province of the Russian empire,
with the title of a duchy. It is bounded on the
north by Esthonia, on the west by the gulf of Riga,
on the south by Courland, and on the east, partly by Ples-
cow, and partly by Novgorod. It is about 200 miles
from north to south, and 150 from east to west. The
land is so fertile in corn, that it is called the granary of
the north; and would produce a great deal more, if
it was not so full of lakes. The fish that abound here are
tons, carps, pikes, flat fish, and many others. In
the forests there are wolves, bears, elk, rein-deer, stags,
and hares. The domestic animals are very numerous;
but the sheep bear very bad wool. Here are a great
number
number of forests, which consist of birch trees, pines, and oaks; and all the houses of the inhabitants are built with wood. The merchandise which they send abroad are flax, hemp, honey, wax, leather skins, and potashes. The Swedes were formerly possessed of this province, but were obliged to abandon it to the Russians after the battle of Pultowa; and it was ceded to them by the peace of the north, concluded in 1722, which was confirmed by another treaty in 1742. It formerly included Livonia, with the two islands called Osel and Dagoe. Riga is the capital.

LIVONICA-TERRA, a kind of fine bole used in the shops of Germany and Italy. It is found in Livonia, from whence it takes its name. It is in the form of little cakes.

LIVRE, a French money of account, containing 20 sols. See Money-Table.

LIXA, or LIXUS, in Ancient Geography, a town on the Atlantic near the river Lixus; made a Roman colony by Claudius Caesar; famous in mythology for the palace of Anteus and his encounter with Hercules, (Pliny.), Now Larache, 65 leagues to the south of the straits of Gibraltar.

LIXIVIOUS, an appellation given to salts obtained from burnt vegetables by pouring water on their ashes.

LIXIVIUM, in Pharmacy, &c. a ley obtained by pouring some liquor upon the ashes of plants; which is more or less powerful, as it has humbled the fixed salts contained in the ashes.

LIXNAW, a barony in the county of Kerry and province of Munster in Ireland, which gives title of baron to the earls of Kerry; the village here of this name being their ancient seat, where the castle was erected. This seat stands agreeably on the river Brick, which is here cut into several pleasant navigable canals, that adorn its plantations and gardens. W. Long. 9° 15'. N. Lat. 52° 15'.

LIZARD. See Lacerta, Erpetology Index.

LIZARD, in Geography, a cape or promontory of Cornwall, situated, according to the most common computation, in W. Long. 5° 47'. N. Lat. 49° 50'.

LLLANDAFF. See Llandaff.

LLOYD, WILLIAM, a most learned English writer and bishop, was born in Berkshire in England in 1627. He was educated under his father, rector of Sonning, and vicar of Tylehurst in Berkshire; then went to Oxford, and took orders. In 1660 he was made prebendary of Ripon; and in 1666 chaplain to the King. In 1667 he took the degree of doctor of divinity; in 1672 he was installed dean of Bangor; and in 1680 was consecrated bishop of St Asaph. He was one of the six bishops who, with Archbishop Sancroft, were committed prisoners to the tower of London, for subscribing a petition to the King against distributing and publishing his declaration for liberty of conscience. Soon after the Revolution he was made almoner to King William and Queen Mary: in 1692 he was translated to the bishopric of Lichfield and Coventry; and in 1699, to the see of Worcester, where he sat till his death, which happened in 1717, the 91st year of his age. Dr Burnet gives him an exalted character, and his works are highly esteemed.

LOACH. See Cobitis, Ichthyology Index.

LOAD, or LOBE, in Mining, a word used especial-ly in the tin-mines, for any regular vein or course, whether metallic or not; but most commonly load means a metallic vein. When the substances forming these loads are reducible to metal, the loads are by the English miners said to be alive; otherwise they are termed dead loads.

In Cornwall and Devonshire the loads chiefly hold their course from eastward to westward, though in other parts of England they frequently run from north to south. See Veins, Geography Index.

LOAD is also used for nine dishes of ore, each dish being about half a hundred weight.

LOADSTONE. See Magnet.

LOADS, in Natural History, are defined to be masses composed of dissimilar particles, stiff, dense, hard, and rough to the touch; not easily broke while moist, readily diffusible in water, and composed of sand and a tough viscid clay. Of these loads some are whitish, and others brown and yellow.

LOAN, any thing given to another, on condition of return or payment.

Public Loans. See Funds and National Debt.

LOANDA, a province of the kingdom of Angola in Africa. It is an island about 15 miles in length, and three in breadth; remarkable chiefly for the capital of Angola situated upon it, in E. Long. 12° 25'. S. Lat. 8° 45'. This town was built by the Portuguese in 1578, under the direction of the first Portuguese governor in these parts. It is large, populous, and pleasantly seated on the declivity of a hill near the sea-coast, and facing the south-west. The island is supplied with fresh water from wells dug in it; and which are not sunk below the depth of three feet when they are filled with excellent water. It is remarkable, however, that the water of these wells continues good only during the time of high tide; for, as that sinks, the water becomes more and more brackish, till at last it is quite salt, almost as much as the sea itself. On the coast of this island are fished the zimbis, or shells used in several parts of Africa instead of money; and with these shells, instead of coin, is carried on a great part of the traffic of this country.

LOANGO, a kingdom of Africa, extending itself about 180 geographical miles in length from south to north; that is, from Cape St Catherine under the second degree of south latitude, to a small river called Lovando Louisa, on the fifth degree of the same. From west to east it extends from Cape Negro on the coast towards the Buchumakeen mountains, so called on account of the vast quantity of ivory and great droves of elephants, about 300 miles. It is divided into four principal provinces, viz. those of Lovangiri, Lango-mogo, Chilongo, and Piri.

The inhabitants are very black, well shaped, and of a mild temper. The men wear long petticoats, from the waist downwards, and have a piece of cloth round their waist. The women's petticoats are made of straw. This country abounds with poultry, oxen, cows, sheep, goats, elephants, leopards, civet-cats, and other animals; so that here are great quantities of elephants' teeth, and fine furs, to be traded for.

The capital city, where the king resides, called Loungo, and in the language of the negroes, Boaric, is situated in South Lat. 42° 45' degrees, a league and a half from
from the sea-coast, and is shaded and adorned with bananas, and other trees. The king, who resides in a large palace in the middle of it, has about 1,500 concubines. If any of them is surprised in adultery, she and her paramour are instantly conveyed to the top of a very high hill, whence they are hurled down headlong from the steepest place.

Every man marries as many wives here as he please, who are obliged to get their husbands a livelihood, as is the practice all along the African coast inhabited by blacks. The women, therefore, cultivate the land, sow and reap, while the lazy husbands latter away their time in idleness.

The king's revenue consists in elephants' teeth, copper, and a kind of petticots made of palm-tree leaves, and called *lavorus*; he has whole stores-houses full of these lavours; but his greatest riches consist in slaves of both sexes.

LOBBY, in Architecture, is a small hall or waiting-room: it is also an entrance into a principal apartment, where there is a considerable space between that and a portico or vestibule, and the length or dimensions will not allow it to be considered as a vestibule or an anteroom. See *Antichamber*.

LOBE, in Anatomy, any fleshy protuberant part, as the lobes of the lungs, the lobes of the ears, &c.

LOBELIA, Cardinal-flower; a genus of plants belonging to the synesium class; and in the natural method ranking under the 29th order, Campanulaceae. See *Botany Index*.

LOBETUM, anciently a town of the Hither Spain: said to have been built by the Libyan Hercules, (Pliny). Now Albarazin, a town of Arragon on the confines of New Castile, on the river Guadalquivir. E. Long. 2 N. Lat. 40. 40.

LOBO, JEROME, a Jesuit missionary, was born at Lisbon in the year 1593. He became a member of the Jesuit society at 16 years of age, and in 1622 went out as a missionary to the East Indies. He sailed to the coast of Mozambique, after making some stay at Goa; and afterwards penetrated into Abyssinia, where his zeal and resolution brought on him the hatred of the monks, from which he incurred much danger and suffering. As he returned to Portugal he was shipwrecked on the coast of Natal, where seven months were spent in constructing shallows to bring them away. One of them foundered, but that in which Father Lobo sailed arrived safe at Angola. After a variety of adventures he arrived at Lisbon; and he employed himself in the cause of the Ethiopian mission both at Madrid and Rome. He took a second voyage to the Indies, where he was made rector of the house at Goa. He returned to Lisbon in 1658, and was chosen rector of the college of Coimbra, where he died in 1678, at the age of 84.

Lobo wrote an historical account of Abyssinia in the Portuguese language, which contains information both curious and valuable. It was translated into French by the abbé le Grand in 1740, and 1728; and the earliest production of Dr Samuel Johnson was an abridged version of this work.

LOBSTER, a species of cancer. See *Cancer*, *Entomology Index*.

LOCAL, in Law, something fixed to the freehold, or tied to a certain place; thus, real actions are local, since they must be brought in the country where they lie; and local customs are those peculiar to certain countries and places.

LOCAL Medicien, those destined to act upon particular parts; as fomentations, episthmes, vesicatories, &c.

LOCARNO, a town of Switzerland, capital of a bailiwick of the same name, seated at the north end of the lake Maggiore, near the river Magia. It carries on a great trade; and the country abounds in pastures, wine, and fruits. It contains 1,500 inhabitants. E. Long 8 31. N. Lat. 46. 45.

LOCHABER, a district of the shire of Inverness in Scotland. It is bounded by Moysten to the west, Glengary to the north, Bardenoch to the east, and Lorn to the south. It derives its name from the lake or loch Aber; and extends about 20 miles from east to west, and 30 from north to south. The country is barren, bleak, mountainsous, and rugged. Near the mouth of the river Aber, in the centre between the West and North Highlands, stands Fort William, with the town of Maryburgh, built upon a navigable arm of the sea, not far from the foot of Benvenis. The town, designed as a sutlery for the garrison, was erected into a borough; and the fort itself was designed as a check upon some of the clans, who had been guilty of depredations and other irregularities. Lochaber is inhabited mostly by Macdonalds, Camerons, and Mackintoshes. The castle of Macdonald of Glengary, in this district, was burnt to the ground in the year 1715, in consequence of his declining for the Pretender. The elegant house and gardens belonging to Cameron of Lochiel underwent the same fate, for the same reason, in the year 1746.

LOCHLIE, in Midwifery, a flux from the uterus consequent to delivery. See *Midwifery*.

LOCK, a well-known instrument used for fastening doors, chests, &c., generally opened by a key.

The lock is reckoned the master-piece in smithery; a great deal of art and delicacy being required in contriving and varying the wards, springs, bolts, &c., and adjusting them to the places where they are to be used, and to the various occasions of using them.

From the various structure of locks, accommodated to their different intentions, they acquire various names. Those placed on outer doors are called stocklocks; those on chamber doors, spring-locks; those on trunks, trunk-locks, pad-locks, &c.

Of these the spring-lock is the most considerable, both for its frequency and the curiosity of its structure. Its principal parts are, the main-plate, the cover-plate, and the pin-hole: to the main-plate belong the key-hole, top-hook, cross-wards, bolt-tee or bolt-knab, draw-back, spring-tumbler, pin of the tumblers, and the staples; to the cover-plate belong the pin, main-ward, cross-ward, step-ward or daw-ward; to the pin-hole belong the hook-ward, main cross-ward, shank, the pot or bread, bow-ward, and bit.

As on the proper construction of locks the security of the most valuable kinds of property almost entirely depends, and as numberless devices are continually fallen upon to elude the utmost efforts of mechanical invention in this respect, it thence becomes an object of no small importance to invent a lock which it should be impossible to open except by its proper key. A treatise upon this subject has been published by Mr Joseph...
Loc. A Brahman; who is confident that he has brought
the matter to the requisite perfection, and that every
one may rest assured of the security of his property
when under the protection of a lock of his invention.
He begins with observing, that the principle on which
all locks depend, is the application of a lever to an
interior bolt, by means of a communication from with-
out; so that, by moving the lever, the bolt is made
upon the bolt, and moves it in such a manner as to
secure the lid or door from being opened by any pull
or push from without. The security of locks in ge-
gerall therefore depends on the number of impediments
we can interpose between the lever (the key) and
the bolt which secures the door: and these impediments
are well known by the name of wards, the number and
intricacy of which alone are supposed to distinguish a
good lock from a bad one. If these wards, however,
do not in an effectual manner preclude the access of all
other instruments besides the proper key, it is still
possible for a mechanic of equal skill with the look-
maker to open it without the key, and thus to elude
the labour of the other.

"Locks (says our author) have been constructed,
and are at present much used and held in great esteem,
from which the picklock is excluded: but the admis-
sion of false keys is an imperfection for which no lock-
smith has ever found a corrective; nor can this imper-
fection be remedied whilst the protection of the bolt
is wholly confided to fixed wards." This position is
proved by a remark, that the locks, let them be as
intricate as we please, must all be expressed on what is
called the dit or web of the key: and therefore when
all the variations that can be expressed on this bit or web
have been run through, every succeeding key must be
the counterpart of some other; and consequently the
same key which opens one will open the other also.
This is evident from the locks usually put upon drawers
and which, though they should be made to resist the
picklock, are still liable to be opened by ten thousand
other keys besides that appropriated to each of them.
But though the variety of wards could be augmented
even to infinity, still there would be no security against
false keys; for as every one of the wards must be ex-
pressed on the web of the key, if another key with a
web quite plain be made to fit the key-hole exactly,
we have only to cover it over with some colouring sub-
stance upon which the wards may make an impression;
whereafter, it is easy to cast out the web in a proper
manner for admitting them, when the lock will be as
easily opened by the false as by the true key.

The first person, according to our author, who had
any claim to merit in the branch of lock-making, is
Mr Baran; whose lock he acknowledges to be by far
more perfect and secure than any that ever appeared
before: though he still considers it as unfit for giving
that absolute security which is to be wished for. His
improvement consisted in the proper application of
what are called tumblers. "These (says Mr Brahman)
are a kind of grapple; by which the bolt is confined,
as well in its active as in its passive station, and rendered
immovable till set at liberty by the key. One of
these instruments is commonly introduced into all locks
that are of any use or value: it is lodged behind the
bolt, and is governed by a spring which acts upon the
bumbler as the tumbler acts upon the bolt: The ap-
pliation therefore of any force to the tumbler, which
is superior to the force of the spring, will cause it to
quit its hold, and set the bolt at liberty." In the
common method of applying these machines, however,
it matters nothing how far the tumbler is lifted above
the point at which it ceases to control the bolt; but
is otherwise in those of Mr Baran's construction.
The motion of his tumblers is circumscribed by a cer-
tain space cut in the centre of the bolt and sufficient
only to answer the purpose intended. The space in
which the tumbler moves is an oblong square;
and is not only furnished with niches on the under side,
into which the hooks of the tumblers are forced by the
spring as in other locks, but is provided with cor-
respondent niches on the other side, into which the
hooks are driven, if any greater force be applied to
the tumblers than what is just sufficient to disengage
them from the bolt. Hence it becomes absolutely necessary,
in the making of a false key, to construct it in such a
manner, that it may with the greatest exactness give
the requisite degree of pressure and no more.

Mr Brahman allows that this is a very great improve-
ment, but objects that it is still possible to frame a key
which will open it as well as its own; nor will the addi-
tion of any number of tumblers preclude the possi-
bility of opening it. "By giving (says he) an uniform
motion to the tumblers, and presenting them with a
face which exactly taliets with the key, they shall par-
take, in a very great degree, of the nature of fixed
wards; and the security of this lock is thereby render-
ed in a proportionable degree defective. Thus, sup-
pose the false key to have passed the wards, and to be
in contact with the most prominent of the tumblers,
the impression, which the slightest touch will leave on
the key, will direct the application of the file till
sufficient space is prepared to give it a free passage.
The key will then bear upon a more remote tumbler;
which difficulty being in manner got over, the
lock will be as easily opened by the false as by the true
key."

This seemingly insuperable objection to the perfe-
tion of lock-making, however, our author removes with
the greatest ease imaginable, by causing the tumblers
which project unequally to present a plane surface:
whence they would require a separate and unequal re-
nition to disengage them; of consequence no distinct
impression could be made by them upon the plane surface
of the web that would give any idea of their positions
with regard to one another, and the construction of a
false key would be altogether impossible.

But though the principal difficulty with regard to
Mr Baron's lock be now overcome, others still occur,
viz. the difficulty of making locks which are construct-
ed with tumblers sufficiently durable. The tumblers
themselves, he observes, must be but slightly made;
and being exposed to perpetual friction by the key and
their own proper motion, they must soon decay; and
the keys of Mr Baron's locks, he also observes, are
much less durable than those of any other locks he
ever saw.

With regard to the lock which Mr Brahman pre-
sents to the public as absolutely perfect, he informs
us, that the idea of constructing it was first suggested
by the alarming increase of house robberies, which may
reasonably be supposed to be perpetrated in a great

H
Locks are measure by pernicious servants, or accomplished by their connivance. Thus it is evident, that the locks which might exclude ordinary housebreakers could be no security against faithless servants, who having constant access to the locks, might easily get false keys fabricated at their leisure. In considering the subject, our author was convinced, that his hope of success depended entirely upon his using means as dissimilar as possible to those by which the old locks were constructed; as these, however varied, had been found insufficient for the purpose. "As nothing (says he) can be more opposite in principle to fixed wards than a lock which derives its properties from the motion of all its parts, I determined that the construction of such a lock should be the subject of my experiment." In the prosecution of this experiment he had the satisfaction to find, that the least perfect of all his models fully ascertained the truth and certainty of his principle. The exclusion of wards made it necessary to cut off all communication between the key and the bolt, as the same passage, which (in a lock simply constructed) would admit the key, might give admission likewise to other instruments. The office, therefore, which in other locks is performed by the extreme point of the key, is here assigned to a lever, which cannot approach the bolt till every part of the lock has undergone a change of position. The necessity of this change to the purposes of the lock, and the absolute impossibility of effecting it otherwise than with the proper key, are the points to be ascertained; and this our author does in the following manner.

Plate XCVI. Figure shows Mr. Braham's first attempt to construct a lock upon this principle: which, to his surprise, turned out complete and perfect. A represents a common axis on which the six levers, crossing the face of the lock, are united as on a joint. Each of these rests upon a separate spring sufficiently strong to bear its weight; or, if depressed by a superior force, to restore it to its proper position when that force is removed. B represents a frame through which the levers pass by separate grooves, exactly fitted to their width, but of sufficient depth to allow them a free motion in a perpendicular direction. The part which projects from the opposite side of the joint A, and is inserted in the bolt C, is a lever to which two offices are assigned; one to keep the bolt in a fixed position, in the absence of the key; the other, to give it its proper motion upon the application of the key. D is a circular platform turning upon a centre. On this the joint or carriage of the levers, and the springs on which they rest, are fixed; and the motion of the platform impels the bolt in either direction, by means of the lever which is projected from the joint A. The inviolable restraint upon this lock, by which means it is subjected only to the action of the key, is lodged in the part E, which is a thin plate, bearing at each extremity on a block, and having of course a vacant space beneath, equal in height to the thickness of the blocks on which it rests. By this plate the motion of the machine is checked or guided in the following manner: On the edge of the plate which faces the movement there are six notches which receive the ends of the levers projecting beyond the frame B; and while they are confined in this manner the motion of the machine is so totally suspended as to defy every power of art to overcome.

To understand in what manner the proper key of this lock overcomes these obstacles, it must be observed, that each lever has a notch on its extremity, and that those notches are disposed as irregularly as possible. To give the machine a capacity of motion, these notches must be brought parallel to each other, and by a distinct but unequal pressure upon the levers, be formed into a groove in a direct line with the edge of the plate E, which the notches are exactly fitted to receive. The least motion of the machine, while the levers are in this position, will introduce the edge of the plate into the groove; which, controuling the power of the springs, will give liberty to the levers to move in a horizontal direction as far as the space between the blocks which support the plate E will admit, and which is sufficient to give the machine power of acting on the bolt. The impossibility of thus bringing the notches on the points of the levers into a direct line, so as to tally with the edge of the plate E by any other means than the motion and impulse of the key, is that which constitutes the principal excellency of this lock.

The key (fig. 2.) exhibits six different surfaces, against which the levers are progressively admitted in the operation of opening the lock: the irregularity of these surfaces shows the unequal and distinct degree of pressure which each lever requires to bring them to their proper bearings, in order to put the machine in motion. Hence it appears, that unless the various heights of the surfaces expressed on the bit of the key are exactly proportioned to the several distances necessary to bring the notches into a straight line with each other, they must remain immoveable; and (says our author) as one stroke of a file is sufficient to cause such a disproportion as will prove an insurmountable impediment to their motion, I may safely assert, that it is not in art to produce a key or other instrument, by which a lock, constructed upon this principle, can be opened.

On this principle it would even be a matter of great difficulty for any workman, however skilful, to construct a key for the lock when open to his inspection: for the levers being raised, by the subjacent springs, to an equal height in the frame B, present a plane surface; and consequently convey no direction that can be of any use in forming a tally to the irregular surface which they present when acting in subjection to the key. Unless therefore we can contrive a method to bring the notches on the points of the levers in a direct line with each other, and to retain them in that position till an exact impression of the irregular surface, which the levers will then exhibit, can be taken; the workman will be unable to fit a key to the lock, or to move the bolt. This process must be rendered extremely troublesome by means of the springs; and if such difficulties occur, even when the lock is open to the inspection of a skilful workman, much more must we suppose it out of the power of one who has not access to the internal parts to make a false key to a lock of this kind.

These difficulties render it necessary in making locks of this kind not to fit the key to the lock, as is usual
in other locks, but to fit the lock to the key. In this kind of lock, therefore, the key must be made first; and the inequalities upon the surface of the bit worked as chance or fancy may direct, without any reference to the lock. The key being thus completed, and applied to the surface of the levers, will, by a gentle pressure, force them to unequal distances from their common station in the frame B, and sink their points to unequal depths into the space beneath the plate E. While the levers are in this position, the edge of the plate E will mark the precise point at which the notch on each lever must be expressed. The notches being cut by this direction, the irregularity which appears when the levers resume their station in the frame B, and the inequality of the recesses on the bit of the key, will appear as a seal and its corresponding impression.

The following is a lock contrived upon the same principle, but more curious; and, in our author's opinion, more extensively useful. Fig. 3. represents a circular block of metal divided from the centre into eight compartments, each containing a cell which forms a passage through the block, as is represented by the small circles described on the flat surface A. In each of these cells two grooves are cut at opposite points, which open a communication with the centre at one point, and with the spherical surface of the block or barrel at the other. The small circle, which marks the centre of the flat surface A, is the key-hole, which likewise forms a passage through the barrel in a parallel line with the cells which surround it. This figure represents the frame in which the active parts of the lock are deposited.

Fig. 4. shows a spiral spring lodged in the bottom of each cell, and occupying one half of the space, the other being filled with a slider resting upon the spring, and represented by fig. 5. The office of these sliders exactly corresponding with that of the levers in the lock already described. Thus, when lodged in their respective cells, they are sustained, like the levers, by the elasticity of the springs upon which they rest, till a superior power be applied; and they are again restored to their stations by the reaction of the springs when the weight is removed. The side B of each slider is projected beyond the circular surface, as represented fig. 6. in a manner similar to the projection of the levers in the former lock beyond the curved frame in which they move. The point C is projected through the interior groove into the space which forms the centre or key-hole, expressed on the flat surface A.

Fig. 7. represents the key. When this is applied, it must of course encounter these interior projections; and when pressed forward, the indented space on its point being unequal, will force the sliders to unequal distances from their bearers; bringing the notches expressed on their exterior projections in a direct line with each other, in a manner similar to that by which the effect is produced upon the levers in the former lock. When the key is withdrawn, and the sliders resume their stations by the pressure of the springs, the disposition of the notches must be irregular in the same proportion that the indentations on the point of the key are unequal; and they must necessarily fall again into a straight line when acted upon by the key.

Fig. 6. shows the barrel completely fitted for action. Its interior end is capped with a plate, which unites its compartments, and confines the springs and sliders within the cells to which they belong. From that plate proceeds the point A, which represents the lever by which the bolt is projected or withdrawn, according to the direction in which the machine performs its revolution.

Fig. 8. shows the flat surface of a thin plate, corresponding in its office with the part C of the former lock. The space cut in its centre is exactly fitted to the spherical surface of the barrel; the circle describing its circumference, and the notches cut on its edge coinciding with the projections of the sliders. The barrel, when circled with this plate at the middle of its spherical surface, has its motion totally suspended till the notches on the projections of the sliders are forced, by the pressure of the key, into a line with each other; a groove being thus formed on the spherical surface of the barrel parallel to, and coinciding with, the edge of the plate, the machine is at liberty to perform a revolution in any direction, but returns to its confined state when the key is withdrawn.

The parts of the movement being thus united, the interior end of the barrel is deposited in a bed represented fig. 9. To this it is fastened at the angles of the plate represented fig. 8. by which the barrel is encircled. The station of the bolt is at A; the lever which acts upon it being projected on the other side. Fig. 10. is a cap or mask which covers the face of the movement, and completes the lock.

On this lock our author observes, that it is excellent for street doors: "For no method of robbery (says he) is more practised, than gaining admittance into houses by those keys, which, as is well known, may be procured at the old iron shops to fit almost any lock in use. Such robberies are generally committed where the servants are allowed to take the key with them when sent on errands, it being impracticable while the key is fixed in the lock. The variations, by which the production of corresponding keys is avoided, have two sources; the one arising from the changes that may be made in the disposition of the levers; the other from the number of points contained on the projected surface of each lever; by which the position of its notch may, in the smallest degree, be varied.

"The variations producible in the dispositions of six figures only, are 720: these, being progressively multiplied by additional figures, will increase by astonishing degrees; and eventually show, that a lock containing twelve levers will admit of 479,001,500 changes; which, with the addition of another lever, will increase to 6,427,020,800. These being again multiplied by the number of changes which the projected surface of the levers will admit in the disposition of the notches, their amount will exceed numeration, and may therefore be properly said to be infinite. The slightest inspection will at once show, that their construction precludes all possibility of obtaining an impression of their internal parts, which is necessary for the fabrication of a false key; for it will be easily seen, that the positions into which the levers are forced by the pressure of the key in opening the lock, can no more be ascertained when the key is withdrawn, than the seal can be copied from its impression on a fluid, or the course of a ship be discovered by tracing it on the surface of the waves.
waves. But inviolable security is not the only excellence they possess; the simplicity of their principle gives them likewise a great advantage over locks that are more complicated, in point of duration; for their essential parts being subject to no friction, nor exposed to any possible accident from without, they will be less affected by use, and less liable to stand in need of repair.

Locke, or Weir, in inland navigations, the general name for all those works of wood or stone made to confine and raise the water of a river: the banks also which are made to divert the course of a river, are called by these names in some places. But the term lock is more particularly appropriated to express a kind of canal enclosed between two gates; the upper called by workmen the sluice gate, and the lower called the flood gate. These serve in artificial navigations to confine the water, and render the passage of boats easy in passing up and down the stream.

LOCKE, JOHN, an eminent English philosopher and writer in the latter end of the 17th century, was son of Mr John Locke of Pensford in Somersetshire, and born at Wrington, near Bristol, in 1632. He was sent to Christ-church in Oxford; but was highly dissatisfied with the common course of studies then pursued in the university, where nothing was taught but the Aristotelian philosophy; and had a great aversion to the disputes of the schools then in use. The first books which gave him a relish for philosophy were the writings of Des Cartes: for though he did not always approve of his notions, yet he thought he wrote with much perspicuity. He applied himself with vigour to his studies, particularly to physic, in which he gained a considerable knowledge, though he never practised it. In 1664, he went to Germany as secretary to Sir William Swan, envoy from the English court to the elector of Brandenburg and some other German princes. In less than a year, he returned to England; where, among other studies, he applied himself to that of natural philosophy, as appears from a register of the changes of the air, which he kept at Oxford from June 24, 1666, to March 28, 1667. There he became acquainted with the lord Ashley, afterwards earl of Shaftesbury, who introduced him into the conversation of some of the most eminent persons of that time. In 1670, he began to form the plan of his Essay on Human Understanding; but his employments and avocations prevented him from finishing it then. About this time he became a member of the Royal Society. In 1672, his patron, now earl of Shaftesbury, and lord chancellor of England, appointed him secretary of the presentations, which place he held till the earl resigned the great seal. In 1673, he was made secretary to a commission of trade, worth 200l. a-year; but that commission was dissolved in 1674. The earl of Shaftesbury being restored to favour, and made president of the council in 1679, sent for Mr Locke to London; but that nobleman did not continue long in his post, being sent prisoner to the Tower; and after his discharge retired to Holland in 1682.

Mr Locke followed his patron thither. He had not been absent from England a year, when he was accused at court of having written certain tracts against the government, which were afterward discovered to be written by another person; and in November 1684, he was deprived of his place of student in Christ-church. In 1685, the English envoy at the Hague demanded him and 83 other persons to be delivered up by the states general: upon which he lay concealed till the year following; and during this time formed a weekly assembly with Mr Linmborch, Mr Le Clerc, and other learned men at Amsterdam. In 1689 he returned to England in the fleet which conveyed the princess of Orange; and endeavoured to procure his restoration to his place of student of Christ-church, that it might appear from thence that he had been unjustly deprived of it: but when he found the college would admit him only as a supernumerary student, he desisted from his claim.

Being esteemed a sufferer for revolution principles, he might easily have obtained a more profitable post; but he contented himself with that of commissioner of appeals, worth 200l. a-year. A year's service was procured for him by the lord Marquess; and about the same time he was offered an appointment in a diplomatic character, but the infirm state of his health prevented him from accepting it. He went afterwards to reside with Sir Francis Metam and his lady, at Oates in Essex, about 25 miles from London, where he spent most of his time during the rest of his life. In this agreeable situation he enjoyed that health and vigour which enabled him to exert his talents in writing upon political subjects. Hence he appears in defence of the revolution in one piece; and considering the great national concern at that time, the ill state of the silver coin, and proposing remedies for it, in others. Hence he was made a commissioner of trade and plantations in 1695, which engaged him in the immediate business of the state; and with regard to the church, he published a treatise the same year, to promote the scheme which King William had much at heart, of a comprehensive with the dissenters. This, however, drew him into one controversy; which was scarcely ended, when he entered into another in defence of his essay, which he held till 1698; soon after which the asthmatic, his constitutional disorder, increasing with his years, began to subdue him; and he became so infirm, that in 1700 he resigned his seat at the board of trade, because he could no longer bear the air of London sufficient for a regular attendance upon it. After this resignation he continued altogether at Oates; in which retirement he employed the remaining last years of his life entirely in the study of the Holy Scriptures.

He died in 1704, aged 73. His writings will immortalize his name. The earl of Shaftesbury, author of the Characteristics, though in one place he speaks of Mr Locke's philosophy with severity, yet observes, concerning his Essay on the Human Understanding, in general, "that it may qualify men as well for business and the world, as for the sciences and the university." His Discourses on Government, Letters on Toleration, and Commentaries on some of St Paul's Epistles, are also held in much esteem.

LOCKED JAW. See Medicine Index.

LOCKMAN, an officer in the isle of Man, who executes the orders of government, much like our under sheriff.

LOCKMAN, an eastern philosopher. See LOKMAN.

LOCLE, a town in a district of the same name in
LOG [ 62 ] LOG

Loca, in Switzerland, adjacent to Neuchatel and Yallon, and united with another named La Guign and Poulov. But these districts occupy some valleys formed by the mountains of Jura; the greatest part of which, not many years ago was one continued forest, though now converted into fine pasture ground filled with flourishing villages. The inhabitants are remarkable for their industry, and excel in many mechanical arts, particularly in watch and clock making; 40,000 watches, it is said, are made in a year. The most singular object at this place, is three subterranean mills, crested on the river Bied, vertically above one another, and 100 feet below the surface of the ground.

Locri, or Locrub Epiestry, in Ancient Geography, a town on the Ionian sea near the promontory Zephyrium. The people are said to be the last who used a code of written laws, compiled by Zaleucus from the laws of the Cretans and others.

Locris, a country of Achaia in Greece; twofold, and divided by Mount Parnassus. The Hither was occupied by the Locri Aolans, called also Zephyrius, or Western, contained between Aetia and Phocias. The Former, or Eastern, was beyond Paros and the town of Thermopylae, and reaching to the Euripus of Euboea; occupied by the Locri Oppuntii, and Episcopi, who were called the Eastern Locri.

Locus Geometricus, denotes a line by which a local or indeterminate problem is solved.

A locu is a line, any point of which may equally solve an indeterminate problem. Thus if a right line suffice for the construction of the equation, it is called locus ad rectum; if a circle, locus ad circulum; if a parallelogram, locus ad parallelogram; if an ellipse, locus ad ellipsis; and so of the rest of the conic sections.

Loculamenta, and Loculi, in Botany, cells or pockets: the internal divisions of a capsule, or other dry seed vessel, enclosing the seeds.

Locust. See Gryllus, Entomology Index.

Locust-Eaters. See Acridopsagia.

American Locust, or Frog-hopper. See Cicada, Entomology Index.

Locust Tree. See Hymenaea and Gleditsia, Botany Index.

Locutius, in Mythology, the god of speech among the Romans, called by Livy Anis Locutius.

Luctorium. A hall or apartment in monasteries, where the monks and other religious met after dinner to converse together.

Lodi, a walled town of Austrian Lombardy, situated on the Adda, in 45° 20' N. Lat. and 9° 30' E. Long. It has a cathedral, 9 churches, and 26 convents, and about 12,000 inhabitants. Here Bonaparte defeated the Austrians in 1796.

Lodgment, in military affairs, a work made by the besiegers in some part of a fortification (after the besieged have been driven out), to maintain it, and be covered from the enemy's fire.

LOG, in the Jewish antiquities, a measure which held a quarter of a cab, and consequently five-sixths of a pint. There is mention of a log, 2 Kings vi. 25, under the name of a four part of a cab. But to Levi- ticus the word log is often met with, and signifies the measure of oil which lepers were to offer at the temple after they were cured of their disease. De Ar-Bothnre says, that the log was a measure of liquids, the seventy-second part of the bath or ephah, and the twelfth part of the hin, according to all the accounts of the Jewish writers.

LOG, a sea term, signifying a small piece of timber, (Fig. 3.) of a triangular, sectorial, or quadrilateral figure, on board a ship, generally about a quarter of an inch thick, and five or six inches from the angular point to the circumference. It is balanced by a thin plate of lead, nailed to the arch, or circular side, so as to swim perpendicularly in the water.

Log-line, a little cord, or line, about a hundred and fifty fathoms long, fastened to the log by means of two legs a b (Fig. 4.), one of which passes through a hole at the corner, and is knotted on the opposite side, while the other leg is attached to the arch by a pin fixed into another hole, so as to draw out occasionally. By these legs the log is hung in equilibrium; and the line thus annexed to it is wound round a reel (Fig. 2.), fixed for that purpose in the gallery of the ship.

This line, from the distance of about ten, twelve, or fifteen fathoms off, the log has certain knots or divisions, which ought to be at least fifty feet from each other; though it was the common practice at sea not to have these above forty-two feet toward.

The length of each knot ought to be the same part of a sea mile as half a minute is of an hour; and admitting the measurement of Mr. Norwood, who makes a degree on a great circle of the earth to contain 367,200 English feet, or about 693 English statute miles, and therefore 10th part of it, or a nautical mile, will be 6120 feet; 62' of 6120, or 41 feet, should be the length of each knot. But because it is safer to have the reckoning rather before the ship than after it, therefore fifty feet may be taken as the proper length of each knot. The knots are sometimes made to consist only of forty-two feet each, even in the present practice; and this method of dividing the log-line was founded on the supposition that 60 miles, each of 5000 English feet, made a degree; for 70 of 5000 is 4111, or, in round numbers, 42 feet. Mariners rather than quit the old way, though known to be erroneous, use glasses for half minute ones, that run but 24 or 25 seconds. They have also used a line of 35 feet or 30 seconds, or a glass of 28 seconds to 42 feet. When this is the case, the distance between the knots should be corrected by the following proportion: as 30 is to 50; so is the number of seconds of the glass to the distance between the knots upon the line. The heat or moisture of the weather has often a considerable effect upon the glass, so as to make it run slower or faster; it should, therefore, be frequently tried by the pendulum in the following manner.

On a round sail hang a string that has a musket ball fixed to one end, carefully measuring between the centre of the ball and the string's loop over the peg 35 inches, being the length of a second pendulum; then swing it, and count one for every time it passes under the peg, beginning at the second time it passes, and the number of swings made during the time the glass is running out shows the seconds is contained. The line also is liable to relax and shrink, and should therefore be occasionally measured.

The use of the log and line is to keep account and make an estimate of the ship's way or distance run; which is done by observing the length of line unwound in half a minute's time, told by a half-minute glass; for so many knots as run out in that time, so many miles.
The author of this device for measuring the ship’s way is not known; and no mention of it occurs till the year 1627, in an East India voyage published by Purchas; but from that time its name occurs in other voyages among his collections; and henceforward it was taken notice of by both our own authors and by foreigners; as by Gunter in 1623; Snellius in 1624; and almost by all the succeeding writers on navigation.

To Heave the Log, as they call it, they throw it into the water on the lee-side, letting it run till it comes without the eddy of the ship’s wake; then one holding a half minute glass, turns it up as just the first knot, or the mark from which the knots begin to be reckoned, turns off the reel (fig. 2.) or passes over the stern. As soon as the glass is out, the reel is stopped, and the knots run off are told, and their parts estimated.

It is usual to heave the log once every hour in ships of war and East Indiamen, and in all other vessels once in two hours, allowance being made for the wind having increased or abated in the intervals.

The log is a very precarious way of computing, and must always be corrected by experience, there being much uncertainty from the motions of the ship, the winds of variable force, the friction of the reel and lightness of the log in the course of the current. Yet this is a much more exact way of computing than any other in use; much preferable certainly to that of the Spaniards and Portuguese, who guessed at the ship’s way by the running of the froth or water by the ship’s side, or to that of the Dutch, who used to heave a chip overboard, and to number the paces they walk on the deck while the chip swims between any two marks or bulk heads on the side.

Compound Log. The above-mentioned errors, and particularly the log’s being subject to drive with the motion of the water at its surface, whereas the experiment requires it to be fixed in the place where it is when the mark commencing the knots goes off the reel, have been considered, and many methods proposed to remove or to lessen them. M. Bouguer proposed the following method. Take for the log a conical piece of wood, which fix to the log-line passed through or along its axis, at about 40, 50, or 60, or more feet, from one end; and to this end fix the diver, which is a body formed of two equal square pieces of tin, or of thin iron plate, fixed right angles to one another along their diagonals; and its size so fitted to that of the cone, that the whole may float. A cone of three inches diameter in the base, and of six inches in the slant height, is proposed by M. Bouguer to suit a diver made of plates about 2½ inches square; the intersection of the diagonals is joined to the log-line, and the loop and peg fixed as in the common log. However, it has been found, that no kind of wood used in British dockyards, when formed into a cone of the above dimensions, will float a diver made of stout tin-plates, one side of the square being 2½ inches. Such a diver weighing 2½ lb. avoirdupois, required to float it a cone of five inches diameter and twelve inches on the slant side, so as the point of the cone, which was made of light fir, should just appear above the water. Now, supposing one side of such a square tin diver to be about ten inches, and made of plates only two-thirds of the thickness of the former, such a diver would weigh, with its solder about 20 ounces, and can be floated by a light fir cone of four inches diameter in the base, and ten inches in the slant height or length; and such a compound log might perhaps be found on trial to be affected by about as much again as that proposed by M. Bouguer; and consequently the difference between the numbers given by the common log and compound log, must be augmented by two-thirds of itself for the necessary correction as below. When the compound log of Bouguer, above described, is hove overboard, the diver will sink too deep to be much affected by the current or motion of water at the surface, and the log will thereby keep more steadily in the place where it first fell; and consequently the knots run off the reel will show more accurately the ship’s rate of sailing. As the common log is affected by the whole motion of the current, so this compound log will feel only a part thereof, viz. such a part nearly as the resistance of the cone is to the resistance of the diver; then the resistances of the above cone and diver are about as 1/5; and consequently this log will drive but one-fifth part of what the common log would do; and so the ship’s true run will be affected by one-fifth only of the motion of the waters. To obtain the true rate of sailing, it will be proper to heave alternately, hour and hour, the common log, and this compound log; then the difference of their knots run off, augmented by its one-fourth part, is the correction, which applied to the knots of the common log, will give the ship’s true rate of sailing at the middle time between the hours when these logs were hove. The correction is additive when the compound log’s run is the greatest, otherwise it is subtractive. To find the course made good: increase the observed angle between the log lines by one-fourth part; and this gives the correction to be applied to the apparent course, or the opposite of that shown by the common log; the correction is to be applied to the right of the apparent course, when the bearing of the common log is to the left of the compound log. Or, thus: the lengths run off both logs, together with their bearings, being known; in a card or compass apply the knots run off, taken from a scale of equal parts along their respective bearings from the centre; join the ends; and in this line produced, on the side next the compound log’s length, take one-fourth of the interval; then a line drawn from the end, thus produced, to the centre of the card, will show the true course and distance made good. When a current, such as a tide, runs to any depth, the velocity of that current may be much better ascertained by the compound log than by the common one; provided the diver does not descend lower than the run of the current; for as those ships which are deepest immersed, drive fastest with the tide; so the diver, by being acted on below, as well as the log on the surface, their joint motion will give the total effect of the current’s motion better than what could be derived from the motion at the surface only. Also, by such a compound log, the depth to which any current runs may be easily tried.

Other Logs. We have an account in the voyage to the North.
North Pole, p. 97. of two other logs, which were tried by Captain Phipps: one invented by Mr. Russel, the other by Foxon; both constructed upon this principle, that a spiral, in proceeding in its own length in the direction of its axis through a resisting medium, makes one revolution round the axis; if therefore the revolutions of the spiral are registered, the number of times it has gone its own length through the water will be known. In both these the motion of the spiral in the water is communicated to the clockwork within the board, by means of a small line fastened at one end to the spiral, which turns it after the ship, and at the other to a spindel, which sets the clockwork in motion. That invented by Mr. Russel has a half spiral of two threads, made of copper, and a small dial of clockwork, to register the number of turns of the spiral. The other log has a whole spiral of wood with one thread, and a larger piece of clockwork with three dials, two of them to mark the distance, and the other divided into knots and fathoms, to show the rate by the half-minute glass, for the convenience of comparing it with the log. This kind of log will have the advantage of every other in smooth water and moderate weather; and it will be useful in finding the trim of a ship when alone, in surveying a coast in a single ship, or in measuring distances in a boat between headlands and shoals; but it is subject to other inconveniences, which will not render it a proper substitute for the common log.

Perpetual Log, a machine so called by its inventor, Mr. Gottchill of London, is intended for keeping a constant and regular account of the rate of a ship's velocity in the interval of heaving the log.

Plate CCXCVII.

Fig. 1 is a representation of the whole machine; the lower part of which, EFG, is fixed to the side of the keel; H representing only the boundary line of the ship's figure. EF are the sections of a wooden external case, left open at the ends KL, to admit the passage of the water during the motion of the ship. At M is a copper grating, placed to obstruct the entrance of any dirt, &c. into the machine. I is a section of a water wheel, made from 6 to 12 inches in diameter, as may be necessary, with floatboards upon its circumference, like a common water-wheels, that turn by the resistance of the water passing through the channel LK. It turns upon a shouldered axis, represented by the vertical section at K. When the ship is in motion, the resistance of the water through the channel LK turns round the wheel I. This wheel, by means of a pinion, is connected with and turns the rod contained in the long copper tube N. This rod, by a pinion fixed at its upper extremity, is connected with and turns upon the whole system of wheels contained in the dial of the case ABCD. This dial, by means of the copper tube N, may be fixed to any convenient place aboard the ship. In the front of the dial are several useful circular graduations, as follow: The reference by the dotted line A has a hand which is moved by the wheels within. The line B points out the motion of the ship in fathoms of 6 feet each. The circle at B has a hand showing the knots, at the rate of 48 feet for each knot; and is to be observed with the half-minute glass at any time. The circle at C has a short and a long hand; the former of which points out the mile in land measure, and the latter or longer the number of knots contained in each mile, viz. 128, which is in the same proportion to a mile as 60 minutes to the hour in the reckoning. At e, a small portion of a circle is seen through the front plate called the register; which shows, in the course of 24 hours (if the ship is on one tack) the distance in miles that the ship has run; and in the 24 hours the mariner need take but one observation, as this register serves as an useful check upon the fathoms, knots, and miles, shown upon the two other circles.

In a plate showing 100 degrees or 6000 miles, and also acts as another register or check; and is useful in case of any mistake being made in observing the distant run by the other circles. The reckoning by these circles, without fear of mistake, may therefore be continued to nearly 12,000 miles.

A communication from this machine may easily be made to the captain's bedside, where by touching a spring only, a bell in the head ABCD will sound as many times in a half minute as the ship sails miles in an hour.

Log-Board, a sort of table, divided into several columns, containing the hours of the day and night, the direction of the winds, the course of the ship, and all the material occurrences that happen during the 24 hours, or from noon to noon; together with the latitude by observation. From this table the officers of the ship are furnished with materials to compile their journals.

Log-Book, a book into which the contents of the logboard is daily copied at noon, together with every circumstance deserving notice that may happen to the ship, either at sea or in a harbour. See Navigation.

LOGARITHMS.

INTRODUCTION.

The labour and time required for performing the arithmetical operations of multiplication, division, and the extraction of roots, were at one time considerable obstacles to the improvement of various branches of knowledge, and in particular the science of astronomy. But about the end of the 16th century, and the beginning of the 17th, several mathematicians began to consider by what means they might simplify these operations, or substitute for them others more easily performed. Their efforts produced some ingenious contrivances for abridging calculations, but of these the most complete by far was that of John Napier, Baron of Merchiston in Scotland, who invented a system of numbers called logarithms, which were so adapted to the numbers to be multiplied, or divided, that these being arranged in the form of a table, each opposite to the number...
LOGARITHMS.

The difference of the logarithms of any two numbers, or terms of the geometrical series, is equal to the logarithm of that term of the series which is equal to the quotient arising from the division of one number by another.

Take for example the terms 128 and 32, the logarithms of which are 7 and 5; the greater of the numbers divided by the lesser is 4, and the difference of their logarithms is 2; and by inspecting the two series this last number will be found to be the logarithm of the former. In like manner, if the terms of the geometrical series be 1024 and 16, the logarithm of which are 10 and 4, we find that 1024 divided by 16 is 64; and so it appears from the table that the latter number, viz. 6, is the logarithm of the former 64.

These two properties of logarithms, the second of which indeed is an immediate consequence of the first, enable us to find with great facility the product or quotient of any two terms of a geometrical series to which there is adapted an arithmetical series, so that each number has its logarithm opposite to it, as in the preceding short table. For it is evident, that to multiply two numbers we have only to add their logarithms, and opposite to that logarithm which is the sum we shall find the number required. Thus, to multiply 16 by 128; to the logarithm of 16, which is 4, we add the logarithm of 128, which is 7, and opposite to the sum 11, we find 2048, the product sought.

On the other hand, to divide any number in the table by any other number, we must subtract the logarithm of the divisor from that of the dividend, and look for the remainder among the logarithms, and opposite to it we shall find the number sought. Thus, to divide 2048 by 128; from 11, which is the logarithm of 2048 we subtract 7, the logarithm of 128, and opposite to the remainder 4 we find 16, the quotient sought.

Let us now suppose any number of geometrical means to be interpolated between each two adjoining terms of the preceding geometrical series, and the same number of arithmetical means between every two adjoining terms of the arithmetical series; then, as the results will still be a geometrical and an arithmetical series, the interpolated terms of the latter will be the logarithms of the corresponding terms of the former, and the two new series will have the very same properties as the original series.

If we suppose the number of interpolated means to be very great, it will follow that among the terms of the resulting geometrical series, some one or other will be found nearly equal to any proposed number whatever. Therefore, although the preceding table exhibits the logarithms of 2, 3, 4, 5, 6, 7, 8, 9, 10, &c. but does not contain the logarithms of the intermediate numbers, 3, 5, 6, 7, 9, 10, &c. yet it is easy to conceive that a table might be formed by interpolation which should contain, among the terms of the geometrical series, all numbers whatever to a certain extent, (or at least others very nearly equal to them) together with their logarithms. If such a table were constructed, or at least if such terms of the geometrical progression were found together with their logarithms, as were either accurately equal to, or coincided nearly, with all numbers...
LOGARITHMS.

introduction.

Quantities in geometrical progression, and the corresponding portions generated of the other line, will constitute a series in arithmetical progression, so that the latter will be the logarithms of the former. And as the terms of the geometrical progression decrease continuously from 0, which is the greatest term, to 0, while the terms of the corresponding arithmetical progression increase from 0 upwards, according to Napier's system the logarithm of 0 is 0, and the logarithms of the sines from radius down to 0, are a series of numbers increasing from 0 to infinite.

The velocities or degrees of quickness with which the motions commence may have to each other any ratio whatever, and by assuming different ratios we shall have different systems of logarithms. Napier supposed the velocities to be equal; but the system of logarithms produced in consequence of this assumption having been found to have some disadvantages, it has been long disused, and a more convenient one substituted instead of it, as we shall presently have occasion to explain.

Napier's work having been written in Latin was translated into English by Mr. Edmund Wright, an ingenious mathematician of that period, and the inventor of the principles of what is commonly though erroneously called Mercator's sailing. The translation was sent to Napier for his perusal, and returned with his approbation, and the addition of a few lines, intimating that he intended to make some alterations in the system of logarithms in a second edition. Mr. Wright died soon after he received back his translation; but it was published after his death, in the year 1616, accompanied with a dedication by his son to the East India Company, and a preface by Henry Briggs, who afterwards distinguished himself so much by his improvement of logarithms. Mr. Briggs likewise gave in this work the description and draught of a scale which had been invented by Wright, as also various methods of his own for finding the logarithms of numbers, and the contrary, by means of Napier's table, the use of which had been attended with some inconvenience on account of its containing only such numbers as were the natural sines to every minute of the quadrant and their logarithms.

There was an additional inconvenience in using the table, arising from the logarithms being partly positive and partly negative; the latter of these was, however, well remedied by John Speidell in his New Logarithms, first published in the year 1619, which contained the sines, cosines, tangents, cotangents, secants, and cosecants, and given in such a form as to be all positive; and the former was still more completely removed by an additional table, which he gave in the sixth impression of his work, in the year 1624, and which contained the logarithms of the whole numbers 1, 2, 3, 4, &c. to 1000, together with their differences and arithmetical complements, &c. This table is now commonly called hyperbolic logarithms, because the numbers serve to express the areas contained between a hyperbola and its asymptote, and limited by ordinates drawn parallel to the other asymptote. This name, however, is certainly improper, as the same spaces may represent the logarithms of any system whatever, (see Fluxions, § 152, Ex. 5.).

In 1719 Robert Napier, son of the inventor of logarithms, published a second edition of his father's Logarithmorum Canonis Descrip. And along with this...
LOGARITHMS.

this the promised Logarithmorum Canonis Constructio, and other pieces written by his father and Mr Briggs. An exact copy of the same two works in one volume was also printed in 1620 at Lyons in France. In 1618 or 1619 Benjamin Ursinus, mathematician to the elector of Brandenburg, published Napier’s tables of logarithms in his Cursus Mathematicus, to which he added some tables of proportional parts; and in 1624, he printed his Trigonometria, with a table of natural sines, and their logarithms of the Napierian kind and form, to every ten seconds of the quadrant.

In the same year, 1624, the celebrated John Kepler published at Marburg, logarithms of nearly the same kind, under the title of Chilias Logarithmorum ad titulum Numeros Rotundos, premissa Demonstratione legitima Ortus Logarithmorum corumque Usus, &c. and in the following year he published a supplement to this work. In the preface to this last he says, that several of the professors of mathematics in Upper Germany, and more especially those of them who were somewhat advanced in years, and were grown averse to new methods of reasoning that carried them out of the old doctrines and principles with which habit had rendered them familiar, doubted in some degree whether Napier’s demonstration of the property of logarithms was perfectly true, and whether the application of them to trigonometrical calculations might not be unsafe and lead the calculator who should trust in them to erroneous results; and in either case, whether the doctrine were true or not, they considered Napier’s demonstration of it as illegitimate and unsatisfactory. This opinion induced Kepler to compose the above-mentioned work, in which the whole doctrine is treated in a manner strictly geometrical, and free from the considerations of motion which the German mathematicians had objected to (and not without reason) in Napier’s mode of treating the subject.

On the publication of Napier’s Logarithms, Mr Henry Briggs, some time professor of geometry in Gresham college London, and afterwards Savilian professor of geometry at Oxford (whom we have already mentioned) applied himself with great earnestness to their study and improvement, and it appears that he had projected at an early period that advantageous change in the system which has since taken place. From the particular view in which Napier took of the subject, and the manner in which he conceived logarithms to be generated, it happened that in his system, the logarithms of a series of numbers which increased in a decuple ratio, (as 1, 10, 100, 1000, &c.) formed a decreasing arithmetical series, the common difference of the terms of which was 2.3235851. But it occurred to Briggs that it would be better and more conformable to the received decimal notation, to adopt a system in which the logarithms of the terms of such a geometrical series should differ from each other by unity or 1. This idea Briggs communicated to the public in his lectures, and also to Napier himself. He even went twice to Edinburgh to see him, and to converse with him upon the subject; and on his first visit Napier said that he had also formerly thought of the same improvement, but that he chose to publish the logarithms he had previously calculated, till such time as his health and convenience would allow him to make others more commodious. And whereas in the change which Briggs proposed, it was intended to make the logarithms of the sines to increase from 0 (the logarithm of radius) to infinity, while the sines themselves should decrease, it was suggested to him by Napier that it would be better to make them decrease so that 0, instead of being the logarithm of radius, should be the logarithm of 1; and that 100000, &c. should be the logarithm of radius and this Briggs admitted would be an improvement and having changed the numbers he had already calculated so as to make them suit Napier’s modification of his plan, he returned with them next year to Edinburgh, and submitted them to his perusal.

It appears therefore that Briggs was the inventor of this improved system of logarithms which has since been universally adopted, and that the only share that Napier had in it was his suggesting to Briggs to begin with the low number 1, and to make the logarithms of the artificial numbers, as Napier had always called them, to increase with the natural numbers, instead of decreasing which made no alteration in the figures, but only in their affections or signs, changing them from negative to positive.

On Briggs’s return from Edinburgh, in 1617, he printed the first thousand logarithms to eight places of figures, besides the index, with the title of Logarithmorum Chilias prima; but these seem not to have been published till after the death of Napier, which happened in 1618, for in his preface he expresses a hope, that the circumstances which led to a change in the system would be explained in Napier’s posthumous work, which was presently to appear. But although Napier had intimated in a note he had given in Wright’s translation of the Canon Mirificus, as well as his Rabdologiæ, printed in 1617, that he intended to alter the scale, yet he altogether omits to state that Briggs either was the first to think of this improvement, or at least to publish it to the world. And as the same silence on this point was observed in Napier’s posthumous work published in 1619 by his son, Briggs took occasion in the preface to his Arithmetica Logarithmica to assert his claims to the improvement he had now carried into execution.

The studied silence which Napier seems to have observed respecting the improvement of the system, which Briggs had communicated to him, has given just reason to suspect that he wished to be considered as the author of that improvement, as well as the original inventor. But although it is possible that he thought of it as soon as Briggs, it would seem to have been no more than justice, if, when announcing his intended change of the scale, he had acknowledged that the same idea had occurred to Briggs as well as to himself.

In 1620 Mr Edmund Gunter published his Canon of Triangles, which contains the artificial or logarithmic sines and tangents to every minute to seven places of figures besides the index, the logarithm of radius being 10. These logarithms are of the kind which had been agreed upon between Napier and Briggs, and they were the first tables of logarithmic sines and tangents that were published of this sort. Gunter also in 1623 reprinted the same in his book de Sectore et Radió, together with the Chilias prima of Briggs; and in the same year he applied the logarithms of numbers, sines, and tangents, to straight lines drawn upon a ruler. This instrument is now in common use for navigation and other purposes, and is commonly called Gunter’s scale. The
LOGARITHMS.

The discoveries in Logarithms were first carried to France by Mr. Edmund Wingate, but not first of all as he says in the preface to his book. He published at Paris in 1624 two small tracts in the French language upon logarithms, and these were reprinted with improvements at London in 1626.

In the year 1624, Briggs published his Arithmetica Logarithmica, a stupendous work considering the short time he had been in preparing it. Here he gives the logarithms of 30000 natural numbers to fourteen places of figures, besides the index; namely, from 1 to 20000 and from 90000 to 100000, together with the differences of the logarithms. He also gives an ample treatise on their construction and use, and he earnestly solicits others to undertake the computation of the intermediate numbers, offering to give instructions, and paper ready ruled for that purpose, to any person inclined to contribute to the completion of so valuable a work. By this notice he had hopes of collecting materials for the logarithms of the intermediate 70000 numbers, while he should employ his time upon the Canon of Logarithmic sines and tangents, and so carry on both works at once.

Soon after this, Adrian Vlacq or Flacq of Gouda in Holland completed the intermediate 70 chilides, and republished the Arithmetica Logarithmica in 1627 and 1628, with these intermediate numbers, making in all, the logarithms of all numbers to 100,000, but only to 10 places of figures. To these was added a table of artificial sines, tangents, and secants, to every minute of the quadrant.

Briggs himself lived also to complete a table of logarithmic sines and tangents, to the 100th part of every degree, to fourteen places of figures besides the index, together with a table of natural sines to the same parts to fifteen places, and the tangents and secants of the same to ten places, with the construction of the whole. But his death, which then happened, prevented him from completing the application and uses of them. However, when dying, he committed the performing of this office to his friend Henry Gellibrand, who accordingly added a preface, and the application of the logarithms to plane and spherical trigonometry. The work was called Trigonometria Britannica, and was printed at Gouda in the year 1633 under the care of Adrian Vlacq.

In the same year, 1633, Adrian Vlacq printed a work of his own, called Trigonometria Artificialis, sive Magnus Canon Triangularium Logarithmicus et Decadas Secundorum Scrupularum Constructus. This work contains the logarithmic sines and tangents to 10 places of figures, with their differences for every ten seconds in the quadrant. It also contains Briggs' table of the first 20000 logarithms to ten places, besides the index, with their differences; and to the whole is prefixed a description of the tables and their applications, chiefly extracted from Briggs' Trigonometria Britannica, which we have already mentioned.

Gellibrand published also, in 1635, An Institution Trigonometrical, containing the logarithms of the first 10,000 numbers, with the natural sines, tangents, and secants, and the logarithmic sines and tangents for degrees and minutes; all to seven places of figures besides the index.

The writers, whose works we have hitherto noticed, were for the most part computers of logarithms. But the system best adapted to practice being now well ascertained, and the labour of constructing the table accomplished, succeeding writers on the subject have had little more to do than to give the tables in the most convenient form. It is true that, in consequence of the numerous discoveries which were afterwards made in mathematics, particularly in the doctrine of series, great improvements were made in the method of computing logarithms; but these, for the most part, came too late to be of use in the actual construction of the table, although they might be applied with advantage to verify calculations previously performed by methods much more laborious.

As it is of importance that such as have occasion to employ logarithms should know what works are held in estimation on account of their extent and accuracy, we shall enumerate the following:

1. Sherwin's Mathematical Tables, in 8vo. These contain the logarithms of all numbers to 101,000; and the sines, tangents, secants, and versed sines, but natural and logarithmic, to every minute of the quadrant. The third edition, printed in 1742, which was revised by Gardiner, is esteemed the most correct; but, in the fifth edition, the errors are so numerous, that no dependence can be placed upon it when accuracy is required.

2. Gardiner's Tables of Logarithms for all numbers to 101,000, and for the sines and tangents to every ten seconds of the quadrant; also for the sines of the first 72 minutes to every single second, &c. This work, which is in quarto, was printed in 1742, and is held in high estimation for its accuracy.

3. An edition of the same work, with some additions, printed in 1770 in Avignon in France. The tables in both editions are to seven places of figures.

4. Tables Portatives de Logarithmes, publiée à Londres par Gardiner, augmentées et perfectionnées dans leur disposition, par M. Cullen.—This work is most beautifully printed in a small octavo volume, and contains all the tables in Gardiner's quarto volume; with some additions and improvements.

5. Dr Hutton's Mathematical Tables, containing common hyperbolic and logistic logarithms, &c.—This work has passed through several editions, under the care of the learned author: it is perhaps the most common of any in this country, and is deservedly held in the highest estimation, both on account of its accuracy, and the very valuable information it contains respecting the history of logarithms, and other branches of mathematics connected with them.

6. Taylor's Table of Logarithmic Sines and Tangents to every second of the quadrant; to which is prefixed a table of logarithms from 1 to 100,000, &c.—This is a most valuable work; but being a very large quarto volume, and also very expensive, it is less adapted to general use than the preceding, which is an octavo, and may be had at a moderate price.

7. Tables portatives des logarithmes, contenant les logarithmes des nombres depuis 1 jusqu'à 108,000; les logarithmes des sines et tangentes, de secondes en secondes pour les cinq premiers degrés, de dix en dix secondes pour tous les degrés du quart-de cercle, et suivant la nouvelle
LOGARITHMS.

We have already shewn that the properties of logarithms are deducible from those of two series, the terms of one of which form a geometrical progression, and those of the other an arithmetical progression; and as this manner of treating the subject is simple, it is perhaps the best adapted of any to such of our readers as have not pursued the study of mathematics to any great extent. We shall now shew bow, from the same principles, the logarithm of any proposed number whatever may be found.

The first step to be taken in constructing a system of logarithms is to assume the logarithm of some determinate number, besides that of unity or 1, which must necessarily be 0. From the particular view which Napier took of the subject, he was led to assume unity for the logarithm of the number 2.718282, by which it happened that the logarithm of 10 was 2.302585, and the assumption being made, the form of the system became determinate, and the logarithm of every number fixed to one particular value.

Mr. Briggs, however, observed, that it would be better to assume unity for the logarithm of 10, instead of making it the logarithm of 2.718282, as in Napier's system, and hence the logarithms of the terms of the geometrical progression

\[ 1, 10, 100, 1000, 10000, \&c. \]

were necessarily fixed to the corresponding terms of this arithmetical progression,

\[ 0, 1, 2, 3, 4, \&c. \]

That is, the logarithm of 1 being 0, and that of 10 being 1, the logarithm of 100 is 2, and that of 1000 is 3, and so on.

The logarithms of the terms of the progression, 1, 10, 100, 1000, &c. being thus determined; in order to form the logarithms of the numbers between 1 and 10 and between 10 and 100, and so on, we must conceive a very great number of geometrical means to be interposed between each two adjoining terms of the preceding geometrical series, and as many arithmetical means between the corresponding terms of the arithmetical series; then, like as the terms of the arithmetical series 0, 1, 2, 3, &c. are the logarithms of the corresponding terms of the geometrical series 1, 10, 100, 1000, &c. the interpolated terms of the former will also be the logarithms of the corresponding interpolated terms of the latter. Now as by supposing the number of means interposed between each two terms of the geometrical series to be sufficiently great, some one or other of these may be found which will be very nearly equal to any proposed number; it is evident that to find the logarithm of such a number, we have only to seek for one of the interpolated means which is very nearly equal to it, and to take the logarithm of that mean as a near value of the logarithm required.

As a particular example, let it be required to find the logarithm of the number 5, according to Briggs' system.

First step of the process.—The number 5 is between 1 and 10, the logarithms of which we already know to be 0 and 1: Let a geometrical mean be found between the two former, and an arithmetical mean between the two latter. The geometrical mean will be the square root of the product of the numbers 1 and 10, which is 3.162277; and the arithmetical mean will be half the sum of the logarithms 0 and 1, which is 0.5; therefore the logarithm of 3.162277 is 0.5. But as the mean thus found is not sufficiently near to the proposed number, we must proceed with the operation as follows:

Second step.—The number 5, whose logarithm is sought, is between 3.162277, the mean last found, and 10, the logarithms of which we know to be 0.5 and 1; we must now find a geometrical mean between the two former, and an arithmetical mean between the two latter. The one of these is \(\sqrt{(3.162277 \times 10)} = 5.623413\), and the other is \(5 + 0.5 = 5.75\); therefore the logarithm of 5.623413 is 0.75.

Third step.—We have now obtained two numbers, namely
LOGARITHMS.

Nature of namely $3.16227$ and $5.623413$, one on each side of 5, together with their logarithms 0.5 and 0.75, we therefore proceed exactly as before, and accordingly we find the geometrical mean, or $\sqrt{(3.162277 \times 5.623413)}$, to be 4.216964, and the arithmetical mean, or $0.5 + 0.75 \over 2$, to be 0.625; therefore the logarithm of 4.216964 is 0.625.

Fourth step.—We proceed in the same manner with the numbers 4.216964, and 5.623413 (one of which is less, and the other greater than 5) and their logarithms 0.625 and 0.75, and find a new geometrical mean, viz. 4.869674, and its corresponding arithmetical mean, or logarithm, 0.6875.

We must go on in this way till we have found twenty-two geometrical means, and as many corresponding arithmetical means or logarithms. And that we may indicate how these are found from each other, let the numbers 1 and 10 be denoted by A and B, and their geometrical means taken in their order by C, D, E, &c. then the results of the successive operations will be as in the following table:

</table>

As the last of these means, viz. Z, agrees with 5, the proposed number, as far as at least as the sixth place of decimals, we may safely consider them as very nearly equal, therefore their logarithms will also be very nearly equal, that is, the logarithm of 5 will be 0.698700 nearly.

In performing the operations indicated in the preceding table, it will be necessary to find the geometrical means at the beginning to many more figures than are here put down, in order to obtain at last a result true to 7 decimal places. Thus it appears that the labour of computing logarithms by this method is indeed very great. It is, however, that which was employed by Briggs and Vlacq in the original construction of logarithms; but since the period in which they lived, others more easy have been found, as we shall presently have occasion to explain.

The logarithm of any number whatever may be found by a series of calculations similar to that which we have just now explained. But in constructing the table it would only be necessary to have recourse to this method in calculating the logarithms of prime numbers; for as often as the logarithm of a number which was the product of other numbers, whose logarithms were known, was required, it would be immediately obtained by adding together the logarithms of its factors. On the contrary, if the logarithm of the product of two numbers were known, and also that of one of its factors, the logarithm of the other factor would be obtained from these, by simply taking their difference.

From this last remark it is obvious, that having now found the logarithm of 5, we can immediately find that of 2; for since 2 is the quotient of 10 divided by 5, its logarithm will be the difference of the logarithms of 10 and 5; now the logarithm of 10 is 1, and the logarithm of 5 is 0.698700, therefore the logarithm of 2 is 0.301030.

Having thus obtained the logarithms of 2 and 5, in addition to those of 10, 100, 1000, &c. we may thence find the logarithms of innumerable other numbers. Thus, because $4 = 2 \times 2$, the logarithm of 4 will be the logarithm of 2 added to itself, or will be twice the logarithm of 2. Again, because $5 \times 10 = 50$, the logarithm of 50 will be the sum of the logarithms of 5 and 10. In this manner it is evident we may find the logarithms of $8 = 2 \times 4$, of $16 = 2 \times 8$, of $25 = 5 \times 5$, and of as many more such numbers as we please.

Besides the view we have hitherto taken of the theory of logarithms, there are others under which it has been presented by different authors. Some of these we proceed to explain, beginning with that in which they are defined to be the measures of ratios; but to see the propriety of this definition, it must be understood what is meant by the measure of a ratio.

According to the definition of a compound ratio, as laid down by writers on geometry, if there be any number of magnitudes A, B, C, D, which are continual proportionals, or such that the ratio of A to B is equal to the ratio of B to C, and that again is equal to the ratio of C to D, and so on, the ratio of the first of these magnitudes A to the third C is considered as made up of two equal ratios, each equal to the ratio of the first A to the second B. And in like manner the ratio of the first A to the fourth D is considered as made up of three equal ratios, each equal to the ratio of the first to the second, and so on. (See GEOMETRY, Sect. III. Def. 10, 11, and 12.) Thus, to take a particular example in numbers, because the ratio of 81 to 3 may be considered as made up of the ratio of 81 to 27, and of 27 to 9, and of 9 to 3, which three ratios are equal among themselves, (GEOMETRY, Sect. III. Def. 4.) the ratio of 81 to 3 will be triple the ratio of 9 to 3; and in like manner the ratio of 27 to 3 will be double the ratio of 9 to 3. Also, because the ratios of 1000 to 100, 100 to 10, 10 to 1, are all equal, the ratio of 1000 to 1 will be three times as great as the ratio of 10 to 1; and the ratio of 100 to 1 will be twice as great; and so on.

Taking this view of ratios, and considering them as a particular species of quantities, made up of others of the same kind, they may evidently be compared with each other, in respect of their magnitudes, in the same manner, as we compare lines or quantities of any kind whatever.
LOGARITHMS.

Nature of whatever. And as when estimating the relative magnitudes of two quantities, two lines for example, if we find that the one contains five such equal parts as the other contains seven, we say the one line has to the other the proportion of 5 to 7; so, in like manner, if two ratios be such, that the one can be resolved into equal ratios, and the other into seven of the same ratios, we may conclude that the magnitude of the one ratio is to that of the other as the number 5 to the number 7; and a similar conclusion may be drawn, when the ratios to be compared are any multiples whatever of some other ratio.

It is well known that there may be lines and other quantities, which, as they admit of no common measure, are said to be incommensurable to each other; and the same will also happen to ratios: That is, there may be two ratios such that into whatever number of equal ratios the one is divided, the other cannot possibly be exactly equal to a ratio composed of any number of these.

We may however conceive the number of equal ratios into which the one is divided to be so great, that a certain number of them shall compose a ratio more nearly equal to the other ratio than by any assignable difference. Therefore, like as we can always find numbers which shall have among themselves, either accurately, or as nearly as we please, the same ratios as any number of lines or other magnitudes have to each other, and which therefore may be taken as the measures or representatives of the lines; so also, corresponding to any system of ratios, there may be always found a series of numbers which will have the same proportions among themselves as the ratios have to each other, and which may in like manner be called the measures of the ratios.

Let us now suppose that unity, or 1, is assumed as the common consequent of all ratios whatever; and that the ratio of 10 (or some particular number) to 1 is compounded of a very great number of equal ratios, as for example 1000000; then, as each of these will be very near to the ratio of equality, (for it will be the ratio of the first term to the second of a series of one million and one continued proportions, the first of which is 10 and last 1), it will follow, and is easy to conceive, that the ratios of all other numbers to unity will each be very nearly equal to some multiple of that small ratio. And by supposing the number of small equal ratios which the ratio of 10 to 1 is composed to be sufficiently great, the ratios of all other numbers to unity may be as nearly equal to ratios which are multiples of that small ratio as we please. Let us still suppose, however, for the sake of illustration, that the number of small ratios contained in that of 10 to 1 is 1000000; then, as it may be proved that the ratio of 2 to 1 will be very nearly the same as a ratio composed of 301030 of these; and that the ratio of 3 to 1 will be nearly equal to a ratio composed of 477121 of them, and that the ratio of 4 to 1 will be nearly equal to a ratio composed of 602950 of them, and so on; these numbers, viz. 1000000, 301030, 477121, and 602950, or any other numbers proportional to them, will be the measures of the ratios of 10 to 1, 2 to 1, 3 to 1, and 4 to 1, respectively; and the same quantities will also be what have been called the logarithms of the ratios; for the word logarithms, if regard be had to its etymology, is λογός άριθμος, or the numbers of small and equal ratios (or ratiocinar as they have been called) contained in the several ratios of quantities one to another.

We have, for the sake of illustration, assumed 100000 as the measure of the ratio of 10 to 1, by which it happens, as already observed, that the measures of the ratios of 2 to 1, 3 to 1, &c. are 301030 and 477121 respectively; as, however, these measures are not absolute, but relative quantities, we may assume any other numbers whatever instead of these, provided they have the same proportions to each other as these numbers have among themselves. Accordingly, we may assume as the measure or logarithm of the ratio of 10 to 1; and then the logarithms of the ratios of 2 to 1, 3 to 1, &c. instead of being 301030, 477121, &c. will be .30102 and .477121, &c. respectively, that is, each will be one-thousandth of what it was before.

In Briggs's system, the logarithm of the ratio of 1 to 1, or, to speak briefly, the logarithm of 10, is unity, but we are at liberty to assume any number whatever as that whose logarithm shall be unity. Naper, in consequence of his particular views of the subject, chose the number 2.718283; and hence it happens that the logarithms of the ratios are expressed by different numbers in the two systems.

It yet remains for us to shew the identity of the properties of logarithms, as explained in the two different views we have now given of the subject; and this may be done as follows.

Let A and B denote any two numbers. The ratio of their product to unity, that is, the ratio of $A \times B$ to 1, is compounded of the ratio of $A \times B$ to B, and 0 to 1; (see GEOMETRY, Part III. Def. 10.) but since $A \times B$, B, A, and 1, are four proportional, the ratio of $A \times B$ to B is equal to the ratio of A to 1. Therefore the ratio of $A \times B$ to 1 is compounded of the ratio of A to 1 and of B to 1; and consequently the logarithm of the ratio of $A \times B$ to 1 will be equal to the sum of the logarithms of the ratios of A to 1, and B to 1; or, in other words, the logarithm of $A \times B$ will be the sum of the logarithms of A and B.

And because log. $(A \times B)=\log. A + \log. B$, therefore, log. B= log. $(A \times B)$— log. A. In this equation let C be substituted for B, and D for A, then, (because $A \times B=D \times C$) we have log. $D=\log. C$— log. D.

We have now given a short sketch of the theory of logarithms as deducible from the doctrine of ratios. It was in this way that the celebrated Kepler treated the subject according to the strictest rules of geometrical reasoning; and in this he has been followed by Mercator, Halley, Cotes, as well as by other mathematicians of later times, as by Mr. Baron Maseres, in his "Elements of Plane Trigonometry," a work in which the whole theory of logarithms is treated with all that perspicuity and accuracy which characterize the ingenious author's various writings. The same mode of treating the subject was likewise adopted by that excellent mathematician Dr. Robert Simson, as appears by a short tract in Latin, written by him and published in his posthumous works. As, however, the doctrine of ratios is of a very abstract nature, and the mode of reasoning upon which it has been established is of a peculiar and subtle kind, we presume that the greater number of readers
LOGARITHMS.

Nature of readers will think this view of the subject less simple
Logarithms, &c and natural than the following, in which we mean to
deduce the theory of logarithms, as well as the manner of
computing them, from the properties of the exponents
of powers.

If we attend to the common scale of notation in
arithmetic, we shall find that it is so contrived as to
express all numbers whatever by means of the powers
of the number 10, which is the root of the scale, and
the nine digits which serve as coefficients to these
powers. Thus, if R denote 10, the root of the scale, so
that R^2 will denote 100, and R^3 1000, and so on,
the number 4371000 is otherwise expressed by 4R^6+
7R^4+R^5+6R^3+5R^2+9. Again, the mixt number
371.243 is expressed by 3R^2+7R^4+R^5+\frac{2}{R} + \frac{4}{R^2} +
\frac{3}{R^3}, or by 3R^2+R^4+R^5+2R^{-1}+4R^{-3}+3R^{-5}.

As to vulgar fractions, by transforming them to decimals, they may be expressed in the same manner.

Thus \(\frac{1}{4} = 0.25 \approx 7R^{-1}+5R^{-3}\). Also \(\frac{1}{3} \approx .666, \&c. = 6R^{-1}+6R^{-3}+6R^{-4}+\&c\).

Although the number 10 has been fixed upon as the
root of the scale of notation, any other number may
be employed to express all numbers whatever in the
same manner; and some numbers are even preferable
to 10. Thus, making 8 the root of a scale, and
denoting it by R, the number 2735, when expressed
according to this scale, is 5R^4+2R^2+5R^0+7R^0, or
5R^4+2R^2+5R^0+7; and here we may observe, that if
a number greater than 10 were assumed as the root of
the scale of notation, it would be necessary to adopt
some new numeral characters in addition to those in
common use, and if a smaller number were assumed,
we might dispense with some of those we already have.

But instead of expressing all numbers by the sums
of certain multiples of the successive powers of some
particular number, we may also express them, if not
accurately, at least as near as we please, by a single power,
whole or fractional, of any positive number whatever,
which may be either whole or fractional, but must not
be unity.

Let us take, for example, 2 as the number, by the
powers of which all others are to be expressed. Then
it may be shown that the numbers, 1, 2, 3, \&c. are all
expressible by the powers of 2, as follows.

\[
\begin{align*}
1 & = 2^0 \\
2 & = 2^1 \\
3 & = 2^1 + 2^0, \text{ nearly } = 2^1
\end{align*}
\]

and so on. And if instead of 2 we take the number 10,
then we have

\[
\begin{align*}
1 & = 10^0 \\
2 & = 10^1, \text{ nearly } = 10^1
\end{align*}
\]

Hence we may conclude, that if \(r\) be put for some
determinate number, and \(n\) for any indefinite positive
whole or fractional, it is always possible to find
another number \(N\), such that the number \(r\) being raised
to the power \(N\) shall either be exactly equal to \(n\), or
shall be as near to it as we please; that is, we shall have
\(r^N \approx n\).

When numbers are expressed in this way by the
powers of some given number \(r\), the exponent of that
power of \(r\) which is equal to any assigned number is
called the logarithm of that number. Therefore, if \(r^N \approx n\)
\(n\) being put for any number) then \(N\) will be the loga-

rithm of the number \(n\).

The logarithms which are produced by giving to \(r\)
some determinate value constitute a system of logarithms,
and the constant number \(r\), from which the system is
formed, is called the base or radical number of the system.

The properties of logarithms may readily be deduced
from the above definition as follows. Let \(a\) and \(b\) be
put for any two numbers, and \(A\) and \(B\) for their loga-
rithms; then, \(r\) being supposed to denote the base, or
radical number of the system, we have \(a = r^A\) and
\(b = r^B\); now if we take the product of \(a\) and \(b\), we
have \(a \cdot b = r^{A+B}\); but according to the defi-
nition, \(A + B\) is the logarithm of \(a\) \(b\), (for it is the
index of that power of \(r\) which is equal to \(a\) \(b\)); therefore,
the sum of the logarithms of any two numbers \(a\) and \(b\)
is the logarithm of their product \(a\) \(b\). Again, we have
\(\frac{a^A}{b^B} = r^{A-B}\); but here \(A-B\) is the index of that
power of \(r\) which is equal to \(\frac{a}{b}\); therefore, \(A-B\) is the
logarithm of \(\frac{a}{b}\).

Hence, if one number \(a\) be divided by
another number \(b\), the excess of the logarithm of the divid-
end above that of the divisor is equal to the logarithm
of the quotient \(\frac{a}{b}\).

Let \(n\) express any number whatever, then raising
both sides of the equation \(a = r^A\) to the \(n\)th power, we have
\(a^n = (r^A)^n = r^{An}\); but here \(n\) \(A\) is manifestly
the logarithm of \(a^n\); therefore, the logarithm of \(a^n\), any
power of a number, is the product of the logarithm of the
number by \(n\), the index of the power. And this must
evidently be true, whether that index be a whole num-
ber, or a fraction, either positive or negative.

From these properties it is easy to see in what man-
ner a table that exhibits the logarithms of all numbers
within certain limits may be applied to simplify calcu-
lations; for since the sum of the logarithms of any two
numbers is equal to the logarithm of their product, it
follows, that as often as we have occasion to find the
product of two or more numbers, we have only to add
their logarithms into one sum, taking them from the
table, and to look in the table for the number whose
logarithm is equal to that sum, and this number will be
the product required. Also, because the excess of the
logarithm of the dividend above that of the divisor is
equal to the logarithm of the quotient; as often as we
have occasion to divide one number by another, we have
only
LOGARITHMS.

Nature of only to subtract the logarithm of the divisor from that of the dividend, and opposite to that logarithm in the table, which is the remainder, we shall find the quotient.

As the logarithm of any power of a number is the product of the logarithm of the number, and the index of the power; and, on the contrary, the logarithm of any root of a number is the quotient found by dividing the logarithm of the number by the index of the root; it follows, that we may find any power or root of a number, by multiplying or dividing the logarithm of the number by the index of the power, or dividing it by the index of the root, and taking that number in the table whose logarithm is the product or quotient for the power or root required.

If in the equation \( sa^n \) where \( a \) is any number, its logarithm, and \( r \) the base of the system we suppose \( sa^n \), then, in this case \( r^A = a \); but this equation can only be satisfied by putting \( A = 0 \). Hence it appears, that in every system of logarithms, the logarithm of unity must be 0. If on the other hand we assume \( a = r \); then we have the equation \( r = r^A \), which is immediately satisfied by putting \( A = 1 \); therefore, the logarithm of the base, or radical number of every system, is necessarily unity.

If we suppose \( r \) to be a positive number greater than unity, and \( A \) a positive number greater than unity, then \( A = 0 \) will be a positive number; for if it be negative, we would have \( A = -A = \frac{1}{r^A} \), a proper fraction, and at the same time a number greater than unity by hypothesis, which is impossible. If on the contrary we suppose \( A \) a proper fraction, then \( A \) must necessarily be negative, for if it were positive, then \( r^A \) would be greater than unity, and \( A = \frac{1}{r^A} \) also greater than unity, while by hypothesis it is a fraction less than unity, which is impossible. Therefore, in every system, the base of which is greater than unity, the logarithm of a whole or mix number is always positive, but the logarithm of a proper fraction is always negative.

Because the logarithm of unity is the logarithm of \( r \) will be \( n \); therefore, the logarithm of any integer power of the radical number \( r \) will always be an integer.

Let \( r \) and \( r' \) denote bases of two different systems; and let \( A \) be the logarithm of a number, \( a \), taken according to the first of these, and \( A' \) its logarithm taken according to the last. Then because \( A = r^A \), and \( a = r^A \); it follows that \( r^A = r^{A'} \), and \( r = r' \). Let us now suppose that \( r' = R \) is the base of a third system of logarithms, and \( R \) and \( R' \) the logarithms of \( r' \) and \( r' \) taken according to this third system; then because

\[
\begin{align*}
r R &= r, \\
r' R' &= r', \\
\text{we have } r R R' &= r R, \\
r R &= r R'.
\end{align*}
\]

Therefore \( R = R \), and \( r = r R' \); but we have already found \( A = A' \), therefore \( R = R' \); and consequently

\[
\begin{align*}
A' &= R, \\
A : A' &= R', \\
\therefore \frac{1}{R} &= \frac{1}{R'}.
\end{align*}
\]

Hence it appears, that the logarithm of a number, taken according to one system, has to its logarithm, taken according to any other system, a constant ratio, which is the same as that of the reciprocals of the logarithms of the radical numbers of those systems, taken according to any system whatever.

Let us next suppose that \( a \) and \( b \) are two numbers, and \( A \) and \( B \) their logarithms, taken according to the same system, and \( r \) the base of the system; then because

\[
r A = a, \\
r B = b;
\]

we have \( r A B = a B, \) and \( r A B = b A \),

therefore \( b A = b A \), and \( a B = a B \). Now as \( r \) is not found in this equation, the value of the fraction \( \frac{A}{B} \) depends only on the numbers \( a \) and \( b \); therefore, the logarithms of any two given numbers have the same ratio in every system whatever.

Having now explained the properties which belong to the logarithms of any system whatever, we proceed to investigate general rules by which the number corresponding to any logarithm, and, on the contrary, the logarithm corresponding to any number, may be found the one from the other. And for this end let us denote any number whatever by \( y \), and its logarithm by \( x \), and put \( r \) as before for the base, or radical number of the system; then by the nature of logarithms we have this equation

\[
y = r x.
\]

Put \( r = 1 + a \), and let the expression \( (1 + a)^x \) be expanded into a series by the binomial theorem; thus we shall have

\[
y = 1 + x a + \frac{x(x - 1)}{1.2} a^2 + \frac{x(x - 1)(x - 2)}{1.2.3} a^3 + \frac{x(x - 1)(x - 2)(x - 3)}{1.2.3.4} a^4 + \&c.
\]

Let this series, the terms of which are arranged according to the powers of the quantity \( a \), be transformed into another, the terms of which shall be arranged according to the powers of \( x \); and to effect this we must find the actual products of the factors which constitute the powers of \( a \), and arrange the terms anew, as follows,

\[
1 = 1, \\
x a = x + a, \\
\frac{x(x - 1)}{1.2} a^2 = \frac{6a^2}{2} + \frac{2a^2}{2}, \\
\frac{x(x - 1)(x - 2)}{1.2.3} a^3 = \frac{24a^3}{3} + \frac{6a^3}{3}, \\
\frac{x(x - 1)(x - 2)(x - 3)}{1.2.3.4} a^4 = \frac{24a^4}{4} + \frac{24a^4}{4} + \&c.
\]

so that adding into one sum the quantities on each side of the sign =, and recollecting that the sum of these on the left-hand side is equal to \( y \), we have
LOGARITHMS.

Nature of Logarithms, &c.

\[ y = r^n = 1 + \frac{a^2}{2}x + \frac{a^3}{3}x^3 + \frac{a^4}{4}x^4 + \&c. \]

which equation, by substituting

\[ A \quad \text{for} \quad a = \frac{a^2}{2} + \frac{a^3}{3} + \frac{a^4}{4} + \&c. \]

\[ A' \quad \text{for} \quad a^3 = \frac{a^2}{2} + \frac{a^4}{4} + \&c. \]

\[ A'' \quad \text{for} \quad a^4 = \frac{a^5}{4} + \&c. \]

\[ A''' \quad \text{for} \quad a^5 = \frac{a^6}{24} + \&c. \]

&c.

may be abbreviated to

\[ y = \frac{1}{1 + Ax + A'x^2 + A''x^3 + A'''x^4 + \&c.} \]

Next, to determine the law of connexion of the quantities \( A, \ A', \ A'', \ A''', \ &c. \) let \( x + \infty \) be substituted in the last equation for \( x \), (here \( x \) is put for any indefinite quantity) thus it becomes

\[ r^x + \infty = 1 + A(x + \infty) + A'(x + \infty)^2 + A''(x + \infty)^3 + \&c. \]

But \( r^x + \infty = r^x \cdot r^\infty \), and since it has been shown that

\[ r = 1 + Ax + A'x^2 + A''x^3 + A'''x^4 + \&c. \]

for the very same reason

\[ r^\infty = 1 + Ax + A'x^2 + A''x^3 + A'''x^4 + \&c. \]

therefore the series

\[ 1 + A(x + \infty) + A'(x + \infty)^2 + A''(x + \infty)^3 + A'''(x + \infty)^4 + \&c. \]

is equal to the product of the two series

\[ 1 + Ax + A'x^2 + A''x^3 + A'''x^4 + \&c. \]

\[ 1 + Ax + A'x^2 + A''x^3 + A'''x^4 + \&c. \]

That is, by actual involution and multiplication,

\[ \frac{1 + Ax + A'x^2 + A''x^3 + \&c.}{1 + Ax + A'x^2 + A''x^3 + \&c.} = 1 + Ax + A'x^2 + A''x^3 + \&c. \]

\[ \left\{ \begin{array}{l}
1 + Ax + A'x^2 + A''x^3 + A'''x^4 + \&c. \\
+ Ax + A'x^2 + A''x^3 + A'''x^4 + \&c. \\
+ Ax + A'x^2 + A''x^3 + A'''x^4 + \&c. \\
+ Ax + A'x^2 + A''x^3 + A'''x^4 + \&c.
\end{array} \right\} = 1 + Ax + A'x^2 + A''x^3 + \&c. \]

Now as the quantities \( A, \ A', \ A'', \ &c. \) are quite independent of \( x \) and \( z \), the two sides of the equation can

Vol. XII. Part I.

only be identical, upon the supposition that the coefficients of like terms in each are equal; therefore, setting aside the first line of each side of the equation, because their terms are the same, and also the first term of the second line, for the same reason, let the coefficients of the remaining terms be put equal to one another, thus we have

\[ \left\{ \begin{array}{l}
A' = \frac{A}{1.2} \\
A'' = \frac{A}{1.2.3} \\
A''' = \frac{A}{1.2.3.4} \\
&c.
\end{array} \right. \]

and hence we have

\[ \left\{ \begin{array}{l}
A' = \frac{A}{1.2} \\
A'' = \frac{A}{1.2.3} \\
A''' = \frac{A}{1.2.3.4} \\
&c.
\end{array} \right. \]

Here the law of the coefficients \( A, A', A'', &c. \) is obvious, each being formed from the preceding by multiplying it by \( A \) and dividing by the exponent of the power of \( A \) which is thus formed. Let these values of \( A', A'', &c. \) be now substituted in the equation

\[ y = r^n = 1 + Ax + A'x^2 + A''x^3 + A'''x^4 + \&c. \]

and it becomes,

\[ y = 1 + Ax + \frac{A}{1.2}x^2 + \frac{A}{1.2.3}x^3 + \frac{A}{1.2.3.4}x^4 + \&c. \]

thus we have obtained a general formula expressing a number in terms of its logarithm and the base of the system, for we must recollect that the quantity \( A \) which is equal to

\[ \frac{a^2}{2} + \frac{a^3}{3} + \frac{a^4}{4} + \frac{a^5}{5} + \&c. \]

is otherwise expressed by

\[ r = \frac{(r-1)^2}{2} + \frac{(r-1)^3}{3} + \frac{(r-1)^4}{4} + \frac{(r-1)^5}{5} + \&c. \]

where \( r \) denotes the base of the system \( (A) \).

If in the formula

\[ r = 1 + Ax + A'x^2 + \frac{A}{1.2}x^3 + \frac{A}{1.2.3}x^4 + \&c. \]

we suppose \( x = 1 \), it becomes

\[ r = 1 + A + \frac{A}{1.2} + \frac{A}{1.2.3} + \frac{A}{1.2.3.4} + \&c. \]

an equation which contains \( r \) only; but as \( r \) has been all along supposed an indeterminate quantity, this equation must be identical, that \( x \), if instead of \( A \), its value, as expressed above in terms of \( r \), were substituted, the whole would vanish.

Again, let us suppose that \( \frac{1}{A} \) is substituted instead of \( x \) in the general formula, thus it becomes

\[ \frac{1}{A} = 1 + 1 + \frac{1}{1.2} + \frac{1}{1.2.3} + \frac{1}{1.2.3.4} + \&c. \]

Thus

(A) For other analytic methods of investigating the same formula, see ALGEBRA, § 293, and FLUXIONS, § 54. and § 70. Ex. 1. also § 200. Prob. 1.
LOGARITHMS.

Thus the quantity $r^A$, whatever the value of $r$, is evidently equal to a constant number, which, as appears from the last equation, is equal to the value of $r$ when $A=1$. By adding together a sufficient number of the terms of the series expressing the value of $r^A$, we find that quantity equal to 

$$2.718281828459045...$$

Let this number be denoted by $e$, and we have $r^A=\frac{1}{e}$, and $e=\frac{1}{r}$; hence it appears, that if the number $e$ be considered as the base of a logarithmic system, the quantity $A$, that is \[ r = \frac{1}{2} \left( \frac{1}{3} \right)^{\frac{1}{3}} \left( \frac{1}{4} \right)^{\frac{1}{4}} \ldots \text{ &c.} \]

is the logarithm of $r$ to the base $e$. But as $r$ is not restricted here to any particular value, we may substitute $y$ instead of it, keeping in mind that $y$ denotes any number whatever, and $x$ its logarithm; thus we have $x$ the logarithm of $y$, expressed by the series 

$$y-1 \left( y-1 \right)^{\frac{1}{2}} \left( y-1 \right)^{\frac{1}{3}} \left( y-1 \right)^{\frac{1}{4}} \ldots \text{ &c.}$$

supposing that the base of the system is the number we have expressed above by $e$.

We have now found a general formula for the logarithm of any number, $y$, taken according to a particular system, namely, that which has the number $e$ for its base. But it is easy from hence to find a formula, which shall apply to any system whatever. For it has been shewn that the logarithms of the same number, taken according to different systems, are to each other as the reciprocals of the logarithms of the bases of the systems, these last logarithms being taken according to any system whatever, that is, \[ \log_e y \text{ to base } e : \log_{10} y \text{ to base } 10 \vdash \frac{1}{\log_{10} e} : \frac{1}{\log_{10} r}, \]

hence we find \[ \log_{10} y \text{ to base } r = \frac{\log_e y \times \log_{10} e}{\log_{10} r} \]

Let the value we have already found for the logarithm of $y$ to base $e$ be substituted in this equation, and it becomes \[ \log_{10} y = \frac{\log_e y \times \left( y-1 \right)^{\frac{1}{2}} \left( y-1 \right)^{\frac{1}{3}} \left( y-1 \right)^{\frac{1}{4}} \ldots \}}{\log_{10} r} \]

which is a general formula for the logarithm of any number whatever, to the base $r$. And it is to be recollected that in the fraction \[ \frac{\log_e y}{\log_{10} r}, \] which is a common multiplier to the series, the logarithms are to be taken according to the same base, which however may be any number whatever (n).

If in the above formula we suppose $r=e$, the multiplier \[ \log_e y \text{ will be unity, and the formula will become simply } \log_{10} r \]

\[ \log_{10} y = \frac{(y-1)^{\frac{1}{2}} + (y-1)^{\frac{1}{3}} + (y-1)^{\frac{1}{4}} + \ldots \text{ &c.}}{2 + 3 + 4 + 5 + \ldots} \]

as we have already remarked. Now this is the system which was adopted by Lord Napier; and although the logarithms which were computed according to this system, or upon the supposition that the radical number is 2.7182818, &c. have been called hyperbolic logarithms, because they happen to be proportional to certain hyperbolic spaces, yet, as the logarithms of every system have the same property, it is more proper to call them Napierian logarithms.

As the constant multiplier $\log_e y$, which occurs in the general formula for the logarithm of any number, is the only part of the formula which depends for its value upon the base of the system, it has been called by writers on logarithms, the modulus of the system. If we suppose the logarithms taken to the base $e$, then the numerator, viz. $\log_e y$, will be unity, and the denominator will be the Napierian logarithm of $r$. If however we suppose the logarithms taken to the base $e$, then the numerator will be $\log_e y$ to base $e$; and the denominator will be unity, so that the modulus of any system whose base is $e$, is the reciprocal of the Napierian logarithm of that base, or it is the logarithm of the number $e$ (the base of the Napierian system) to the base $r$.

In the Napierian system the modulus is unity, and hence the logarithms of this system, as far as depends upon facility of computation, are the most simple of any. It was, however, soon found that a system whose base should be the same as the root of the scale of the arithmetical notation, viz. the number 10, would be the most convenient of any in practice; and accordingly such a system was actually constructed by Mr. Briggs. This is the only one now in common use, and is called Briggs's system, also the common system of logarithms. The modulus of this system therefore is the reciprocal of the Napierian logarithm of 10; or it is the common logarithm of $2.7182818$, &c. the base of the Napierian system. We shall in future denote this modulus by $M$; so that the formula expressing the common logarithm of any number $y$ will be \[ \log_{10} y = \log_e y \times \log_e 10 = \log_e y \times \frac{\log_{10} e}{\log_{10} 10} \]

If the number $y$, whose logarithm is required be very near to unity, so that $y-1$ is a small quantity, then the logarithm may be found from this formula with great ease, because the series will converge very rapidly. If, however, $y-1$ be greater than unity, the series, instead of converging, will diverge, so as to be in its present form of no use.

It may however be transformed into another, which shall converge in every case, by substituting in it \[ \sqrt[n]{y} \]

instead of $y$, and observing that $\log_{10} \sqrt[n]{y} \approx \frac{\log_{10} y}{n}$.

(n) For other methods of investigating the same formula see ALGEBRA, 284, and Fluxions, § 70, Ex. 2. also § 136.
Thus we have two limits to the value of the logarithm of $y$, which, by taking the number $n$ sufficiently great, may come as near to each other as we please.

In like manner we find two limits to the value of the reciprocal of the modulus, viz.

$$
\frac{1}{M} \leq n \left( \sqrt[10]{\frac{1}{y}} - 1 \right), \quad \frac{1}{M} \geq n \left( 1 - \frac{1}{\sqrt[10]{y}} \right).
$$

It is evident that the difference between the two limits of $\log y$, is

$$
\frac{\pi}{2} \leq n \left( \frac{1}{\sqrt[10]{y}} - 1 \right) \left( 1 - \frac{1}{\sqrt[10]{y}} \right) \leq \pi
$$

therefore if we take either the one or the other of the two preceding expressions for $\log y$, the error in excess or defect is necessarily less than this quantity.

By these formulas we may depend upon having the logarithm of any number true to $n$ figures, if we give to $n$ such a value that the root $\sqrt[10]{y}$ shall have $n$ cyphers between the decimal point and the first significant figure on the right. So that in general, as the error is the smaller according as $n$ the exponent of the root is greater, we may conclude that it becomes nothing, or may be reckoned as nothing, when $n$ is taken indefinitely great; and this being the case, we may conclude that either of these expressions

$$
n \left( \frac{\pi}{2} - 1 \right), \quad n \left( 1 - \frac{1}{\sqrt[10]{y}} \right)
$$

is the accurate value of $\log y$.

The best manner of applying the preceding formula is to take some power of the number 2 for $n$; for by doing so, the root $\sqrt[10]{y}$ may be found by a repetition of extractions of the square root only. It was in this way that Briggs calculated the first logarithms; and he remarked, that if in performing the successive extractions of the square root, he at last obtained twice as many decimal places as there were cyphers after the decimal point, the integer before it being unity, then the decimal part of this root was exactly the half of that which went before; so that the decimal parts of the two roots were to each in the same proportion as their logarithms: now this is an evident consequence of the preceding formula.

To give an example of the application of the formula, let it be required to find the numerical value of $M$, the modulus of the common system of logarithms, which, as it is the reciprocal of the Napierian logarithm of 10, is equal to

$$
\frac{1}{n} \times \frac{1}{\sqrt[10]{10}} \text{ nearly,}
$$

when $n$ is some very great number. Let us suppose $n = 200 = 8^3$; then, dividing unity by 8, and this result again by 8, and so on, we shall, after 20 divisions, have $\frac{1}{n}$ or $\frac{1}{8^3}$ equal to

$$
0.00000000000000086736173798840354.
$$

Also, by extracting the square root of 10, and the square root of this result, and so on, after performing 60 extractions we shall find $\sqrt[10]{10}$ equal to

$$
1.0000000000000000109714208125504303251.
$$

Therefore,
LOGARITHMS.

Therefore, \( \frac{1}{n} \times \frac{1}{\sqrt{n^{10^{-1}}} + 1} \) or \( M \), is equal to

\[
\frac{1}{n^{10^{-1}}} + 1 = 0.434944819.
\]

As a second example, let it be required to find by the same formula the logarithm of the number 3, which is nearly equal to

\[
\eta M (\sqrt[3]{3} - 1) = \frac{n(\sqrt[3]{3} - 1)}{n(\sqrt[3]{10} - 1)} = \frac{\sqrt[3]{3} - 1}{\sqrt[3]{10} - 1}.
\]

\( M \) being as before a very great number. Let us suppose also in this case that \( n = 2^{36} \); then after 60 extractions of the square root we have \( \sqrt[3]{3} \) equal to

1.00000 00000 00095 26942 64074 58932.

Therefore, taking the value of \( \sqrt[3]{10} \) as found in last example, we have

\[
\log 3 = \frac{\sqrt[3]{3} - 1}{\sqrt[3]{10} - 1} = 0.95289426407458932
\]

\[
= 0.7712 11547 19662.
\]

This method of computing logarithms is evidently attended with great labour, on account of the number of extractions of roots which it requires, to obtain a result true to a moderate number of places of figures. But the two series, which we have given, serve to simplify and complete it. For whatever be the number \( y \), it is only necessary to proceed with the extractions of the square root, till we have obtained for \( \sqrt[n]{y} \) a value which is unity followed by a decimal fraction; and then \( \sqrt[n]{y} - 1 \), being a fraction, its powers will also be fractions, which will be so much the smaller as their exponents are greater; thus a certain number of terms of the series will serve to express the logarithm as to many decimal places as may be required.

There are yet other analytical artifices by which the series

\[
\log y = M \left\{ (y - 1) - \frac{1}{3} (y - 1)^2 + \frac{1}{7} (y - 1)^3 - \frac{1}{9} (y - 1)^4 + \mathrm{&c.} \right\}
\]

may be transformed into others which shall always converge, and in particular the following. Let \( 1 + u \) be substituted in the series for \( y \); then it becomes

\[
\log (1 + u) = M \left( u - \frac{u^3}{3} + \frac{u^5}{5} - \frac{u^7}{7} + \mathrm{&c.} \right).
\]

In like manner let \( 1 - u \) be substituted for \( y \), and we have

\[
\log (1 - u) = M \left( -u - \frac{u^3}{3} + \frac{u^5}{5} - \frac{u^7}{7} + \mathrm{&c.} \right).
\]

Let each side of the latter equation be subtracted from the corresponding side of the former; the result on the left-hand side will be

\[
\log (1 + u) - \log (1 - u) = M \frac{1 + u}{1 - u} + \mathrm{&c.}
\]

which, by the nature of logarithms, is equal to

\[
\frac{1 + u}{1 - u};
\]

and on the right-hand side the alternate terms

of the two series, having the same sign, these will by subtraction destroy each other, so that we shall have

\[
\log \frac{1 + u}{1 - u} = 2M \left( u + \frac{u^3}{3} + \frac{u^5}{5} + \frac{u^7}{7} + \mathrm{&c.} \right).
\]

which series, by substituting \( z \) for \( \frac{1 + u}{1 - u} \), and con-

sequently, \( \frac{z - 1}{z + 1} \) for \( u \), will be otherwise expressed thus,

\[
\log \left( \frac{z - 1}{z + 1} \right) = 2M \left\{ (\frac{z - 1}{z + 1})^{-1} + \frac{1}{3} (\frac{z - 1}{z + 1})^{-1} + \frac{1}{7} (\frac{z - 1}{z + 1})^{-1} + \mathrm{&c.} \right\},
\]

and this formula for the logarithm of a number is not only simple, but has also the property of converging in every possible case.

That we may give an example of the utility of this formula, we shall employ it in the calculation of the Napierian logarithm of 2, which by the above formula will be

\[
2 \left( \frac{1}{3} + \frac{1}{3^3} + \frac{1}{5 \cdot 3^3} + \frac{1}{7 \cdot 3^5} + \frac{1}{9 \cdot 3^9} + \mathrm{&c.} \right) = A + \frac{1}{3} B + \frac{1}{5} C + \frac{1}{7} D + \frac{1}{9} E + \mathrm{&c.}
\]

where \( A \) is put for \( \frac{2}{3} \), \( B \) for \( \frac{2}{3^3} \), \( C \) for \( \frac{2}{3^5} \), \( D \) for \( \frac{2}{3^7} \), \( E \) for \( \frac{2}{3^9} \), &c. The calculation will be as follows.

\[
A = 0.696666666666666666
\]

\[
B = 0.024601358025
\]

\[
C = 0.001666666666666666
\]

\[
D = 0.000133333333333333
\]

\[
E = 0.00001123456789
\]

\[
F = 0.00000123456789
\]

\[
G = 0.000000123456789
\]

\[
H = 0.0000000123456789
\]

\[
I = 0.00000000123456789
\]

\[
K = 0.000000000123456789
\]

\[
L = 0.0000000000123456789
\]

\[
M = 0.00000000000123456789
\]

\[
A = 0.693147180551
\]

\[
B = 0.024601358025
\]

\[
C = 0.001666666666666666
\]

\[
D = 0.000133333333333333
\]

\[
E = 0.00001123456789
\]

\[
F = 0.00000123456789
\]

\[
G = 0.000000123456789
\]

\[
H = 0.0000000123456789
\]

\[
I = 0.00000000123456789
\]

\[
K = 0.000000000123456789
\]

\[
L = 0.0000000000123456789
\]

\[
M = 0.00000000000123456789
\]

Nap. log. 2 = 0.693147180551.

Thus, by a very easy calculation, we have obtained the Napierian logarithm of 2 true to the first ten places of figures; the accurate value, as far as the 12th place, being 0.693147180550.

If this very simple process by which we have found the logarithm of 2 (the whole of which is here actually put down), be compared with the laborious calculations which must have been performed to have found the same logarithm by the method explained in the beginning of this section, the great superiority of this method to the other, and even to the second method, by which we have found the numerical value of \( M \), and the common logarithm of 3, must be very apparent.

In the same manner as we have found the logarithm of 2 we may find those of 3, 5, &c. In computing the logarithm
LOGARITHMS.

Nature of logarithm of 3 the series would converge by the powers of \( \frac{3-1}{3+1} = \frac{2}{4} \), and in computing the logarithm of 5 it would converge by the powers of \( \frac{5-1}{5+1} = \frac{2}{6} \), but in each of these cases the series would converge slower, and of course the labour would be greater than in computing the logarithm of 2. And if the number whose logarithm was required was still more considerable; as for example 199, the series would converge so slow as to be useless.

We may however avoid this inconvenience by again transforming this last formula into another which shall express the logarithm of any number by means of a series, and a logarithm supposed to be previously known.

To effect this new transformation, let \( \frac{1+u}{1-u} = 1 + \frac{x}{n} \), then, by resolving this equation in respect of \( u \), we have \( u = \frac{x}{2n+x} \). Let these values of \( \frac{1+u}{1-u} \) and \( u \) be substituted in the formula,

\[
\log \left( \frac{1+u}{1-u} \right) = 2M \left( \frac{x^3}{3} + \frac{x^5}{5} + \frac{x^7}{7} + \cdots + \text{c.c.} \right)
\]

and we have \( \log \left( \frac{1+u}{1-u} \right) = \frac{n+x}{n} \log (n+x) - \log n \),

therefore, by substituting this value of \( \frac{n+x}{n} \), and transposing \( \log n \) to the other side of the equation, we have

\[
\log (n+x) = \log n + 2M \left\{ \frac{x}{2n+x} + \frac{x}{2n+x} \left( \frac{x}{2n+x} \right)^3 + \frac{x}{2n+x} \left( \frac{x}{2n+x} \right)^5 + \cdots + \text{c.c.} \right\}
\]

By the assistance of this formula, and the known properties of logarithms, we may proceed calculating the logarithm of one number from that of another as follows.

To find the Napierian logarithm of 3 from that of 2, which has been already found. We have here \( n=2, \ x=1, \) and \( \frac{2n+x}{2} = \frac{3}{2} \). Therefore the logarithm required is equal to

\[
\log 2 + 2 \left( \frac{1}{5} + \frac{1}{3 \cdot 5} + \frac{1}{5 \cdot 5} + \frac{1}{7 \cdot 5} + \cdots + \text{c.c.} \right)
\]

\[
= \log 2 + A + \frac{1}{7} B + \frac{1}{3} C + \frac{1}{5} D + \frac{1}{7} E + \cdots + \text{c.c.}
\]

where \( A \) is put for \( \frac{3}{25} \), \( B \) for \( \frac{3}{25} A \), \( C \) for \( \frac{3}{25} B \), and so on.

The calculation may stand thus:

\[
\begin{align*}
A &= 0.400000000000 \\
B &= \frac{1}{7} A = 0.016000000000 \\
C &= \frac{1}{7} B = 0.000600000000 \\
D &= \frac{1}{7} C = 0.000025600000 \\
E &= \frac{1}{7} D = 0.000001240000 \\
F &= \frac{1}{7} E = 0.000000040600 \\
G &= \frac{1}{7} F = 0.000000001638 \\
H &= \frac{1}{7} G = 0.000000000066 \\
A &= 0.400000000000 \\
B &= 0.053333333333 \\
C &= 0.001280000000 \\
D &= 0.00003657143 \\
E &= 0.00000113778 \\
F &= 0.00000030724 \\
G &= 0.0000000125 \\
H &= 0.0000000004 \quad \text{(to 10 decimal places)}
\end{align*}
\]

This logarithm is true to 10 decimal places, the accurate value to 12 figures being 1.098612898968.

To find the Napierian logarithm of 4. This is immediately had from that of 2 by considering that \( 4 \approx 2^2 \), therefore \( \log 4 = \log 2 + 2 \cdot \log 2 \).

\[
\begin{align*}
\log 2 &= 0.693147180551 \\
\log 4 &= 1.386294361102 \\
\log 4 &= 2 \cdot \log 2 + 2 \cdot 0.693147180551
\end{align*}
\]

This logarithm is also true to 10 places besides the integer.

To find the Napierian logarithm of 5, from that of 4; we have \( n=4, \ x=1, \) and \( \frac{2n+x}{2} = \frac{5}{2} \), therefore the logarithm of 5 is expressed by

\[
\log 5 = 2 + \left( \frac{1}{9} + \frac{1}{3 \cdot 9} + \frac{1}{5 \cdot 9} + \frac{1}{7 \cdot 9} + \cdots + \text{c.c.} \right)
\]

\[
= \log 4 + A + \frac{1}{7} B + \frac{1}{3} C + \frac{1}{5} D + \frac{1}{7} E + \cdots + \text{c.c.}
\]

where \( A = \frac{1}{9} \), \( B = \frac{1}{3} A \), \( C = \frac{1}{5} B \), and so on.

The calculation.

\[
\begin{align*}
A &= 0.222222222222 \\
B &= \frac{1}{3} A = 0.074074074074 \\
C &= \frac{1}{5} B = 0.014814814814 \\
D &= \frac{1}{7} C = 0.002058823529 \\
E &= \frac{1}{7} D = 0.000294117647 \\
F &= \frac{1}{7} E = 0.000041948150 \\
G &= 0.000000000000 \\
H &= 0.000000000000 \\
A &= 2.222222222222 \\
B &= 0.00914494742 \\
C &= 0.0006774035 \\
D &= 0.000059736 \\
E &= 0.00000174 \\
F &= 0.0000000006 \quad \text{(to 10 decimal places)}
\end{align*}
\]

This result is also correct to the first ten places of decimals.

The
LOGARITHMS.

The logarithm of 6 is found from those of 2 and 3, by considering, that because $6 \approx 2 \times 3$, therefore $\log 6 \approx \log 2 + \log 3$.

\begin{align*}
\text{Nap. log. 2} &= 0.693147180551 \\
\text{Nap. log. 3} &= 1.098612288659 \\
\text{Nap. log. 6} &= 1.791759469210
\end{align*}

This result is correct as far as the tenth decimal place.

We might find the logarithm of 7 from the logarithm of 6, that is, from the logarithm of 3 and 2, in the same manner as we have found the logarithms of 5 and 3; but it may be more readily found from the logarithms of 2 and 5 by reasoning thus. Because $\frac{2 \times 5^2}{7^2} = \frac{50}{49}$, therefore $\log 2 + \log 5 - \frac{2}{9} \log 7$ or $\log \frac{50}{49}$, and consequently

\[
\log 7 = \frac{1}{3} \log 2 + \log 5 - \frac{2}{9} \log \frac{50}{49}
\]

Now the logarithm of $\frac{50}{49}$ may be readily obtained from the formula

\[
\log n = 2M \left\{ \frac{\frac{n-1}{2}}{n+1} + \frac{1}{2} \left( \frac{\frac{n-1}{2}}{n+1} \right)^3 + \frac{1}{3} \left( \frac{\frac{n-1}{2}}{n+1} \right)^5 + \text{&c.} \right\}
\]

For substituting $\frac{50}{49}$ for $n$, the formula gives

\[
\text{Nap. log. } \frac{50}{49} = \frac{1}{9.11^2} + \frac{1}{9.11^3} + \frac{1}{9.11^5} + \text{&c.}
\]

where $A = \frac{2}{9.11^2}$, $B = \frac{1}{9.11^3}$, $C = \frac{1}{9.11^5}$, &c. This series converges with great rapidity, and a few of its terms will be sufficient to give the logarithm of 7, as appears from the following operation.

\[
\begin{align*}
A &= \frac{1}{9.11^2} = 0.020202020202 \\
B &= \frac{1}{9.11^3} = 0.00002061220 \\
C &= \frac{1}{9.11^5} = 0.000000000042 \\
B &= \frac{1}{9.11^3} = 0.0000687073 \\
C &= \frac{1}{9.11^5} = 0.000000000042
\end{align*}
\]

\[
\text{Nap. log. } \frac{50}{49} = 0.02022707317
\]

\[
\begin{align*}
\text{Nap. log. 2} &= 0.346573590275 \\
\text{Nap. log. 5} &= 1.585437912417 \\
\text{Nap. log. 7} &= 1.956011502692
\end{align*}
\]

Thus by a few calculations we have found the Napierian logarithms of the first ten numbers, each true to ten decimal places; and since the Napierian logarithm of 10 is now known, the modulus of the common system, which is the reciprocal of that logarithm, will also be known, and will be

\[
\frac{1}{10} = 0.301029995664
\]

The common logarithms of the first ten numbers may now be found from the Napierian logarithms by multiplying each of the latter by the modulus, or dividing by its reciprocal, that is, by the Napierian logarithm of 10. And as the modulus of the common system is so important an element in the theory of logarithms, we shall give its value, together with that of its reciprocal, as far as the 30th decimal place.

\[
M = 0.434294481903251827651128918917
\]

The formulas we have already given are sufficient for finding the logarithms of all numbers whatever throughout the table; but there are yet others which may often be applied with great advantage, and we shall now investigate some of these.

Because

\[
\log n = 2M \left\{ \frac{n-1}{n+1} + \frac{1}{2} \left( \frac{n-1}{n+1} \right)^3 + \frac{1}{3} \left( \frac{n-1}{n+1} \right)^5 + \text{&c.} \right\}
\]

If we now suppose

\[
n = \frac{n^a}{n^a - 1} = \frac{n^a}{(n-1)(n+1)}
\]

so that $\frac{n-1}{n+1} = \frac{1}{2n^a - 1}$, then the formula becomes

\[
\log \frac{n^a}{(n-1)(n+1)} = 2M \left\{ \frac{1}{2n^a - 1} + \frac{1}{3} \left( \frac{1}{2n^a - 1} \right)^3 + \frac{1}{5} \left( \frac{1}{2n^a - 1} \right)^5 + \text{&c.} \right\}
\]

But
LOGARITHMS.

But \( \log \frac{n^2}{(n-1)(n+1)} = 2 \log n - \log (n-1) - \log (n+1) \), therefore, putting \( N \) for the series
\[
2M \left\{ \frac{i}{2} \cdot n^{-1} + \frac{i}{2} \cdot n^{-1} \right\} + \frac{i}{2} \cdot n^{-1} + \&c.
\]
we have this formula,
\[
2 \log n - \log (n-1) - \log (n+1) = N;
\]
and hence, as often as we have the logarithms of any two of three numbers whose common difference is unity, the logarithm of the remaining number may be found. Example. Having given
the common log. of \( \sqrt[3]{0.05424250943} \)
the common log. of \( 2.199 \);

it is required to find the common logarithm of \( 11 \).

Here we have \( 2 \log 10 - \log 9 - \log 11 = N \), and hence we have
\[
\log 11 = 2 \log 10 - \log 9 - N,
\]
where \( N = \frac{2M}{0.0436478666} + \frac{2M}{199} + \\&c. \)
\( M \) being \( 0.0436480540 \).

Calculation of \( N \).
\[
A = \frac{2M}{0.0436478666} = 0.00364, B = \frac{A}{3.199} = 0.0000003674
\]
\[
\log 9 = 0.05424250943 \quad N = 0.00436480540
\]

\[
\log 9 + N = 0.05460731483 \quad \log 11 = 1.0413268317
\]

Here the series expressed by \( N \) converges very fast, so that two of its terms are sufficient to give the logarithm true to 10 places of decimals. But the logarithm of \( 11 \) may be expressed by the logarithms of smaller numbers, and a series which converges still more rapidly, by the following artifice, which will apply also to some other numbers. Because the numbers 98, 99, and 100 are the products of numbers, the greatest of which is 11, for \( 98 = 2 \times 7 \times 11 \), 99 = 9 \times 11, and 100 = 10 \times 10, it follows that if we have an equation composed of terms which are the logarithms of these three numbers, it may be resolved into another, the terms of which shall be the logarithms of the number 11 and other smaller numbers. Now by the preceding formula, if we put 99 for \( n \), we have
\[
2 \log 99 - \log 98 - \log 100 = N,
\]
that is, substituting \( \log 9 + \log 11 \) for \( \log 99 \), \( 2 + 2 \log 7 \) for \( \log 98 \), and \( 2 + 2 \log 10 \) for \( \log 100 \),
\[
2 \log 9 + 2 \log 11 - 2 - 2 \log 7 = N.
\]

and hence by transposition, \( \&c. \)
\[
\log 11 = 4N + \frac{2M}{19601} - \log 7 + \log 9 + \log 10 \]
and in this equation
\[
N = \frac{2M}{19601} + \frac{2M}{19601} + \&c.
\]
The first term alone of this series is sufficient to give the logarithm of \( 11 \) true to 14 places.

Another formula, by which the logarithm of a number is expressed by the logarithms of other numbers and a series, may be found as follows.

Resuming the formula
\[
\log \frac{n}{n-1} = 2M \left\{ \frac{2}{n-1} \right\} + \frac{2}{n+1} + \&c.
\]
Let us assume
\[
\frac{\frac{n-1}{n+2}}{\frac{n-2}{n+1}} = \frac{\frac{3}{n-3}}{\frac{3}{n-3}} + \frac{2}{(n-3)} + \&c.
\]

Let these values of \( x \), and \( \frac{n-1}{n+1} \), be substituted in the formula, and it becomes
\[
\log \frac{(n-1)(n+2)}{(n-2)(n+1)} = 2M \left\{ \frac{2}{n-3} \right\} + \frac{2}{n+1} + \&c.
\]
But the quantity on the left-hand side of this equation is manifestly equal to \( 2 \log (n-1) + \log (n+2) - \log (n-2) - 2 \log (n+1) \), therefore, putting \( P \) for the series,
\[
2M \left\{ \frac{2}{n-3} \right\} + \frac{2}{n+1} + \&c.
\]
we have this formula,
\[
\log (n+2) + 12 \log (n-1) - \log (n-2) - 2 \log (n+1) = P.
\]
By this formula we may find, with great facility, the logarithm of any one of the four numbers \( n-2, n-1, n+1, n+2 \), having the logarithms of the other three. We may also employ it in the calculation of logarithms, as in the following example. Let the numbers \( 5, 6, 7, 8 \), be substituted successively in the formula; then, observing that \( \log 6 = \log 2 + \log 3 \), and \( \log 8 = \log 2 + \log 10 \), we have these four equations,
\[
\log 7 + 2 \log 2 - 3 \log 3 = \frac{2M}{55} + \frac{2M}{3.55} + \&c.
\]
\[
-2 \log 7 + \log 2 + 2 \log 5 = \frac{2M}{99} + \frac{2M}{3.99} + \&c.
\]
\[
4 \log 3 - 4 \log 2 - 2 \log 5 = \frac{2M}{161} + \frac{2M}{3.161} + \&c.
\]
\[
5 - 5 \log 3 + 2 \log 7 = \frac{2M}{244} + \frac{2M}{3.244} + \&c.
\]

Let \( \log 2, \log 3, \log 5, \) and \( \log 7 \), be new considered as four unknown quantities, and by resolving those equations in the usual manner (see Algebra, Sect. VII.) the logarithms may be determined.

Resuming once more the formula
\[
\log x = 2M \left\{ \frac{x-1}{x+1} \right\} + \frac{x-1}{x+1} + \&c.
\]
let
LOGARITHMS.

Instead of \( \infty \), then, by this substitution \( \frac{n+1}{n+1} \) will become

\[
\frac{-72}{n^2 - 25n^2 + 72} = \frac{n(n+5)}{(n+3)(n+3)(n+4)(n+4)} \text{ be substituted in it}
\]

The formula will be transformed to

\[
\log \frac{n(n+5)}{(n+3)(n+3)(n+4)(n+4)} = 2M \left\{ \frac{72}{n^2 - 25n^2 + 72} + \frac{72}{n^2 - 25n^2 + 72} \right\} + \text{c.c.}
\]

Hence, putting the latter side of this equation equal to \( Q \), we have this formula,

\[
2 \log n + \log (n+5) + \log (n-5) - \log (n+3) - \log (n-3) - \log (n+4) - \log (n-4) = 0
\]

which may be applied to the calculation of logarithms in the same manner as the former.

When it is required to find the logarithm of a high number, as for example 1231, we may proceed as follows:

\[
\log 1231 = \log (1230 + 1) = \log \left( 1230 \left(1 + \frac{1}{1230}\right) \right) = \log 1230 + \log \left(1 + \frac{1}{1230}\right).
\]

Again, \( \log 1230 = \log 2 + \log 5 + \log 123, \) and \( \log 123 = \log \left(120 \left(1 + \frac{1}{40}\right)\right) = \log 120 + \log \left(1 + \frac{1}{40}\right) \).

\[
\log 120 = \log \left(2^3 \times 3 \times 5\right) = 3 \log 2 + 3 \log 3 + 3 \log 5
\]

Therefore

\[
\log 1231 = 4 \log 2 + 3 \log 3 + 2 \log 5 + \log \left(1 + \frac{1}{40}\right) + \log \left(1 + \frac{1}{1230}\right)
\]

Thus the logarithm of the proposed number is expressed by the logarithms of 2, 3, 5, and the logarithms of \( 1 + \frac{1}{40}, 1 + \frac{1}{1230} \), all of which may be easily found by the formulas already delivered.

Having now explained, at considerable length, the theory of logarithms upon principles purely analytical, such being, as we conceive, the most natural way of reasoning concerning the properties of number, we shall conclude this section by stating briefly the ground upon which it was referred to the principles of geometry by the mathematicians of the 17th century. Let \( C \) (fig. 2.) be the centre, and \( CH, CK \) the asymptotes of an hyperbola. In either of these let there be taken any number of continual proportions \( CA, CB, CD, CE, \) &c. then if \( B, b, D, d, E, e \), &c. be drawn parallel to the other asymptote, meeting the curve in \( a, b, d, e \), &c. the hyperbolic spaces \( A a b B, B b d D, D d e E, \) &c. are equal to one another; also if straight lines be drawn from \( C \) to the points \( a, b, d, e \), &c. the hyperbolic sectors \( A C b, b C d, d C e, \) &c. shall also be equal (Conic Sections, Part III. prop. 30.). Now, since it appears by this proposition that the segments \( CA, CB, \) Description \( CD, CE, \) &c. of the asymptote being taken in continued geometrical progression, the corresponding hyperbolic areas \( A a B, A a D, A a e, \) &c. constitute a series of quantities in continued arithmetical progression, it is evident that the two series will have, in respect to each other, the same properties as numbers and their logarithms; so that, if we assume \( CA \) any segment of the asymptote as the representative of unity, and suppose \( CB, CD, CE, \) &c. to be the representatives of other numbers, the hyperbolic areas \( A a B, A a D, A a e \) will be the geometrical representatives of the logarithms of these numbers; and so will the hyperbolic sectors \( a b, b d, c e, \) &c.

Let \( CA \) (the line denoting unity) be the side of a rhombus \( C A a L \) inscribed at the vertex of the hyperbola, and let \( CP = n.x \) CA \( (n \) being put for any number); draw \( PD \) parallel to \( CL \) meeting the hyperbola in \( P \), then it may be shown, by the methods usually employed in reasoning about curvilinear areas, that the area of the rhombus \( A a L \) is to the hyperbolic area \( A aP \) as \( 1 \) to the Napierian logarithm of the number \( n \). Therefore if the hyperbola be equilateral, so that \( AAaL \) is a square, &c. consequently its area \( = 1 \times 1 = 1 \), the Napierian logarithm of \( n \), and the area \( AAaP \) may be taken as the mutual representatives of each other. It is this circumstance which induced mathematicians to call these logarithms hyperbolic. But with equal propriety might the logarithms of any other system be called hyperbolic, as they may be equally expressed by the area of the equilateral hyperbola, or indeed by the area of any hyperbola whatever, (see Fluxions, § 152. Ex. 5.)

SECT. II.

DESCRIPTION AND USE OF THE TABLE.

THE common system of logarithms is so constructed, that \( 0 \) being the logarithm of unity, or 1, the logarithm of 10 is 1; by which it happens that the logarithm of 100 is 2, that of 1000 is 3, and so on. Also, the logarithm of \( \frac{1}{10} \), or \( .1 \), is \(-1\), that is, 1 considered as subtractive; or, in the language of algebra, \( minus \) one; and the logarithm of \( \frac{1}{3} \) or \( .3 \), is \(-2\); and the logarithm of \( .001 \) is \(-3\), and so on, as in the following short table.

<table>
<thead>

</tbody>
</table>

As the terms of the geometrical progression 1, 10, 100, &c. continued backwards as well as forward, are the only numbers whose logarithms are integers; the logarithms of all other numbers whatever must be either fractions or mixt numbers. Accordingly, the logarithms of all numbers, whether integer or mixt, between 1 and 10 are expressed by decimal fractions less than
LOGARITHMS.

The logarithms of numbers between 10 and 100 are expressed by mixt numbers composed of unity and a decimal fraction. The logarithms of numbers between 100 and 1000 are expressed by mixt numbers composed of the number 2 and a decimal fraction, and so on. On the other hand, the logarithm of any vulgar or decimal fraction less than 1, but greater than $\frac{1}{10}$ or $\frac{1}{100}$, will be some negative decimal fraction between 0 and -1; and the logarithm of any fraction between .1 and .01, will be a negative mixed quantity between -1 and -2, and so on.

But it must be remarked, that any fraction, or mixt number, considered as entirely negative, may always be transformed into another mixt number of equal value, that shall have its integer part negative, but its fractional part positive, by diminishing the integer by unity, and increasing the fractional part by the same quantity. Thus let the mixt quantity be $-2\frac{3}{5}$, which may be also written thus $-2.6$. Let the integer -2 be diminished by 1, and the result is $-2-1=-3$.

Also, let the fraction $-\frac{3}{5}$ be increased by 1, and it becomes $-\frac{3}{5}+1=\frac{2}{5}$; therefore the fraction $-2\frac{3}{5}$ or $-2.6$, when transformed, is $-3+\frac{2}{5}$, or $-3.4$, which may be written thus, 3.7; where the negative sign is placed over the integer to indicate that it is the only part of the expression that is considered as negative, the other part, viz. .7, being reckoned positive.

Since therefore any fractional or mixt quantity, considered as entirely negative, is equivalent to another mixt quantity, the integer part of which only is negative, but the fractional part positive, it is evident that instead of expressing the logarithms of fractions by numbers considered as entirely negative, we may express them by numbers having their integer parts negative, and their decimal parts positive; and it is usual so to express them. Thus the logarithm of .03, instead of being expressed by $-1.52288$, that is, by $-1.52288$, is usually expressed by $2.47712$, by which is to be understood $-2+4.7712$. Again, the logarithm of .7, which, if considered as entirely negative, would be $-1.5490$, is otherwise 1.8510.

As the logarithms of any series of numbers forming a geometrical progression, the common ratio of which is 10, will exceed each other by the logarithm of 10, that is, by 1, it follows that the logarithms of all numbers denoted by the same figures, and differing only in the position of the decimal point, will have the decimal part of their logarithms the same; but the integers standing before the decimals will be different, and will be positive or negative, according as the numbers are whole or fractional, as in these examples.

The integer figure of a logarithm, is called its index or characteristic; and it is always less by one than the Vol. XII. Part I.

The number of integer figures which the natural number consists of; or it is equal to the distance of the first figure from the place of units or first place of integers, whether on the left or on the right of it.

The table of logarithms given at the end of this article, contains the decimal parts of the logarithms of all numbers from 1 to 10,000; and indeed of all numbers which can be expressed by four figures, preceded or followed by any numbers of cyphers, such as the numbers 367500, .002795, &c. The index, however, is not put down; but it is easily supplied by the rule which has just now been given. The table also contains the differences of the logarithms of all numbers from 1000 to 10,000, by means of which the logarithm of any number consisting of five figures may be easily obtained.

1. To find the logarithm of any number consisting of four or any smaller number of figures. Look for the number in the columns titled at the top Numbers; and in the same line with it, on the right, in the column of logarithms, will be found the decimal part of its logarithm, to which supply the decimal point, and its index according to rule delivered above. Thus,

<table>
<thead>
<tr>
<th>Number</th>
<th>Logarithm</th>
</tr>
</thead>
<tbody>
<tr>
<td>9</td>
<td>0.95424</td>
</tr>
<tr>
<td>17</td>
<td>1.23043</td>
</tr>
<tr>
<td>2.63</td>
<td>0.41996</td>
</tr>
<tr>
<td>3.42</td>
<td>1.2775</td>
</tr>
<tr>
<td>6.280</td>
<td>0.79796</td>
</tr>
<tr>
<td>37.49</td>
<td>1.57392</td>
</tr>
<tr>
<td>60.27</td>
<td>1.78010</td>
</tr>
<tr>
<td>0.0034</td>
<td>3.36922</td>
</tr>
<tr>
<td>85.620</td>
<td>5.93975</td>
</tr>
</tbody>
</table>

2. To find the logarithm of a number consisting of five figures.

Find the decimal part of the logarithm of the first four figures of the number, (that is, find the logarithm of the proposed number as if the last figure were a cypher), by the preceding rule, and find the difference between that logarithm and the next greater, as given in the column of differences (to the right of the column of logarithms). Then state this proportion:

As 1, To the tabular difference, So is the last, or fifth figure of the number, To a fourth proportional;

which being added to the former logarithm, and the decimal point and index supplied, will be the logarithm sought.

Example. Required the logarithm of 186.47. The decimal part of the logarithm of the first four figures, viz. 1864, is .27045, and the difference opposite to it in the column marked D on the top is 23. Therefore we have this proportion:

$$10 : 23 :: 7 : \frac{23}{10} = 16.1$$

The fourth proportional is 16.1, or, rejecting the decimal part, .16 nearly; therefore,

to log. of 168.4, 27045 add 16

the log. of 168.47 is 2.27064
LOGARITHMS.

3. To find the logarithm of a vulgar fraction or mixt number, find its logarithm as above, or having reduced the vulgar fraction to a decimal, subtract the logarithm of the denominator from the logarithm of the numerator, and the remainder will be the logarithm of the fraction sought.

Ex. 1. To find the logarithm of \(\frac{3}{8}\).

From the log. of 3 0.47712
Subtract the log. of 16 1.20412

Rem. log. of \(\frac{3}{8}\) or of .1875 1.27300

Here, as the lower number is greater than the upper, the remainder must be negative; the subtraction, however, is so performed, that the decimal part of the remainder is positive, and the integer negative.

Ex. 2. To find the logarithm of \(13\frac{1}{2}\) or \(\frac{77}{4}\).

From log. of 55 1.74036
Subtract log. of 4 0.60206

Rem. log. of \(13\frac{1}{2}\) or of 13.75 1.13830

4. To find the number corresponding to any given logarithm.

Seek the decimal part of the proposed logarithm in the column of logarithms, and if it be found exactly, the figures of the number corresponding to it will be found in the same line with it in the column of numbers. If the index of the given logarithm is 3, the four figures of the numbers thus found are integers; but if it be 2, the three first figures are integers, and the fourth is a decimal, and so on; the number of integer figures before the decimal point being always one greater than the index, if it be positive; but if it be negative, the number sought will be a decimal, and the number of cyphers between the decimal point and first significant figure will be one less than the index.—

Examples. The number corresponding to the logarithm 3.57392 is 3749. The number corresponding to 1.12775 is 13.42. The number corresponding to 3.36922 is .00234, and so on.

But if the given logarithm is not exactly found in the table, subtract the next less tabular logarithm from it, and take the difference between that logarithm, and the next greater (as given in the column of differences). Then state this proportion:

\[
\text{As the difference, taken from the table, is to 10, so is the difference between the given logarithm and the next less, to a fourth proportional, which being annexed to the four figures corresponding to the logarithm next less than the given one, will be the logarithm required.}
\]

Example. Find the number answering to the logarithm 4.13278.

The decimal part of given log. is .13278
That of next less, viz. log. of 13.57, is .13238
Difference 20

The tabular difference is 32, therefore we have this proportion,

\[
32 : 10 :: 20 : \frac{20 \times 10}{32} = 6 \text{ nearly.}
\]

Therefore the number corresponding to the proposed logarithm is .13576.

In like manner may the numbers to the following logarithms be found.

<table>
<thead>

</tr>
</tbody>
</table>

The table of logarithms of numbers is followed by a Table of logarithmic Sines and Tangents, for every minute of the quadrant, with their differences. For the explanation of this table we refer to TRIGONOMETRY, to which branch of mathematics it is intended to be applied.

We shall now give practical rules, illustrated by examples, for performing the different operations of arithmetic by logarithms.

MULTIPLICATION BY LOGARITHMS.

Rule.

Take out the logarithms of the factors from the table; then add them together, and their sum will be the logarithm of the product required. Then find, by inspection of the table, the natural number answering to their sum, and it will be the product required.

Observing to add what is to be carried from the decimal part of the logarithm to the positive index or indices, or else subtract it from the negative.

Also adding the indices together when they are of the same kind, that is, both positive or both negative; but subtracting the less from the greater when the one is positive and the other negative, and prefixing the sign of the greater to the remainder.

EXAMPLES.

Ex. 1. To multiply 2.314 by 50.62.

<table>
<thead>
<tr>
<th>Numbers</th>
<th>Logarithms</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.314</td>

<td>0.55461</td>
</tr>
<tr>
<td>2.1046</td>
<td>0.32317</td>
</tr>
<tr>
<td>0.8372</td>
<td>1.92283</td>
</tr>
<tr>
<td>0.0294</td>
<td>2.46835</td>
</tr>
</tbody>
</table>

1.26896

Here the 2 to carry cancels the — 2, and there remains the — 1 to set down.

DIVISION BY LOGARITHMS.

RULE.

Subtract the logarithm of the divisor from the logarithm of the dividend, and the number answering to the remainder will be the logarithm of the quotient required.

Observing to change the sign of the index of the divisor from positive to negative, or from negative to positive; then take the sum of the indices if they be of the same name, or their difference when they have different signs, with the sign of the greater for the index to the logarithm of the quotient.

Also, when 1 is borrowed in the left-hand place of the decimal part of the logarithm, add it to the index of the divisor when that index is positive, but subtract it when negative; then let the index arising from thence be changed, and work with it as before.

EXAMPLES.

Ex. 1. To divide 24163 by 4567.

<table>
<thead>
<tr>
<th>Numbers</th>
<th>Logarithms</th>
</tr>
</thead>
<tbody>
<tr>
<td>Divid. 24163</td>

<tbody>
<tr>
<td>Divid. .06314</td>
<td>2.80030</td>
</tr>
<tr>
<td>Divis. .007241</td>
<td>3.85980</td>
</tr>
<tr>
<td>Quot. 8.720</td>
<td>0.94050</td>
</tr>
</tbody>
</table>

Here I carried from the decimals to the — 3 makes it — 2, which taken from the other — 2, leaves 0 remaining.

Ex. 4. Divide .7438 by 12.947.

<table>
<thead>
<tr>
<th>Numbers</th>
<th>Logarithms</th>
</tr>
</thead>
<tbody>
<tr>
<td>Divid. .7438</td>
<td>1.87146</td>
</tr>
<tr>
<td>Divis. 12.947</td>
<td>1.11218</td>
</tr>
<tr>
<td>Quot. .05749</td>
<td>2.75928</td>
</tr>
</tbody>
</table>

Here the 1 taken from the — 1 makes it become — 2 to set down.

PROPORTION BY LOGARITHMS.

RULE.

Add the logarithms of the second and third terms, and from the sum subtract the logarithm of the first term by the foregoing rules, the remainder will be the logarithm of the fourth term required.

Or in any compound proportion whatever, add together the logarithms of all the terms that are to be multiplied; and from that sum take the sum of the others, the remainder will be the logarithm of the answer.

But, instead of subtracting any logarithm, we may add its arithmetical complement, and the result will be the same. By the arithmetical complement is meant the logarithm of the reciprocal of the given number, or the remainder by taking the given logarithm from 0, or from 10, changing the beginning of the scale from 0 to 10; the easiest way of doing which is to begin at the left hand, and subtract each figure from 9, except at the last significant figure on the right hand, which must be subtracted from 10. But when the index is negative, it must be added to 9, and the rest subtracted as before; and for every complement that is added, subtract 10 from the last sum of the indices.

EXAMPLES.

Ex. 1. Find a fourth proportional to 72.34, 2.519, and 357.48.

<table>
<thead>
<tr>
<th>Numbers</th>
<th>Logarithms</th>
</tr>
</thead>
<tbody>
<tr>
<td>As 72.34</td>
<td>1.85938</td>
</tr>
<tr>
<td>To 2.519</td>
<td>0.40213</td>
</tr>
<tr>
<td>So is 357.48</td>
<td>2.53325</td>
</tr>
</tbody>
</table>

To 12.448 1.09510

Here the logarithms of the second and third terms are added together, and the logarithm of the first term is subtracted from the sum; but by taking the arithmetical
LOGARITHMS.

3 to carry, the difference —5, is the index of the product.

Ex. 4. To raise 1.0045 to the 365th power.

Number. Logarithm.
Root 1.0045 0.00105
The index 365

Power 5.1493 0.71175

EVOLUTION BY LOGARITHMS.

Rule.

DIVIDE the logarithm of the number by the index of the root, and the number answering to the quotient is the root sought.

When the index of the logarithm to be divided is negative, and does not exactly contain the divisor without some remainder, increase the index by such a number as will make it exactly divisible by the index of the root, carrying the units borrowed as many tens to the left-hand place of the decimal, and then divide as in whole numbers.

EXAMPLES.

Ex. 1. Find the square root of 2.

Number. Logarithm.
Power .2 2.030103
Root 1.4142 0.1505

Ex. 2. Find the 10th root of 365.

Number. Logarithm.
Power 365 10.25629
Root 1.804 0.25623

Ex. 3. To find \(4 \sqrt{.093}\).

Number. Logarithm.
Power .093 2.06848
Root .30496 1.48424

Here the divisor 2 is contained exactly in the negative index —2, and therefore the index of the quotient is —1.

Ex. 4. To find \(\sqrt[4]{.00048}\).

Number. Logarithm.
Power .00048 3.468124
Root .078298 2.89375

Here the divisor 3, not being exactly contained in —4, it is augmented by 2 to make up 6, in which the divisor is contained just 2 times, then the 2 thus borrowed being carried to the decimal figure 6, makes 26, which divided by 3 gives 8, &c.

- **LOGARITHMS OF NUMBERS.**

- **Log.** indicates the logarithm of the number.
- **D** indicates the decimal part of the logarithm.

This table provides the logarithms and decimal parts for a range of numbers, useful for various mathematical calculations and computations.

**Note:** The values in the table represent logarithms of numbers, where the logarithm of a number is the exponent to which a fixed base (usually 10) is raised to produce that number. The table lists logarithms to the nearest hundredth for values ranging from 912 to 9950.

Digitized by Google.
LOGARITHMIC CURVE. If on the line AN both ways indefinitely extended, be taken AC, CE, EG, GI, IL, on the left hand, and also AG, GP, &c. on the right, all equal to one another, and if at the points PG, A, C, E, G, I, L, be erected to the right line AN the perpendiculars PS, g, d, AB, CD, EF, GH, IK, LM, which let be continually proportional, and represent numbers, viz. AB, 1; CD, 10; EF, 100, &c. then shall we have two progressions of lines, arithmetical and geometrical: for the lines AC, AE, AG, &c. are in arithmetical progression, or as 1, 2, 3, 4, 5, &c. and so represent the logarithms to which the geometrical lines AB, CD, EF, &c. do correspond. For since AG is triple of the first line AC, the number GH shall be in the third place from unity, if CD be in the first: so likewise shall LM be in the fifth place, since AL is 5 AC. If the extremities of the proportionals S, d, D, F, &c. be joined by right lines, the figures SBML will become a polygon, consisting of more or less sides, according as there are more or less terms in the progression.

If the parts AC, CE, EG, &c. be bisected in the points e, e, g, i, l, and there be again raised the perpendiculars, c, d, ef, gh, ik, lm, which are mean proportionals between AB, CD, CD, EF, &c. then there will arise a new series of proportionals, whose terms, Logarithmic curve, beginning from that which immediately follows unity, are double of those in the first series, and the difference of the terms becomes less, and approaches nearer to a ratio of equality than before. Likewise, in this new series, the right lines, AL, A c, express the distances of the terms LM c d, from unity, viz. since AL is ten times greater than A c, LM shall be the tenth term of the series from unity; and because A c is three times greater than A c, ef will be the third term of the series if c d be the first, and there shall be two mean proportionals between AB and ef, and between AB and LM, there will be nine mean proportionals. And if the extremities of the lines B d, Dy, F A, &c. be joined by right lines, there will be a new polygon made, consisting of more but shorter sides than the last.

If, in this manner, mean proportions be continually placed between every two terms, the number of terms at last will be made so great, as also the number of the sides of the polygon, as to be greater than any given number, or to be infinite; and every side of the polygon so lessened, as to become less than any given right line; and consequently the polygon will be changed into a curve-lined figure; for any curve-lined figure may be conceived as a polygon, whose sides are infinitely
Logarithmic Curve
Logarithmic Lines.

It is manifest from this description of the logarithmic curve, that all numbers at equal distances are continually proportional. It is also plain, that if there be four numbers, AB, CD, IK, LM, such that the distance between the first and second be equal to the distance between the third and fourth, let the distance from the second to the third be what it will, these numbers will be proportional. For because the distances AC, IL, are equal, AB shall be to the inercent $D$, as IK is to the inercent MT. Wherefore, by composition, $AB : DC :: IK : ML$. And, contrariwise, if four numbers be proportional, the distance between the first and second shall be equal to the distance between the third and fourth.

The distance between any two numbers is called the logarithm of the ratio of those numbers; and, indeed, doth not measure the ratio itself, but the number of terms in a given series of geometrical proportionals, proceeding from one number to another, and defines the number of equal ratios by the composition whereof the ratio of number is known.

Logarithmic Lines. For many mechanical purposes it is convenient to have the logarithms of numbers laid down on scales, as well as the logarithmic sines and tangents; by which means computations may be carried on by mere measurement with compasses. Lines of this kind are always put on the common Gunter's scale; but as those instruments must be extended to a very great length, in order to contain any considerable quantity of numbers, it becomes an object of importance to shorten them. Such an improvement has been made by Mr. William Nicholson, and published in the 77th volume of the Philosophical Transactions. The principles on which the construction of his instruments depends are as follow:

1. If two geometrical series of numbers, having the same common ratio, be placed in order with the terms opposite to each other, the ratio between any term in one series and its opposite in the other will be constant. Thus,

2 6 18 54 162, &c.
3 9 27 81 243, &c.

Then,

2 3 6 9 18 27 54 81 162 243, &c.

where it is evident, that each of the terms in the upper series is exactly two-thirds of the corresponding one in the lower.

2. The ratio of any two terms in one series will be the same with that between those which have an equal distance in the other.

3. In all such geometrical series as have the same ratio, the property above mentioned takes place, though we compare the terms of any series with those of another: Thus,

2 4 8 16 32 64, &c.
3 6 12 24 48 96, &c.
4 8 16 32 64 128, &c.
5 10 20 40 80 160, &c.; where it is plain that 2, 4, 3; also 2, 4, 4, 8, and 2, 4, 5, 10, &c., have the same ratio with that of each series.

4. If the differences of the logarithms of the numbers be laid in order upon equidistant parallel right lines, in such a manner that a right line drawn across the whole shall intersect it at divisions denoting numbers in geometrical progression; then, from the condition of the arrangement, and the property of this logarithmic line, it follows, 1st, That every right line so drawn will, by its intersections, indicate a geometrical series of numbers; 2dly, That such series as are indicated by these right lines will have the same common ratio; and, 3dly, That the series thus indicated by two parallel right lines, supposed to move laterally, without changing either their mutual distance or parallelism to themselves, will have each the same ratio and in all series indicated by such two lines, the ratio between an antecedent and consequent; the former taken upon one line, and the latter upon another, will be also the same.

The 1st of these propositions is proved in the following manner. Let the lines AB, CD, EF, represent parts of the logarithmic line arranged according to the proportion already mentioned; and let GH be a right line passing through the points c, c, c, denoting numbers in geometrical progression; then will any other line IK, drawn across the arrangement, likewise pass through three points $f, d, b$, in geometrical progression. From one of the points of intersection $f$ in the last-mentioned line IK, draw the line $fg$ parallel to GH, and intersecting the arrangements in the points $g, h$; and the ratios of the numbers $e, f, g$, will be equal, as well as of $a, b, c$; because the intervals on the logarithmic line, or differences of the logarithms of those numbers, are equal. Again, the point $f$, the line $rd$, and the line $d, b$, are in arithmetical progression denoting the differences between the logarithms of the numbers themselves; whence the quotients of the numbers are in geometrical progression.

The 2d proposition is proved in a similar manner. For it was shown that the line $fg$, parallel to GH, passes through points of division denoting numbers in the same continued ratio as those indicated by the line GH; it may also be shown, that the line LM parallel to any other line IK, will pass through a series of points denoting numbers which have the same continued ratio with those indicated by the line IK, to which it is parallel.

The 3d proposition arises from the parallelism of the lines to their former situation; by which means they indicate numbers in a geometrical series, having the same common ratio as before: their distance on the logarithmic line also remains unchanged: whence the differences between the logarithms of the opposite numbers, and of consequence their ratios, will always be constant.

5. Supposing now an antecedent and consequent to be given in any geometrical series, it will always be possible to find them, provided the line be of unlimited length. Drawing two parallel lines, then, through each of the numbers, and supposing the lines to move without changing their direction or parallel situation, they will continually describe new antecedents and consequents in the same geometrical series as before.

6. Though the logarithmic line contain no greater range of numbers than from 1 to 10, it will not be found necessary for the purposes of computation to repeat it. The only thing requisite is to have a slider or beam with two fixed points at the distance of the interval betwixt 1 and 10, and a moveable point made to range betwixt them always to indicate the antecedent; then, if the consequent fixed point fall within the

Plate CCXCVII.

Fig. 11.
LOGIC is the art of thinking and reasoning justly; or, it may be defined the science or history of the human mind, inasmuch as it traces the progress of our knowledge from our first and most simple conceptions through all their different combinations, and all those numerous deductions that result from variously comparing them one with another.

The precise business of logic therefore is, to explain the nature of the human mind, and the proper manner of conducting its several powers, in order to the attainment:
WE find ourselves surrounded with a variety of objects, which acting differently upon our senses, convey distinct impressions into the mind, and thereby rouse the attention and notice of the understanding. By reflecting too on what passes within us, we become sensible of the operations of our own minds, and attend to them as a new set of impressions. But in all this there is only bare consciousness. The mind, without proceeding any farther, takes notice of the impressions that are made upon it, and views things in order, as they present themselves one after another. This attention of the understanding to the object acting upon it, whereby it becomes sensible of the impressions they make, is called by logicians perception; and the notices themselves, as they exist in the mind, and are there treasured up to be the materials of thinking and knowledge, are distinguished by the name of ideas. In the article Metaphysics it shall be shown large, how the mind, being furnished with ideas, contrives to diversify and enlarge its stock: we have here chiefly to consider the means of making known our thoughts to others; that we may not only understand how knowledge is acquired, but also in what manner it may be communicated with the greatest certainty and advantage.

CHAP. I. Of Words, considered as the signs of our Ideas.

I. Our ideas, though manifold and various, are nevertheless all within our own breasts, invisible to others, nor can of themselves be made appear. But God, designing us for society, and to have fellowship with those of our kind, has provided us with organs fitted to frame articulate sounds, and given us also a capacity of using those sounds as signs of internal conceptions. Hence spring words and language: for, having once pitched upon any sound to stand as the mark of an idea in the mind, custom by degrees establishes such a connection between them, that the appearance of the idea in the understanding always brings to our remembrance the sound or name by which it is expressed; as in like manner the bearing of the sound never fails to excite the idea for which it is made to stand. And thus it is easy to conceive how a man may record his own thoughts, and bring them again into view in any succeeding period of life. For this connection being once settled, as the same sounds will always serve to excite the same ideas; if he can but contrive to register his words in the order and disposition in which the present train of his thoughts present themselves to his imagination, it is evident he will be able to recall these thoughts at pleasure, and that too in the very manner of their first appearance. Accordingly we find, that the inventions of writing and printing, by enabling us to fix and perpetuate such perishable things as sounds, have also furnished us with the means of giving a kind of permanency to the transactions of the mind, insomuch that they may be in the same manner subjected to our review as any other objects of nature.

II. But besides the ability of recording our own and of the thoughts, there is this farther advantage in the use of mutual external signs, that they enable us to communicate our conception of thoughts to others, and also to receive information of knowledge what passes in their breasts. For any number of men, from one having agreed to establish the same sounds as signs of man to another, it is apparent, that the repetition of these sounds must excite the like perceptions in each, and create a perfect correspondence of thoughts. When, for instance, any train of ideas succeed one another in my mind, if the names by which I am wont to express them have been annexed by those with whom I converse to the very same set of ideas, nothing is more evident, than that, by repeating those names according to the tenor of my present conceptions, I shall raise in their minds the same course of thought as has taken possession of my own. For by barely attending to what passes within themselves upon hearing the sounds which I repeat, they will also become acquainted with the ideas in my understanding, and have them in a manner laid before their view. So that we here clearly perceive how a man may communicate his sentiments, knowledge, and discoveries to others, if the language in which he converses be extensive enough to mark all the ideas and transactions of his mind. But as this is not always the case, and men are often obliged to invent terms of their own to express new views and conceptions of things; it may be asked, how in these circumstances we can become acquainted with the thoughts of another, when he makes use of words, to which we have never annexed any ideas, and that of course can raise no perceptions in our minds? In order to unveil this mystery, and give some little insight into the foundation, growth, and improvement of language, the following observations will be found of considerable moment.

III. First, That no word can be to any man the simple sign of an idea, till that idea comes to have a real existence in his mind. For names, being only so far intelligible as they denote known internal conceptions, if there is no such to answer them, there they are plainly sounds without signification, and of or a discourse convey no instruction or knowledge. But when sooner are the ideas to which they belong raised in the understanding, than, finding it easy to connect them with the established names, we can join in any agreement of this kind made by others, and thereby enjoy the
LOGIC.

Part I.

Experience and observation bring men to an agreement in the names of their simple ideas, seeing they cannot convey the perceptions in one another's minds, nor make known those perceptions by words to others. The effect is produced by experience and observation. These find, for instance, that the name of heat is annexed to that sensation which men feel when they approach the fire, I make it also the sign of the sensation excited in me by such an approach, nor have any doubt but it denotes the same perception in my mind as in theirs. For we are naturally led to imagine, that the same objects operate alike upon the organs of the human body, and produce an uniformity of sensations. No man fancied, that the idea raised in him by the taste of sugar, and which he calls sweetness, differs from that excited in another by the like means; or that wood, to whose relish he has given the epithet bitter, produces in another the sensation which he denotes by the word sweet. Presuming therefore upon this conformity of perceptions, when they arise from the same objects, we easily agree as to the names of our simple ideas: and if at any time, by a more narrow scrutiny into things, new ideas of this class come in our way, which we choose to express by terms of our own invention; these names are explained, not by a definition, but by referring to the objects whence the ideas themselves may be obtained.

