¹⁰¹ Sails down the Indus. ^{Macedon.} began to return. Having arrived at the Hydaspes, he made the necessary preparations for sailing down the Indus into the ocean. For this purpose, he ordered vast quantities of timber to be felled in the neighbourhood of the Hydaspes, through which he was to sail into the Indus; he caused the vessels with which he had passed other rivers to be brought thither, and assembled a vast number of artificers capable of repairing and equipping his fleet; which, when finished, consisted of 80 vessels of three banks of oars, and 2000 lesser ships and transports. Those who were to manage this fleet were collected out from the Phœnicians, Cyprians, Carians, and Egyptians following his army, and who were reckoned perfectly well skilled in the naval art. When all things were ready, the army embarked about break of day; the king, in the mean time, sacrificed to the gods according to the ceremonies used in his own country, and likewise according to those of the country where he now was. Then he himself went on board; and causing the signal to be given by sound of trumpet, the fleet set sail. Craterus and Hephæstion had marched some days before with another division of the army; and in three days the fleet reached that part of the river which was opposite to their camps. Here he had information, that the Oxydracæ and Malli were raising forces to oppose him; upon which he immediately determined to reduce them; for, during this voyage, he made it a rule to compel the inhabitants on both sides of the river to yield him obedience. But before he arrived on the coasts of the people above mentioned, he himself sustained no small danger; for, coming to the confluence of the Acesines with the Hydaspes, from whence both rivers roll together into the Indus, the eddies, whirlpools, and rapid currents, rushing with tremendous noise from the respective channels of those rivers into the great one formed by them both, at once terrified those who navigated his vessels, and actually destroyed many of the long vessels, with all who were aboard of them; the king himself being in some danger, and Nearchus the admiral not a little at a loss. As soon as this danger was over, Alexander went on shore; and having ordered his elephants with some troops of horse and archers to be carried across, and put under the command of Craterus, he then divided his army on the left-hand bank into three bodies; the first commanded by himself, the second by Hephæstion, and the third by Ptolemy. Hephæstion had orders to move silently through the heart of the country, five days march before the king; that if, on Alexander's approach, any of the barbarians should attempt to shelter themselves by retiring into the country, they might fall into the hands of Hephæstion. Ptolemy Lagus was ordered to march three days journey behind the king, that if any escaped his army, they might fall into Ptolemy's hands; and the fleet had orders to stop at the confluence of this river with the Hydraotes till such time as these several corps should arrive.

¹⁰² His expedition against the Malli. Alexander himself, at the head of a body of horse and light armed foot, marched through a desert country against the Malli; and, scarce affording any rest to his soldiers, arrived in three days at a city into which the barbarians had put their wives and children, with a good garrison for their defence. The country

^{Macedon.} people, having no notion that Alexander would march through such a desert and barren region, were all unarmed, and in the utmost confusion. Many of them therefore were slain in the field; the rest fled into the city, and shut the gates. But this only protracted their fate for a short time; for the king, having ordered the city to be invested by his cavalry, took it, as well as the castle, by storm, and put all he found there to the sword. He sent at the same time Perdiccas with a considerable detachment, to invest another city of the Malli at a considerable distance; but when he came there he found it abandoned. However, he pursued the inhabitants, who had but lately left it, and killed great numbers of them on the road. After this the king took several other cities, but not without considerable resistance; for the Indians sometimes chose to burn themselves in their houses rather than surrender. At last he marched to their capital city; and finding that abandoned, he proceeded to the river Hydraotes, where he found 50,000 men encamped on the opposite bank, in order to dispute his passage. He did not hesitate, however, to enter the river with a considerable party of horse: and so much were the Indians terrified at his presence, that their whole army retired before him. In a short time they returned and attacked him, being ashamed to fly before such an inconsiderable number; but in the mean time the rest of the Macedonian forces came up, and the Indians were obliged to retire to a city which lay behind them, and which Alexander invested that very night. The next day he stormed the city with such violence, that the inhabitants were compelled to abandon it, and to retire to the castle, where they prepared for an obstinate defence. The king instantly gave orders for scaling the walls, and the soldiers prepared to execute these orders as fast as they could; but the king being impatient, caught hold of a ladder and mounted it first himself, being followed by Leonatus, Peucestas, and Abreas, the latter a man of great valour, and who on that account had double pay allowed him. The king having gained the top of the battlements, cleared them quickly of the defendants, killing some of them with his sword, and pushing others over the walls: but after this was done, he ¹⁰³ was in more danger than ever; for the Indians galled ^{His desperate valour, and danger.} him with their arrows from the adjacent towers, though they durst not come near enough to engage him. His own battalion of targeteers mounting in haste to second him, broke the ladders; which, as soon as Alexander perceived, he threw himself down into the castle, as did also Peucestas, Leonatus, and Abreas. As soon as the king was on the ground, the Indian general rushed forward to attack him; but Alexander instantly despatched him, as well as several others who followed him. Upon this the rest retired, and contented themselves with throwing darts and stones at him at a distance. Abreas was struck into the head with an arrow, and died on the spot; and, shortly after, another pierced through the king's breast-plate into his body. As long as he had spirits, he defended himself valiantly; but, through a vast effusion of blood, losing his senses, he fell upon his shield. Peucestas then covered him with the sacred shield of Pallas on one side, as did Leonatus with his own shield on the other, though they themselves were dreadfully

¹⁰⁴ **Macedon.** dreadfully wounded. In the mean time, however, the soldiers on the outside, eager to save their king, supplied their want of ladders, by driving large iron pins into the walls. By the help of these many of them ascended, and came to the assistance of Alexander and his companions. The Indians were now slaughtered without mercy; but Alexander continued for some time in a very dangerous way: however, he at last recovered his strength, and showed himself again to his army, which filled them with the greatest joy.

Is with difficulty saved by his men.

¹⁰⁵ He proceeds in his voyage down the Indus.

The Malli, being now convinced that nothing but submission could save the remainder of them, sent deputies to Alexander, offering the dominion of their country; as did also the Oxydracæ: and the king having settled every thing in these countries agreeable to his mind, proceeded on his voyage down the river Indus. In this voyage he received the submission of some other Indian princes; and perceiving, that at the point of the island Pattala, the river divided itself into two vast branches, he ordered an haven and convenient docks to be made there for his ships; and when he had careened his fleet, he sailed down the right-hand branch towards the ocean. In his passage he sustained great difficulties by reason of his want of pilots, and at the mouth of the river very narrowly missed being cast away: yet all this did not hinder him from pursuing his first design, though it does not appear that he had any other motive thereto than the vain desire of boasting that he had entered the ocean beyond the Indus: for, having consecrated certain bulls to Neptune, and thrown them into the sea, performed certain libations of golden cups, and thrown the cups also into the sea, he came back again; having only surveyed two little islands, one at the mouth of the Indus, and one a little farther in the ocean.

On the king's return to Pattala, he resolved to sail down the other branch of the Indus, that he might see whether it was more safe and commodious for his fleet than that which he had already tried; and for this he had very good reasons. He had resolved to send Nearchus with his fleet by sea, through the Persian gulf up the river Tigris, to meet him and his army in Mesopotamia; but as the possibility of this voyage depended on the ceasing of the Etesian winds, there was a necessity of laying up the fleet till the season should prove favourable. Alexander, therefore, sailing through this branch of the Indus, sought on the sea coast for bays and creeks, where his fleet might anchor in safety; he caused also pits to be sunk, which might be filled with fresh water for the use of his people; and took all imaginable precautions for preserving them in ease and safety till the season would allow them to continue their voyage. In this he succeeded to his wish; for he found this branch of the river Indus, at its mouth, spread over the plain country, and forming a kind of lake, wherein a fleet might ride with safety. He therefore appointed Leonatus, and a part of his army, to carry on such works as were necessary: causing them to be relieved by fresh troops as often as there was occasion; then having given his last instructions to Nearchus, he departed with the rest of the army, in order to march back to Babylon.

¹⁰⁶ Sets out for Babylon.

Before the king's departure, many of his friends

Macedon. advised him against the route which he intended to take. They told him, that nothing could be more rash or dangerous than this resolution. They acquainted him, that the country through which he was to travel was a wild uncultivated desert; that Semiramis, when she led her soldiers this way out of India, brought home but 20 of them; and that Cyrus, attempting to do the same, returned with only seven. But all this was so far from deterring Alexander, that it more than ever determined him to pursue no other road. As soon, therefore, as he had put things in order, he marched at the head of a sufficient body of troops to reduce the Oritæ, who had never vouchsafed either to make their submission or to court his friendship. Their territories lay on the other side of a river called *Arabia*, which Alexander crossed so speedily, that they had no intelligence of his march; whereupon most of them quitted their country, and fled into the deserts. Their capital he found so well situated, that he resolved to take it out of their hands, and to cause a new and noble city to be founded there, the care of which he committed to Hephæstion. Then he received the deputies of the Oritæ and Gedrosi; and having assured them, that if the people returned to their villages, they should be kindly treated, and having appointed Apollonenes president of the Oritæ, and left a considerable body of troops under Leonatus to secure their obedience, he began his march through Gedrosia. In this ¹⁰⁷ march his troops suffered incredible hardships. The **His dan-** road was very uncertain and troublesome, on account ^{gerous} of its lying through deep and loose sands, rising in many ^{march} places into hillocks, which forced the soldiers to climb, ^{through} at the same time that it sunk under their feet; there ^{Gedrosia.} were no towns, villages, nor places of refreshment, to be met with; so that, after excessive marches, they were forced to encamp among these dry sands. As to provisions, they hardly met with any during their whole march. The soldiers were therefore obliged to kill their beasts of carriage; and such as were sent to bring some corn from the sea side, were so grievously distressed, that, though it was sealed with the king's signet, they cut open the bags, choosing rather to die a violent death for disobedience than perish by hunger. When the king, however, was informed of this, he freely pardoned the offenders; he was also forced to accept the excuses that were daily made for the loss of mules, horses, &c. which were in truth eaten by the soldiers, and their carriages broken in pieces to avoid further trouble. As for water, their want of it was a great misfortune; and yet their finding it in plenty was sometimes a greater: for, as by the first they perished with thirst, so by the latter they were burst, thrown into dropsies, and rendered incapable of travel. Frequently they met with no water for the whole day together: sometimes they were disappointed of it at night; in which case, if they were able, they marched on; so that it was common with them to travel 30, 40, 50, or even 60 miles without encamping. Numbers through these hardships were obliged to lag in the rear; and of these many were left behind, and perished; for indeed scarce any ever joined the army again. Their miseries, however, they sustained with incredible patience, being encouraged by the example of their king; who, on this occasion, suffered greater hardships than the meanest soldier in his army. At last they

Macedon. they arrived at the capital of Gedrosia, where they refreshed themselves, and staid some time: after which they marched into Caramania; which being a very plentiful country, they there made themselves ample amends for the hardships and fatigues they had sustained. Here they were joined first by Craterus with the troops under his command, with a number of elephants: then came Stasanor president of the Arians, and Pharismanes the son of Phrataphernes governor of Parthia. They brought with them camels, horses, and other beasts of burden, in vast numbers; having foreseen, that the king's march through Gedrosia would be attended with the loss of the greatest part, if not of all the cavalry and beasts belonging to his army.

109
Redresses
the grie-
vances of
his people.

During Alexander's stay in Caramania, he redressed the injuries of his people, who had been grievously oppressed by their governors during his absence. Here also he was joined by his admiral Nearchus, who brought him an account that all under his command were in perfect safety, and in excellent condition; with which the king was mightily pleased, and, after having bestowed on him singular marks of his favour, sent him back to the navy. Alexander next set out for Persia, where great disorders had been committed during his absence. These also he redressed, and caused the governor to be crucified; appointing in his room Peucestas, who saved his life when he fought singly against a whole garrison as above related. The new governor was no sooner invested with his dignity, than he laid aside the Macedonian garb, and put on that of the Medes; being the only one of Alexander's captains, who, by complying with the manners of the people he governed, gained their affection.

While Alexander visited the different parts of Persia, he took a view, among the rest, of the ruins of Persepolis, where he is said to have expressed great sorrow for the destruction he had formerly occasioned. From Persepolis he marched to Spasa, where he gave an extraordinary loose to pleasure; resolving to make himself and his followers some amends for the difficulties they had hitherto undergone: purposing at the same time so effectually to unite his new conquered with his hereditary subjects, that the jealousies and fears which had hitherto tormented both, should no longer subsist. With this view he married two wives of the blood royal of Persia; viz. Barsine, or Statira, the daughter of Darius, and Parysatis the daughter of Ochus. Drypetis, another daughter of Darius, he gave to Hephæstion; Amastrine, the daughter of Oxyartes the brother of Darius, married Craterus; and to the rest of his friends, to the number of 80, he gave other women of the greatest quality. All these marriages were celebrated at once, Alexander himself bestowing fortunes upon them; he directed likewise to take account of the number of his officers and soldiers who had married Asiatic wives; and though they appeared to be 10,000, yet he gratified each of them according to his rank. He next resolved to pay the debts of his army, and thereupon issued an edict directing every man to register his name and the sum he owed; with which the soldiers complying slowly, from an apprehension that there was some design against them, Alexander ordered tables heaped with money to be set in all quarters of the camp, and caused every man's debts to be paid on his bare word, without even

other two
wives.

111
Pays the
debts of his
army.

making any entry of his name: though the whole sum came to 20,000 talents. On such as had distinguished themselves in an extraordinary manner, he bestowed crowns of gold. Peucestas had the first; Leonatus the second; Nearchus the third; Onesicritus the fourth; Hephæstion the fifth; and the rest of his guards had each of them one. After this he made other dispositions for conciliating, as he supposed, the differences among all his subjects. He reviewed the 30,000 youths, whom at his departure for India he had ordered to be taught Greek and the Macedonian discipline; expressing high satisfaction at the fine appearance they made, which rendered them worthy of the appellation he bestowed on them, viz. that of *Epigoni*, i. e. successors. He promoted also, without any distinction of nation, all those who had served him faithfully and valiantly in the Indian war. When all these regulations were made, he gave the command of his heavy-armed troops to Hephæstion, and ordered him to march directly to the banks of the Tigris, while in the mean time a fleet was equipped for carrying the king and the troops he retained with him down to the ocean.