VI. Being in this manner furnished with simple ideas, and the names by which they are expressed; the meaning of terms that stand for complex ideas is easily got, because the ideas themselves answering to these terms may be conveyed into the mind by definition; a wise contribution. For our complex notions are only certain combinations of simple ideas. When therefore these are enumerated, and the manner in which they are united into one conception explained, nothing more is wanting to raise that conception in the understanding; and thus the term denoting it comes of course to be understood. And here it is worth while to reflect...
Confined to the representing of certain determinate settled notions, such as are annexed by the speaker or writer to the words he uses. As nevertheless it is universally allowed that the signification of words is perfectly voluntary, and not the effect of any natural and necessary connection between them and the ideas for which they stand; some may perhaps wonder why definitions are not so too. In order therefore to unravel this difficulty, and show distinctly the connexion of ideas in speech, we must carefully distinguish between the connection of our words and ideas, and the unfolding of the ideas themselves.

II. First, as to the connexion of our words and ideas; The connexion between our minds the idea of any words and ideas is an effect of the voluntary choice of men speak-.

VII. There is this farther advantage in the ability towards the improvement of knowledge, we enjoy of communicating our complex notions by our definitions; that as these make by far the largest class of our ideas, and most frequently occur in the progress and improvement of knowledge, so they are by these means imparted with the greatest readiness, than which nothing would tend more to the increase and spreading of science: for a definition is soon perceived, and if the terms of it are well understood, the idea itself finds an easy admission into the mind. Whereas, in simple perceptions, where we are referred to the objects producing them, if these cannot be come at, as is sometimes the case, the names by which they are expressed must remain empty sounds. But new ideas of this class occurring very rarely in the sciences, they seldom create any great obstruction. It is otherwise with our complex notions; for every step we take leading us into new combinations and views of things, it becomes necessary to explain these to others, before they can be made acquainted with our discoveries: and as the manner of definitions is easy, requiring no apparatus but that of words, which are always ready, and at hand; hence we can with less difficulty remove such obstacles as might arise from terms of our own invention, when they are made to stand for new complex ideas suggested to the mind by some present train of thinking. And thus at last we act let into the mystery hinted at in the beginning of this chapter, viz. how we may become acquainted with the thoughts of another, when he makes use of words to which we have as yet joined no ideas. The answer is obvious from what has been already said. If the terms denote simple perceptions, he must refer us to these objects of nature whereas the perceptions themselves are to be obtained; but, if they stand for complex ideas, their meaning may be explained by a definition.

Chapter II. Of Definition.

I. A definition is the unfolding of some conception of the mind, answering to the word or term made use of as the sign of it. Now, as in exhibiting any idea to another, it is necessary that the description be such as may excite that precise idea in his mind; hence it is plain that definitions, properly speaking, are not arbitrary, but

of
LOGIC.

Part I. or Perception.

of us that the definition of the name is arbitrary, they mean no more than this; that as different ideas may be connected with any term, according to the good pleasure of him that uses it; in like manner may different descriptions be applied to the term, suitable to the ideas so connected. But this connexion being settled, and the term considered as the sign of some fixed idea in the understanding, we are no longer left to arbitrary explications, but must study such a description as corresponds with that precise idea. Now this alone, according to what has been before laid down, ought to be accounted a definition. What seems to have occasioned some confusion in this matter is, that many explanations of words, where no idea is unfolded, but merely the connexion between some word and idea asserted, have yet been dignified with the name of definitions. Thus, when we say that a clock is an instrument by which we measure time; that is by some called a definition; and yet it is plain that we are beforehand supposed to have an idea of this instrument, and only taught that the word clock serves in common language to denote that idea. By this rule all explications of words in our dictionaries will be definitions, nay, the names of even simple ideas may be thus defined. White, we may say, is the colour we observe in snow or milk; heat the sensation produced by approaching the fire; and so in innumerable other instances. But these, and all others of the like kind, are by no means definitions, exciting new ideas in the understanding, but merely contrivances to remind us of known ideas, and teach their connexion with the established names.

V. Because we use definitions properly so called, we first consider the term we use, as the sign of some inward conception, either annexed to it by custom, or our own free choice: and then the business of the definition is to unfold and explicate that idea. As therefore the whole art lies in giving just and true copies of our ideas; a definition is then said to be made perfect, when it serves distinctly to excite the idea described in the mind of another, even supposing him before wholly unacquainted with it. This point settled, let us next inquire what those ideas are which are capable of being thus unfolded? and in the first place it is evident, that all our simple ideas are necessarily excluded. We have seen already that experience alone is to be consulted here, insomuch that if either the objects whence they are derived come not in our way, or the avenues appointed by nature for their reception are wanting, no description is sufficient to convey them into the mind. But where the understanding is already supplied with these original and primary conceptions, as they may be called, they may be united together in an infinity of different forms; so may all their several combinations be distinctly laid open, by enumerating the simple ideas concerned in the various collections, and tracing the order and manner in which they are linked one to another. Now these combinations of simple notices constitute what we call our complex notions, whence it is evident, that complex ideas, and those alone, admit of that kind of description which goes by the name of a definition.

VI. Definitions, then, are pictures or representations of our ideas; and as these representations are then only possible when the ideas themselves are complex, it is obvious to remark, that definitions cannot have place, but where we make use of terms standing for such complex ideas. But our complex ideas being, as we have said, nothing more than different combinations of simple ideas; we then know and comprehend them perfectly, when we know the several simple ideas of which they consist, and can so put them together in our minds as may be necessary towards the framing of that peculiar connexion which gives every idea its distinct and proper appearance.

VII. Two things are therefore required in every definition: first, That all the original ideas, out of which the complex one is formed, be distinctly enumerated; and, secondly, That the order and manner of combining them into one conception be clearly explained. Where a definition has these requisites, no thing is wanting to its perfection; because every one who reads it and understands the terms, seeing at once what ideas he is to join together, and also in what manner, can at pleasure form in his own mind the complex conception answering to the term defined. Let us, for instance, suppose the word square to stand for that idea by which we represent to ourselves a figure whose sides subtend quadrants of a circumscribed circle. The parts of this idea are the sides bounding the figure. These must be four in number, and all equal among themselves, because they are each to subtend a fourth part of the same circle. But, besides these component parts, we must also take notice of the manner of putting them together, if we would exhibit the precise idea for which the word square here stands. For four equal right lines, anyhow joined, will not subtend quadrants of a circumscribed circle. A figure with this property must have its sides standing also at right angles. Taking in therefore this last consideration respecting the manner of combining the parts, the idea is fully described, and the definition thereby rendered complete. For a figure bounded by four equal sides, joined together at right angles, has the property required; and is moreover the only right-lined figure to which that property belongs.

VIII. It will now be obvious to every one, in what manner we ought to proceed, in order to arrive at just and adequate definitions. First, We are to take an exact view of the idea to be described, trace it to its original principles, and mark the several simple descriptions that enter into the composition of it. Secondly, We are to consider the particular manner in which these elementary ideas are combined, in order to the forming of that precise conception for which the term we make use of stands. When this is done, and the idea wholly unravelled, we have nothing more to do than fairly transcribe the appearance it makes to our own minds. Such a description, by distinctly exhibiting the order and number of our primitive conceptions, cannot fail to excite at the same time in the mind of every one that reads it, the complex idea resulting from them; and therefore attains the true and proper end of a definition.

CHAP. III. Of the Composition and Resolutions of our Ideas, and the Rules of Definition thence arising.

I. The rule laid down in the foregoing chapter is general, extending to all possible cases; and is indeed that
that to which alone we can have recourse, where any
doubt or difficulty arise. It is not, however, necessary
that we should practise it in every particular instance.

Many of our ideas are extremely complicated, inso-
much that to enumerate all the simple perceptions out
of which they are formed, would be a very trouble-
some and tedious work. For this reason logicians
have established certain compendious rules of defining,
of which it may not be amiss here to give some ac-
count. But in order to the better understanding of
what follows, it will be necessary to observe, that
there is a certain gradation in the composition of our
ideas. The mind of man is very limited in its views,
and cannot take in a great number of objects at once.
We are therefore fain to proceed by steps, and make
our first advances subservient to those which follow.
Thus, in forming our complex notions, we begin at
first with but a few simple ideas, such as we can man-
age with ease, and unite them together into one con-
ception. When we are provided with a sufficient
stock of these, and have by habit and use rendered
them familiar to our minds, they become the compo-
nent parts of other ideas still more complicated, and
form what we may call a second order of compound
notions. This process, as is evident, may be continued
to any degree of composition we please, mounting from
one stage to another, and enlarging the number of com-
binations.

II. But now in a series of this kind, whoever would
acquaint himself perfectly with the last and highest
order of ideas, finds it much the most expedient
method to proceed gradually through all the inter-
mediate steps. For, were he to take any very compo-
und idea to pieces, and, without regard to the several
classes of simple perceptions that have already been
formed into distinct combinations, break it at once in
to its original principles, the number would be so great
as perfectly to confound the imagination, and over-
come the utmost reach and capacity of the mind.
When we see a prodigious multitude of men jumbled
together in crowds, without order or any regular posi-
tion, we find it impossible to arrive at an exact know-
ledge of their number. But if they are formed into
separate battalions, and so stationed as to fall within
the leisure survey of the eye; by viewing them succes-
sively and in order, we come to an easy and certain de-
ctermination. It is the same in our complex ideas.
When the original perceptions, out of which they are
framed, are very numerous, it is not enough that we
take a view of them in loose and scattered bodies; we
must form them into distinct classes, and unite those
classes in a just and orderly manner, before we can ar-
rive at a true knowledge of the compound notions re-
sulting from them.

III. This gradual progress of the mind to its com-
 pound notions, through a variety of intermediate steps,
plainly points out the manner of conducting the def-
nitions by which these notions are conveyed into the
minds of others. For as the series begins with simple
and easy combinations, and advances through a suc-
cession of different orders, rising one above another in
the degree of composition, it is evident, that, in a train
of definitions expressing these ideas, a like gradation
is to be observed. Thus the complex ideas of the
lowest order can no otherwise be described than by
enumerating the simple ideas out of which they are
made, and explaining the manner of their union. But
then in the second, or any other succeeding order, as
they are formed out of those gradual combinations, and
constitute the inferior classes, it is not necessary, in de-
scribing them, to mention one by one all the simple
ideas of which they consist. They may be more distinct-
ly and briefly unfolded, by enumerating the compound
ideas of a lower order, from whose union they result,
and which are all supposed to be already known in con-
sequence of previous definitions. Here then it is that
the logical method of defining takes place; which, that
it may be the better understood, we shall explain some-
what more particularly the several steps and gradations
of the mind in compounding its ideas, and thence de-
duce that peculiar form of a definition which logicians
have thought fit to establish.

IV. All the ideas we receive from the several ob-
jects of nature that surround us, represent distinct in-
dividuals. These individuals, when compared togeth-
er, are found in certain particulars to resemble each
other. Hence, by collecting the resembling particulars
together, we form the notion of a species; where, in the simple
ideas, the composition is lessened, because we
leave out what is peculiar to the several species com-
pared, and retain only the particulars wherein they
agree. It is easy to conceive the mind proceeding
thus from one step to another, and advancing through
its several classes or general notions, until at last it
comes to the highest genus of all, denoted by the word
being, where the bare idea of existence is only con-
cerned.

V. In this procedure we see the mind unravelling
to complex idea, and tracing it in the ascending scale
from greater or less degrees of composition, until it
terminates in one simple perception. If now we take
the series the contrary way, and, beginning with the
last or highest genus, carry our view downwards,
advancing through all the inferior genera and species, quite to
the individuals, we shall thereby arrive at a distinct
apprehension of the conduct of the understanding in of percep-
tion, compounding its ideas. For, in the several classes of
our perceptions, the highest in the scale is for the
most part made up of but a few simple ideas, such as
the mind can take in and survey with ease. This first
general notion, when branched out into the different
subdivisions contained under it, has in every one of
them something peculiar, by which they are distin-
guished among themselves; insomuch that, in des-
cending from the genus to the species, we always
superadd some new idea, and thereby increase the
degree of composition. Thus the idea denoted by
the word figure is of a very general nature, and com-
posed of but few simple perceptions, as implying no
more than space everywhere bounded. But if we
descend farther, and consider the boundaries of this
space, as that they may be either lines or surface, we
fall.
fall into the several species of figure. For where the space is bounded by one or more surfaces, we give it the name of a solid figure; but where the boundaries are lines, it is called a plain figure (A).

VI. In this view of things it is evident, that the species is formed by superadding a new idea to the genus. Here, for instance, the genus is circumscribed space. If now to this we superadd the idea of a circumscription by lines, we frame the notion of that species of figures which are called plain; but if we conceive the circumscription to be by surfaces, we have the species of solid figures. This superadded idea is called the specific difference, not only as it serves perception, to divide the species from the genus, but because, being different in all the several subdivisions, we thereby also distinguish the species one from another. And as it is likewise that conception, which, by being joined to the general idea, completes the notion of the species: hence it is plain, that the genus and specific difference are to be considered as the proper and constituent parts of the species. If we trace the progress of the mind still further, and observe it advancing through

(A) This account of the composition and resolution of our ideas is agreeable to the common doctrine of logicians on the subject. Into the truth of the doctrine itself we shall inquire afterwards under the article Metaphysics: but to prevent mistakes, it may be proper to observe here, that though every writer of logic has treated largely of general and specific ideas, there is in reality nothing general in the matter but the terms of language. When we utter, for instance, the word triangle, that general term does not, as has been often said, suggest to the mind the general idea of a triangle, which is neither oblique nor rectangle, neither equilateral nor scalene, &c. for such a triangle, as it cannot exist in nature, cannot be conceiv’d in idea. In like manner, the general term Virtue does not excite a general idea of virtue, which is neither prudence, nor temperance, nor fortitude, nor justice, nor charity, &c. for which that is distinct from all these is not virtue. What then is the import of such general terms? The answer is obvious: they denote classes of objects; and are never used without some word of limitation, but when something has no dependence upon the particular qualities, which distinguish the individuals from each other, is affirmed or denied of the whole class. Thus we may affirm, that the three angles of a plain triangle are equal to two right angles: and this proposition is demonstrably true, not of a triangle, which is neither oblique nor rectangle, neither equilateral nor scalene, for such a triangle never was conceiv’d; but of all these triangles equally, as the truth of the proposition and the progress of the demonstration has no dependence upon the peculiarities which distinguish these triangles from one another. Again, When we say that a man of virtue will be rewarded by God, we do not mean by the word virtue a general idea making part of each of the complex and more particular ideas of prudence, fortitude, justice, &c. and at the same time different from them all; but we affirm, that the man who practises any or all of these virtues, according as he has opportunity, will be rewarded by God.

The history of our ideas is shortly thus: That act of the mind, if it may be called an act, which makes known an external object, is termed perception. That act of the mind which makes known an internal object, is termed consciousness. Objects once perceived may be recalled to the mind by the power of memory; and when they are so recalled, we have a perception of them in all respects similar to the original perception, only less distinct; we fancy ourselves in the same place, and the object perceived attended by the same circumstances. This indistinct secondary perception of an object is termed an idea; and therefore the precise and accurate definition of an idea, in contradistinction to an original perception, is “that perception of a real object which is raised in the mind by the power of memory.” Now all our original perceptions being of particular objects, it is obvious that our ideas, which are only those perceptions recalled, must be of particular objects likewise, and that no man can have an idea of a thing of which the real existence is contradictory and impossible. But the general and specific ideas of logicians, are ideas of nothing which exist, or which can possibly exist. They are acquired, we are told, by abstraction, in the following manner. Among a number of individuals we perceive certain qualities the same in all, whilst in each individual there are other qualities which have nothing similar to them in any other individual: now the mind, it is said, has a power of abstracting the particular qualities of each individual from those which are common to the whole, and of those last forming a general idea of the whole class. Thus all men have nearly the same form; and they have each some stature and some colour, though there are not perhaps two individuals who have precisely the same stature and the same colour. Now, say the advocates for general ideas, if we abstract what is peculiar to each individual, and retain what is common to the whole race, we have the general idea signified by the word man. That is, if we conceive a being in human shape, which is of stature and colour, but neither tall nor short, neither white nor black, nor red nor brown, nor any other colour which we ever saw, we have the general idea of humanity, and understand the meaning of the word man! Surely no person who is not the slave of prejudice will pretend that he can frame such an idea as this—the idea of an object which cannot possibly exist in nature.

By this we do not mean to affirm, that we cannot frame ideas of such objects as have no real existence; for it is as easy to imagine a man with ten heads as with one, because there is nothing contradictory between ten heads and one body. But figure, which is said to be space bounded neither by lines nor superficies; colour, which is neither red nor white, nor blue nor black, &c.; and animal, which is neither man, beast, bird, nor insect; are impossible in nature, and inconceivable in idea. There is, however, no harm in still retaining the phrase general idea, provided he who uses it takes care to let it be known, that by these words he means not any abstract and contradictory idea, but merely a class of real objects. The phrase may at times prevent much circumlocution; for which reason we have retained the use of it in the text.
Part I.

LOGIC.

through the inferior species, we shall find its manner of proceeding to be always the same. For every lower species is formed by superadding some new idea to the species next above it; insomuch that in this descending scale of our perceptions, the understanding passes through different orders of complex notions, which become more and more complicated at every step it takes. Let us resume here, for instance, the species of plain figures. They imply no more than space bounded by lines. But if we take in an additional consideration of the nature of these lines, as whether they are right or curved, we fall into the subdivisions of plain figure, distinguished by the names of rectilinear, curvilinear, and mixtilinear.

VII. And here we are to observe, that though plain figures, when considered as one of those branches that come under the notions of figure in general, take the name of a species; yet compared with the classes of curvilinear, rectilinear, and mixtilinear, into which they themselves may be divided, they really become a genus, of which the before-mentioned subdivisions constitute the several species. These species, in the same manner as in the case of plane and solid figures, consist of the genus and specific difference as their constituent parts. For in the curvilinear kind, the curvity of the lines bounding the figure makes what is called the specific difference; to which if we join the genus, which here is a plain figure or space circumscribed by lines, we have all that is necessary towards completing the notion of this species. We are only to take notice, that this last subdivision, having two genera above it, viz., plain figure, and figure in general; the genus joined with the specific difference, in order to constitute the species of curvilinears, is that which lies nearest to the said species. It is the notion of plain figure, and not of figure in general, that, joined with the idea of curvity, makes up the complex conception of curve-lined figures. For in this descending scale of our ideas, figure in general, plain figures, curve-lined figures, the two first are considered as genera in respect of the third; and the second in order, or that which stands next to the third, is called the nearest genus. But now as it is this second idea, which, joined with the notion of curvity, forms the species of curve-lined figures; it is plain, that the third or last idea in the series is made up of the nearest genus and specific difference. This rule holds invariably, however far the series is continued; because, in a train of ideas thus succeeding one another, all that precede the last are considered as so many genera in respect of that last; and the last itself is always formed by superadding the specific difference to the genus next to it.

VIII. Here then we have an universal description, applicable to all our ideas of whatever kind, from the highest genus to the lowest species. For, taking them in order downwards from the said general idea, they everywhere consist of the genus proximum and differentia specifica, as logicians love to express themselves. But when we come to the lowest species of all, comprehending under it only individuals, the superadded idea, by which these individuals are distinguished one from another, no longer takes the name of the specific difference. For here it serves not to denote distinct species, but merely a variety of individuals, each of which, having a particular existence of its own, is therefore numerically different from every other of the same kind. And hence it is, that in this last case, logicians choose to call the superadded idea by the name of the numerical difference; insomuch that, as the idea of a species is made up of the nearest genus and specific difference, so the idea of an individual consists of the lowest species and numeric difference. Thus the circle is a species of curve-lined figures, and what we call the lowest species, as comprehending under it only individuals. Circles in particular are distinguished from one another by the length and position of their diameters. The length therefore and position of the diameter of a circle form what logicians call the numerical difference; because, these being given, the circle itself may be described, and an individual thereby constituted.

IX. Thus the mind, in compounding its ideas, being to follow one another consisting of but a few simple notices, are easily combined and brought together into one conception, and pass on. Thence it proceeds to the species comprehended under the general idea; and these are formed by joining together the genus and specific difference. And as it often happens, that these species may be still farther subdivided, and run on in a long series of continued gradations, producing various orders of compound ideas. The several orders are regularly and successively formed by annexing in every step the specific difference to the nearest genus. When by this method of procedure we are come to the lowest order of all, by joining the species and numeric difference, we frame the ideas of individuals. And here the series necessarily terminates, because it is impossible any farther to bound or limit our conceptions. This view of the composition of our ideas, representing their constituent parts in every step of the progression, naturally points out the true and genuine form of a definition. For as definitions are no more than descriptions of the ideas for which the terms defined stand; and as ideas are then described, when we enumerate distinctly and in order the parts of which they consist; it is plain, that by making our definitions follow one another according to the natural train of our conceptions, they will be subject to the same rules, and keep pace with the ideas they describe.

X. As therefore the first order of our compound notions, or the ideas that constitute the highest genera in the different scales of perception, are formed by the various uniting together a certain number of simple notices; orders of these terms expressing these genera are defined by conception. Enumerating the simple notices so combined. And as the species comprehended under any genus, or the complex ideas of the second order, arise from superadding the specific difference to the said general idea; so the definition of the names of the species is absolved, in a detail of the ideas of the specific difference, connected with the term of the genus. For the genus having been before defined, the term by which it is expressed stands for a known idea, and may therefore be introduced into all subsequent definitions, in the same manner as the names of simple perceptions. It will now be sufficiently obvious, that the definitions of all the succeeding orders of compound notions will every
LOGIC

XI. Here then we have the true and proper form of a definition, in all the various orders of conception. This is that method of defining which is commonly called *logic*, and which we see is perfect in its kind, inasmuch as it presents a full and adequate description of the idea for which the term defined stands.

PART II. OF JUDGMENT.

CHAPTER I. Of the Grounds of Human Judgment.

THE mind being furnished with ideas, its next step in the way to knowledge is, the comparing these ideas together, in order to judge of their agreement or disagreement. In this joint view of our ideas, if the relation is such as to be immediately discoverable by the bare inspection of the mind, the judgments thence obtained are called *intuitive*, from a word that denotes to look at; for in this case, a mere attention to the ideas compared suffices to let us see how far they are connected or disjointed. Thus, *that the Whole is greater than any of its Parts*, is an intuitive judgment, nothing more being required to convince us of its truth, than an attention to the ideas of whole and part. And this too is the reason why we call the act of the mind forming those judgments *intuition*; as it is indeed no more than an immediate perception of the agreement or disagreement of any two ideas.

II. But here it is to be observed, that our knowledge of this kind respects only our ideas, and the relations between them; and therefore can serve only as a foundation to such reasonings as are employed in investigating those relations. Now it so happens, that many of our judgments are conversant about facts, and the real existence of things which cannot be traced by the bare contemplation of our ideas. It does not follow, because I have the idea of a circle in my mind, that therefore a figure answering to that idea has a real existence in nature. I can form to myself the notion of a centaur or golden mountain, but never imagine on that account that either of them exists. What then are the grounds of our judgment in relation to facts? *experience and testimony*. By experience we are informed of the existence of the several objects which surround us, and operate upon our senses. Testimony is of a wider extent, and reaches not only to objects beyond the present sphere of our observation, but also to facts and transactions, which being now past, and having no longer any existence, could not without this conveyance have fallen under our cognizance.

III. Here we have three foundations of human judgment, from which the whole system of our knowledge may with ease and advantage be derived. First, *Intuition*, which respects our ideas themselves, and their relations; and is the foundation of that species of reasoning which we call *demonstration*. For whatever is deduced from our intuitive perceptions, by a clear and connected series of proofs, is said to be demonstrated, and produces absolute certainty in the mind. Hence the knowledge obtained in this manner is what we properly term *science*; because in every step of the procedure it carries its own evidence along with it, and leaves no room for doubt or hesitation. And what is highly worthy of notice; as the truths of this class express the relations between our ideas, and the same relations must ever and invariably subsist between the same ideas, our deductions in the way of science constitute what we call *eternal, necessary, and immutable truths*. If it be true that the whole is equal to all its parts, it must be so unchangeably; because the relation of equality being attached to the ideas themselves, must ever intervene where the same ideas are compared. Of this nature are all the truths of natural religion, morality, and mathematics, and in general whatever may be gathered from the bare view and consideration of our ideas.

IV. The second ground of human judgment is *experience*, from which we infer the existence of those objects that surround us, and fall under the immediate knowledge of our senses. When we see the sun, or cast our eyes towards a building, we not only have percepts and qualities of those objects within ourselves, but ascribe to them a real existence out of the mind. It is also discovered by the information of the senses that we judge of the qualities of bodies; as when we say that *snow is white, fire hot, or steel hard*. For as we are wholly unacquainted with the internal structure and constitution of the bodies that produce these sensations in us, may, and are unable to trace any connexion between that structure and the sensations themselves, it is evident, that we build our judgments altogether upon observation, ascribing to bodies such qualities as are answerable to the perceptions they excite in us. Not that we ever suppose the qualities of bodies to be things of the same nature with our perceptions; for there is nothing in fire similar to our sensation of heat, or in a sword similar to pain: but that when different bodies excite in our minds similar perceptions, we necessarily ascribe to those bodies not only an existence independent of us, but likewise similar qualities, of which it is the nature to produce similar perceptions in the human mind. But this is not the only advantage derived from experience; for to that too we are indebted for all our knowledge regarding the co-existence of sensible qualities in objects, and the operations of bodies one upon another. *Ivory*, for instance, is hard and elastic: this we know by experience, and indeed by that alone. For, being altogether strangers to the true nature both of elasticity and hardness, we cannot by the bare contemplation of our ideas determine how far the one necessarily implies the other, or whether there may not be a repugnance between them. But when we observe them to exist both in the same object, we are then assured from experience that they are not incompatible; and when we also find, that a stone is hard and not elastic, and that air though elas-
Part II.

LOGIC.

or stic is not hard, we also conclude upon the same founda-
Judgment, that the ideas are not necessarily conjoint,
but may exist separately in different objects. In like
manner, with regard to the operations of bodies one
upon another, it is evident, that our knowledge this
way is all derived from observation. *Aqua regia*
dissolves gold, as has been found by frequent trial, nor
is there any other way of arriving at the discovery.
Naturalists may tell us, if they please, that the parts
of *aqua regia* are of a texture apt to insinuate between
the corpuscles of gold, and thereby loosen and shake
them asunder. If this is a true account of the matter,
it will notwithstanding be allowed, that our conjecture
in regard to the conformation of these bodies is de-
duced from the experiment, and not the experiment
from the conjecture. It was not from any previous
knowledge of the intimate structure of *aqua regia* and
gold, and the aptness of their parts to act or to be act
upon, that we came by the conclusion above men-
tioned. The natural constitution of bodies is in a
manner wholly unknown to us: and could we even
surmount this difficulty, yet as the separation of the
parts of gold implies something like an active force in
the *menstruum*, and we are unable to conceive how
it comes to be possessed of this activity, the effect must
be owned to be altogether beyond our comprehension.
But when repeated trials had once confirmed it, in-
somuch that it was admitted as an established truth
in natural knowledge, it was then easy for men to
spin out theories of their own invention, and con-
trive such a structure of parts, both for gold and *aqua
regia*, as would best serve to explain the phenomenon
upon the principles of that system of philosophy they
had adopted.

V. From what has been said it is evident, that as
intuition is the foundation of what we call *scientifical*
knowledge, so is experience of *natural*. For this last
being wholly taken up with objects of sense, or those
bodies that constitute the natural world; and their
properties, as far as we can discover them, being to be
traced only by a long and painful series of observations;
it is apparent, that, in order to improve this branch of
knowledge, we must betake ourselves to the method
of trial and experiment.

VI. But though experience is what we may term
the immediate foundation of natural knowledge, yet
with respect to particular persons its influence is very
narrow and confined. The bodies that surround us
are numerous, many of them lie at a great distance,
and some quite beyond our reach. Life is so short,
and so crowded with cares, that but little time is left
for any single man to employ himself in unfolding the
mysteries of nature. Hence it is necessary to admit
many things upon the testimony of others, which by
this means becomes the foundation of a great part of
our knowledge of body. No man doubts of the power
of *aqua regia* to dissolve gold, though perhaps he nev-er
himself made the experiment. In these therefore
and such like cases we judge of the facts and opera-
tions of nature upon the mere ground of testimony.
However, as we can always have recourse to ex-
perience where any doubt or scruple arises, this is justly
considered as the true foundation of natural philoso-
phy; being indeed the ultimate support upon which
our assent rests, and where we appeal when the high-
est degree of evidence is required.

VII. But there are many facts that will not allow
of an appeal to the senses; and in this case testimony
is the true and only foundation of our judgments. All
by, the human actions of whatever kind, when considered as ground
of already past, are of the nature here described; because
having now no longer any existence, both the facts
themselves, and the circumstances attending them, can
be known only from the relations of such as have suf-
cient opportunities of arriving at the truth. *Testimony*
therefore is justly accounted a third ground of human
judgment; and as from the other two we have deduced
*scientific* and *natural* knowledge, so we may from this
derive *historical*; by which we mean, not merely a
knowledge of the civil transactions of states and king-
doms, but of all facts whatsoever, where testimony is
the ultimate foundation of our belief.

CHAP. II. Of Affirmative and Negative Propositions.

I. While the comparing of our ideas is considered
merely as an act of the mind, associating them toge-
ther, and joining or disjoining them according to the
result of its perceptions, we call it *judgment*; but when
our judgments are put into words, they then bear the
name of *propositions*. A proposition therefore is a sen-
tence expressing some judgment of the mind, whereby
two or more ideas are affirmed to agree or disagree.
Now, as our judgments include at least two ideas, one
of which is affirmed or denied of the other, so must a
proposition have terms answering to these ideas. The
idea of which we affirm or deny, and of course the
term expressing that idea, is called the *subject* of the
proposition. The idea affirmed or denied, as also the
term answering it, is called the *predicate*. Thus in
the proposition, *God is omnipotent*: *God* is the subject, it be-
ing of him that we affirm omnipotence; and *omnipotent*
is the predicate, because we affirm the idea expressed
by that word to belong to God.

II. But as, in propositions, ideas are either joined
or disjoined; it is not enough to have terms expres-
sing those ideas, unless we have also some words to
denote their agreement or disagreement. That word
in a proposition, which connects two ideas together,
is called the *copula*; and if a negative particle be an-
nexed, we thereby understand that the ideas are dis-
joined. The *substantive verb* is commonly made use
of for the copula; as in the above mentioned proposi-
tion, *God is omnipotent*: *God* is the subject of the
copula, and signifies the agreement of the ideas of *God*
and *omnipotence*. But if we mean to separate two
ideas; then, besides the substantive verb, we must also
use some particle of negation, to express this repug-
nance. The proposition, *man is not perfect*, may serve
as an example of this kind; where the notion of per-
fection being removed from the idea of *man*, the ne-
gative particle *not* is inserted after the copula, to sig-
nify the disagreement between the subject and predi-
cate.

III. Every proposition necessarily consists of these
three parts; but then it is not alike needful that they
be all severally expressed in words; because the copula
is often included in the term of the predicate, as when a single

S 2
we say, he sits; which imports the same as he is sitting. In the Latin language, a single word has often the force of a whole sentence. Thus ambulat is the same as ille est ambulans; amo, as ego sum amans; and so in innumerable other instances: by which it appears, that we are not so much to regard the number of words in a sentence, as the ideas they represent, and the manner in which they are put together. For wherever two ideas are joined or disjoined in an expression, though of but a single word; it is evident that we have a subject, predicate, and copula, and of consequence a complete proposition.

IV. When the mind joins two ideas, we call it an affirmative judgment; when it separates them, a negative; and as any two ideas compared together must necessarily either agree or not agree, it is evident that all our judgments fall under these two divisions. Hence likewise the propositions expressing these judgments are all either affirmative or negative. An affirmative proposition connects the predicate with the subject, as a stone is heavy; a negative proposition separates them, as God is not the author of evil. Affirmation therefore is the same as joining two ideas together; and this is done by means of the copula. Negation, on the contrary, marks the repugnance between the ideas compared; in which case a negative particle must be called in, to show that the connexion included in the copula does not take place.

V. Hence we see the reason of the rule commonly laid down by logicians, That in all negative propositions the negation ought to affect the copula. For as the copula, when placed by itself, between the subject and the predicate, manifestly binds them together; it is evident, that in order to render a proposition negative, the particles of negation must enter into it in such a manner as to destroy this union. In a word, then only are two ideas disjoined in a proposition, when the negative particle may be so referred to the copula, as to break the affirmation included in it, and undo that connexion it would otherwise establish. When we say, for instance, No man is perfect: take away the negation and the copula of itself plainly unites the ideas in the proposition. But as this is the very reverse of what is intended, a negative mark is added, to show that this union does not here take place. The negation, therefore, by destroying the effect of the copula, changes the very nature of the proposition, inasmuch that, instead of binding two ideas together, it denotes their separation. On the contrary, in this sentence, The man who departs not from an upright behaviour is beloved of God; the predicate beloved of God is evidently affirmed of the subject an upright man; so that, notwithstanding the negative particle, the proposition is still affirmative. The reason is plain: the negation here affects not the copula; but, making properly a part of the subject, serves, with other terms in the sentence, to form one complex idea, of which the predicate beloved of God is directly affirmed.

CHAP. III. Of Universal and Particular Propositions.

I. The next considerable division of propositions is Division of into universal and particular. Our ideas, according to propositions what has been already observed in the First Part, are universal into all singular as they enter the mind, and represent individual objects. But as by abstraction we can render them universal, so as to comprehend a whole class of things, and sometimes several classes at once; hence the terms expressing these ideas must be in like manner universal. If, therefore, we suppose any general term to become the subject of a proposition, it is evident, that whatever is affirmed of the abstract idea belonging to that term, may be affirmed of all the individuals to which that idea extends. Thus, when we say, Men are mortal; we consider mortality, not as confined to one or any number of particular men, but as what may be affirmed without restriction of the whole species. By this means the proposition becomes as general as the idea which makes the subject of it; and indeed derives its universality entirely from that idea, being more or less so according as this may be extended to more or fewer individuals. But it is further to be observed of these general terms, that they sometimes enter a proposition in their full latitude, as in the example given above; and sometimes appear with a mark of limitation. In this last case we are given to understand, that the predicate agrees not to the whole universal idea, but only to a part of it; as in the proposition, Some men are wise: For here wisdom is not affirmed of every particular man; but restrained to a few of the human species (a).

II. Now from this different appearance of the general idea that constitutes the subject of any judgment universal or particular, arises the division of propositions into universal and particular. An universal proposition is that where the subject is some general term taken in its full latitude; insomuch that the predicate agrees to all the individuals comprehended under it, if it denotes a proper species; and to all the several species, and their individuals, if it marks an idea of a higher order. The words all, every, no, none, &c. are the proper signs of this universality; and as they seldom fail to accompany general truths, so they are the most obvious criterion whereby to distinguish them. All animals have a power of beginning motion. This is an universal proposition; as we know from the word all prefixed to the subject animals, which denotes that it must be taken in its full extent. Hence the power of beginning motion may be affirmed of all the several species of animals.

III. A particular proposition has in like manner Propositions particular where some some general term for its subject; but with a mark of a universal subject limitation where some universal subject appears with limitation.

(a) See the preceding note, where it is demonstrated that the terms alone, and not the ideas, are in reality general. The term man is equally applicable to every individual of the human race; and therefore, what is affirmed or denied of men in general, is affirmed or denied of all the individuals, without regard to their discriminating qualities. Some is a definitive word (see Grammar), which, prefixed to the word man, limits the significance of that general term; and therefore what is affirmed of some men, is affirmed only of part of the race, but that part itself is not ascertained.
Part II.  

LOGIC.

limitation added, to denote, that the predicate agrees only to some of the individuals comprehended under a species, or to one or more of the species belonging to any genus, and not to the whole universal idea. Thus, Some stones are heavier than iron; Some men have an uncommon share of prudence. In the last of these propositions, the subject some men implies only a certain number of individuals, comprehended under a single species. In the former, where the subject is a genus that extends to a great variety of distinct classes, some stones may not only imply any number of particular stones, but also several whole species of stones, inasmuch as there may be not a few with the property there described. Hence we see, that a proposition does not cease to be particular by the predicate’s agreeing to a whole species, unless that species, singly and distinctly considered, makes also the subject of which we affirm or deny.

IV. There is still one species of propositions that remains to be described, and which the more deserves our notice, as it is not yet agreed among logicians to which of the two classes mentioned above they ought to be referred; namely, singular propositions, or those where the subject is an individual. Of this nature are the following: Sir Isaac Newton was the inventor of fluxions; This book contains many useful truths. What occasions some difficulty as to the proper rank of these propositions is, that, the subject being taken according to the whole of its extension, they sometimes have the same effect in reasoning as universals. But if it be considered that they are in truth the most limited kind of particular propositions, and that no proposition can with any propriety be called universal but where the subject is some universal idea; we shall not be long in determining to which class they ought to be referred. When we say, Some books contain useful truths; the proposition is particular, because the general term appears with a mark of restriction. If therefore we say, This book contains useful truths; it is evident that the proposition must be still more particular, as the limitation implied in the word this, is of a more confined nature than in the former case.

V. We see, therefore, that all propositions are either affirmative or negative; nor is it less evident, that in both cases they may be universal or particular. Hence arises that celebrated fourfold division of them into universal affirmative and universal negative, particular affirmative and particular negative, which comprehends indeed all their varieties. The use of this method of distinguishing them will appear more fully afterwards, when we come to treat of reasoning and syllogism.

CHAP. IV. Of Absolute and Conditional Propositions.

I. The objects about which we are chiefly conversant in this world, are all of a nature liable to change. What may be affirmed of them at one time, cannot often at another; and it makes no small part of our knowledge to distinguish rightly these variations, and trace the reasons upon which they depend. It is observable, that amidst all the vicissitudes of nature, some things remain constant and invariable; nor even are the changes, to which we see others liable, effected but in consequence of uniform and steady laws, which, when known, are sufficient to direct us in our judgments about them. Hence philosophers, in distinquishing the objects of our perception into various classes, have been very careful to note, that some properties belong essentially to the general idea, so as not to be separable from it but by destroying its very nature; while others are only accidental, and may be ascribed or denied of it in different circumstances. Thus solidity, a yellow colour, and great weight, are considered as essential qualities of gold: but whether it shall exist as an uniform conjoined mass, is not alike necessary. We see that by a proper menstruum it may be reduced to a fine powder, and that an intense heat will bring it into a state of fusion.

II. From this diversity in the several qualities of things arises a considerable difference as to the manner of our judging about them. For all such properties as are inseparable from objects when considered as belonging to any genus or species, are affirmed absolutely and without reserve of that general idea. Thus we say, God is very weighty; A stone is hard; Animals have a power of self-motion. But in the case of mutual or accidental qualities, as they depend upon some other consideration distinct from the general idea, that also must be taken into the account, in order to form an accurate judgment. Should we affirm, for instance, of some stones, that they are very susceptible of a rolling motion; the proposition, while it remains in this general form, cannot with any advantage be introduced into our reasonings. An aptness to receive that mode of motion flows from the figure of the stone; which, as it may vary infinitely, our judgment then only becomes applicable and determinate, when the particular figure, of which volubility is a consequence, is also taken into the account. Let us then bring in this other consideration, and the proposition will run as follows: Stones of a spherical form are easily put into a rolling motion. Here we see the condition upon which the predicate is affirmed, and therefore know in what particular cases the proposition may be applied.

III. This consideration of propositions respecting the manner in which the predicate is affirmed of the subject gives rise to the division of them into absolute and conditional. Absolute propositions are those wherein the subject imparts to the subject, and which therefore belongs to it in all and condi-

possible cases: as, God is infinitely wise; Virtue tends to the ultimate happiness of man. But where the predicate is not necessarily connected with the idea of the subject, unless upon some consideration distinct from that idea, there the proposition is called conditional. The reason of the name is taken from the supposition annexed, which is of the nature of a condition, and may be expressed as such, thus: If a stone is exposed to the rays of the sun, it will contract some degree of heat; If a river runs in a very declining channel, its rapidity will constantly increase.

IV. There is not, any thing of greater importance in philosophy than a due attention to this division of importance propositions. If we are careful never to affirm things of this division absolutely but where the ideas are inseparably con-

joined; and if in our other judgments we distinctly mark the conditions which determine the predicate to belong to the subject; we shall be the less liable to mistake.
mistake in applying general truths to the particular concerns of human life. It is owing to the exact observance of this rule that mathematicians have been so happy in their discoveries, and that what they demonstrate of magnitude in general may be applied with ease in all obvious occurrences.

V. The truth of it is, particular propositions are then known to be true, when we can trace their connexion with universals; and it is accordingly the great business of science to find out general truths that may be applied with safety in all obvious instances. Now the great advantage arising from determining with care the conditions upon which one idea may be affirmed or denied of another is this; that thereby particular propositions really become universal, may be introduced with certainty into our reasonings, and serve as standards to conduct and regulate our judgments. To illustrate this by a familiar instance: if we say, Some water acts very forcibly; the proposition is particular: and as the conditions on which this forcible action depends are not mentioned, it is as yet uncertain in what cases it may be applied. Let us then supply these conditions, and the proposition will run thus: Water conveyed in sufficient quantity along a steep descent acts very forcibly. Here we have an universal judgment, inasmuch as the predicate forcible action may be ascribed to all water under the circumstances mentioned. Nor is it less evident that the proposition in this new form is of easy application; and in fact we find that men do apply it in instances where the forcible action of water is required; as in corn-mills and many other works of art.

Chap. V. Of Simple and Compound Propositions.

I. Hitherto we have treated of propositions, where only two ideas are compared together. These are in the general called simple; because, having but one subject and one predicate, they are the effect of a simple judgment that admits of no subdivision. But if it so happens that several ideas offer themselves to our thoughts at once, whereby we are led to affirm the same thing of different objects, or different things of the same object; the propositions expressing these judgments are called compound: because they may be resolved into as many others as there are subjects or predicates in the whole complex determination on the mind. Thus, God is infinitely wise and infinitely powerful. Here there are two predicates, infinite wisdom and infinite power, both affirmed of the same subject; and accordingly the proposition may be resolved into two others; affirming these predicates severally. In like manner in the proposition, Neither kings nor people are exempt from death; the predicate is denied of both subjects, and may therefore be separated from them in distinct propositions. Nor is it less evident, that if a complex judgment consists of several subjects and predicates, it may be resolved into as many simple propositions as are the number of different ideas compared together. Riches and honours are apt to elate the mind, and increase the number of our desires. In this judgment there are two subjects and two predicates, and it is at the same time apparent that it may be resolved into four distinct propositions. Riches are apt to elate the mind. Riches are apt to increase the number of our desires. And so of honours.

II. Logicians have divided these compound propositions into a great many different classes; but, in our opinion, not with a due regard to their proper definition. Thus, conditionals, causals, relatives, &c. are compound mentioned as so many distinct species of this kind, propositions though in fact they are no more than simple propositions. To give an instance of a conditional; If a stone is exposed to the rays of the sun, it will contract some degree of heat. Here we have but one subject and one predicate; for the complex expression, A stone exposed to the rays of the sun, constitutes the proper subject of this proposition, and is no more than one determined idea. The same thing happens in causals. Rehoboam was unhappy because he followed evil counsel. There is here an appearance of two propositions arising from the complexity of the expression; but when we come to consider the matter more nearly, it is evident that we have but a single subject and predicate. The pursuit of evil counsel brought misery upon Rehoboam. It is not enough, therefore, to render a proposition compound, that the subject and predicate are complex notions, requiring sometimes a whole sentence to express them; for in this case the comparison is still confined to two ideas, and constitute what we call a simple judgment. But where there are several subjects or predicates, or both, as the affirmation or negation may be alike extended to them all; the proposition expressing such a judgment is truly a collection of as many simple ones as there are different ideas compared. Confining ourselves, therefore, to this more strict and just notion of compound propositions, they are all reducible to two kinds. viz. copulatives and disjunctives.

III. A copulative proposition is, where the subjects and predicates are so linked together, that they may be all severally affirmed or denied one of another. Of this nature are the examples of compound propositions given above. Riches and honours are apt to elate the mind, and increase the numbers of our desires. Neither kings nor people are exempt from death. In the first of these the two predicates may be affirmed severally of each subject, whence we have four distinct propositions. The other furnishes an example of the negative kind, where the same predicate, being disjoined from both subjects, may be also denied of them in separate propositions.

IV. The other species of compound propositions are those called disjunctives; in which, comparing several diverse predicates with the same subject, we affirm that one of them necessarily belongs to it, but leave the particular predicate undetermined. If any one, for example, says, This world either exists of itself, or is the work of some all-wise and powerful cause, it is evident that one of the two predicates must belong to the world; but as the proposition determines not which, it is therefore of the kind we call disjunctive. Such too are the following: The sun either moves round the earth, or is the centre about which the earth revolves. Friendship finds men equal, or makes them so. It is the nature of all propositions of this class, supposing them to be exact in point of form, that upon determining the particular predicate, the rest are of course to be removed: or if
all the predicates but one are removed, that one necessarily takes place. Thus, in the example given above; if we allow the world to be the work of some wise and powerful cause, we of course deny it to be self-existent; or if we deny it to be self-existent, we must necessarily admit that it was produced by some wise and powerful cause. Now this particular manner of linking the predicates together, so that the establishing one displaces all the rest; or the excluding all but one necessarily establishes that one; cannot otherwise be effected than by means of disjunctive particles. And hence it is that propositions of this class take their names from these particles which make so necessary a part of them, and indeed constitute their very nature considered as a distinct species.

CHAP. VI. Of the Division of Propositions into Self-evident and Demonstrable.

I. WHEN any proposition is offered to the view of the mind, if the terms in which it is expressed be understood; upon comparing the ideas together, the agreement or disagreement asserted is either immediately perceived, or found to lie beyond the present reach of the understanding. In the first case the proposition is said to be self-evident, and admits not of any proof, because a bare attention to the ideas themselves produces full conviction and certainty; nor is it possible to call in any thing more evident by way of confirmation. But where the connexion or repugnance comes not so readily under the inspection of the mind, there we must have recourse to reasoning; and if by a clear series of proofs we can make out the truth proposed, insomuch that self-evidence shall accompany every step of the procedure, we are then able to demonstrate what we assert, and the proposition itself is said to be demonstrable. When we affirm, for instance, that it is impossible for the same thing to be and not to be; whoever understands the terms made use of perceives at first glance the truth of what is asserted, nor can he by any efforts bring himself to believe the contrary. The proposition therefore is self-evident, and such that it is impossible by reasoning to make it plainer; because there is no truth more obvious or better known, from which a consequence it may be deduced. But if we say, This world had a beginning; the assertion is indeed equally true, but shines not forth with the same degree of evidence. We find great difficulty in conceiving how the world could be made out of nothing; and are not brought to a free and full consent, until by reasoning we arrive at a clear view of the absurdity involved in the contrary supposition. Hence this proposition is of the kind we call demonstrable, insomuch as its truth is not immediately perceived by the mind, but yet may be made appear by means of others more known and obvious, whence it follows as an unavailable consequence.

II. From what has been said, it appears, that reasoning is employed only about demonstrable propositions, and that our intuitive and self-evident perceptions are the ultimate foundation on which it rests.

III. Self-evident propositions furnish the first principles of reasoning; and it is certain, that if in our researches we employ only such principles as have this character of self-evidence, and apply them according to the rules to be afterwards explained, we shall be in no danger of error in advancing from one discovery to another. For this we may appeal to the writings of the mathematicians, which being conducted by the express model here mentioned, are an incontrovertible proof of the firmness and stability of human knowledge, when built upon so sure a foundation. For not only have the propositions of this science stood the test of ages; but are found attended with that invincible evidence, as forces the assent of all who duly consider the proofs upon which they are established. Since the mathematicians are universally allowed to have hit upon the right method of arriving at unknown truths, since they have been the happiest in the choice as well as the application of their principles, it may not be amiss to explain here their method of stating self-evident propositions, and applying them to the purposes of demonstration.

IV. First then it is to be observed, that they have Definitions been very careful in ascertaining their ideas, and fixing the signification of their terms. For this purpose, they begin with definitions, in which the meaning of their words is so distinctively explained, that the one is not to fail to excite in the mind of an attentive reader knowledge of the very same ideas as are annexed to them by the writer. And indeed the clearness and irresistible evidence of mathematical knowledge is owing to nothing so much as this care in laying the foundation. Where the relation between any two ideas is accurately and justly traced, it will not be difficult for another to comprehend that relation, if in setting himself to discover it he brings the very same ideas into comparison. But if, on the contrary, he affixes to his words ideas different from those that were in the mind of him who first advanced the demonstration: it is evident that as the same ideas are not compared, the same relation cannot subsist, insomuch that a proposition will be rejected as false, which, had the terms been rightly understood, must have appeared incontrovertibly true. A square, for instance, is a figure bounded by four equal right lines, joined together at right angles. Here the nature of the angles makes the equality of the sides; and many properties demonstrated of the square flow entirely from its being a rectangular figure. If therefore we suppose a man, who has formed a partial notion of a square, comprehending only the equality of its sides, without regard to the angles, reading some demonstration that implies also this latter consideration; it is plain he would reject it as not universally true, inasmuch as it could not be applied where the sides were joined together at equal angles. For this last figure, answering still to his idea of a square, would be yet found without the property assigned to it in the proposition. But if he comes afterwards to correct his notion, and render his idea complete, he will then readily own the truth and justness of the demonstration.

V. We see, therefore, that nothing contributes so much to the improvement and certainty of human knowledge, as the having determinate ideas, and procuring a ready reception to the truths they count it is, that mathematicians, as was before observed, always vance.
always begin by defining their terms, and distinctly unfolding the notions they are intended to express. Hence such as apply themselves to these studies have exactly the same views of things; and, bringing always the very same ideas into comparison, readily discern the relations between them. It is likewise of importance, in every demonstration, to express the same idea invariably by the same word. From this practice mathematicians never deviate; and if it be necessary in their demonstrations, where the reader's comprehension is aided by a diagram, it is much more so in all reasonings about moral or intellectual truths where the ideas cannot be represented by a diagram. The observation of this rule may sometimes be productive of ill-sounding periods; but when truth is the object, sound ought to be despised.

The establishing of principles, the second step in mathematical knowledge, VI. When the mathematicians have taken this first step, and made known the ideas whose relations they intend to investigate, their next care is to lay down some self-evident truths, which may serve as a foundation for their future reasonings. And here indeed they proceed with remarkable circumspection, admitting no principles but what flow immediately from their definitions, and necessarily force themselves upon a mind in any degree attentive to its ideas. Thus a circle is a figure formed by a right line moving round some fixed point in the same plane. The fixed point round which the line is supposed to move, and where one of its extremities terminates, is called the centre of the circle. The other extremity, which is conceived to be carried round until it returns to the point whence it first set out, describes a curve running into itself, and termed the circumference. All right lines drawn from the centre to the circumference are called radii. From these definitions compared, geometers derive this self-evident truth; that the radius of the same circle are all equal to one another.

VII. We now observe, that in all propositions we either affirm or deny some property of the idea that constitutes the subject of our judgment, or we maintain that something may be done or effected. The first sort are called speculative propositions, as in the example mentioned above, the radii of the same circle are all equal to one another. The others are called practical, for a reason too obvious to be mentioned; thus, that a right line may be drawn from point to another is a practical proposition; inasmuch as it expressed that something may be done.

VIII. From this twofold consideration of propositions arises the twofold division of mathematical principles into axioms and postulates. By an axiom they understand any self-evident speculative truth; as, That the whole is greater than its parts: That things equal to one and the same thing are equal to one another. But a self-evident practical proposition is what they call a postulate. Such are those of Euclid; that a finite right line may be continued directly forwards; that a circle may be described about any centre with any distance. And here we are to observe, that as in an axiom the agreement or disagreement between the subject and pre-
CHAPTER I.

Of Reasoning in general, and the Parts of which it consists.

It often happens in comparing ideas together, that their agreement or disagreement cannot be discerned at first view, especially if they are of such a nature as not to admit of an exact determination; because, by reason of their disagreeing forms, it is impossible so to put them together, as that their several parts shall mutually coincide. Here then it becomes necessary to look out for some third idea that will admit of such an application as the present case requires; wherein if we succeed, all difficulties vanish, and the relation we are in quest of may be traced with ease. Thus, right-lined figures are all reduced to squares, by means of which we can measure their areas, and determine exactly their agreement or disagreement in point of magnitude.

II. But how can any third idea serve to discover a relation between two others? The answer is, by being compared severally with these others; for such a comparison enables us to see how far the ideas with which this third is compared are connected or disjointed between themselves. In the example mentioned above of two right-lined figures, if we compare each of them with some square whose area is known, and find the one exactly equal to it, and the other less by a square inch, we immediately conclude that the area of the first figure is a square inch greater than that of the second. This manner of determining the relation between any two ideas, by the intervention of some third with which they may be compared, is that which we call reasoning; and is indeed the chief instrument by which we push on our discoveries, and enlarge our knowledge. The great art lies in finding out such intermediate ideas, as when compared with the others in the question, will furnish evident and known truths; because, as will afterwards appear, it is only by means of them that we arrive at the knowledge of what is hidden and remote.

III. Hence it appears, that every act of reasoning necessarily includes three distinct judgments; two wherein the ideas whose relation we want to discover are severally compared with the middle idea, and a third wherein they are themselves connected or disjointed, according to the result of that comparison. Now, as in the second part of logic, our judgments, when put into words, were called propositions, so here in the third part the expressions of our reasonings are termed syllogisms. And hence it follows, that as every act of reasoning implies three several judgments, so every syllogism must include three distinct propositions. When a reasoning is thus put into words, and appears in form of a syllogism, the intermediate idea made use of, to discover the agreement or disagreement we search for, is called the middle term; and the two ideas themselves with which this third is compared, go by the name of the extremes.

IV. But as these things are best illustrated by example, let us, for instance, set ourselves to inquire whether men are accountable for their actions. As the relation between the ideas of man and accountableness, come not within the immediate view of the mind, our first care must be to find out some third idea that will enable us the more easily to discover and trace it. A very small measure of reflection is sufficient to inform us, that no creature can be accountable for his actions, unless we suppose him capable of distinguishing the good from the bad; that is, unless we suppose him possessed of reason. Nor is this alone sufficient. For what would it avail him to know good from bad actions, if he had no freedom of choice, nor could avoid the one and pursue the other? hence it becomes necessary to take in both considerations in the present case. It is at the same time equally apparent, that wherever there is ability of distinguishing good from bad actions, and of pursuing the one and avoiding the other, there also a creature is accountable. We have then got a third idea, with which accountableness is inseparably connected, viz. reason and liberty; which are here to be considered as making up one complex conception. Let us now take this middle idea, and compare it with the other term in the question, viz. man, and we all know by experience that it may be affirmed of him. Having thus by means of the intermediate idea formed two several judgments, viz. that man is possessed of reason and liberty; and that reason and liberty imply accountableness; a third obviously and necessarily follows, viz. that man is accountable for his actions. Here then we have a complete act of reasoning, in which, according to what has been already observed, there are three distinct judgments: two that may be styled previous, inasmuch as they lead to the other, and arise from comparing the middle idea with the two ideas in the question: the third is a consequence of those previous acts, and flows from combining the extreme ideas between themselves. If now we put this reasoning into words, it exhibits what logicians term a syllogism; and, when proposed in due form, runs thus:

"Every creature possessed of reason and liberty is accountable for his actions."

"Man is a creature possessed of reason and liberty."

"Therefore man is accountable for his actions."

V. In this syllogism we may observe, that there are premises, three several propositions expressing the three judgments implied in the act of reasoning; and so disposed as to represent distinctly what passes within the mind in tracing the more distant relations of its ideas. The two first propositions answer the two previous judgments in reasoning, and are called the premises, because they are placed before the other. The third is termed the conclusion, as being gained in consequence of what was asserted in the premises. We are also to remember, + T that
LOGIC.

Of Reasoning.

Of the terms expressing the two ideas whose relations we inquire after, as here man and accountability, are in general called the extremes; and that the intermediate idea, by means of which the relation is traced, viz. a creature possessed of reason and liberty, takes the name of the middle term. Hence it follows, that by the premises of a syllogism we are always to understand the two propositions where the middle term is severally compared with the extremes; for these constitute the previous judgments, whence the truth we are in quest of is by reasoning deduced. The conclusion is that other proposition, in which the extremes themselves are joined or separated agreeably to what appears upon the above comparison.

VI. The conclusion is made up of the extreme terms of the syllogism: and the extreme, which serves as the predicate of the conclusion, goes by the name of the major term: the other extreme, which makes the subject in the same proposition, is called the minor term. From this distinction of the extremes arises also a distinction between the premises, where these extremes are severally compared with the middle term. That proposition which compares the greater extreme, or the predicate of the conclusion, with the middle term, is called the major proposition: the other, wherein the same middle term is compared with the subject of the conclusion or lesser extreme, is called the minor proposition. All this is obvious from the syllogism already given, where the conclusion is, Man is accountable for his actions. For here the predicate accountable for his actions being connected with the middle term in the first of the two premises, every creature possessed of reason and liberty is accountable for his actions, gives what we call the major proposition. In the second of the premises, man is a creature possessed of reason and liberty, we find the lesser extreme, or subject of the conclusion, viz. man, connected with the same middle term, whence it is known to be the minor proposition.

When a syllogism is proposed in due form, the major proposition is always placed first, the minor next, and the conclusion last.

VII. These things premised, we may in the general define reasoning to be an act or operation of the mind, deducing some unknown proposition from other previous ones that are evident and known. These previous propositions, in a simple act of reasoning, are only two in number; and it is always required that they be of themselves apparent to the understanding, insomuch that we assent to and perceive the truth of them as soon as proposed. In the syllogism given above, the premises are supposed to be self-evident truths; otherwise the conclusion could not be inferred by a single act of reasoning. If, for instance, in the major, every creature possessed of reason and liberty is accountable for his actions, the connection between the subject and predicate could not be perceived by a bare attention to the ideas themselves; it is evident that this proposition would no less require a proof than the conclusion deduced from it. In this case a new middle term must be sought for, to trace the connexion here supposed; and this of course furnishes another syllogism, by which having established the proposition in question, we are then, and not before, at liberty to use it in any succeeding train of reasoning. And should it so happen, that in this second essay there was still some previous proposition whose truth did not appear at first sight, we must then have recourse to a third syllogism, in order to lay open that truth to the mind: because so long as the premises remain uncertain, the conclusion built upon them must be too so. When, by conducting our thoughts in this manner, we at last arrive at some syllogism where the previous propositions are intuitive truths; the mind then rests in full security, as perceiving that the several conclusions has passed through stand upon the immoveable foundation of self-evidence, and when traced to their source terminate in it.

VIII. We see, therefore, that in order to infer the conclusion by a single act of reasoning, the premises must be intuitive propositions. Where they are not, previous syllogisms are required; in which case reasoning becomes a complicated act, taking in a variety of successive steps. This frequently happens in tracing the more remote relation of our ideas; where, many middle terms being called in, the conclusion cannot be made out but in consequence of a series of syllogisms following one another in train. But although in this concatenation of propositions, those that form the premises of the last syllogism are often considerably removed from self-evidence; yet if we trace the reasoning backwards, we shall find them the conclusions of previous syllogisms, whose premises approach nearer and nearer to intuition in proportion as we advance, and are found at last to terminate in it. And if, after having thus unravelled a demonstration, we take it the contrary way; and observe how the mind, setting out with intuitive perceptions, couples them together to form a conclusion: how, by introducing this conclusion into another syllogism, it still advances one step farther; and so proceeds, making every new discovery subservient to its future progress; we shall then perceive clearly, that reasoning, in the highest sense of that faculty, is no more than an orderly combination of those simple acts which we have already so fully explained.

IX. Thus we see, that reasoning, beginning with first principles, rises gradually from one judgment to another, and connects them in such manner, that every step of the progression brings intuitive certainty along with it. And now at length we may clearly understand the definition given above of this distinguishing faculty of the human mind. Reason, we have said, is the ability of deducing unknown truths from principles or propositions that are already known. This evidently appears by the foregoing account, where we see that no proposition is admitted into a syllogism, to serve as one of the previous judgments on which the conclusion rests, unless it is itself a known and established truth, whose connexion with self-evident principles has been already traced.

CHAP. II. Of the several kinds of Reasoning: and first, of that by which we determine the Genera and Species of Things.

I. All the aims of human reason may in the general be reduced to these two: 1. To rank things under twofold.

those universal ideas to which they truly belong; and, 2. To ascribe to them their several attributes and properties in consequence of that distribution.
Part III.

LOGIC.

II. One great aim of human reason is to determine the genera and species of things. We have seen in the First Part of this treatise, how the mind proceeds in framing general ideas. We have also seen in the Second Part, how by means of these general ideas we come by universal propositions. Now as in these universal propositions we affirm some property of a genus or species, it is plain that we cannot apply this property to particular objects till we have first determined whether they are comprehended under that general idea of which the property is affirmed. Thus there are certain properties belonging to all even numbers, which nevertheless cannot be applied to any particular number, until we have first discovered it to be of the species expressed by that natural name. Hence reasoning begins with referring things to their several divisions and classes in the scale of our ideas; and as these divisions are all distinguished by particular names, we thereby learn to apply the terms expressing general conceptions to such particular objects as come under our immediate observation.

III. Now, in order to arrive at these conclusions, by which the several objects of perception are brought under general names, two things are manifestly necessary. First, That we take a view of the idea itself denoted by that general name, and carefully attend to the distinguishing marks which serve to characterize it. Secondly, That we compare this idea with the object under consideration, observing diligently wherein they agree or differ. If the idea is found to correspond with the particular object, we then without hesitation apply the general name; but if no such correspondence intervenes, the conclusion must necessarily take a contrary turn. Let us, for instance, take the number eight, and consider by what steps we are led to pronounce it an even number. First then, we call to mind the idea signified by the expression on even number, viz. that it is a number divisible into two equal parts. We then compare this idea with the number eight, and find them manifestly to agree, see at once the necessity of admitting the conclusion. These several judgments therefore transferred into language, and reduced to the form of a syllogism, appear thus:

Every number that may be divided into two equal parts is an even number.

The number eight may be divided into two equal parts.

Therefore the number eight is an even number.

IV. Here it may be observed, that where the general idea, to which particular objects are referred, is very familiar to the mind, and frequently in view; this reference, and the application of the general name, seem to be made without any apparatus of reasoning. When we see a horse in the fields, or a dog in the street, we readily apply the name of the species; habit, and a familiar acquaintance with the general idea, suggesting it instantaneously to the mind. We are not however to imagine on this account that the understanding departs from the usual rules of just thinking. A frequent repetition of acts begets a habit; and habits are attended with a certain promptness of execution, that prevents our observing the several steps and gradations by which any course of action is accomplished. But in other instances, where we judge not by precontracted habits, as when the general idea is very complex, or less familiar to the mind, we always proceed according to the form of reasoning established above. A goldsmith, for instance, who is in doubt as to any piece of metal, whether it be of the species called gold, first examines its properties, and then comparing them with the general idea signified by that name, if he finds a perfect correspondence, no longer hesitates under what class of metals to rank it.

V. Nor let it be imagined that our researches here, The great because in appearance bounded to the imposing of generality upon particular objects, are therefore tri- vial and of little consequence. Some of the most con- siderable debates among mankind, and such too as 72

Nor let it be imagined that our researches here, The great because in appearance bounded to the imposing of generality upon particular objects, are therefore tri- vial and of little consequence. Some of the most con- siderable debates among mankind, and such too as regarding their lives, interest, and happiness, turn wholly upon this article. Is it not the chief employ- ment of our several courts of judicature to determine in particular instances, what is law, justice, and equity? Of what importance is it in many cases to decide aright whether an action shall be termed murder or manslaughter? We see then that no less than the lives and fortunes of men depend often upon these decisions. The reason is plain. Actions, when once referred to a general idea, draw after them all that may be affirmed of that idea; insomuch that the determining the species of actions is all one with determining what proportion of praise or disgrace, commendation or blame, &c. ought to follow them. For as it is allowed that murder deserves death; by bringing any particular action under the head of murder, we of course decide the punishment due to it.

VI. But the great importance of this branch of rea- soning, and the necessity of care and circumspection in referring particular objects to general ideas, is still farther evident from the practice of the mathematicians. Every one who has read Euclid, knows, that maticsian.

The figures hence resulting are often squares, parallelograms, or rectangles. Yet Euclid never supposes this from their bare appearance, but always demonstrates it upon the strictest principles of geometry. Nor is the method he takes in any thing different from that described above. Thus, for instance, having defined a square to be a figure bounded by four equal sides joined together at right angles; when such a figure arises in any construction previous to the demonstration of a proposition, yet he never calls it by that name until he has shown that its sides are equal, and all its angles right ones. Now this is apparently the same form of reasoning we have before exhibited in proving eight to be an even number.

VII. Having thus explained the rules by which we are to conduct ourselves in ranking particular objects under general ideas, and shown their conformity to the practice and manner of the mathematicians: it remains only to observe, that the true way of rendering this part of knowledge both easy and certain is, by considering this habituating ourselves to clear and determinate ideas, and keeping them steadily annexed to their respective names. For as all our aim is to apply general words and conceptions, if these words stand for invariable ideas that are perfectly known to the mind, and can be readily distinguished upon occasion, there will be little danger.
of mistake or error in our reasonings. Let us suppose that, by examining any object, and carrying our attention successively from one part to another, we have acquainted ourselves with the several particulars observable in it. If among these we find such as constitute some general idea, framed and settled beforehand by the understanding, and distinguished by a particular name, the resemblance thus known and perceived necessarily determines the species of the object, and thereby gives it a right to the name by which that species is called. Thus four equal sides, joined together at right angles, make up the notion of a square. As this is a fixed and invariable idea, without which the general name cannot be applied; we never call any particular figure a square until it appears to have these several conditions; and contrariwise, wherever a figure is found with these conditions, it necessarily takes the name of a square. The same will be found to hold in all our other reasonings of this kind, where nothing can create any difficulty but the want of settled ideas. If, for instance, we have not determined within ourselves the precise notion denoted by the word manslaughter, it will be impossible for us to decide whether any particular action ought to be called by that name: because, however nicely we examine the action itself, yet, being strangers to the general idea with which it is to be compared, we are utterly unable to judge of their agreement or disagreement. But if we be careful to remove this obstacle, and distinctly trace the two ideas under consideration, all difficulties vanish, and the resolution becomes both easy and certain.

VIII. Thus we see of what importance it is towards the improvement and certainty of human knowledge, that we accustom ourselves to clear and determinate ideas, and a steady application of words.

CHAP. III. Of Reasoning, as it regards the Powers and Properties of Things, and the Relations of our general Ideas.

I. We now come to the second great end which men have in view in their reasonings; namely, the discovering and ascribing to things their several attributes and properties. And here it will be necessary to distinguish between reasoning, as it regards the sciences, and as it concerns common life. In the sciences, our reason is employed chiefly about universal truths, it being by them alone that the bounds of human knowledge are enlarged. Hence the division of things into various classes, called otherwise genera and species. For these universal ideas being set up as the representatives of many particular things, whatever is affirmed of them may be also affirmed of all the individuals to which they belong. Murder, for instance, is a general idea, representing a certain species of human actions. Reason tells us that the punishment due to it is death. Hence every particular action, coming under the notion of murder, has the punishment of death allotted to it. Here then we apply the general truth to some obvious instance; and this is what properly constitutes the reasoning of common life. For men, in their ordinary transactions and intercourse one with another, have, for the most part, to do only with particular objects. Our friends and relations, their characters and behaviour, the constitution of the several bodies that surround us, and the uses to which they may be applied, are what chiefly engage our attention. In all these, we reason about particular things; and the whole result of our reasoning is, the applying the general truths of the sciences in the ordinary transactions of human life. When we see a viper, we avoid it. Wherever we have occasion for the forcible action of water to move a body that makes considerable resistance, we take care to convey it in such a manner that it shall fall upon the object with impetuosity. Now all this happens in consequence of our familiar and ready application of these two general truths. The bite of a viper is mortal. Water falling upon a body with impetuosity, acts very forcibly towards setting it in motion. In like manner, if we set ourselves to consider any particular character, in order to determine the share of praise or displeasure that belongs to it, our great concern is to ascertain exactly the proportion of virtue and vice. The reason is obvious. A just determination, in all cases of this kind, depends entirely upon an application of these general maxims of morality: Virtuous actions deserve praise; vicious actions deserve blame.

II. Hence it appears that reasoning, as it regards the steps common life, is no more than the ascribing the general properties of things to those several objects with which we are more immediately concerned, according as they are found to be of that particular division or common class to which the properties belong. The steps then by which we proceed are manifestly these. First, We refer the object under consideration to some general idea or class of things. We then recollect the several attributes of that general idea. And lastly, Ascribe all those attributes to the present object. Thus, in considering the character of Sempronius, if we find it to be of the kind called virtuous, when we at the same time reflect that a virtuous character is deserving of esteem, it naturally and obviously follows that Sempronius is so too. These thoughts put into a syllogism, in order to exhibit the form of reasoning here required, run thus:

"Every virtuous man is worthy of esteem."
"Sempronius is a virtuous man:"
"Therefore Sempronius is worthy of esteem."

III. By this syllogism it appears, that before we af- }

The conference of a particular object, that object must nounced worthy of esteem only in consequence of his }

being a virtuous man, or coming under that general branches of }

notion. Hence we see the necessary connexion of the reasoning }

various parts of reasoning, and the dependence they one another. The determining the genera }

and species of things is, as we have said, one exercise of }

human reason; and here we find that this exercise is the }

first in order, and previous to the other, which consists in }

ascribing to them their powers, properties, and relations. }

But when we have taken this previous step, and brought }

particular objects under general names; as the properties }

we ascribe to them are no other than those of the general idea, it is plain that, }

in order to a successful progress in this part of know- }

ledge, we must thoroughly acquaint ourselves with the }

several relations and attributes of these general ideas.
of

reasoning.

ideas. When this is done, the other part will be easy, and requires scarce any labour or thought, as being no more than an application of the general form of reasoning represented in the foregoing syllogism. Now, as we have already sufficiently shown how we are to proceed in determining the genera and species of things, which, as we have said, is the previous step to this second branch of human knowledge; all that is farther wanting towards a due explanation of it is, to offer some considerations as to the manner of investigating the general relations of our ideas. This is the highest exercise of the powers of the understanding, and that by means whereof we arrive at the discovery of universal truths; insomuch that our deductions in this way constitute that particular species of reasoning which we have before said regards principally the sciences.

IV. But that we may conduct our thoughts with some order and method, we shall begin with observing, that the relations of our general ideas are of two kinds: either such as immediately discover themselves, upon comparing the ideas one with another; or such as, being more remote and distant, require some assistance to bring them into view. The relations of the first kind furnish us with intuitive and self-evident truths: those of the second are traced by reasoning, and a due application of intermediate ideas. It is of this last kind that we are to speak here, having despatched what was necessary with regard to the other in the Second Part. As, therefore, in tracing the more distant relations of things, we must always have recourse to intervening ideas, and are more or less successful in our researches according to our acquaintance with these ideas, and ability of applying them; and it is evident, that to make a good reasoner, two things are principally required. First, An extensive knowledge of those intermediate ideas, by means of which things may be compared one with another. Secondly, The skill and talent of applying them happily in all particular instances that come under consideration. And here, rules and precepts are very in particular instances.

V. In order to our successful progress in reasoning, we must have an extensive knowledge of those intermediate ideas by means of which things may be compared one with another. For as it is not every idea that will answer the purpose of our inquiries, but only those as are peculiarly related to the objects about which we reason, so as, by a comparison with them to furnish evident and known truths; nothing is more apparent than that the greater variety of conceptions we can call into view, the more likely we are to find some among them that will help us to the truths here required. And, indeed, it is found to hold in experience, that in proportion as we enlarge our views of things, and grow acquainted with a multitude of different objects, the reasoning faculty gathers strength: for, by extending our sphere of knowledge, the mind acquires a certain force and penetration, as being accustomed to examine the several appearances of its ideas, and observe what light they cast one upon another.

VI. This is the reason why, in order to excel remarkably in any one branch of learning, it is necessary to have at least a general acquaintance with the whole circle of arts and sciences. The truth of it is, all the various divisions of human knowledge are very nearly related among themselves, and, in innumerable instances, serve to illustrate and set off each other. And although it is not to be denied that, by an obstinate application to one branch of study, a man may make considerable progress, and acquire some degree of eminence therein; yet his views will be always narrow, learning we must be row and contracted, and he will want that masterful in general discernment which not only enables us to pursue our acquainted discoveries with ease, but also, in laying them open to the others, to spread a certain brightness around them, the whole circle of arts and sciences, with whatever relates to that science. A general knowledge is a good preparation, and enables us to proceed with ease and expedition in whatever branch of learning we apply to. But then, in the minute and intricate questions of any science, we are by no means qualified to reason with advantage until we have perfectly mastered the science to which they belong.

VII. We come now to the second thing required. Secondly, that we proceed in order to a successful progress in reasoning, the skill of applying intermediate ideas happily in all particular instances that come under consideration. And here, rules and precepts are very in particular instances of little service. Use and experience are the best instructors. For, whatever logicians may boast of being able to form perfect reasoners by book and rule, we find by experience, that the study of their precepts does not always add any great degree of strength to the understanding. In short, it is the habit alone of reasoning that makes a reasoner. And therefore the true way to acquire this talent is, by being much conversant in those sciences where the art of reasoning is allowed to reign in the greatest perfection. Hence it was that the ancients, who so well understood the manner of forming the mind, always began with mathematics, as the foundation of their philosophical studies. Here the understanding is by degrees habituated to truth, contracts inespressibly a certain kindred with it, and learns never to yield its assent to any proposition but where the evidence is sufficient to produce full conviction. For this reason what is called mathematical demonstrations the most of the ancients or purgatives of the soul, as being the proper means to cleanse it from error, and restore that natural exercise of its faculties in which just thinking consists.

VIII. If therefore we would form our minds to the habit of reasoning closely and in train, we cannot take of mathematical demonstrations in mathematical demonstrations, so as to contract a kind of familiarity with them. Not that we look upon it as now necessary that all men should be deep mathematicians; in this, but that, having got the way of reasoning which that study necessarily brings the mind to, they may be able to transfer it to other parts of knowledge, as they shall have occasion.

IX. But although the study of mathematics be of all others the most useful to form the mind, and give it the most powerful philosophy to be neglected. For there also we meet with many opportunities of exercising the powers of and just the understanding; and the variety of subjects makes it a really going.
Part III.

LOGIC.

"Whatever is bad is not the work of God:
All the natural passions and appetites of men are the work of God:
Therefore the natural passions and appetites of men are not bad."

Again, In the third figure, the middle term is the subject of the two premises: As,
All Africans are black:
All Africans are men:
Therefore some men are black."

And lastly, By making it the predicate of the major, and subject of the minor, we obtain syllogisms in the fourth figure: As,
The only Being who ought to be worshipped is the Creator and Governor of the world:
The Creator and Governor of the world is God:
Therefore God is the only Being who ought to be worshipped."

II. But, besides this fourfold distinction of syllogisms, there is also a further subdivision of them in of syllogism, every figure, arising from the quantity and quality, as they are called, of the propositions. By quantity we mean the consideration of propositions, as universal or particular; by quality, as affirmative or negative.

Now as, in all the several dispositions of the middle term, the propositions of which a syllogism consists may be either universal or particular, affirmative or negative; the due determination of these, and so putting them together as the laws of argumentation require, constitute what logicians call the moods of syllogisms. Of these moods there is a determinate number to every figure, including all the possible ways in which propositions differing in quantity or quality can be combined, according to any disposition of the middle term, in order to arrive at a just conclusion.

The first figure has only four legitimate moods. The major proposition in this figure must be universal, and the minor affirmative, and it has this property, that it yields conclusions of all kinds, affirmative and negative, universal and particular.

The second figure has also four legitimate moods. Its major proposition must be universal, and one of the premises must be negative. It yields conclusions both universal and particular, but all negative.

The third figure has six legitimate moods. Its minor must always be affirmative, and it yields conclusions both affirmative and negative, but all particular.

These are all the figures which were admitted by the inventor of syllogisms, and of which, so far as we know, the number of legitimate moods has been ascertained, and severally demonstrated. In every figure it will be found upon trial, that there are sixty-four different moods of syllogism; and he who thinks it worth while to construct so many in the fourth figure, always remembering that the middle term in each must be the predicate of the major and the subject of the minor proposition, will easily discern what number of these moods are legitimate, and give true conclusions.

Besides the rules that are proper to each figure, Aristotle has given some that are common to all, by which the legitimacy of syllogisms may be tried.

3 These
Part III.

LOGIC.

III. The division of syllogisms according to mood and figure respects those especially which are known by the name of plain simple syllogisms; that is, which are bounded to three propositions, all simple, and where the extremes and middle term are connected, according to the rules laid down. But as the mind is not tied down to any one precise form of reasoning, but sometimes makes use of more, sometimes of fewer premises, and often takes in compound and conditional propositions, it may not be amiss to take notice of the different forms derived from this source, and explain the rules by which the mind conducts itself in the use of them.

IV. When in any syllogism the major is a conditional proposition, the syllogism itself is termed conditional. Thus:

"If there is a God, he ought to be worshipped;"
"But there is a God;"
"Therefore he ought to be worshipped."

In this example, the major, or first proposition, is, we see, conditional, and therefore the syllogism itself is also of the kind called by that name. And here we are to observe, that all conditional propositions are made of two distinct parts: one expressing the condition upon which the predicate agrees or disagrees with the subject, as in this now before us, if there is a God; the other joining or disjoining the said predicate and subject, as here, he ought to be worshipped. The first of these parts, or that which implies the condition, is called the antecedent; the second, where we join or disjoin the predicate and subject, has the name of the consequent.

V. In all propositions of this kind, supposing them to be exact in point of form, the relation between the antecedent and consequent must ever be true and real; that is, the antecedent must always contain some certain and genuine condition, which necessarily implies the consequent; for otherwise the proposition itself will be false, and therefore ought not to be admitted into our reasonings. Hence it follows, that when a conditional proposition is assumed, if we admit the antecedent of that proposition, we must at the same time necessarily admit the consequent; but if we reject the consequent, we are in like manner bound to reject the antecedent. For as the antecedent always expresses some condition which necessarily implies the truth of the consequent; by admitting the antecedent, we allow of that condition, and therefore ought also to admit the consequent. In like manner, if it appears that the consequent ought to be rejected, the antecedent evidently must be so too: because, as was just now demonstrated, the admitting of the antecedent would necessarily imply the admission also of the consequent.

VI. There are two ways of arguing in hypothetical syllogisms, which lead to a certain and unavoidable conclusion. For as the major is always a conditional proposition, consisting of an antecedent and a consequent; if the minor admits the antecedent, it is plain that the conclusion must admit the consequent. This is called arguing from the admission of the antecedent to the admission of the consequent, and constitutes that mood or species of hypothetical syllogisms which is distinguished in the schools by the name of the modus ponens, inasmuch as by it the whole conditional proposition, both antecedent and consequent, is established. Thus:

"If God is infinitely wise, and acts with perfect freedom, he does nothing but what is best;"
"But God is infinitely wise, and acts with perfect freedom;"
"Therefore he does nothing but what is best."

Here we see the antecedent or first part of the conditional proposition is established in the minor, and the consequent or second part in the conclusion; whence the syllogism itself is an example of the modus ponens. But if now we on the contrary suppose that the minor reject the consequent, then it is apparent that the conclusion must also reject the antecedent. In this case we are said to argue from the removal of the consequent to the removal of the antecedent, and the particular mood or species of syllogisms thence arising is called by logicians the modus tollens; because in it both antecedent and consequent are rejected or taken away, as appears by the following example:

"If God were not a Being of infinite goodness, neither would he consult the happiness of his creatures;"
"But God does consult the happiness of his creatures;"
"Therefore he is a Being of infinite goodness."

VII. These two species take in the whole class of unconditional syllogisms, and include all the possible ways of arguing that lead to a legitimate conclusion; because we cannot here proceed by a contrary process of reasoning, that is, from the removal of the antecedent to the removal of the consequent, or from the establishing of the consequent to the establishing of the antecedent. For although the antecedent always expresses some real condition, which, once admitted, necessarily implies the consequent, yet it does not follow that there is therefore no other condition; and if so, then, after removing the antecedent, the consequent may still hold, because of some other determination that infers it. When we say, If a stone is exposed some time to the rays of the sun, it will contract a certain degree of heat; the proposition is certainly true; and, admitting the antecedent, we must also admit...
admit the consequent. But as there are others ways by which a stone may gather heat, it will not follow, from the ceasing of the before-mentioned condition, that therefore the consequent cannot take place. In other words, we cannot argue: But the stone has not been exposed to the rays of the sun; therefore neither has it any degree of heat: Inasmuch as there are a great many other ways by which heat might have been communicated to it. And if we cannot argue from the removal of the antecedent to the removal of the consequent, no more can we from the admission of the consequent to the admission of the antecedent: because, as the consequent may flow from a great variety of different suppositions, the allowing of it does not determine the precise supposition, but only that some one of them must take place. Thus in the foregoing proposition, If a stone is exposed some time to the rays of the sun, it will contract a certain degree of heat; admitting the consequent, viz. that it has contracted a certain degree of heat, we are not therefore bound to admit the antecedent, that it has been some time exposed to the rays of the sun: because there are many other causes whence that heat may have proceeded. These two ways of arguing, therefore, hold not in conditional syllogisms.

VIII. As from the major’s being a conditional proposition, we obtain the species of conditional syllogisms: so, where it is a disjunctive proposition, the syllogism to which it belongs is also called disjunctive, as in the following example:

"The world is either self-existent, or the work of some finite, or of some infinite Being:
"But it is not self-existent, nor the work of a finite being:
"Therefore it is the work of an infinite Being."

Now a disjunctive proposition is that, where of several predicates, we affirm one necessarily to belong to the subject, to the exclusion of all the rest, but leave that particular one undetermined. Hence it follows, that as soon as we determine the particular predicate, all the rest are of course to be rejected; or if we reject all the predicates but one, that one necessarily takes place. When, therefore, in a disjunctive syllogism, the several predicates are enumerated in the major; if the minor establishes any one of these predicates, the conclusion ought to remove all the rest; or if, in the minor, all the predicates but one are removed, the conclusion must necessarily establish that one. Thus, in the disjunctive syllogism given above, the major affirms one of the three predicates to belong to the earth, viz. self-existence, or that it is the work of a finite, or that it is the work of an infinite Being. Two of these predicates are removed in the minor, viz. self-existence, and the work of a finite being. Hence the conclusion necessarily ascribes to it the third predicate, and affirms that it is the work of an infinite Being. If now we give the syllogism another incommensurate form, that the minor may establish in other predicates, by ascribing the earth to be the production of an infinite Being: then the conclusion must remove the other two, asserting it to be neither self-existent, nor the work of a finite Being. These are the forms of reasoning in these species of syllogisms, the justness of which appears at first sight: and that there can be no other, is evident from the very nature of a disjunctive proposition.

IX. In the several kinds of syllogisms hitherto mentioned, we may observe that the parts are complete; imperfect that is, the three propositions of which they consist are or mutila. represented in form. But it often happens, that some taut syllogism of the premises is not only an evident truth, but familiar and in the minds of all men; in which case it is usually omitted, whereby we have an imperfect syllogism, that seems to be made up of only two propositions. Should we, for instance, argue in this manner:

"Every man is mortal:
"Therefore every king is mortal."

the syllogism appears to be imperfect, as consisting but of two propositions. Yet it is really complete; only the minor (every king is a man) is omitted, and left to the reader to supply, as being a proposition so familiar and evident that it cannot escape him.

X. These seemingly imperfect syllogisms are called enthymemes; and occur very frequently in reasoning, especially where it makes a part of common conversation. Nay, there is a particular elegance in them, because, not displaying the argument in all its parts, they leave somewhat to the exercise and invention of the mind. By this means we are put upon exerting ourselves, and seem to share in the discovery of what is proposed to us. Now this is the great secret of fine writing, so to frame and put together our thoughts, as to give full play to the reader’s imagination, and draw him insensibly into our views and course of reasoning. This gives a pleasure not unlike to that which the author himself feels in composing. It besides shortens discourse, and adds a certain force and liveliness to our arguments, when the words in which they are conveyed favour the natural quickness of the mind in its operations, and a single expression is left to exhibit a whole train of thoughts.

XI. But there is another species of reasoning with two propositions, which seems to be complete in itself, and where we admit the conclusion without supposing any tacit or suppressed judgment in the mind, from which it follows syllogistically. This happens between propositions, where the connexion is such, that the admission of the one necessarily and at the first sight implies the admission also of the other. For if it so falls out, that the proposition on which the other depends is self-evident, we content ourselves with barely affirming it, and infer that other by a direct conclusion. Thus, by admitting an universal proposition, we are forced also to admit all the particular propositions comprehended under it, this being the very condition that constitutes a proposition universal. If then that universal proposition chances to be self-evident, the particular ones follow of course, without any farther train of reasoning. Whoever allows, for instance, that things equal to one and the same thing are equal to one another; must at the same time allow, that two triangles, each equal to a square whose side is three inches, are also equal between themselves. This argument, therefore,

"Things equal to one and the same thing, are equal "
"to one another."

Therefore,
Part III.

"Therefore these two triangles, each equal to the square of a line of three inches, are equal between themselves"—
is complete in its kind, and contains all that is necessary towards a just and legitimate conclusion. For the first or universal proposition is self-evident, and therefore requires no farther proof. And as the truth of the particular is inseparably connected with that of the universal, it follows from it by an obvious and unavoidable consequence.

XII. Now, in all cases of this kind, where propositions are deduced one from another, on account of a known and evident connection, we are said to reason by immediate consequence. Such a coherence of propositions manifest at first sight, and forcing itself upon the mind, frequently occurs in reasoning. Logicians have explained at some length the several suppositions upon which it takes place, and allow of all immediate consequences that follow in conformity to them. It is however observable, that these arguments, though seemingly complete, because the conclusion follows necessarily from the single proposition that goes before, may yet be considered as real enthymemes, whose major, which is a conditional proposition, is wanting. The syllogism but just mentioned, when represented according to this view, will run as follows:

"If things equal to one and the same thing, are equal to one another; these two triangles, each equal to a square whose side is three inches, are also equal between themselves.

But things equal to one and the same thing, are equal to one another:

Therefore also those triangles, &c. are equal between themselves."

This observation will be found to hold in all immediate consequences whatsoever, insomuch, that they are in fact no more than enthymemes of hypothetical syllogisms. But then it is particular to them, that the ground on which the conclusion rests, namely its coherence with the minor, is of itself apparent, and seen immediately to flow from the rules and reasons of logic.

XIII. The next species of reasoning we shall take notice of here is what is commonly known by the name of a syllogism. This is a way of arguing, in which a great number of propositions are so linked together, that the predicate of one becomes continually the subject of the next following, until at last a conclusion is formed, by bringing together the subject of the first proposition, and the predicate of the last. Of this kind is the following argument:

"God is omnipotent:

An omnipotent Being can do every thing possible:

He that can do every thing possible, can do whatever ever involves not a contradiction:

Therefore God can do whatever involves not a contradiction."

This particular combination of propositions may be continued to any length we please without in the least weakening the ground upon which the conclusion rests.

The reason is, because the syllogism itself may be resolved into as many simple syllogisms as there are middle terms in it; where this is found universally to hold, that when such a resolution is made, and the syllogisms are placed in train, the conclusion of the last in the series is also the conclusion of the syllogisms. This kind of argument, therefore, as it serves to unite several syllogisms into one, must stand upon the same foundation with the syllogisms of which it consists, and is indeed, properly speaking, no other than a compendious way of reasoning syllogistically.

XIV. What is here said of plain simple propositions may be as well applied to those that are conditional; that is, any number of them may be so joined together in a series, that the consequent of one shall become continually the antecedent of the next following; in which case, by establishing the antecedent of the first proposition, we establish the consequent of the last, or by removing the last consequent remove also the first antecedent. This way of reasoning is exemplified in the following argument:

"If we love any person, all emotions of hatred towards him cease:

If all emotions of hatred towards a person cease, we cannot rejoice in his misfortunes:

If we rejoice not in his misfortunes, we certainly wish him no injury:

Therefore, if we love a person, we wish him no injury."

It is evident that this sorites, as well as the last, may be resolved into a series of distinct syllogisms, with this only difference, that here the syllogisms are all conditional.

XV. The last species of syllogism we shall take notice of in this chapter is that commonly distinguished by the name of a dilemma. A dilemma is an argument by which we endeavour to prove the absurdity or falsehood of some assertion. In order to this, we assume a conditional proposition, the antecedent of which is the assertion to be disproved, and the consequent a disjunctive proposition, enumerating all the possible suppositions upon which that assertion can take place. If then it appears, that all these several suppositions ought to be rejected, it is plain that the antecedent or assertion itself must be so too. When therefore such a proposition as that before mentioned is made the major of any syllogism; if the minor rejects all the suppositions contained in the consequent, it follows necessarily, that the conclusion ought to reject the antecedent, which, as we have said, is the very assertion to be disproved. This particular way of arguing is that which logicians call a dilemma; and from the account here given of it, it appears that we may in the general define it to be a hypothetical syllogism, where the consequent of the major is a disjunctive proposition, which is wholly taken away or removed in the minor. Of this kind is the following:

"If God did not create the world perfect in its kind, it must either proceed from want of inclination, or from want of power:

But it could not proceed either from want of inclination, or from want of power:

Therefore, he created the world perfect in its kind."
LOGIC.

Part III.

II. But in sciences which treat of things external to the mind, we cannot assume as first principles the most general propositions, and from them infer others less and less general till we descend to particulars. The reason is obvious. Every thing in the universe, whether of mind or body, presents itself to our observation in its individual state; so that perception and judgment employed in the investigation of truth, whether physical, metaphysical, moral, or historical, have in the first place to encounter with particulars. “With these reason begins, or should begin, its operations. It observes, tries, canvasses, examines, and compares them together, and judges of them by some of those native evidences and original lights, which, as they are the first and indispensable inlets of knowledge to the mind, have been called the primary principles of truth.”

See Metaphysics.

III. “By such acts of observation and judgment, diligently practised and frequently repeated, on many individuals of the same class or of a similar nature, not indulging their agreements, marking their differences however minute, and rejecting all instances which, however similar in appearance, are not in effect the same, reason, with much labour and attention, extracts some general laws respecting the powers, properties, qualities, actions, passions, virtues, and relations of real things. This is no hasty, premature, notional abstraction of the mind, by which images and ideas are formed that have no archetypes in nature: it is a rational, operative, experimental process, instituted and executed upon the constitution of beings, which in part compose the universe. By this process reason advances from particulars to generals, from less general to more general, till by a series of slow progression, and by regular degrees, it arrive at the most general notions, called forms or formal causes (c). And by affirming or denying a genus of a species, or an accident of a substance or class of substances, through all the stages of the gradation, we form conclusions, which, if logically drawn, are axioms (d), or general propositions ranged one above another,

(c) Qui Formas novit, is, quae adhuc non facta sunt, qualia nec nature vicissitudines, nec experimentales industrie unquam in actum producissent, nec cogitationem humanam subitare suissent, detegit et educit. Baconi Nov. Org.

(d) The word axiom, auctoritas, literally signifies dignity: Hence it is used metaphorically to denote a general truth or maxim, and sometimes any thing that is self-evident, which is called a dignity on account of its importance in a process of reasoning. The axioms of Euclid are propositions extremely general; and so are the axioms of the Newtonian philosophy. But these two kinds of axioms have very different origins. The former appear true upon a bare contemplation of our ideas; whereas the latter are the result of the most laborious induction. Lord Bacon therefore strenuously contends that they should never be taken upon conjecture, or even upon the authority of the learned; but that, as they are the general principles and grounds of all learning, they should be canvassed and examined with the most scrupulous attention, “ut axiomatum corrigitur iniquitas, quae plerumque in exemplis vulgatis fundamentum habent.” De Augm. Sc. lib. ii. cap. 2. “Atque illa ipsa putativa principia ad rationes reddendas compellare decrevimus, quoquaque planæ constant.” Distrib. Operis.—Dr Tatham makes a distinction between axioms intuitive and axioms self-evident. Intuitive axioms, according to him, pass through the five senses of common sense, and cause direct conviction on the minds; as external objects do on the sense of all men. Other axioms, though not intuitive, may be properly said to be self-evident; because, in their formation, reason judges by single comparisons without the help of a third idea or middle term; so that they have their evidence in themselves, and though inductively framed they cannot be syllogistically proved. If this distinction be just, and we think it is, only particular truths can be intuitive axioms.
Part III

LOGIC.

IV. "Thus, for instance, the evidence of the external senses is obviously the primary principle from which all physical knowledge is derived. But, whereas nature begins with causes, which, after a variety of changes, produce effects, the senses open upon the effects, and from them, through the slow and painful road of experiment and observation, ascend to causes. By experiments and observations skilfully chosen, artfully conducted, and judiciously applied, the philosopher advances from one stage of inquiry to another in the rational investigation of the general causes of physical truth. From different experiments and observations made on the same individual subject, and from the same experiments and observations made on different subjects of the same kind, by comparing and judging, he discovers some qualities, causes, or phenomena, which, after carefully distinguishing and rejecting all contradictory instances that occur, he finds common to many. Thus from many collateral comparisons and judgments formed upon particulars he ascends to genera; and by a repetition of the same industrious process and laborious investigation, he advances from general to more general, till at last he is enabled to form a few of the most general, with their attributes and operations, into axioms or secondary principles, which are the well-founded laws enacted and enforced by the God of nature. This is that just and philosophic method of reasoning which sound logic prescribes in this as well as in other parts of learning; by which, through the slow but certain road of experiment and observation, the mind ascends from appearances to qualities, from effects to causes; and from experiments upon many particular subjects forms general propositions concerning the powers and properties of physical body.

V. "Axioms so investigated and established are applicable to all parts of learning, and are the indispensable, and indeed the wonderful expedients, by which, in every branch of knowledge, reason pushes on its inquiries in the particular pursuit of truth; and the method of reasoning by which they are formed, is that of true and legitimate induction; which is therefore by Lord Bacon, the best and soundest of logicians, called the key of interpretation.

VI. "Instead of taking his axioms arbitrarily out of the great families of the categories (see Category), and erecting them by his own sophistical invention into the principles upon which his dispute was to be employed, had the analytical genius of Aristotle presented us with the laws of the true inductive logic, by which axioms are philosophically formed, and had he with his usual sagacity given us an example of it in a single branch of science, he would have brought to the temple of truth, an offering more valuable that he has done by the aggregate of all his logic and philosophical productions.

VII. "In all sciences, except the mathematics, it is only after the inductive process has been industriously pursued and successfully performed, that definition may be logically and usefully introduced, by beginning with the genus, passing through all the grades and subordinate stages, and marking the specific difference as it descends, till it arrive at the individual, which is the subject of the question. And by adding an affirmation or negation of the attribute of the genus or the species or individual, or of a general accident on the particular substance so defined, making the definition a proposition, the truth of the question will be logically solved without any farther process. So that instead of being the first, as employed by the logic in common use, definition may be the last act of reason in the search of truth in general.

VIII. "These axioms or general propositions, thus and so syllogistically established, become another species of principle, which may be properly called secondary, and which lay the foundation of the syllogistic method of reasoning. When these are formed, but not before, we may safely admit the maxim with which logicians set out in the exercise of their art, as the great hinge on which their reasoning and disputation turn: From truths that are already known, to derive others which are not known. Or, to state it more comprehensively, so as to apply to probable as well as to scientific reasoning—From truths which are better known, to derive others which are less known. Philosophically speaking, syllogistic reasoning is, under general propositions to reduce others which are less general or which are particular; for the inferior ones are known to be true, only as we trace their connexion with the superior. Logically speaking, it is, To predicate a genus of a species or individual comprehended under it, or an accident of the substance in which it is inherent.

IX. "Thus induction and syllogism are the two methods of direct reasoning corresponding to the two kinds of principles, primary and secondary, on which they are founded, and by which they are respectively conducted. In both methods, indeed, reason proceeds by judging and comparing, but the process is different throughout; and though it may have the sanction of Aristotle, an inductive syllogism is a solecism.

X. "Till general truths are ascertained by induction, the third or middle terms, by which syllogisms are made are nowhere safely to be found. So that another position of the Stagirite, that syllogism is naturally prior to induction, is equally unfounded; for induction does not only naturally but necessarily precede syllogism; and, except in mathematics, is in every respect indispensable to its existence; since, till generals are established, there can be neither definition, proposition, nor axiom, and of course no syllogism. And as induction is the first, so is it the more essential and fundamental instrument of reasoning: for as syllogism cannot produce its own principles, it must have them from induction; and if the general propositions or secondary principles be imperfectly or infirmly established, and much more if they be taken at hazard, upon authority, or by arbitrary assumption like those of Aristotle, all the syllogizing in the world is a vain and useless logomachy, only instrumental to the multiplication of false learning, and to the invention and confirmation of error. The truth of syllogisms depends ultimately on the truth of axioms, and the truth of axioms on the soundness of inductions (e)."—But though induction is

LOGIC.

Part III.

Of Reasoning.

108 Why we have treated of syllogism first.

Chap. VI. Of Demonstration.

I. Having dispatched what seemed necessary to be said with regard to the two methods of direct reasoning, induction and syllogism; we now proceed to consider the laws of demonstration. And here it must be acknowledged, that in strict demonstration, which removes from the mind all possibility of doubt or error, the inductive method of reasoning has no place. When the experiments and observations from which the general conclusion is drawn are numerous and extensive, the result of this mode of reasoning is moral certainty; and could the induction be made complete, it would be absolute certainty, equally convincing with mathematical demonstration. But however numerous and extensive the observations and experiments may be upon which an inductive conclusion is established, they must of necessity come short of the number and extent of nature; which, in some cases, by its immensity, will defeat all possibility of their co-extension; and in others, by its distance, lies out of the reach of their immediate application. Though truth does not appear in all other departments of learning with that bold and resistless conviction with which it presides in the mathematical science, it shines through them all, if not interrupted by prejudice or perverted by error, with a clear and useful, though inferior strength. And as it is not necessary for the general safety or convenience of a traveller, that he should always enjoy the heat and splendour of a mid-day sun, whilst he can with more ease pursue his journey under the weaker influence of a morning or an evening ray; so it is not requisite, for the various concerns and purposes of life, that men should be led by truth of the most redundant brightness. Such truth is to be had only in those sciences which are conversant about ideas and their various relations; where every thing being certainly what it appears to be, definitions and axioms arise from mere intuition. Here syllogism takes up the process from the beginning; and by a sublime intellectual motion advances from the simplest axioms to the most complicated speculations, and exhibits truth springing out of its first and purest elements, and spreading on all sides into a system of science. As each step in the progress is syllogistic, we shall endeavour to explain the use and application of syllogisms in this species of reasoning.

We have seen, that in all the different appearances they put on, we still arrive at a just and legitimate conclusion; now it often happens, that the conclusion of one syllogism becomes a previous proposition in another; by which means great numbers of them are sometimes linked together in a series, and truths are made to follow one another in a train. And as in such a concatenation of syllogisms all the various ways of reasoning that are truly conclusive may be with safety introduced; hence it is plain, that in deducing any truth from its first principles, especially where it lies at a considerable distance from them, we are at liberty to combine all the several kinds of syllogisms above explained, according as they are found best to suit the end and purpose of our inquiries. When a proposition is thus, by means of syllogisms, collected from others more evident and known, it is said to be proved; so that we may in the general define the proof of a proposition to be a syllogism, or series of syllogisms, collecting that proposition from known and evident truths. But more particularly, if the syllogisms of which the proofs consist admit of no premisses but definitions, self-evident truths, and propositions already established, then is the argument so constituted called a demonstration; whereby it appears that demonstrations are ultimately founded on definitions and self-evident propositions.

II. All syllogisms whatsoever, whether compound, all syllogisms whatsoever are reducible to syllogisms in some one of the four figures. But this is reducible to nothing at all. Syllogisms of the first figure, in particular, admit of all possible conclusions; that is, any proposition whatsoever, whether an universal affirmative or universal negative, a particular affirmative or particular negative, which fourfold division embraces all their varieties; any one of these may be inferred by virtue of some syllogism in the first figure. By this means it happens that the syllogisms of all the other figures are reducible also to syllogisms of the first figure, and may be considered as standing on the same foundation with them. We cannot here demonstrate and explain the manner of this reduction, because it would too much swell the bulk of this treatise. It is enough to take notice that the thing is universally known and allowed among logicians, to whose writings we refer such as desire farther satisfaction in this matter. This then being laid down, it is plain that any demonstration whatsoever may be considered as composed of a series of syllogisms, all in the first figure. For, since all the syllogisms that enter the demonstration are reducible to syllogisms of some one of the four figures; and since the syllogisms of all the other figures are farther reducible to syllogisms of the first figure, it is evident that the whole demonstration may be resolved into a series of these last syllogisms. Let us now, if possible, discover the ground upon which the conclusion rests in syllogisms of the first figure; because, by so doing, we shall come at an universal principle of certainty, whence the evidence of all demonstrations in all their parts may be ultimately derived.

III. The rules then of the first figure are briefly these. The middle term is the subject of the major proposition, and the predicate of the minor. The major is always an universal proposition and the minor always affirmative. Let us now see what effect these rules will have in reasoning. The major is an universal proposition of which the middle term is the subject, standing the ruggedness of its style, has so much real merit as a system of logic, that it cannot be too diligently studied by the young inquirer who wishes to travel by the straight road to the temple of Science.
of subject, and the predicate of the conclusion the predicate.

Hence it appears, that in the major the predicate of the conclusion is always affirmed or denied universally of the middle term. Again, the minor is an affirmative proposition, whereof the subject of the conclusion is the subject, and the middle term the predicate. Here then the middle term is affirmed of the subject of the conclusion; that is, the subject of the conclusion is affirmed to be comprehended under, or to make a part of, the middle term. Thus then we see what is done in the premises of a syllogism of the first figure. The predicate of the conclusion is universally affirmed or denied of some idea. The subject of the conclusion is affirmed to be or to make a part of that idea. Hence it naturally and unavoidably follows, that the predicate of the conclusion ought to be affirmed or denied of the subject. To illustrate this by an example, we shall resume one of the syllogisms of the first chapter.

"Every creature possessed of reason and liberty is accountable for his actions;"

"Man is a creature possessed of reason and liberty;"

"Therefore man is accountable for his actions."

Here, in the first proposition, the predicate of the conclusion accountableness, is affirmed of all creatures that have reason and liberty. Again, in the second proposition, man, the subject of the conclusion, is affirmed to be or to make a part of this class of creatures. Hence the conclusion necessarily and unavoidably follows, viz. that man is accountable for his actions; because, if reason and liberty be that which constitutes a creature accountable, and man has reason and liberty, it is plain he has that which constitutes him accountable. In like manner, where the major is a negative proposition, or denies the predicate of the conclusion universally of the middle term, as the minor always asserts the subject of the conclusion to be or make a part of that middle term, it is no less evident that the predicate of the conclusion ought in this case to be denied of the subject. So that the ground of reasoning, in all syllogisms of the first figure, is manifestly this: "Whatever may be affirmed universally of any idea, may be affirmed of every or any number of particulars comprehended under that idea." And again: "Whatever may be denied universally of any idea, may be in like manner denied of every or any number of its individuals." These two propositions are called by logicians the dictum de omni, and dictum de nullo; and are indeed the great principles of syllogistic reasoning, inasmuch as all conclusions whatsoever rest immediately upon them, or upon propositions deduced from them. But what adds greatly to their value is, that they are really self-evident truths, and such as we cannot gainsay without running into an express contradiction. "To affirm, for instance, that no man is perfect, and yet argue that some men are perfect; or to say that all men are mortal, and yet that some men are not mortal, is to assert a thing to be and not to be at the same time.

IV. And now we may affirm, that, in all syllogisms of the first figure, if the premises are true, the conclusion must needs be true. If it be true that the predicate of the conclusion, whether affirmative or negative, agree universally to some idea; and if it be also true that the subject of the conclusion is a part of or comprehended under that idea; then it necessarily follows, that the predicate of the conclusion agrees also to the subject. For to assert the contrary, would be to run counter to some one of the two principles before established; that is, it would be to maintain an evident contradiction. And thus we are come, at last to the point we have been all along endeavouring to establish; namely, that every proposition which can be demonstrated is necessarily true. For as every demonstration may be resolved into a series of syllogisms all in the first figure; and as in any one of these syllogisms, if the premises are true, the conclusion must needs be so too; it evidently follows, that if all the several premises are true, all the several conclusions are so, and consequently the conclusion also of the last syllogism, which is always the proposition to be demonstrated. Now that all the premises of a demonstration are true, will easily appear from the very nature and definition of that form of reasoning. A demonstration, as we have said, is a series of syllogisms, all whose premises are either definitions, self-evident truths, or propositions already established. Definitions are identical propositions, wherein we connect the description of an idea with the name by which we choose to have that idea called, and therefore as to their truth there can be no dispute. Self-evident propositions appear true of themselves, and leave no doubt or uncertainty in the mind. Propositions, before established, are no other than conclusions gained by one or more steps from definitions and self-evident principles, that is, from true premises, and therefore must needs be true. Whence all the previous propositions of a demonstration being, we see, manifestly true; the last conclusion, or proposition to be demonstrated, must be so too. So that demonstration not only leads to certain truth, but we have here also a clear view of the ground and foundation of that certainty. For as, in demonstrating, we may be said to do nothing more than combine a series of syllogisms together, all resting on the same bottom; it is plain that one uniform ground of certainty runs through the whole, and that the conclusions are everywhere built upon some one of the two principles before established, as the foundation of all our reasoning. These two principles are easily reduced into one, and may be expressed thus: "Whatever predicate, whether affirmative or negative, agrees universally to any idea; the same must needs agree to every or any number of individuals comprehended under that idea." And thus at length we have, according to our first design, reduced the certainty of demonstration to one simple and universal principle; which carries its own evidence along with it, and which is indeed the ultimate foundation of all syllogistic reasoning.

V. Demonstration therefore serving as an infallible guide to truth and certainty.

The rules of logic furnish a sufficient basis, we may now venture to assert, that the rules of logic furnish a sufficient criterion for the distinguishing between truth and falsehood. For since distinguishing every proposition that can be demonstrated is necessarily true, he is able to distinguish truth from falsehood; and falsehood who can with certainty judge when a proposition is truly demonstrated. Now, a demonstration is, as we have said, nothing more than a concatenation of syllogisms, all whose premises are definitions, self-evident.
To judge therefore of the validity of a demonstration, we must be able to distinguish whether the definitions that enter it are genuine, and truly descriptive of the ideas they are meant to exhibit: whether the propositions assumed without proofs as intuitive truths have really that self-evidence to which they lay claim: whether the syllogisms are drawn up in due form, and agreeable to the laws of argumentation: in fine, whether they are combined together in a just and orderly manner, so that no demonstrable propositions serve anywhere as premises unless they are conclusions of previous syllogisms. Now, it is the business of logic, in explaining the several operations of the mind, fully to instruct us in all these points. It teaches the nature and end of definitions, and lays down the rules by which they ought to be framed. It unfolds the several species of propositions, and distinguishes the self-evident from the demonstrable. It delineates also the different forms of syllogisms, and explains the laws of argumentation proper to each. In fine, it describes the manner of combining syllogisms, so as that they may form a train of reasoning, and lead to the successive discovery of truth. The precepts of logic, therefore, as they enable us to judge with certainty when a proposition is duly demonstrated, furnish a sure criterion for the distinguishing between truth and falsehood.

VI. Perhaps it may be objected, that demonstration is a thing very rare and uncommon, as being the prerogative of but a few sciences, and therefore the criterion here given can be of no great use. But wherever, by the bare contemplation of our ideas, truth is discoverable, there also demonstration may be attained. Now that is an abundantly sufficient criterion which enables us to judge with certainty in all cases where the knowledge of truth comes within our reach; for with discoveries, that lie beyond the limits of the human mind, we have, properly, no business or concernment. When a proposition is demonstrated, we are certain of its truth. When, on the contrary, our ideas are such as have no visible connection or repugnance, and therefore furnish not the proper means of tracing their agreement or disagreement, there we are sure that scientific knowledge is not attainable. But where there is some foundation of reasoning, which yet amounts not to the full evidence of demonstration, there the precepts of logic, by teaching us to determine aight of the degree of proof, and of what is still wanting to render it full and complete, enable us to make a due estimate of the measures of probability, and to proportion our assent to the grounds on which the proposition stands. And this is all we can possibly arrive at, or even so much as hope for, in the exercise of faculties so imperfect and limited as ours.

VII. Before we conclude this chapter, it may not be improper to take notice of the distinction of demonstration into direct and indirect. A direct demonstration is, when, beginning with definitions, self-evident propositions, or known and allowed truths, we form a train of syllogisms, and combine them in an orderly manner, continuing the series through a variety of successive steps, until at last we arrive at a syllogism whose conclusion is the proposition to be demonstrated. Proofs of this kind leave no doubt or uncertainty behind them; because, all the several premises being true, the conclusions must be so too, and of course the last conclusion or proposition to be proved. The other species of demonstration is the indirect, or, as it is sometimes called, the apagogical. The manner of proceeding here is, by assuming a proposition which directly contradicts that we mean to demonstrate; and thence, by a continued train of reasoning, in the way of a direct demonstration, deducing some absurdity or manifest untruth. For hereupon we conclude, that the proposition assumed was false; and thence again, by an immediate consequence, that the proposition to be demonstrated is true. Thus Euclid, in his third book, being to demonstrate that circles which touch one another inwardly have not the same centre, assumes the direct contrary to this, viz. that they have the same centre; and thence, by an evident train of reasoning, proves that a part is equal to the whole. The supposition therefore leading to this absurdity he concludes to be false, viz. that circles touching one another inwardly have the same centre; and thence again immediately infers, that they have not the same centre.

VIII. Now, because this manner of demonstration is ground of reasoning; we shall therefore endeavour to show, that it is equally with the other leads to truth and certainty.

Two propositions are said to be contradictory of one another, when that which is asserted to be in the one is asserted not to be in the other. Thus the propositions, Circles that touch one another inwardly have the same centre, and Circles that touch one another inwardly have not the same centre, are contradictories, because the second asserts the direct contrary of what is asserted in the first. Now, in all contradictory propositions, this holds universally, That one of them is necessarily true, and the other necessarily false. For if it be true, that circles which touch one another inwardly have not the same centre; it is unavoidably false that they have the same centre. On the other hand, if it be false that they have the same centre, it is necessarily true that they have not the same centre. Since therefore it is impossible for them to be both true or both false at the same time, it unavoidably follows, that one is necessarily true, and the other necessarily false. This then being allowed, which is indeed self-evident; if any two contradictory propositions are assumed, and one of them can by a clear train of reasoning be demonstrated to be false, it necessarily follows that the other is true. For as the one is necessarily true, and the other necessarily false; when we come to discover which is the false proposition, we thereby also know the other to be true.

IX. Now this is precisely the manner of an indirect demonstration, as is evident from the account given of it above. For there we assume a proposition which directly contradicts that we mean to demonstrate; and, having by a continued series of proofs shown it to be false, thence infer that it is contradictory, or the proposition to be demonstrated is true. As, therefore, this last conclusion is certain and unavoidable, let us next inquire after what manner we come to be satisfied of the falsehood of the assumed proposition, that so no possible doubt may remain as to the force and validity of demonstration of this kind. The manner then is plainly this: Beginning with the assumed proposition,
Of Method, we, by the help of definitions, self-evident truths, or propositions already established, continue a series of reasoning, in the way of a direct demonstration, until at length we arrive at some absurdity or known falsehood. Thus Euclid, in the example before mentioned, from the supposition that circles touching one another inwardly have the same centre, deduces that a part is equal to the whole. Since, therefore, by a due and orderly process of reasoning, we come at last to a false conclusion; it is manifest, that all the premises cannot be true: for, were all the premises true, the last conclusion must be so too, by what has been before demonstrated. Now, as to all the other premises made use of in the course of reasoning, they are manifest and known truths by supposition, as being either definitions, self-evident propositions, or truths previously established. The assumed proposition is that only as to which any doubt or uncertainty remains. That alone, therefore, can be false; and indeed, from what has been already shown, must necessarily be so. And thus we see, that in indirect demonstrations, two contradictory propositions being laid down, one of which is demonstrated to be false, the other, which is always the proposition to be proved, must necessarily be true; so that here, as well as in the direct way of proof, we arrive at a clear and satisfactory knowledge of truth.

X. This is universally the method of reasoning in all apologetical or direct demonstrations. But if any proposition is assumed, from which, in a direct train of reasoning, we can deduce its contradictory; the proposition so assumed is false, and the contradictory one true. For if we suppose the assumed proposition to be true, then, since all the other premises that enter the demonstration are also true, we shall have a series of reasoning consisting wholly of true premises; whence the last conclusion or contradictory of the assumed proposition must be true likewise; so that by this means we should have two contradictory propositions both true at the same time, which is manifestly impossible. The assumed proposition, therefore, whence this absurdity flows, must necessarily be false; and consequently its contradictory, which is here the proposition deduced from it, must be true. If then any proposition is proposed to be demonstrated, and we assume the contradictory of that proposition, and thence directly infer the proposition to be demonstrated; by this very means we know that the proposition so inferred is true. For, since from an assumed proposition we have deduced its contradictory, we are thereby certain that the assumed proposition is false; and if so, then its contradictory, or that deduced from it, which in this case is the same with the proposition to be demonstrated, must be true.

PART IV. OF METHOD.

WE have now done with the three first operations of the mind, whose office it is to search after truth, and enlarge the bounds of human knowledge. There is yet a fourth, which regards the disposal and arrangement of our thoughts, when we endeavour so to put them together as that their mutual connexion and dependence may be clearly seen. This is what logicians called Method, and place always the last in order in explaining the powers of the understanding; because it necessarily supposes a previous exercise of our other faculties, and some progress made in knowledge before we can exert it in any extensive degree.

II. In
LOGIC.

Part IV.

II. In this view, it is plain that we must be beforehand well acquainted with the truths we are to combine together; otherwise, how could we discern their several connections and relations, or so dispose of them as their mutual dependence may require? But it often happens, that the understanding is employed, not in the arrangement and composition of known truths, but in the search and discovery of such as are unknown. And here the manner of proceeding is very different. We assemble at once our whole store of knowledge relating to any subject, and, after a general survey of things, begin with examining them separately and by parts. Hence it comes to pass, that whereas, at our first setting out, we were acquainted only with some of the grand strokes and outlines of truth; by thus purging her through several windings and recesses, we gradually discover those more inward and finer touches whence she derives all her strength, symmetry, and beauty. And here it is, that when, by a narrow scrutiny into things, we have unravelled any part of knowledge, and traced it to its first and original principles, insomuch that the whole frame and contexture of it lies open to the view of the mind; here it is that, taking it the contrary way, and beginning with these principles, we can so adjust and put together the parts as the order and method of science require.

III. But as these things are best understood when illustrated by examples, let us suppose any machine, for instance a watch, presented to us, whose structure and composition we are as yet unacquainted with, but want, if possible, to discover. The manner of proceeding, in this case, is, by taking the whole to pieces, and examining the parts separately, one after another. When, by such a scrutiny, we have thoroughly informed ourselves of the frame and contexture of each, we then compare them together, in order to judge of their mutual action and influence. By this means we gradually trace out the inward make and composition of the whole, and come at length to discern how parts of such a form, and so put together as we found in unravelling and taking them asunder, constitute that particular machine called a watch, and contribute to all the several motions and phenomena observable in it. This discovery being made, we can take things the contrary way, and, beginning with the parts, so dispose and connect them as their several uses and structures require, until at length we arrive at the whole itself, from the unravelling of which those parts resulted.

IV. And as it is in tracing and examining the works of art so is it, in a great measure, in unfolding any part of human knowledge: for the relations and mutual habitudes of things do not always immediately appear upon comparing them one with another. Hence we have recourse to intermediate ideas; and, by means of them, are furnished with those previous propositions that lead to the conclusion we are in quest of. And if it so happens that the previous propositions themselves are not sufficiently evident, we endeavour, by new middle terms, to ascertain their truth; still tracing things backward, in a continual series, until at length we arrive at some syllogism where the premises are first and self-evident principles. This done, we become perfectly satisfied as to the truth of all the conclusions we have passed through, inasmuch as they are now seen to stand upon the firm and immovable foundation of our intuitive perceptions. And as we arrived at this certainty by tracing things backward to the original principles whence they flow; so may we at any time renew it by a direct contrary process, if, beginning with these principles, we carry the train of our thoughts forward, until they lead us, by a connected chain of proofs, to the very last conclusion of the series.

V. Hence it appears, that, in disposing and putting together our thoughts, either for our own use, that is, to analytic discoveries we have made, or at all times lie open to the review of the mind, or where we mean to communicate and unfold the discoveries to others, there are two ways of proceeding equally within our choice: for we may so propose the truths relating to any part of knowledge, as they presented themselves to the mind in the manner of investigation; carrying on the series of proofs, in a reverse order, until they at last terminate in first principles; or, beginning with these principles, we may take the contrary way, and from them deduce, by a direct train of reasoning, all the several propositions we want to establish. This diversity in the manner of arranging our thoughts gives rise to the twofold division of method established among logicians: for method, according to their use of the word, is nothing else but the order and disposition of our thoughts relating to any subject. When truths are so proposed and put together as they were or might have been discovered, this is called the analytic method, or the method of resolution; insomuch as it traces things backward to their source, and resolves knowledge into its first and original principles. When, on the other hand, they are deduced from these principles, and connected according to their mutual dependence, insomuch that the truths first in order tend always to the demonstration of those that follow; this constitutes what we call the synthetic method, or method of composition. For here we proceed by gathering together the several scattered parts of knowledge, and combining them into one whole or system, in such manner that the understanding is enabled distinctly to follow truth through all her different stages and gradations.

VI. There is this farther to be taken notice of, in relation to these two species of method; that the first otherwise has also obtained the name of the method of invention, the method of invention, and the method of doctrine or instruction; inasmuch as in laying our thoughts before others, we generally choose to proceed in the synthetic manner, deducing them from their first principles. For we are to observe, that although there is great pleasure in pursuing truth in the method of investigation, because it places us in the condition of the inventor, and shows the particular train and process of thinking by which he arrived at his discoveries; yet it is not so well accommodated to the purposes of evidence and conviction. For, at our first setting out, we are commonly unable to divine where the analysis will lead us; insomuch that our searches are for some time little better than a mere groping in the dark. And even after light begins to break in upon us, we are still obliged to many reviews,
Part IV. LOGIC

LOGIC, and a frequent comparison of the several steps of the investigation among themselves. Nay, when we have unravelled the whole, and reached the very foundation on which our discoveries stand, all our certainty, in regard to their truth, will be found in a great measure to arise from that connexion we are now able to discern between them and first principles, taken in the order of composition. But in the synthetic manner of disposing our thoughts, the case is quite different: for as we here begin with the intuitive truths, and advance by regular deductions from them, every step of the procedure brings evidence and conviction along with it; so that, in our progress from one part of knowledge to another, we have always a clear perception of the ground on which our asent rests. In communicating therefore our discoveries to others, this method is apparently to be chosen, as it wonderfully improves and enlightens the understanding, and leads to an immediate perception of truth.

VII. The logic which for so many ages kept possession of the schools, and was deemed the most important of the sciences, has long been condemned as a mere art of wrangling, of very little use in the pursuit of truth. Attempts have been made to restore it to credit, but without success; and of late years little or no attention whatever has been paid to the art of reasoning in the course of that which is called a liberal education. As both extremes may be faulty, it should seem that we cannot conclude this short treatise more properly than with the following

REFLECTIONS ON THE UTILITY OF LOGIC.

If Aristotle was not the inventor of logic, he was certainly the prince of logicians. The whole theory of syllogisms he claims as his own, and as the fruit of much time and labour; and it is universally known, that the later writers on the art have borrowed their materials almost entirely from his Organon and Porphyry's Introduction. But after men had laboured near 2000 years in search of truth by the help of syllogisms, Lord Bacon proposed the method of induction, as a more effectual engine for that purpose; and since his days the art of logic has gradually fallen into disrepute.

To this consequence many causes contributed. The art of syllogism is admirably calculated for wrangling; and by the schoolmen it was employed with too much success, to keep in countenance the absurdities of the Romish church. Under their management it produced numberless disputes, and numberless sects, who fought against each other with much animosity without gaining or losing ground; but it did nothing considerable for the benefit of human life, whilst the method of induction has improved arts and increased knowledge. It is no wonder, therefore, that the excessive admiration of Aristotle, which continued for so many ages, should end in an undue contempt: and that the high esteem of logic, as the grand engine of science, should at last make way for too unfavourable an opinion, which seems now prevalent, of its being unworthy of a place in a liberal education. Men rarely leave one extreme without running into the contrary: Those who think according to the fashion, will be as prone to go into the present extreme as their grandfathers were to go into the former; and even they who

Vol. XII. Part I.
LOGIC.

Part IV.

Of the Method of science which gives such scope to long and accurate trains of reasoning, or in which there is so little room for authority or prejudice of any kind to give a false bias to the judgment. When a youth of moderate parts begins to study Euclid, every thing is new to him: His apprehension is unsteady; his judgment is feeble, and rests partly upon the evidence of the thing, and partly upon the authority of his teacher. But every time he goes over the definitions, the axioms, the elementary propositions, more light breaks in upon him; and as he advances, the road of demonstration becomes smooth and easy; he can walk in it firmly, and take wider steps, till at last he acquires the habit not only of understanding a demonstration, but of discovering and demonstrating mathematical truths.

It must indeed be confessed, that a man without the rules of logic may acquire a habit of reasoning justly in mathematics, and perhaps in any other science. Good sense, good examples, and assiduous exercise, may bring a man to reason justly and acutely in his own profession without rules. But whoever thinks, that from this concession he may infer the inutility of logic, betrays by this inference a great want of that art; for he might as well infer, because a man may go from Edinburgh to London by the way of Paris, that therefore any other road is useless.

There is perhaps no art which may not be acquired, in a very considerable degree, by example and practice, without reducing it to rules. But practice joined with rules may carry a man forward in his art farther and more quickly than practice without rules.—Every ingenious artist knows the utility of having his art reduced to rules, and thereby made a science. By rules he is enlightened in his practice, and works with more assurance. They enable him sometimes to correct his own errors, and often to detect the errors of others; and he finds them of great use to confirm his judgment, to justify what is right, and to condemn what is wrong. Now mathematics are the noblest praxis of logic. Through them we may perceive how the stated forms of syllogism are exemplified in one subject, namely the predicament of quantity; and by marking the force of these forms, as they are there applied, we may be enabled to apply them of ourselves elsewhere. Whoever, therefore, will study mathematics with this view, will become not only by mathematics a more expert logician, and by logic a more rational mathematician, but a wiser philosopher, and an acuter reasoner, in all the possible subjects either of science or deliberation. But when mathematics, instead of being applied to this excellent purpose, are used not to exemplify logic, but to supply its place, no wonder if logic fall into contempt; and if mathematics, instead of furthering science, become in fact an obstacle. For when men, knowing nothing of that reasoning which is universal, come to attach themselves for years to a single species, a species wholly involved in lines and numbers, the mind becomes incapacitated for reasoning at large, and especially in the search of moral truth. The object of mathematics is demonstration; and whatever in that science is not demonstration, is nothing, or at least below the sublime inquirer's regard. Probability, through its almost infinite degrees, from simple ignorance up to absolute certainty, is the terra incognita of the mathematician. And yet here it is that the great business of the human mind is carried on in the search of all the important truths which concern us as reasonable beings. And here too it is that all its vigour is exerted: for to proportion the assent to the probability accompanying every varying degree of moral evidence, requires the most enlarged and sovereign exercise of reason.

In reasonings of this kind, will any man pretend that it is of no use to be well acquainted with the various powers of the mind by which we reason? Is it of no use to resolve the various kinds of reasoning into their simple elements; and to discover, as far as we are able, the rules by which these elements are combined in judging and in reasoning? Is it of no use to mark the various fallacies in reasoning, by which even the most ingenious men have been led into error? It must surely betray great want of understanding to think these things useless or unimportant. Now these are the things which logicians have attempted; and which they have executed—not indeed so completely as to leave no room for improvement, but in such a manner as to give very considerable aid to our reasoning powers. That the principles they have laid down with regard to definition and division, with regard to the conversion and opposition of propositions, and the general rules of reasoning, are not without use, is sufficiently apparent from the blunders committed daily by those who disdain any acquaintance with them.

Although the art of categorical syllogism is confessedly little fitted for the discovery of unknown truth, it may yet be employed to excellent purposes, as it is the most compendious method of detecting a fallacy. A man in quest of unknown truths must generally proceed by the way of induction, from effects to causes; but he who as a teacher is inculcating any system upon others, begins with one or more self-evident truths, and proceeds in the way of demonstration, to the conclusion which he wishes to establish. Now every demonstration, as has been already observed, may be reduced into a series of syllogisms, of which the conclusion of the preceding always enters into the premises of that which follows: and if the first principles be clear and evident, and every syllogism in some legitimate mode and figure, the conclusion of the whole must infallibly be admitted. But when the demonstration is thus broken into parts; if we find that the conclusion of one syllogism will not, without altering the meaning of the terms, enter legitimately into the premises of that which should immediately follow; or, supposing it to make one of the premises of a new syllogism, if we find that the conclusion resulting from the whole series thus obtained, is different from that of the demonstration; we may, in either of these cases, rest assured that the author's reasoning is fallacious, and leads to error; and that if it carried an appearance of conviction before it was thus resolved into its elementary parts, it must have been owing to the inability of the mind to comprehend at once a long train of arguments. Whoever wishes to see the syllogistic art employed for this purpose, and to be convinced of the truth of what we have said respecting its utility, may consult the excellent writer recommended by Locke, who, in places innumerable of his incomparable book, has, without pedantry, even in that pedantic age, made the happiest application of the rules of
LOGISTÆ, certain officers at Athens, in number ten, whose business consisted in receiving and passing the accounts of magistrates when they went out of office. The logiste were elected by lot, and had ten euthyni or auditors of accounts under them.

LOGOGRAPHY, a new method of printing, in which the types, instead of answering only to single letters, are made to correspond to whole words.

This method, though seemingly a retrograde procession in the printing art, has lately obtained the sanction of his majesty's patent, and has for some time been actually put in execution in the way of trade, apparently with advantage to the proprietors. In the year 1753, a treatise upon this subject appeared by Henry Johnson, in which the origin as well as the utility of the art are fully laid down, and the matter set forth in such a light as can scarce allow us to doubt that it is an improvement in the art. Mr Johnson informs us, that about five years before, viz. in the year 1778, intending to publish a daily list of blanks and prizes in the lottery numerically arranged, he found it could not be accomplished in time by the ordinary way of printing. On this account he procured types of two, three, or more figures as was necessary for this purpose; and thus any entire number might as readily be taken up as if it had been a single type. His next attempt was in forming some large mercantile tables of pounds, shillings, pence, and farthings. For these he procured types expressive of any sum of money ready composed and united, "by which (says he) every species of figure-printing could be performed for the tenth part of the cost, printers always charging it double the price of letter-printing." Having thus succeeded to his wish in his two first attempts, he next began to consider if the method could not be applied to words; and in this also the success was equal.

The properties of the logographic art according to our author, are: 1. That the compositor shall have less charged upon his memory than in the common way. 2. It is much less liable to error. 3. The type of each word is as easily laid hold of as that of a single letter. 4. The decomposition is much more readily performed, even by the merest novices, than they now decompose letters. 5. No extraordinary expense nor greater number of types is required in the logographic than in the common method of printing.

The first of these positions is proved by our author in the following manner. In the common method, the compositor has 150 divisions to which there is no reference, and the printing offices are not agreed with respect to the mode of placing their boxes; "but under this improvement he has only to know the letters of the alphabet, and is assisted with an index of them, insomuch that the simplicity of the latter Logograph-
of 20 newspapers, the Spectator, and Common Prayer- 
book. The method was, by procuring duplicates of 
every sheet, so that each alternate side might be pasted 
over with white paper, in order to leave the whole of 
the words on both sides perfect; and thus the whole 
might be touched with less danger of injury than other-
wise could have been done. The confusion arising 
from the parts of other words being seen from the 
outside side was likewise prevented.

3. The words, being separately cut out, were then 
put into a case marked with the divisions from one to 
16, according to the number of letters contained in 
each word. Thus several letters were distinctly col-
clected; and then each separate parcel sorted in a case 
containing 26 divisions, marked with the letters of 
the alphabet, according to the commenceing letter of 
the word; and thus all the words were ranged al-
phabetically, consisting of two, three, four, or five letters, 
in separate parcels.

4. The same words were then placed together, and 
pasted into an alphabet, with the number of times 
marked to each that had occurred on the whole; that 
in this manner a proportion might be determined how 
many times particular words ought to be repeated for 
the printing of one sheet, and also to know what 
words are in general use: There are likewise a num-
er of technical terms, and favourite phrases, a great 
number of times repeated almost by every author; but 
though these occur throughout the whole book in 
great proportion to the rest, no more of them will be 
necessary than what suffice for a single sheet.

5. The whole of the above might be done without 
the trouble just mentioned, by posting every word at 
time into a triformed alphabet; because the subdivi-
sions of the second and third commenceing letter of 
each word for references are now obtained, and thus 
can easily be placed in its proper division, and may 
be marked as often as it occurs, without repeating the 
same word; whereas we plainly see the ease and expedi-
tion of it, from the facility and expedition of posting 
every word from a leaf in any book. Before such sub-
divisions were known, they could only have been placed 
under the first commenceing letter of the word; which 
would cause such a multiplicity of repetitions, 
that it would take up more time, be far more liable 
to error, and require more subordinate postings to 
bring them into arrangement; so that they may be 
found more easily than by the above proceeding. 
Thus also a collection will be obtained of single and 
double words, which are constantly required from 20 to 
400 or 500 times in the printing of one sheet of any work 
whatever; and which alone would abridge the compro-
sitor's work near one-third. This second process like-
ewise enabled the author to reject, out of the first col-
collection, obsolete words, technical terms, &c. which 
reduces the original collection to one-fifth part.

6. By proceeding in this manner, several species of 
words are omitted in the founts. 1. Obsolete words; 
because they occur so seldom, that the difference of 
time lost in composing them in the ordinary method 
would be imperceptible. 2. Technical terms, names 
of places, animals, &c.; though, for any particular 
work, the terms peculiar to it may be added to the 
fount in a biformed alphabet apart. 3. Real com-
pounds, or words that may be compounded of others,
are also rejected; because we actually have the words 
already, and they may be joined with sufficient expedi-
tion, though the spaces are annexed to each, by 
being constructed accordingly. 4. Those of the same 
spelling are likewise omitted, though they bear differ-
ent significations, for obvious reasons.

7. The variation of tenses, degrees of comparison, 
and numerous words in the English language, having 
general, the same terminations, such as ed, ing, ly, 
ment, ness, &c. an alphabet may be formed of such 
a kind as is capable of being annexed to the abso-
olute words or radices, and expeditiously, as the whole 
word could be found in the fount, from its being 
thereby so much less extended. Thus, by dividing se-
veral words into their radices and terminations, many 
other words may be formed from their radix by the ad-
dition of various terminations, and each termination 
may be added to other radices to which they are ap-
licable.

8. Some radices are imperfect, viz. such as end with 
the vowel e, which must therefore be added in the usual 
way of composition. Thus, in the word adore, the ra-
dix is ad, to which the terminations es, ed, est, eth, 
es, ing, may be added occasionally.

9. By rejecting also the words which come under this 
last denomination, the number necessary for a fount is 
reduced to one-tenth of what it would otherwise be, as 
will appear evident from the following considerations: 
1st. There are at least 42 verbs, the infinitive of which 
ends in -fy; as qualify, signify; the radices of which 
are seek, sign; the terminations are, ifes, ifed, ifing, 
&c. And Mr Johnson informs us, that by applying 
these radices to other terminations, he was enabled to 
dispense with more than 500 words which would other-
wise have been necessary. 2nd. For all regular verbs, no 
more than six terminations are necessary, viz. s, est, eth, 
ed, es, ing. There are but few irregular ones in the 
English language; whence it happens that 12 or 14 
words may be formed from one single perfect verb as a ra-
dix, and many imperfect ones save double that num-
ber.

10. By using only the set of terminations which 
may be contained in a box of two feet square, the 
common operation of printing would be shortened nearly 
one half; and in order to find out those which are most in use, and fittest to retain, our author digested 
them alphabetically, with the radices, words, or syl-
lables, which make complete words annexed to them. 
Thus,

```
tain | abs—apper—ascer
  s   | de—dit—con
  ed  | cen—cap—cur
  ing | enter—main—re—sus, &c.
  ment
```

11. Thus it will be found, that out of more than 
100,000 words of which the English language consists, 
there will not be wanted much above 3500 far a com-
plete fount. This will be very evident to any person 
who consults a dictionary. He will there find, that a 
vast number of words require an explanation; whereas 
in any miscellaneous work, there are none but what 
can be understood most readily either together or apart. 
Newspapers retain more of the uncommon kind of words 
than any others. " The vocabulary (says our author) or
LOG [ 165 ]

Logography.

or alphabet as it is called, of the Chinese, consists of above 83,000 letters or characters; yet he is admitted a master of the language who knows about 4000 of them, no more being in general use."

The expedition with which the logographic method of printing can be accomplished, depends essentially on their arrangement; which, from great numbers of experiments, our author found to be best accomplished in the following manner: 1. Words of one, two, or three syllables, are alphabetically placed by themselves, including all possible commencing syllables, by which the compositor cannot fail of finding the word either in whole or in part, let it be what it will; and when the whole cannot be found at once, the same alpha may easily be found in single or double syllables among the terminations. 2. All words above three syllables have the same alphabetical arrangement; the terminations being the same at the bottom of each. Experience shows, that by a very few lessons, the meanest capacity may determine the number of syllables, and refer to the particular case containing words of that number, there being conspicuous references to each; and by thus equalizing them, any person may possess himself very expeditiously of what he wants. Even boys who scarcely knew more than the letters of the alphabet, were hardly a fortnight employed in this method, when they could at the first glance tell the number of letters contained in any word.

By this simplicity of arrangement, any intelligent person, who never composed in his life, by being placed in a room with the apparatus, could compose and print, without other previous instruction than desiring him to remember that the words under three syllables, and those above, but four, were alphabetically disposed in separate alphabets, and that whenever he wants a word, the first letter is seen in capitals of two inches on the walls, the second in letters of one inch in right lines; and where it is necessary to have more columns than one for such second letter, the third is given in red down the column, comprehending about 12 divisions, to contain the types of the word coming under such reference.

To exemplify this method as far as it can be done without actually seeing the apparatus, our author instances the two words Above and Unfortunately. In looking for the former, the first letter, A, is seen upon the wall as already mentioned; the second, B, is on the case under it, and down that column is OVE, opposite to the cell containing the types of the whole word; which would be only three references instead of five with spaces, as in the common method. The other word, viz. Unfortunately, may be found by the same references, though it contains 13 letters; but it admitting that practice will give the word as soon as a single letter, the average will be found eight for one."—Our author's explanation of the method in which this word might be composed, however, seems by no means intelligible.—"For this distinction in the cases (says he), the alphabet, or rather masks of first reference in large characters on the wall, is divided into two classes, not as vowels and consonants, but as follows, viz. A, Con, Dis, E, In, O, P, S, Us, commencing references, the second or subsequent letters of the words being in a right line from left to right, and down each column is found the remainder of the reference to the words, distinguishing always the third letter in red. The second distinction is that for all other commencing letters, the second letter of reference is in a column down, and the third letter in lines from left to right in red.

These are the directions given by our author for forming a fount of words; the next requisite is a fount of syllables, formed in the following method: 1. A complete set of two letters was obtained in all their possible combinations, amounting to 676. 2. Having next obtained the possible combination of these letters, viz. 17576, by retaining only all possible syllables, and words of three letters, it is reduced to the 30th part, which answer all the purposes of composing with syllables of two and three letters, for Latin, French, English, and all names of persons, places, and things, every possible syllable being comprehended among them. Hence it forms an universal triformed alphabet, where English characters are used; from whence all partial bifomed and triformed alphabets in the arrangement of English, French, Latin, and all technical matters, are drawn. Though combinations of four letters are again 26 times the number of those of three letters, and five letters increase in the same ratio; yet as much as all possible combinations increase in quantity proportionate to the number of letters combined, so they decrease in the actual number of syllables included among them, insomuch, that all the syllables of four, five, six, and seven letters together, are considerably fewer than the syllables of three letters only.—Besides the two founts already mentioned, a third was found necessary for such terminations as are most commonly followed by particular punctuations; but after some consideration, this was judged unnecessary.

Our author now proceeds to obviate some objections which most naturally occur to one who first hears of his invention. These are,

1. A single letter damaged in a word renders the whole useless.

This is not denied by Mr. Johnson; but he contends, that the quantity of metal lost in this manner is quite trifling.

2. How are the blanks or spaces in a line to be managed, as these are by no means equal?

To this our author replies, that, at the time of writing the pamphlet, he was untended whether it be most eligible to have spaces cast along with the beginnings of words, or to space them in the common manner. The former would be more expeditions; and where a greater distance is required, other spaces may be introduced in the ordinary method.

3. How is a long word at the end of a line to be divided?

This may be easily accomplished by means of the syllabic fount already mentioned.

4. How is the error of substituting one word for another to be rectified.

The answer to this is, that an error of the kind specified may be corrected in the very same manner as is done in common printing. Long words may be divided by means of the syllabic fount already mentioned, and the intervals between the words may be filled up with spaces as usual.

LOGWOOD. See HEMATOXYLON, BOTANY AND DYEING LISTS.

LOHOCH, or Loch, in Pharmacy, a composition of
LOL

Abel, says that the word Lollard signifies "praising Lollards God," from the German lohen, "to praise," and herr, "Lord," because the Lollards employed themselves in travelling about from place to place, singing psalms and hymns.

Others, much to the same purpose, derive lolthard, lolthard, or lollett, follen, as it was written by the ancient Germans, from the old German word folten, folten, or folten, and the termination hard, with which many of the High Dutch words end. Lollen signifies "to sing with a low voice," and therefore Lollard is a singer, or one who frequently sings; and in the vulgar tongue of the Germans it denotes a person who is continually praising God with a song, or singing hymns to his honour. The Alexians or Cellites were called Lollards, because they were public singers who made it their business to inter the bodies of those who died of the plague, and sang a dirge over them in a mournful and indistinct tone as they carried them to the grave. The name was afterwards assumed by persons that dishonoured it; for we find, among those Lollards who made extraordinary pretences to piety and religion, and spent the greatest part of their time in meditation, prayer, and such acts of piety, there were many abominable hypocrites, who entertained the most ridiculous opinions, and concealed the most enormous vices under the specious mark of this extraordinary profession. And many injurious aspersions were propagated against those who assumed this name by the priests and monks; so that, by degrees, any person who covered heresies or crimes under the appearance of piety, was called a Lollard. Thus the name was used not to denote any one particular sect, but was formerly common to all persons and all sects who were supposed to be guilty of impiety towards God or the church, under an external profession of extraordinary piety. However, many societies consisting both of men and women under the name of Lollards, were formed in most parts of Germany and Flanders, and were supported partly by their manual labours, and partly by the charitable donations of pious persons. The magistrates and inhabitants of the towns where these brethren and sisters resided, gave them particular marks of favour and protection, on account of their great usefulness to the sick and needy. They were thus supported against their malignant rivals, and obtained many papal constitutions by which their institution was confirmed, their persons exempted from the cognizance of the inquisitors, and subjected entirely to the jurisdiction of the bishops; but as these measures were insufficient to secure them from molestation, Charles duke of Burgundy, in the year 1472, obtained a solemn bull from Pope Sixtus IV. ordering that the Cellites or Lollards should be ranked among the religious orders, and delivered from the jurisdiction of the bishops; and Pope Julius II. granted them yet greater privileges in the year 1506. Mohein informs us that many societies of this kind are still subsisting at Cologn, and in the cities of Flanders, though they have evidently departed from their ancient rules.

Lollard and his followers rejected the sacrifice of the mass, extreme unction, and penances for sin; arguing, that Christ's sufferings were sufficient. He is likewise said to have set aside baptism, as a thing of no effect; and repentance, as not absolutely necessary,
In England, the followers of Wickliffe were called, by way of reproach, \textit{Lollards}, from some affinity there was between some of their tenets; though others are of opinion that the English Lollards came from Germany.

They were solemnly condemned by the archbishop of Canterbury and the council of Oxford.

\textbf{Lombard}, \textit{Peter}, well known by the title of \textit{Master of the Sentences}, was born at Novara in Lombardy; but being bred at Paris, he distinguished himself so much at that university, that, he first had the canonry of Chartres conferred upon him, was some time tutor to Philip son of Louis le Gros, and lastly obtained the see of Paris. He died in 1564. His work of the Sentences is looked on as the source of the scholastic theology of the Latin church. He wrote also Commentaries on the Psalms, and on St. Paul's Epistles.

\textbf{Lombards}, a Scandinavian nation, who settled in Italy in the fourth century, and for some time made a considerable figure.

Their name of Lombards, or Longobards, is by some derived from the word \textit{lack}, or \textit{lache}, signifying in the German tongue \textit{winter}; because the Lombards, while in Scandinavia, lived in marshes, or near the sea. Others think that it comes from the two German words \textit{langen harden}, or \textit{helleborden}, that is, from the long halberds they were supposed to use in war. But Paulus Diaconus their historian, and who was himself a Lombard, tells us that they were called \textit{Longobards} from the length of their beards.

A nation called the Lombards is mentioned by Tacitus, Strabo, and Ptolemy; but these are different from the Lombards who afterwards settled in Italy, and are reckoned to be the same with the Gepide, whom the Italian Lombards almost exterminated. The Lombards who settled in Italy are first mentioned by Prosper Aquitanus, bishop of Placidia in the year 350. That writer tells us, that about this time the Lombards, abandoning the most distant coasts of the ocean, and their native country Scandinavia, and seeking for new settlements, as they were overstocked with people at home, first attacked and overcame the Vandals in Germany. They were then headed by two chiefs, Iberus and Aion; who, dying about the year 380, were succeeded by Agil- mund, who is commonly reckoned the first king of the Lombards.

Before the time of Odoacer, the Lombard history affords nothing remarkable; in his time, however, they settled on the Danube, in the country of the Rugians, whom Odoacer had almost totally exterminated or carried into captivity. During their stay in this country, they rendered themselves formidable to the neighbouring nations, and carried on successful wars with the Heruli and Gepide. In 526, they were allowed by the emperor Justinian to settle in Pannonia; and here they made war a second time with the Gepide. Alboinus, the Lombard king, killed the king of the Gepide with his own hand; put his army to the rout, and sent such numbers of them in pieces, that they ceased from that time to be a nation. Having caused the deceased king's head to be cut off, he made a cup of his skull, called in the language of the Lombards schale, which made use of in all public entertainments. However, having taken, among many other captives of great distinction, the last king's daughter, by name Rosamunda, he married her after Alboinus, the death of his former wife Closdivinta, the daughter of Clotaire king of France.

By this victory Alboinus gained such reputation that his friendship was courted by Justinian; and, in consequence of the emperor's application, a body of 6000 Lombards were sent to the assistance of Narses against the Goths. The success of the Romans in this expedition, the invasion of Italy by the Lombards, and their successes in that country, have been taken notice of under the article \textit{ITALY}, No. 28-32. At Alboinus, the last Alboinus, having made himself master of Venetia, Liguria, Æmilia, Etruria, and Umbria, was slain by the treachery of his wife, in the year 573, the fourth at the end of his reign. This princess was the daughter of the instigation of the Gepide, whom Alboinus had killed in battle, and make a cup of his skull, above related.

As he was one day feasting at Verona, with his chief favourites and principal officers, in the height of his mirth he sent for the queen, and, filling the detested cup, commanded her to drink merrily with her father. Rosamunda, struck with horror, hurried out of the room; and highly incensed against her husband for thus barbarously triumphing over the misfortunes of her family, resolved, at all events, to make him pay dear for such an inhuman and affronting conduct. Accordingly, she discovered her intention to Helmi- child the king's shield-bearer, a youth of great boldness and intrepidity. Helmichild peremptorily refused to imbrue his hands in the blood of his sovereign, or to be any way accessory to his death; and in this resolution he persisted, till he was, by a shameful stratagem, forced by the queen to a compliance: for she, knowing that he carried on an intrigue with one of her ladies, placed herself one night in her bed, and receiving the youth, indulged him as if she had been his own mistress in his amorous desires; which she had no sooner done, than discovering herself to the deceived lover, she told him that he must now either put the king to death, or be put to death by him. Helmichild, well apprised, that, after what he had done, his safety depended upon the death of the king, engaged in the treason, which he otherwise abhorred. One day, therefore, while Alboinus was reposing in his chamber after dinner, Helmichild, with some others whom he had made privy to his design, breaking in unexpectedly, fell upon the king with their daggers. Alboinus starting up at their first coming in, laid hold of his sword, which he had always by him; but having in vain attempted to draw it, the queen having beforehand fastened it in the seabbard, he defended himself for some time with a footstool; but was in the end overpowered, and despatched with many wounds.

Rosamunda had promised to Helmichild, that, as soon as he had despatched the king, she would marry him, and, with her person, bestow upon him the kingdom of the Lombards. The first part of her promise she immediately performed; but was so far from being able to bestow the crown upon him, that both of them were obliged to save themselves by flight. They fled to Longinus the exarch of Ravenna, taking with them all the jewels and treasure of the late king. Longinus received her with the greatest marks of friendship and kindness, and assured her of his protection. She had not been long in Ravenna, however, before the exarch, judging
LOM [168]

LOM

Lombars. — Judging that a favourable opportunity now offered of making himself king of Italy by her means, imparted his design to her, and declared his intention to marry her; provided, by some means or other, she despatched Helmichild. — Rosamund, highly pleased with the proposal, resolved to satisfy her ambition by getting rid of the person whom she had married in order to gratify her revenge. Accordingly, having prepared a strong poison, she mixed it with wine, and gave it to her husband as he came out of the bath, and called for drinks, according to his custom. Helmichild had not half emptied the cup, when, by the sudden and strange operation which he felt in his bowels, he concluded what it was; and, with his sword point at the queen’s breast, compelled her to drink the rest. The poison had the same effect on both; for they died in a few hours. Longinus, on the death of the queen, laid aside all thoughts of making himself king of Italy; and sent the king’s treasure to Constantinople, together with Alboinoood, the daughter of Alboin by Rosamund, whom she had brought along with her.

6 Her death. After the death of Alboin, the Lombards chose Clephius, one of the nobility, for their king. He was murdered after a short reign of 18 months, upon which ensued an interregnum of 10 years, as related under the article Italy, No. 32. During this time, they extended their conquests in that country; but at last the Romans, jealous of their progress, resolved to put a stop to their victories, and, if possible, to drive them quite out. For this purpose, they designed not only to employ their own force, but entered into alliance with the Franks; which so alarmed the Lombards that they re-established the monarchical form of government amongst themselves, and chose Asturiano, the son of Clephius, for their king. This monarch, considering that the power of the dukes, who had governed Lombardy for the space of 10 years, was during that length of time very much established, and that they would not probably be willing to part with the authority which they had so long enjoyed, allowed them to continue in their governments; but obliged them to contribute a moiety of their revenues towards the maintenance and support of his royal dignity, suffering them to dispose of the other as they thought proper. He reserved to himself the supreme dominion and authority; and took an oath of the dukes, that in time of war, they would readily assist him to the utmost of their power. Though he could remove the dukes at pleasure, yet he deprived none of them of their dukedoms, except in cases of treason; nor gave them to others, except when their male issue failed. Having settled matters in this manner with the dukes, he enacted several other wholesome laws against debauch, rape, murder, adultery, and other vices which prevailed amongst his subjects, and was the first of the Lombard kings who embraced Christianity. Most of his subjects followed the example of their monarch; but as they were all instructed by Arim bishops, they continued long infected with that heresy; which occasioned great disputes between them and the orthodox bishops of the cities subject to them.

7 Monarchy abolished. From the re-establishment of the monarchy under Asturiano, to the reign of Rothari in 656, the history of the Lombards affords nothing memorable. This period is remarkable for the introduction of written laws among these people. Before his time they had been governed only by tradition; but Rothari, in imitation of the Romans and Goths, undertook the publishing of written laws; and to those which he enacted, many were added by the succeeding princes. Grotius prefers the method which the Lombards followed in making laws, to that which was practised by the Romans themselves. Among the latter the emperor was the sole lawgiver; so that whatever pleased him had the force of a law. But the Lombard kings did not assume that power to themselves, since their laws were enacted in public assemblies, convened for that purpose, after they had been maturely examined and approved of by all the lords of the kingdom. From these assemblies were excluded the ecclesiastic order, and the people; so that the legislative power was lodged in the king and nobles alone.

The reign of Rothari is remarkable, not only for his introducing written laws among his subjects, but for the conquests he made, and the successful wars carried on with the exarch of Ravenna, whom he totally defeated in several engagements, and made himself master of some part of his territories. This monarch died in 652; and the affairs of the Lombards went on prosperously, till the ambition of Luitprand laid the foundation of the total ruin of his kingdom. He ascended the throne of Lombardy in 711, and Luitprand watched all opportunities of enlarging his dominions at the expense of the emperor’s. Of this, a fair opportunity offered in 716: for the emperor Leo Isauricus, who at that time reigned in the east, having, by his famous edict, forbidden the worship of images, and ordered them to be everywhere pulled down, the people were so provoked at this innovation, that, in several places, they openly revolted, and, falling upon the emperor’s officers, drove them out of the cities. In the east, Germanus, patriarch of Constantinople, opposed the emperor’s design with great warmth; but Leo caused him to be deposed, and Anastasius to be raised to that see in his room, ordering at the same time all the images in the imperial city to be pulled down and publicly burnt. He strictly enquired his officers in the west, especially the exarch of Ravenna, to see his edict punctually obeyed in their respective governments. In compliance with these orders, Scholasticus, then exarch, began to pull down the images in all the churches and public places in Ravenna; which incensed the superstitious multitude to such a degree, that taking arms, they openly declared they would rather renounce their allegiance to the emperor than give up the worship of images.

Thus a kind of civil war was being kindled in the city, Lombard thought he had a new and favourable opportunity of making himself master of the seat of the exarch, not doubting but the conquest of such an important place would be followed by that of the whole exarchate. Having therefore drawn together all his forces, he unexpectedly appeared before Ravenna, and laid at last closely besieged it. The exarch little expected such a stroke. Re-
which he took, plundered, and levelled with the
ground. The loss of this place, and the severe treat-
ment the inhabitants met with from the king, threw
the citizens of Ravenna into the utmost consternation;
which Luitprand being informed of, he resolved to
take advantage of their fears, and, returning before
Ravenna while the inhabitants were thus dishearten-
ed, to attempt once more the reduction of that place.
Accordingly he led his whole army against it; and,
by frequent attacks, tired the inhabitants and garri-
sion to such a degree, that the exarch, finding they
could hold out no longer, and despairing of relief,
privately withdrew. Luitprand, informed of his re-
treat, attacked the town with more violence than ever;
and, having carried it by storm, gave it to be plunder-
ed by his soldiers, who found in it an immense booty,
as it had been for a long time the seat of the Roman
emperors, of the Gothic kings, and the exarchs. The
king stripped it of most of its valuable monuments of
antiquity, and caused, amongst the rest, an equestrian
statue of an emperor, of wonderful workmanship, to be
conveyed to Pavia, where it is to be seen to this day.

The reduction of Ravenna was followed by the surren-
der of several cities of the exarchate, which Luitprand
reduced to a dukedom; appointing Hildebrand his
grandson to govern it with the title of duke: and giving
him, as he was yet an infant, Pereaude duke of Vicenza
for his guardian.

The conquest of Ravenna and the greater part of
the exarchate did not a little alarm Gregory II. bi-
shop of Rome. He was then at variance with the
emperor, whose edict against the worshipping of im-
ages he had opposed with all his might, and by that
means provoked Leo to such a degree, that he had
threatened to drive him from the see, and send him into
exile. However, the pope, no less jealous of the
power of the Lombards than all his predecessors had
been, resolved, by some means or other, to put a stop
to their conquests. The only prince in Italy to whom
he could have recourse was Urrus duke of Venice, the
Venetians making already no inconsiderable figure.
To him accordingly, he wrote a very pressing letter;
conjoining him to assist his worthy son the exarch, and,
for the love of the holy faith, to attempt with him
the recovery of the exarchate, which the wicked na-
tion of the Lombards had unjustly taken from his sons
Leo and Constantine emperors. Urrus and the Ve-
etians, moved with the pope's letter, and at the same
time greatly alarmed at the growth of so powerful a
neighbour, promised to assist the exarch with the
whole strength of their republic; and accordingly fitted out
a considerable fleet, pretending it was designed for the
safety of the emperor against the Saracens. At the
same time the exarch, who had taken refuge in Ve-
nice; abandoning that place, as it were in despair of
bringing the duke over to his party, raised, in the
places still subject to the emperor, what forces he was
able; and having got together a considerable body,
he marched with them towards Imola, giving out that
he designed to besiege that city; but turning on a
sudden towards Ravenna, as had been agreed on be-
tween him and the Venetians, he laid siege to it by
land, while they invested it almost at the same instant
by sea. Pereaude defended the town for some time
with great courage and resolution: obliging all those
who were able to bear arms to repair to the walls. But
the Venetians, having, in spite of all opposition, forced
open one of the gates on the side of the sea, the city
was taken, and Pereaude slain, while he was attempt-
ing, at the head of a choice body, to drive the enemy
from the posts they had seized. As for Hildebrand,
he fell into the hands of the Venetians; who, having
thus recovered Ravenna to the emperor, returned home,
leaving the exarch in possession of the city. Luitprand
was then at Pavia; but the town was taken before he
could assemble his troops to relieve it.

And now Gregory, bishop of Rome, to whom the
recovery of Ravenna was chiefly owing, persuading
himself, that the emperor would, out of gratitude,
give ear to his remonstrances and admonitions, began
to solicit him with more pressing letters than ever to
revolve his edict against the worship of images; but
Leo, well apprised that the bishop, in all the mea-
sures he had taken, had been more influenced by a re-
gard to his own interest than to that of the empire,
instead of hearkening to his remonstrances, was still
more provoked against him for thus obstinately oppos-
ing the execution of his edict. Being, therefore,
resolved at all events to have it observed in Rome itself,
and, on the other hand, not doubting but the pope
would oppose it to the last with all his might; in order
to remove all obstacles, he sent three officers to Rome,
with private orders, either to despatch the pope, or to
take him prisoner, and convey him to Constantinople.
At the same time, he wrote to Mauritius duke of
Rome, secretly enjoining him to assist his three officers
in their undertaking: but no favourable opportunity
offering to put their design in execution, the emperor,
in the year 725 recalled Scholasticus, and sent Paul
a patrician into Italy, to govern in his room, with pri-
ivate instructions to encourage the above-mentioned of-
ferers with the promise of great rewards, and to assure
them of his protection.

But, in the mean time, the plot was discovered, and
two of the conspirators were apprehended by the citizens
of Rome, and put to death: the third having escaped
into a monastery, where he took the monastic habit
and ended his days. Hereupon the exarch, in com-
promise with the emperor's orders, resolved to proceed
no longer by secret plots, but by open force. Accord-
ingly, he drew together a considerable body of troops,
and set out at the head of them on his march to Rome,
with a design to seize on the pope, and send him, as he
had engaged to do, in chains to Constantinople. But
Luitprand on this occasion, Luitprand, though highly provoked assisted the
against Gregory for having stirred up the Venetians against
him, yet resolved to assist him and the citizens of Rome against the
exarch. On this occasion, Luitprand, though having been so
provoked against him, yet resolved to assist him and the citizens of Rome
against the exarch. In order to keep the balance even between them, and by assisting sometimes
the one and sometimes the other, weaken both
Pursuant to this resolution, he ordered the Lombards of
Tuscany, and those of the dukedom of Spoleto, to join
the pope and the inhabitants of Rome; who, being
by this reinforcement far superior in strength and num-
ber to the exarch, obliged him to return to Ravenna,
and give over all thoughts of any further attempt on
the person of the pope.

In the mean time, Leo, persisting in his former re-
solution of suppressing throughout his dominions the
worship of images, sent fresh orders to the exarch
Y  Paul,
Paul, strictly enjoining him to cause his edict to be put in execution in all the cities of Italy under his empire, especially in Rome. At the same time, he wrote to the pope, promising him his favour and protection if he complied with the edict; and declaring him, if he continued to oppose it, a rebel, and no longer vested with the papal dignity. But Gregory was so far from yielding to the emperor's threats, or promises, that on the contrary, he solemnly excommunicated the exarch for attempting to put the imperial edict in execution; and at the same time wrote circular letters to the Venetians, to King Lothair, to the Lombard dukes, and to all the chief cities of the empire, exhorting them to continue steadfast in the Catholic faith, and to oppose with all their might such a detestable innovation. These letters made such an impression on the minds of the people in Italy, that though of different interests, and often at war with one another, they all united; protesting they would defend the Catholic faith, and the life of the pope, in so glorious a cause, at the expense of their own; nay, the citizens of Rome, and the inhabitants of Pentapolis, now Marca d'Ancona, not contenting themselves with such a protestation, openly revolted from the emperor; and, pulling down his statues, they elected, by their own authority, magistrates to govern them during the interregnum. We are even told, that, transported with a blind zeal, they were for choosing a new emperor, and conducting him to Constantinople, not doubting but the people would everywhere join them. But the pope, thinking this resolution unseasonable, and not to be easily put in execution, opposed it; so that it did not take place.

In the mean time the exarch Paul, having gained a considerable party in Ravenna, began, pursuant to the repeated orders from the emperor, to remove the images, as so many idols, out of the churches. Here a civil war upon the adverse party, supported and encouraged by the pope, flew to arms; and, falling upon the iconoclasts, or image-breakers, as they styled them, gave rise to a civil war within the walls of Ravenna. Great numbers were killed on both sides: but those who were for the worship of images prevailed in the end, a dreadful slaughter was made of the opposite party, and, among the rest, the exarch himself was murdered. However, the city of Ravenna continued faithful to the emperor; but most of the citizens of Romagna belonging to the exarchate, and all those of Pentapolis or La Marca d'Ancona, absolving the emperor as an heretic, submitted to Lothair king of the Lombards; who, pretending a zeal for the Catholic religion, took care to improve the discontent of the people to his advantage, by representing to them, that they could never maintain their religious rights under a prince, who was not only an heretic, but a persecutor of the orthodox.

In Naples, Exilaratus, duke of that city, having received peremptory orders from the emperor to cause his edict to be put in execution, did all that lay in his power to persuade the people to receive it; but finding all his endeavours thwarted by the bishop of Rome, for whom the Neapolitans had a great veneration, he hired assassins to murder him. But the plot being discovered, though carried on with great secrecy, the Neapolitans, highly provoked against the duke, tore both him and his son to pieces, and likewise put to death one of his chief officers, who had composed a libel against the pope. Lothair, and Gregory at that time duke of Benevento, laying hold of so favourable an opportunity to make themselves masters of the dukedom of Naples, did all that lay in their power to persuade the Neapolitans to submit to them. But the Neapolitans, bearing an irreconcilable hatred to the Lombards, with whom they had been constantly at variance, rejected every overture of that nature with the utmost indignation; and continuing steadfast in their allegiance to Leo, received from Constantinople one Peter, who was sent to govern them in the room of Exilaratus. Some writers suppose the Neapolitans, in this general revolt of the cities of Italy, to have shaken off the yoke with the rest, and to have appointed magistrates of their own election to govern them, in the room of the officers hitherto sent from Constantinople, or named by the exarch: but they are certainly mistaken; it being manifest from history, that Peter succeeded Exilaratus in that dukedom, and that the Neapolitans continued to live under the emperors, till they were conquered many years after by the Normans.

In the mean time, Leo hearing of the murder of the exarch, and the general revolt of the cities, and not doubting but the pope was the chief author of so much mischief, sent the enuch Eutychius into Italy, with the title and authority of exarch, strictly enjoining him to get the pope despatched by some means or other, since his death was absolutely necessary for the tranquillity of Italy. The exarch spared no pains to get the pope into his power: but a messenger, whom he had sent to Rome, being apprehended by the citizens, and an order from the emperor being found upon him to all his officers in that city, commanding them to put the pope to death at all events, the pope's friends thenceforth guarded him with such care, that the exarch's emissaries could never afterwards find an opportunity of executing their design. As for the messenger, the Romans were for putting him to death; but the pope interposed, contenting himself with communicating the exarch.

And now the Romans, provoked more than ever the Theophrastus against Leo; and, on the other hand, unwilling to live under the Lombards, resolved to revolt from the emperor, and appoint their own magistrates, keeping themselves united under the pope, not yet as their prince, but only as their head. This they did accordingly; and from these slender beginnings the sovereignty of the popes in Italy took its rise, though they did not then, as is commonly supposed by historians, but many years after, become sovereign lords of Rome.

Eutychius failed in his design upon the life of the pope; but having brought with him from Constantinople a good number of troops, he easily quelled the rebellion in Ravenna, and severely punished the authors of the late disturbances. As for the rebellious Romans, he was well apprized he could never reduce them, so long as they were supported by the king of the Lombards; and therefore he employed all his art and policy to take off that prince from the party of the Romans, and bringing him over to his own.

Lothair, for some time, withstood all his offers; but
but Thrasimund duke of Spello revolting at this very juncture, the exarch, laying hold of that opportunity, offered to assist the king with all his strength against the rebellious duke, provided he would, in like manner, assist him against the pope and the Romans. With this proposal Luitprand readily closed; and a league being concluded upon these terms between him and the exarch, the two armies joined, and began their march towards Spello. At their approach, the duke, despairing of being able to resist two such powers, came out with a small attendance to meet them, and, throwing himself at the king's feet, sued, in that humble posture, for pardon; which Luitprand not only granted him, but confirmed him in the dukedom, after he had obliged him to take a new oath of allegiance, and give hostages for his fidelity in time to come. From Spello, the two armies marched, in pursuance of the treaty, to Rome; and encamped in the meadows of Nera, between the Tiber and the Vatican.

The pope submits to Luitprand. Gregory had caused the city of Rome to be fortified in the best manner he could; but being sensible that the Romans alone could not long hold out against two such armies, and reflecting on the kind treatment the duke of Spello had met with upon his submitting to the king, he resolved to follow his example: and accordingly, taking with him some of the clergy, and the principal inhabitants of the city, he went to wait on the king in his camp; and there, with a pathetic speech, as he was a great master of eloquence, softened Luitprand to such a degree, that, throwing himself at his feet in the presence of the whole army, he begged pardon for entering into an alliance against him: and, assuring him of his protection for the future, he went with them to the church of St Peter; and there, disarming himself in the presence of his chief officers, he laid his girdle, his sword, and his gauntlet, with his royal mantle, his crown of gold, and cross of silver, on the apostle's sepulchre. After this, he reconciled the pope with the exarch, who was then upon received into the city, where he continued for some time, maintaining a friendly correspondence with the pope. At this time an impostor, taking the name of Tibertius, and pretending to be descended from the emperors, seduced a great many people in Tuscany, and was by them proclaimed emperor. The exarch resolved to march against him; but as he had not sufficient forces to oppose the rebels, Gregory, who let no opportunity slip of obliging Leo, persuaded the Romans to attend the exarch in this expedition; by which means the usurper being taken in a castle, his head was sent to the emperor, and the rebellion utterly suppressed. But the emperor still insisting upon his edict against the images being received in Rome, the Romans, at the instigation of the pope, publicly renounced their allegiance to Leo, paid him no more tribute, and withdrew for ever their obedience to the emperors of the East.

Leo, informed of this revolt, but not questioning but the pope was the author of it, immediately caused all the patrimonies of the church of Rome in Sicily, Calabria, and his other dominions, to be confiscated. At the same time, he ordered a powerful army to be raised, with a design to recover the towns that had revolted; to chastise the Romans for their rebellion; and, above all, to be revenged on the pope, who had raised all these disturbances, by himself opposing, and persuading others to oppose, the execution of his edict. Gregory, alarmed at the warlike preparations that were carrying on throughout the empire, and well apprised that they were chiefly designed against him and the Romans, resolved to recur to the protection of the French, the only nation at that time capable of coping with the emperor, and on whom, on account of their zeal for religion, he thought he might depend. The Lombards were then very powerful; but, as they wanted to be masters of Rome, he did not think it advisable to trust them. The Venetians, though zealous in the defence of the pope, were not yet in a condition to withstand the power of the emperor; and, besides, were jealous of the Lombards, who watched all opportunities of enlarging their dominions at the expense of their neighbours. As for Spain, it was then in a most deplorable condition, being overrun, and almost wholly ruined, by the Saracens.

The French nation was at this time governed by the celebrated Charles Martel, who had distinguished himself in a most eminent manner in the wars of France and Germany; and had, not long before, gained a signal victory over the Saracens in the neighbourhood of Tours; whence he was generally reputed the best commander, and the greatest hero, of his time. To him, therefore, Gregory sent a solemn embassy, with a great number of relics, earnestly entreating him to take the Romans, and the church, under his protection, and defend them against the attempts of Leo. The ambassadors were received with extraordinary marks of honour; and a treaty was soon concluded between them and Charles, who engaged to march into Italy in person, at the head of a powerful army, in defence of the Romans and the church, if they should be attacked either by the emperor or the Lombards. On the other hand, the Romans were to acknowledge him for their protector, and confer on him the honour of the consulsip as it had been formerly conferred on Clovis by the emperor Anastasius, after that prince had defeated the Visigoths. The ambassadors returned from France loaded with rich presents. But Gregory did not long enjoy the fruit of their negociations; for he died the same year 731, and was succeeded by Gregory III. in whose time some place the above-mentioned embassy.

The French nation was at this time just recovered, end of the from its distressed situation under the descendants of Lombard Clovis; and by the bravery and conduct of Charles Martel, had become the most powerful kingdom in the west. His successor Pepin was no less wise and powerful than his father had been; and as the ambition of the Lombard princes would be satisfied with nothing less than the entire conquest of Italy, the French monarch, Charlemagne, under colour of assisting the pope, at last put an end to the empire of Lombardy, as related under the article FRANCE, N° 21, 22.

The Lombards were at first a cruel and barbarous nation; but divesting themselves by degrees of their native fierceness and barbarity, especially after they had embraced the Christian religion, they governed with such equity and moderation, that most other na-
LOMBARD, or LOMBARD, PETER, an engraver of considerable eminence, who flourished about the year 1660. He was a native of Paris, where he learned the art of engraving. It appears that he came to England before the Revolution, because some of his plates for English publications are dated prior to that event. He executed a vast variety of plates, as well historical as emblematical; which, however, were chiefly for books. But his best works are portraits; and of these he produced a considerable number, which are esteemed. They are mostly after Vandyck. — He also engraved historical subjects, from Poussin, Raphael, Annibal Carracci, Guido, and other masters.

LOMENTACEÆ, in Botany, (from lomentum, a colour used by painters), the name of the 33d order in Linnæus's Fragments of a Natural Method, consisting of the following genera, many of which furnish beautiful tinctures that are used in dying, viz. adenanthrea, bauhinia, cesalpinia, cassia, ceratonia, cerica, gleditsia, guilindima, hematoxylin, hymenaea, mimosa, paraxia, poitania, polygamus. See Botany.

LOCH-LOMOND, a large lake of Dunbarton or Lennox-shire in Scotland, of which Mr. Pennant gives the following description. "Loch-Lomond, the last, the most beautiful of the Caledonian lakes. The first view of it from Tarbet presents an extensive serpentine winding amidst lofty hills; on the north, barren, black, and rocky, which darken with their shade that contracted part of the water. On the west side, the mountains are clothed near the bottoms with woods of oak quite to the water edge; their summits lofty, naked, and craggy. On the east side, the mountains are equally high; but the tops form a more even ridge parallel to the lake, except where Benlomond, like Saul amidst his companions, overtops the rest. The upper parts were black and barren; the lower had great marks of fertility, or at least of industry, for the yellow corn was finely contrasted with the verdure of the groves intermixed with it.

"This eastern boundary is part of the Grampian hills, which extend from hence through the counties of Perth, Angus, Mearns and Aberdeen. The road runs sometimes through woods; at others is exposed and naked; in some, so steep as to require the support of a wall; the whole the work of the solidiciary: blessed exchange of instruments of destruction for those that give safety to the traveller, and polish to the once inaccessible native! Two great headlands covered with trees separate the first scene from one totally different; the last is called the Point of Firkin. On passing this cape an expanse of water bursts at once on your eye, varied with all the softer beauties of nature. Immediately beneath is a flat covered with wood and corn; beyond, the headlands stretch far into the water, and consist of gentle risings; many have their surfaces covered with wood, others adorned with trees loosely scattered either over a fine verdure or the purple bloom of the heath. Numbers of islands are dispersed over the lake, of the same elevated form as the little coves, and wooded in the same manner; others just peep above the surface, and are tufted with trees; and numbers are so disposed as to form magnificent visites between.

"Opposite Luss, at a small distance from shore, is a mountainous island almost covered with wood; it is near half a mile long, and has a most fine effect. I could not count the number of islands, but was told there are 28; the largest two miles long, and stocked with deer.

"The length of this charming lake is 24 miles; its greatest breadth 8; its greatest depth, which is between the point of Firkin and Benlomond, is 120 fathoms. Besides the fish common to the lochs are guineas, called here poans.

"The surface of Loch-Lomond has for several years past been observed gradually to increase, and invade the adjacent shore; and there is reason to suppose that churches, houses, and other buildings, have been lost in the water. Near Luss is a large heap of stones at a distance from the shore, known by the name of the old church; and about a mile to the south of that, in the middle of a large bay, between Camusdar and the isle Inch-tavanack, is another heap, said to have been the ruins of a house. To confirm this, it is evident by a passage in Camden's Atlas Britannica, that an island, existing in his time, is now lost; for he speaks of the isle of Camusdar, placed between the lands of the same name and Inch-tavanack, in which, adds he, was an house and orchard. Besides this proof, large trees with their branches still adhering are frequently found in the mud near the shore, overwhelmed in former times by the increase of water. This is supposed to be occasioned by the vast quantities of stone and gravel that are continually brought down by the mountain rivers, and by the falls of the banks of the Leven; the first filling the bed of the lake, the last impeding its discharge through the bed of the river."

LOMONOSOF, a celebrated Russian poet, the great refiner of his native tongue, was the son of a dealer in fish at Kolmogori: he was born in 1711, and was fortunately taught to read; a rare circumstance at that time for a person of his station in Russia. His natural genius for poetry was first kindled by the perusal of the Song of Solomon, done into verse by Polotski, whose rude compositions, perhaps scarcely superior to our version of the psalms by Sternhold and Hopkins, inspired him with such an irresistible passion for the muses, that he fled from his father, who was desirous of compelling him to marry, and took refuge in the Kasikonospaski monastery at Moscow; there he had
Lomonozof, which were printed in three volumes at London, will serve to show the versatility of his genius, and his extensive knowledge in various branches of literature. The first volume, besides a Preface on the advantages derived to the Russian tongue from the ecclesiastical writings, contains ten sacred and nineteen panegyric odes, and several occasional pieces of poetry.

The second comprises An Essay on Prose on the Rules for Russian Poetry; Translation of a German Ode; Idyll; Tamira and Selim, a tragedy; Demophoon, a tragedy; Poetical Epistle on the Utility of Glass; two cantos of an epic poem, entitled, Peter the Great; A Congratulatory Copy of Verses; An Ode; Translation of Baptist Rousseau's Ode Sur le Bonheur; Heads of a Course of Lectures on Natural Philosophy; certain passages translated in verse and prose, according to the original, from Cicero, Erasmus, Lucian, Ælian, Ammianus Marcellinus, Quintus Curtius, Homer, Virgil, Martial, Ovid, Horace, and Seneca, which Russian translations were brought as examples in his Lectures upon Rhetoric; lastly, Description of the Comet which appeared in 1743. The third volume consists chiefly of Speeches and Treatises read before the Academy; Panegyric on the Empress Elizabeth; on Peter the Great; Treatise on the Advantages of Chemistry; on the Phenomena of the Air occasioned by the Electrical Fire, with a Latin translation of the same; on the Origin of Light as a new Theory of Colours; Methods to determine with precision the course of a Vessel, on the origin of Metals by the means of Earthquakes; Latin Dissertation on Solidity and Fluidity; on the Transit of Venus in 1761, with a German translation. Besides these various subjects, Lomonozof made no inconsiderable figure in history, having published two small works relative to that of his own country.

The first, styled Annals of the Russian Sovereigns, is a short chronology of the Russian monarchs; and the second is, the Ancient History of Russia, from the Origin of that Nation to the Death of the Great Duke Yaroslav I. in 1054; a performance of great merit, as it illustrates the most difficult and obscure period in the annals of this country.

LONDON.

London, a large city of Middlesex in England, the metropolis of Great Britain, and one of the most wealthy and populous cities in the world, is situated on the river Thames, in 51° 31' north latitude, 400 miles south of Edinburgh, and 270 south-east of Dublin; 180 miles west of Amsterdam, 210 north-west of Paris, 500 south-west of Copenhagen, 600 north-west of Vienna, 750 south-west of Stockholm, 800 north-east of Madrid, 820 north-west of Rome, 850 north-east of Lisbon, 1360 north-west of Constantinople, and 1414 south-west of Moscow.

This city was by the Romans first called Londinium or Londonium, as we find it in Tacitus, Ptolemy, Antoninus, and Ammianus. That name was afterwards changed into Augusta. How long this name prevailed, is not certainly known; but after the establishment of the Saxons we find it called Caer Lundain, Lundun Byrig, Lunden Ceaster, Lunden-weise, Lundene, Lund-berth or Lundenburg; since the Conquest the records call it Londonia, Londenia, London, Londres; and, for several ages past, it has been called London, a manifest corruption from Tacitus's Londinium. The most probable derivation of these names appears to be, either from the British words thong, "a ship," and din, "a town," i.e. a town or harbour for ships; or from Llin, "a lake," i.e. Llin din, "the town upon the lake," the Serry side being supposed, upon very probable grounds, to have been anciently a great expanse of water.

Londinium, however, was not the primitive name of this famous place, which existed before the invasion of the Romans; being, at the time of Caesar's arrival in the island, the capital of the Trinobantes or Trinounantes. The name of this nation, as appears from Baxter's British Glossary *, was derived from the three following British words, tri, nou, hanti, which signify the "inhabitants of the new city." This name, it is supposed,
supposed, might have been given them by their neighbours, on account of their having newly come from the continent into Britain, and having there founded a city called *tri-nov*, or the "new city," the most ancient name of the renowned metropolis of Britain. The Trinobantes had come so lately from Belgium, that they seem scarcely to have been firmly established in Britain at the time of the first Roman invasion: for their new city, which soon after became so famous, was so insubstantial, that it is not mentioned by Caesar, though he must have been within sight of the place where it was situated. His silence about this place, indeed, is brought as a proof that he did not cross the Thames; while Norden by the *firmissima civitas* of the Trinobantes understand the city in question, the Trinobantes themselves having been among the first of the British states who submitted to that conqueror.

By Ptolemy, and some other ancient writers of good authority, indeed, Londinium is placed in Cantium, or Cent, on the south side of the Thames; and it is the opinion of some moderns, that the Romans probably had a station there, to secure their conquests on that side of the river, before they reduced the Trinobantes. The place fixed upon for this station is St George's Field, a large plat of ground situated between Lambeth and Southwark, where many Roman coins, bricks, and chequered pavements, have been found. Three Roman ways from Kent, Surrey, and Middlesex, intersected each other in this place; this therefore is supposed to be the original Londinium, which it is thought became neglected after the Romans reduced the Trinobantes, and settled on the other side of the Thames; and the name was transferred to the new city.

The Romans possessed themselves of London, on their second invasion in the reign of Claudius, about 105 years after their first under Caesar. They had begun with Camelodunum, the present Maldon in Essex; and having taken it, planted there a colony consisting of veterans of the 14th legion. London and Verulam were next taken possession of about one and the same time. Camelodunum was made a *colonia* or place governed entirely by Roman laws and customs; Verulam (on the site of which St Alban's now stands), a *municipium*, in which the natives were honoured with the privileges of Roman citizens, and enjoyed their own laws and constitutions; and Londinium only a *prefectura*, the inhabitants, a mixture of Romans and Britons, being suffered to enjoy no more than the name of citizens of Rome, being governed by prefects sent annually from thence, without having either their own laws or magistrates. "It was even then of such concourse (says Mr Pennant), and such vast trade, that the wise conquerors did not think fit to trust the inhabitants with the same privileges as other places of which they had less reason to be jealous." But others observe, that this is a mistake; and that the Romans, in order to secure their conquest, and to gain the affections of those Britons who had already submitted to their authority, made London equally a municipium or free city with Verulamium, as may be seen by referring to Aulus Gellius, *lib. xvi. c. 13.* and to Spanhem. *orbis Roman.*

It is difficult to say what were the particular articles of commerce exported from and imported into the port of London at this period. The imports and exports of the island in general we know: Strabo says, "Britain produceth corn, cattle, gold, silver, iron; besides which, skins, slaves, and dogs, naturally excellent hunters, are exported from that island." It is probable that the two first and three last articles were exported from London; and perhaps, too, the *gonates* or jet-stone mentioned by Solinus as one of the productions of Britain, together with horses, were exported from thence. The imports were at first mostly metal ware, and works in brass, polished bits of bone emulating ivory, horse collars, toys of amber, glasses, and other articles of the same material.

In the reign of Nero, as Tacitus informs us, London was become a city highly famous for the great conflux of merchants, her extensive commerce, and plenty of all things. No fewer than seven of the fourteen itineraries of Antoninus begin or end at London; which tends to corroborate the many proofs which might be adduced, that this city was the capital of Britain in the Roman times.

At first London had no walls or other fortifications. When first to defend it, and was therefore exposed to the attacks of every enemy; and thus it suffered severely about the year 64, being burnt by the Britons under Boudicca, and all the inhabitants massacred. But it was soon restored by the Romans; and increased so much, that in the reign of the emperor Severus it is called by Hero- dian a great and wealthy city. It continued, however, in a defenceless state for more than a century after this last period; when at last a wall of hewn stone and British bricks was erected around it.

London at this time extended in length from Ludgate-hill to a spot a little beyond the Tower. The breadth was not half equal to the length, and at each end grew considerably narrower. Maitland ascribes the building of the walls to Theodosius governor of Britain in 569. Dr Woodward, with more probability, supposes them to have been founded under the auspices of Constantine the Great: and this seems to be confirmed by the numbers of coins of that emperor's mother Helen, which have been discovered under them, placed there by him in compliment to her.

The same emperor made it a bishop's see; for it appears that the bishops of London and York, and another English bishop, were at the council of Arles in the year 314: he also settled a mint in it; as is plain from some of his coins. The ancient course of the wall Their sa- was as follows: It began with a fort near the present site of the Tower, was continued along the Minories, and the back of Houndsditch, across Bishopsgate-street, in a straight line by London wall to Cripplegate; then returned southward by Crowder's Well alley (where several remnants of lofty towers were lately to be seen), to Aldersgate, thence along the back of Bull-and-Mouth-street to Newgate, and again along the back of the houses in the Old Bailey to Ludgate; soon after which, it probably finished with another fort, where the house, late the king's printing house, in Black Friars, now stands: from hence another wall ran near the river side, along Thames-street, quite to the fort on the eastern extremity. The walls were three miles a hundred and sixty-five feet in circumference, guarded at proper distances on the land side with fifteen lofty towers; some of them were re-
London submits to the Saxons.

After the Romans deserted Britain, a new and fierce race succeeded. The Saxons, under their leaders Hengist and Horsa, landed in 449, having been invited by the provincials as auxiliaries against the Scots and Picts; but quarrelling with their friends, they found means to establish themselves in the island, and in process of time entirely subdued them, as related under the article ENGLAND, No. 31-44. London fell into the hands of these invaders about the year 477, and became the chief city of the Saxon kingdom in Essex. It suffered much in the wars carried on between the Britons and Saxons: but it soon recovered; so that Bede calls it a princely mart town, under the government of a chief magistrate, whose title of portgrave or porttrecce, (for we find him called by both names), conveys a grand idea of the mercantile state of London in those early ages, that required a governor or guardian of the port. During the civil wars of the Saxons with each other, the Londoners had always the address to keep themselves nester; and about the year 819, when all the seven Saxon kingdoms fell under the power of Egbert, London became the metropolis of England, which it has ever since continued.

During the invasions of the Danes, London suffered greatly. In 849, these invaders entered the Thames with 250 ships, plundered and burnt the city, and massacred the inhabitants; and two years after they returned with a fleet of 350 sail, fully determined to destroy everything that had escaped their barbarity in the former expedition. At this time, however, they were disappointed; most of their troops being cut in pieces by King Ethelwulf and his son Athelbald; yet such was the destruction made by those barbarians at London, that it suffered more from these two incursions than ever it had done before.

In the reign of King Alfred the Great, London began to recover from its former ruined state. He rebuilt its walls, drove out the Danish inhabitants who had settled there, restored the city to its former liberties and beauty, and committed the care of it to his son-in-law, Ethelred duke of Mercia, in hopes that this might always be a place of secure retreat within its strong walls, whatever might happen from a foreign or domestic enemy. In 893, however, he had the mortification to see his capital totally reduced to ashes by an accidental fire, which could not be extinguished, as the houses at that time were all built of wood. The walls, however, being constructed of incombustible materials, continued to afford the same protection as before; the houses were quickly rebuilt, and the city divided into wards and precincts, for its better order and government. This king also instituted the office of sheriff, the nature of which office made it necessary to have it also in London; so that here we have the glimmerings of the order of magistrates afterwards settled in the city of London: in the person of the portreeve, or portgrave, or governor of the city, as supreme magistrate; in the sheriff, and in the officer or subordinate magistrate by what name soever then distinguished, which, being placed at the head of each ward or precinct, were analogous to the more modern title of aldermen and common-council men.

Alfred having settled the affairs of England in the Brick and most prudent manner, directed his attention to the ornamenting, as much as possible, the city of London. For this purpose, he spirited up the English to an emulation in building their houses of stronger and more durable materials than formerly. At that time their houses were mostly of wood; and a house built of any other materials was looked upon as a kind of wonder. But Alfred having begun to raise his palaces of stone and brick, the opulent Londoners, and the nobility resident in and about London, followed the example, though the custom did not come into general use till some ages after.

In 1015, a foreign enemy again appeared before London. Canute, king of Denmark, having invaded by Canute, and plundered the counties of Dorset, Somerset, and Wilts, sailed up the Thames with 200 ships, and laid siege to the city. The citizens continued faithful, notwithstanding the defection of the greatest part of the kingdom; and made such a brave resistance, that Canute thought fit to withdraw his army, leaving only his fleet to blockade the city by water, that when he found a fair opportunity he might renew the siege with better success. At last, however, being defeated in several battles by Edmund Ironside, he was obliged to call off his ships to cover his own army in case of necessity. In the compromise, however, which was afterwards made between Edmund and Canute, the city of London was given to the latter, and owned him for its lawful sovereign. We have a strong proof of the opulence of London even at this time, from the tax laid upon it by Canute in order to pay his army; this being not less than 10,500l, while the rest of the nation was at the same time taxed only at 72,000l.

In 1046, we have the first instance of the London-Sends representatives to parliament. This happen-ers sending representatives to parliament. This happen-пened on settling the succession to the throne after Cnut's death. The English in general declared for Ed-ward, son of King Ethelred; or, if that could not beward, son of King Ethelred; or, if that could not be carried, for Hardicanute, son of Canute by Queen carried, for Hardicanute, son of Canute by Queen Emma, and then absent on a tour to Denmark. The city of London espoused the claim and interest of Har-rrold Harefoot, son also of Canute, by Queen Elviga-
The attachment of the citizens to Stephen, however, was a crime which never could be forgiven by Henry II. and, of consequence, he made them sensible of his displeasure, by making frequent demands of money from them. About this time, indeed, the Londoners were arrived at such a pitch of licentiousness, that their profligacy seemed a curse rather than a blessing. The sons of the most eminent and wealthy citizens entered into a confederacy to commit burglaries, and to rob and murder all that came in their way in the night-time. The king took an opportunity from these irregularities to enrich himself. He demanded several loans and free gifts; till at last the Londoners, to prevent further inquiries into their conduct, paid into the exchequer 5000l. in three years. These disorders, however, were at last stopped by the execution of John Senex; who, though a very rich and reputable citizen, had engaged in these enterprises. He offered 500l. weight of silver, a prodigious sum in those days, for his pardon, but was refused. The king, however, still continued to drain the citizens of their money by free gifts; and at last fined every separate guild, fraternity, or company, that had presumed to act as bodies corporate without the royal letters-patent.

On the death of Henry II. the title of the first magistrate of London was changed from portergrece to that of bailiff; and in 1189 claimed and acted in the office of the chief bailiff at the coronation of Richard I. In 1191 this monarch permitted the bailiff, named Henry of mayor Fits-Alaine, to assume the title of mayor. For, in 1192, we find certain orders of the mayor and aldermen instituted to prevent fires; whereby it was ordained, that "all houses thereafter to be erected in London and the liberties thereof, should be built of stone, with party-walls of the same; and covered either with slates or tiles, to prevent those dreadful calamities by fire, which were frequently and chiefly occasioned by houses built of wood, and thatched with straw or reeds." And for this purpose, it was also provided by the disreputable men of the city, "that 12 aldermen of the city should be chosen in full hustings, and there sworn to assist the mayor in appeasing contentions that might arise among neighbours in the city upon enclosure between land and land, and to regulate the dimensions of party-walls, which were to be of stone, 16 feet high and three feet thick; and to give directions about girders, windows, gutters, and walls." Such confidence also did Richard put in the wisdom and faithfulness of the city of London, that when it was resolved to fix a standard for weights and measures for the whole realm, his majesty committed the execution thereof to the sheriffs of London and Middlesex, whom he commanded to provide measures, gallons, iron rods, and weights, for standards, to be sent to the several counties of England. This happened in 1198, at which time corn was advanced to the enormous price of 18s. 4d. per quarter.

The city of London was much favoured by King John, who granted them three charters soon after his granted to accession. The first was a recital and confirmation of the city by King John, those granted by Henry I. and II. with the further privilege of being free from toll and every other duty or custom in his majesty's foreign dominions; for which they paid the sum of 5000 merks. The second was a confirmation of one granted by King Richard.
LONDON.

By this the citizens of London had the jurisdiction and conservancy of the river Thames; with a clause to extend that jurisdiction, and the powers therewith granted, to the river Medway; and with another clause to enable the said city, as conservators of the rivers Thames and Medway, to inflict a penalty of 10l. upon any person that should presume to erect a weir in either of these rivers. The third charter contains a fine for the non-payment of the sheriffs of London and Middlesex at the ancient rent, of which they had been deprived by Queen Maud; granting them also the additional power of choosing their own sheriffs. This charter was given by way of conveyance from the crown to the citizens for a valuable consideration, by which the sheriffs became their freestold; and this is the first covenant or conveyance we find on record with the legal terms of to have and to hold, which are at this time accounted an essential part in all conveyances of property.

During the reign of Henry III. the city of London was oppressed in many different ways. In 1218, he exacted a fine of 40 marks for selling a sort of cloth not two yards within the lists; and a 15th of the citizens personal estates for the enjoyment of their ancient rights and privileges. In 1221, he commanded by proclamation all the foreign merchants to depart the city, which drew 50 marks from the Hanseatic company of the Steelyard, to have seisin of their guild or hall in Thames-street. But it was the wrestling match at St. Giles's in the fields that brought on their greatest burden. In the year 1221, on St. James's day, the citizens of London having carried off the victory from the people of Westminster and other neighbouring villages, the steward of the abbey of Westminster, meditating revenge against the Londoners, proposed another wrestling match with them, and gave a ram for the prize. The citizens resorted to the place at the time appointed; but were unexpectedly assaulted by a great number of armed men, who killed and wounded many, and dispersed the rest. This raised a great commotion in the city. The populace breathed revenge; and, by the instigation of Constantine Fitz-Arnulf, a great favourer of the French party during the troubles in King John's reign, they proceeded to Westminster, and pulled down the houses both of the steward and abbot. Hearing afterwards that the abbot was come into the city with his complaint to Philip d'Aubeny the king's counsel, they pursued him, beat his servants cruelly, took away 12 of his horses, and would have murdered himself, had not escaped by a back door. Upon this tumult, Hubert de Bury, then chief justice, summoned the mayor and many of the principal citizens to attend him in the tower of London; and inquiring for the authors of the riot, Constantine, the ringleader, boldly answered, that 'he was one, that they had done no more than they ought; and that they were resolved to know what they had done, let the consequence be what it would.' In this he was seconded by his nephew and one Geoffrey: but the justice, having dismissed all the rest, detained these three, and ordered them to be hung next morning, though Constantine offered 15,000 marks for his pardon. Hubert then coming into the city with a strong guard, caused the hands and feet of most of the principal rioters he could seize to be cut off: all which was executed without any legal proceedings or form of trial. After these arbitrary cruelties, he degraded the mayor and all the magistrates; placed a custos over the city, and obliged 30 persons of his own choosing to become securities for the good behaviour of the whole city. Several thousand marks were also exacted by the king, before he would consent to reconciliation.

This arbitrary conduct alarmed the whole nation. The parliament of 1224 began to be uneasy for themselves, and addressed his majesty that he would be pleased to confirm the charter of liberties which he had sworn to observe; and the consequence of this application was a confirmation of the magna charta in the full parliament at Westminster in the year 1225. At this time, also, the rights and privileges of the citizens were confirmed. They were exempted from prosecution for bursels, i.e. listed cloth; and were granted the right of having a common seal. The necessary circumstances of this monarch, however, made him often exact money arbitrarily as long as he lived.

Under the succeeding reigns, as the liberty of the people in general was augmented, so the liberty, opulence, and power of the citizens of London, increased, until they became a kind of balance to the power of the crown itself, which in some measure they still continue to be. Riots indeed, for which they generally suffered, were by no means so frequent; the city often suffered by fires and plagues. Nothing, however, happened which materially affected the welfare of the city, till the reign of Charles II. in 1665.—This year London was ravaged by the most violent plague ever known in Britain. The whole summer had been remarkably still and warm, so that the weather was sometimes suffocating even to people in perfect health; and by this unusual heat and sultry atmosphere, people were undoubtedly prepared for receiving the infection, which appeared with violence in the months of July, August, and September. A violent plague had raged in Holland in the year 1663; on which account the importation of merchandise from that country was prohibited by the British legislature in 1664. Notwithstanding this prohibition, however, it seems the plague had actually been imported; for in the close of the year 1664, two or three persons died suddenly in Westminster, with marks of the plague on their bodies. Some of their neighbours, terrified at the thoughts of their danger, removed into the city; but their removal proved too late for themselves, and fatal to those among whom they came to reside. They soon died of the plague; and communicated the infection to so many others, that it became impossible to extinguish the seeds of it, by separating those that were infected from such as were not. It was confined, however, through a hard frosty winter, till the middle of February, when it again appeared in the parish of St. Giles's, to which it had been originally brought; and, after another long rest till April, showed its malignant force afresh, as soon as the warmth of the spring gave it opportunity. —At first, it took off one here and there, without any certain proof of their having infected each other, and houses began to be shut up, with a design to prevent its spreading. But it was now too late; the infection gained ground every day, and the shutting up of houses only made the disease spread wider. People,
afraid of being shut up, and sequestered from all communication with society, concealed their illness, or found means to escape from their places of confinement; while numbers expired in the greatest torments, destitute of every assistance; and many died both of the plague and other diseases, who would in all probability have recovered, had they been allowed their liberty, with proper exercise and air.—A house was shut up on account of a maid-servant, who had only spots, and not the gangrenous plague-blotsches, upon her, so that her distemper was probably a petechial fever. She recovered; but the people of the house obtained no liberty to stir, either for air or exercise, for 40 days. The bad air, fear, anger, and vexation, attending this injurious treatment, cast the mistress of the family into a fever. The visitors appointed to search the house, said it was the plague, though the physicians were of a different opinion: the family, however, were obliged to begin their quarantine anew though it had been almost expired before; and this second confinement affected them so much, that most of the family fell sick, some of one distemper and some of another. Every illness that appeared in the family produced a fresh prolongation of their confinement; till at last the plague was actually brought in by some of those who came to inquire into the health of the family, and almost every person in the house died.— Many examples of a similar kind happened, and this was one of the worst consequences of shutting up houses. All means of putting a stop to the infection were evidently ineffectual. Multitudes fled into the country; many merchants, owners of ships, &c. shut themselves up, on board their vessels, being supplied with provisions from Greenwich, Woolwich, and single farm houses on the Kentish side. Here, however, they were safe; for the infection never reached below Deptford, though the people were frequently on shore to the country towns, villages, and farm houses, to buy fresh provisions. As the violence of the plague increased, the ships which had families on board removed farther off; some went quite out to sea, and then put into such harbours and roads as they could best get at.

In the mean time, the distemper made the most rapid advances within the city. In the last week of July, the number of burials amounted to 2010; but the first week of August it rose to 3187; thence to 3880; then to 4237; the next week, to 6102; and at last to 7000 and 8000 weekly. In the last week of September, however, the fury of the disease began to abate; though vast numbers were sick, yet the number of burials decreased from 7155 to 5538; the next week there was a further decrease to 4929, then to 4327, next to 2655, then to 1421, and the next week to 1031.

All this while, the poor people had been reduced to the greatest distresses, by reason of the stagnation of trade, and the sicknesses to which they were peculiarly liable on account of their manner of living. The rich, however, contributed to their subsistence in a most liberal manner. The sums collected on this occasion are indeed almost incredible; being said to amount to 100,000l. per week. The king is reported to have contributed 10,000l. weekly; and in the parish of Cripplegate alone, 17,000l. was distributed weekly among the poor inhabitants.—By the vigilance also of the magistrates, provisions continued remarkably cheap throughout the whole time of this dreadful calamity, so that all riots and tumults on that account were prevented; and at last, on the cessation of the disease in the winter of 1665, the inhabitants who had fled returned to their habitations, and London appearance became as populous as ever, though it was computed that 100,000 persons had been carried off by the plague.

The city was scarcely recovered from the desolation occasioned by the plague, when it was almost totally laid in ashes by a most dreadful fire. This broke out in a baker's shop in Pudding-lane, on Saturday night, September 2. 1666. In a few hours Billingsgate ward was entirely burnt down; and before morning the fire had crossed Thames-street, and destroyed the church of St Magnus. From thence it proceeded to the bridge, and consumed a great pile of buildings there; but was stopped by the want of any thing more to destroy. The flames, however, being scattered by a strong east wind, continued their devastations in other quarters. All efforts to stop it proved unsuccessful throughout the Sunday. That day it proceeded up as far as Garlick-bitch; and destroying Canon street, invaded Cornhill and the Exchange. On Monday, the flames having proceeded eastward against the wind through Thames-street, invaded Tower street, Gracechurch-street, Fenchurch-street, Dowgate, Old Fish-street, Watling-street, Threadneedle-street, and several others, from all which it broke at once into Cheapside. In a few hours Cheapside was all in flames, the fire having reached it from so many places at once. The fire then, continuing its course from the river on one side, and from Cheapside on the other, surrounded the cathedral of St Paul's. This building stood by itself at some distance from other houses, and the violence of the flames, and the heat of the atmosphere occasioned by them, that the cathedral took fire at top. The great beams and massive stones broke through into Faith-church underneath, which was quickly set on fire; after which, the flames invaded Pater-noster-row, Newgate-street, the Old Bailey, Ludgate-hill, Fleet-street, Ironmonger-lane, Old Jewry, Laurencelane, Milk-street, Wood-street, Gutter-lane, Fosterlane, Lothbury, Cateaton-street; and, having destroyed Christ-church, burnt furiously through St Martin's le Grand towards Aldersgate.

The fire had now attained its greatest extent, and was several miles in compass. The vast clouds of smoke obscured the sun so, that he either could not be seen at all, or appeared through it as red as blood. The flames reached an immense way up into the air, and their reflection from the smoke, in the nighttime seemed also like flame, made the appearance still more terrible. The atmosphere was illuminated to a great extent, and this illumination is said to have been visible as far as Jedburgh in Scotland. Some of the light ashes also are said to have been carried to the distance of 16 miles. Guildhall exhibited a singular appearance. The oak with which it was built was so solid, that it would not flame, but burnt like charcoal, so that the building appeared for several hours like an enchanted palace of gold or burnished brass.

At last, on Wednesday morning, when every one expected
London

History.

expected that the suburbs as well as the city were to have been burnt, the fire began of itself to abate by reason of the wind having ceased, and some other changes no doubt taken place in the atmosphere. It was checked by the great building in Leadenhall-street, and in other streets by the blowing up several houses with gunpowder; and on Thursday the flames were quite extinguished.—The following is a calculation of the damage done by this extraordinary conflagration.

Calculation of the damage done.

It was never certainly known whether this fire was accidental or designed. A suspicion fell upon the Papists; and this gained such general credit, that it is asserted for a truth on the monument which is erected in memory of the conflagration. Of the truth of this assertion, however, though there was not sufficient proof, it had the effect of making the Papists most violently suspected and abhorred by the Protestants, which some time after proved very prejudicial to the city itself.

From this calamity, great as it was, London soon recovered itself, and became much more magnificent than before; the streets, which were formerly crooked and narrow, being now built wide and spacious; and the industry of its inhabitants repaired the losses they had sustained. In 1679, the city was again alarmed by the discovery of a design to destroy it by fire a second time. Elizabeth Oxley, servant to one Rind in Fetter-lane, having set her master's house on fire, was apprehended on suspicion, and confessed, that she had been hired to do it by one Stubbs a Papist, for a reward of 3l. Stubbs being taken into custody, acknowledged that he had persuaded her to it; and that he himself had been prevailed upon by one Father Gifford his confessor, who had assured him, that by burning the houses of heretics he would do a great service to the church. He also owned that he had several conferences with Gifford and two Irishmen on the affair. The maid and Stubbs also agreed in declaring, that the Papists intended to rise in London, expecting to be powerfully supported by a French army. In consequence of this discovery, the Papists were banished from the city, and five miles round, and five Jesuits were hanged for the above-mentioned plot.

The Papists thought to revenge themselves by forgering what was called the meal-tub plot, in which the Presbyterians were supposed to have treacherous designs against the life of the king. Sir Edmondbury Godfrey also, who had been very active in his proceedings against the Papists, was murdered by some unknown persons; and this murder, together with their discovering the falseness of the meal-tub plot, so exasperated the Londoners, that they resolved to shew their detestation of Popery, by an extraordinary exhibition on the 17th of November, Queen Elizabeth's accession to the throne, on which day they had usually burnt the pope in effigy. The procession began with a person on horseback personating Sir Edmondbury Godfrey, attended by a bellman proclaiming his execrable murder. He was followed by a person carrying a large silver cross, with priests in cope, Carmelites, and Gray-fraries, followed by six Jesuits: then proceeded divers waiters, and after them some bishops with lawn sleeves, and others with cope and mitres. Six cardinals preceded the pope, enthroned in a stately pageant, attended by divers boys with pots of incense, and the devil whispering in his ear. In this order they marched from Bishopsgate to Fleet-street; and there, amidst a great multitude of spectators, committed his holiness to the flames.

This procession gave great offence to the court, at which the duke of York, afterwards James II. had a great influence. The breach was farther widened by the choice of sheriffs for that year. The candidates set up by the court were rejected by a majority of almost two to one; but this did not deter their party from demanding a poll in their behalf, upon which a tumult ensued. This was represented by the Popish party in such colours to the king, that he issued out a commission that same evening for trying the rioters; which, however, was so far from intimidating the rest, that they grew more and more determined, not only to oppose the Popish party, but to exclude the duke of York from his succession to the crown.

In the mean time, the king prevailed the parliament, to prevent them from proceeding in their inquiry concerning the Popish plot, and the exclusion-bill. Upon this the lord-mayor, aldermen, and common-council, presented a petition to his majesty, in which they requested, that he would permit the parliament to sit in order to complete their salutary measures and councils. This petition was highly represented by the king; who, instead of granting it, dissolved the parliament, and could never afterwards be reconciled to the city. From this time it was determined to seize their charter; and fresh provocations having...
The history of the election of sheriffs, a quo warranto was last produced by the attorney-general, in order to overthrow their charter, and thereby to deprive the citizens of the power to choose sheriffs. This information set forth, "That the mayor and commonalty and citizens of the city of London, by the space of a month then last past and more, used, and yet do claim to have and use, without any lawful warrant or legal grant, within the city of London aforesaid, and the liberties and privileges of the same city, the liberties and privileges following, viz. 1. To be of themselves a body corporate and politic, by the name of mayor and commonalty and citizens of the city of London. 2. To have sheriffs ciuitat. et. com. London. et. com. Middlesex, and to name, make, and elect, and constitute them. 3. That the mayor and aldermen of the said city should be justices of the peace, and hold sessions of the peace. All which liberties, privileges, and franchises, the said mayor and commonalty, and citizens of London, upon the king did by the space aforesaid usurp, and yet do usurp."

Though nothing could be more unjust than this prosecution, the ministry were determined at all events to crush the Londoners; rightly judging, that it would be an easy matter to make all other corporations surrender their charters into the king's hands, and that they had no other body in the nation to fear. Accordingly they displaced such judges as would not approve of their proceedings; and, on the 12th of June 1683, Justice Jones pronounced the following sentence: "That a city might forfeit its charter; that the malversations of the common-council were acts of the whole city; and that the points set forth in the pleadings were just grounds for the forfeiting of a charter."

Notwithstanding this sentence, however, the attorney-general, contrary to the usual custom in such cases, was directed to move that the judgment might not be recorded: being afraid of the consequences. Yet it was judged that the king might seize the liberties of the city. A common-council was immediately summoned to deliberate on this exigency. The country party moved to have the judgment entered; but they were overruled by the court party, who insisted upon an absolute submission to the king before judgment was entered; and though this was in effect a voluntary surrender of the city-liberties, and deprived themselves of the means of getting the judgment reversed, the act of submission was carried by a great majority: and in a petition from the lord mayor, aldermen, and common-council, they acknowledged their own misgovernment, and his majesty's leniency; begged his pardon, and promised constant loyalty and obedience; and humbly begged his majesty's commands and directions. To this his majesty answered, that he would not reject their suit, if they would agree upon the following particulars. 1. That no lord mayor, sheriff, recorder, common sergeant, town clerk, or constable, of the city of London, or steward of the borough of Southwark, shall be capable of, or admitted to, the exercise of their respective offices before his majesty shall have approved of them under his sign-manual. 2. That if his majesty shall disapprove the choice of any person to be lord mayor, and signify the same under his sign-manual to the lord mayor, or in default of a lord mayor, to the recorder or senior alderman, the citizens shall, within one week, proceed to a new choice: and if his majesty shall in like manner disapprove the second choice, his majesty may, if he pleases, nominate a person to be lord mayor for the year ensuing. 3. If his majesty shall, in like manner, disapprove the persons chosen to be sheriffs, or either of them, his majesty may appoint sheriffs for the year ensuing. 4. That the lord mayor and court of aldermen may, with the leave of his majesty, displace any alderman, recorder, &c. 5. Upon the election of an alderman, if the court of aldermen shall judge and declare the person presented to be unfit, the ward shall choose again; and upon a disapproval of a second choice, the court may appoint another in his room. 6. That the justices of the peace should be by the king's commission; and the setting of those matters to be left to his majesty's attorney-general and counsel learned in the law."

To these the lord-keeper added, in the king's name, "That these regulations being made, his majesty would not only pardon this prosecution, but would confirm their charter in such a manner as should be consistent with them; concluding thus: "My lord mayor, the term draws towards an end, and Midsummer-day is at hand, when some of the officers used to be chosen; whereof his majesty will reserve the approbation. Therefore, it is his majesty's pleasure, that you return to the city, and consult the common council, that he may speedily know your resolutions thereupon, and accordingly give his directions. That you may see the king is in earnest, and the matter is not capable of delay, I am commanded to let you know he hath given orders to his attorney-general to enter upon judgment on Saturday next; unless you prevent it by your compliance in all these particulars."

A common-council was summoned, when the friends of liberty treated those slavish conditions as they deserved; and even declared, that they were ready to sacrifice all that was near or dear to them, rather than submit to such arbitrary impositions: but when it was put to the vote, there appeared a majority of 18 for submission.

Thus the king got the government of the city into his own hands, though he and his brothers entirely lost the affections of the Londoners. But, not content with The king their submission, his majesty departed from his promise; breaks his commanded the judgment upon the quo warranto to promise. be entered; and commissioned Sir William Pritchard, the lord mayor, to hold the same office during his majesty's pleasure. In the same manner he appointed or displaced the other magistrates as he thought proper; after which the ministry, having nothing to fear, proceeded in the most arbitrary manner.

In this subjection to the will of the court, the city Privileges of London continued till the Revolution; but, in 1689, of the city the immediate restoration of the Londoners to their franchise was ordered; and in such a manner and form, as to put it out of the powers of an arbitrary ministry and a corrupt judge and jury to deprive them of their chartered liberties for the time to come. Accordingly a bill was brought into parliament, and passed, for reversing the judgment of the quo warranto against the city of London, and for restoring the same to its ancient rights.
LONDON.

Description of the city.

That part of this immense capital which is distinguished by the name of The City, stands on the north shore of the river, from the Tower to the Temple, occupying only that space formerly encompassed by the wall, which in circumference measures but three miles and 165 feet. In this wall there were seven gates by land, viz. Ludgate, Aldgate, Cripplegate, Aldersgate, Moorgate, Bishopsgate, which were all taken down in September 1760; and Newgate, the county gaol, which was also taken down in 1776, and a massive building erected a little south of it, which by the rioters in 1780 received damage to the amount of 80,000l. On the side of the water there were Dowgate and Billingsgate, long since demolished, as well as the postern-gate near the Tower. In the year 1670, there was a gate erected called Temple-Bar, which terminates the bounds of the city westward. The liberties, or those parts of this great city which are subject to its jurisdiction, and lie without the walls of London, are bounded on the east, in Whitechapel, the Minories, and Bishopsgate, by bars, which were formerly posts and chains, that were frequently taken away by arbitrary power, when it was thought proper to seize the franchises of the city of London; on the north, they are bounded in the same manner in Pickaxe-street, at the end of Fan-alley, and in St John's-street: on the west, by bars in Holborn: at the east end of Middle Row, and at the west end of Fleet-street, by the gate called Temple-Bar, already mentioned. On the south, we may include the jurisdiction which the city holds on the river Thames, and over the borough of Southwark.

The city, including the borough, is at present divided into 32 wards.

1. Aldersgate ward takes its name from a city-gate which lately stood in the neighbourhood. It is bounded on the east by Cripplegate ward; on the west, by Farrington ward within and without; and on the south, by Farrington ward within. It is very large, and is divided into Aldersgate-within and Aldersgate-without. Each of these divisions consists of four precincts, under one alderman, eight common-council men, of whom two are the alderman's depute, eight constables, fourteen inquest-men, eight scavengers, and a beadle; exclusive of the officers belonging to the liberty of St Martin's le Grand, which contains 168 houses.

2. Aldgate takes its name also from a gate, which was of great antiquity, being mentioned in King Edgar's charter to the knights of the Knights-Guild about the year 990; and was probably of a much more ancient foundation, for it was the gate through which the Roman vicinal way lay to the ferry at Oldford. In the time of the wars between King John and his barons, the latter effected the city through this gate, and committed great devastations among the houses of the religious. Aldgate was rebuilt by the leaders of the party after the Roman manner. They made use of stone which they brought from Caen, and a small brick called the Flanders tile, which Mr Pennant thinks has been often mistaken for Roman. The new gate was very strong, and had a deep well within it. In 1471, this gate was assaulted by the Bastard of Falconbridge, who got possession of it for a few hours, but the portcullis being drawn up, the troops which had entered were all cut off, and the citizens, headed by the alderman of the ward and recorder, having made a sally, defeated the remainder with great slaughter. In 1666, Aldgate was taken down and rebuilt; and many Roman coins were found in digging the foundations. The ward of Aldgate is bounded on the east by the city wall, which divides it from Portsoken ward; on the north, by Bishopsgate ward; on the west, by Lime-street and Langbourn wards; and on the south, by Tower-street ward. It is governed by an alderman, six common-council men, six constables, twenty inquest-men, seven scavengers, and a beadle; besides the officers belonging to St James's, Duke's Palace. It is divided into seven precincts.

3. Bawishawe or Basinghall ward, is bounded on the east and south by Coleman-street ward, on the north by part of Cripplegate, and on the west by part of the wards of Cheap and Cripplegate. On the south, it begins at Blackwell-hall; and runs northward to London wall, pulled down some time ago to make way for new buildings in Fore-street, and spreads 38 feet east, and 54 feet west against the place where that wall stood. This is a very small ward, and consists only of two precincts: the upper precinct contains no more than 66, and the lower only 76 houses. It is governed by an alderman, four common-council men, of whom one is the alderman's deputy, three constables, seventeen inquest-men, three scavengers, and a beadle. It has its name from Bawishall, the possession-house of the family of Basing, which was the principal house in it, and stood in the place of Blackwell-hall.

4. Billingsgate ward is bounded on the east by Tower-street ward; on the north, by Langbourn ward; on the west, by the ward of Bridge-within; and on the south, by the river Thames. There have been many conjectures concerning the origin of the name of Billingsgate, none of which seems to be very well authenticated. It is, for instance, supposed to have derived its name from a British king named Belinus, said to have been an assistant of Brutus king of the Gauls at the taking of Rome, and is the same with the Belmass mentioned in the Welsh genealogies. The name of Ludgate is said to be derived from his son Lord. It is divided into 12 precincts; and is governed by an alderman, 10 common-council men, one of whom is the alderman's deputy, 11 constables, 14 inquest-men, six scavengers, and a beadle. The situation of Billingsgate, on the river, gives it great advantage for the sale of merchandise; so that it is well inhabited, and is in a continual hurry of business at the several wharfs or quays.

5. Bishopsgate ward is bounded on the east by Aldgate ward, Portsoken ward, and part of the Tower-livery, or Norton-falgate; on the west, by Broadstreet ward and Moorfields; and on the south, by Langbourn ward.
9. Candlewick ward, Candlewick-street, or Candlewick-street ward as it is called in some ancient records, is bounded on the east by Bridge ward; on the south, by Dowgate and part of Bridge ward; on the west, by Dowgate and Wallbrook; and on the north, by Langbourn ward. It is but a small ward, consisting of about 256 houses; yet is divided into seven subwards. It is governed by an alderman, eight common-council men, of whom one is the alderman's deputy, seven constables, 13 inquest-men, seven scavengers, and a beadle. It has its name from a street, formerly inhabited chiefly by candlewrights or candle-makers, both in tallow and wax; a very profitable business in the times of Popery, when incredible quantities of wax candles were consumed in the churches. That street, however, or at least its name, Candlewick, is lost since the great conflagration, for which the name Canon-street is substituted, the candlewrights being at that time burnt out and dispersed through the city.

10. Castle-Baynard ward is bounded by Queenhithe and Bread-street wards on the east; on the south, by the Thames; and on the west and north by the ward of Farringdon-within. It is divided into 10 precincts, under the government of an alderman, 12 common-council men, one of whom is the alderman's deputy, nine constables, 14 inquest-men, seven scavengers, and a beadle. It takes its name from a castle built on the bank of the river by one Baynard, a soldier of fortune, who came in with William the Conqueror, and was by that monarch raised to great honours and authority.

11. Cheap ward is bounded on the east by Broad-street and Wallbrook wards; on the north, by Coleman-street, Bassishaw, and Cripplegate; and on the south, by Cordwainers ward. It is divided into nine precincts; and is governed by an alderman, 12 common-council men, of whom one is the alderman's deputy, 11 constables, 13 inquest-men, nine scavengers, and a beadle. It has its name from the Saxon word chepe, which signifies a market, kept in this division of the city, now called Cheapside; but then known by the name of Westcheap, to distinguish it from the market then also kept in Eastcheap, between Canon or Candlewick-street and Tower-street.

12. Coleman-street ward is bounded on the east by Bishopsgate, Broad-street, and Cheap wards; on the north, by Cripplegate ward, Middle Moordells, and Bishopsgate; on the south, by Cheap ward; and on the west, by Bassishaw ward. It is divided into six precincts; and is governed by an alderman, six common-council men, one of whom is the alderman's deputy, six constables, 13 inquest-men, six scavengers, and a beadle. The origin of the name is not certainly known.

13. Cordwainers ward is bounded on the east by Wallbrook, on the south by Vintry ward, on the west by Bread-street, and on the north by Cheap ward. It is divided into eight precincts; and is governed by an alderman, eight common council men, one of whom is the alderman's deputy, eight constables, 14 inquest-men, eight scavengers, and a beadle. Its proper name is Cordwainers-street ward; which it has from Cordwainers-street, now Bow-lane, formerly occupied chiefly
14. Cornhill ward is but of small extent. It is bounded on the east by Bishopsgate, on the north by Broad-street, on the north by Cheap ward, and on the south by Langbourn ward. It is divided into four precincts, which are governed by one alderman, six common-council men, of whom one is the alderman's deputy, four constables, 16 inquest-men, four scavengers, and a beadle. It takes its name from the principal street in it, known from the earliest ages by the name of Cornhill, because the corn-market was kept there.

15. Cripplegate ward is bounded on the east by Moorfields, Coleman-street ward, Bassishaw ward, and Cheap ward; on the north by the parish of St Luke's, Old-street; on the west, by Aldersgate ward; and on the south, by Cheap ward. It is divided into 13 precincts, nine within and four without the wall; and is governed by an alderman, 12 common-council men, of whom two are the alderman's deputies, 13 constables, 34 inquest-men, 76 scavengers, and three beadles. It takes its name from Cripplegate, which stood on the north-west part of the city wall. It was an old plain void, made of all ornament, with one postern; but had more the appearance of a fortification than any of the other gates. It was removed in order to widen the entrance into Wood-street, which, by the narrowness of the gateway, was too much contracted and rendered dangerous for passengers and great waggons.

16. Dowgate ward is bounded on the east by Candlewick and Bridge wards, on the north by Wallbrook ward, on the west by Vintry ward, and on the south by the Thames. It is divided into eight precincts, under the government of an alderman, eight common-council men, of whom one is the alderman's deputy, eight constables, 15 inquest-men, five scavengers, and a beadle. It has its name from the ancient water gate, called Dowgate, which was made in the original wall that ran along the north side of the Thames, for the security of the city against all attempts to invade it by water.

17. Farringdon ward within is bounded on the east by Cheap ward and Baynard-castle ward; on the north, by Aldersgate and Cripplegate wards, and the liberty of St Martin's le Grand; on the west by Farringdon-without; and on the south by Baynard-castle ward and the river Thames. It is divided into 18 precincts; and governed by one alderman, 17 common-council men, of whom one is the alderman's deputy, 19 constables, 17 inquest men, 19 scavengers, and two beadles. It takes its name from William Farringdon, citizen and goldsmith of London, who, in 1279, purchased all the aldermanny with the appurtenances, within the city of London and suburbs of the same, between Ludgate and Newgate, and also without these gates.

18. Farringdon ward without is bounded on the east by Farringdon within, the precinct of the late priory of St Bartholomew near Smithfield, and the ward of Aldersgate; on the north, by the Charter-house, the parish of St John's Clerkenwell, and part of St Andrew's parish without the freedom; on the west, by High Holborn and St Clement's parish in the Strand; and on the south by the river Thames. It is governed by one alderman, 16 common-council men, of whom two are the alderman's deputies, 23 constables, 48 inquest-men, 24 scavengers, and four beadles. It takes its name from the same goldsmith who gave name to Farringdon within.

19. Langbourn ward is bounded on the east by Aldgate ward, on the north, by part of the same, and Lime-street ward; on the south, by Tower-street, Billingsgate, Bridge, and Candlewick wards; and on the west by Wallbrook. It is divided into 12 precincts. It had its name from a rivulet or long bourn of fresh water, which anciently flowed from a spring near Magpye alley adjoining to St Catherine Coleman's church.

20. Lime-street ward is bounded on the east and north by Aldgate ward, on the west by Bishopsgate; and on the south by Langbourn ward. It is divided into four precincts; and governed by an alderman, four common-council men, one of whom is the alderman's deputy, four constables, 13 inquest-men, four scavengers, and a beadle. It is very small, and has its name from some lime kilns that were formerly built in or near Lime-street.

21. Portsoken ward is bounded on the east by the parishes of Spitalfields, Stepney, and St George's in the east; on the south, by Tower-hill, on the north, by Bishopsgate ward, and on the west by Aldgate ward. It is divided into five precincts; and is governed by an alderman, five common-council men, one of whom is the alderman's deputy, five constables, 19 inquest-men, five scavengers, and a beadle. Its name signifies the franchise of the liberty gate. This Portsoken was for some time a guild; and had its beginning in King Edgar, when 13 knighth, "well beloved of the king and realm, for services by them done," requested to have a certain portion of land on the east part of the city, left desolate and forsaken of the inhabitants by reason of too much servitude. They besought the king to have this land, with the liberty of a guild for ever. The king granted their request on the following condition, viz. that each of them should victoriously accomplish three combats, one above the ground, one under ground, and the third in the water: and after this, at a certain day, in East Smithfield, they should run with spears against all comers. All this was gloriously performed; upon which the king named it Knights Guild, and extended it from Aldgate to the places where the bars now are on the east, and to the Thames on the south, and as far into the water as a horseman could ride at low water and throw his spear.

22. Queenhithe ward is bounded on the east by Dowgate, on the north by Bread-street and Cordwainers wards, on the south by the Thames, and on the west by Castle-Baynard ward. It is divided into nine precincts; and is governed by one alderman, six common-council men, one of whom is the alderman's deputy, and nine constables. It has its name from the hithe, or harbour for large boats, barges, and lighters; for which, and even for ships, it was the anchoring place, and the quay for loading and unloading vessels almost of any burden used in ancient times. It has the name of queen, because the queens of England usually possessed the tolls and customs of vessels that unloaded goods at this hithe, which were very considerable.

23. Tower ward, or Tower-street ward, is bounded on the south by the river Thames, on the east by Tower-hill.
L O N

Division into Wards.

Tower-hill and Aldgate ward, on the north by Langbourn ward, and on the west by Billingeigate ward. It is governed by one alderman, 12 common-council men, of whom one is the alderman's deputy, 12 constables, 13 inquest-men, 12 scavengers, and one beadle. It takes its name from Tower-street, so called because it leads out of the city in a direct line to the principal entrance of the Tower of London.

24. Vintry ward is bounded on the east by Dowgate, on the south by the Thames, on the west by Queenhithe ward, and on the north by Cordwainers ward. It is a small ward, containing only 418 houses; but is divided into nine precincts, and governed by an alderman, nine common-council men, one of whom is the alderman's deputy, nine constables, 13 inquest-men, three scavengers, and a beadle. It takes its name from the vintners or wine-merchants of Bourdeaux, who formerly dwelt in this part of the city, were obliged to land their wines on this spot, and to sell them in 40 days, till the 28th of Edward I.

25. Wallbrook ward is bounded on the east by Langbourn, on the south by Dowgate ward, on the west by Cordwainers ward, and on the north by Cheapside. It is small, containing only 306 houses; but is divided into seven precincts, and governed by an alderman, eight common-council men, of whom one is the alderman's deputy, seven constables, 13 inquest-men, six scavengers, and a beadle. It has its name from the rivulet Wallbrook, that runs down the street of this name into the river Thames near Dowgate; but in process of time it was so lost by covering it with bridges, and buildings upon these bridges, that its channel became a common sewer.

The town of Bridge without includes the borough of Southwark, and the parishes of Rotherhithe, Newington, and Lambeth. It has its name from London bridge, with the addition of the word without, because the bridge must be passed in order to come at it. Westminster is generally reckoned a part of London, though under a distinct government; and has long been famous for the palaces of our kings, the seat of our law tribunals, and of the high court of parliament; all which shall be described in their order.

The city and liberties of London are under an ecclesiastical, a civil, and a military government.

As to its ecclesiastical government, London is a bishop's see, the diocese of which comprehends not only Middlesex, Essex, and part of Hertfordshire, but the British plantations in America. The bishop of London takes precedence next to the archbishops of Canterbury and York; but the following parishes of this city are exempt from his jurisdiction, being peculiar under the immediate government of the archbishop of Canterbury, viz. All-hallows in Bread-street, All-hallows Lombard-street, St. Dunstan in the East, St. John Baptist, St. Leonard Eastcheap, St. Mary Aldermary, St. Mary Botolph, St. Mary le Bow, St. Michael Crooked-lane, St. Michael Royal, St. Pancras Soper-lane, and St. Vedast Foster-lane.

The civil government of London divides it into wards and precincts, under a lord mayor, aldermen, and common-council.

The mayor, or lord mayor, is the supreme magistrate, chosen annually by the citizens, pursuant to a charter of King John. The present manner of electing a lord mayor is by the liverymen of the several companies, assembled in Guildhall annually on Michaelmas-day, according to an act of common council in A.D. 1476, where, and when, the liverymen choose, or rather nominate, two aldermen below the chair, who have served the office of sheriff, to be returned to the court of aldermen, who may choose either of the two; but generally declare the senior of the two, so returned, to be lord mayor elect. The election being over, the lord mayor elect, accompanied by the recorder and divers aldermen, is soon after presented to the lord chancellor (as his majesty's representative in the city of London) for his approbation; and on the 28th of November following is sworn into the office of mayor at Guildhall; and on the day after, before the barons of the exchequer at Westminster, the procession on which occasion is exceedingly grand and magnificent.

The lord mayor sits every morning at the mansion-house, or place where he keeps his mayoralty, to determine any difference that may happen among the citizens, and to do other business incident to the office of a chief magistrate. Once in six weeks, or eight times in the year, he sits as chief judge of oyer and terminer, or gaol-delivery of Newgate for London and the county of Middlesex. His jurisdiction extends all over the city and suburbs, except some places that are exempt. It extends also from Colneyhithe, above Staines-bridge in the west, to Yeodale, or Yeomlet, and the mouth of the river Medway, and up that river to Upnor castle, in the east; by which he exercises the power of punishing or correcting all persons that shall annoy the streams, banks, or banks. For which purpose his lordship holds several courts of consistory in the counties adjacent to the said river, for its conservation, and for the punishment of offenders. See the article MAYOR'S COURT.

The title of dignity, alderman, is of Saxon original, Alderman, and of the greatest honour, answering to that of earl; though now it is nowhere to be found but in chartered societies. And from hence we may account for the reason why the aldermen and commonalty of London were called barons after the Conquest. These magistrates are properly the subordinate governors of their respective wards under the lord mayor's jurisdiction; and they originally held their aldermannies either by inheritance or purchase; at which time the aldermannies or wards changed their names as often as their governors or aldermen. The oppressions, to which the citizens were subject from such a government, put them upon means to abolish the perpetuity of that office; and they brought it to an actual election. But that manner of election being attended with many inconveniences, and becoming a continual bone of contention among the citizens, the parliament, 17 Richard II. A.D. 1394, enacted, that the aldermen of London should continue in their several offices during life or good behaviour. And so it still continues: though the manner of electing has several times varied. At present it is regulated by an act of parliament, passed in the year 1724; and the person so elected is to be returned by the lord mayor (or other returning officer in his stead, duly qualified to hold a court of wardmote) to the court of lord mayor and aldermen, by whom the person
by the livermen of the several companies on Midsummer day. Their office, according to Camden, in general, is to collect the public revenues within their several jurisdictions; to gather into the exchequer all fines belonging to the crown; to serve the king’s writs of process; to attend the judges, and execute their orders; to impanel juries; to compel headstrong and obstinate men by the posse comitatus to submit to the decisions of the law; and to take care that all condemned criminals be duly punished and executed. In particular, in London, they are to execute the orders of the common-council, when they have resolved to address his majesty, or to petition parliament.

The sheriffs, by virtue of their office, hold a court at Guildhall every Wednesday and Friday, for actions entered at Wood-street Compter; and on Thursdays, and Saturdays, for those entered at the Poultry Compter: of which the sheriffs being judges, each has its assistant, or deputy, who are called the judges of those courts; before whom are tried actions of debt, trespass, covenant, &c. and where the testimony of any absent witness in writing is allowed to be good evidence. To each of these courts belong four attorneys, who, upon their being admitted by the court of aldermen, have an oath administered to them.

To each of these courts likewise belong a secondary, a clerk of the papers, a prothonotary, and four clerks-sitters. The secondary’s office is to allow and return all writs brought to remove clerks out of the said courts; the clerk of the papers files and copies all declarations upon actions; the prothonotary draws and engrosses all declarations; the clerk-sitters enter actions and attachments, and take bail and verdicts. To each of the compters, or prisons belonging to these courts, appertain 16 serjeants at mace, with a yeoman to each, besides inferior officers, and the prison-keeper.

In the sheriffs’ court may be tried actions of debt, case, trespass, account, covenant, and all personal actions, attachments, and sequestrations. When an erroneous judgment is given in either of the sheriffs’ courts of the city, the writ of error to reverse this judgment must be brought in the court of hustings before the lord mayor; for that is the superior court. The sheriffs of London may make arrests and serve executions on the river Thames.

We do not read of a recorder till the 1304, who, by the nature of his office, seems to have been intended as an assistant to, or assessor with, the lord mayor, in the execution of his high office, in matters of justice and law. He is chosen by the lord mayor and aldermen only; and takes place in all courts, and in the common-council, before any one that hath not been mayor. Of whom we have the following description in one of the books of the chamber: “He shall be, as is wont to be, one of the most skilful and virtuous apprentices of the law of the whole kingdom; whose office is always to sit on the right hand of the mayor, in recording pleas, and passing judgments; and by whom records and processes, had before the lord mayor and aldermen at Great St Martin’s, ought to be recorded by word of mouth before the judges assigned there to correct errors. The mayor and aldermen have therefore used commonly to set forth all other businesses, touching the city, before the king and his
LONDON.

and citizens, and to attend them in hunting in those grounds to which they are authorized by charter. 6. The common crier. It belongs to him and the serjeant at arms, to summon all executors and administrators of freemen to appear, and to bring in inventories of the personal estates of freemen, within two months after their decease: and he is to have notice of the appraisements. He is also to attend the lord mayor on set days, and at the courts held weekly by the mayor and aldermen. 7. The water bailiff, whose office is to look after the preservation of the river Thames against all encroachments; and to look after the fishermen for the preservation of the young fry, to prevent the destroying them by unlawful nets. For that end, there are juries for each county, that hath any part of it lying on the sides or shores of the said river; which juries, summoned by the water bailiff at certain times, do make inquiry of all offences relating to the river and the fish, and make their presentments accordingly. He is also bound to attend the lord mayor on set days in the week. These seven purchase their places; except the town clerk, who is chosen by the livery.

There are also three serjeant carvers; three serjeants of the chamber; a serjeant of the channel; four yeomen of the water side; an under water bailiff; two yeomen of the chamber; two meal weathers; two yeomen of the wood wharfs; a foreign taker; city marshals. There are besides these, seven gentlemen's men; as the sword-bearer's man, the common hunt's two men, the common crier's man, and the carvers three men.

Nine of the foregoing officers have liveries of the lord mayor, viz. the sword-bearer and his man, the three carvers, and the four yeomen of the water side. All the rest have liveries from the chamber of London.

The following officers are likewise belonging to the city; farmer of the markets, auditor, clerk of the chamber, clerk to the commissioners of the sewers, clerk of the court of conscience, beadle of the same court, clerk of the city works, printer to the city, justice of the Bridge yard, clerk comptroller of the Bridge house, steward of the Borough, bailiff of the Borough.

There is also a coroner, called so from corona, i.e. a crown, because he deals principally with the crown, or in matters pertaining to the imperial crown of England. See the article CORONER.

Besides these officers, there are several courts in this city for the executing of justice, viz. the court of hustings, lord mayor's court, &c. In the city there are also two subordinate kinds of governement. One executed by the aldermen, deputy, and common-council men, and their inferior officers, in each ward; under which form are comprehended all the inhabitants, free or not free of the city. Every ward is therefore like a little free state, and at the same time subject to the lord mayor as chief magistrate of the city. The housekeepers of each ward elect their representatives, the common-council, who join in making bye-laws for the government of the city. The officers and servants of each ward manage the affairs belonging to it, without the assistance of the rest; and each has a court called the wardmote, as has been already described, for the management of its own affairs. The other, by the

The next chartered officer of this corporation is the chamberlain; an officer of great repute and trust, and is in the choice of the livery annually. This officer, though chosen annually on Midsummer-day, is never displaced during his life, except some very great crime can be made out against him. He has the keeping of the moneys, lands, and goods, of the city orphans, or takes good security for the payment thereof when the parties come to age. And to that end he is deemed in the law a sole corporation, to him and his successors, for orphans; and therefore a bond or a recognizance made to him and his successors, is recoverable by his successors. This officer hath a court peculiarly belonging to him. His office may be termed a public treasury, collecting the customs, moneys, and yearly revenues, and all other payments belonging to the corporation of the city. It was customary for government to appoint the chamberlain receiver of the land tax; but this has been discontinued for several years past.

The other officers under the lord mayor are 1. The common serjeant. He is to attend the lord mayor and court of aldermen on court days, and to be in council with them on all occasions, within or without the precincts or liberties of the city. He is to take care of orphans estates, either by taking account of them, or to sign their indentures, before their passing the lord mayor and court of aldermen. And likewise he is to set, let, and manage the orphans estates, according to his judgment, to the best advantage. 2. The town clerk; who keeps the original charter of the city, the books, rolls, and other records, wherein are registered the acts and proceedings of the city; so that he may not be improperly termed the city-register; he is to attend the lord mayor and aldermen at their courts, and signs all public instruments. 3. The city remembrancer; who is to attend the lord mayor on certain days, his business being to put his lordship in mind of the select days he is to go abroad with the aldermen, &c. He is to attend daily at the parliament house, during the sessions, and to report to the lord mayor their transactions. 4. The sword-bearer; who is to attend the lord mayor at his going abroad, and to carry the sword before him, being the emblem of justice. This is an ancient and honourable office, representing the state and princely office of the king's most excellent majesty, in his representative the lord mayor; and, according to the rule of armory, "He must carry the sword upright, the hilt being held under his bulk, and the blade directly up the midst of his breast, and so forth between the sword-bearer's brows." 5. The common hunt; whose business it is to take care of the pack of hounds belonging to the lord mayor.

Other offices.
LONDON.

Government.

Master, wardens, and court of assistants, of the incorporate companies; whose power reaches no farther than over the members of their respective guilds or fraternities; except that in them is vested the power to choose representatives in parliament for the city, and all those magistrates and officers elected by a common hall; which companies are invested with distinct powers, according to the tenor of their respective charters.

The military government of the city is lodged in a lieutenancy, consisting of the lord mayor, aldermen, and other principal citizens, who receive their authority by a commission from the king. Those have under their command the city trained bands, consisting of six regiments of foot, distinguished by the names of the white, orange, yellow, blue, green, and red, each containing eight companies of 150 men, amounting in all to 7200. Besides these six regiments, there is a corps called the artillery company, from its being taught the military exercise in the artillery ground. This company is independent of the rest, and consists of 700 or 800 volunteers. All these, with two regiments of foot of 800 men each, commanded by the lieutenant of the Tower of London, make the whole militia of this city; which, exclusive of Westminster and the borough of Southwark, amounts to about 10,000 men.

The trading part of the city of London is divided into 89 companies; though some of them can hardly be called so, because they have neither charters, halls, nor liverys. Of these 89 companies, 55 have each a hall for transacting the business of the corporation; and this consists of a master or prime warden, a court of assistants and livery. Twelve of these companies are superior to the rest both in antiquity and wealth; and of one of those 12 the lord mayors have generally made themselves free at their election. These companies are the mercers, grocers, drapers, fishmongers, goldsmiths, skinners, merchant-taylors, haberdashers, salters, ironmongers, vintners, and clothworkers. The principal incorporated societies of the merchants of this city are, the Hamburgh Company, the Hudson's Bay Company, the Russia Company, the Turkey Company, the East India Company, the Royal African Company, the South Sea Company, and some Insurance Companies. The most of these companies have stately houses for transacting their business, particularly the East India and South Sea Companies. See Company.

The streets and public buildings in London and its liberties being far too numerous for a particular description in this work, we shall only select the most remarkable, beginning with London Bridge as the most ancient, and proceeding in our survey through the wards into which the city is divided.

I. Remarkable Buildings, &c. in the City.—The original bridge, which stands in Bridge ward, was of wood, and appears to have been first built between the years 993 and 1016; but being burnt down about the year 1136, it was rebuilt of wood in 1163. The expenses, however, of maintaining and repairing it became so burdensome to the inhabitants of the city, that they resolved to build a stone bridge a little westward of the wooden one. This building was begun in 1176, and finished in 1209; and was 915 feet long, 44 feet high, and 73 feet wide; but houses being built on each side, the space between was only 23 feet.

This great work was founded on enormous piles driven as closely as possible together: on their tops were laid long planks 10 inches thick, strongly bolted; and on them was placed the base of the piers, the lowermost stones of which were bedded in pitch, to prevent the water from damaging the work; around all were the piles which were called the stolings, designed for the preservation of the foundation piles. These contracted the space between the piers so greatly, as to occasion at the retreat of every tide a fall of five feet, or a number of temporary cataracts, which since the foundation of the bridge have occasioned the loss of many thousand lives. The number of arches was 19, of unequal dimensions, and greatly deformed by the stolings and the houses on each side, which overhung and leaned in a most terrific name. In most places they hid the arches, and nothing appeared but the rude piers. Within recollection, frequent arches of strong timber crossed the street from the tops of the houses to keep them together, and from falling into the river (A). Nothing but use could preserve the quiet of the inmates, who soon grew deaf to the noise of the falling waters, the clamours of watermen, or the frequent shrieks of drowning wretches. In one part had been a drawbridge, useful either by way of defence or for the admission of ships into the upper part of the river. This was protected by a strong tower. It served to repulse Falconbridge the Bastard in his general assault on the city in 1471, with a set of banditti, under pretence of rescuing the unfortunate Henry, then confined in the Tower. Sixty houses were burnt on the bridge on the occasion. It also served to check, and in the end annihiliate, the ill-conducted insurrection of Sir Thomas Wyat, in the reign of Queen Mary. The top of this tower, in the sad and turbulent days of this kingdom, used to be the shambles of human flesh, and covered with heads of quarters.

(A) The gallant action of Edmund Osborne, ancestor to the duke of Leeds, when he was apprentice to Sir William Hewet, cloth-worker, may not improperly be mentioned in this place. About the year 1326, when his master lived in one of those tremendous houses, a servant maid was playing with his only daughter in her arms in a window over the water, and accidentally dropped the child. Young Osborne, who was witness to the misfortune, instantly sprang into the river, and beyond all expectation, brought her safe to the terrified family! Several persons of rank paid their addresses to her when she was marriageable, among others the earl of Shrewsbury; but Sir William gratefully decided in favour of Osborne: Osborne, says he, saved her, and Osborne shall enjoy her. In her right he possessed a great fortune. He became sheriff of London in 1575, and lord mayor in 1582.
LONDON.

Public Buildings.

The narrowness of the passage on this bridge, and the straitness of the arches, having occasioned frequent and fatal accidents, the magistrates of London, in 1756 and 1758, obtained acts of parliament for improving and widening the passage over and through the bridge. In consequence of these acts of parliament, a temporary wooden bridge was built, and the houses on the old bridge were taken down. Instead of a narrow street 23 feet wide, there is now a passage of 31 feet for carriages, with a raised pavement of stone on each side 7 feet broad for the use of foot passengers. The sides are secured by stone balustrades, lighted in the night with lamps. The passage through the bridge is enlarged by throwing the two middle arches into one, and by other alterations and improvements; notwithstanding which, it is still greatly subject to its former inconveniences.

The Strand or Waterloo Bridge is one of the noblest structures of the kind in the world, whether we regard the simple and chaste grandeur of its architecture, its convenience as a bridge, or the impression of indestructibility which it forces on the mind. It was begun in the year 1811, and opened in 1817, on the anniversary of the battle of Waterloo. The architect was Mr. Rennie. It cost rather more than one million of money, all of which was raised by private subscription. It crosses the Thames near the Savoy to the opposite shore of Lambeth-marsh. It contains 9 equal arches, each of 127 feet span. The piers are 20 feet high; the width within the parapets 42 feet, the footpaths being 7 feet each, and the roadway 28 feet. It is perfectly flat, and is built of granite.

The Vauxhall, which was begun nearly at the same time as the Waterloo Bridge, crosses the Thames from Milbank to the Cumberland tea-gardens near Vauxhall. It consists of 9 arches of equal span, of cast-iron. The span is 78 feet, the height 29 feet, and the breadth of the roadway 36 feet: the length is 899 feet. It was built by private subscription, and cost nearly 300,000l. A road is opened from it to Pimlico, and thus it is connected with Hyde Park corner.

Southwark Bridge is not yet finished. It crosses the Thames at the bottom of Queen's Street Cheapside to Bankside. It consists of 3 arches of cast-iron. The centre arch is 240 feet span, and the side ones 210 feet each. The river here is narrow, but deep and rapid. The estimate is 387,000l. Mr. Rennie is the architect. It is building by private subscription.

Near the north side of London bridge stands the Monument, a beautiful and magnificent fluted column of the Doric order, built with Portland stone, and erected in memory of the conflagration 1666. It was begun by Sir Christopher Wren in 1671, and finished by him in 1677. Its height from the pavement is 202 feet; the diameter of the shaft, or body of the column, is 15 feet; the ground-plinth, or lowest part of the pedestal, is 28 feet square; and the pedestal is 40 feet high. Over the capital is an iron balcony encompassing a cone 32 feet high, which supports a blazoning urn of gilt brass. Within is a staircase of black marble, containing 32 steps, each ten inches and a half broad, and six inches thick. The west side is adorned with a curious emblem in alt-relief, denoting the destruction and restoration of the city. The first female figure represents London sitting in ruins, in a languishing posture, with her head dejected, her hair dishevelled, and her hand carelessly lying on her sword. Behind is Time, gradually raising her up: at her side is a woman touching her with one hand, whilst a winged sceptre in the other directs her to regard the goddesses in the clouds; one with a cornucopia, denoting Plenty; the other with a palm branch, the emblem of Peace. At her feet is a bee-hive, showing, that by industry and application the greatest misfortunes are to be overcome. Behind the figure of Time are citizens exulting at his endeavours to restore her; and beneath, in the midst of the ruins, is a dragon, who, as the supporter of the city arms, with his paw endeavours to preserve the same. Opposite to the city, on an elevated pavement, stands the king in a Roman habilis, with a laurel on his head, and a truncheon in his hand; and approaching her, commands three of his attendants to descend to her relief. The first represents the Sciences with a winged head and circle of naked boys dancing thereon; and holding Nature in her hand, with her numerous breasts, ready to give assistance to all. The second is Architecture, with a plan in one hand, and a square and pair of compasses in the other; and the third is Liberty, waving a bat in the air, showing her joy at the pleasing prospect of the city's speedy recovery. Behind the king stands his brother the duke of York, with a garland in one hand to crown the rising city, and a sword in the other for her defence. The two figures behind are Justice and Fortitude; the former with a coronet, and the latter with a rein'd lion; and under the royal pavement lies Envy, gnawing a heart, and incessantly emitting pernicious fumes from her mouth. On the plinth the reconstruction of the city is represented by busts and labourers at work upon houses. On the north, south, and east sides, are inscriptions relating to the destruction occasioned by the conflagration, the regulations about rebuilding the city, and erecting the monument; and round it is the following one:—"This pillar was set up in perpetual remembrance of the most dreadful burning of this Protestant city, begun and carried on by the treachery and malice of the Popish faction, in the beginning of September, in the year of our Lord 1666, in order to their carrying on their horrid plot for extirpating the Protestant religion and old English liberty, and introducing Popery and slavery." Dr. Wendeborn, in his account of London, observes, that the monument, though not much above 100 years old, bears visible marks of decay already; and it will not probably be long before it must be pulled down. Some
are of opinion that this is occasioned by the fault of
the architect, others by the continual shaking of the
ground by coaches; but the doctor inclines to the lat-

er opinion.

The Tower. Eastward of the bridge and monument stands the
Tower, which gives name to another ward. It is the
chief fortress of the city, and supposed to have been originally built by William the Conqueror. It ap-
pears, however, to have been raised upon the remains
of a more ancient fortress, erected probably by the Ro-
mans: for in 1723, in digging on the south side of
what is called Cesar's Chapel, there were discovered
some old foundations of stone, three yards broad, and
so strongly cemented that it was with the utmost dif-

culty they were forced up. The first work (accord-
ing to Mr Pennant) seems to have been suddenly flung
up in 1066 by the Conqueror, on his taking possession
of the capital; and included in it a part of the ancient

wall.

The great square tower, called the White Tower,
was erected in the year 1078, when it arose under the
directions of Gundulph bishop of Rochester, who was a
great military architect. This building originally stood
by itself. Fitz-Stephen gives it the name of Arx Pa-
alatina, " the Palatine Tower; " the commander of
which had the title of Palatine bestowed on him. With-
in this tower is a very ancient chapel for the use of such
of our kings and queens who wished to pay their de-

votion here. In 1092 a violent tempest did great in-
jury to the Tower; but it was repaired by William
Rufus and his successor. The first added another ca-
stellated building on the south side between it and the
Thames, which was afterwards called St Thomas's

Tower.

The Tower was first enclosed by William Long-
champ bishop of Ely and chancellor of England, in
the reign of Richard I. This haughty prelate having a
quarrel with John, third brother to Richard, under
pretence of guarding against his designs, surrounded the
whole with walls embattled, and made on the out-
side a vast ditch, into which, in after times, the water
from the Thames was introduced. Different princes
added other works. The present contents within the
walls are 172 acres and 3 rods, the circuit on the out-
side of the ditch 1052 feet. It was again enclosed
with a mud wall, by Henry III.: this was placed at a
distance from the ditch, and occasioned the taking
down part of the city-wall, which was resented by the
citizens; who, pulling down this precinct of mud, were
punished by the king with a fine of a thousand
marks.

The Lion Tower was built by Edward IV. It was
originally called the Butwalke, but received the former
name from its use. A menagerie had very long been
a piece of regal state; Henry I. had bis at his manor
of Woodstock, where he kept lions, leopards, lynxes,
porcupines, and several other uncommon beasts. They
were afterwards removed to the Tower. Edward II.
commanded the sheriffs of London to pay the keepers
of the king's leopards sixpence a-day for the suste-
nance of the leopards, and three halfpence a-day for
the diet of the keeper out of the fee-farm of the city.
The royal menagerie is to this day exceedingly well
supported.

In 1758 the Tower ditch was raised all round. New
barracks were some years ago erected on the Tower
wharf, which parts it from the river; and upon the
wharf is a line of 61 pieces of cannon, which are fired
upon state holidays. On this side of the Tower the
ditch is narrow, and over it is a drawbridge. Parallel
to the wharf, within the walls, is a platform 70 yards
in length called the Ladies Line, because much fre-
cuenced by the ladies in the summer; it being shaded
in the inside with a row of lofty trees, and without
is a delightful prospect of the shipping with boats pas-
ning and repassing on the river Thames. You ascend
this line by stone steps, and being once upon it you may
walk almost round the walls of the Tower without in-

terruption.

The principal entrance into the Tower is by a gate
to the west, large enough to admit coaches and heavy
carriages; but these are first admitted through an out-
ward gate, situated without the ditch upon the hill,
and must pass a stout stone bridge built over the ditch
before they can approach the main entrance. There
is, besides, an entrance near the very south-west corner
of the Tower outward wall, for persons on foot, over
the drawbridge already mentioned to the wharf.
There is also a water-gate commonly called Traitor's
gate, through which it has been customary to convey
traitors and other state prisoners to or from the Tower,
and which is seldom opened on any other occasion;
but the lords committed to the Tower in 1746 were
publicly admitted at the main entrance. Over this gate
is a regular building, terminated at each end by two
round towers, on which are embrasures for pointing
cannon. In this building there are the infantry, the
mill, and the water-works that supply the Tower with
water.

In the Tower, the curiosities of which are more
particularly described in the note (a), are a church,
the offices of ordinance, those of the keepers of the
records

(a) In examining the curiosities of the Tower of London, it will be proper to begin with those on the
outside of the principal gate. The first thing a stranger usually goes to visit is the wild beasts; which, from
their situation, first present themselves: for having entered the outer gate, and passed what is called the spur-
guard, the keeper's house presents itself before you, which is known by a painted lion on the wall, and another
over the door which leads to their dens. By ringing a bell, and paying sixpence each person, you may easily

gain admittance.

On passing the principal gate you see the White Tower, built by William the Conqueror. This is a large,
square, irregular stone building, situated almost in the centre, no one side answering to another, nor any of its
watch-towers, of which there are four at the top, built alike. One of these towers is now converted into an ob-

servatory. In the first story are two noble rooms, one of which is a small armory for the sea-service, it hav-
ing various sorts of arms, very curiously laid up, for above 10,000 seamen. In the other room are many closets
and
records, of the jewel office, of the Spanish armory, the horse armory, and the new or small armory; with barracks for the soldiers of the garrison, and handsome houses for several officers who reside here. The principal officers of the Tower, are, a constable, a lieutenant, and a deputy-lieutenant. Belonging to this fortress are 11 hamlets; the militia of which, consisting of 400 men, are obliged, at the command of the constable of the Tower, to repair hither, and reinforce the garrison.

On Little Tower-hill is the Victualling office for the navy. It is separated from Tower-hill by a wall and gate, and contains houses for the officers, slaughter-houses, store rooms, a brew-house, a salting-house, and barrelling-house; under the direction of seven commissioners and other inferior officers.

The Mint was formerly within the Tower; but within these few years it has been removed to an elegant building, erected on purpose, on the north-east corner of Tower-hill. Its area comprises 159,700 feet, of which 71,200 are in the buildings; it cost 288,856l, exclusive of the machinery. The steam engines, &c. for coining, are of the best construction.

In Tower ward is also the Custom-house, a large, handsome, and commodious building of brick and stone. It stands upon the banks of the Thames, and is accommodated and presses, all filled with warlike engines and instruments of death. Over this are two other floors, one principally filled with arms; the other story are kept match, sheep-skins, tanned hides, &c.; and in a little room called Julius Caesar's chapel, are deposited some records, containing perhaps the ancient usages and customs of the place. In this building are also preserved the models of the new-invented engines of destruction that have from time to time been presented to the government. Near the south-west angle of the White Tower is the Spanish armory, in which are deposited the spoils of what was vainly called the Invincible Armada; in order to perpetuate to latest posterity the memory of that signal victory obtained by the English over the whole naval power of Spain in the reign of Philip II.

You are now come to the grand storehouse, a noble building to the northward of the White Tower, that extends 245 feet in length and 60 in breadth. It was begun by King James II. who built it to the first floor; but it was finished by King William III. who erected that magnificent room called the New or Small Armory, in which that prince, with Queen Mary his consort, dined in great form, having all the warrant workmen and labourers to attend them, dressed in white gloves and aprons, the usual badges of the order of masonry. To this noble room you are led by a folding door, adjoining to the east end of the Tower chapel, which leads to a grand staircase of 50 easy steps. On the left side of the uppermost landing-place is the work-shop, in which are constantly employed about 14 furnishing, in cleaning, repairing, and new-placing the arms. On entering the armory, you see what they call a wilderness of arms, so artfully disposed, that at one view you behold arms for near 80,000 men, all bright and for service; a sight which it is impossible to behold without astonishment; and besides those exposed to view, there were, before the late war, 16 chests shut up, each chest holding about 1000 muskets. The arms were originally disposed by Mr. Harris, who contrived to place them in this beautiful order, both here and in the guard-chamber of Hampton-court. He was a common gunsmith; but after he had performed this work, which is the admiration of people of all nations, he was allowed a pension from the crown for his ingenuity.

Upon the ground floor, under the small armory, is a large room of equal dimensions with that, supported by 20 pillars, all hung round with implements of war. This room, which is 24 feet high, has a passage in the middle 16 feet wide.

The horse armory is a plain brick building, a little to the eastward of the White Tower; and is an edifice rather convenient than elegant, where the spectator is entertained with a representation of those kings and heroes of our own nation, with whose gallant actions it is to be supposed he is well acquainted; some of them equipped and sitting on horseback, in the same bright and shining armour they were used to wear when they performed those glorious actions which gave them a distinguished place in the British annals.

You now come to the line of kings, which your conductor begins by reversing the order of chronology; so that in following them we must place the last first.

In a dark stone room, about 20 yards to the eastward of the grand store-house, or new armory, the crown jewels are deposited. 1. The imperial crown, with which it is pretended that all the kings of England have been crowned since Edward the Confessor in 1040. It is of gold, enriched with diamonds, rubies, emeralds, sapphires, and pearls: the cap within is of purple velvet, lined with white taffety, turned up with three rows of ermine. They are, however, mistaken in showing this as the ancient imperial diadem of St. Edward; for that, with the other most ancient regalia of this kingdom, was kept in the arched room in the cloisters in Westminster Abbey till the civil war: when, in 1642, Harry Martin, by order of the parliament, broke open the iron chest in which it was secured, took it thence, and sold it, together with the robes, sword, and sceptre, of St. Edward. However, after the Restoration, King Charles II. had one made in imitation of it, which is that now shown. 2. The golden orb, or globe, put into the king's right hand before he is crowned: and borne in his left hand, with the sceptre in his right, upon his return into Westminster-hall after he is crowned. It is about six inches in diameter, edged with pearl, and enriched with precious stones. On the top is an amethyst, of a violet colour, near an inch and a half in height, set with a rich cross of gold, adorned with diamonds, pearls, and precious stones. The whole height of the ball and cup is 11 inches. 3. The golden sceptre, with its cross set upon a large amethyst of great value, garnished round with table diamonds.
The handle of the sceptre is plain, but the pummel is set round with rubies, emeralds, and small diamonds. The top rises into a flower-de-lis of six leaves, all enriched with precious stones, from whence issues a round or ball, made of the amethyst already mentioned. The cross is quite covered with precious stones. 4. The sceptre, with the dove, the emblem of peace, perched on the top of a small Jerusalem cross, finely ornamented with table diamonds and jewels of great value. This emblem was first used by Edward the Confessor, as appears by his seal; but the ancient sceptre and dove was sold with the rest of the regalia, and this now in the Tower was made after the Restoration. 5. St Edward's staff, four feet seven inches and a half in length, and three inches three quarters in circumference, all of beaten gold, which was carried before the king at his coronation. 6. The rich crown of state, worn by his majesty in parliament; in which is a large emerald seven inches round; a pearl esteemed the finest in the world; and a ruby of incalculable value. 7. The crown belonging to his royal highness the prince of Wales. The king wears his crown on his head when he sits upon the throne; but that of the prince of Wales is placed before him, to show that he is not yet come to it. 8. The late Queen Mary's crown, globe, and sceptre, with the diadem she wore at her coronation with her consort King William III. 9. An ivory sceptre, with a dove on the top, made for King James II's queen, whose garniture is gold, and the dove on the top gold enamelled with white. 10. The curvata, or sword of mercy, which has a blade of 32 inches long, and near two broad, is without a point, and is borne naked before the king at his coronation, between the two swords of justice, spiritual and temporal. 11. The golden spurs, and the armillars, which are bracelets for the wrists. These, though very antique, are worn at the coronation. 12. The ampulla, or casket of gold, finely engraved, which holds the holy oil the kings and queens of England are anointed with; and the golden spoon that the bishop pours the oil into. These are two pieces of great antiquity. The golden eagle, including the pedestal, is about nine inches high, and the wings expand about seven inches. The whole weighs about ten ounces. The neck of the eagle curves off about a third of the neck, which is hollow, for holding the holy oil; and when the king is anointed by the bishop, the oil is poured into the spoon out of the bird's bill. 13. A rich saltsoever of state, in form like the square White Tower, and so exquisitely wrought, that the workmanship of modern times is in no degree equal to it. It is of gold, and used only on the king's table at the coronation. 14. A noble silver font, double gilt, and elegantly wrought, in which the royal family are christened. 15. A large silver fountain presented to King Charles II. by the town of Plymouth, very curiously wrought; but much inferior in beauty to the above. Besides these, which are commonly shown, there are in the jewel office all the crown jewells worn by the princes and princesses at coronations, and a great variety of old curious plate.

The record office consists of three rooms, one above another, and a large round room, where the rolls are kept. These are all handsomely wainscotted, the wainscot being framed into presses round each room, within which are shelves and repositories for the records; and for the easier finding of them, the year of each reign is inscribed on the inside of these presses, and the records placed accordingly. Within these presses, which amount to 56 in number, are deposited all the rolls, from the first year of the reign of King John to the beginning of the reign of Richard III. but those after this last period are kept in the Rolls Chapel. The records in the Tower, among other things, contain the foundation of abbeys and other religious houses; the ancient tenures of all the lands in England, with a survey of the manors; the original of laws and statutes; proceedings of the courts of common law and equity; the rights of England to the dominion of the British seas; leagues and treaties with foreign princes; the achievements of England in foreign wars; the settlement of Ireland, as to law and dominion; the forms of submission of some Scottish kings for territories held in England; ancient grants of our kings to their subjects; privileges and immunities granted to cities and corporations during the period above mentioned; enrolments of charters and deeds made before the Conquest; the bounds of all the forests in England, with the several respective rights of the inhabitants to common pasture, and many other important records, all regularly disposed, and referred to in near a thousand folio indexes. This office is kept open, and attendance constantly given, from seven o'clock till one, except in the months of December, January, and February, when it is open only from eight to one, Sundays and holidays excepted. A search here is half a guinea, for which you may peruse any one subject a year.
LONDON.

The Trinity House. 54

Public Buildings.

Customhouse, is the Trinity House; a society founded in 1515, at a period in which the British navy began to assume a system. The founder was Sir Thomas Spert, comptroller of the navy, and commander of the great ship Henry Grace de Dieu. It is a corporation, consisting of a master, four wardens, eight assistants, and eighteen elder brethren; selected from commanders in the navy and the merchants; and now and then a complainant is paid to one or two of our first nobility. They may be considered as guardians of our ships, military and commercial. Their powers are very extensive: they examine the mathematical children of Christ’s hospital, and the masters of his majesty’s ships; they appoint pilots for the river Thames; settle the general rates of pilotage; erect light houses and sea marks; grant licenses to poor seamen, not free of the city, to row on the Thames; prevent foreigners from serving on board our ships without license; punish scamen for mutiny and desertion; hear and determine complaints of officers and men in the merchants service, but liable to appeal to the judge of the court of admiralty; supervise the deepening and cleansing of the river Thames, &c.

The Minories. 55

Between Aldgate and the Tower is the street called the Minories, from some poor ladies of the order of St Clare, or minoresses. They had been invited to London by Blanch, queen of Navarre, and wife to Edmund earl of Lancaster, who founded a convent for them in 1293. On the suppression of the monasteries it was converted into a dwelling house for some of the nobility, and is now in the possession of the Dartmouth family. Till of late years, the Minories were but a despicable street; but have now been excellently rebuilt, and are as elegant as any in the city.

On the west side of the city walls at this place, stood the house of the Crutched or Crossed Friars, an order instituted at Bologna in 1169, and of which a branch settled in England in 1244, where they were accommodated with a house in this place by two citizens named Ralph Hosier and William Sovernanus, who became members of their order. Henry VIII. granted their house to Sir Thomas Wyat the elder, who built a handsome mansion on part of the ground where it stood. This mansion became afterwards the residence of John Lord Lumley, a celebrated warrior in the time of Henry VIII. In process of time, it was converted into a navy office: but this office being removed to Somerset-house, the India Company have erected in its place a most magnificent warehouse, in form of an oblong square of about 250 feet by 160, enclosing a court of 150 by 60 feet, the entrance to which is by an arched gateway.

Billingsgate. 57

Billingsgate is distinguished by its market. Billingsgate was a small port for the reception of shipping, and for a considerable time the most important place for the landing of almost every article of commerce. In the time of King William, Billingsgate began to be celebrated as a fish-market. In 1699 it was by act of parliament made a free port for fish to be sold there every day except Sunday; but Mr Pennant informs us, that the object of this has long been frustrated, and that fish are no longer to be had there in perfection. The same author gives a list of the fish which in the time of Edward III. were brought to the London market; the monarch himself having condescended to regulate the prices, that his subjects might not be imposed upon by those who sold them. Among these were the conger-eel and porpoise, neither of which is now admitted to any table. A pike at that time cost 6s. 8d. whence our author concludes, that it was an exotic fish, and brought over at vast expense. Some fishes are mentioned in his list with which the naturalist owns himself unacquainted, viz. the barkey, bran, barrine, crappie, and rumb. In Archbishop Neville’s great feast is mentioned also a fish named thrice-poole, unknown at present. Saus were formerly accounted a fish; and these, together with the sturgeon and porpoise, were the only fresh fish permitted by the 33d of Henry VIII. to be bought of any stranger at sea between England, France, Flanders, and Zealand.

Limestreet ward is remarkable for a very large building of great antiquity, called Leadenhall, with flat hall. Battlements leaned on the top, and a spacious square in the middle. In 1309 it was the house of Sir Hugh Neville, knight; in 1384, of Humphry Bohun, earl of Hereford; in 1408 it became the property of the celebrated Whittington, who presented it to the mayor and commonalty of London; and in 1419, a public granary was erected here by Sir Simon Eyre, a citizen and draper, who built it with stone in its present form. This granary was designed as a preservative against famine, and to be kept always full of corn, which design was for some time happily answered. The house came to be used for many other purposes besides that of a granary; as for keeping the artillery and arms of the city. Preparations for any kind of pageantry or triumph were also made here; and from its strength the place was considered as the chief fortress within the city in case of any popular insurrection, and was likewise the place from whence alms were distributed. In this edifice are warehouses for the sale of leather, Chester baize, meal, and wool. Adjoining to Leadenhall is a market, thence called Leadenhall market, consisting of five considerable squares or courts, and reckoned one of the greatest markets in Europe for flesh, and other provisions, as well as for leather, green bides, and wool. A little to the eastward is the India House, built in 1726, on the spot occupied by Sir William Craven, mayor in 1610. According to Mr Pennant, this house “is not worthy of the lords of Indostan.”

In Broad-street is the Bank of England, a stone building, which occupies one side of Threadneedle-street. The centre, and the building behind, were founded in the year 1733; the architect George Sampson. Before that time the business was transacted in Graces-hall. The front is a sort of vestibule; the base rustic, the ornamental columns above Fiona. Within is a court leading to a second elegant building, which contains a hall and offices, where the debt of above 250 millions is punctually discharged. Of late years two wings of uncommon elegance, designed by Sir Robert Taylor, have been added, at the expense of a few houses, and of the church of St Christopher’s le Stocks. “The name of the projector of this national glory (says Mr Pennant), was Mr James Paterson of Scotland.” This palladium of our country was in
LONDON.

1780 saved from the fury of an infamous banditti by the virtue of its citizens, who formed suddenly a volunteer company, and overawed the miscreants; while the chief magistrate skulked trembling in his mansion-house, and left his important charge to its fate. This important building has ever since been very properly guarded by the military; who, in passing through the city, have often given offence to many busy characters who would strive to preserve the city rights, at the expense of the national destruction. A lord mayor was the last who interested himself by applying to Mr. Grenville, who gave him to understand, that if the guards were not quietly permitted to discharge their duty, the bank would be removed to Somerset-house.

At the extremity of Threadneedle-street is Merchant-Taylors Hall. In this street also is the South Sea House, first established in 1711 for the purpose of an exclusive trade to the South sea, and for supplying Spanish America with Negroes.

Near the junction of Throgmorton-street with Broad-street stood a magnificent house built by Cromwell earl of Essex; after whose fall, the house and gardens were bought by the Drapers company. The house was destroyed in the great fire, but rebuilt for the use of the company in a magnificent manner.

Mr. Pennant informs us, that St. Giles's church in the fields, and a few houses to the west of it, in the year 1600, were barely separated from Broad-street. The church is supposed to have belonged to an hospital for lepers, founded about the year 1117, by Matilda queen to Henry I. In ancient times it was customary here to present to malefactors, on their way to the gallows (which, about the year 1413, was removed from Smithfield, and placed between St. Giles's high-street and Hog-lane (C), a great bowl of ale, as the last refreshment they were to receive in this life. On the door to the churchyard is a curious piece of sculpture, representing the last day, containing an amazing number of figures, set up about the year 1686. This church was rebuilt in 1625. By the amazing raising of the ground by filth and various adventitious matter, the floor in the year 1730 was eight feet below the surface acquired in the intervening time. This alone made it necessary to rebuild the church in the present century. The first stone was laid in 1730; it was finished in 1734, at the expense of 10,000l. — In the churchyard is a great square pit, with many rows of coffins piled one upon the other, all exposed to sight and smell, the latter of which is highly offensive if not dangerous.

On the west side of Broad-street stood the house of the Augustinians, founded by Humphry Bohun earl of Somerset in 1253, for friars and hermits of the Augustinian order. On the dissolution of the monasteries, great part of the house was granted to William Lord St. John, afterwards marquis of Winchester, and lord treasurer, who founded a magnificent house named Winchester-house. The west end of the church was granted in 1551 to John de Lasco for the use of the Germans and other fugitive Protestants, and afterwards to the Dutch as a place for preaching. A part of it was also converted into a glasshouse for Venice glass, in which the manufacture was carried on by artists from that city, and patronised by the duke of Buckingham. The place was afterwards converted into Pinners-hall, belonging to the company of pinners.

To the eastward of Winchester-street stood the house Gresham of that very eminent merchant Sir Thomas Gresham, afterwards known by the name of Gresheim College: (See GRESHAM). It has been pulled down not many years ago; and the Excise office, a most magnificent and at Excise the same time simple building, rose in its place. Mr. Pennant informs us, that from the 9th of January 1786 to January 5th 1787, the payments into this office amounted to no less than 5,531,114l. 6s. 10d.

The Royal Exchange, which is the meeting place of Royal Ex. the merchants of London, stands in the ward of Cornhill, and is the finest and strongest fabric of the kind in Europe. It was founded in the year 1566. Sir Thomas Gresham, merchant in London, made an offer to the lord mayor and citizens, to build, at his own expense, a commodious edifice for merchants to meet and transact business, provided the city would find him a convenient situation for the same. Mr. Pennant informs us, that one Richard Clough a Welshman, originally Sir Thomas's servant, first put him on this design by a letter from Antwerp, in which he reproached the London merchants with having no place to transact their business, but walking about in the rain, more like pedlars than merchants. The citizens, in compliance with Sir Thomas's desire, purchased, for the sum of 3,532l. 80 houses in the two alleys called New St. Christopher's and Swan-alley, leading out of Cornhill into Threadneedle-street. The materials of those houses were sold for 478l. and the ground, when cleared, was conveyed to Sir Thomas Gresham, who, accompanied by several aldermen, laid the first brick of the new building on the 7th of June that year. Each alderman also laid his brick, and left a piece of gold for the workmen; who set about it with such assiduity and resolution, that the whole fabric was roofed by the month of November 1567, and was soon after completed under the name of the Bourse. This building was totally destroyed by the fire.

\[ (c) \]

This late place of execution, according to Mr. Pennant, was called in the time of Edward III. when the gentle Mortimer finished his days here, the Elms; but the original as well as the present name was Tybourne; not from tye and burn, as it were called so from the manner of capital punishments; but from bourse, the Saxon word for a "brook," and Tye the name of that brook, which joined gave name to a manor before the Conquest. Here was also a village and church denominated St. John the Evangelist, which fell to decay, and was succeeded by that of Mary-bourne, corrupted into Mary-la-bonne. In 1678, Queen Henrietta Maria was compelled by her priests to take a walk by way of penance to Tyburn. What her offence was we are not told; but Charles was so disgusted at this insolence, that he soon after sent them and all her majesty's French servants out of the kingdom.
fire in 1666; and in this place the present magnificent structure was erected at the expense of 80,000l. which stands upon a plat of ground 203 feet in length and 171 in breadth, containing an area in the middle, of 61 square perches, surrounded with a substantial and regular stone building, wrought in rustic. It has two fronts, north and south, each of which is a piazza; and in the centre are the grand entrances into the area, under a very lofty and noble arch. The south front in Cornhill is the principal; on each side of which are Corinthian demi-columns, supporting a compass pediment; and, in the intercolumniation on each side, in the front next the street, is a niche, with the statues of King Charles I. and II. in Roman habits, and well executed. Over the aperture, on the corrus between the two pediments, are the king's arms in relief; on each side of this entrance is a range of windows placed between demi-columns and pilasters of the Composite order, above which runs a balustrade. This building is 56 feet high; and from the centre, in this front, rises a lantern and turret 178 feet high, on the top of which is a vase of gilt brass made in the shape of a grasshopper the crest of Sir Thomas Gresham's arms. The north front in Threadneedle-street is adorned with pilasters of the Composite order; but has neither columns nor statues on the outside; and has triangular, instead of compass, pediments. The inside of the area is also surrounded with piazzas, forming ambulatories for merchants, &c. to shelter themselves from the weather, when met there upon business. Above the arches of this piazza is an entablature with curious ornaments; and on the cornice a range of pilasters with an entablature extending round, and a compass pedi-

ment in the middle of the cornice of each of the four sides. Under the pediment on the north side are the king's arms; on the south, the city's arms; on the east, Sir Thomas Gresham's arms; and on the west, the mercers' arms, with their respective enrichments. In these intercolumns are 24 niches, 20 of which are filled with the statues of the kings and queens of England. Under these piazzas, within the area, are 28 niches, all vacant but that in which Sir Thomas Gresham's statue is placed in the north-west angle, and that in the south-west, where the statue of Sir John Barnard was placed in his lifetime by his fellow-citizens, to express their sense of his merit. The centre of this area also is ornamented with a statue of King Charles II. in a Roman habit, standing upon a marble pedestal about eight feet high, and encompassed with iron rails; which pedestal is enriched on the south side with an imperial crown, a sceptre, sword, palm-branches, and other decorations, with a very flattering inscription to the king. On the west side is a Cupid cut in relief, resting his right hand on a shield, with the arms of France and England quartered, and holding a rose in his left hand. On the north side is another Cupid supporting a shield, with the arms of Ireland; and on the east side are the arms of Scotland, with a Cupid holding a thistle; all done in relief: the whole executed by that able statue Mr. Gibbon.

In this area, merchants, and such as have business with them, meet every day at change hours; and for the more regular and reader despatch of business, they dispose of themselves into separate walks, according to the following plan:

---

![Diagram of London streets and markets](attachment:diagram.png)
In building this expensive structure there was an eye not only to magnificence, and to accommodate the merchants, but also to reimburse the expense. For this reason a gallery was built over the four sides of the Royal Exchange. This was divided into 200 shops, which were let out to haberdashers, milliners, &c. and which for several years were well occupied. But these shops have now for a long time been deserted, and the galleries are let out to the Royal Exchange Assurance Office, the Merchant-seamen's Office, the Marine Society, and to auctioneers, &c. Under the whole area there are the finest dry vaults that can be found anywhere, which are let out to the East India Company to deposit their pepper. In the turret is a good clock with four dials, which is well regulated every day, so that it becomes a standard of time to all the mercantile part of the town; and it goes with chimes at three, six, nine, and twelve o'clock, playing upon twelve bells. The outside of this grand fabric suffers very much in its elegance from the shops that surround it, and are built within its walls; and which are occupied by booksellers, toymen, cutlers, hosiers, watchmakers, &c.

South of the Royal Exchange, and near the west extremity of Lombard-street, is the General Post Office, which is a handsome and commodious building.

In Walbrook is the Mansion-house, for the residence of the lord mayor. This edifice was begun in 1739, and finished in 1753. It is built of Portland stone, with a portico of six fluted columns, of the Corinthian order in the front. The basement story is very massive, and consists of rustic work; in the centre of it is the door, which leads to the kitchen, cellars, and other offices. On each side rises a flight of steps, leading up to the portico, in the middle of which is the principal entry. The stone balustrade of the stairs is continued along the front of the portico, and the columns support a large angular pediment, adorned with a group of figures in bas relief, representing the dignity and opulence of the city of London. It is an extremely heavy building, of an oblong form, and its depth is the long side, having several magnificent apartments, which are not, however, well lighted, on account of the houses that surround it.

Behind the Mansion-house is St Stephen's Church, in Walbrook, justly reputed the masterpiece of the celebrated Sir Christopher Wren, and said to exceed every modern structure in the world in proportion and elegance. The Mansion-house, and many adjacent buildings, stand on the place where the Stocks-market once stood. This took its name from a pair of stocks erected near the spot in 1281; and was the great market of London for provisions during many centuries.

In this ward is situated one of the most remarkable pieces of antiquity in London. It is a great stone, now standing in a case on the north side of Canon-street, close under the south wall of St Swithin's church. It is called London-stone; and was formerly pitched edgeways on the other side of the street, opposite to where it now stands, fixed deeply in the ground, and strongly fastened with iron bars; but for the convenience of wheel carriages it was removed to its present situation. This stone is mentioned so early as the time of Athelstan, king of the West Saxons, and has been carefully preserved from age to age. Of the original cause of its erection no memorial remains; but it is conjectured, that as London was a Roman city, this stone might be the centre, and might serve as an object from which the distance was computed to the other considerable cities or stations in the province.

In Dowgate ward is a noted academy, called Merchant-Taylors School, from its having been founded by Taylors the merchant-taylors company, in the year 1561. It was destroyed by the fire of London in 1666, but was rebuilt, and is a very large structure, with commodious apartments for the masters and ushers, and a fine library. Sir Thomas White, lord mayor of this city, having founded St John's college in Oxford in 1557, appointed this school as a seminary for it, and established at Oxford 46 fellowships for scholars elected from this school.

The church of St Mary le Bow, in Cordwainers' St Mary le street ward, is the most eminent parochial church in the Bow city. It was originally built in the reign of William the Conqueror; and being the first church the steeple of which was embellished with stone arches or bows, took thence its denomination of le Bow. It was burnt down in the fire of 1666, but soon afterwards rebuilt. The steeple of this church is reckoned the most beautiful of its kind in Europe.

In Cheap ward is Guildhall, or the townhouse of Guildhall, London. This was originally built in 1411, but so damaged by the great fire already mentioned, as to be rebuilt in 1669. The front has a Gothic appearance; and this character is also due to the two gigantic effigies which stand within the hall. The hall is 153 feet long, 50 broad, and 55 high, adorned with the royal arms, and those of the city and its companies, as well as with several portraits of English sovereigns and judges. In this building are many apartments for transacting the business of the city, besides one for each of the judicial courts, namely, that of the King's Bench, the Common Pleas, and the Exchequer.

In the year 1246 Cheapside was an open field, and named Crown-field, from an inn with the sign of the crown. At that time, and even for 200 years afterwards, none of the streets of London were paved excepting Thames-street, and from Ludgate-hill to Charing-Cross.

Goldsmith's Hall stands in Foster-lane, which opens into the west end of Cheapside. In this lane also is Hall. St Martin's le Grand, which, though surrounded by the city, was yet subject, near three centuries, to Westminster Abbey. A fine college was built here in 700 by Wyclif, king of Kent; and, about the year 1056, rebuilt and chiefly endowed by Ingelric and Edward, two noble brothers. In 1668, it was confirmed and made independent of every other ecclesiastical jurisdiction, even that of the pope himself not excepted; and its privileges were confirmed by succeeding monarchs. It was governed by a dean, and a number of secular canons. In this jurisdiction a magnificent church was erected, but pulled down in 1438, when the college was surrendered; after which a tavern was erected on the spot.

A little to the westward of Mary le Bow church, the Cross (in the adjoining ward), stood the Cross and Conduit and Con in the middle of the street. The former was built by Edward I. in 1290, in memory of his queen Eleanor, Bb2 whose
whose body was rested on that spot in its way to be buried. Originally it had the statue of the queen at full length, resembling exactly that at Northampton. Having at length fallen to decay, it was rebuilt in 1441 by John Hetherby mayor of the city, at the expense of several citizens, being now ornamented with various images, as those of the Resurrection, the Virgin Mary, &c. As the magnificent processions took this road, it was new gilt at every public entry. After the Reformation, the images gave so much offence, that it was thought proper to substitute that of Diana in place of the Virgin Mary. This, however, was resented by Queen Elizabeth, who offered a reward for the discovery of the offenders. As she imagined that a cross, the symbol of the Christian religion, could not justly give offence to any professor of that religion, she ordered a cross to be placed on the summit and gilt; but in 1643, the parliament ordered the demolition of all crosses and other marks of Romish superstition.

Splendid tournaments were held between the Cross and Sopers-lane in the year 1331; but as Queen Philippa and a great number of other ladies, dressed in rich attire, were sitting on the upper scaffolding to behold the sport, the great gable way, and they suddenly fell down among the knights and others who stood below; many of whom were grievously hurt. The carpenters were saved from punishment by the intercession of the queen; but the king, to prevent accidents of the like nature, ordered a building of stone to be erected near Bow church, from whence the queen and other ladies might behold such spectacles in safety. This was used for the same purpose till the year 1410, when Henry IV. granted it to certain mercenaries, who converted it into shops, warehouses, and other places necessary for their trade.

A small distance eastward from the Cross stood the Conduit, which served to fill the lesser ones with water brought by pipes from Paddington.—This stood on the spot where the old conduit was situated, which was founded in 1285, constructed of stone lined with lead, and rebuilt in 1479 by Thomas Iian, one of the shepherds. On some grand occasions, these conduits have been made to run with clarion; as at the coronation of Anna Bullen.

On the north side of Cheapside stood the Hospital of St Thomas of Acon, founded by Fitz-Theobald de Herles, and his wife Agnes, sister to the famous Thomas à Becket. The hospital was built 20 years after the murder of Thomas; and such was his reputation for sanctity, that it was dedicated to him even before he was canonized, and that in conjunction with the Virgin Mary herself. The whole was granted by King Henry VIII. to the company of mercers. It was destroyed by the great fire in 1666; but rebuilt by the mercers company, who have their hall here.—Immediately to the east is a narrow street called the Old Jewry, which took its name from a great synagogue which stood here till the Jews were expelled the kingdom in 1291. After them an order of friars named Public Fratres de sacco, or de penitentia, took possession of the Buildings synagoge: and in 1305, Robert Fitzwalter, the great banner-bearer of the city, requested that the friars might assign it to him; the reason of which probably was, that it stood near to his house, which was situated in the neighbourhood of the present Grocers-hall. The chapel was bought by the grocers from Fitzwalter in 1411 for 320 marks.

In Bassishaw or Basinghall ward, is Blackwell or Bakewell Bakewell hall, which adjoins to Guildhall, and is the hall greatest mart of woolen cloth in the world. It was purchased of King Richard II. by the city; and has ever since been used as a weekly market for broad and narrow woolen cloths, brought out of the country. Formerly proclamations were issued to compel people to bring their goods into the hall, to prevent deceit in the manufactures, which might be productive of discredit in foreign markets, and likewise be the means of defrauding the poor children of Christ's hospital of part of the revenue which arose from the bailage of this great magazine. It suffered in the general devastation in 1666; but was rebuilt in 1672, and is now a spacious edifice, with a stone front adorned with columns. Cripplegate ward is remarkable for a college, called Sion College, founded in 1627, on the site of Elsing-le-grange hospital (D) or priory, by Dr Thomas White, vicar of St Dunstan's in the West, for the improvement of the London clergy; and with almshouses under their care, for 20 poor persons, 10 men and 10 women. In the year 1631, a charter was procured for incorporating the clergy of London, by which they were constituted fellows of the college; and out of the incumbents are annually elected, on Tuesday three weeks after Easter, a president, two deans, and four assistants, who are to meet quarterly to hear a Latin sermon, and afterwards be entertained at dinner in the college hall at the expense of the foundation. John Simpson, rector of St Olave's, who superintended the building, added, at his own expense, for the use of the studious part of the London clergy, a library 120 feet long, and amply filled with books.

In this ward is a hall which belonged to the company of barber-surgeons, the professions of barber and hall surgeon being formerly exercised by the same person. It was built by the celebrated Iuigo Jones, and the upper end is formed out of one of the towers or barbicans of London wall. The anatomical theatre is elliptical, and very finely contrived. The hall is now called Barber's Hall; the surgeons, who disdained to be any longer associated with their ancient brethren, having obtained a separate charter, and built themselves a new hall in the Old Bailey.

Farringdon ward within, is distinguished by the most magnificent Protestant church in the world, the Cathedral of St Paul. The best authority we have for the origin of this church, is from its great restorer Sir Christopher Wren. His opinion, that there had been

(d) This was founded by William Elsing mercer in 1329 (on the site of a decayed nunnery), for the support of 100 blind men. He afterwards changed it into a priory, and became himself the first prior, who with four canons-regular were to superintend the miserable objects.
L O N

a church on this spot, built by the Christians in the
time of the Romans, was confirmed: when he search-
ed for the foundations for his own design, he met
with those of the original presbyterium, or semicircular
chancel, of the old church. They consisted only of
Kentish rubble stone, artfully-worked, and consolidated
with exceedingly hard mortar, in the Roman manner,
much excelling the superstructure. He expatiates
on the notion of there having been here a temple of Diana,
and the discovery of the horns of animals used in the
sacrifices to that goddess, on which the opinion has
been founded, so much having been discovered in all his
searches.

The first church is supposed to have been destroyed
in the Dioclesian persecution, and to have been re-
built in the reign of Constantine. This was again
demolished by the pagan Saxons; and restored, in
603, by Sebert, a petty prince, ruling in these parts,
under Ethelbert king of Kent, the first Christian
monarch of the Saxon race; who, at the instance of
St Augustine, appointed Melitius the first bishop of
London. Erkenwalde, the son of King Offa, fourth
in succession from Melitius, ornamented his cathedral
very highly, and improved the revenues with his own
patrimony. He was most deservedly canonized: for
the very litter, in which he was carried, in his last ill-
ness, continued many centuries to cure fevers by the
touch; and the very chips, carried to the sick, restored
them to health!

When the city of London was destroyed by fire, in
1086, this church was burnt; the bishop Mauritius
began to rebuild it, and laid the foundations, which
remained till its second destruction, from the same
cause, in the 17th century. Notwithstanding Mauri-
tius lived twenty years after he had begun this pious
work, and Bishop Beauvais enjoyed the see twenty
more, yet such was the grandeur of the design, that
it remained unfinished. The first had the ruins of the
Palatine tower bestowed on him, as materials for
the building; and Henry I. bestowed on Beauvais
part of the ditch belonging to the tower, which,
with purchases made by himself, enabled him to en-
close the whole with a wall. The same monarch
granted besides, that every ship which brought stone for
the church, should be exempted from toll; he gave him
also all the great fish taken in his precinct, except the
tongues: and, lastly, he secured to him and his succe-
sor the delicious tythes of all his venison in the county
of Essex.

The style of the ancient cathedral was most beau-
tiful Gothic; over the east end was an elegant circu-
lar window; alterations were made in the ends of
the two transepts, so that their form is not delivered
down to us in the ancient plans; and from the central
tower rose a lofty and most graceful spire. The dimen-
sions, as taken in 1309, were these: The length six
hundred and ninety feet; the breadth a hundred and
twenty; the height of the roof of the west part, from
the floor, one hundred and two; of the east part, a
hundred and eighty-eight; of the tower, two hundred
and sixty; of the spire, which was made of wood cover-
ced with lead, two hundred and seventy-four. The
whole space the church occupied was three acres, three
roods, and twenty-one perches.

We may be astonished at this amazing building, and
naturally inquire what fund could supply money to
support so vast an expense. But monarchs resigned
their revenues resulting from the customs due for the
materials, which were brought to the adjacent wharfs:
they furnished wood from the royal forests; prelates
gave up much of their revenues; and, what was more
than all, by the pious bane of indulgences, and remis-
sions of penance, brought in from the good people of
this realm most amazing sums. Pope Innocent III.
in 1252, gave a release of sixty days penance; the
archbishop of Cologne, gave, a few years before, a
relaxation of fifty days; and Boniface archbishop of
Canterbury, forty days.

The high altar dazzled with gems and gold, the
gifts of its numerous votaries. John King of France,
when prisoner in England, first paying his respects to
St Erkenwald's shrine, offered four boxes of gold;
and the gifts at the obsequies of princes, foreign
and British, were of immense value. On the day of the
conversion of the tutelar saint, the charities were pro-
digious, first to the souls, when an indulgence of forty
days pardon was given, very plentimentibus, contritis et
confessis; and, by order of Henry III. fifteen hundred
tapers were placed in the church, and fifteen thousand
poor people fed in the churchyard.

The holiness of this place did not prevent thieves
and prodigies of all denominations from lurking within
the precincts, and committing, under the favour of the
night, murders, and every sort of crime. Edward I.
gave the dean and canons permission to enclose the
whole within a wall; and to have gates, to be shut
every night, to exclude all disorderly people. Within
these walls, on the north-west side, was the bishop's
palace. Froissart tells us, that after the great tour-
nament in Smithfield, King Edward III. and his queen
lodged here, on occasion of their nuptials (5.)—In
1561, the noble spire was totally burnt by lightning,
and never restored.

In consequence of the resolutions taken in 1620, by
James I.

(5) Before this cathedral was the famous Paul's Cross, a pulpit formed of wood, mounted upon steps of
stone, and covered with lead, in which the most eminent divines were appointed to preach every Sunday in the
forenoon. To this place, the court, the mayor and aldermen, and principal citizens, used to resort. The
greatest part of the congregation sat in the open air; the king and his train had covered galleries; and the bet-
ter sort of people were also protected from the injury of the weather but the far greater part stood exposed in
the open air: for which reason the preacher went in very bad weather; to a place called the Shrouds; a covered
space on the side of the church, to protect the congregation in inclement seasons. Considerable contributions
were raised among the nobility and citizens, to support such preachers as were (as was often the case) called to town
from either of the universities. In particular, the lord mayor and aldermen ordered that every preacher, who
came from a distance, should be freely accommodated, during five days, with sweet and convenient lodgings, fire,
candle,
LONDON.

James I. to repair the cathedral, the celebrated Inigo Jones was appointed to the work. But it was not attempted till the year 1633, when Laud laid the first stone, and Inigo the fourth. That great architect, begun with a most notorious impropriety, giving to the west end a portico of the Corinthian order, beautiful indeed, to this ancient Gothic pile; and to the ends of the two transepts Gothic fronts in a most horrible style. The great fire made way for the restoring of this magnificent pile in its present noble form by Sir Christopher Wren, an architect worthy of so great a design.

It is built of fine Portland stone, in form of a cross. On the outside are two ranges of pilasters, consisting of a hundred and twenty each; the lower range of the Corinthian order, and the upper of the Composite. The spaces between the arches of the windows and the architrave of the lower order are filled with a great variety of curious enrichments, as also those above. On the north side is a portico, the ascent to which is by twelve steps of black marble, and its dome supported by six very large columns. Over the dome is a pediment, the face of which is engraved with the royal arms, regalia, and other ornaments. On the south is a portico, the ascent to which is by twenty-five steps, and its dome supported by six columns, corresponding with those on the north side. The west front is graced with a most magnificent portico supported by twelve lofty Corinthian columns: over these are eight columns of the Composite order, which support a noble pediment, crowned with its acroteria; and in this pediment is the history of St Paul's conversion, boldly carved in bas relief. The ascent to this portico is by a flight of steps of black marble, extending the whole length of the portico; and over each corner of the west front is a handsome turret. A vast dome, or cupola, rises in the centre of the building. Twenty feet above the roof of the church is a circular range of thirty-two columns with niches, placed exactly against others within. These are terminated by their entablature, which supports a handsome gallery, adorned with a stone balustrade. Above the columns last mentioned is a range of pilasters, with windows between them: and from the entablature of these, the diameter of the dome gradually decreases. On the summit of the dome is an elegant lanthorn, from the centre of which runs a beautiful lantern, adorned with Corinthian columns. The whole is crowned with a copper ball, supporting a cross, both finely gilt. Within, the cupola stands on eight stupendous pillars curiously adorned: the roof of the choir is supported by six pillars, and that of the church by two ranges, consisting of twenty more. The roof of the church and choir is adorned with arches and spacious periphe-

rises of enrichments, admirably carved in stone. Quite round the inside of the cupola, there is a whispering iron balcony, or gallery, the top of which is richly painted by Sir James Thornhill.

The first stone of this superb edifice was laid on June 21. 1675; and the building was completed in 1710; but the whole decoration was not finished till 1713. It was a most singular circumstance, that notwithstanding it was 35 years in building, it was begun and finished by one architect, and under one prelate, Henry Compton bishop of London. The church of St Peter's was 135 years in building, in the reigns of 19 popes, and went through the hands of twelve architects. It is not, as often mistaken, built after the model of that famous temple: it is the entire conception of our great countryman, and has been preferred in some respects by a judicious writer, to even the Roman Basilica. Its dimensions are less. The comparative view is given in the Parentalia, and copied in London and its Environs. The height of St Peter's, to the top of the cross, is 437 feet and a half; that of St Paul's 340 feet; so that, from its situation, it is lofty enough to be seen from the sea. The length of the first is 729 feet; of the latter, 700. The greatest breadth of St Peter's is 364; of St Paul's, 180.

In the reigns of James I. and Charles I. the body of this cathedral was the common resort of the politicians, the newsmongers, and idle in general. It was called Paul's walk; and is mentioned in the old plays and other books of the times.

Notwithstanding the magnificence of this noble pile, however, it is remarked to have many defects. Its situation is such, that it cannot be viewed at a distance. The division of the porticos, and the whole structure, into two stories on the outside, certainly indicates a like division within, which is acknowledged to be a fault. The dome, it has also been observed, bears too great a proportion to the rest of the pile, and ought to have been raised exactly in the centre of the building; besides that, there ought to have been two steeples at the east end, to correspond with those at the west. On entering this church, we instantly perceive an obvious deficiency, not only of elevation but length, to assist the perspective; and the columns are heavy and clumsy, rather encumbering the prospect than enriching it.

St Paul's occupies an area of six acres, and is railed all round with iron balustrades, each about five feet and a half high, fixed on a dwarf wall of heath stone. In the west end of this area is a marble statue of Queen Anne, holding a sceptre in one hand, and a globe

...
LOND

Public Buildings.

globe in the other, surrounded with four emblematical figures representing Great Britain, France, Ireland, and America.

Besides very large contributions for carrying on this edifice, the parliament granted a duty on sea-coal, which, at a medium, produced 5000l. a-year; and the whole expense of the building is said to have amounted to 736,72 l. 2s. 3d.

On the east side of the cathedral is St Paul's School, founded in 1509 by Dr John Collet dean of this church, who endowed it for a principal master, an under-master, a chaplain, and 153 scholars.

In Warwick-lane, in the same ward, stands the College of Physicians, erected in 1662 by Sir Christopher Wren. It is built of brick, and has a spacious stone frontispiece. Near the south extremity of the Old Bailey, on the east side, is the hall of the Company of Surgeons, with a theatre for dissection.

Adjoining to Christ-church in Newgate-street is Christ's Hospital, which, before the dissolution of monasteries by Henry VIII. was a house of Gray-friars. The hospital was founded by King Edward VI. for supporting and educating the fatherless children of poor freemen of this city; of whom 1000 of both sexes are generally maintained in the house or out at nurse, and are likewise clothed and educated. In 1673, a mathematical school was founded here by Charles II. endowed with 320l. a-year; and a writing school was added in 1694 by Sir John Moor, an alderman of the city. After the boys have been seven or eight years on the foundation, some are sent to the university, and others to sea; while the rest, at a proper age, are put apprentices to trades at the charge of the hospital. At first their habit was a russet cotton, but was soon after changed for blue, which has ever since continued to be their colour; and on this account the foundation is frequently called the Blue-coat hospital. The affairs of this charity are managed by a president and about 300 governors, besides the lord mayor and aldermen. The fabric, which is partly Gothic and partly modern, was much damaged by the fire of 1666, but was soon repaired, and has been since increased with several additions. The principal buildings, which form the four sides of an area, have a piazza round them with Gothic arches, and the walls are supported by abutments. The front is more modern, and has Doric pilasters supported on pedestals.

In Castle-Baynard ward is a large structure called Doctors Commons. It consists of several handsome paved courts, in which the judges of the court of admiralty, those of the court of delegates, of the court of arches, and the prerogative court, with the doctors that plead causes, and the proctors of the place, all live in a collegiate way; and from commoning together, as in other colleges, the name of Doctors Commons is derived. Here courts are kept for the trial of civil and ecclesiastical causes under the archbishop of Canterbury and the bishop of London. The college has an excellent library, every bishop at his consecration giving 25l. or 50l. towards purchasing books for it.

Near Doctors Commons, on St Bennet's Hill, is the College of Heralds, who were incorporated by King Richard III. Besides the chief officer, who is the earl-marshal of England, here are three kings-at-arms, viz. Garter, Clarenceux, and Norroy, with six heralds, four pursuivants, and eight proctors. Garter attends the installments of knights of that order, carries the garter to foreign princes, regulates the ceremonies at coronations, and the funerals of the royal family and nobility: Clarenceux directs the funeral ceremonies of those under the degree of peers south of Trent; and Norroy performs the like office for those north of Trent. This building was originally the house of the earl of Derby. It is a spacious quadrangle, built of brick, and has convenient apartments. Here are kept records of the coats of arms of all the families and names in England, with an account when they were granted, and on what occasions.

In Farringdon ward without, is a large building called Bridewell, from a spring formerly known by the name of St Bridget's or St Bride's Well. It was originally a royal palace, and occupied all the ground from Fleet-ditch on the east to Water-lane on the west. That part of it now called Salisbury-court was given to the bishops of Salisbury for their town residence; and the east part, which was rebuilt by King Henry VIII. is the present Bridewell. It was granted to the city by Edward VI. as an hospital; and he endowed it for the lodging of poor travellers, and for the correction of vagabonds, strumpets, and idle persons, as well as for finding them work. In one part of the building 20 artificers have houses; and about 150 boys, distinguished by white hats and blue doublets, are put apprentices to grovers, flaxdressers, weavers, &c. and when they have served their time are entitled to the freedom of the city, with 10l. towards carrying on their respective trades. The other part of Bridewell is a receptacle for disorderly persons, who are kept at beating hemp and other hard labour.

Near Bridewell is St Bride's Church, a stately fabric 111 feet long, 57 broad, and 41 high, with a beautiful spire 234 feet in altitude, and has a ring of 12 bells in its tower.

Opposite to Fleet-ditch, over this part of the river, Blackfriars stands Blackfriars Bridge; a most elegant structure, built after the design of Mr Robert Mylne. The situation of the ground on the two shores obliged the architect to employ elliptical arches; which, however, have a very fine effect. The number of arches is nine; of which the centre one is 100 feet wide. The whole length is 995 feet; the breadth of the carriage way is 28 feet, and that of the two foot-ways 7 each. Over each pier is a recess; an apology for the beautiful Ionic pillars which support them, and which have a most beautiful effect from the river. This bridge was begun in 1760; and finished in 1768, at the expense of 152,840l. to be discharged by a toll upon the passengers. It is situated almost at an equal distance between those of Westminster and London, commands a view of the Thames from the latter to Whitehall, and discovers the majesty of St Paul's in a very striking manner.

West Smithfield. In this ward is an area containing Smithfield three acres of ground, called in old records Smithfield-Pond or Horse-Pool, it having been formerly a watering place for horses. It was in ancient times the common place of execution; and at the south-west corner there was a gallows called the Elms, from a number of elm-
tress that grew in the neighbourhood. It was likewise the scene of public juts and tournaments, and has been a market-place for cattle above 500 years.

On the south side of this area, and contiguous to Christ's hospital, is St Bartholomew's Hospital. It was originally founded soon after the accession of Henry I. by Rahere, the king's jester, as an infirmary for the priory of St Bartholomew the Great, which then stood near the spot. But upon the dissolution of religious houses, Henry VIII. refounded it, and endowed it with 500 marks a-year, on condition that the citizens should pay the same sum annually for the relief of 100 lame and infirm patients. The endowments of this charity have since been so much enlarged, that it now receives the distrested of all denominations. In 1702, a beautiful frontispiece was erected towards Smithfield, adorned with pilasters, entablature, and a pediment of the Ionic order, with a statue of King Henry VIII. standing in a niche in full proportion, and those of two cripples on the top of the pediment over it. In 1729, a plan was formed for rebuilding the rest of this hospital, in consequence of which a magnificent edifice has been erected.

Among many other privileges granted by Henry I. to the prior and canons of the monastery of St Bartholomew the Great, and to the poor of the infirmary, was that of keeping a fair in Smithfield on the eve, day, and morrow, of St Bartholomew. This fair, called Bartholomew fair, has been held annually ever since; and by the indulgence of the magistrates of London, to whom the privilege of keeping it devolved upon the dissolution of the priory, it was used to continue a fortnight. A great number of booths was erected in it by the actors of the theatres, for the exhibition of dramatic performances of various kinds; and it became at length a scene of so much licentiousness and riot, that Sir John Barnard when lord mayor of London reduced the time of the fair to its original duration of three days. This laudable example has been followed ever since; and the magistrates have likewise prohibited all public exhibitions which had been formerly accompanied with so much disorder.

In a street in this ward, called the Old Bailey, is a hall named Justice hall, or the Session's house, where a court is held eight times a-year by the king's commission of oyer and terminer for the trial of criminals for offences committed within the city of London and county of Middlesex. The judges of this court are the lord mayor, those of the aldermen that have served that office, and the recorder; who are attended by the sheriffs and by one or more of the national judges.

In this street is also the great criminal prison, rebuilt in 1779 in a more convenient situation, and on a more enlarged plan, than the former prison, called Newgate: by which name it is still distinguished. It consists of two wings, the debtors and the felons side, with the keeper's house in the middle. The felons are generally between 200 and 300. Single rooms in the state-side of the prison, or in the governor's house, are let to prisoners who choose to pay for them.

In this ward is likewise a prison called the Fleet Prison, from a small river named the Fleet which formerly ran by it; the building is large. It is a prison for the confinement of debtors, and such as are committed for contempt of court. There are 109 rooms, Public 145 feet by 124. The number of prisoners is general. Buildings between 200 and 300. They are allowed to exercise and amuse themselves in a large court.

In Chancery-lane is an office consisting of a house, The Rolls, and chapel, called the office and chapel of the Rolls, from being the great repository of the modern rolls and records of the kingdom. This building was originally the house of an eminent Jew; but being forfeited to the crown, King Henry III. in the year 1225, converted it into a hospital for the reception and accommodation of Jewish and other proselytes. In 1377, Edward III. granted this hospital and its chapel to William Burstall, master of the rolls, to whose successors in that office it has ever since belonged. Round this office there is a small district consisting of about 200 houses, called the Liberty of the Rolls, over which the magistrates of London have no authority, it being under the government of the master of the rolls.

In this ward are several Inns of court and chancery, particularly the Inner and Middle Temple, Serjeants Inn, Clifford's Inn, Barnard's Inn, Staple's Inn, and Fournival's Inn.

The Temple received its name from being originally the Temple, founded by the Knights Templars, who settled here in 1185. It was at first called the New Temple, to distinguish it from the former house of the Knights Templars, which stood in Holborn near Chancery lane. The original building was divided into three parts; the Inner, the Middle, and the Outer Temple. The Inner and the Outer Temple were so called, because one was within and the other was without the Bar; and the Middle derived its name from being situated between them. Upon the dissolution of the order of Knights Templars, the New Temple devolved to the Knights Hospitallers of St John of Jerusalem, who granted a lease of it to the students of the common law, and converted that part of it called Inner and Middle Temple into two inns of court for the study and practice of the common law. The Outer Temple became a house for the earl of Essex.

The buildings of the Temple escaped the fire in 1666, but were most of them destroyed by subsequent fires, and have since been rebuilt. The two Temples are each divided into several courts, and have pleasant gardens on the banks of the Thames. They are appropriated to distinct societies, and have separate halls, where the members dine in common during term-time. The Inner Temple hall is said to have been built in the reign of Edward III. and the Middle Temple hall, which is a magnificent edifice, was rebuilt in 1572 in form of a college hall. The Middle Temple gate, Mr Pennant informs us, was erected by Sir Amias Powlet on a singular occasion. It seems that Sir Amias, about the year 1501, thought fit to put Cardinal Wolsey, then parson of Lymington, into the stocks. In 1515, being sent for to London by the cardinal on account of that ancient grudge, he was commanded not to quit town till further orders. In consequence, he lodged five or six years in this gateway, which he rebuilt; and to pacify his eminence, adorned the front with the cardinal's cap, badges, cognisance, and other devices of this butcher's son; so low were the great
which are well executed. This building was 242 feet long and 40 broad, exclusive of two wings of a later erection, intended for the reception of such lunatics as were deemed incurable. This hospital contained a great number of convenient cells or apartments, where the patients were maintained and received all medical assistance without any other expense to their friends than that of bedding. The structure was divided into two stories, through each of which ran a long gallery from one end of the house to the other. On the south side were the cells, and on the north the windows that gave light to the galleries, which were divided in the middle by handsome iron gates, to keep the men and women separate. This hospital being pulled down, it is intended to erect another building for the use of the same charity, at a short distance from the metropolis. A new road is to be opened from the site of the old hospital to the Royal Exchange.

Opposite to Bethlem hospital stood that of St. Luke's, a long plain building, till of late appropriated to the same purposes, but wholly independent of the former. It was founded on the humane consideration that Bethlem was incapable of receiving all the miserable objects which were offered. Of late years the patients were removed from the old hospital to a new one erected under the same name in Old-street, on the plan of the former, extending in front 492 feet. The old hospital is now pulled down, and replaced by a handsome row of houses. Uncured patients may be taken in again, by a very liberal regulation, on the payment of five shillings a week; so that their friends may, if they choose, try a second time the force of medicine on their unhappy relations or acquaintances.

Besides the three markets already mentioned at Smithfield for cattle and hay, at Leadenhall for but-markets, Cheapside meat, wool, hides, and Colchester baize, and at Billingsgate for fish; there are in this city the following other markets, which are all very considerable, viz. Honey lane, Newgate, and Fleet-market, chiefly for flesh, though with separate divisions for fish, butter, eggs, poultry, herbs, and fruit; and the Three-Cranes market, for apples and other fruit. The principal cornmarket is held in a neat exchange situated in Market-lane, and that for flour at Queenhithe. In Thams-street, near Billingsgate, there is an exchange for dealers in coals and masters of vessels in that trade to transact their business.

II. The borough of Southwark. It was called a Borough by the Saxons Suth, or the "South work," in respect of Southwark; to some fort or fortification bearing that aspect from London. It was also called the Borough, or Burgh, &c. probably from the same reason. It was long independent of the city of London; but, in consideration of the inconveniences arising from the escape of malefactors from the great capital into this place, it was in 1327 granted by Edward III. to the city, on payment of 10 l. annually. In 1670 it was called the county of Southwark; it was afterwards styled the bailiwick of Southwark, and the mayor and commonalty of London appointed the bailiff. This power, however, not being sufficient to remedy the evil, a more intimate connexion was thought necessary; and in the reign of Edward VI. on a valuable consideration paid to the crown, it was formed into a 26th ward, by the title of Bridge Ward Without; with a reservation of certain privileges.
L O N D O N.

Christ-church, though contiguous to the Borough, is in the county of Surry.

The principal church in Southwark is that of St Saviour, which was formerly a priory of regular canons. Being dedicated to the Virgin Mary, and situated near the bank of the Thames, it was called St Mary Over Re, or Overy, by which appellation it is commonly known. This church is built in the manner of a cathedral, with three aisles from east to west, and a cross aisle. It is reckoned the largest parish-church in England, the three aisles first mentioned measuring 269 feet in length, and the cross aisle 109 feet. The height within is 47 feet, and it has a tower with four spires 150 feet high.

Not far from St George's church stood the magnificent palace of Charles Brandon duke of Suffolk, the deserved favourite of Henry VIII. After his death, in 1545, it came into the king's hands, who established here a royal mint. It at that time was called Southwark Place, and in a great measure preserved its dignity. Edward VI. once dined in it. His sister and successor presented it to Heath, archbishop of York, as an inn or residence for him and his successors whenever they repaired to London. As to the Mint, it became a sanctuary for insolvent debtors; but at length becoming the pest of the neighbourhood, by giving shelter to villains of every species, that awakened the attention of parliament; which by the statutes 8 and 9 Will. III. 9 George I. and 11 George I. entirely took away its abusive privileges.

In the parish of Christ-church, near the water on the banks of the Thames, stood Paris-garden, one of the ancient play-places of our metropolis. Ben Johnson is reproached for his libels by one Decker, an envious critic, with his ill success on the stage, and in particular with having performed the part of Zuliman at Paris-garden. It seems to have been much frequented on Sundays. This profanation (Mr Poyntz observes) was at length fully punished by the dire accident which befell the spectators in 1582, when the scaffolding suddenly fell, and multitudes of people were killed or miserably maimed. The omen seems to have been accepted; for in the next century the manor of Paris-garden was erected into a parish, and a church founded under the name of Christ's.

Beyond this place of amusement were the Bear-garden and place for baiting of bulls, the British circus; "Herein (says Stow) were kept bears, bulls, and other beasts to be baited; as also mastives in several kennels nourished to bait them. These bears and other beasts are there kept in plots of ground scaffolded about for the beholders to stand safe." This was then an amusement for persons of the first rank; our great, if not good, Elizabeth caused the French ambassadors to be carried to this theatre, to divert them with these bloody spectacles.

Not far from these scenes of cruel pastime was the Stewards' Bordello.

---

(c) In 1377 this prison was opened by a mob of sailors, who murdered a gentleman confined in it for killing one of their comrades, and who had beenpardoned by the court. It was again broken open by Wat Tyler and his followers in 1381. It escaped in the infamous riots of 1780, while the King's Bench, the Borough Prison, and the Clink Prison, were nearly at the same instant sacrificed to their fury.
L O N D O N.

Bordello or Stews, permitted and openly licensed by government, under certain laws or regulations. They were farmed out. Even a lord mayor did not disdain to own them: but rented them to the Froes, that is, "the bawds," of Flanders. Among other singular regulations, no stockholder was to admit married women; nor were they to keep their houses on Sundays; nor were they to admit any women who had on them the perilous infirmity of burning. These infamous houses were very properly suppressed in the reign of Henry VIII.