Thus ended the exploits of Alexander; the greatest conqueror that ever the world saw, at least with respect to the rapidity of his conquests. In 12 years time he had brought under his subjection Egypt, Libya, Asia Minor, Syria, Phœnicia, Palestine, Babylonia, Persia, with part of India and Tartary. Still, however, he meditated greater things. He had now got a great taste in maritime affairs; and is said to have meditated a voyage to the coasts of Arabia and Ethiopia, and thence round the whole continent of Africa to the straits of Gibraltar. But of this there is no great certainty: though that he intended to subdue the Carthaginians and Italians, is more than probable. All these designs, however, were frustrated by his death, which happened at Babylon in 323 B. C. He is said to have received several warnings of his approaching fate, and to have been advised to avoid that city; which advice he either despised or could not follow. He died of a fever after eight days illness, without naming any successor; having only given his ring to Perdicas, and left the kingdom, as he said, to the most worthy.

The character of this great prince has been variously represented; but most historians seem to have looked upon him rather as an illustrious madman than one upon whom the epithet of *Great* could be properly bestowed. From a careful observation of his conduct, however, it must appear, that he possessed not only a capacity to plan, but likewise to execute, the greatest enterprises that ever entered into the mind of any of the human race. From whatever cause the notion originated, it is plain that he imagined himself a divine person, and born to subdue the whole world: and extravagant and impracticable as this scheme may appear at present, it cannot at all be looked upon in the same light in the time of Alexander. The Greeks were in his time the most powerful people in the world in respect to their skill in the military art, and the Persians were the most powerful with respect to wealth and numbers. The only other powerful people in the world were the Carthaginians, Gauls, and Italian nations. From a long series of wars which the Cartha-

Babylon.

113
His charac-
ter.

Macedon. ginians carried on in Sicily, it appeared that they were by no means capable of contending with the Greeks, even when they had an immense superiority of numbers; much less then could they have sustained an attack from the whole power of Greece and Asia united. The Gauls and Italians were indeed very brave, and of a martial disposition; but they were barbarous, and could not have resisted armies well disciplined and under the command of such a skillful leader as Alexander. Even long after this time, it appeared that the Romans themselves could not have resisted the Greeks; since Regulus, after having defeated the Carthaginians and reduced them to the utmost distress, was totally unable to resist a Carthaginian army commanded by a Greek general, and guided by Greek discipline.

Thus it appears, that the scheme of Alexander cannot by any means be accounted that of a madman, or of one who projects great things without judgment or means to execute them. If we consider from his actions the end which most probably he had in view, could his scheme have been accomplished, we shall find it not only the greatest but the *best* that can possibly be imagined. He did not conquer to destroy, enslave, or oppress; but to civilize and unite the whole world as one nation. No sooner was a province conquered than he took care of it as if it had been part of his paternal inheritance. He allowed not his soldiers to oppress and plunder the Persians, which they were very much inclined to do; on the contrary, by giving into the oriental customs himself, he strove to extinguish that inveterate hatred which had so long subsisted between the two nations. In the Scythian countries which he subdued, he pursued the same excellent plan. His courage and military skill, in which he never was excelled, were displayed, not with a view to rapine or desultory conquest, but to civilize and induce the barbarous inhabitants to employ themselves in a more proper way of life. "Midst the hardships of a military life (says Dr Gillies), obstinate sieges, bloody battles, and dear bought victories, he still respected the rights of mankind, and practised the mild virtues of humanity. The conquered nations enjoyed their ancient laws and privileges; the rigours of despotism were softened; arts and industry encouraged; and the proudest Macedonian governors compelled, by the authority and example of Alexander, to observe the rules of justice towards their meanest subjects. To bridle the fierce inhabitants of the Scythian plains, he founded cities and established colonies on the banks of the Iaxartes and Oxus; and those destructive campaigns usually ascribed to his restless activity, and blind ambition, appeared to the discernment of this extraordinary man not only essential to the security of the conquests which he had already made, but necessary for the more remote and splendid expeditions which he still purposed to undertake, and which he performed with singular boldness and unexampled success." In another place, the same author gives his character in the following words.

"He was of a low stature, and somewhat deformed; but the activity and elevation of his mind animated and ennobled his frame. By a life of continual labour, and by an early and habitual practice of the gymnastic exercises, he had hardened his body against

the impressions of cold and heat, hunger and thirst, and prepared his robust constitution for bearing such exertions of strength and activity, as have appeared incredible to the undisciplined softness of modern times. In generosity and in prowess, he rivalled the greatest heroes of antiquity; and in the race of glory, having finally outstripped all competitors, became ambitious to surpass himself. His superior skill in war gave uninterrupted success to his arms; and his natural humanity, enlightened by the philosophy of Greece, taught him to improve his conquests to the best interests of mankind. In his extensive dominions he built or founded not less than 70 cities; the situation of which being chosen with consummate wisdom, tended to facilitate communication, to promote commerce, and to diffuse civility through the greatest nations of the earth. It may be suspected, indeed, that he mistook the extent of human power, when in the course of one reign he undertook to change the face of the world: and that he miscalculated the stubbornness of ignorance and the force of habit, when he attempted to enlighten barbarism, to soften servitude, and to transplant the improvements of Greece into an African and Asiatic soil, where they have never been known to flourish. Yet let not the designs of Alexander be too hastily accused of extravagance. Whoever seriously considers what he actually performed before his 33d year, will be cautious of determining what he might have accomplished had he reached the ordinary term of human life. His resources were peculiar to himself; and such views as well as actions became him as would have become none besides. In the language of a philosophical historian, 'he seems to have been given to the world by a peculiar dispensation of Providence, being a man like to none other of the human kind.'

"From the part which his father Philip and himself acted in the affairs of Greece, his history has been transmitted through the impure channels of exaggerated flattery, or malignant envy. The innumerable fictions which disgrace the works of his biographers, are contradicted by the most authentic accounts of his reign, and inconsistent with those public transactions which concurring authorities confirm. In the present work it seemed unnecessary to expatiate on such topics, since it is less the business of history to repeat or even to expose errors than to select and impress useful truths. An author, ambitious of attaining that purpose, can seldom indulge the language of general panegyric. He will acknowledge, that Alexander's actions were not always blameless; but, after the most careful examination, he will affirm, that his faults were few in number, and resulted from his situation rather than from his character.

"From the first years of his reign he experienced the crimes of disaffection and treachery, which multiplied and became more dangerous with the extent of his dominions and the difficulty to govern them. Several of his lieutenants early aspired at independence; others formed conspiracies against the life of their master. The first criminals were treated with a lenity becoming the generous spirit of Alexander: but when Philotas, the son of Parmenio, and even Parmenio himself, afforded reason to suspect their fidelity; when the Macedonian youths, who, according to the institution

Macedon.

tution of Philip, guarded the royal pavilion, prepared to murder their sovereign, he found it necessary to depart from his lenient system, and to hold with a firmer hand the reins of government. Elated by unexampled prosperity, and the submissive reverence of vanquished nations, his loftiness disgusted the pride of his European troops, particularly the Macedonian nobles, who had been accustomed to regard themselves rather as his companions than subjects. The pretensions which sound policy taught him to form and to maintain, of being treated with those external honours ever claimed by the monarchs of the East, highly offended the religious prejudices of the Greeks, who deemed it impious to prostrate the body or bend the knee to any mortal sovereign. Yet had he remitted formalities consecrated by the practice of ages, he must insensibly have lost the respect of his Asiatic subjects. With a view to reconcile the discordant principles of the victors and vanquished, he affected an immediate descent from Jupiter Ammon, a claim liberally admitted by the avarice or fears of the Libyan priests; and which, he had reason to expect, could not be very obstinately denied by the credulity of the Greeks and Macedonians; who universally acknowledged that Philip, his reputed father, was remotely descended from the Grecian Jupiter. But the success of this design, which might have entitled him, as a son of Jupiter, to the same obeisance from the Greeks which the barbarians readily paid him as monarch of the East, was counteracted, at first by the secret displeasure, and afterwards by the open indignation, of several of his generals and courtiers. Nor did the conduct of Alexander tend to extricate him from this difficulty. With his friends he maintained that equal intercourse of visits and entertainments which characterized the Macedonian manners; indulged the liberal flow of unguarded conversation; and often exceeded that intemperance in wine which disgraced his age and country."

We shall conclude this character of Alexander with observing, that he had in view, and undoubtedly must have accomplished, the sovereignty of the ocean as well as of the land. The violent resistance made by the Tyrians had shown him the strength of a commercial nation; and it was undoubtedly with a view to enrich his dominions by commerce, that he equipped the fleet on the Indus, and wished to keep up a communication with India by sea as well as by land. "It was chiefly with a view to the former of these objects (says Dr Robertson), that he examined the navigation of the Indus with so much attention. With the same view, on his return to Susa, he in person surveyed the course of the Euphrates and Tigris, and gave directions to remove the cataracts or dams with which the ancient monarchs of Persia, induced by a peculiar precept of their religion, which enjoined them to guard with the utmost care against defiling any of the elements, had constructed near the mouths of these rivers, in order to shut out their subjects from any access to the ocean. By opening the navigation in this manner, he proposed that the valuable commodities of India should be conveyed from the Persian gulf into the interior parts of his Asiatic dominions, while by the Arabian gulf they should be carried to Alexandria, and distributed to the rest of the world.

"Grand and extensive as these schemes were, the

Macedon.

precautions employed, and the arrangements made for carrying them into execution, were so various and so proper, that Alexander had good reason to entertain sanguine hopes of their proving successful. At the time when the mutinous spirit of his soldiers obliged him to relinquish his operations in India, he was not 30 years of age complete. At this enterprising period of life, a prince of a spirit so active, persevering, and indefatigable, must have soon found means to resume a favourite measure on which he had been long intent. If he had invaded India a second time, he would not, as formerly, have been obliged to force his way through hostile and unexplored regions, opposed at every step by nations and tribes of barbarians whose names had never reached Greece. All Asia, from the shores of the Ionian sea to the banks of the Hyphais, would then have been subject to his dominion; and through that immense stretch of country he had established such a chain of cities or fortified stations, that his armies might have continued their march with safety, and have found a regular succession of magazines provided for their subsistence. Nor would it have been difficult for him to bring into the field forces sufficient to have achieved the conquest of a country so populous and extensive as India. Having armed and disciplined his subjects in the east like Europeans, they would have been ambitious to imitate and to equal their instructors; and Alexander might have drawn recruits, not from his scanty domains in Macedonia and Greece, but from the vast regions of Asia, which in every age has covered the earth, and astonished mankind with its numerous armies. When at the head of such a formidable power he had reached the confines of India, he might have entered it under circumstances very different from those in his first expedition. He had secured a firm footing there, partly by means of the garrisons which he left in the three cities which he had built and fortified, and partly by his alliance with Taxiles and Porus. These two Indian princes, won by Alexander's humanity and beneficence, which, as they were virtues seldom displayed in the ancient mode of carrying on war, excited of course a higher degree of admiration and gratitude, had continued steady in their attachment to the Macedonians. Reinforced by their troops, and guided by their information as well as by the experience which he had acquired in his former campaigns, Alexander must have made rapid progress in a country where every invader from his time to the present age has proved successful.

"But this and all his other splendid schemes were terminated at once by his untimely death. In consequence of that, however, events took place which illustrate and confirm the justness of the preceding speculations and conjectures, by evidence the most striking and satisfactory. When that great empire, which the superior genius of Alexander had kept united and in subjection, no longer felt his superintending controul, it broke into pieces, and its various provinces were seized by his principal officers, and parcelled out among them. From ambition, emulation, and personal animosity, they soon turned their arms against one another; and as several of the leaders were equally eminent for political abilities and for military skill, the contest was maintained long, and carried on with frequent vicissitudes of fortune. Amidst the various convulsions and revolutions

Macedon. revolutions which these occasioned, it was found that the measures of Alexander for the preservation of his conquests had been concerted with such sagacity, that upon the final restoration of tranquillity, the Macedonian dominion continued to be established in every part of Asia, and not one province had shaken off the yoke. Even India, the most remote of Alexander's conquests, quietly submitted to Python the son of Agenor, and afterwards to Seleucus, who successively obtained dominion over that part of Asia. Porus and Taxiles, notwithstanding the death of their benefactor, neither declined submission to the authority of the Macedonians, nor made any attempt to recover independence."

114
Causes of the dissolution of his empire.

With the death of Alexander fell also the glory of the Macedonians; who very soon relapsed into a situation, as bad, or worse, than that in which they had been before the reign of Philip. This was occasioned principally by his not having distinctly named a successor, and having no child of his own come to the years of discretion to whom the kingdom might seem naturally to belong. The ambition and jealousy of his mother Olympias, his queen Roxana, and especially of the great commanders of his army, not only prevented a successor from being ever named, but occasioned the death of every person, whether male or female, who was in the least related to Alexander. To have a just notion of the origin of these disturbances, it is necessary in the first place to understand the situation of the Macedonian affairs at the time of Alexander's death.

When Alexander set out for Asia, he left Antipater, as we formerly observed, in Macedon, to prevent any disturbances that might arise either there or in Greece. The Greeks, even during the lifetime of Alexander, bore the superiority which he exercised over them with great impatience; and, though nothing could be more gentle than the government of Antipater, yet he was exceedingly hated, because he obliged them to be quiet. One of the last actions of Alexander's life set all Greece in a flame. He had, by an edict, directed all the cities of Greece to recal their exiles; which edict, when it was published at the Olympic games, created much confusion. Many of the cities were afraid, that, when the exiles returned, they would change the government; most of them doubted their own safety, if the edict took place; and all of them held this peremptory decree to be a total abolition of their liberty. No sooner, therefore, did the news of Alexander's death arrive than they prepared for war.

115
Aridæus appointed king.

In Asia the state of things was not much better; not indeed through any inclination of the conquered countries to revolt, but through the dissensions among the commanders.—In the general council which was called soon after the death of Alexander, after much confusion and altercation, it was at last agreed, or rather commanded by the soldiers, that Aridæus, the brother of Alexander, who had always accompanied the king, and had been wont to sacrifice with him, should assume the sovereignty.—This Aridæus was a man of very slender parts and judgment, not naturally, but by the wicked practices of Olympias, who had given him poisonous draughts in his infancy, lest he should stand in the way of her son Alexander or any of his family; and for this, or some other reason, Perdiccas, Ptolemy, and most of the horse officers, resented his promotion to such a degree, that they quitted the assembly, and even the city.

VOL. XII. Part I.