The bishop of Winchester had formerly a palace here with a park (the same that is now called Southwark-park), which is since converted into warehouses and tenements, held by lease from the bishops of that see.

Besides several alms-houses, there are here St Thomas's and Guy's Hospital, two of the noblest endowments in England. The former was first erected in 1215 by Peter de Rupibus, bishop of Winchester, who endowed it with land to the amount of 343s. 8d. a year; from which it was held of the abbots of Bermondsey, one of whom in 1428 granted a right to the master of the hospital to hold all the lands it was then in possession of belonging to the said abbot and convent, the whole revenue of which did not exceed 266l. 17s. 6d. per annum. In the year 1557, after the citizens of London had purchased of Edward VI. the manor of Southwark and its appurtenances, of which this hospital was a part, they expended 1100l. in repairing and enlarging the edifice, and immediately received into it 260 patients; upon which the king in 1553 incorporated this hospital with those of Christ-church and Bridewell in the city of London. The building being much decayed, three beautiful squares adorned with colonnades were erected by voluntary subscription in 1693, to which in 1732 the governors added a magnificent building, consisting of several wards with proper offices. The annual disbursements of this hospital have for many years amounted to 8000l. The house is divided into 19 wards, and is said to contain 474 beds.

Guy's Hospital.

Adjoining to St Thomas's stands Guy's Hospital, perhaps the most extensive charitable foundation that ever was established by one man in private life. The founder of this hospital was Thomas Guy, a bookseller in Lombard-street, London, who lived to see the edifice roofed in; and at his death, in 1724, left 283,292l. 16s. including the expense of the building, to finish and endow it. This hospital consists of two capacious squares, containing 12 wards and 433 beds. It was incorporated by charter from parliament, and the first governors were appointed in 1725.

In St George's Fields, westward of the King's Bench prison, is the Magdalen Hospital for the reception of penitent prostitutes; a smaller hospital called the Asylum for orphan girls; and not far distant is the Westminster Lying-in Hospital: Institutions, of which the following feeling and animated account is given by Mr Pennant.

"The Asylum is an institution of a most heavenly nature, calculated to save from perdition of soul and body the brighter part of the creation; such on whom Providence hath bestowed angelic faces and elegant forms, designed as blessings to mankind, but too often debased to the vilest uses. The hazard that these innocents constantly are liable to from a thousand temptations, from poverty, from death of parents, from the diabolical procress, and often from the stupendous wickedness of parents themselves, who have been known to sell their beauteous girls for the purpose of prostitution, induced a worthy band to found in the year 1758 the Asylum, or House of Refuge. Long may it flourish, and eternal be the reward of those into whose minds so amiable a conception entered!

"To afford means of salvation to those unhappy beings who had the ill fortune to lose the benefits of this divine institution, the Magdalen Hospital was instituted for the reception of the penitent prostitutes. To save from vice, is one great merit. To reclaim and restore to the dignity of home, rank in life, is certainly not less meritorious. The joy at the return of one sinner to repentance is esteemed by the highest authority worthy of the heavenly host. That ecstasy, I trust, this institution has often occasioned. Since its foundation in the same year with the former, to December 25, 1786, not fewer than 2471 have been admitted. Of these (it is not to be wondered that long and evil habits are often incurable) 300 have been discharged, uneasy under constraint; 45 proved lunatics, and afflicted with incurable fits; 60 have died; 52 never returned from hospitals they were sent to; 338 discharged for faults and irregularities. How to be dreaded is the entrance into the bounds of vice, since the retreat from its paths is so difficult! Finally, 1608 prodigals have been returned to their rejoicing parents; or placed in reputable services, or to honest trades, banes to idleness, and securities against a future relapse." Into this charity, every woman who has been seduced (and is not pregnant or diseased), whether recommended or not, may apply for admission to the committee, who alone are for that purpose on the first Tuesday in every month.

Akin to those charities is that of the Lying-in Hospital, which is not intended merely for the reception of "the honest matron who can deposite her burden with the consciousness of lawful love, but also for the unhappy wretches whom some villain in the unguarded moment has seduced, and then left a prey to desertion of friends, to poverty, want, and guilt. — Lest such may be driven to despair by such complicated misery, and be tempted to destroy themselves and murder their infants, here was founded in 1765 this humane preventative, the Westminster New Lying-in Hospital, in which every assistance and accommodation requisite in such situations are provided in the most attentive and liberal manner. To obviate all objection to its being an encouragement to vice, no one is taken in a second time: but this most excellent charity is open to the worthy distressed matron as often as necessity requires. None are rejected who have friends to recommend. And of both descriptions upwards of 4000 have experienced its salutary effect."

St George's Fields are now almost covered with new St George's erected buildings, from the ditch to the end of Great Surr-y-street, or Burrow's Buildings, to the Fishmongers alms-houses, in one direction; and from the Marshalsea prison to the Dog and Duck, in the other direction; with several irregular indentures in its circumference: And where the principal roads meet, an obelisk has been erected, pointing out the distance it stands from...
LON DON.

from different parts of London, Westminster, and Blackfriars bridges. Among the buildings which serve to embellish and improve this entrance to London, Chatham-square and Bridge-street-Blackfriars may be particularly specified.

At Lambeth, the archbishops of Canterbury have had a palace. According to Mr Pennant, it was in the earlier times a manor, possibly a royal one: for the great Hardiknap died here in 1063, in the midst of the jollity of a wedding dinner; and here, without any formality, the usurper Harold is said to have snatched the crown and placed it on his own head. At that period it was part of the estate of Gods, wife to Walter earl of Mantes, and Eustace earl of Boulogne; who presented it to the church of Rochester, but reserved to herself the patronage of the church. It became in 1197 the property of the see of Canterbury, by exchange transacted between Gianville bishop of Rochester and the archbishop Hubert Walter. The building was improved by Langton the successor of Walter; but it was afterwards neglected and became ruinous. "No pious zeal (says Mr Pennant) restored the place, but the madness of priestly pride. Boniface, a wrathful and turbulent primate, elected in 1244, took it into his head to become a visitor of the priory of St Bartholomew, to which he had no right. The monks met him with reverential respect, but assured him the office did not belong to him. The meek prelate rushed on the sub-prior, knocked him down, kicked, beat, and buffeted him, tore the cope off his back, and stamped on it like one possessed, while his attendants paid the same compliments to all the poor monks. The people enraged at his unpriestly conduct would have torn him to pieces; when he retired to Lambeth, and, by way of expiation, rebuilt it with great magnificence. At a subsequent period it was very highly improved by the munificent Henry Chichely, who enjoyed the priory from 1414 to 1443. I lament to find so worthy a man to have been the founder of a building so reproachful to his memory as the Lollards tower, at the expense of near 280l. Neither Protestants or Catholics should omit visiting this tower, the cruel prison of the unhappy followers of Wickliffe. The vast staples and rings to which they were chained before they were brought to the stake, ought to make Protestants bless the hour which freed them from so bloody a religion." During the civil wars of the last century, this palace suffered greatly; but at the Restoration, the whole was repaired by Archibishop Juxton.

The parish church of Lambeth (ii), which is at a small distance from the palace, has a plain tower; and the architecture is of the Gothic of the time of Edward IV. It has very little remarkable in it, except the figure of a pedlar and his dog, painted in one of the windows; and tradition says, that the parish was obliged to this man for the bequest of a piece of land, which bears the name of the Pedler's Acre. In the churchyard is the tomb of old Tradescant. Both father and son were great travellers; and the former is supposed to have visited Russia and most parts of Europe, Turkey, Greece, many of the eastern countries, Egypt, and Barbary; out of which he introduced multitudes of plants and flowers, unknown before in our gardens. The monument is an altar tomb; embellished with emblematical sculptures; and bearing the following inscription, which is both singular and historical:

Know, stranger, ere thou pass, beneath this stone
Lye John Tradescant, grand sire, father, son;
The last dy'd in his spring; the other two
Liev'd till they had travell'd Art and Nature through,
As by their choice collections may appear,
Of what is rare, in land, in sea, in air;
Whilst they (as Homer's Iliad in a nut)
A world of wonders in one closet shut:
These famous Antiquarians, that had been
Both gardeners to the Rose and Lily Queen,
Transplanted now themselves, sleep here; and when
Angels shall with their trumpets waken men,
And fire shall purg the world, these hence shall rise,
And change this garden for a paradise.

From Lambeth, eastward along the river side, Lambeth was once a long tract of dreary marsh, and still Marsh, in parts called Lambeth Marsh; about the year 1560, there was not a house on it from Lambeth palace as far as Southwark. In a street called Narrow-wall (from one of the ancient embankments) is Mrs Conde's noted manufactory of artificial stone (1): At a small distance, Mess. Beaufoy's (x) great work

(1) In describing this church, Mr Pennant takes occasion to mention the sad example of fallen majesty in the person of Mary d'Este, the unhappy queen of James II.; who, flying with her infant prince from the ruin impending over their house, after crossing the Thames from the abdicated Whitehall, took shelter beneath the ancient walls of this church a whole hour, from the rain of the inclement night of December 6, 1688. Here she waited with aggravated misery, till a common coach, procured from the next inn, arrived, and conveyed her to Gravesend, from whence she sailed, and bade an eternal adieu to these kingdoms.

(1) Her repository consists of several very large rooms filled with every ornament, which can be used in architecture. The statue, the vase, the urn, the rich chimney pieces, and, in a few words, every thing which could be produced out of natural stone or marble by the most elegant chisel, is here to be obtained at an easy rate.

(x) "Where (says Mr Pennant) the foreign wines are most admirably mimicked. Such is the prodigality and luxury of the age, that the demand for many sorts exceeds in a great degree the produce of the native vineyards. We have skilful fabricators, who kindly supply our wants. It has been estimated, that half of the port, and five-sixths of the white wines consumed in our capital, have been the produce of our home vineyards. The product of duty to the state from a single house was in one year, from July 5, 1785 to July 5, 1786, not less than 7363l. 92. 8d. The genial banks of the Thames opposite to our capital, yield almost every species of white wine; and, by a wondrous magic, Mess. Beaufoy pour forth the materials for the rich Frontiniac,
LONDON.

This ground, so profitable to the proprietors, and so productive of revenue to the state, was within memory the scene of low dissipation. Here stood Cuper's garden, noted for its fireworks, and the great resort of the profligate of both sexes. This place was ornamented with several of the mutilated statues belonging to Thomas earl of Arundel, which had been for that purpose begged from his lordship by one Boyder Cuper, a gardener in the family. The great timber yards beneath which these antiquities were found, are very well worthy of a visit. One would fear that the forests of Norway and the Baltic would be exhausted, to supply the wants of our overgrown capital, were we not assured that the resources will successively be increased equal to the demand of succeeding ages. In this parish are also vast distilleries, formerly the property of Sir Joseph Mawbey; where are seldom less than 2000 hogs, which are fed entirely on grains.

The dean and chapter are invested with an ecclesiastical and civil jurisdiction within the liberties of Westminster, St Martin's le Grand, near Cheapside, in the city of London, and some towns in Essex, which are exempted from the jurisdiction of the bishop of London and the archbishop of Canterbury.

St Margaret's Church was founded by Edward the Confessor, since which time it has been frequently rebuilt. In the east end of this church is a window curiously painted, with the history of the crucifixion, and with the figures of several apostles and saints finely executed. It formerly belonged to a private chapel at Copt-hall, near Epping in Essex, and was purchased by the officers of this parish, some years ago for 400 guineas. In this church the house of commons attends divine service on state holidays.

The church of St John the Evangelist was erected in 1728, and having sunk considerably whilst it was building, occasioned an alteration of the plan. On the north and south sides are magnificent porticoes, supported by vast stone pillars, as is also the roof of the church; at each of the four corners is a beautiful stone tower and pinnacle, which were added with the view of making the whole structure sink equally. The parts of this building are held together by iron bars, which run across even the aisles.

The most remarkable structure in Westminster is the abbey-church of St Peter. On its site stood once a temple of Apollo, which according to tradition was thrown down by an earthquake in the time of Antonius Pius; and from the ruins of which Sessert king of the West Saxons raised a Christian church, which was ruined by the Danes. It was repaired by Edward the Confessor, and given to a few monks; and this spot was chosen for his burial-place. Henry III. 160 years after, took down this fabric of Edward's, and erected a new church, which was 50 years in building. It suffered much by fire in 1274, but was repaired by Edward I. Edward II. and the abbots. In 1700 this church being much decayed, the parliament granted money for repairing it, and has frequently repeated the bounty since that time. The form of the abbey is that of a long cross:

Frontimans to the more elegant tables; the Madeira, the Calcavella, and the Lisbon, into every part of the kingdom.
LONDON.

The cross: its greatest length is 489 feet, and the breadth of the west front 66 feet; the length of the cross aisle is 189 feet, and the height of the roof 92 feet. At the west end are two towers: the nave and cross aisle are supported by 50 slender pillars of Sussex marble exclusive of pilasters. In the upper and lower ranges there are 94 windows, all which, with the arches, roofs, and doors, are in the Gothic taste. The inside of this church is much better executed than the outside: and the perspective is good; particularly that of the grand aisle. The choir, from which there is an ascent by several steps to a fine altar-piece, is paved with black and white marble; having 28 stalls on the north, the same number on the south, and eight at the west end. The altar is made of a beautiful piece of marble, the gift of Queen Anne, enclosed by a curious balustrade, and upon a pavement of porphyry, jasper, Lydian, and serpentine stones, laid in the mosaic style, at the expense of Abbot Ware, A.D. 1723; and is said to be one of the most beautiful of its kind in the world.

On each side of this altar a door opens into St Edward’s chapel; round which are 10 other chapels, and are dedicated, 1. To St Andrew. 2. To St Michael. 3. To St John Evangelist. 4. Islip’s chapel. 5. To St John Baptist. 6. To St Paul. 7. Henry V.’s chapel. 8. To St Nicholas. 9. To St Edmund. 10. To St Benedict.

In St Edward’s chapel are still to be seen the remains of his shrine; which, though now in obscurity, and robbed of all its riches and lustre, was once esteemed the glory of England, so far as art and riches could make it. Here are the tombs of King Edward I. and several other kings and queens of England; and here also is shown the famous chair in which the kings of Scotland used to be crowned at Scone. Henry V.’s chapel is divided from St Edward’s by an iron screen, on each side of which are statues as big as life.—St Andrew’s chapel, which is next the north cross, and the others which surround the choir, are crowded with the monuments of noble personages, worthy the attention of the curious. At the corner of St Benedict’s chapel, an iron gate opens into the south cross aisle; which from the number of monuments erected therein to celebrated English poets, has obtained the name of the Poets’ corner: though here we find most magnificent monument erected at the south end in memory of the late John duke of Argyle and Greenwich; another to William Camden the antiquarian; and others to the celebrated divine Dr Isaac Barrow, to Thomas Parr who died at the age of 152 years, &c.—The south aisle is adorned with 19 curious monuments of the pious, the brave, and the learned; and turning northward from the west door, we view a greater number.

On the east of the abbey, and which, though separate from the other chapels in the choir, seems to be one and the same building with the abbey, stands the chapel of King Henry VII. which that king founded in the year 1502, and was at that time styled the wonder of the world, and is now one of the most expensive remains of the ancient English taste and magnificence. There is no looking upon it without admiration: it conveys an idea of the fine taste of Gothic architecture in that age; and the inside is so noble, majestic, and of such curious workmanship, that it would take a volume to describe each part with justice and propriety.

Its original intention was to be a dormitory for the royal blood: and so far the will of the founder has been observed, that none have been interred therein but such as have traced their descent from ancient kings. The tomb of King Henry VII. is most magnificent, enclosed with a screen of cast brass, most admirably designed, and as well executed. Within the rails are the figures of that king and his royal consort, in their robes of state, on a tomb of black marble: and at the head of this tomb lie the remains of Edward VI. In different parts of this chapel are the monuments of Lewis Stewart duke of Richmond, George Villars, duke of Buckingham, John Sheffield duke of Buckingham, Charles Montague marquis of Halifax, Edward V. and his brother Richard; the vault of James I. and his queen Anne and daughter Mary, on which is a small tomb adorned with the figure of a child; a lofty monument of Queen Elizabeth, and another of Mary queen of Scots; the monuments for Margaret Douglas daughter of Margaret queen of Scots, Margaret countess of Richmond mother to Henry VII. the vault of King Charles II. and William III. Queen Mary his consort, Queen Anne, and Prince George. Over these royal personages are their effigies (except that of Prince George) in wainscot presses, made of wax to resemble life, and dressed in their coronation robes. And at the corner of the great east window, in another wainscot press, stands the effigy of Mary duchess of Richmond, daughter to James duke of Richmond and Lenox, dressed in the very robes she wore at the coronation of Queen Anne. On leaving the aisle, you are shown another press, containing the effigy of General Monk, who, on account of his loyalty, and the part he took in the restoration of King Charles II. had a vault appropriated to him and his family amongst the royal blood.

In a fine vault under Henry the VII.’s chapel, is the burying place of the present royal family, erected by his late majesty King George II. Adjoining to the abbey are the cloisters, built in a quadrangular form, with piazzas towards the court, where several of the prebendaries have their houses.

Near the abbey church is the King’s school, usually Westminster; called Westminster school. It was originally founded in 1570, and a second time by Queen Elizabeth in 1569, whenever it is sometimes called the Queen’s College; and is at present one of the greatest schools in the kingdom. The learned antiquary Mr Camden was once master of it, and Ben Johnson one of his scholars. Dr Busby, who was master upwards of 30 years, greatly contributed to keep up its reputation, formed its museum, and improved both the master’s and his prebendarial house. —This school, instead of one master and one usher as at first, has now an upper and under master, and five ushers, who have about 400 youths under their tuition. A plan was set on foot when the present archbishop of York was master, for building a college for the use of the students, but this did not succeed.

On the north-east side of the abbey is an old Go. Westmin-thic building called Westminster-hall, first built by Wil-iter hall.

Digitized by Google
LONDON.

Near these buildings is a bridge over the Thames, called Westminster Bridge, accounted one of the most complete and elegant structures of the kind in the known world. It is built entirely of stone, and extends over the river at a place where it is 1223 feet wide: which is above 380 feet broader than at London Bridge. On each side is a fine balustrade of stone, with places of shelter from the rain. The width of the bridge is 44 feet, having on each side a fine footway for passengers. It consists of 14 piers, and two large and two small arches, all semicircular, that in the centre being 76 feet wide, and the rest decreasing four feet each from the other, so that the two least arches of the 13 great ones are each 52 feet. It is computed that the value of 40,000l. in stone and other materials is always under water. This magnificent structure was begun in 1730, and finished in 1750, at the expense of 380,000l. defrayed by the parliament. It was built after the design of M. Labelye, an ingenious architect, a native of France.

On the bank of the Thames, at the east confines of Whitehall, St Margaret's parish, was a palace called Whitehall, originally built by Hubert de Burgh, earl of Kent, before the middle of the 13th century. It afterwards devolved to the archbishop of York, whence it received the name of York Place, and continued to be the city residence of the archbishops till it was purchased by Henry VIII of Cardinal Wolsey in 1530. At this period it became the residence of the court; but in 1697 was destroyed by accidental fire, all except the Banqueting-house, which had been added to the palace of Whitehall by James I, according to a design of Inigo Jones. This is an elegant and magnificent structure of hewn stone, adorned with an upper and lower range of pillars, of the Ionic and Composite orders; the capitals are enriched with fruit and foliage, and between the columns of the windows. The roof is covered with lead, and surrounded with a balustrade. The building chiefly consists of one room of an oblong form 40 feet high, and a proportionable length and breadth. The ceiling is painted by the celebrated Sir Peter Paul Rubens. It is now used only as a chapel royal, and the other part of the house is occupied with state offices.

Opposite the Banqueting-house stands the Horse Guards, so called from being the station where that part of his majesty's troops usually do duty. It is a strong building, of hewn stone, consisting of a centre and two wings. In the former is an arched passage into St James's Park; and over it, in the middle, rises a cupola. In a part of the building is the War Office. Near the Horse-guards is the Treasury: a large building, which fronts the Parade in St James's Park; and where the board of treasury is kept.

Eastward of the Horse-guards is the Admiralty Office, a large pile, built with brick and stone. The front towards Whitehall has two deep porticos, and a lofty portico supported by four large stone pillars. A piazza, consisting of beautiful columns, runs almost from one end to the other. The wall before the court has been lately built in an elegant manner, and each side of the gate is ornamented with naval emblems. Besides a hall, and other public apartments, here are spacious houses for seven commissioners of the admiralty.

At a little distance from the Admiralty, where three
capital streets terminate, is a large opening called Charing-cross, from one of the crosses which King Edward I. caused to be erected in memory of his queen Eleanor, and Charing the name of a village in which it was built. The cross remained till the civil wars in the reign of Charles I. when it was destroyed by the fanatics, as a monument of popish superstition; but after the Restoration, an equestrian statue of Charles I. was set up in its stead. This, which is of brass, and finely executed, continues to be an ornament to the place. It was made in 1623, at the expense of the Howard-Arundel family. The parliament sold it to a brazier in Holborn, with strict orders to break it to pieces; but he concealed it under ground till the Restoration, when it was set up in 1678.

At the west end of the Moll, in St James's park, which begins near Charing-cross, stands the Queen's Palace. It was originally known by the name of Arlington House; but being purchased by the late duke of Buckingham's father, who rebuilt it from the ground in 1703, it was called Buckingham House, till the year 1752, when it was purchased by his majesty for a royal residence. It is built of brick and stone, having in the front two ranges of pilasters of the Corinthian and Tuscan orders. It has a spacious court yard, enclosed with iron rails, fronting St James's park, with offices on each side, with two pavilions, separated from the mansion house by colonnades of the Tuscan, Doric, and Ionic orders. His majesty has here built a fine library, in an octagonal form, besides several other additions.

Eastward of the queen's palace stands St James's, an old building, which, till the former was purchased by the crown, had been the town residence of the royal family since the burning of Whitehall in 1697. This palace was built by Henry VIII. and obtained its name from an hospital which formerly stood on the spot. It is an irregular building, of a mean appearance without, but contains several magnificent apartments. Here the court and levees are still kept, and most of the persons belonging to the household have their residence. The chapel of the hospital was converted to the use of the royal family, as it now remains, and is a royal peculiar, exempted from all episcopal jurisdiction. When this palace was built, it abutted in the south-west upon an uncultivated swampy tract of ground, which the king enclosed and converted into a park, called from the palace St James's park. He also laid it out into walks, and collected the water into one body. It was afterwards much enlarged and improved by King Charles II., who planted it with lime trees, and formed a beautiful vista, near half a mile in length, called the Mall, from its being adapted to a play at bowls distinguished by that name. He also formed the water into a canal 100 feet broad and 2800 feet long; and furnished the park with a decoy, and several ponds for water-fowl; but these have lately been destroyed, on account of the unwholesome vapours which they excited.

In a line with St James's palace, on the east side, is Marlborough-house, which belongs to the duke of Marlborough, and is a large brick edifice, ornamented with stone.

The Strand, when first formed.

Eastward from Charing-cross, runs that fine street the Strand, which terminates at Temple-bar. In the year 1353 the whole of it was an open high way, with gardens to the water side. In that year it was so ruinous, that Edward III. by an ordinance directed a tax to be raised upon wool, leather, wine, and goods carried to the staple at Westminster, from Temple-bar to Westminster abbey, for the repair of the road; and that all owners of houses adjacent to the high way should repair as much as lay before their doors. Before the above period, it entirely cut off Westminster from London; nothing intervened between the scattered houses, and a village which afterwards gave name to the whole; and St Martin's stood literally in the fields. But about the year 1560 a street was formed, loosely built; for all the houses on the south side had great gardens to the river, were called by their owners names, and in after-times gave name to the several streets that succeeded them, pointing down to the Thames; each of them had stairs for the convenience of taking boat, of which many to this day bear the names of the houses. As the court was for centuries either at the palace of Westminster or Whitehall, a boat was the customary conveyance of the great to the presence of their sovereign. The north side was a mere line of houses from Charing-cross to Temple-bar; all beyond was country. The gardens which occupied part of the site of Covent-garden were bounded by fields, and St Giles's was a distant country village. Our capital found itself so secure in the vigorous government of Queen Elizabeth, that, by the year 1660, most considerable additions were made to the north of the long line of street just described. St Martin's-lane was built on both sides. St Giles's church was still inhabited; but Broad-street and Holborn were completely formed into streets with houses all the way to Snow-hill. Covent-garden and Lincoln's inns-fields were built, but in an irregular manner. Drury-lane, Clare-street, and Long-acre, arose in the same period.

Almost contiguous to Charing-cross, and upon the Northumberland House, which stands on the site of the hospital of St Mary Rounceval. Henry VIII. granted it to Sir Thomas Caverden. It was afterwards transferred to Henry Howard earl of Northampton; who, in the time of James I. built here a house, and called it after his own name. He left it to his kinsman the earl of Suffolk, lord treasurer; and by the marriage of Algernon Percy Earl of Northumberland, with Elizabeth daughter of Theophilus earl of Suffolk, it passed into the house of the present noble owner. The greater part of the house was built by Bernard Jensen, an architect in the reign of James I. The front next the street was begun by Algernon in 1748, and finished by the present duke, who married his daughter. Two additional wings to the front next the Thames, and a variety of other improvements both in building and furniture, have contributed to render this house the largest and most magnificent in London. It contains a gallery of 100 feet long by 26 wide, most superbly furnished.

A short way eastward, on the same side, stood Durham Yard, which took its name from a palace built originally by the illustrious Thomas de Hatfield, elected bishop of Durham in 1343; designed by him for the town residence of him and his successors. At this place, in
in 1540, was held a most magnificent feast, given by the challengers of England, who had caused to be proclaimed, in France, Flanders, Scotland, and Spain, a great and triumphant justing to be held at Westminster, for all comers that would undertake them. But both the challengers and defendants were English.

Durham-yard is now filled with a most magnificent mass of buildings, called the Adelphi, in honour of two brothers, the ingenious Adams, its architects. Besides its fine lodgings, it is celebrated for its enchanting prospect, the utility of its wharfs, and its subordinate apartments answering a variety of purposes of general benefit.

A little to the eastward stood Somerset-House, a palace built by Somerset the protector in the time of Edward VI; and to make way for which he demolished a great number of buildings without making any recompense to the owners. Part of the church of St John of Jerusalem and the Tower were blown up for the sake of the materials; and the cloisters on the north side of St Paul's, with the charnel house and chapel, underwent the same fate; the tombs being destroyed, and the bones thrown into Finsbury-fields. This happened in 1549; but it is probable that he did not live to inhabit the palace he built, as he was executed in the year 1552. After his death the palace fell to the crown; and it became an occasional place of residence, first to Queen Elizabeth, and afterwards to Catherine queen to King Charles II. It was built in a style of architecture compounded of the Grecian and Gothic; and the back, front, and water-gate, were done from a design of Inigo Jones, about the year 1623. A chapel was begun the same year by that architect, and finished some time after. The whole of this structure was demolished in 1775, in consequence of an act of parliament; and a most magnificent edifice, from a design by Sir William Chambers, has been erected for the accommodation of all the public offices,—those of the Treasury, the Secretary of State, the Admiralty, the War, and the Excise, excepted. The Royal Society, and the Society of Antiquaries, hold their meetings here, in apartments which have been allotted to them by royal munificence; and here also are annually exhibited the works of the British painters and sculptors. The terrace on the south side is a walk bounded by the Thames, and unparalleled for grandeur and beauty of view.

The church of St Martin is distinguished by the name of St Martin's in the Fields, from its situation, which was formerly a field, with only a few scattered houses. The church being decayed, was rebuilt by Henry VIII. and again by James I. but not being large enough to accommodate the inhabitants of the parish, it was augmented in 1607, at the charge of Prince Henry, eldest son of James I. and several of the nobility. After many expensive reparations, however, it was entirely taken down in 1720, and a new church begun, which was finished in 1726. This is an elegant edifice, built of stone. On the west front is a noble portico of Corinthian columns, supporting a pediment, in which are represented the royal arms in bas relief. The ascent to the portico is by a flight of very long steps. The length of this church is about 140 feet, the breadth 60, and height 45. It has a fine arched roof sustained by stone columns of the Corinthian order. The steeple has a beautiful spire, and one of the best rings of bells in London.

St James's Church was built in the reign of Charles II. at the expense of Henry earl of St Alban's, and other neighbouring inhabitants. The building is of brick and stone, about 85 feet long, 60 broad, and 45 feet high, with a handsome steeple 150 feet in height.

St George's Church, near Hanover-square is a beautiful structure. This was one of the fifty new churches erected within the reign of Queen Anne. The ground for the edifice was given by the late Lieutenant-general Stuart, who also left 4000l. to the parish, towards erecting and endowing a charity school; which, by additional benefactions and subscriptions, is become very considerable.

The greater part of the parish of St Paul's Covent-garden, was anciently a garden, belonging to the abbot and convent of Westminster, and was then called Convent garden, a name corrupted into Covent, and more generally Common-garden. In 1552, Edward VI. gave it to the earl of Bedford, with an adjoining field, formerly called the Seven Acres, but now, being turned into a long street, called Long-acre. The church of St Paul's, Covent-garden, was built by Inigo Jones, and was esteemed one of the most simple and perfect pieces of architecture in England. It was burnt by accident a few years ago; but has since been rebuilt in a very plain style. In the area before the church, of about three acres of ground, is Covent garden market, which is the best in England for herbs, fruit, and flowers. On the north, and part of the east side, is a magnificent piazza, designed by Inigo Jones.

Next to the parish of St Paul, Covent-garden, is St Mary that of St Mary le Strand. This is also one of the fifty le Strand, new churches built in the reign of Queen Anne, and &c. is a handsome piece of architecture, though not very extensive. At the entrance, on the west side, is an ascent by a flight of steps, in a circular form, which leads to a similarly shaped portico of Ionic columns, covered with a dome, that is crowned with a vase. The columns are continued along the body of the church, with pilasters of the same order at the corners; and in the intercolumniations are niches handsomely ornamented. Over the dome is a pediment supported by Corinthian columns, which are also continued round the body of the structure, over those of the Ionic order. A handsome balustrade is carried round the top of the church, and adorned with vases.

A little eastward from the preceding church is that of St Clement's Danes, situated likewise in the Strand. A church is said to have stood in this place since about the year 1200; but the present structure was begun in 1662, designed by Sir Christopher Wren. It is built of stone, with two rows of windows, the lower plain, but the upper ornamented; and the termination is by an attic, the pilasters of which are covered with vases. On the south side is a portico, covered with a dome supported by Ionic columns; and opposite to this is another. The steeple is beautiful, and of a great height.

The church of St George, Bloomsbury, is also one of the fifty new churches erected by act of parliament. It is distinguished from all the rest by standing south.
and north, and by the statue of King George I. at the top of its pyramidal steeple.

In Lamb's Conduit-fields, on the north side of the town, is a large and commodious structure called the Foundling Hospital, for the reception of exposed and deserted children. This laudable charity was projected by several eminent merchants in the reign of Queen Anne; but was not carried into execution till many years afterwards, when a charter for its establishment was obtained, through the indefatigable assiduity of Mr Thomas Coram, the commander of a merchant vessel, who spent the remainder of his life in promoting this design. From the time of its institution, the parliament has occasionally granted considerable sums for its support; and in some years upwards of 6000 infants have been received.

Not far from hence is an Hospital for the Small-pox; and in different parts of the town there are others, either for the sick of all kinds, or those in particular circumstances. Of the latter are several Lying-in hospitals, and the Lock Hospital for female patients in the venereal disease. Of the former are St. George's and Middlesex Hospitals, besides several infirmaries.

Gray's Inn. Gray's Inn is one of the four principal inns of court; which, though situated within the limits of the parish of St. Andrew, Holborn, is yet without the liberties of the city of London. It took its name from an ancient family of the name of Gray, which formerly resided here, and in the reign of Edward III. demised it to some students in the law; but it is said to have been afterwards conveyed to the monks of Shene, near Richmond in Surrey, who leased it to the society of the Inn. It was held by this tenement till the dissolution of the monasteries, when Henry VIII. granted it to the society in fee-farm. This Inn consists chiefly of two quadrangles, and has an old hall well built of timber, with a chapel in the Gothic style. Here is also a good library, and the inn is accommodated with a spacious garden.

Lincoln's Inn. Lincoln's Inn, another of the four principal inns of court, was originally the palace of Ralph Neville bishop of Chichester, and chancellor of England about the year 1226. It afterwards devolved to the earl of Lincoln, who converted it into a court for the students of law about the year 1310. From him it received the name of Lincoln's Inn, and consisted only of what is now called the old square, which is entered from Chancery-lane. At present this square contains, besides buildings for the lawyers, a large hall where the lord chancellor hears causes in the sitting after term. To this inn belongs likewise a fine garden, which has lately been diminished by the building of some large and commodious offices, for the use of the six clerks in the court of chancery, &c.

In the parish of St. James, Clerkenwell, is an hospital called the Charter-house, which is a corruption of the word chartreuse, a name formerly used for a convent or priory of the Carthusians, which this place formerly was. After the dissolution of monasteries it fell to the earl of Suffolk, who disposed of it to Thomas Sutton, Esq. a citizen of London, in the time of King James I. for 13,000l. The purchaser intending it for an hospital, applied to the king for a patent, which he obtained in 1611, and the grant was confirmed by parliament in 1623. Mr. Sutton having expended 7000l. in fitting up the buildings, gave it the name of King James's Hospital, and endowed it with lands to the amount of near 4500l. a-year, for the maintenance of 80 gentlemen, merchants or soldiers, who should be reduced to indigent circumstances; and 40 boys, to be instructed in classical learning. The men are provided with handsome apartments, and all the necessities of life except clothes; instead of which each of them is allowed a gown, and 71. a-year. Of the boys, 29 are at a proper time sent to the university, where each has an allowance of 20l. a-year for eight years. Others, who are judged more fit for trade, are put out apprentices, and the sum of 40l. is given with each of them. As a farther encouragement to the scholars, there are nine ecclesiastical preferments in the gift of the governors. It is also by the recommendation of the latter that all pensioners and young are received into the hospital. They consist of 16, of which number the king is always one, and the others are generally noblemen of the first rank. To this hospital belong a master, a preacher, two schoolmasters, a physician, a register, a receiver, a treasurer, a steward, an auditor, and other officers; and the annual revenues of it being now increased to upwards of 6000l. five men and four boys have been added to the original number.

In the parish of St. Luke stands the Haberdashers' Almshouses, or Aske's Hospital, so called from having been erected by the company of haberdashers, pursuant to the will of Robert Aske, Esq. one of the members, who left 30,000l. for the building and the relief of 20 poor members of the company; besides the maintenance and education of 20 boys, some of decayed freemen of the same company. This is a large edifice of brick and stone, 450 feet long, with a piazza in front 340 feet in length, consisting of stone columns of the Tuscan order. In the middle of the building is a chapel, adorned with columns, entablatures and pediment, of the Ionic order; under the pediment is a niche with a statue of the founder. In the same parish is the Ironmongers hospital, likewise a large building.

In the parish of St. Mary, Whitechapel, stands the London Hospital, for the reception of the sick. It is a large building, and was erected a few years since by voluntary contribution. Here are also some considerable almshouses.

Within the precincts of Westminster are several state houses of and houses belonging to the nobility, some of which have the nobility been already mentioned. Of the others, the most remarkable at present are, Burlington-house, Devonshire-house, Egremont-house, and Bedford-house; Carleton-house, the magnificent abode of the prince of Wales; and the superb residence erected by the duke of York between the Treasury and the Horse-guards.

To these may be added, Montagu-house (now the British Museum), which was built on a French plan by the first duke of Montagu, who had been ambassador in France. The staircase and ceilings were painted by Rousseau and La Fosse: the apotheosis of Iris, and the assembly of the gods, are by the last. It was purchased of the duke's heirs by parliament, for uniting together the Royal, Cottonian, Harleian, Sloanean, and other collections of books, MSS. coins, antiquities, subjects in natural history, &c. &c. for the public use, for which it is excellently adapted. The first of these
LONDON.

these libraries contains the books and MSS. of our princes from Henry VII. to Charles II.; the second the MSS. collected by Sir John Cotton, his son, and grandson Sir John, which last gave it to the public by act 12 and 13 Will. III. c. 7. The Harleian collection of MSS. was formed by Edward earl of Oxford, and purchased by government in 1753, at the same time with the library, MSS. and natural curiosities, of Sir Hans Sloane. This last cost Sir Hans 50,000l.; and he left it to will, to the use of the public, on condition that the parliament would pay 20,000l. to his executors. It comprehends an amazing number of curiosities; among which are, the library, including books of drawings, MSS. and prints, amounting to about 50,000 volumes; medallions and coins, ancient and modern, 20,000; cameos and intaglios, about 700; seals, 268; vessels, &c. of agate, Jasper, &c. 542; antiquities, 1125; precious stones, agates, Jasper, &c. 2256; metals, minerals, ores, &c. 2772; crystal, spar, &c. 1864; fossils, flints, stones, 1275; earths, sands, salts, 1035; bitumens, sulphures, &c. 999; tales, mice, &c. 388; corals, sponges, &c. 1421; testacea, or shells, &c. 5943; echini, echinata, &c. 659; asteriae, trichoi, entrochi, &c. 241; crustacea, crabs, lobsters, &c. 353; stelie marine, star-fishes, &c. 173; fish, and their parts, &c. 1555; birds, and their parts, eggs, and nests of different species, 1172; quadrupeds, &c. 1886; vipers, serpents, &c. 521; insects, &c. 539; vegetables, 12,556; hortus siccus or volumes of dried plants, 334; human, as calculi, anatomical preparations, 756; miscellaneous things, natural, 2008; mathematical instruments, 55. A catalogue of all the above is written in a large number of volumes. It is a large and magnificent building; and has behind it a garden, consisting nearly of nine acres. It has of late been very much enriched by an accession of Egyptian curiosities, chiefly taken from General Menou at Alexandria; by the splendid collection of minerals belonging to the Hon. C. Greville, which was purchased by parliament at the expense of 13,000 sterling; and by the Elgin marbles. All parts of the museum, except the library and coins, may be seen every Monday, Wednesday, and Friday (except during August and September, and in Christmas, Easter, and Whitsun weeks), between the hours of ten and four, without any difficulty or other form than the visitor entering his name, &c. in a book. This regulation was adopted only in 1810, previous to which there was much trouble and delay in procuring admission.

Besides a great number of spacious streets, which are daily increasing, this part of the metropolis is ornamented with several magnificent squares, viz. Grosvenor-square, Berkeley-square, Portman-square, Cavendish-square, Hanover-square, St. James's-square, Soho-square, Bloomsbury-square, Queen's-square, Lincoln's-Inn-fields, Leicester-square, Red-Lion-square, &c.

Before the conflagration in 1666, LONDON (which like most other great cities, had arisen from small beginnings) was totally inelegant, inconvenient, and unhealthy, of which latter misfortune many melancholy proofs are authenticated in history, and which, without doubt, proceeded from the narrowness of the streets, and the unaccountable projections of the buildings, that confined the putrid air, and joined with other circumstances, such as the want of water, rendered the city seldom free from pestilential devastation. The fire which consumed the greatest part of the city, dreadful as it was to the inhabitants at that time, was productive of consequences which made ample amends for the losses sustained by individuals; a new city arose on the ruins of the old; but, though more regular, open, convenient, and healthful, than the former, yet it by no means answered to the characters of magnificence or elegance, in many particulars; and it is ever to be lamented (such was the infatuation of those times), that the magnificent, elegant, and useful plan of the great Sir Christopher Wren, was totally disregarded, and sacrificed to the mean and selfish views of private property; views which did irreparable injury to the citizens themselves, and to the nation in general: for had that great architect's plan been followed, what has often been asserted must have been the result; the metropolis of this kingdom would incontestably have been the most magnificent and elegant city in the universe; and of consequence must, from the prodigious resort of foreigners and taste who would have visited it, have become an inexhaustible fund of riches to this nation. But as the deplorable blindness of that age has deprived us of so valuable an acquisition, it is become absolutely necessary that some efforts should be made to render the present plan in a greater degree answerable to the character of the richest and most powerful people in the world.

The plan of London, in its present state, will in its plan many instances appear to very moderate judges to be still defective as injudicious a disposition as can easily be conceived. For a city of trade and commerce, on the borders of so noble a river as the Thames. The wharfs and quays on its banks are extremely mean and inconvenient; and the want of regularity and uniformity in the streets of the city of London, and the mean avenues to many parts of it, are also circumstances that greatly lessen the grandeur of its appearance. Many of the churches and other public buildings are likewise thrust up in corners, in such a manner as might tempt foreigners to believe that they were designed to be concealed. The improvements of the city of London for some years past have, however, been very great; and the new streets, which are numerous, are in general more spacious, and built with greater regularity and elegance.

The streets, with the exception of a few on the south inside of the river which are little frequented, are all well paved; and on each side are flag stones for foot passengers. Underneath the pavements are large vaulted channels, called sewers, which communicate with each house by smaller ones, and with every street by convenient openings and gratings, to carry off all filth that can be conveyed in that manner into the river. A great part of London is now lighted with gas. In the beginning of 1817 the number of gas lights supplied was 76,500, in producing which 28 chalders of coals were consumed daily.

London, then, in its large sense, including Westminster, Southwark, and part of Middlesex, forms one great metropolis, of vast extent and of religious wealth. When considered with all its advantages, it is now what ancient Rome once was; the seat of liberty, the encourager of arts, and the admiration of the whole world. It is the centre of trade;
has an intimate connexion with all the counties in the kingdom; and is the grand mart of the nation, to which all parts send their commodities, from whence they are again sent back into every town in the nation and to every part of the world. From hence innumerable carriages by land and water are constantly employed: and from hence arises that circulation in the national body which renders every part healthful, vigorous, and in a prosperous condition; a circulation that is equally beneficial to the head and the most distant members. Merchants are here as rich as noblemen; witness their incredible loans to government: and there is no place in the world where the shops of tradesmen make such a noble and elegant appearance, or are better stocked.

The Thames, on the banks of which London is situated, is a river which, though not the largest, is the richest and most commodious for commerce of any in the world. It is continually filled with fleets, sailing to or from the most distant climates; and its banks, from London-bridge to Blackwall, form almost one continued great magazine of naval stores; containing numerous wet docks, dry docks, and yards for the building of ships, for the use of the merchant; besides the places allotted for the building of boats and lighters, and the king’s yards lower down the river for the building of men of war.

One of the greatest modern improvements to the port of London was the erection of docks, which are justly deemed the most wonderful works of the kind in the world. The first, the West India docks, were begun in 1800, and completed in 1802. The several basins of which they consist, and the canal connecting them with the river, cover 65 acres. They are kept always full by locks. The northern or import dock is 2600 by 510 feet, and 29 feet deep. It will hold between 200 and 300 ships. The export dock on the south side is 2600 by 400 feet, and 29 feet deep. An open shed along the whole line of the water in front of the warehouses, receives the cargoes, which are hoisted up to the warehouses by cranes. In these docks 450 vessels have been discharged in the space of 6 months. The East India docks, which are situated a little below Blackwall, were built in 1805. The discharging dock is 1410 feet long and 560 wide, containing 18½ acres. The loading dock is 780 feet long and 520 wide, containing 93 acres: the depth of both is 30 feet. The London dock, erected in 1803, is built in the angle of the river below Wapping, between Ratcliff highway and the Thames: it covers 20 acres. Its length is 1262 feet, and width 690: its depth is 27 feet. It is capable of receiving 230 vessels of 300 tons. The warehouses for storing tobacco and wine cover 5 acres; and the whole is surrounded by a wall.

As the city is about 62 miles distant from the sea, it enjoys, by means of this beautiful river, all the benefits of navigation, without the danger of being surprised by foreign fleets, or of being annoyed by the moist vapours of the sea. It rises regularly from the water-side, and, extending itself on both sides along its banks, reaches a prodigious length from east to west in a kind of amphitheatre towards the north, and is continued for near 20 miles on all sides, in a succession of magnificent villas and populous villages, the country seats of gentlemen and tradesmen; whither the latter retire for the benefit of fresh air, and to relax their minds from the hurry of business.

The irregular form of London makes it difficult to ascertain its extent. However, its length from east to west is generally allowed to be above seven miles from its great Hyde-park corner to Poplar; and its breadth in some extent places three, in others two, and in others again not much above half a mile. But taking in the villages included in the population returns, it is supposed to cover 30 square miles.

The population of London, though much enlarged during the last century, did not increase quite so fast as the population of the country parts of England. London, according to the population abstract, contained in 1700, 674,320 inhabitants, which was nearly one-eighth of the population of England; but in 1801 it contained 900,000, which is rather less than one-tenth of the population of England. In 1811 the population of the city, including the villages actually adjoining or closely connected with it, was by the returns 1,071,662. During the period between 1801 and 1811, the population of London increased between 12 and 13 per cent, while that of England increased 14½ per cent. The population of what is called properly the city, has diminished since 1700; this arises from buildings formerly occupied as dwelling-houses, being now used as warehouses, &c. and also from a greater space being occupied by wider streets, and the houses being larger.

The mortality in London has considerably diminished since 1700. In that year it was 19,443, or 1 in 25; since 1801 it has been about 1 in 38. In 1817 there were buried 19,668, of which 10,033 were males and 9,035 females; and in the same year there were christened 24,129, of which 12,624 were males, and 11,505 females.

The mean annual temperature of London is 51°. The temperature of May on an average of eight years is 56.61, of July 66.3, of September 59.63. The greatest usual cold is 20°, and occurs in January. The greatest usual heat is 81°, and occurs in July. The mean height of the barometer is 29.88 at the house of the Royal Society. There are about 209 days in the year without rain, and 136 in which it rains or snows. The average depth of rain during the four last years of the last century was 19 inches. The prevailing winds are the south-west and north-east, the former of which blows on an average 112 days in the year, and the latter 58.

Pauperism has increased greatly in London. The number of persons receiving relief in 1813 was about double of the number in 1803. The average annual expenditure for the poor for the years 1810, 1814, 1815, was 720,000l.; the annual number of persons receiving permanent relief was 36,034, and of persons receiving occasional relief 81,282.

Beside St Paul’s cathedral and the collegiate church General at Westminster, there are 114 parish-churches and 62 chapels of the established religion; 17 foreign Protestant chapels; 11 chapels belonging to the Germans, Dutch, Danes, &c.; 28 Independent meetings; 34 Presbyterian meetings; 20 Baptist meetings; 11 Polish chapels, and meeting-houses for the use of foreign ambassadors and people of various sects; and 6 Jewish synagogues. So that there are above 300 places devo-
L O N D O N.

In wheat-flour, for pies and puddings, oat-meal and rice, &c. at half a farthing a-day, for a million of people for a week.

In salt, oil, vinegar, capers, olives, and other sauces, at half a farthing a-day, for a million of people for a week.

In roots and herbs of all sorts, both for food and physic, at half a farthing a-day, for a million of people for a week.

In sea-coal, charcoal, candles, and fire-wood of all sorts, at 1d. a-day, for a million of people for a week.

In paper of all sorts (a great quantity being used in printing) quills, pens, ink, and wax, at a farthing a-day, for a million of people for a week.

In tobacco, pipes, and snuff, at half a farthing a-day, for a million of people for a week.

In clothing, as linen and woollen, for men, women, and children, shoes, stockings, &c. at 35. 6d. per week, for a million of people for a week.

Expences for horse-meat, in hay, oats, beans, 1000 load of hay a-week, at 42s. a load, comes to 2200l. in oats, and beans the like value, 2000l. which is in all, for one week.

Cider, rum, brandy, strong waters, coffee, chocolate, tea, &c. at 1d. a-day, for a million of people for one week.

The common firing is pit coal, commonly called sea-firing, per coal, of which there are consumed upwards of 766,880 tons, &c. chaldrons every year. The annual consumption of oil in London and Westminster for lamps, amounts to 400,000l. In 1787, the quantity of porter brewed in London for home consumption and foreign exportation, amounted to 1,176,856 barrels. In 1805 it amounted to 1,200,000 barrels of 36 gallons each.

The above was the weekly consumption of the articles specified a few years ago. The following is the annual consumption of some of them estimated since the year 1800.

Bullocks 110,000: sheep and lambs 776,000: calves 210,000: hogs 210,000: suet pigg 60,000: milk in gallons 6,980,000; for which the inhabitants pay 481,066l. and this is the produce of 8,500 cows: vegetables and fruit 3,000,000l: spirituous liquors and compounds 11,145,782 gallons: wine 32,000 tons, butter 16,600,000 pounds: cheese 21,100,000 pounds.

This great and populous city is happily supplied with abundance of fresh water from the Thames and the New River; which is not only of inconceivable service to every family, but, by means of fire-places everywhere dispersed, the keys of which are deposited with the parish officers, the city is in a great measure secured from the spreading of fire: for these plugs are no sooner opened, than there are vast quantities of water to supply the engines. This plentiful water has been attended with another advantage, it has given rise.
LONDON.

The London Institution was formed in the autumn of 1805, by the indefatigable exertions of a few spirited individuals. The house in the mean time is in the Old Jewry, till the managers can procure a more suitable place. The design of it is to promote the dissemination of science, literature, and the arts: its view at present being confined to three objects, viz. the acquisition of a valuable and extensive library; the diffusion of useful knowledge by the means of lectures and experiments; and the establishment of a reading room, where the foreign and domestic journals are provided for the use of the proprietors and subscribers. The government of the Institution is vested in a president, four vice-presidents, twenty managers, and the secretary. The number of proprietors is limited to 1000, each of whom pays 7½ guineas for a share, and the life subscribers pay 25 guineas.

LONDONDERRY, or COLERAIN, a county of Ireland, in the province of Ulster. It is bounded on the south and south-west by the county of Tyrone; by Antrim on the east, from which it is parted by the river Bann: by Donegal on the west; and that country, and the Deucalcedonian ocean on the north. Its length is about 32½ miles, its breadth 25, containing about 511,688 acres. In 1813 it contained 186,000 inhabitants. The bogs and heaths of this county are manured with sea-shells, as those of Donegal. Like that, too, it is pretty champaign, and not unfruitful. It is particularly noted for a very clear river called the Bann, abounding with salmon, a fish said to delight in limpid streams. This river, to distinguish it from a lesser of the same name, is called the Greater or Lower Bann. In order to cultivate, settle, and civilize this county, King James I. granted it by letters patent, to a society, by the name of the Governor and Assistants at London of the new plantation of Ulster in the realm of Ireland. It contains four baronies; and besides the two knights of the shire, sends to parliament one member for the city of Londonderry, and one for Colerain. See LONDONDERRY, SUPPLEMENT.

Londonderry, or Derry, the capital of the county, and the see of a bishop, stands at the bottom of Lough-foyle. This city has a very good port, to which ships of the greatest burden have access, and a considerable trade. It will be ever famous for the gallantry and perseverance with which it defended itself in three memorable sieges, in defiance of the greatest hardships and discouragements, namely, 1st, in 1641, when the rebels could not reduce it either by fraud or force.

2dly, In 1649, when it was besieged by the Lord Ardes, and reduced almost to extremity by famine, till at last relieved by troops sent from England. 3dly, When it held out against the French and Irish from the 7th of December 1688, to the last day of July 1689, though it was neither well fortified nor provided with a garrison or stores of provision and ammunition, and hardly any attempt made to relieve it during so long a time. Though the city is 20 miles up the river, yet very large ships can come up to the quay, where there are four or five fathoms of water. It is now well fortified with a strong wall, besides outworks; and along the banks of the river are several castles and a fort. This city is of no great antiquity, having been built and planted in the reign of James I. by a colony sent by the society above mentioned. The trade of the town is very considerable, having not only a large share in the herring fishery, but sending ships also to the West Indies, New England, and Newfoundland, for which they are so advantageously situated, that a vessel bound from thence to America often arrives there before a London ship can get clear of the soundings, or arrive in the latitude of Londonderry. Though there are many shallows in Lough-foyle, which serves it instead of a road; yet they are easily avoided. There is in the town an Infirmary, a Theatre, and a Linen-Hall. There is also a large and commodious Jail, and an elegant Court-house. The inhabitants of this city are almost all Protestants. It gave the title of earl and baron to a branch of the family of Pitt, which became extinct in 1764; but part of the title was revived in Robert Stewart, who was created Baron Londonderry.
LON

LON [ 215 ]

London.

LON

LONDON, in 1789. A late traveller says, "Derry is, perhaps, the cleanest, best built, and most beautifully situated town in Ireland; and excepting Cork, as convenient as any for commerce, foreign and domestic." The lake almost surrounds it; and the whole ground-plot both of it and its liberties belongs to the 12 great companies of London. The imports are flax seed, hardware, iron, timber, and West India goods. The exports are yarn, linen, salmon salted and barrelled, &c. It contains 18,500 inhabitants, and has a wooded bridge 1098 feet long, which was erected in 1791. Lat. 55° 49' W.; Lat. 55° 4' N.

LONG, and, being given to whatever exceeds the usual standard of length.

LONG-Boat, the largest and strongest boat belonging to any ship. It is principally employed to carry great burdens, as anchors, cables, ballast, &c. See Boat.

LONG, Roger, D. D. master of Pembroke-hall in Cambridge, Lowndes's professor of astronomy in that university, rector of Cherrington in Huntingdonshire, and of Bradwell in Essex, was author of a well known and much improved treatise of astronomy, and the inventor of a remarkably curious astronomical machine, thus described by himself. "I have, in a room lately built in Pembroke-hall, erected a sphere of 18 feet diameter, wherein above 30 persons may sit conveniently; the entrance into it is over the south pole by six steps; the frame of the sphere consists of a number of iron meridians, not complete semicircles, the northern ends of which are screwed to a large round plate of brass, with a hole in the centre of it; through this hole, from a beam in the ceiling, comes the north pole, a round iron rod, about three inches long, and supports the upper parts of the sphere to its proper elevation for the latitude of Cambridge; the lower part of the sphere, so much of it as is invisible in England, is cut off; and the lower or southern ends of the meridians, or truncated semicircles, terminate on, and are screwed down to a strong circle of oak, of about 13 feet diameter; which, when the sphere is put into motion, runs upon large rollers of lignum vitae, in the manner that the tops of some windmills are made to turn round. Upon the iron meridians is fixed a Zodiac of tin painted blue, whereon the ecliptic and heliocentric orbits of the planets are drawn, and the constellations and stars traced: the Great and Little Bear and Draco are already painted in their places round the north pole; the rest of the constellations are proposed to follow; the whole is turned round with a small winch, with as little labour as it takes to wind up a jack, though the weight of the iron, tin, and wooden circle, is about 1000 pounds. When it is made use of, a plane table will be placed in the middle thereof. The whole, with the floor, is well supported by a frame of large timber." Thus far Dr Long, before this curious piece of mechanism was perfected. Since the above was written, the sphere has been completely finished; all the constellations and stars of the northern hemisphere, visible at Cambridge, are painted in their proper places upon plates of iron joined together, which form one concave surface. Dr Long published a Commencement Sermon 1728; and an answer to Dr Galley's pamphlet on Greek Accents; and

* FEB. 1783, died December 16th, 1770, at the age of 91. As the materials for this article are scanty, we shall subjoin, from the Gentleman's Magazine, a few traits of him, as delineated in 1769 by Mr Jones. "He is now in the 88th year of his age, and for his years vegeate and active. He was lately (in October) put in nomination for the office of vice-chancellor. He executed that trust once before; I think in the year 1737; a very ingenious person, and sometimes very facetious. At the public commencement in the year 1613, Dr Greene (master of Bennet college, and afterwards bishop of Ely) being then vice-chancellor, Mr Long was pitched upon for the tripos-performance; it was witty and humorous, and has passed through divers editions. Some that remembered the delivery of it, told me, that in addressing the vice-chancellor (whom the university was usually styled Miss Greene), the tripos-orator, being a native of Norfolk, and assuming the Norfolk dialect, instead of saying, Domina Vice-Cancelleria, did very archly pronounce the words thus, Domina Vice-Cancelleria; which occasioned a general smile in that great auditory. His friend the late Mr Bonfoy of Ripon told me this little incident, 'That he and Dr Long walking together in Cambridge in a dusky evening, and coming to a short post fixed in the pavement, which Mr B. in the midst of chat and inattention, took to be a boy standing in his way, he said in a hurry, 'Get out of my way, boy.' 'That boy, Sir, said the doctor very calmly and slyly, is a post-boy, who turns out of his way for nobody.'—I could recollect several other ingenious repartees if there were occasion. One thing is remarkable, he never was a hale and hearty man, always of a tender and delicate constitution, yet took great care of it. He is common drink water. He always dines with the fellows in the hall. Of late years he has left off eating flesh-meats, in the room thereof, puddings, vegetables, &c. sometimes a glass or two of wine."

LONGEVITY, length of life.

From the different longevities of men in the beginning of the world, after the flood, and in these ages, Mr Derham draws an argument for the interposition of a divine Providence.

Immediately after the creation, when the world was to be peopled by one man and one woman, the ordinary age was 900 and upwards.—Immediately after the flood, when there were three persons to stock the world, their age was cut shorter, and none of those patriarchs, but Shem, arrived at 900. In the second century we find none that reached 240: in the third, none but Teerah that came to 200 years; the world, at least a part of it, by that time being so well peopled, that they had built cities, and were canted out into distant nations. —By degrees, as the number of people increased, their longevity dwindled, till it came down at length to 70 or 80 years: and there it stood, and has continued to stand ever since the time of Moses.—This is found a good medium, and by means hereof the world is neither overstocked, nor kept too thin: but life and death keep a pretty equal pace.

That the common duration of man's life has been the same in all ages since the above period, is plain both from sacred and profane history. To pass by others, Plato lived to 81, and was accounted an old man: and the instances of longevity produced by Piny, lib. vii. c. 48, as very extraordinary, may most of them be matched in modern histories.—In the following Tables are collected into one point of view the most memorable instances
### Longevity

Instances of long-lived persons of whose age we have any authentic records. The first and second are extracted from Mr. Whitehurst's Inquiry into the Origin and Strata of the Earth, with some additions by Dr. Father- gill; who inserted them, accompanied by a third, to Longevity, gathered with a number of useful observations, in the first volume of the Memoirs of the Manchester Literary Society.

(o) Well known to persons of credit in Northampton.
Mr Carew, in his Survey of Cornwall, assures us, that it is no unusual thing with the inhabitants of that county to reach 90 years of age and upwards, and even to retain their strength of body and perfect use of their senses. Besides Brown, the Cornish beggar, who lived to 120, and one Polezew to 130 years of age, he remembered the decease of four persons in his own parish, the sum of whose years, taken collectively, amounted to 340. Now, although longevity evidently prevails more in certain districts than in others, yet it is by no means confined to any particular nation or climate; nor are there wanting instances of it in almost every quarter of the globe, as appears from the preceding as well as the subsequent Table; which might have been considerably enlarged, had it appeared necessary; but we have only added, in the last, three recent instances that are peculiarly remarkable.

(r) This man, in 1789, at the age of 120, quitted his native hills, and from the summit of Mount Jura undertook a journey to Versailles, to behold and return thanks to the national assembly for the vote which had freed him and his poor countrymen from the feudal yoke. In the early part of his life, he was a servant in the family of the prince de Beauharnet. His memory continued good to the last day of his life; and the principal inconveniences which he felt from his great age were, that his sight was weakened, and the natural heat of his body was so diminished, that he shivered with cold in the middle of the dog-days if he was not sitting by a good fire. This old man was received in the body of the house by the national assembly, indulged with a chair, and directed to keep on his hat lest he should catch cold if he was to sit uncovered. A collection was made for him by the members, which exceeded 500l. sterling; but he lived not to return to Mount Jura. He was buried on Saturday the 31st of January 1790, with great funeral pomp, in the parish-church of St Eustace at Paris.

(s) He served as a private at the taking of Gibraltar in 1704.

(t) Memoirs of the Life and gallant Exploits of the Old Highlander, Serjeant Donald Macleod, &c. published 1791, in the 103d year of his age.—This old gentleman, for it appears that he really is a gentleman both by birth and by behaviour, was born in the year of the Revolution, in the parish of Bracadill, in the isle of Sky, and county of Inverness, North Britain. He is a cadet of the family of Ulinnis in Sky; and descended, through his mother, from Macdonald of Slate, the ancestor of the present Lord Macdonald. The earlier part of his life coincided with the famine of seven years in Scotland; which was so great as to suggest, even
A certain author mentions a list collected by himself of 107 persons, who all died at the age of 120 and upwards. Two of them attained the age of 150, three of 152, one of 154, one of 169, and another of 175. In 1763 there were found in Sweden 988 females above 90 years of age. We have seen a list of 104 persons, none of whom died under 120 years of age, and one of them, it is said, lived to the prodigious age of 183. Forty-one of them belonged to England, 16 to Scotland, and 24 to Ireland.

The antediluvians are purposely omitted, as bearing too much reference to the present race of mortals, to afford any satisfactory conclusions; and as they have been already taken notice of in a separate article; see Antediluvians. As the improbable stories of some persons who have almost rivalled them in modern times, border too much upon the marvellous to find a place in these tables, the present examples are abundantly sufficient to prove, that longevity does not depend, so much as has been supposed, on any particular climate, situation, or occupation in life: for we see, that it often prevails in places where all these are extremely dissimilar; and it would, moreover, be very difficult, in the histories of the several persons above mentioned, to find any circumstance common to them all, except, perhaps, that of being born of healthy parents, and of being inured to daily labour, temerity, and simplicity of diet. Among the inferior ranks of mankind, therefore, rather than among the sons of ease and luxury, shall we find the most numerous instances of longevity; even frequently, when other external circumstances seem extremely unfavourable; as in the case of the poor sexton at Peterborough, who, notwithstanding his unpromising occupation among dead bodies, lived long enough to bury two crowned heads, and to survive two complete generations. The livelihood of Henry Jenkins and old Parre is said to have consisted chiefly of the coarsest fare, as they depended on precarious alms. To which may be added the remarkable instance of Agnes Milbourne, who, after bringing forth a numerous offspring, and being obliged, through extreme indigence, to pass the latter part of her life in St Luke’s workhouse, yet reached her 120th year in that sordid and unfriendly situation. The plain diet and invigorating employments of a country life are acknowledged on all hands to be highly conducive to health and longevity; while the luxuries and refinements of large cities are allowed to be equally destructive to the human species; and this consideration alone, perhaps, more than counterbalances all the boasted privileges of superior elegance and civilization resulting from a city life.

From country villages, and not from crowded cities, have the preceding instances of longevity been chiefly supplied. Accordingly it appears from the London bills of mortality, during a period of 30 years, viz. from the year 1728 to 1758, the sum of the deaths amounted to 750,322, and that in all this prodigious number, only 242 persons survived the 100th year of their age! This overgrown metropolis is computed by Dr. Price to contain a ninth part of the inhabitants of England, and to consume annually 7000 persons, who remove into it from the country every year, without increasing it. He moreover observes, that the number of inhabitants in England and Wales has diminished about one-fourth in Europe, and so rapidly of late, that in 11 years, near 200,000 of our common people have been lost. If the calculation be just, however alarming it may appear in a national view, there is this consolation, when considered in a philosophical light, that without partial evil, there can be no general good; and

to the patriotic Mr. Fletcher, the idea of the people selling themselves as slaves for immediate subsistence. He was bred in the midst of want and hardships, cold, hunger, and for the years of his apprenticeship with a mason and stone-cutter in Inverness, in incessant fatigue. He enlisted, when a boy, in the Scottish service, in the town of Perth in the last year of the reign of King William. The regiment into which he enlisted was the Scots Royals, commanded by the Earl of Orkney. That old military corps, at that time, used bows and arrows as well as swords, and wore steel caps. He served in Germany and Flanders under the duke of Marlborough; under the duke of Argyle, in the rebellion 1715; in the Highland Watch, or companies raised for enforcing the laws in the Highlands; in the same companies when, under the name of the 42d regiment, they were sent abroad to Flanders, to join the army under the duke of Cumberland; in the same regiment in Ireland, and on the breaking out of the French war, 1737, in America. From the 42d he was drafted to act as a drill serjeant in the 78th regiment, in which he served at the reduction of Louisburg and Quebec. After this he became an out-pensioner of Chelsea Hospital. But such was the spirit of this brave and hardy veteran, that he served in Germany under the marquis of Granby, and offered his services in the American war to Sir Henry Clinton; who, though he declined to employ the old man in the fatigues and dangers of war, treated him with great kindness, allowed him a liberal weekly pension out of his own pocket, and sent him home in a ship charged with despatches to government. — The serjeant, "as his memory, according to the observation of his biographer, is impaired, does not pretend to make an exact enumeration of all his offspring: but he knows of 16 sons now living, 14 of whom are in the army and navy, besides daughters; the eldest of whom by his present wife is a mantuamaker at Newcastle. — His eldest son is now 83 years old, and the youngest only nine. Nor, in all probability, would this lad close the rear of his immediate progeny, if his present wife, the boy’s mother, had not attained to the 49th year of her age." — In his prime, he did not exceed five feet and seven inches. He is now inclined through age to five feet five inches. He has an interesting physiognomy, expressive of sincerity, sensibility, and manly courage. His biographer very properly submits it to the consideration of the Polygraphic Society, whether they might not do a thing worthy of themselves and their ingenious art, if they should multiply likenesses of this living antiquity, and circulate them at an easy rate throughout Britain and Europe. They would thus gratify a very general curiosity; a curiosity not confined to the present age.
Longevity. And that what a nation loses in the scale of population at one period, it gains at another; and thus, probably, the average number of inhabitants on the surface of the globe continues at all times nearly the same. By this medium, the world is neither overstocked with inhabitants nor kept too thin, but life and death keep a tolerably equal pace. The inhabitants of this island, comparatively speaking, are but as the dust in the balance; yet instead of being diminished, we are assured by other writers, that within these 30 years they are greatly increased.

The desire of self-preservation, and of prolonging the short span of life, is so intimately interwoven with our constitution, that it is justly esteemed one of the first principles of our nature, and, in spite even of pain and misery, seldom quits us to the last moments of our existence. It seems, therefore, to be no less our duty than our interest, to examine minutely into the various means that have been considered as conducive to health and long life: and, if possible, to distinguish such circumstances as are essential to that great end from those which are merely accidental. But here it is much to be regretted, that an accurate history of the lives of all the remarkable persons in the above table, so far as relates to the diet, regimen, and the use of the non-naturals, has not been faithfully handed down to us; without which it is impossible to draw the necessary inferences. Is it not then a matter of astonishment, that historians and philosophers have hitherto paid so little attention to longevity? If the present imperfect list should excite others, of more leisure and better abilities, to undertake a full investigation of so interesting a subject, the inquiry might prove not only curious but highly useful to mankind. In order to furnish materials for a future history of longevity, the bills of mortality throughout the kingdom ought first to be revised, and put on a better footing, agreeable to the scheme of which Manchester and Clesiter have already given a specimen highly worthy of our imitation. The plan, however, might be further improved with very little trouble, by adding a particular account of the diet and regimen of every person who dies at 80 years of age or upwards; and mentioning whether his parents were healthy, long-lived people, &c. An accurate register, thus established throughout the British dominions, would be productive of many important advantages to society, not only in a medical and philosophical, but also in a political and moral view.

All the circumstances which are most essentially necessary to life, may be comprised under the six following heads: 1. Air and climate; 2. Meat and drink; 3. Motion and rest; 4. The sensations and exertions; 5. Sleep and watching; 6. Affections of the mind.

Those, though all perfectly natural to the constitution, have by writers been styled the non-naturals, by a strange perversion of language, and have been all copiously handled under that improper term. However, it may not be amiss to offer a few short observations on each, as they are so immediately connected with the present subject.

1. Air, &c. It has long been known that fresh air is more immediately necessary to life than food; for a man may live two or three days without the latter, but not many minutes without the former. The vivifying principle contained in the atmosphere, so essential to longevity, the support of flame, as well as animal life, concerning which authors have proposed so many conjectures, appears now to be nothing else but that pure dephlogisticated fluid lately discovered by that ingenious philosopher Dr Priestley. The common atmosphere may well be supposed to be more or less healthy in proportion as it abounds with this animating principle. As this exhales in copious streams from the green leaves of all kinds of vegetables, even from those of the most poisonous kinds, may we not, in some measure account why instances of longevity are so much more frequent in the country than in large cities; where the air, instead of partaking so largely of this salutary impregnation, is daily contaminated with noxious animal effluvia and phlogiston?

With respect to climate, various observations conspire to prove, that those regions which lie within the temperate zones are best calculated to promote long life. Hence, perhaps, may be explained, why Italy has produced so many long-livers, and why islands in general are more salutary than continents; of which Bermudas and some others afford examples. And it is a pleasing circumstance that our own island appears from the above table (notwithstanding the sudden vicissitudes to which it is liable) to contain far more instances of longevity than could well be imagined. The ingenious Mr Whitehurst assures us, from certain facts, that Englishmen are in general longer lived than North Americans; and that a British constitution will last longer, even in that climate, than a native one. But it must be allowed in general, that the human constitution is adapted to the peculiar state and temperature of each respective climate, so that no part of the habitable globe can be pronounced too hot or too cold for its inhabitants. Yet, in order to promote a friendly intercourse between the most remote regions, the Author of nature has wisely enabled the inhabitants to endure great and surprising changes of temperature with impunity.

2. Foods and drink. Though foods and drink of the most simple kinds are allowed to be the best calculated for supporting the body in health, yet it can hardly be doubted but variety may be safely indulged occasionally, provided men would restrain their appetites within the bounds of temperance: for bountiful Nature cannot be supposed to have poured forth such a rich profusion of provisions, merely to tantalize the human species, without attributing to her the part of a cruel step-mother, instead of that of the kind and indulgent parent. Besides, we find, that by the wonderful powers of the digestive organs, a variety of animal and vegetable substances, of very discordant principles, are happily assimilated into one bland homogenous chyle; therefore it seems natural to distrust those cynical writers, who would rigidly confine mankind to one simple dish, and their drink to the mere water of the brook. Nature, it is true, has pointed out that mild insipid fluid as the universal diluent, and therefore most admirably adapted for our daily beverage. But experience has equally proved, that vinous and的精神uous liquors, on certain occasions, are no less salutary and beneficial, whether it be to support strength against sickness or bodily fatigue, or to exhilarate the mind under the pressure of heavy misfortunes. But, alas!
Longevity. what Nature meant for innocent and useful cordials, to be used only occasionally, custom and caprice have by degrees rendered habitual to the human frame, and liable to the most enormous and destructive abuses. Hence it may be justly doubted, whether gluttony and intemperance have not depopulated the world more than even the sword, pestilence, and famine. True, therefore, is the old maxim, "Modus utendi, ex veneno facit medicamentum, ex medicamento venenum." See Dietetics, Supplement.

3. and 4. Motion and rest, sleep and watching. It is allowed on all hands, that alternate motion and rest, and sleep and watching, are necessary conditions to health and longevity; and that they ought to be adapted to age, temperament, constitution, temperature of the climate, &c. but the errors which mankind daily commit in these respects become a fruitful source of diseases. While some are bloated and relaxed with ease and indolence, others are emaciated, and become rigid through hard labour, watching, and fatigue.

5. Secretions and excretions. Where the animal functions are duly performed, the secretions go on regularly; and the different evacuations so exactly correspond to the quantity of aliment taken in, in a given time, that the body is found to return daily to nearly the same weight. If any particular evacuation happen to be preternaturally diminished, some other evacuation is proportionally augmented, and the equilibrium is commonly preserved; but continued irregularities, in these important functions, cannot but terminate in disease.

6. Affections of the mind. The due regulation of the passions, perhaps, contributes more to health and longevity than that of any of the non-naturals. The animating passions, such as joy, hope, love, &c. when kept within proper bounds, gently excite the nervous influence, promote an equable circulation, and are highly conducive to health; while the depressing affections, such as fear, grief, and despair, produce the contrary effect, and lay the foundation of the most formidable diseases.

From the light which history affords us, as well as from some instances in the above table, there is great reason to believe, that longevity is in a great measure hereditary; and that healthy long-lived parents would commonly transmit the same to their children, were it not for the frequent errors in the non-naturals, which so evidently tend to the abbreviation of human life.

Where is it, but from these causes, and the unnatural modes of living, that, of all the children which are born in the capital cities of Europe, nearly one half die in early infancy? To what else can we attribute this extraordinary mortality? Such an amazing proportion of premature deaths is a circumstance unheard of among savage nations, or among the young of other animals! In the earliest ages, we are informed, that human life was protracted to a very extraordinary length; yet how few persons, in these latter times, arrive at that period which nature seems to have designed! Man is by nature a field animal, and seems destined to rise with the sun, and to spend a large portion of his time in the open air, to subdue his body to robust exercises and the inclemency of the seasons, and to make a plain homely repast only when hunger dictates. But art has studiously defeated the kind intentions of nature; and by enslaving him to all the blandishments of sense, has left him, alas! an easy victim to folly and caprice. To enumerate the various abuses which take place from the earliest infancy, and which are continued through the succeeding stages of modish life, would carry us far beyond our present intention. Suffice it to observe, that they prevail more particularly among people who are the most highly polished and refined. To compare their artificial mode of life with that of nature, or even of the long-livers in the list, would probably afford a very striking contrast; and at the same time supply an additional reason why, in the very large cities, instances of longevity are so very rare.

LONGFORD, a county of Ireland, in the province of Leinster, bounded by the counties of Leitrim and Cavan on the north, Meath on the east and south, and Roscommon on the west. It contains 143,700 Irish plantation acres, 24 parishes, and above 50,000 inhabitants; and returns two members to the imperial parliament. It is small, and much encumbered with bog, intermixed with a tolerable good soil; and is about 25 miles long, and 24 broad. See LONGFORD, Supplement.

LONGFORD, a town of Ireland, situated on the river Cromlin, in the county of Longford and province of Leinster, 64 miles from Dublin; which river falls a few miles below this place into the Shannon. It is a borough, port, market, and fair town; and formerly returned two members to parliament. Patron Lord Longford. It gave title of earl to the family of Augier; of viscount, to the family of Mickletonwaite; and now gives that of baron, to the family of Pakenham. Within a mile and a half of the town is a charter-school for above 40 children. This place has a barracks for a troop of horse. It is large and well built; and in a very early age an abbey was founded here, of which St Idus, one of St Patrick's disciples, was abbot. In the year 1409, a fine monastery was founded to the honour of the virgin Mary, for Dominican friars, by O'Ferral prince of Annally. This monastery being destroyed by fire, Pope Martin V. by a bull in the year 1429, granted an indulgence to all who should contribute to the rebuilding of it. In 1433, Pope Eugene IV. granted a bull to the same purpose; and in 1438 he granted another to the like effect. The church of this friary, now the parish church, is in the diocese of Ardagh. The fairs are four in the year.

LONG-ISLAND, an island of North America, belonging to the state of New York, which is separated from the continent by a narrow channel. It extends from the city of New York east 140 miles, terminating with Montauk point; and is not more than ten miles in breadth on an average. It is divided into three counties, King's, Queen's, and Suffolk. The south side of the island is flat land, of a light, sandy soil, bordered on the sea-coast with large tracts of salt meadow, extending from the west point of the island to Southampton. This soil, however, is well calculated for raising grain, especially Indian corn. The north side of the island is hilly, and of a strong soil, adapted to the culture of grain, hay, and fruit. A ridge of hills extends from Jamaica to Southold. Large herds of cattle feed upon Hampstead plain and on the salt marshes upon the south side of the island. Hampstead plain in Queen's county is a curiosity. It is
is 16 miles in length, east and west, and 7 or 8 miles wide. The soil is black and to appearance rich, and yet it was never known to have any natural growth, but a kind of wild grass and a few shrubs. It is frequented by vast numbers of plover. Rye grows tolerably well on some parts of the plain. The most of it lies common for cattle, horses, and sheep. As there is nothing to impede the prospect in the whole length of this plain, it has a curious but tiresome effect upon the eye, not unlike that of the ocean. The island contained 48,752 inhabitants in 1810.

LONGIMETRY, the art of measuring lengths, both accessible and in accessible. See Geometry and Trigonometry.

LONGING, a preternatural appetite in pregnant women, and in some sick persons when about to recover. It is called *peca* from the bird of that name, which is said to be subject to the same disorder. The disorder consists of both a desire of unusual things to eat and drink, and in being soon tired of one and wanting another. It is called *malacria* from *malacria*, "weakness." In pregnant women it is somewhat relieved by bleeding, and in about the fourth month of their pregnancy it leaves them. Chlorotic girls, and men who labour under suppressed hemorrhoids, are very subject to this complaint, and are relieved by the respective evacuations. In general, whether this disorder is observed in pregnant women, in persons recovering from an acute fever, or those who labour under obstructions of the natural evacuations, this craving of the appetite should be indulged.

LONGINICO, a town of Turkey in Europe, in the Morea, anciently called *Olympia*, famous for being the place where the Olympic games were celebrated, and for the temple of Jupiter Olympus, about a mile distant. It is now but a small place, situated on the river Alpheus, 10 miles from its mouth, and 50 south of Lepanto. E. Long. 22°. N. Lat. 37° 35'.

LONGINUS, Dionysius, a celebrated Greek critic of the third century, was probably an Athenian. His father's name is unknown, but his mother was allied to the celebrated Plutarch. His youth was spent in travelling with his parents, which gave him an opportunity to increase his knowledge, and improve his mind. After his travels, he fixed his residence at Athens, and with the greatest assiduity applied to study. Here he published his Treatise on the Sublime; which raised his reputation to such a height, and gave the Athenians such an opinion of his judgment and taste, that they made him sovereign judge of all authors, and every thing was received and rejected by the public according to his decisions. He seems to have stayed at Athens a long time; here he taught the academic philosophy, and among others had the famous Porphyry for his pupil. But it was at length his fortune to be drawn from Athens, and to mix in more active scenes; to train up young princes to virtue and glory; to guide the busy passions of the great to noble objects; to struggle for, and at last to die in the cause of liberty. Zenobia, queen of the East, prevailed on him to undertake the education of her sons; and he soon gained an uncommon share in her esteem: she spent the vacant hours of her life in his conversation, and modelled her sentiments and conduct by his instructions. That princess was at war with Aurelian; and being defeated by him near Antioch, was compelled to shut herself up in Longinus, her capital city. The emperor wrote her a letter, in which he ordered her to surrender; to which she returned an answer, drawn up by Longinus, which filled him with resentment. The emperor laid siege to the city; and the Palmyrians were at length obliged to open their gates and receive the conqueror. The queen and Longinus endeavoured to fly into Persia, but were unhappily overtaken and made prisoners when they were on the point of crossing the Euphrates. The queen, intimidated, weakly laid the blame of vindicating the liberty of her country on its true author; and the brave Longinus, to the disgrace of the conqueror, was carried away to immediate execution. The writings of Longinus were numerous, some on philosophial, but the greater part on critical subjects. Dr. Pearce has collected the titles of 25 treatises, none of which, excepting that on the Sublime, have escaped the depredations of time and barbarians. On this imperfect piece the great fame of Longinus is raised, who, as Pope expresses it—"is himself the great sublime he draws." The best edition of his works is that by Tottius, printed at Utrecht in 1694, *cum notis variorum.* It has been translated into English by Mr. Smith.

LONGISSIMUS DORSI. See Anatomy, Table of the Muscles.

LONGITUDE, in Geography and Navigation, is the distance of any place from another eastward or westward, counted in degrees upon the equator: but when the distance is reckoned by leagues or miles and not in degrees, or in degrees on the meridian, and not of the parallel of latitude, in which case it includes both latitude and longitude, it is called departure.

To find the longitude at sea, is a problem to which the attention of navigators and mathematicians has been drawn ever since navigation began to be improved. The importance of this problem soon became so well known, that, in 1598, Philip III. of Spain offer a reward of 1000 crowns for the solution; and 10,000 florins, who offered 10,000 florins. In 1714 an act was passed in the British parliament, empowering certain commissioners to make out a bill for a sum not exceeding 2000l. for defraying the necessary expenses of experiments for ascertaining this point; and likewise granting a reward to the person who made any progress in the solution, proportionable to the degree of accuracy with which the solution was performed: 10,000l. was granted if the longitude should be determined to one degree of a great circle, or 60 geographical miles; 15,000l. if to two-thirds of that distance; and 20,000l. if to half the distance.

In consequence of these proffered rewards, innumerable attempts were made to discover this important secret. The first was that of John Morin professor of mathematics at Paris, who proposed it to Cardinal Richelieu; and though it was judged insufficient on account of the imperfection of the lunar tables, a pension of 2000 livres per annum was procured for him in 1645 by Cardinal Mazarine. Gemma Frisius had indeed, in 1530, projected a method of finding the longitude by means of watches, which at that time were newly invented: but the structure of these machines was then so too imperfect to admit of any attempt; nor even
Longitude. In 1631, when Merian made an attempt to pursue this purpose, they were advanced in any considerable degree. About the year 1664, Mr. Hooke and Mr. Huygens made a very great improvement in watchmaking, by the application of the pendulum spring. Mr. Hooke having quarrelled with the ministry, no experiment was made with any of his machines; but many were made with those of Mr. Huygens. One experiment particularly, made by Major Holmes, in a voyage from the coast of Guinea in 1663, answered so well, that Mr. Huygens was encouraged to improve the structure of his watches: but it was found that the variations of heat and cold produced such alterations in the rate of going of the watch, that unless this could be remedied, the watches could be of little use in determining the longitude.

In 1714 Henry Sully, an Englishman, printed a small tract at Vienna upon the subject of watchmaking. Having afterwards removed to Paris, he applied himself to the improvement of time-keepers for the discovery of the longitude. He taught the famous Julion de Roy; and this gentleman, with his son, and M. Berthoud, are the only persons who, since the days of Sully, have turned their thoughts this way. But though experiments have been made at sea with some of their watches, it does not appear that they have been able to accomplish any thing of importance with regard to the main point. The first who succeeded in any considerable degree was Mr. John Harrison; who, in 1726, produced a watch which went so exactly, that for ten years together it did not err above one second in a month. In 1736 it was tried in a voyage to Lisbon and back again, on board one of his majesty's ships; during which it corrected an error of a degree and a half in the computation of the ship's reckoning. In consequence of this he received public encouragement to go on; and by the year 1761 had finished three time-keepers, each of them more accurate than the former. The last turned out so much to his satisfaction, that he was applied to by the commissioners of longitude for leave to make an experiment with his watch in a voyage to the West Indies. Permission being granted, his son Mr. William Harrison set out in his majesty's ship the Deptford for Jamaica in the month of November 1761. This trial was attended with all imaginable success. The longitude of the island, as determined by the time-keeper, differed from that found by astronomical observations only one minute and a quarter of the equator; the longitudes of places seen by the way being also determined with great exactness. On the ship's return to England, it was found to have erred no more during the whole voyage than 1' 54" in time, which is little more than 28 miles in distance; which being within the limits prescribed by the act, the inventor claimed the whole 20,000l. offered by government. Objections to this, however, were soon started. Doubts were pretended about the real longitude of Jamaica, as well as the manner in which the time had been found both there and at Portsmouth. It was alleged also, that although the time-keeper happened to be right at Jamaica, and after its return to England, this was by no means a proof that it had always been so in the intermediate times; in consequence of which allegations, another trial was appointed in a voyage to Barbadoes. Precautions were now taken to obviate as many of these objections as possible. The commissioners sent out proper persons to make astronomical observations at that island; which, when compared with others in England, would ascertain beyond a doubt its true situation. In 1764 then, Mr. Harrison junior set sail for Barbadoes; and the result of the experiment was, that the difference of longitude between Portsmouth and Barbadoes was shown by the time-keeper to be 3h. 55' 3'" and by astronomical observations to be 3h. 54' 20", the error being now only 43" of time, or 10' 45" of longitude. In consequence of this and the former trials, Mr. Harrison received one half of the reward promised, upon making a discovery of the principles upon which his time-keeper was constructed. He was likewise promised the other half of the reward as soon as time-keepers should be constructed by other artists who should answer the purpose as well as those of Mr. Harrison himself. At this time he delivered up all his time-keepers, the last of which was sent to Greenwich to be tried by Mr. Nevil Maskelyne, the astronomer-royal. On trial, however, it was found to go with much less regularity than had been expected; but Mr. Harrison attributed this to his having made some experiments with it which he had not time to finish when he was ordered to deliver up the watch. Soon after this, an agreement was made by the commissioners with Mr. Kendall to construct a watch upon Mr. Harrison's principles; and this upon trial was found to answer the purpose even better than any that Harrison himself had constructed. This watch was sent out with Captain Cook in 1772; and during all the time of his voyage round the world in 1773, 1774, and 1775, never erred quite 145 seconds per day; in consequence of which, the house of commissioners in 1774, ordered the other 10,000l. to be paid to Mr. Harrison. Still greater accuracy, however, has been attained. A watch was lately constructed by Mr. Arnold, which, during a trial of 13 months, from February 1779 to February 1780, varied no more than 6.66" during any two days; and the greatest difference between its rates of going on any day and the next to it was 4.11". The greatest error it would have committed therefore in the longitude during any single day would have been very little more than one minute of longitude; and thus might the longitude be determined with as great exactness as the latitude generally can.—This watch, however, has not yet been tried at sea.

Thus the method of constructing time-keepers for discovering the longitude seems to be brought to as great a degree of perfection as can well be expected. Still, however, as those watches are subject to accidents, and may thus alter the rate of their going without any possibility of a discovery, it is necessary that some other method should befallen upon, in order to correct from time to time those errors which may arise either from the natural going of the watch, or from any accident which may happen to it. Methods of this kind are all founded upon celestial observations of some kind or other; and for these methods, or even for an improvement in time-keepers, rewards are still held out by government. After the discoveries made by Mr. Harrison, the act concerning the longitude was repealed, excepting so much of it as related to the constructing, printing, publishing, &c. of nautical almanacks and other useful tables. It was enacted also, that
Longitude. That any person who shall discover a method for finding the longitude by means of a time-keeper, the principles of which have not hitherto been made public, shall be entitled to a reward of 5000l. If, after certain trials made by the commissioners, the said method shall enable a ship to keep her longitude, during a voyage of six months, within 50 geographical miles, or a degree of a great circle. If the ship keeps her longitude within 40 geographical miles for that time, the inventor is entitled to a reward of 1500l. and to 10,000l. if the longitude is kept within half a degree. If the method be by improved astronomical tables, the author is entitled to 500l. when they show the distance of the moon from the sun and stars within 15 seconds of a degree, answering to about 7 minutes of longitude, after allowing half a degree for errors of observation and under certain restrictions, and after comparison with astronomical observations for a period of 182 years, during which the lunar irregularities are supposed to be completed. The same rewards are offered to the person who shall with the like accuracy discover any other method of finding the longitude.

These methods require celestial observations; and any of the phenomena, such as the different apparent places of stars with regard to the moon, the beginning and ending of eclipses, &c. will answer the purpose: only it is absolutely necessary that some variation should be perceptible in the phenomenon in the space of two minutes; for even this short space of time will produce an error of 40 miles in longitude. The most proper phenomena therefore for determining the longitude in this manner are the eclipses of Jupiter's satellites. Tables of their motions have been constructed, and carefully corrected from time to time, as the mutual attractions of these bodies are found greatly to disturb the regularity of their motions. The difficulty here, however, is to observe these eclipses at sea; and this difficulty has been found so great, that no person seems able to surmount it. The difficulty arises from the violent agitation of a ship in the ocean, for which no adequate remedy has ever yet been found, nor probably will ever be found. Mr. Christopher Irwin indeed invented a machine which he called a marine chair, with a view to prevent the effects of this agitation; but on trying it in a voyage to Barbadoes, it was found to be totally useless.

A mechanical method of finding the longitude was proposed by Messrs. Whiston and Ditton from the report and flash of great guns. The motion of sound is known to be nearly equable, from whatever body it proceeds or whatever be the medium. Supposing therefore a mortar to be fired at any place the longitude of which is known, the difference between the moment that the flash is seen and the report heard will give the distances between the two places; whence, if we know the latitudes of these places, their longitudes must also be known. If the exact time of the explosion be known at the place where it happens, the difference of time at the place where it is heard will likewise give the difference of longitude. Let us next suppose the mortar to be loaded with an iron shell filled with combustible matter, and fired perpendicularly upward into the air, the shell will be carried to the height of a mile, and will be seen at the distance of near 100; whence, supposing neither the flash of the mortar should be seen nor the report heard, still the longitude might be determined by the altitude of the shell above the horizon.

According to this plan, mortars were to be fired at certain times and at proper stations along all frequented coasts for the direction of mariners. This indeed might be of use, and in stormy weather might be a kind of improvement in lighthouses, or a proper addition to them; but with regard to the determination of longitude, is evidently ridiculous.

We shall now proceed to give some practical directions for finding the longitude at sea by proper celestial observations; exclusive of those from Jupiter's satellites, which, for reasons just mentioned, cannot be practised at sea. In the first place, however, it will be necessary to point out some of those difficulties which stand in the way, and which render even this method of finding the longitude precarious and uncertain. These lie principally in the reduction of the observations of the heavenly bodies made on the surface of the earth to similar observations supposed to be made at the centre; which is the only place where the celestial bodies appear in their proper situation. It is also very difficult to make proper allowances for the refraction of the atmosphere, by which all objects appear higher than they really are; and another difficulty arises from their parallaxes, which make them, particularly the moon, appear lower than they would otherwise do, excepting when they are in the very zenith. It is also well known, that the nearer the horizon any celestial body is, the greater its parallax will be; and as the parallax and refraction act in opposite ways to each other, the former depressing and the latter raising the object, it is plain, that great difficulties must arise from this circumstance. The sun, for instance, whose parallax is less than the refraction, must always appear higher than he really is; but the moon, whose parallax is greater than her refraction, must always appear lower.

To render observations of the celestial bodies more easy, the commissioners of longitude have caused an Ephemeris or Nautical Almanack to be published annually, containing every requisite for solving this important problem which can be put into any form of tables. But whatever may be done in this way, it will be necessary to make the necessary preparations concerning the dip of the horizon, the refraction, semidiameters, parallax, &c. in order to reduce the apparent to the true altitudes and distances; for which we shall subjoin two general rules.

The principal observation for finding the longitude at sea is that of the moon from the sun, or from some remarkable star near the zodiac. To do this, the operator must be furnished with a watch which can be depended upon for keeping time within a minute for six hours; and with a good Hadley's quadrant, or, which is preferable, a sextant: and this last instrument will still be more fit for the purpose if it be furnished with a screw for moving the index gradually; likewise an additional dark glass, but not so dark as the common kind, for taking off the glare of the moon's light in observing her distance from a star. A small telescope, which may magnify three or four times, is also necessary to render the contact of a star with the moon's limb more discernible. A magnifying glass of
Longitude, one and a half or two inches focus will likewise assist
the operator in reading off his observations with the
greater facility.

1. To make the observation. Having examined and
adjusted his instrument as well as possible, the observer
is next to proceed in the following manner: If the dis-
tance of the moon from the sun is to be observed, turn
down one of the screens; look at the moon directly
through the transparent part of the horizon-glass; and
keeping her in view, gently move the index till the
sun's image be brought into the silvered part of that
glass. Bring the nearest limbs of both objects into
contact, and let the quadrant librate a little on the lu-
nar ray; by which means the sun will appear to rise
and fall by the side of the moon; in which motion the
nearest limbs must be made to touch one another exact-
ly by moving the index. The observation is then
made; and the division coinciding with that on the
Vernier scale, will show the distance of the nearest
limbs of the objects.

When the distance of the moon from a star is to be
observed when the moon is very bright, turn down the
lightest screen, or use a dark glass lighter than the
screens, and designed for this particular purpose; look
at the star directly through the transparent part of the
horizon-glass; and keeping it there, move the index
till the moon's image is brought into the silvered part
of the same glass. Make the quadrant librate gently
on the star's ray, and the moon will appear to rise
and fall by the star: move the index between the libra-
tions, until the moon's enlightened limb is exactly touched
by the star, and then the observation is made. In
these operations, the plane of the quadrant must always
pass through the two objects, the distance of which is
to be observed: and for this purpose it must be placed
in various positions according to the situation of the
objects, which will soon be rendered easy by prac-
tice.

The observation being made, somebody at the very
instant that the operator calls must observe by the
watch the exact hour, minute, and quarter minute, if
there be no second hand, in order to find the apparent
time; and at the same instant, or as quick as possible,
two assistants must take the distance of those objects
the distance of which is observed; after which the ob-
servations necessary for finding the longitude are com-
pleted.

The Ephemeris shows the moon's distance from the
sun, and likewise from proper stars, to every three
hours of apparent time for the meridian of Greenwich;
and that the greater number of opportunities of observ-
ing this luminary may be given, her distance is gen-
erally set down from at least one object on each side of
her. Her distance from the sun is set down while it is
between 40 and 120 degrees; so that, by means of a
sextant, it may be observed for two or three days after
her first and before her last quarter. When the moon
is between 40 and 90 degrees from the sun, her distance
is set down both from the sun and from a star on the
contrary side; and, lastly, when the distance is above
120 degrees, the distance is set down from two stars,
one on each side of her. The distance of the moon
from objects on the east side of her is found in the Ephe-
meris in the 8th and 9th pages of the month; and her
distance from objects on the west is found in the 10th Longi-
itude and 11th pages of the month.

When the Ephemeris is used, the distance of the
moon must only be observed from those stars the dis-
tance of which is set down there; and these afford a
ready means of knowing the star from which her dis-
tance ought to be observed. The observer has then
nothing more to do than to set his index to the dis-
tance roughly computed at the apparent time, esti-
mate nearly for the meridian at Greenwich; after
which he is to look to the east or west of the moon,
according as the distance of the star is found in the
8th or 9th, or in the 10th or 11th, pages of the month;
and having found the moon upon the horizon-glass, the star will easily be found by sweeping
with the quadrant to the right or left, provided the air
be clear and the star be in the line of the moon's short-
est axis produced. The time at Greenwich is esti-
mated by turning into time the supposed longitude
from that place, and adding it to the apparent time
at the ship, or subtracting it from it as occasion re-
quires. The distance of the moon from the sun, or a
star, is roughly found at this time, by saying, As 180
minutes (the number contained in three hours) is to
the difference in minutes between this nearly estimated
time and the next preceding time set down in the
Ephemeris; so is the difference in minutes between the
distance in the Ephemeris for the next preceding
and next following times, to a number of minutes: which
being added to the next preceding distance, or sub-
tracted from it, according as it is increasing or de-
creasing, will give the distance nearly at the time the
observation is to be made, and to which the index must
be set.

An easier method of finding the angular distance is
by bringing the objects nearly into contact in the
common way, and then fixing the index tight to a
certain degree and minute; waiting until the objects
are nearly in contact, giving notice to the assistants to
get ready with the altitudes, and when the objects are
exactly in contact to call for the altitudes and the exact
time by the watch. The observer may then prepare
for taking another distance, by setting his index three
or four minutes backwards or forwards, as the objects
happen to be receding from or approaching to each
other; thus proceeding to take the distance, altitudes,
and time by the watch, as before. Thus the observer
may take as many distances as he thinks proper; but
four at the distance of three minutes, or three at the
distance of four minutes, will at all times be sufficient.
Thus not only the eye of the observer will be less fat-
tigated, but he will likewise be enabled to manage his
instrument with much greater facility in every direc-
tion, a vertical one only excepted. If in taking the
distances the middle one can be taken at any even di-
vision on the arch, such as a degree, or a degree and
20 or 40 minutes, that distance will be independent of
the Nonius division, and consequently free of those
corrs which frequently arise from the inequality of
that division in several parts of the graduated arch.
The observation ought always to be made about two
hours before or after noon; and the true time may be
found by the altitude of the sun taken at the precise
time of the distance. If three distances are taken,
then
Longitude then find the time by the altitude corresponding with
the middle distance; and thus the observation will be
secured from any error arising from the irregularity of
the going of the watch. As the time, however,
found by the altitude of a star cannot be depended up-
on, because of the uncertainty of the horizon in the
night, the best way of determining the time for a night
observation will be by two altitudes of the sun; one
taken on the preceding afternoon, before he is within
six degrees of the horizon; and the other on the next
morning, when he is more than six degrees high. It
must be observed, however, that in order to follow
these directions, it is necessary that the atmosphere
should be pretty free from clouds; otherwise the ob-
server must take the observations at such times as he
can best obtain them.

2. To reduce the observed Distance of the Sun or a
Star from the Moon to the true Distance. 1. Turn the
longitude into time, as if it be time at the ship
if the longitude be west, but subtract it if it be east,
which will give the supposed time at Greenwich; and
this we may call reduced time. 2. Find the nearest
noon or midnight both before and after the reduced
time in the seventh page of the month in the Ephemeris.
3. Take out the moon's semidiameter and horizontal
parallaxes corresponding to these moons and midnights,
and find their differences. Then say, As 12 hours is
to the moon's semidiameter in 12 hours, so is the reduced
time to a number of seconds; which, either added to or subtracted from the moon's semidiameter at the
noon or midnight just mentioned, according as it is in-
creasing or decreasing, will give her apparent semidi-
meter; to which add the correction from Table VIII.
of the Ephemeris, and the sum will be her true semidi-
meter at the reduced time. And as 12 hours is to the
difference of the moon's horizontal parallax in 12 hours,
so is the reduced time to a fourth number; which be-
ing added to or subtracted from the moon's horizontal
parallax at the moon or midnight before the reduced
time; according as it is increasing or decreasing, the
sum or difference will be the moon's horizontal parallax
at the reduced time. 4. If the reduced time be nearly
any even part of 12 hours, viz. 5th, 7th, &c. these
parts of the difference may be taken, and either added
or subtracted according to the directions already given,
without being at the trouble of working by the rule of
proportion. 5. To the observed altitude of the sun's
lower limb add the difference between the semidiameter
dip; and that sum will be his apparent altitude.
6. From the sun's refraction take his parallax in alti-
itude, and the remainder will be the correction of the
sun's altitude. 7. From the star's observed altitude take
the dip of the horizon, and the remainder will be the
apparent altitude. 8. The refraction of a star will be
the correction of its altitude. 9. Take the difference
between the moon's semidiameter and dip, and add it
to the observed altitude if her lower limb was taken, or
subtract it if her upper limb was taken; and the sum or
difference will be the apparent altitude of her centre.
10. From the proportional logarithm of the moon's ho-
izontal parallax, taken out of the nautical almanack
(increasing its index by 10), taking the logarithmic co-
sine of the moon's apparent altitude, the remainder will
be the proportional logarithm of her parallax in alti-
tude; from which take her refraction, and the remain-
der will be the correction of the moon's altitude.
11. To the observed distance of the moon from a star add
her semidiameter if the nearest limb be taken, but sub-
tract it if the farthest limb was taken, and the sum or
difference will be the apparent distance. 12. To the observed
distance of the sun and moon add both their
semidiameters, and the sum will be the apparent
distance of their centres.

3. To find the true Distance of the Objects, having
their apparent Altitudes and Distances. 1. To the pro-
portional logarithm of the correction of the sun or
star's altitude, add the logarithmic cosine of the sun
or star's apparent altitude; the logarithmic sine of the
apparent distance of the moon from the sun or star;
and the logarithmic cosecant of the moon's apparent
altitude. The sum of these, rejecting 30 from the
index, will be the proportional logarithm of the first
angle. 2. To the proportional logarithm of the cor-
rection of the sun or star's altitude, and the loga-
ithmic cotangent of the sun or star's apparent
altitude, and the logarithmic tangent of the apparent
distance of the moon from the sun or star. The sum
of these, rejecting 20 in the index, will be the pro-
portional logarithm of the second angle. 3. Take
the difference between the first and second angles,
adding it to the apparent distance if it be less than
30, and the first angle be greater than the second;
but subtracting it if the second be greater than the
first. If the distance be greater than 90, the sum of
the angles must be added to the apparent distance,
which will give the distance corrected for the refra-
cition of the sun or star. 4. To the proportional
logarithm of the correction of the moon's altitude add
the logarithmic cosine of her apparent altitude; the
logarithmic sine of the distance corrected for the sun
or star's refraction and the logarithmic cosecant of
the sun's or star's apparent altitude. The sum, reject-
ing 30 in the index, will be the proportional loga-
ithm of the third angle. 5. To the proportional
logarithm of the correction of the moon's apparent
altitude, add the logarithmic cotangent of her appar-
ent altitude, and the tangent of the distance cor-
rected for the sun or star's refraction; their sum, re-
jecting 20 in the index, will be the proportional
logarithm of the fourth angle. 6. Take the difference
between the third and fourth angles, and subtract it
from the distance corrected for the sun or star's re-
fraction if less then 90, and the third angle be greater
than the fourth; or add it to the distance if the fourth
angle be greater than the third: but if the distance be
more than 90, the sum of the angles must be subtrac-
ted from it, to give the distance corrected for the sun
or star's refraction, and the principal effects of the
moon's parallax. 7. In Table XX. of the Ephemeris,
look for the distance corrected for the sun and star's
refraction, and the moon's parallax in the top column,
and the correction of her altitude in the left-hand side
column; take out the number of seconds that stand
under the former, and opposite to the latter. Look
again in the same table for the corrected distance
in the top column, and the principal effects of the moon's
parallax in the left-hand side column, and take out the
number of seconds. The difference between these two
numbers
4. To determine the Longitude after having obtained the true Distance.—Look in the Ephemeris among the distances of the objects for the computed distance betwixt the moon and the other object observed on the given day. If it be found there, the time at Greenwich will be at the top of the column; but if it falls between two distances in the Ephemeris which stand immediately before and after it, and also the difference between the distance standing before and the computed distance; then take the proportional logarithms of the first and second differences, and the difference between these two logarithms will be the proportional logarithm of a number of hours, minutes, and seconds; which being added to the time standing over the first distance, will give the true time at Greenwich. Or it may be found by saying, As the first difference is to three hours, so is the second difference to a proportional part of time: which being added as above directed, will give the time at Greenwich. The difference between Greenwich time and that at the ship, turned into longitude, will be that at the time the observations were made; and will be east if the time at the ship is greatest, but west if it is least.

Having given these general directions, we shall next proceed to show some particular examples of finding the longitude at sea by all the different methods in which it is usually tried.

1. To find the longitude by Computation from the Ship’s Course.—Were it possible to keep an accurate account of the distance the ship has run, and to measure it exactly by the log* or any other means, then both latitude and longitude would easily be found by settling the ship’s account to that time. For the course and distance being known, the difference of latitude and departure is readily found by the Traverse Table; and the difference of longitude being known, the true longitude and latitude will also be known. A variety of causes, however, concur to render this computation inaccurate; particularly the ship’s continual deflection from the course set by her bearing to the right and left round her centre of gravity: the unequal care of those at the helm, and the distance supposed to be sailed being erroneous, on account of stormy seas, unsteady winds, currents, &c. for which it seems impossible to make any allowance. The place of the ship, however, is judged of by finding the latitude every day, if possible, by observations; and if the latitude found by observation agrees with that by the reckoning, it is presumed that the ship’s place is properly determined; but if they disagree, it is concluded that the account of the longitude stands in need of correction, as the latitude by observation is always to be depended upon.

Currents very often occasion errors in the computation of a ship’s place. The causes of these in the great depths of the ocean are not well known, though many of the motions near the shore can be accounted for. It is supposed that some of those in the great oceans are owing to the tide following the moon, and a certain libration of the waters arising from thence; likewise that the unsettled nature of these currents may be owing to the changes in the moon’s declina-

tion. In the torrid zone, however, a considerable cur-

rent is occasioned by the trade winds, the motion being constantly to the west, at the rate of eight or ten miles per day. At the extremities of the trade winds, or near the 30th degree of north or south latitude, the currents are probably compounded of this motion to the westward, and of one towards the equator; whence all ships sailing within these limits ought to allow a course each day for the current.

When the error is supposed to have been occasioned by a current, it ought if possible to be tried whether the case is so or not; or we must make a reasonable estimate of its drift and course. Then with the setting and drift, as a course and distance, find the difference of latitude and departure; with which the dead reckoning is to be increased or diminished; and if the latitude thus corrected agrees with that by observation, the departure thus corrected may be safely taken as true, and thus the ship’s place with regard to the longitude determined.

Exam. Suppose a ship in 24 hours finds, by her dead reckoning, that she has made 96 miles of difference of latitude north and 38 miles of departure west; but by observation finds her difference of latitude 112, and on trial that there is a current which in 24 hours makes a difference of 16 miles latitude north, and 10 miles of departure east: Required the ship’s departure.

<table>
<thead>
<tr>
<th>Miles.</th>
<th>Departure by</th>
<th>Miles.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Diff. lat. by account 96 N.</td>
<td>account</td>
<td>38 W.</td>
</tr>
<tr>
<td>Diff. lat. by current 16 N.</td>
<td>by current</td>
<td>10</td>
</tr>
<tr>
<td>True diff. lat. 112</td>
<td></td>
<td>28 W.</td>
</tr>
</tbody>
</table>

Here the dead reckoning corrected by the current gives the difference of latitude 112 miles, which is the same as that found by observation; whence the departure 28 is taken as the true one.

When the error is supposed to arise from the courses and distances, we must observe, that if the difference of latitude, or the direct course has been within three points of the meridian, the error is most probably in the distance. But if the departure be much greater than the difference of latitude, or the direct course be within three points of the parallel, or more than five points from the meridian, the error is probably to be ascribed to the course. But if the courses in general are near the middle of the quadrant, the error may be either in the course, or in the distance, or both. This method admits of three cases.

1. When, by the dead reckoning, the difference of latitude is more than once and a half the departure; or when the course is less than three points: Find the course to the difference of latitude and departure. With this course and the meridional difference of latitude by observation, find the difference of longitude.

2. When the dead reckoning is more than once and a half the difference of latitude; or when the course is more than five points: Find the course and distance, with the difference of latitude by observation, and departure by account; then with the co-middle latitude by observation, and departure by account, find the difference of longitude.

3. When:
When the difference of latitude and departure by account is nearly equal, or the direct course is between three and five points of the meridian: Find the course with the difference of latitude and departure by account since the last observation. With this course and the difference of latitude by observation find another departure. Take half the sum of these departures for the true one. With the true departure and difference of latitude by observation find the true course; then with the true course and meridional difference of latitude find the difference of longitude.

2. To find the Longitude at Sea by a Variation-chart.—
Dr Halley having collected a great number of observations on the variation of the needle in many parts of the world; by that means was enabled to draw certain lines on Mercator's chart, shewing the variation in all the places over which they passed in the year 1700, at which time he first published the chart; whence the longitude of those places might be found by the chart, provided the Variation at the time of the observation and the line by which it lay was given. The rule is, Draw a parallel of latitude on the chart through the latitude found by observation; and the point where it cuts the curved line marked with the variation that was observed will be the ship's place.

Examine. A ship finds by observation the latitude to be 18° 20' north, and the variation of the compass to be 4° west. Required the ship's place.—Lay a ruler over 18° 20' north parallel to the equator; and the point where its edge cuts the curve of 4° west variation gives the ship's place, which will be found in about 27° 10' west from London.

This method of finding the longitude, however, is attended with two inconveniences. 1. That when the variation lines run east or west, or nearly so, it cannot be applied; though as this happens only in certain parts of the world, a variation chart may be of great use for the rest. Even in those places indeed where the variation curves do run east or west, they may be of considerable use in correcting the latitude when meridian observations cannot be had; which frequently happens on the northern coasts of America, the Western ocean, and about Newfoundland; for if the variation can be found exactly, the east and west curve answering to it will show the latitude. But, 2. The variation itself is subject to continual change; whence a chart, though ever so perfect at first, must in time become totally useless; and hence the charts constructed by Dr Halley, though of great utility at their first publication, became at length almost entirely useless. A new one was published in 1746 by Messrs. Mounthe and Dodson, which was so well received, that in 1756 they again drew variation lines for that year, and published a third chart the year following. They also presented to the Royal Society a curious paper concerning the variation of the magnetic needle, with a set of tables annexed containing the result of more than 50,000 observations, in six periodical reviews from the year 1700 to 1756 inclusive, adapted to every five degrees of latitude and longitude in the most frequented oceans; all of which were published in the Philosophical Transactions for 1757.

3. To find the Longitude by the Sun's Declination.—Having made such observations on the sun as may enable us to find his declination at the place, take the difference between this computed declination and that shown at London by the Ephemeris; from which take the difference also the daily difference of declination at that time; then say, as the daily difference of declination is to the above found difference, so is 360 degrees to the difference of longitude. In this method, however, a small error in the declination will make a great one in the longitude.

4. To find the Longitude by the Moon's Culminating.—Seek in the Ephemeris for the time of her coming to the meridian on the given day and on the day following, and take their difference; also take the difference between the times of culminating on the same day as found in the ephemeris and as observed; then say, as the daily difference in the ephemeris is to the difference between the ephemeris and observation, so is 360 degrees to the difference of longitude. In this method also a small difference in the culminating will occasion a great one in the longitude.

5. By Eclipses of the Moon.—This is done much in the same manner as by the eclipses of Jupiter's satellites: For if, in two or more distant places where an eclipse of the moon is visible, we carefully observe the times of the beginning and ending, the number of digits eclipsed, or the time when the shadow touches some remarkable spot, or when it leaves any particular spot on the moon, the difference of the times when the observations were made will give the difference of longitude. Phenomena of this kind, however, occur too seldom to be of much use.

6. In the 76th volume of the Philosophical Transactions, Mr Edward Pigot gives a very particular account of his method of determining the longitude and latitude of York; in which he also recommends the method of determining the longitude of places by observations of the moon's transit over the meridian. The instruments used in his observations were a gridiron pendulum clock, a two feet and a half reflector, an eighteen inch quadrant made by Mr Bird, and a transit instrument made by Mr Sisson.

By these instruments an observation was made, on the 10th of September 1783, of the occultation of a star of the ninth magnitude by the moon, during an eclipse of that planet, at York and Paris. Besides this, there were observations made of the immersions of Ψ Aquarii and Ω Piscium; the result of all which was, that between Greenwich and York the difference of meridians was 4° 27'.
Longitude

... should have relied on as the best, that of August 30, 1783, marked excellent, is one of those most distant from the truth.

After giving a number of observations on the eclipse of the moon September 10, 1783, our author concludes, that the eclipses of the moon's spots are in general too much neglected, and that it might be relied upon much more were the following circumstances attended to: 1. To be particular in specifying the clearness of the sky. 2. To choose such spots as were well defined, and leave no hesitation as to the part eclipsed. 3. That every observer should use, as far as possible, telescopes equally powerful, or at least the magnifying powers be the same. "A principal objection (says he) may still be urged, viz. the difficulty of distinguishing the true shadow from the penumbra. Was this obviated, I believe the results would be more exact than from Jupiter's first satellite: Undoubtedly the shadow appears better defined if magnified a little; but I am much inclined to think, that, with high magnifying powers, there is greater certainty of choosing the same part of the shadow, which perhaps is more than a sufficient compensation for the loss of distinctness."

The following rule for meridian observations of the moon's limb is next laid down: "The increase of the moon's right ascension in twelve hours (or any given time found by computation) is to 12 hours, as the increase of the moon's right ascension between two places found by observation is to the difference of meridians.

EXAMPLE:

November 30, 1782.

13 12 57.62 Meridian transit of moon's second limb
13 13 29.08 Ditto of a mg
31.46 Difference of right ascension.

13 14 8.05 Meridian transit of moon's second limb
13 14 30.13 Ditto of a mg
32.08 Difference at York
31.46 Difference at Greenwich,

9.38 Increase of the moon's apparent right ascension between Greenwich and York, by observation.

141" in seconds of a degree, ditto, ditto, ditto.

The increase of the moon's right ascension for 12 hours, by computation, is 23,340 seconds; and 12 hours reduced into seconds is 43,200. Therefore, according to the rule stated above,

23,340" : 43,200" : diff. of merid. = 261°

These easy observations and short reduction (says Mr Pigot) are the whole of the business. Instead of computing the moon's right ascension for 12 hours, I have constantly taken it from the Nautical Almanacks, which give it sufficiently exact, provided some attention be paid to the increase or decrease of the moon's motion. Were the following circumstances attended to, the results would be undoubtedly much more exact.

1. Compare the observations with the same made in several other places. 2. Let several and the same stars be observed at these places. 3. Such stars as are nearest in right ascension and declination to the moon are infinitely preferable. 4. It cannot be too strongly urged, to get, as near as possible, an equal number of observations of each limb, to take a mean of each set, and then a mean of both means. This will in a great measure correct the error of telescopes and sight. 5. The adjustment of the telescopes to the eye of the observer before the observation is also very necessary, as the sight is subject to vary. 6. A principal error proceeds from the observation of the moon's limb, which may be considerably lessened, if certain little round spots near each limb were also observed in settled observatories; in which case the libration of the moon will perhaps be a consideration. 7. When the difference of meridians, or of the latitudes of places is very considerable, the change of the moon's diameter becomes an equation.

Though such are the requisites to use this method with advantage, only one or two of them have been employed in the observations that I have reduced. Two-thirds of these observations had not even the same stars observed at Greenwich and York; and yet none of the results, except a doubtful one, differ 15" from the mean; therefore I think we may expect a still greater exactness, perhaps within 10", if the above particulars be attended to.

When the same stars are not observed, it is necessary for the observers at both places to compute their right ascension from tables, in order to get the apparent right ascension of the moon's limb. Though this is not so satisfactory as by actual observation, still the difference will be trifling, provided the star's right ascensions are accurately settled. I am also of opinion, that the same method can be put in practice by travellers with little trouble, and a transit instrument, constructed so as to fix up with facility in any place. It is not necessary, perhaps, that the instrument should be perfectly in the meridian for a few seconds of time, provided stars, nearly in the same parallel of declination with the moon, are observed; nay, I am inclined to think, that if the instrument deviates even a quarter or half a degree, or more, sufficient exactness can be attained; as a table might be computed, showing the moon's parallax and motion for such deviation; which last may easily be found by the well-known method of observing stars whose difference of declination is considerable.

As travellers very seldom meet with situations to observe stars near the pole, or find a proper object for determining the error of the line of collimation, I shall recommend the following method as original.

Having computed the apparent right ascension of four, six, or more stars, which have nearly the same parallel of declination, observe half of them with the instrument inverted, and the other half when in its right position. If the difference of right ascensions between each set by observation agrees with the computation, there is no error; but if they disagree, half that disagreement is the error of the line of collimation. The same observations may also serve to determine,
Longitude. mine, whether the distances of the corresponding wires are equal. In case of necessity, each limb of the sun might be observed in the same manner, though probably with less precision. By a single trial I made above two years ago, the result was much more exact than I expected. Mayer's catalogue of stars will prove of great use to those that adopt the above method.—I am rather surprised that the immersions of known stars of the sixth and seventh magnitude, behind the dark limb of the moon, are not constantly observed in fixed observatories, as they would frequently be of great use.

The annexed rule for finding the ship's place, with the miscellaneous observations on different methods, were drawn up by Mr John M'Lean of Edinburgh.

1. With regard to determining the ship's place by the help of the course and distance sailed, the following rule may be applied.—It will be found as expeditious as any of the common methods by the middle latitude or meridional parts; and is in some respects preferable, as the common tables of sines and tangents only are requisite in applying it.—Let \( a \) and \( b \) be the distances of two places from the same pole in degrees, or their complete latitude; \( e \) the angle which a meridian makes with the rhumb line passing through the places; and \( L \) the angle formed by their meridians, or the difference of longitude in minutes: then \( A \) and \( B \) being the logarithmic tangents of \( \frac{1}{2} a \), and \( \frac{1}{2} b \), the sine of \( C \), and \( S \) the sine of \( (C + 1') \), we shall have the following equation:

\[
\frac{A}{S} = \frac{B}{S} \tag{A}
\]

Also, from a well known property of the rhumb line, we have the following equation:

\[
S + E = R + D, \quad \text{where} \quad S \quad \text{is} \quad \text{the logarithmic cosine of} \quad C, \quad E \quad \text{the logarithm of the length of the rhumb line, or distance,} \quad D \quad \text{the logarithm of the minutes difference of latitude, and} \quad R \quad \text{the logarithm of the radius.}
\]

By the help of these two equations, we shall have an easy solution of the several cases to which the middle latitude, or meridional parts, are commonly applied.

Exam. A ship from a port in latitude 56° N. sails S. W. by W. till she arrives at the latitude of 45° N.: Required the difference of longitude?

Here \( a = 34°, b = 50°, e = 56° 15', A = 9.48534, B = 9.56107, S = 9.9199368, S = 9.9199464 \); therefore, \( \frac{A}{S} = \frac{B}{S} = 897 \) the minutes difference of longitude. Also, \( S = 9.75447, D = 2.98227 \); therefore \( E = R + D = 3.23733 \), to which the natural number is 1728, the miles in the rhumb line sailed over.

2. The common method of finding the difference of longitude made good upon several courses and distances, by means of the difference of latitude and departure made good upon the several courses, is not accurately true.

For example: If a ship should sail due south 600 miles, from a port in 60° north latitude, and then due west 600 miles, the difference of longitude found by the common methods of solution would be 1053; whereas Longitude.

the true difference of longitude is only 933, less than the former by 120 miles, which is more than one-eighth of the whole. Indeed every considerable alteration in the course will produce a very sensible error in the difference of longitude. Though, when the several rhumb lines sailed over are nearly in the same direction, the error in longitude will be but small.

The reason of this will easily appear from the annexed figure, in which the ship is supposed to sail from \( Z \) to \( A \), along the rhumb lines \( ZB, BA \); for if the meridians \( PZ, PkoeBL \) be drawn; and very near the latter other two meridians \( PhD, Pmn \); and likewise the parallels of latitude \( Bn, De, mo, hk \); then it is plain that \( De \) is greater than \( hk \), (for \( De \) is to \( hk \) as the sine of \( DP \) to the sine of \( hP \)): and since this is the case everywhere, the departure corresponding to the distance \( BZ \) and course \( BZC \), will be greater than the departure to the distance \( oZ \) and course \( oZC \). And in the same manner, we prove that \( nB \) is greater than \( mo \); and consequently, the departure corresponding to the distance \( AB \), and course \( ABL \), is greater than the departure to the distance \( An \), and course \( AoL \). Wherefore, the sum of the two departures corresponding to the courses \( ABL \) and \( BZC \), and to the distances \( AB \) and \( BZ \), is greater than the departure corresponding to the distance \( AZ \) and course \( AZC \); therefore the course answering to this sum as a departure, and \( CZ \) as a difference of latitude, (\( AC \) being the parallel of latitudes passing through \( A \)), will be greater than the true course \( AZC \) made good upon the whole. And hence the difference of longitude found by the common rules will be greater than the true difference of longitudes; and the error will be greater or less according as \( BA \) deviates more or less from the direction of \( BZ \).

3. Of determining the ship's longitude by lunar observations.

Several rules for this purpose have been lately published, the principal object of which seems to have been to

\[
(A) \quad A \neq B \text{ signifies the difference between} \quad A \text{ and} \quad B.
\]
Longitude, to abbreviate the computations requisite for determining the true distance of the sun or star from the moon's centre. This, however, should have certainly been less attended to than the investigation of a solution, in which considerable errors in the data may produce a small error in the required distance. When either of the luminaries has a small elevation, its altitude will be affected by the variableness of the atmosphere; likewise the altitude, as given by the quadrant, will be affected by the inaccuracy of the instrument, and the uncertainty necessarily attending all observations made at sea. The sum of these errors, when they all tend the same way, may be supposed to amount to at least one minute in altitude; which, in many cases, according to the common rules for computing the true distance, will produce an error of about 30 minutes in the longitude. Thus, in the example given by Mons. Callet, in the Tables Portatives, if we suppose an error of one minute in the sun's altitude, or call it 6° 26' 34", instead of 6° 27' 34'"; we shall find the alteration in distance according to his rule to be 54", producing an error of about 27" or 2° in the longitude; for the angle at the sun will be found, in the spherical triangle whose sides are the complement of the sun's altitude, complement of the moon's altitude, and observed distance, to be about 26°; and as radius is to the cosine of 26°, so is 16 the supposed error in altitude, to 54" the alteration in distance. Perhaps the only method of determining the distance, so as not to be affected by the errors of altitude, is that by first finding the angles at the sun and moon, and by the help of them the corrections of distance for parallax and refraction. The rule is as follows:

Add together the complement of the moon's apparent altitude, the complement of the sun's apparent altitude, and the apparent distance of centres; from half the sum of these subtract the complement of the sun's altitude, and add together the logarithmic cosecant of the complement of the moon's altitude, the logarithmic cosecant of the apparent distance of centres, the logarithmic sine of the half sum, and the logarithmic sine of the remainder; and half the sum of these four logarithms, after rejecting 20 from the index,

Cosec. 0.2512 — a co. alt. 70° 42' 0 4 0.25169
Cosec. 0.11479 — ob. dist. 50 9 0.11479

2) 154 55
Sine 9.98950 — 77 27 9.98950
Rem. 6 45 — 9.07018
Sine 9.83688 — Rem. 43 23 2) 19.42616
9.71308 — 58° 54' 2
Cosec. 9.98314 — 15° 54' 2
2 31 48 = a's angle.

Rad. : Cosec. 31° 48' : star's refract, 162° : 132° = 2d correct. of distance.

Here
Here the first correction of distance is additive, since the angle at the moon is obtuse; and the second correction is also additive, since the angle at the star is acute; therefore their sum $92^\circ + 138^\circ = 1061^\circ = 17^\circ 41'$, being added to $50^\circ 8' 41''$, the apparent distance of the star from the moon’s centre, gives $50^\circ 26' 21''$ for the true distance of centres nearly; and $2 \times L (d+8) - L (2 L R + L 2 + L D) = L 8''$, which, being added to the distance twice corrected, gives $50^\circ 26' 29''$ for the true distance. By comparing this distance with the computed distances in the Ephemeris, the time at Greenwich corresponding to that of observing the distance will be known; and the difference of those times will, in degrees and minutes, at the rate of 15 degrees to the hour, give the longitude of the place of observation; which will be east if the time at the place be greater than that at Greenwich, but west if it be less.

LONGITUDINAL, in geology, denotes something placed lengthwise; thus some of the fibres in the vessels of the human body are placed longitudinally, others transversely or across.

LONGOBARDI. See LOMBARDS.

LONGOMONTANUS, CHRISTIAN, a learned astronomer, born in a village of Denmark in 1620. He was the son of a ploughman; and was obliged to suffer during his studies all the hardships to which he could be exposed, dividing his time, like the philosopher Cleantes, between the cultivation of the earth and the lessons he received from the minister of the place. At last, when he was 15, he stole away from his family, and went to Wiburg, where there was a college, in which he spent 11 years; and though he was obliged to earn a livelihood, he applied himself to study with such ardour, that among other sciences he learned the mathematics in great perfection. He afterwards went to Copenhagen; where the professors of that university in a short time conceived so high an opinion of him, that they recommended him to the celebrated Tycho Brahe. Longomontanus lived eight years with him famous astronomer, and was of great service to him in his observations and calculations. At length, being extremely desirous of obtaining a professorship in Denmark, Tycho Brahe consented, though with some difficulty, to deprive himself of his service; gave him a discharge, filled with the highest testimonies of his esteem; and furnished him with money for the expense of his long journey. He obtained a professorship of mathematics in the university of Copenhagen in 1605; and discharged the duty of it worthily till his death, which happened in 1647. He wrote many learned works; amused himself with endeavouring to square the circle, and pretended that he had made that discovery; but Dr John Pell, an English mathematician, attacked him warmly on that subject, and proved that he was mistaken.

LONGTOWN, a town of Cumberland, on the Scotch border, near the conflux of the Esk and Kirkby, 9 miles from Carlisle, and 313 miles from London. It has a market on Thursday, and a charity school for 60 children. The population in 1811 was estimated at 1579.

LONGUEVILLE, a town of France, in the department of Lower Seine, and in the territory of Caux, seated on the small river Lec, 17 miles north of Rouen. It has the title of a duchy. E. Long. 1. 10. N. Lat. 49° 46'.

LONGWY, a town of France, in the department of Moselle, with a castle, divided into the old and new towns. This last was built and fortified by Louis XIV. It is seated on an eminence. It was taken by the king of Prussia in 1792, but retaken two months after. E. Long. 5. 58'. N. Lat. 49° 32'.

LONGUS, a Greek sophist, author of a book entitled Παμμέλεια, or Pastoral, or a romance containing the loves of Daphnis and Chloe. Huetius, bishop of Avanches, speaks very advantageously of this work; but he censures the obscene touches with which it is interspersed. None of the ancient authors mention him, so that the time when he lived cannot be certainly fixed. There is an English translation of this author, which is ascribed to Mr J. Craggs, once secretary of state.

LONICERA, Honeysuckle. A genus of plants belonging to the pentandria class. See Botany Index.

LONSDALE, or Kirkby Lonsdale, a town of Westmoreland, seated on the river Lune, in a pleasant and rich valley of the same name. It is a large well built town, has a handsome church, and a fine stone bridge over the river. It contained 1368 inhabitants in 1811, and is the best town in the county except Kendal. It gives title of earl to the Lawther family. W. Long. 27. N. Lat. 54° 10'.

LOO, a town of the United Provinces, in Gelderland, eight miles west of Deventer, where the prince of Orange has a fine palace. E. Long. 6° 0'. N. Lat. 52° 18'.

LOOF, the after part of a ship’s bow; or that part of her side forward where the planks begin to be incurved into an arch as they approach the stem.

LOOF, or Luff. See LUFF.

LOOK-OUT, in the sea-language, a watchful attention to some important object or event which is expected to arise from the present state of a ship, &c. It is principally used in navigation when there is a probability of danger from the real or supposed proximity of land, rocks, enemies, and, in short, whatever peril she may encounter through inattention, which might otherwise have been avoided by a prudent and necessary vigilance.

There is always a look-out kept on a ship’s forecastle at sea, to watch for any dangerous objects lying near her track, and to which she makes a gradual approach as she advances: the mate of the watch accordingly calls often from the quarter-deck, “Look out abreast there!” to the persons appointed for this service.

LOOKING-GLASS, a mirror of glass, which reflects the images of objects placed before them. See the article MIRROR and OPTICS.

For casting, grinding, and polishing looking-glasses, see the article GLASS.

For foliating looking-glasses, see the article FOLIATING.

LOOL, in Metallurgy, a vessel made to receive the washings of ores of metals. The heavier or more metallic parts of the ores remain in the trough in which they are washed; the lighter and more earthy wash off with the water, but settle in the lool.
LOOM, the weaver's frame; a machine whereby several distinct threads are woven into one piece.

Looms are of various structures, accommodated to the various kinds of materials to be woven, and the various manner of weaving them; viz. for woollens, silks, linens, cottons, cloths of gold, and other works, as tapestry, ribbands, stockings, &c. divers of which will be found under their proper heads. See Weaving.

The weaver's loom-engine, otherwise called the Dutch loom-engine, was brought into use from Holland to London, about the year 1676.

Loom, at sea. If a ship appears big, when at a distance, they say she looms, or appears a great sail: the term is also used to denote the indistinct appearance of any other distant objects.

Loom-gale, at sea, a gentle easy gale of wind, in which a ship can carry her top-sails a-trip.

Loop, in the iron works, is a part of a sowe or block of cast iron broken or melted off from the rest, and prepared for the forge or hammer. The usual method is, to break off the loop of about three quarters of a hundred weight. This loop they take up with their slinging-tongs, and beat it with iron sledges till they bring it to a four-square mass, of about two feet long, which they call a bloom.

LOPEZ de VEGA. See Vega.

LOPEZ, or Indian Root, in the Materia Medica.

The plant to which this article belongs is unknown. Neither the woody nor cortical part of the root has any remarkable sensible quality. A slight bitterness is perceptible; and it is recommended, like simarouba, in diarrhoea, even of the colliquative kind, in half-drum doses four times a-day. Little of this root has been brought to Europe; but some of those who have had an opportunity of employing it, speak in very high terms of the effects obtained from it.

LOPHIUS, Fishing-frog, Toad-fish, or Sea devil, is a genus of the branchiostegous order of fishes. See Ichthyology Index.

LORANTHUS, a genus of plants belonging to the hexandria class, and in the natural method ranking under the 48th order, Aggregata. See Botany Index.

LORARII, among the Romans, officers whose business it was, with whips and scourges, to compel the gladiators to engage. The lorarii also punished slaves who disobeyed their masters.

LORCA, a town of Spain, in the province of Murcia, containing about 30,000 inhabitants. It is divided into the upper and lower towns. The streets in the former are narrow, crooked, and steep, and the houses poor and ill-built; but the lower town is better laid out and built. The town has a collegiate chapter, eight parish churches, seven monasteries, two monasteries, two botnaries, and a college. There is also a saltpetre manufactory here. On the 30th April 1802, the bursting of an artificial basin of water above the town, swept away 600 houses, two hospitals, two convents, mills, &c. and destroyed 6000 people in the town and the adjacent country, over which its ravages extended for the space of 16 leagues. The total loss was estimated at more than two millions sterling.

LORD, a title of honour given to those who are noble either by birth or creation. In this sense, it amounts to much the same as peer of the realm, or lord of parliament. The title is by courtesy also given to all the sons of dukes and marquises, and to the eldest sons of earls: and it is also a title of honour bestowed on those who are honourable by their employments; as lord advocate, lord chamberlain, lord chancellor, &c. The word is Saxon, but abbreviated from two syllables into one; for it was originally Hlaford, which by dropping the aspiration became Loford, and afterwards by contraction Lord. "The etymology of the word (says J. Coatiss) is well worth observing; for it was composed of hlaf a loaf of bread," and ford, "to give or afford;" so that Hlaford, now Lord, implies a giver of bread," because, in those ages, such great men kept extraordinary houses, and feed all the poor; for which reason they were called givers of bread, a thing now much out of date, great men being fond of retaining the title, but few regarding the practice for which it was first given. See Lady.

House of Lords, one of the three estates of parliament, and composed of the Lords Spiritual and Temporal.

1. The Spiritual Lords consist of two archbishops and 24 bishops; and, at the dissolution of monasteries by Henry VIII., consisted likewise of 25 mitred abbots and two priors; a very considerable body, and in those times equal in number to the temporal nobility. All these hold, or are supposed to hold, certain ancient baronies under the king: for William the Conqueror thought proper to change the spiritual tenor of frankalmoin or free aims, under which the bishops held their lands during the Saxon government, into the feudal or Norman tenure by barony; which subjected their estates to all civil charges and assessments, from which they were before exempt; made their right of succession to those baronies, which were unalienable from their respective dignities, the bishops and abbots were allowed their seats in the house of lords. But though these lords spiritual are in the eye of the law a distinct estate from the lords temporal, and are so distinguished in most of our acts of parliament; yet in practice they are usually blended together under the name of the lords: they intermix in their votes, and the majority of such intermixture joins both estates. And from this want of a separate assembly, and separate negative of the prelates, some writers have argued very cogently, that the lords spiritual and temporal are now in reality only one estate: which is unquestionably true in every effectual sense, though the ancient distinction between them still nominally continues. For if a bill should pass their house, there is no doubt of its validity, though every lord spiritual should vote against it; of which Selden and Sir Edward Coke give many instances; as, on the other hand, doubtless it would be equally good, if the lords temporal present were inferior to the bishops in number, and every one of those temporal lords gave his vote to reject the bill; though this Sir Edward Coke seems to doubt of.

2. The Temporal Lords consist of all the peers of the realm (the bishops not being in strictness held to be such, but merely lords of parliament), by whatever title of nobility distinguished; dukes, marquises, earls. See Viscount or barons*. Some of these sit by descent, as do all ancient peers; some by creation, as do all
and distinct powers from the commons. See also KING, NOBILITY, PARLIAMENT, COMMONS, and COMMON-ALTY.

As to the peculiar laws and customs relating to the house of lords: One very ancient privilege is that declared by the charter of the forest, confirmed in parliament 9 Hen. III.; viz. that every lord spiritual or temporal summoned to parliament, and passing through the king's forests, may, both in going and returning, kill one or two of the king's deer without warrant; in view of the forester if he be present, or on blowing a horn if he be absent; that he may not seem to take the king's venison by stealth.

In the next place, they have a right to be attended, and constantly are, by the judges of the court of king's bench and common pleas, and such of the barons of the exchequer as are of the degree of the coif, or have been made sequejants at law; as likewise by the king's learned counsel, being sequejants, and by the masters of the court of chancery; for their advice in point of law, and for the greater dignity of their proceedings. The secretaries of state, with the attorney and solicitor general, were also used to attend the house of peers, and have to this day (together with the judges, &c.) their regular writs of summons issued out at the beginning of every parliament, ad tractandum et consilium impendendum, though not ad consensum, but, whenever of late years they have been members of the house of commons, their attendance here hath fallen into disuse.

Another privilege is, that every peer, by license obtained from the king, may make another lord of parliament his proxy, to vote for him in his absence: A privilege, which a member of the other house can by no means have, as he is himself but a proxy for a multitude of other people.

Each peer has also a right, by leave of the house, when a vote passes contrary to his sentiments, to enter his dissent on the journals of the house, with the reasons for such dissent; which is usually styled his protest.

All bills likewise, that may in their consequences any way affect the rights of the peerage, are by the custom of parliament to have their first rise and beginning in the house of peers, and to suffer no changes or amendments in the house of commons.

There is also one statute peculiarly relative to the house of lords; 6 Ann. c. 23. which regulates the election of the 16 representative peers of North Britain, in consequence of the 22d and 23d articles of the Union: and for that purpose prescribes the oaths, &c. to be taken by the electors; directs the mode of balloting; prohibits the peers electing from being attended in an unusual manner; and expressly provides, that no other matter shall be treated of in that assembly, save only the election, on pain of incurring a præmum. See also the statutes NOBILITY and PEERAGE.

LORDOSIS, (of λαψης, bent inwards), in the medical writings, a name given to a distempered state of the spine, in which it is bent inwards, or towards the anterior parts. It is used in opposition to gibbus, or hump-backed. See SURGERY.

LORETTO, a town of Italy, in the Marche or Marche of Ancona, with a bishop's see. It is small but fortified; and contains the famous cast austria, or
The holy chapel, so much visited by pilgrims. This chapel, according to the legend, was originally a small house in Nazareth, inhabited by the virgin Mary, in which she was saluted by the angel, and where she bore our Saviour. After their deaths, it was held in great veneration by all believers in Jesus, and at length consecrated into a chapel, and dedicated to the Virgin; upon which occasion St Luke made that identical image, which is still preserved here, and dignified with the name of our Lady of Loreto. This sanctified edifice was allowed to sojourn in Galilee as long as that district was inhabited by Christians; but when infidels got possession of the country, a band of angels, to save it from pollution, took it in their arms, and conveyed it from Nazareth to a castle in Dalmatia. This fact might have been called in question by incredulous people, had it been performed in a secret manner; but, that it might be manifest to the most short-sighted spectator, and evident to all who were not perfectly deaf as well as blind, a blaze of celestial light, and a concert of divine music, accompanied it during the whole journey; besides, when the angels, to rest themselves, set it down in a little wood near the road, all the trees of the forest bowed their heads to the ground, and continued in that respectful posture as long as the sacred chapel remained among them. But not having been entertained with suitable respect at the castle above mentioned, the same indefatigable angels carried it over the sea, and placed it in a field belonging to a noble lady called Lorettina, from whom the chapel takes its name. This field happened unfortunately to be frequented at that time by highwaymen and murderers: a circumstance with which the angels undoubtedly were not acquainted when they placed it there. After a year or two were better informed they removed it to the top of a hill belonging to two brothers, where they imagined it would be perfectly secure from the dangers of robbery or assassination; but the two brothers, the proprietors of the ground, being equally enamoured of their new visitor, became jealous of each other, quarrelled, fought, and fell by mutual wounds. After this fatal catastrophe, the angels in waiting finally moved the holy chapel to the eminence where it now stands, and has stood these 400 years, having lost all relish for travelling.

The sacred chapel stands due east and west, at the farther end of a large church of the most durable stone of Istria, which has been built around it. This may be considered as the external covering, or as a kind of great coat to the casa santo, which has a smaller coat of more precious materials and workmanship nearer its body. This internal covering, or case, is of the choicest marble, after a plan of San Salvi's; and ornamented with baso relief, the workmanship of the best sculptors which Italy could furnish in the reign of Leo X. The subjects of these baso relieves are the history of the Blessed Virgin, and other parts of the Bible. The whole case is about 60 feet long, 30 in breadth, and the same in height: but the real house itself is no more than 32 feet in length, 14 in breadth, and at the sides about 18 feet in height; the centre of the roof is four or five feet higher. The walls of this little holy chapel are composed of pieces of a reddish substance, of an oblong square shape, laid one upon another, in the manner of brick. At first sight, on a superficial view, these red-coloured oblong substances appear to be nothing else than common Italian bricks; and, which is still more extraordinary, on a second and third view, with all possible attention, they still have the same appearance. Travellers, however, are assured with great earnestness, that there is not a single particle of brick in their whole composition, being entirely of a stone, which, though it cannot now be found in Palestine, was formerly very common, particularly in the neighbourhood of Nazareth.

The holy house is divided within into two unequal portions, by a kind of grate-work of silver. The division towards the west is about three-fourths of the fixed; that to the east, called the Sanctuary. In the larger division, which may be considered as the main body of the house, the walls are left bare, to show the true original fabric of Nazareth stone; for they must not be supposed to be bricks. At the lower or western wall there is a window, the same through which the angel Gabriel entered at the Annunciation. The architraves of this window are covered with silver. There are a great number of golden and silver lamps in this chapel: one of the former, a present from the republic of Venice, is said to weigh 37 pounds, and some of the silver lamps weigh from 120 to 130 pounds. At the upper end of the largest room is an altar, but so low, that from it you may see the famous image which stands over the chimney in the small room or sanctuary. * Golden and silver angels, of considerable size, kneel around her, some offering hearts of gold, enriched with diamonds, and one an infant of pure gold. The wall of the sanctuary is plated with silver, and adorned with precious stones, and votive gifts of various kinds. The figure of the Virgin herself by no means corresponds with the fine furniture of her house: she is a little woman, about four feet in height, with the features and complexion of a negro. Of all the sculptors that ever existed, assuredly St Luke, by whom this figure is said to have been made, is the least of a flatterer; and nothing can be a stronger proof of the Blessed Virgin's contempt for external beauty than her being satisfied with this representation of her. The figure of the infant Jesus, by St Luke, is of a piece with that of the Virgin: he holds a large golden globe in one hand, and the other is extended in the act of blessing. Both figures have crowns on their heads, enriched with diamonds: these were presents from Ann of Austria, queen of France. Both arms of the Virgin are enclosed within her robes, and no part but her face is to be seen; her dress is most magnificent, but in a wretched bad taste: this is not surprising, for she has no female attendants. She has particular clothes for different feasts held in honour of her, and, which is not quite so decent, is always dressed and adorned by the priests belonging to the chapel; her robes are ornamented with all kinds of precious stones down to the hem of her garment.

There is a small place behind the sanctuary, in which are shown the chimney, and some other furniture, which they pretend belonged to the Virgin when she lived at Nazareth; particularly a little earthen porringer, out of which the infant used to eat. The pilgrims bring rosaries, little crucifixes, and agnus dei's which the obliging priest shakes for half a minute.
nute in this diab; after which it is believed they acquire the virtue of curing various diseases, and prove an excellent preventive of all temptations of Satan. The grotto which the image had on when the chapel arrived from Nazareth is of red camblet, and carefully kept in a glass shrine.

Above 100 masses are daily said in this chapel, and in the church in which it stands. The jewels and riches to be seen at any one time in the holy chapel are of a small value in comparison of those in the treasury, which is a large room adjoining to the vestry of the great church. In the presses of this room are kept those presents which royal, noble, and rich bigots of all ranks, have, by oppressing their subjects and injuring their families, sent to this place. To enumerate every particular would fill volumes. They consist of various utensils and other things in silver and gold; as lamps, candlesticks, goblets, crowns, and crucifixes; lamps, eagles, saints, apostles, angels, virgins, and infants: then there are cameos, pearls, gems, and precious stones, of all kinds and in great numbers. What is valued above all the other jewels is, the miraculous pearl, wherein they assert that Nature has given a faithful delineation of the Virgin sitting on a cloud with the infant Jesus in her arms. There was not room in the presses of the treasury to hold all the silver pieces which had been presented to the Virgin. Several other presses in the vestry are completely full. It is said that those pieces are occasionally melted down by his holiness for the use of the state: and also that the most precious of the jewels are picked out and sold for the same purpose, false stones being substituted in their room.

Pilgrimages to Loretto are not so frequent with foreigners, or with Italians of fortune and distinction, as they are with the poor, who make this journey now are poor people, who depend for their maintenance on the charity they receive on the road. To those who are in such a rank in life as precludes them from availing themselves of the charitable institutions for the maintenance of pilgrims, such journeys are attended with expense and inconvenience; and fathers and husbands, in moderate or confined circumstances, are frequently brought to disagreeable dilemmae, by the rash vows of going to Loretto which their wives or daughters are apt to make on any supposed deliverance from danger. To refuse, is considered by the whole neighbourhood as cruel, and even impious; and to grant, is often highly distressing, particularly to such husbands as, from affection or any other motives, do not choose that their wives should be long out of their sight. But the poor, who are maintained during their whole journey, and have nothing more than a bare maintenance to expect from their labour at home, to them a journey to Loretto is a party of pleasure as well as devotion, and they have the most agreeable road they can take to heaven. The greatest concourse of pilgrims is at the seasons of Easter and Whit Sunday. The rich travel in their carriages; a great number come on horseback or on mules; or, what is still more common, on asses. Great numbers of females come in this manner, with a male friend walking by them as their guide and protector: but the greatest number of both sexes are on foot. The pilgrims on foot, as soon as they enter the suburbs, begin a hymn in honour of the Virgin, which they continue till they reach the church. The poorer sort are received into an hospital, where they have bed and board for three days.

The only trade of Loretto consists of rosaries, crucifix, little madonas, agnus dei's, and medals, which are manufactured here, and sold to pilgrims. There are great numbers of shops full of these commodities, some of them of a high price; but infinitely the greater part are adapted to the purses of the buyers, and sold for a mere trifle. The evident poverty of those manufacturers and traders, and of the inhabitants of this town in general, is a sufficient proof that the reputation of our Lady of Loretto is greatly on the decline.

In the great church which contains the holy chapel are confessionals, where the penitents from every country of Europe may be confessed in their own language; priests being always in waiting for that purpose: each of them has a long white rod in his hand, with which he touches the heads of those to whom he thinks it proper to give absolution. They place themselves on their knees in groups around the confessional chair; and when the holy father has touched their heads with the expiatory rod, they retire, freed from the burden of their sins, and with renewed courage to begin a fresh account.

In the spacious area before this church there is an elegant marble fountain, supplied with water from an adjoining hill by an aqueduct. Few even of the most inconsiderable towns of Italy are without the useful ornament of a public fountain. The embellishments of sculpture and architecture are employed with great propriety on such works, which are continually in the people's view; the air is refreshed and the eye delighted by the streams of water they pour forth; a sight peculiarly agreeable in a warm climate. In this area there is also a statue of Sixtus V. in bronze. Over the portal of the church itself is a statue of the Virgin; and above the middle gate is a Latin inscription, importing that within is the house of the mother of God, in which the Word was made flesh. The gates of the church are likewise of bronze, embellished with basso relievos of admirable workmanship: the subjects taken partly from the Old and partly from the New Testament, and divided into different compartments. As the gates of this church are shut at noon, the pilgrims who arrive after that time can get no nearer the santa casa than these gates, which are by this means sometimes exposed to the first violence of that holy ardour which was designed for the chapel itself. All the sculpture upon the gates which is within reach of the mouths of those zealous, is in some degree effaced by their kisses.

There are also several paintings to be seen here; some of which are highly esteemed, particularly two in the treasury. The subject of one of these is the Virgin's Nativity, by Annibal Caracci; and of the other, a Holy Family by Raphael. There are some others of considerable merit which ornament the altar of the great church. These altars, or little chapels, of which this fabric contains a great number, are lined with marble and embellished by sculpture; but nothing within this church interests a traveller of sensibility so much as the iron grates before those chapels, which were
were made of the fetters and chains of the Christian slaves, who were freed from bondage by the glorious victory of Lepanto.

The palace where the governor resides stands near the church, and the ecclesiastics who are employed in it lodge in the same palace, where they receive the pilgrims of high distinction. The environs of this town are very agreeable, and in fine weather the high mountains of Croatia may be seen from hence. It is seated on a mountain, in E. Long. 13° 50' N. Lat. 43° 24'.

LORICA, was a cuirass, brigantine, or coat of mail, a name among the Roman soldiers. It was generally made of leather, and is supposed to be derived from forum. — The loricae were set with plates of metal in various forms: sometimes in hooks or rings like a chain, sometimes like feathers, and sometimes like the scales of serpents or fishes, to which plates of gold were often added. There were other lighter cuirasses, consisting only of many folds of linen cloth, or of flax made strong enough to resist weapons. Such soldiers as were rated under 1000 drachmae, instead of the lorica now described, wore a pectorale. — The Roman lorica was made like a shirt, and defended the wearer both before and behind, but was so contrived that the back part could be occasionally separated from the front. Some of the loricae were made of cords of hemp or flax, close set together; whence they are called thoraces bulices, trilices, &c. from the number of the cords fixed one upon another; but these were used rather in hunting than in the field of battle.

LORIS, in Zoology. See LEMUR, MAMMALIA Index.

LORIMERS, one of the companies of London, that make bits for bridles, spurs, and such like small iron ware. They are mentioned in statute 1 Rich. II. c. 12. — The word seems derived from the Latin word lorum, "a thong."

LORME, PHILIBERT DE, one of the most celebrated architects in the 16th century, was born at Lyons. Queen Catherine de Medicis gave him the superintendence of buildings; and he had the direction of those of the Louvre, the Tuileries, the castle of St. Anet, St Germain, and other edifices erected by her orders. He also wrote several books on architecture. He died about the year 1577.

LORNE, a division of Argyllshire in Scotland, which gives the title of marquis to the duke of Argyll. It extends above 30 miles in length from north to south, and about nine at its utmost breadth; bounded on the east by Braightain; on the west by the islands; on the north by Lochaber; and is divided from Knapdale on the south by Loch Etive, on the banks of which stands the castle of Beregornium, where the courts of justice were anciently held. This district, abounding with lakes, is the most pleasant and fertile part of Argyllshire, producing plenty of oats and barley. It once belonged to the ancient family of Macdougal, still residing on the spot; but devolved to the lords of Argyll in consequence of a marriage with the heiress, at that time a branch of the Stuart family. The chief place of note in this district is the castle of Dunstaffnage, a seat of the Scottish kings previous to the conquest of the Picts in 843 by Kenneth II. In this place was long preserved the famous stone, the pala-
LORRAIN, a sovereign state of Europe, bounded on the north by Luxemburg and the archbishopric of Treves, on the east by Alsace and the duchy of Deux Ponts, on the south by Franche Comte, and on the west by Champagne and the duchy of Barr. It is about 100 miles in length, and 75 in breadth; and abounds in all sorts of corn, wine, hemp, flax, rape-seed, game, and fish, with which it carries on some trade, and in general all the necessaries of life. There are fine meadows and large forests, with mines of iron, silver, and copper, as also salt pits. There are a great number of rivers; of which the principal are the Maese or Meuse, the Moselle, the Scille, the Meure, and the Sarre. It is divided into three parts; the duchy of Lorrain, properly so called, which was heretofore a sovereign state; the duchy of Barr, which formerly belonged to the dukes of Lorrain, but afterwards came under the government of France; and the third comprehends the three bishoprics of Metz, Toul, and Verdun, which have belonged to France ever since the year 1552. In 1733, the emperor of Germany being at war with France, this last got possession of the duchy of Lorrain; and when there was a peace made in 1735, it was agreed, that Stanislaus king of Poland, father-in-law to the king of France, should possess these duchies, and that after his death they should be united for ever to the crown of France. It was also then agreed, that Francis Stephen, duke of Lorrain, and the emperor's son-in-law, should have the grand duchy of Tuscany as an equivalent for Lorrain. After the death of the great duke of Tuscany, in 1737, King Stanislaus and the duke of Lorrain took possession of their respective dominions, and the cession was confirmed and guaranteed by a treaty in 1738. The trade consists in corn and linen cloth. Nancy is the capital town.

LORRAIN, Robert le, an eminent sculptor, born at Paris in 1566. From his infancy, he was most rapid a progress in the art of designing, that at the age of 18 the celebrated Girardon intrusted him with the care of teaching his children and correcting his disciples. He committed to him also, in conjunction with Noulissen, the execution of the famous tomb of Cardinal Richelieu in the Sorbonne, and his own tomb at St. Landres in Paris. On his return from Rome, he finished several pieces at Marseilles, which had been left imperfect by the death of M. Puget. He was received into the academy of sculpture in 1701. His chef d'oeuvre is Galatea, a work universally admired. Lorrain afterwards made a Bacchus for the gardens at Versailles, a Faun for those of Marly; and several bronzes, among which is Anordemada; all in an excellent taste. This artist succeeded chiefly in heads; and more particularly in that of young girls, which he performed with incomparable delicacy and truth.

LOTEN, John, a good landscape painter of the English school, though a native of Switzerland. His taste led him to solemn and dreary scenes, as land-storms accompanied with showers of rain, &c. and he seldom omitted to introduce oak trees in his prospects; his landscapes are generally large; and he painted with nature, truth, and force. But the effect of his composition had been much greater if he had been less cold in his colouring; for the judicious eye is not pleased with the darkish tint that predominates in it. He died in London about 1681.

LOTHIAN, a name given to three counties of Scotland, viz. Haddingtonshire, Edinburghshire, and Linlithgowshire; otherwise called East, Mid, and West, Lothian.

1. East Lothian, or Haddingtonshire, is bounded on the north-west by the frith of Forth; and on the east by the German sea; on the south-east by Berwickshire; and on the west by the county of Edinburgh. It extends about 25 miles from east to west, and where broadest, nearly 15 from north to south; it is about 297 square miles. Of the whole county about 64 parts in the hundred are arable, 16 meadows or low lying ground, and 20 hills and wastes. This is one of the most fruitful counties in Scotland, producing great quantities of wheat and all sorts of grain, well watered, and plentifully supplied with fish, fowl, flet, and all the necessaries of life. It abounds with towns, villages, and farms, interspersed with a great number of agreeable houses belonging to persons of rank and fortune. Beside farming, which is successfully carried on, the people towards the sea-coast employ themselves in the fishery, salt-making, and in foreign trade; and some of the more inland inhabitants engage in the linen and woollen manufactures. Limestone and coal are found in most parts of the county, and great numbers of sheep are fed on the hills of Lammermuir. See Haddingtonshire, Supplement.

2. Edinburghshire, or Mid Lothian, is about 35 miles long, but varies in its breadth in different places from five to 16 miles; area 358 square miles. It is bounded on the east by Haddingtonshire; on the west by the shire of Linlithgow; on the south, by Peeblesshire; and on the north, by part of West Lothian and the frith of Forth. The aspect of the country is in general level and pleasant, interspersed with a few hills, that help to exhibit agreeable prospects, rivers and shaded with wood. It produces plenty of coal, limestone, a soft black marble, and some copper ore. The soil, of itself fertile, is finely cultivated, and yields as plentiful harvests of excellent wheat as are found in any part of Great Britain. The whole shire is interspersed with noble houses and plantations belonging to noblemen and gentlemen of fortune. The farmers, in general, are skilful and wealthy. The country is well inhabited, and presents us with a good number of towns and populous villages. Along the sea coast the common people subsist by fishing, and traffic in coals and salt, and some few carry on a smuggling commerce. Those in the inland are employed in farming, and some branches of the weaving manufacture. Edinburgh is a county within itself. See Edinburghshire, Supplement.

3. The shire of Linlithgow, or West Lothian, is bounded on the north by the frith of Forth. The small river Almond divides it from Edinburghshire on the east. On the south-west it joins the county of Lanark; and on the west, it is parted from Stirlingshire by Aton, a small river. Its form, though irregular, approaches to a parallelogram. It measures from north-east to south-west, 20 miles. It breadth, except on the shore of the frith, does not exceed 12. The country is pleasant and fertile, abounding with corn and pasture.
LOT

LOT

LOTHIAN

LT. Lottery.

LOTION is, strictly speaking, such washing as concerns beautifying the skin, by cleansing it of those deformities which a distempered blood throws upon it. Medicines of this kind, however, are for the most part innocent, and sometimes very dangerous; the only proper method of treating these disorders is, by administering such medicines as tend to correct the morbid state of the constitution from whence they arise.

LOTION, in Pharmacy, denotes a preparation of medicines, by washing them in some liquid, either made very light, so as to take away only the dregs; or sharp, so as to penetrate them, in order to clear them of some salt or corrosive spirit, as is done to antimony, precipitates, magisteries, &c. or intended to take away some founlness or ill quality, or to communicate some good one.

LOTOPHAGI, in Ancient Geography, a people of the Regio Syrtica (so called from their living on the lotus); inhabiting between the two Syrtaces, from the Cynopus to the Triton. The lotus was said to be a food so luscious, as to make strangers forget their native country. A sweet wine was expressed from it, which did not keep above ten days, (Pliny).

LOTOPHAGI of Homer. See Meninx.

LOTTERY, a kind of public game at hazard, frequent in Britain, France, &d Holland, in order to raise money for the service of the state; being appointed with us by the authority of parliament, and managed by commissioners appointed by the lords of the treasury for that purpose. It consists of several numbers of blanks and prizes, which are drawn out of wheels, one of which contains the numbers, and the other the corresponding blanks or prizes.

The Romans invented lotteries to enliven their Saturnalia. This festival began by the distribution of tickets which gained some prize. Augustus made lotteries which consisted of things of little value; but Nero established some for the people, in which 1000 tickets were distributed daily, and several of those who were favoured by fortune got rich by them.

Heliogabalus invented some very singular: the prizes were either of great value or of none at all: one gained a prize of six slaves, and another of six fies; some got valuable vases, and others vases of common earth.

The first English lottery we find mentioned in history was drawn A.D. 1569. It consisted of 40,000 lots, at 10s. each lot: the prizes were plate; and the profits were to go towards repairing the havens of this kingdom. It was drawn at the west door of St Paul's cathedral. The drawing began on the 11th of January 1569, and continued incessantly, day and night, till the 6th of May following; as Maitland, from Stowe, informs us in his history, vol. i. p. 257. There were then only three lottery offices in London. The proposals for this lottery were published in the years 1567 and 1568. It was at first intended to have been drawn at the house of Mr Derick, her majesty's servant, i.e. her jeweller, but was afterwards drawn as above mentioned.

Dr Rawlinson showed the Antiquarian Society, 1748, "A proposal for a very rich lottery general without any blankes, containing a great number of good prizes, as well of redy money as of plate and certain sorts of merchandizes, having been valued and prise by the commandment of the queene's most excellent majestie's order, to the intent that such commodities as may chance to arise thereof, after the charges borne may be converted towards the reparations of the havens and strength of the realme, and towards such other public good works. The number of lots shall be four hundred, and every lot shall be the summe of tenne shillings sterling, and no more. To be filled by the feast of St Bartholomew. The shew of prizes are to be seen in Cheapeaside, at the sign of the Queenes Armes, the house of Mr Derick, goldsmith, servant to the queene. Some other orders about it in 1567-8. Printed by Hen. Bynasby." In the reign of Queen Anne, it was thought necessary to suppress lotteries, as nuisances to the public. Since that time, however, they have been licensed by an act of parliament, under various regulations. The act passed in 1778 restrains any person from keeping an office for the sale of tickets, shares, or chances, or for buying, selling, ensuring, or registering, without a licence; for which licence each office-keeper must pay 30l. to continue in force for one year, and the produce to be applied towards defraying the expense of the lottery. And no person is allowed to sell any share or chance less than a sixteenth, on the penalty of 30l. All tickets divided into shares or chances are to be deposited in an office, to be established in London by the commissioners of the treasurer, who are to appoint a person to conduct the business thereof: and all shares are to be stamped by the said officer, who is to give a receipt for every ticket deposited with him. The numbers of all tickets so deposited are to be entered in a book, with the names of the owners, and the number of shares into which they are divided. All tickets deposited in the office are to remain there three days after the drawing. And any person keeping an office, or selling shares, or who shall publish any scheme for receiving money in consideration of any interest to be granted in any ticket in the said lottery, &c. without being in possession of such ticket, shall forfeit 500l. and suffer three months imprisonment. And no business is to be transacted at any of the offices after eight in the evening, except on the evening of the Saturday preceding the drawing. No person is to keep any office for the sale of tickets, &c. in Oxford or Cambridge, on penalty of 20l. Before this regulating statute took place, there were upwards of 400 lottery offices in and about London only; but the whole number afterwards, for all Britain, as appeared by the list published by authority, amounted to no more than 57. They have, however, increased greatly again.

Some farther regulations to prevent the frauds committed by insurances were made in 1793. In 1808 the reports of a committee of the house of commons disclosed a dreadful scene of vice and misery brought on by lotteries, and recommended their abolition, or at least that they should be put under other regulations. Their suggestions, however, have had but little effect hitherto. The gross sum received by government from the lottery, is estimated to be 750,000l. per annum, of which 500,000l. is for tickets, and the remainder for postages, stamps, &c.

LOTUS, or Bird's-foot Trefoil; a genus of plants
LOV [ 239 ] LOVE

plants belonging to the diadelphus class; and in the natural method ranking under the 32d order, Papilionaceae. See Botany Index.

Lotus of Homer. See Diospyros.
Egyptian Lotus. See Nymphaea, Botany Index.
Libyan Lotus. See Rhamnus.
LOVAGE. See Ligusticum.

LOVE, in a large sense of the word, denotes all those affections of the pleasing kind which objects and incidents raise in us; thus we are said to love not only intelligent agents of morally good dispositions, but also sensual pleasures, riches, and honours. But Love, in its usual and more appropriate signification, may be defined, "that affection which, being compounded of animal desire, esteem, and benevolence, becomes the bond of attachment and union between individuals of the different sexes; and makes them feel in the society of each other a species of happiness which they experience no where else." We call it an affection rather than a passion, because it involves a desire of the happiness of its object: And that its constituent parts are those which have been just enumerated, we shall first endeavour to prove, and then proceed to trace its rise and progress from a selfish appetite to a generous sentiment.

Animal desire is the actual energy of the sensual appetite: and that it is an essential part of the complex affection, which is properly called love, is apparent from this consideration, that though a man may have sentiments of esteem and benevolence towards women who are both old and ugly, he never supposes himself to be in love of any woman, to whom he feels not the sensual appetite to have a stronger tendency than to other individuals of her sex. On the other hand, that animal desire alone cannot be called the affection of love is evident; because he who gratifies such a desire without esteeming its object, and wishing to communicate at the same time that he receives enjoyment, loves not the woman, but himself. Men in animal desire has nothing in view but the species and the sex of its object; and before it make a selection, it must be combined with sentiments very different from itself. The first sentiment with which it is combined, and by which a man is induced to prefer one woman to another, seems to be that by which we are delighted with gracefulness of person, regularity of features, and beauty of complexion. It is not indeed to be denied that there is something irresistible in female beauty. The most severe will not pretend that they do not feel an immediate prepossession in favour of a handsome woman: but this prepossession, even when combined with animal desire, does not constitute the whole of that affection which is called love. Savages feel the influence of the sensual appetite, and it is extremely probable that they have some ideas of beauty; but among savages the affection of love is seldom felt. Even among the lower orders of civil society it seems to be a very gross passion, and to have in it more of the selfishness of appetite than of the generosity of esteem. To these observations many exceptions will no doubt be found (A): but we speak of savages in general, and of the great body of the labouring poor, who in the choice of their mates do not study—who indeed are incapable of studying, that rectitude of mind, and those delicacies of sentiment, without which neither man nor woman can deserve to be esteemed.

In the savage state, and even in the first stages of refinement, the bond of union between the sexes seems to consist of nothing more than mere animal desire and instinctive tenderness for their infant progeny. The former impels them to unite for the propagation of the species; and the latter preserves the union, till the children, who are the fruit of it, be able to provide for their own subsistence. That in such unions, whether casual or permanent, there is no mutual esteem and benevolence, is apparent from the state of subjection in which women are held in rude and uncultivated nations, as well as from the manner in which marriages are in such nations contracted.

Sweetness of temper, a capital article with us in the female character, displays itself externally in mild looks and gentle manners, and is the first and perhaps the most powerful inducement to love in a cultivated mind. "But such graces (says an ingenious writer) are scarce discernible in a female savage; and even of the H工业企业 in the most polished woman would not be perceived by a male savage. Among savages, strength and boldness are the only valuable qualities. In these, females are miserably deficient; for which reason they are contemned by the males as beings of an inferior order. The North American tribes glory in idleness: the drudgery of labour degrades a man in their opinion, and is proper for women only. To join young persons in marriage is accordingly the business of the parents; and it would be unpardonable meanness in the bridegroom to show any fondness for the bride. In Guiana a woman never sits with her husband, but after every meal attends him with water for washing; and in the Caribbea islands she is not even permitted to eat in the presence of her husband. Dampier observes in general, that among all the wild nations with which he was acquainted, the women carry the burdens, while the men walk before and carry nothing but their arms; and that women even of the highest rank are not better treated. In Siberia, and even in Russia, the capital excepted, men till very lately treated their wives in every respect like slaves. It might indeed be thought, that animal desire, were there nothing else, should have raised women to some degree of estimation among men; but male savages, utter strangers to decency and refinement, gratify animal desire with as little ceremony as they do hunger or thirst."

"Hence it was that in the early ages of society a man purchased a woman to be his wife, as one purchases an ox or a sheep to be food; and valued her only as she contributed to his sensual gratification. Instances innumerable might be collected from every nation of which we are acquainted with the early history; but we..."
"The gods command me to forgive the past;"
"But let this first invasion be the last;"
"For know, thy blood, when near thou darst invade,
Shall stream in vengeance on my recking blade.

Pope has made the language of this rough warrior less inconsistent with the peculiar resentment natural to an injured lover than it is in the original (a); but from the last quoted passage, even as translated by him, it is apparent that Achilles would have been equally hurt had Agamemnon threatened to deprive him of any other part of his plunder. Accordingly he yields up Briseis, not in grief for a mistress whom he loses, but in sullenness for an injury that is done him. Nor let it be imagined, that this coldness proceeded from the pride of the hero, which would not permit him to acknowledge his love of a captive. With the generous affection of love captives and princesses were equally incapable of inspiring him. He repeatedly affirmed that he delighted in his fair Lynessian slave, but it was only as an instrument of sensual gratification; for as to every thing else in a woman, he was so totally indifferent, that he declared he would not, when he should be disposed to marry, give himself the trouble to make a choice, but leave the whole matter to his father.

"If heav'n restore me to my realms with life,
The rev'rend Peleus shall elect my wife."

Even Agamemnon, of whom Pope and Madame Dacier think more favourably as a lover, speaks the very same language when mentioning his favourite captive Chryseis. In his furious debate with Achilles he calls her indeed—

"A maid, unmatch'd in manners as in face,
Skill'd in each art, and crown'd with e'ry grace."

And adds,

"Not half so dear were Clytemnestra's charms,
When first her blooming beauties blest my arms."

But this was said merely to enhance the value of the prize, which for the public good he was about to resign; for that she was dear to him only as ministering to his pleasure, is past dispute from the language which he had previously held with her father, as well as from his requiring grateful Greece to pay a just equivalent, and to repair his private loss. A man who really loves would have thought nothing an equivalent for the object of his love; much less would he be insinuated to her father..."
father a possibility of his dismissing from his embrace a woman whom he esteemed, when time should have robbed her of every youthful grace.

Since, then, it is so apparent, that in the heroic age of Greece even princes and kings were strangers to the generous affection of love, it needs not occasion much surprise that the same affection has very little influence upon mankind in the lowest ranks of the most polished societies of modern Europe. That this is actually the case, that among the generality of uncultivated men and women there is no other bond of attachment than the sensual appetite, every year furnishes multiplied proofs. We daily see youths, rejected by their mistresses, paying their addresses without delay to girls who, in looks, temper, and disposition, are diametrically opposite to those whom so lately they pretended to love. We daily see maidens, slighted by their lovers, receiving the addresses of men, who, in nothing but their sex, resemble those to whom a week before they wished to be married; and we believe it is not very uncommon to find a girl entertaining several lovers together, that if one or more of them should prove false, she may still have a chance not to be totally deserted. Did esteem and benevolence, placed on manners and character, constitute any part of vulgar love, these people would act very differently; for they would find it impossible to change their lovers and their mistresses with the same ease that they change their clothes.

To this account of love, as it appears in savage nations, some one may perhaps oppose the paintings of the softer passion in the poems of Ossian. That bard describes the female character as commanding respect and esteem, and the Caledonian heroes as cherishing for their mistresses a flame so pure and elevated as never was surpassed, and has seldom been equalled, in those ages which we commonly call most enlightened. This is indeed true; and it is one of the many reasons which have induced nations and others to produce the whole of modern fiction. Into that debate we do not enter. We may admit the authenticity of the poems, without acknowledging that they furnish any exception to our general theory. They furnish in the manner in which they describe a wonderful anomaly in the general history of man. All other nations of which we read were in the hunter state savage and cruel. The Caledonians, as exhibited by Ossian, are gentle and magnanimous. The heroes of Homer fought for plunder, and felt no clemency for a vanquished foe. The heroes of Ossian fought for fame; and when their enemies were subdued, they took them to their bosoms. The first of Greeks committed a mean insult on the dead body of the first of Trojans. Among the Caledonians insults offered to the dead, as well as cruelty to the living, were condemned as infamous. The heroes of Ossian appear in no instance as savages. How they came to be polished and refined before they were acquainted with agriculture and the most useful arts of life, it is not our business to inquire; but since they unquestionably were so, their treatment of the female sex, instead of opposing, confirms our theory; for we never conceived rich clothes, superb houses, highly-dressed food, or even the knowledge of foreign tongues, to be necessary to the acquisition of a generous sentiment. Luxury indeed appears to be as inimical to love as barbarism: and we believe, that in modern nations, the tender and exalted affection which deserves that name is as little known among the highest orders of life as among the lowest. Perhaps the Caledonian ladies of Ossian resembled in their manners the German ladies of Tacitus, who accompanied their husbands to the chase, fought by their sides in battle, and partook with them of every danger. If so, they could not fail to be respected by a race of heroes among whom courage took place of all other virtues: and this single circumstance, from whatever cause it might proceed, will sufficiently account for the estimation of the female character among the ancient Germans and Caledonians, so different from that in which it has been held in almost every other barbarous nation.

But if among savages and the vulgar, love be unknown, it cannot possibly be an instinctive affection: and therefore it may be asked, How it gets possession of the human heart; and by what means we can judge whether in any particular instance it be real or imaginary? These questions are of importance, and deserve to be fully answered; though many circumstances conspire to render it an easy task to give to them such answers as shall be perfectly satisfactory. Love can subsist only between individuals of the different sexes. A man can hardly love two women at the same time; and we believe that a woman is still less capable of loving at once more than one man. Therefore, there is a natural tendency to make men and women pair, or, in other words, it is the source of marriage: but in polished society, where alone this affection has any place, so many things besides mutual attachment are necessary to make the married life comfortable, that we rarely see young persons uniting from the impulse of love, and have therefore but few opportunities of tracing the rise, progress, and consequences of the affection. We shall, however, throw together such reflections as have occurred to us on the subject, not without indulging a hope that they may be useful to the younger part of our readers when forming the most important connection in life.

We have said, that the perception of beauty, combined with animal desire, is the first inducement which a man can have to prefer one woman to another. It may be added, that elegance of figure, a placid masculine countenance, with a person which indicates strength and agility, are the qualities which first tend to attach any woman to a particular man. Beauty has been defined, "That particular form, which is by Pere the most common of all particular forms to be met with in the same species of beings." Let us apply this definition to our own species, and try, by means of it, to ascertain what constitutes the beauty of the human face. It is evident, that of countenances we find a number almost infinite of different forms, of which forms one only constitutes beauty, whilst the rest, however numerous, constitute what is not beauty, but deformity or ugliness. To an attentive observer, however, it is evident, that of the numerous particular forms of ugliness, there is not one which includes so many faces as are formed after that particular cast which constitutes beauty. Every particular species of the animal as well as the vegetable creation, may be said to have a fixed or determinate form, to which, as to a centre, nature is continually inclining. Or it may be
LOV [ 242 ] LOV

be compared to pendulums vibrating in different directions over one central point; and as they all cross the centre, though only one passes through any other point; so it will be found that perfect beauty is often produced by nature than deformity: we do not mean than deformity in general, but than any one kind and degree of deformity. To instance in a particular part of a human feature; the line which forms the ridge of the nose is deemed beautiful when it is straight; but this is likewise the central form, which is often found than any one particular degree of concave, convex, or any other irregular form that shall be proposed. As we are then more accustomed to beauty than deformity, we may conclude that to be the reason why we approve and admire it, just as we approve and admire fashions of dress for no other reason than that we are used to them. The same thing may be said of colour as of form: it is custom alone which determines our preference of the colour of the European to that of the Ethipians, and which makes them prefer their own colour to ours; so that though habit and custom cannot be the cause of beauty (see BEAUTY), they are certainly the cause of our liking it.

That we do like it cannot be denied. Every one is conscious of a pleasing emotion when contemplating beauty either in man or woman; and when that pleasure is combined with the gratification of the sensual appetite, it is obvious that the sum of enjoyment must be greatly increased. The perception of beauty, therefore, necessarily directs the energy of the sensual appetite to a particular object; but still this combination is a mere selfish feeling, which regards its object only as the best of many similar instruments of pleasure. Before it can deserve the name of love, it must be combined with esteem, which is never bestowed but upon moral character and internal worth; for let a woman be ever so beautiful, and of course ever so desirable as an instrument of sensual gratification, if she be not possessed of the virtues and dispositions which are peculiar to her sex, she will inspire no man with a generous affection. With regard to the outlines, indeed, whether of internal disposition or of external form, men and women are the same; but nature, intending them for mates, has given them dispositions, which though concordant, are, however, different, so as to produce together delicious harmony. "The man, more robust, is fitted for severe labour, and for field exercise; the woman, more delicate, is fitted for sedentary occupations, and particularly for nursing children. The man, bold and vigorous, is qualified for being a protector; the woman, delicate and timid, requires protection. Hence it is, that a man never admires a woman for possessing bodily strength or personal courage; and women always despise men who are totally destitute of these qualities. The man, as a protector, is directed by nature to govern; the woman, conscious of inferiority, is disposed to obey. Their intellectual powers correspond to the destination of nature. Men have penetration and solid judgment to fit them for governing; women have sufficient understanding to make a decent figure under a good government: a greater proportion would excite dangerous rivalry between the sexes, which nature has avoided by giving them different talents. Women have more imagination and sensibility than men, which make all their enjoyments more exquisite; at the same time that they are better qualified to communicate enjoyment. Add another capital difference of disposition: the gentle and insinuating manners of the female sex tend to soften the roughness of the other sex; and wherever women are indulged with any freedom, they polish sooner than men."

These are not the only particulars that distinguish the sexes. With respect to the ultimate end of love, it is the privilege of the male, as superior and protector, to make a choice: the female, preferred, has no privilege but barely to consent or to refuse. Whether this distinction be the immediate result of the originally different dispositions of the sexes, or only the effect of associations inevitably formed, may be questioned; but among all nations it is the practice for men to court, and for women to be courted: and were the most beautiful woman on earth to invert this practice, she would forfeit the esteem, however by her external grace she might excite the desire, of the man whom she addressed. The great moral virtues which may be comprehended under the general term integrity, are all absolutely necessary to make either men or women estimable; but to procure esteem to the female character, the modesty peculiar to their sex is a very essential circumstance. Nature hath provided them with it as a defence against the artful solicitations of the other sex before marriage, and also as a support of conjugal fidelity.

A woman, therefore, whose dispositions are gentle, delicate, and rather timid than bold, who is possessed of a large share of sensibility and modesty, and whose manners are soft and insinuating, must, upon moral principles (see MORAL PHILOSOPHY), command the esteem and benevolence of every individual of the other sex who is possessed of sound understanding; but if her person be deformed, or not such as to excite some degree of animal desire, she will attract no man's love. In like manner, a man whose moral character is good, whose understanding is acute, and whose conversation is instructive, must command the esteem of every sensible and virtuous woman; but if his figure be disagreeable, his manner unpolished, his habits slovenly, and, above all, if he be deficient in personal courage, he will hardly excite desire in the female breast. It is only when the qualities which command esteem are, in the same person, united with those which excite desire, that the individual so accomplished can be an object of love to one of the other sex; but when these qualities are thus united, each of them increases the other in the imagination of the lover. The beauty of his mistress gives her, in his apprehension, a greater share of gentleness, modesty, and every thing which adorns the female character, than perhaps she really possesses; whilst his persuasion of her internal worth makes him, on the other hand, apprehend her beauty to be absolutely unrivalled.

To this theory an objection readily offers itself, which it is incumbent upon us to obviate. Men and women sometimes fall in love at first sight, and very often before they have opportunities of forming a just estimate of each other's moral character: How is this circumstance to be reconciled with the progressive generation of love? We answer, By an association of ideas, which is formed upon principles of physiognomy.
LOV

ny. Every passion and habitual disposition of mind gives a particular cast to the countenance, and is apt to discover itself in some feature of the face. This we learn by experience; and in time, without any effort of our own, the idea of each particular cast of countenance comes to be so closely associated in our minds with the internal disposition which it indicates, that the one can never afterwards be presented to our view without instantly suggesting the other to the imagination. See Metaphysics and Physiognomy.

Hence it is that every man, who has been accustomed to make observations, naturally forms to himself, from the features and lineaments of a stranger's face, some opinion of his character and fortune. We are no sooner presented to a person for the first time, than we are immediately impressed with the idea of a proud, a reserved, an affable, or a good-natured man; and upon our going into a company of absolute strangers, our benevolence or aversion, our awe or contempt, rises instantly towards particular persons, before we have heard them speak a word, or know so much as their names or designations. The same thing happens when we are presented to the fair sex. If a woman, seen for the first time, have that particular cast of countenance, and that expression of features, to which we have associated notions of gentleness, modesty, and other female virtues, she instantly commands our esteem; and if she have likewise so much beauty as to make her an object of particular desire, esteem and desire become suddenly combined; and that combination constitutes the affection of love. Such, too, is the nature of all mental associations, that each part of which they are composed adds strength and vividness to the other parts; so that, in the present instance, desire makes us imagine virtues in the woman which her countenance perhaps does not indicate; and the virtues which are there actually visible, make us apprehend her beauty as more perfect than it is.

The affection thus generated is more or less pure, and will be more or less permanent, according as the one or the other part of which it is compounded predominates. "Where desire of possession prevails over our esteem of the person and merits of the desirable object, love loses its benevolent character: the appetite for gratifying becomes ungovernable, and tends violently to its end, regardless of the misery that must follow. In that state love is no longer a sweet agreeable affection: it becomes a selfish, painful passion, which, like hunger and thirst, produceth no happiness but in the instant of fruition; and when fruition is over, disgust and aversion generally succeed to desire. On the other hand, where esteem, founded on a virtuous character and gentle manners, prevails over animal desire, the lover would not for the world gratify his appetite at the expense of his mistress's honour or peace of mind. He wishes, indeed, for enjoyment; and to his enjoyment is more exquisite than to the mere sensual lover, because it unites sentiment with the gratification of sense; at the same time that, so far from being succeeded by disgust or aversion, it increases his benevolence to the woman, whose character and manners he esteems, and who has contributed so much to his pleasure. Benevolence to an individual, having a general end, admits of acts without number, and is seldom fully accomplished. Hence mutual love, which is composed chiefly of esteem and benevolence, can hardly be of a shorter duration than its objects. Frequent enjoyment endears such lovers to each other, and makes constancy a pleasure; and when the days of sensual enjoyment are over, esteem and benevolence will remain in the mind, making sweet, even in old age, the society of that pair, in whom are collected the affections of husband, wife, lover, friend, the tenderest affections of human nature."

From the whole of this investigation, we think it appears, that the affection between the sexes which deserves the name of love, is inseparably connected with virtue and delicacy; that a man of loose morals cannot be a faithful or a generous lover; that in the breast of him who has ranged from woman to woman for the mere gratification of his sensual appetite, desire must have effaced all esteem for the female character; and that, therefore, the maxim too generally received, "that a reformed rake makes the best husband," has very seldom a chance to be true. We think it may likewise be inferred, that thousands fancy themselves in love who know not what love is, or how it is generated in the human breast: and therefore we beg leave to advise such of our readers as may imagine themselves to be in that state, to examine their own minds, with a view to discover, whether, if the objects of their love were old and ugly, they would still esteem them for the virtues of their character, and the propriety of their manners. This is a question which deserves to be well weighed by the young and the amorous, who in forming the matrimonial connexion, are too often blindly impelled by the mere animal desire inflamed by beauty. "It may indeed happen, after Elements the pleasure of gratifying that desire is gone (and if of Critic. not refined by esteem and benevolence, go it must with a swift pace), that a new bond of attachment may be formed upon more dignified and more lasting principles; but this is a dangerous experiment. Even supposing good sense, good temper, and internal worth of every sort, yet a new attachment upon such qualifications is rarely formed; because it commonly or rather always, happens, that such qualifications, the only solid foundation of that indissoluble connexion, if they did not originally make esteem predominate over animal desire, are afterwards rendered altogether inviable by satiety of enjoyment-creating disgust?"

LOVE, in Medicine. The symptoms produced by this passion as a disease, according to medical writers, are as follow: The eyelids often twinkle; the eyes are hollow, and yet appear as if full with pleasure: the pulse is not peculiar to the passion, but the same with that which attends solicitude and care. When the object of this affection is thought of, particularly if the idea is sudden, the spirits are confused, the pulse changes, and its force and time are very variable: in some instances, the person is sad and watchful; in others, the person, not being conscious of his state, pines away, is slothful, and regardless of food; though the wiser, when they find themselves in love, seek pleasant company and active entertainments. As the force of love prevails, sights grow deeper; a tremor affects the heart and pulse; the countenance is alternately pale and red; the voice is suppressed in the fauces; the eyes grow dim; cold sweats break out; sleep absents itself, at least until the morning; the secretions...
Love. 

become disturbed; and a loss of appetite, a hectic fever, melancholy, or perhaps madness, if not death, constitutes the sad catastrophe. On this subject the curious may consult Ægineta, lib. iii. cap. 17. Orig. Syno. lib. viii. cap. 9. or a treatise professedly written on love, as it is a distemper, by James Ferrard, Oxford, printed 1642.

The manners of the Greeks and Romans were similar to each other in the affairs of love. They generally made a discovery of their passion by writing upon trees, walls, doors, &c. the name of their beloved. They usually decked the door of their dwelling with flowers and garlands, made libations of wine before their houses, sprinkling the posts with the same liquor, as if the object of their affection was a real goddess. For a man's garland to be untied, and for a woman to compose a garland, were held to be indubitable indications of their love.

When their love was without success, they used several arts to excite affection in the object of their desire. They had recourse to enchantresses, of whom the Thessalian were in the highest estimation. The means made use of were most commonly philtres or love potions, the operation of which was violent and dangerous, and frequently deprived such as drank them of their reason. Some of the most remarkable ingredients of which they were composed were, the hippocanes, the jynx, insects bred from putrefaction, the fish remora, the lizard, brains of a calf, the hairs on the tip of a wolf's tail, his secret parts, the bones of the left side of a toad eaten with ants, the blood of doves, bones of snakes, feathers of screech-owls, twisted cords of wool in which a person had hanged himself, rags, torches, reliques, a nest of swallows buried and famished in the earth, bones snatched from hungry hitches, the marrow of a boy famished in the midst of plenty, dried human liver; to these may be added several herbs growing out of putrid substances. Such were the ingredients that entered into the composition of that infernal draught called love potion.

But, besides the philtres, various other arts were used to excite love, in which the application of certain substances was to have a magical influence on the person against whom they levelled their skill. A hyena's udder worn under the left arm, they fancied would draw the affections of whatever woman they fixed their eyes upon. That species of olives called wilicwy, and barley-bran made up into a paste, and thrown into the fire, they thought would excite the flame of love. Flour was used with the same intention. Burning laurel, and melted wax, were supposed to have the like effect. When one heart was to be hardened, and another mollified, clay and wax were exposed to the same fire together. Images of wax were frequently used, representing the persons on whom they wished to make an impression; and whatever was done to the substitute of wax, they imagined was felt by the person represented. Enchanted medicaments were often sprinkled on some parts of the house where the person resided. Love-pledges were supposed to be of singular use and efficacy; these they placed under their threshold, to preserve the affections of the owner from wandering. Love-knots were of singular power, and the number three was particularly observed in all they did. But no good effect was expected, if the use of these things was not attended with charms or magical verses and forms of words. See Magic.

Having mentioned their arts of exciting love, it may not be amiss to take notice, that the ancients imagined, that love excited by magic may be allayed by more powerful spells and medicaments, or by applying to demons more powerful than those who had been concerned in raising that passion. But love inspired without magic had no cure; Apollo himself could find no remedy, but cried out

Hic mihi quod nulla amor est medicabilis herbis.

The antidotes against love were generally agnus castus, which has the power of weakening the generative faculty; sprinkling the dust in which a mule had rolled herself; tying toads in the hide of a beast newly slain; applying amulets of minerals or herbs, which were supposed of great efficacy in other cases; and invoking the assistance of the inferior deities. Another cure for love was bathing in the waters of the river Seleneus; to which we may add the lover's leap, or jumping down from the Leucadian promontory.

Love-Apple. See Solanum, Botany Index.

LOVENTINUM, or LENTINUM, in Ancient Geography, a town of the Demetia in Britain, near the mouth of the Tuerobius or Tivy. Supposed to have been afterwards swallowed up by an earthquake, and to have stood where is now the lake called Llyn Sivitas in Brecknockshire.

LOUGHBOURNE, a town of Leicestershire in England, 110 miles from London. It is the second town in the county, and was in the Saxons time a royal village. Its market is on Thursday; the number of inhabitants in 1811 was 5400. It has a large church, and a free school; besides a charity school for 82 boys, and another for 20 girls. It has been very much reduced by fires; but is still a very agreeable town, with rich meadow-ground, on the fosse, which runs here almost parallel with the river Soar. The new canal has made the coal trade here very extensive.

LOUGHBRICKLAND, a town of Ireland, situated in the county of Down, and province of Ulster, 58 miles from Dublin. The name signifies the lake of the speckled trout; and it was so called from a lake near it, which abounds with those fish. It consists of one broad street, at the end of which is the parish church, said to have been built by Dr Taylor when bishop of Dromore, soon after the Restoration. The linen manufacture is carried on here very extensively; and the town is a great thoroughfare, the turnpike road from Dublin to Belfast passing near it.

LOUGH-DERG, anciently Derg-abhan, i.e. "the river of the woody morass," from a river which issues out of this lake. This lough is situated in the county of Donegal and province of Ulster in Ireland, and is famous for having in it the island that contains St Patrick's purgatory, which is a narrow little cell, hewn out of the solid rock, in which a man could scarce stand upright. There is also a lake of this name situated between the counties of Galway and Tipperary.

LOUGH-NEAGH, a loch or lake of Ireland, situated in the counties of Armagh, Down, Derry, and Antrim, and province of Ulster. This lake is 20 miles
in length, and varies from 8 to 12 miles in breadth. The area of this lake is computed to be 100,000 acres. It is remarkable for a healing virtue; and likewise for petrifying wood, which is not only found in the water but in the adjacent soil at a considerable depth. On its shores several beautiful gems have been discovered. Its ancient name was Loch-Eoch, or Loch-Neagh, from Loch, "a lake," and Neach, "wonderful, divine, or eminent." Its petrifving powers are not instantaneous, as several of the ancient have supposed, but require a long series of ages to bring them to perfection, and appear to be occasioned by a fine mud or sand, which insinuates itself into the pores of the wood, and which in process of time becomes hard like stone. On the borders of this lake is Shane's castle, the elegant seat of Lord O'Nei. Dr Smyth seems to doubt whether the healing quality in this lake is not to be confused to one side of it, called the fishing-bank; and he informs us, that this virtue was discovered in the reign of Charles II., in the instance of the son of one Mr Cunningham, who had an evil which run on him in eight or ten places; and notwithstanding all applications, seemed incurable: at length he was perfectly healed, after bathing in this lough about eight days. Hence that writer gives us another derivation of the name Loch-Neagh, which (he says) seems to him to hint at this quality; Neasg or Nes, in Irish, signifying " a sore or ulcer," which might not improbably be corrupted into Neoch: Hence be apprehends, this lake was remarked at a much earlier period for its healing property. As to its petrifving power, it is mentioned by Neniaus, a writer of the 6th century, who says, " Et omnis steganus facit ligna duressa in lapides. Homines autem findunt ligna, et postquam formavarent, projicuiunt in stagnum, et manet in eo usque ad caput annis, et in capite annis lapis inventur; et vocatur steganum Loch-Eoch." Lough-Neagh gives title of baron to the family of Steffington.

Lough-Strangford, a lake of Ulster, situated in the county of Down and province of Ulster. It takes its present name from a small port-town called Strangford, seated on the west side of the narrow entrance into the sea. It was formerly known by the name of Lough-Cone or Lough Coyne. It is a deep bay or inlet of the sea, about 17 miles long and four or five broad; it goes west as far as Downpatrick, and north as far as Comber and Newtown, and by computation covers 25,775 acres, Irish plantation measure. It abounds with excellent fish, particularly smelts; and off the bar there is a periodical herring fishery in or about August. The bar or entrance into the lough is about three miles below Strangford. There is a long neck at the entrance in the middle of the passage, dangerous to strangers on account of the current; yet there is a broad passage on either side, and deep water. The current here is very strong and rapid, running at the rate of six or seven miles an hour. There are but few vessels that go higher up than Strangford. A good many vessels bound up the channel put in here, if the wind is unfavourable to their passage. The islands in this lake are numerous; Dr Boat enumerates them at 260. But from an actual survey, made at the time Dr Smyth wrote his history of that county, it appears, there are 54 islands small and great, known by particular names, and many others nameless; the contents of these 54 islands added together amount to 954 acres and a half. The great and profitable manufacture carried on in these islands, and the flat stony coasts surrounding the lake, is the burning of sea-weed into kelp, which employs a number of hands, and has been computed to produce to the several proprietors a neat profit of 1000l. per annum and upwards. Four of the islands here are called Swan islands, from the number of swans that frequent them.

Louis, or St Louis, Knights of, the name of a military order in France, instituted by Louis XIV. in 1693. Their colours were of a flame colour, and pass from left to right; the king was their grand master. There were in it eight great crosses, and 24 commanders; the number of knights was not limited. At the time of their institution, the king charged his revenue with a fund of 900,000 livres for the pensions of the commanders and knights.

Louis, Lewis, Louis d'or, or Levéole, a French coin, first struck in 1640, under the reign of Louis XIII., and which has now a considerable currency. See Money-Table.

Louisiana, an extensive country of North America, lying between Mexico and the river Mississippi, and now forming one of the united states of the North American republic. The name was originally given to a region extending from the gulf of Mexico, northward and westward to an unknown distance, but is now confined to the southern part of this territory. Louisiana was originally discovered and settled by the French; and, after remaining in their hands for about a century, it was transferred to Spain by treaty in 1762. In 1801 Spain gave up the colony again to France, by which it was sold to the United States in 1803 for sixty millions of francs. In 1812 Louisiana was erected into a state, and admitted as a member of the union. It extends between 29° and 33° of north latitude, and between the river Sabine on the west, and the Perdido on the east, embracing an area of 45,860 square miles.

The greater part of the country is a level plain, and that part which reaches from the sea-shore, 20 or 30 miles inward, is a morass on a level with high water, without trees or shrubs. The Mississippi flows through the eastern part of it; and as its waters have generally a higher level than the adjoining country, the cultivated parts are protected from inundation by embankments. This great river sends off part of its waters by lateral courses to the sea, and forms a kind of delta. A considerable part of the country is overflowed during the annual swell of the river in May and June, which the river rises 50 feet in the upper part of its course; but at New Orleans, within 100 miles of the sea, the rise is only 12 feet. The richest soil is along the banks of the Mississippi and its branches; the other parts are either swampy, or light and sandy. It abounds with a great variety of wood, and the wild vine is extremely common. The settlements are confined chiefly to the banks of the streams. The population in 1810 was 86,156; but in 1814 was estimated at 101,700. Of this population 30,000 reside in the capital, New Orleans, which is situated about 100 miles from the mouth of the river, and carries on a very extensive trade. It has now become the centre of trade for the states situated on the western side of the Allegheny mountains.
LOU [246] LOU

Louisiana, mountains, and has increased more rapidly within the last ten years than any other town in the United States. The produce received from the upper country is immense; between 300 and 400 sea vessels arrive and depart annually, and about 900 flat-bottomed boats and barges descend the river from the western territories. The river communication has been much improved by the use of steam-boats, which are now numerous upon the Mississippi and Ohio. These have also been employed as drag-boats to assist loaded vessels in ascending from the sea to New Orleans. The principal exports are cotton, tobacco, sugar, and flour. The exports of Louisiana in 1817 amounted to 9,024,812 dollars, of which 8,241,254 were domestic produce, and 783,558 foreign produce. The tonnage belonging to New Orleans in 1815 was 17,204. (Ward's Account of the United States.)

The agricultural productions of Louisiana are the same with those of the other southern states; but sugar is now cultivated to a greater extent here than in any other part of the union. The cane is planted in January, February, or March, and ripens in October. The average produce is estimated at 800 or 1000 pounds per acre. The quantity made on the Mississippi alone in 1812 was estimated at ten millions of pounds. It is computed that there are one million acres in the state adapted to the culture of sugar. Tobacco and cotton are also cultivated to a considerable extent. Of the latter 20,000 bales were exported in 1812. Rice is cultivated in swampy places unfit for any other species of grain, and the produce is estimated at 15 barrels per acre, each weighing 500 pounds. Maize is raised, but this plant, as well as wheat, rye, barley and oats, do not thrive so well as in states farther north, and are not very much cultivated. Figs and olives succeed, and it is believed that silk would be found profitable. The sweet orange, the citron, lemon, and lime, are cultivated below the 30th parallel. Immense herds of cattle are raised in the natural meadows of Opelousas and Atakapas. The mutton is considered to be superior to that of the northern states, the other kinds of flesh inferior. In the richest and most populous parts of the country plantations bring from 40 to 50 dollars an acre, exclusive of slaves and buildings. The profits of a slave are estimated at 140 dollars per annum. Negro tradesmen are let or hired at from 20 to 30 dollars a month. Some planters have a yearly income of 20,000 dollars, and possess from 10,000 to 20,000 head of cattle.

There are no manufactures of much importance in this state. Salt is made at two or three places. Within 65 miles above, and an equal distance below New Orleans, there are 36 saw mills, some of which are driven by steam, and others by water let off by small openings in the banks of the Mississippi. Pitch and tar are manufactured, and of the cane or reed are made hats, sieves, baskets, mats, &c. Candles are made of the vegetable wax derived from the Myrtica cerifera.

Louisiana is in many parts rather unhealthy. Bilious fever prevails generally in autumn, and the yellow fever has several times made its appearance. Sore throat, tetanus, and dysentery are also not uncommon. The most sickly season at New Orleans is August. The births in that city in the year ending March 1808 were 456, the deaths 769. Snow seldom falls in this state, and frost is only experienced in December and January. In summer the thermometer sometimes rises to 93 in the shade. The mean temperature of spring water is said to be 65°. About the 1st of February peach and plum trees are in blossom.

The most considerable rivers are the Mississippi, which has generally a breadth of 800 yards in this state. Its depth near New Orleans exceeds 150 feet. The Red river runs into the Mississippi near Fort Adams. The Sabine river falls into the gulf of Mexico. The Lafourche, Atchafalaya, and Iberville, are outlets of the Mississippi. There are also several lakes, of which those of Ponchartrain and Chetimache are the most considerable. Lake Borgne is an arm of the sea. By its rivers and lakes Louisiana enjoys an inland navigation of 4600 miles.

A mass of native iron weighing 3000 pounds was lately discovered on the banks of Red river. Iron ore, silver, alum, coal, and potter's earth, are found in the state. There are also salt springs at different places.

The constitution of this state was framed by a convention at New Orleans in 1812. The legislature consists of a senate chosen for four years, and house of representatives for two. All free white male citizens of 21 years of age, and paying taxes, are electors. The members of both houses receive four dollars a day for their services. The governor is elected for four years.

The judges of all the courts hold their offices during good behaviour. The militia consists of all the free white citizens.

This country was invaded by a British force in December 1814. It advanced to within six miles of New Orleans, but was defeated there on the 8th January 1815, with the loss of its commander General Packenham its and 2600 men killed and wounded. The Americans, who were commanded by General Jackson, and fought behind an entrenchment, lost according to their own account, only 7 killed and 8 wounded.

Soon after Louisiana was ceded to the United States, there were two societies established for the promotion of science and literature, one of them at New Orleans, and another at Natchez. The former designs to publish a monthly magazine for the purpose of diffusing a knowledge of the country, and to amuse the readers of it with a variety of useful subjects. The latter, which was established in 1803, called the Mississippi Society for the Acquerriment and Dissemination of useful Knowledge, consists of near 40 members, and has correspondents in various parts of the United States. The American government has granted it a charter of incorporation.

LOUSE. See PEDICULUS, ENTOMOLOGY INDEX.
LOUSY DISEASE. See MEDICINE INDEX.

LOUTH, a town of Lincolnshire in England, 156 miles from London. It is a town corporate, contained 4728 inhabitants in 1811, and has two weekly markets. Here are several handsome houses. From hence there is a canal to the sea at Tilney, about eight miles. Besides a charity school for 40 children, it has a free school founded by Edward VI. with a large church, and a fine steeple, which some think is as high as Grantham spire, which is 288 feet. Louth is 156 miles north from London.

LOUTH, a county in the eastern part of Ireland, which extends in the form of a bow or half-moon, on
LOU [247] LÓW

Louvain

the side of the ocean, being much longer than it is broad; it is bounded on the south and south-west by the county of East Meath, on the north-west by Monaghan, on the north by Armagh, and on the north-east by the bay of Carlingford, which parts it from the county of Down: it is watered by several small rivers; and its south frontiers are watered by the river Boyne. Its chief towns are Dundalk and Carlingford; unless we include Drogheda, a part whereof is in this county. It is the smallest county in the kingdom; but very fertile and pleasant, and abounding with many remains of antiquities, of which Mr Wright, in his Louthiana, has given a very ample description. It contains 111,780 Irish plantation acres, 50 parishes, five baronies, and five boroughs; and formerly returned 10 members to the Irish parliament: it is about 22 miles long, and 14 broad. See LOUTH, SUPPLEMENT.

LOUTH, a town in the above county, having a yearly fair.

LOUVAIN, a city in the kingdom of the Netherlands, in the province of Brabant, pleasantly seated on the river Dyle, in a plentiful and agreeable country. The walls are about eight or nine miles in circumference; but they include several fields and vineyards. The castle stands on a high hill, surrounded with fine gardens, and has a charming prospect all over the country. This town contains nine market places, 14 water-mills, 126 streets, 16 stone bridges, and several handsome palaces. The town-house is a venerable old building, adorned with statues on the outside; and the churches are very handsome, particularly the collegiate church of St Peter; but the principal-ornament is the university, founded only in 1426 by John IV. duke of Brabant, with the concurrence of Pope Martin V. It contains about 40 colleges, four of which are called Pedagogia. There is in the number also an English college of friars-preachers, which owes its establishment to the liberalties of Cardinal Philip Howard, brother to the duke of Norfolk, who, before he was raised to the purple, had been private chaplain to Queen Catherine, consort to Charles II. The Irish have likewise a seminary, erected in part under the care of Eugenius Mathaeus, titular archbishop of Dublin, anno 1623, which receives its appointments from the Propaganda at Rome. Besides the above, there are two convents for the Irish, one of Recollects and the other of Dominicans, where divinity and the mathesis are taught. In the last century the number of scholars exceeded 4,000; but in the year 1744 the inhabitants amounted to 12,000, including 2,000 students only. At the beginning of the 14th century, under John III: it flourished considerably in the manufacture of woollen cloth: 400 houses were then occupied by substantial clothiers, who gave employment to an incredible number of weavers, and but few were left unemployed; but an inestimable number of weavers, whose work was so great, it is said, that a bell hung over their street might prevent any injuries which the children in the street might suffer from the crowd and hurry on their returning from work. In 1382, these weavers, however, took up arms, and rebelled against their sovereign Prince Wenceslaus, throwing from the windows of the town hall 17 of the aldermen and counsellors, and afterwards proceeded to lay waste great part of Brabant; but being besieged and reduced to great extremities, they submittedly implored his clemency; which was granted after the execution of some of the principal ringleaders. The weavers, the chief instigators to this revolt, were banished, the greater part of whom took refuge in England; where they first introduced, or at least augmented very much, the woollen manufacture. The town, by this circumstance, being almost depopulated, the university was established to supply in some measure the loss of the rebellious clothiers. Since that time the manufacture gradually declined, no cloth of any account being made there at present. This impolitic step of the duke Wenceslaus sent treasures to England, through the hands of those exiled people: an important lesson to governors, that they should deal with great precaution respecting such useful members of the community. Upon the ruins of these looms was formed the cloth manufacture of Limbourg, which is carried on with good advantage to this day. There is yet standing at Louvain part of the old draper's-hall, now converted into four public schools, where lectures in divinity, philosophy, law, and physic, are given, and the public acts are made. Adjoining to the schools is the university library which altogether compose a large pile of building. Over the door of the chief entrance we read these words, Sapiencia adiuvat sibi domum. The principal church is collegiate, dedicated to St Peter, which had formerly three very large towers with elevated spires, one considerably higher than the two collaterals; these were blown down in the year recorded by this chronogram, oMnIoCaDiint. From the name of this church, the burgheurs have acquired the nickname of Petermen, whose ancestors having clothed the back by a noble woollen manufacture, the modern Petermen now compose an ignoble mixture for the belly, called after them Peterman beer, a sort of whitish muddy ale, which they notwithstanding send in large quantities to all parts of the country, as well as to Holland, by the canals. Louvain was anciently the capital of the province; long before Brussels had any claim to that title. It was taken by the French in 1792, afterwards lost, and retaken in 1794. E. Long. 4°. 40. N. Lat. 51° 12'.

LOUY8, or LOUIS, John, an engraver of considerable eminence, who flourished about the middle of the 14th century. According to Basan he was a native of Flanders. He learned the art of engraving from Peter Soutman, at the time that Suiderhoef studied under the same master; and his usual style of engraving bears some resemblance to that of his master's. One of his best prints is Diana, with her nymphs, reposing after the chase; a middling-sized plate, lengthwise, from Rubens.

LOW-BELL, in birding, a name given to a bell, by means of which they take birds at night, in open champaign countries, and among stubble, in October. The method is to go out about nine o'clock at night in a still evening, when the air is mild and the moon shines not visible. The bell is rung in a deep and hollow sound, and of such a size, that a man conveniently carry it in one hand. The person who carries it is to make it toll all the way he goes, nearly as may be, in that manner in which the bell on the neck of a sheep tolls as it goes on and feeds. There must also be a box made like a large lantern, about a foot square, and lined with tin, but with one side open. Two or three great lights are to be set in this; and the box is to be fixed to the person's breast, with the open side forwards, so that the light may be cast forward to a great distance. It will spread as it goes.
LOW

[ 248 ]

LOW goes out of the box; and will distinctly show to the person that carries it whatever there is in the large space of ground over which it extends, and consequently all the birds that roost upon the ground. Two persons must follow him who carries the box and bell, one on each side, so as not to be within the reach of the light to show themselves. Each of these is to have a hand-net, of about three or four feet square, fastened to a long stick or pole; and on whichever side any bird is seen at roost, the person who is nearest is to lay his net over it, and take it with as little noise as possible.

When the net is over the bird, the person who laid it is not to be in a hurry to take the bird, but must stay till he who carries the light is got beyond it, that the motions may not be discovered. The blaze of the light and the noise of the bell terrify and amaze the birds in such a manner that they remain still to be taken; but the people who are about the work must keep the greatest quiet and stillness that may be.

Some people are fond of going on this scheme alone. The person then fixes the light box to his breast, and carries the bell in one hand and the net in the other; the net in this case may be somewhat smaller, and the handler shorter. When more than one are out at a time, it is always proper to carry a gun; as it is no uncommon thing to have a hare when on this expedition.

LOW, EAST, a town of Cornwall in England, 231 miles from London, in the post road from Plymouth. It is an ancient borough by prescription, made a corporation by charter of Queen Elizabeth, consisting of nine burgesses (of whom one is chosen mayor), a recorder, aldermen, &c.; and the mayor, magistrates, and freemen, who are about 68, choose the members of parliament. This being a manor of the duchy of Cornwall, was settled by King William on Lord Somers, and is now held by the corporation at the fee-farm rent of 20s. a-year. It is situated pretty commodiously on a creek of the sea, over which there is a large stone bridge, supported by 15 arches, which leads to West Low. The chief benefit which the inhabitants have is in their fishery. Here is a battery of four guns, and a small chapel. It contained 608 inhabitants in 1811.

Low, West, called also Port Pigham, a town of Cornwall, divided from East Low by a stone bridge of 15 arches over the river Low, from whence both towns receive their name, as the river does from the lowness of its current between its high banks. The corporation, by charter of Queen Elizabeth, consists of 12 burgesses, one of whom is annually chosen mayor, and, with the other burgesses, has power to choose a steward. Its members, whom it has sent to parliament ever since the 6th of Edward VI. are elected by the corporation and freemen, who are about 60. There was a chapel of ease here in the reign of Henry VIII. which was afterwards converted into a town-hall; and the town lying in the parish of Talland, the people go thither to church. There is a pretty little harbour here; near the mouth of which is a small island called St George’s, which abounds with sea-pies. The river here is navigable for vessels of 100 tons. Population in 1811, 433.

LOWER, Richard, an eminent English physician in the 17th century, was born in Cornwall, and educated at Westminster school and Oxford; after which he studied medicine, and practised under Dr Thomas Willis, whom he instructed in some parts of anatomy, especially when the latter was writing his Cerebri Anatomiae. He, with Dr Willis, in 1674, discovered the medicinal waters at Ashop in Northamptonshire; which, upon their recommendation, became very much frequented. In 1665, he followed Dr Willis to London; practised physic under him; and became fellow of the Royal Society, and of the College of Physicians. In 1669 he published his Tractatus de Corde; and after the death of Dr Willis in 1683 he was esteemed the most eminent physician in London. Upon the breaking out of the Popish plot in 1678, says Mr Wood in his Athene Oxoniensis, he closed with the Whigs, supposing that party would carry all before them; but, being mistaken, he lost his credit and practice. He died in 1691.

LOWERING, among distillers, a term used to express the debasing the strength of any spirituous liquor, by mixing water with it. The standard and marketable price of these liquors is fixed in regard to a certain strength in them called proof; this is that strength which makes them, when shaken in a phial or poured from on high into a glass, retain a froth or crown of bubbles for some time. In this state, spirits consist of about half pure or totally inflammable spirit, and half water; and if any foreign or home spirits are to be exposed to sale, and are found to have that proof wanting, scarce any body will buy it till it has been distilled again and brought to that strength; and if it is above that strength, the proprietor usually adds water to it to bring it down to that standard. See the article Proof.

There is another kind of lowering among the retailers of spirituous liquors to the vulgar, by reducing it under the standard proof. Whoever has the art of doing this without destroying the bubble proof, which is easily done by means of some addition that gives a greater tenacity to the parts of the spirits, will deceive all that judge by this proof alone. In this case, the best way to judge of liquors is by the eye and tongue, and especially by the instrument called Hydrometer.

LOWTH, William, D. D. a learned divine, born at London in 1661, was the son of an apothecary, and took his degrees at Oxford. His eminent worth and learning recommended him to Dr Mew bishop of Winchester, who made him his chaplain, gave him two livings in Hampshire, and conferred on him a prebend in the cathedral of Winchester. He acquired an unusual share of critical learning. Thus situated in life, the labours of Mr Lowth appear to have been strictly confined within the limits of his own province, and applied solely to the peculiar duties of his functions; yet, in order that he might acquire himself the better in theology, he had pursued his studies with a more general and extensive view. Few were more deeply versed in critical learning; there being scarcely any ancient author, Greek or Latin, profane or ecclesiastical, especially the latter, but what he had read with accuracy, constantly accompanying his reading with critical and philological remarks. Of his collections in this way he was upon all occasions very communicative. Hence his notes on Clemens Alexandrinus, which are to be met with in Potter’s edition of that father. Hence his remarks on Josephus, communicated
LOWTH, Robert, D.D. second son of the preceding Dr William Lowth, and bishop successively of St David’s, Oxford, and London, was born on the 29th of November 1710, probably at Buriton in the county of Hants. He received the rudiments of his education at Winchester college, where his school exercises were distinguished by uncommon elegance; and having resided the requisite number of years in that seminary, in 1730 he succeeded on the foundation at New College, Oxford. He took the degree of M. A. June 8. 1737. Though his abilities must have been known to those with whom he was connected, he was not forward to appear before the world as a writer. At Oxford he continued many years improving his talents, with little notice from the great, and with preferment so small as to have at present escaped the distinct recollection of some of his contemporaries.

He was not, however, suffered to languish for ever in obscurity. His genius and his learning forced themselves upon the notice of the illustrious society of which he was a member; and he was placed in a station where he was eminently qualified to shine. In 1741 he was elected by the university to the professorship of poetry, re-elected in 1743, and whilst he held that office he read his admirable lectures De sacra poesi Hebraeorum. In 1744 Bishop Hoadley collated him to the rectory of Ovington in the county of Hants; added to it, nine years afterwards, the rectory of East Wealdon in the same county; and in the interim raised him to the dignity of archdeacon of Winchester. These repeated favours be some years afterwards acknowledged in the following manly and respectful terms of gratitude: "This address, my Lord, is not more necessary on account of the subject, than it is in respect of the author. Your Lordship, unsolicited and unasked, called him from one of those colleges to a station of the first dignity in your diocese, and took the earliest opportunity of accumulating your favour upon him, and of adding to that dignity a suitable support. These obligations he is now the more readily to acknowledge, as he is removed out of the reach of further favours of the like kind. And though he hath relinquished the advantages so generously conferred on him, yet he shall always esteem himself highly honour'd in having once enjoyed the patronage of the great advocate of civil and religious liberty."

On the 8th of July 1754 the university of Oxford conferred upon him the degree of D. D. by diploma; an honour which, as it is never granted but to distinguished merit, was probably conferred on Mr Lowth in consequence of his prelections on the Hebrew poetry, which had then been lately published. Having in 1740 travelled with Lord George and Lord Frederick Cavendish, he had a claim upon the patronage of the Devonshire family; and in 1755, the late duke being then lord lieutenant of Ireland, Dr Lowth went to that kingdom as his grace's first chaplain. Soon after this appointment he was offered the bishopric of Limerick; but preferring a less dignified station in his own country, he exchanged it with Dr Leslie, prebendary of Durham and rector of Sedgefield, for these preferments. In November 1765 he was chosen F. R. S. In June 1766 he was, on the death of Dr Squire, preferred to the bishopric of St David's; which, in the October following, he resigned for that of Oxford, vacant by the translation of Bishop Hume to Salisbury. In April 1777, he was translated to the see of London, vacant by the death of Bishop Terrick; and in 1783 he declined the offer of the primacy of all England.

Having been long afflicted with the stone, and having long borne the severest sufferings of pain and sickness with the most exemplary fortitude and resignation, this great and good man died at Fulham, Nov. 3. 1787; and on the 12th his remains were privately interred in a vault at Fulham church, near those of his predecessor. He had married in 1752, Mary, the daughter of Laurence Jackson of Christ-church, Hants, Esq. by whom he had two sons and five daughters. His lady and two children only survived him.

His literary character may be estimated from the value and the importance of his works; in the account of which we may begin with his prelections on the Hebrew Poetry. The choice of so interesting a subject naturally attracted general attention; and the work has been read with equal applause abroad and at home. In these Prelections the author has acquitted himself in the most masterly manner, as a poet, a critic, and a divine; and such is the classic purity of his Latin style, that though we have read the work with the closest attention, and with no other view than to discover, if possible, an Anglicism in the composition, we never found a single phrase to which, we believe, a critic of the Augustan age could possibly have objected. This is an excellence to which neither Milton nor Johnson has attained; to which indeed no other English writer of Latin with whom we are acquainted has attained, unless perhaps Atterbury must be excepted. To the Prelections was subjoined a short conutation of Bishop Hare's system of Hebrew metre; which occasioned a Latin letter from Dr Edwards of
Lowth. Clare-hall, Cambridge, to Dr Lowth, in vindication
of the Harian metre. To this the author of the pre-
lections replied in a larger confusion, in which Bi-
shop Hare's system is completely overthrown, and the
fallacy upon which it was built accurately investigated.
After much attentive consideration, Bishop Lowth has
pronounced the metre of the Hebrews to be perfectly
irreversible.

In 1758 he published The life of William of Wyke-
ham, bishop of Winchester, with a dedication to Bishop
Hoadley; which involved him in a dispute concerning
a decision which that bishop had lately made respecting
the wardenship of Winchester-college. This con-
traversy was on both sides carried on with such abilities,
that, though relating to a private concern, it may yet
be read, if not with pleasure, at least with improvement.
The life of Wykeham is drawn from the most authentic
sources: and affords much information concerning the
manners, and some of the public transactions of the pe-
riod in which Wykeham lived, whilst it displays some
private intelligence respecting the two literary societies
of which he was the founder. In these two societies
Dr Lowth was educated, and he gratefully expresses his
obligations to them.

In 1762 was first published his Short Introduction to
English Grammar, which has since gone through many
editions. It was originally designed only for private
and domestic use: but its judicious remarks being too
valuapel to be confined to a few, the book was given to
the world: and the excellence of its method, which
teaches what is right by showing what is wrong, has
insured public approbation and very general use. In
1765 Dr Lowth was engaged with Bishop Warburton
in a controversy, which made much noise at the time,
which attracted the notice even of royalty, and of
which the memory is still recent. If we do not wish
to dwell on the particulars of this controversy, it is
because violent literary contention is an evil, which
though like other vices it may sometimes be unavoid-
able, is yet always to be regretted; and because the
characters of learned, ingenious, and amiable men,
ever appear to less advantage than under the form
wherein real hostility obliges them to assume.
The two combatants indeed engaged with erudition
and ingenuity, such as is seldom brought into conflict;
but it appears that, in the opinion of Dr Johnson,
Warburton had the most scholastic learning, and that
Lowth was the most correct scholar; that, in their con-
test with each other, neither of them had much argu-
ment, and that both were extremely abusive. We have
heard, and we hope it is true, that they were afterwards
reconciled, and expressed mutual regret for the violence
of their past conduct.

In 1778 Bishop Lowth published his last great work,
A Translation of Isaiah. To his literary and theological
abilities, the translator joined the most critical know-
ledge of the character and spirit of the eastern poetry;
and, accordingly, the prophecies of Isaiah (which,
though almost always sublime or elegant, are yet some-
times obscure) were translated in a manner adequate
to the highest expectations of the public. Several
occasional discourses, which the bishop, by his station,
was at different times called upon to deliver, were of
course published, and are all worthy of their excellent
author; but there is one on the kingdom of God, on the
extension and progressive improvement of Christ's re-
ligion, and on the means of promoting these by the
advancement of religious knowledge, by freedom of
inquiry, by toleration, and mutual charity, which may
be distinguished above the rest, as exhibiting a most
comprehensive view of the successive states of the Chris-
tian church, and containing the truer principles of
Christianity.

Of the bishop's poetical pieces, none display greater
merit than Verses on the Genealogy of Christ, and the
Choice of Hercules, both written very early in his life.
He wrote a spirited imitation of an Ode of Horace,
applied to the alarming situation of this country in
1745; and likewise some verses on the death of Fre-
dric prince of Wales, with a few smaller poems. The
following inscription on the tomb of his daughter,
beautifully displays his paternal affection and classic
taste. As it is short, and, in our opinion, has all the
merit of the ancient epitaph, the reader will probably
be pleased with such a specimen of his lordship's Lat-
nity.

Cara, vale, ingenio praestans, pietate, pudore,
Et placuam natae nomine cara, vale.
Cara Maria, vale. At venit, felicia actum,
Quando iterum tecum, sim modo dignus, ero.
Cora, redi, leta tum dicam voce, paternam,
Eja, age in amplexus, cara Maria, redi.

Learning and taste, however, did not constitute Bishop
Lowth's highest excellence. Eulogium itself can scarce-
ly ascend to extravagance when speaking of him ei-
ther as a private man, or as a pastor of the church of
Christ. His amiable manners rendered him an orna-
ment to his high station, whilst they endeared him to
all with whom he conversed; and his zeal for the in-
teresst of true religion made him willing to promote
places of trust and dignity such gentlemen as he knew
were best qualified to fill them. Of his modesty,
gentleness, and pleasing conversation, we have the testi-
mony of one whose decision will hardly be disputed.—
"It would answer no end (says Bishop Warburton) to
tell you what I thought of the author of Hebrew poe-
try, before I saw him. But this I may say, I was never
more surprised, when I did see him, than to find him of
such amiable and genteel manners, of so modest, sensible,
and disengaged a deportment." He united, indeed,
in an eminent degree, the qualities of the gentleman
with those of the scholar: he conversed with elegance,
as he wrote with accuracy. As a husband, a father,
or the master of a family, he was as nearly faultless as
the imperfections of humanity will easily permit. His
temper, when roused by what he thought improper con-
duct was indeed susceptible of considerable warmth;
but if he could be highly offended, upon a slight con-
sequence he could likewise forgive. His heart was ten-
der and sympathetic. He possessed a mind that felt
its own strength, and decided on whatever came before
it with promptitude and firmness. In those trials
where affliction was to be suffered or subdued, he be-
haved as a man and a Christian. His piety had no
stinture of moroseness; his charity no leaven of ostenta-
tion. To his whole diocese he was endeared by his
laudable discretion and his useful zeal. To the
world he was a benefit by his exemplary life and his
splendid abilities. And whilst virtue and learning are
reverenced
LUBEC, a city and port-town of Germany, in the circle of Lower Saxony, and duchy of Holstein in E. Long. 10° 50', N. Lat. 53° 55'. It stands at the confluence of several rivers, the largest of which is the Trave, 12 miles from the Baltic, where it has a fine harbour, and 40 north-east of Hamburg. By the Sterkizitz, another of those rivers, it has a communication with the Elbe, and consequently with the German ocean. The city lies on the side of a hill, with the Trave, increased by the Sterkizitz on the one side, and the Wakenitz on the other; and is strongly fortified with bastions, moats, walls, and ramparts; the last of which are planted with trees, and form an agreeable walk. Lubec being formerly the chief of the Hanse towns, was very powerful in consequence of the vast trade carried on; but a great part of that trade is now transferred to Hamburg; however, it is still said to employ 150 of its own ships, and has a great share of the Baltic trade. It is about two miles in length, and more than one in breadth. The houses are all of stone, but old fashioned. Several of the streets have on each side rows of lime trees, with canals in the middle, like those of Holland. The public structures consist of the ancient cathedral of the bishopric of Lubec, and several other Lutheran churches; a nunnery for 32 ladies, with an abbess and prioress; a poor-house, an almshouse, and house of correction; an orphan-house; an hospital dedicated to the Holy Ghost; a house in which poor travellers are entertained three days, and then sent forward with a pass; the city armoury, a grammar-school of seven classes, the Calvinist church, and the Popish chapel. The deputys of the Hanse towns used to meet here formerly in the town-house. An alliance still subsists between Lubec, Hamburg, and Bremen; and these cities, under the name of Hanse Towns, negotiate treaties with foreign powers. Here are divers manufactures, and the city's territory is about 60 miles in compass. In the diet of the empire Lubec is possessed of the third seat among the Rhenish imperial cities; and among those of the circle, has the first. In the matricula, its assessment is 480 florins, and to the chamber of Wetzlar it pays 537 rix-dollars and 89 kruitzers. The city is a republic within itself, and both makes and executes laws in regard to civil and criminal matters, &c. A father and son, or two brothers, cannot be in the regency at the same time. The famous league of the Hanse was begun here in 1164. This city had its charter of privileges from the emperor Frederic II. Formerly it carried on war, both offensive and defensive, for several years, not only against the dukes of Mecklenburg, but against the kings of Sweden and Denmark; particularly in 1428, when it fitted out 250 ships of force against Eric X. king of Denmark. There are about 20 churches in Lubec, with lofty steeples or spires. The Trave brings ships of burden into the very heart of the city; but the largest unload at Travemunde, i.e. the mouth of the Trave, eight or ten miles distant. Formerly it is said to have employed no less than 600 ships, but its trade is now greatly reduced. In the famous cellar here, it is said, there is wine 200 years old. The town's garrison consists of about 700 or 800 men. The revenue of its Lutheran bishop, though he is a prince of the empire, is said not to exceed 30001. Lubec fell into the hands of the French in 1806, when Bonaparte overran the Prussian dominions; and many of the inhabitants were cruelly extorted and plundered; but it has since been restored to its rank as a free city. The population is 42,000.

LUBEN, a town of Germany, in the marquisate of Lower Lusatia. It is situated on the river Spree, and is the capital of a small circle of the same name. It is the seat of the diets, and of the chief tribunals and offices; and has several churches, with a noble land-house and hospital. E. Long. 14° 25', N. Lat. 52°.

LUBENIETSKI, Stanislaus, a Polish gentleman, descended from a noble family, and born at Cracow in 1623, was educated by his father with great attention. He became a celebrated Socinian minister; and took great pains to obtain a toleration from the German princes for his Socinian brethren. His labours, however, were ineffectual; being himself persecuted by the Lutheran ministers, and banished from place to place; until at length he was banished out of the world, with his two daughters, by poison, his wife narrowly escaping, in 1675. He wrote of his writing A History of the Reformation in Poland; A Treatise on Comets; with other works, in Latin.

LUBIN, Emilhard, was professor of poetry in the university of Rostock in 1595; and ten years afterwards was promoted to the professorship of divinity. He wrote notes on Anacreon, Juvenal, Persius, &c. and several other works; but that which made the most noise is a treatise on the nature and origin of evil, entitled Phosphors de Causa prima et Natura Mali, printed at Rostock in 1596; in which he has a curious hypothesis to account for the origin of moral evil.
Lucas. [ 252 ]

He supposed two co-eternal principles, not matter and vacuam, as Epicurus did; but God, and Nihilum or Nothing. This being published against by Grawier, was defended by Lubin; but after all he is deemed better acquainted with polite literature than with divinity. He died in 1621.

LUBLIN, a handsome and considerable town of Poland, capital of the palatinate of the same name, with a citadel, a bishop's see, an university, and a handsome bishop's palace. Here the judgements for all Poland were held. It has three fairs, frequented by merchants from all nations. It is seated on the river Bystrzna. E. Long. 23. 31. N. Lat. 51. 26.

LUCA, in Ancient Geography, a town of Tauria, on the river Ausser; a colony and a municipium. Now Lucca, capital of the republic of that name, near the river Sechia. E. Long. 14. 20. N. Lat. 43. 45.

LUCANIA, a country of Italy, and a part of Magna Graecia; bounded on the north by the river Silurus by which it was separated from the Picentini, and by the river Bradanus by which it was parted from the Apuli Peucetii; on the south by the Laius, which separated it from the Bruttii; on the east by the Sinus Tarentinus; and on the west by the Tuscan sea. Lucani, the people, descendants of the Samnites. Lucanus the epithet, (Horace.) Lucane boves denoted elephants; first seen in Pyrhyis's wars in Lucaniana, whence the appellation (Pline.)

LUCANUS, Marcus Annæus, a Latin poet, born at Corduba in Spain, about A. C. 39. He was the son of Annæus Mela, the youngest brother of Seneca; and was conveyed to Rome from the place of his nativity at the age of eight months; a circumstance, as his more indulgent critics observe, which sufficiently refutes the censure of those who consider his language as provincial. At Rome he was educated under the Stoic Cornutus, so warily celebrated by his disciple Persius the satirist, who was the intimate friend of our poet. In the close of his education, Lucan is said to have passed some time at Athens. On his return to Rome he rose to the office of questor, before he had attained the legal age. He was afterwards enrolled among the augurs; and married a lady of noble birth, and of a most amiable character. Lucan had for some time been admitted to familiarity with Nero, when the emperor chose to contend for poetical honours by the public recital of a poem he had composed on Niobe; and some verses of his imperial production are supposed to be preserved in the first satire of Persius. Lucan had the hardiness to repeat a poem on Orpheus, in competition with that of Nero; and, what is more remarkable, the judges of the contest were just and bold enough to decide against the emperor. From hence Nero became the persecutor of his successful rival, and forbade him to produce any poetry in public. The well known conspiracy of Piso against the tyrant soon followed; and Tacitus, with his usual sarcastic severity, concludes that Lucan engaged in the enterprise from the poetical injuries he had received: "a remark (says Mr Hayley) who has endeavoured to refute the imputation) which does little credit to the candour of the historian; who might have found a much nobler, and, I will add, a more probable motive for his conduct, in the generous ardour of his character, and his passionate adoration of freedom. In the sequel of his narration, Tacitus alleges a charge against our poet, which, if it were true, must lead us to detect him as the most abject of mankind. The historian asserts, that Lucan, when accused of the conspiracy, for some time denied the charge; but corrupted at last by a promise of impunity, and desirous to atone for the tardiness of his confession, accused his mother Atilla as his accomplice. This circumstance is so improbable in itself, and so little consonant to the general character of Lucan, that some writers have ventured to assert, as a calumny invented by Nero, to vilify the object of his envious abhorrence. But the name of Tacitus has given such an air of authority to the story, that it may seem to deserve a more serious discussion, particularly as there are two subsequent events related by the same historian, which have a tendency to invalidate the accusation so injurious to our poet. The events I mean are, the fate of Anæus, and the escape of Atilla, the two parents of Lucan. The former died in consequence of an accusation brought against him, after the death of his son, by Fabius Romanus, who had been an intimate with Lucan, and forgery some letters in his name, with the design of proving his father concerned in the conspiracy. These letters were produced to Nero, who sent them to Anæus, from an eager desire, says Tacitus, to get possession of his wealth. From this fact two inferences may be drawn, according to the different lights in which it may be considered:—If the accusation against Anæus was just, it is clear that Lucan had not betrayed his father, and it appears the less likely to have endangered by his confession the life of a parent, to whom he owed a still tender regard. —If Anæus was not involved in the conspiracy, and merely put to death by Nero for the sake of his treasure, we may the more readily believe, that the tyrant who murdered the father from avarice, might calumniate the son from envy. But the escape of Atilla affords us the strongest reason to conclude that Lucan was perfectly innocent of the abjact and unnatural treachery of which Tacitus has supposed him guilty. Had the poet really named his mother as an accomplice, would the vindictive and sanguinary Nero have spared the life of a woman whose family he detested, particularly when other females were put to death for their share in the conspiracy? That Atilla was not in that number, the historian himself informs us in the following remarkable sentence, "Atilla mater Anæus Lucani, sine absolutione, sine supplicio, dissimulata," thus translated by Gordon: "The information against Atilla, the mother of Lucan, was dissembled; and, without being cleared, she escaped unpunished."

The preceding remarks will, our author hopes, vindicate to every candid mind the honour of Lucan, whose firmness and intrepidity of character are indeed very forcibly displayed in that picture of his death which Tacitus himself has given us. He was condemned to have his veins cut, as his uncle Seneca had before him. Lucan, "while his blood issued in streams, perceiving his feet and hands to grow cold and stiffen, and life to retire by little and little from the extremities, while his heart was still beating with vital warmth, and his faculties nowise impaired, recollected some lines of his own, which described a wounded soldier expiring in a manner that resembled this. The lines themselves he rehearsed; and they were the last words he
he ever uttered." The critics differ concerning the
verses of the Pharsalia which the author quoted in so
memorable a manner. The two passages he is supposed
to have repeated are the following; of which Lip-
sius contends for the latter.

Sanguis erant lacrymine: que cunctum foramina nova
Humor, ab his largus manat crur: ora redundunt,
Et patule nares: sudor rubet: omnia plenis
Membræ fluent venis: totum est pro veline corpus.
Lib. ix. v. 814.

Now the warm blood at once; from every part
Ran purple poison down, and drain'd the fainting heart.
Blood falls for tears; and o'er his mournful face
The ruby drops their tainted passage trace.
Where'er the liquid juices find a way,
There streams of blood, their crimson rivers stray,
His mouth and gushing nostrils find a flood,
And o'en the pores ooze out the trickling blood;
In the red deluge all the parts lie drown'd,
And the whole body seems one bleeding wound. Rowe.

Scintitatur avulsus; nec sicut vulnera sanguis
Emiciit lenta: rupest cadit undique venis,
Discursuque animae, diversa in membris mentis,
Interceptus aquis.
Lib. iii. v. 638.

No single wound the gaping rupture seems,
Where trickling crimson wells in slender streams;
But, from an op'ning horrible and wide,
A thousand vessels pour the bursting tide:

(A) At tu, seu rapidum poli per axem
Fame curribus arduis levatus,
Qua surgunt animæ potentiore,
Terras despicis et sepulchra rides:
Seu pacis meritum nemus recluse
Felix Elysia tenes in oris,
Quo Pharsalia turba congregatur;
Et te nobile carmine insonant
Pompeii comitantur et Catones:
Tu magna sacer et superbus umbra
Nescis Tartaros, et procul nocentum
Audis verbera, palidumque visa
Matris lampade respici Neronem.
Adsidus lucidus: et vocante Polla
Uam, quaeso, diem deos silentum
Exores; solet hoc patere lenum
Ad nuptias redemptus maritis.
Hec te non thiathis procax dolosis
Falsi numinis indut figuris;
 Ipsum sed colit, et frequentat ipsum
Imis altius insitus medullis;
Ae solatia vana subministrat
Vultus, qui simili notatus, auro
Stratis præmit, excubatque somno
Secure. Procul hinc alite mortes;
Hec vitæ genitrix est origo
Cedat luctus atrox, genisque manent
Jam dulces lacrymas, dolorque festus
Quicquid fleverat ante nunc adoret.

But you, O! whether to the skies
On Fame's triumphant car you rise,
(Where mightier souls new life assume)
And mock the confines of the tomb;

Or whether in Elysium blest
You grace the groves of sacred rest,
Where the Pharsalian heroes dwell;
And, as you strike your epic shell,
The Pompeys and the Catos throng
To catch the animating song;
Of Tartarus the dread control
Binds not your high and hallow'd soul:
Distant you hear that wailing coast,
And see the guilty Nero's ghost
Grow pale with anguish and affright,
His mother flashing on his sight.

Be present to your Polla's vows,
While to your honour'd name she bows!
One day let your entreaties gain
From those who rule the shadowy train!
Their gates have op'd to bless a wife,
And given a husband back to life.
In you the tender fair invites
No fancied god with frantic rites:
You are the object of her prayers,
You in her inmost heart she bears:
And stampt on mimic gold, your head
Adorns the faithful mourner's bed,
And soothes her eyes before they close,
The guardian of her chaste repose.
Away with all funeral state!
From hence his nobler life we date:
Let mourning change the pang severe,
To fond devotion's grateful tear!
And festal grief, its anguish o'er,
What it lamented, now adore!
Lucanus, the Stag-Beetle, a genus of insects of the order of coleoptera. See Entomology Index.

Lucar de Barameda (St.), a handsome and considerable town of Spain, with a very good harbour, well defended, in Andalusia. It was once the greatest port in Spain, before the galleons unloaded their treasures at Cadiz. It is seated at the mouth of the river Guadalquivir. W. Long. 5° 57'. N. Lat. 36° 40'.

Lucar de Guadiana (St.), a strong town of Spain, in Andalusia, on the confines of Algave; seated on the river Guadiana, with a little harbour. W. Long. 5° 39'. N. Lat. 37° 32'.

Lucar de Mayor (St.), a small town of Spain, in Andalusia, with the title of a duchy. It is seated on the river Guadiana, in W. Long. 6° 32'. N. Lat. 37° 27'.

Lucaria, a feast celebrated at Rome on the 18th of July, in memory of the flight of the Romans into a great wood, where they found an asylum, and saved themselves from destruction. This wood, in which they found protection, was situated between the Tyber and the Via Salaria. The enemies from whom the Romans fled were the Gauls.—On this festival, Plutarch tells us, it was customary to pay the actors, and such as contributed to the public amusement, with the money arising from the selling of wood. This money was called lucar. It is obvious, from what has been observed, that lucar and lucaria are derived from lucus, a grove.

Lucas Jacobs, an eminent artist, more generally known by the name of Lucas van Leyden, or Hugens, was born at Leyden in 1494. He received his first instructions in the art of painting from his father Hugens Jacobs; but completed his studies in the school of Cornelius Engelbrecht. He gained much money by his profession; and being of a generous turn of mind, he spent it freely, dressed well, and lived in a superior style. For 15 years before his death, he made a tour into Zealand and Brabant; and during his journey, a painter of Flushing, envious of his great abilities, gave him poison at an entertainment; which, though very slow, was too fatal in its effect, and put an end to his life, after six years languishing under its cruel influence. Others, denying the story of the poison, attribute his death to his incessant industry. The superiority of this artist's genius manifested itself in his infancy: for his works, even from the age of nine, were so excellent as to excite the admiration of all contemporaneous artists; and when he was about 15, he painted a St Hubert, which gained him great applause. His taste of colouring (Mr Pilkington observes) is good; his attitudes (making a reasonable allowance for the stiff German taste) are well chosen; his figures have a considerable expression in their faces, and his pictures are very highly finished. He endeavoured to proportion the strength of his colouring to the different degrees of distance in which his objects were placed: for in that early time, the true principles of perspective were but little known, and the practice of it was much less observed. In the town hall at Leyden, the most capital picture of Lucas, the subject of which is the Last Judgment, is preserved with great care; the magistrates having refused very large sums which have been offered for it.

This artist painted not only in oil, but also in distemper and upon glass. Nor was he less eminent for his engraving than for his painting. He carried on a familiar and friendly correspondence with Albert Durer, who was his contemporary; and, it is said, that as regularly as Albert Durer published one print, Lucas published another, without the least jealousy on either side, or wish to depreciate each other's merit. And when Albert came into Holland upon his travels, he was received by Lucas in a most cordial and affectionate manner. His style of engraving, however, according to Mr Strutt, differed considerably from that of Albert Durer; "and seems evidently to have been founded upon the works of Lucas van Meethen. His prints are very neat and clear, but without any powerful effect. The strokes are as fine and delicate upon the objects in the front, as upon those in the distances; and this want of variety, joined with the feebleness of the masses of shadow, give his engravings, with all their neatness, an unfinished appearance, much unlike the firm substantial effects which we find in the works of Albert Durer. He was attentive to the minutiae of his art. Every thing is carefully made out in his prints, and no part of them is neglected. He gave great character and expression to the heads of his figures; but on examination of his works, we find the same heads
LUCCA, a small republic of Italy, on the coast of the Mediterranean, between the territory of Genoa on the west, Modena on the north, and Tuscany on the east. According to Keyser, it is only about 30 miles in circumference, but is exceeding fertile and populous. It contains, besides the city of Lucca, 150 villages. The number of inhabitants is computed at 120,000. The government is lodged in a gonfalonier, whose power is much the same with that of the doges of Venice and Genoa. He is assisted by nine counsellors: but the power of all the ten continues only for two months; during which time they live in the state-palace, and at the public expense. They are chosen out of the great council, which consists of 240 nobles; but even this council is changed by a new election every two years. The revenues of the republic are about 400,000 scudi or crowns; out of which they maintain 500 men by way of regular force, and 70 Swiss as a guard to their acting magistrates. The city of Lucca is situated in a plain, terminating in most delightful eminences, adorned with villas, summer-houses, corn-fields, and plantations of every kind; so that nothing either for use or for pleasure is here wanting. The city, which is about three Italian miles in circumference, has regular well-lined fortifications; and its streets though irregular, are wide, well paved, and full of handsome houses. The number of its inhabitants is computed to be above 40,000; and they carry on large manufactures, especially of silk stuffs. Lucca has a bishop, who enjoys several extraordinary privileges; and its cathedral is Gothic. The city stands in E. Long. 11° 27'. N. Lat. 43° 52'.

LUCENTI, LUCENTIARIA, or Lucentium, a town of the Hither Spain, now Alicante, a sea-port of Valencia.

LUCERES, in Roman antiquity, the third in order of the three tribes into which Romulus divided the people; including all foreigners: so called from the lucus or grove, where Romulus opened an asylum.

LUCERIA, in Ancient Geography, a town of Apulia in Italy; which in Strabo's time still exhibited marks of Diomed's sovereignty in those parts. Ptolemy has Nuceria; whether from mistake, or the custom of his time, uncertain. Now Nocera de Pagani, in the kingdom of Naples. E. Long. 15° 0'. N. Lat. 40° 40'.

LUCERIUS, in Mythology, a name given to Jupiter, as Luceria was given to Juno, as the deities which gave light to the world.

LUCERNE, one of the 13 cantons of Switzerland. It holds the third place among the 13; and is the head of the Catholic cantons. Though less than Zurich, and consequently much less than Berne, it is, however, far more extensive than any of the rest, being 15 or 16 leagues long, and eight broad. The population is estimated at 100,000. Even the mountainous part is not barren, but ordnate in wood and pasture, furnishing cattle, hides, cheese, and butter, for exportation. All the north part is fertile in grain, fruit, and hay; supplying sufficient for the consumption of the inhabitants; but as the mountainers of the little cantons come to their market for corn, the people of Lucerne purchase this commodity from other parts of Switzerland, but especially from Alsace and Suabia.

Translation of the Whole Duty of Man. He died in 1715.
The town of Lucerne is situated at the extremity of a most beautiful lake of the same name, where the river Reuss issues from it. The buildings are ancient, and the streets narrow; nor is Lucerne populous in proportion to its extent, the inhabitants being only between 3,000 and 4,000. Since this is the great passage to Italy by Mount St. Gotthard, and the merchandise which passes the Alps on mules, and is to be transported by the rivers Reuss, Aar, and Rhine, is all deposited here, it might have a flourishing trade if arts and manufactures were attended to. The Reuss separates the town into two unequal parts, which are connected by three bridges: one wide for carriages, and two narrow covered ones for foot passengers; besides these, there is a fourth over an arm of the lake, to pass to the cathedral. Three of these bridges have old paintings of the Dance of Death, and the History of the Bible, and of Switzerland. They make a commodious dry walk for the inhabitants. Of religious edifices, the principal are the cathedral, or collegiate church of St. Leuer; the convent of Cordeliers; the college of the Jesuits; the convent of Capuchins; and two convents of nuns. Of the secular buildings, the hotel de ville is the principal. The arsenal is well furnished. The water tower is remarkable for its position and antiquity; it is said to have been a pharos or lighthouse. What greatly attracts the notice of strangers is, a plan in relief of part of the cantons of Lucerne, Zug, and Berne, and the whole of Schwyz, Uri, and Unterwald, executed by General Pfiffer on a large scale. He has completed about 60 square leagues; the plan is 12 feet long, and nine and a half broad: every mountain is accurately measured; and every object distinctly placed.

The lake of Lucerne exhibits greater variety and more picturesque scenery than any other of the Swiss lakes. It is seven leagues long in a right line, and three wide about Kussnacht; but the shape is very irregular. The whole south side is bordered by high mountains; but the north exhibits hills of no great height. The narrow gulf that extends towards the west, is bordered on the west and north-west by Mount Pilat, which is a single mountain rising boldly more than 6,000 feet above the lake; and on the south by Mount Burgenberg. Stanz Stadt, belonging to the canton of Unterwald, is on this side; and at this place the lake is deepest. Kussnacht is on the point of the other gulf, which extends towards the east, and is wider than the former. All the country to the west of these gulls, and part of it to the north of the latter, belongs to the canton of Lucerne; but that which is to the south and north-east is dependent on the canton of Zug. All the mountains on the left shore of the lake belong to the canton of Unterwald; those on the right, partly to the canton of Uri, partly to that of Schwyz, partly to the little republic of Gersau, but principally to the canton of Lucerne.

Lucerne, in Botany. See Medicago, Botany Index.

Lucerne, in Agriculture Index. 

Lucerne, St., one of the Caribbee islands, about 22 miles long, and 11 broad, the middle of it lying in N. Lat. 39° 14. W. Long. 27° 0. It was first settled by the French in 1653; but was reduced by the English in 1664, who evacuated it in 1666. The French immediately resettled the island, but were again driven away by the Caribbes. As soon as the savages were gone, the former inhabitants returned, but only for a short time; for being afraid of falling a prey to the first privateer that should visit their coasts, they removed either to other French settlements that were stronger, or which they might expect to be better defended. There was then no regular culture or colony at St. Lucia; it was only frequented by the inhabitants of Martinique, who came thither to cut wood, and to build canoes, and who had considerable docks on the island. In 1718 it was again settled by the French; but four years after, it was given by the court of Louisburg to the Duke of Montague, who was sent to take possession of it. This occasioned some disturbance between the two courts; which was settled, however, by an agreement made in 1731, that, till the respective claims should be finally adjusted, the island should be evacuated by both nations, but that both should wood and water there. This precarious agreement furnished an opportunity for private interest to exert itself. The English no longer molested the French in their habitations; but employed them as their assistants in carrying on with richer colonies a smuggling trade, which the subjects of both governments thought equally advantageous to them. This trade has been more or less considerable till the treaty of 1753, when the property of St. Lucia was secured to the crown of France. After that time the colony flourished considerably. In the beginning of the year 1772, the number of white people amounted to 2,018 souls, men, women, and children; that of the blacks to 663 free men, and 12,795 slaves. The cattle consisted of 928 mules or horses, 2,070 head of horned cattle, and 318 sheep or goats. There were 38 sugar plantations, which occupied 978 pieces of land; 5,875,589 coffee trees; 1,321,600 cocoa plants; and 367 plots of cotton. There were 706 dwelling places. The annual revenue at that time was about 175,000l., which, according to the Abbé Raynal, must have increased one-eighth yearly for some time. It was taken by the British in 1778; restored to France in 1781. It fell again into the hands of the British in 1794, was evacuated in 1795, and was again retaken in 1796.

The soil of St. Lucia is tolerably good, even at the sea side; and is much better the farther one advances into the country. The whole of it is capable of cultivation, except some high and craggy mountains which bear...
bear evident marks of old volcanoes. In one deep valley there are still eight or ten ponds, the water of which boils up in a dreadful manner, and retains some of its heat at the distance of 6000 toises from its reservoirs. The air in the inland parts, like that of all other uninhabited countries, is foul and unwholesome; but grows less noxious as the woods are cleared and the ground laid open. On some parts of the sea coast, the air is still more unhealthy, on account of some small rivers which spring from the foot of the mountains, and have not sufficient slope to wash down the sands with which the influx of the ocean stops up their mouths, by which means they spread themselves into unwholesome marshes on the neighboring grounds. St. Lucia was restored to France in 1815.

LUCIA, St., a high and mountainous island of Africa, and one of those of Cape Verde, is about nine leagues long, and lies in the latitude of 16° 15' N. According to the English geographers; but according to all others, it is a degree farther to the northward. On the east-south-east side is a harbour, with a bottom and shore of white sand; but its best road is opposite to St. Vincent's to the south-west, where there are at least 23 fathoms of water. On the west side there is no water: it abounds with goats, sea and land fowl, tortoises, &c. but whether it hath any inhabitants is not certainly known.

LUCIAN, a celebrated Greek author in the first century, was born at Samosata, of obscure parents, in the reign of the emperor Trajan. He studied law, and practised some time as an advocate; but growing weary of the wrangling oratory of the bar, he commenced oratorian. He lived to the time of Marcus Aurelius, who made him registrar of Alexandria in Egypt; and, according to Suidas, he was at last murdered by dogs. Lucian was one of the finest wits in all antiquity. His Dialogues, and other works, are written in Greek. In these he has joined the useful to the agreeable, instruction to satire, and erudition to elegance; and he everywhere meet with that fine and delicate raillery which characterizes the Attic taste.

Those who censure him as an impious scoffer at religion, have reason on their side, if religion consisted in the theology of the Pagan poets, or in the extravagant opinions of philosophers; for he perpetually throws such ridicule on the gods and philosophers, with their vices, as inspires hatred and contempt for them; but it cannot be said that he writes anywhere against an overruling providence.

LUCIANISTS, or Lucanists, a religious sect, so called from Lucianus, or Lucanus, a heretic of the second century, being a disciple of Marcion, whose errors he followed, adding some new ones to them. Epiphanius says he abandoned Marcion; teaching that people ought not to marry, for fear of enriching the Creator; and yet other authors mention that he held this error in common with Marcion and other Gnostics. He denied the immortality of the soul; asserting it to be material.

There was another sect of Lucianists, who appeared some time after the Arians. They taught, that the Father had been a father always, and that he bore the name even before he begot the Son; as having in him the power or faculty of generation; and in this manner they accounted for the eternity of the Son.

Vol. XII. Part I.

LUCID INTERVALS, the fits of lunatics or maniacs, during which the phrenzy leaves them in possession of their reason.

LUCIFER, according to the poets, was the son of Jupiter and Aurora. In astronomy, Lucifer is the bright planet Venus, which either goes before the sun in the morning, for 290 days, and is our morning star; or in the evening follows the sun, during the same time, and then is called Hesperus or the evening star.

LUCIFERA, in Mythology, a surname given to Diana, under which title she was invoked by the Greeks in childbed. She was represented as covered with a large veil, interspersed with stars, bearing a crescent on her head, and holding in her hand a lighted flambeau.

LUCIFERIANS, a religious sect, who adhered to the schism of Lucifer, bishop of Cagliari, in the fourth century, who was banished by the emperor Constantius, for having defended the Nicene doctrine concerning the three Persons in the Godhead. St. Augustine seems to intimate, that they believed the soul, which they considered as of a carnal nature, to be transmitted to the children from their fathers. Theodoret says, that Lucifer was the author of a new error. The Luciferians increased mightily in Gaul, Spain, Egypt, &c. The occasion of the schism was, that Lucifer would not allow any acts he had done to be abolished. There were but two Luciferian bishops, but a great number of priests and deacons. The Luciferians bore a peculiar aversion to the Arians.

LUCILIUS, Caius, a Roman knight, and a Latin poet, was born at Noessa in Italy, about 143 B.C. He served under Scipio Africanus in the war with the Numantines; and was in great favour with that celebrated general, and with Lucius. He wrote 30 books of satires, in which he lashed several persons of quality very sharply. Some learned men ascribe the invention of satire to him; but M. Dacier has maintained, with great probity, that Lucilius only gave a better turn to that kind of poetry, and wrote it more wit and humour than his predecessors Ennius and Pacuvius had done. His fragments have been carefully collected by Francis Douza at Leyden in 1599, with notes. But they require still to be better illustrated by some learned critic.

LUCINA, a goddess among the Romans, who presided over women in labour. Some take her to be Diana, others Juno. She was called Lucina, because she brought children to the light; from the Latin word lux, light.

LUCIUS, the specific name of the pike. See ESOP, ICHTHYLOGY Index.

LUCONIA. See MANILLA.

LUcretia, the famous Roman matron, wife of Collatinus, and the cause of the revolution in Rome from a monarchy to a republic: this lady being ravished by Sextus, the eldest son of Tarquin king of Rome, stabbed herself, 509 B.C. See the article CHASTITY. The bloody peniard, with her dead body exposed to the senate, was the signal of Roman liberty; the expulsion of the Tarquins, and abolition of the regal dignity, was instantly resolved on, and carried into execution. See ROMA.

LUcretius, or Titus Lucretius, Caius, one...
of the most celebrated of the Latin poets, was born of an ancient and noble Roman family, and studied at Athens, where he became one of Epicurus' sect. He acquired great reputation by his learning and eloquence; but in the flower of his age fell into a frenzy, occasioned by a philthre given him by his wife, who was distantly fond of him. Lucertius, during the intervals of his madness, put Epicurus' doctrines into verse, and composed his six books De Rerum Natura, which are still extant. It is said that he killed himself in a fit of madness, in the 34th year before the Christian era, when 51 years old. The most correct edition of Lucertius is that of Simon de Colline. The cardinal de Polignac has refuted Lucertius' arguments, in his excellent Latin poem entitled Anti-Lucertius. His poem De Rerum Natura has been translated into English by Mr. Creech.

LUCRINUS LACUS, in Ancient Geography, a lake of Campania, between Baiae and Puteoli, famous for its oysters (Hercule, Martial, Juvenile); Lucrinenses (Cicero), the people dwelling on it. Now a perfect bay since the earthquake in 1538.

LUCULLUS, Lucius Licinius, a Roman general celebrated for his eloquence, his victories, and his riches. In his youth he made a figure at the bar; and being afterwards made quaestor in Asia, and praetor in Africa, governed those provinces with great moderation and justice. Scares was he known as a military man, when he twice beat the fleet of Hamilcar, and gained two great victories over him. His happy genius was greatly improved by study; for he employed his leisure in reading the best authors on military affairs. Being made consul with Anuelius Cotta, during the third war with Mithridates king of Pontus, he was sent against this prince: and this expedition was attended with a series of victories, which did him less honour than an act of generosity towards his colleague; who, willing to take advantage of his absence to signalize himself by some great exploit, hastened to fight Mithridates; but was defeated and shut up in Chalcedonia; where he must have perished, if Lucullus, sacrificing his resentment to the pleasure of saving a Roman citizen, had not flown to his assistance, and disengaged him. All Pontus then submitted to Lucullus; who being continued in his government of Asia, entered the territories of Tigranes, the most powerful king in Asia. That prince marched with a formidable army against Lucullus: who defeated him with a handful of men, and killed great numbers of his forces; took Tigranocertes, the capital of his kingdom; and was ready to put an end to the war, when the intrigues of a tribune got him deposed, and Pompey nominated in his room. Lucullus having brought home prodigious riches, now gave himself up to excessive luxury; and his table was served with a profusion till that time unknown. He brought from the East a great number of books, which he formed into a library, and gave admittance to all men of learning, who frequented it in great numbers. Toward the end of his life, he fell into a kind of madness: and Lucullus, his brother, was appointed his guardian. He is said to have been the first who brought cherries into Europe, having brought the grafts from the kingdom of Pontus.

LUCUS, in general, denotes a wood or grove sacred to a deity; so called à lucendo, because a great number of lights were usually burning in honour of the god (Isidorus); a practice common with idolaters, as we learn from Scripture: hence Homer's ανερχομαι alae.

LUD, a British king mentioned in our old chronicles, and said to have reigned about the year of the world 3878. He is reported to have enlarged and walled about Troyvount, or New Troy, where he kept his court, and made it his capital. The name of London is hence derived from Lud's town; and Ludgate from his being buried near it: but this is only one among many other derivations of the name of London; which are at least equally probable. See LONDON.

LUDAMAR, a Moorish kingdom in the interior part of Africa, the capital of which is situated in N. Lat. 15°0. W. Long. 60°50. which Mr Park considers as little superior to a desert. The Moors of Ludamar subsist chiefly on the flesh of their cattle.

The barrenness of the country is such, that it furnishes few materials for manufacture: but the inhabitants contrive to weave a strong cloth, with which their tents are covered; the thread is spun by the women from goats hair, and with the hides of their cattle they furnish saddles, bridles, pouches, and other articles of leather. They can also convert the native iron procured from the negroes into spears, knives, and pots for boiling their food; but they purchase their fire-arms and other weapons of a similar nature from the Europeans, in exchange for slaves.

Their ideas of female perfection are truly singular, since a woman, to have the smallest pretensions to beauty, must be one who requires a slave under each arm to support her as she walks; and a perfect beauty, according to Mr Park, is a load for a camel.

The wealth of the Moors chiefly consists in their numerous herds of cattle, yet the majority of the people spend their days in a state of idleness. The tent of the king is the common place of rendezvous for the indolent, where they appear to enjoy an unlimited liberty of speech; yet in the praise of their sovereign they are wholly unanimous, singing songs to his honour, which never fail to be filled with the grossest adulation. The king sometimes eats out of the same basin with the driver of his camels, and during the heat of the day exposes himself upon the same bed.

Cavalry constitute the chief military strength of Ludamar, which are well mounted, and are very expert in attacking by surprise. The horse of every soldier is furnished by himself, as also his military implements, consisting of a large sabre, a double-barrelled gun, a red leather bag for holding his balls, and a powder-horn slung over his shoulder. He has no pay, and his only compensation arises from plunder.

They have no intercourse with civilized nations, yet they boast an advantage over the negroes, as they possess, although in a very limited degree, the knowledge of letters. They are esteemed the vainest, proudest, and most bigoted, ferocious, and intolerant of all the nations of the earth, blending in their character the blind superstition of the negro with the savage cruelty and treachery of the Arab. It was with the utmost difficulty that Mr Park made his escape from this cruel and inhospitable people.

LUDI, a term used for shows and public representations.
tations made by the Romans for the entertainment of the people. See Games.

For an account of the particular games of Greece and Rome, as the Isthmian, Nemeian, Olympic, &c. See Isthmian, &c.

LUDIUS, a celebrated painter, lived in the reign of Augustus Caesar, and excelled in grand compositions. He was the first who painted the fronts of houses in the streets of Rome; which he beautified with great variety of landscapes, and many other different subjects.

LUDLOW, EDMUND, son of Sir Henry Ludlow, was born at Maidenhead, and educated in Trinity college, Oxford. His father opposing the king's interest, Mr Ludlow joined with the same party, and was present at the battle of Edgehill as a volunteer under the earl of Essex. Upon the death of his father, he was chosen knight of the shire for Wilts, and obtained the command of a regiment of horse for the defence of that county. He was a man of King Charles I's judges: after whose death he was sent by the parliament into Ireland, in quality of lieutenant-general of the horse; which employment he discharged with diligence and success till the death of the lord-deputy Ireton, when he acted for some time as general, though without that title; Cromwell, who knew him to be sincerely in the interest of the commonwealth, always finding out some pretext to hinder the conferring of that character upon him. The last stroke had been given by Ludlow to the Irish rebellion, if the usurpation of Cromwell had not prevented it. Under his power he never acted; and though Cromwell used his utmost efforts, he remained inflexible. After Cromwell's death, he endeavoured to restore the commonwealth: but Charles II, being recalled, he thought proper to conceal himself, and escaped into Switzerland, where he settled. After the Revolution, he came over into England, in order to be employed in Ireland against King James: but appearing publicly in London, it gave great offence; and an address was presented by Sir Edward Seymour to King William III, for a proclamation in order to apprehend Colonel Ludlow, attainted for the murder of King Charles I. Upon this he returned to Switzerland, where he died. During his retirement in Switzerland he wrote his Memoirs.

LUDLOW, a town of Shropshire in England, situated at the conflux of the Teme and Corve, 18 miles from Shrewsbury, and 138 from London. The president of the council of the marches, established by Henry VIII. generally kept his courts in it, by which the town was much benefited, these courts not having been abolished till the 1st of William and Mary. Its neighbourhood to Wales makes it a great thoroughfare, and engages many of the Welsh to send their children of both sexes to it for education. It was incorporated by Edward IV. and among other privileges has that of trying and executing criminals within itself. It is one of the nearest towns in England, with walls and seven gates. It is divided into four wards; and is governed by 2 bart'rs, 12 aldermen, 25 common-council men, a recorder, a town-clerk, steward, chamberlain, coroner, &c. From the castle on the top of the hill on which the town stands is a most delightful prospect. In an apartment of the outer gatehouse Samuel Butler is said to have written the first part of Hudibras. Of this castle, which was besieged and taken by King Stephen, some of the offices are fallen down, and great part of it turned into a bowling-green; but part of the royal apartments and the sword of state are still left. The walls were at first a mile in compass, and there was a lawn before it for near two miles, of which much is now enclosed. The battlements are very high and thick, and adorned with towers. It has a neat chapel, where are the coats of arms of abundance of Welsh gentry, and over the stable-doors are the arms of Queen Elizabeth, the earls of Pembroke, &c. This castle was a palace of the prince of Wales, in right of his principality. The river Teme has a good bridge over it, several weirs across it, and turns a great many mills. Here is a large parochial church, which was formerly collegiate; in the choir whereof is an inscription relating to Prince Arthur, elder brother to King Henry VIII. who died here, and whose bones were here deposited, though it is said his heart was taken up some time ago in a leaden box. In this choir is a closet, commonly called God's House, where the priests used to keep their consecrated utensils; and in the market-place is a conduit, with a long stone cross on it, and a niche wherein is the image of St Laurence, to whom the church was dedicated. On the north side of the town there was a rich priory, whereof there are few ruins to be seen except those of its church. Here are an alms-house for 30 poor people, and two charity-schools where 50 boys and 30 girls are both taught and clothed. It has a market on Monday, and three lesser ones on Wednesday, Friday, and Saturday. Its fairs are on the Tuesday Easter, Whit-Wednesday, August 21. Sept. 28. and Dec. 8. Provisions are very cheap here; and at the annual horse races there is the best of company. The country round is exceedingly pleasant, fruitful, and populous, especially that part called the Coverdale. Ludlow sends two members to parliament, and contained 2550 inhabitants in 1811.

LUDOLPH, Job, a very learned writer of the 17th century, was born at Erfurt in Thuringia. He travelled much, and was master of 26 languages, visited libraries, searched after natural curiosities and antiquities everywhere, and conversed with learned men of all nations. He published a History of Ethiopia, and other curious books.

LUDOLPH, Henry William, nephew of Job above mentioned, was born at Erfurt in 1655. He came over to England as secretary to M. Leute, envoy from the court of Copenhagen to that of London; and being recommended to Prince George of Denmark, was received as his secretary. He enjoyed this office for some years, until he was incapacitated by a violent disorder; when he was discharged with a handsome pension: after he recovered, he travelled into Muscovy, where he was well received by the czar, and where his knowledge made the Muscovite priests suppose him to be a conjurer. On his return to London in 1654, he was cut for the stone; and as soon as his health would permit, in acknowledgment of the civilities he had received in Muscovy, he wrote a grammar of their language, that the natives might learn their own tongue in a regular method. He then travelled into the East, to inform himself of the state of the Christian church.
in the Levant; the deplorable condition of which induced him, after his return, with the aid of the bishop of Worcester, to print an edition of the New Testament in the vulgar Greek, to present to the Greek church. In 1709, when such numbers of Palatines came over to England, Mr Ludolph was appointed by Queen Anne one of the commissioners to manage the charities raised for them; and he died early the following year. His collected works were published in 1712.

LUDWIGIA, a genus of plants belonging to the tetrandria class, and in the natural method ranking under the 17th order, Calycanthemae. See Botany Index.

LUES, among physicians, is in general used for a disease of any kind; but in a more particular sense is restrained to contagious and pestilential diseases; thus the lues Galliaca, or venerea, signifies the venereal disease. See Medicine Index.

LUFF, the order from the pilot to the steer-man to put the helm towards the lee-side of the ship, in order to make the ship sail nearer the direction of the wind. Hence, luff round, or luff a-lee, is the excess of this movement, by which it is intended to throw the ship's head up in the wind, in order to tack her, &c. A ship is accordingly said to spring her luff when she yields to the effort of the helm, by sailing nearer to the line of the wind than she had done before. See also Hauling the Wind.

LUFF-Tackle, a name given by sailors to any large tackle that is not destined for a particular place, but may be variously employed as occasion requires. It is generally somewhat larger than the jigger tackle, although smaller than those which serve to hoist the heavier materials into and out of the vessel, which latter are the main and fore tackles, the stay and quarter tackles, &c.

LUG-SAIL, a square sail, hoisted occasionally on the mast of a boat or small vessel upon a yard which hangs nearly at right angles with the mast. These are more particularly used in the barca longa, navigated by the Spaniards in the Mediterranean.

LUGDUNUM, in Ancient Geography, the capital of the Segusians in Gallia Celtica, situated at the confluence of the Arar and Rhodanus, on an eminence, as the Celtic term duce signifies; built by Manuilius Plancus under Augustus, while commanding in that part of Gaul; and whither he led a colony. Now Lyons, capital of the Lyonnais.

LUGDUNUM Bavarorum, in Ancient Geography, a town of the Batavi in Gallia Belgica. Now Leyden in Holland.

LUGDUNUM Convenarum, in Ancient Geography, a town of Gaul in Aquitania, at the foot of the Pyrenees. Now S. Bertrand, in Gascony.

LUGEAS LACUS, in Ancient Geography, a lake of Japydia, the westmost district of Illyricum, to the south of the Save, and near the head of the Arsea. Now commonly called the Zircinicus Lake, from a small adjoining town. It is locked on every side with mountains; from which scanty currents run down; the less in quantity their waters, because drank up by the earth; till at length they are swallowed up in rocky furrows, so formed as to resemble artificial. In these the water being so redundant as to refuse receiving any more, they regurgitate, and return the water with extraordinary celerity, which thus spreading itself, forms a lake, in most places 8 cubits deep. These waters afterwards retire with no less celerity than they came on, not only through the furrows, but pass through the whole of the bottom, as through a sieve; which when perceived by the inhabitants, they directly stop up the larger apertures, and thus take large quantities of fish: when the lake is dry, they cut down their harvest on the spot where they sowed, and sow again before the inundation comes on; and grass shoots so quick on it, that it may be cut down in three weeks time, (Lazius, Wernherus.)

LUGGER SHALL, a borough of Wiltshire, 12 miles north of Salisbury, and 7 miles north by west of London. It is an ancient borough by prescription, though but a small hamlet, near the forest of Chute, in a delightful country; and was the residence of several kings. It had formerly a castle. It is governed by a bailiff chosen yearly at the lord of the manor's court-leet. On the neighbouring downs there used to be horse-races. Population in 1811, 487.

LUKE, ST, the evangelist, and the disciple of the apostles, was originally of Antioch in Syria, and by profession a physician. He particularly attached himself to St Paul, and was his faithful companion in his travels and labours. He went with him to Troas in Macedonia about the year 53; and, ten years after, the acts of the Apostles, which contains a history of 30 years. Of all the inspired writers of the New Testament, his works are written in the most elegant Greek. It is believed that St Luke died at Rome, or in Achaia.

Gospel of St Luke, a canonical book of the New Testament. Some think that it was properly St Paul's Gospel; and that, when the apostle speaks of his Gospel, he means what is called St Luke's. Irenæus says, that St Luke digested into writing what St Paul preached to the Gentiles; and Gregory Nazianzen tells us, that St Luke wrote with the assistance of St Paul.

St Luke the Evangelist's Day, a festival in the Christian church, observed on the 18th of October.

LULA, a town of Swedish Lapland; seated at the mouth of the river Lula, on the west side of the gulf of Bothnia, 42 miles south-west of Tornëa. E. Long. 21° 0' N. Lat. 64° 30'.

LULAPMARK, a province of Swedish Lapland; bounded by that of Tornëa on the north, by the Bothnic gulf on the east, by Pitibla Lapmark on the south, and Norway on the west.

LULL, JOHN BAPTIST, the most celebrated and most excellent musician that has appeared in France since the revival of learning, was born at Florence. He was taken to France when very young by a person of quality; and he carried the art of playing on the violin to the highest perfection. Louis XIII. made him superintendent of music. Some time after Perinna having introduced operas into France, and quarrelling with his company, he resigned his privilege to Lulli. Operas were then carried to the utmost perfection by this celebrated musician, and were attended with continual
LUNA, a town and port of Liguria, at the mouth of the Macra. The town was but small, but the port large and beautiful, according to Strabo. Now extinct, and its ruins called Luna Distruita. It was famous for its quarries of white marble, thence called Lunense; and for its cheese, remarkable rather for its size than goodness, each being a thousand weight.

Luna, in Astronomy, the moon. See Astronomy, passim.

Luna, in the jargon of the alchemists, signifies silver; so called from the supposed influence of the moon thereupon.

Luna Cornua, in Chemistry, is a compound of muriatic acid with silver. See Silver, Muriate of, Chemistry Index.

Lunacy, a species of madness. See Lunatic, and Medicine Index.

Lunacy, in Law. See Idiocy and Lunatic.

Lunae Mens, in Ancient Geography, a promontory of Lusitania. Now Rock of Lisbon. W. Long. 16. N. Lat. 38. 50.—Another Luna Mons of Ethiopia, from which the Nile was supposed to take its rise.

Lunae Portus, a very extensive port, or more truly a bay, of Liguria, between Portus Venetius and Portus Erecus, 20 miles in compass. Now il Golfo della Spezia, on the east coast of the territory of Genoa.

Lunah, something relating to the Moon.

Lunar Month. See Month.

Lunar Year, consists of 354 days, or 12 synodical months. See Year.

Lunar Dial. See Dialling.

Lunare on, in Anatomy, is the second bone in the first row of the carpus. It has its name from the Latin, luna, "the moon," because one of its sides is in form of a crescent.

Lunaria, Satin-Flower, or Moonwort; a genus of plants belonging to the tetradynamia class; and in the natural method ranking under the 95th order, Silicous. See Botany Index.

Lunarium, in Ancient Geography, a promontory of the further Spain, between Blinda and Buctulo. Commonly called el cabo de Palafugel, in Catalonia, on the Mediterranean; or cabo de Tosa, on the same coast, and in Catalonia, 15 miles from the former, to the west.

Lunatic, a person affected with that species of madness termed lunacy. The word is indeed properly applied to one that hath lucid intervals; sometimes enjoying his senses, and sometimes not; and that frequently supposed to depend on the influence of the moon.

Lunatic, in Law. Under the general term of non compos mentis (which Sir Edward Coke says is the most legal name), are comprised not only lunatics, but persons under frenzy, or who lose their intellects by disease; those that grow deaf, dumb, and blind, not being born so; or such, in short, as are judged by the court of chancery incapable of conducting their own affairs. To these also, as well as idiots, the king is guardian, but to a very different purpose. For the law always imagines, that these accidental misfortunes may be removed; and therefore only constitutes the crown a trustee for the unfortunate persons, to protect their property, and to account to them for all profits received, if they recover, or after their decease to their representatives.
Lunatic representatives. And therefore it is declared by the statute 17 Edw. II. c. 10. that the king shall provide for the custody and sustentation of lunatics, and preserve their lands, and the profits of them, for their use when they come to their right mind; and the king shall take nothing to his own use: and if the parties be in such estate, the residue shall be distributed for their souls by the advice of the ordinaries, and of course (by the same) amendments of the laws of administrations) shall now go to their executors or administrators.

On the first attack of lunacy, or other occasional insanity, when there may be hopes of a speedy restitution of reason, it is usual to confine the unhappy objects in private custody under the direction of their nearest friends and relations: and the legislature, to prevent all abuses incident to such private custody, hath thought proper to interpose its authority, by 14 Geo. III. c. 49. for regulating private mad-houses. But when the disorder is grown permanent, and the circumstances of the party will bear such additional expense, it is thought proper to apply to the royal authority to warrant a lasting confinement.

The method of proving a person non compos is very similar to that of proving him an idiot. The lord chancellor, to whom, by special authority from the king, the custody of idiots and lunatics is intrusted, upon petition or information, grants a commission in nature of the writ de idiota inquirendo, to inquire into the party's state of mind; and if he be found non compos, he usually commits the care of his person, with a suitable allowance for his maintenance, to some friend, who is then called his committee. However, to prevent sinister practices, the next heir is seldom permitted to be of this committee of the person; because it is his interest that the party should die. But it hath been said there lies not the same objection against his next of kin, provided he be not his heir; for it is his interest to preserve the lunatic's life, in order to increase the personal estate by savings, which he or his family may hereafter be entitled to enjoy. The heir is generally made the manager or committee of the estate, it being clearly his interest by good management to keep it in condition: accountable, however, to the court of chancery, and to the non compos himself, if he recovers; or otherwise, to his administrators. See Idiocy.

Lunation, the period or space of time between one new moon and another; also called synodical month. See Cycle and Epoch.

Lunden, or Lund, a considerable town of Sweden, in Gotland; and capital of the territory of Schonen, with an archbishop's see and an university. It was ceded to the Swedes by the Danes in 1658. E. Long. 13. 25. N. Lat. 55. 40.

Lundy Island, situated 30 miles in the sea, off the north-west coast of Devonshire, is five miles long and two broad, but so encompassed with inaccessible rocks, that it has but one entrance to it, so narrow that two men can scarcely go abreast. It is reckoned in the hundred of Brandon. It had once both a fort and a chapel. The south part of it is indifferent good soil, but the north part of it is barren, and has a high pyramidal rock called the Constable. Here are horses, kine, hogs, and goats, with great store of sheep and rabbits; but the chief commodity is fowl, with which it abounds much, their eggs being very thick on the ground at their season of breeding. No venomous creature will live in this island. In the reign of Henry VIII. one William Morisco, who had conspired to murder him at Woodstock, fled to this island, which he fortified, turned pirate, and did much damage to this coast; but was taken by surprise at length, with 16 of his accomplices, and put to death.

Lune, Lunula, in Geometry, a plane in form of a crescent or half-moon, terminated by the circumference of two circles, that intersect each other within.

Lunenburg, or Lunenburg Zell, a principality of Germany, forming part of the kingdom of Hanover, bounded to the south by that of Calenberg, the diocese of Hildesheim, and the duchy of Brunswick; to the north, by the duchy of Lunenburg and the Elbe, by the last of which it is separated from the territory of the imperial city of Hamburgh; to the east, by the duchy of Brunswick, the Alte Mark, and the duchy of Mecklenburg; and to the west, by the duchies of Bremen and Verden, the county of Hoya, and the principality of Calenberg. The soil, except along the Elbe, Aller, and Jetz, is either sand, heath, or moor. In the more fruitful parts of it are produced wheat, rye, barley, oats, pease, buck-wheat, flax, hemp, hops, pulse, oak, beech, fir, pines, birch, and alder, together with black cattle and horses. The heaths abound with bees and honey, and a small kind of sheep whose wool is long and coarse. Lunenburg is well furnished with salt springs and limestone, and the forest of Gorte with venison. The rivers Elbe, Ilmenau and Aller, are navigable; and consequently very advantageous to the country, independent of the fish which they yield. The general diets of this principality are convened by the sovereign twice a year, and held at Zell. They consist of the deputies of the nobility and the towns of Lunenburg, Unzen, and Zell, who have the nomination of the members of the high colleges, and other officers, jointly with the sovereign.

There are near 200 Lutheran churches in the country, under two general and 15 subordinate superintendents, several grammar-schools, two Calvinist churches at Zell, and an academy of exercises at Lunenburg. The manufactures are chiefly linen cloth, cottons, ribbons, stockings, hats, starch, bleached wax, refined sugar, gold and silver wires, all kinds of wooden wares, barges, boats, and ships. The exports of these to Hamburgh, Lubec, and Altona, are considerable. The neighbourhood of these cities, with the facility of conveying goods and merchandise to them and other places, either by land or water, is very advantageous to this country, and contributes greatly to its subsistence. On account of this principality, the king of Great Britain has a seat and voice both in the college of the princes of the empire and of the circle of Lower Saxony. Its quota in the matricula is 20 horse and 120 foot, or 720 florins in lieu of them. The revenues of the principality arise chiefly from the demesnes, tolls on the Elbe, contributions, duties on cattle, beer, wine, brandy, and other commodities, which altogether must be very considerable, some bailiwicks alone yielding upwards of 20,000 rix-dollars.

Lunenburg, the capital of the principality of the same name, is a pretty large town of Germany, on the river Elmen, or the Ilmenau, which is navigable from the town to the Elbe, at the distance of 13 miles. It is 27 miles from Hamburgh, 43 from Zell, 65 from Brunswick.
LUNenburg, Bruns\v{u}c, 76 from Bremen, 68 from Hanover; and stands in E. Long. 10. 40, N. Lat. 53. 28. Its inhabitants are reckoned at between 8000 and 9000. Formerly this was one of the Hanse towns, and an imperial city. Some derive its name from Lina, the ancient name of the Ilmenau; others from Luna, the moon, an image of which is said to have been worshipped by the inhabitants in the times of Paganism. Here were anciently several convents, viz. one of Minims, another of Premonstratensians, another of Benedectines, and a fourth of Minorites. Out of the revenues of the Benedictine monastery was founded an academy for the martial exercises, where young gentlemen of the principality of Luenenburg are maintained gratis, and taught French, fencing, riding, and dancing; but foreigners are educated at a certain fixed price. A Latin school was also founded, consisting of four classes, and well endowed out of these revenues. The superintendency and management of these, and the estates appropriated to their maintenance, belongs to the landscape director, and the ausreiter, who are both chosen from among the Luenenburg nobility. The first came in place of the Popish abbot, and as such is head of the states of the principality, and president of the provincial college. He has the title of excellency; and to his high instruments styles himself, by the grace of his landscape director and lord of the mansion of St Michael in Luenenburg. The chief public edifices are three parish-churches, the ducal palace, three hospitals, the town-house, the salt-magazine, the anatomic theatre, the academy; the conventual church of St Michael, in which lie interred the ancient dukes, and in which is the famous table eight feet long, and four wide, plated over with chased gold, with a rim embellished with precious stones, of an immense value, which was taken from the Saracens by the emperor Otho, and presented to this church: but in 1698, a gang of thieves stripped it of 200 rubies and emeralds, together with a large diamond, and most of the gold, so that at present but a small part of it remains. Here are some very rich salt springs. Formerly when there was a great demand for the salt, upwards of 120,000 tons have been annually boiled here, and sold off; but since the commencement of the present century, the salt trade hath declined greatly. A fifth of the salt made here belongs to the king, but is fatted out. It is said to excel all the other salt made in Germany. This town is well fortified, and has a garrison, which is lodged in barracks. In the neighbourhood is a good limestone quarry; and along the Ilmenau are warehouses, in which are lodged goods brought from all parts of Germany, to be forwarded by the Ilmenau to Hamburgh, or by the Asche to Lubeck, from whence other goods are brought back the same way. The town itself carries on a considerable traffic in wax, honey, wool, flax, linen, salt, lime, and beer.

LUNENSE MARMOR, in the natural history of the ancients, the name of that species of white marble now known among us by the name of the Carrara marble, and distinguished from the statuary kind by its greater hardness and less splendour. It was ever greatly esteemed in building and ornamental works, and is so still. It is of a very close and fine texture, of a very pure white, and much more transparent than any other of the white marbles. It has always been found in great quantities in Italy, and is so to this day. See LUNA.

LUNETTE, in Fortification, an enveloped counter-guard, or elevation of earth, made beyond the second ditch, opposite to the places of arms, differing from the ravelines only in their situation. Lunettes are usually made in ditches full of water, and serve to the same purpose as faussebrayes, to dispute the passage of the ditch. See Fortification.

LUNETTE, in the manage, is a half horse-shoe, or such a shoe as wants the sponge, i.e. that part of the branch which runs towards the quarters of the foot.

LUNETTE is also the name of two small pieces of felt, made round and hollow, to clap upon the eyes of a vicious horse that is apt to bite, and strike with his fore feet, or that will not suffer his rider to mount him.

LUNGS, in Anatomy, a part of the human body, serving for respiration. See Anatomy, No. 177.

In the Journal de Medicine for June 1793, is a description of an Instrument for Inflating the Lungs, invented by M. Gorcey, physician to the military hospital at Neufbrissac, which appears to be extremely well adapted to the purpose, whilst it may be used with the greatest ease and facility.

This instrument, which the inventor styles apodopus, that is, "resorer of respiration," consists of a double pair of bellows, BCLM, in the two different parts of which have no communication with each other. In the lower side BM, is an aperture A for a valve constructed on the principles of those of Mr Nairne's air-pump. It consists of a rim of copper, closed at one end by a plate of the same metal, in which plate are seven small holes placed at equal distances. This plate is covered with pieces of silk coated with elastic gum, in which are six transverse incisions of two or three lines in length. Each incision is so made as to be situated between two of the holes, and at an equal distance from each: see D, fig. 2. The silk must be made very secure by a thread passing several times round the rim. It is obvious, that a stream of air applied to that side of the plate which is opposite the silk, will pass through the holes, and lifting up the silk, escape through the incisions. On the contrary, a stream of air applied to the other side will press the silk upon the plate, and thus close the holes, so that it will be impossible for it to pass through them. This valve opens internally, so as to admit the air from without. At B is another valve, on the same construction, but opening in a contrary direction, thus permitting the air to escape out of the lower part into the tube EF, but preventing its entrance. At C is another valve, opening internally to admit the air from the tube EF; and at D there is a fourth, opening externally to discharge the air from the upper part.

The flexible tube EF, screwed on at the end CB, being introduced into one of the nostrils, whilst the mouth and the other nostril are closed by an assistant, if we separate the two handles LM, which were close together at the introduction of the tube, it is evident, that the air in the lungs will rush into the upper part through the valve C, whilst the external air will fill the lower part through the valve A: the handles being
being again brought into contact, the atmospheric air will be forced into the lungs through the valve B, and at the same time the air in the upper part will be discharged at the valve D. Thus by the alternate play of the double bellows, the lungs will be alternately filled and emptied as in respiration. In using the instrument care should be taken not to be too violent; as the more perfectly the natural motion of respiration is imitated, the better.

To prevent any substances from without injuring the valves A D, fig. 1, the rim is made with a screw, B, fig. 3, in order to receive a cap AA, fig. 3, full of small holes. This screw has also another use. If air or oxygen gas be preferred, a bladder filled with it, fig. 4, may be mounted to the valve A, fig. 1, and, to prevent waste, as this air may serve several times, a flexible tube may be screwed on the valve D, fig. 1, communicating with the bladder by means of the opening d, fig. 4; thus it may be employed as often as the operator thinks proper.

There is a handle K to the partition in the middle, in order that, if it be at any time necessary to use either of the divisions alone, the other may be confined from acting. c, b, fig. 5, represent the two valves to be applied at the end of the instrument C, B, fig. 1; and fig. 6, is a section of the end CB, showing the valves in their proper places.

It is proper to add, that the capacity of the instrument should be proportioned to the quantity of air received into the lungs in inspiration, which Dr Goodwyn has ascertained to be twelve cubical inches or somewhat more. Each division of the instrument, therefore, should be capable of containing that quantity.

LUNA-MORT. See Pulmonaria, Botany Index.

LUNISOLAR YEAR, in Chronology, the space of 532 common years; found by multiplying the cycle of the sun by that of the moon.

LUNULA. See Lune.

LUPERCALIA, feasts instituted in ancient Rome, in honour of the god Pan. The word comes from Lupercal, the name of a place under the Palatine mountain, where the sacrifices were performed.

The Lupercalia were celebrated on the 15th of the kalends of March, that is, on the 15th of February, or, as Ovid observes, on the 3d day after the ides. They are supposed to have been established by Evander.

On the morning of this feast, the Luperci, or priests of Pan, ran naked through the streets of Rome, striking the married women they met on the hands and belly with a thong or strap of goats leather, which was held an omen promising them fecundity and happy deliveries. See Luperci.

This feast was abolished in the time of Augustus; but afterwards restored, and continued to the time of the emperor Anastasius.—Baronius says it was abolished by Pope in 496.

LUPERCALIA, a name given to the priests of the god Pan. See Lupercalia.

The Luperci were the most ancient order of priests in Rome; they were divided into two colleges or companies, the one called Fabii and the other Quiritii. To these Caesar added a third, which he called Julia.

LUPINUS, Lupine; a genus of plants belonging to the diadelphic class; and in the natural method rank-
their sources in the Lusatias, which are also watered by the Neisse and Queis. The ancient inhabitants of this country were the Saxons, who were succeeded by the Vandals, and these by the Sober-Wends, a Slavonian people. The present inhabitants, the descendants of the Wends, have an odd dress; and the language is so inarticulate and guttural, that it hath been said, it might be pronounced without lips, teeth, or tongue; but the towns are almost wholly peopled by Germans.

In the Upper Lusatia are six towns which appear at the land-diets, 16 smaller country towns, and four market towns. In the Lower are four diet towns, 13 country towns, and two market ones. Both marquisates were formerly subject either to the kings of Bohemia, the archdukes of Austria, or electors of Brandenburg; but, in 1650, both were absolutely ceded to the elector of Saxony, in lieu of the 72 tons of gold which he expended in assisting the emperor Ferdinand II. against the Bohemians.

Christianity was first planted in Lusatia in the seventh century; but it was several centuries after that before Popery was fully established. In the 11th century many cloisters were erected in the country; but at the Reformation such numbers embraced Lutheranism, that it became the predominant religion, and still continues, though there are still several Roman Catholic foundations, churches, market-towns, and villages. The enthusiastic sect of Hurnhuters possesses a great influence and esteem here. There are considerable manufactures of woollen and linen stuffs in the Lusatias, especially the Upper. At Budissen, and in the adjacent country, prodigious quantities of stockings, spatterdashes, caps, and gloves are made. The linen manufactures also flourish here, chiefly in the Upper Lusatia, where all sorts of linen are made, printed, and dyed. Exclusive of these, there are considerable manufactures of hats, leather, paper, gunpowder, iron, glass, bleached wax, &c. Though the demand and exportation of these commodities, particularly linen and woollens, is not so great as formerly, yet it is still considerable, and more than overbalances their importation in wool, yarn, silk, wines, spices, corn, fresh and baked fruits, garden stuff, and hops. Disputes of many years standing have subsisted between the country artificers and linen manufacturers on the one side, and the diet-towns on the other; the latter unjustly seeking to exclude the former from any share in the linen trade. The natives of this country are said to have quick natural parts, but to be sordidly penurious. We are told they observe the Saxon laws much better than they did the Bohemian. Learning hath been much esteemed and encouraged in both marquisates since the Reformation. The schools in the six diet towns of Upper Lusatia, particularly at Gorlitz, Budissen, and Zittau, greatly distinguish themselves, having good instructors. In Lower Lusatia also are some good schools, with stipends for the maintenance of students. Printing is said to be much followed, and brought to great perfection in this country.

In Upper Lusatia, the states consist, 1st, of those called state-lords; 2dly, of the prelates; 3dly, of the gentry and commonality, under which are comprehended the counts, barons, nobles, and burgesses, possessors of fees and fief-estates; and, 4thly, of the representatives of the six principal towns. Without the consent of these states no taxes can be imposed, nor any thing of importance, that regards the public, transacted. The diets are ordinary or extraordinary. The ordinary meet once in three years, and the extraordinary when summoned by the sovereign upon particular emergencies. As to ecclesiastical matters, the dean of Budissen and his consistory exercise all manner of episcopal jurisdiction; and among the Protestants, the jurisdiction belongs either to the superior, the upper office, or the patrons. The revenues arising to the superior or sovereign, from Upper Lusatia, consist partly of the subsidies granted by the states, among which, at present, are reckoned capitation and estate-money; and partly of the beer-tax, excise, tolls, &c.

—Upper Lusatia is divided into two great circles, viz. those of Budissen and Gorlitz, which are again divided into lesser circles.

The land states of Lower Lusatia consist, like those of the Upper, of prelates, lords, and knights, and the representatives of the state towns, which are Luc-kuau, Gubben-Lubben, and Kalau. Two land diets are yearly held at Lubben, called voluntary-diets; but when the superior causes the states to be summoned together at his discretion, and propositions are laid before them, by commissaries deputed for that purpose, such convention is called a great land diet. The marquisate is divided into five circles, each of which holds a circle assembled in its circle town. The chief officers appointed either by the superior or the states are, the president of the upper office, the land captain, and the land judge. The principal tribunals are, the land court, and the upper office, to which lie appeals from the inferior judicatories. There are also officers for the several circles. Spiritual matters belong here to a consistory, erected in 1668. The ordinary taxes are paid into the chest of the circle; and from thence consigned to the general chest, of which the upper tax-receiver is superintendent. By him an annual account of the receipts is made out, which is examined and passed by the deputies of the states.

LUSITANIA, in Ancient Geography, one of the divisions of Spain, extending to the north of the Tagus, quite to the sea of Cantabria, at least to the Promontorium Ceticum. But Augustus, by a new regulation, made the Anas its boundary to the south, the Darius to the north; and thus constituting only a part of the modern Portugal. Lusitani the people, (Diodorus, Stephanus.)

LUSTRAL, an epithet given by the ancients to the water used in their ceremonies to sprinkle and purify the people. From them the Romanists have borrowed the holy water used in their churches.

Lustral Day (Dies Lustricus), that whereon the lustrations were performed for a child, and its name given; which was usually the ninth day from the birth of a boy, and the eighth from that of a girl. Though others performed the ceremony on the last day of that week wherein the child was born, and others on the fifth day from its birth.

Over this feast-day the goddess Nundina was supposed to preside; the midwives, nurses, and domestics bathed the child backwards and forwards, around a fire burning on the altars of the gods, after which they sprinkled it with water; hence this feast had the name...
Lustration, Lustration.

Lustral. of *amphibromia.* The old women mixed saliva and dust with the water. The whole ended with a sumptuous entertainment. The parents received gifts from their friends on this occasion. If the child was a male, their door was decked with an olive garland; if a female, with wool, denoting the work about which women were to be employed.

Lustration, in antiquity, sacrifices or ceremonies by which the ancients purified their cities, fields, armies, or people, defiled by any crime or impurity. Some of these lustrations were public, others private. There were three species or manners of performing lustration, viz. by fire and sulphur, by water, and by air; which last was done by fanning and agitating the air round the thing to be purified. Some of these lustrations were necessary, i.e. could not be dispensed with; as lustrations of houses in time of a plague, or upon the death of any person: others again were done out of choice, and at pleasure. The public lustrations at Rome were celebrated every fifth year; in which they led a victim thrice round the place to be purified, and in the mean time burnt a great quantity of perfumes. Their country lustrations, which they called *ambervolia,* were celebrated before they began to reap their corn: in those of the armies, which they called *orninuitia,* some chosen soldiers, crowned with laurel, led the victims, which were a cow, a sheep, and a bull; thrice round the army ranged in battle array in the field of Mars, to which deity the victims were afterwards sacrificed, after pouring out many imprecations upon the enemies of the Romans. The lustrations of their flocks were performed in this manner: the shepherd sprinkled them with pure water, and thrice surrounded his sheepfold with a composition of savin, laurel, and brimstone set on fire; and afterwards sacrificed to the goddess Pales an offering of milk boiled, wine, a cake, and millet. As for private houses, they were lustrated with water, a fumigation of laurel, juniper, olive tree, savin, and such like; and the victim commonly was a pig. Lustrations made for particular persons were commonly called *expiations,* and the victims *picula.* There was also a kind of lustration used for infants, by which they were purified, girls the third, and boys the ninth, day after their birth; which ceremony was performed with pure water and spittle. See the article *Ambervolia.* — In their lustratory sacrifices, the Athenians sacrificed two men, one for the men of their city, and the other for the women. Divers of these expiations were austere: some fasted; others abstained from all sensual pleasures; and some, as the priests of Cybele, castrated themselves. The postures of the penitents were different according to the different sacrifices. The priests changed their habits according to the ceremony to be performed: white, purple, and black, were the most usual colours. They cast into the river, or at least out of the city, the animals or other things that had served for a lustration or sacrifice of atonement; and thought themselves threatened with some great misfortunes when by chance they trod upon them. Part of these ceremonies were abolished by the emperor Constantine: and his successors: the rest subsisted till the Gothic kings were masters of Rome; under whom they expired, excepting what the popes thought proper to adopt and bring into the church.

Lustre, the gloss or brightness appearing on any thing, particularly on manufactures of silk, wool, or stuff. It is likewise used to denote the composition or manner of giving that gloss.

The lustre of silks is given them by washing in soap, then clear water, and dipping them in alum water cold. To give stuff a beautiful lustre: For every eight pounds of stuff allow a quarter of a pound of linseed: boil it half an hour, and then strain it through a cloth, and let it stand till it is turned to a jelly: afterwards put an ounce and a half of gum to dissolve 24 hours; then mix the liquer, and put the cloth into this mixture; take it out, dry it in the shade, and press it. If once doing is not sufficient, repeat the operation. Curriers give a lustre to black leather first with juice of barberries, then with gum-arabic, ale, vinegar, and Flanders glue, boiled together. For coloured leather, they use the white of an egg beaten in water. Moroccos have their lustre from juice of barberries, and lemon or orange. For hats, the lustre is frequently given with common water: sometimes a little black dye is added: the same lustre serves for furs, except that for very black furs they sometimes prepare a lustre of gall, copperas, Roman alum, ox’s maw, and other ingredients.

Lustre, an appellation given to a branched candelabrum, when made of glass. See Branch and Jesse.

Lustrings. A company was incorporated for making, dressing, and lustrating alamodes and lustrings in England, who were to have a benefit thereof, by stat. 4 and 5 William and Mary. And no foreign silks known by the name of lustrings or alamodes are to be imported but at the port of London. See Silk.

Lustrum, in Roman antiquity, a general muster and review of all the citizens and their goods, which was performed by the censors every fifth year, who afterwards made a solemn lustration. See the article Lustration.

This custom was first instituted by Servius Tullius, about 180 years after the foundation of Rome. In course of time the lustra were not celebrated so often; for we find the fifth lustrum celebrated at Rome only in the 574th year of that city.

Lute, or Luting, among chemists, a mixed, tenacious, ductile substance, which grows solid by drying, and, being applied to the juncture of vessels, stops them up so as to prevent the air from getting in or out.

Lute is also a musical instrument with strings.—The lute consists of four bars, viz. the table, the body or belly, which has nine or ten sides: the neck, which has nine or ten stops or divisions, marked with strings: and the head or cross, where the screws for raising and lowering the strings to a proper pitch of tone are fixed. In the middle of the table there is a rose or passage for the sound; there is also a bridge that the strings are fastened to, and a piece of ivory between the head and the neck to which the other extremities of the strings are fitted. In playing, the strings are struck with the right hand, and with the left the stops are pressed. The lutes of Bologna are esteemed the best on account of the wood, which is said to have an uncommon disposition for producing a sweet sound.

Lutetia,
LUTERICA PARISIUM, in Ancient Geography, a town of the Parisii, in Gallia Celtica, situated in an island in the Sequana or Seine. It received its name, as some suppose, from the quantity of clay, lutum, which is in its neighbourhood. J. Caesar fortified and embellished it, from which circumstance some authors call it Julii Civitas. Julian the apostate resided there for some time. It is now Paris, the capital of France, so called from its name Portus in the lower age.

LUTHER, Martin, the celebrated author of the Reformation, was a native of Eisleben in Saxony, and born in 1483. Though his parents were poor, he received a learned education; during the progress of which, he gave many indications of uncommon vigour and acuteness of genius. As his mind was naturally susceptible of serious impressions, and tinged with somewhat of that religious melancholy which delights in the solitude and devotion of a monastic life, he retired into a convent of Augustinian friars; where he acquired great reputation, not only for piety, but for love of knowledge and unwearying application to study. The cause of the retirement is said to have been, that he was once struck by lightning, and his companion killed by his side by the same flash. He had been taught the scholastic philosophy which was in vogue in those days, and made considerable progress in it; but happening to find a copy of the Bible which lay neglected in the library of his monastery, he applied himself to the study of it with such eagerness and assiduity, as quite astonished the monks; and increased his reputation for sanctity so much, that he was chosen professor first of philosophy, and afterwards of theology, at Wittenberg on the Elbe, where Frederic elector of Saxony had founded an university.

While Luther continued to enjoy the highest reputation for sanctity and learning, Tetzel, a Dominican friar, came to Wittenberg in order to publish indulgences. Luther beheld his success with great concern, and having first inveighed against indulgences from the pulpit, he afterwards published 95 theses, containing his sentiments on that subject. These he proposed, not as points fully established, but as subjects of inquiry and disputation. He appointed a day on which the learned were invited to impugn them either in person or by writing; and to the whole he subjoined solemn protestations of his high respect for the apostolic see, and of his implicit submission to its authority. No opponent appeared at the time prefixed; the theses spread over Germany with astonishing rapidity, and were read with the greatest eagerness.

Though Luther met with no opposition for some little time after he began to publish his new doctrines, it was not long before many zealous champions arose to defend those opinions with which the wealth and power of the clergy were so strictly connected. Their cause, however, was by no means promoted by these endeavours; the people began to call in question even the authority of the canon law and of the pope himself. The court of Rome at first despised these new doctrines and disputes; but at last the attention of the pope was raised by the great success of the reformer, and the complaints of his adversaries, Luther was summoned in the month of July 1518, to appear at Rome, within 60 days, before the auditor of the chamber. One of Luther’s adversaries, named Priemans, who had written against him, was appointed to examine his doctrines, and to decide concerning them. The pope wrote at the same time to the elector of Saxony, beseeching him not to protect a man whose heretical and profane tenets were so shocking to pious ears; and enjoined the provincial of the Augustinians to check by his authority the rashness of an arrogant monk, which brought disgrace upon their order, and gave offence and disturbance to the whole church.

From these letters, and the appointment of his open enemy Priemans to be his judge, Luther easily saw what sentence he might expect at Rome; and therefore discovered the utmost solicitude to have his case tried in Germany, and before a less suspected tribunal. He wrote a submissive letter to the pope, in which he promised an unreserved obedience to his will, for as yet he entertained no doubt of the divine original of the pope’s authority; and by the intercession of the other professors, Cajetan, the pope’s legate in Germany was appointed to be his examiner in the cause. Luther appeared before him without hesitation; but Cajetan thought it below his dignity to dispute the point with a person so much his inferior in rank; and therefore required him of the apostolic powers with which he was clothed, to retract the errors which he had uttered with regard to indulgences and the nature of faith, and to abstain for the future from the publication of new and dangerous opinions; and at the last forbade him to appear in his presence, unless he proposed to comply with what had been required of him.

This haughty and violent manner of proceeding, together with some other circumstances, gave Luther’s friends such strong reason to suspect that even the imperial safe-conduct would not be able to protect him from the legate’s power and resentment, that they prevailed on him secretly to withdraw from Augsburg, where he had attended the legate, and to return to his own country. According to a form of which there had been some examples, he prepared a solemn appeal from the pope, ill-informed at that time concerning his cause, to the pope, when he should receive more full intimation with respect to it. — Cajetan, enraged at Luther’s abrupt retreat, and at the publication of his appeal, wrote to the elector of Saxony, complaining of both; and requiring him, as he regarded the peace of the church, or the authority of its head, either to send that seditious monk a prisoner to Rome, or to banish him out of his territories. Frederick had hitherto, from political motives, protected Luther, as thinking he might be of use in checking the enormous power of the see of Rome, and though all Germany resounded with his name; the elector had never yet admitted him into his presence. But upon this demand made by the cardinal, it became necessary to throw off somewhat of his former reserve. He had been at great expense and bestowed much attention on founding a new university, an object of considerable importance to every German prince; and foreseeing how fatal a blow the removal of Luther would be to its
LUTHER

reputation, he not only declined complying with either of the pope's requests, but openly discovered great concern for Luther's safety.

The situation of our reformer, in the mean time, came daily more and more alarming. He knew very well what were the motives which induced the elector to afford him protection, and that he could by no means depend on a continuance of his friendship. If he should be obliged to quit Saxony, he had no other asylum, and must stand exposed to whatever punishment the rage or bigotry of his enemies could inflict; and so ready were his adversaries to condemn him, that he had been declared a heretic at Rome before the expiration of the 60 days allowed him in the citation for making his appearance. Notwithstanding all this, however, he discovered no symptoms of timidity or remissness; but continued to vindicate his own conduct and opinions, and to inveigh against those of his adversaries with more vehemence than ever. Being convinced, therefore, that the pope would soon proceed to the most violent measures against him, he appealed to a general council, which he affirmed to be the representative of the Catholic church, and superior in power to the pope, who being a fallible man, might err, as St Peter, the most perfect of his predecessors, had done.

The court of Rome were equally assiduous in the mean time to crush the author of these new doctrines which gave them so much uneasiness. A bull was issued by the pope, of a date prior to Luther's appeal, in which he magnified the virtues of indulgences, and subjected to the heaviest ecclesiastical censures all who presumed to teach a contrary doctrine. Such a clear decision of the sovereign pontiff against him might have been very fatal to Luther's cause; but not the death of the emperor Maximilian, which happened on January 17, 1519, contributed to give matters a different turn. Both the principles and interest of Maximilian had prompted him to support the authority of the see of Rome; but, in consequence of his death, the vicariate of that part of Germany which is governed by the Saxon laws devolved to the elector of Saxony; and, under the shelter of his friendly administration, Luther himself enjoyed tranquillity; and his opinions took such root in different places, that they could never afterwards be eradicated. At the same time, as the election of an emperor was a point more interesting to the pope (Leo X.) than a theological controversy which he did not understand, and of which he could not foresee the consequences, he was so extremely solicitous not to irritate a prince of such considerable influence in the electoral college as Frederick, that he discovered a great unwillingness to pronounce the sentence of excommunication against Luther, which his adversaries continually demanded with the most clamorous importunity.

From the reason just now given, and Leo's natural aversion to severe measures, a suspension of proceeding against Luther took place for 18 months, though perpetual negotiations were carried on during this interval in order to bring the matter to an amicable issue. The manner in which these were conducted having given our reformer many opportunities of observing the corruption of the court of Rome, its obstinacy in adhering to established errors, and its indifference about truth, however clearly proposed or strongly proved, he began, in 1520, to utter some doubts with regard to the divine original of the papal authority, which he publicly disputed with Ecius, one of his most learned and formidable antagonists. The dispute was indecisive, both parties claiming the victory; but it must have been very mortifying to the partizans of the Romish church to bear such an essential point of their doctrine publicly attacked.

The papal authority being once suspected, Luther proceeded to push on his inquiries and attacks from one doctrine to another, till at last he began to shake the firmest foundations on which the wealth and power of the church were established. Leo then began to perceive that there were no hopes of reclaiming such an incorrigible heretic; and therefore prepared to denounced the sentence of excommunication against him. The college of cardinals was often assembled, in order to prepare the sentence with due deliberation; and the ablest canonists were consulted how it might be expressed with unexceptionable formality. At last it was issued on the 15th of June 1520. Forty-one propositions, extracted out of Luther's works, were therein condemned as heretical, scandalous, and offensive to pious ears; all persons were forbidden to read his writings, upon pain of excommunication; such as had any of them in their custody were commanded to commit them to the flames; he himself, if he did not, within 60 days, publicly recant his errors, and burn his books, was pronounced an obstinate heretic, excommunicated, and delivered to Satan for the destruction of the flesh: and all secular princes were required, under pain of incurring the same censure as the depraved person, that he might be punished as his crimes deserved.

Luther was not in the least disconcerted by this sentence, which he had for some time expected. He renewed his appeal to a general council; declared the pope to be that antichrist, or man of sin, whose appearance is foretold in the New Testament; declaimed against his tyranny with greater vehemence than ever; and at last, by way of retaliation, having assembled all the professors and students in the university of Wittenberg, with great pomp, and in the presence of a vast multitude of spectators, he cast the volumes of the canon law, together with the bull of excommunication, into the flames. The manner in which this action was justified gave still more offence than the action itself. Having collected from the canon laws some of the most extravagant propositions with regard to the plenitude and omnipotence of the pope's power, as well as the subordination of all secular jurisdiction to his authority, he published these with a commentary, pointing out the impiety of such tenets, and their evident tendency to subvert all civil government.

On the accession of Charles V. to the empire, Luther found himself in a very dangerous situation. Charles, in order to secure the pope's friendship, had determined to treat him with great severity. His eagerness to gain this point, rendered him not averse to gratify the papal legates in Germany, who insisted, that without any delay or formal deliberation, the diet then sitting at Worms ought to condemn a man whom the pope had already excommunicated as an incorrigible heretic. Such an abrupt manner of proceeding, however, being deemed unprecedented and unjust by the members
members of the diet, they made a point of Luther's appearing in person, and declaring whether he adhered or not to those opinions which had been drawn upon him the censures of the church. Not only the emperor, but all the princes through whose territories he had to pass, granted him a safe-conduct; and Charles wrote to him at the same time, requiring his immediate attendance on the diet, and renewing his promises of protection from any injury or violence. Luther did not hesitate a moment about yielding obedience; and set out for Worms, attended by the herald who had brought the emperor's letter and safe-conduct. While on his journey, many of his friends, whom the fate of Huss, under the same circumstances, had taught to attach the same security of an imperial safe-conduct, filled with solicitous advice, and entreated him not to rush wantonly into the midst of danger. But Luther, superior to such terrors, silenced them with this reply, "I am lawfully called (said he) to appear in that city; and thither will I go in the name of the Lord, though as many devils as there are tiles on the houses were there combined against me."

The reception which he met with at Worms, was such as might have been reckoned a full reward of all his labours, if vanity and the love of applause had been the principles by which he was influenced. Greater crowds assembled to behold him than had appeared at the emperor's public entry; his apartments were daily filled with princes and personages of the highest rank; and he was treated with an homage more sincere, as well as more flattering, than any which pre-eminence in birth or condition can command. At his appearance before the diet, he behaved with great decorum, and with equal firmness. He readily acknowledged an excess of oratory and vehemence in his controversial writings; but refused to retract his opinions unless he were convinced of their falsehood, or to consent to their being tried by any other rule than the word of God. When neither threats nor intrigues could prevail on him to depart from this resolution, some of the ecclesiastics proposed to imitate the example of the council of Constance, and by punishing the author of this pestilent heresy, who was now in their power, to deliver the church at once from such an evil. But the members of the diet refusing to expose the German integrity to fresh reproach by a second violation of public faith, and Charles being no less unwilling to bring a stain upon the beginning of his administration by such an ignominious action, Luther was permitted to depart in safety. A few days after he left the city, a severe edict was published in the emperor's name, and by authority of the diet, depriving him, as an obstinate and excommunicated article, of all the privileges which he enjoyed as a subject of the empire, forbidding any prince to harbour or protect him, and requiring all to seize his person as soon as the term specified in his protection should be expired.

But this vigorous decree had no considerable effect; the execution of it being prevented partly by the multiplicity of occupations which the commotions in Spain, together with the wars in Italy and the Low Countries, created to the emperor; and partly by a prudent precaution employed by the elector of Saxony, Luther's faithful patron. As Luther, on his return from Worms, was passing near Altenstrain in Thuringia, a number of horsemen in masks rushed suddenly out of a wood, where the elector had appointed them to lie in wait for him, and surrounding his company, carried him, after dismissing all his attendants, to Wortenburg, a strong castle not far distant. There the elector ordered him to be supplied with everything necessary or agreeable; but the place of his retreat was carefully concealed, until the fury of the present storm against him began to abate, upon a change in the political system of Europe. In this solitude, where he remained nine months, and which he frequently called his Patmos, after the name of that island to which the apostle John was banished, Luther found his usual vigour and industry in defence of his doctrines, or in composition of his adversaries, publishing several treatises, which revived the spirit of his followers, astonished to a great degree and disheartened at the sudden disappearance of their leader.

Luther, weary at length of his retirement, appeared publicly again at Wittemberg, upon the 6th of March 1522. He appeared indeed without the elector's leave; but immediately wrote him a letter to prevent his taking it ill. The edict of Charles V. as severe as it was, had given little or no check to Luther's doctrine; for the emperor was no sooner gone to Flanders, than his edict was neglected and despised, and the doctrine seemed to spread even faster than before. Carolostadius, in Luther's absence, had pushed things on faster than his leader; and had attempted to abolish the use of mass, to remove images out of the churches, to set aside auricular confession, invocation of saints, the abstaining from meats; had allowed the monks to leave their monasteries, to neglect their vows, and to marry; in short, had quite changed the doctrine and discipline of the church at Wittemberg: all which, though not against Luther's sentiments, was yet blamed by him, as being rashly and unseasonably done. Lutheranism was still confined to Germany: it was not got to France; and Henry VIII. of England made the most rigorous acts to hinder it from invading his realm. Nay, he did something more: to show his zeal for religion and the holy see, and perhaps his skill in theological learning, he wrote a treatise Of the seven sacraments, against Luther's book Of the captivity of Babylon; which he presented to Leo X. in October 1521. The pope received it very favourably; and was so well pleased with the king of England, that he complimented him with the title of Defender of the Faith. Luther, however, paid no regard to his kingship: but answered him with great sharpness, treating both his person and performance in the most contemptuous manner. Henry complained of Luther's rude usage of him to the princes of Saxony; and Fisher, bishop of Rochester, replied to his answer, in behalf of Henry's treatise: but neither the king's complaint, nor the bishop's reply, was attended with any visible effects.

Luther, though he had put a stop to the violent proceedings of Carolostadius, now made open war with the pope and bishops: and, that he might make the people despise their authority as much as possible, he wrote one book against the pope's bull, and another against the order falsely called the order of bishops. The same year, 1522, he wrote a letter, dated July the 29th to the assembly of the states of Bohemia;
in which he assured them that he was labouring to establish their doctrine in Germany, and exhorited them not to return to the communion of the church of Rome; and he published also this year, a translation of the New Testament in the German tongue, which was afterwards corrected by himself and Melanchthon. This translation having been printed several times, and being in every body's hands, Ferdinand archduke of Austria, the emperor's brother, made a very severe edict, to hinder the farther publication of it; and forbade all the subjects of his imperial majesty to have any copies of it, or of Luther's other books. Some other princes followed his example; and Luther was so angry at it, that he wrote a treatise Of the secular power, in which he accuses them of tyranny and impiety. The diet of the empire was held at Nuremberg, at the end of the year; to which Hadrian VI. sent his brief, dated November the 23th: for Leo X. died upon the 2d of December 1521, and Hadrian had been elected pope upon the 9th of January following. In this brief, among other things, he observes to the diet, how he had heard with regret of the sentence of Leo X. which was ordered to be executed by the edict of Worms, continued to teach the same errors, and daily to publish books full of heresies: that it appeared strange to him, that so large and so religious a nation could be seduced by a wretched apostate friar: that nothing, however, could be more pernicious to Christendom; and that therefore he exhorits them to use their utmost endeavours to make Luther, and the authors of these tumults, return to their duty: or, if they refuse and continue obstinate, to proceed against them according to the laws of the empire, and the severity of the last edict.