However, Meleager, at the head of the phalanx vigorously supported their first resolution, and threatened loudly to shed the blood of those who affected to rule over their equals, and to assume a kingdom, which no way belonged to them: Aridæus was accordingly arrayed in royal robes, had the arms of Alexander put upon him, and was saluted by the name of *Philip*, to render him more popular. Thus were two parties formed, at the head of whom were Meleager and Perdiccas, both of them pretending vast concern for the public good, yet at bottom desiring nothing more than their own advantage. Perdiccas was a man of high birth, and had a supreme command in the army, was much in favour with Alexander, and one in whom the nobility had put great confidence. Meleager had become formidable by having the phalanx on his side, and having the nominal king entirely in his power; for Aridæus, or Philip, was obliged to comply with whatever he thought proper; and publicly declared, that whatever he did was by the advice of Meleager; so that he made his minister accountable for his own schemes, and no way endangered himself. The Macedonians also, besides their regard for the deceased king, soon began to entertain a personal love for Philip on account of his moderation.

Macedon.
116
A party formed by Meleager, and another by Perdiccas.

It is remarkable, however, that notwithstanding all the favours which Alexander had conferred upon his officers, and the fidelity with which they had served him during his life, only two of them were attached to the interests of his family after his death. These were Antipater, and Eumenes the Cardian, whom he had appointed his secretary. Antipater, as we have already seen, was embroiled with the Greeks, and could not assist the royal family who were in Asia; and Eumenes had not as yet sufficient interest to form a party in their favour. In a short time, however, Perdiccas prevailed against Meleager, and got him murdered; by which means the supreme power for a time fell into his hands. His first step, in consequence of this power, was to distribute the provinces of the empire among the commanders in the following manner, in order to prevent competitors, and to satisfy the ambition of the principal commanders of the army. Aridæus, and the son of Roxana, born after the death of his father, were to enjoy the regal authority. Antipater had the government of the European provinces. Craterus had the title of *protector*. Perdiccas was general of the household troops in the room of Hephestion. Ptolemy the son of Lagos had Egypt, Libya, and that part of Arabia which borders upon Egypt. Cleomenes, a man of infamous character, whom Alexander had made receiver-general in Egypt, was made Ptolemy's deputy. Leomedon had Syria; Philotas, Cilicia; Python, Media; Eumenes, Cappadocia, Paphlagonia, and all the country bordering on the Euxine sea, as far as Trapezus; but these were not yet conquered, so that he was a governor without a province. Antigonus had Pamphylia, Lycia, and Phrygia Major; Cassander, Caria; Menander, Lydia; Leonatus, Phrygia on the Hellespont.

117
Meleager murdered, and the empire divided.

In the mean time, not only Alexander's will, but Alexander himself, was so much neglected, that his body was allowed to remain seven days before any notice was taken of it, or any orders given for its being embarked. The only will he left was a short memo-

118
Alexander's body neglected, and his will set aside.

†

S s

• randum

Macedon. randum of six things he would have done.—1. The building of a fleet of 1000 stout galleys, to be made use of against the Carthaginians and other nations who should oppose the reduction of the sea-coasts of Africa and Spain, with all the adjacent islands as far as Sicily. 2. A large and regular highway was to be made along the coast of Africa, as far as Ceuta and Tangier. 3. Six temples of extraordinary magnificence were to be erected at the expence of 1500 talents each. 4. Castles, arsenals, havens, and yards for building ships, to be settled in proper places throughout his empire. 5. Several new cities were to be built in Europe and Asia; those in Asia to be inhabited by colonies from Europe, and those in Europe to be filled with Asiatics; that, by blending their people and their manners, that hereditary antipathy might be eradicated which had hitherto subsisted between the inhabitants of the different continents. 6. Lastly, He had projected the building of a pyramid, equal in bulk and beauty to the biggest in Egypt, in honour of his father Philip. All these designs, under pretence of their being expensive, were referred to a council of Macedonians, to be held nobody knew when or where.

The government, being now in the hands of Perdiccas and Roxana, grew quickly very cruel and distasteful. Alexander was scarce dead when the queen sent for Statira and Drypetis the two daughters of Darius, one of whom had been married to Alexander and the other to Hephæstion: but as soon as they arrived at Babylon, caused them both to be murdered, that no son of Alexander by any other woman, or of Hephæstion, might give any trouble to her or her son Alexander. Sisygambis, the mother of Darius, no sooner heard that Alexander the Great was dead, than she laid violent hands on herself, being apprehensive of the calamities which were about to ensue.

119
The daughters of Darius put to death by Roxana.

120
The Greeks revolt, but are subdued.

War was first declared in Greece against Antipater in the year 323 B. C. Through the treachery of the Thessalians, that general was defeated, with the army he had under his own command. Leonatus was therefore sent from Asia, with a very considerable army, to his assistance; but both were overthrown with great loss by the confederates, and Leonatus himself was killed. In a short time, however, Craterus arrived in Greece with a great army, the command of which he resigned to Antipater. The army of the confederates amounted to 25,000 foot and 3000 horse; but Antipater commanded no fewer than 40,000 foot, 3000 archers, and 5000 horse. In such an unequal contest, therefore, the Greeks were defeated, and forced to sue for peace; which they did not obtain but on condition of their receiving Macedonian garrisons into several of their cities. At Athens also the democratic government was abrogated; and such a dreadful punishment did this seem to the Athenians, that 22,000 of them left their country, and retired into Macedon.

121
Disturbances in Asia and Thrace.

While these things were doing in Greece, disturbances began also to arise in Asia and in Thrace. The Greek mercenaries, who were dispersed through the inland provinces of Asia, despairing of ever being allowed to return home by fair means, determined to attempt it by force. For this purpose, they assembled to the number of 20,000 foot and 3000 horse; but were all cut off to a man by the Macedonians. In Thrace, Lysimachus was attacked by one Seuthes, a

prince of that country, who claimed the dominions of his ancestors, and had raised an army of 20,000 foot and 8000 horse. But though the Macedonian commander was forced to engage this army with no more than 4000 foot and 2000 horses, yet he kept the field of battle, and could not be driven out of the country. Perdiccas, in the mean-time, by pretending friendship to the royal family, had gained over Eumenes entirely to his interest; and at last put him in possession of the province of Cappadocia by the defeat of Ariarathea and cruel-ty of Perdiccas. 122
king of that country, whom he afterwards cruelly caused to be crucified. His ambition, however, now began to lead him into difficulties. At the first division of the provinces, Perdiccas, to strengthen his own authority, had proposed to marry Nicæa the daughter of Antipater; and so well was this proposal relished, that her brethren Jollas and Archias conducted her to him, in order to be present at the celebration of the nuptials. But Perdiccas now had other things in view. He had been solicited by Olympias to marry her daughter Cleopatra, the widow of Alexander king of Epirus, and who then resided at Sardis in Lydia. Eumenes promoted this match to the utmost of his power, because he thought it would be for the interest of the royal family; and his persuasions had such an effect on Perdiccas, that he was sent to Sardis to compliment Cleopatra, and to carry presents to her in name of her new lover. In the absence of Eumenes, however, Alcetas, the brother of Perdiccas, persuaded him to marry Nicæa; but, in order to gratify his ambition, he resolved to divorce her immediately after marriage, and marry Cleopatra. By this last marriage, he hoped to have a pretence for altering the government of Macedon: and, as a necessary measure preparative to these, he entered into contrivances for destroying Antigonus. Unfortunately for himself, however, he ruined all his schemes by his own jealousy and precipitate cruelty. Cynane, the daughter of Philip by his second wife, had brought her daughter named *Adda*, and who was afterwards named *Eurydice*, to court, in hopes that King Aridæus might marry her. Against Cynane, Perdiccas, from some political motives, conceived such a grudge, that he caused her to be murdered. This raised a commotion in the army; which frightened Perdiccas to such a degree, that he now promoted the match between Aridæus and Eurydice; to prevent which, he had murdered the mother of the young princess. But, in the mean time, Antigonus, knowing the designs of Perdiccas against himself, fled with his son Demetrius to Greece, there to take shelter under the protection of Antipater and Craterus, whom he informed of the ambition and cruelty of the regent.

A civil war was now kindled. Antipater, Craterus, Neoptolemus, and Antigonus, were combined against Perdiccas; and it was the misfortune of the empire in general, that Eumenes, the most able general, as well as the most virtuous of all the commanders, was on the side of Perdiccas, because he believed him to be in the interest of Alexander's family. Ptolemy, in the mean time, remained in quiet possession of Egypt; but without the least intention of owning any person for his superior: however, he also acceded to the league formed against Perdiccas; and thus the only person in the whole empire who consulted the interest of the royal family was Eumenes.

Macedon. It was now thought proper to bury the body of Alexander, which had been kept for two years, during all which time preparations had been making for it. Aridæus, to whose care it was committed, set out from Babylon for Damascus, in order to carry the king's body to Egypt. This was sore against the will of Perdiccas; for it seems there was a superstitious report, that wherever the body of Alexander was laid, that country should flourish most. Perdiccas, therefore, out of regard to his native soil, would have it conveyed to the royal sepulchres in Macedon; but Aridæus, pleading the late king's express direction, was determined to carry it into Egypt, from thence to be conveyed to the temple of Jupiter Ammon.—The funeral was accordingly conducted with all imaginable magnificence. Ptolemy came to meet the body as far as Syria: but, instead of burying it in the temple of Jupiter Ammon, erected a stately temple for it in the city of Alexandria; and, by the respect he showed for his dead master, induced many of the Macedonian veterans to join him, and who were afterwards of the greatest service to him.

124
Alexander
buried in
Egypt.

125
Perdiccas
killed by
his own
men.

126
A new di-
vision of
the empire.

No sooner was the funeral over, than both the parties above mentioned fell to blows. Perdiccas marched against Ptolemy: but was slain by his own men, who, after the death of their general, submitted to his antagonist: and thus Eumenes was left alone to contend against all the other generals who had served under Alexander. In this contest, however, he would by no means have been overmatched, had his soldiers been attached to him; but as they had been accustomed to serve under those very generals against whom they were now to fight, they were on all occasions ready to betray and desert Eumenes. However he defeated and killed Neoptolemus and Craterus, but then found himself obliged to contend with Antipater and Antigonus. Antipater was now appointed protector of the kings, with sovereign power; and Eumenes was declared a public enemy. A new division of Alexander's empire took place. Egypt, Libya, and the parts adjacent, were given to Ptolemy, because they could not be taken from him. Syria was confirmed to Leomedon. Philoxenus had Cilicia. Mesopotamia and Arbelitus were given to Amphimachus. Babylon was bestowed on Seleucus. Susiana fell to Antigonus, who commanded the Macedonian *Argyraspidae* or *Silver Shields*, because he was the first who opposed Perdiccas. Peucestas held Persia. Tlepolemus had Caramania. Python had Media as far as the Caspian straits. Stasander had Aria and Drangia; Philip, Parthia; Stasonor, Bactria and Sogdia; Sybirtius, Aracopa; Oxyartes, the father of Roxana, Parapomisis. Another Python had the country between this province and India. Porus and Taxiles held what Alexander had given them, because they would not part with any of their dominions. Cappadocia was assigned to Nicanor. Phrygia Major, Lycania, Pamphylia, and Lycia, were given to Antigonus; Caria to Cassander, Lydia to Clytus, Phrygia the Less to Aridæus. Cassander was appointed general of the horse; while the command of the household troops was given to Antigonus, with orders to prosecute the war against Eumenes. Antipater having thus settled every thing as well as he could, returned to Macedon with the two kings, to the great joy of his countrymen,

having left his son Cassander to be a check upon Antigonus in Asia. Macedon.

Matters now seemed to wear a better aspect than they had yet done; and, had Eumenes believed that his enemies really consulted the interest of Alexander's family, there is not the least doubt that the war would have been immediately terminated. He saw, however, that the design of Antigonus was only to set up for himself, and therefore he refused to submit. From this time, therefore, the Macedonian empire ceased in Asia: and an account of the transactions of this part of the world fall to be recorded under the article SYRIA. The Macedonian affairs are now entirely confined to the kingdom of Macedon itself, and to Greece.

Antipater had not long been returned to Macedon, when he died; and the last action of his life completed the ruin of Alexander's family. Out of a view to the public good, he had appointed Polysperchon, the eldest of Alexander's captains at hand, to be *protector* and *governor* of Macedon. This failed not to disgust his son Cassander; who thought he had a natural right to these offices, and of course kindled a new civil war in Macedon. This was indeed highly promoted by his first actions as a governor. He began with attempting to remove all the governors appointed in Greece by Antipater, and to restore democracy wherever it had been abolished. The immediate consequence of this was, that the people refused to obey their magistrates; the governors refused to resign their places, and applied for assistance to Cassander. Polysperchon also had the imprudence to recal Olympias from Epirus, and allow her a share in the administration; which Antipater, and even Alexander himself, had always refused her. The consequence of all this was, that Cassander invaded Greece, where he prevailed against Polysperchon: Olympias returned to Macedon, where she cruelly murdered Aridæus and his wife Eurydice; she herself was put to death by Cassander, who afterwards caused Roxana and her son to be murdered, and Polysperchon being driven into Etolia, first raised to the crown Hercules the son of Alexander by the daughter of Darius, and then by the instigation of Cassander murdered him, by which means the line of Alexander the Great became totally extinct.

127
Total de-
struction of
Alexander's
family.

Cassander having thus destroyed all the royal family, assumed the regal title as he had for 16 years before had all the power. He enjoyed the title of *king of Macedon* only three years; after which he died, about 298 B. C. By Thessalonica, the daughter of Philip king of Macedon, he left three sons, Philip, Antipater, and Alexander. Philip succeeded him, but soon after died of a consumption. A contest immediately began between the two brothers, Antipater and Alexander. Antipater seized the kingdom; and to secure himself in it, murdered his mother Thessalonica, if not with his own hand, at least the execrable act was committed in his presence. Alexander invited Pyrrhus king of Epirus, and Demetrius the son of Antigonus, to assist him and revenge the death of his mother. But Pyrrhus being bought off, and a peace concluded between the brothers, Alexander, being afraid of having too many protectors, formed a scheme of getting Demetrius assassinated. Instead of this, however, both he and Antipater were put to death; and Demetrius

128
Various re-
volutions
in the go-
vernment.

Macedon. Demetrius became king of Macedon four years after the death of Cassander.