The resolution of this diet was published in the form of an edict, upon the 6th of March 1523; but it had no effect in checking the Lutherans, who still went on in the same triumphant manner. This year Luther wrote a great many pieces: among the rest, one upon the dignity and office of the supreme magistrate; which, as Dr. Fox hath observed, upon the Louvois is said to have been highly pleased with. He wrote also a treatise about the same time, a writing in the German language to the Waldenses, or Pickards, in Bohemia and Moravia, who had applied to him "about worshipping the body of Christ in the eucharist." He wrote also another book, which he dedicated to the senate and people of Prague, "about the institution of ministers of the church." He drew up a form of saying mass. He wrote a piece, entitled, An example of Papish doctrine and divinity; which Dupin calls a contrary against nuns and those who profess a monastic life. He wrote also against the vows of virginity, in his preface to his commentary on 1 Cor. viii. And his exhortations here were, it seems, followed with effects; for soon after, nine nuns, among whom was Catharine de Bore, eloped from the nunneri Nimpetschen, and were brought, by the assistance of Leonard Ceppen, a burgess of Torgau, to Wittenberg. Whatever offence this proceeding might give to the Papists, it was highly extolled by Luther; who, in a book written in the German language, compares the deliverance of these nuns from the slavery of a monastic life to that of the souls which Jesus Christ has delivered by his death. This year Luther had occasion to canonize two of his followers, who, as Melchior Adam relates, were burnt at Brusel in the beginning of July, and were the first who suffered martyrdom for his doctrine. He wrote also a consolatory epistle to three noble ladies at Misina, who were banished from the duke of Saxony's court at Friburg, for reading his books.

In the beginning of the year 1524, Clement VII. sent a legate into Germany to the diet, which was to be held at Nuremberg. Hadrian VI. died in October 1523, and was succeeded by Clement upon the 19th of November. A little before his death he canonized Benno, who was bishop of Meissen in the time of Gregory VII. and one of the most zealous defenders of the holy see. Luther, imagining that this was done directly to oppose him, drew up a piece with this title, Against the New Idol and Old Devil set up at Meissen; in which he treats the memory of Gregory with great freedom, and does not spare even Hadrian. Clement VII.'s legate represented to the diet of Nuremberg the necessity of enforcing the execution of the edict of Worms, which had been strangely neglected by the princes of the empire; but the legate's solicitations, which were very pressing, the decrees of that diet were thought so ineffectual, that they were condemned at Rome, and rejected by the emperor. It was in this year that the dispute between Luther and Erasmus, about free-will, began. Erasmus had been much courted by the Papists to write against Luther; but he was all along of opinion, that writing would not be found an effectual way to end the differences and establish the peace of the church. However, tired out at length with the importunities of the pope and the Catholic princes, and desirous at the same time to clear himself from the suspicion of favouring a cause which he would not seem to favour, he resolved to write against Luther, though, as he tells Melanchthon, it was with some reluctance, and chose free-will for the subject. His book was entitled, A Disputa, or Conference about Free-will; and was written with much moderation, and without personal reflections. He tells Luther in the preface, "That he ought not to take his disserting from him, in opinion illiberal, he had allowed himself the liberty of differing from the judgment of popes, councils, universities, and doctors of the church." Luther was some time before he answered Erasmus's book; but at last published a treatise De Servo Arbitrio, or Of the Servitude of Man's Will; and though Melanchthon had promised Erasmus, that Luther should answer him with civility and moderation, yet Luther had so little regard to Melanchthon's promise, that he never wrote any thing sharper. He accused Erasmus of being careless about religion, and little solicitous what became of it, provided the world continued in peace; and that his notions were rather philosophical than Christian. Erasmus immediately replied to Luther in a piece called Hyperaspistes; in the first part of which he answers his arguments, and in the second his personal reflections.

In October 1524, Luther threw off the monastic habit; which, though not premeditated and designed, yet a very proper preparative to a step he took the year after; we mean, his marriage with Catharine de Bore. Catharine de Bore was a gentleman's daughter, who had been a nun, and was taken, as we have observed, out of the nunneri Nimpetschen, in the year
that Catharine de Bore was brought to bed soon after her marriage with Luther; but Erasmus, who had wrote that news to his friends, acknowledged the falsity of it a little after.

His marriage, however, did not retard his activity and diligence in the work of reformation. He revised the Augsburg confession of faith, and apologised for the Protestants, when the Protestant religion was first established on a firm basis. See Protestants and Reformation.

After this, Luther had little else to do than to sit down and contemplate the mighty work he had finished: for that a single monk should be able to give the church so rude a shock, that there needed but such another entirely to overthrow it, may very well seem a mighty work. He did indeed little else: for the remainder of his life was spent in exhorting princes, states, and universities, to confirm the reformation which had been brought about through him; and publishing from time to time such writings as might encourage, direct, and aid them in doing it. The emperor threatened temporal punishment with armies, and the pope eternal with bulls and anathemas; but Luther cared for none of their threats. His friend and coadjutor Melancthon was not so indifferent; for Melancthon had a great deal of softness, moderation, and diffidence in his make, which made him very uneasy, and even sorrowful, in the present disorders. Hence we find many of Luther's letters written on purpose to support and comfort him under these several distresses and anxieties.

In the year 1533, Luther wrote a consolatory epistle to the citizens of Ochats, who had suffered some hardships for adhering to the Augsburg confession of faith: in which, among other things, he says, "The devil is the host, and the world is his inn; so that wherever you come, you shall be sure to find this ugly host." He had also about this time a terrible controversy with George duke of Saxony, who had such an aversion to Luther's doctrine, that he obliged his subjects to take an oath that they would never embrace it. However, 60 or 70 citizens of Leipsic were found to have deviated a little from the Catholic way in some point or other, and they were known previously to have consulted Luther about it; upon which George complained to the elector John, that Luther had not only abused his person, but also preached up rebellion among his subjects. The elector ordered Luther to be acquainted with this; and to be told at the same time, that if he did not clear himself of the charge, he could not possibly escape punishment. But Luther easily refuted the accusation, by proving, that he had been so far from stirring up his subjects against him, on the score of religion, that, on the contrary, he had exhorted them rather to undergo the greatest hardships, and even suffer themselves to be banished.

In the year 1534, the Bible translated by him into German was first printed, as the old privilege, dated at Bibliopolis, under the elector's hand, shows: and it was published the year after. He also published this year a book against masses and the consecration of priests, in which he relates a conference he had with the devil upon those points; for it is remarkable in Luther's whole history, that he never had any conflicts of any kind within, but the devil was always his antagonist.
Luther. In February 1537, an assembly was held at Smalkald about matters of religion, to which Luther and Melanchthon were called. At this meeting Luther was seized with so grievous an illness, that there were no hopes of his recovery. He was afflicted with the stone, and had a stoppage of urine for 11 days. In this terrible condition he would needs undertake to travel, notwithstanding all that his friends could say or do to prevent him: his resolution, however, was unshaken, and with a good effect: for the night after his departure he began to be better. As he was carried along, he made his will, in which he bequeathed his detestation of Popery to his friends and brethren; agreeably to what he often used to say: *Pestis erat in se Deus et in me morte tua, papal.* That is, "I was the plague of Popery in my life, and shall continue to be so in my death."

This year the pope and the court of Rome, finding it impossible to deal with the Protestants by force, began to have recourse to stratagem. They affected therefore to think, that though Luther had indeed carried things on with a high hand and to a violent extreme, yet what he had pleaded in defence of these measures was not entirely without foundation. They talked with a seeming show of moderation: and Pius III. who succeeded Clement VII. proposed a reformation first among themselves, and even went so far as to fix a place for a council to meet at for that purpose. But Luther treated this fiction as they deserved to be treated; unmasked and detected it immediately; and, to ridicule it the more strongly, caused a picture to be drawn, in which was represented the pope seated on high upon a throne, some cardinals about him with foxes tails on, and seeming to evacuate upwards and downwards (sursum deorum repurgare, as Melchior Adam expresses it). This was fixed over against the title-page, to let the readers see at once the scope and design of the book; which was, to expose that cunning and artifice with which those subtle politicians affected to cleanse and purify themselves from their errors and superstitions. Luther published about the same time A Conflation of the Pretended Grant of Constantine to Sylvester Bishop of Rome; and also some letters of John Huss, written from his prison at Constance to the Bohemians.

In this manner was Luther employed till his death, which happened in the year 1546. That year, accompanied by Melanchthon, he paid a visit to his own country, which he had not seen for many years, and returned again in safety. But soon after he was called thither again by the ears of Mansfeld, to compose some differences which had arisen about their boundaries. Luther had not been used to such matters; but because he was born at Eisleben, a town in the territory of Mansfeld, he was willing to do his country what service he could, even in this way. Preaching his last sermon therefore at Wittenberg, upon the 17th of January, he set off on the 23d; and at Hall in Saxony lodged with Justus Jonas, with whom he staid three days, because the waters were out. Upon the 28th, he passed over the river with his three sons and Dr Jonas; and being in some danger, he said to the Doctor, "Do not you think it would rejoice the devil exceedingly, if I and you, and my three sons, should be drowned?" When he entered the territories of the earls of Mansfeld, he was received by 100 horsemen or more, and conducted in a very honourable manner; but was at the same time so very ill, that it was feared he would die. He said, that these fits of sickness often came upon him when he had any great business to undertake: of this, however, he did not recover; but died upon the 18th of February, in the 63d year of his age. A little before he expired, he wrote a poem in praise of his countrymen; and at his request, his executors, in token of their respect for his death, published it in the month of August, 1546. Luther, as a means of propagating the Gospel, wrote a treatise, entitled "On the Council of Trent," and another on his "Catechism," which were published after his death.

A thousand lies were invented by the Papists about Luther's death. Some said that he died suddenly; others, that he killed himself; others, that the devil strangled him: others, that his corpse stunk so abominably, that they were forced to leave it in the way, as it was carried to be interred. Nay, lies were invented about his death, even while he was yet alive. Luther, however, to give the most effectual refutation of this account of his death, put forth an advertisement of his being alive; and, to be even with the Papists for the malice they had shown in this lie, wrote a book at the same time to prove, that "the papacy was founded by the devil."

Luther's works were collected after his death, and printed at Wittenberg in 7 vols. folio. Catharine de Bore survived her husband a few years; and continued the first year of her widowhood at Wittenberg, though Luther had advised her to seek another place of residence. She went from thence in the year 1547, when the town was surrendered to the emperor Charles V. Before her departure, she had received a present of 50 crowns from Christian III. King of Denmark; and the elector of Saxony, and the counts of Mansfeld, gave her good tokens of their liberality. With these additions to what Luther had left her, she had wherewithal to maintain herself and her family handsomely. She returned to Wittenberg, when the town was restored to the elector, where she lived in a very devout and pious manner, till the plague obliged her to leave it again in the year 1552. She sold what she had at Wittenberg, and retired to Torgau, with a resolution to end her life there. An unfortunate mishance befell her in her journey thither, which proved fatal to her. The horses growing unruly, and attempting to run away, she leaped out of the vehicle she was conveyed in; and, by leaping, got a fall, of which she died about a quarter of a year after, at Torgau, upon the 20th of December 1552. She was buried there in the great church, where her tomb and epitaph are still to be seen; and the university of Wittenberg, which was then at Torgau because the plague raged at Wittenberg,
LUTHERANISM, the sentiments of Martin Luther with regard to religion. See LUTHER.

Lutheranism has undergone some alterations since the time of its founder.—Luther rejected the epistle of St. James as inconsistent with the doctrine of St. Paul, in relation to justification; he also set aside the Apocalypse: both which are now received as canonical in the Lutheran church.

Luther reduced the number of sacraments to two, viz. baptism, and the eucharist: but he believed the impanation, or consubstantiation, that is, that the matter of the bread and wine remain with the body and blood of Christ; and it is in this article that the main difference between the Lutherans and English churches consists.

Luther maintained the mass to be no sacrifice; exploded the adoration of the host, auricular confession, meritorious works, indulgences, purgatory, the worship of images, &c. which had been introduced in the corrupt times of the Romish church. He also opposed the doctrine of free will, maintained predestination, and asserted our justification to be solely by the imputation of the merits and satisfaction of Christ. He also opposed the fastings in the Roman church, monastic vows, the celibate of the clergy, &c.

LUTHERANS, the Christians who follow the opinions of Martin Luther, one of the principal reformers of the church in the 16th century. See LUTHER.

The Lutherans, of all Protestants, are those who differ least from the Romish church; as they affirm, that the body and blood of Christ are materially present in the sacrament of the Lord's supper, though in an incomprehensible manner; and likewise represent some religious rites and institutions, as the use of images in churches, the distinguishing vestments of the clergy, the private confession of sins, the use of wafers in the formation of the Lord's supper, the form of exorcism in the celebration of baptism, and other ceremonies of the like nature, as tolerable, and some of them as useful. The Lutherans maintain, with regard to the divine decrees, that they respect the salvation or misery of men, in consequence of a previous knowledge of their sentiments and character, and not as free and unconditional, and as founded on the mere will of God. Towards the close of the last century, the Lutherans began to entertain a greater liberality of sentiment than they had before adopted; though in many places they persevered longer in severe and despotic principles than other Protestant churches.

Their public teachers now enjoy an unbounded liberty of dissenting from the decisions of those symbols or creeds which were once deemed almost infallible rules of faith and practice, and of declaring their dissent in the manner they judge the most expedient. Morstein attributes this change in their sentiments to the maxim which they generally adopted, that Christians were accountable to God alone for their religious opinions; and that no individual could be justly punished by the magistrate for his erroneous opinions, while he conducted himself like a virtuous and obedient subject, and made no attempts to disturb the peace and order of civil society.

LUTHERAN, in Architecture, a kind of window.
in 1692, and that of Nerwind in 1693. He died in Versailles in 1695.

LUXURIANS Flos. "a luxuriant or double flower;" a flower, some of whose parts are increased in number, to the diminution or entire exclusion of others.

The parts that are augmented or multiplied in luxuriant flowers, are the flower-cup and petals, which Linnaeus considers as the seguments or covers of the flower; the parts that are diminished, or entirely excluded, are the stamens or chives, which the same author denominates the male organs of generation.

Luxuriance in flowers is capable of the three following varieties.

1. A flower is said to be multiplied (flos multiplicatus), when the increase of the petals is not such as to exclude all the stamens: in this sense, flowers are properly said to be double, triple, or quadruple, according to the number of multiplications of the petals.

2. A flower is said to be full (flos plenus), when, by the multiplication of the petals, all the stamens are excluded. Such are most of the double flowers that engage the attention of florists.

3. A flower is said to be prolific (flos profliger), which produces flowers, and sometimes leaves, from its centre.

For a particular description of each of these kinds of luxuriance in flowers, see the articles Multipliactus Flos, Plenus Flos, and Profliger Flos.

Many natural orders of plants do not in any circumstances produce luxuriant flowers. Of this kind are the masqued flowers of Tournefort, excepting calve's-snout; the rough-leaved, umbelliferous, starry plants, and such as flower at the joints, of Ray: some umbelliferous flowers, however, are prolific.

The pea-bloom, or butterfly-shaped flowers, are rarely rendered double: some instances, however, of luxuriance, are observed in a species of lady's-finger, cornilila, and broom.

All luxuriant flowers are vegetable monsters. Such as are perfectly full, by which we mean the greatest degree of luxuriance, cannot be propagated by seeds; because these, for want of impregnation, can never ripen. Full flowers therefore are very properly denominated by Linnaeus eunuchus. This highest degree of luxuriance is very common in caraxation, lychnis, anemone, stook, Indian cress, rose, marsh marigold, ranunculus, violet, peony, and narcissus.

Flowers which do not exclude all the stamens, perfect their seeds. Of this kind are poppy, fean-flower, campanula, and some others.

Some flowers, as those of the water-lily, fig-marigold, and cactus, have many rows or series of petals, without the number of stamens being in the least diminished. Such flowers are by no means to be reckoned luxuriant, in the slightest degree.

Luxuriance in flowers is generally owing to excess of nourishment.

LUXURY: voluptuouness, or an extravagant indulgence in diet, dress, and equipage.

Luxury, among the Romans, prevailed to such a degree, that several laws were made to suppress, or at least limit it. The extravagance of the table began about the time of the battle of Actium, and continued in great excess till the reign of Galba. Peacock, crane of Malta, nightingales, venison, wild and tame fowl, were considered as delicacies. A profusion of provisions was the reigning taste. Whole wild boars were often served up, and sometimes they were filled with various small animals, and birds of different kinds: this dish they called the Trojan horse, in allusion to the wooden horse filled with soldiers. Fowls and game of all sorts were served up in whole pyramids, piled up in dishes as broad as moderate tables. Lucullus had a particular name for each apartment; and in whatever room he ordered his servants to prepare the entertainment, they knew by the direction the expense to which they were to go. When he supped in the Apollo, the expense was fixed at 50,000 drachmas, that is 1250l. M. Antony provided eight boars for 12 guests. Vitellius had a large silver platter, said to have cost a million of sesterces, called Minerva's buckler. In this he blended together the livers of gilt-heads, the brains of pheasants and peacocks, the tongues of pheniceters, and the milt of lampreys. Caligula served up to his guests pearls of great value dissolved in vinegar; the same was done also by Clodius the son of Asop the tragedian. Apicius laid aside 90,000,000 of sesterces, beside a mighty revenue, for no other purpose but to be sacrificed to luxury; finding himself involved in debt, he looked over his accounts, and though he had the sum of 10,000,000 of sesterces still left, he poisoned himself for fear of being starved to death.

The Roman laws to restrain luxury were Lex Orchia, Fannia, Didia, Licinia, Cornelia, and many others: But all these were too little; for as riches increased amongst them, so did sensuality.

What were the ideas of luxury entertained in England about two centuries ago, may be gathered from the following passage of Holinshed; who, in a discourse prefixed to his History, speaking of the increase of luxury, says, "Neither do I speak this in reproach of any man, God is my judge; but to show, that I do rejoice rather to see how God has blessed us with his good gifts, and to behold how that in a time wherein all things are grown to the most excessive prices, we yet do find means to obtain and achieve such furniture as heretofore was impossible. There are old men yet dwelling in the village where I remain, which have noted three things to be marvellously altered in England within their sound remembrance. One is the multitude of chimneys lately erected; whereas in their young days there were not above two or three, if so many, in most uplandish towns of the realm (the religious houses, and manor places of their lords, always excepted, and peradventure some great personages), but each made his fire against a reredos [skreen] in the hall, where he dressed his meat and dined. The second is the great amendment of lodging; for, said they, our fathers and we ourselves have bawl off upon straw pallets, each on a sheet, under coverlets made of a dogswaine or borhart orio (to use their own terms), and a good log under their head instead of a bolster. If it were so that the father or Goodman of the house had a mattrase, or flock bed and sheets, a sack of chaff to rest his head upon, he thought himself to be as well lodged as the lord of the town. So well were they contented, that pillows (said they) were thought meet only
tions controller, with many more noble officers; 1000
servitors, 62 cooks, 515 menial apparatus in the kit-
cchen. But such was the fortune of the man, that after
his extreme prodigality he died in the most abject but
unpitied poverty, victus jacuit in summa inopia.
And as to dress, luxury in that article seems to have
attained a great height long before Holinshed's time:
For in the reign of Edward III., we find no fewer than
seven sumptuary laws passed in one session of parlia-
ment to restrain it. It was enacted, that men servants of
lords, as also of tradesmen and artisans, shall be content
with one meal of fish or flesh every day; and the other
meals, daily, shall be of milk, cheese, butter and the
like. Neither shall they use any ornaments of gold,
silk, or embroidery; nor their wives and daughters any
veils above the price of twelvemore. Artisans and
yeomen shall not wear cloth above 40s. the whole piece
(finer than being about 6s. per piece), nor the or-
aments before named. Nor the women any veils of
silk, but only those of thread made in England. Gen-
tleman under the degree of knights, not having 100l.
yearly in land, shall not wear any cloth above 4½
marks the whole piece. Neither shall they or their fe-
males use cloth of gold, silver, or embroidery, &c.
But esquires having 200l. per annum or upwards of
rent, may wear cloths of five marks the whole piece
of cloth; and they and their females may also wear stuff
of silk, silver, ribbons, girdles, or furs. Merchants,
citizens, burghers, and artificers or tradesmen, as well
of London as elsewhere, who have goods and chattels
of the clear value of 500l. and their females, may wear
as is allowed to gentlemen and esquires of 100l. per an-
um. And merchants, citizens, and burgesses, worth
above 1000l. in goods and chattels, may (and their fe-
males) wear the same as gentlemen of 200l. per annum.
Knights of 200 marks yearly may wear cloth of six
marks the cloth, but no higher; but no cloth of gold,
nor furred with ermine: but all knights and ladies hav-
ing above 400 marks yearly, up to 1000l. per annum,
may wear as they please, ermine excepted: and the
may wear ornaments of pearl and precious stones for
their heads only. Clerks having degrees in cathedral,
colleges, &c. may wear as knights and esquires of the
same income. Plowmen, carters, shepherds, and such
like, not having 40s. value in goods or chattels, shall
wear no sort of cloth but blanket and russet lawn of 1d.
and shall wear girdles and belts; and they shall only
eat and drink suitable to their stations. And whose-
ever uses other apparel than is prescribed by the above
laws shall forfeit the same.
Concerning the general utility of luxury to a state,
there is much difference of opinion among political
writers. Baron Montesquieu asserts, that luxury is ne-
necessary in monarchies, as in France; but ruinous to
democracies, as in Holland. With regard therefore to
Britain, whose government is cojoined of both spe-
cies, it is held to be a dubious question, how far private
luxury is a public evil; and, as such, cognizable by
public laws. And indeed our legislators have several
times changed their sentiments as to this point; for for-
merly there were a number of penal laws existing to re-
strain excess in apparel, chiefly made in the reigns of
Edward III. IV. and Henry V. III., a specimen of which
we have inserted above. But all of them it appeared
expedient to repeal at an after period. In fact, although

luxury
Luxury will of necessity increase according to the influx of wealth, it may not be for the general benefit of commerce to impose, as in the above cited laws, an absolute prohibition of every degree of it; yet, for the good of the public, it may be necessary that such as go beyond proper bounds in eating, drinking, and wearing what by no means is suitable to their station, should be taxed accordingly, could it be done without including those who have a better title to such indulgence. This is certainly, however, a point which should be maturely weighed before executed; and, in mercantile countries at least, such restrains may be found prejudicial, most likely impracticable, especially where true liberty is established. Sir William Temple observes, speaking of the trade and riches, and at the same time of the frugality of the Hollanders, "That some of our maxims are not so certain as current policies: as that encouragement of excess and luxury if employed in the consumption of native commodities, is of advantage to trade. It may be so to that which impoverisheds, but not to that which enriches a country. It is indeed less prejudicial, if it lies in native than in foreign wares: but the humour of luxury and expense cannot stop at certain bounds; what begins in native will proceed to foreign commodities; and though the example arise among idle persons, yet the imitation will run into all degrees, even of those men by whose industry the nation subsists. And besides, the more of our own we spend, the less shall we have to send abroad: and so it will come to pass, that while we drive a vast trade, yet, by buying much more than we sell, we shall come to be poor at last."

LYCIA, or LIBYA, a name anciently given to all that part of Africa lying between the border of Egypt and the river Triton; and comprehending Cyrenaica, Mararamia, and the Regio Siculo. See these articles.

LYCEUM, Athens, in antiquity, the name of a celebrated school or academy at Athens, where Aristotle explained his philosophy. The place was composed of porticos and trees planted in the quinuexian form, where the philosophers disputed walking. Hence, philosophy of the Lyceum is used to signify the philosophy of Aristotle, or the Peripatetic philosophy. Suidas observes, that the Lyceum took its name from its having been originally a temple of Apollo Lyceus; or rather a portico or gallery built by Lyceus son of Apollo; but others mention it to have been built by Pisistratus or Pericles.

LYCIUS, in Ancient Geography, a mountain of Arcadia, sacred to Jupiter; whence Jupiter Lyceus (Pliny). Sacred also to Pan (Virgil); and hence Lycaon, the rites performed to Pan on this mountain; which Evander carrying with him to Latium, were called Lupercalia (Virgil).

LYCAON, in fabulous history, the first king of Arcadia, son of Pelasgus and Meliboea. He built a town called Lycomedes, on the top of Mount Lyceus, in honour of Jupiter. He had many wives, by whom he had a daughter called Callisto, and 50 sons. He was succeeded on the throne by Nyctimus, the eldest of his sons. He lived about 1820 years before the Christian era.—Another king of Arcadia, celebrated for his eruditions. He was changed into a wolf by Jupiter, because he offered human victims on the altar of the god Pan. Some attribute this metamorphosis to another cause. The sins of mankind, as they relate, were become so enormous, that Jupiter visited the earth to punish wickedness and impiety. He came to Arcadia, where he was announced as a god, and the people began to pay proper adoration to his divinity. Lycaon, however, who used to sacrifice all strangers to his wanton cruelty, laughed at the pious prayers of his subjects; and to try the divinity of the god, he served up human flesh on his table. This impiety so irritated Jupiter, that he immediately destroyed the house of Lycaon, and changed him into a wolf.

LYCAONIA, in Ancient Geography, a small country of the Hither Asia, contained between Pamphylia to the south, Cappadocia to the north, Pisidia and Phrygia to the west, and Armenia Minor to the east. Lycaonia, the people. This country, though situated very near Mount Taurus, and part of it on it, yet the Romans reckoned it in Asia intra Tarus. Arca-dia, anciently called Lycaonia (Stephanus).—Also an island in the Tiber, joined to Rome by a bridge, and to the land by another, namely, the Cestius and Fabri-cius.

LYCHNIUS, CAMPION, including also Catch-fly, &c.; a genus of plants belonging to the decandria class, and order pentagynia; and in the natural method ranking under the 22d order, Caryophyllaceae. See Botany Index.

LYCIA, a country of Asia Minor, bounded by the Mediterranean on the south, Caria on the west, Pamphylia on the east, and Phrygia on the north. It was anciently called Mixyae and Tretmis, from the Mi-lyae, or Solymi, a people of Crete, who came to settle there. The country received the name of Lycia from Lycus the son of Pandion, who established himself there. The inhabitants have been greatly commended by all the ancients for their sobriety and justice. They were conquered by Cresus king of Lydia, and afterwards by Cyrus. Though they were subject to the power of Persia, yet they were governed by their own kings, and only paid a yearly tribute to the Persian monarch. They became part of the Macedonian empire when Alexander came into the east, and afterwards were ceded to the house of the Seleucidae. The country was reduced into a Roman province by the emperor Claudius.

LYCIUM, a genus of plants belonging to the pentandria class; and in the natural method ranking under the 28th order, Lurideae. See Botany Index.

LYCODONTES, the petrified teeth of the lupus-piscis, or wolf-fish, frequently found fossil. They are of different shapes; but the most common kind rise into a seminary bicorn form, and are hollow within, somewhat resembling an acorn-cup; this hollow is found sometimes empty, and sometimes filled with the stratum in which it is immersed. Many of them have an outer circle of a different color from the rest.

LYCOMEDES, in fabulous history, a king of Scyros, an island in the Ægean sea. He was son of Apollo and Parthenope. He was secretly intrusted with the care of young Achilles, whom his mother Thetis had disguised in woman's clothes, to remove him from the Trojan war, where she knew he must unavoidably perish. Lycomedes has rendered himself famous for his treachery to Theseus, who had implored his protection.
LYCOPS, when driven from his throne of Athens by the usurper Menestheus. Lycomedes, as it is reported, either envious of the fame of his illustrious guest, or bribed by the emissaries of Menestheus, led Theseus to an elevated place, on pretense to show him the extent of his dominions, and perfidiously threw him down a precipice, where he was killed.

LYCOPHERON, a genus of plants belonging to the cryptogamia class. See Botany Index.

LYCOPERSICON. See Solanum, Botany Index.

LYCOPHRON, a famous Greek poet and grammarian, born at Colchis in Euboea, flourished about 304 B.C. and, according to Ovid, was killed by an arrow. He wrote 20 tragedies; but all his works are lost, except a poem entitled Cassandra, which contains a long train of predictions, which he supposes to have been made by Cassandra, Priam's daughter. This poem is extremely obscure. The best edition of it is that of Dr Potter, printed at Oxford in 1697, folio.

LYCOPODIUM, or Club-moss; a genus of plants belonging to the cryptogamia class. See Botany Index.

LYCOPOLIS, or Lycon, in Ancient Geography, so called from the worship of wolves. Lycopolis, the people; Lycopolitae, the district. There were two towns of this name, one in the Delta, or Lower Egypt, near the Mediterranean; the other in the Thebaïs, or Higher Egypt, in the northern part, to the west of the Nile.

LYCOPSIS, a genus of plants belonging to the pentandria class; and in the natural method ranking under the 41st order, Asperiformes. See Botany Index.

LYCOPUS, a genus of plants belonging to the diandria class; and in the natural method ranking under the 424th order, Verticillatae. See Botany Index.

LYCURGIA, a festival observed by the Spartans, in memory of their lawgiver Lycurgus, whom they honoured with a temple and anniversary sacrifice.

LYCURGUS, the celebrated legislator of the Spartans, was the son of Euonides, king of Sparta. He travelled to Greece to the isle of Crete, to Egypt, and even to the Indies; to converse with the sages and learned men of those countries, and to learn their manners, customs, and their laws. After the death of his brother Polydectes, who was king of Sparta, his widow offered the crown to Lycurgus, promising that she would make herself mistress of the child of which she was pregnant, provided he would marry her; but Lycurgus nobly refused these advantageous offers, and afterwards contented himself with being tutor to his nephew Cha-rillus, and restored to him the government when he came of age; but notwithstanding this regular and generous conduct, he was accused of a design to usurp the crown. This calumny obliged him to retire to the island of Crete, where he applied himself to the study of the laws and customs of nations. At his return to Lacedaemon, he reformed the government: and, to prevent the disorders occasioned by luxury and the love of riches, he prohibited the use of gold and silver; placed all the citizens in a state of equality; and introduced the strictest temperance, the most exact discipline, and those admirable laws which (a few exceptions) have been celebrated by all historians. It is said, that, to engage the Lacedaemonians to observe them inviolably, he made them promise with an oath not to change any part of them till his return; and that he afterwards went to the island of Crete, where he killed himself, after having ordered that his ashes should be thrown into the sea, for fear lest if his body should be carried to Sparta the Lacedaemonians would think themselves absolved from their oath. He flourished about 870 B.C.

LYDD, a town of England, in Kent, two miles and a half south-west of Romney, of which town and port it is a member, and 71 miles from London. It is a populous town, and is incorporated by the name of a bailiff, jurats, and commonalty. In the beach near Stone-end, is a heap of stones, fancied to be the tomb of Crispin and Crispianus; and near the sea is a place called Holmstone, consisting of beach and pebble-stones, which abounds with holm trees.

LYDGE, John, called the Monk of Bury; not, as Cibber conjectures, because he was a native of that place, for he was born about the year 1380, in the village of Lydgate, but because he was a monk of the Benedicent convent at St. Edmund's in the county of Suffolk. After studying some time in our English universities, he travelled to France and Italy: and, having acquired a competent knowledge of the languages of those countries, he returned to London, where he opened a school, in which he instructed the sons of the nobility in polite literature. At what time he retired to the convent of St Edmund's-Bury, does not appear; but he was certainly there in 1415. He was living in 1446, aged about 65; but in what year he died is not known. Lydgate, according to Pits, was an elegant poet, a persuasive rhetorician, an expert mathematician, an acute philosopher, and a tolerable divine. He was a voluminous writer; and, considering the age in which he lived, an excellent poet. His language is less obsolete, and his versification much more harmonious, than the language and versification of Chaucer, who wrote about half a century before him. He wrote: 1. History of the Theban war, printed at the end of Chaucer's works, 1561, 1602, 1697. 2. Poemata; of good counsel; at the end of Chaucer's works. 3. The lay of Hector; London 1594, folio, printed by Caxton, dedicated to Henry V. 4. Life of the blessed Virgin; printed by Caxton. 5. The proverbs of Lydgate upon the fall of princes; printed by Wink. Word. London, 160. 6. Dispute of the horse, the sheep, and the goose; printed in Caxton's Collect. 410. 7. The temple of brass; among the works of Chaucer. 8. London lickpenny; vide Stow's history, &c. &c. Besides an incredible number of other poems and translations preserved in various libraries, and of which the reader will find a catalogue in Bishop Tanner.

LYDIA, in Ancient Geography, a celebrated kingdom of Asia Minor. All the ancient writers tell us that Lydia was first called Mœa or Mœmia, from Mon or Phrygia and Lydia; and that it was known under no other denomination till the reign of Artaxerxes, when it began to be called Lydia from its son Lydus. Bochart finding in his learned collection of Phcenician words the word laugh, signifying "to-wind," and observing that the country was watered by the Maeander so famous for its windings, concludes that it was then named Lydia, or Lydus. As,
As to the ancient name of Mæonia, he takes it to be a Greek translation of the Phoenician word ἱνα; wherein he agrees in some measure with Stephanus, who derives the name of Mæonia from Mæon, the ancient name of the Maeander. Some take the word Mæonia to be a translation of a Hebrew word signifying "metal," because that country, say they, was in former times enriched above any other with mines. Though Lydia and Mæonia are by most authors indiscriminately used for one and the same country, yet they are sometimes distinguished; that part where Mount Tmolus stood, watered by the Pactolus, being properly called Mæonia; and the other, lying on the coast, Lydia. This distinction is used by Homer, Callimachus, Dionysius, and other ancient writers. In after ages, when the Ionians, who had planted a colony on the coast of the Egean sea, began to make some figure, that part was called Ionia, and the name of Lydia given to the ancient Mæonia—Lydia, according to Pliny, Ptolemy, and other ancient geographers, was bounded by Mysia and Caria to the north, by Caria on the south, by Phrygia Major on the east, and Ionia on the west, lying between the 37th and 39th degrees of north latitude. What the ancients style the kingdom of Lydia was not confined within these narrow boundaries, but extended from Halys to the Egean sea. Pliny's description includes Æolia, lying between the Hermus and the Caicus.

As to the origin of the Lydians, Josephus, and after him all the ecclesiastical writers, derive them from Lud, Shem's fourth son; but this opinion has no other foundation than the similitude of names. Some of the ancients will have the Lydians to be a mixed colony of Phrygians, Mysians, and Carians. Others finding some conformity in religion and religious ceremonies between the Egyptians and Tuscans who were a Lydian colony, conclude them, without any farther evidence, to be originally Egyptians. All we know for certain is, that the Lydians were a very ancient nation, as is manifest from their very fables; for Atys, Tantalus, Pelops, Niobe, and Arachne, are all said to have been the children of Lydus. And thus in his Lydiaca, quoted by Stephanus, informs us, that the ancient city of Ascalon, one of the five satrapies of the Philistines, mentioned in the books of Joshua and the Judges, was built by one Ascalus a Lydian, whose Achimius king of Lydia had appointed to command a body of troops which he sent, we know not on what occasion, into Syria. The Heracleidae, or kings of Lydia descended from Hercules, began to reign before the Trojan war; and had been preceded by a long series of sovereigns sprung from Atys, and hence styled Atyade; a strong proof of the antiquity of that kingdom.

The Lydians began very early to be ruled by kings, whose government seems to have been truly despotic, and the crown hereditary. We read of three distinct races of kings reigning over Lydia, viz. the Atyade, the Heracleidae, and the Mermnadæ.

The Atyade were so called from Atys the son of Coys, and grandson of Mars, the first Lydian king. But the history of this family is obscure and fabulous. The Atyade were succeeded by the Heracleidae, or the descendants of Hercules. For Hercules being, by the direction of the oracle, sold as a slave to Omphale a queen of Lydia, to expiate the murder of Iphitus, had, during his captivity, by one of her slaves, a son named Cleobates, whose grandson Argon was the first of the Heraclidae that ascended the throne of Lydia. This race is said to have reigned 505 years; the son succeeding the father for 22 generations. They began to reign about the time of the Trojan war. The last of the family was the unhappy Candaules, who lost both his life and kingdom by his imprudence: an event of which we have the following account from Herodotus. Candaules had a wife whom he passionately loved, and believed the most beautiful of her sex. He extolled her charms to Gyges his favourite, whom he used to intrust with his most important affairs; and the more to convince him of her beauty, resolved to show her to him quite naked; he accordingly placed him in the porch of her chamber where the queen used to undress when she went to bed, ordering him to retire after he should have seen her, and take all possible care not to be observed. But notwithstanding all the caution he could use, she plainly discovered him going out; and though she did not doubt but it was her husband's contrivance, yet she passed that night in a seeming tranquillity, suppressing her resentment till next morning, when she sent for Gyges, and resolutely told him that she must either by his death atone for the criminal action he had been guilty of, or put to death Candaules the contriver of it, and receive both her and the kingdom of Lydia for his reward. Gyges at first earnestly begged of her that she would not drive him to the necessity of such a choice. But finding that he could not prevail with her, and that he must either kill his master or die himself, he chose the former part of the alternative. Being led by the queen to the same place where her husband had posted him the night before, he stabbed the king while he was asleep, married the queen, and took possession of the kingdom, in which he was confirmed by the answer of the Delphic oracle. The Lydians having taken up arms to revenge the death of their prince, an agreement was made between them and the followers of Gyges, that if the oracle should declare him to be lawful king of Lydia, he should be permitted to reign; if not, he should resign the crown to the Heraclidae. The answer of the oracle proving favourable to Gyges, he was universally acknowledged for lawful king of Lydia. Candaules is said to have purchased a picture painted by Bularcas, representing a battle of the Magnetes, for its weight in gold; a circumstance which shows how early the art of painting began to be in request, for Candaules was contemporary with Romulus.

Gyges having thus possessed himself of the kingdom of Lydia, sent many rich and valuable presents to the oracle of Delphos; among others, six cups of gold weighing 30 talents, and greatly esteemed for the workmanship. He made war on Miletus and Smyrna, took the city of Colophon, and subdued the whole country of Troas. In his reign, and by his permission, the city of Abydos was built by the Milesians. Plutarch and other writers relate his accession to the crown of Lydia in a quite different manner, and tell us, without making any mention of the queen, that Gyges rebelled against Candaules and slew him in an engagement. In Gyges began the third race,
LYDIA [279]

race, called Meriones; who were also, properly speaking, Herculean, being descended from a son of Hercules by Omphale. Gyges reigned 38 years, and was succeeded by his son Ardyas.

This prince carried on the war against the Milesians which his father had begun, and possessed himself of Priene, in those days a strong city. In his reign the Cimmerians invaded and overran all Asia Minor; but what battles were fought against the Lydians and these invaders, and with what success, we find no where mentioned. Herodotus only informs us, that in the time of Ardyas they possessed themselves of Sardis, the metropolis of Lydia, but could never reduce the castle. Ardyas reigned 49 years, and was succeeded by his son Sadyattes, who reigned 12 years, and warred most part of his reign with the Milesians.

After him came his son Alyattes, who for the space of five years continued the war which his father had begun against the Milesians, ravaging their country, and about harvest time carrying away all their corn yearly, in order to oblige them, and want of provisions, to surrender their city, which he knew he could not reduce in any other way, the Milesians being at that time masters of the sea. In the 12th year of this war the Lydians having set fire to the corn in the fields, the flames were carried by a violent wind, which happened to blow at that time, to the temple of Minerva at Assesus, and burnt it down to the ground. Not long after, Alyattes falling sick, sent to consult the oracle at Delphos; which refused to return any answer till such time as the king should rebuild the temple of Minerva at Assesus. Alyattes, thus warned, despatched embassadors to Milesis, enjoining them to conclude a truce with the Milesians till the temple should be rebuilt. On the arrival of the embassadors, Thrasybulus, then king of Milesis, commanded all the corn that was at that time in the city to be brought into the market-place, ordering the citizens to banquet in public, and revel as if the city were plentifully stored with all manner of provisions. This stratagem Thrasybulus pursued with such success that the embassadors, seeing such quantities of corn, and the people everywhere diverting themselves, might acquaint their master with their affliction, and divert him from pursuing the war. As Thrasybulus had designed, so it happened; for Alyattes, who believed the Milesians greatly distressed for provisions, receiving a different account from his embassadors, changed the truce into a lasting peace, and ever afterwards lived in amity and friendship with Thrasybulus and the Milesians. He was succeeded after a reign of 57 years, by his son Croesus, whose uninterrupted prosperity, in the first years of his reign, far eclipsed the glory of his predecessors. He was the first that made war on the Ephesians, whose city he besieged and took, notwithstanding their consecrating it to Diana, and FASTening the walls by a rope to her temple, which was seven stadia distant from the city. After the reduction of Ephesus he attacked, under various pretences, the Ionians and Ætolians, obliquing them, and all the other Greek states of Asia, to pay him a yearly tribute. Having met with such extraordinary success by land, the Lydian prince determined to render his power equally conspicuous by sea. For this purpose he thought seriously of equipping a fleet, with which he proposed to invade and conquer the Grecian islands directly fronting his dominions. But this design, which, considering the slow progress in maritime power among the nations most diligent to attain it, would probably have failed of success, was prevented by the advice of a philosophical traveller, conveyed in such a lively turn of wit as easily changed the resolution of the king. Bias of Priene in Ionis, some say Pittacus of Mitylene in the isle of Lesbos, while he travelled after the Grecian custom, from curiosity and a love of knowledge, was presented to Croesus at the Lydian court; and being asked by that prince what news from Greece; he answered with a republican freedom, that the islanders had collected powerful squadrons of cavalry with an intention of invading Lydia. "May the gods grant (said Croesus), that the Greeks, who are unacquainted with horsemanship, should attack the disciplined valour of the Lydian cavalry; there would soon be an end to the contest." In the same manner (replied Bias), as if the Lydians, who are totally unexperienced in naval affairs, should invade the Greeks by sea. Struck by the prettiness of this unexpected observation, Croesus desisted from his intended expedition against the islands, and instead of employing new means for extending his conquests, determined peaceably to enjoy the laurels which he had won, and to display the grandeur which he had attained. But his happiness was soon after allayed by the death of his favourite son Alyta, who was unfortunately killed at the chase of a wild boar. For this loss he continued disconsolate for two years and in a state of inaction, till the conquests of Cyrus, and growing power of the Persians, roused up his martial spirit, and diverted his mind to other thoughts. He apprehended that the success which attended Cyrus in all his undertakings, might at last prove dangerous to himself, and therefore resolved to put a stop, if possible, to his progress. In taking this resolution, which might probably be attended with the most important consequences, he was desirous to learn the will of heaven concerning the issue of the war. The principal oracles which he consulted were those of Branchus in Ionia, of Hammon in Libya, and of Delphi in Greece. Among these respected shrines, the oracle of Delphi maintained its ascendancy, as the most faithful interpreter of fate. Croesus was fully persuaded of its veracity; and desirous generously to compensate for the trouble which he had already given, and still meant to give, the priests of Apollo, he sacrificed 3000 oxen to the god, and adorned his shrine with dedications equally valuable for the workmanship and for the materials; precious vessels of silver, ewers of iron beautifully inlaid and enamelled; various ornaments of pure gold, particularly a golden lion weighing ten talents, and a female figure three cubits or near five feet high. In return for these magnificent presents, the oracle, in ambiguous language, flattered Croesus with obtaining an easy victory over his enemies, and with enjoying a long life and a prosperous reign. The god at the same time enjoined him to contract an alliance with the most powerful of the Grecian states.

Elevated with these favourable predictions of Apollo, Croesus prepared to yield a ready obedience to the only condition required on his part for the accomplishment of his aspiring purpose. Not deeming himself sufficiently acquainted with the affairs of Greece, to know what particular
particular republic was meant by the oracle, he made particular inquiry of those best informed concerning the state of Europe; and discovered, that among all the members of the Grecian confederacy, the Athenians and Lacedaemonians were justly entitled to the pre-eminence. In order to learn which of these communities deserved the epithet of most powerful, it was necessary to send ambassadors into Greece. The Lydians despatched with this important commission, soon discovered that the Athenians after having been long harassed by internal dissensions, were actually governed by the tyrant Pisistratus. The Spartans, on the other hand, though anciently the worst regulated of all the Grecian communities, had enjoyed domestic peace and foreign prosperity ever since they had adopted the wise institutions of Lycurgus. After that memorable period, they had repeatedly conquered the warlike Argives, triumphed over the hardy Arcadians; and notwithstanding the heroic exploits of Aristomenes, subdued and enslaved their unfortunate rivals of Messene.

To the Lydian ambassadors, therefore, the Spartan republic appeared to be pointed out by the oracle, as the community whose alliance they were enjoined to solicit. Having repaired accordingly to Sparta, they were introduced not only to the kings and senate, but, as the importance of the negociation required, to the general assembly of the Lacedaemonians, to whom they, in few words, declared the object of their commission; “We are sent, O Lacedaemonians! by Cyrus, king of the Lydians and of many other nations, who commanded by the oracle of Apollo to seek the friendship of the most powerful people of Greece, now summons you, who justly merit that epithet, to become his faithful allies, in obedience to the will of the god whose authority you acknowledge.” The Lacedaemonians, pleased with the alliance of a warlike king, and still more with the fame of their valor, readily accepted the proposed alliance. To the purpose of an offensive and defensive league, they joined the more respected ties of sacred hospitality. A few years before this transaction, they had sent to purchase gold at Sardis for making a statue of Apollo. Cyrus had on that occasion gratuitously supplied their want. Remembering this generosity, they gave the Lydian ambassadors at their departure, as a present for their master, a vessel of brass containing 300 amphorae (above 12 hogheads), and beautifully carved on the outside with various forms of animals.

Cyrus, having thus happily accomplished the design recommended by the oracle, was eager to set out upon his intended expedition. He had formerly entered into alliance with Amasis king of Egypt, and Labynetus king of Babylon. He had now obtained the friendship of the most warlike nation of Europe. The newly raised power of Cyrus and the Persians seemed incapable of resisting such a formidable confederacy.

Elevated with these flattering ideas of his own invincible greatness, Cyrus waited not to attack the Persian dominions until he had collected the strength of his allies. The sanguine impetuousity of his temper, unexperienced in adversity, unfortunately precipitated him into measures no less ruinous than daring. Attended only by the arms of Lydia, and a numerous band of mercenaries, whom his immense wealth enabled him at any time to call into his service, he marched towards the river Halyss; and having crossed with much difficulty that deep and broad stream, entered the province of Cappadocia, which formed the western frontier of the Median dominions. That unfortunate country soon experienced all the calamities of invasion. The Pterian plain, the most beautiful and the most fertile district of Cappadocia, was laid waste; the ports of the Euxine, as well as several inland cities, were plundered; and the indolent inhabitants were either put to the sword or dragged into captivity. Encouraged by the unresisting softness of the natives of those parts, Cyrus was eager to push forwards; and if Cyrus did not previously meet him in the field, he had determined to proceed in triumph to the mountains of Persia. Against this dangerous resolution he was in vain exorted by a Lydian named Sandanus; who, when asked his opinion of the war, declared it with that freedom which the princes of the east have in every age permitted, amidst all the pride and caprices of despotical power, to men distinguished by the gifts of nature or education. “You are preparing, O king, to march against a people who lead a laborious and a miserable life; whose daily subsistence is often denied them, and is always scanty and precarious; who drink only water, and who are clothed with the skins of wild beasts. What can the Lydians gain by the conquest of Persia; they who enjoy all the advantages of which the Persians are destitute? For my part, I deem it a blessing of the gods, that they have not excited the warlike policy of these miserable barbarians to invade and plunder the luxurious wealth of Lydia.” The moderation of this advice was rejected by the fatal presumption of Cyrus; who confounding the dictates of experienced wisdom with the mean suggestions of pusillanimity, dismissed the counsellor with contempt.

Meanwhile, the approach of Cyrus, who was not of a temper to permit his dominions to be ravaged with impunity, afforded the Lydian king an opportunity of bringing the war to a more speedy issue than by his intended expedition into Persia. The army of Cyrus gradually augmented on his march: the tributary princes cheerfully contributing with their united strength towards the assistance of a master whose valor and generosity they admired, and who now took arms to protect the safety of his subjects, as well as to support the grandeur of his throne. Such was the rapidity of his movement, especially after being informed of the destructive ravages of the enemy in Cappadocia, that he arrived from the shores of the Caspian to those of the Euxine sea before the army of Cyrus had provided the necessaries for their journey. That prince, when apprised of the neighbourhood of the Persians, encamped on the Pterian plain; Cyrus likewise encamped at no great distance; frequent skirmishes happened between the light troops; and at length a general engagement was fought with equal fury and perseverance, and only terminated by the darkness of night. The loss on both sides hindered a renewal of the battle. The numbers, as well as the courage of the Persians, much exceeded the expectation of Cyrus. As they discovered not any intention to harass his retreat, he determined to move back towards Sardis, to spend the winter in the amusements of his pa
LYDIA

lace; and after summoning his numerous allies to his standard, to take the field early in the spring with such increase of force as seemed sufficient to overpower the Persians.

But this design was defeated by the careful vigilance of Cyrus. That experienced leader allowed the enemy to retire without molestation; carefully informing himself of every step which they took, and of every measure which they seemed determined to pursue. Patiently watching the opportunity of a just revenge, he waited until Croesus had re-entered his capital, and had disbanded the foreign mercenaries, who composed the most numerous division of his army. It then seemed the proper time for Cyrus to put his Persians in motion; and such was his celebrity, that he brought the first news of his own arrival in the plain of Sardis. Croesus, whose firmness might well have been shaken by the imminence of this unforeseen danger, was not wanting on the present occasion to the duties which he owed to the fame and the lustre of the Lydian throne. Throwing off his crown and the parts of his own person, he took up the arms of a heliotrope, and conducted the Persian forces, who had been long accustomed to victory, and who were animated with a high sense of national honour, burned with a desire of enjoying an opportunity to check the daring insolence of the invaders. Croesus indulged and encouraged this generous ardour. The Lydians in that age fought on horseback, armed with long spears; the strength of the Persians consisted in infantry. They were so little accustomed to the use of horses, that camels were almost the only animals which they employed as beasts of burden. This circumstance suggested to a Mede, by name Harpagus, a stratagem, which being communicated to Cyrus, was immediately adopted with approbation by that prince. Harpagus, having observed that horses had a strong aversion to the shape and smell of camels, advised the Persian army to be drawn up in the following order: All the camels which had been employed to carry baggage and provisions were collected into one body, arranged in a long line fronting the Lydian cavalry. The foot soldiers of the Persians were posted immediately behind the line, and placed at a due distance. The Median horse (for a few squadrons of these followed the standard of Cyrus) formed the rear of the army. As the troops on both sides approached to join battle, the Lydian cavalry, terrified at the unusual appearance of the camels, mounted with men in arms, were thrown into disorder, and turning their heads, endeavoured to escape from the field. Croesus, who perceived the confusion, was ready to despair of his fortune; but the Lydians, abandoning their horses, prepared with uncommon bravery to attack the enemy on foot. Their courage deserved a better fate; but unaccustomed as they were to this mode of fighting, they were received and repelled by the experienced valour of the Persian infantry, and obliged to take refuge within the fortified strength of Sardis, where they imagined themselves secure. The walls of that city bid defiance to the rude art of attack, as then practised by the most warlike nations. If the Persian army should invest it, the Lydians were provided with provisions for several years; and there was reason to expect, that in a few months, and even weeks, they would receive such assistance from Egypt, Babylonia, and Greece (to which countries they had already sent ambassadors), as would oblige the Persians to raise the siege.

The Lydian ministers despatched into Greece met with great sympathy from the Spartans. That people were particularly observant of the faith of treaties; and while they punished their enemies with unexampled severity, they behaved with generous compassion towards those whom they had once accepted for allies. They immediately resolved therefore to send him a speedy and effectual relief; and for this purpose assembled their troops, made ready their vessels, and prepared every thing necessary for the expedition.

The valour of the Spartans might perhaps have upheld the sinking empire of Lydia; but before their armament could set sail, Croesus was no longer a sovereign. Notwithstanding the strength of Sardis, that city had been taken by storm on the 20th day of the siege; the walls having been scaled in a quarter, which appearing altogether inaccessible, was too carelessly guarded. This was effected by the enterprise of Hyrcanes a Mede, who accidentally observed a crevice descending part of the rock in order to recover his helmet. Hyrcanes was a native of the mountainous province of Mardia, and being accustomed to clamber over the dangerous precipices of his native country, resolved to try his activity in passing the rock upon which he had discovered the Lydian. The design was more easily accomplished than he had reason to expect; emulation and success encouraged the bravest of the Persians to follow his example; these were supported by greater numbers of their countrymen; the garrison of Sardis was surprised; the citadel stormed; the rich capital of Lower Asia subjected to the vengeful rapacity of an indignant victor. Thus ended the ancient kingdom of Lydia, which continued subject to the Persians till they also were conquered by the Macedonians. For the fate of the Lydian monarch, see the article CROEUS.

LYDIAT, Thomas, a learned English divine, born in 1572, and educated at Oxford. About the year 1605, he became acquainted with Dr James Usher, afterwards archbishop of Armagh, who carried him to Ireland. He was at Dublin college for about two years, after which he returned to England; and the rectory of Alkington becoming vacant, he was presented to it: but at length, being engaged for the debts of a near relation, which for the present he was unable to pay, having before spent his patrimony in printing several books, he was sent to prison; and was confined at Oxford, in the King's Bench, and elsewhere, till Sir William Boswell, a generous patron of learned men, Dr Robert Pink, warden of New college, Bishop Usher, and Dr Laud, discharged the debt. In the civil wars, he suffered much in his rectory of Alkington from the parliament party; was four times pillaged to the value of at least 70l; and was forced for a quarter of a year together to borrow a shirt to shift himself. He died in 1646. He wrote some pieces in English, and many works in Latin, on chronology and natural history.

LYDIUS LAPIS, in the natural history of the ancients: the name of the stone used by way of touchstone for the trial of gold and silver, and called by some Herculis lapis; both of which names were also applied by the ancients to the loadstone; and hence has arisen
LYGEUM, a genus of plants belonging to the triandria class; and in the natural method ranking under the fourth order, Graminae. See Botany Index.

LYGII, Ligii, Lugii, or Logiones, in Ancient Geography, a people of Germany, to the west of the Vitula, where it forms a bend like a crescent; Liggis, (Dio); Lugii, (Strabo); Logiones, (Zosimus). Their name Lugii is conjectured to be derived from their mutually close confederacy or league. The Vitula was their boundary to the north, east, and south, with Mount Asciuburgius to the west. Now the whole of that country lies in Poland, on this side the Vitula.

LYING-IN WOMEN. See Midwifery.

LYING-TO, or Lying-by, the situation of a ship, when she is retarded in her course, by arranging the sails in such a manner as to counteract each other with nearly an equal effort, and render the ship almost immovable, with respect to her progressive motion, or headway. A ship is usually brought to by the main and fore top sails, one of which is laid aback, whilst the other is full; so that the latter pushes the ship forward, whilst the former resists this impulse, by forcing her astern. This is particularly practised in a general engagement, when hostile fleets are drawn up in two lines of battle opposite each other. It is also used to wait for some other ship, either approaching or expected; or to avoid pursuing a dangerous course, especially in dark or foggy weather.

LYME-REGIS, a sea port town of Dorsetshire in England, 148 miles from London. It lies near the sea, on the very borders of Devonshire, in a cavity between two rocky hills, which makes it difficult of access. As it lies on the declivity of a hill, the houses make a good show, rising one above another; and some of them are built of free-stone, and covered with blue slate. The number of inhabitants in 1811 was estimated at 1325. The corporation consists of a mayor (who is justice of peace during his mayoralty and the year after, and in the third year both justice and coroner), a recorder, 13 capital burgesses, and a town clerk. This place had formerly a very flourishing trade to France, Spain, the Straits, Newfoundland, and the West Indies. In which trade the customs amounted some years to 16,000l. But it stands on such a high steep rock, that the merchants are obliged to load and unload their goods at a place a quarter of a mile off, called the Cobb, originally built in the reign of Edward III. which costs a great sum to maintain, but forms such a harbour as perhaps is not to be equalled in the world, the ships being sheltered by a high thick stone wall, raised in the main sea, a great way from the shore, broad enough for carriages and warehouses, and the customhouse officers have one upon it. The cellars of the low part of the town, near the sea, are however often overflowed by the spring tides 10 or 12 feet. There are guns planted for the defence both of the Cobb and of the town, the shore here being very proper for batteries. The customhouse stands on pillars, with the corn market under it. There is an almshouse in Church-street, also Presbyterian and Anabaptist meeting-houses. The town hall is near Broad-street. The church stands at the east end of the town on a rising ground. The market here is on Friday, and there are two fairs in the year. We read, that in 774, the Saxon king Inwulf gave land hereabouts to the church of Sherborne, for the boiling of salt there to supply its necessities. At this place the duke of Monmouth landed in 1655. A few years ago above 2000l. worth of gold and silver coin of Char. I. and II. were discovered by some labourers.

LYMINGTON, a borough town of Hampshire in England, 97 miles south-west of London. It stands about a mile from the channel running between the main land and the isle of Wight; and has a harbour for vessels of considerable burden. The tide flows near a mile above the town. It has a market on Saturdays; and sends two members to parliament. The population in 1811 was estimated at 2641.

LYMPH, a fine colourless fluid, separated in the body from the mass of blood, and contained in peculiar vessels called lymphatics. See Anatomy.

LYMPHAEA, were artificial caves or grottos among the Romans, furnished with a great many tubes, canals, and various hydraulic apparatus through which the water gushed out upon the spectators unexpectedly whilst they were admiring the beautiful arrangement of the shell-work in the grotto.

LYMPHATHI, was a name given by the Romans to such as were seized with madness. It is supposed to be used for Nymphati, because the ancients imagined that every person who had the misfortune to see a Nymph was instantly struck with phrenzy. Lymphati may indeed signify "madmen," as derived from lympha, "water," over which element the Nymphs were thought to preside: But it appears most likely, that distracted people were called lymphati, from the circumstance of madmen's being affected with the hydrophobia or dread of water after the bite of a mad dog; for this peculiarity, in cases of canine madness, was unknown to the Romans.

LYNEUS, in fabulous history, one of the 50 sons of Aegus, married Hypermenestra, one of the 50 daughters of Danaus. See Hypermenestra.

LYNEUS, in fabulous history, one of the Argonauts, who went with Jason in the expedition to obtain the golden fleece. He was of great use to the Argonauts, by enabling them to avoid the sand banks and rocks they found in their way. The poets say, that Lyneus had so piercing a sight, that it could not only penetrate to the bottom of the sea, but even to hell. Some mythologists suppose, that this fable is taken from Lyneus's skill in observing the stars, and discovering the mines of gold and silver concealed in the earth.

LYNCURIOUM, a stone thought to be the same with...
Lynceum, "lynx," and ura, "urine."

LYNCURUSIUS LAPIS, a stone capable of producing mushrooms.

In the Ephemerides of the Curious, we find mention made of a stone, so called by Dr. John George Wockamerus, who saw one in Italy, which never ceases to produce in a few days mushrooms of an excellent flavour by the most simple and easy process imaginable. "It is (says he) of the bigness of an ox's head, rough and uneven on its surface, and on which also are perceived some clefs and crevices. It is black in some parts, and in others of a lighter and grayish colour. Internally it is porous, and nearly of the nature of the pumice-stone, but much heavier; and it contains a small piece of flint, which is so incorporated with it as to appear to have been formed at the same time the stone itself received its form. This gives room to judge, that those stones have been produced by a fat and viscous juice, which has the property of indurating whatever matter it infiltrates into. The stone here spoken of, when it has been lightly covered with earth, and sprinkled with warm water, produces mushrooms of an exquisite flavour, which are usually round, sometimes oval, and whose borders, by their inflexions and different curvities, represent in some measure human ears. The principal colour of these mushrooms is sometimes yellowish, and sometimes of a bright purple; but they are always disseminated with different spots, of a deep orange colour, or red brown; and when these spots are recent, and still in full bloom, they produce a very agreeable effect to the sight. But what appears admirable is, that the part of the stalk which remains adhering to the stone, when the mushroom has been separated from it, grows gradually hard, and petrifies in time, so that it seems that this fungites restores to the stone the nutritive juice it received from it, and that it thus contributes to its increase."

John Baptist Porta pretends, that this stone is found in several parts of Italy; and that it is not only to be met with at Naples, taken out of Mount Vesuvius, but also on Mount Panthericus, in the principality of Arelio; on Mount Garganus, in Apulia; and on the summits of some other very high mountains. He adds, that the mushrooms which grow on those sorts of stones, and are usually called fungites lynceurii, have the property of dissolving and breaking the stone of the kidneys and bladder; and that, for this purpose, nothing more is required than to dry them in the shade, and being reduced to powder, to make the patient, fasting, take a sufficient quantity of this powder in a glass of white wine, which will so cleanse the excretory ducts of the urine, that no stones will ever after be collected in them. As to the form of those mushrooms, their root is stony, uneven, divided according to its longitudinal direction, and composed of fibres as fine as hairs, interwoven one with another. Their form, on first shooting out, resembles a small bladder, scarce then larger than the bud of a vine; and if in this state they are squeezed between the fingers, an aqueous subacid liquor issues out. When they are at their full growth, their pedicle is of a finger's length, larger at top than at bottom, and becomes insensibly slenderer in proportion as it is nearer the earth. These mushrooms are also formed in an umbrella, and variegated with an infinity of little specks situated very near one another.

They are smooth and even on the upper part, but underneath leafy like the common mushrooms. Their taste is likewise very agreeable, and the sick are not debauched eating of them when they have been dressed in a proper manner. Curiosity having prompted some naturalists and physicians to submit these stones to a chemical analysis, in order to be more competent judges of the uses they might be put to in medicine, there first came forth, by distillation, an insipid water, and afterwards a spirituous liquor. The retort having been heated to a certain point, there arose an oil, which had nearly the smell and taste of that of guaiacum; and a very acid salt was extracted from the ashes.

LYNN-REGIS, a town of Norfolk, in England, distant 98 miles from London. It is a handsome, large, well-built place, and sends two members to parliament. It was a borough by prescription in 1298. King John, on account of its adherence to him against the barons, made it a free borough, with large privileges. He appointed it a provost, and gave it a large silver cup of 73 ounces doubly gilt and enamelled, and a large silver sword that is carried before the mayor; though this last, according to some, is Henry VIII's sword, which he gave to the town when he came into his hands by exchange with the bishop of Norwich; after which it was called King's Lynn, whereas before it was Bishop's Lynn. Henry III. made it a mayor town, for its serving him against the barons. It has had 15 royal charters; and is governed by a mayor, high-steward, under-steward, recorder, 12 aldermen, and 18 common-council men. It has two churches, besides St. Nicholas's, a chapel of ease to St. Margaret's, a Presbyterian and a Quakers meeting-house, with a bridewell or workhouse, and several almshouses, and a free school. In September 1741 the spires of its two churches were both blown down by a storm of wind; and that of St. Margaret's, which was 193 feet in height, having beat in the body of the church, it has been since rebuilt, towards which King George II. gave 1000l. and the late earl of Orford, then Sir Robert Walpole, 500l. This church was formerly an abbey, and afterwards one of the largest parish-churches in England. The town house, called Trinity-hall, is a noble old fabric; and so is the Exchange, which is of free-stone, with two orders of columns. St. Nicholas's chapel is very ancient, and reckoned one of the fairest and largest of the kind in England. It has a bell tower of free stone, and an octagonal spire over it, both which together are 170 feet from the ground. There is a library in it that was erected by subscription; and there is another at St. Margaret's. Here have been formerly several monasteries; but the only fabric remaining that belongs to any religious order is the Gray-friars steeple, a noted seacmark. The situation of this town, near the fall of the Ouse into the sea, after having received several other rivers, of which some are navigable, gives it an opportunity of extending its trade into eight different counties; by which many considerable cities and towns, viz. Peterborough, Ely, Stamford, Bedford, St. Ives, Huntingdon, St. Neot's, Northampton, Cambridge, St. Edmundsbury, and the north parts of Bucks, as well as the inland parts of Norfolk and Suffolk, are supplied with heavy goods, not only from our own
Lynn, regis, produce, as coals and salt from Newcastle, but also of merchandise imported from abroad, especially wine; of which two articles, viz. coals and wine, this is the greatest port for importation of any place on all the eastern coast of England; and those wherein the Lynn merchants deal more largely than any town in England, except London, Bristol, and Newcastle. In return for this, Lynn receives back all the corn which the counties just mentioned produce, for exportation; and therefore sends more of it abroad than any port except Hull. The foreign trade of the merchants here, is very considerable, especially to Holland, Norway, and the Baltic, and also to Spain and Portugal; and formerly they drove a good trade to France, till it was turned off, by treaties on one hand, and by prohibitions, high duties, &c. on the other, to Spain and Portugal. The harbour is safe when ships are in it, but difficult to enter by reason of the many flats and shoals in the passage; which, however, are well buoyed, and good pilots are always ready. The town consists of about 2400 houses; and appears to have been very strong, by the ruins of the works demolished in the civil wars. St Anne's platform at the north end mounts 12 great guns, and commands all the ships passing near the harbour; and towards the land, besides the wall, there is a ditch. Four rivulets run through the town; and the tide of the Ouse, which is about as broad here as the Thames at London bridge, rises 20 feet perpendicular. In the great market-place a statue was erected in 1686 to the honour of King James II. There is another spacious market-place, adorned with a statue of King William III. and a fine cross with a dome and gallery round it, supported by 16 pillars. The market-house is of free-stone, supported by 16 columns, and is 70 feet high, erected on four steps, nearly adorned with statues, &c. Every first Monday in the month, the mayor, aldermen, preachers, &c. meet to hear and determine all controversies amicably, for preventing law-suits. This was first established in 1283, and is called The Feast of Reconciliation. The markets are on Tuesdays and Saturdays; and it has two fairs; one of which, beginning Feb. 14, lasts for a fortnight, and is called Lynn mart; the other is a cheese fair on Oct. 6. The adherence of this town to King John and to Henry VIII. as above mentioned, are not the only instances of its loyalty to its sovereigns; for, in the late civil wars, it held out for King Charles I. and sustained a formal siege of above 15,000 men of the parliament army for above three weeks; but, for want of relief, was obliged to surrender, and submit to the terms of paying 100. a-head for every inhabitant, and a month's pay to the soldiers, to save the town from plunder. There are more gentry, and consequently more gaiety, in this town than in Yarmouth or even Norwich; there being such plenty of estabishes and drinkables, that Spelman says, Ceres and Bacchus seem to have established their magazines at this place; the east side abounding with corn, sheep, rabbits, hares, &c. the west side with cheese, butter, black cattle, swans, and the wild-fowl common to marshes, besides the abundance of sea and river fish; so that he thinks there is no place in Great Britain, if in Europe, has such a variety as on this small compass of ground. At a small distance from the town, stands a mount, called the Lady's or Red Mount, which was once a chapel dedicated to the Virgin Mary, which was a resting-place for pilgrims on their way towards her convent at Walsingham. The king's staithe-yard, or quay, where the greatest part of the imported wines is landed and put into large vaults, is a handsome square. People pass hence into the fen country, and over the famous washes into Lincolnshire in boats, which are often lost, by venturing out at an improper season and without guides. The population in 1811 was 10,239.

LYNX. See Felis, Mammalia Index.

LYON, King of Arms. See King, and Law, No. civii. 16.

This office is of great antiquity and respect in Scotland; and although the precise time of its institution is unknown, yet it must have been as early as the introduction of armorial figures as hereditary marks of gentility and distinction into this country, which was in the 12th century. His regalia are, a crown of gold, with a crimson velvet cap, a gold tassel, and an ermine lining: a velvet robe reaching to his feet, with the arms of the kingdom embroidered thereon before and behind in the proper tinctures; a triple row of gold chain round his neck, with an oval gold medal pendant thereon, on one side of which is the royal bearing, and on the other St Andrew with his cross enamelled in proper colours, and a baton of gold enamelled green, powdered with the badges of the kingdom. The lord lyon's rank is superior to that of any other king of arms, as he holds his office immediately from the sovereign by commission under the great seal; whereas the kings of arms in England are deputies to the earl marshal, and act under his authority. Formerly Scotland was divided into two provinces, the one on the north and the other on the south side of Forth; and these provinces were under the management of two deputies appointed by the lord lyon, to superintend the execution of all the business of his office. Before the Revolution, the lord lyon, at his admission into office, was most solemnly crowned by the sovereign or his commissioner, in presence of the nobility, the officers of state, and other great men, after a suitable sermon preached in the royal chapel; and his crown was of the same form with the imperial crown of the kingdom. On solemn occasions he wears the regalia above described; at all other times he wears the oval gold medal or badge on his breast, suspended by a broad green ribbon. He has the absolute disposal of all the offices in his own court, and of the heralds and pursuivants places. The messengers at arms throughout Scotland are also created by him, and are amenable to his jurisdiction. And the powers vested in him by his commission are the same with those of the sovereign in all matters relative to the marks of gentility.

LYONET, Peter, an ingenious naturalist, and member of several learned societies, was born at Maestricht, and was descended from a very ancient and respectable family of Lorrain. He had scarcely attained his seventh year before he displayed an uncommon strength and agility in all bodily exercises; but he was not less diligent in the improvement of his mind. Being placed at the Latin school, he learned chronology, and exercised himself in Latin, Greek, and French poetry, as also in Hebrew, logic, and the Cartesian physics. He was particularly fond of the study of languages,
Lyonet, whose he understood no less than nine living and dead. Having entered the university of Leyden, he studied the Newtonian philosophy, geometry, algebra, &c.; but his father (who was a clergyman), desiring he should attach himself to divinity, he reluctantly abandoned the former studies, as his passion for them was not easily to be overcome. He at the same time applied himself to anatomy, and also to music and drawing. He began afterwards to practise sculpture: and performed several pieces in wood, some of which are preserved, and have been greatly admired by the artists. After this, he betook himself to drawing portraits of his friends from life; wherein, after three or four months practice, he became a great proficient.

Having attained the degree of candidate in divinity, he resolved to study law, to which he applied himself so much zeal, that he was promoted at the end of the first year. Arrived at the Hague, he undertook the study of deciphering; and became secretary of the cyphers, translator of the Latin and French languages, and patent-master to their High Mightinesses. Meanwhile, having taken a strong liking to the study of insects, he undertook an historical description of such as are found about the Hague, and to that end collected materials for several volumes; and having invented a method of drawing adapted thereto, he enriched this work with a great number of plates, universally admired by all the connoisseurs who had seen them. In the year 1724 was printed at the Hague a French translation of a German work, the "Theology of Insects," by Mr. Leser. Love of truth engaged by Mr. Lyonet to defer the publication of this above-mentioned description, and to make some observations on that work, to which he has added two most beautiful plates, engraved from his designs. This performance caused his merit to be universally known and admired. The celebrated M. de Reaumur had the above translation reprinted at Paris, not so much on account of the work itself, as of Mr. Lyonet's observations; and bestowed on it, as did also many other authors, the highest encomiums. He afterwards executed drawings of the fresh water polypus for Mr. Trembley's beautiful work, 1744. The ingenious Wandelaar had engraved the first five plates; when Mr. Lyonet, who had never witnessed this operation, concerned at the difficulties he experienced in getting the remaining eight finished in the superior style he required, resolved to perform the task himself. He accordingly took a lesson of one hour of Mr. Wandelaar, engraved three or four small plates, and immediately began upon the work himself, which he performed in such a manner as drew on him the highest degree of praise, both from Mr. Trembley and from many other artists, particularly the celebrated Van Gucl, who declared that the performance astonished not only the amateurs, but also the most experienced artists. In 1748 he was chosen member of the Royal Society of London. In 1749 he began (by mere chance) his amazing collection of horns and shells, which, according to the universal testimony of all travellers and amateurs who have visited it, is at present the most beautiful, and certainly one of the most valuable in Europe. In 1753 he became member of the newly-established Dutch Society of Sciences at Haerlen; and in 1757, after the celebrated M. le Cat, professor in anatomy and surgery, and member of almost all the principal societies in Europe, had seen Mr. Lyonet's incomparable "Tractat Anatomique de la Chenille qui ronge le Bois de Saule," with the drawings belonging to it (which work was afterwards published), he was elected member of the Royal Academy of Sciences of Rome, whereof M. le Cat was perpetual secretary. After the publication of this treatise he became, in 1760, member of the Royal Academy of Sciences of Berlin; in 1761, of the Imperial Academy of Naturalists; and, in 1763, of the Imperial Academy of Sciences at St. Petersburg. In order to enable such as might be desirous of following him in his intricate and most astonishing discoveries respecting the structure of this animal, Mr. Lyonet published, in the Transactions of the Dutch Society of Sciences at Haerlen, a description and a plate (as he also afterwards did in French at the beginning of his "Tractat Anatomique") of the instrument and tools he had invented for the purpose of dissection, and likewise of the method he used to ascertain the degree of strength of his magnifying glasses. Notwithstanding all this labour, which was considerably increased by the extensive correspondence which he for many years carried on with several learned and respectable personages, he still found means to set apart a large proportion of his time (as he himself mentions it in his preface) for the immediate service of his country; but was not fortunate enough (as appears by his writings) to get any other recompense for his exertions than sorrow and disappointment.

During the last fifteen or twenty years of his life, Mr. Lyonet added to the valuable treasure he had already collected of natural curiosities, a most superb cabinet of paintings, consisting of more than 560 performances; among which are many of the most eminent works of the first Dutch masters. He did this with a view to procure himself some amusement during the latter part of his life, when old age and infirmities must weaken his powers, and set bounds to his activity. He had always indeed accustomed himself to employment, so much that he has written some pieces of Dutch poetry; and this disposition remained with him till within a fortnight of his death, when he was attacked with an inflammation in his breast, which, though apparently cured, was, in the end, the cause of his dissolution. He died at the Hague in January 1789, aged 83 years, leaving behind him a most estimable character.

LYONOS, a large province of France; bounded on the north by Burgundy; on the east, by Dauphiny, Bresse, and the principality of Dombes; on the south, by Vivarais and Velay; and on the west by Auvergne and a small part of Bourbonnais. It comprehends Lower Lyonnais, Beaujolais, and Forez; and it produces corn, wine, fruits, and more especially excellent chestnuts. The principal rivers are the Seine, the Rhone, and the Loire. Lyons is the capital town.

LYONS, a large, rich, ancient, and famous town of France, being the most considerable in the kingdom, next to Paris, with an archbishop's see, an academy of sciences and belles letters, and an academy of arts and sciences settled here in 1736. It is seated at the confluence of the rivers Rhone and Saone: on the side of
LYR

of it are two high mountains; and the mountain of St.
Sebastian serves as a bulwark against the north winds,
which often blow here with great violence. It con-
tains nearly 100,000 inhabitants; and the houses, in
general, are high and well built. It has six gates, and as
many suburbs. The town-house, the arsenal, the am-
phitheatre built by the ancient Romans, the hospital,
and the numerous palaces, are worthy of a traveller's
attention. The cathedral is a superb structure, and
the canons that compose the chapter are all persons of
distinction. It was a place of great trade, and was
especially distinguished by its silk manufactures, which
however have been greatly reduced by the Revolution.
It derives vast advantages from the rivers near it; and
is situated in E. Long. 4. 59. N. Lat. 45. 46. Lyons
was the scene of some of the horrid transactions of
the French revolution. See France.

LYRA, a species of fish. See Callionymus, Ich-
thyology Index.

LYRA, in Astronomy, a constellation in the north-
ern hemisphere. The number of its stars, in Ptole-
my's catalogue, is ten; in Tycho's eleven; in Heve-
lius's seventeen; and in the Britannic catalogue twenty
one.

LYRE, a musical instrument of the stringed kind,
much used by the ancients.

Concerning the number of strings with which this in-
strument was furnished, there is great controversy. Some
assert it to be only three; and that the sounds of the
two remote were acute, and that of the intermediate
one a mean between those two extremes; that Mer-
cury, the inventor, resembled those three chords to as
many seasons of the year, which were all that the Greeks
reckoned, namely, summer, winter, and spring: assign-
ing the acute to the first, the grave to the second, and
the mean to the third.

Others assert that the lyre had four strings; that the
interval between the first and the fourth was an octave;
that the second was a fourth from the first, and the fourth
the same distance from the third, and that from the sec-
tod to the third was a tone.

Another class of writers contend that the lyre of
Mercury had seven strings. Nicomachus, a follower
of Pythagoras, and the chief of them, gives the follow-
ing account of the matter: "The lyre made of the
shell was invented by Mercury; and the knowledge of
it, as it was constructed by him of seven strings, was
transmitted to Orpheus: Orpheus taught the use of it
to Thamyris and Linus; the latter of whom taught it
to Hercules, who communicated it to Amphion the
Theban, who built the seven gates of Thebes to the
seven strings of the lyre." The same author proceeds
to relate, "That Orpheus was afterwards killed by the
Thracian women; and that they are reported to have
had his lyre into the sea, which was afterwards thrown
up at Antissa, a city of Lesbos: that certain fishers
finding it, they brought it to Terpander, who carried
it into Egypt, exquisitely improved, and showing it to
the Egyptian priests, assumed to himself the honour of
its invention."

This difference among authors seems to have arisen
from their confusing together the Egyptian and the
Greek Mercury. The invention of the primitive
lyre with three strings was due to the first Egyptian

HERMES, as mentioned under that article.—The lyre
attributed to the Grecian Mercury is described by al-
most all the poets to be an instrument of seven strings "See Mer-
ccury.

Vincenzo Galilei has collected the various opinions of
the several Greek writers who have mentioned the in-
vention of the chelys or testudo; and the late Mr
Spence has done the same in a very circumstantial but
ludicrous manner. "Horace talks of Mercury as a
wonderful musician, and represents him with a lyre.
There is a ridiculous old legend relating to this inven-
tion, which informs us, that Mercury, after stealing
some bulls from Apollo, retired to a secret grove,
which he used to frequent, at the foot of a mountain
in Arcadia. Just as he was going in, he found a tor-
toise feeding at the entrance of his cave: he killed the
poor creature, and perhaps ate the flesh of it. As he
was diverting himself with the shell, he was mightily
pleased with the noise it gave from its concave figure.
He had possibly been cunning enough to find out, that
a thong pulled strait and fastened at each end, when
struck with the finger, made a sort of musical sound.
However that was, he went immediately to work, and
put several thongs out of the hide he had lately
stolen, and fastened them as tight as he could to the
shell of this tortoise; and, in playing with them, made
a new kind of music with them to divert himself in his
retreat." This, considered only as an account of the
first invention of the lyre, is not altogether so unnat-
ural.

The most ancient representations of this instrument
agree very well with the account of its invention: the
lyre, in particular on the old celestial globes, was
represented as made of one entire shell of a tortoise;
and that of Amphion in the celebrated group of the Dicre
or Toro, in the Farnese palace at Rome, which is of
Greek sculpture, and very high antiquity, is figured in
the same manner.

There have, however, been many other claimants to
the seven-stringed lyre. For though Mercury invent-
ed this instrument in the manner already related, it is
said he afterwards gave it to Apollo, who was the first
that played upon it with method, and made it the con-
stant companion of poetry. According to Homer's
account of this transaction, in his hymn to Mercury,
it was given by that god to Apollo, as a peace-offering
and indemnification for the oxen which he had stolen
from him:

To Pharus Musia's son presents the lyre,
A gift intended to appease his ire,
The god receives it gladly, and essays
The novel instrument a thousand ways;
With dexterous skill the plectrum wields; and sings
With voice accordant to the trembling strings,
Such strains as gods and men approv'd, from whence
The sweet alliance sprung of sound and sense.

Diodorus informs us, that Apollo soon repenting of
the cruelty with which he had treated Marsyas in con-
sequence of their musical contest, broke the strings of
the lyre, and by that means put a stop for a time to any
further progress in the practice of that new instrument.
"The Muses (adds he) afterwards added to this instru-
ment the string called mese; Linus, that of lichains; and
and Orpheus and Thamyris, those strings which are named hypate and parhypate (A).

Again, many ancient and respectable authors tell us, that, before the time of Terpander, the Grecian lyre had only four strings; and, if we may believe Suidas, it remained in this state 856 years, from the time of Amphiion, till Terpander added to it three new strings, which extended the musical scale to a heptachord, or seventh, and supplied the player with two conjoint tetrachords. It was about 150 years after this period, that Pythagoras is said to have added an eighth string to the lyre, in order to complete the octave, which consisted of two disjoint tetrachords.

Boeotius gives a different history of the scale, and tells us, that the system did not long remain in such narrow limits as a tetrachord. Chordebus, the son of Athis, or Athis, king of Lydia, added a fifth string; Hyagnis, a sixth; Terpander, a seventh; and at least Lychoon of Samos, an eighth. But all these accounts are irreconcileable with Homer's hymn to Mercury, where the chelys, or testudo, the invention of which he named after that god, is said to have had seven strings. There are many stories concerning the musicians of ancient Greece to the strings that were afterwards added to these, by which the scale, in the time of Aristoxenus, was extended to two octaves. Athenezus, more than once, speaks of the nine-stringed instrument; and Ion of Chios, a tragic and lyric poet and philosopher, who first recited his pieces in the 82nd Olympiad, 452 B. C. mentions, in some verses quoted by Euclid, the ten-stringed lyre; a proof that the third conjoint tetrachord was added to the scale in his time, which was about 150 years after Pythagoras is supposed to have constructed the octachord.

The different claimants among the Greeks to the same musical discoveries, only prove that music was cultivated in different countries, and that the inhabitants of each country invented and improved their own instruments, some of which happening to resemble those of other parts of Greece, rendered it difficult for historians to avoid attributing the same invention to different persons. Thus the single flute was given to Nereus and Marsyas; the syrinx or fluteula to Pan and to Cybele; and the lyre or cithara, to Mercury, Apollo, Amphiion, Linus, and Orpheus. Indeed, the mere addition of a string or two to an instrument without a neck, was so obvious and easy, that it is scarce possible not to conceive many people to have done it at the same time.

With respect to the form of the ancient lyre, as little agreement is to be found among authors as about the number of strings. The best evidences concerning it, are the representations of that instrument in the bands of ancient statues, bas reliefs, &c. See Plate CCXCVIII. CCXCVIII. where,

Fig. 1. is a representation of the testudo, or lyre of Fig. 1. Amphiion, in front, as it appears on the base of the celebrated Toro Farnese at Rome. This admirable work, consisting of four figures bigger than the life, besides the toro or bull, was found in Caracalla's baths, where the Farnese Hercules was likewise discovered; and, except the Laocoön, is the only piece of Greek sculpture mentioned by Pliny that is now remaining. The two projections near the bottom, seem to have been fastenings for the strings, and to have answered the purpose of tail-pieces in modern instruments.

Fig. 2. The lyre held by Terpsichore, in the picture Fig. 2. of that muse dug out of Herculanenum.

Fig. 3. The Abyssinian testudo, or lyre in use at pre-Fig. 3. sent in the province of Tigre, from a drawing of Mr Bruce, communicated to Dr. Burney. "This instrument (says he) has sometimes five, sometimes six, and most frequently seven strings, made of the thongs of raw sheep or goat skins, cut extremely fine, and twisted; they rot soon, are very subject to break in dry weather, and have scarce any sound in wet. From this idea, however, of this instrument being to accompany and sustain a voice, one would think that it was better mounted formerly. "The Abyssinians have a tradition, that the sistrum, lyre, and tambourine, were brought from Egypt into Ethiopia, by Thot, in the very first ages of the world. The flute, kettle-drum, and trumpet, they say, were brought from Palestine, with Meneche, the son of their queen of Saba by Solomon, who was their first Jewish king.

"The lyre in Amharic is called bog, 'the sheep;' in Ethiopia it is called mesinka; the verb sinko signifies to strike strings with the fingers: no plectrum is ever used in Abyssinia; so that mesinka, being literally interpreted, will signify the 'strung instrument played upon with the fingers.'

"The sides which constitute the frame of the lyre, were anciently composed of the horns of an animal of the goat kind, called agassen, about the size of a small cow,

© It has been already related, that the lyre invented by the Egyptian Mercury had but three strings; and, by putting these two circumstances together, Dr. Burney observes, we may perhaps acquire some knowledge of the progress of music, or at least, of the extension of its scale, in the highest antiquity.

Mesoe, in the Greek music, is the fourth sound of the second tetrachord of the great system, and first tetrachord invented by the ancients, answering to our A, on the fifth line in the base. If this sound then was added to the former three, it proves two important points; first, that the most ancient tetrachord was that from E in the base to A; and that the three original strings in the Mercenian and Apollonian lyre were tuned E, F, G, which the Greeks called Hypate Meson, Parhypate Mesin, Meson Diotomes. The addition therefore of Mesoe to these, completed the first and most ancient tetrachord, E, F, G, A.

The string lichamos, then, being added to these, and answering to our D on the third line in the base, extended the compass downwards, and gave the ancient lyre a regular series of five sounds in the Dorian mode, the most ancient of all the Greek modes; and the two strings called Hypate and Parhypate, corresponding with our B and C in the base, completed the heptachord, or seven sounds, B, C, D, E, F, G, A, a compass that received no addition till after the time of Pindar, who calls the instrument then in use the sevem-tongued lyre.
and common in the province of Tigre. I have seen several of these instruments very elegantly made of such horns, which nature seems to have shaped on purpose. Some of the horns of an African species of this animal may be seen in M. Buffon's history of the king of France's cabinet. They are bent, and less regular than the Abyssinian; but after fire-arms became common in the province of Tigre, and the woods were cut down, this animal being more scarce, the lyre has been made of a light red wood; however, it is always cut into a spiral twisted form, in imitation of the ancient materials of which the lyre was composed. The drawing I send you is one of these instruments made of wood.

The kingdom of Tigre, which is the largest and most populous province of Abyssinia, and was during many ages the seat of the court, was the first which received letters, and civil religious government; it extended once to the Red sea: various reasons and revolutions have obliged the inhabitants to resign their sea coast to different barbarous nations. Pagan and Mahometans: while they were possessed of it, they say that the Red sea furnished them with tortoise-shells, of which they made the bellies of their lyres, as the Egyptians did formerly, according to Apollodorus and Lucian; but having now lost that resource, they have adopted in its place a particular species of gourd, or pumpkin, very hard and thin in the bark, still imitating with the knife the squares, compartments, and figure of the shell of the tortoise.

The lyre is generally from three feet to three feet six inches high; that is, from a line drawn through the point of the horns, to the lower part of the base of the instrument as made. These instruments made of wood are generally light, and easy of carriage, as an instrument should naturally be in so rugged and mountainous a country.

When we consider the parts which compose this lyre, we cannot deny it the earliest antiquity. Man in his first state was a hunter and a fisher, and the oldest instrument was that which partsakes most of that state. The lyre, composed of two principal pieces, owes the one to horns of an animal, the other to the shell of a fish.

It is probable, that the lyre continued with the Ethiopians in this rude state as long as they confined themselves to their rainy, steep, and rugged mountains; and afterwards, when many of them descended along the Nile into Egypt, its portability would recommend it in the extreme heats and weariness of their way. Upon their arrival in Egypt, they took up their habitation in caves, in the sides of mountains, which are inhabited to this day. Even in these circumstances, an instrument larger than the lyre must have been inconvenient and liable to the caverns; but, when these people increased in numbers and courage, they ventured down into the plain, and built Thebes. Being now at their ease, and in a fine climate, all nature smiling around them, music and other arts were cultivated and refined, and the imperfect lyre was extended into an instrument of double its compass and volume. The size of the harp could be now no longer an objection; the Nile carried the inhabitants every where easily, and with such effort; and we may naturally suppose in the fine evenings of that country, that the Nile was the favourite scene upon which this instrument was practiced; at least the sphinx and lotus upon its head, seem to hint that it was somehow connected with the overflows of that river.” See Harp.

Fig. 4. An Etruscan lyre, with seven strings, in the collection of Etruscan, Greek and Roman antiquities, published from the cabinet of the Hon. Sir William Hamilton, Vol. I. Naples 1766. Plate CIX. With respect to this instrument, it is worthy of observation, that though the vase upon which it is represented is of such indubitable and remote antiquity, the tail-piece, bridge, belly and sound-holes, have a very modern appearance, and manifest a knowledge in the construction of musical instruments among the Etruscans, superior to that of the Greeks and Romans in much latter times. The lower part of the instrument has much the appearance of an old bass-viol, and it is not difficult to discover in it more than the embryo of the whole violin family. The strings lie round, as if intended to be played on with a bow; and even the cross lines on the tail-piece are such as we frequently see on the tie-pieces of old viols.

Fig. 5. The Tripodian lyre of Pythagoras the Zacythian, from a bass relief in the Maufi palace at Rome representing the whole choir of the muses. Athenæus gives the following account of this extraordinary instrument, Lib. XIV. cap. xv. p. 537. Many ancient instruments are recorded (says Artemon), of which we have so little knowledge, that we can hardly be certain of their existence; such as the tripod of Pythagoras the Zacythian, which, on account of its difficulty, continued in use but a short time. It resembled in form the Delphic tripod, whence it derived its name, which stands upon a moveable base that was turned by the foot of the player: the strings were placed between the legs of the stool; the vase at the top served for the purpose of a sound-board, and the strings of the three sides of the instrument were tuned to three different modes, the Doric, Lydian, and Phrygian. The performer sat on a chair made on purpose: striking the strings with the fingers of the left hand, and using the plectrum with the right, at the same time turning the instrument with his foot to whichever of the three modes he pleased; so that by great practice he was enabled to change the modes with such velocity, that those who did not see him would imagine they heard three different performers playing in three different modes. After the death of this admirable musician, no other instrument of the same kind was ever constructed.”

Fig. 6. A lyre in the famous ancient picture dug out of Herculaneum, upon which Chiron is teaching young Achilles to play. See CHIRON.

LYRICO POETRY, was such as the ancients sung to the lyre or harp.—It was originally employed in celebrating the praises of gods and heroes, and its characteristic was sweetness. Who was the author of it is not known. It was much cultivated by the Greeks: and Horace was the first who attempted it in the Latin language. Anacreon, Alceus, Stesichorus, Sappho, and Horace, were the most celebrated lyric poets of antiquity.

LYRODI, among the ancients, a kind of musicians who played on the lyre, and sung at the same time.
LYS, or LIS. See LIS.

LIS, the name of a measure used by the Chinese in estimating distances. Two hundred lis make 60 geographical miles, which are equal to one degree.

LYSANDER, a famous Spartan general. See SPARTA.

LYSANDRIA, a Samian festival, celebrated with games and sacrifices in honour of the Lacedaemonian general Lysander. It was antiquely called heres; but this name the Samians abolished by a public decree.

LYSIARCH, an ancient magistrate, who superintended the sacred games, and presided in matters of religion in the province of Lycia. He was created in a council consisting of deputies from all the provincial cities, in number 23. The lysiarchs were both heads of the council and pontiffs of the province.

LYSIAS, an ancient Grecian orator, was born at Syracuse in the 80th Olympiad. At 15, he went to Thurion, a colony of the Athenians; and when grown up, assisted in the administration of the government there many years. When about 47 years of age, he returned to Athens; whence, being afterwards banished by the 30 tyrants, he went to Megara. Upon his return, Thrasybulus would have had him employed again in state matters; but this not taking place, he spent the remainder of his life as a private man. He was very familiar with Socrates, and other illustrious philosophers. He professed to teach the art of speaking; not that he pleaded at the bar himself, but he supplied others with speeches. "Fuit Lysias in causis forensibus non versatus (says Cicero), sed egregie subtilissimus scriptor atque elegans, &c. Quintilian calls him, "sagax atque elegans, et quod nihil, si oratorio satis sit docet, genus perfectum. Nihil enim est inane, nihil accessitum; puro tamen fonti, quam magno fluminii, proprior." Plutarch and Photius relate, that 425 orations were formerly exhibited under the name of Lysias; of which 34 only are now extant. The best edition of them is by Dr John Taylor at London, 1739, 4to; Cambridge, 1740, 8vo.

LYSIMACHIA, LOOSESTRIFE, a genus of plants belonging to the pentandria class; and in the natural method ranking under the 20th order, Rotaceae. See BOTANY INDEX.

LYSIPPUS, a celebrated Greek statuary, was born at Sicome, and first followed the business of a locksmith, which he quitted in order to practice painting. But he afterwards applied himself entirely to sculpture; in which he acquired an immortal reputation, and made a great number of statues that were the admiration of the people of Athens and Rome. His grand statue of the Sun represented in a car drawn by four horses, was worshipped at Rhodes. He made several statues of Alexander and his favourites, which were brought to Rome by Metellus after he had reduced the Macedonian empire; and the statue of a man wiping and anointing himself after bathing, being particularly excellent, was placed by Agrippa before his baths in that city. He lived in the time of Alexander the Great, about 334 B.C.; and left three sons, Lysippus, who were all famous statuaries.

LYTHRUM, PURPLE LOOSESTRIFE, a genus of plants belonging to the decandria class; and in the natural method ranking under the 17th order, Calycanthemæ. See BOTANY INDEX.

LYTTELTON, EDWARD, Lord Lyttelton, keeper of the great seal in the reign of Charles I. was eminent for his probity and his moderation at the commencement of that monarch's disputes with his subjects. Without forfeiting his fidelity to the king, he preserved the esteem of the parliament till 1644, when he was made colonel of a regiment in the king's army at York. He died in 1645. Besides several of his speeches which have been printed, he wrote reports in the common pleas and exchequer, printed at London in 1618, 2 folio; several arguments and discourses, &c.

LYTTELTON, George Lord, eldest son of Sir Thomas Lyttelton, Bart. descended from the great judge Lyttelton, was born in 1700, at seven months; and the midwife, supposing him to be dead, threw him carelessly into the cradle; where, had not some signs of life been taken notice of by one of the attendants, he might never have recovered. He received the elements of his education at Eton school, where he showed an early inclination to poetry. His pastoral and some other light pieces were originally written in that seminary of learning; from whence he was removed to the university of Oxford, where he pursued his classical studies with uncommon avidity, and sketched the plan of his Persian Letters; a work which afterwards procured him great reputation, not only from the elegance of the language in which they were composed, but from the excellent observations they contained on the manners of mankind.

In the year 1728, he set out on the tour of Europe; and, on his arrival at Paris, accidentally became acquainted with the honourable Mr Poyntz, then our minister at the court of Versailles; who was so struck with the extraordinary capacity of our young traveller, that he invited him to his house, and employed him in many political negotiations, which he executed with great judgment and fidelity.

Mr Lyttelton's conduct, while on his travels, was a lesson of instruction to the rest of his countrymen. Instead of lounging away his hours at the coffee-houses frequented by the English, and adopting the fashionable follies and vices of France and Italy, his time was passed alternately in his library and in the society of men of rank and literature. In this early part of his life, he wrote a poetical epistle to Dr Ayscough, and another to Mr Pope, which show singular taste and correctness.

After continuing a considerable time at Paris with Mr Poyntz, who, to use his own words, behaved like a second father to him, he proceeded to Lyons and Geneva; and from thence to Turin, where he was honoured with great marks of friendship by his Sardinian majesty. He then visited Milan, Venice, Genoa, and Rome, where he applied himself closely to the study of the fine arts; and was, even in that celebrated metropolis, allowed a perfect judge of painting, sculpture, and architecture.

During his continuance abroad, he constantly cor-
LYT

responded with Sir Thomas, his father. Several of
his letters are yet remaining, and place his filial af-
collection in a very distinguished light. He soon after
returned to his native country, and was elected re-
presentative for the borough of Okehampton in Devon-
shire; and behaved so much to the satisfaction of his con-
stituents, that they several times re-elected him for
the same place without putting him to the least
expenue.

About this period, he received great marks of friend-
ship from Frederic prince of Wales, father of his pre-
sent majesty; and was, in the year 1737, appointed
principal secretary to his royal highness, and continued
in the strictest intimacy with him till the time of his
death. His attention to public business did not, how-
ever, prevent him from exercising his poetical talent.
A most amiable young lady, Miss Fortescue, inspired
him with a passion, which produced a number of little
pieces, remarkable for their tenderness and elegance;
and he had a happy facility of striking out an extem-
pore compliment, which obtained him no small share
of reputation. One evening being in company with
Lord Cobham and several of the nobility at Stowe,
his lordship mentioned his design of putting up a bost
of Lady Suffolk in his beautiful gardens; and, turning
to Mr Lyttelton, said, "George, you must furnish
me with a motto for it." "I will, my lord," answered
Mr Lyttelton; and directly produced the following
coupit:

Her wit and beauty for a court were made,
But truth and goodness fit her for a shade.

When Mr Pitt, afterwards earl of Chatham, lost his
commission in the guards, in consequence of his spirited
conduct in parliament, Mr Lyttelton was in waiting at
Leicester-house, and, on hearing the circumstance,
immediately wrote these lines:

Long had thy virtue mark'd thee out for fame,
Far, far superior to a cornet's name;
This generous Walpole saw, and griev'd to find
So mean a post disgrace that noble mind
The servile standard from thy free-born hand
He took, and bade thee lead the patriot band.

In the year 1742, he married Lucy, the daughter
of Hugh Fortescue, Esq. of Filleigh in the county
of Devon, the lady above mentioned, whose exemplary
conduct, and uniform practice of religion and virtue,
established his conjugal happiness upon the most solid
basis.

In 1744, he was appointed one of the lords com-
missioners of the treasury; and, during his continuance
in that station, constantly exerted his influence in re-
warding merit and ability. He was the friend and
patron of the late Henry Fielding, James Thomson
author of the Seasons, Mr Mallet, Dr Young, Mr
Hammond, Mr West, Mr Pope, and Voltaire. On
the death of Thomson, who left his affairs in a very
embarrassed condition, Mr Lyttelton took that poet's
sister under his protection. He revised the tragedy of
Coriolanus, which that writer had, not put the last
hand to; and brought it out at the theatre-royal,
Covent-garden, with a prologue of his own writing,
in which he so affectionately lamented the loss of that
delightful bard, that not only Mr Quin, who spoke
the lines, but almost the whole audience, spontaneously
burst into tears.

In the beginning of the year 1746, his felicity was
interrupted by the loss of his wife, who died in the
29th year of her age; leaving him one son, Thomas,
the late Lord Lyttelton; and a daughter, Lucy, who
afterwards married Lord Viscount Valentia. The
remains of his amiable lady were deposited at Over-
Aley in Worcestershire; and an elegant monument
was erected to her memory in the church of Hagley,
which contains the following inscription written by
her husband:

Made to engage all hearts, and charm all eyes:
Tho' meek, magnanimous; tho' witty, wise;
Polite, as all her life in courts had been;
Yet good, as she the world had never seen:
The noble fire of an exalted mind,
With gentlest female tenderness combin'd;
Her speech was the melodious voice of love,
Her song the warbling of the vernal grove,
Her eloquence was sweeter than her song,
Soft as her heart, and as her reason strong.
Her form each beauty of her mind express'd,
Her mind was virtue by the Graces dress'd.

Besides these beautiful lines, Mr Lyttelton wrote a
monody on the death of his lady, which will be re-
membered while conjugal affection and a taste for
poetry exist in this country.

His masterly observations on the conversion and
apostleship of St Paul, were written at the desire of
Gilbert West, Esq. in consequence of Mr Lyttelton's
asserting, that beside all the proofs of the Christian
religion, which might be drawn from the prophecies
of the Old Testament, from the necessary connection
it has with the whole system of the Jewish religion,
from the miracles of Christ, and from the evidence
given of his resurrection by all the other apostles,
he thought the conversion of St Paul alone, duly
considered, was of itself a demonstration sufficient
to prove Christianity to be a divine revelation. Mr West
was struck with the thought: and assured his friend,
that so impenitent a proof would be of great use to
convince those unbelievers that will not attend to a
longer series of arguments; and time has shown he was
not out in his conjecture, as the tract is esteemed one
of the best defences of Christianity which has hitherto
been published.

In 1754, he resigned his office of lord of the trea-
sury, and was made cofferer to his majesty's house-
hold, and sworn of the privy-council; previous to
which, he married a second time, Elizabeth daughter
of Field-marshal Sir Robert Rich; whose indirest con-
duct gave him great uneasiness, and from whom he
was separated, by mutual consent, a few years after his
marriage.

After being appointed chancellor, and under trea-
surer of the court of exchequer, he was, by letters-
patent dated the 10th of November 1755, 31 Geo. II.
created a peer of Great Britain, by the style and title
of Lord Lyttelton, Baron of Franklyne, in the county of
Worcester. His speeches on the Scotch and mutiny
bills in the year 1747, on the Jew bill in 1753, and
on the privilege of parliament in 1763, showed sound
judgment, powerful eloquence, and inflexible inte-
grity.
During the last ten years he lived chiefly in retirement, in the continual exercise of all the virtues which can ennoble private life. His last work was Dialogues of the Dead, in which the morality of Cambrai and the spirit of Fontenelle are happily united.

He was suddenly seized with an inflammation of the bowels, in the middle of July 1773, at his seat at Hagley; which terminated in his death, on the 22d of that month. His last moments were attended with unimpaired understanding, unaffected greatness of mind, calm resignation, and humble but confident hopes in the mercy of God. As he had lived universally esteemed, he died lamented by all parties. A complete collection of his works has been published since his decease, by his nephew George Ayscough, Esq.

M.

M, a liquid consonant, and the twelfth letter in the alphabet. It has one unvaried sound, and is pronounced by striking the upper lip against the lower; in which the pronunciation of this letter agrees with that of s; the only difference between the two consisting in a little motion made in the nose in pronouncing m, and not in s: whence it happens that those who have taken cold, for m ordinarily pronounce s; the nose in that case being disabled from making the necessary motion.

All consonants are formed with the aid of vowels; in em the vowel precedes, in be it follows; and m is never mute.

Quintilian observes, that the m sometimes ends Latin words but never Greek ones; the Greeks always changing it in that case into a, for the sake of the better sound.

M is also a numeral letter, and among the ancients was used for a thousand; according to the verse, M caput est numeri, quem scimus mile teneri.

When a dash is added to the top of it, as ₠; it signifies a thousand times a thousand.

M, as an abbreviation, stands for Manlius, Marcus, Martius, and Mucius: M.A. signifies magister artium, or master of arts; MS. manuscript, and MSS. manuscripts.

M, in astronomical tables, and other things of that kind, is used for meridional or southern; and sometimes for meridian or mid-day.

M, in medicinal prescription, is frequently used to signify a maniple or handful; and it is sometimes also put at the end of a recipe, for misc.; "mingle it;" or for. mistura, "a mixture." Thus M.f. juliopium signifies "mix and make a julep.

M, in Law, the brand or stigma of a person convicted of manslaughter, and admitted to the benefit of his clergy. It is to be burnt on the brawn of his left thumb.

M, in Law, the seal or stamp of a person convicted of manslaughter, and admitted to the benefit of his clergy. It is to be burnt on the brawn of his left thumb.

MAAT, JOHN. See Blankof.

MABILLON, JOHN, a very learned writer of France in the 17th century, was born at Perremonte, on the frontiers of Champagne, in 1632. He was educated in the university of Rheims, and afterwards entered into the abbey of the Benedictines of St. Remy. In the year 1663, he was appointed keeper of the treasures and monuments of France at St. Dennis; but Mabillon having unfortunately broke a looking glass there, which was pretended to have belonged to Virgil, he desired leave of his superiors to quit an employment which frequently obliged him to tell things he did not believe. Next year he went to Paris; and was very serviceable to Father d'Achery, who was desirous of having some young monk who could assist him in compiling his Spicilegium. This made him known. Soon after, the congregation of St. Maur having formed a design of publishing new editions of the fathers, revised from the MSS. in the libraries of the Benedictines, Mabillon was charged with the edition of St. Bernard, which he prepared with extraordinary diligence. After that, he published many other works, which are evidences of his vast capacity and industry. In 1682, he was employed by Mr. Colbert in examining some ancient titles relating to the royal family. The year following he sent him into Germany, to search the archives and libraries of the ancient abbeys, for what was most curious and proper to illustrate the history of the church in general, and that of France in particular. He has published an account of this journey. In 1685, he undertook another journey into Italy, by order of the king of France; and returned the year following with a very noble collection. He placed in the king's library above 3000 volumes of rare books, printed and in MSS., and composed two volumes of the pieces which he had discovered in that country. He was highly esteemed for his virtues as well as his learning.

MACACO, or MACAUCO. See Lemur, Mammalia Index.

MACAO, a town of China in the province of Canton, seated in an island at the mouth of the river Ta-e. The Portuguese have been in possession of the harbour for 130 years. Formerly they had a great trade here; but now they have only a fort with a small garrison. The houses built after the European manner; and there is a Chinese mandarin, as well as a Portuguese governor, to take care of the town and the neighbouring country. E. Long. 109. N. Lat. 22. 12.

MACAO. See Psittacus, Ornithology Index.

MACARIANS, in ecclesiastical history, the followers of Macarius, an Egyptian monk, who was distinguished
MACARONIC, or MACARONIAN, a kind of burlesque poetry, consisting of a jumble of words of different languages, with words of the vulgar tongue Latinized, and Latin words modernized. Macaronic among the Italians, as has been observed by Callius Rhodigines, signifies a coarse clownish man; and because this kind of poetry is patched out of several languages, and full of extravagant words, &c. the Italians, among whom it had its rise, gave it the name of macaronian or macaronic poetry. Others choose to derive it from macaronibus, from macaronia, a kind of confection made of meal not boiled, sweet almonds, sugar, and the white of eggs, accounted a great dainty among the country people in Italy, which, from their being composed of various ingredients, occasioned this kind of poetry, which consists of Latin, Italian, Spanish, French, English, &c. to be called by their name.

Example.—A bold fellow in the macaronic style, says,

Enspalvi omnes scadronos et reginandos, &c.

Another example:

Archi lapsos pestiferos furiamque manantum,
Et grandem esse meum qua inopinum facta ruellis,
Toxinuxque alto trambiantem corda clochero, &c.

Theoph. Folengio, a Benedictine monk of Mantua, was the first who invented, or at least cultivated, this kind of verse. See FOLENGIO.

The best pieces of this kind are, the Baldus of Folengo, and Macaronis Forsa by Stefano a Jesuit, among the Italians; and the Reatus veritatis, super terribili estestes paionarum de Ruelli, among the French. The famous Rabelais first transferred the macaronic style out of the Italian verse into French prose: and on the model thereof formed some of the best things in his Pantagruel. We have little in English in the macaronic way; nothing scarce, but some little loose pieces collected in Camden’s remains. But the Germans and Netherlanders have had their macaronic poets; witness the Certamen Catholicum cum Colmunistes, of one Martinus Hamseonis Frisius, which contains about 1200 verses, all the words whereof begin with the letter C.

MACARSKA, a town of Dalmatia, and capital of Primogoria, with a pretty good harbour, and a bishop’s see, seated on the gulf of Venice. E. Long. 17. 57. N. Lat. 43. 42.

MACASSAR, a considerable kingdom of the island of Celebes, in the East Indies. The climate is very hot; and would be intolerable, were it not for the rains which fall when the sun is directly over their heads. The soil is extremely fertile, and there are Macassar ripe fruits at all times of the year. There are great numbers of monkeys, who are devoured by monstrous Macabees, some of which are so large, that they will swallow one of these animals entire. The Macassars are large, robust, courageous, and greatly addicted to war. They profess the Mahometan religion.

MACASSAR, a large, strong, and handsome town, of the island of Celebes, and capital of the kingdom of the same name, with the same king. The houses are all built of wood, and supported by thick posts; and they have ladders to go up into them, which they draw up as soon as they have entered. The roofs are covered with very large leaves, which prevent the rain from entering. It is seated near the mouth of a large river, which runs through the kingdom from north to south. E. Long. 117. 55. 8. Lat. 5. 0. See CELEBES, SUPPLEMENT.

MACASSAR Poison, in Natural History, called ipa in the Macassar and Malayen tongue, is the gum of a certain tree, shining, brittle, black, and every way like stone-pitch, growing in the island of Celebes, in the South seas; with which all the natives arm themselves in travel, having a long hollow trunk of a hard red wood like brasil, accurately bored, and at one end is fixed a large lance-blade of iron. Then they make a small arrow, very straight, and somewhat bigger than a large wheaten straw: at one end they fix it into a round piece of white, light, soft wood, like cork. about the length of the little finger, just fit for the bore of the trunk, to pass clear by the form of one’s breath, and to fill it so exactly, that the air may not pass by, but against it, in order to carry it with the greater force. At the other end they fix it in either a small fish-tooth for that purpose, or make a blade of wood of the bigness of the point of a lancet, about three-quarters of an inch long, and making a little notch in the end of the arrow, they stick it firm therein, which they anoint with poison. The poisonous gum, when gathered, is put into hollow bamboo or canes, stopped up very close, and thus brought to Macassar. When they fit it for use, they take a piece of smooth turtle-shell, and a stick cut flat and smooth at the end: then they take green galangal root, grate it, and with the addition of a little fair water, press the juice into a clean china dish: then with a knife scraping a little of the poison upon the shell, dip the end of the stick in the forementioned liquor, and with this dissolve the poison to the consistency of a syrup: when this is done, they anoint the fish-tooth or wooden blade with the same stir; and by it the sun, that it may be baked hard. The pointed arrows thus prepared, are put in hollow bamboo, close shut, and in this state they retain their virtue for a month.

MACCABÆUS, JUDAS. See JUDAS.

MACCABEES, two apocryphal books of scripture, containing the history of Judas and his brothers, and their wars against the Syrian kings in defence of their religion and liberties, so called from Judas Mattathias, surnamed Maccabees, as some say from the word מַכָּבֶה, formed of the initials of מַחְצָה וַכָּבָד וַעֲדָן יִשְׂרָאֵל, q. d. Who is like unto thee, O Lord, among the gods; which was the motto of his standard; whence those who fought under his standard were called Maccabees, and the name was generally applied to all who suffered in the cause of
MACBETH, a Scots nobleman in the 11th century, nearly allied to Duncan king of Scotland.—Not contested with curbing the king's authority, he carried his pestilent-ambition so far as to put him to death; and, chasing Malcolm Canmore his son and heir into England, usurped the crown. Siward earl of Northumberland, whose daughter Duncan had married, undertook, by the order of Edward the Confessor, the protection of the fugitive prince.—He marched with an army into Scotland; defeated and killed Macbeth; and restored Malcolm to the throne of his ancestors. Shakespeare has made this transaction the subject of one of his best tragedies.

MACBRIDE, Dr. David, an eminent physician and philosopher, was descended from an ancient family in the county of Galloway in Scotland. His grandfather, a clergyman, had settled in Ireland about the end of the 17th century, as minister to a Presbyterian congregation at Belfast; and his father, who followed the same line, was settled at Ballymeny in the county of Antrim, where he married, and where our author was born in April 1726. After a proper school-education, and having passed some time under the tuition of an eminent surgeon in his native place, he was sent to the university of Glasgow. Having there completed the usual course of academical studies, he went to Edinburgh for the further prosecution of medical science. After a short stay there, a war then prevailing between France and Britain, he was induced to go on board the navy in the station of a surgeon's mate. In the service of his country he continued for several years; and after discharging for some time the duties of an assistant, he was raised to the rank of surgeon. In this situation, he first turned his thoughts towards the discovery of a remedy for the sea-scurvy. It was not, however, at this period, that either chance or reasoning suggested to him the employment of an article which has since been attended with the most beneficial consequences. Here he had an opportunity only of observing the symptoms, of studying the nature, and of lamenting the consequences, of this disease.

The termination of the war by the peace of Aix-la-Chapelle put a period to Dr. Macbride's employment as a naval surgeon. He had now probably obtained much medical knowledge in the school of experience; but he was sensible that he had still much to acquire in that of science. An ardent keenness to mingle in active life had led him from the schools of medicine at an earlier period than could have been the case; and, with the earnest desire to form his future practice in the best established principles led him back to them, when a judgment, matured by years, and informed from the observation of facts, rendered him capable of hearing teachers with greater advantage. He returned therefore to Edinburgh, and again entered on the career of academical pursuits, under the tuition of Dr. Monro, and those other teachers, whose abilities raised the fame of that medical school. But not satisfied with the instructions to be had from any one set of professors, the celebrity of the medical teachers in London led him also to visit that capital. There he particularly became the pupil of those distinguished lecturers, Dr. Hunter and Dr. Smellie. And while from the former he laboured to acquire an accurate chirurgical knowledge, from the latter he endeavoured to obtain the true principles of midwifery considered as a science. At the same time he was no less industrious in improving himself in the successful practice of both arts by attention at hospitals.

Thus prepared for the exercise of his profession, about the end of the year 1749 he fixed his residence in Dublin in the character of surgeon and accoucheur. If amiable manners, and extensive knowledge of his profession, could alone be sufficient introductions to practice, he might in a short time have look-
After the merit of Dr Macbride came to be properly known, the public seemed to show a desire for making compensation for having so long overlooked it. His employment increased so rapidly, that he had more business than he could transact either with ease or safety. This having kept him in perpetual agitation both of body and mind, at last induced an almost total incapacity of sleeping. From this circumstance his health could not fail to be impaired. In this situation, after accidental exposure to cold, he was attacked with a fever, which put an end to his life on the 13th of December 1778, in the 53d year of his age.

Those who were among his most intimate acquaintance were inclined to believe that his death was not a little hastened by domestic calamities. During his residence in Dublin he was twice married, and as often subjected to that inexpressible distress which must result from a final separation in this world from the most intimate and loving friends. By both of his wives he had several children; but none of them survived their father. And on these calamitous events, although he was able to conceal his feelings from the world, yet they gave a severe shock to his constitution. After his death, several of the playful trinkets of his infants, with the signature of dulces extus, were found in his repositories among papers on medical and other important subjects: an incontrovertible proof, that in him at least, the great mind of the philosopher was conjoined with the feeling heart of the affectionate father. But if his abilities were remarkable as a philosopher and physician, if his conduct was exemplary as a husband and parent, his memory is amiable as a companion and friend. His polite and benevolent conduct, joined to his taste for the fine arts, conciliated the affections and esteem of all who knew him. His death was universally and sincerely lamented in the city of Dublin.

MACCLESFIELD, a town of Cheshire in England, 171 miles from London, is seated on the edge of a forest of the same name, upon a high rank near the river Bollin; and is a large handsome town, with a fine church and a very high steeple. It was erected into a borough by King Edward III. is governed by a mayor, and enjoys great privileges and jurisdictions by virtue of the court and the liberties of the forest. In its church are two brass plates, on one of which there is a promise of 26,000 years and 26 days pardon for saying five Pater-Nosters, and five Aveu. It has extensive manufactures in silk and cotton. In Macclesfield forest are many pits dug for the sake of the turf; in which it is common to find fir-trees buried, which are dug up for various uses, but which serve splinters that serve the poor for candles. The population in 1811 was 12,200. W. Long. 2. 10. N. Lat. 52. 15.

MACE, an ancient weapon, formerly much used by the cavalry of all nations. It was commonly made of iron; its figure much resembles a chocolate mill; many specimens may be seen in the Tower. It was with one of these that Walworth mayor of London knocked the rebel Wat Tyler from off his horse in Smithfield for approaching the young King Richard II. in an insolent manner; and as he fell he dispatched him with his dagger. The mace in modern times changed its form; and being no longer a war instrument, is made of copper or silver gilt, ornamented with
in Macedon. He was an Argive, a descendant of Macedon, Hercules, and about 800 years B.C. conducted a small colony of his countrymen into the inland district of Macedon, at that time distinguished by the name of Aemathia as already mentioned. This territory was about 300 miles in circumference. On the south it was separated from the sea by a number of Greek republics, of which the most considerable were those of Olynthus and Amphipolis; and on the north, east, and west, was surrounded by the barbarous kingdoms of Thrace, Paeonia, and Illyricum. According to the traditions of those times, Caranus, having consulted the oracle on the success of his intended expedition, was commanded to be directed by the goats in the establishment of his empire. For some time he proceeded at random, without knowing what to make of the oracle's answer; but happening to enter the small kingdom of Aemathia, at that time governed by King Midas, he observed a herd of goats running towards Edessa the capital. Recollecting then the answer of the oracle, he attacked and took the city by surprise, soon after making himself master of the whole kingdom. In memory of this remarkable event he called the city Aegae, and the people Aegiates, from the goats who conducted him, and made use of the figure of a goat in his standard. From this fable also we see why the figure of a goat is so frequently seen on the coins of Philip and his successors.

The little colony of Argives led into Aemathia by Policy of Caranus would soon have been overwhelmed by the barbarous nations who surrounded it, had not this prince and his subjects taken care to ingratiate themselves with their neighbours, rather than to attempt to subdue them by force of arms. They instructed them in the Grecian religion and government, and in the knowledge of many useful arts; adopting themselves, in some degree, the language and manners of the barbarians; imparting to them in return some part of the Grecian civilization and polite behaviour. Thus they gradually associated with the fierce and warlike tribes in their neighbourhood; and this prudent conduct, being followed by succeeding generations, may be looked upon as one of the causes of the Macedonian greatness.

Caranus, dying after a reign of three years, left the kingdom to his son Caenis; who having considerably enlarged his dominions, was succeeded by Thuryman, and by Perdiccas I. This last prince is by Thucy- dides and Herodotus accounted the founder of the Macedonian monarchy; though this history is so obscured by fable, that nothing certain can now be known concerning it. In process of time, however, the good understanding which had subsisted between the Macedonians and their barbarous neighbours began to suffer an interruption; and in 691 B.C. the kingdom invasion by Persians was for the first time invaded by the Illyrians. At the Illyrians they did considerable damage by their ravages; but the Macedonian monarch, Argeus, having decoyed them into an ambush, cut off great numbers, and obliged the remainder to leave the kingdom. In the reign of his successors, however, they returned, and occasionally proved very troublesome enemies till the reigns of Philip and Alexander.

In the mean time the kingdom of Macedon began to be affected by those great events which took place and Macedon in other parts of the world. Cyrus having overthrown Persia...
MACEDON, the Babylonian empire, and conquered all the western part of Asia, established a mighty monarchy, which threatened all the eastern parts of Europe with subjugation. The Greeks, however, having now emerged from their barbarism, and acquired great knowledge in the art of war, were able to resist effectually this very formidable power; but the kingdom of Macedon, obscure and unconnected, was obliged to yield, and though not formally made a province of the Persian empire, was nevertheless accounted in some sort as under the vassalage and protection of the Persians. Alcetas, who ascended the Macedonian throne about the time that the Persian monarchy was founded, had the dexterity to preserve his dominions from the encroachments of the Greeks on the one hand, and of the Persians on the other; but in the reign of his successor Amyntas, a formal demand was made of submission to the great king Darius, by sending him a present of earth and water. Seven ambassadors were sent on this errand by Megabizus, one of the officers of Darius. They were sumptuously entertained by Amyntas; but having attempted to take some indecent liberties with the Macedonian women, Alexander the king's son caused them all to be murdered. This rash action had almost proved the ruin of the kingdom: but Alexander found means to pacify Bubares the general sent against him by Megabizus, by showing him his sister Cygzena, a very beautiful woman, with whom the Persian fell in love at first sight, and afterwards married her.

From this time the Macedonians were accounted the faithful allies of the Persians; and, through the interest of his son-in-law, Amyntas obtained the country in the neighbourhood of Mount Haemus and Olympus, at the same time that the city of Alabanda in Phrygia was given to Amyntas the nephew of Alexander. The Macedonians distinguished themselves in the time of the Persian invasion of Greece, by furnishing their allies with 200,000 recruits; though some cities, particularly Ptolemea, Olynthus, and Pallene, adhered to the Grecian interest. The two last were taken and raised, and the inhabitants massacred by the Persians; but Ptolemea escaped by reason of the sea breaking into the Persian camp, where it did great damage. Alexander, however, afterwards thought proper to court the favour of the Greeks by giving them intelligence of the time, when Maridusianus designed to attack them. The remaining transactions of this reign are entirely unknown, farther than that he enlarged his dominions to the river Nessus on the east and the Axios on the west.

Alexander I. was succeeded by his son Perdiccas II. who, according to Dr Gillies, "inherited his father's abilities, though not his integrity." But from his duplicity above mentioned both to Greeks and Persians, it does not appear that he had much to boast of as to the latter quality. In the Peloponnesian war he espoused the cause of the Spartans against the Athenians, from whom he was in danger by reason of their numerous settlements on the Macedonian coast, and their great power by sea. For some time, however, he amused the Athenians with a show of friendship; but at last, under pretence of enabling Olynthus and some other cities to recover their liberties, he assisted in destroying the influence of the Athenians in those places, in hopes of establishing that of the Macedonians in its stead. But this design failed of success; the Olynthian confederacy was broken, and the members of it became subject to Sparta, until at last, by the misfortunes of that republic, they became sufficiently powerful not to resist the encroachments of the Macedonians, but to make considerable conquests in their country.

Perdiccas II. was succeeded about 416 B.C. by Archelaus I. He enlarged his dominions by the conquest of Pydna, and other places in Pieria, though his ambition seems rather to have been to improve his dominions than greatly to extend them. He facilitated the communication between the principal towns of Macedonia, by cutting straight roads through most part of the country; he built walls and fortresses in such places as afforded a favourable situation; encouraged agriculture and the arts, particularly those subservient to war; formed magazines of arms; raised and disciplined a considerable body of cavalry; and in a word, says Dr Gillies, "added more to the solid grandeur of Macedon than had been done by all his predecessors put together. Nor was he regardless of the arts of peace. His palace was adorned by works of Greek painters. Euripides was long entertained at his court; Socrates was earnestly solicited to live there, after the example of this philosophic poet, formed by his precepts and cherished by his friendship: men of merit and genius in the various walks of literature and science were invited to reside in Macedonia, and treated with distinguished regard by a monarch duly attentive to promote his own glory and the happiness of his subjects."

This great monarch died after a reign of six years, The king's a space by far too short to accomplish the magnificent projects he had formed. After his death the kingdom fell under the power of usurpers or weak and wicked monarchs. A number of competitors contended for the throne, and these, in rivalry to civil dissenions, constantly appeared for the throne; and these by turns called in to their assistance the Thracians, Illyrians, Thessalians, the Olynthian confederacy, Athens, Sparta, and Thebes. Barelyllis, an active and daring chief, who, from being head of a gang of robbers, had become sovereign of the Illyrians, entered Macedon at the head of a numerous army, deposed Amyntas II., the father of Philip, and set up in his place one Argeus, who consented to become tributary to the Illyrians. Another candidate for the throne, named Pamorces, was supported by the Thracians; but by the assistance of the Thessalians and Olynthians, Amyntas was enabled to resume the government. After his restoration, however, the Olynthians refused to deliver up several places of importance belonging to Macedonia which Amyntas had either intrusted to their care, or which they had taken from his antagonist. Amyntas complained to Sparta, and that republic, which had already formed schemes of very extensive ambition, so readily complied with the request, that it was generally supposed to have proceeded from Spartan emissaries sent into Macedonia. They pretended indeed to hesitate a little, and to take time to deliberate on the army which ought to be raised for the purpose; but Cleomenes, the principal ambassador, represented the urgency of the case in such a manner, that the troops which happened at that time to be ready were ordered to take the field without delay. Two thousand Spartans, under the command
mit on very humiliating conditions. They formally re-
nounced all claim to the dominion of Chalide; they
ceded the Macedonian cities to their ancient governor;

The Olym-
and in consequence of this Amyntas left the city of E-
thians obli-
ged him to do so. He left behind him two brothers, Perdiccas and Philip,
both very young; so that Pausanias again found means
to usurp the throne, being supported not only by the Thracians, but a considerable number of Greek mer-
cenaries, as well as a powerful party in Macedon itself.

In this critical juncture, however, Iphicrates the Athenian happening to be on an expedition to Am-
phipolis, was addressed by Eurydice the widow of
Amyntas, so warmly in behalf of her two sons, whom she presented to him, that he interested himself in their behalf, and got Perdiccas the eldest established on
the throne. He was induced also to this piece of generosity by the kindness which Eurydice and her husband had formerly shown to himself; and he like-
wise saw the advantages which must ensue to his country from a connexion with Macedon. During the
minority of the young prince, however, his brother Ptolemy, who was his guardian, openly aspired to the

Engages to conquer it for the Athenians.

31 Macedon. to the confederacy; and trusting to the strength of their new allies, behaved in such an insolent manner to Philip, that he was not long of finding a specious pretext for hostility; at which the Olynthians, greatly alarmed, sent ambassadors to Athens, requesting their assistance against such a powerful enemy. Philip, however, justly alarmed at such a formidable conspiracy, sent agents to Athens, with such expedition that they arrived there before any thing could be concluded with the Olynthian deputies. Having gained over the popular leaders and orators, he deceived and flattered the magistrates and senate in such an artful manner, that a negociation was instantly set on foot, by which Philip engaged to conquer Amphipolis for the Athenians, upon condition that they surrendered to him the strong fortress of Pydna, a place which he represented as of much less importance to them; promising also to confer upon them many other advantages, which, however, he did not specify at that time. Thus the Athenians, deceived by the perfidy of their own magistrates, elated with the hopes of recovering Amphipolis, and outwitted by the superior policy of Philip, rejected with disdain the proposals of the Olynthians.

The ambassadors of Olynthius returned home highly disgusted with the reception they had met with; but had scarce time to communicate the news to their countrymen, when the ambassadors of Philip arrived at Olynthius. He pretended to condole with them on the disappointment they had received at Athens; but testified his surprise that they should court the assistance of that distant and haughty republic, when they could avail themselves of the powerful kingdom of Macedon, which wished for nothing more than to enter into equal and lasting engagements with their confederacy. As a proof of his moderation and sincerity, he offered to put them in possession of Anthemus, an important town in the neighbourhood, of which the Macedonians had long claimed the jurisdiction, making many other fair promises; and among the rest, that he would reduce for them the cities of Pydna and Potidea, which he chose rather to see in dependence on Olynthius than Athens. Thus he prevailed upon the Olynthians not only to abandon Amphipolis, but to assist him with all their power in the execution of his design.

Philip now lost no time in executing his purposes on Amphipolis; and pressed the city so closely, that the people were glad to apply to the Athenians for relief. Accordingly they despatched two of their most eminent citizens, Hierax and Stratocles, to represent the danger of an alliance between Philip and the Olynthians, and to profess their sorrow for having so deeply offended the parent state. This representation had such an effect, that though the Athenians were then deeply engaged in the Social war, they would probably have paid some attention to the Amphipolitans, had not Philip taken care to send them a letter with fresh assurances of friendship, acknowledging their right to Amphipolis, and which he hoped shortly to put in their hands in terms of his recent agreement. By these specious pretences the Athenians were persuaded to pay as little regard to the deputies of the Amphipolitans as they had already done to those of the Olynthians; so that the city, unable to defend itself alone against so powerful an enemy, surrendered at last at discretion in the year 357 B.C.

Philip still proceeded in the same cautious and politic manner in which he had begun. Though the obstinate defence of the Amphipolitans might have furnished a pretence for severity, he contented himself with banishing a few of the popular leaders from whom he had most cause to dread opposition, treating the rest of the inhabitants with all manner of clemency; but took care to add Amphipolis to his own dominions, from which he was determined that it never should be separated, notwithstanding the promises he had made to the Athenians. Finding that it was not his interest at this time to fall out with the Olynthians, he cultivated the friendship of that republic with great assiduity; took the cities of Pydna and Potidea, which he readily yielded to the Olynthians, though they had given him but little assistance in the reduction of these places. Potidea had been garrisoned by the Athenians; and them the artful king sent back without ransom, lamenting the necessity of his affairs which obliged him contrary to his inclination, to oppose their republic. Though this was rather too great a sop to the Athenians at present, they were not much concerned with the Social war, that they had not leisure to attend to the affairs of other nations. Philip made the best use of his time, and next projected the conquest of the gold mines of Thrace. That rich and fertile country was now held by one Cotys, a prince of such weak and intellectual self-sufficing faculties, that the superstition of the Greeks, into the gold mines of Thrace, which he was newly initiated, had almost entirely subdued his reason; and he wandered about in quest of the goddess Minerva, with whom he fancied himself in love. The invasion of the Macedonians, however, awaked him from his reverie; and Cotys, finding himself destitute of other means of opposition, attempted to stop the progress of the enemy by a letter. To this Philip paid no regard: the Thracians were instantly expelled from their possessions at Crenides, where there were very valuable gold mines. These had formerly been worked by colonies from Thasos and Athens; but the colonists had long since been expelled by the barbarous Thracians, who knew not how to make use of the pressure they were in possession of. Philip took the trouble to descend into the mines himself, in order to inspect the works; and having caused them to be repaired, planted a Macedonian colony at Crenides, bestowed upon it the name of Philippia, and drew annually from the gold mines to the value of near 1000 talents, 200,000 sterlings; an immense sum in those days. The coins struck here were likewise called Philippi.

Philip having obtained this valuable acquisition, settled the next upon him to settle the affairs of Thessaly, affairs of where every thing was in confusion. This country had greatly to Alexander tyrant of his advances, Tissaphernes, Pitho, and Lycophron, the brothers-in-law of Alexander, who had likewise murdered him. By the united efforts of the Thessalians and Macedonians, however, these usurpers were easily overthrown, and effectually prevented from making any disturbances in the future; and the Thessalians, out of a mistaken gratitude, surrendered to Philip all the revenues arising from

Macedon from their fair and towns of commerce, as well as all the conveniences of their harbours and shipping; a condescension which Philip took care to secure in the most effectual manner.

Having now not only established his sovereignty in the most effectual manner, but rendered himself very powerful and formidable to his neighbours, Philip determined to enjoy some repose from his fatigue. Having formed an alliance with Abydus king of Epirus, he in the year 317 B.C. married Olympia the sister of that prince; a match thought the more eligible, as the kings of Epirus were supposed to be descended from Achilles. The nuptials were solemnized at Pella with great pomp, and several months were spent in shows and diversions; during which Philip showed such an extreme proclivity to vice of every kind, as disgraced him in the eyes of his neighbours, and most probably laid the foundation of his future domestic unhappiness. So much was this behaviour of the Macedonian monarch taken notice of by the neighbouring states, that the Paeonians and Illyrians threw off the yoke, engaging in their schemes the king of Thrace: and notwithstanding the insatiable state of that prince, their designs were now carried on with more judgment than was usual with barbarians. Philip, however, notwithstanding his dissipation, got warning of his danger in sufficient time to prevent the bad consequences which might have ensued had the confederates got time to bring their matters to a proper bearing. Early in the spring 316 he took the field with the flower of the Macedonian troops. Having marched in person against the Paeonians and Thraceans, he despatched Parmenio his best general into Illyria. Both enterprises proved successful; and while Philip returned victorious from Thrace, he received an account of the victory gained by Parmenio; a second messenger informed him of a victory gained by his chariot at the Olympic games; and a third, that Olympia had been delivered of a son at Pella. This was the celebrated Alexander, to whom the diviners prophesied the highest prosperity and glory, as being born in such auspicious circumstances.

A short time after the birth of Alexander, Philip wrote a letter to the philosopher Aristotle, whom he chose for preceptor to his young son. The letter was written with great brevity, containing only the following words: “Know that a son is born to us. We thank the gods not so much for their gift, as for bestowing it at a time when Aristotle lives. We assure ourselves that you will form him a prince worthy of his father, and worthy of Macedonia.” He next set about the farther enlargement of his territories, which were already very considerable. Paeonia was now one of his provinces; on the east his dominions extended to the sea of Thasos, and on the west to the lake Lychnus. The Thessalians were in effect subjects to this jurisdiction, and the possession of Amphipolis had secured him many commercial advantages; he had a numerous and well-disciplined army, with plentiful resources for supporting such an armament, and carrying through the other schemes suggested by his ambition; though his deep and impenetrable policy rendered him more truly formidable than all these put together. His first scheme was the reduction of Olythus, the most populous and fertile country on the borders of Macedon; after which his ambition prompted him to acquire the sovereignty of all Greece. To accomplish the former, he had hitherto courted the friendship of the Olythians by every possible method; and without letting slip any opportunity to accomplish the latter, he deprived the Athenians gradually of several of their settlements in Thrace and Macedon. In these depredations, however, he took care always to give such appearance of justice to his actions, that his antagonists, who had studied the matter less deeply, could not find a plausible pretext for engaging in war against him, even when he had openly committed hostilities against them. Philip easily perceived that the affairs of the Greeks were coming to a crisis, and he determined to wait the event of their mutual dissensions. That event did not disappoint his hopes. The Phocians, account of which had violated the religion of those days in a manner extraordinary; they had even ploughed up the lands consecrated to Apollo; and however they might pretend to excuse themselves by examples, the Amphicyonians fulminated a decree against the Phocians, commanding the sacred lands to be laid waste, and imposing a heavy fine upon the community.

By this decree all Greece was again involved in the war called Phocian, from the name of the city about which it commenced. Philip at the beginning of the troubles was engaged in Thrace, where a civil war had taken place among the sons of Cotys; and wherever Philip interfered, he was sure to make matters turn out to his own advantage. His encroachments at length became so enormous, that Kerosobates, the most powerful of the contending princes, agreed to cede the Thracian Chersonesus to the Athenians; who immediately sent Chares to the head of a powerful armament to take possession of it. In this expedition the town of Sestos was taken by storm, and the inhabitants cruelly treated by Chares, while Philip invested himself in the siege of Methone in Piene. This city he likewise reduced; but the king lost an eye at the siege in the following extraordinary manner, if we may give credit to some ancient historians. A celebrated archer, named Aster, had, it seems, offered his services to Philip, being represented as such an excellent marksman, that he could hit the swiftest bird on the wing. Philip replied, that he would be of excellent use if they were to make war with starlings. Aster, disgusted with this reception, went over to the enemy, and with an arrow wounded the king in the eye. When the weapon was extracted, it was found to have on it the following inscription: “For the right eye of Philip.” The king ordered the arrow to be shot back again, with another inscription importing that he would cause Aster to be hanged when the town was taken. A report was raised after Philip’s death, that he had lost his eye by prying too narrowly into the amours of Olympus and Jupiter Ammon; which the vanity of his successor prompted him to cherish, as his flatterers had probably been the instigators of it.

All this time the Phocian war raged with the greatest fury, and involved in it all the states of Greece. Lycomnes, one of the Thessalian tyrants, whom Philip had engaged in a war with Osmarchus, the Phocians having taken part with the Phocians, Lycomnes called in Onomarchus, the Phocian general, to protect...

great temptation to Philip, who well knew how to value the importance of its situation both with respect to commerce and war: and in order to pave the way to this important conquest, he attacked the fortress of Heraclea, a small and in itself unimportant place, though, by reason of its neighbourhood to Byzantium, the acquisition was valuable to Philip. The Athenians, however, at last began to perceive the danger by the signs of Philip, and determined to counteract them. For this purpose they entered into an alliance with Olynthus; and having warned Kersbelites of his danger, they ordered a powerful fleet to the defence of the Heraclea. But these vigorous measures were counteracted by the report of Philip's death, which had been occasioned by his wound at Methone, and a distemper arising from the fatigue he had afterwards undergone. The insistent Athenians too easily gave credit to this report; and, as if all danger had been over with his death, discontinued their preparations, and directed their whole attention to the sacred war. —This context, instead of being ended by the death of Onomarchus, now raged with double fury. Philip, above-mentioned, the only surviving brother of Onomarchus, undertook the cause of the Phocians, and his affairs becoming every day more and more desperate, he undertook the most unaccountable method of retrieving them which could be imagined: having converted into ready money the most precious materials belonging to the temple at Delphi, and with this treasure doubled the pay of his soldiers. But this new piece of sacrilege, he indeed brought many adventurers to his standard, though he cut off all hopes of mercy for himself or his state.

Haying the assistance of 10,000 Macedonians, 2000 Acheans, and 5000 Athenian foot, with 400 cavalry, he was still enabled to make a very formidable appearance; and the Phocians took the field with great prospect of success.

Philip now thought it time to throw off the mask Philip cast entirely, for which the proceedings of the Athenians in the quarrel, particularly their league with Olynthus, furnished him with a plausible pretext; and the revenging such horrid sacrilege as had been committed at Delphi seemed to give him a title to march at the head of an army into Greece. The superstition of the Greeks, however, had not yet blinded them to such a degree, but they could easily perceive that Philip's ploy was a mere pretence, and that his real design was to invade and conquer the whole country. The Athenians no sooner heard of the march of the Macedonian army, than they despatched, with all expedition, a strong guard to secure the pass of Thermopylae; so that Philip was obliged to return greatly chagrined and disapprov'd. Their next step was to call an assembly, to deliberate upon the measures proper to be taken in order to restrain the ambition of the Macedonian monarch; and this assembly is rendered memorable by the first appearance of Demosthenes as an orator against Philip. Athens for some time had been in a very alarming situation. They were deeply involved in the sacred war; their northern possessions were continually insulted and plundered by Philip; while a number of his mercenary partisans drew off the public attention to such a degree, that, instead of taking measures to counteract that ambitious prince, they a-
soused themselves with speculations about the designs of the Persian monarch, who was preparing for war against the Cyprians, Egyptians, and Phenicians. Isocrates the celebrated orator, and Phocion the statesman, joined the multitude in their present opinion, though not from any mercenary motives, but purely from a sense of the unsteady conduct of the Athenians; who, they were assured, could not contend with a prince of the vigour and activity of Philip; and therefore exhorted them by all means to cultivate the friendship of the Sickencar and to oppose the probability of success. Isocrates, indeed, greatly wished for an expedition into Asia, and looked upon Philip to be the only general capable of conducting it, though at present the Greeks had no pretence for making war upon the Persians, but that of revenging former injuries: and on this subject he addressed a discourse to Philip himself; and it is even said, that Isocrates, by the power of his rhetoric, prevailed upon Philip and the Athenians to lay aside their animosities for a short time, and consent to undertake this expedition in conjunction.

If this coalition, however, did really take place, it was of very short duration. The views of Phocion and Isocrates were violently opposed by Demosthenes. Though sensible of the corruption and degeneracy of his countrymen, he hoped to be able to rouse them from their lethargy by dint of his eloquence; a talent he had been at great pains to cultivate, and in which he is said to have excelled all men that ever existed.

In his first addresses to the people, this celebrated orator exhorted them to awake from their indolence, and to assume the direction of their own affairs. They had been too long governed, he said, by the incapacity of a few ambitious men, to the great disadvantage as well as disgrace of the community. In the first place, an orator who had placed himself at the head of a faction of no more than 300 or 400, availed himself and his followers of the carelessness and negligence of the people, to rule them at pleasure. From a consideration of their present weakness and corruption, as well as of the designs and commotions of the neighbouring powers, he advised them to abandon all romantic and distant schemes of ambition; and instead of carrying their arms into remote countries, to prepare for repelling the attacks which might be made upon their own dominions. He insisted also upon a better regulation of their finances, a more equal distribution of the public burdens, in proportion to the abilities of those upon whom they were laid, and upon the retrenching many superfluous expenses. Having pointed out in a strong light the vigorous conduct of Philip; and shown by what means he had attained to such a respectable footing in the world, be next laid down a proper plan for their military operations. He told them, that they were not yet prepared to meet Philip in the field; they must begin with protecting Olynthus and the Chersonesus, for which it would be necessary to raise a body of 3000 light armed troops, with a due proportion of cavalry, which ought to be transported under a proper convoy to the islands of Lemnos, Thasos, and Scithos, in the neighbourhood of Macedon. In these they would enjoy all kinds of necessaries in abundance, and might avail themselves of every favourable incident, to appear at Macedon. The first summons of their allies; and either to repel the incursions of the Macedonians, or harass their territories. While this was going on, more vigorous preparations might be made for war at home; and it was proposed, that only the fourth part of the Athenian citizens should enlist, and no more supplies were wanted at present but 50 talents. But notwithstanding the moderation of these proposals, and the urgent necessities of the state, it was impossible to prevail upon the indolent and careless Athenians, to provide for their own safety. They appear, indeed, at this time to have been desperately sunk in effeminacy and dissipation; which disposition Philip took care to encourage to the utmost of his power. There was an assembly in the city called the Sixty, from their consisting originally of that number, who met expressly for the purposes of extinguisihing all care about public affairs, and to intoxicate themselves with every kind of pleasure they had in their power. With this assembly Philip was so well pleased, that he sent them money to support their extravagancies; and so effectually did they answer his purposes, that all the eloquence of Demosthenes could not counteract the speeches of orators much his inferiors when backed by Macedonian gold.

Philip himself, as we have already hinted, was excessively debauched in his private character, and the most shameful stories are related of him by the ancient writers, particularly by Demosthenes. Theopompus, too, an author who flourished in the time of Alexander, and was rewarded and honoured by him, also speaks of him in such terms as we cannot with decency relate: but these accounts, coming from the avowed enemies of the king, are scarcely to be credited; and perhaps policy, as well as inclination, might contribute somewhat to this scandalous behaviour, that he might thereby recommend himself to the liberties of Athens, and prevent even many of the more thinking part of the people from suspecting his designs. But in whatever excesses he might at times indulge himself, he never lost sight of his main object, the subjugation of the Greek states. On pretence of being in want of money to defray the expense of his buildings, he borrowed money at a very high price throughout the whole country; and this he found an easy matter to do, as the dissolution of the Delphic treasures had rendered cash very plentiful in Greece. Thus he attached his creditors firmly to his own interest; and on pretence of paying debts, was enabled without molestation to bestow a number of pensions and gratuities upon the Athenian orators, who by their treacherous harangues contributed greatly to the ruin of their country; at least as far as it could be ruined by subjection to a prince who would have obliged them to remain at peace, and apply themselves to useful arts. These he himself encouraged in a very eminent degree. The greatest part of his time was employed at Pella, which city he adorned in the most magnificent manner with temples, theatres, and porticoes. He invited by liberal rewards, the most ingenuous artists in Greece; and as many of these met with very little encouragement in their own country, great numbers flocked to him from all quarters. In the government of his people, also, Philip behaved with the utmost impartiality: listening with condescension to the complaints of the meanest
Macedon. meanest of his subjects, and keeping up a constant correspondence with those whom he thought worthy of his acquaintance; from which, it is not easy to imagine how he could be so guilty of the vices we have already mentioned from some ancient historians.

The fate of Olynthus was now soon determined. This city, which held the balance of power between Athens and Macedon, was taken and plundered, and the inhabitants sold for slaves; but the chief hope of Philip was in putting an end to the Phocian war. For this purpose he affected a neutrality, that he might thereby become the arbiter of Greece. His hopes were well founded; for the Thesians, who were at the head of the league against the Phocians, solicited him on the one side, and the states confederate with the Phocians did the like on the other. He answered neither, yet held both in dependence. In his heart he favoured the Thesians, or rather placed his hopes of favouring his own cause in that state; for he well knew, that the Athenians, Spartans, and other states allied with Phocis, would never allow him to pass Thermopylae, and lead an army into their territories. So much respect, however, did he show to the ambassadors from these states, particularly Corinth and Phocis, who came from Athens, that they believed him to be in their interest, and reported as much to their masters. The Athenians, who were now dissolved in ease and luxury, received this news with great satisfaction; and named immediately ten plenipotentiaries to go and treat of a full and lasting peace with Philip. Among these plenipotentiaries were Demosthenes and Aeschines, the most celebrated orators in Athens. Philip gave directions that these ambassadors should be treated with the utmost civility; naming, at the same time, three of his ministers to confer with them, viz. Antipater, Parmenio, and Eurylochus. Demosthenes being obliged to return to Athens, recommended it to his colleagues not to carry on their negotiations with Philip's deputies; but to proceed with all diligence to court, there to confer with the king himself. The ambassadors, however, were so far from following his instructions, that they suffered themselves to be put off for three months by the arts of Philip and his ministers.

In the mean time, the king took from the Athenians such places in Thrace as might best cover his frontiers; giving their plenipotentiaries, in their stead, abundance of fair promises, and the strongest assurances that his good will should be as beneficial to them as ever their colonies had been. At last a peace was concluded; but then the ratification of it was deferred till Philip had possessed himself of Pherae in Thessaly, and saw himself at the head of a numerous army: then he ratified the treaty; and dismissed the plenipotentiaries with assurances, that he would be ready at all times to give the Athenians proofs of his friendship. On their return to Athens, when this matter came to be debated before the people, Demosthenes plainly told them, that, in his opinion, the promises of Philip ought not to be relied on, because they appeared to be of little significance in themselves, and came from a prince of so much art, and so little fidelity, that they could derive no authority from their maker. Aeschines, on the other hand, gave it as his sentiment, that the king of Macedon's assurances ought to give them full satisfaction. He said, that for his part, he was not politicians enough to see any thing of disguise or dissimulation in the king's conduct; that there was great danger in distrusting princes; and that the surest method of putting men upon deceit was to show that we suspected them of it. The rest of the plenipotentiaries concurred with Aeschines; and the people, desirous of quiet, and addicted to pleasure, easily gave credit to all that was said, and decreed that the peace should be kept. All this was the easier brought about, because Phocis, the worthiest of the public, did not oppose Philip; which was owing to his having a just sense of the state his country was in. He conceived, that the Athenians of those times were nothing like their ancestors; and therefore, as he expressed himself on another occasion, he was desirous, since they would not be at the head of Greece themselves, that they would at least be upon good terms with that power which would be so.

Philip, who knew how to use as well as to procure passes opportunity, while the Athenians were in this good Thermopylae, and humour, passed Thermopylae, without their knowing whether he would fall on Phocis or Theselas; but he Phocian observed with confidence, that he would commit the Plutarch, and Phocian war. to put on crowns of laurel, declaring them thereby the troops of Apollo, and himself the lieutenant-general of that god. He then entered Phocis with an air of triumph; which so terrified the Phocians, whom he had caused to be proclaimed sacrilegious persons, that they immediately dismissed all thoughts of defence, and without more ado submitted to his mercy. Thus the Phocian war, which had so long employed all Greece, was ended without a stroke; and the judge- ment on the Phocians remitted to the Amphictyons, or grand council of Greece. By their decree the walls of three Phocian cities were demolished, the people were forbid to inhabit in any but villages, to pay a yearly tribute of 60 talents, and never to make use either of horses or arms till they had repaid to the temple of Apollo the money they had sacrilegiously carried from thence. Their arms were taken from them, broken to pieces, and burnt; their double voice in the council was taken from them, and given to the Macedonians. Other orders were made for settling the-affairs both of religion and state throughout Greece: all of which were executed by Philip with great exactness and moderation, he paying the most profound respect to the council and, when he had performed its commands, retiring peaceably with his army back to Macedon, which gained him great reputation.

At Athens alone, the justice and piety of Philip was not understood. The people began to see, though a little too late, that they had been abused and deceived by those who had negotiated the late peace. They saw that, through their acceptance of it, the Phocians were destroyed; that Philip was become master of the Athenian Thermopylae, and might enter Greece when he pleased; that, in abandoning their allies, they had abandoned themselves; and that, in all probability, they might soon feel the weight of his power, whom they had so foolishly trusted: they therefore began to take new and hostile measures; they ordered that the women should retire out of the villages into the city; their walls be repaired, and their forts new strengthened.
Macedon. They seemed inclined to question Philip's election into the council of the Amphictyons, because it had been done without their consent; and even to proceed to an open war. In all likelihood they had carried things to extravagancy, if Demosthenes had not interposed. He told them, that though he was not for making the peace, he was however for keeping it; and that he saw no manner of occasion for their entering into so unequal a contest as would needs ensue, if they took up arms, not only against Philip, but against all the states concurring with him in the late transactions. This seems to have cooled the rage of the Athenians; and have brought them to think of ruining Philip by degrees, as by degrees they had raised him.

The fame of his achievements without the bounds of Macedon having disposed the subjects of Philip to hope every thing from his conduct, and the several states of Greece to desire above all things his friendship; the prudent monarch laid hold of this favourable situation, to fix his dominion on such a stable foundation as that a reverse of fortune should not immediately destroy it. To this end, while he carried on his negotiations through Greece, he likewise kept his army in exercise, by taking several places in Thrace, which terribly incommoded the Athenians. Diopithes, who had the government of the Athenian colonies in those parts, perceiving well what end Philip had in view, did not stay for instructions from home; but having raised with much expedition a considerable body of troops, taking advantage of the king's being absent with his army, entered the adjacent territories of Philip, and wasted them with fire and sword.

The king, who, on account of the operations of the campaign in the Chersonese, was not at leisure to repel Diopithes by force, nor indeed could divide his army without imminent hazard, chose, like an able general, rather to abandon his provinces to insults, which might be afterwards revenged, than, by following the dictates of an ill-passioned, to hazard the loss of his veteran army, whereon lay all his hopes. He contented himself, therefore, with complaining to the Athenians of Diopithes's conduct, who, in a time of peace had entered his dominions, and committed such devastations as could scarcely have been justified in a time of war. His partisans supported this application with all their eloquence. They told the Athenians, that unless they recalled Diopithes, and brought him to a trial for this infringement of the peace, they ought not to hope either for the friendship of Philip or of any other prince or state; neither could they justly complain, if, promptly by such a precedent, others should break faith with them, and fall without the least notice upon their dominions. Demosthenes defended Diopithes: and undertook to show that he deserved the praise and not the censure of the Athenians. Those of the other party began then to charge him with crimes of a different nature; they alleged, that he oppressed the subjects and maltreated the allies of Athens. Demosthenes replied, that of these things there were as yet no proofs; that when such should appear, a single galley might be sent to bring over Diopithes to abide their judgment, but that Philip would not come if they sent a fleet: whence he inferred, that they ought to be cautious, and to weigh well the merits of this cause before they took any resolution.

He said, that it was true Philip had not as yet attacked Attica, or pretended to make a descent on their territories in Greece, or to force his way into their ports; when it came to that, he was of opinion they would be hardly able to defend themselves; wherefore he thought such men were to be esteemed as fought to protect their frontiers, in order to keep Philip as long as might be at a distance: whereupon he moved, that, instead of disowning what Diopithes had done, or directing him to dismiss his army, they should send him over recruits, and show the king of Macedon they knew how to protect their territories, and to maintain the dignity of their state, as well as their ancestors. These arguments had such an effect, that a decree was made conformable to his motion.

While affairs stood thus, the Illyrians recovering courage, and seeing Philip at such a distance, harassed the frontiers of Macedon, and threatened a new invasion; but Philip, by quick marches, arrived on the borders of Illyricum: and struck this barbarous people with such a panic, that they were glad to compound for their former depredations at the price he was pleased to set. Most of the Greek cities in Thrace now sought the friendship of the king, and entered into a league with him for their mutual defence. As it cannot be supposed that each of these free cities had a power equal to that of Philip, we may therefore look upon him as their protector. About this time Philip's schemes negotiations in Peloponnesus began to come to light; defeated the Argives and Messenians, growing weary of that tyrannical authority which the Spartans exercised over them, applied to Thebes for assistance; and the Thebans out of their natural aversion to Sparta, sought to open a passage for Philip into Peloponnesus, that, in conjunction with them, he might humble the Lacedaemonians. Philip readily accepted the offer; and resolved to procure a decree from the Amphictyons, directing the Lacedaemonians to leave Argos and Messene free; which if they complied not with, he, as the lieutenant of the Amphictyons, might, with great appearance of justice, march with a body of troops to enforce their order. When Sparta had intelligence of this, she immediately applied to Athens, earnestly entreating assistance, as in the common cause of Greece. The Argives and Messenians, on the other hand, laboured assiduously to gain the Athenians to their side; alleging that, if they were friends to liberty, they ought to assist those whose only aim was to be free. Demosthenes, at this juncture, outwrested Philip, if we may borrow that king's expression; for, by a vehement harangue, he not only determined his own citizens to become the avowed enemies of the king, but also made the Argives and Messenians not over fond of him for an ally; which when Philip perceived, he laid aside all thoughts of this enterprise for the present, and began to practise in Euboea.