In 287 B. C. Demetrius was driven out by Pyrrhus, who was again driven out by Lysimachus two years after, who was soon after killed by Seleucus Nicanor; and Seleucus, in his turn, was murdered by Ptolemy Ceraunus, who became king of Macedon about 285 B. C. The new king was in a short time cut off, with his whole army, by the Gauls; and Antigonus Gonatus, the son of Demetrius Poliorcetes, became king of Macedon in 278 B. C. He proved successful against the Gauls, but was driven out by Pyrrhus king of Epirus; who, however, soon disoblged his subjects to such a degree, that Antigonus recovered a great part of his kingdom. But in a little time, Pyrrhus being killed at the siege of Argos in Greece, Antigonus was restored to the whole of Macedon; but scarcely was he seated on the throne, when he was driven from it by Alexander the son of Pyrrhus. This new invader was, in his turn, expelled by Demetrius the son of Antigonus; who, though at that time but a boy, had almost made himself master of Epirus. In this enterprise, however, he was disappointed; but by his means Antigonus was restored to his kingdom, which he governed for many years in peace. By a stratagem he made himself master of the city of Corinth, and from that time began to form schemes for the thorough conquest of Greece. The method he took to accomplish this was, to support the petty tyrants of Greece against the free states: which indeed weakened the power of the latter; but involved the whole country in so many calamities, that these transactions could not redound much to the reputation either of his arms or his honour. About 243 B. C. he died, leaving the kingdom to his son, Demetrius II.

129
War with
the Ro-
mans.

Neither Demetrius, nor his successor Antigonus Dossion, performed any thing remarkable. In 221 B. C. the kingdom fell to Philip, the last but one of the Macedonian monarchs. To him Hannibal applied for assistance after the battle of Cannæ, which he refused; and the same imprudence which made him refuse this assistance prompted him to embroil himself with the Romans; and at last to conclude a treaty with them, by which he in effect became their subject, being tied up from making peace or war but according to their pleasure. In 179 B. C. he was succeeded by his eldest son Perseus, under whom the war with the Romans was renewed. Even yet the Macedonians were terrible in war; and their phalanx, when properly conducted, seems to have been absolutely invincible by any method of making war known at that time. It consisted of 16,000 men, of whom 1000 marched abreast, and thus was 16 men deep, each of whom carried a kind of pike 23 feet long. The soldiers stood so close, that the pikes of the fifth rank reached their points beyond the front of the battle. The hindermost ranks leaned their pikes on the shoulders of those who went before them, and, locking them fast, pressed briskly against them when they made the charge; so that the first five ranks had the impetus of the whole phalanx, which was the reason why the shock was generally irresistible. The Romans had never encountered such a terrible enemy; and in the first battle, which happened 171 B. C. they were defeated with the loss of 2200 men, while the Macedonians lost no more than 60. The ge-

nerals of Perseus now pressed him to storm the enemy's camp: but he being naturally of a cowardly disposition, refused to comply, and thus the best opportunity he ever had was lost. Still, however, the Romans gained little or no advantage, till the year 168 B. C. when Paulus Æmilius, a most experienced commander, was sent to Macedon. Perseus now put all upon the issue of a general engagement; and Æmilius, with all his courage and military experience, would have been defeated, had the Macedonians been commanded by a general of the smallest courage or conduct. The light-armed Macedonians charged with such vigour, that after the battle, some of their bodies were found within two furlongs of the Roman camp. When the phalanx came to charge, the points of their spears striking into the Roman shields, kept the heavy-armed troops from making any motion; while, on the other hand, Perseus's light-armed men did terrible execution. On this occasion, it is said, that Æmilius tore his clothes, and gave up all hopes. However, perceiving that as the phalanx gained ground it lost its order in several places, he caused his own light-armed troops to charge in those places, whereby the Macedonians were soon put into confusion. If Perseus with his horse had on the first appearance of this charged the Romans briskly, his infantry would have been able to recover themselves; but instead of this, he betook himself to flight, and the infantry at last did the same, but not till 20,000 of them had lost their lives.

Macedonia
||
Macer.

This battle decided the fate of Macedon, which immediately submitted to the conqueror. The cowardly king took refuge in the island of Samothrace: but was at last obliged to surrender to the Roman consul, by whom he was carried to Rome, led in triumph, and afterwards most barbarously used. Some pretenders to the throne appeared afterwards; but being unable to defend themselves against the Romans, the country was reduced to a Roman province in 148 B. C. To become a Roman province. them it continued subject till the year 1357, when it was reduced by the Turkish sultan Bajazet, and has remained in the hands of the Turks ever since.

130
Macedonia
becomes a

province.

MACEDONIANS, in ecclesiastical history, the followers of Macedonius, bishop of Constantinople, who through the influence of the Eunomians, was deposed by the council of Constantinople in 360, and sent into exile. He considered the Holy Ghost as a divine energy diffused throughout the universe, and not as a person distinct from the Father and the Son. The sect of Macedonians was crushed before it had arrived at its full maturity, by the council assembled by Theodosius in 381, at Constantinople. See SEMI-ARIANS.

MACEDONIUS. See MACEDONIANS.

MACER, EMLIUS, an ancient Latin poet, was born at Verona, and flourished under Augustus Cesar. Eusebius relates, that he died a few years after Virgil. Ovid speaks of a poem of his, on the nature and quality of birds, serpents, and herbs; which he says Macer being then very old had often read to him:

*Sæpe suas volucres legit mihi grandior ævo,
Quæque nocet serpens, quæ juvat herba, Macer.
De Ponto, lib. iv. eleg. 10.*

There is extant a poem upon the nature and power of herbs under Macer's name; but it is spurious. He also wrote

Macer ||
Machiavel. wrote a supplement to Homer, as Quintus Calaber did afterwards in Greek :

*Tu canis aeterno quicquid restabat Homero :
Ne careant summa Troica bella manu.
De Ponto, lib. ii. eleg. 10.*

MACERATION, is an infusion of, or soaking ingredients in water or any other fluid, in order either to soften them or draw out their virtues.

MACERATA, a town of Italy, in the territory of the church, and in the Marche of Ancona, with a bishop's see, an university, and about 10,000 inhabitants. It is situated near the mountain Chiento, in E. Long. 13. 37. N. Lat. 43. 15.

MACHAON, a celebrated physician among the ancients, son of Æsculapius and brother to Podalirius. He went to the Trojan war with the inhabitants of Trica, Ithome, and Oechalia. According to some, he was king of Messenia. He was physician to the Greeks, and healed the wounds which they received during the Trojan war. Some supposed he was killed before Troy by Eurypylos the son of Telephus. He received divine honours after death, and had a temple in Messenia.

MACHÆRUS, in *Ancient Geography*, a citadel on the other side Jordan, near the mountains of Moab, not far from and to the north of the *Lacus Asphaltites*. It was the south boundary of the Peræa : situated on a mountain encompassed round with deep and broad valleys ; built by Alexander king of the Jews ; destroyed by Gabinius, in the war with Aristobulus, and rebuilt by Herod, with a cognominal town round it. Here John the Baptist was beheaded (Josephus).

MACHIAN, one of the Molucca islands, in the East Indian ocean, about 20 miles in circumference, populous and fertile, producing cloves and sago ; and is in possession of the Dutch, who have three strong forts built on it,

MACHIAVEL, NICHOLAS, a famous political writer of the 16th century, was born of a distinguished family at Florence. He wrote in his native language with great elegance and politeness, though he understood very little of the Latin tongue ; but he was in the service of Marcellus Virgilius, a learned man, who pointed out to him many of the beautiful passages in the ancients, which Machiavel had the art of placing properly in his works. He composed a comedy upon the ancient Greek model : in which he turned into ridicule many of the Florentine ladies, and which was so well received, that Pope Leo X. caused it to be acted at Rome. Machiavel was secretary, and afterwards historiographer, to the republic of Florence. The house of Medicis procured him this last office, together with a handsome salary, in order to pacify his resentment for having suffered the torture upon suspicion of being an accomplice in the conspiracy of the Soderini against that house, when Machiavel bore his sufferings without making any confession. The great encomiums he bestowed upon Brutus and Cassius, both in his conversations and writings, made him strongly suspected of being concerned in another conspiracy against Cardinal Julian de Medicis, who was afterwards pope under the name of *Clement VII*. However, they carried on no proceedings against him ; but from that time he turned every thing into ridicule, and

gave himself up to irreligion. He died in 1530, of a remedy which he had taken by way of prevention. Of all his writings, that which has made the most noise, and has drawn upon him the most enemies, is a political treatise entitled the *Prince* ; which has been translated into several languages. The world is not agreed as to the motives of this work ; some thinking he meant to recommend tyrannical maxims ; others, that he only delineated them to excite abhorrence. Machiavel also wrote, Reflections on Titus Livius, which are extremely curious ; the History of Florence, from the year 1205 to 1494 ; and a quarto volume of Poems and other pieces. Mr Harrington considers him as a superior genius, and as the most excellent writer on politics and government that ever appeared. See a view of his opinions in *FIRST DISSERTATION, SUPPLEMENT*, p. 32.

MACHINE, (*Machina*), in the general, signifies any thing that serves to augment or to regulate moving powers : Or it is any body destined to produce motion, so as to save either time or force. The word comes from the Greek *μαχανη*, " machine, invention, art : " And hence, in strictness, a machine is something that consists more in art and invention, than in the strength and solidity of the materials ; for which reason it is that inventors of machines are called *ingenieurs* or *engineers*.

Machines are either simple or compound. The simple ones are the seven mechanical powers, viz. lever, balance, pulley, axis and wheel, wedge, screw, and inclined plane. See *MECHANICS*.

From these the compound ones are formed by various combinations, and serve for different purposes. See *MECHANICS* ; also *AGRICULTURE*, *CANNON*, *CENTRIFUGAL*, *STEAM*, *FURNACE*, *BURROUGHS*, *RAMSDEN*, &c. &c.

MACHINES used in war amongst the Greeks were principally these ; 1. *Κλίμακας*, or scaling ladders ; 2. The battering ram ; 3. The *helcopolis* ; 4. The *χιλωνα* or tortoise, called by the Romans *testudo* ; 5. The *σχυμα* or *agger*, which was faced with stone, and raised higher than the wall ; 6. Upon the *σχυμα* were built *πυργου* or towers of wood ; 7. *Γεφυραι*, or osier hurdles ; 8. *Catapulta*, or *καταπαλτα*, from which they threw arrows with amazing force ; and, 9. The *λιθόβαλοι*, *πυρροβαλοι*, or *αψιλαραι*, from which stones were cast with great velocity.

The principal warlike machines made use of by the Romans were, the ram, the *lupus* or wolf, the *testudo* or tortoise, the *balista*, the *catapulta*, and the *scorpion*.

MACHINERY, in epic and dramatic poetry, is when the poet introduces the use of machines ; or brings some supernatural being upon the stage, in order to solve some difficulty or to perform some exploit out of the reach of human power.

The ancient dramatic poets never made use of machines, unless where there was an absolute necessity for so doing ; whence the precept of Horacc,

*Nec Deus intersit, nisi dignus vindice nodus
Inciderit.*

It is quite otherwise with epic poets, who introduce machines in every part of their poems ; so that nothing is done without the intervention of the gods. In Milton's *Paradise Lost*, by far the greater part of the actors

Machinery ||
Mackenzie. ||
tdrs are supernatural personages : Homer and Virgil do nothing without them ; and, in Voltaire's *Henriade*, the poet has made excellent use of St Louis.

As to the manner in which these machines should act, it is sometimes invisibly, by simple inspirations and suggestions ; sometimes by actually appearing under some human form ; and, lastly, by means of dreams and oracles, which partake of the other two. However, all these should be managed in such a manner as to keep within the bounds of probability.

Plate
CCXCVIII. MACHUL, an instrument of music among the Hebrews. Kircher apprehends that the name was given to two kinds of instruments, one of the stringed and the other of the pulsatile kind. That of the former sort had six chords ; though there is great reason to doubt whether an instrument requiring the aid of the hair-bow, and so much resembling the violin, be so ancient. The second kind was of a circular form, made of metal, and either hung round with little bells, or furnished with iron rings suspended on a rod or bar that passed across the circle. Kircher supposes that it was moved to and fro by a handle fixed to it, and thus emitted a melancholy kind of murmur.

MACHYNLETH, a town of Montgomeryshire in North Wales, 198 miles from London, and 32 from Montgomery. It is an ancient town, and has a market on Mondays, and several fairs. In 1811 it contained 1252 inhabitants. It is seated on the river Douay, over which there is a large stone bridge, which leads into Merionethshire. It was here that Owen Glyndwr exercised the first acts of his royalty in 1402. Here he accepted the crown of Wales, and assembled a parliament ; and the house wherein they met is now standing, divided into tenements.

MACKENZIE, SIR GEORGE, an able lawyer, a polite scholar, and a celebrated wit, was born at Dundee in the county of Angus in Scotland in 1636, and studied at the universities of Aberdeen and St Andrew's ; after which he applied himself to the civil law, travelled into France, and prosecuted his study in that faculty for about three years. At his return to his native country he became an advocate in the city of Edinburgh ; and soon gained the character of an eminent pleader. He did not, however, suffer his abilities to be confined entirely to that province. He had a good taste for polite literature ; and he gave the public, from time to time, incontestable proofs of an uncommon proficiency therein. He had practised but a few years, when he was promoted to the office of a judge in the criminal court ; and, in 1674, was made king's advocate, and one of the lords of the privy council in Scotland. He was also knighted by his majesty. In these stations he met with a great deal of trouble, on account of the rebellions which happened in his time ; and his office of advocate requiring him to act with severity, he did not escape being censured, as if in the deaths of some particular persons who were executed he had stretched the laws too far. But there does not seem to have been any just foundation for this clamour against him ; and it is generally agreed, that he acquitted himself like an able and upright magistrate. Upon the abrogation of the penal laws by King James II. our advocate, though he had always been remarkable for his loyalty, and even censured for his zeal against traitors and fanatics, thought himself

obliged to resign his post ; being convinced, that he Mackenzie could not discharge the duties of it in that point with a good conscience. But he was soon after restored, and held his offices till the Revolution ; an event which, it seems, he could not bring himself to approve. He had hoped that the prince of Orange would have returned to his own country when matters were adjusted between the king and his subjects ; and upon its proving otherwise, he quitted all his employments in Scotland, and retired into England, resolving to spend the remainder of his days in the university of Oxford. He arrived there in September 1689, and prosecuted his studies in the Bodleian library, being admitted a student there by a grace passed in the congregation, June 2. 1690. In the spring following, he went to London, where he fell into a disorder, of which he died in May 1691. His corpse was conveyed by land to Scotland, and interred there with great pomp and solemnity. " The politeness of his learning, and the sprightliness of his wit, were (says the reverend Mr Granger) conspicuous in all his pleadings, and shone in his ordinary conversation." Mr Dryden acknowledges, that he was unacquainted with what he calls the *beautiful turn of words and thoughts in poetry*, till they were explained and exemplified to him in a conversation with that noble wit of Scotland Sir George Mackenzie.—He wrote several pieces of history and antiquities ; Institutions of the laws of Scotland ; Essays upon various subjects, &c. His works were printed together at Edinburgh in 1716, in 2 vols. folio.

MACKEREL. See SCOMBER, ICHTHYOLOGY *Index*.

MACLAURIN, COLIN, a most eminent mathematician and philosopher, was the son of a clergyman, and born at Kilmoddan in Scotland in 1698. He was sent to the university of Glasgow in 1709 ; where he continued five years, and applied himself to study in a most intense manner. His great genius for mathematical learning discovered itself so early as at twelve years of age ; when, having accidentally met with an Euclid in a friend's chamber, he became in a few days master of the first six books without any assistance ; and it is certain, that in his 16th year he had invented many of the propositions which were afterwards published under the title of *Geometria Organica*. In his 15th year he took the degree of master of arts ; on which occasion he composed and publicly defended a thesis, On the power of Gravity, with great applause. After this he quitted the university, and retired to a country-seat of his uncle, who had the care of his education ; for his parents had been dead some time. Here he spent two or three years in pursuing his favourite studies ; but, in 1717, he offered himself a candidate for the professorship of mathematics in the Marischal college of Aberdeen, and obtained it after a ten days trial with a very able competitor. In 1719, he went to London, where he became acquainted with Dr Hoadley then bishop of Bangor, Dr Clarke, Sir Isaac Newton, and other eminent men ; at which time also he was admitted a member of the Royal Society ; and in another journey in 1721, he contracted an intimacy with Martin Folkes, Esq. the president of it, which lasted to his death.

In 1722, Lord Polwarth, plenipotentiary of the king of Great Britain at the congress of Cambray, engaged him

Maclaurin him to go as a tutor and companion to his eldest son, who was then to set out on his travels. After a short stay at Paris, and visiting other towns in France, they fixed in Lorraine; where Maclaurin wrote his piece *On the Percussion of Bodies*, which gained the prize of the Royal Academy of Sciences for the year 1724. But his pupil dying soon after at Montpellier, he returned immediately to his profession at Aberdeen. He was hardly settled here, when he received an invitation to Edinburgh; the curators of that university being desirous that he should supply the place of Mr James Gregory, whose great age and infirmities had rendered him incapable of teaching. He had some difficulties to encounter, arising from competitors, who had good interest with the patrons of the university, and also from the want of an additional fund for the new professor, which however at length were all surmounted, principally by the means of Sir Isaac Newton. In November 1725, he was introduced into the university. After this, the mathematical classes soon became very numerous, there being generally upwards of 100 young gentlemen attending his lectures every year; who being of different standings and proficiency, he was obliged to divide them into four or five classes, in each of which he employed a full hour every day, from the first of November to the first of June.

He lived a bachelor to the year 1733: but being not less formed for society than for contemplation, he then married Anne, the daughter of Mr Walter Stewart solicitor-general for Scotland. By this lady he had seven children, of whom two sons and three daughters, together with his wife, survived him. In 1734, Berkeley, bishop of Cloyne, published a piece called "*The Analyst*;" in which he took occasion, from some disputes that had arisen concerning the grounds of the fluxionary method, to explode the method itself, and also to charge mathematicians in general with infidelity in religion. Maclaurin thought himself included in this charge, and began an answer to Berkeley's book: but, as he proceeded, so many discoveries, so many new theories and problems occurred to him, that instead of a vindicatory pamphlet, his work came out, *A complete system of fluxions*, with their application to the most considerable problems in geometry and natural philosophy. This work was published at Edinburgh in 1742, 2 vols. 4to; and as it cost him infinite pains, so it is the most considerable of all his works, and will do him immortal honour. In the mean time, he was continually obliging the public with some performance or observation of his own; many of which were published in the fifth and sixth volumes of the "*Medical Essays*" at Edinburgh. Some of them were likewise published in the *Philosophical Transactions*; as the following: 1. Of the construction and measure of curves, N^o 356. 2. A new method of describing all kinds of curves, N^o 359. 3. A letter to Martin Folkes, Esq. on equations with impossible roots, May 1726, N^o 394. 4. Continuation of the same, March 1729, N^o 408. 5. December the 21st, 1732, on the description of curves; with an account of farther improvements, and a paper dated at Nancy, November 27. 1722, N^o 439. 6. An account of the treatise of fluxions, January 27. 1742, N^o 467. 7. The same continued, March 10. 1742, N^o 469. 8. A rule for finding the meridional

parts of a spheroid with the same exactness as of a sphere, August 1741, N^o 461. 9. Of the basis of the cells wherein the bees deposit their honey; Nov. 3. 1734, N^o 471.

In the midst of these studies, he was always ready to lend his assistance in contriving and promoting any scheme which might contribute to the service of his country. When the earl of Morton set out in 1739 for Orkney and Shetland, to visit his estates there, he desired Mr Maclaurin to assist him in settling the geography of those countries, which is very erroneous in all our maps; to examine their natural history, to survey the coasts, and to take the measure of a degree of the meridian. Maclaurin's family affairs, and other connexions, would not permit him to do this; he drew, however, a memorial of what he thought necessary to be observed, furnished the proper instruments, and recommended Mr Short, the famous optician, as a fit operator for the management of them. He had still another scheme for the improvement of geography and navigation, of a more extensive nature; which was the opening of a passage from Greenland to the South sea by the north pole. That such a passage might be found, he was so fully persuaded, that he has been heard to say, if his situation could admit of such adventures, he would undertake the voyage, even at his own charge. But when schemes for finding it were laid before the parliament in 1744, and himself consulted by several persons of high rank concerning them, before he could finish the memorials he proposed to send, the premium was limited to the discovery of a north-west passage: and he used to regret, that the word west was inserted, because he thought that passage, if at all to be found, must lie not far from the pole.

In 1745, having been very active in fortifying the city of Edinburgh against the rebel army, he was obliged to fly from thence to the north of England; where he was invited by Herring, then archbishop of York, to reside with him during his stay in this country. In this expedition, however, being exposed to cold and hardships, and naturally of a weak and tender constitution, he laid the foundation of an illness which put an end to his life, in June 1746, at the age of 48.

Mr Maclaurin was a very good as well as a very great man, and worthy of love as well as admiration. His peculiar merit as a philosopher was, that all his studies were accommodated to general utility; and we find, in many places of his works, an application even of the most abstruse theories, to the perfecting of mechanical arts. He had resolved, for the same purpose, to compose a course of practical mathematics, and to rescue several useful branches of the science from the bad treatment they often met with in less skilful hands. But all this his death prevented; unless we should reckon, as a part of his intended work, the translation of Dr David Gregory's "*Practical Geometry*," which he revised, and published with additions, 1745. In his lifetime, however, he had frequent opportunities of serving his friends and his country by his great skill. Whatever difficulty occurred concerning the constructing or perfecting of machines, the working of mines, the improving of manufactures, the conveying of water, or the execution of any other public work,

he

Maclaurin. he was at hand to resolve it. He was likewise employed to terminate some disputes of consequence that had arisen at Glasgow concerning the gauging of vessels; and for that purpose presented to the commissioners of excise two elaborate memorials, with their demonstrations, containing rules by which the officers now act. He made also calculations relating to the provision, now established by law, for the children and widows of the Scots clergy, and of the professors in the universities, entitling them to certain annuities and sums, upon the voluntary annual payment of a certain sum by the incumbent. In contriving and adjusting this wise and useful scheme, he bestowed a great deal of labour, and contributed not a little towards bringing it to perfection. It may be said of such a man, that "he lived to some purpose;" which can hardly be said of those, how uncommon soever their abilities and attainments, who spend their whole time in abstract speculations, and produce nothing to the real use and service of their fellow creatures.

Of his works, we have mentioned his *Geometria Organica*, in which he treats of the description of curve lines by continued motion. We need not repeat what has been said concerning his piece which gained the prize of the Royal Academy of Sciences in 1724. In 1740, the academy adjudged him a prize, which did him still more honour, for solving the motion of the tides from the theory of gravity; a question which had been given out the former year, without receiving any solution. He had only ten days to draw this paper up in, and could not find leisure to transcribe a fair copy; so that the Paris edition of it is incorrect. He afterwards revised the whole, and inserted it in his *Treatise of Fluxions*; as he did also the substance of the former piece. These, with the *Treatise of Fluxions*, and the pieces printed in the *Philosophical Transactions*, of which we have given a list, are all the writings which our author lived to publish. Since his death, two volumes more have appeared; his *Algebra*, and his *Account of Sir Isaac Newton's Philosophical Discoveries*. His *Algebra*, though not finished by himself, is yet allowed to be excellent in its kind; containing, in no large volume, a complete elementary treatise of that science, as far as it hath hitherto been carried. His *Account of Sir Isaac Newton's Philosophy* was occasioned in the following manner: Sir Isaac dying in the beginning of 1728, his nephew, Mr Conduitt, proposed to publish an account of his life, and desired Mr Maclaurin's assistance. The latter, out of gratitude to his great benefactor, cheerfully undertook, and soon finished, the history of the progress which philosophy had made before Sir Isaac's time, and this was the first draught of the work in hand; which not going forward, on account of Mr Conduitt's death, was returned to Mr Maclaurin.—To this he afterwards made great additions, and left it in the state in which it now appears. His main design seems to have been, to explain only those parts of Sir Isaac's philosophy which have been, and still are, controverted; and this is supposed to be the reason why his grand discoveries concerning light and colours are but transiently and generally touched upon. For it is known, that ever since the experiments, on which his doctrine of light and colours is founded,

have been repeated with due care, this doctrine has not been contested; whereas his accounting for the celestial motions, and the other great appearances of nature, from gravity, is misunderstood, and even ridiculed by some to this day.

MACQUER, PHILIPPE, advocate of the parliament of Paris, where he was born in 1720, being descended from a respectable family. A weakness in his lungs having prevented him from engaging in the laborious exercises of pleading, he dedicated himself to literary pursuits. His works are, 1. *L'Abregé Chronologique de l'Histoire Ecclesiastique*, 3 vols. 8vo. written in the manner of the present Henault's History of France, but not possessed of equal spirit and elegance. 2. *Lcs Annales Romanes*, 1756, 8vo; another chronological abridgement, and much better supported than the former. Into this work the author has introduced every thing most worthy of notice which has been written by Saint Evremond, Abbé Saint-Real, President Mouteaquieu, Abbé Mably, &c. concerning the Romans; and, if we except a difference of style, which is easily discernible, it is, in other respects, a very judicious compilation. 3. *Abregé Chronologique de l'Histoire d'Espagne et de Portugal*, 1759, 1765, in 2 vols. 8vo. This book, in point of accuracy, is worthy of the president Henault, by whom it was begun; but it displays no discrimination of character nor depth of research. The author received assistance from M. Lacombe, whose talents for chronological abridgement are well known. The republic of letters sustained a loss by the death of M. Macquer, which happened on the 27th of January 1770, at the age of 50. As to his character, he was industrious, agreeable, modest, and sincere, and an enemy to all foolish vanity and affectation. He had a cold imagination, but a correct taste. He had an eager thirst for knowledge of every kind, and he had neglected no useful branch of study. He had a share in the *Dictionary of Arts and Professions*, in 2 vols. 8vo, and in the Translation of the *Syphilis of Fracastor* published by Lacombe.

MACQUER, Pierre Joseph, brother to the former, was born at Paris the 9th of October, 1718, and died there February 16. 1784. He was a member of the Academy of Sciences, and professor of pharmacy; and was engaged in the *Journal de Sçavans*, for the articles of medicine and chemistry. With the latter science he was intimately acquainted. He had a share in the *Pharmacopœia Parisiensis*, published in 1758, in 4to. His other works are, 1. *Elemens de Chimie theorique*; Paris, 1749, 1753, 12mo; which have been translated into English and German.—2. *Elemens de Chimie pratique*, 1751, 2 vols. 12mo. These two works were republished together, in 1756, in 3 vols. 12mo. 3. *Plan d'un cours de Chimie experimentale et raisonnée*. 1757, 12mo; in the composition of which he was associated with M. Beaumé. 4. *Formula Medicamentorum Magistralium*, 1763. 5. *L'Art de la Teinture en Soie*, 1763. 6. *Dictionnaire de Chimie, contenant la Théorie et la Pratique de cet art*, 1766, 2 vols. 8vo; which has been translated into German, with notes; and into English, with notes, by Mr Kier. Macquet has, by his labours and writings, greatly contributed to render useful an art which formerly tended only to ruin the health of the patient by foreign remedies, or to reduce

Macquer ||
Macrocephalus. reduce the professors of it to beggary, while they prosecuted the idle dreams of converting every thing into gold.

MACRIN, **SALMON**, one of the best Latin poets of the 16th century, was born at Loudun. His true name was *John Salmon*; but he took that of *Macrin*, from his being frequently so called in ridicule by Francis I. on account of his extraordinary leanness. He was preceptor to Claudius of Savoy, count of Tende; and to Honorius the count's brother; and wrote several pieces of poetry in lyric verse, which were so admired, that he was called *the Horace of his time*. He died of old age, at Loudun, in 1555.—**Charles MACRIN**, his son, was not inferior to him as a poet, and surpassed him in his knowledge of the Greek tongue. He was preceptor to Catharine of Navarre, the sister of Henry the Great; and perished in the massacre on St Bartholomew's day in 1572.

MACROBII, a people of Ethiopia, celebrated for their justice, and the innocence of their manners: also a people in the island of Merœ. The Hyperboreans were also called *Macrobi*: they generally lived to their 120th year; and from their longevity they obtained their name (*μακροσ βιος, long life.*)

MACROBIUS, **AMBROSIUS AURELIUS THEODOSIUS**, an ancient Latin writer, who flourished towards the latter part of the fourth century.—Of what country he was, is not clear: Erasmus, in his *Ciceronianus*, seems to think he was a Greek; and he himself tells us, in the preface to his *Saturnalia*, that he was not a Roman, but laboured under the inconveniences of writing in a language which was not natural to him. Of what religion he was, Christian or Pagan, is uncertain. Barthius ranks him among the Christians; but Spanheim and Fabricius suppose him to have been a heathen. This, however, is certain, that he was a man of consular dignity, and one of the chamberlains or masters of the wardrobe to Theodosius; as appears from a rescript directed to Florentius, concerning those who were to obtain that office. He wrote a commentary upon Cicero's *Somnium Scipionis*, and seven books of *Saturnalia*, which treat of various subjects, and are an agreeable mixture of criticism and antiquity. He was not an original writer, but made great use of other people's works, borrowing not only their materials, but even their language, and for this he has been satirically rallied by some modern authors, though rather unfairly, considering the express declaration and apology which he makes on this head, at the very entrance of his work. "Don't blame me," says he, "if what I have collected from multifarious reading, I shall frequently express in the very words of the authors from whom I have taken it: for my view in this present work is, not to give proofs of my eloquence, but to collect and digest into some regularity and order such things as I thought might be useful to be known. I shall therefore here imitate the bees, who suck the best juices from all sorts of flowers, and afterwards work them up into various forms and orders with some mixture of their own proper spirit." The *Somnium Scipionis* and *Saturnalia* have been often printed; to which has been added, in the later editions, a piece entitled *De Differentiis et Societatibus Græci Latiniq; Verbi*.