This county, now called Negrupont, is separated from Greece by the Eupirus, a strait so narrow, that Euboea might easily be united to the continent. This situation made Philip call it the fetters of Greece, which he therefore sought to have in his own hands. There had been for some years great disturbances in that country; under colour of which, Philip sent forces

Vol. XII. Part I.
Macedon. thither, and demolished Ponthus, the strongest city in those parts, leaving the country under the government of three lords, whom Demosthenes roundly calls tyrants, established by Philip. Shortly after, the Macedonians took Olynthus, which was left under the government of five magistrates, styled also tyrants at Athens. Thither Plutarch of Ercetra, one of the most eminent persons in Euboea, went to represent the distresses of his country, and to implore the Athenians to set it free. This suit Demosthenes recommended warmly to the people; who sent thither their famous leader Phocion, supported by formidable votes, but a very slender army: yet so well did he manage the affairs of the commonwealth and her allies, that Philip quickly found he must for a time abandon that project; which, however, he did not till he had formed another no less beneficial to himself, or less dangerous to Athens. It was the prosecution of his conquests in Thrace which he thought of pushing much farther than he had hitherto done, or could be reasonably suspected to have any intention of doing.

Extraordinary preparations were made by the Macedonian monarch for this campaign. His son Alexander was left regent of the kingdom; and he himself with 30,000 men laid siege to Perinthus, one of the strongest cities in the country. At present, however, all his arts of cajoling and pretenting friendship were insufficient to deceive the Athenians. They gave the command of their army and fleet to Phocion; a general of great abilities, and with whom Philip would have found it very hard to contend. On the other hand, the king of Persia began to turn jealous of the growing power of the Macedonian monarch. The Persian kings had been accustomed to regard those of Macedon as their faithful allies, but the good fortune of Philip, the continual clamour of the Athenians against him, and his dethroning at pleasure the petty princes of Thrace, made him now regarded in another light. When, therefore, he led his troops against Perinthus, the Great King, as he was styled by the Greeks, sent his letters mandatory to the governors of the maritime provinces, directing them to supply the place with all things in their power; in consequence of which they filled it with troops, granted subsidies in ready money, and sent besides great convoys of provision and ammunition. The Byzantines also, supposing their own turn would be next, exerted their utmost endeavours for the preservation of Perinthus; sending thither the flower of their youth, with all other necessaries for an obstinate defence. The consequence of all this was, that Philip found himself obliged to raise the siege with great loss.

That the reputation of the Macedonian arms might not sink by this disgrace, Philip made war on the Scythians and Triballi, both of whom he defeated; and then formed a design of invading Attica, though he had no fleet to transport his troops, and knew very well that the Thessalians were not to be depended upon if he attempted to march through the Pise, and that the Thebans would even then be ready to oppose his march. To obviate all these difficulties, he had recourse to Athens itself; where by means of his partisans, he procured his old friend AEschines to be sent their deputy to the Amphilcyons. This seemed a small matter, and yet was the hinge on which his whole project turned. By that time AEschines had taken his seat, a question was stirred in the council, whether the Locrians of Amphissa had not been guilty of sacrilege in ploughing the fields of Cyrrha in the neighbourhood of the temple of Delphi. The assembly being divided in their opinions, AEschines proposed to take a view, which was accordingly decreed. But when the Amphilcyons came in order to see how things stood, the Locrians, either jealous of their property, or spurred thereby by the suggestions of some who saw farther than themselves, fell upon those venerable persons so rudely, that they were compelled to secure themselves by flight. The Amphilcyons decreed, that an army should be raised, under the command of one of their own number, to chastise the delinquents; but as this army was to be composed of troops sent from all parts of Greece, the appearance at the rendezvous was so inconsiderable, that the Amphilcyons sent to command them durst undertake nothing. The whole matter being reported to the council, AEschines, in a long and eloquent harangue, showed how much the welfare and even the safety of Greece depended on the observance of the decrees; and after inveighing against the want of public spirit in such as had not sent their quotas at the time appointed by the council, he moved that they should elect Philip for their general, and pray him to execute their decree. The deputae from the other states, conceiving that by this expedient their respective constituents would be free from any farther trouble or expense, came into it at once; whereupon a decree was immediately drawn up, purporting that ambassadors should be sent to Philip of Macedon, in the name of Apollo and the Amphilcyons, once more to require his assistance, and to notify to him, that the states of Greece had unanimously chosen him their general, with full power to act as he thought fit against such as had opposed the authority of the Amphilcyons. Thus of a sudden Philip acquired all that he sought; and having an army ready in expectation of this event, he immediately marched the Amphilcyons, but in appearance, but in reality to accomplish his own designs: For having passed into Greece with his army, instead of attacking the Locrians, he seized immediately upon Elatea, a great city of Phocis upon the river Cephissus.

The Athenians in the mean time were in the utmost confusion on the news of Philip's march. However, by the advice of Demosthenes, they invited the Thebans to join them against the common enemy of Greece, and Philip endeavoured as much as possible to prevent this confederation from taking place; but all his efforts proved ineffectual. The Athenians raised an army, which marched immediately to Eeleusis, where they were joined by the Thebans. The confederates made the best appearance that had ever been seen in Greece, and the troops were exceedingly good; but unfortunately the generals were men of no conduct or skill in the military art. An engagement ensued at Chromoza, where in Alexander commanded one wing of the Macedonian army, and his father Philip the other. The confederate army was divided according to the different nations of which it consisted; the Athenians having the right and the Boeotians the left. In the beginning of the battle the confederates had the better; whereupon...
This victory determined the fate of Greece; and from this time we must reckon Philip supreme lord of all the Grecian states. The first use he made of his power was to convok a general assembly, wherein he was recognized generalissimo, and with full power appointed their leader against the Persians. Having, by virtue of his authority, settled a general peace among them, and appointed the quota that each of the states should furnish for the war, he dismissed them: and returning to Macedon, began to make great preparations for this new expedition. His pretence for making war on the Persians at this time was the assistance given by the Persians to the city of Perinthus, as already mentioned. In the mean time, however, the king by reason of the dissensions which reigned in his family, was made quite miserable. He quarrelled with his wife Olympias to such a degree, that he divorced her, and married another woman named Cleopatra. This produced a quarrel between him and his son Alexander; which also came to such a height, that Alexander retired into Epirus with his mother. Some time afterwards, however, he was recalled, and a reconciliation took place in appearance; but in the mean time a conspiracy was formed against the king’s life, the circumstances and causes of which are very much unknown. Certain it is, however, that it took effect, as the king was exhibiting certain shows in honour of his daughter’s marriage with the king of Epirus. Philip having given a public audience to the ambassadors of Greece, went next day in state to the theatre. All the seats were early taken up; and the shows began with a splendid procession, wherein the images of the 12 superior deities of Greece were carried, as also the image of Philip, habited in like manner, as if he now made the 13th, at which the people shouted aloud. Then came the king alone, in a white robe, crowned, with his guards at a considerable distance, the Greeks might see he placed his safety only in his confidence of the loyalty of his subjects. Pausanias, the assassin, however, had fixed himself close by the door of the theatre; and observing that all things fell out as he had foreseen they would, took his opportunity when the king drew near him, and plunging his sword in his left side, laid him dead at his feet. He then fled as fast as he was able towards the place where his horses were; and would have escaped, had not the twig of a vine caught his shoe and thrown him down. This gave time to those who pursued him to come up with him; but instead of securing him, in order to exact a discovery of his accomplices, they put an end to his life.

With regard to the character of this monarch, it appears certain, that he was one of the most eminent persons that ever sat on a throne. Had he lived for some time longer, he would in all probability have subdued the Persians: which was in truth less difficult than what he had already done. Had that event taken place (says Dr Gillies), the undertakings of his long and successful reign would have been ennobled and illuminated by the splendour of extensive foreign conquest. Philip would have reached the height of such renown as is obtained by the habits of activity, vigilance, and fortitude, in the pursuit of unbounded greatness; and in the opinion of posterity, would perhaps have surpassed the glory of all kings and conquerors who either preceded or followed him. Yet, even on this supposition, there is not any man of sense and probity, who, if he allows himself time for serious reflection, would purchase the imagined grandeur and prosperity of the king of Macedon at the price of his artifices and his crimes; and to a philosopher, who considered either the means by which he had obtained his triumphs, or the probable consequences of his dominion over Greece and Asia, the busy ambition of thismighty conqueror would appear but a deceitful scene of splendid misery.

No sooner did the news of Philip’s death reach Athens, than, as if all danger had been past, the inhabitants showed the most extravagant signs of joy. Demosthenes and his party put on chaplets of flowers, and behaved as if they had gained a great victory. Pausanias reproved them for this madness; bidding them remember, that the army which had beaten them at Cheronea was lessened but by one. This reproof, however, had very little effect. The people heard with pleasure all the harsh things which the orators could say of the young Alexander king of Macedon, whom they represented as a giddy wrong-headed boy, ready to grasp all things in his imagination, and able to perform nothing. The affairs of Macedon indeed were in a very distracted state on the accession of Alexander: for all the neighbouring nations had the same notion of the young king with the Athenians; and being irritated by the usurpations of Philip, immediately revolted; and the states of Greece entered into a confederacy against him. The Persians had been contriving to transfer the war to Macedon; but as soon as the news of Philip’s death reached them, they behaved as if all danger had been over. At the same time Attalus, one of the Macedonian commanders, aspired to the crown, and sought to draw off the soldiers from their allegiance.

In the councils held on this occasion, Alexander’s best friends advised him rather to make use of dissimulation than force, and to cajole those whom they thought he could not subdue. These advices, however, were ill suited to the temper of their monarch. He thought that vigorous measures only were proper, and therefore immediately led his army into Thessaly, declared Here he harangued the princes so effectually, that he general of thoroughly gained them over to his interest, and was by them declared general of Greece; upon which he returned to Macedon, where he caused Attalus to be seized and put to death.
In the spring of the next year (333 B.C.) Alexander resolved to subdue the Triballians and Illyrians, who inhabited the country now called Bulgaria and Scythia, and had been very formidable enemies to the Macedonian power. In this expedition he discovered, though then but 20 years of age, a surprising degree of military knowledge. Having advanced to the passes of Mount Haemus, he found that the barbarians had posted themselves in the most advantageous manner. On the tops of the cliffs, and at the head of every passage, they had placed their carriages and wagons in such a manner as to form a kind of parapet with their shafts forwards, that when the Macedonians should have half ascended the rock, they might be able to push these heavy carriages down upon them. They reckoned the more upon this contrivance, because of the close order of the phalanx, which, they imagined, would be terribly exposed by the soldiers wanting room to stir, and thereby avoid the falling wagons. But Alexander, having directed his heavy-armed troops to march, gave orders, that, where the way would permit, they should open to the right and left, and suffer the carriages to go through; but that, in the narrow passes, they should throw themselves on their faces with their shields behind them, that the carts might run over them. This had the desired effect; and the Macedonians reached the enemies works without the loss of a man. The dispute was then quickly decided; the barbarians were driven from their posts with great slaughter, and left behind them a considerably booty for the conquerors.

The next exploits of Alexander were against the Getae, the Taenii, and some other nations inhabiting the country on the other side of the Danube. They he also overcame; showing in all his actions the most perfect skill in military affairs, joined with the greatest valour. In the mean time, however, all Greece was in commotion by a report which had been confidently spread abroad, that the king was dead in Illyria. The Thebans, on this news, seized Amyntas and Timolaus, two eminent officers in the Macedonian garrison which held their citadel, and dragged them to the market-place, where they were put to death without either form or process, or any crime alleged against them. Alexander, however, did not suffer them to remain long in their mistake. He marched with such expedition, that in seven days he reached Pallene in Thessaly; and in six days more he entered Boeotia, before the Thebans had any intelligence of his passing the straits of Thermopylae. Even then they would not believe that the king was alive; but insisted that the Macedonian army was commanded by Antipater, or by one Alexander the son of Areus. The rest of the Greeks, however, were not so hard of belief; and therefore sent no assistance to the Thebans, who were thus obliged to bear the consequences of their own folly and obstinacy. The city was taken by storm, and the inhabitants were for some hours massacred without distinction of age or sex; after which the houses were demolished, all except that of Pindar the famous poet, which was spared out of respect to the merit of its owner, and because he had celebrated Alexander king of Macedon. The lands, excepting those destined to religious uses, were shared among the soldiers, and all the prisoners sold for slaves; by which 440 talents were brought into the king’s treasury.

By this severity the rest of the Grecian states were so thoroughly humbled, that they thought no more of making any resistance, and Alexander had nothing further to hinder him from his favourite project of invading Asia. Very little preparation was necessary for the Macedonian monarch, who went out as to an assured conquest, and reckoned upon being supplied only by the spoils of his enemies. Historians are not agreed as to the number of his army: Arrian says, that there were 30,000 foot and 5000 horse. Diodorus Siculus tells us, that there were 13,000 Macedonian foot, 7000 of the confederate states, and 5000 mercenaries. These were under the command of Parmenio. Of the Odri sians, Triballians, and Illyrians, there were 5000; and of the Agrians, who were armed only with darts, 1000. As for the horse, he tells us there were 1800 commanded by Philotas, and as many Thessalians under the command of Callas: out of the confederate states of Greece, were 500 commanded by Eurygius; and 900 Thracians and Maeonians, who led the van under Cassander. Plutarch tells us, that, according to a low computation, he had 30,000 foot and 5000 horse; and, according to the largest reckoning, he had 54,000 foot and 4000 horse. As to his fund for the payment of the army, Aristobulus says it was but 70 talents; and Onesicritus, who was also in this expedition, not only takes away the 70 talents, but affirms that the king was 200 in debt. As for provisions, there was just sufficient for a month and no more; and to prevent disturbances, Antipater was left in Macedonia with 12,000 foot and 1500 horse.

The army having assembled at Amphipolis, he sets out on marched from thence to the mouths of the river Strymon; then crossing Mount Pangeus, he took the road to Abdera. Crossing the river Eurus, he proceeded through the country of Patis, and in 20 days reached Sestos; thence he came to Eleus, where he sacrificed on the tomb of Proteus, because he was the first among the Greeks who at the siege of Troy set foot on the Asiatic shore. He did this, that his landing might be more propitious than that of the hero to whom he sacrificed, who was slain soon after. The greatest part of the army, under the command of Parmenio, embarked at Sestos, on board of a fleet of 150 galleys of three benches of oars, besides small craft. Alexander himself sailed from Eleus; and when he was in the middle of the Hellespont, offered a bull to Neptune and the Nereids, pouring forth at the same time a libation from a golden cup. When he drew near the shore, he launched a javelin, which stuck in the earth: then, in complete armour, he leaped upon the strand; and having erected altars to Jupiter, Minerva, and Hercules, he proceeded to Ilium. Here again he sacrificed to Minerva; and taking down some arms which had hung in the temple of that goddess since the time of the Trojan war, consecrated his own in their stead. He sacrificed also to the ghost of Priam, to avert his wrath on account of the descent which he himself claimed from Achilles.

In the mean time the Persians had assembled a great army in Phrygia; among whom was one Memnon a Phrygian, the best officer in the service of Darius. Alexander,
Alexander, as soon as he had performed all the ceremonies which he judged necessary, marched directly towards the enemy. Memnon gave it as his opinion, that they should burn and destroy all the country round, that they might deprive the Greeks of the means of subsisting, and then transport a part of their army into Macedon. But the Persians, depending on their cavalry, rejected this salutary advice; and posted themselves along the river Granicus, in order to wait the arrival of Alexander. In the engagement which happened on the banks of that river, the Persians were defeated, and Alexander became master of all the neighbouring country; which he immediately began to take care of, as if it had been part of his hereditary dominions. The city of Sardis was immediately delivered up; and here Alexander built a temple to Jupiter Olympus. After this, he restored the Ephesians to their liberty; ordered the tribute which they formerly paid to the Persians to be applied towards the rebuilding the magnificent temple of Diana; and having settled the affairs of the city, marched against Miletus. This place was defended by Memnon with a considerable body of troops who had fled thither after the battle of Granicus, and therefore made a vigorous resistance. The fortune of Alexander, however, prevailed; and the city was soon reduced, though Memnon with part of the troops escaped to Halicarnassus. After this, the king dismissed his fleet, for which various reasons have been assigned; though it is probable, that the chief one was to show his army that their only resource now was in subverting the Persian empire.

Almost all the cities between Miletus and Halicarnassus submitted as soon as they heard that the former was taken; but Halicarnassus, where Memnon commanded with a very numerous garrison, made an obstinate defence. Nothing, however, was able to resist the Macedonian army. Memnon was at last obliged to abandon the place; upon which Alexander took and razed the city of Tralles in Phrygia; received the submission of several princes tributary to the Persians; and having destroyed the Marmarians, a people of Lycia who had fallen upon the rear of his army, put an end to the campaign; after which he sent home all the new married men; in obedience, it would seem, to a precept of the Mosaic law, and which endeared him more to his soldiers than any other action of his life.

As soon as the season would permit, Alexander quitted the province of Phaselis; and having sent part of his army through the mountainous country to Perga, by a short but difficult road, took his route by a certain promontory, where the way is altogether impassable, except when the north winds blow. At the time of the king's march the south wind had held for a long time; but of a sudden it changed, and blew from the north so violently that, as he and his followers declared, they obtained a safe and easy passage through the Divine assistance. By this means the march towards Gordium, a city of Phrygia, the enemy having abandoned the strong pass of Telmisus, through which it was necessary for him to march. When he arrived at Gordium, and found himself under a necessity of staying some time there till the several corps of his army could be united, he expressed a strong desire of seeing Gordius's chariot, and the famous knot in the harness, of which such strange stories had been published to the world. The cord in which this knot was tied, was made of the inner rind of the cornel tree; and no eye could perceive where it had begun or ended. Alexander, when he could find no possible way of untying, and yet was unwilling to leave it tied lest it should cause some fears in the breasts of his soldiers, is said by some authors to have cut the cords with his sword, saying, "It matters not bow it is undone." But Aristobulus assures us, that the king wrested a wooden pin out of the beam of the waggon, which, being driven in across the beam, held it up; and so took the yoke from under it. Be this as it will, however, Arrian informs us, that a great tempest of thunder, lightning, and rain, happening the succeeding night, it was held declarative of the true solution of this knot, and that Alexander should become lord of Asia.

The king having left Gordium, marched towards Cilicia; where he was attended with his usual good fortune, the Persians abandoning all the strong passes as he advanced. As soon as he entered the province, he received advice that Arsameus, whom Darius had made governor of Tarsus, was about to abandon it, and that the inhabitants were very apprehensive that he intended to plunder them before he withdrew. To prevent this, the king marched incessantly, and arrived just in time to save the city. But his saving it had His sickness and weakness ere the recovery.

As soon as the news that Ptolemy and Asander had defeated the Persian generals, and made great conquests on the Heslepons; a little after that, he met the Persian army at Issus, commanded by Darius himself. A bloody engagement ensued, in which the Persians were defeated with great slaughter, as related under the article Issus. The consequences of this victory were very advantageous to the Macedonians. Many governors of provinces and petty princes submitted themselves to the conqueror; and such as did so were treated, not as a newly conquered people, but as his old hereditary subjects; being neither burdened with soldiers nor oppressed with tribute. Among the number of those places which, within a short space after the battle of Issus, sent deputies to submit to the conqueror, was the city of Tyre. The king, whose name was Azelmirus,
Macôn, was absent in the Persian fleet; but his son was among the deputies, and was very favourably received by Alexander. The king probably intended to confer particular honours on the city of Tyre; for he acquainted the inhabitants that he would come and sacrifice to the Tyrian Hercules, the patron of their city, to whom they had erected a most magnificent temple. But these people, like most other trading nations, were too suspicious to think of admitting such an enterprising prince with his troops within their walls. They sent therefore their deputies again to him, to inform him, that they were ready to do whatever he should command them; but, as to his coming and sacrificing in their city, they could not consent to that, but were positively determined not to admit a single Macedonian within their gates. Alexander immediately dismissed their deputies in great displeasure. He then assembled a council of war, wherein he insisted strongly on the disaffected state of Greece (for most of the Grecian states had sent ambassadors to Darius, to enter into a league with him against the Macedonians), the power of the Persians by sea, and the folly of carrying on the war in distant provinces, while Tyre was left unreduced behind them: he also remarked, that if once this city was subdued, the sovereignty of the sea would be transferred to them, because it would fix their possession of the coasts; and as the Persian fleet was composed chiefly of tributary squadrons, those tributaries would fight the battles, not of their late, but of their present masters. For these reasons the siege of Tyre was resolved on. The town was not taken, however, without great difficulties which provoked Alexander to such a degree, that he treated the inhabitants with the greatest cruelty. See Tyre.

After the reduction of Tyre, Alexander, though the season was already far advanced, resolved to make an expedition into Syria; and in his way thither proposed to chastise the Jews, who had highly offended him during the siege of Tyre: for when he sent to them to demand provisions for his soldiers, they answered, that they were the subjects of Darius, and bound by oath not to supply his enemies. The king, however, was pacified by their submission; and not only pardoned them, but conferred many privileges upon them, as related under the article Jews.

From Jerusalem Alexander marched directly to Gaza, the only place in that part of the world which still held out for Darius. This was a very large and strong city, situated on a high hill, about five miles from the sea-shore. One Boatis or Betis, an eunuch, had the government of the place; and had made every preparation necessary for sustaining a long and obstinate siege. The governor defended the place with great valour, and several times repulsed his enemies; but at last it was taken by storm, and all the garrison slain to a man; and this secured to Alexander an entrance into Egypt, which having before been very impatient of the Persian yoke, admitted the Macedonians peaceably.

Here the king laid the foundations of the city of Alexandria, which for many years after continued to be the capital of the country. While he remained here, he also formed the extraordinary design of visiting the temple of Jupiter Ammon. As to the motives by which he was induced to take this extraordinary journey, authors are not agreed; but certain it is, that he hazarded himself and his troops in the highest degree; there being two dangers in this march, which, with the example of Cambyses, who lost the greatest part of his army in it, might have terrified any body but Alexander. The first was the want of water, which, in the sandy deserts surrounding the temple, is nowhere to be found; the other, the uncertainty of the road from the fluctuation of the sands; which changing their situation every moment, leave the traveller neither a road to walk in nor mark to march by. These difficulties, however, Alexander got over; though not without a miraculous interposition, as is pretended by all his historians.

Alexander having consulted the oracle, and received a favourable answer, returned to pursue his conquests. Having settled the government of Egypt, he appointed the general rendezvous of his forces at Tyre. Here he met with ambassadors from Athens, requesting him to pardon such of their countrymen as he had found serving the enemy. The king, being desirous to oblige such a famous state, granted their request; and sent also a fleet to the coast of Greece, to effect the purposes of some communications which had lately happened in Peloponnesus. He then directed his march to Thapsacus; and having passed the Euphrates and Tigris, met with Darius near Arbela, where the Persians were again overthrown with prodigious slaughter; and Alexander in effect became master of the Persian empire.

After this important victory, Alexander marched directly to Babylon, which was immediately delivered up; the inhabitants being greatly disaffected to the Suse, and Persian interest. After 30 days stay in this country, the king marched to Susa, which had already surrendered to Philoxenus; and here he received the treasures of the Persian monarch, amounting, according to the most generally received account, to 50,000 talents. Having received also at this time a supply of 6000 foot and 500 horse from Macedon, he set about reducing the nations of Media, among whom Darius was retired. He first reduced the Uxians, and having forced a passage to Persepolis the capital of the empire, he like a barbarian destroyed the stately palace there, a pile of building not to be equalled in any part of the world; after having given up the city to be plundered by his soldiers. In the palace he found 120,000 talents, which he appropriated to his own use, and caused immediately to be carried away upon mules and camels; for he had such an extreme aversion to the inhabitants of Persepolis, that he determined to leave nothing valuable in the city.

During the time that Alexander remained at Persepolis, he received intelligence that Darius remained at Ecbatana the capital of Media; upon which he pursued him with the greatest expedition, marching at the rate of near 40 miles a-day. In 15 days he reached Ecbatana, where he was informed that Darius had retired from thence five days before, with an intent to pass into the remotest provinces of his empire. This put some stop to the rapid progress of the Macedonian army; and the king, perceiving that there was no necessity for hurrying himself and his soldiers in such a manner, began to give the orders requisite in the present situation of his affairs. The Thessalian horse,
Macedon. horse, who had deserved exceedingly well of him in all his battles, he dismissed according to his agreement; gave them their whole pay, and ordered 2000 talents over and above to be distributed among them. He then declared that he would force no man: but if any were willing to serve him longer for pay, he desired they would enter their names in a book, which a great many of them did; the rest sold their horses, and prepared for their departure. The king appointed Epocillus to conduct them to the sea, and assigned him a body of horse as an escort: he likewise sent Menetes with them, to take care of their embarkation, and that they were safely landed in Eubea without any expence to themselves.

On receiving fresh information concerning the state of Darius's affairs, the king set out again in pursuit of him, advancing as far as Rhages, a city one day's journey from the Caspian straits: there he understood that Darius had passed those straits some time before; which information leaving him again without hopes, he halted for five days. Oxidates, a Persian whom Darius had left prisoner at Susa, was made governor of Media, while the king departed on an expedition into Parthia. The Caspian straits he passed immediately without opposition; and then gave directions to his officers to collect a quantity of provisions sufficient to serve his army on a long march through a wasted country. But before his officers could accomplish those commands, the king received intelligence that Darius had been murdered by Bessus, one of his own subjects, and governor of Bactria, as is related at length under the article Persia.

As soon as Alexander had collected his forces together, and settled the government of Parthia, he entered Hycania; and having, according to his usual custom, committed the greatest part of his army to the care of Craterus, he, at the head of a choice body of troops, passed through certain craggy roads, and before the arrival of Craterus, who took an open and easy path, struck the whole provinces with such terror, that all the principal places were immediately put into his hands, and soon after the province of Aria also submitted, and the king continued Satibarzanes the governor in his employment.—The reduction of this province finished the conquest of Persia; but the ambition of Alexander to become master of every nation of which he had the least intelligence, induced him to enter the country of the Mardi, merely because its rocks and barrenness had hitherto hindered any body from conquering, or indeed from attempting to conquer it. This conquest, however, he easily accomplished, and obliged the whole nation to submit to his pleasure. But in the mean time disturbances began to arise in Alexander's new empire, and among his troops, which all his activity could not thoroughly suppress. He had scarcely left the province of Aria, when he received intelligence, that the traitor Bessus had caused himself to be proclaimed king of Asia by the name of Artaxerxes; and that Satibarzanes had joined him, after having massacred all the Macedonians who had been left in the province. The king appointed one Arnameus governor in the room of Satibarzanes; and marched thence with his army against the Zoranges, who, under the command of Barzaentes, one of those who had conspired against Darius, had taken up arms, and threatened to make an obstinate defence. But their numbers daily falling off, Barzaentes being afraid they would purchase their own safety at the expense of his, privately withdrew from his camp, and, crossing the river Indus, sought shelter among the nations beyond it. But they, either dreading the power of Alexander, or detesting the treachery of this Persian towards his former master, seized and delivered him up to Alexander, who caused him immediately to be put to death.

The immense treasure which the Macedonians had acquired in the conquest of Persia began now to corrupt them. The king himself was of a most generous disposition, and liberally bestowed his gifts on those around him; but they made a bad use of his bounty, and foolishly indulged in those vices by which the former possessors of that wealth had lost it. The king did all in his power to discourage the lazy and inactive pride which now began to show itself among his officers; but neither his discourses nor his example had any considerable effect. The manners of his courtiers from bad became worse, in spite of all he could say or do to prevent it; and at last they proceeded to censure his conduct, and to express themselves with some bitterness on the subject of his long continuance of the-war, and his leading them constantly from one labour to another. This came to such a height, that the king was at last obliged to use some severity, in order to keep his army within the limits of their duty. From this time forward, however, Alexander himself began to alter his conduct; and by giving a little into the customs of the Orientals, endeavoured to secure that obedience from his new subjects which he found so difficult to be preserved among his old ones. He likewise endeavoured, by various methods, to blend the customs of the Asiatics and the Greeks. The form of his civil government resembled that of the ancient Persian kings; in the military affairs, however, he preserved the Macedonian discipline; but then he made choice of 30,000 boys out of the provinces, whom he caused to be instructed in the Greek language, and directed to be brought up in such a manner as that from time to time he might with them fill up the phalanx. The Macedonians saw with great concern these extraordinary measures, which suited very ill with their gross understandings; for they thought, after all the victories they had gained, to be absolute lords of Asia, and to possess not only the riches of its inhabitants, but to rule the inhabitants themselves: whereas they now saw, that Alexander meant no such thing; but that, on the contrary, he conferred governments, offices at court, and all other marks of confidence and favour, indiscriminately both on Greeks and Persians.—From this time also the king seems to have given instances of a cruelty he had never shown before. Philotas his most intimate friend was seized, tortured, and put to death for a conspiracy of which it could never be proved that he was guilty; and soon after Parmenio and some others were executed without any crime at all were alleged. These things very much disturbed the army. Some of them wrote home to Macedon of the king's suspicions of his friends, and his disposition to hunt out enemies at the very extremities of the world. Alexander having intercepted some of these letters, and procured
procured the best information he could concerning their authors, picked out these dissatisfied people, and having disposed them into a corps, gave it the title of the turbulent battalion; hoping by this means to prevent the spirit of disaffection from pervading the whole army.

As a farther precaution against any future conspiracies, Alexander thought fit to appoint Hephaestion and Clytus generals of the auxiliary horse; being apprehensive, that if this authority was lodged in the hands of a single person, it might prompt him to dangerous undertakings, and, at the same time, furnish him with the means of carrying them into execution. To keep his forces in action, he suddenly marched into the country of the Euergetes, i.e. Benefactors; and found them full of that kind and hospitable disposition for which that name had been bestowed on their ancestors: he therefore treated them with great respect; and at his departure added some lands to their dominions, which lay contiguous, and which for that reason they had requested of him.

Turning then to the east, he entered Arachosia, the inhabitants of which submitted without giving him any trouble. While he passed the winter in these parts, the king received advice, that the Arians, whom he had so lately subdued, were again up in arms, Satibarzanes being returned into that country with two thousand horse assigned him by Bessus. Alexander instantly despatched Artabazus the Persian, with Eryxus and Caramus, two of his commanders, with a considerable body of horse and foot; he likewise ordered Phrataphernes, to whom he had given the government of Parthia, to accompany them. A general engagement ensued, wherein the Arians behaved very well, as long as their commander Satibarzanes lived; but he engaging Eryxus, the Macedonian struck him first into the throat, and then, drawing forth his spear again, through the mouth; so that he immediately expired, and with him the courage of his soldiers, who instantly began to fly; whereupon Alexander’s commanders made an easy conquest of the rest of the country, and settled it effectually under his obedience.

The king, notwithstanding the inclemency of the season, advanced into the country of Paropamisus, so called from the mountain Paropamisus, which the soldiers of Alexander called Cune anus. Having crossed the country in 16 days, he came at length to an opening leading into Media; which finding of a sufficient breath, he directed a city to be built there, which he called Alexandria, as also several other towns about a day’s journey distant from thence: and in these places he left 7000 persons, part of them such as had hitherto followed his camp, and part of the mercenary soldiers, who, weary of continual fatigue, were content to dwell there. Having thus settled things in this province, sacrificed solemnly to the gods, and appointed Proxes the Persian president thereof, with a small body of troops under the command of Niloxenus to assist him, he resumed his former design of penetrating into Bactria.

Bessus, who had assumed the title of Artaeoxes, when he was assured that Alexander was marching towards him, immediately began to waste all the country between Paropamisus and the river Oxus; which river he passed with all his forces, and then burnt all the vessels he had made use of for transporting them, retiring to Nautaca, a city of Sogdia; fully persuaded, that, by the precautions he had taken, Alexander would be compelled to give over his pursuit. This conduct of his, however, disheartened his troops, and gave the lie to all his pretensions; for he had affected to censure Darius’ conduct, and had charged him with cowardice, in not defending the rivers Euphrates and Tigris, whereas he now quitted the banks of the most defensible river perhaps in the whole world. As to his hopes, though they cannot by any means be ill founded, yet they proved absolutely vain; for Alexander, continuing his march, notwithstanding all the hardships his soldiers sustained, reduced all Bactria under his obedience, particularly the capital Bactria and the strong castle Aornus: in the latter he placed a garrison under the command of Archeclus; but the government of the province he committed to Artabazus. He then continued his march to the river Oxus; on the banks of which, when he arrived, he found it three quarters of a mile over, its depth more than proportionable to its breadth, its bottom sandy, its stream so rapid as to render it almost unnavigable, and neither boat nor tree in its neighbourhood; so that the ablest commanders in the Macedonian army were of opinion that they should be obliged to march back. The king, however, having first sent away, under a proper escort, all his infantry and worn-out soldiers, that they might be conducted safe to the sea-ports, and from thence to Greece, devised a method of passing this river without either boat or bridge, by causing the hides which covered the soldiers tents and carriages to be stuffed with straw, and then tied together, and thrown into the river. Having crossed the Oxus, he marched directly towards the camp of Bessus, where, when he arrived, he found it abandoned; but received at the same time letters from Spitamenes and Dataphernes, who were the chief commanders under Bessus, signifying, that, if he would send a small party to receive Bessus, they would deliver him into his hands; which they did accordingly, and the traitor was put to death in the manner related in the history of Persia.

A supply of horses being now arrived, the Macedonian cavalry were remounted. Alexander continued his march to Maracanda the capital of Sogdia, from whence he advanced to the river Iaxartes. Here he performed great exploits against the Scythians; from whom, however, though he overcame them, his army suffered much; and the revolted Sogdians being headed by Spitamenes, gave him a great deal of trouble. Here Alexander married Roxana the daughter of Oxyartes, a prince of the country whom he had subdued. But during these expeditions, the king greatly disgusted his army by the murder of his friend Clytus in a drunken quarrel at a banquet, and by his extravagant vanity in claiming divine honours.

At last he arrived at the river Indus, where Hephestasion and Perdiccas had already provided a bridge of Indus boats for the passage of the army. The king refreshed his troops for 30 days in the countries on the other side of the river, which were those of his friend and ally Taxiles, who gave him 30 elephants, and joined his army now with 700 Indian horse, to which, when they were to enter upon action, he afterwards added 5000 foot,
The true reason of this seems to have been his enmity to Porus, a famous Indian prince whose territories lay on the other side of the river Hydaspes. During this recess, the king sacrificed with great solemnity; receiving also ambassadors from Ambisurus, a very potent prince, and from Daxares, who was likewise a king in those parts, with tenders of their duty, and considerable presents. These ceremonious over, Alexander appointed Philip governor of Taxila, and put a Macedonian garrison into the place, because he intended to erect an hospital there for the cure of his sick and wounded soldiers. He then ordered the vessels, of which his bridge had been composed when he passed the Indus, to be taken to pieces, that they might be brought to the Hydaspes, where he was informed that Porus with a great army lay encamped to hinder his passage. When he approached the banks of this river with his army and the auxiliaries under the command of Taxiles, he found that the people he had to do with were not so easily to be subdued as the Persians and other Asiatics. The Indians were not only a very tall and robust, but also a very hardy and well disciplined people; and their king Porus was a prince of high spirit, invincible courage, and great conduct.

It was about the summer solstice when Alexander reached the Hydaspes, and consequently its waters were broader, deeper, and more rapid, than at any other time; for in India the rivers swell as the sun’s increasing heat melts the snow, and subside again as winter approaches. Alexander therefore had every difficulty to struggle with. Porus had made his dispositions so judiciously, that Alexander found it impossible to practise upon him as he had done upon others, and to pass the river in his view: wherefore he was constrained to divide his army into small parties, and to practice other arts, in order to get the better of so vigilant an enemy. To this end he caused a great quantity of corn and other provisions to be brought into his camp; giving out, that he intended to remain when he was till the river fell, and by becoming formidable should give him an opportunity of forcing a passage: this did not, however, hinder Porus from keeping up very strict discipline in his camp; which when Alexander perceived, he frequently made such motions as seemed to indicate a change of his resolution, and that he had still thoughts of passing the river. The main thing the Macedonians stood in fear of were the elephants; for the bank being very steep on the other side, and it being the nature of horses to start at the first appearance of those animals, it was foreseen that the army would be disordered, and incapable of sustaining the charge of Porus’s troops.

At length Alexander passed the river by the following contrivance. There was, at the distance of 150 stadia, from his camp, a rocky promontory projecting into the river, thick covered with wood; and over against the promontory there lay a pretty large uninhabited island, covered with trees. The king therefore conceived within himself a project of covering a body of troops from this promontory into that island; and upon this scheme he built his hopes of surprising Porus, vigilant as he was. To this end he kept him and his army constantly alarmed for many nights together, till be perceived that Porus apprehended it was only done to harass his troops, and therefore no longer drew out of his camp, but trusted to his ordinary guards; then Alexander resolved to put his design in execution. A considerable body of horse, the Macedonian phalanx, with some corps of light-armed foot, he left in his camp under the command of Craterus, as also the auxiliary Indians, giving these orders, to be observed in his absence, that if Porus marched against him with part of his army, and left another part with the elephants behind in his camp, Craterus and his forces should remain where they were; but if it so happened that Porus withdrew his elephants, then Craterus was to pass the river, because his cavalry might then do it safely. Alexander having marched half the way, or about nine of our miles, ordered the mercenary troops under the command of Attalus and other generals, to remain there; and directed them, that as soon as they knew he was engaged with the Indians on the other side, they should pass in vessels provided for that purpose, in order to assist him. Then marching a long way about, that the enemy might not perceive his design of reaching the rock, he advanced as diligently as he could towards that post. It happened very fortunately for him, that a great storm of thunder, lightning, and hail, rose in the night, whereby his march was perfectly concealed, his vessels of 30 oars put together, and his tents stuffed and stitched, so that they passed from the rock into the island, without being perceived, a little before break of day; the storm ceasing just as he and his soldiers were ready for their passage. When they had traversed the island, they boldly set forward to gain the opposite shore in sight of Porus’s outguards, who instantly posted away to give their master an account of the attempt. Alexander landed first himself, and was followed as expeditiously as possible by his forces, whom he took care to draw up as fast as they arrived. When they began their march again, they found that their good fortune was not so great as at first they esteemed it; for it appeared that they had not reached the river, which were in truth in another island much larger than the former. They crossed it as fast as they could, and found that it was divided from the terra firma by a narrow channel, which, however, was so swelled by the late heavy rain, that the poor soldiers were obliged to wade up to the breast. When they were on the other side, the king drew them up again carefully, ordering the foot to march slowly, they being in number about 6000, while himself with 500 horse advanced before.

As soon as Porus received intelligence that Alexander was actually passing the river, he sent his son with 2000 horse and 120 armed chariots, to oppose him. But they came too late: Alexander was already got on shore, and even on his march. When the Macedonian scouts perceived them advance, they informed the king, who sent a detachment of Pomas de - to attack them, remaining still at the head of his con- foured and valiant in expectation of Porus. But when he found that this party was not supported, he instantly attacked with all his horse, and defeated them with the slaughter of many, and the loss of all their armed chariots, the son of Porus being slain in the fight. The remainder of the horse returning to the camp with this disastrous account, Porus was in some confusion: however, he took very quickly the best and wisest resolutions his circumstances would allow: which were,
MACEDON [314] MAC

Macedon. to leave a party of his army, with some of his ele-
phants, to oppose Craterus, who was now about to
pass the river also; and, with the rest, to march against
Alexander and his forces, who were already passed.
This resolution once taken, he marched immediately
out of his camp at the head of 4,000 horse, 30,000
foot, 300 chariots, and 200 elephants. He advanced
as expeditiously as he could, till he came into a plain
which was firm and sandy, where his chariots and
elephants might act to advantage; there he halted, that
he might put his army in order, knowing well that he
need not go in quest of his enemy. Alexander soon
came up with his horse, but he did not charge Porus;
on the contrary, he halted, and put his troops in or-
der, that they might be able to defend themselves in
case they were attacked. When he had waited some
time, his foot arrived; whom he immediately surround-
ed with his horse, that, after so fatiguing a march,
they might have time to cool and breathe themselves,
before they were led to engage. Porus permitted all
this, because it was not his interest to fight, and be-
cause he depended chiefly upon his order of battle, the
elephants covering his foot, so that the Macedonians
could not charge them.

When Alexander had disposed his foot in proper
order, he placed his horse on the wings: and, observ-
ing that he was much superior in them to the enemy,
and that the cavalry of Porus were easy to be charged,
he resolved to let the foot have as little share as possible
in the battle. To this end, having given the necessary
directions to Coenus who commanded them, he went
himself to the right, and with great fury fell upon the
left wing of Porus. The dispute, though short, was
very bloody: the cavalry of Porus, though they fought
gallantly, were quickly broken; and the foot being by
this means uncovered, the Macedonians charged them.
But the Indian horse rallying, came up to their relief,
yet were again defeated. By this time the archers had
wounded many of the elephants, and killed most of
their riders, so that they did not prove less troublesome
and dangerous to their own side than to the Macedo-
nians; whence a great confusion ensued: and Coenus,
taking this opportunity, fell on with the troops under
his command, and entirely defeated the Indian army.
Porus himself behaved with the greatest intrepidity,
and with the most excellent conduct: he gave his or-
ders and directed every thing, as long as his troops
retained their form; and when they were broken, he
retired from party to party as they made stands, and
continued fighting till every corps of Indians was put
to the rout. In the mean time Craterus had passed
with the rest of the Macedonian army; and these, fall-
ing upon the flying Indians, increased the slaughter
of the day excessively, insomuch that 20,000 foot and
3,000 horse were killed, all the chariots were hacked
to pieces, and the elephants not killed were taken; two
of Porus's sons fell there, as also most of his officers of
all ranks.

As for Porus, Alexander gave strict directions that
no injury might be done to his person: he even sent
carriages locked together, and their tents pitched
in the centre. Notwithstanding the apparent difficulty
of forcing these entrenchments, Alexander resolved im-
extant to attack them. The Indians laid encamped, having three circular lines of

commanded the horse on the other side of the lake, to be extremely vigilant, and to cause all his trumpets to sound, that the forces might repair to that post where the Indians made their greatest effort. These precautions had all the effect that could be desired: for of the few Indians who got through the lake, and passed the Macedonian horse, the greater part were killed on the roads; but the greatest part of their army was constrained to retire again through the water into the city. Two days after, the place was taken by storm. Seventeen thousand Indians were killed; 70,000 taken prisoners; with 300 chariots, and 500 horse. The Macedonians are said to have lost only 100 men in this siege; but they had 1200 wounded, and among these several persons of great distinction.

The city was no sooner taken, than Alexander despatched Eumenes his secretary, with a party of horse, to acquaint the inhabitants of the cities adjacent with what had befallen the Sangalans; promising also, that they should be kindly treated if they would submit. But they were so much affrighted at what had happened to their neighbours, that, abandoning all their cities, they fled to the mountains, choosing rather to expose themselves to wild beasts, than to these invaders, who had treated their countrymen so cruelly. When the king was informed of this, he sent detachments of horse and foot to scour the roads; and these, finding aged, infirm, and wounded people, to the number of about 500, put them to the sword without mercy. Perceiving that it was impossible to persuade the inhabitants to return, he caused the city of Sangala to be razed, and gave the territories to the few Indians who had submitted to him.

Alexander, still unsated with conquest, now prepared to pass the Hyphasis. The chief reason which induced him to think of this expedition was, the information he had received of the state of the countries beyond that river. He was told that they were in themselves rich and fruitful; that their inhabitants were not only a very martial people, but very civilized; that they were governed by the nobility, who were their equals in the laws; and that as they lived in happiness and freedom, it was likely they would fight obstinately in defence of those blessings. He was farther told, that among those nations there were the largest, strongest, and most useful elephants bred and tamed; and was therefore fired with an earnest desire to reduce such a bold and brave people under his rule, and of attaining to the possession of the many valuable things that were said to be amongst them. As exorbitant, however, as his personal ambition was, he found it impossible to induce any part of it into the minds of his soldiers; who were so far from wishing to triumph over new and remote countries, that they were highly desirous of leaving those that they had already conquered. When therefore they were informed of the king's intentions, they privately consulted together in the camp about the situation of their own affairs. At this consultation, the gravest and best of the soldiers lamented that they were made use of by their king, not as lions, who fall fiercely upon those who have injured them; but as mastiffs who fly upon and tear those who are pointed out to them as enemies. The rest were not so modest; but expressed themselves roundly against the king's humour for leading them from battle to battle, from siege to siege, and from river to river; protesting that they would follow him no further, nor lavish away their lives and longer, to purchase fame for him.

Alexander was a man of too much penetration not to be early in perceiving that his troops were very uneasy. He therefore barangued them from his tribunal; but though his eloquence was great, and the love his army had for him was yet very strong, they did not relent. For some time the soldiers remained sullen and silent; and at last turned their eyes on Caesar, an old and experienced general, whom Alexander loved, and in whom the army put great confidence. He had the generosity to undertake their cause; and told Alexander frankly, "That men endured toil in hopes of repose; that the Macedonians were already much reduced in their numbers; that of those who remained, the greater part were invalids; and that they expected, in consideration of their former services, that he would now lead them back to their native country: an act which, of all others, would most contribute to his own great designs; since it would encourage the youth of Macedon, and even of all Greece, to follow him in whatever new expedition he pleased to undertake." The king was far from being pleased with this speech of Caesar, and much less with the disposition of his army, which continued in a deep silence. He therefore dismissed the assembly: but next day he called another, wherein he told the soldiers plainly, that he would not be driven from his purpose; that he would proceed in his conquests with such as should follow him voluntarily; as for the rest, he would not detain them, but would leave them at liberty to go home to Macedon, where they might publish, "that they had left their king in the midst of his enemies." Even this expedition had no success; his army was so thoroughly tired with long marches and desperate battles, that they were determined to go no further, either for fair speeches or foul. Upon this Alexander retired to his tent, where he refused to see his friends, and put on the same gloomy temper that reigned among his troops. For the three days things remained in this situation. At last the king suddenly appeared; and, as if he had been fully determined to pursue his first design, he gave orders for sacrificing for the good success of his new undertaking. Ariander the augur reported, that the omens were altogether inauspicious; upon which the king said, that since his proceeding farther was neither pleasing to the gods, nor grateful to his army, he would return. When this was rumoured among the army, they assembled in great numbers about the royal tent, saluting the king with loud acclamations, wishing him success in all his future designs; giving him at the same time hearty thanks, for that "he who was invincible had suffered himself to be overcome by their prayers."

A stop being thus put to the conquests of Alexander, he determined to make the Hyphasis the boundary of his dominions; and having erected twelve altars of an extraordinary magnitude, he sacrificed on them: after which he exhibited shows in the Grecian manner; and, having added all the conquered country in these parts to the dominions of Porus, he

 began
began to return. Having arrived at the Hydaspes, he made the necessary preparations for sailing down the Indus into the ocean. For this purpose, he ordered vast quantities of timber to be felled in the neighbourhood of the Hydaspes, through which he was to sail into the Indus; he caused the vessels with which he had passed other rivers to be brought thither, and assembled a vast number of artificers capable of repairing and equipping his fleet; which, when finished, consisted of 50 vessels of three banks abreast, and 2000 lesser ships and transports.

Those who were to manage this fleet were collected out from the Phœnicians, Cyprians, Carians, and Egyptians following his army, and who were reckoned perfectly well skilled in the naval art. When all things were ready, the army embarked about break of day; the king, in the mean time, sacrificed to the gods according to the ceremonies used in his own country, and likewise according to those of the country where he now was. Then he himself went on board; and causing the signal to be given by sound of trumpet, the fleet set sail. Craterus and Hephaestion had marched some days before with another division of the army; and in three days the fleet reached that part of the river which was opposite to their camps. Here he had information, that the Oxydracae and Malli were raising forces to oppose him; upon which he immediately determined to reduce them; for, during this voyage, he made it a rule to compass the inhabitants on both sides of the river to yield him obedience. But before he arrived on the coasts of the people above mentioned, he himself sustained no small danger; for, coming to the confluence of the Acesines with the Hydaspes, from whence both rivers roll together into the Indus, the eddies, whirlpools, and rapid currents, rushing with tremendous noise from the respective channels of these rivers into the great one formed by them both, at once terrified those who navigated his vessels, and actually destroyed many of the long vessels, with all who were aboard of them; the king himself being in some danger, and Nearcyclus the admiral not a little at a loss. As soon as this danger was over, Alexander went on shore; and having ordered his elephants with some troops of horse and archers to be carried across, and put under the command of Craterus, he then divided his army on the left-hand bank into three bodies; the first commanded by himself, the second by Hephaestion, and the third by Ptolemy. Hephaestion had orders to move silently through the heart of the country, five days march before the king; that if, on Alexander's approach, any of the barbarians should attempt to shelter themselves by retiring into the country, they might fall into the hands of Hephaestion. Ptolemy Lagos was ordered to march three days journey behind the king, that if any escaped his army, they might fall into Ptolemy's hands; and the fleet had orders to stop at the confluence of this river with the Hydaspes till such time as these several corps should arrive.

Alexander himself, at the head of a body of horse and light armed foot, marched through a desert country against the Malli; and, scarce affording any rest to his soldiers, arrived in three days at a city into which the barbarians had put their wives and children, with a good garrison for their defence. The country people, having no notion that Alexander would march through such a desert and barren region, were all unarmed, and in the utmost confusion. Many of them therefore were slain in the field; the rest fled into the city, and shut the gates. But this only protracted their fate for a short time; for the king, having ordered the city to be invested by his cavalry, took it, as well as the castle, by storm, and put all be found there to the sword. He sent at the same time Perdiccas with a considerable detachment to invest another city of the Malli at a considerable distance; but when he came there he found it abandoned. However, he pursued the inhabitants, who had but lately left it, and killed great numbers of them on the road. After this the king took several other cities, but not without considerable resistance; for the Indians sometime chose to burn themselves in their houses rather than surrender. At last he marched to their capital city; and finding that abandoned, he proceeded to the river Hydaspes, where he found 50,000 men encamped on the opposite bank, in order to dispute his passage. He did not hesitate, however, to enter the river with a considerable party of horse: and so much were the Indians terrified at his presence, that their whole army retired before him. In a short time they returned and attacked him, being ashamed to fly before such an inconsiderable number; but in the mean time the rest of the Macedonian forces came up, and the Indians were obliged to retire to a city which lay behind them, and which Alexander invested that very night. The next day he stormed the city with such violence, that the inhabitants were compelled to abandon it, and to retire to the castle, where they prepared for an obstinate defence. The king instantly gave orders for scaling the walls, and the soldiers prepared to execute these orders as fast as they could; but the king being impatient, caught hold of a ladder and mounted it first himself, being followed by Leonatus, Peucestas, and Abreas, the latter a man of great valour, and who on that account had double pay allowed him. The king having gained the top of the battlements, cleared them quickly of the defenders, killing some of them with his sword, and pushing others over the walls: but after this was done, he rate valour, was in more danger than ever; for the Indians galled and endangered him with their arrows from the adjacent towers, though they durst not come near enough to engage him. His own battalion of archers, mounting in haste to second him, broke the ladders; which, as soon as Alexander perceived, he threw himself down into the castle, as did also Peucestas, Leonatus, and Abreas. As soon as the king was on the ground, the Indian general rushed forward to attack him; but Alexander instantly despatched him, as well as several others who followed him. Upon this the rest retired, and contented themselves with throwing darts and stones at him at a distance. Abreas was struck into the head with an arrow, and died on the spot; and, shortly after, another pierced through the king's breast-plate into his body. As long as he had spirits, he defended himself valiantly; but, through a vast effusion of blood, losing his senses, he fell upon his shield. Peucestas then covered him with the sacred shield of Pallas on one side, as did Leonatus with his own shield on the other, though they themselves were dreadfully
dreadfully wounded. In the mean time, however, the soldiers on the outside, eager to save their king, supplied their want of ladders, by driving large iron pins into the walls. By the help of these many of them ascended, and came to the assistance of Alexander and his companions. The Indians were now slaughtered without mercy; but Alexander continued for some time in a very dangerous way: however, he at last recovered his strength, and showed himself again to his army, which fled at the sight of his presence. The Malli, being now convinced that nothing but submission could save the remainder of them, sent deputies to Alexander, offering the dominion of their country; as did also the Oxydraces: and the king having settled every thing in these countries agreeable to his mind, proceeded on his voyage down the river Indus. In this voyage he received the submission of some other Indian princes; and perceiving, that at the point of the island Pattala, the river divided itself into two vast branches, he ordered an haven and convenient docks to be made there for his ships; and when he had careened his fleet, he sailed down the right-hand branch towards the ocean. In his passage he sustained great difficulties by reason of his want of pilots, and at the mouth of the river very narrowly missed being cast away: yet all this did not hinder him from pursuing his first design, though it does not appear that he had any other motive thereto than the vain desire of boasting that he had entered the ocean beyond the Indus: for, having consecrated certain bulls to Neptune, and thrown them into the sea, performed certain libations of golden cups, and threw the cups also into the sea, he came back again; having only surveyed two little islands, one at the mouth of the Indus, and one a little farther in the ocean.

On the king’s return to Pattala, he resolved to sail down the other branch of the Indus, that he might see whether it was more safe and commodious for his fleet than that which he had already tried; and for this he had very good reasons. He had resolved to send Nearchus with his fleet by sea, through the Persian gulf up the river Tigris, to meet him and his army in Mesopotamia; but as the possibility of this voyage depended on the ceasing of the Etesian winds, there was a necessity of laying up the fleet till the season should prove favourable. Alexander, therefore, sailing through this branch of the Indus, sought on the sea coast for bays and creeks, where his fleet might anchor in safety; he caused also pits to be sunk, which might be filled with fresh water for the use of his people; and took all imaginable precautions for preserving them in ease and safety till the season would allow them to continue their voyage. In this he succeeded to his wish; for he found this branch of the river Indus, at its mouth, spread over the plain country, and forming a kind of lake, wherein a fleet might ride with safety. He therefore appointed Leonatus, and a part of his army, to carry on such works as were necessary: causing them to be relieved by fresh troops as often as there was occasion; then having given his last instructions to Nearchus, he departed with the rest of the army, in order to march back to Babylon.

Before the king’s departure, many of his friends advised him against the route which he intended to take. They told him, that nothing could be more rash or dangerous than this resolution. They acquainted him, that the country through which he was to travel was a wild uncultivated desert; that Semiramis, when she led her soldiers this way out of India, brought home but 23 of them; and that Cyrus, attempting to do the same, returned with only seven. But all this was far from deterring Alexander. He was more than ever determined to see no other road. As soon, therefore, as he had put things in order, he marched at the head of a sufficient body of troops to reduce the Orite, who had never vouchsafed either to make their submission or to court his friendship. Their territories lay on the other side of a river called Arabis, which Alexander crossed so speedily, that they had no intelligence of his march; whereupon most of them quitted their country, and fled into the deserts. Their capital he found so well situated, that he resolved to take it out of their hands, and to cause a new and noble city to be founded there, the care of which he committed to Hephestion. Then he received the deputies of the Orite and Gedoris; and having assured them, that if the people returned to their villages, they should be kindly treated, and having appointed Apollonenes president of the Orite, and left a considerable body of troops under Leonatus to secure their obedience, he began his march through Gedoris. In this march his troops suffered incredible hardships. The road was very uncertain and troubled, on account of its lying through deep and loose sands, rising in many places into hillocks, which forced the soldiers to climb, at the same time that it sunk under their feet; there were no towns, villages, nor places of refreshment, to be met with; so that, after excessive marches, they were forced to encamp among these dry sands. As to provisions, they hardly met with any during their whole march. The soldiers were therefore obliged to kill their beasts of carriage; and such as were sent to bring some corn from the sea side, were so grievously distressed, that, though it was sealed with the king’s signet, they cut open the bags, choosing rather to die a violent death for disobedience than perish by hunger. When the king, however, was informed of this, he freely pardoned the offenders; he was also forced to accept the excuses that were daily made for the loss of mules, horses, &c. which were in truth eaten by the soldiers, and their carriages broken in pieces to avoid further trouble. As for water, their want of it was a great misfortune; and yet their finding it in plenty was sometimes a greater: for, as by the first they perished with thirst, so by the latter they were burnt, thrown into dropies, and rendered incapable of travel. Frequently they met with no water for the whole day together; sometimes they were disappointed of it at night; in which case, if they were able, they marched on; so that it was common with them to travel 30, 40, 50, or even 60 miles without encamping. Numbers through these hardships were obliged to lag in the rear; and of these many were left behind, and perished; for indeed scarce any ever joined the army again. Their miseries, however, they sustained with incredible patience, being encouraged by the example of their king; who, on this occasion, suffered greater hardships than the meanest soldier in his army. At last they
they arrived at the capital of Gedrosia, where they refreshed themselves, and said some time: after which they marched into Caramania; which being a very plentiful country, there they made themselves ample amends for the hardships and fatigues they had sustained. Here they were joined first by Craterus with the troops under his command, with a number of elephants: then came Stasamus president of the Arians, and Pharrhanes the son of Phratapernes governor of Parthia. They brought with them camels, horses, and other beasts of burden, in vast numbers; having foreseen, that the king's march through Gedrosia would be attended with the loss of the greatest part, if not of all the cavalry and beasts belonging to his army.

During Alexander's stay in Caramania, he redressed the injuries of his people, who had been grievously oppressed by their governors during his absence. Here also he was joined by his admiral Nearchus, who brought him an account that all under his command were in perfect safety, and in excellent condition; with which the king was mightily pleased, and, after having bestowed on him singular marks of his favour, sent him back to the navy. Alexander next set out for Persia, where great disorders had been committed during his absence. These also he redressed, and caused the governor to be crucified; appointing in his room Peucetas, who saved his life when he fought singly against a whole garrison as above related. The new governor was no sooner invested with his dignity, than he laid aside the Macedonian garb, and put on that of the Medes; being the only one of Alexander's captains, who, by complying with the manners of the people he governs, has obtained so great a name.

While Alexander visited the different parts of Persia, he took a view, among the rest, of the ruins of Persepolis, where he is said to have expressed great sorrow for the destruction he had formerly occasioned. From Persepolis he marched to Sippe, where he gave an extraordinary loose to pleasure; resolving to make himself and his followers some amends for the difficulties they had hitherto undergone: purposes at the same time so effectually to unite his new conquered with his hereditary subjects, that the jealousies and fears which had hitherto tormented both, should no longer subsist. With this view he married two wives of the blood royal of Persia; viz. Barsine, or Statira, the daughter of Darius, and Parysatis the daughter of Ochus. Drypetis, another daughter of Darius, he gave to Hephestion; Amasia, the daughter of Oxyartes the brother of Darius, married Craterus; and to the rest of his friends, to the number of 80, he gave other women of the greatest quality. All these marriages were celebrated at once; Alexander himself bestowing fortunes upon them; he directed likewise to take account of the number of his officers and soldiers who had married Asiatic wives; and though they appeared to be 10,000, yet he gratified each of them according to his rank. He next resolved to pay the debts of his army, and thereupon issued an edict directing every man to register his name and the sum he owed; with which the soldiers complying slowly, from an apprehension that there was some design against them, Alexander ordered tables heaped with money to be set in all quarters of the camp, and caused every man's debts to be paid on his bare word, without even making any entry of his name: though the whole sum came to 20,000 talents. On such as had distinguished themselves in an extraordinary manner, he bestowed crowns of gold. Peucetas had the first; Leonatus the second; Nearchus the third; Onesicritus the fourth; Hephestion the fifth; and the rest of his guards had each of them one. After this he made other dispositions for conciliating, as he supposed, the differences among all his subjects. He reviewed the 30,000 youths, whom at his departure for India he had ordered to be taught Greek and the Macedonian discipline; expressing high satisfaction at the fine appearance they made, which rendered them worthy of the appellation he bestowed on them, viz. that of Epigonoi, i. e. successors. He promoted also, without any distinction of nation, all those who had served him faithfully and valiantly in the Indian war. When all these regulations were made, he gave the command of his heavy-armed troops to Hephestion, and ordered him to march directly to the banks of the Tigris, while in the mean time a fleet was equipped for carrying the king and the troops he retained with him down to the ocean.

Thus ended the exploits of Alexander; the greatest conqueror that ever the world saw, at least with respect to the rapidity of his conquests. In 12 years time he had brought under his subjection Egypt, Libya, Asia Minor, Syria, Phoenicia, Palestine, Babylonia, Persia, with part of India and Tartary. Still, however, he meditated greater things. He had now got a great taste in maritime affairs; and is said to have meditated a voyage to the coasts of Arabia and Ethiopia, and then to have sailed to the whole continent of Africa to the straits of Gibraltar. But of this there is no great certainty: though that he intended to subdue the Carthaginians and Italians, is more than probable. All these designs, however, were frustrated by his death, which happened at Babylon in 323 B.C. He is said to have received several warnings of his approaching fate, and to have been advised to avoid that city; which advice he either despised or could not follow. He died of a fever after eight days illness, with the open naming any successor; having only given his ring to Perdiccas, and left the kingdom, as he said, to the most worthy.

The character of this great prince has been variously represented; but most historians seem to have looked upon him rather as an illiterates madman than one upon whom the epitaph of Great could be properly bestowed. From a careful observation of his conduct, however, it must appear, that he possessed not only a capacity to plan, but likewise to execute, the greatest enterprises that ever entered into the head of any of the human race. From whatever cause the notion originated, it is plain that he imagined himself a divine person, and born to subdue the whole world: and extravagant and impracticable as this scheme may appear at present, it cannot at all be looked upon in the same light in the time of Alexander. The Greeks were in his time the most powerful people in the world in respect to their skill in the military art, and the Persians were the most powerful with respect to wealth and numbers. The only other powerful people in the world were the Carthaginians, Gauls, and Italian nations. From a long series of wars which the Carthaginians
Carthaginian army commanded by a Greek general, and guided by Greek discipline.

Thus it appears, that the scheme of Alexander cannot by any means be accounted that of a madman, or of one who projects great things without judgment or means to execute them. If we consider from his actions the end which most probably he had in view, could his scheme have been accomplished, we shall find it not only the greatest but the best that can possibly be imagined. He did not conquer to destroy, enslave, or oppress; but to civilize and unite the whole world as one nation. No sooner was a province conquered than he took care of it as if it had been part of his paternal inheritance. He allowed not his soldiers to oppress and plunder the Persians, which they were very much inclined to do; on the contrary, by giving into the oriental customs himself, he strove to extinguish that inveterate hatred which had so long subsisted between the two nations. In the Scythian country, in which he subdued, he pursued the same excellent plan. His courage and military skill, in which he never was excelled, were displayed, not with a view to rapine or desultory conquest, but to civilize and induce the barbarous inhabitants to employ themselves in a more proper way of life. "Midst the hardships of a military life (says Dr Gillies), obstinate sieges, bloody battles, and dear bought victories, he still respected the rights of mankind, and practised the mild virtues of humanity. The conquered nations enjoyed their ancient laws and privileges; the rigours of despotism were softened; arts and industry encouraged; and the proudest Macedonian governors compelled, by the authority and example of Alexander, to observe the rules of justice towards their meanest subjects. To bridle the fierce inhabitants of the Scythian plains, he founded cities and established colonies on the banks of the Iaxartes and Oxus; and those destructive campaigns usually ascribed to his restless activity, and blind ambition, appeared to the discernment of this extraordinary man not only essential to the security of the conquests which he had already made, but necessary for the more remote and splendid expeditions which he still purposed to undertake, and which he performed with singular boldness and unexampled success." In another place, the same author gives his character in the following words.

"He was of a low stature, and somewhat deformed; but the activity and elevation of his mind animated and ennobled his frame. By a life of continual labour, and by an early and habitual practice of the gymnastic exercises, he had hardened his body against the impressions of cold and heat, hunger and thirst, and prepared his robust constitution for bearing such exertions of strength and activity, as have appeared incredible to the undisciplined softness of modern times. In generosity and in prowess, he rivalled the greatest heroes of antiquity; and in the race of glory, having finally outstripped all competitors, became ambitious to surpass himself. His superior skill in war gave uninterrupted success to his arms; and his natural humanity, enlightened by the philosophy of Greece, taught him to improve his conquests to the best interests of mankind. In his extensive dominions he built up founded not less than 70 cities; the situation of which being chosen with consummate wisdom, tended to facilitate communication, to promote commerce, and to diffuse civility through the greatest nations of the earth. It may be suspected, indeed, that he mistook the extent of human power, when in the course of one reign he undertook to change the face of the world: and that he miscalculat ed the stubbornness of ignorance and the force of habit, when he attempted to enlighten barbarism, to soften servitude, and to transplant the improvements of Greece into an African and Asiatic soil, where they have never been known to flourish. Yet let not the designs of Alexander be too hastily accused of extravagance. Whoever seriously considers what he actually performed before his 33rd year, will be cautious of determining what he might have accomplished had he reached the ordinary term of human life. His resources were peculiar to himself; and such views as well as actions became him as would have become none besides. In the language of a philosophical historian, "he seemed to have been given to the world by a peculiar dispensation of Providence, being a man like to none other of the human kind."

"From the part which his father Philip and himself acted in the affairs of Greece, his history has been transmitted through the impure channels of exaggerated flattery, or malignant envy. The innumerable fictions which disgrace the works of his biographers, are contradicted by the most authentic accounts of his reign, and inconsistent with those public transactions which concurred authorities confirm. In the present work it seemed unnecessary to expatiate on such topics, since it is less the business of history to repeat or even to expose errors than to select and impress useful truths. An author, ambitious of attaining that purpose, can seldom indulge the language of general panegyric. He will acknowledge, that Alexander's actions were not always blameless; but, after the most careful examination, he will affirm, that his faults were few in number, and resulted from his situation rather than from his character.

"From the first years of his reign he experienced the crimes of disaffection and treachery, which multiplied and became more dangerous with the extent of his dominions and the difficulty to govern them. Several of his lieutenants early aspired at independence; others formed conspiracies against the life of their master. The first criminals were treated with a lenity becoming the generous spirit of Alexander: but when Philotas, the son of Parmenio, and even Parmenio himself, afforded reason to suspect their fidelity; when the Macedonian youths, who, according to the insti-
MACEDON.

The Macedonian aristocracy, led by Philip, showed the royal pavilion, prepared to murder their sovereign, he found it necessary to depart from his lenient system, and to hold with a firmer hand the reins of government. Elated by unexampled prosperity, and the submissive reverence of vanquished nations, his loftiness disgusted the pride of his European troops, particularly the Macedonian nobles, who had been accustomed to regard themselves rather as his companions than subjects. The pretensions which sounded policy taught him to form and to maintain, of being treated with those external honors which admired by the monarchs of the East, highly offended the religious prejudices of the Greeks, who deemed it impious to prostrate the body or bend the knee to any mortal sovereign. Yet had he remitted formalities consecrated by the practice of ages, he must insensibly have lost the respect of his Asiatic subjects. With a view to reconcile the discordant principles of the victors and vanquished, he affected an immediate descent from Jupiter Ammon, a claim liberally admitted by the avarice or fears of the Libyan priests; and which, however reasonable to expect, could not be very obstinately denied by the credulity of the Greeks and Macedonians; who universally acknowledged that Philip, his reputed father, was remotely descended from the Greek Jupiter. But the success of this design, which might have entitled him, as a son of Jupiter, to the same obeisance from the Greeks which the barbarians readily paid him as monarch of the East, was counteracted, if not at first by the secret displeasure, and afterwards by the open indignation, of general and courtiers. Nor did the conduct of Alexander tend to extricate him from this difficulty. With his friends he maintained that equal intercourse of visits and entertainments which characterized the Macedonian manners; indulged the liberal flow of ungoverned conversation; and often exceeded that intemperance in wine which disgraced his age and country.

We shall conclude this character of Alexander with observing, that he had in view, and undoubtedly must have accomplished, the sovereignty of the ocean as well as of the land. The violent resistance made by the Tyrians had shown him the height of a commercial nation; and it was undeniably with a view to enrich his dominions by commerce, that he equipped the fleet on the Indus, and wished to keep up a communication with India by sea as well as by land. It was chiefly with a view to the former of these objects (says Dr Robertson), that he examined the navigation of the Indus with so much attention. With the same view, on his return to Susa, he in person surveyed the course of the Euphrates and Tigris, and gave directions to preserve the estuaries or deltas with which the ancient monarchs of Persia, induced by a peculiar precept of their religion, which enjoined them to guard with the utmost care against defiling any of the elements, had constructed near the mouths of these rivers, in order to shut out their subjects from any access to the ocean. By opening the navigation in this manner, he proposed that the valuable commodities of India should be conveyed from the Persian gulf into the interior parts of his Asiatic dominions, while by the Arabian gulf they should be carried to Alexandria, and distributed to the rest of the world.

"Grand and extensive as these schemes were, the precautions employed, and the arrangements made for carrying them into execution, were so various and so proper, that Alexander had good reason to entertain sanguine hopes of their proving successful. At the time when the mutinous spirit of his soldiers obliged him to relinquish his operations in India, he was not 30 years of age complete. At this enterprising period of life, a prince of a spirit so active, persevering, and indefatigable, must have soon found means to resume a favourite measure on which he had been long intent. It he turned India a second time, as formerly, he must have been obliged to force his way through hostile and unexplored regions, opposed at every step by nations and tribes of barbarians whose names had never reached Greece. All Asia, from the shores of the Indian sea to the banks of the Hysophas, would then have been subject to his dominion; and through that immense stretch of country he had established such a claim of cities or fortified stations, that his armies might have continued their march with safety, and have found a regular succession of magazines provided for their subsistence. Nor would it have been difficult for him to bring into the field forces sufficient to have achieved the conquest of a country so populous and extensive as India. Having armed and disciplined his subjects in the east like Europeans, they would have been ambitious to imitate and to equal their instructors; and Alexander might have drawn recruits, not from his scanty domains in Macedonia and Greece, but from the vast regions of Asia, which, in every age has covered the earth and astonished mankind with its numerous armies. When at the head of such formidable power he had reached the confines of India, he might have entered it under circumstances very different from those in his first expedition. He had secured a firm footing there, partly by means of the garrisons which he left in the three cities which he had built and fortified, and partly by his alliance with Taxiles and Porus. These two Indian princes, won by Alexander's humanity and benevolence, which, as they were virtues seldom displayed in the ancient mode of carrying on war, excited of course a higher degree of admiration and gratitude, had continued steady in their attachment to the Macedonians. Reinforced by their troops, and guided by their information as well as by the experience which he had acquired in his former campaigns, Alexander must have made rapid progress in a country where every invader from his time to the present age has proved successful.

"But this and all his other splendid schemes were terminated at once by his untimely death. In consequence of that, however, events took place which illustrate and confirm the justness of the preceding speculations and conjectures, by evidence the most striking and satisfactory. When that great empire, which the superior genius of Alexander had kept united and in subjection, no longer felt his superintending control, it broke into pieces, and its various provinces were seized by his principal officers, and parcelled out among them. From ambition, emulation, and personal animosity, they soon turned their arms against one another; and as several of the leaders were equally eminent for political abilities and for military skill, the contest was maintained long, and carried on with frequent vicissitudes of fortune. Amidst the various convulsions and revolutions,
revolutions which these occasioned, it was found that the measures of Alexander for the preservation of his conquests had been concerted with such sagacity, that upon the final restoration of tranquillity, the Macedonian dominion continued to be established in every part of Asia, and not one province had shaken off the yoke. Even India, the most remote of Alexander's conquests, quietly submitted to Python the son of Agenor, and afterwards to Seleucus, who successively obtained dominion over that part of Asia. Porus and Taxis, notwithstanding the death of their benefactor, neither declined submission to the authority of the Macedonians, nor made any attempt to recover independence.

With the death of Alexander fell also the glory of the Macedonians; who very soon relapsed into a situation, as bad, or worse, than that in which they had been before the reign of Philip. This was occasioned principally by his not having distinctly named a successor, and having no child of his own come to the years of discretion to whom the kingdom might seem naturally to belong. The ambition and jealousy of his mother Olympias, his queen Roxana, and especially of the great commanders of his army, not only prevented a successor from being ever named, but occasioned the death of every person, whether male or female, who was in the least related to Alexander. To have a just notion of the origin of these disturbances, it is necessary in the first place to understand the situation of the Macedonian affairs at the time of Alexander's death.

When Alexander set out for Asia, he left Antipater, as we formerly observed, in Macedon, to prevent any disturbances that might arise either there or in Greece. The Greeks, even during the lifetime of Alexander, bore the superiority which he exercised over them with great impatience; and, though nothing could be more gentle than the government of Antipater, yet he was exceedingly hated, because he obliged them to be quiet. One of the last actions of Alexander's life set all Greece in a flame. He had, by an edict, directed all the cities of Greece to recall their exiles; which edict, when it was published at the Olympic games, created much confusion. Many of the cities were afraid, that, when the exiles returned, they would change the government; most of them doubted their own safety, if the edict took place; and all of them held this peremptory decree to be a total abolition of their liberty. No sooner, therefore, did the news of Alexander's death arrive than they prepared for war.

In Asia the state of things was not much better; not indeed through any inclination of the conquered countries to revolt, but through the dissensions among the commanders.—In the general council which was called soon after the death of Alexander, after much confusion and altercation, it was at last agreed, or rather commanded by the soldiers, that Arideus, the brother of Alexander, who had always accompanied the king, and had been wont to sacrifice with him, should assume the sovereignty. —This Arideus was a man of very slender parts and judgment, not naturally, but by the wicked practices of Olympias, who had given him poison in his infancy, lest he should stand in the way of her son Alexander or any of his family; and for this, or some other reason, Perdiccas, Ptolemy, and most of the horse officers, resented his promotion to such a degree, that they quitted the assembly, and even the city.

However, Meleager, at the head of the phalanx vigorously supported their first resolution, and threatened to shed the blood of those who affected to rule over their equals, and to assume a kingdom, which was not due to them; Arideus was accordingly arrayed in royal robes, had the arms of Alexander put upon him, and was saluted by the name of Philip, to render him more popular. Thus were two parties formed, at the head of whom were Meleager and Perdiccas, both of them pretending vast concern for the public good, yet at bottom desiring nothing more than their own advantage. Perdiccas was a man of high birth, by Perdicas, and had a supreme command in the army, was much in favour with Alexander, and one in whom the nobility had put great confidence. Meleager had become formidable by having the phalanx on his side, and having the nominal king entirely in his power; for Arideus, or Philip, was obliged to comply with whatever he thought proper; and publicly declared, that whatever he did was by the advice of Meleager; so that he made his minister accountable for his own schemes, and no way endangered himself. The Macedonians also, besides their regard for the deceased king, soon began to entertain a personal love for Philip on account of his moderation.

It is remarkable, however, that notwithstanding all the favours which Alexander had conferred upon his officers, and the fidelity with which they had served him during his life, only two of them were attached to the interests of his family after his death. These were Antipater, and Eumenes the Cardian, whom he had appointed his secretary. Antipater, as we have already seen, was embroiled with the Greeks, and could not assist the royal family who were in Asia; and Eumenes had not as yet sufficient interest to form a party in their favour. In a short time, however, Perdiccas prevailed against Meleager, and got him murdered; murdered, by which means the supreme power for a time fell into the hands of the latter. His first step, in consequence of this power, was to distribute the provinces of the empire among the commanders in the following manner, in order to prevent competitors, and to satisfy the ambition of the principal commanders of the army. Arideus, the son of Roxana, born after the death of his father, were to enjoy the regal authority. Antipater had the government of the European provinces. Craterus had the title of protector. Perdiccas was general of the household troops in the room of Hephaeston. Ptolemy the son of Lagus had Egypt, Libya, and that part of Arabia which borders upon Egypt. Cleomenes, a man of infamous character, whom Alexander had made received-general in Egypt, was made Ptolemy's deputy. Leomedon had Syria; Philotas, Callias; Python, Media; Eumenes, Cappadocia, Paphlagonia, and all the country bordering on the Euxine sea, as far as Traces; but these were not yet conquered, so that he was a governor without a province. Antigonus had Pamphylia, Lycia, and Phrygia Major; Cassander, Cappadocia, Meander, Lydia; Leonicus, Phrygia on the Hallespont.

In the mean time, not only Alexander's will, but Alexander himself, was so much neglected, that his body was allowed to remain seven days before any notice was taken of it, or any orders given for its being embalmed. The only will he left was a short memo-
random of six things he would have done.—1. The
building of a fleet of 1000 stout galleys, to be made
use of against the Carthaginians and other nations who
should oppose the reduction of the sea-coasts of Africa
and Spain, with all the adjacent islands as far as Sicily.
2. A large and regular highway was to be made along
the coast of Africa, as far as Creta and Tangier. 3.
Six temples of extraordinary magnificence were to be
erected at the expense of 1500 talents each. 4. Cas-
tles, arsenals, havens, and yards for building ships, to
be settled in proper places throughout his empire. 5.
Several new cities were to be built in Europe and Asia;
those in Asia to be inhabited by colonies from Macedon,
and those in Europe to be filled with Asiatics; that, by
blending their people and their manners, that hereditary
antipathy might be eradicated which had hitherto sub-
sisted between the inhabitants of the different contin-
ents. 6. Lastly, He had projected the building of a
pyramid, equal in bulk and beauty to the biggest in
Egypt, in honour of his father Philip. All these de-
signs, under pretence of their being expensive, were
referred to a council of Macedonians, to be held nobody
knew when or where.

The government, being now in the hands of Perdic-
cas and Roxana, grew quickly very cruel and distaste-
ful. Alexander was scarce dead when the queen sent
for Statira and Drypetis the two daughters of Darius,
one of whom had been married to Alexander and the other
to Hephæstion; but as soon as they arrived at
Babylon, caused them both to be murdered, that no
son of Alexander by any other woman, or of Hephæ-
sion, might give any trouble to her or her son Alexan-
der. Sisygambis, the mother of Darius, no sooner
heard that Alexander the Great was dead, than she laid
violent hands on herself, being apprehensive of the ca-
lamities which were about to ensue.

War was first declared in Greece against Antipater
in the year 323 B.C. Through the treachery of the
Thessalians, that general was defeated, with the army
he had under his own command. Leonatus was there-
fore sent from Asia, with a very considerable army,
to his assistance; but both were overthrown with great loss
by the confederates, and Leonatus himself was killed.
In a short time, however, Craterus arrived in Greece
with a great army, the command of which he resigned
to Antipater. The army of the confederates amounted
to 25,000 foot and 3000 horse; but Antipater com-
manded no fewer than 40,000 foot, 3000 archers, and
3000 horse. In such an unequal contest, therefore, the
Greeks were defeated, and forced to sue for peace; which
they did not obtain but on condition of their re-
ceiving Macedonian garrisons into several of their cit-
ties. At Athens also the democratic government was
abrogated; and such a dreadful punishment did this
seem to the Athenians, that 22,000 of them left their
country, and retired into Macedonia.

While these things were doing in Greece, distur-
bances began also to arise in Asia and in Thrace. The
Greeks mercenaries, who were dispersed through the
inland provinces of Asia, desiring of ever being al-
lowed to return home by fair means, determined to
attempt it by force. For this purpose, they assembled
to the number of 20,000 foot and 3000 horse; but
were all cut off to a man by the Macedonians. In
Thrace, Lysimachus was attacked by one Suthes, a
prince of that country, who claimed the dominions of
Macedon and his ancestors, and had raised an army of 20,000 foot
and 8000 horse. But though the Macedonian com-
mander was forced to engage this army with no more
than 4000 foot and 2000 horses, yet he kept the field
of battle, and could not be driven out of the country.
Perdiccas, in the mean-time, by pretending friendship
to the royal family, had gained over Eumenes entirely
to his interest; and at last put him in possession of the
Ambition province of Cappadocia by the defeat of Ariarathes and cruel-
king of that country, whom he afterwards cruelly
caused to be crucified. His ambition, however, now
began to lead him into difficulties. At the first division
of the provinces, Perdiccas, to strengthen his own au-
tority, had proposed to marry Nesca the daughter of
Antipater; and so well was this proposal relished, that
her brethren Jolias and Archias conducted her to him,
in order to be present at the celebration of the nuptials.
But Perdiccas now had other things in view. He had
been solicited by Olympias to marry her daughter Cleo-
patra, the widow of Alexander king of Epirus, and
who then resided at Sardis in Lydia. Eumenes pro-
moted this match to the utmost of his power, because
he thought it would be for the interest of the royal fa-
mily; and his persuasions had such an effect on Per-
dicas, that he was sent to Sardis to compliment Cleo-
patra, and to carry presents to her in name of her new
lover. In the absence of Eumenes, however, Alcetas,
the brother of Perdiccas, persuaded him to marry Ni-
caea; but, in order to gratify his ambition, he resolved
to divorce her immediately after marriage, and marry
Cleopatra. By this last marriage, he hoped to have a
pretence for altering the government of Macedon: and,
as a necessary measure preparative to these, he entered
into contrivances for destroying Antigonus. Unfortu-
nately for himself, however, he ruined all his schemes
by his own jealousy and precipitate cruelty. Cyanau,
the daughter of Philip by his second wife, had brought
her daughter named Adisa, and who was afterwards
named Eurydice, to court, in hopes that King Aridus
might marry her. Against Cyanune, Perdiccas, from
some political motives, conceived such a grudge, that
he caused her to be murdered. This raised a commotion
in the army; which frightened Perdiccas to such a de-
gree, that he now promoted the match between Ari-
dus and Eurydice; to prevent which, he had murder-
ed the mother of the young princess. But, in the mean-
time, Antigonus, knowing the designs of Perdiccas
against himself, fled with his son Demetrius to Greece,
there to take shelter under the protection of Antipater
and Craterus, whom he informed of the ambition and
ureality of the regent.

A civil war was now kindled. Antipater, Craterus,
Neoptolemus, and Antigonus, were combined against nation a
Perdiccas; and it was the misfortune of the empire in gen-

eral, that Eumenes, the most able general, as well
as the most virtuous of all the commanders, was on
the side of Perdiccas, because he believed him to be in
the interest of Alexander's family. Ptolemy, in the
mean time, remained in quiet possession of Egypt; but
without the least intention of owning any person for
his superior: however, he also acceded to the league
formed against Perdiccas; and thus the only person in
the whole empire who consulted the interest of the royal
family was Eumenes.
It was now thought proper to bury the body of Alexander, which had been kept for two years, during all which time preparations had been making for it. Aristeus, to whose care it was committed, set out from Babylon for Damascus, in order to carry the king's body to Egypt. This was sore against the will of Perdiccas; for it seems there was a superstitious report, that wherever the body of Alexander was laid, that country should flourish most. Perdiccas, therefore, out of regard to his native soil, would have it conveyed to the royal sepulchres in Macedon; but Aristeus, pleading the late king's express direction, was determined to carry it into Egypt, from thence to be conveyed to the temple of Jupiter Ammon. —The funeral was accordingly conducted with all imaginable magnificence. Ptolemy came to meet the body as far as Syria; but, instead of burying it in the temple of Jupiter Ammon, erected a stately temple for it in the city of Alexandria; and, by the respect he showed for his dead master, induced many of the Macedonian veterans to join him, and who were afterwards of the greatest service to him.

No sooner was the funeral over, than both the parties above mentioned fell to blows. Perdiccas marched against Ptolemy; but was slain by his own men, who, after the death of their general, submitted to his antagonist; and thus Eumenes was left alone to contend against all the other generals who had served under Alexander. In this contest, however, he would by no means have been overmatched, had his soldiers been attached to him; but as they had been accustomed to serve under those very generals against whom they were now to fight, they were on all occasions ready to betray and desert Eumenes. However he was defeated and killed Neoptolemus and Craterus, but then found himself obliged to contend with Antipater and Antigonus. Antipater was then appointed protector of the kings, with sovereign power; and Eumenes was declared a public enemy. A new division of Alexander's empire took place. Egypt, Libya, and the part adjacent, were given to Ptolemy, because they could not be taken from him. Syria was confirmed to Leoncetas. Philoxenus had Cilicia. Meopotamia and Arbelus were given to Amphimacus. Babylon was bestowed on Seleucus. Susiana fell to Antigonus, who commanded the Macedonian Argyraspides or Silver Shields, because he was the first who opposed Perdiccas. - Ptolemais held Persia. Tlepolemus had Caramania. Python had Media as far as the Caspian straits. Stasias had Aria and Drangia; Philip, Parthia; Stasias, Bactria and Sogdia; Sybaris, Aracopa; Oxyartes, the father of Roxana, Paropamisus. Another Python had the country between this province and India. Paurus and Taxis held what Alexander had given them, because they would not part with any of their dominions. Cappadocia was assigned to Nicanor. Phrygia Major, Lydia, Lycaonia, Pamphylia, and Iazy, were given to Antigonus; Caria to Cassander, Lydia to Clytus, Phrygia the Less to Aristeus. Cassander was appointed general of the horse; while the command of the household troops was given to Antigonus, with orders to prosecute the war against Eumenes. Antipater having thus settled everything as well as he could, returned to Macedon with the two kings, to the great joy of his countrymen, having left his son Cassander to be a check upon Antigonus in Asia.

Matters now seemed to wear a better aspect than they had yet done; and, had Eumenes believed that his enemies really consulted the interest of Alexander's family, there is not the least doubt that the war would have been immediately terminated. He saw, however, that the design of Antigonus was only to set up for himself, and therefore he refused to submit. From this time, therefore, the Macedonian empire ceased in Asia; and an account of the transactions of this part of the world fall to be recorded under the article Syria. The Macedonian affairs are now entirely confined to the kingdom of Macedon itself, and to Greece.

Antipater had not long been returned to Macedon. Total destruction of Alexander's family. When he died; and the last action of his life completed, the ruin of Alexander's family. Out of a view to the public good, he had appointed Ptolemaus, the eldest of Alexander's captains at hand, to be protector and governor of Macedon. This failed not to disgust his son Cassander; who thought he had a natural right to these offices, and of course kindled a new civil war in Macedon. This was indeed highly promoted by his first actions as a governor. He began with attempting to remove all the governors appointed in Greece by Antipater, and to restore democracy wherever it had been abolished. The immediate consequence of this was, that the people refused to obey their magistrates; the governors refused to resign their places, and applied for assistance to Cassander. Polyperchon also had the imprecation to reconcile Olympias from Epirus, and allow her a share in the administration; which Antipater, and even Alexander himself, had always refused her. The consequence of all this was, that Cassander invaded Greece, where he prevailed against Polyperchon: Olympias returned to Macedon, where she cruelly murdered Aristeus and his wife Eurydice; she herself was put to death by Cassander, who afterwards caused Roxアナ and her sons to be murdered, and Polyperchon being driven into Eotia, first raised to the crown Hercules the son of Alexander by the daughter of Darius, and then by the instigation of Cassander murdered him, by which means the line of Alexander the Great became totally extinct.

Cassander having thus destroyed all the royal family, various revolutions assumed the regal title as he had for 16 years before had all the power. He enjoyed the title of king of Macedon only three years; after which he died, about 298 B.C. By Theassalonica, the daughter of Philip king of Macedon, he had three sons, Philip, Antipater, and Alexander. Philip succeeded him, but soon after died of a consumption. A contest immediately began between the two brothers, Antipater and Alexander. Antipater seized the kingdom; and to secure himself in it, murdered his mother Thessalonica, if not with his own hand, at least the execrable act was committed in his presence. Alexander invited Pyrrhus king of Epirus, and Demetrius the son of Antigonus, to assist him and revenge the death of his mother. But Pyrrhus being bought off, and a peace concluded between the brothers, Alexander, being afraid of having too many protectors, formed a scheme of getting Demetrius assassinated. Instead of this, however, both he and Antipater were put to death; and
Demetrius became king of Macedon four years after the death of Cassander.

In 287 B.C. Demetrius was driven out by Pyrrhus, who was again driven out by Lysimachus two years after, who was soon after killed by Seleucus Nicanor; and Seleucus, in his turn, was murdered by Ptolemy Ceraunus, who became king of Macedon about 285 B.C. The new king was in a short time cut off, with his whole army, by the Gauls; and Antigonus Gonatus, the son of Demetrius Poliorcetes, became king of Macedon in 278 B.C. He proved successful against the Gauls, but was driven out by Pyrrhus king of Epirus; who, however, soon disoblige his subjects to such a degree, that Antigonus recovered a great part of his kingdom. But in a little time, Pyrrhus being killed at the siege of Argos in Greece, Antigonus was restored to the whole of Macedon; but scarcely was he seated on the throne, when he was driven from it by Alexander the son of Pyrrhus. This new invader was, in his turn, expelled by Demetrius the son of Antigonus; who, though at that time but a boy, had almost made himself master of Epirus. In this enterprise, however, he was disappointed; but by his means Antigonus was restored to his kingdom, which he governed for many years in peace. By a stratagem he made himself master of the city of Corinth, and from that time began to form schemes for the thorough conquest of Greece. The method he took to accomplish this was, to support the petty tyrants of Greece against the free states; which indeed weakened the power of the latter; but involved the whole country in so many calamities, that these transactions could not repond much to the reputation either of his arms or his honour. About 243 B.C. he died, leaving the kingdom to his son, Demetrius II.

Neither Demetrius, nor his successor Antigonus Doson, performed any thing remarkable. In 221 B.C. the kingdom fell to Philip, the last but one of the Macedonian monarchs. To him Hannibal applied for assistance after the battle of Cannae, which he refused; and the same imprudence which made him refuse this assistance prompted him to embroil himself with the Romans; and at last to conclude a treaty with them, by which he in effect became their subject, being tied up from making peace or war but according to their pleasure. In 179 B.C. he was succeeded by his eldest son Perseus, under whom the war with the Romans was renewed. Even yet the Macedonians were terrible in war; and their phalanx, when properly conducted, seems to have been absolutely invincible by any method of making war known at that time. It consisted of 16,000 men, of whom 1000 marched abreast, and thus was 16 men deep, each of whom carried a kind of pike 23 feet long. The soldiers stood so close, that the pikes of the fifth rank reached their points beyond the front of the battle. The hindmost ranks leaned their pikes on the shoulders of those who went before them, and, locking them fast, pressed briskly against them when they made the charge; so that the first five ranks had the impetus of the whole phalanx, which was the reason why the shock was generally irresistible. The Romans had never encountered such a terrible enemy; and in the first battle, which happened 177 B.C. they were defeated with the loss of 22,000 men, while the Macedonians lost no more than 60. The generals of Perseus now pressed him to storm the enemy's camp: but he being naturally of a cowardly disposition, refused to comply, and thus the best opportunity he ever had was lost. Still, however, the Romans gained little or no advantage, till the year 168 B.C. when Paulus Emilius, a most experienced commander, was sent to Macedon. Perseus now put all upon the issue of a general engagement; and Emilius, with all his courage and military experience, would have been defeated, had the Macedonians been commanded by a general of the smallest courage or conduct. The light-armed Macedonians charged with such vigour, that after the battle, some of their bodies were found within two furlongs of the Roman camp. When the phalanx came to charge, the points of their spears striking into the Roman shields, kept the heavy-armed troops from making any motion; while, on the other hand, Perseus's light-armed men did terrible execution. On this occasion, it is said, that Emilius tore his clothes, and gave up all hopes. However, perceiving that as the phalanx gained ground it lost its order in several places, he caused his own light-armed troops to charge in those places, whereby the Macedonians were soon put into confusion. If Perseus with his horse had on the first appearance of this charged the Romans briskly, his infantry would have been able to recover themselves; but instead of this, he betook himself to flight, and the infantry at last did the same, but not till 20,000 of them had lost their lives.

This battle decided the fate of Macedon, which immediately submitted to the conqueror. The cowardly king took refuge in the island of Samothrace: but was at last obliged to surrender to the Roman consul, by whom he was carried to Rome, led in triumph, and afterwards most barbarously used. Some pretenders to the throne appeared afterwards; but being unable to defend themselves against the Romans, the country Macedon was reduced to a Roman province in 148 B.C.

Macedonians, in ecclesiastical history, the followers of Macedonius, bishop of Constantinople, who through the influence of the Eunomians, was deposed by the council of Constantinople in 366, and sent into exile. He considered the Holy Ghost as a divine energy diffused throughout the universe, and not as a person distinct from the Father and the Son. The sect of Macedonians was crushed before it had arrived at its full maturity, by the council assembled by Theodosius in 381, at Constantinople. See Semi-arians.

MACEDONIUS. See Macedonians.

MACER, Emilius, an ancient Latin poet, was born at Verona, and flourished under Augustus Caesar. Eusebius relates, that he died a few years after Virgil. Ovid speaks of a poem of his, on the nature and quality of birds, serpents, and herbs; which he says Macer being then very old had often read to him:

Sepe suas volucres legit mili grandior aro,
Quereque nocet serpens, qua juvat herba, Macer.

De Ponto, lib. iv. eleg. 10.

There is extant a poem upon the nature and power of herbs under Macer's name; but it is spurious. He also wrote
MAC

MACERATION, is an infusion of, or soaking ingredients in water or any other fluid, in order either to soften them or draw out their virtues.

MACERATA, a town of Italy, in the territory of the church, and in the Marche of Ancona, with a bishop's see, an university, and about 10,000 inhabitants. It is situated near the mountain Chiento, in E. Long. 13. 37. N. Lat. 43. 15.

MACHAON, a celebrated physician among the ancients, son of Esculapius and brother to Pothalius. He went to the Trojan war with the inhabitants of Treta, Ithome, and Oechalia. According to some, he was king of Messenia. He was physician to the Greeks, and healed the wounds which they received during the Trojan war. Some supposed he was killed before Troy by Euryalus the son of Telephus. He received divine honours after death, and had a temple in Messenia.

MACHERUS, in Ancient Geography, a citadel on the other side Jordan, near the mountains of Moab, not far from and to the north of the Lacus Asphaltites. It was the southern boundary of the Perea: situated on a mountain encompassed round with deep and broad valleys; built by Alexander king of the Jews; destroyed by Gabinus, in the war with Aristobulus, and rebuilt by Herod, with a cognominous town round it. Here John the Baptist was beheaded (Josephus).

MACHIAN, one of the Molucca islands, in the East Indian ocean, about 20 miles in circumference, populous and fertile, producing cloves and sago; and is in possession of the Dutch, who have three strong forts built on it.

MACIHEL, NICHOLAS, a famous political writer of the 16th century, was born of a distinguished family at Florence. He wrote in his native language with great elegance and politeness, though he understood very little of the Latin tongue; but he was in the service of Marcellus Virgilius, a learned man, who pointed out to him many of the beautiful passages in the ancients, which Machiavel had the art of placing properly in his works. He composed a comedy upon the ancient Greek model: in which he turned into ridiculous many of the Florentine ladies, and which was so well received, that Pope Leo X. caused it to be acted at Rome. Machiavel was secretary, and afterwards historiographer, to the republic of Florence. The house of Medicis procured him this last office, together with a handsome salary, in order to pacify his resentment for having suffered the torture upon suspicion of being an accomplice in the conspiracy of the Soderini against that house, when Machiavel bore his sufferings without making any confession. The great encomiums he bestowed upon Brutus and Cassius, both in his conversations and writings, made him strongly suspected of being concerned in another conspiracy against Cardinal Julian de Medicis, who was afterwards pope under the name of Clement VII. However, they carried on no proceedings against him; but from that time he turned every thing into ridicule, and gave himself up to irreligion. He died in 1539, of a Machiavellian remedy which he had taken by way of prevention. Of all his writings, that which has made the most noise, and has drawn upon him the most enemies, is a political treatise entitled the Prince; which has been translated into several languages. The world is not agreed as to the motives of this work; some thinking he meant to recommend tyrannical maxims; others, that he only delineated them to excite abhorrence. Machiavel also wrote, Reflections on Titus Livius, which are extremely curious; the History of Florence, from the year 1205 to 1494; and a quarto volume of Poems and other pieces. Mr. Harrington considers him a superior genius, and as the most excellent writer on politics and government that ever appeared. See a view of his opinions in First Dissertation, Supplement, p. 32.

MACHINE, the general, signifies any thing that serves to augment or to regulate moving powers: Or it is any body destitute to produce motion, so as to save either time or force. The word comes from the Greek μηχανη, "machine, invention, art." And hence, in strictness, a machine is something that consists more in art and invention, than in the strength and solidity of the materials; for which reason it is that inventors of machines are called ingenieurs or engineers.

Machines are either simple or compound. The simple ones are the seven mechanical powers, viz. lever, balance, pulley, axis and wheel, wedge, screw, and inclined plane. See MECHANICS.

From these the compound ones are formed by various combinations, and serve for different purposes. See MECHANICS; also AGRICULTURE, CANNON, CENTRIFUGAL, STEAM, FURNACE, BURROUGHS, RAMSDEN, &c. &c.

MACHINES used in war amongst the Greeks were principally these: 1. Κλαδος, or scaling ladders; 2. The battering ram; 3. The telamōn or tortoise, called by the Romans testudo; 5. The σφαῖρα or ogger, which was placed on a stone, and raised higher than the wall; 6. Upon the σφαῖρα were built στυγοὺς or towers of wood; 7. Καταπελτή, or scorpion; 8. Catapult, or καταπελτής, from which they threw arrows with amazing force; and, 9. The Κάλαμος, or πιγμᾶς, from which stones were cast with great velocity.

The principal warlike machines made use of by the Romans were, the ram, the λύπος or wolf, the testudo or tortoise, the balista, the catapulta, and the scorpion.

MACHINERY, in epic and dramatic poetry, is when the poet introduces the use of machines; or brings some supernatural being upon the stage, in order to solve some difficulty or to perform some exploit out of the reach of human power.

The ancient dramatic poets never made use of machines, unless where there was an absolute necessity for so doing; whence the precept of Horace,

Nec Deus interstis, nisi dignus vindice nodus
Inciderit.

It is quite otherwise with epic poets, who introduce machines in every part of their poems; so that nothing is done without the intervention of the gods. In Milton's Paradise Lost, by far the greater part of the act-
MACHINERY

tre are supernatural personages: Homer and Virgil do
nothing without them; and, in Voltaire's Henriade, the
poet has made excellent use of St Louis.

As to the manner in which these machines should
act, it is sometimes invisibly, by simple inspirations and
suggestions; sometimes by actually appearing under
some human form; and, lastly, by means of dreams and
oracles, which partake of the other two. However, all
these should be managed in such a manner as to keep
within the bounds of probability.

MACHUL, or an instrument of music among the
Hebrews. Kircher apprehends that the name was
given to two kinds of instruments, one of the stringed
and the other of the pustilial kind. That of the
former sort had six chords; though there is great rea-
son to doubt whether an instrument requiring the aid
of the hair-bow, and so much resembling the violin,
be so ancient. The second kind was of a circular form,
made of metal, and either hung round with little bells,
or furnished with iron rings suspended on a rod or bar
that passed across the circle. Kircher supposes that it
was moved to and fro by a handle fixed to it, and thus
emitted a melancholy kind of murmur.

MACHYNLETH, a town of Montgomeryshire
in North Wales, 156 miles from London, and 32 from
Montgomery. It is an ancient town, and has a market
on Mondays, and several fairs. In 1811 it contained
1,252 inhabitants. It is seated on the river Douay, over
which there is a large stone bridge, which leads into
Merionethshire. It was here that Owen Olynwy exer-
cised the first acts of his royalty in 1402. Here
he accepted the crown of Wales, and assembled a parlia-
ment; and the house wherein they met is now stand-
ing, divided into tenements.

MACKENZIE, Sir George, an able lawyer,
a polite scholar, and a celebrated wit, was born at
Dundee in the county of Angus in Scotland in 1636,
and studied at the universities of Aberdeen and St An-
drew's; after which he applied himself to the civil law,
travelled into France, and prosecuted his study in that
faculty for about three years. At his return to his
native country he became an advocate in the city of
Edinburgh; and soon gained the character of an emi-
nent pleader. He did not, however, suffer his abili-
ties to be confined entirely to that province. He had
a good taste for polite literature; and he gave the pub-
lic, from time to time, incontestable proofs of an
uncommon proficiency therein. He had practised but a
few years, when he was promoted to the office of a
judge in the criminal court; and, in 1674, was made
king's advocate, and one of the lords of the privy coun-
cil in Scotland. He was also knighted by his majesty.
In these stations he met with a great deal of trouble,
on account of the rebellions which happened in his
time; and his office of advocate requiring him to act
with severity, he did not escape being censured, as if
in the deaths of some particular persons who were exe-
cuted he had stretched the laws too far. But there
does not seem to have been any just foundation for this
clamour against him; and it is generally agreed, that
he acquitted himself like an able and upright magis-
trate. Upon the abrogation of the penal laws by
King James II., our advocate, though he had always
been remarkable for his loyalty, and even censured for
his zeal against traitors and fanatics, thought himself
obliged to resign his post; being convinced, that he
Mackenzie could not discharge the duties of it in that point with
a good conscience. But he was soon after restored, and
held his offices till the Revolution; an event which,
seems, he could not bring himself to approve. He
had hoped that the prince of Orange would have re-
turned to his own country when matters were adjusted
between the king and his subjects; and upon its pro-
ving otherwise, he quitted all his employments in Scot-
land, and retired into England, resolving to spend the
remainder of his days in the university of Oxford. He
arrived there in September 1689, and prosecuted his
studies in the Bodleian library, being admitted a stu-
dent there by a grace passed in the congregation, June
2, 1690. In the spring following, he went to Lon-
don, where he fell into a disorder, of which he died
in May 1691. His corpse was conveyed by land to
Scotland, and interred there with great pomp and no-
mincer. "The politeness of his learning, and the
spleenishness of his wit, were (says the reverend Mr
Granger) conspicuous in all his pleadings, and shown
in his ordinary conversation." Mr Dryden acknowled-
ges, that he was unacquainted with what he calls the
beautiful turn of words and thoughts in poetry, till they
were explained and exemplified to him in a conver-
sation with that noble wit of Scotland Sir George Mac-
kenzie.—He wrote several pieces of history and anti-
quities; Institutions of the laws of Scotland; Essays
upon various subjects, &c. His works were printed
at Edinburgh in 1716, in 2 vols. folio.

MACKEREL. See SCOMBER, ICHTHYOLOGY.

MACLAURIN, Colin, a most eminent mathema-
tician and philosopher, was the son of a clergyman, and
born at Kilmoddan in Scotland in 1698. He was sent
to the university of Glasgow in 1709; where he con-
tinued five years, and applied himself to study in a
most intense manner. His great genius for mathemati-
cal learning discovered itself so early as at twelve
years of age; when, having accidentally met with an
Eyclid in a friend's chamber, he became in a few days
master of the first six books without any assistance;
and it is certain, that in his 16th year he had invest-
ned many of the propositions which were afterwards
published under the title of Geometria Organica.
In his 17th year he took the degree of master of arts;
on which occasion he composed and publicly defended a
After this he quitted the university, and retired to a
country-seat of his uncle, who had the care of his
education; for his parents had been dead some time.
Here he spent two or three years in pursuing his fa-
vourite studies; but, in 1717, he offered himself a
candidate for the professorship of mathematics in the
Marischal college of Aberdeen, and obtained it after
a ten days trial with a very able competitor. In 1719,
he went to London, where he became acquainted with
Dr Hoadley then bishop of Bangor, Dr Clarke, Sir
Isaac Newton, and other eminent men; at which time
also he was admitted a member of the Royal Society;
and in another journey in 1721, he contracted an in-
timacy with Martin Folkes, Esq., the president of it,
which lasted to his death.

In 1722, Lord Polwarth, plenipotentiary of the king
of Great Britain at the congress of Cambray, engaged
him to go as a tutor and companion to his eldest son, who
was then to set out on his travels. After a short stay at
Paris, and visiting other towns in France, they fixed
in Lorraine; where Macaulain wrote his piece On The
Percussion of Bodies, which gained the prize of the
Royal Academy of Sciences for the year 1744. But
his pupil dying soon after at Montpelier, he returned
immediately to his profession at Aberdeen. He was
hardly settled here, when he received an invitation to
Edinburgh; the curators of that university being de-
sirous that he should supply the place of Mr James
Gregory, whose great age and infirmities had rendered
him incapable of teaching. He had some difficul-
ties to encounter, arising from competitors, who had
good interest with the patrons of the university, and
also from the want of an additional fund for the new
professor, which however at length were all surmount-
ed, principally by the means of Sir Isaac Newton. In
November 1725, he was introduced into the university.
After this, the mathematical classes soon became very
numerous, there being generally upwards of 100 young
gentlemen attending his lectures every year; who being
of different standings and proficiency, he was obliged to
divide them into four or five classes, in each of which
he employed a full hour every day, from the first of
November to the first of June.
He lived a bachelor to the year 1733; but being
not less formed for society than for contemplation, he
then married Anne, the daughter of Mr Walter Stew-
art solicitor-general for Scotland. By this lady he
had seven children, of whom two sons and three daugh-
ters, together with his wife, survived him. In 1734,
Berkeley, bishop of Cloyne, published a piece called
The Analyst; in which he took occasion, from
some disputes that had arisen concerning the grounds
of the fluxionary method, to explode the method it-
self, and also to charge mathematicians in general
with infidelity in religion. Macaulain thought him-
self included in this charge, and began an answer to
Berkeley's book: but, as he proceeded, so many dis-
coversies, so many new theories and problems occurred
to him, that instead of a vindicatory pamphlet, his
work came out, A complete system of fluxions, with
their application to the most considerable problems in
gometry and natural philosophy. This work was pub-
lished at Edinburgh in 1742, 2 vols. 4to; and as it
was his own merit and pains, so it is the most consider-
able of all his works, and will do him immortal honour.
In the mean time, he was continually obliging the
public with some performance or observation of his
own; many of which were published in the fifth and
sixth volumes of the "Medical Essays" at Edin-
burgh. Some of them were likewise published in the
Philosophical Transactions; as the following: 1. Of
the construction and measure of curves, N° 336.
2. A new method of describing all kinds of curves,
N° 359. 3. A letter to Martin Folkes, Esq. on equa-
tions with impossible roots, May 1726, N° 394.
4. Continuation of the same, March 1729, N° 408.
5. December the 21st, 1732, on the description of
curves; with an account of farther improvements, and
a paper dated at Nancy, November 27, 1722, N° 439.
6. An account of the treatise of fluxions, January 27,
1742, N° 467. 7. The same continued, March 10,
1742, N° 469. 8. A rule for finding the meridional
parts of a spheroid with the same exactness as of a Maclaurin
sphere, August 1741, N° 461. 9. Of the basis of the
cells wherein the bees deposite their honey; Nov. 3.
1734, N° 471.
In the midst of these studies, he was always ready
to lend his assistance in contriving and promoting any
scheme which might contribute to the service of his
country. When the earl of Morton set out in 1739
for Orkney and Shetland, to visit his estates there,
he desired Mr Macaulain to assist him in settling the
gography of those countries, which is very errone-
ous in all our maps; to examine their natural history,
to survey the coasts, and to take the measure of a de-
gree of the meridian. Macaulain's family affairs, and
other connexions, would not permit him to do this;
but he drew, however, a memorial of what he thought
necessary to be observed, furnished the proper instru-
ments, and recommended Mr Short, the famous op-
tician, as a fit operator for the management of them.
He had still another scheme for the improvement of
geography and navigation, of a more extensive nature;
which was the opening of a passage from Greenland to
the South sea by the north pole. That such a pas-
sage might be found, he was so fully persuaded, that
he has been heard to say, if his situation could admit
of such adventures, he would undertake the voyage,
even at his own charge. But when schemes for finding
it were laid before the parliament in 1744, and him-
self consulted by several persons of high rank consider-
ing them, before he could finish the memorials he pro-
posed to send, the premium was limited to the discov-
ery of a north-west passage, and he used to regret,
that the word west was inserted, because he thought
that passage, if at all to be found, must lie not far from
the pole.
In 1745, having been very active in fortifying the
city of Edinburgh against the rebel army, he was ob-
liged to fly from thence to the north of England;
where he was invited by Herring, then archbishop of
York, to reside with him during his stay in this coun-
ty. In this expedition, however, being exposed to
cold and hardships, and naturally of a weak and ten-
der constitution, he laid the foundation of an illness
which put an end to his life, in June 1746, at the age
of 48.
Mr Macaulain was a very good as well as a very
great man, and worthy of love as well as admiration.
His peculiar merit as a philosopher was, that all his
studies were accommodated to general utility; and we
find, in many places of his works, an application even
of the most abstruse theories, to the perfection of me-
chanical arts. He had resolved, for the same purpose,
to compose a course of practical mathematics, and to
rescue several useful branches of the science from the
bad treatment they often met with in less skilful hands.
But all this his death prevented; unless we should
reckon, as a part of his intended work, the translation
of Dr David Gregory's "Practical Geometry,"
which was made, and published with additions, 1745.
In his lifetime, however, he had frequent opportuni-
ties of serving his friends and his country by his great
skill. Whatever difficulty occurred concerning the
constructing or perfecting of machines, the working of
mines, the improving of manufactures, the conveying
of water, or the execution of any other public work,
Maclaurin, he was at hand to resolve it. He was likewise employed to terminate some disputes of consequence that had arisen at Glasgow concerning the gauging of vessels; and for that purpose presented to the commissioners of excise two elaborate memorials, with their demonstrations, containing rules by which the officers now act. He made also calculations relating to the provision, now established by law, for the children and widows of the Scotti clergy, and of the professors in the universities, entitling them to certain annuities and sums, upon the voluntary annual payment of a certain sum by the incumbent. In contriving and adjusting this wise and useful scheme, he bestowed a great deal of labour, and contributed not a little towards bringing it to perfection. It may be said of such a man, that "he lived to some purpose;" which can hardly be said of those, how uncommon soever their abilities and attainments, who spend their whole time in abstract speculations, and produce nothing to the real use and service of their fellow creatures.

Of his works, we have mentioned his Geometria Organica, in which he treats of the description of curve lines by continued motion. We need not repeat what has been said concerning his piece which gained the prize of the Royal Academy of Sciences in 1724. In 1749, the academy adjudged him a prize, which did him still more honour, for solving the motion of the tides from the theory of gravity; a question which had been given out the former year, without receiving any solution. He had only ten days to draw this paper up in, and could not find leisure to transcribe a fair copy; so that the Paris edition of it is incorrect. He afterwards revised the whole, and inserted it in his Treatise of Fluxions; as he did also the substance of the former piece. These, with the Treatise of Fluxions, and the pieces printed in the Philosophical Transactions, of which we have given a list, are all the writings which our author lived to publish. Since his death, two volumes more have appeared; his Algebra, and his Account of Sir Isaac Newton's Philosophical Discoveries. His Algebra, though not finished by himself, is yet allowed to be excellent in its kind: containing, in no large volume, a complete elementary treatise of that science, as far as it hath hitherto been carried. His Account of Sir Isaac Newton's Philosophy was occasioned in the following manner: Sir Isaac dying in the beginning of 1726, his nephew, Mr. Conduit, proposed to publish an account of his life, and desired Mr. Maclaurin's assistance. The latter, out of gratitude to his great benefactor, cheerfully undertook, and soon finished, the history of the progress which philosophy had made before Sir Isaac's time, and this was the first draught of the work in hand; which not going forward, an account of Mr. Conduit's death, was returned to Mr. Maclaurin.

To this be afterwards made great additions, and left in the state in which it now appears. His main design seems to have been, to explain only those parts of Sir Isaac's philosophy which have been, and still are, controverted; and this is supposed to be the reason why his grand discoveries concerning light and colours are but transiently and generally touched upon. For it is known, that ever since the experiments, on which his doctrine of light and colours is founded, have been repeated with due care, this doctrine has not been contested; whereas his accounting for the celestial motions, and the other great appearances of nature, from gravity, is misunderstood, and even ridiculed by some to this day.

MACQUER, PHILIPPE, advocate of the parliament of Paris, where he was born in 1726, being descended from a respectable family. A weakness in his lungs having prevented him from engaging in the laborious exercises of pleading, he determined himself to literary pursuits. His works are: 1. L'Abrégé Chronologique de l'histoire Ecclesiastique, 3 vols. 8vo, written in the manner of the present Henault's History of France, but not possessed of equal spirit and elegance. 2. Les Annales Romaines, 1756, 8vo; another chronological abridgment, and much better supported than the former. Into this work the author has introduced everything most worthy of notice which has been written by Saint Evremond, Abbé Saint-Real, President Montesquieu, Abbé Mably, &c. concerning the Romans; and, if we except a difference of style, which is easily discernible, it is, in other respects, a very judicious compilation. 3. Abrégé Chronologique de l'Histoire d'Espagne et de Portugal, 1759, 1765, in 2 vols. 8vo. This book, in point of accuracy, is worthy of the president Henault, by whom it was begun; but it displays no discrimination of character nor depth of research. The author received assistance from M. Laccombe, whose talents for chronological abridgment are well known. The republic of letters sustained a loss by the death of M. Macquer, which happened on the 27th of January 1770, at the age of 50. As to his character, he was industrious, agreeable, modest, and sincere, and an enemy to all foolish vanity and affectation. He had a cold imagination, but a correct taste. He had an eager thirst for knowledge of every kind, and he had neglected no useful branch of study. He had a share in the Dictionary of Arts and Professions, in 2 vols. 8vo, and in the Translation of the Syphilis of Fracastor published by Laccombe.

MACQUER, Pierre Joseph, brother to the former, was born at Paris the 9th of October, 1718, and died there February 16, 1784. He was a member of the Academy of Sciences, and professor of pharmacy; and was engaged in the Journal de Spatums, for the articles of medicine and chemistry. With the latter science he was intimately acquainted. He had a share in the Pharmacopoeia Parisiensis, published in 1758, in 4to. His other works are: 1. Elements de Chimie theorique; Paris, 1749, 1753, 12mo; which have been translated into English and German. 2. Elements de Chimie pratique, 1751, 2 vols. 12mo. These two works were republished together, in 1756, in 3 vols. 12mo. 3. Plan d'un cours de Chimie experimentale et theorique, 1757, 12mo; in the composition of which he was associated with M. Beaumé. 4. Formule Medicamentorum Magistralium, 1753. 5. L'Art de la Teinture en Soie, 1765. 6. Dictionnaire de Chimie, contenant la Theorie et la Pratique de cet art, 1766, 2 vols. 8vo; which has been translated into German, with notes; and into English, with notes, by Mr. Kier. Macquer has, by his labours and writings, greatly contributed to render useful an art which formerly tended only to ruin the health of the patient by foreign remedies, or to reduce
reduce the professors of it to beggary, while they prosecuted the idle dreams of converting every thing into gold.

MACRIN, Samuel, one of the best Latin poets of the 16th century, was born at Louden. His true name was John Salmon; but he took that of Macrin, from being frequently so called in ridicule by Francis I. on account of his extraordinary leanness. He was preceptor to Claudius of Savoy, count of Tende; and to Honorius the count's brother; and wrote several pieces of poetry in lyric verse, which were so admired, that he was called the Horace of his time. He died of old age, at Louden, in 1555. —Charles Macrin, his son, was not inferior to him as a poet, and surpassed him in his knowledge of the Greek tongue. He was preceptor to Catharine of Navarre, the sister of Henry the Great; and perished in the massacre on St Bartholomew's day in 1572.

MACROBIUS, a people of Ethiopia, celebrated for their justice, and the innocence of their manners: also a people in the island of Merce. The Hyperboreans were also called Macrobii; they generally lived to their 120th year; and from their longevity they obtained their name (μακρώι ὀλίγοι, long life.).

MACROBIUS, Ambrosius Aurelius Theodosius, an ancient Latin writer, who flourished towards the latter part of the fourth century. —Of what country he was, is not clear: Erasmus, in his Ciceronianus, seems to think he was a Greek; and himself tells us, in the preface to his Saturnalia, that he was not a Roman, but labored under the inconveniences of writing in a language which was not natural to him. Of what religion he was, Christian or Pagan, is uncertain. Barthius ranks him among the Christian; but Spanheim and Fabricius suppose him to have been a heathen. This, however, is certain, that he was a man of consular dignity, and one of the chamberlains or masters of the wardrobe to Theodosius; as appears from a rescript directed to Florentius, concerning those who were to obtain that office. He wrote a commentary upon Cicero's Somnium Scipionis, and seven books of Saturnalia, which treat of various subjects, and are an agreeable mixture of criticism and antiquity. He was not an original writer, but made great use of other people's works, borrowing not only their materials, but even their language, and for this he has been satirically rallied by some modern authors, though rather unfairly, considering the express declaration and apology which he makes on this head, at the very entrance of his work. "Don't blame me," says he, "if what I have collected from multifarious reading, I shall frequently express in the very words of the authors from whom I have taken it: for my view in this present work is, not to give proofs of my eloquence, but to collect and digest into some regularity and order such things as I thought might be useful to be known. I shall therefore here imitate the bees, who suck the best juices from all sorts of flowers, and afterwards work them up into various forms and orders with some mixture of their own proper spirit." The Somnium Scipionis and Saturnalia have been often printed; to which has been added, in the later editions, a piece entitled De Differentia et Societatis Graeci Latinique Verbi.

MACROCEPHALUS (compound of μακροζ, "great," and κεφαλα, "head," denotes a person with a head larger or longer than the common size. Macrocephali, or Long-heads, is a name given to a certain people, who, according to the accounts of authors, were famous for the uncommon length of their heads; yet custom so far habituated them to it, that instead of looking on it as a deformity, they esteemed it a beauty, and, as soon as the child was born, moulded and fashioned its head in their hands to as great a length as possible, and afterwards used all such rollers and bandages as might seem most likely to determine its growing long. The greater part of the islanders in the Archipelago, some of the people of Asia, and even some of those of Europe, still press their children's heads out lengthwise. We may observe also, that the Cypriots, many people of America, &c. are all born with some singularity in the conformation of their heads; either a flatness on the top, two extraordinary protruberances behind, or one on each side; singularities which we can only regard as an effect of an ancient and strange mode, which at length is become hereditary in the nation. According to the report of many travellers, the operation of compressing the head of a child lengthwise, while it is yet soft, is with a view insensibly to enlarge the interval between the two eyes, so that the visual rays turning more to the right and left, the sight would embrace a much larger portion of the horizon; the advantage of which they are well acquainted with, either in the constant exercise of hunting, or on a thousand other occasions. Ever since the 16th century, the missionaries established in the countries inhabited by the savages of America, have endeavoured to destroy this custom; and we find in the sessions of the third council of Lima, held in 1585, a canon which expressly prohibits it. But if it has been repressed one way, the free negroes and Maroons, although Africans, have adopted it, since they have been established among the Caribs, solely with the view of distinguishing their children, which are born free, from those who are born in slavery. The Omaquis, a people of South America, according to P. Veigh, press the heads of their children so violently between two planks that they become quite sharp at the top, and flat before and behind. They say they do this to give their heads a greater resemblance to the moon.

MACROCERCI, a name given to that class of animalcules, which have tails longer than their bodies.

MACROCOLUM, or MACROCOLLUM (formed of μακροζ, "large," and κολος, "I join," among the Romans, the largest kind of paper then in use. It measured sixteen inches, and frequently two feet.

MACROCOSM, a word denoting the great world or universe. It is compounded of the Greek words μακροζ, "great," and κοσμος, "world."

MACROOM, or MACROOM, a town of Ireland in the barony of Muskerry, county of Cork, and province of Munster, 142 miles from Dublin; it is situated amongst hills, in a dry gravelly limestone soil. —This place is said to take its name from an old crooked oak, so called in Irish, which formerly grew here. The castle was first built in King John's time, soon after the English conquest (according to Sir Richard Cox), by the Carews; but others attribute it to the Daltons. It was repaired and beautified by Teague Macartey, who died in the year 1565, and was father to...
the celebrated Sir Cormac Mac Teague mentioned by Camden and other writers as an active person in Queen Elizabeth's time. The late earls of Glancarthy altered this castle into a more modern structure, being burnt down in the wars of 1641. Opposite to the bridge is the parish-church, dedicated to St Colman of Cloyne. Here is a barracks for a foot company, a market-house, and a handsome Roman Catholic chapel. A considerable number of persons have been employed in this town in combing wool and spinning yarn, and some salt-ships have been erected here. At half a mile's distance is a spaw, that rises on the very brink of a bog; its waters are a mild chalybeate, and are accounted serviceable in hypochondriacal cases, and in cutaneous eruptions. The fairs are four in the year.

MACROURUS, a genus of fishes belonging to the order Thoracoptera. See Ichthyology Index.

MACATARIO, in the Roman sacrifices, signifies the act of killing the victim. This was performed either by the priest himself, or some of his inferior officers, whom we meet with under the names of poper, agonec, cultrarii, and victimarii; but, before the beast was killed, the priest, turning himself to the east, drew a crooked line with his knife, from the forehead to the tail. Among the Greeks, this ceremony was performed most commonly by the priest, or, in his absence, by the most honourable person present. If the sacrifice was offered to the celestial gods, the victim's throat was bent up towards heaven; if to the infernal, or to heroes, it was killed with its throat towards the ground. The manner of killing the animal was by a stroke on the head, and, after it was fallen, thrusting a knife into its throat. Much notice was taken, and good or ill success predicted, from the struggles of the beast, or its quiet submission to the blow, from the flowing of the blood, and the length of time it happened to live after the fall, &c.

MACULÆ, in Astronomy, dark spots appearing on the luminous surfaces of the sun and moon, and even some of the planets. See Astronomy Index.

MAD-APPLE. See Solanum, Botany Index.

MADAGASCAR, the largest of the African islands, is situated between 43° and 51° of E. Long., and between 12° and 26° of S. Lat.; extending in length near 1000 miles from north-north-east to south-south-west, and about 300 in breadth where broadest. It was discovered in 1506 by Laurence Almeida; but the Persians and the Arabians were acquainted with it from time immemorial under the name of Serendib. Alphonzo Aluquerque ordered Ruy Pereira to Con- thito to visit the interior parts, and that general intrusted Tristan d'Acunha with the survey. The Portuguese called it the island of St Lawrence; the French who visited it in the reign of Henry IV. named it Isle Dauphine; its proper name is Madagages. It is now, however, by common consent, called Madagascar.

This large island, according to many learned geographers, is the Cerné of Pliny, and the Menuthiades of Ptolemy. It is everywhere watered by large rivers, streams and rivulets, everywhere has their sources at the foot of that long chain of mountains which runs through the whole extent of the island from east to west.

The two highest promontories are called Vivagora and Botismone. These mountains (according to the abbe Rochon*) enclose within their bosoms a variety of precious minerals and useful fossils. The traveller (who for the first time rambles over savage and mountainous countries, intersected with valleys and with hills, where nature left to herself brings forth the most singular and the most varied productions) is involuntarily surprised and terrified at the sight of precipices, the summits of which are crowned with monstrous trees, that seem coeval with the world. His astonishment is redoubled at the noise of those grand cascades, the approach to which is generally inaccessible. But to those views so sublimely picturesque, rural scenes soon succeed; little hills, gently rising grounds, and plains, the vegetation of which is never repressed by the intemperance or the viciousness of the seasons. The eye contemplates with pleasure those vast savannas which nourish numberless herds of bullocks and of sheep. You behold a flourishing agriculture, produced almost solely by the fertilizing womb of nature. The fortunate inhabitants of Madagascar do not bedew the earth with their sweat; they scarcely stir the ground with a rake, and even that slight preparation is sufficient. They scrape little holes at a small distance from each other, into which they scatter a few grains of rice, and cover them with their feet; and so great is the fertility of the soil, that the lands sown in this careless manner produce a hundred fold.

The forests present a prodigious variety of the most useful and the most beautiful trees; ebony, wood for dyeing, bamboos of an enormous thickness, and palm trees of every kind. The timber employed in shipbuilding is no less common than those kinds so much prized by the cabinetmaker. We are told by the French governor Ploisant, in his history of this island, that in the year 1650 he sent to France 72,000 weight of Grand Isle of aloe of an excellent quality. All of these various trees and shrubs are surrounded by an infinite number of parasitical plants; mushrooms of an infinite diversity of kinds and colours are to be met with everywhere in the woods: and the inhabitants know well how to distinguish those which are prejudicial to the health. They collect large quantities of useful gums and resins; and out of the milky sap of a tree, denominated by them finguero, a species of jatropha, the inhabitants, by means of coagulation, make that singular substance known to naturalists by the name of gum elastic, or Indian rubber.

Besides the aromatic and medicinal herbs which abound in the forests, the island produces flax and hemp of a length and strength which surpass any in Europe. Sugar-canes, wax, honey of different kinds, tobacco, indigo, white-pepper, gum-lac, ambergris, silk, and cotton, would, long since, have been objects of commerce which Madagascar would have yielded in profusion, if the Europeans, in visiting the island, had furnished the inhabitants with the necessary information for preparing and improving these several productions.

The sugar-canes (as we are informed by another traveller) are much larger and finer than any in the West Indies; being as thick as a man's wrist, and so full of juice, that a foot of them will weigh two pounds. When the natives travel, they carry a sugar-cane along with them, which will support them for two or three days. Here are also plenty of tamarinds; and such quantities of limes and oranges, that very large casks may
Madagascar, like savages in general, possesses a character equally devoid of vice and of virtue; the gratifications of the present moment solely occupy his reflections; he possesses no kind of foresight whatever; and he cannot conceive the idea that there are men in the world who trouble themselves about the evils of futurity.

The population of the island has been estimated at four millions; but this calculation is thought exaggerated by our author, and indeed it appears incredible to us. Every tribe or society inhabits its own country, and is governed by its own customs. Each of these acknowledges a chief; this chief is sometimes elective, but more usually hereditary. The lands are not divided and portioned out, but belong to those who are at the trouble of cultivating them. These islanders make use of neither locks nor keys; the principal part of their food consists in rice, fish, and flesh; their rice is moistened with a soup which is seasoned with pimento, ginger, saffron, and aromatic herbs. They display wonderful cunning in catching a variety of birds, many of which are unknown in Europe; they have the pheasant, the patridge, the quail, the pintado, the wild duck, teal of five or six different kinds, the blue hen, the black paroquet, and the turtle-dove, in great plenty; and also a bat of a monstrous size, which is much prized on account of its exquisite flavour. These last are so hideous in their appearance, that they at first terrify the Europeans sailors; but after they have vanquished their repugnance to them, they prize their flesh infinitely before that of the pullets of their own country. The Melagashes also catch an immense quantity of sea-fish: such as the dorado, the sole, the herring, the mackerel, the turtle, &c. with oysters, crabs, &c. The rivers afford excellent eels, and mullets of an exquisite flavour.

The inhabitants near St Augustine's bay, Mr Ives informs us, speak as much broken English as enables them to exchange their provisions for European articles. These, on the part of the Melagashes are cattle, poultry, milk, fruit, rice, salt, porcelain, potatoes, yams, fish, lances, and shells. From the Europeans they receive muskets, powder, bullets, flints, cloutsies, (including handkerchiefs, and linen of all kinds), beads, iron pots, &c.—Silver, which they call mantie, is in great esteem with them, and is made by them into bracelets for their wives.

That part of the island at which the English squadron touched, is in the dominions of the king of Bada, who, by the account of Mr Ives, seemed greatly to affect to be an Englishman. They had no sooner touched at the island, than they were waited on by one called Robin Hood, and another person, both of whom bore the office of purser. Among these were Philip the general; John Anderson and Frederic Martin, captains. Nor did the king himself and his family disdain to pay them a visit; who, in like manner, were distinguished by English names; the king's eldest son being called the prince of Waier, and the court not being without a duke of Cumberland, a Prince Augustus, princes, &c. as in England. All these grandees came on board naked, excepting only a slight covering about their loins and on their shoulders, made of a kind of grass growing on the island; which they had adorned with small glass beads by way of border or fringe. Their hair resembled that of the Indians.
MAD [332] MAD

Indians in being long and black, rather than the woolly heads of the African negroes. "The wives of the Melagaches (according to our author) take great pains with their husbands hair; sometimes putting it in large and regular curls; at other times braiding it in great order, and making it shine with a particular oil which the island produces. The men always carry in their hands a wooden lance headed with iron, which is commonly made very neat; and they are such excellent marksmen, that they will strike with it a very small object at 30 or 40 yards distance. They have also commonly a musket, which they get from Europeans in exchange for cattle, and are always sure to keep in excellent order. I am sorry to say (continues Mr Ives) that the English are frequently guilty of great impositions in this kind of traffic, by disposing of cheap and ill-tempered barrels among the poor inhabitants, who sometimes lose their lives by the bursting of these pieces. Such iniquitous practices as these must in the end prove injurious to the nation; and has indeed already made the name of more than one-half of these traders truly infamous among the deluded but hitherto friendly Madagascanians.

"They are a civil and good-natured people, but easily provoked, and apt to show their resentment on the least provocation, especially when they think themselves injured or slighted. Another characteristic of them is, the very high notions of dignity they entertain of their king; which is carried to such a height, that they are never more sensibly hurt than when they imagine he is treated with incivility or disrespect. This mighty monarch resides in a town built with mud, about 12 miles up the country from St Augustine's bay. On the east side of the bay, as you enter, there resided one Prince William, a relation and tributary to the king; but who in most cases acted as an independent prince, and always used his utmost endeavours with the officers to cause them buy their provisions from him, and not from the king or his subjects. In this prince's territories, not far from the sea, are the remains of a fort built by the pirate.

"All the women of Madagascar, excepting the very poorest sort, wear a covering over their breasts and shoulders, ornamented with glass beads, and none go without a cloth about their loins. They commonly walk with a long slender rod or stick. The men are allowed to marry as many women as they can support.

"During our stay at this island (says Mr Ives), I observed with great concern, several miserable objects in the last stage of the venereal disease. They had not been able to find any cure; and as far as I could learn, their doctors are totally ignorant of medicine. The only method they use for curing all distempers, as well external as internal, is the wearing on the arm or neck a particular charm or amulet; or besmearing the part affected with earth moistened with the juice of some plant or tree, and made up into soft paste.

"I took some pains to learn their religious tenets, and find that they worship one Universal Father: whom, when they speak in English, they call God; and in whom they conceive all kinds of perfection to reside. The sun they look upon as a glorious body; and, I believe, as a spiritual being, but created and dependent. They frequently look up to it with wonder, if not with praise and adoration. They make their supplications to the One Almighty, and offer sacrifices to him in their distresses. I had the curiosity to attend a sacrifice, at the hut of John Anderson, whose father had for a long time been afflicted with sickness. About sunset an ox was brought into the yard; and the son, who officiated as a priest, slew it. An altar was reared high, and the post of it was sprinkled with the blood of the victim. The head, after its being severed from the body, was placed, with the horns on, at the foot of the altar: the cauld was burned on the fire, and most of the pluck and entrails boiled in a pot. The sick man, who was brought to the door, and placed on the ground so as to face the sacrifice, prayed often, and seemingly with great fervency. His eyes were fixed attentively towards the heavens, and his hands held up in a supplicating posture. The ceremony ended with the son's cutting up the ox into small pieces; the greatest part of which he distributed amongst the poor slaves belonging to his father and himself; reserving, however, some of the best pieces for his own use. Upon the whole, I saw so many circumstances in this Madagascanian sacrifice, so exactly resembling those described in the Old Testament as offered up by the Jews, that I could not turn my thoughts back to the original, without being sensibly struck by the exactness of the copy."

When the squadron first arrived at Madagascar, the king of Baha, a man of about 60 years of age, was ill of the gout. Having demanded of Admiral Watson some presents, the latter complimented him, among other things, with some brandy. The monarch then asked him if he had any doctor with him, and if he was a great doctor, and a king's doctor? To all which being answered in the affirmative, he desired him to bring some mabonets (medicines) for his sick knee. With this requisition Mr Ives designed to comply; but having waited until some officers should be ready to accompany him, his majesty in the mean time, took such a dose of brandy as quickly sent the gout into his head, and occasioned his death. Mr Ives observes, that it happened very luckily for him that the monarch's decease happened without his having taken any of the medicines intended for him, as it would have been impossible to avoid the imputation of having poisoned him, which would certainly have been resent ed by his loyal subjects.

The king's death occasioned great confusion; the grandees being desirous that it should be concealed for some time. This, however, was found impossible; on which they set off for the Mud Town about 11 o'clock the same evening. All the inhabitants of the village followed their example; leaving only the dogs, who set up the most hideous howling. Captain Frederic Martin coming to take leave of the English, begged with great earnestness for a fresh supply of gunpowder; whispering that the king was dead, and that they should in all probability go to war about making another. They had been formerly told, that one who had the title of duke of Baha would certainly succeed to the throne; but they afterwards learned, that the King, libey the general having given or caused of Rhapins the late king's son, and taken him under his tutelage and protection, this youth, who was only about
The following is a description of the southern division of the island, from the Abbé Rochon.

"That part of Madagascar in which Fort-Dauphin is situated is very populous. Almost all the villages are placed on eminences, and surrounded with two rows of strong palisadoes, somewhat in the manner of such of our fences as are composed of hurdles and turf. Within, is a parapet of solid earth about four feet in height; large pointed bamboo placed at the distance of five feet from each other, and sunk in a pit, form a kind of loop-holes, which contribute towards the defence of these villages, some of which are besides fortified with a ditch ten feet in breadth and six in depth. The dwelling of the chief is called a donac. When the chiefs go abroad, they are always provided with a musket and a stick armed with iron, and adorned at the extremity with a little tuft of cow's hair. They wear a bonnet of red wool. It is chiefly by the colour of their bonnet that they are distinguished from their subjects. Their authority is extremely limited: however, in the province of Carcaronosi, the lands by custom belong to their chiefs, who distribute them among their subjects for the purposes of cultivation; they exact a trilling quit-rent in return, which in their language is called jaenens. The people of Carcaronosi are not altogether ignorant of the art of writing; they even possess some historical works in the Malagasy tongue: but their learned men, whom they term Ombiascas, make use of the Arabic characters alone. They have treatises on medicine, geomancy, and judicial astrology; the most renowned live in the province of Mutana; it is in that district that magic still remains in all its glory; the Matanes are actually dreaded by the other Madagascanese on account of their excellence in this delusive art. The Ombiascas have public schools in which they teach geomancy and astrology. The natives have undoubtedly learned the art of writing from the Arabsians, who made a conquest of this island about 300 years since.

"The people of the province of Anosy, near Fort Dauphin, are lively, gay, sensible, and grateful; they are passionately fond of women; are never melancholy in their company; and their principal occupation is to please the sex; indeed, whenever they meet their wives, they begin to sing and dance. The women, from being happy, are always in good humour. Their lively and cheerful character is extremely pleasing to the Europeans. I have often been present at their assemblies, where affairs of importance have been agitated; I have observed their dances, their sports, and their amusements, and I have found them free from those excesses which are but too common among polished nations. Indeed I was too young at this time for my observations to be of much weight; but if my experience be insufficient to inspire confidence, I beg the reader will rather consider the nature of things, than the relations given by men without principles or intelligence, who fancy that they have a right to tyrannize over the inhabitants of every country which they can subdue. If the people of Madagascar have sometimes availed themselves of treachery, they have been forced to it by the tyranny of the Europeans. The weak have no other arms against the strong. Could they defend themselves by any other means from our artillery and bayonets? They are uninformed and helpless; and we avail ourselves of their weakness, in order to make them submit to our covetousness and caprice. They receive the most cruel and oppressive treatment, in return for the hospitality which they generously bestow on us; and we call them traitors and cowards, when we force them to break the yoke with which we have been pleased to load them."

In the second volume of Count Benyowsky's Memoirs and Travels we have the following account of the religion, government, &c. of the people of this island.

"The Madagascar nation believe in a Supreme Being, whom they call Zanharie, which denotes creator of all things. They honour and revere this Being; but have dedicated no temple to him, and much less have they substituted idols. They make sacrifices, by killing oxen and sheep, and they address all these libations to God. It has been asserted, that this nation likewise makes offerings to the devil: but in this there is a deception; for the piece of the sacrificed beast which is usually thrown into the fire is not intended in honour of the devil, as is usually pretended. This custom is very ancient, and no one can tell the true reason of it. With regard to the immortality of the soul, the Madagascar people are persuaded, that, after their death, their spirit will return again to the region in which the Zanharie dwells; but they by no means admit that the spirit of man, after his death, can suffer any evil. As to the distinction of evil or good, they are persuaded that the good and upright man shall be recompensed, in this life, by a good state of health, the constancy of his friends, the increase of his fortunes, the obedience of his children, and the happiness of beholding the prosperity of his family: and they believe that the wicked man's fate shall be the contrary to this. The Madagascar people, upon this conviction, when they make oaths, add benedictions in favour of those who keep them, and curses against those who break them. In this manner it is that they appeal to the judgment of Zanharie, in making agreements; and it has never been known, or heard of, that a native of Madagascar has broken his oath, provided it was made in the usual manner, which they say was prescribed by their forefathers.

"As to their kings and form of government, &c. the Madagascar people have always acknowledged the line of Ramini, as that to which the rights of Ampansacabe or sovereign belongs. They have considered this line as extinct since the death of Dian Ramini Larizon, which happened 66 years ago, and whose body was buried upon a mountain, out of which the river Manangourou springs; but having acknowledged the heir of this line on the female side, they re-established this title in the year 1776. The right of the Ampansacabe consists in nominating the Rohandrians to assist in the cabars, at which all those who are cited are bound to appear, and the judgment of the Ampansacabe in his cabar is decisive. Another prerogative of the Ampansacabe is, that each Rohandrian is obliged to leave him by will a certain proportion of his property, which the successors usually purchase by a slight tribute or fine. Thirdly, The Ampansacabe has a right to exact from each Rohandrian one-tenth
tenth of the produce of his land, and a number of horned cattle and slaves, in proportion to the riches of the country possessed by each Rohandrian. The second order is composed of the Rohandrians, or princes. Since the loss of the Ampansascabe, three of these Rohandrians have assumed the title of kings, namely the Rohandrian of the province of Mahavelou, named Hiavi; of the province of Voemar, named Lambotini; and a third at Bombetoki, named Cimamounpou. The third order consists of the Voadiziri, or lords of a district, composed of several villages. The fourth order consists of the Lohavohits, or chiefs of villages. The fifth order, Ondatzзи, who are freemen, compose the attendants or followers of the Rohandrians, Voadiziri, or Lohavohits. The sixth order consists of Ombiasse, or learned men; and this order forms the warriors, workmen, physicians, and diviners: these last possess no charge. The seventh order consists of Ampurias or slaves.

Leaving made inquiries from Bombetoki passing to the northward, and as far as Itaperé, the result proved that there are 38 Rohandrians actually reigning, and 287 Voadiziri. With respect to the Lohavohits, Ondatzзи, and Ombiasse, it was not possible to obtain any accurate determination of their number. These orders preserve a regular gradation, respecting which it would be very difficult to give a detailed account. They live in the manner we read of concerning the ancient patriarchs. Every father of a family is priest and judge in his own house, though he depends upon the Lohavohits, who superintends his conduct. This last is answerable to his Voadiziri, and the Voadiziri to the Rohandrians.

The Madagascar people having no communication with the main land of Ethiopia, have not altered their primitive laws; and the language throughout the whole extent of the island is the same. It would be rash to determine the origin of this nation; it is certain that it consists of three distinct races, who have for ages past formed intermixtures which vary to infinity. The first race is that of Zafe Ibrahim; or descendants of Abraham; but they have no vestige of Judaism, except circumcision, and some names, such as Isaac, Reuben, Jacob, &c. This race is of a brown colour. The second race is that of Zaferramini: with respect to this, some books which are still extant among the Ombiasse, affirm that it is not more than six centuries since their arrival at Madagascar. With respect to the third race of Zafe Canambou, it is of Arabian extraction, and arrived much more lately than the others from the coasts of Ethiopia: hence it possesses neither power nor credit, and fills only the charges of writers, historians, poets, &c.

In regard to arts and trades, the Madagascar nation are contented with such as are necessary to make their moveable, tools, utensils, and arms for defence; to construct their dwellings, and the boats which are necessary for their navigation; and lastly, to fabricate cloths and stuffs for their clothing. They are desirous only of possessing the necessary supplies of immediate utility and convenience. The principal and most respected business, is the manufacture of iron and steel. The artists in this way call themselves ampanefa vihe. They are very expert in fusing the ore, and forging utensils, such as hatchets, hammers, anvil-vils, knives, spades, tagsy, rames, pinsers, tweezers for pulling out the hair, &c. The second class consists of the goldsmiths (ompasena vola mena): they cast gold in ingots, and make up bracelets, buckles, earrings, drops, rings, &c. The third are called ompavilansa, and are potters. The fourth are the ompasenaota, or turners in wood, who make boxes called katta, plates, wooden and horn spoons, bee-hives, coffins, &c. The fifth ompan cacasou, or carpenters. They are very expert in this business, and make use of the rule, the plane, the compasses, &c. The sixth are the ompaupisi, or ropemakers. They make their ropes of different kinds of bark of trees, and likewise of hemp. The seventh, ompan lamba, or weavers. This business is performed by women only, and it would be reckoned disgraceful in a man to exercise it. The ompiassees are the literary men and physicians, who give advice only. The herenisees are comedians and dancers.

The Madagascar people always live in society; that is to say, in towns and villages. The towns are surrounded by a ditch and palisades (as already mentioned), at the extremities of which a guard of from 12 to 20 armed men is kept. The houses of private people consist of a convenient cottage, surrounded by several small ones: the master of the house dwells in the largest, and his women or slaves lodge in the smaller. These houses are built of wood, covered with leaves of the palm tree or straw.

The houses of the great men of the country are very spacious; each house is composed of two walls and four apartments: round about the principal house other smaller habitations are built for the accommodation of the women, and the whole family of the chief; but the slaves cannot pass the night within them. Most of the houses inhabited by the Rohandrians are built with taste and admirable symmetry.

The French attempted to conquer and take possession of the whole island, by order, and for the use of their Most Christian Majesties Louis XIII. and XIV.; and they maintained a footing on it from the year 1642 to 1657. During this period, by the most cruel treachery, they taught the native princes the barbarous traffic in slaves, by villanously selling to the Dutch governor of Mauritius a number of innocent people, who had been assisting them in forming a settlement at Fort Dauphin.

The Abbé Rochell tells us, that the insalubrity of the air in Madagascar determined his countrymen in 1664 to quit that immense island, in order to establish themselves at so inconsiderable a place as the isle of Bourbon, which is scarcely perceptible in a map of the globe: but it is apparent, from the account of the state of the French affairs on the island of Madagascar, in 1665, when Flacourt's narrative was published, that their ill treatment of the natives had raised such a general and formidable opposition to their residence in the country, that the French were obliged to abandon their possessions for other reasons than the unhealthy qualities of the climate. We have not room here for a detail of all the oppressive measures of the French, which the abbé himself candidly censures in the strongest terms; but shall extract the following narrative, both because it is interesting in itself, and exhibits the causes and the means of their expulsion.
Madagascar.

La Case, one of the French officers employed by the governor of Fort Dauphin against the natives, was so successful in all his enterprises, that they called him Deaan Pouns, the name of a chief who had formerly conquered the whole island. The French governor, jealous of his renown, treated him harshly, and refused to allow him the rank or honours due to his valour. The sovereign of the province of Amboule, called Deaan Rascitat, taking advantage of his discontent, prevailed on him to become his general. Five Frenchmen followed him. Deaan Nong, the daughter of Rascitat, captivated by the person and heroism of La Case, offered him her hand with the consent of her father. The chief, grown old, infirm, and arrived at the last stage of existence, had the satisfaction of securing the happiness of his subjects, by appointing his son-in-law absolute master of the rich province of Amboule. La Case, in marrying Deaan Nong, refused to take the titles and honours attached to the sovereign power: he would accept of no other character, than that of the first subject of his wife, who was declared sovereign at the death of her father. Secure in the affection of this princess, who was not only possessed of personal charms, but of courage and great qualities, he was beloved and respected by her family, and by all the people of Amboule, who revered him as a father; and yet, how much sooner he wished it, he was unable to contribute to the prosperity of his countrymen at Fort Dauphin, whom he knew to be in the utmost distress. The governor, regarding him as a traitor, had set a price on his head, and on the heads of the five Frenchmen who had followed him. The neighbouring chiefs, irritated at this treatment of a man whom they so much venerated, unanimously refused to supply the fort with provisions. This occasioned a famine in the place, which, with a contagious fever and other maladies, reduced the French garrison to 80 men.

The establishment at Fort Dauphin, on the point of being totally destroyed, was preserved for a short time from ruin by the arrival of a vessel from France, commanded by Kercadie an officer of Britanny, who, with the assistance of a young advocate who had been kidnapped on board the vessel, prevailed on the envious and implacable governor Chamargou to make peace with La Case and his sovereign spouse Deaan Nong. This peace, however, lasted but for a short time; the French, restless and insolent to the neighbouring nations, again drew on them the vengeance of the natives. Even the few friends whom they had been able to acquire by means of La Case, were rendered hostile to them by the tyrannical zeal of the missionaries; who, not content with being tolerated and allowed to make converts, insisted on Deaan Manang, sovereign of Mandrany, a powerful, courageous, and intelligent chief, well disposed to the French, to divorce all his wives but one. This prince, not convinced of the necessity of such a measure, assured them that he was unable to change his habits and way of living, which were those of his forefathers. “You would allow me (says he) to have one wife; but if the possession of one woman is a blessing, why should a numerous seraglio be an evil, while peace and concord reign among those of whom it is composed? Do you see among us any indications of jealousy or hatred? No, all our women are good; all try to make me happy; and I am more their slave than their master.” This speech had no effect on Father Stephen, superior of the Madagascar mission. He peremptorily ordered him instantly to repudiate all his wives except one; and threatened, in presence of the women, to have them taken from him by the French soldiers, if he hesitated in complying with his commands. It is easy to imagine, says M. Bachin, with what indignation this language must have been heard in the donce or palace of this prince. The females assailed the missionary on all sides; loaded him with excoriations and blows; and in their fury, would doubtless have afforded him no more quarter than the Thracian women did Orpheus, if Deaan Manang, notwithstanding his own agitation, had not made use of all his authority to save him.

In order to free himself from the persecution of this prince, he removed with his family 70 or 80 miles into the country; but he was soon followed by Father Stephen and another missionary, with their attendants. The chief, Manang, still received them civilly; but he intreated them no longer to insist on the conversion of him and his people, as it was impossible to oblige them to quit the customs and manners of their ancestors. The only reply which Father Stephen made to this intreaty, was by tearing off the old, and the amulets and charms which the chief wore as sacred badges of his own religion; and, throwing them into the fire, he declared war against him and his nation. This violence instantly cost him and his followers their lives: they were all massacred by order of Manang, who vowed the destruction of all the French in the island; in which intention he proceeded in a manner that had been related to an eye witness, who was afterwards provincial commissary of artillery, in a narrative published at Lyons in 1723, entitled Voyage de Madagascar. “Our yoke (says the Abbé Rochais) was become odious and insupportable. Historians, for the honour of civilized nations, should bury in oblivion the afflicting narratives of the atrocities exercised on these people, whom we are pleased to call barbarous, treacherous, and deceitful, because they have revolted against European adventurers, whose least crime is that of violating the sacred rites of hospitality.”

It was about the year 1672 that the French were totally driven from the island of Madagascar; and no considerable attempts were made to form fresh establishments there till within these few years, by M. de Madave, and by Count Benyowski; neither of which was attended with success, for reasons given by the Abbé, but which we have not room to detail.

MADDER, a plant used in dyeing. See Rubia, Botany Index; and for its dyeing properties, see Dyeing.

MADEIRAS, a cluster of islands, belonging to Portugal, situated in the Atlantic ocean, in W. Long. 16°, and between 32° and 33° N. Lat.—The largest of them, called Madeira, from which the rest take their name, is about 55 English miles long, and 10 miles broad; and was first discovered on the 2d of July, in the year 1419, by João Gonzales Zarco, there being no historical foundation for the fabulous report of its discovery by one Machin an Englishman. It is divided into two capitaneias, named Funchal and Marico, from the towns of
of those names. The former contains two judicatures, viz. Funchal and Galheta; the latter being a town with the title of a county, belonging to the family of Castello Melhor. The second capitania likewise comprehends two judicatures, viz. Maxico (read Mashico) and San Vicente.

Funchal is the only citadel or city in the island, which has also seven villas or towns; of which there are four, Calheta, Camara de Lobos, Ribeira Braba, and Ponta do Sol in the capitania of Funchal, which is divided into 26 parishes. The other three are in the capitania of Maxico, which consists of 17 parishes; these towns are called Maxico, San Vicente, and Santa Cruz.

There is one curiosity in the town of Funchal, which deserves to be taken notice of, and that is a chamber in one of the corners of the Franciscan convent, the walls and ceiling of which are completely covered with rows of human skulls and human thigh bones, so arranged that in the obtuse angle made by each pair of the latter, crossing each other obliquely, is placed a skull. The only vacant space that appears is in the centre of the side opposite to the door, on which there is an extraordinary painting above a kind of altar, but what the subject it is intended to represent, it is difficult to determine. A figure probably intended for St Francis, the patron saint, seems to intent on trying in a balance the comparative weight of a sinner and a saint. A dirty lamp suspended from the ceiling, and just glimmering in the socket, serves dimly to light up this dismal den of skulls. The monk who acts as steward, is careful to impress on the minds of those who visit it, the idea that they are all relics of holy men who died on the island, although Mr Barrow is of opinion that the church-yard must have been frequently robbed, in order to accumulate such a prodigious number of skulls, which from a rough computation made by that gentleman, could not be under 3000.

The governor is at the head of all the civil and military departments of this island, of Porto-banto, the Salvages, and the Ilhas Desertas; which last only contain the temporary huts of some fishermen, who resort thither in pursuit of their business; his salary is computed to be worth 2000l. per annum, 200l. of which is in the form of a present from the English merchants.

The law department is under the correidor, who is appointed by the king of Portugal, commonly sent from Lisbon, and holds his place during the king's pleasure. All causes come to him from inferior courts by appeal. Each judicature has a senate; and a Juiz or judge, whom they choose, presides over them. At Funchal he is called Juiz da Fora; and in the absence, or after the death of the correidor, acts as his deputy. The foreign merchants elect their own judge, called the Procuror, who is at the same time collector of the king's customs and revenues, which amount in all to about 12,000l. sterling. For the greatest part of this sum is applied towards the salaries of civil and military officers, the pay of troops, and the maintenance of public buildings. This revenue arises, first from the tenth of all the produce of this island belonging to the king, by virtue of his office as grand master of the order of Christ; secondly, From ten per cent. duties laid on all imports, provisions execepted; and lastly, From the eleven per cent. charged on all exports.

The island has but one company of regular soldiers of 100 men: the rest of the military force is a militia consisting of 3000 men, divided into companies, each commanded by a captain, who has one lieutenant under him and one ensign. There is no pay given to either the private men or the officers of this militia; and yet their places are much sought after, on account of the rank which they communicate. These troops are embodied once a year, and exercised once a month. All the military are commanded by the Sargento Mor. The governor has two Capitanos de Sen about him, who do duty as aides-de-camp.

The secular priests on the island are about 1200, many of whom are employed as private tutors. Since the expulsion of the Jesuits, no regular public school is to be found here; unless we except a seminary, where a priest, appointed for that purpose, instructs and educates ten students at the king's expense. These wear a red cloak over the usual black gowns worn by ordinary students. All those who intend to go into orders, are obliged to qualify themselves by studying in the university of Coimbra, lately re-established in Portugal. There is also a dean and chapter at Madeira, with a bishop at their head, whose income is considerably greater than the governor's; it consists of 110 pipes of wine, and of 40 muids of wheat, each containing 34 bushels; which amounts in common years to 3000l. sterling. Here are likewise 60 or 70 Franciscan friars, in four monasteries, one of which is at Funchal. About 300 nuns live on the island, in four convents, of the order of Merci, Sta Clara, Incarnation, and Dom Jesus. Those of the last-mentioned institution may marry whenever they choose, and leave their monastery.