MACROCEPHALUS (compounded of *μακρος*, "great," and *κεφαλη*, "head," denotes a person with

a head larger or longer than the common size. **Macrocephali**, or **Long-heads**, is a name given to a certain people, who, according to the accounts of authors, were famous for the unseemly length of their heads: yet custom so far habituated them to it, that instead of looking on it as a deformity, they esteemed it a beauty, and, as soon as the child was born, moulded and fashioned its head in their hands to as great a length as possible, and afterwards used all such rollers and bandages as might seem most likely to determine its growing long. The greater part of the islanders in the Archipelago, some of the people of Asia, and even some of those of Europe, still press their children's heads out lengthwise. We may observe also, that the Epirots, many people of America, &c. are all born with some singularity in the conformation of their heads; either a flatness on the top, two extraordinary protuberances behind, or one on each side; singularities which we can only regard as an effect of an ancient and strange mode, which at length is become hereditary in the nation. According to the report of many travellers, the operation of compressing the head of a child lengthwise, while it is yet soft, is with a view insensibly to enlarge the interval between the two eyes, so that the visual rays turning more to the right and left, the sight would embrace a much larger portion of the horizon; the advantage of which they are well acquainted with, either in the constant exercise of hunting, or on a thousand other occasions. Ever since the 16th century, the missionaries established in the countries inhabited by the savages of America, have endeavoured to destroy this custom; and we find in the sessions of the third council of Lima, held in 1585, a canon which expressly prohibits it. But if it has been repressed one way, the free negroes and Maroons, although Africans, have adopted it, since they have been established among the Caribs, solely with the view of distinguishing their children, which are born free, from those who are born in slavery. The *Omaquas*, a people of South America, according to P. Veigh, press the heads of their children so violently between two planks that they become quite sharp at the top, and flat before and behind. They say they do this to give their heads a greater resemblance to the moon.

MACROCERCI, a name given to that class of animals, which have tails longer than their bodies.

MACROCOLUM, or **MACROCOLLUM** (formed of *μακρος*, "large, and *καλλων*, "I join,") among the Romans, the largest kind of paper then in use. It measured sixteen inches, and frequently two feet.

MACROCOSM, a word denoting the great world or universe. It is compounded of the Greek words *μακρος*, "great," and *κοσμος*, "world."

MACROOMP, or **MACROOM**, a town of Ireland in the barony of Muskerry, county of Cork, and province of Munster, 142 miles from Dublin; it is situated amongst hills, in a dry gravelly limestone soil.—This place is said to take its name from an old crooked oak, so called in Irish, which formerly grew here. The castle was first built in King John's time, soon after the English conquest (according to Sir Richard Cox), by the Carews; but others attribute it to the Daltons. It was repaired and beautified by Teague Macarty, who died in the year 1565, and was father to

the celebrated Sir Cormac Mac Teague mentioned by Camden and other writers as an active person in Queen Elizabeth's time. The late earls of Glancarty altered this castle into a more modern structure, it being burnt down in the wars of 1641. Opposite to the bridge is the parish-church, dedicated to St Colman of Cloyne. Here is a barrack for a foot company, a market-house, and a handsome Roman Catholic chapel. A considerable number of persons have been employed in this town in combing wool and spinning yarn, and some salt-works have been erected here. At half a mile's distance is a spaw, that rises on the very brink of a bog; its waters are a mild chalybeate, and are accounted serviceable in hypochondriacal cases, and in cutaneous eruptions. The fairs are four in the year.

MACROURUS, a genus of fishes belonging to the order *Thoracici*. See *ICHTHYOLOGY Index*.

MACTATIO, in the Roman sacrifices, signifies the act of killing the victim. This was performed either by the priest himself, or some of his inferior officers, whom we meet with under the names of *popæ*, *agones*, *cultrarii*, and *victimarii*; but, before the beast was killed, the priest, turning himself to the east, drew a crooked line with his knife, from the forehead to the tail. Among the Greeks, this ceremony was performed most commonly by the priest, or, in his absence, by the most honourable person present. If the sacrifice was offered to the celestial gods, the victim's throat was beut up towards heaven; if to the infernal, or to heroes, it was killed with its throat towards the ground. The manner of killing the animal was by a stroke on the head, and, after it was fallen, thrusting a knife into its throat. Much notice was taken, and good or ill success predicted, from the struggles of the beast, or its quiet submission to the blow, from the flowing of the blood, and the length of time it happened to live after the fall, &c.

MACULÆ, in *Astronomy*, dark spots appearing on the luminous surfaces of the sun and moon, and even some of the planets. See *ASTRONOMY Index*.

MAD-APPLE. See *SOLANUM, BOTANY Index*.

MADAGASCAR, the largest of the African islands, is situated between 43° and 51° of E. Long. and between 12° and 26° of S. Lat.; extending in length near 1000 miles from north-north-east to south-south-west, and about 300 in breadth where broadest. It was discovered in 1506 by Laurence Almeyda; but the Persians and the Arabians were acquainted with it from time immemorial under the name of *Serandib*. Alphonzo Albuquerque ordered Ruy Pereira dy Conthinto to visit the interior parts, and that general intrusted Tristan d'Acunha with the survey. The Portuguese called it the island of *St Laurence*; the French who visited it in the reign of Henry IV. named it *Ile Dauphine*; its proper name is *Madegasse*. It is now, however, by common consent, called *Madagascar*.

This large island, according to many learned geographers, is the Cerné of Pliny, and the Menuthiasde of Ptolemy. It is everywhere watered by large rivers, streams and rivulets, which have their sources at the foot of that long chain of mountains which runs through the whole extent of the island from east to west.

* *Voyage à Madagascar, &c.* Paris 1791. The two highest promontories are called *Vivagora* and *Botistmenc*. These mountains (according to the abbé Rochon*)

Madagas-
car.

enclose within their bosoms a variety of precious minerals and useful fossils. The traveller (who for the first time rambles over savage and mountainous countries, intersected with valleys and with hills, where nature left to herself brings forth the most singular and the most varied productions) is involuntarily surprised and terrified at the sight of precipices, the summits of which are crowned with monstrous trees, that seem coeval with the world. His astonishment is redoubled at the noise of those grand cascades, the approach to which is generally inaccessible. But to those views so sublimely picturesque, rural scenes soon succeed; little hills, gently rising grounds, and plains, the vegetation of which is never repressed by the intemperance or the vicissitude of the seasons. The eye contemplates with pleasure those vast savannas which nourish numberless herds of bullocks and of sheep. You behold a flourishing agriculture, produced almost solely by the fertilizing womb of nature. The fortunate inhabitants of Madagascar do not bedew the earth with their sweat; they scarcely stir the ground with a rake, and even that slight preparation is sufficient. They scrape little holes at a small distance from each other, into which they scatter a few grains of rice, and cover them with their feet; and so great is the fertility of the soil, that the lands sown in this careless manner produce a hundred fold.

The forests present a prodigious variety of the most useful and the most beautiful trees; ebony, wood for dyeing, bamboos of an enormous thickness, and palm trees of every kind. The timber employed in ship-building is no less common than those kinds so much prized by the cabinetmaker. We are told by the French governor Flacourt, in his history of this island †, that in the year 1650 he sent to France 52,000 weight of aloes of an excellent quality. All of these various trees and shrubs are surrounded by an infinite number of parasitical plants; mushrooms of an infinite diversity of kinds and colours are to be met with everywhere in the woods: and the inhabitants know well how to distinguish those which are prejudicial to the health. They collect large quantities of useful gums and resins; and out of the milky sap of a tree, denominated by them *fungiourc*, a species of jatropha, the inhabitants, by means of coagulation, make that singular substance known to naturalists by the name of *gum elastic*, or Indian rubber.

Besides the aromatic and medicinal herbs which abound in the forests, the island produces flax and hemp of a length and strength which surpass any in Europe. Sugar-canes, wax, honey of different kinds, tobacco, indigo, white-pepper, gum-lac, ambergris, silk, and cotton, would long since have been objects of commerce which Madagascar would have yielded in profusion, if the Europeans, in visiting the island, had furnished the inhabitants with the necessary information for preparing and improving these several productions.

The sugar-canes (as we are informed by another traveller †) are much larger and finer than any in the West Indies; being as thick as a man's wrist, and so full of juice, that a foot of them will weigh two pounds. When the natives travel, they carry a sugar-cane along with them, which will support them for two or three days. Here are also plenty of tamarinds; and such quantities of limes and oranges, that very large casks may

† *Hist. de la Grand Isle de Madag.* Paris 1660.

† *Ives's Voyage to India*, p. 14.

Madagas-
car.

may be filled with their juices at a trifling expence, as they may be purchased for iron pots, muskets, powder, ball, &c. During the short time that Admiral Watson's squadron staid here in 1754, Mr Ives preserved about half a hoghead full of those juices, which proved afterwards of the greatest service to the ships crews. It must be observed, however, that no good water is to be had at St Augustine in the south-west part of the island, where ships usually touch, unless boats are sent for it four or five miles up the river; and instead of filling their casks at low water (as is the case in most other rivers), they must begin to fill at about a quarter's flood: The reason assigned for this is, that the river has a communication with the sea at other places besides this of St Augustine's bay; and it has been found by experience, that the sea water brought into the river by the flood tide is not discharged till a quarter's flood of the next tide in St Augustine's bay; and for three miles up the river, the water is always very brackish, if not quite salt.

The abundance and variety of provisions of every kind, which a fine climate and fertile soil can produce, are on no part of the globe, according to M. Rochon, superior to those of Madagascar: game, wild-fowl, poultry, fish, cattle, and fruits, are alike plentiful. The oxen, Mr Ives also informs us, are large and fat, and have each a protuberance of fat between the shoulders, weighing about 20 pounds. Their flesh is greatly esteemed by all the European nations trading to India, and ships are sent to Madagascar on purpose to kill and salt them on the island. The protuberance of fat above mentioned is particularly esteemed after it has lain some time in salt; but our author says, that he could not join in the encomiums either on this piece or the beef in general; as the herbage on which the creatures feed gives their flesh a particular taste, which to him was disagreeable. The sheep differ little from the goats; being equally hairy, only that their heads are somewhat larger: their necks resemble that of a calf, and their tails weigh at least ten pounds. Vast quantities of locusts rise here from the low lands in thick clouds, extending sometimes to an incredible length and breadth. The natives eat these insects, and even prefer them to their finest fish. Their method of dressing them is to strip off their legs and wings, and fry them in oil.

The inhabitants (termed *Melagaches* or *Madecasses*), M. Rochon informs us, are in person above the middle size of Europeans. The colour of the skin is different in different tribes: among some it is of a deep black, among others tawney; some of the natives are of a copper colour, but the complexion of by far the greatest number is olive. All those who are black have woolly hair like the negroes of the coast of Africa: those, on the other hand, who resemble Indians and Mulattoes, have hair equally straight with that of the Europeans; the nose is not broad and flat; the forehead is large and open; in short, all the features are regular and agreeable. Their physiognomy displays the appearance of frankness and of satisfaction; they are desirous only of learning such things as may administer to their necessities; that species of knowledge which demands reflection is indifferent to them; sober, agile, active, they spend the greatest part of their time either in sleep or in amusement. In fine, according to the Abbé, the native of

Madagas-
car.

Madagascar, like savages in general, possesses a character equally devoid of vice and of virtue; the gratifications of the present moment solely occupy his reflections; he possesses no kind of foresight whatever; and he cannot conceive the idea that there are men in the world who trouble themselves about the evils of futurity.

The population of the island has been estimated at four millions; but this calculation is thought exaggerated by our author, and indeed it appears incredible to us. Every tribe or society inhabits its own canton, and is governed by its own customs. Each of these acknowledges a chief; this chief is sometimes elective, but more usually hereditary. The lands are not divided and portioned out, but belong to those who are at the trouble of cultivating them. These islanders make use of neither locks nor keys; the principal part of their food consists in rice, fish, and flesh; their rice is moistened with a soup which is seasoned with pimento, ginger, saffron, and aromatic herbs. They display wonderful cunning in catching a variety of birds, many of which are unknown in Europe; they have the pheasant, the partridge, the quail, the pintado, the wild duck, teal of five or six different kinds, the blue hen, the black paroquet, and the turtle-dove, in great plenty; and also a bat of a monstrous size, which is much prized on account of its exquisite flavour. These last are so hideous in their appearance, that they at first terrify the European sailors: but after they have vanquished their repugnance to them, they prize their flesh infinitely before that of the pullets of their own country. The Melagaches also catch an immense quantity of sea-fish: such as the dorado, the sole, the herring, the mackarel, the turtle, &c. with oysters, crabs, &c. The rivers afford excellent eels, and mullets of an exquisite flavour.

The inhabitants near St Augustine's bay, Mr Ives informs us, speak as much broken English as enables them to exchange their provisions for European articles. These, on the part of the Melagaches are cattle, poultry, milk, fruit, rice, salt, porcelain, potatoes, yams, fish, lances, and shells. From the Europeans they receive muskets, powder, bullets, flints, *clouties*, (including handkerchiefs, and linen of all kinds), beads, iron pots, &c.—Silver, which they call *manila*, is in great esteem with them, and is made by them into bracelets for their wives.

That part of the island at which the English squadron touched, is in the dominions of the king of *Baba*, who, by the account of Mr Ives, seemed greatly to affect to be an Englishman. They had no sooner touched at the island, than they were waited on by one called *Robin Hood*, and another person, both of whom bore the office of *pursers*. Along with these were *Philibry* the general; John Anderson and Frederic Martin, captains. Nor did the king himself and his family disdain to pay them a visit; who, in like manner, were distinguished by English names; the king's eldest son being called the prince of Wales, and the court not being without a duke of Cumberland, a Prince Augustus, princesses, &c. as in England. All these grandees came on board naked, excepting only a slight covering about their loins and on their shoulders, made of a kind of grass growing on the island; which they had adorned with small glass beads by way of border or fringe. Their hair resembled that of the

Madagas-
car.