In the year 1768, the inhabitants living in the 43 parishes of Madeira, amounted to 65,913, of whom there were 31,341 males and 32,572 females. But in that year 5243 persons died, and no more than 2158 children were born; so that the number of the dead exceeded that of the born by 3045. It is highly probable that some epidemical distemper carried off so disproportionate a number in that year, as the island would shortly be entirely depopulated if the mortality were always equal to this. Another circumstance concurs to strengthen this supposition, namely, the excellence of the climate. The weather is in general mild and temperate: in summer, the heat is very moderate on the higher parts of the island, whither the better sort of people retire for that season; and in the winter the snow remains there for several days, whilst it is never known to continue above a day or two in the lower parts.

The common people of this island are of a tawny colour, and well shaped; though they have large feet, owing perhaps to the efforts they are obliged to make in climbing the craggy paths of this mountainous country. Their faces are oblong, their eyes dark; their black hair naturally falls in ringlets, and begins to crisp in some individuals, which may perhaps be owing to intermarriages with negroes; in general, they are hard featured, but not disagreeable. Their women are too frequently ill-favoured, and want the florid complexion, which, when united to a pleasing assemblage...
The polite world about half a century ago. Their ladies Madeiras are delicate and have agreeable features: but the characteristic jealousy of the men still locks them up, and deprives them of a happiness which the country women, amidst all their distresses, enjoy. Many of the better people are a sort of petite noblesse, which we would call gentry, whose genealogical pride makes them unsociable and ignorant, and causes a ridiculous affectionate gravity. The landed property is in the hands of a few ancient families, who live at Funchal, and in the various towns on the island.

Madeira consists of one large mountain, whose branches rise everywhere from the sea towards the centre of the island, converging to the summit, in the midst of which is a depression or excavation, called the Val by the inhabitants, always covered with a fresh and delicate herbage. This and another cavity of the same description are supposed on good grounds to have been craters of volcanoes. The rocks consist of three or four different species of lava, some of which have assumed a regular prismatic form, some of the prisms being extremely perfect, and others of the lump. They also contain olivine, and occasionally carbonate of lime and zeolite; and intermixed with the strata of lava are beds of clay, with layers of silt and ashes. The soil of the island is clay on the surface, and large masses of it as hard as brick are found underneath.

Many brooks and small rivulets descend from the summits in deep chasms or glens, which separate the various parts of the island. The beds of the brooks are in some places covered with stones of all sizes, carried down from the higher parts by the violence of winter rains or floods of melted snow. The water is conducted by wents and channels in the vineyards, where each proprietor has the use of it for a certain time; some being allowed to keep a constant supply of it, some to use it thrice, others twice, and others only once a week. As the heat of the climate renders this supply of water to the vineyards absolutely necessary, it is not without great expense that a new vineyard can be planted; for the maintaining of which, the owners must purchase water at a high price, from those who are constantly supplied, and are thus enabled to spare some of it.

Wherever a level piece of ground can be contrived in the higher hills, the natives make plantations of eddios, enclosed by a kind of dyke to cause a stagnation, as that plant succeeds best in swampy ground. Its leaves serve as food for hogs, and the country people use the roots for their own nourishment.

The sweet potato is planted for the same purpose, and makes a principal article of diet; together with chestnuts, which grow in extensive woods, on the higher parts of the island, where the vine will not thrive. Wheat and barley are likewise sown, especially in spots where the vines are decaying through age, or where they are newly planted. But the crops do not produce above three months provisions; and the inhabitants are therefore obliged to have recourse to other food, besides importing considerable quantities of corn from North America, in exchange for wine.

The want of manure, and the inactivity of the people, are in some measure the causes of this disadvantage; but supposing husbandry to be carried to its perfection
The great produce of Madeira is the wine, from which it has acquired fame and support. Where the soil, exposure, and supply of water, will admit of it, the vine is cultivated. One or more walks, about a yard or two wide, are laid round the vineyard, and are enclosed by stone walls two feet high. Along these walks which are arched over with laths about seven feet high, they erect wooden pillars at regular distances, to support a lattice-work of bamboos, which slopes down from both sides of the walk, till it is only a foot and a half or two feet high, in which elevation it extends over the whole vineyard. The vines are in this manner supported from the ground, and the people have room to root out the weeds which spring up between them. In the season of the vintage, they creep under this lattice-work, cut off the grapes, and lay them into baskets: some bunches of these grapes weigh six pounds and upwards. This method of keeping the ground clean and moist, and ripening the grapes in the shade, contributes to give the Madeira wines that excellent flavour and body for which they are remarkable. The owners of vineyards are however obliged to allot a certain spot of ground for the growth of bamboos; for the lattice-work cannot be made without them. It is said some vineyards lie quite neglected for want of this useful reed.

The wines are not all of equal goodness, and consequently of different prices. The best, made of a vine imported from Candi by order of the Infante of Portugal, Don Henry, is called Madeira Malmsy, a pipe of which cannot be bought on the spot for less than 40l. or 42l. sterling. It is an exceeding rich sweet wine, and is only made in a small quantity. The next sort is a dry wine, such as is exported for the London market, at 30l. or 31l. sterling the pipe. Inferior sorts for the East India, West India, and North American markets, sell at 28l. 25l. and 20l. sterling. About 40,000 pipes are annually exported, one half of which goes to the British settlements in the East and West Indies. The best vines grow on the south side of the island, and on the side of the hill which points to the east. The inhabitants import Indian corn and wheat from North America, great quantities of salt fish from Newfoundland, and fresh meat and live sheep and oxen from Barbary. The total amount of imports from England in the 17 years ending in 1809, was 3,478,043l. and of exports to England only 216,167l.

The enclosures of the vineyards consist of walls, and hedges of prickly pear, pomegranates, myrtle, brambles, and wild roses. The gardens produce peaches, apricots, quinces, apples, pears, walnuts, cherries, and many other European fruits; together with oranges and then some tropical plants, such as bananas, goavas, and pine-apples. The common domestic animals of Europe are likewise found at Madeira; and their mutton and beef, though small, is very well tasted. Their horses are small, but sure-footed; and with great agility climb the difficult paths, which are the only means of communication in the country. They have no wheel-carriages of any kind: but in the town they use a sort of drays or slidges, formed of two pieces of plank joined by cross pieces, which make an acute angle before; these are drawn by oxen, and are used to transport casks of wine, and other heavy goods, to and from the warehouses.

The animals of the feathered tribe, which live wild here, are more numerous than the wild quadrupeds; there being only the common gray rabbit here, as a representative of the last-mentioned class. Tame birds, such as turkeys, geese, ducks, and hens, are very rare, which is perhaps owing to the scarcity of corn.

There are no snakes whatsoever in Madeira; but all the houses, vineyards, and gardens, swarm with lizards. The friars of one of the convents complained to Mr. Forster, that these vermin destroyed the fruit in their garden; they had therefore placed a brass-kettle in the ground to catch them, as they are constantly running about in quest of food. In this manner they daily caught hundreds, which could not get out on account of the smooth sides of the kettle, but were forced to perish.

The shores of Madeira, and of the neighbouring Salvages and Desertas, are not without fish; but as they are not in plenty enough for the rigid observance of Lent, pickled herrings are brought from Gottenburg in English Bottoms, and salted cod from New York and other American ports, to supply the deficiency.

MADIAN, in Ancient Geography, a town of Arabia Petraea, near the Arnon; so called from one of the sons of Abraham by Ketura; in ruins in Jerome’s time. Jerome mentions another MADIAN, or Midian, beyond Arabia, in the desert, to the south of the Red Sea; and hence Madianae, and Madianitae, the people; and Madianae Regio, the country.

MADNESS, a most dreadful kind of delirium, without fever. See Medicine Index.

MADRAS. See ST. GEORGE.

MADRE DE POPA, a town and convent of South America, in Terra Firma, seated on the river Grande. It is almost as much resorted to by pilgrims of America as Loreto is in Europe; and the image of the Virgin Mary is said to have done many miracles in favour of the seafaring people. W. Long. 76°. N. Lat. 11°. 30’.

MADREPORA, in Natural History, the name of a genus of submarine substances; belonging to the order lithophyta. See Helminthology Index.

MADRID, a town of New Castile in Spain, and capital of the whole kingdom, though it never had the title of a city, is situated in W. Long. 3°. 5’ N. Lat. 40°. 26’. It stands in the centre of a large plain, surrounding with mountains, and in the very heart of Spain, on the banks of the little river Manzanares, which is always very low and shallow, except when it is swelled by the melting of the snow on the mountains. The city is in general well laid out; the streets are very handsome; and the houses are fair and lofty, but built of brick, with lattice-windows, except those of the rich,
of Pieté in Paris, the principal object of which is to advance money to the necessitous.

The city of Madrid contains 15 gates, 18 parishes, 35 convents of monks, and 31 of nuns; 39 colleges, hospitals, or houses of charity; 7398 dwelling-houses, and about 168,000 inhabitants. The Lombard traveller Father Caimo, tells us, that 50,000 sheep and 12,000 oxen are annually consumed there; to which his editor has added a ludicrous estimate of the onions and leeks devoured there, which he says amounts to 970000000000000000000000000000000045. But this writer (M. Bourgonne observes) would not at present have any reason to complain of the disagreeable smells of the streets, nor would he find all the perfumes of Arabia necessary to defend himself from them. By the vigilance of the modern police, for which (M. Bourgonne informs us) it is indebted to the Count d'Aranda, it is rendered one of the cleanest cities in Europe.

There are four academies in Madrid: The first is the Spanish academy, founded in 1714, in imitation of the French academy, and consisting of 24 members, including the president. Its device is a crucible on burning coals, with the motto lympia, fera, y da esplender; “it purifies, fixes, and gives lustre.” Its first object was the compilation of a dictionary of the Spanish language, which was published in six volumes folio, and of which a new edition, with great additions, has been lately put to the press. The same academy is also employed on a superb edition of Don Quixote, adorned with elegant engravings far superior to the last, and collated with all the former editions. The second is the academy of history; which owes its origin to a society of individuals, the object of whose meetings was to preserve and illustrate the historical monuments of the kingdom of Spain. Their labours met the approbation of Philip V, who in 1722 confirmed the statutes by a royal cedula. This academy consists of 24 members, including the president, secretary, and censor. Its device is a river at its source; and the motto, In patriam populumque suis. The other two academies are, the academy of the fine arts, painting, sculpture, and architecture; and the academy of medicine. The latter is held in no great esteem.

The environs of Madrid contain several royal seats; among which are El Buen Retiro, Casa del Campo, Florida, Le Pardo Sarsuela, and St Ildefonso; but the most magnificent, not only in this country but perhaps in the whole world, is the Escorial, which takes its name from a small village near which it stands, about 22 miles north-west from Madrid; and of which a description is given under the article ESCORIAL. Another royal palace, greatly admired, particularly for its delicious gardens and surprising water-works, is Aranjuez, which is situated on the Tagus, about 30 miles south of Madrid. See ARANJUZ.

MADRIGAL, a short amorous poem, composed of a number of free and unequal verses, neither confined to the regularity of a sonnet, nor to the point of an epigram; but only consisting of some tender and delicate thought, expressed with a beautiful, noble, and elegant simplicity.

Menage derives the word from mandra, which in Latin and Greek, signifies “a sheep-fold;” imagining
MAE

it to have been originally a kind of pastoral or shepherd's song; whence the Italians formed their madrigale, and we madrigal. Others rather choose to derive it from the word madrugar, which in the Spanish language signifies "to rise in the morning!" the madrigales being formerly sung early in the morning by those who had a mind to serenade their mistresses.

MAVURA, a province of Asia, in the peninsula on this side the Ganges; bounded on the east by Tanjore and Marava, on the south-east by the sea, on the west by the Balagate mountains, which separate it from Malabar, and on the north by Visavapur and Carnata. The inhabitants are Cennoos, and of a thievish disposition. The commodities are rice, elephants teeth, and cotton cloth; of which last a good deal is made here, and very fine. At this place is a pearl fishery, which brings in a large sum annually.

MÆANDER, in Ancient Geography, a celebrated river of Asia Minor, rising near Celenne. It flows through Caris and Ionia into the Ægean sea between Miletus and Priene, after it has been increased by the waters of the Marsyas, Lycus, Euxon, Lethans, &c. It is celebrated among the poets for its windings, which amount to no less than 600, and from which all obliquities have received the name of mæanders. It forms in its course, according to the observation of some travellers, the Greek letters ζ ξ & ω; and from its windings Dedaus is said to have had the first idea of his famous labyrinth.

MÆIA, ancinctly a people of Britain, near Sever's wall, inhabiting the district now called Landerdale, in Northumberland.

MÆCENAS, CAIUS CILIUS, the great friend and counsellor of Augustus Caesar, was himself a very polite scholar, but is chiefly memorable for having been the patron and protector of men of letters. He was descended from a most ancient and illustrious origin, even from the kings of Hetruria, as Horace often tells us; but his immediate forefathers were only of the equestrian order. He is supposed to have been born at Rome, because his family lived there; but in what year antiquity does not tell us. It says as little about his education: but we know it must have been of the most liberal kind, and perfectly agreeable to the dignity and splendour of his birth, since he excelled in every thing that related to arms, politics, and letters. How Mæcenas spent his younger years is also unknown to us, any farther than by effects; there being no mention made of him by any writer before the death of Julius Caesar, which happened in the year of Rome 709. Then Octavius Caesar, who was afterwards called Augustus, went to Rome to take possession of his uncle's inheritance; and then Mæcenas became first publicly known, though he appears to have been Augustus's intimate friend, and as it should seem guardian, from his childhood. From that time he accompanied him through all his fortunes, and was his counsellor and adviser upon all occasions; so that Pseudo Albinovanus justly called him Caesaris dextrem, "Cæsar's right-hand."

In A. R. 710, the year that Cicero was killed and Ov'il born, Mæcenas distinguished himself by his courage and military skill at the battle of Modena, where the consuls Hostius and Passa were slain in fighting against Antony; as he did afterwards at Philippi.

After this last battle began the memorable friendship between Mæcenas and Horace. Horace, as Suetonius relates, was a tribune in the army of Brutus and Cassius, and upon the defeat of those generals made a prisoner of war. Mæcenas, finding him an accomplished man, became immediately his friend and protector; and afterwards recommended him to Augustus, who restored him his estate with no small additions. In the mean time, though Mæcenas behaved himself well as a soldier in these and other battles, yet his principal profession was that of a minister and counsellor. He was the adviser, the manager, the negociator, in everything that related to civil affairs. When the league was made at Brundusium between Antony and Augustus, Mæcenas was sent to act on the part of Augustus. This we learn from Horace in his journey to Brundusium:

Hoc venturus erat Mæcenas optimus, atque Cæveius, missi magnis de rebus urtera
Legati, aversos soliti componere amicos. Sat. v. lib. r.

And afterwards, when this league was near breaking, through the suspicions of each party, Mæcenas was sent to Antony to ratify it anew.

In the year 717, when Augustus and Agrippa went to Sicily to fight Sextus Pompeius by sea, Mæcenas went with them; but soon after returned to appease some commotions which were rising at Rome: for though he usually attended Augustus in all his military expeditions, yet whenever there was any thing to be done at Rome either with the senate or the people, he was always dressed thereto for that purpose.

Upon the total defeat of Antony at Actium, Mæcenas returned to Rome, to take the government into his hands, till Augustus could settle some necessary affairs in Greece and Asia. Agrippa soon followed Mæcenas; and when Augustus arrived, he placed these two great men and faithful adherents, the one over his civil, the other over his military concerns. While Augustus was extinguishing the remains of the civil war in Asia and Egypt, young Lepidus, the son of the triumvir, was forming a scheme to assassinate him at his return to Rome. This conspiracy was discovered at once, by the extraordinary vigilance of Mæcenas; who, as Velleius Paterculus says, "observing the rash counsels of the headstrong youth with the same tranquillity and calmness as if nothing at all had been doing, instantly put him to death, without the least noise and tumult; and by that means extinguished another civil war in its very beginning."

The civil war being now at an end, Augustus returned to Rome; and from this time Mæcenas indulged himself at vacant hours in literary amusements, and the conversation of men of letters. In the year 734 Virgil died, and left Augustus and Mæcenas heirs to what he had. Mæcenas was excessively fond of this poet, who, of all the wits of the Augustan age, stood highest in his esteem; and if the Georgics and the Æneid be owing to the good taste and encouragement of this patron, as there is some reason to think, posterity cannot comemostrate him with too much gratitude. Horace may be ranked next to Virgil in Mæcenas's good graces: we have already mentioned how and at what time their friendship commenced. Propertius also acknowledges Mæcenas for his favourer and protector, lib. ii. eleg. 7-
Nor must Varius be forgot, though we have nothing of his remaining; since we find him highly praised by both Virgil and Horace. He was a writer of tragedies; and Quintilian thinks he may be compared with any of the ancients. In a word, Macenas's house was a place of refuge and welcome to all the learned of his time; not only to Virgil, Horace, Propertius, and Varus, but to Fundarius, whom Horace extols as an admirable writer of comedies; to Fuscus Arius, a noble grammarian, and Horace's intimate friend; to Plotius Tusca, who assisted Varus in correcting the Æneid after the death of Virgil; to Valerius, a poet and a very learned man, who, as Pliny tells us, dedicated a book to Augustus, De nou Herbarum; to Asinus Pollio, an excellent tragic writer; and to several others, whom it would be tedious to mention. All these dedicated their works, or some part of them at least, to Macenas, and celebrated his praises in them over and over: and we may observe farther, what Plutarch tells us, that even Augustus himself inscribed his Commentaries to him and to Agrippa.

Macenas continued in Augustus's favour to the end of his life, but not uninterruptedly. Augustus had an intrigue with Macenas's wife: and though the minister bore this liberty of his master very patiently, yet there was a coldness on the part of Augustus, which, however, soon went off. Macenas died in the year 745; but at what age we cannot precisely determine, though we know he must have been old. He must have been older than Augustus, because he was a kind of tutor to him in his youth: and we find him often called an old man by Pindar Alkinonenes, a contemporary poet, whose elegy upon his dead patron is still extant. He made Augustus his heir; and recommended his friend Horace to him in those memorable last words, "Horatii Flacci, ut mi, memor esto," &c. Horace, however, did not probably survive him long, as there is no elegy of his upon Macenas extant, nor any account of one having ever been written, which there certainly would have been had Horace survived him any time. Nay, Father Sanadon, the French editor of Horace, will have it, that the poet died before his patron; and that these last words were found only in Macenas's will, which had not been altered.

Macenas is said never to have enjoyed a good state of health in any part of his life: and many singularities are related of his bodily constitution. Thus Pliny tells us, that he was always in a fever; and that, for three years before his death, he had not a moment's sleep. Though he was certainly an extraordinary man, and possessed many admirable virtues and qualities, yet it is agreed on all hands, that he was very luxurious and effeminate. "Macenas (says Velleius Paterculus) was of the equestrian order, but sprung from a most illustrious origin. He was a man, who, when business required, was able to undergo any fatigue and watching; who consulted properly upon all occasions, and knew as well how to execute what he had consulted; yet a man who in seasons of leisure was luxurious, soft, and effeminate, almost beyond a woman. He was no less dear to Caesar than Agrippa, but distinguished by him with fewer honours; for he always continued of the equestrian rank, in which he was born: not that he could not have been advanced upon the least intimation, but he never solicited it."
MÆOSTIS PALUS or Lacus, Mastica Palus, or Mæo-
ticus Lacus, in Ancient Geography, a large lake or part of
the sea between Europe and Asia, at the north of the
Euxine, to which it communicates by the Cimmerian
Bosphorus. It was worshipped as a deity by the
Massagetae. It extends about 350 miles from south-
west to north-east, and is about 600 miles in cir-
cumference. Still called Palus Mæostis, reaching from
Crim Tartary to the mouth of the Don.

MÆSTLIN, MICHAEL, in Latin Mastilinus, a ce-
lebrated astronomer of Germany, was born in the duchy
of Wittemberg; but spent his youth in Italy, where he
made a speech in favour of Copernicus's system, which
brought Galileo over from Aristotle and Ptolemy, to
whom he had been hitherto entirely devoted. He af-
terwards returned to Germany, and became professor
of mathematics at Tubingen; where, among his other
scholars, he taught the great Kepler, who has praised
several of his ingenious inventions, in his Astronomia
Optica. Though Tycho Brahe did not assent to Mæ-
stlin's opinion, yet he allowed him to be an extraordinary
person, deeply skilled in the science of astronomy.
Mestlin published many mathematical and astronomical
works; and died in 1590.

MÆSTRICTH, an ancient town of the Nether-
lands; is about four miles in circumference, and strong-
ly fortified. The inhabitants, the number of whom is
estimated at 18,000, are noted for making excellent
fire arms. It contains an arsenal, a handsome town-
house, and a good library. Both Papists and Prote-
stants are allowed the free exercise of their religion,
and the magistrates are composed of both. It is seat-
ed on the river Meuse, which separates it from Wyck,
and with which it communicates by a handsome bridge.
Maestrictch revolted from the Spaniards in 1570, but
was reduced in 1579. Louis XIV. became master of
it in 1673; but it was restored to the states by the
treaty of Nimicus in 1678. It was again taken by the
French in 1704, and remained in their possession till
1814. It now belongs to the kingdom of the Ne-
theders. E. Long. 5° 50. N. Lat. 50° 52.

MAFFÉ, EUS, VEGIO, a Latin poet, born in Lomb-
ardy in 1407, was greatly admired in his time.
He wrote epigrams, and a humorous supplement to
Virgil, which he called The thirteenth book of the
Æneid: this was as humorously translated into Eng-
lish a few years since by Mr. Ellis. Maffau wrote
also some prose works. He was chancellor of Rome
towards the end of the pontificate of Martin V.; and
died in 1458.

MAFFEI, SCIPIO, a celebrated Italian poet, born
of an illustrious and ancient family at Verona, in 1675.
After having finished his studies, he took arms, and
distinguished himself by his valour at the battle of Do-
navert; but he more particularly distinguished himself
by his love of learning, which made him undertake se-
veral voyages into France, England, and Germany.
He conversed with the learned in all those countries,
and obtained their friendship and esteem. He was a
member of the academy of the Arcadia at Rome, an
honorary foreign member of that of Inscriptions at
Paris; and died in 1755. He wrote many works in
verse and prose, which are esteemed; the most known
of which are, 1. The tragedy of Merope, of which
there
there are two French translations in prose. 2. Ceremony, a comedy. 3. A translation, into Italian verse, of the first book of Homer’s Iliad. 4. Many other pieces of poetry, in a collection entitled Rhyme and Prose, quarto. His principal works in prose are, 1. Ves
eria illustrata. 2. Istoria diplomatica. 3. Scienza caval
terescia; an excellent work, in which he attacks duell
ing. 4. An edition of Theatre Italiano. 5. An edition
casso; the same ingenious gentleman proposed to
find an arch of equilibrium for them also, and to con-
struct it when the span is 20 feet, the pitch or height
20 (which are the same dimensions as the semicircle),
the inclined exterior walls at top forming an angle
of 13 degrees, and the height of their angular point a
below the top of the arch, so that the very curious
was answered in 1775 by the reverend
Mr. Wildbore, to be found in Mr. Hutton’s Miscella
Mathematica.

Artillery Magazine. In a siege, the magazine is
made about 25 or 30 yards behind the battery, towards
the parallels, and at least three feet under ground, to
hold the powder, loaded shells, portières, &c. Its sides
and roof must be well secured with boards to prevent
the earth from falling in: a door is made to it, and a
double trench or passage is sunk from the magazine to
the battery, one to go in and the other to come out at,
to prevent confusion. Sometimes traverses are made in
the passages to prevent ricochet shot from plunging into
them.

Magazine, on shipboard, a close room or store
house, built in the fore or after-part of the hold to
contain the gunpowder used in battle. This apartment
is strongly secured against fire, and no person is al
lowed to enter it with a lamp or candle: it is therefore
lighted, as occasion requires, by means of the candles
or lamps in the light-room contiguous to it.

Magazine Air-Gun. See Air-Gun.

Magazine, Literary; a well-known species of pe
riodical publications, of which the first that appeared
was The Gentleman’s, set on foot by the projector Mr
Edward Cave in the year 1731: (see the article Cave).
This, as Dr. Kippis observes, “may be considered as
something of an epocha in the literary history of this
country. The periodical performances before that time
were almost wholly confined to political transactions,
and to foreign and domestic occurrences; but the
monthly magazines have opened a way for every kind
of inquiry and information. The intelligence and dis
ussion contained in them are very extensive and va
rious: and they have been the means of diffusing a gen
eral habit of reading through the nation, which in a
certain degree hath enlarged the public understanding.
Many young authors, who have afterwards risen to con
siderable eminence in the literary world, have here
made their first attempts in composition. Here too are
preserved a multitude of curious and useful hints, observ
ations, and facts, which otherwise might have never
appeared; or if they had appeared in a more evanescent
form, would have incurred the danger of being lost. If
it
it were not an invidious task, the history of them would be no insidious or unentertaining subject. The magazines that unite utility with entertainment are undoubtedly preferable to those (if there have been any such) which have only a view to idle and frivolous amusement. It may be observed, that two of them, The Gentleman's and The London, which last was begun the year after the former, have, amidst their numerous rivals, preserved their reputation to the present day. They have both of them, in general, joined instruction with pleasure; and this likewise hath been the case with some others of a later origin. The original London Magazine, it has been believed, has been discontinued for some years past. The next oldest publication of this kind, is that entitled The Scots Magazine: which was commenced at Edinburgh a few years posterior to the appearance of The Gentleman's at London; which, like it, has survived many rivals, and has been continued, under different proprietors and editors, with various degrees of merit.

MAGDALEN, MARY. See MARY.

Religious of St. MAGDALEN, a denomination given to divers communities of nuns, consisting generally of penitent courtzants; sometimes also called Magdalenettes. Such are those at Metz, established in 1432; those at Paris, in 1432; those at Naples, first established in 1314, and endowed by Queen Soacha, to serve as a retreat for public courtzants, who should be taken to repentance; and those of Ronen and Bourdeaux, which had their original among those of Paris in 1618. In each of these monasteries there are three kinds of persons and congregations: the first consist of those who are admitted to make vows, and these bear the name of St. Magdalen; the congregation of St. Martha is the second, and is composed of those whom it is not judged proper to admit to vows; finally, the congregation of St. Lazarus is composed of such as are detained there as penitence.

The religious of St. Magdalen at Rome were established by Pope Leo X. Clement VIII settled a revenue on them; and farther appointed, that the effects of all public prostitutes, dying intestate, should fall to them; and that the testaments of the rest should be invalid unless they bequeathed a portion of their effects, which was to be at least a fifth part, to them.

MAGDALEN Hospital. See LONDON, No. 115.

MAGDALENA, one of the Marquesas islands, about five leagues in circuit, and supposed to be in S. Lat. 10. 25. W. Long. 138. 50. It was only seen at nine leagues distance by those who discovered it.

MAGDALENE'S CAVE, a cave of Germany, and in Carinthia, 10 miles east of Graz. It appears like a chasm in a rock, and at the entrance torches are lighted to conduct travellers. It is divided into several apartments, or halls, with a vast number of pillars formed by nature, which give it a beautiful appearance, they being white and glossy, and almost transparent. The bottom is of the same substance, insomuch that a person may fancy himself to be walking among the ruins of an enchanted castle, surrounded with magnificent pillars, some entire and others broken.

MAGDEBURG, a duchy of Germany, in the circle of Lower Saxony; bounded on the north by the duchy of Mecklenburgh, on the south and south-west by the principality of Anhalt and Halberstadt, on the east by Upper Saxony with part of Brandenburg, and on the west by the duchy of Wolfenbuttel. The Saale circle, and that of Luxenwalde, are separated from the rest, and surrounded on all sides by a part of Upper Saxony. This country is for the most part level; but sandy, marshy, or overgrown with woods. There are salt springs in it, so rich that they are sufficient to supply all Germany with that commodity. The Hohe circle is the most fruitful part of it. In the Saale circle, where wood is scarce, there is pit-coal: and at Rothenburg is a copper-mine worked. The duchy is well watered, for the Elbe posses through it; and the Saale, Havel, Aller, Ohre, and Elster, either rise in, or wash some part of it in their course. The whole duchy, exclusive of that part of the county of Mansfeld, which is connected with it, is said to contain 29 cities, six towns, 274 villages, and 335,000 inhabitants. The states of the country consist of the clergy, the nobility, and deputies of the cities. Before it became subject to the electoral house of Brandenburg, frequent diets were held in it; but at present no diets are held, nor have the states the direction of the finances as formerly. Before the Reformation, it was an archbishopric, subject in spirituals to the pope alone, and its prelate was primate of all Germany; but embracing the Reformation, it chose itself administrators, till the treaty of Munster, in 1648, when it was given, together with the bishopric of Halberstadt, to the elector of Brandenburg, as an equivalent for the Hither Pomerania, granted by that treaty to the king of Sweden. Lutheranism is the predominant religion here; but Calvinists, Jews, and Roman Catholics, are tolerated. Of the last there are five convents, who never embraced the Reformation. All the Lutheran parishes, amounting to 314, are subject to 16 inspectors, under one general superintendent; cities, six towns, and the old town of Magdeburg are under the direction of their senior. The Jews have a synagogue at Halle. The manufactures of the duchy are cloth, stuffs, stockings, linen, oilskins, leather, and parchment; of which, and grain of all sorts, large quantities are exported. The arms of it are, Party per pale, red and pearl. The king of Prussia, as duke of Magdeburg, sits and votes between the elector of Bavaria, as duke of Bavaria, and the elector palatine, as palgrave of Lautern. Of the states of the circle of Lower Saxony he is the first. His matricular assessment for the duchy is 43 horses and 156 foot, or 1300 florins monthly; and to the chamber of Wetzlar, 343 florins and 40 kruizers. For the civil government of the duchy there is a council of regency, with a war and demese chamber; and for the ecclesiastical a consistory and general superintendent. The revenues of the duchy, arising from the salt-works, demesne, and taxes, some of which are very heavy and oppressive, are said to amount to 800,000 rixdares annually. With respect to duty, all who are a roadseeper in the Prussian dominion is obliged to buy a certain quantity for himself and wife; and also for every child and servant, horse, cow, calf, and sheep, that he possesses. The principal places are Magdeburg, Halle, and Glauncke.

MAGDEBURG, a city of Germany, in a duchy of the same name, of which it is not only the capital, but that
of all Lower Saxony, and formerly of even all Germany. It stands on the Elbe, in E. Long. 11. 38. N. Lat. 52. 16. It is a city of great trade, strongly fortified, and very ancient. Its name signifies the maiden city; which, some imagine, took its rise from the temple of Venus, which is said to have stood here antecedently, and to have been destroyed by Charlemagne. The founder of the city is supposed to have been Otho I. or his empress Editha, daughter to Edmund the Saxon king of England. The same emperor founded a Benedictine convent here, which he afterwards converted into an archbishopric, of which the archbishop was a count-palatine, and had very great privileges, particularly that of wearing the archiepiscopal pallium, and having the cross borne before him, besides many others. The first tournament in Germany is said to have been appointed near this city, by the emperor Henry the Fowler; but these pastimes were afterwards abolished, because they occasioned such envy and animosity among the nobility, that several of them killed one another upon the spot. The situation of the city is very convenient and pleasant, upon the banks of the Elbe, amidst spacious fruitful plains, and on the road between High and low Germany. It has been a great sufferer by fires and sieges; but by none so much as that in 1631, when the emperor's general, Count Tilly, took it by storm, plundered, and burnt it on fire, by which it was entirely reduced to ashes, except the cathedral, the convent of our Lady, and a few cottages belonging to fishermen; of 40,000 burghers, not above 400 escaping. The soldiers spared neither age nor sex; but ript up women with child, murdered sucking infants in sight of their parents, and ravished young women in the streets; to prevent which violence, many of them flung themselves into the Elbe, and others into the fire. The city is now populous, large, and well built, particularly the broad streets and cathedral square. The principal buildings are the king's palace, the governor's house, the armoury, guildhall, and cathedral. The last is a superb structure in the antique taste, dedicated to St Maurice, which has a fine organ, the master pipe of which is so big, that a man can scarce clasp it with both arms; it also contains the tombs of the emperor Otho and the empress Editha; a fine marble statue of St Maurice, a porphyry font, an altar in the choir of one stone of divers colours, curiously wrought, and many other curiosities. They show here a bedstead and table which belonged to Martin Luther, when he was an Augustinian friar in a cloister of this city before the Reformation. Among the relics, they pretend to have the bason in which Pilate washed his hands after his condemnation of our Saviour; the lantern which Judas made use of when he apprehended him; and the ladder on which the cock crowed after St Peter denied him. The chapter consists of a provost, sixteen major and seven minor canons; besides which, there are four other Lutheran collegiate foundations, and a Lutheran convent dedicated to our Lady, in which is a school or seminary. Here is also a gymnasiaum, with an academy, in which young gentlemen are instructed in the art of war. The canons of the chapter, which, except the change of religion, is upon the same footing as before the Reformation, must make proof of their nobility. The prebends and dignities are all in the gift of the elector; and the revenue of the provost is computed at 12,000 crowns a-year. Here is a great trade, and a variety of manufactures. The chief are those of woolen cloths and stuffs, silks, cottons, linens, stockings, hats, gloves, tobacco, and snuff. The city was formerly one of the Hanse and Imperial towns. Editha consort to Otho I. on whom it was conferred as a dowry, among many other privileges and advantages, procured it the grant of a yearly fair. The burgrave of this city was anciently an office of great power; having the civil and criminal jurisdiction, the office of hereditary cupbearer being annexed to it, and was long held as a fief of the archbishopric, but afterwards became an imperial fief, which was again conferred on the archbishopric by the elector of Saxony, upon certain conditions.

MAGDOLUM, or MAGDALUM, in Ancient Geography, a town of the Lower Egypt, twelve miles to the south of Pelusium (Herodotus, Antomine), which doubtless is the Migdal or Magdal of Jeremiah.—Another MAGDALUM, or MIGDOL, denoting literally "a tower or place of strength," near the Red sea, (Moses) far to the south of the former.

MAGELLAN, FERDINAND DE, an eminent navigator, was by birth a Portuguese, of a good family. He served in the East Indies with reputation for five years under Albuquerque, and in 1510 he greatly distinguished himself at the battle of Malacca. Deeming his services poorly repaid by his own court, he entered into the employment of Charles V. king of Spain. He has been charged with peculation by some of his countrymen, who have assigned this as the reason why he quitted Portugal. In conjunction with Ray Fojero he formed the bold design of discovering a new passage by the west to the Molucca islands, which he offered to prove fell within the division of the globe assigned by the pope to the crown of Castile. It is said that he first proposed this enterprise to Emanuel king of Portugal, who rejected it, as opening a way for other nations to have access to the East Indies, the trade of which was now monopolized by the Portuguese. The proposition was agreed to by the king of Spain, and on the 20th of September 1519 Magellan sailed from San Lucar with five ships and 236 men under his command. His officers soon murmured at this appointment, considering it as a disgrace to be commanded by a renegade Portuguese; and when the fleet was lying at a port in South America which they named San Julian, a conspiracy was formed against him by three of the captains, which he discovered and quelled. He caused the captain of one of the ships to be assassinated, he boarded a second, and secured the mutineers, and the third submitted.

The coast on which they lay was that of Patagonia; and this first voyage contains accounts of the extraordinary stature of the natives. About the end of October they reached a cape, to which they gave the name of Dier la Virgines, forming the entrance of the straits which bear the name of Magellan. He exerted all his authority to induce his men to venture on this unknown passage, with the view of crossing a vast ocean beyond it, at the hazard of running short of provisions, of which a supply for three months was all he had remaining. One of his ships abandoned him, and made the best of her way to Europe. The rest proceeded, and on the
Magellan

27th of November they discovered the South sea, which made Magellan shed tears of joy. They continued their voyage over this ocean, now visited for the first time by Europeans, and were not long in suffering those evils from famine which they had apprehended. The men were reduced to the necessity of eating the hides with which the rigging was covered. The weather proved so uniformly calm and temperate, that they gave to the ocean the name of Pacific. They came in sight of the Ladrones on the 6th of March, so called from the thievish disposition of the inhabitants; and from thence they sailed to the Philippines. At Zebu Magellan obtained with little difficulty the conversion of the king; and on condition of his becoming a vassal of Spain, the Portuguese assisted him in reducing some neighbouring chieftains, and the cross was erected over some burnt villages.

With about 50 men Magellan landed upon Matan, whose chief refused to submit to Zebu, had an engagement between them lasted for the greater part of the day. His troops having spent all their ammunition, found it necessary to retreat, during which Magellan was wounded in the leg by an arrow, beaten down, and at last slain with a lance. This happened in 1521. By this act of imprudence he lost the honour of being the first circumnavigator of the globe, which fell to the lot of Cano, who brought his ship home by the East Indies. Yet Magellan has secured an immortal name among maritime discoveries, by the commencement of this great enterprise, in which he displayed extraordinary skill and resolution, but disregarded justice and humanity, then almost universal among adventurers of this class.

Strait of Magellan, a narrow passage between the island of Terra del Fuego and the southern extremity of the continent of America. This passage was first discovered by Ferdinand Magellan, who sailed through it into the South sea, and from thence to the East Indies. Other navigators have passed the same way; but as these voyages are exceedingly difficult, and subject to storms, it has been common to sail by Cape Horn, rather than through the strait of Magellan. See Strait Le Maire, and Terra del Fuego.

Magellan's clouds, misty appearances like clouds, seen in the heavens towards the south pole, and having the same apparent motion as the stars. They are three in number, two of them near each other. The largest lies far from the south pole; but the other two are not many degrees more remote from it than the nearest conspicuous star, that is, about 11 degrees. Mr. Boyle conjectures, that if these clouds were seen through a good telescope, they would appear to be multitudes of small stars, like the milky-way.

Maggi, Jerome, in Latin Maggius, one of the most learned men of the 16th century, was born at Anghiari in Tuscany. He applied himself to all the sciences, and to the art of war; and distinguished himself so much in this last study, that the Venetians sent him into the island of Cyprus in quality of judge of the admiralty. When the Turks besieged Famagusta, he performed all the services that could be expected from the most excellent engineer: he invented mines and machines for throwing fire, by means of which he destroyed all the works of the besiegers, and in an instant overthrew what had cost the Turks infinite labour. But they had their revenge; for, taking the city in 1571, they plundered his library, carried him loaded with chains to Constantinople, and treated him in the most inhuman and barbarous manner. He nevertheless comforted himself from the example of Apollo, Menippus, Epictetus, and other learned men; and, after passing the whole day in the meanest drudgery, he spent the night in writing. He composed, by the help of his memory alone, treatises filled with quotations, which he dedicated to the Imperial and French ambassadors. These ministers, moved by compassion for this learned man, resolved to purchase him; but while they were treating for his ransom, Maggi found means to make his escape, and to get to the Imperial ambassador's house; when the grand visir being enraged at his flight, and remembering the great mischief he had done the Turks during the siege of Famagusta, sent to have him seized, and caused him to be strangled in prison in 1572. His principal works are, 1. A Treatise on the Bells of the Ancients. 2. On the Destruction of the World by Fire. 3. Commentaries on Æmilius Probus's Lives of Illustrious Men. 4. Commentaries on the Institutes. These works are written in elegant Latin. He also wrote a treatise on fortification in Italian; and a book on the situation of ancient Tuscany.

He ought not to be confounded with his brother Bartholomew Maggi, a physician at Bologna, who wrote a treatise on gunshot wounds; nor with Vincent Maggi, a native of Brescia, and a celebrated professor of humanity, at Ferrara in Padua, who was the author of several works.

Maggioù, Lake of, a beautiful lake, situated on the confines of Switzerland and Italy, on the south side of the Alps. It is about 50 miles long and 4 or 5 miles broad, and is bent into a very irregular figure. Its height above the level of the sea, according to Count Morosini, is 732 feet. Its greatest known depth is 1560 feet. It receives the waters of the Tesino, Maggia, and other rivers from the surrounding mountains. There are several islands in it, and two of these, called the Borromean islands, which have been beautified with gardens and buildings at a great expense, are much admired by travellers.

Maggot, the common name of the fly-worm bred in flesh, from the egg of the great blue flesh fly. Notwithstanding the distaste for this animal, its figure and structure of parts are greatly worth attending to; and may serve as a general history of the class of worms produced from the eggs of flies.

This animal is white and fleshly; its body is composed of a number of rings, like the bodies of caterpillars and other similar insects; and is capable, at the pleasure of the animal, of assuming different figures; being at times more or less extended in length, and consequently more or less thick.

Notwithstanding that this animal has no legs, it is able to move itself very swiftly; and in its first attempt to move, its body is extended to its greatest length, and assumes something of the figure of a pointed cone. The pointed part of the cone is the head of the animal, and is not separated from the next ring by any deeper furrow than the rest of the rings are from one another. In some states of the animal, one may see two short horns thrust out from the head; but more generally
generally two scaly hooks are observable; these are, however, sometimes hid, and have each of them a case or sheath, into which the animal can retract them at pleasure. These hooks are bent into an arch, the concavity of which is towards the plane on which the creature is placed; and they are thickest at their insertion in the head, and thence diminish gradually, till they terminate in a fine sharp point.

These two hooks are placed in a parallel direction, and can never come together, and therefore cannot serve in the place of teeth for grinding the food; but merely to pull and sever it in pieces, that it may be of a proper size for the mouth of the creature. Besides these hooks, the maggot has a kind of dart, which is about a third part of their length, and is placed at an equal distance between them. This is also brown and scaly like them; it is quite straight, and terminates in a fine point. The hooks have as it were two scaly thorns at their points; and this dart seems intended, by reiterated strokes, to divide and break the pieces of flesh these have separated from the rest into smaller parts. Immediately below the apertures for the egress of the hooks, is placed the mouth of the animal; the creature does not show this little opening unless pressed: but if the pressure is properly managed, will sufficiently open it, and there may be discovered within it a small protuberance, which may very naturally be supposed either the tongue or the sucker of the animal. The hooks in these creatures not only supply the place of teeth, but also of legs; since it is by fastening these hooks into the substance it is placed on, and then drawing up its body to it, that it pulls itself along.

The back of this creature lowers itself by degrees as it approaches the extremity of the belly: and near the place where the back begins to lower itself, are placed the creature’s two principal organs of respiration. One may perceive there are two small roundish brown spots: they are very easily distinguishable by the naked eye, because the rest of the body of the creature is white; but if we take in the assistance of glasses, each of these spots appears to be a brown circular eminence raised a little above the rest of the body. On each of these spots one may also discover three oblong oval cavities, something of the shape of botton holes; these are situated in a parallel direction to one another, and their length nearly in a perpendicular direction to that of the body of the animal. These apertures are so many stigmata or air-holes: openings destined to admit the air necessary to the life of the animal. It has six of these stigmata, three in each side of its body.

The great transparency of the body of this animal gives us an opportunity also to distinguish that it has on each side a large white vessel running the whole length of the body. It is easy to follow the course of these vessels through their whole length, but they are most distinct of all towards its hinder part; and they are always seen to terminate in each of the brown spots above mentioned; this leaves us no room to doubt that they are the two principal tracheae.

The ramifications of the two great tracheae are very beautifully seen in this creature, especially on its belly; and it is remarkable, that no vessel analogous to the great artery in the caterpillar class can be discovered in these; though, if there were any such, their great transparence must needs make them very easily distinguishable; nor could its dilatations and contractions, if so considerable as in that class of animals, be less so.

See CATERPILLAR, ENTOMOLOGY Index.

MAGI, or MAGIANS, an ancient religious sect in Persia, and other eastern countries, who maintained that there were two principles, one the cause of all good, the other the cause of all evil: and, abominating the adoration of images, they worshipped God only by fire; which they looked upon as the brightest and most glorious symbol of Oromasdes, or the good god; as darkness is the truest symbol of Ahriman, or the evil god. This religion was reformed by Zoroaster, who maintained that there was one supreme independent Being; and under him two principles or angels, one the angel of goodness and light, and the other of evil and darkness; that there is a perpetual struggle between them, which shall last to the end of the world; that then the angel of darkness and his disciples shall go into a world of their own, where they shall be punished in everlasting darkness; and the angel of light and his disciples shall also go into a world of their own, where they shall be rewarded in everlasting light.

The priests of the magi were the most skilful mathematicians and philosophers of the ages in which they lived, insomuch that a learned man and a magian became equivalent terms. The vulgar looked on their knowledge as supernatural; and hence those who practised wicked and mischievous arts, taking upon themselves the name of magians, drew on it that ill significance which the word magician now bears among us.

This sect still subsists in Persia under the denomination of guers, where they watch the sacred fire with the greatest care, and never suffer it to be extinguished.

MAGIC, (Magia, Magia), in its ancient sense, the science or discipline and doctrine of the magi, or wise men of Persia. See Magus.

The origin of magic as the magi is ascribed to Zoroaster. Salmasius derives the very name from Zoroaster, who, he says, was surnamed Mog, whence Magnus. Others, instead of making him the author of the Persian philosophy, make him only the restorer and improver thereof; alleging, that many of the Persian rites in use among the Magi were borrowed from the Zabii among the Chaldeans, who agreed in many things with the Magi of the Persians; whence some make the name magus common both to the Chaldeans and Persians. Thus Plutarch mentions, that Zoroaster instituted magi among the Chaldeans, in imitation whereof the Persians had theirs too.

MAGIC, in a more modern sense, is a science which teaches to perform wonderful and surprising effects.

The word magic originally carried with it a very innocent, nay, laudable meaning; being used purely to signify the study of wisdom, and the more sublime parts of knowledge; but in regard the ancient magi engaged themselves in astrology, divination, sorcery, &c., the term magic in time became odious, and was only used to signify an unlawful and diabolical kind of science, depending on the assistance of the devil and departed souls.

If any wonder how so vain and deceitful a science should gain so much credit and authority over men’s minds, Pliny gives the reason of it. It is, says he,
Magic. because it has possessed itself of three sciences of the most esteem among men: taking from each all that is great and marvellous in it. Nobody doubts but it had its first origin in medicine; and that it insinuated itself into the minds of the people, under pretence of affording extraordinary remedies. To these fine promises it added every thing in religion that is pompous and splendid, and that appears calculated to blind and captivate mankind. Lastly, it mingled judicial astrology with the rest; persuading people, curious of futurity, that it saw every thing to come in the heavens. Agrippa divides magic into three kinds; natural, celestial, and ceremonial or superstitious.

Natural Magic is no more than the application of natural active causes to passive subjects; by means whereof many surprising, but yet natural, effects are produced.

In this way many of our experiments in natural philosophy, especially those of electricity, optics, and magnetism, have a kind of magical appearance, and among the ignorant and credulous might easily pass for miracles. Such, without doubt, have been some of those miracles wrought by ancient magicians, whose knowledge of the various powers of nature, there is reason to believe, was much greater than modern vanity will sometimes allow.

Baptista Porta has a treatise of natural magic, or of secrets for performing very extraordinary things by natural causes. The natural magic of the Chaldæans was nothing but the knowledge of the powers of simples and minerals. The magic which they called theurgia, consisted wholly in the knowledge of the ceremonies to be observed in the worship of the gods, in order to be acceptable. By virtue of these ceremonies they believed they could converse with spiritual beings, and cure diseases.

Celestial Magic borders nearly on judiciary astrology: it attributes to spirits a kind of rule or dominion over the planets, and to planets a dominion over men; and on these principles builds a ridiculous kind of system. See Astrology.

Superstitious or Goetic Magic consists in the invocation of devils. Its effects are usually evil and wicked, though very strange, and seemingly surpassing the powers of nature; supposed to be produced by virtue of some compact, either tacit or express, with evil spirits: but the truth is, these have not all the power that is usually imagined, nor do they produce those effects ordinarily ascribed to them.

This species of magic, there is every reason to believe, had its origin in Egypt, the native country of paganism. The first magicians mentioned in history were Egyptians; and that people so famed for early wisdom believed not only in the existence of demons, the great agents in magic (see Daemon), but also that different orders of those spirits presided over the elements of earth, air, fire, and water, as well as over the persons and affairs of men. Hence they ascribed every disease with which they were afflicted to the immediate agency of some evil demon. When any person was seized with a fever, for instance, they did not think it necessary to search for any natural cause of the disease: it was immediately attributed to some demon which had taken possession of the body of the patient, and which could not be ejected but by charms and incantations.

These superstitions notions, which had spread from Egypt over all the east, the Jews imbibed during their captivity in Babylon. Hence we find them in the writings of the New Testament attributing almost every disease to which they were incident to the immediate agency of devils (see Possession). Many of the same impious superstitions were brought from Egypt and Chaldea by Pythagoras, and transmitted by him and his successors to the Platonists in Greece. This is apparent from the writers of the life of Pythagoras. Ambigus, speaking of the followers of that philosopher, says expressly, that they cured certain diseases by incantations; and Porphyry adds, that they cured diseases both of the mind and of the body by songs and incantations. This was exactly the practice of the Egyptian priests, who were all supposed to keep up a constant intercourse with demons, and to have the power of controlling them by magical charms and sacred songs. Agreeably to this practice of his masters, we are told that Pythagoras directed certain diseases of the mind, doubtless those which he attributed to the agency of demons, to be cured partly by incantations, partly by magical hymns, and partly by music—καὶ τὴν ψυχήν ἐπαναστήσει τοῖς μετὰ τῶν θεῶν καὶ μαγικάς τοις ἰαίμαιναι.

That there are different orders of created spirits, whether called demons or angels, whose powers intellectual and active greatly surpass the powers of man, reason makes probable, and revelation certain. Now it was the universal belief of the ancient nations, says the learned Mosheim, especially of the orientals, that certain sounds and words, for the most part barbarous, were highly grateful, and that others were equally disagreeable, to these spirits. Hence, when they wished to render a demon propitious, and to employ him on any particular office, the magicians composed their sacred songs of the words which were believed to be agreeable to him; and when it was their intention to drive him from themselves or others, they sung in a strain which they fancied a demon could not bear but with horror. From the same persuasion arose the custom of suspending from the neck of a sick person, whose disease was supposed to be inflicted by a demon, an amulet, sometimes made of gold and sometimes of parchment, on which was written one or more of those words which demons could not bear either to hear or to see: and in a didactic poem on the healing art still extant, we are taught by Serenus Sammoniacus, that the word Abracadabra is an infallible remedy for a semitarian fever or ague; and to banish grief of heart, Marcellinus thinks nothing more effectual than the word macutor. In more modern times, as we are informed by Agrippa, the words used by those in compact with the devil, to invoke him, and to succeed in what they undertake, are, Dies, mise, jacquet, benedicti, dominus, evanемых. There are a hundred other formulas of words composed at pleasure, or gathered from several different languages, or patched from the Hebrew or formed in imitation of it. And among the primitive Christians there was a superstitious custom, of which we suspect some remains may yet be found among the illiterate vulgar in different countries,
MAG [ 349 ]

Magic.

of fastening to the neck of a sick person, or to the bed on which he lay, some text from the New Testament, and especially the first two or three verses of the gospel of St John, as a charm undoubtedly efficacious to banish the disease.

That magicians who could thus cure the sick, were likewise believed to have the power of inflicting diseases, and of working miracles, by means of their sub-servient demons, need not be doubted. Ancient writers of good credit are full of the wonders which they performed. We shall mention a few of those which are best attested, and inquire whether they might not have been effected by other means than the interposition of demons.

The first magicians of whom we read are those who in Egypt opposed Moses. And we are told, that when Aaron cast down his rod, and it became a serpent, they also did the like with their enchantments; "for they cast down every man his rod, and they became serpents." This was a phenomenon which it must be confessed, had a very miraculous appearance; and yet there seems to have been nothing in it which might not have been effected by slight of hand. The Egyptians, and perhaps the inhabitants of every country where serpents abound, have the art of depriving them of their power to do mischief, so that they may be handled without danger. It was easy for the magicians, who were favoured by the court, to pretend that they changed their rods into serpents, by dexterously substituting one of these animals in place of the rod. In like manner they might pretend to change water into blood, and to produce frogs; for if Moses gave in these instances, as we know he did in others, any previous information of the nature of the miracles which were to be wrought, the magicians might easily provide themselves in a quantity of blood and number of frogs sufficient to answer their purpose of deceiving the people. Beyond this, however, their power could not go. It stopped where that of all workers in legerdemain must have stopped—at the failure of proper materials to work with. Egypt abounds with serpents; blood could be easily procured; and without difficulty they might have frogs from the river: But when Moses produced lice from the dust of the ground, the magicians, who had it not in their power to collect a sufficient quantity of these animals, were compelled to own this to be an effect of divine agency.

The appearance of Samuel to Saul at Endor is the next miracle, seemingly performed by the power of magic, which we shall consider. It was a common pretence of magicians, that they could raise up ghosts from below, or make dead persons appear unto them to declare future events; and the manner of their incantation is thus described by Horace:

--- Pallor ultrasque
Fecerat horrendas aspectu. Scalpere terram
Unguiibus, et pullam divellere mordicus agram
Conspirat: cruror in fossam confusus, ut inde
Manes elicerent, animas responsa daturas.

"With yellings dire they fill'd the place,
And hideous pale was either's face.
Soon with their nails they scrap'd the ground,
And fill'd a magic trench profound

Whether the witch of Endor made use of such infernal charms as these, the sacred historian has not informed us; but Saul addressed her, as if he believed that by some form of incantation she could recall from the state of departed spirits the soul of the prophet who had been for some time dead. In the subsequent apparition, however, which was produced, some have thought there was nothing more than a trick, by which a cunning woman imposed upon Saul's credulity, making him believe that some confidant of her own was the ghost of Samuel. But had that been the case, she would undoubtedly have made the pretended Samuel's answer as pleasing to the king as possible, both to save her own life, which appears from the context to have been in danger, and likewise to have procured the larger reward. She would never have told her sovereign, she durst not have told him, that he himself should be shortly slain, and his sons with him; and that the host of Israel should be delivered into the hands of the Philistines. For this reason many critics, both Jewish and Christian, have supposed that the apparition was really a demon or evil angel, by whose assistance the woman was accustomed to work wonders, and to foretell future events. But it is surely very incredible, that one of the apostate spirits of hell should have upbraided Saul for applying to a sorceress, or should have accosted him in such words as these: "Why hast thou' disquieted me, to bring me up? Wherefore dost thou ask of me, seeing the Lord is departed from thee, and is become thine enemy! For the Lord hath rent the kingdom out of thy hand, and given it to thy neighbour, even to David. Because thou obeyedst not the voice of the Lord, therefore the Lord hath done this thing to thee this day." It is to be observed farther, that what was here denounced against Saul was really prophetic, and that the event answered to the prophecy in every particular. Now, though we do not deny that there are created spirits of penetration vastly superior to that of the most enlarged human understanding; yet we dare maintain, that no finite intelligence could by its own mere capacity have ever found out the precise time of the two armies engaging, the success of the Philistines, the consequences of the victory, and the very names of the persons that were to fall in battle. Saul and his sons were indeed men of tried bravery, and therefore likely to expose themselves to the greatest danger: but after the menaces which he received from the apparition, he would have been impelled, one should think, by common prudence, either to chiefe with the enemy, or to retire from the field without exposing himself, his sons, and the whole army, to certain and inevitable destruction; and his acting differently, with the consequences of his conduct, were events which no limited understanding could either foresee or certainly foretell. If to these circumstances we add the suddenness of Samuel's appearance, with the effect which it had upon the sorceress herself, we shall find reason to believe, that the apparition was that of no evil demon. There is not, we believe, upon record, another instance of any per-
son's pretending to raise a ghost from below, without previously using some magical rites or some form of incantation. As nothing of that kind is mentioned in the case before us, it is probable that Samuel appeared before he was called. It is likewise evident from the narrative, that the apperition was not what the woman expected; for we are told, that "when she saw Samuel, she cried out for fear." And when the king exhorted her not to be afraid, and asked what she saw, "the woman said, I see gods (clohim) ascending out of the earth." Now, had she been accustomed to do such feats, and known that what she saw was only her subservient demon, it is not conceivable that she could have been so frightened, or have mistook her familiar for clohim in any sense in which that word can be taken. We are therefore strongly inclined to adopt the opinion of those who hold that it was Samuel himself who appeared and propounded, not called up by the wretched woman or her demons, but, to her utter confusion, and the disgrace of her art, sent by God to rebuke Saul's madness in a most affecting and mortifying way, and to deter all others from ever applying to magicians or demons for assistance when refused comfort from heaven. For though this hypothesis may to a superficial thinker seem to transgress the rule of Horace—Nec deus interret, &c.—which is as applicable to the interpretation of scripture, as to the introduction of supernatural agency in human compositions; yet he who has studied the theological constitution of Israel, the nature of the office which was there termed regal, and by what means the administration in emergencies conducted, will have a different opinion; and at once perceive the dignus vindice nodus.

The sudden and wonderful destruction of the army of Brennus the Gaul, has likewise been attributed to magic, or, what in this inquiry amounts to the same thing, to the interposition of evil spirits, whom the priests of Apollo invoked as gods. Those barbarians had made an inroad into Greece, and invested the temple of Apollo at Delphi, with a view to plunder it of the sacred treasure. Their numbers and courage overpowered all opposition; and they were just upon the point of making themselves masters of the place, when, Justin informs us, that, to encourage the besieged, the priests and prophetess "advenisse deum ciamant; eumque se vidisse desilientem in templum per culminis aperta fastigia. Dum omnes opem dei suppliciter implorant, juvenem supra humanum modum insignis pulchritudinis, comitesque ei duas armatas virgines, ex propinquus duabus Dianae Minervaque sedibus occurrisses, nec oculis tantum habe se perspexisse; audisse

This was unquestionably an extraordinary event; and it must be ascribed either to the immediate interposition of the Supreme Being, to natural means, or to the agency of demons: there is no other alternative. But it is altogether incredible that the Supreme Being should have miraculously interposed to defend the temple of a pagan divinity. It is very difficult to suppose that an earthquake, produced in the ordinary course of nature, should have been foretold by the priests, or that it could have happened so opportunely for the preservation of their treasure from the hands of fierce barbarians. Nothing, therefore, it has been said, remains, but either to allow the earthquake to have been produced by evil spirits, or to deny the truth of the historian's relation. But the catastrophe of Brennus's army is recorded in the same manner by so many ancient writers of good credit, that we cannot call in question their veracity; and therefore, being unwilling to admit the agency of demons into this affair, it will be incumbent on us to show by what human contrivance it might have been effected; for its arrival at so critical a juncture will not easily suffer us to suppose it a mere natural event.

"The inclination of a Pagan priest (says Bishop Warburton *) to assist his god in extremity, will hardly be questioned; and the inclination of those at Delphi was not ill seconded by their public management and address. On the first rumour of Brennus's march against them, they issued orders, as from the oracle, to all the region round, forbidding the country people to secret or bear away their wine and provisions. The effects of this order succeeded to their expectations. The half-starved barbarians finding, on their arrival in Phocis, so great a plenty of all things, made short marches, dispersed themselves over the country, and revelled in the abundance that was provided for them. This respite gave time to the friends and allies of the god to come to his assistance. Their advantages of situation likewise supported the measures which they had taken for a vigorous defence. The town and temple of Delphi were seated on a bare and cavernous rock, defended on all sides with precipices instead

(A) "Called aloud that the god had arrived: That they had seen him leap into the temple through the aperture in the roof: That whilst they were all humbly imploring his help, a youth of more than human beauty, accompanied by two virgins in armour, had run to their assistance from the neighbouring temples of Diana and Minerva; and that they had not only beheld these things with their eyes, but had also heard the whizzing of his bow and the clanger of his arms. They therefore earnestly exhorted the besieged not to neglect the heavenly signal, but to sally out upon their enemies, and partake with the divinities of the glory of the victory." With these words the soldiers being animated, eagerly rushed to battle: and were themselves quickly sensible of the presence of the god; for part of the rock being torn away by an earthquake, rolled down upon the Gauls; whose thickest battalions being thus thrown into confusion, fled, exposed to the weapons of their enemies. Soon afterwards a tempest arose, which by cold and the fall of hailstones cut off the wounded.
thing particular or important in the facts, but because some credit seems to have been given to the narration by the discerning Cudworth. Philostratus, in his life of Apollonius Tyaneus, informs us that a laughing demoniac at Athens was cured by that magician, who ejected the evil spirit by threats and menaces; and the biographer adds, that the demon, at his departure, is said to have overturned a statue which stood before the porch where the cure was performed. The other instance is of the same magician freeing the city of Ephesus from the plague, by stoning to death an old ragged beggar whom Apollonius called the plague, and who appeared to be a demon by his changing himself into the form of a shagged dog.

That such tales as these should have been thought worthy of the slightest notice by the incomparable author of the Intellectual System, is indeed a wonderful phenomenon in the history of human nature. The whole story of Apollonius Tyaneus, as is now well known, is nothing better than a collection of the most extravagant fables: but were the narrative such as that credit could be given to the facts here related, there appears no necessity in either case for calling in the agency of evil spirits by the power of magic. The Athenians of that age were a superstitious people. Apollonius was a shrewd impostor, long practised in the art of deceiving the multitude. For such a man it was easy to persuade a friend and confidant to act the part of the laughing demoniac; and without Cudworth's much difficulty the statue might be so undermined as inevitably to tumble, upon a violent concession being given to the ground at the time of the departure of the pretended demon. If so, this feat of magic dwindles down into a very trifling trick performed by means both simple and natural. The other case of the poor man at Ephesus, who was stoned to death, is exactly similar to that of those innocent women in our own country, whom the vulgar in the last century were instigated to burn for the supposed crime of witchcraft. We have no reason to suppose that an Ephesian mob was less inflammable or credulous than a British mob, or that Apollonius played his part with less skill than a Christian demonologist; and as the spirits of our witches, who were sacrificed to folly and fanaticism, were often supposed to migrate from their dead bodies into the bodies of hares or cats accidentally passing by, so might this impostor at Ephesus persuade his cruel and credulous instruments, that the spirit of their victim had taken possession of the body of the shagged dog.

Still it may be said, that in magic and divination events have been produced out of the ordinary course of nature; and as we cannot suppose the Being...
Magic.

Being to have countenanced such abominable practices by the interposition of his power, we must necessarily attribute those effects to the agency of demons, or evil spirits. Thus, when Æneas consulted the Sibyl, the agency of the inspiring god changed her whole appearance:

"Poscere satis
Tempus, sit: "Deus, ecce, Deus." Cui talia facti
Ante fores, subito non vultus, non color unus,
Non comperit manere omnes: sed pectus anhelum,
Et rabiencia corda tumulat; majestique videri,
Nec mortales sonantes: afflata est numine quando
Jam propiore Dei....."

"Aloud she cries,
"This is the time, inquire your destinies.
He comes, behold, a god!" Thus while she said,
And shivering at the sacred enry said,
Her colour changed, her face was not the same;
And hollow groans from her deep spirit came;
Her hair stood up; convulsive rage possessed
Her trembling limbs, and heav'd her lab'ring breast;
Greater than human kind she seemed to look,
And with an accent more than mortal spoke.
Her staring eyes with sparkling fury roll,
When all the god came rushing on her soul."

DRYDEN.

In answer to this, it is to be observed, that the temple of Apollo at Cume was an immense excavation in a solid rock. The rock was probably of the same kind with that on which the temple of Delphi was built, full of fissures, out of which exhaled perpetually a poisonous kind of vapour. Over one of these fissures was the tripod placed, from which the priestess gave the oracle. Now we learn from St Chrysostom, that the priestess was a woman: "Quæ in tripodes sedens expansa malignum spiritum per internas immensus, et per gentiles partes subuentem excitavit, furia repulsit, furores animantibus baccharis, ex ore spumam emissis, et sic furoris verba loquebatur." By comparing this account with that quoted above from Justin, which is confirmed both by Pausanias and by Strabo, it is evident, that what Chrysostom calls malignum spiritum was a particular kind of vapour blown forcibly through the fissure of the rock. But if there be a vapour of such a quality as, if received per partes gentiles, would make a woman furious, there is surely no necessity for calling into the scene at Cume the agency of a demon or evil spirit. Besides, it is to be remembered, that in all mystical and magical rites, such as this was, both the priests, and the persons consulting them, prepared themselves by particular kinds of food, and sometimes, as there is reason to believe, by human sacrifices, for the approach of the god or demon whose aid they invoked. On the present occasion, we know from the poet himself, that a cake was used which was composed of poppy-seed and honey; and Plutarch speaks of a shrub called lucophyt contributes, which drives men into a kind of frenzy, and makes them confess all their wickedness which they had done or intended. This being the case, the illusions of fancy occasioned by poppy will sufficiently account for the change of the sibyl's appearance, even though the inhaled vapour should not have possessed that efficacy which Chrysostom and Justin attribute to it. Even some sorts of our ordinary food occasion strange dreams, for which onions in particular are remarkable. Excessive drunkenness, as is well known, produces a disorder named by the baccanalianians of this country the blue devil, which consists of an immense number of spectres, accompanied with extreme horror to the person who sees them. From these facts, which cannot be denied, there must arise a suspicion, that by using very unnatural food, such as human blood, the vilest of insects, serpents, and medicated cakes, by shutting themselves up in solitude and caves, and by devising every method to excite horrid and dreadful ideas or images in the fancy, the ancient magicians might by natural means produce every phenomenon which they attributed to their gods or demons. Add to this, that in ancient times magic was studied as a science. Now, as we cannot suppose that every one who studied it intended absolutely nothing, or that all who believed in it were wholly deceived; what can we infer, but that the science consisted in the knowledge of those drugs which produced the phantoms in the imagination, and of the method of preparing and properly employing them for that purpose? The celebrated Friar Bacon indeed, as far back as the 13th century, wrote a book de Nullitate Magiae: but though we should allow that this book proved to demonstration, that in his time no such thing as magic existed, it never could prove that the case had always been so. At that time almost all the sciences were lost; and why not magic as well as others? It is likewise an undoubted fact, that magic at all times prevailed among the Asiatics and Africans more than among the Europeans. The reason doubtless was, that the former had the requisites for the art in much greater perfection than we. Human sacrifices were frequent among them; they had the most poisonous serpents, and the greatest variety of vegetable poisons, together with that powerful narcotic opium; all which were of essential use in mystical and magic rites. They had, besides, a burning sun, frightful deserts and solitudes; which, together with extreme fasting, were all called in to their assistance, and were sufficient to produce, by natural means, the most wonderful phenomena which have ever been attributed to magical incantations. Even in our own days, we have the testimony of two travellers, whom we cannot suspect to be either liars or enthusiasts, that both the Indians and Africans perform feats for which neither they nor the most enlightened Europeans can account. The one is Mr Grose, who visited the East Indies about the year 1762; and the other is Mr Bruce, who informs us, that the inhabitants of the western coast of Africa pretend to hold a communication with the devil, and verify their assertions in such a manner that neither he nor other travellers know what to make of it: but it does not from this follow, that Mr Bruce believed that communication to be real. We have all seen one of the most illiterate men that ever assumed the title of Doctor, perform feats very surprising, and such as even a philosopher would have been puzzled to account for, if he had not been previously let into the secret; and yet no man supposes that Katterfeld holds any communication...
Still it may be objected, that we have a vast number of histories of witches, who in the last century confessed, that they were present with the devil at certain meetings; that they were carried through the air, and saw many strange feats performed, too numerous and too ridiculous to be here mentioned. The best answer to this objection seems to be that given by Dr. Ferriar in his essay on Popular Illusions*. "The solemn meeting of witches (says he) is supposed to be put beyond all doubt by the numerous confessions of criminals, who have described their ceremonies, named the times and places of their meetings, with the persons present, and who have agreed in their relations, though separately delivered. But I would observe, first, that the circumstances told of those festivals are in themselves ridiculous and incredible; for they are represented as gloomy and horrible, and yet with a mixture of childish and extravagant fancies, more likely to disgust and alienate than conciliate the minds of their guests. They have every appearance of un-easy dreams. Sometimes the devil and his subjects say messes; sometimes he preaches to them; more commonly he was seen in the form of a black goat, surrounded by imps in a thousand frightful shapes; but none of these forms are new, they all resemble known quadrupeds or reptiles. Secondly, I observe, that there is direct proof furnished even by demonologists, that all those supposed journeys and entertainments were nothing more than dreams. Persons accused of witchcraft have been repeatedly watched about the time they had fixed for their meeting; they have been seen to anoint themselves with soporific compositions; after which they fell into profound sleep; and on awakening several hours afterwards, they have related their journey through the air, with their amusement at the festival, and have named the persons whom they saw there." This is exactly conformable to the practice of the ancient magicians and diviners, and seems to be the true way of accounting, as well for many of the phenomena of magic, as for that extravagant and shameful superstition which prevailed so much during part of the last century, and by which such numbers of innocent men and women were cruelly put to death (c). We may indeed be assured, that the devil has it not in his power to reverse in a single instance the laws of nature without a divine permission; and we can conceive but one occasion (see Possession) on which such permission could be given consistently with the wisdom and the goodness of God. All the tales, therefore, of diabolical agency in magic and witchcraft must undoubtedly be false; for a power, which the devil is not himself at liberty to exert, he cannot communicate to a human creature. Were the case otherwise; were those powers, "which (according to Johnson) only the control of Omnipotence restrains from laying creation waste, subservient to the invocations of wicked mortals; were those spirits,—

(c) For some farther account of popular illusions, see Animal Magnetism.
merely the business of the imagination in the diviner or magician.

Magic Square, a square figure, formed of a series of numbers in mathematical proportion; so disposed in parallel and equal ranks, as that the sums of each row, taken either perpendicularly, horizontally, or diagonally, are equal.

Let the several numbers which compose any square number (for instance, 1, 2, 3, 4, 5, &c. to 25 inclusive, the square number) be disposed, in their natural order, after each other in a square figure of 25 cells, each in its cell; if now you change the order of these numbers, and dispose them in the cells in such manner, as that the five numbers which fill a horizontal rank of cells, being added together, shall make the same sum with the five numbers in any other rank of cells, whether horizontal or vertical, and even the same number with the five in each of the two diagonal ranks: this disposition of numbers is called a magic square, in opposition to the former disposition, which is called a natural square. See the figures following.

One would imagine that these magic squares had that name given them, in regard this property of all their ranks, which, taken any way, make always the same sum, appeared extremely surprising, especially in certain ignorant ages, when mathematics passed for magic: but there is a great deal of reason to suspect, that these squares merited their name still farther, by the superstitious operations they were employed in, as the construction of talismans, &c.; for according to the childish philosophy of those days, which attributed virtues to numbers, what virtue might not be expected from numbers so wonderful?

However, what was at first the vain practice of makers of talismans and conjurers, has since become the subject of a serious research among mathematicians; not that they imagine it will lead them to any thing of solid use or advantage (magic squares savour too much of their original to be of much use); but only as it is a kind of play, where the difficulty makes the merit, and it may chance to produce some new views of numbers, which mathematicians will not lose the occasion of.

Eman. Moschopolus, a Greek author of no great antiquity, is the first that appears to have spoken of magic squares: and by the age wherein he lived, there is reason to imagine he did not look on them merely as a mathematician. However, he has left us some rules for their construction. In the treatise of C. Agrippa, so much accused of magic, we find the squares of seven numbers, viz. from three to nine inclusive, disposed magically; and it must not be supposed that those seven numbers were preferred to all the other without some very good reason: in effect, it is because their squares, according to the system of Agrippa and his followers, are planetary. The square of 3, for instance, belongs to Saturn; that of 4 to Jupiter; that of 5 to Mars; that of 6 to the Sun; that of 7 to Venus; that of 8 to Mercury; and that of 9 to the Moon. M. Bachet applied himself to the study of magic squares, on the hint he had taken from the planetary squares of Agrippa, as being unacquainted with the work of Moschopolus, which is only in manuscript in the French king's library; and, without the assistance of any author, he found out a new method for those squares whose root is uneven, for instance 25, 49, &c. but he could not make any thing of those whose root is even.

After him came M. Frenicle, who took the same subject in hand. A certain great algebraist was of opinion, that whereas the 16 numbers which compose the square might be disposed 209227898880000 different ways in a natural square (as from the rules of combination it is certain they may), they could not be disposed in a magic square above 16 different ways; but M. Frenicle showed, that they might be thus disposed 878 different ways: whence it appears how much his method exceeds the former, which only yielded the 55th part of magic squares of that of M. Frenicle.

To this inquiry he thought fit to add a difficulty that had not yet been considered: the magic square of 7, for instance, being constructed, and its 49 cells filled, if the two horizontal ranks of cells, and, at the same time, the two vertical ones, the most remote from the middle, be retraced; that is, if the whole border or circumference of the square be taken away, there will remain a square whose root will be 5, and which will only consist of 25 cells. Now it is not at all surprising that the square should be no longer magical, because the ranks of the large ones were not intended to make the same sum, excepting when taken entire with all the seven numbers that fill their seven cells; so that being mutilated each of two cells, and having lost two of their numbers, it may be well expected, that their remainders will not any longer make the same sum. But M. Frenicle would not be satisfied, unless when the circumference or border of the magic square was taken away, and even any circumferences at pleasures, or, in fine, several circumferences at once, the remaining square was still magical: which last condition, no doubt, made these squares vastly more magical than ever.

Again, He inverted that condition, and required that any circumference taken at pleasure, or even several circumferences, should be inseparable from the square; that is, that it should cease to be magical when they were removed, and yet continue magical after the removal of any of the rest. M. Frenicle, however, gives no general demonstration of his methods, and frequently seems to have no other guide but chance. It is true, his book was not published by himself, not did it appear till after his death, viz. in 1693.

In 1703, M. Poignard, canon of Brussels, published a treatise of sublime magic squares. Before him there had been no magic squares made but for series of natural numbers that formed a square; but M. Poignard made two very considerable improvements. 1. Instead of taking all the numbers that fill a square, for instance the 36 successive numbers, which would fill all the cells of a natural square whose side is 6, he only takes as many successive numbers as there are units in
in the side of the square, which, in this case, are six; and these six numbers alone he disposes in such manner in the 36 cells, that none of them are repeated twice in the same rank, whether it be horizontal, vertical, or diagonal; whence it follows, that all the ranks, taken all the ways possible, must always make the same sum, which M. Poignard calls repeated progression. 2. Instead of being confined to take these numbers according to the series and succession of the natural numbers, that is, in an arithmetical progression, he takes them likewise in a geometrical progression, and even in an harmonical progression. But with these two last progressions the magic must necessarily be different from what it was: in the squares filled with numbers in geometrical progression, it consists in this, that the products of all the ranks are equal; and in the harmonical progression, the numbers of all the ranks continually follow that progression: he makes squares of each of these three progressions repeated.

This book of M. Poignard gave occasion to M. de la Hire to turn his thoughts the same way, which he did with such success, that he seems to have well nigh completed the theory of magic squares. He first considers uneven squares: all his predecessors on the subject having found the construction of even ones by much the most difficult; for which reason M. de la Hire reserves those for the last. This excess of difficulty may arise partly from hence, that the numbers are taken in arithmetical progression. Now in that progression, if the number of terms be uneven, that in the middle has some properties, which may be of service; for instance, being multiplied by the number of terms in the progression, the product is equal to the sum of all the terms.

M. de la Hire proposes a general method for uneven squares, which has some similitude with the theory of compound motions, so useful and fertile in mechanics. As that consists in decomposing motions, and resolving them into others more simple; so does M. de la Hire's method consist in resolving the square that is to be constructed into two simple and primitive squares. It must be owned, however, it is not quite so easy to conceive these two simple and primitive squares in the compound or perfect square, as in an oblique motion to imagine a parallel and perpendicular one.

Suppose a square of cells, whose root is uneven, for instance 7; and that its 49 cells are to be filled magically with numbers, for instance the first 7; M. de la Hire, on the side, takes the first 7 numbers, beginning with unity, and ending with the root 7; and on the other 7, and all its multiples to 49, exclusively; and as these only make six numbers, he adds 0, which makes this an arithmetical progression of 7 terms as well as the other; 0, 7, 14, 21, 28, 35, 42. This done, with the first progression repeated, he fills the square of the root magically: In order to this, he writes in the first seven cells of the first horizontal rank the seven numbers proposed in what order he pleases, for that is absolutely indifferent; and it is proper to observe here, that these seven numbers may be ranged in 5040 different manners in the same rank. The order in which they are placed in the first horizontal rank, be it what it will, is that which determines their order in all the rest. For the second horizontal rank, he places in its first cell, either the third, the fourth, the fifth, or the sixth number, from the first number of the first rank; and after that writes the six others in order as they follow. For the third horizontal rank, he observes the same method with regard to the second that he observed in the second with regard to the first, and so of the rest. For instance, suppose the first horizontal rank filled with the seven numbers in their natural order, 1, 2, 3, 4, 5, 6, 7; the second horizontal rank may either commence with 3, with 4, with 5, or with 6: but in this instance it commences with 3; the third rank therefore must commence with 5, the fourth with 7, the fifth with 2, the sixth with 4, and the seventh with 6. The commencement of the ranks which follow the first being thus determined, the other numbers, as we have already observed, must be written down in the order wherein they stand in the first, going on to 5, 6, and 7, and returning to 1, 2, &c. till every number in the first rank be found in every rank underneath, according to the order arbitrarily pitched upon at first. By this means it is evident, that no number whatever can be repeated twice in the same rank; and by consequence, that the seven numbers 1, 2, 3, 4, 5, 6, 7, being in each rank, must of necessity make the same sum.

It appears, from this example, that the arrangement of the numbers in the first rank being chosen at pleasure, the other ranks may be continued in four different manners; and since the first rank may have 5040 different arrangements, there are less than 20,160 different manners of constructing the magic square of seven numbers repeated.

The order of the numbers in the first rank being determined; if in beginning with the second rank, the second number 2, or the last number 7, should be pitched upon in one of these cases, and repeated; and in the other case, the other diagonal would be false unless the number repeated seven times should happen to be 4; for four times seven is equal to the sum of 1, 2, 3, 4, 5, 6, 7: and in general, in every square consisting of an unequal number of terms, in arithmetical progression, one of the diagonals would be false according to those two constructions, unless the term always repeated in that diagonal were the middle term of the progression. It is not, however, at all necessary to take the terms in an arithmetical progression; for, according to this method, one may construct a magic square of any numbers at pleasure, whether they be according to any certain progression or not. If they be in an arithmetical progression, it will be proper, out of the general method, to except those
two constructions which produce a continual repetition of the same term in one of the two diagonals, and only
to take in the case wherein that repetition would pre-
vent the diagonal from being just; which case being
absolutely disregarded when we computed that the
square of 7 might have 20,160 different constructions,
it is evident that by taking that case in, it must have
vastly more.

To begin the second rank with any other number
besides the second and the last, must not, however, be
looked on as an universal rule: it holds good for the
square of 7; but if the square of 9, for instance, were
to be constructed, and the fourth figure of the first
horizontal rank were pitched on for the first of the
second, the consequence would be, that the fifth and
seventh horizontal ranks would likewise commence
with the same number, which would therefore be re-
peated three times in the same vertical rank, and oc-
casion other repetitions in all the rest. The general
rule, therefore, must be conceived thus: Let the
number in the first rank pitched on, for the commence-
ment of the second, have such an exponent for its
quotient; that is, let the order of its place be such, as
that if an unit be taken from it, the remainder will not be
an integral quotient part of the root of the square; that is,
cannot divide it equally. If, for example, in the square
of 7, the third number of the first horizontal rank be
pitched on for the first of the second, such construc-
tion will be just; because the exponent of the place
of that number, viz. 3, subtracting 1, that is 2, cannot
divide 7. Thus also might the fourth number of the
same first rank be chosen, because 4−1, viz. 3, cannot
divide 7; and, for the same reason, the fifth
or sixth number might be taken: but in the square of
9, the fourth number of the first rank must not be ta-
ken, because 4−1, viz. 3, does divide 9. The rea-
son of this rule will appear very evidently, by consi-
dering in what manner the returns of the same num-
bers do or do not happen, taking them always in the
same manner in any given series. And hence it fol-
ows, that the fewer divisions the root of any square
to be constructed has, the more different manners of
constructing it there are; and that the prime numbers,
i.e. those which have no divisions, as 5, 7, 11, 13,
&c., are those whose squares will admit of the most
variations in proportion to their quantities.

The squares constructed according to this method
have some particular properties not required in the
problem; for the numbers that compose any rank para-
allel to one of the two diagonals, are ranged in the
same order with the numbers that compose the dia-
ogonal to which they are parallel. And as any rank par-
aallel to a diagonal must necessarily be shorter, and
have fewer cells than the diagonal itself, by adding
to it the correspondent parallel, which has the number of cells
by which the other falls short of the diagonal, the numbers of
those two parallels, placed as it were end to end, still follow the
same order with those of the diagonal: besides that their sums
are likewise equal; so that they are magical on another account.
Instead of the squares which we
have hitherto formed by horizontal ranks, one might
also form them by vertical ones; the case is the same
in both.

All we have hitherto said regards only the first
primitive square, whose numbers, in the proposed ex-
ample, were, 1, 2, 3, 4, 5, 6, 7; here still remains the
second primitive, whose num-

ers are 0, 7, 14, 21, 28, 35, 42. M. de la Hire proceeds
in the same manner here as in the
first; and this may like-
wise be constructed in 20,160
different manners, as contain-
ing the same number of terms
with the first. Its construction
being made, and of consequence
all its ranks making the same
sum, it is evident, that if we
bring the two into one, by adding together the num-
bers of the two corresponding cells of the two squares,
that is, the two numbers of the first of each, the two
numbers of the second, of the third, &c. and dispose
them in the 49 corresponding cells of a third square, it
will likewise be magical in regard to its rank, formed
by the addition of equal sums to equal sums, which
must of necessity be equal among themselves. All that
remains in doubt is, whether or no, by the addition of
the corresponding cells of the two squares, all the
cells of the third will be filled in such manner, as that
each not only contains one of the numbers of the pro-
gression from 1 to 49, but also that this number be dif-
f erent from any of the rest, which is the end and design
of the whole operation.

As to this it must be observed, that if in the con-
struction of the second primitive square care has been
taken, in the commencement of the second horizontal
rank, to observe an order with regard to the first, dif-
f erent from what was observed in the construction of
the first square; for instance, if
the second rank of the first square
began with the third term of the
first rank, and the second rank
of the second square commenced
with the fourth of the first rank,
as in the example it actually
does; each number of the first
square may be combined once,
and only once, by addition with
all the numbers of the second.

And as the numbers of the first
are here 1, 2, 3, 4, 5, 6, 7, and those of the second,
0, 7, 14, 21, 28, 35, 42; by combining them in this
manner we have all the numbers in the progression from
1 to 49, without having any of them repeated; which
is the perfect magic square proposed.

The necessity of constructing the two primitive
squares in a different manner does not at all hinder but
that each of the 20,160 constructions of one may
be combined with all the 20,160 constructions of the
other: of consequence, therefore, 20,160 multiplied
by itself, which makes 406,425,600, is the number of
different constructions that may be made of the per-
f ect square, which here consists of the 49 numbers
of the natural progression. But as we have already
observed, that a primitive square of seven numbers re-
pe
The sum of all the 16 numbers, seen through the hole, is equal to the sum of the 16 numbers in any horizontal or vertical column, viz. to 2056.

The magic circle of circles, Plate CCXCVIII, is composed of a series of numbers from 12 to 75 inclusive, divided into eight concentric circular spaces, and ranged in eight radii of numbers, with the number 12 in the centre; which number, like the centre, is common to all these circular spaces, and to all the radii.

The numbers are so placed, that the sum of all those in either of the concentric circular spaces above mentioned, together with the central number 12, make 360; equal to the number of degrees in a circle.

The numbers in each radius also, together with the central number 12, make just 360.

The numbers in half of any of the above circular spaces, taken either above or below the double horizontal line, with half the central number 12, make 180; equal to the number of degrees in a semicircle.

If any four adjoining numbers be taken, as if in a square, in the radial divisions of these circular spaces, the sum of these, with half the central number, makes 180.

There are, moreover, included, four sets of other circular spaces, bounded by circles which are eccentric with respect to the common centre; each of these sets containing five spaces. The centres of the circles which bound them are at A, B, C, and D. The set whose centre is at A is bounded by dotted lines; the set whose centre is at C is bounded by lines of short unconnected strokes; and the set round D is bounded by lines of unconnected longer strokes, to distinguish them from one another. In drawing this figure by hand, the set of concentric circles should be drawn with black ink, and the four different sets of eccentric circles with four kinds of ink of different colours; as blue, red, yellow, and green, for distinguishing them readily from one another. These sets of eccentric circular spaces intersect those of the concentric, and each other; and yet the numbers contained in each of the eccentric spaces, taken all around through any of the 20 which are eccentric, make the same sum as those in the concentric, namely 360, when the central number 12 is added. Their halves also, taken above or below the double horizontal line, with half the central number, make 180.

Observe, that there is not one of the numbers but what belongs at least to two of the circular spaces, some to three, some to four, some to five; and yet they are all so placed as never to break the required number 360 in any of the 28 circular spaces within the primitive circle.

To bring these matters in view, all the numbers as above mentioned are taken out, and placed in separate columns as they stand around both the concentric and eccentric circular spaces, always beginning with the outermost and ending with the innermost of each set, and also the numbers as they stand in the eight radii from the circumference to the centre; the common central number 12 being placed the lowest in each column.
1. In the eight concentric circular spaces.

If, now, we take any four numbers, in a square form, either from No. 1. or No. 2. (we suppose from No. 1.) as in the margin, and add half the central number 12 to them, the sum will be 180; equal to half the numbers in any circular space taken above or below the double horizontal line, and equal to the number of degrees in a semicircle. Thus, 14, 72, 25, 63, and 6, make 180.

Magic Lantern. See Dioptrics, art. x.

Magician, one who practises magic, or hath the power of doing wonderful feats by the agency of spirits.

Among the eastern nations it seems to have been formerly common for the princes to have magicians about their court to confer with upon extraordinary occasions. And concerning these there hath been much disputation: some supposing that their power was only feigned, and that they were no other than impostors who imposed on the credulity of their sovereigns; while others have thought that they really had some unknown connexion or correspondence with evil spirits, and could by their means accomplish what otherwise would have been impossible for men. See the article Magic.

Magindanao, or Mindanao. See Mindanao.

Magistry, an old term in chemistry, given to precipitates. Thus, magistry and precipitate are synonymous; formerly precipitate was a general term, and magistry applied to particular precipitates, such as the magistry of bismuth, &c. See Bismuth, Chemistry Index.

Magistrate, any public officer to whom the executive power of the law is committed either wholly or in part.

Magliabechi, Antony, a person of great learning, and remarkable for an amazing memory, was born at Florence in 1633. His father died when he was only seven years old. His mother had him taught grammar and drawing, and then put him apprentice to one of the best goldsmiths in Florence. When he was about 16 years old, his passion for learning began to appear; and he laid out all his money in buying books. Becoming acquainted with Michael Ermini, librarian to the cardinal de Medicis, he soon perfected himself by his assistance in the Latin tongue, and in a little time became master of the Hebrew. His name soon became famous among the learned. A prodigious memory was his distinguishing talent; and he retained not only the sense of what he had read, but
but frequently all the words and the very manner of spelling. It is said that a gentleman, to make trial of the force of his memory, lent him a manuscript he was going to print. Some time after it was returned, the gentleman, coming to him with a melancholy countenance, pretended it was lost, and requested Maglia bechi to recollect what he remembered of it; upon which he wrote the whole, without missing a word. He generally shut himself up the whole day, and opened his doors in the evening to the men of letters who came to converse with him. His attention was so absorbed by his studies, that he often forgot the most urgent wants of nature. Cosimo III., grand duke of Florence, made him his librarian; but he still continued negligent in his dress, and simple in his manners.

An old cloak served him for a morning gown in the day and for bed-clothes at night. The duke, however, provided for him a commodious apartment in his palace, which he was with difficulty persuaded to take possession of; but which he quitte d four months after, and returned to his house. He was remarkable for his extraordinary modesty, his sincerity, and his benevolence, which his friends often experienced in their wants. He was a patron of men of learning; and had the highest pleasure in assisting them with his advice and information, and in furnishing them with books and manuscripts. He had the utmost aversion at any thing that looked like constraint; and therefore the grand duke always dispensed with his personal attendance, and sent him his orders in writing. Though he lived a very sedentary life, he reached the 81st year of his age; and died in the midst of the public applause, after enjoying, during the latter part of his life, such affluence as few have ever procured by their learning.

By his will, he left a very fine library to the public, with a fund for its support.

MAGLOIRE, Sr, a native of Wales in Great Britain, and cousin german to St Sampson and St Malo. He embraced a monastic life, and went into France, where he was made abbot of Dol, and after that a provincial bishop in Brittany. He afterwards founded a monastery in the island of Jersey, where he died on the 14th of October 575, about the age of 80. His remains were transported to the suburb of St Jacques, and deposited in a monastery of Benedictines, which was ceded to the fathers of the oratory in 1628. It is now the seminary of St Magloire, celebrated on account of the learned men whom it has produced. —

This saint cultivated poetry with considerable success: the hymn which is sung at the feast of All Saints was composed by him; Celo quos eadem gloria consecravit, &c.

MAGNA ASSIBA ELIGENDA, is a writ anciently directed to the sheriff for summoning four lawful knights before the justices of assize, in order to choose 12 knights of the neighbourhood, &c. to pass upon the great assize between such a person plaintiff and such a one defendant.

MAGNA CHARTA. See CHARTA.

MAGNANIMITY, denotes greatness of mind, particularly in circumstances of trial and adversity. —

It has been justly observed of it, that it is the good sense of pride, and the noblest way of acquiring applause. It renders the soul superior to the trouble, disorder, and emotion, which the appearance of great danger might excite; and it is by this quality that heroes maintain their tranquillity, and preserve the free use of their reason, in the most surprising and dreadful accidents. It admires the same quality in its enemy; and fame, glory, conquests, desire of opportunities to pardon and oblige their opposers, are what glow in the minds of the brave. Magnanimit y and courage are inseparable.

1. The inhabitants of Privernum being subdued and taken prisoners after a revolt, one of them being asked by a Roman senator, who was for putting them all to death, what punishment he and his fellow captives deserved? answered with great intrepidity, "We deserve that punishment which is due to men who are jealous of their liberty, and think themselves worthy of it." Plautinus perceiving that his answer exasperated some of the senators, endeavoured to prevent the ill effects of it, by putting a milder question to the prisoner: How would you believe (says he) if Rome should pardon you?" "Our conduct (replied the generous captive) depends upon yours. If the peace you grant be an honourable one, you may depend on a constant fidelity on our parts: if the terms of it be hard and dishonourable, lay no stress on our adherence to you." Some of the judges construed these words as menaces; but the wiser part finding in them a great deal of magnanimity, cried out, that a nation whose only desire was liberty, and their only fear that of losing it, was worthy to become Roman. Accordingly, a decree passed in favour of the prisoners, and Privernum was declared a municipium. Thus the bold sincerity of one man saved his country, and gained it the privilege of being incorporated into the Roman state.

2. Subrius Flavius, the Roman tribune, being impeached for having conspired against the life of the emperor Nero, not only owned the charge, but gloried in it. Upon the emperor's asking him what provocation he had given him to plot his death. Because I abhorred thee (said Flavius), though there was not in the whole army one more zealously attached to thee than I, so long as thou didst merit affection; but I began to hate thee when thou becamest the murderer of thy mother, the murderer of thy brother and wife, a charioteer, a comedian, an incendiary, and a tyrant." Tacitus tells us, that the whole conspiracy afforded nothing which proved so bitter and pungent to Nero as this reproach. He ordered Flavius to be immediately put to death, which he suffered with amazing intrepidity. When the executioner desired him to stretch out his neck vauntily, "I wish (replied he) thou mayest strike as valiantly."

3. When the Scythian ambassadors waited on Alexander the Great, they gazed attentively upon him for a long time without speaking a word; being very probably surprised, as they formed a judgment of men from their air and stature, to find that his did not answer the high idea they entertained of him from his fame. At last, the oldest of the ambassadors (according to Q. Curtius) addressed him thus: "Had the gods given thee a body proportionable to thy ambition, the whole universe would have been too little for thee. With one hand thou wouldst touch the east, and with the other the west; and, not satisfied with this, thou wouldst follow the sun, and know where he hides himself.
MAG [360] MAG

Magnanimity. But what have we to do with thee? we never set foot in thy country. May not those who inhabit woods be allowed to live, without knowing who thou art, and whence thou comest? We will neither command over, nor submit to, any man. And that thou mayest be sensible what kind of people the Scyths are, know, that we received from heaven as a rich present, a yoke of oxen, a ploughshare, a dart, a javelin, and a cup. These we make use of, both with our friends and against our enemies. To our friends we give corn, which we procure by the labour of our oxen; with them we offer wine to the gods in our cup; and with regard to our enemies, we combat them at a distance with our arrows, and near at hand with our javelins. But thou, who boastest thy coming to extirpate robbers, thou thyself are the greatest robber upon earth. Thou hast plundered all nations thou overcamest; thou hast possessed thyself of Lydia, invaded Syria, Persia, and Bactriana; thou art forming a design to march as far as India; and now thou comest hither to seize upon our herds of cattle. The great possessions thou hast, only make thee covet more eagerly what thou hast not. If thou art good, thou oughtest to do good to mortals, and not deprive them of their possessions. If thou art a mere man, reflect always on what thou art. They who have loved and been loved by their true friends, the strongest friendships being contracted between equals; and they are esteemed equals who have not tried their strength against each other; but do not imagine that those whom thou conquerest can love thee.

4. Richard I. king of England, having invested the castle of Chalus, was shot in the shoulder with an arrow; an unskilful surgeon endeavouring to extract the weapon, mangled the flesh in such a manner, that a gangrene ensued. The castle being taken, and perceiving he should not live, he ordered Bertram de Gourdon, who had shot the arrow, to be brought in to his presence. Bertram being come, "What harm (said the king) did I ever do thee, that thou shouldn’t kill me?" The other replied with great magnanimity and courage, "You killed with your own hand my father and two of my brothers, and you likewise designed to have killed me. You may now satiate your revenge. I should cheerfully suffer all the torments that can be inflicted, were I sure of having delivered the world of a tyrant who filled it with blood and carnage." This bold and spirited answer struck Richard with remorse. He ordered the prisoner to be presented with one hundred shillings, and set at liberty; but Maccarde, one of the king’s friends, like a true ruffian, ordered him to be flayed alive.

5. The following modern instance is extracted from a French work, entitled, Ecole historique et morale du soldat, &c. A mine, underneath one of the outworks of a citadel, was intrusted to the charge of a serjeant and a few soldiers of the Piedmontese guards. Several companies of the enemy’s troops had made themselves masters of this work; and the loss of the place would probably soon have followed had they maintained their post in it. The mine was charged, and a single spark would blow them all into the air. The serjeant, with the greatest coolness, ordered the soldiers to retire, desiring them to request the king to take care of his wife and children; struck fire, set a match to the train, and sacrificed himself for his country.

MAGNE S, or M AGNESIA, in Ancient Geography, a town or a district of Thessaly, at the foot of Mount Pelus, called by Philip, the son of Demetrius, one of the three keys of Greece, (Pausanias).

MAGNE SIA, or M AGNESIA ALBA, in Chemistry, a peculiar kind of earth. See CHEMISTRY Index.

Black MAGNE SIA. See MANGANESE, CHEMISTRY and MINERALOGY Index.

MAGNE SIA, in Ancient Geography, a maritime district of Thessaly, lying between the south part of the Sinus Theraeicus and the Pegaeus to the south, and to the east of the Pelasgiotis. Magne Sia, the people. Magne Sia and Magnesius, the epithet; (Horace).

MAGNE SIA, a town of Asia Minor on the Meander, about 15 miles from Ephesus. Themistocles died there: it was one of the three towns given him by Artaxerxes, with these words, "to furnish his table with bread." It also celebrated for a battle which was fought there, 195 years before the Christian era, between the Romans and Antiochus king of Syria. The forces of Antiochus amounted to 70,000 men according to Appian, or 70,000 foot and 12,000 horse according to Livy, which has been exaggerated by Florus to 300,000 men; the Roman army consisted of about 28,000 or 30,000 men, 2000 of whom were employed in guarding the camp. The Syrians lost 50,000 foot and 4000 horse; and the Romans only 300 killed, with 25 horse. It was founded by a colony from Magnesia in Thessaly; and was commonly called Magnesia ad Meandrum, to distinguish it from another called Magnesia ad Sipyllum in Lydia at the foot of Mount Sipyus.

MAGNESIA ad Sipyllum, anciently Tantalus, the residence of Tantalus, and capital of Mecon, where now stands the lake Salae. A town of Lydia, at the foot of Mount Sipyus, to the east of the Hermus; adjudged free under the Romans. It was destroyed by an earthquake in the reign of Tiberius.

MAGNET (Magne) the LOADSTONE; a species of iron ore. See MAGNETISM, and MINERALOGY Index.

The magnet is also called Lapis Heracleus, from Hercules, a city of Magnesia, a port of the ancient Lydia, where it is said to have been first found, and from which it is usually supposed to have taken its name. Though others derive the word from a shepherd named Magnus, who first discovered it with the iron of his crook on Mount Ida. It is also called Lapis Nautes, from its use in navigation; and siderites, from its attracting iron, which the Greeks call eidos.

The ancients reckoned five kinds of magnets, different in colour and virtue; the Ethiopic, Magnesian, Boeotian, Alexandrian, and Natician. They also took it to be male and female: but the chief use they made of it was in medicine; especially for the cure of burns and defluxions on the eyes.—The modern, more fortunate in its application, employ it to conduct them in their voyages. See NAVIGATION.

The most distinguished properties of the magnet are, that it attracts iron, and that it points to the poles of the world; and in other circumstances also dips or in-
MAGNETISM.

INTRODUCTION.

General Principles.

If the mineral body called magnet or lodestone (an ore of iron which will be described under Mineralogy) is brought within a moderate distance from a piece of iron or steel, or other ferruginous body, such as a small key, a sewing needle, or the like, the ferruginous body will approach the magnet; and if no obstacle intervene, will come in contact with it, and the two bodies will adhere together, so as to form an evident force to separate them from each other.

Again, if a magnet be freely balanced, so that it be left at liberty to assume any direction, as if it be suspended by a thread, or made to float on the surface of water by placing it on a piece of cork, or wood, it will soon settle itself in one particular direction, so as to turn one part of its surface towards the northern point of the horizon, and the opposite part of course towards the southern point. These two parts of the surface of the magnet are called its north and south poles; this property of the magnet, of assuming this particular direction, is called its polarity, or its directive power; and when a magnet is placed so as to arrange itself in such a direction, it is said to traverse.

The direction in which a suspended magnet finally settles is called the magnetic meridian, and it is different in different places, and at different times. It is generally, however, very different from the real meridian line, so that the north pole of a magnet declines a little to the east or west, and the south pole to the west or east.

The difference of the magnetic from the astronomical meridian, is called the declination, or variation of the magnet; and the declination is said to be east or west, according as the north pole of the magnet verges to the one or the other of these points.

If an oblong magnet be suspended on a pivot by its VOL. XII. Part I, centre of gravity, it does not settle in a perfectly hori-

Dipping the magnet.

zontal position, but one of its poles is depressed below the horizontal line, and the other elevated as far above it, making an angle with the horizon that is also different on different parts of the earth's surface. This depression of one of the poles is called the dipping of the magnet.

If two magnets that are each freely suspended, be brought within a moderate distance from each other, so that the north pole of the one is opposed to the south pole of the other, they will attract each other; and if no obstacle intervene, will rush together: but if the two north poles, or the two south poles, be mutually opposed, the magnets will repel each other.

Such are the leading properties of what is called the natural magnet; but what is of more importance, as we shall see hereafter, any piece of iron or steel may, by being rubbed with a natural magnet, or by some other processes to be afterwards explained, be made to acquire the same properties, and thus in every useful respect serve the same purposes as the natural magnet. These pieces of iron or steel, thus magnetised, are called artificial magnets; and when they are of a slender oblong form, they are termed magnetic needles. When afterwards we speak of the polarity, the declination, or the dipping of the magnetic needle, we would be understood as alluding to these slender, oblong, artificial magnets.

A straight line joining the two poles of a magnet is Axis and called its axis, and a line drawn transversely on the sur-

equator of the magnet, perpendicular to the axis, is called the equator.

The properties of natural and artificial magnets enumerated above are attributed to the agency of some power, unknown force or power, either inherent in the magnet, or imparted to it by the processes to which it is subjected. This force is sometimes called magnetism, but we shall for the present denominate it the magnetic power.
MAGNETISM.

Chapter I.

Essai sur l'Origine des Forces Magnetiques, par M. Prevost.

Description des Courants Magnetiques. Strasbourg, 1753.

Traité de l'Aimant, par Dalence. Amst. 1687.

Besides the above original works, there are several valuable dissertations on magnetism by Des Cartes, Bernoulli, Euler, Du Tour, Coulomb, &c. which have been published in the miscellaneous works of these authors, or in the journals and transactions of academies.

We shall divide this article into three chapters. In the first we shall briefly describe the principal instruments made use of in experimental magnetism; in the second we shall arrange under distinct heads or propositions, the leading principles of magnetism, point out how these may be illustrated by experiments, and explain the construction and uses of the magnetic apparatus, as they are deducible from the principles laid down; and in the third we shall notice the more important theories of magnetism, and exemplify the illustration of some of the preceding facts by that theory which we shall feel most disposed to adopt.

Chapter I. Of Magnetical Apparatus.

The principal instruments employed in experimental magnetism are reducible to three instruments: First, Magnets of various kinds and forms; Secondly, Magnetic needles and compasses; and, Thirdly, the Dipping needle. Of compasses we have nothing to say here, having fully treated of them under Compass.

Magnets, as we have said, are either natural or artificial. The natural magnet may be cut into various forms, according to the experiments that are to be made with it. The most usual shape is oblong, having the poles at the two most distant extremities. Dr Gilbert, whom we shall mention more at large hereafter, made his magnets of a spherical shape, so as to resemble the terrestrial globe. Magnets of this shape are called terrelae, or little earths, and have usually marked upon their surface the magnetic poles, meridian, and equator.

Natural magnets of an oblong shape have usually an armature or piece of soft iron attached to each pole, called the conductor; and another piece of soft iron placed so as to join two of the extremities of the former pieces, and usually furnished with a hole or hole in the middle. Plate Fig. 1. The armature is commonly inclosed in a brass box, represented in the figure by the dotted lines DC, CC, CD: and to the upper part of the box is fixed a ring E, for holding the magnet.

One of the most common forms of the artificial magnet is that of an oblong bar, as NS, fig. 2, of which Fig. 2. N is the north pole, and S the south, having the north end marked with a transverse notch. These bars are made of hardened steel, and are either sold separately, or, what is more common, in sets of six in a box.

Another very common form of the artificial magnet is...
MAGNETISM.

is that of a horse shoe, such as fig. 3, having the two poles N, S, brought near each other, and commonly united by a piece of soft iron or conductor. The horse-shoe magnets sometimes consist only of a single crooked bar; but they are frequently composed of several such bars united together by their flat surfaces, and inclosed in a leathern covering that envelopes all but the poles, and thus preserves the bars from rusting.

Instead of the very arched form of which horse-shoe magnets are usually made, they are sometimes constructed so as to form nearly a semicircle, and in this shape they are very convenient for several experiments.

Artificial magnets, like the natural, when of an oblong shape, are sometimes armed at each end, so as to enable them to apply both poles to a ferrous body at the same time. One material advantage of the horse-shoe magnet is, that in it such an armature is unnecessary, as the poles are brought so near each other as easily to be applied to the object it is proposed to lift, as a key, &c.

A magnetic needle is an oblong piece of steel, tempered so as commonly to assume the blue tinge that is seen in watch-springs, and supported on a brass point, so as, when left at liberty, to arrange itself in the magnetic meridian, but in a horizontal position. These needles are sometimes made pointed at both extremities; sometimes the northern extremity is made in the form of a cross; but perhaps the best form is that of the oblong, with extremities that are nearly obtuse, such as is represented at fig. 4. To balance the needle on its pivot, it is furnished near its middle with a hollow cap, which is formed of some substance that is not attracted by the magnet. The cap is usually of brass; but for nice experiments it is sometimes made of agate, as this latter does not wear so fast as brass, and consequently the needle will longer retain its original suspension.

The dipping needle, fig. 5, consists of an oblong bar of steel, AB, balanced between two horizontal slips of brass, CD, CD, so as when magnetised to form an angle with the horizon, equal to the dipping of the needle at the place where the instrument is made. The two horizontal slips of brass are either fixed to a graduated semicircle that is supported on a stand of wood, or more commonly they form diameters to a brass ring which is graduated on its circumference, and furnished with a ring, H, by which it may be held on the finger.

The construction and uses of these instruments will be fully explained in the next chapter; our only object here being to bring the reader acquainted with the names and general form of the instruments that are made use of in the experiments which we are about to describe, for illustrating the principles of magnetism. Several smaller articles will be required by the experimentalist; but these are easily procured, and need no particular description. Such are a number of sewing needles of various sizes, soft iron bars, pieces of iron wire, small iron balls, iron filings, &c.

SEC. I. Of Magnetical Polarity.

We have stated (No. 3,) that when a magnet is sus-

vised to describe, for illustrating the principles of magnetism. Several smaller articles will be required by the experimentalist; but these are easily procured, and need no particular description. Such are a number of sewing needles of various sizes, soft iron bars, pieces of iron wire, small iron balls, iron filings, &c.
MAGNETISM.

freely suspended, the same extremity always points towards the north, and this northern extremity always dips below the horizon, at least in these northern latitudes; and if the position of the needle be disturbed by mechanical motion, or by the application of a magnet, it will be resumed when the disturbing cause is removed.

The polarity of magnets therefore is permanent.

We have said that the magnetic line varies at different times, and in different places. The declination of the magnet is so uncertain as to impose great impediments to the art of navigation, as it is necessary in the course of a long voyage, frequently to ascertain the degree of variation for any particular time or place. The method of doing this is mentioned under COMPASS. The declination observed in different places at different times, has been laid down in tables; and as such tables are very useful, we shall here subjoin one, given by Mr Cavallo.

It is of still more importance to know the progressive change of the declination at any certain place, and we shall therefore give here the following table of the declination as observed at London in different years, from 1576 to 1808.
From 1702 to 1794 21° 54' Stationary.
In 1708  - 22 17
1709  - 22 0
1700  - 22 12
1701  - 22 1
1802  - 21 45
1801  - 21 59
1804  - 22 10
At Jamaica 1805  - 6 30 E.

At Alexandria in Egypt,
In 1761  - 11° 4' W.
1798  - 13 6

At Cairo,
In 1761  - 12° 25' W.
1798  - 12

The declination of the magnetic needle has been found to be different, even at different hours of the day. The following table contains the result of some observations made by Mr. Canton on the daily variation, and on the mean variation of each month.

The declination observed at different hours of the same day. June 27, 1759.

</table>
Magnets have been constructed for showing the declination of the needle in various parts of the earth by means of curve lines. Respecting these charts and several other circumstances with regard to this subject, see Variation of the Compass.

It may not be improper here to point out the general method of applying the polarity of the magnet to the useful purposes of navigation, mining, &c.

A mariner's compass, or magnetic needle in a case, is so placed as to be as little as possible disturbed by the motion of the vessel, person, &c. In a ship, it is placed in the binnacle (see Binnacle), or suspended from the upper deck in the cabin. Then the head of the vessel is kept by the helm in such a direction as to make any required angle with the line of the needle, or the person (in mining or travelling) advances in a similar manner. Thus supposing that a vessel sets out from a certain port, in order to go to another place that is exactly westward of the former; as for example, from the Land's End in Cornwall to Newfoundland on the coast of North America. The vessel must be directed in such a way, as that its course may be always at right angles with the direction of the magnetic needle, or so that the part of the needle or compass card, which points to the northward, (allowing for the variation) may be always kept to the right hand of the man at the helm, or to the starboard side of the vessel. The reason of this is evident; for supposing the needle to point duly north and south, the direction of east and west being perpendicular to it, this must be the true course of the vessel. From this example, a little reflection will easily point out how a vessel may be steered in any other course.

The declination of the magnetic needle is disturbed by the nearer approach of a ferrous body, especially if this be of considerable size.

On holding the extremity of a pretty large iron rod, such as a poker, near one end of a magnetic needle properly suspended, the needle will be found to turn considerably from its usual direction. This circumstance, though proper to be mentioned here, will be better understood when we have considered the attractive power of the magnet. The fact is useful, as it teaches us to keep magnetic needles in such a situation as not to be acted on by any considerably body of iron.

A magnet, whether natural or artificial, has a greater effect in disturbing the polarity of a magnetic needle than is produced by iron.

Magnetic polarity seems also to be affected by changes in the state of the atmosphere; and the following axioms respecting this effect on the declination of the needle, collected by M. la Cotte, are deserving of attention.

1. The greatest declination of the needle from the north towards the west, takes place about two in the afternoon; and the greatest approximation of it towards the north, about eight in the morning; so that from the last-mentioned hour till about two in the afternoon, it endeavours to remove from the north, and between two in the afternoon and the next morning, to approach it.

2. The annual progress of the magnetic needle is as follows:—Between January and March, it removes from the north; between March and May it approaches it; in June it is stationary; in July it removes from it; in August, September, and October it approaches it; its declination in October is the same as in May; in November and December it removes from the north; its greatest western declination is at the vernal equinox, and its greatest approximation to the north, at the autumnal equinox.

3. The declination of the magnetic needle is different, according to the latitude; among us, (i.e. in France) it has always increased since 1657; before that period it was easterly.

4. Before volcanic eruptions and earthquakes, the magnetic needle is often subject to very extraordinary movements.

5. The magnetic needle is agitated before and after the appearance of the northern lights: its declination on those occasions is about noon greater than usual.

So much has already been said respecting the phenomena, &c. of the dipping needle, under the article Dipping Needle, that it is unnecessary here to add much more on the subject. It was there noticed, that at the equator the dipping needle lies quite horizontal, and that one of its extremities inclines more towards the earth, according as the instrument is carried farther from the equator. We may here add, that from some late observations made by experimentalists with balloons, it appears that the higher we ascend above the surface

(A) In reply to some inquiries respecting the mode of employing the compass in mining, we were favoured by an ingenious friend, who is manager of one of the most extensive coalworks in this island, with the following remarks: "The compass is used in all mines where great accuracy is required. In some coal-mines the effects or faces of the coal are the guides to the miners in excavating the mine, and the compass is used to ascertain the situation and extent of the excavations. In other coal-mines the courses of the excavations are at first directed by the compass. In doing this, the compass is placed in a given situation, and is made to point the desired course. Then from the centre of one sight a perpendicular line is conveyed to the roof of the mine, and a small mark is there made with chalk; then a person looks at a candle (placed so as nearly to touch the roof), through the lower part of the sight of the compass nearest to him, and through the upper part of the opposite sight. The candle at the roof is moved in any direction until he sees it through both sights of the compass. It is then in a proper place, and a chalk mark is made in the roof immediately above it. A line struck with a chalked cord, between these two marks upon the roof, marks the proper course, by which the workmen are directed in making the excavation. By applying one part of a chalked cord along part of the course or white line thus begun on the roof, and extending the other part of the cord past it to any required distance, and then striking the cord, the course may be continued from time to time as the excavation advances."
Magnetism.

In an aerostatic voyage made at St. Petersburg in 1804 by M. M. Sacharoff and Robertson, it was observed that the south pole of a magnetic needle, balanced on a pin, dipped below the horizon nearly 10 degrees.

The following table shows the magnetic dip as observed at several different places at various times.

MAGNETISM.

To what was said under Dipping Needle, respecting the construction of that instrument, we may add, that notwithstanding the great improvements that have been lately made in the arts, the making of a dipping needle is one of the most delicate and difficult tasks that an instrument-maker can undertake. The needle must be made of tempered steel which we are certain has no magnetism before it is touched; it must be poised so nicely, and with such a perfect coincidence of its centre of gravity and axis of motion, that it will retain any position (before being magnetised) that is given it. A good dipping needle cannot be had below twenty guineas.

Sect. II. On Magnetic Attraction and Repulsion.

A magnet attracts iron, and all bodies, into the composition of which iron enters in any considerable degree. This principle is illustrated by very simple experiments, which will readily occur to every reader. It is of consequence here to observe, that the purer and softer the iron with which the magnet is presented, the stronger will be the attraction; thus, a magnet attracts a piece of soft and clean iron much more strongly than it attracts any other ferruginous body of the same shape and weight. Hard steel, or the harder ores of iron, are less forcibly attracted than soft steel, and still less than soft iron; and all pieces of iron are less forcibly attracted in proportion as they are oxygenated.

The attractive power of a magnet is not equally strong at every part of its surface. It is most powerful at the poles of the magnet, and it is found to diminish in proportion as the part of the surface is more distant from the poles. Thus, in an oblong magnet, the attraction is least at about its middle, where it is often very trilling.

It is by this property of the magnet that we are enabled to discover the poles of a magnet, where they are not yet ascertained; a circumstance which is often necessary with respect to natural magnets, in which, when of an irregular shape, it would otherwise be difficult to discover the poles. The usual method of ascertaining the poles of a magnetic body is, to present various parts of the body to be examined, successively to the poles of a magnetic needle, when it will soon be discovered which parts of the body have most influence on the needle, by the pole of the latter standing perpendicularly to that part of the body. It will presently appear, that in this way it may also be ascertained, which of these poles is the north, and which the south, as the south pole of the body under examination will have most influence on the north pole of the needle, and vice versa.

A good magnet should have no more than two poles, and these should be situated in the extreme surface of the magnet; but it sometimes happens, especially in natural magnets, and in artificial magnetic bars, if they be very long, that there are more than two poles, or that the poles are very confused. For example, in a very long magnetised bar, there may be a strong north pole at one extremity, a south pole a little farther on, then a weaker north pole, and so on to the extremity, which will be found possessed of a still weaker south polarity. These poles are to be discovered by presenting to several parts of the bar one or other of the poles of a magnetic needle; for, as we shall immediately mention, each pole of the needle will be attracted towards that part of the rod which is possessed of the contrary polarity.

The attractive power of the magnet and the iron is most forcible when the two bodies are in contact, and it diminishes as they are made to recede from each other. The exact law according to which this diminution takes place, has not yet been completely ascertained. We shall see in the next chapter, what approximation has been made to it.

A magnet is not capable of lifting above a certain weight of iron; and all magnets of the same form and size are not able to lift the same weight. Among the natural magnets the smallest seem in general to possess a greater attractive power in proportion to their size, than those of larger dimensions. Mr Cavallo mentions a small magnet that weighed not more than 6 or 7 grains, and was capable of lifting about 300 grains; and Sir Isaac Newton possessed a magnet that he wore in a ring, weighing about 3 grains, which is said to have lifted 746 grains, or nearly 250 times its own weight. The larger natural magnets are very weak in proportion to these. Those of two pounds scarcely lift more than ten times their own weight. It seems extraordinary, that a piece cut off from a large magnet is sometimes much stronger in respect of its attractive power, than the magnet from which it was taken.

It has been said that the attractive power of magnets is greatest at their poles. In this point, however, are seldom equal in this respect; and it appears, that in these norther parts of the world, the northern pole of magnets is more powerful than the south. In the southern hemisphere the contrary effect is said to take place. The attractive power of the magnet is most forcible when both poles are made to act conjunctly; hence an armed magnet, or one of the horse-shoe form, is best adapted for experiments on the force of magnetic attraction.

It is of little consequence whether the iron that is presented to the magnet be in one piece, or consist of several pieces. The attraction is indeed stronger in the former case; but if several pieces of iron are presented to the magnet, they will either all adhere about the pole of the magnet, or will adhere to each other, so as to form a sort of chain. If a small iron ball be made to adhere to the pole of a magnet, this ball will support a second; and this latter, if the magnet be pretty strong, will support a third. If the magnet be of the horse-shoe form, and have these three balls hanging by one ball, if two others be suspended from the other pole, all the five may be made to adhere, so as to form a curved chain. It will be evident, that pieces of iron which present a greater extent of surface than the above spherical balls, will be more powerfully attracted.

One of the most pleasing experiments on the attractive action of the magnet for iron, is shown by means of iron filings on iron filings.

Exper. Let a paper be placed above a bar magnet, and let small iron filings be shaken on the paper through a guaze sieve. They will arrange themselves round the magnet in a very beautiful manner, forming curves and arches of curves, as represented in fig. 6. At the two ends of the magnet, as at a, there are chains of filings standing out nearly perpendicular; and along the sides they...
MAGNETISM.

they form complete curves, bending outwards away from the magnet towards its middle, and having their extremities bounded by the poles of the magnet; and at the corners there are a number of arches that seem to form imperfect curves.

A similar effect may be produced by straining iron filings on a piece of paper, so as to leave a vacancy in the middle, capable of receiving a bar magnet. When the magnet is placed on the paper, and the paper gently tapped, so as to agitate the filings, these will arrange themselves about the magnet, in curves, as above described.

The form of these curves will be better defined if the magnet be laid at the bottom of an earthen or glass vessel of water, and the iron filings be sifted over it so as to pass through the water.

The attraction between a magnet and a ferruginous body is mutual.

Exper.—Place a piece of iron or other ferruginous body upon a piece of cork or wood, so that it may float on the surface of water in an earthen or wooden vessel. Bring a magnet within a moderate distance of the floating body, and the latter will approach the former, and may be drawn by it in any direction. Again, place the magnet on cork or wood, so as to float on the water, and present to it a piece of iron or other ferruginous body. The magnet will now approach the iron, and may be drawn by it as the iron was before. Lastly, place both the magnet and the iron on separate pieces of wood or cork, within a moderate distance of each other, on the surface of the water. They will gradually approach each other, with a velocity that becomes greater in proportion as they approach nearer each other.

Magnetic attraction is not sensibly impeded by the interposition of bodies of any kind, that do not contain iron in their composition.

Exper.—Suppose that a magnet, placed at the distance of an inch from a piece of iron, exerts a certain degree of attraction, it will be found that the attraction is not sensibly weakened by the interposition of a plate of glass, a sheet of paper, a piece of copper, or any other similar substance. A needle, inclosed in a glass tube, will be still attracted by the magnet.

It is not easy to ascertain correctly the degree of attractive force exerted between a magnet and a ferruginous body. The usual method of observing this is, to fasten a magnet to one arm of a balance, and placing the body to be attracted at different distances below the magnet, to counterpoise the attraction with weights placed in the opposite scale of the balance. Proceeding in this way, then, if we find that it requires the weight of an ounce to counterpoise the attractive power of a magnet, when presented immediately to a piece of iron, it will be found that it requires the same counterpoise, if a plate of any matter that is not ferruginous be interposed.

Not only is iron attracted by the magnet, but under certain circumstances, one piece of iron exerts an attractive power on another piece of iron.

Exper.—Let an oblong piece of iron be fixed in a spherical piece of wood or cork, so as to float in water in the true magnetic line, as in Exper. 2. of No. 16. When the iron is nearly in the magnetic position, Vol. XII. Part I.

bring the extremity of a large iron rod, as the point of a new poker, holding it in a position not very different from that of the iron wire, within about a quarter of an inch of the upper extremity of the floating iron, and hold it there for some time, a little towards one side. The floating wire will gradually approach the iron rod with an accelerated motion, will at length touch it, and may be drawn through the water in any direction. A similar attraction will take place between the head of the poker and the extremity of the wire that is below the water.

The attractive power of the magnet is increased by the near approach of a piece of iron.

Exper. 1.—Suppose we have a magnetic bar that is capable of supporting a small key by one of its extremities, but which will not lift a key somewhat larger.

If we bring a considerable oblong piece of iron near the opposite extremity of the bar, it will be found capable of supporting the larger key, or at least of lifting a weight somewhat greater than it sustained before.

Exper. 2.—Let an oblong magnetic bar be supported in a horizontal position, and let a piece of iron wire, about an inch in length, be hung by a short thread, so that its extremity is just opposite one of the poles of the magnetic bar, but so far out of the reach of the bar's attractive power as not to be brought from the perpendicular. Now, if a considerable iron bar be brought with one end within a moderate distance of the opposite pole of the magnet, the suspended wire will be drawn towards the magnet, thus shewing that the power of the latter has been increased by the juxtaposition of the bar of iron. If the bar of iron be brought still nearer the opposite pole of the magnet, the suspended wire will be drawn still nearer its adjacent pole; but if the bar of iron be drawn back from the magnet, the wire will fall into its original position.

This fact leads to many important practical conclusions in the management of magnets. As the juxtaposition of iron to the poles of a magnet improves its powers, we may infer, if we keep a piece of soft iron in contact with the poles, the magnet will be improved by it; and this is in fact the case, and it shews the utility of the armature and conductor mentioned in No. 13. But of this more hereafter.

The attractive power of a magnet may be improved by increasing the weight appended to it.

This is best shewn by a horse-shoe magnet, having a conductor of soft iron attached to its two poles, and a brass ring at the convex part by which it may be suspended. If a small bag be hung to the conductor, and if the magnet is capable of sustaining a certain weight at any particular time, it will, by adding a little more, suppose a few shot, to the bag, at moderate intervals, be made to support gradually a much greater weight. If the magnet, on a first trial, was able to lift a small key, it will soon be able to lift a larger one, &c. How far this increase of power may be carried, has not, we believe, yet been ascertained.

It sometimes happens that a magnet does not show any great attractive power, as exemplified in its power of lifting a considerable weight of iron, though it may have a great effect in exciting or in altering magnetic polarity. This was observed by Dr Gilbert, who remarks...
Magnetism.

Chap. II.

Experimental Illustrations.

 marks that the directive power of a magnet extends farther than its attractive power.

*The contrary poles of two magnets attract each other; that is, the north the south, and vice versa.*

Exper. 1.—Place two oblong magnets on cork or wood, so as to float in water, or suspend each by a pretty long thread, with the north pole of the one opposed to the south pole of the other. They will gradually approach, and will at length rush together.

A similar effect will be produced, if the north pole of a bar magnet be held near the south pole of a magnetic needle; the latter will be attracted, and the same thing will happen if the south pole of the bar is brought near the north pole of the needle.

Exper. 2.—Take two semicircular magnets, and dip their extremities into iron filings. The filings will of course adhere to the extremities of the magnets, and will appear as if radiating from them. Now, present the two magnets with their adhering filings to each other, so that the north and south pole of the one is opposite to the contrary poles of the other, and the iron filings at their extremities will approach each other, and coalesce, as represented in fig. 7.

The attraction exerted between two magnets is not so strong in proportion, as between a magnet and a piece of iron in contact; but it has been found to commence at a greater distance.

*The corresponding poles of two magnets repel each other; that is, the north the north, and the south the south.*

Exper. 1.—Make the two magnets float on water, or suspend them by threads, so that the north or south pole of the one may be opposite to the north or south pole of the other. They will recede from each other; and the repulsion will evidently be greater, in proportion as they are brought nearer together.

Exper. 2.—Take two semicircular magnets, and dip their ends in iron filings, as mentioned above. Present them to each other, so that their corresponding poles may be mutually opposed. The filings at their extremities will start back, and leave a vacancy between the opposed poles of the magnets, somewhat like what is represented in fig. 8.

It sometimes happens that the corresponding poles of two magnets do not repel each other, but either mutually attract, or are quite indifferent. In this case, it will, in general, be found that one of them is stronger than the other; and the reason of the phenomenon will appear hereafter.

The repulsive power of a magnet is generally in a less proportion than its attractive power.

It is by the attractive power of the magnet that we usually ascertain whether any substance be magnetic; that is, whether the magnet possess any attractive power for it. If the body contain any considerable quantity of iron in its composition, its magnetism is easily ascertained, by approaching it with the pole of a pretty strong magnetic bar. If, however, the magnetism is too feeble to be discovered in this way, it may be ascertained by placing the body on a piece of cork or wood, so that it may float on the surface of water or mercury, in an earthen or wooden vessel, and bringing the pole of the magnet within a small distance of the floating body. It will sometimes be necessary to bring the magnet within one-tenth of an inch of the body, when, if it possesses any magnetism, it will gradually approach the magnet. This experiment is most satisfactory when the body to be examined is made to float on mercury; but in that case the vessel containing the mercury must not be too small, otherwise the natural convexity of the surface of the mercury will cause the floating body perpetually to fall down towards the sides of the vessel. A common soup plate will answer the purpose very well. It is also necessary that the mercury be very pure, and as clean as possible. To insure this, it will be proper, before using the mercury, to pass it through a conical piece of writing paper, rolled up so as to terminate in a very small aperture; or, what is better, to squeeze it through a pretty thick piece of shamosi leather. It need scarcely be remarked, that in these delicate experiments, the air of the room should be kept as still as possible.

By the above methods, Mr Cavallo and others discovered, that the following substances are in some measure affected by the magnet. Most metallic ores, especially after their having been exposed to a fire; zinc, bismuth, and particularly cobalt, as well as their ores, are almost always attracted. Of the earths, the calcareous is the least, if at all, and the siliceous is the most frequently, attracted. The ruby, the chrysolite, and the tourmaline, are attracted. The emerald, and particularly the garnet, are not only attracted, but frequently acquire a permanent polarity. The opal is weakly attracted, especially after combustion. Most animal and vegetable substances, after combustion, are attracted. Even soot, and the dust which usually falls upon whatever is left exposed to the atmosphere, are sensibly attracted by the magnet.

"It has long ago been remarked, that platina, nick. Coulomb's experiments, and several other bodies, acquire a sensitive degree of univer. magnetism; but some philosophers attribute this property only to a portion of iron not easy to be separated, than.

and conclude, that by obtaining a greater degree of purity, we might succeed in rendering them perfectly indifferent to the action of the magnetic bar.

The new experiments which Citizen Coulomb has made and repeated before the Academy, lead us on the contrary to think, that the action of magnetism extends through all nature; for none of the bodies he has yet tried was found to resist this power.

"But however real this action may be, it is not unlike in all bodies, and in most of them it must be necessarily very small, to have escaped the attention of philosophers to this time. In order therefore to exhibit and to measure these results, we must begin by placing the bodies in a situation which shall allow them to yield to the weakest action.

"For this purpose, Citizen Coulomb fashioned his subjects into the form of a cylinder or small bar; and in this state he suspended them to a silken thread, such as is drawn from the silk-worm's cone, and in this state he placed them between the opposite poles of two magnetic bars of steel. The single thread of silk could hardly bear the weight of a quarter of an ounce without breaking, consequently it became round to form small bars very light and thin. Citizen Coulomb made them about seven or eight millimetres in length (or less than half an inch), with three-fourths of a millimetre (or
Chap. II. MAGNETISM.

In his experiments he placed the steel bars in the same right line, their opposite poles being five or six millimetres farther than the length of the needle intended to oscillate between them. The result of the experiment showed, that whatever might be the substance of the needle, it always disposed itself according to the direction of the two bars; and that if they were turned from this direction, they always recovered it, after oscillations of which the number was often more than 30 per minute. It was therefore easy in every case to determine, from the weight and figure of the needle, the force which had produced the oscillation.

These experiments were successfully made with small needles of gold, silver, copper, lead, tin, small cylinders of glass, a piece of chalk, a fragment of bone, and different kinds of wood.

Citizen Coulomb has proved, that the force of torsion of the silk thread is so slight, that in order to draw it round the entire circle, it would require a force scarcely equal to the one hundred thousandth part of a gram, (or about one seven hundredth part of a grain). A quantity so minute cannot therefore sensibly derange the measure of magnetic force in the different bodies: and its effect, even if it were admitted to be of perceivable magnitude, may also be urged in proof of the general conclusion of Citizen Coulomb, because the magnetic power must overcome this resistance of the thread in order to manifest itself. Our author gives, in the third volume of the Memoirs of Natural Philosophy and Mathematics of the National Institute, a very simple formula to determine the magnetic force of a body from the time of its oscillations; and he means to shew in another memoir, the method of determining this result in different bodies of the same figure placed between the poles of two bars. He thinks it now proved, that all the elements which enter into the composition of our globe are subjected to the magnetic power, and that the whole mass collectively forms one single magnet.

In favour of those who might be desirous of repeating his experiments, and rendering them very sensible, the author remarks, that the method of succeeding consists in diminishing the size of the oscillating bodies. From some essays, of which the results terminate this memoir, it seems to follow, that the accelerating forces are inversely as the masses, or very nearly in the direct proportion of the surfaces; but Citizen Coulomb gives this rule only as a first deduction, which requires to be confirmed.

The opinion of the general influence of magnetism on all terrestrial bodies was, as we shall see hereafter, maintained by our countryman Dr Gilbert, though Coulomb has certainly the merit of having put it to the test of experiment.

Besides the experiments which we have related, there are some that depend on the attractive power of the magnet, and which are ranked among scientific amusements. We shall here describe a few of these.

Before we relate the manner of making these experiments, it may be proper to describe an instrument that is employed in some of them. This, from its form and apparent use, is called the magnetic perspective glass, and is thus constructed.

Provide an ivory tube about 2½ inches long, and of such a form as is expressed in fig. 9. The sides of this tube must be so thin as to admit a considerable quantity of light. It is to open at one end with a screw, and on the front at that end must be placed an eye-glass of about two inches focus, and at the other end any glass you please.

Have a small magnetic needle like that in a compass. Fig. 9. It must be strongly touched, and so placed at the bottom of the tube that it may turn freely round. It is to be fixed on the centre of a small ivory circle C, of the thickness of a counter, placed on the object-glass D, and painted black on the side next it. This circle must be kept fast by a circular rim of pasteboard, that the needle may not rise off its pivot, in the same manner as in the compass. This tube will thus become a kind of compass sufficiently transparent to show the motion of the needle. The eye-glass serves more clearly to distinguish the direction of the needle, and the glass at the other end, merely to give the tube the appearance of a common perspective glass. It will appear, from what has been already stated, that the needle in this tube, when placed over and at a small distance from a magnet, or any machine in which it is contained, will necessarily place itself in a position directed by that magnet, and consequently show where the north and south pole of it is placed; the north end of the needle constantly pointing to the south end of the magnet. This effect will take place, though the magnet be enclosed in a case of wood, or even metal. You must observe, however, that the attracting magnet must not be very far distant from the needle, especially if it be small, as in that case its influence extends but to a short distance. This tube may be differently constructed, by placing the needle in a perpendicular direction, on a small axis of iron, on which it must turn quite freely, between two small plates of brass placed on each side of the tube; the two ends of the needle should be in exact equilibrium. The north and south ends of the needle will, in like manner, be attracted by the south and north ends of the magnetic bar. The former construction, however, appears preferable, as it is more easily excited, and the situation of the needle much more easily distinguished.

Exp. 1. The Communicative Piece of Money.

Take a crown or dollar, and drill a hole in the side of it, in which place a piece of wire, or a large needle. Then close the hole with a small piece of wotter, that it may not be perceived. Now, the needle in the magnetic perspective before described, when it is brought near to this piece of money, will fix itself in a direction corresponding to the wire or needle in that place. Desire any person to lend you a crown piece or dollar, which you dexterously change for one that you have prepared as above. Then give the latter piece to another person, and leave him at liberty either to put it privately in a snuff-box, or not; he is then to place the box on a table, and you are to tell him by means of your glass, whether the crown is or is not in the box. Then bringing your perspective close to the box, you will know, by the motion of the needle, whether it be there or not; for as the needle in the perspective will always
MAGNETISM.

always keep to the north of itself, if you do not perceive it has any motion, you conclude the crown is not in the box. It may happen, however, that the wire in the crown may be placed to the north, in which case you will be deceived. Therefore, to be sure of success, when you find the needle in the perspective remain stationary, you may, on some pretence desire the person to move the box into another position, by which you will certainly know whether the crown-piece be there or not. You must remember that the needle in the perspective must here be very sensible, as the wire in the crown cannot possibly have any great attractive force.

Exp. 2. The Magnetic Table.

Under the top of a common table place a magnet that turns on a pivot, and fix a board under it, that nothing may appear. There may also be a drawer under the table, which you pull out to show that there is nothing concealed. At one end of the table there must be a pin that communicates with the magnet, and by which it may be placed in different positions; this pin must be so placed as not to be visible to the spectators. Strew some steel filings or very small nails over that part of the table where the magnet is. Then ask any one to lend you a knife or a key, which will then attract part of the nails or filings. Then placing your hand in a careless manner on the pin at the end of the table, you alter the position of the magnet, and giving the key to any person, you desire him to make the experiment, which he will then not be able to perform. You then give the key to another person, at the same time placing the magnet, by means of the pin, in the first position, when that person will immediately perform the experiment.

Exp. 3. The Mysterious Watch.

You desire any one in company who has a watch with a steel balance (a), to lend it you for a few minutes, asking him whether it will continue to go when laid on the table. He will probably say it will. To prove to him that he is wrong, you lay it on that part of the table below which you have previously placed a strong bar-magnet (as in Exp. 2.), so that the watch may be above one of the poles. It will immediately stop. Now, if you shift the position of the magnet, and give the watch to another person to lay it on the table, it will not stop; but replacing the magnet, and desiring a third person to try the experiment, he will succeed. All this, to those who are not acquainted with the secret, will appear very extraordinary.

Exp. 4. The Magnetic Dial.

Provide a circle of wood or ivory, of about five or six inches diameter, as fig. 10. which must turn quite free on the stand B (fig. 11), in the circular border A; on the circle must be placed the dial of pasteboard C (fig. 10.), whose circumference is to be divided into 12 equal parts, in which must be inscribed the numbers from 1 to 12, as on a common dial. There must be a small groove in the circular frame D, to receive the pasteboard circle; and observe that the dial must be made to turn so freely that it may go round without moving the circular border in which it is placed. Between the pasteboard circle and the bottom of the frame, place a small artificial magnet E (fig. 12.) that has a hole in its middle, or a small protuberance. On the outside of the frame place a small pin F, which serves to show where the magnetic needle I, that is placed on a pivot at the centre of the dial, is to stop. This needle must turn quite freely on its pivot, and its two sides should be in exact equilibrium. Then provide a small bag, that has five or six divisions, like a lady's work-bag, but smaller. In one of these divisions put small square pieces of pasteboard on which are written the numbers from 1 to 12, and if you please you may put several of each number. In each of the other divisions you must put 12 or more like pieces, observing, that all the pieces in each division must be marked with the same number. Now the needle being placed upon its pivot, and turned quickly about, it will necessarily stop at that point where the north end of the magnetic bar is placed, and which you previously knew by the situation of the small pin in the circular border. You therefore present to any person that division of the bag which contains the several pieces on which is written the number opposite to the north end of the bar, and tell him to draw any one of them he pleases. Then placing the needle on the pivot, you turn it quickly about, and it will necessarily stop, as we have already said, at that particular number.

Another experiment may be made with the same dial, by desiring two persons to draw each of them one number out of two different divisions of the bag; and if their numbers, when added together, exceed 12, the needle or index will stop at the number they exceed it; but if they do not amount to 12, the index will stop at the sum of those two numbers. In order to perform this experiment, you must place the pin against the number 5, if the two numbers to be drawn from the bag be 10 and 7; or against 9, if they be seven and two. If this experiment be made immediately after the former, as it easily may, by dexterously moving the pin, it will appear the more extraordinary.

Exp. 5. The Divining Circles.

On the top of a thin box, as AB fig. 13. paste two Divining circles drawn on paper, as F, G, each of which is divided into compartments. In those of one circle, as G, Fig. 13. are written questions, and in those of the other, as F, appropriate answers. Through the centre of the circle G an axle passes, carrying a toothed wheel, and which works into the pinion d, to the axis of which is fixed another pinion, and this receives the teeth of another wheel g, whose axis is passed through the centre of the circle F. On the axis of the wheel c is to be fixed an index a above the paper circle, and to the axis of the wheel g, just below the cover of the box, is fixed a bar magnet g g, turning together with the axis; while on the part of the axis that projects above the circle F a loose needle x x is balanced, so as to move independently of the axis. A carton on strong paper, of the size

(b) The balance of a watch is sometimes, though very seldom, made of brass, when it is scarcely susceptible of magnetic influence.
of F should cover the pasted circle, and turn easily on the centre s; and it should have a triangular piece as F cut out, in order to see the answers. If now the needle be taken off its point, and a person be desired to ask some of the questions on the circle G, the index must be turned to the question, and then the needle placed on its pivot, giving it a whirl round. When it stops, its point will stand over the proper answer, which may be seen by turning the open part of the carton to that place.

Sect. III. Of the Communication and Production of Magnetism.

The whole of this important part of the subject may be said to depend on one general fact, which we shall therefore lay down and illustrate. 

Any piece of iron when in the neighbourhood of a magnet, is itself a magnet, and possesses all the material properties of that body.

Exp. 1.—Let there be a large and strong magnet properly supported in the horizontal direction, at a distance from iron or other similar bodies, and with its poles perfectly free. Take also any small piece of common iron, not more than two or three inches long, such as a common small key, and take another piece of iron, as a smaller key, or short piece of wire about the size of a goose quill.

In the first place hold the key in a horizontal position, with one end opposite one of the poles of the magnet, but so as not to be in contact with it. Then bring the other piece of iron to the other end of the key, and it will hang by the key, and will so continue to hang, though we withdraw the key from the magnet horizontally, till there is a certain interval between the key and the magnet, when the former will be no longer able to support the piece of iron. Even at this distance the key will, however, be found capable of supporting a piece of iron considerably smaller than the former, till its distance from the magnet is increased.

Again, hold the key with one extremity below one of the poles of the magnet, and touch the other extremity with the small piece of iron, the latter will adhere till the key be removed too far below the magnet.

Thirdly, Hold the key with one of its extremities above one of the poles of the magnet, but at such a distance that there is room for the small piece of iron to go between the key and the magnet, without touching the latter. The piece of iron will be supported by the key, as in the two former instances.

Fourthly, Let the magnet be placed in a vertical position, and hold the key with one extremity immediately below or above one of the poles. The piece of iron will be supported in a similar manner, in the former case by the extremity of the key that is most remote from the magnet, and in the latter by that which is adjacent.

If, instead of approaching the magnet with the key, we reverse the circumstances, the effect of the magnet in rendering the key magnetic will be still more evident. Suppose the piece of iron to be lying on the table; let one end of it be touched with the key, and there will be found no attraction between them; but if we hold the key very near one extremity of the wire, we bring the pole of the magnet near the other end of the key, we shall see the wire rise from the table, and adhere to the key.

In all these cases the attractive power of the key, that is, its magnetism, is evidently derived from its juxtaposition to the magnet.

Exp. 2.—Let two pieces of iron be suspended by separate ends of a piece of thread, so that they may be hung from a pin in the wall in a situation parallel to each other, or in contact. Now bring one end of a bar magnet a little below the wires, and they will repel each other. If these wires are of soft iron, they will collapse immediately on the magnet being withdrawn; but if they are formed of hard iron or of steel, they will continue apart for a considerable time.

Here the two wires are, by the proximity of the magnet, become magnets, and the extremities next the bar have each acquired a similar polarity, i.e., both contrary to that of the adjacent pole of the bar. They, therefore, repel each other.

Exp. 3.—Let a bar-magnet, such as N, S, fig. 14. Fig. 14. be laid in a horizontal position, and let a small key, as B, C, be held near the north pole of the magnet, in the direction of its axis. Let a very small magnetic needle, supported on a sharp pivot, be brought near that end of the key C, which is most remote from N. The needle will immediately turn its south pole towards C, as is indicated by the feathered part of the arrow c. Hence it appears that the key has acquired a directive power like a magnet, and that its remote extremity performs the office of a north pole, as it attracts the south pole of the needle, and repels its north pole. If it be said that the magnetic needle in this case is affected directly by the directive power of the magnet, as it would take the above position though the key were not present; to shew that the effect is produced through the medium of the key, remove the needle into another situation as b, and it will still arrange itself with the same pole opposite C, and if it be carried to the proximate extremity of the key, as at a, it will turn round, and present its north pole to B, thus shewing that it is, at least in some measure, influenced by the key.

In general, when a piece of iron is presented to the nearest pole of a magnet, the extremity next that pole is possessed of the contrary polarity, and the remote extremity has acquired a similar polarity. The situation of the key to the poles, however, depends much on the form of the piece of iron, and on the part of its surface which is adjacent to the pole of the magnet. If the form be that of an oblong bar, one extremity of which is presented to the pole, which is the most usual case, the circumstances will be as we have just mentioned. If the oblong bar be presented to the pole in a perpendicular direction, with its middle very near the pole of the magnet, this middle point will be possessed of a polarity contrary to that of the adjacent pole, while the two extremities have acquired the same polarity. If the presented iron be in the form of a circular plate, and its centre be held near the pole of the magnet, this centre will have the contrary polarity, and every point of the circumference the same polarity. If the plate have its circumference fashioned into points, each of these points will acquire a very strong polarity, contrary to that of the pole near which the centre of the plate is held.

The communication of magnetic power from the magnet
Magnetism.

Chapter II.

Magnets to the key in the foregoing experiments, will be still more strongly illustrated by holding another piece of wire to the wire that is already suspended by the key. The new piece of wire will also be suspended, and so several more may be suspended by one another, like the links of a chain, according to the strength of the magnet. This fact was known to the ancients, who speak of a loadstone causing an iron ring to carry another ring; and that a third, till the whole puts on the appearance of a chain.

It will be found that the magnet has lost none of its power by producing magnetism in the iron, and of course, that nothing has been transferred from the magnet to the iron. The magnetism of the iron thus caused by its juxtaposition to a magnet is called induced magnetism, or magnetism by induction.

There is an apparent exception to the universality of the above proposition. If the key be held in such a position that it shall be perpendicular to the magnet, with one extremity either opposite one of the poles, or a little above the centre of the other, the bit of wire will not be attracted by that extremity, and we may hence suppose that the key has acquired no magnetic power by its proximity to the magnet. But if we bring a needle or a piece of iron wire near its remote end, it will be strongly attracted, and shewn that end to have the same polarity with the nearest pole of the magnet. Now, the ends both of the key and the wire that are next the magnet, having the same polarity with the pole of the magnet nearest them, cannot attract each other, but on the contrary will repel each other, and therefore the wire cannot adhere to the key, though by the change produced by the other extremity, it is evident that the key has acquired magnetic power.

There is, however, one exception. If the key in the first experiment, with the wire hanging to it, be carried from any of the situations there described, towards the middle of the magnet, the wire will fall off as soon as it arrives very near the middle. If we suppose a plane to pass through the centre of the magnet in a direction perpendicular to its axis, so as to form the magnetic equator, a slender piece of iron held any where within this plane can acquire no sensible magnetism, which is demonstrated by its showing no signs of polarity, and not being attracted by the magnet. Now it is well known that the greatest activity of a magnet resides in its two poles, and that those magnets are the best in which this activity is least diffused. A certain circumference of every magnet is entirely inactive, as we see in the experiment with the iron filings described in No. 26, where the filings collect themselves principally on two points of the surface, between which there is a space all round, to which no filings are attached. Many circumstances shew that the two poles of a magnet have contrary actions; the north pole producing a strong northern polarity in the remote end of an iron bar brought near it, and a south polarity in the proximate end, while an opposite effect is produced by its south pole. Now, adopting this principle, that the actions of the two poles are opposite, it follows that if these actions are equal, and act in a similar manner, each must counteract and prevent the action of the other, and produce what may be called a magnetic equilibrium. Therefore if a slender iron rod or thin plate be placed so that every part of it lies within the magnetic equator, it will exhibit no magnetism, will not be attracted by the magnet, and will not attract iron. This will be more satisfactorily when we have explained the theory of magnetism.

The consideration of the above important facts will enable us to explain, especially after what will be stated in the next chapter, the production or communication of magnetism in all the methods by which these are usually effected.

Magnetism may be produced artificially in a piece of artificial iron or steel, by various methods.

1. By touching the iron or steel either with a natural magnet, or with a steel bar already magnetised. The process of communicating magnetism by natural magnet or artificial magnets, or by what has been called touch-magnet, has undergone various improvements and modifications, which we shall endeavour briefly to trace.

The most simple method of magnetizing a bar of old steel is to apply the north pole of a magnet to that extremity of the bar which is to acquire a south polarity. In this way, merely by contact, a slight degree of magnetic power will, after some time, be imparted to the bar, and the communication will be expedited by striking the bar so as to make it sound. Only a slight degree of magnetism can, however, be communicated in this way, and unless the steel bar be very short, its poles will be much confused.

Another method of communicating magnetism to a bar of this kind is, to apply the pole of a magnet to one end of the bar, and pass it on to the other end, giving a moderate degree of pressure. This is repeated several times on both sides of the bar, taking care always to begin the stroke at the same end as at first, and instead of drawing the magnet back along the bar, lifting it up every time that we come to the other end. The following description will best explain the mode of communicating magnetism in this way, by one or two magnetic bars.

When only one magnetic bar is to be made use of, one of its poles must be applied as represented in Fig. 15: where CD represents the needle or steel bar to be magnetized. The magnet AB is then to be drawn all along the surface of it, till it reaches the extremity D. The magnet being then removed, must be applied to the extremity C, and drawn over the needle as before. Thus the needle must be rubbed several times, by which means it will acquire a considerable degree of magnetism. In this method, the other extremity of the needle which the magnet touched last acquires the contrary magnetism; that is, if B be the north pole of the magnet, C will be the north pole and D the south of the needle. This method, however, is never found to be equally effectual with that in which two magnets, or both poles of one magnet, are made use of.

To communicate magnetism by means of two magnetic bars, place the bar or needle AB, Fig. 16, upon a table; then set the two magnetic bars CD, EF, straight upright upon it at a little distance, equal on both sides from the middle of the bar AB, and in such a manner that the south pole D of one of the bars may be nearest to that end of the bar AB which is to become the north pole, &c. These two bars must then be slid gradually towards one extremity of the bar, keeping them constantly at the same distance from each other; and when one of them, for instance CD, is arrived
Magnetism.

Chap. II.

In order to proceed properly, it is necessary to employ a considerable degree of pressure. A parallelogram of steel bars and soft iron should be kept firm by wedges, somewhat in the manner of printers types, and the extremities of the magnetic bars should be perfectly cleaned.

Dr Robertson supposed, that wetting these extremities considerably aided the process; but he found that the least particle of oil between the bars greatly obstructed it, as did the smallest piece of the thinnest gold leaf.

He found that bars which were rough acquired a more powerful
powerful magnetism than those which were moderately polished; but that, if moderately rough, they acquired the first degrees of magnetism more expeditiously than smooth bars, but did not receive so strong an impregnation as the latter.

The method of making artificial magnets has been greatly improved by M. Coulomb, who in a series of memoirs, printed in the Memoirs of the Academy of Sciences, and of the National Institute of Paris, has communicated a number of valuable observations and experiments, that have contributed, perhaps more than any preceding labours, to the advancement both of the theory and practice of magnetism. Many years ago he published his process for making very powerful artificial magnets.

In his operations he uses four very strong magnets previously impregnated. He placed his two strongest magnets, (as NS, NS, fig. 19,) on a horizontal plane in one right line, at such a distance that they might be a few lines nearer to each other than the length of the needle n s intended to be magnetized. He afterwards took the two magnets N S, and inclining them as in the method of Aepinus, he placed them first on the middle of the needle, or with their poles nearly in contact. He then drew each magnet, without changing its inclination, to the extremity of the needle, and repeated this operation 5 or 6 times on each face of the needle. It is clear, that in this operation the poles of the needle n s remain fixed and invariable at the extremities of the needle, by means of the two strong magnets NS on which it rests. The effect produced by these can only be augmented by the action of the two superior magnets, which concur in magnetizing all the particles of the needle in the same direction.

He found likewise, that in this method of magnetizing there is a greater certainty of giving to both surfaces of needles intended to determine the magnetic meridian, an equal degree of magnetism; a circumstance deserving of the greatest attention in the construction of compasses, if the needle be suspended with its broadest surface parallel to the horizon.

After these previous processes, he took 30 bars of steel hardened and tempered to the temper of a spring, five or six lines broad, two or three lines thick, and 36 inches long. The blades of fencing foils, such as are found in the shops, make pretty good magnets. English sheet iron cut into pieces one inch wide, hardened and lowered to spring temper, is preferable. When each compound magnet is to contain no more than 15 or 20 pounds of steel, it is sufficient to make the bars 30 or 36 inches long.

He magnetized each bar singly, according to the method already described. He then took two rectangular parallelepipeds of very soft iron, well polished, six inches in length, between 20 and 24 lines broad, and 10 or 12 lines thick. With these two parallelepipeds, represented fig. 20. at N and S, he formed the armour of his magnet, by enveloping one extremity of each parallelepiped with a stratum of his magnetic bars, so that the extremities of the parallelepipeds may project beyond the extremities of the bars 20 or 24 lines, and the other end may be enveloped by the ends of the set of bars. On this first layer of steel bars of three or four lines thick he places a second, three inches shorter than the first, so that the first projects beyond the second about 18 lines on each side. The whole is secured at the ends by two binding pieces of copper, which press the bars close together, and prevent the armour from escaping.

Fig. 20. represents two artificial magnets composed according to the method just described. N and S are the extremities of the two iron parallelepipeds. The two other extremities are inclosed by the bars. Each magnet thus compounded is solidly connected together by the copper pieces marked a, b, a', b'. The pieces of contact A, R, join the opposite poles of the magnets.

He found by experience, that with an apparatus of this form, each part weighing 15 or 20 lbs., a force of 80 or 100 lbs. will be required to separate the pieces of contact; and that when an ordinary needle of the compass is placed on the two extremities of the compound bars fig. 20. they become magnetized to saturation, without its being necessary to rub them with the upper part. When magnets of greater force are desired, it is necessary, in proportion as the number of bars is increased, to augment their length also, and the dimensions of the parallelepipeds of iron which serve for the armour. It would be easy to ascertain the different dimensions which the magnets ought to have, in a manner sufficiently accurate for practice, from the laws of magnetism, and the position of the centre of action of the bars of steel of different lengths and thickness.

2. Iron or steel is rendered magnetic by being placed in a position corresponding to the magnetic meridian.

It has been often observed, that a bar of iron which has stood for a long time exactly or nearly in the magnetic direction, has acquired a degree of magnetic power, the extremities possessing opposite polarity. In this and other northern parts of Europe, old vanes of turrets, window bars, and even pokers that have stood long inclined in the chimney corner, are often very sensibly magnetic, their lower extremity becoming a north, and the upper a south pole. In the highest part of the steeple of St Giles's church in Edinburgh, on the north side, the upper bar of a hand-rail leading to a stair is very magnetical. It is worthy of remark, that those parts of such old bars which have become foliated and crumbly by exposure to the air are the most magnetic.

This magnetic state of perpendicular iron bars was, as we are informed by Dr Gilbert, first observed in the vane spindles of the Augustine church at Mantua.

3. A bar of steel long hardened or exposed to violent friction, while lying in the magnetic meridian, becomes magnetic.

This fact was well known to Dr Gilbert, who in a plate represents a blacksmith hammering a bar of steel in the magnetic position. Many smiths tools, such as long drills, that receive great pressure while in motion, broaches that are worked with a long lever, so as to act very fast, become very sensibly magnetic; the lower end, in these latitudes, being always a north pole. When a steel punch is driven hard into a piece of iron, the punch has sometimes been rendered magnetic by a single blow. There is scarcely a cutting or boring tool in a smith's shop that does not possess some degree of magnetic power. Even soft steel and iron will acquire it by being violently twisted or exposed to great friction, and the magnetism thus acquired...
MAGNETISM.

Chap. II.