Indians in being long and black, rather than the woolly heads of the African negroes. "The wives of the Melagaches (according to our author) take great pains with their husbands hair; sometimes putting it in large and regular curls; at other times braiding it in great order, and making it shine with a particular oil which the island produces. The men always carry in their hands a wooden lance headed with iron, which is commonly made very neat; and they are such excellent marksmen, that they will strike with it a very small object at 30 or 40 yards distance. They have also commonly a musket, which they get from Europeans in exchange for cattle, and are always sure to keep in excellent order. I am sorry to say (continues Mr Ives) that the English are frequently guilty of great impositions in this kind of traffic, by disposing of cheap and ill-tempered barrels among the poor inhabitants, who sometimes lose their lives by the bursting of these pieces. Such iniquitous practises as these must in the end prove injurious to the nation; and has indeed already made the name of more than one-half of these traders truly infamous among the deluded but hitherto friendly Madagascarians.

"They are a civil and good-natured people, but easily provoked, and apt to show their resentment on the least provocation, especially when they think themselves injured or slighted. Another characteristic of them is, the very high notions of dignity they entertain of their king; which is carried to such a height, that they are never more sensibly hurt than when they imagine he is treated with incivility or disrespect. This mighty monarch resides in a town built with mud, about 12 miles up the country from St Augustine's bay. On the east side of the bay, as you enter, there resided one Prince William, a relation and tributary to the king; but who in most cases acted as an independent prince, and always used his utmost endeavours with the officers to cause them buy their provisions from him, and not from the king or his subjects. In this prince's territories, not far from the sea, are the remains of a fort built by Avery the pirate.

"All the women of Madagascar, excepting the very poorest sort, wear a covering over their breasts and shoulders, ornamented with glass beads, and none go without a cloth about their loins. They commonly walk with a long slender rod or stick. The men are allowed to marry as many women as they can support.

"During our stay at this island (says Mr Ives), I observed with great concern, several miserable objects in the last stage of the venereal disease. They had not been able to find any cure; and as far as I could learn, their doctors are totally ignorant of medicine. The only method they use for curing all distempers, as well external as internal, is the wearing on the arm or neck a particular charm or amulet; or besmearing the part affected with earth moistened with the juice of some plant or tree, and made up into soft paste.

"I took some pains to learn their religious tenets; and find that they worship one Universal Father: whom, when they speak in English, they call *God*; and in whom they conceive all kinds of perfection to reside. The sun they look upon as a glorious body; and, I believe, as a spiritual being, but created and

Madagas-
car.

dependent. They frequently look up to it with wonder, if not with praise and adoration. They make their supplications to the *One Almighty*, and offer sacrifices to him in their distresses. I had the curiosity to attend a sacrifice, at the hut of John Anderson, whose father had for a long time been afflicted with sickness. About sunset an ox was brought into the yard; and the son, who officiated as a priest, slew it. An altar was reared nigh, and the post of it was sprinkled with the blood of the victim. The head, after its being severed from the body, was placed, with the horns on, at the foot of the altar: the caul was burned on the fire, and most of the pluck and entrails boiled in a pot. The sick man, who was brought to the door, and placed on the ground so as to face the sacrifice, prayed often, and seemingly with great fervency. His eyes were fixed attentively towards the heavens, and his hands held up in a supplicating posture. The ceremony ended with the son's cutting up the ox into small pieces; the greatest part of which he distributed amongst the poor slaves belonging to his father and himself; reserving, however, some of the best pieces for his own use. Upon the whole, I saw so many circumstances in this Madagascarian sacrifice, so exactly resembling those described in the Old Testament as offered up by the Jews, that I could not turn my thoughts back to the original, without being sensibly struck by the exactness of the copy."

When the squadron first arrived at Madagascar, the king of Baba, a man of about 60 years of age, was ill of the gout. Having demanded of Admiral Watson some presents, the latter complimented him, among other things, with some brandy. The monarch then asked him if he had any doctor with him, and if he was a great doctor, and a king's doctor? To all which being answered in the affirmative, he desired him to bring some *mahomets* (medicines) for his sick knee. With this requisition Mr Ives designed to comply; but having waited until some officers should be ready to accompany him, his majesty in the mean time, took such a dose of brandy as quickly sent the gout into his head, and occasioned his death. Mr Ives observes, that it happened very luckily for him that the monarch's decease happened without his having taken any of the medicines intended for him, as it would have been impossible to avoid the imputation of having poisoned him, which would certainly have been resented by his loyal subjects.

The king's death occasioned great confusion; the grantees being desirous that it should be concealed for some time. This, however, was found impossible; on which they set off for the *Mud Town* about 11 o'clock the same evening. All the inhabitants of the village followed their example; leaving only the dogs, who set up the most hideous howling. Captain Frederic Martin coming to take leave of the English, begged with great earnestness for a fresh supply of gunpowder; whispering that the king was dead, and that they should in all probability go to war about making another. They had been formerly told, that one who had the title of *duke* of Baba would certainly succeed to the throne; but they afterwards learned, that Philibey the general having espoused the cause of *Raphani* the late king's son, and taken him under his tutelage and protection, this youth, who was only about

Madagas- 16 years of age, succeeded his father as king of
car. Babu.

The following is a description of the southern division of the island, from the Abbé Rochon.

“That part of Madagascar in which Fort-Dauphin is situated is very populous. Almost all the villages are placed on eminences, and surrounded with two rows of strong palisades, somewhat in the manner of such of our fences as are composed of hurdles and turf. Within, is a parapet of solid earth about four feet in height; large pointed bamboos placed at the distance of five feet from each other, and sunk in a pit, form a kind of loop-holes, which contribute towards the defence of these villages, some of which are besides fortified with a ditch ten feet in breadth and six in depth. The dwelling of the chief is called a *donac*. When the chiefs go abroad, they are always provided with a musket and a stick armed with iron, and adorned at the extremity with a little tuft of cow's hair. They wear a bonnet of red wool. It is chiefly by the colour of their bonnet that they are distinguished from their subjects. Their authority is extremely limited: however, in the province of *Carcanossi*, the lands by custom belong to their chiefs, who distribute them among their subjects for the purposes of cultivation; they exact a trifling quit-rent in return, which in their language is called *faensa*. The people of *Carcanossi* are not altogether ignorant of the art of writing; they even possess some historical works in the Madagascar tongue: but their learned men, whom they term *Ombiasses*, make use of the Arabic characters alone. They have treatises on medicine, geomancy, and judicial astrology; the most renowned live in the province of *Matatane*; it is in that district that magic still remains in all its glory; the *Matanes* are actually dreaded by the other Madecassees on account of their excellence in this delusive art. The *Ombiasses* have public schools in which they teach geomancy and astrology. The natives have undoubtedly learned the art of writing from the Arabians, who made a conquest of this island about 300 years since.

“The people of the province of *Anossi*, near Fort Dauphin, are lively, gay, sensible, and grateful; they are passionately fond of women; are never melancholy in their company; and their principal occupation is to please the sex; indeed, whenever they meet their wives, they begin to sing and dance. The women, from being happy, are always in good humour. Their lively and cheerful character is extremely pleasing to the Europeans. I have often been present at their assemblies, where affairs of importance have been agitated; I have observed their dances, their sports, and their amusements, and I have found them free from those excesses which are but too common among polished nations. Indeed I was too young at this time for my observations to be of much weight; but if my experience be insufficient to inspire confidence, I beg the reader will rather consider the nature of things, than the relations given by men without principles or intelligence, who fancy that they have a right to tyrannize over the inhabitants of every country which they can subdue. If the people of Madagascar have sometimes availed themselves of treachery, they have been forced to it by the tyranny of the Europeans. The weak have no other arms against the strong. Could they

defend themselves by any other means from our artillery and bayonets? They are uninformed and helpless; and we avail ourselves of their weakness, in order to make them submit to our covetousness and caprice. They receive the most cruel and oppressive treatment, in return for the hospitality which they generously bestow on us; and we call them traitors and cowards, when we force them to break the yoke with which we have been pleased to load them.”

In the second volume of Count Benyowsky's Memoirs and Travels we have the following account of the religion, government, &c. of the people of this island.

“The Madagascar nation believe in a Supreme Being, whom they call *Zanharc*, which denotes creator of all things. They honour and revere this Being; but have dedicated no temple to him, and much less have they substituted idols. They make sacrifices, by killing oxen and sheep, and they address all these libations to God. It has been asserted, that this nation likewise makes offerings to the devil: but in this there is a deception; for the piece of the sacrificed beast which is usually thrown into the fire is not intended in honour of the devil, as is usually pretended. This custom is very ancient, and no one can tell the true reason of it. With regard to the immortality of the soul, the Madagascar people are persuaded, that, after their death, their spirit will return again to the region in which the *Zanharc* dwells; but they by no means admit that the spirit of man, after his death, can suffer any evil. As to the distinction of evil or good, they are persuaded that the good and upright man shall be recompensed, in this life, by a good state of health, the constancy of his friends, the increase of his fortunes, the obedience of his children, and the happiness of beholding the prosperity of his family: and they believe that the wicked man's fate shall be the contrary to this. The Madagascar people, upon this conviction, when they make oaths, add benedictions in favour of those who keep them, and curses against those who break them. In this manner it is that they appeal to the judgment of *Zanharc*, in making agreements; and it has never been known, or heard of, that a native of Madagascar has broken his oath, provided it was made in the usual manner, which they say was prescribed by their forefathers.

“As to their kings and form of government, &c. the Madagascar people have always acknowledged the line of *Ramini*, as that to which the rights of *Ampansacabe* or sovereign belongs. They have considered this line as extinct since the death of *Dian Ramini Larizon*, which happened 66 years ago, and whose body was buried upon a mountain, out of which the river *Manangourou* springs; but having acknowledged the heir of this line on the female side, they re-established this title in the year 1776. The right of the *Ampansacabe* consists in nominating the *Rohandrians* to assist in the *cabars*, at which all those who are cited are bound to appear, and the judgment of the *Ampansacabe* in his *cabar* is decisive. Another prerogative of the *Ampansacabe* is, that each *Rohandrian* is obliged to leave him by will a certain proportion of his property, which the successors usually purchase by a slight tribute or fine. Thirdly, The *Ampansacabe* has a right to exact from each *Rohandrian* one-

Madagas-
car.

Madagas-
car.

tenth of the produce of his land, and a number of horned cattle and slaves, in proportion to the riches of the country possessed by each Rohandrian. The second order is composed of the Rohandrians, or princes. Since the loss of the Ampansacabe, three of these Rohandrians have assumed the title of *kings*, namely the Rohandrian of the province of Mahavelou, named *Hiavi*; of the province of Voemar, named *Lambouin*; and a third at Bombetoki, named *Cimanounpou*. The third order consists of the Voadziri, or lords of a district, composed of several villages. The fourth order consists of the Lohavohits, or chiefs of villages. The fifth order, Ondzatz, who are freemen, compose the attendants or followers of the Rohandrians, Voadziri, or Lohavohits. The sixth order consists of Ombiasses, or learned men; and this order forms the warriors, workmen, physicians, and diviners: these last possess no charge. The seventh order consists of Ampurias or slaves.

“ Having made inquiries from Bombetoki passing to the northward, and as far as Itapere, the result proved that there are 38 Rohandrians actually reigning, and 287 Voadziri. With respect to the Lohavohits, Ondzatz, and Ombiasses, it was not possible to obtain any accurate determination of their number. These orders preserve a regular gradation, respecting which it would be very difficult to give a detailed account. They live in the manner we read of concerning the ancient patriarchs. Every father of a family is priest and judge in his own house, though he depends upon the Lohavohits, who superintends his conduct. This last is answerable to his Voadziri, and the Voadziri to the Rohandrian.

“ The Madagascar people having no communication with the main land of Æthiopia, have not altered their primitive laws; and the language throughout the whole extent of the island is the same. It would be a rash attempt to determine the origin of this nation; it is certain that it consists of three distinct races, who have for ages past formed intermixtures which vary to infinity. The first race is that of Zafe Ibrahim, or descendants of Abraham; but they have no vestige of Judaism, except circumcision, and some names, such as Isaac, Reuben, Jacob, &c. This race is of a brown colour.—The second race is that of Zaferamini: with respect to this, some books which are still extant among the Ombiasses, affirm that it is not more than six centuries since their arrival at Madagascar.—With respect to the third race of Zafe Canambou, it is of Arabian extraction, and arrived much more lately than the others from the coasts of Æthiopia: hence it possesses neither power nor credit, and fills only the charges of writers, historians, poets, &c.

“ In regard to arts and trades, the Madagascar nation are contented with such as are necessary to make their moveables, tools, utensils, and arms for defence; to construct their dwellings, and the boats which are necessary for their navigation; and lastly, to fabricate cloths and stuffs for their clothing. They are desirous only of possessing the necessary supplies of immediate utility and convenience. The principal and most respected business, is the manufacture of iron and steel. The artists in this way call themselves *ampanefa vihe*. They are very expert in fusing the ore,

and forging utensils, such as hatchets, hammers, anvils, knives, spades, sagayes, razors, pincers, or tweezers for pulling out the hair, &c. The second class consists of the goldsmiths (*ompanefa vola mena*): they cast gold in ingots, and make up bracelets, buckles, earrings, drops, rings, &c. The third are called *ompavilanga*, and are potters. The fourth are the *ompunvata*, or turners in wood, who make boxes called *vatta*, plates, wooden and horn spoons, bee-hives, coffins, &c. The fifth *ompan cacasou*, or carpenters. They are very expert in this business, and make use of the rule, the plane, the compasses, &c. The sixth are the *ompaniavi*, or ropemakers. They make their ropes of different kinds of bark of trees, and likewise of hemp. The seventh, *ampan lamba*, or weavers. This business is performed by women only, and it would be reckoned disgraceful in a man to exercise it. The *ombiasses* are the literary men and physicians, who give advice only. The *heravits* are comedians and dancers.

“ The Madagascar people always live in society; that is to say, in towns and villages. The towns are surrounded by a ditch and pallisades (as already mentioned), at the extremities of which a guard of from 12 to 20 armed men is kept. The houses of private people consist of a convenient cottage, surrounded by several small ones: the master of the house dwells in the largest, and his women or slaves lodge in the smaller. These houses are built of wood, covered with leaves of the palm tree or straw.

“ The houses of the great men of the country are very spacious; each house is composed of two walls and four apartments: round about the principal house other smaller habitations are built for the accommodation of the women, and the whole family of the chief; but the slaves cannot pass the night within them.—Most of the houses inhabited by the Rohandrians are built with taste and admirable symmetry.”

The French attempted to conquer and take possession of the whole island, by order, and for the use of, their Most Christian Majesties Louis XIII. and XIV. and they maintained a footing on it from the year 1642 to 1657. During this period, by the most cruel treachery, they taught the native princes the barbarous traffic in slaves, by villainously selling to the Dutch governor of Mauritius a number of innocent people, who had been assisting them in forming a settlement at Fort Dauphin.

The Abbé Rochon tells us, that the insalubrity of the air in Madagascar determined his countrymen in 1664, to quit that immense island, in order to establish themselves at so inconsiderable a place as the isle of Bourbon, which is scarcely perceptible in a map of the globe: but it is apparent, from the account of the state of the French affairs on the island of Madagascar, in 1661, when Flacourt's narrative was published, that their ill treatment of the natives had raised such a general and formidable opposition to their residence in the country, that the French were obliged to abandon their possessions for other reasons than the unhealthy qualities of the climate. We have not room here for a detail of all the oppressive measures of the French, which the abbé himself candidly censures in the strongest terms; but shall extract the following narrative, both because it is interesting in itself, and exhibits the causes and the means of their expulsion.

La

Madagas-
car.

La Case, one of the French officers employed by the governor of Fort Dauphin against the natives, was so successful in all his enterprises, that they called him *Deaan Pous*, the name of a chief who had formerly conquered the whole island. The French governor, jealous of his renown, treated him harshly, and refused to allow him the rank or honours due to his valour. The sovereign of the province of Ambouille, called *Deaan Rascitat*, taking advantage of his discontent, prevailed on him to become his general. Five Frenchmen followed him. Deaan Nong, the daughter of Rascitat, captivated by the person and heroism of La Case, offered him her hand with the consent of her father. The chief, grown old, infirm, and arrived at the last stage of existence, had the satisfaction of securing the happiness of his subjects, by appointing his son-in-law absolute master of the rich province of Ambouille. La Case, in marrying Deaan Nong, refused to take the titles and honours attached to the sovereign power: he would accept of no other character, than that of the first subject of his wife, who was declared sovereign at the death of her father. Secure in the affection of this princess, who was not only possessed of personal charms, but of courage and great qualities, he was beloved and respected by her family, and by all the people of Ambouille, who revered him as a father; and yet, how much soever he wished it, he was unable to contribute to the prosperity of his countrymen at Fort Dauphin, whom he knew to be in the utmost distress. The governor, regarding him as a traitor, had set a price on his head, and on the heads of the five Frenchmen who had followed him. The neighbouring chiefs, irritated at this treatment of a man whom they so much venerated, unanimously refused to supply the fort with provisions. This occasioned a famine in the place, which, with a contagious fever and other maladies, reduced the French garrison to 80 men.

The establishment at Fort Dauphin, on the point of being totally destroyed, was preserved for a short time from ruin by the arrival of a vessel from France, commanded by Kercadio an officer of Brittany, who, with the assistance of a young advocate who had been kidnapped on board the vessel, prevailed on the envious and implacable governor Chamargou to make peace with La Case and his sovereign spouse Deaan Nong. This peace, however, lasted but for a short time; the French, restless and insolent to the neighbouring nations, again drew on them the vengeance of the natives. Even the few friends whom they had been able to acquire by means of La Case, were rendered hostile to them by the tyrannic zeal of the missionaries; who, not contented with being tolerated and allowed to make converts, insisted on Deaan Manang, sovereign of Mandrary, a powerful, courageous, and intelligent chief, well disposed to the French, to divorce all his wives but one. This prince, not convinced of the necessity of such a measure, assured them that he was unable to change his habits and way of living, which were those of his forefathers. "You would allow me (says he) to have one wife; but if the possession of one woman is a blessing, why should a numerous seraglio be an evil, while peace and concord reign among those of whom it is composed? Do you see among us any indications of jealousy or

2

hatred? No, all our women are good; all try to make me happy; and I am more their slave than their master." This speech had no effect on Father Stephen, superior of the Madagascar mission. He peremptorily ordered him instantly to repudiate all his wives except one; and threatened, in presence of the women, to have them taken from him by the French soldiers, if he hesitated in complying with his commands. It is easy to imagine, says M. Rochin, with what indignation this language must have been heard in the *donac* or palace of this prince. The females assailed the missionary on all sides; loaded him with execrations and blows; and in their fury, would doubtless have afforded him no more quarter than the Thracian women did Orpheus, if Deaan Manang, notwithstanding his own agitation, had not made use of all his authority to save him.

In order to free himself from the persecution of this priest, he removed with his family 70 or 80 miles up into the country; but he was soon followed by Father Stephen and another missionary, with their attendants. The chief, Manang, still received them civilly; but he intreated them no longer to insist on the conversion of him and his people, as it was impossible to oblige them to quit the customs and manners of their ancestors. The only reply which Father Stephen made to this intreaty, was by tearing off the *oli*, and the amulets and charms which the chief wore as sacred badges of his own religion; and, throwing them into the fire, he declared war against him and his nation. This violence instantly cost him and his followers their lives: they were all massacred by order of Manang, who vowed the destruction of all the French in the island; in which intention he proceeded in a manner that has been related by an eye witness, who was afterwards provincial commissary of artillery, in a narrative published at Lyons in 1722, entitled *Voyage de Madagascar*. "Our yoke (says the Abbé Rochon) was become odious and insupportable. Historians, for the honour of civilized nations, should bury in oblivion the afflicting narratives of the atrocities exercised on these people, whom we are pleased to call barbarous, treacherous, and deceitful, because they have revolted against European adventurers, whose least crime is that of violating the sacred rites of hospitality."

It was about the year 1672 that the French were totally driven from the island of Madagascar; and no considerable attempts were made to form fresh establishments there till within these few years, by M. de Modave, and by Count Benyowski; neither of which was attended with success, for reasons given by the Abbé, but which we have not room to detail.

MADDER, a plant used in dyeing. See RUBIA, BOTANY *Index*; and for its dyeing properties, see DYEING.

MADEIRAS, a cluster of islands, belonging to Portugal, situated in the Atlantic ocean, in W. Long. 16°, and between 32° and 33° N. Lat.—The largest of them, called *Madeira*, from which the rest take their name, is about 55 English miles long, and 10 miles broad; and was first discovered on the 2d of July, in the year 1419, by Joao Gonzales Zarco, there being no historical foundation for the fabulous report of its discovery by one Machin an Englishman. It is divided into two capitania, named *Funchal* and *Marico*, from the towns of

Madagas-
car
||
Madeiras.

Madeiras. of those names. The former contains two judicatures, viz. Funchal and Galheta; the latter being a town with the title of a county, belonging to the family of Castello Melhor. The second capitania likewise comprehends two judicatures, viz. Maxico (read Mashico) and San Vicente.

Funchal is the only citadel or city in the island, which has also seven villas or towns; of which there are four, Calheta, Camara de Lobos, Ribeira Braba, and Ponta de Sol in the capitania of Funchal, which is divided into 26 parishes. The other three are in the capitania of Maxico, which consists of 17 parishes; these towns are called *Maxico*, *San Vicente*, and *Santa Cruz*.

There is one curiosity in the town of Funchal, which deserves to be taken notice of, and that is a chamber in one of the corners of the Franciscan convent, the walls and ceiling of which are completely covered with rows of human skulls and human thigh bones, so arranged that in the obtuse angle made by each pair of the latter, crossing each other obliquely, is placed a skull. The only vacant space that appears is in the centre of the side opposite to the door, on which there is an extraordinary painting above a kind of altar, but what the subject it is intended to represent, it is difficult to determine. A figure probably intended for St Francis, the patron saint, seems to be intent on trying in a balance the comparative weight of a sinner and a saint. A dirty lamp suspended from the ceiling, and just glimmering in the socket, serves dimly to light up this dismal den of skulls. The monk who attends as shewman, is careful to impress on the minds of those who visit it, the idea that they are all relics of holy men who died on the island, although Mr Barrow is of opinion that the church-yard must have been frequently robbed, in order to accumulate such a prodigious number of skulls, which from a rough computation made by that gentleman, could not be under 3000.

The governor is at the head of all the civil and military departments of this island, of Porto-Santo, the Salvages, and the Ilhas Desertas; which last only contain the temporary huts of some fishermen, who resort thither in pursuit of their business; his salary is computed to be worth 2000l. per annum, 200l. of which is in the form of a present from the English merchants.

The law department is under the corregidor, who is appointed by the king of Portugal, commonly sent from Lisbon, and holds his place during the king's pleasure. All causes come to him from inferior courts by appeal. Each judicature has a senate; and a *Juiz* or judge, whom they choose, presides over them. At Funchal he is called *Juiz da Fora*; and in the absence, or after the death of the corregidor, acts as his deputy. The foreign merchants elect their own judge, called the *Providor*, who is at the same time collector of the king's customs and revenues, which amount in all to about 12,000l. sterling. Far the greatest part of this sum is applied towards the salaries of civil and military officers, the pay of troops, and the maintenance of public buildings. This revenue arises, first from the tenth of all the produce of this island belonging to the king, by virtue of his office as grand master of the order of Christ; secondly, From ten per cent. duties laid on all imports, provisions ex-

cepted; and lastly, From the eleven per cent. charged **Madeiras.** on all exports.

The island has but one company of regular soldiers of 100 men: the rest of the military force is a militia consisting of 3000 men, divided into companies, each commanded by a captain, who has one lieutenant under him and one ensign. There is no pay given to either the private men or the officers of this militia; and yet their places are much sought after, on account of the rank which they communicate. These troops are embodied once a-year, and exercised once a-month. All the military are commanded by the *Serjeante Mor*. The governor has two *Capitanos de Sal* about him, who do duty as aides-de-camp.

The secular priests on the island are about 1200, many of whom are employed as private tutors. Since the expulsion of the Jesuits, no regular public school is to be found here; unless we except a seminary, where a priest, appointed for that purpose, instructs and educates ten students at the king's expence. These wear a red cloak over the usual black gowns worn by ordinary students. All those who intend to go into orders, are obliged to qualify themselves by studying in the university of Coimbra, lately re-established in Portugal. There is also a dean and chapter at Madeira, with a bishop at their head, whose income is considerably greater than the governor's; it consists of 110 pipes of wine, and of 40 muys of wheat, each containing 24 bushels; which amounts in common years to 3000l. sterling. Here are likewise 60 or 70 Franciscan friars, in four monasteries, one of which is at Funchal. About 300 nuns live on the island, in four convents, of the order of *Merci*, *Sta Clara*, *Incanação*, and *Dom Jesus*. Those of the last-mentioned institution may marry whenever they choose, and leave their monastery.

In the year 1768, the inhabitants living in the 43 parishes of Madeira, amounted to 63,913, of whom there were 31,341 males and 32,572 females. But in that year 5243 persons died, and no more than 2198 children were born; so that the number of the dead exceeded that of the born by 3045. It is highly probable that some epidemical distemper carried off so disproportionate a number in that year, as the island would shortly be entirely depopulated if the mortality were always equal to this. Another circumstance concurs to strengthen this supposition, namely, the excellence of the climate. The weather is in general mild and temperate: in summer, the heat is very moderate on the higher parts of the island, whither the better sort of people retire for that season; and in the winter the snow remains there for several days, whilst it is never known to continue above a day or two in the lower parts.

The common people of this island are of a tawney colour, and well shaped; though they have large feet, owing perhaps to the efforts they are obliged to make in climbing the craggy paths of this mountainous country. Their faces are oblong, their eyes dark; their black hair naturally falls in ringlets, and begins to crisp in some individuals, which may perhaps be owing to intermarriages with negroes; in general, they are hard featured, but not disagreeable. Their women are too frequently ill-favoured, and want the florid complexion, which, when united to a pleasing assemblage

Madeiras. blage of regular features, gives our northern fair ones the superiority over all their sex. They are small, have prominent cheek bones, large feet, an ungraceful gait, and the colour of the darkest brunette. The just proportion of the body, the fine form of their hands, and their large lively eyes, seem in some measure to compensate for those defects. The labouring men, in summer, wear linen trowsers, a coarse shirt, a large hat, and boots; some have a short jacket made of cloth, and a long cloak, which they sometimes carry over their arm. The women wear a petticoat, and a short corselet or jacket, closely fitting their shapes, which is a simple, and often not an elegant dress. They have also a short but wide cloak; and those that are unmarried tie their hair on the crown of their head, on which they wear no covering.

The country people are exceeding sober and frugal; their diet in general consisting of bread and onions, or other roots, and little animal food. However, they avoid eating tripe, or any offals, because it is proverbially said of a very poor man, "He is reduced to eat tripe." Their common drink is water, or an infusion of the remaining rind or skin of the grape (after it has passed through the wine press), which when fermented acquires some tartness and acidity, but cannot be kept very long. The wine for which the island is so famous, and which their own hands prepare, seldom if ever regales them.

Their principal occupation is the planting and raising of vines; but as that branch of agriculture requires little attendance during the greatest part of the year, they naturally incline to idleness. The warmth of the climate, which renders great provision against the inclemencies of weather unnecessary, and the ease with which the cravings of appetite are satisfied, must tend to indolence, wherever the regulations of the legislature do not counteract it, by endeavouring, with the prospect of increasing happiness, to infuse the spirit of industry. It seems the Portuguese government does not pursue the proper methods against this dangerous lethargy of the state. They have lately ordered the plantation of olive trees here, on such spots as are too dry and barren to bear vines; but they have not thought of giving temporary assistance to the labourers, and have offered no premium by which these might be induced to conquer their reluctance to innovations and aversion to labour.

The vineyards are held only on an annual tenure, and the farmer reaps but four-tenths of the produce; since other four-tenths are paid in kind to the owner of the land, one-tenth to the king, and one to the clergy. Such small profits, joined to the thought of toiling merely for the advantage of others, if improvements were attempted, entirely preclude the hopes of a future increase. Oppressed as they are, they have however preserved a high degree of cheerfulness and contentment; their labours are commonly alleviated with songs, and in the evening they assemble from different cottages to dance to the drowsy music of a guitar.

The inhabitants of the towns are more ill-favoured than the country people, and often pale and lean. The men wear French clothes, commonly black, which do not seem to fit them, and have been in fashion in

VOL. XII. Part I.

the polite world about half a century ago. Their ladies *Madeiras.* are delicate and have agreeable features: but the characteristic jealousy of the men still locks them up, and deprives them of a happiness which the country women, amidst all their distresses, enjoy. Many of the better people are a sort of *petite noblesse*, which we would call *gentry*, whose genealogical pride makes them unsocial and ignorant, and causes a ridiculous affectation of gravity. The landed property is in the hands of a few ancient families, who live at Funchal, and in the various towns on the island.

Madeira consists of one large mountain, whose branches rise everywhere from the sea towards the centre of the island, converging to the summit, in the midst of which is a depression or excavation, called the *Val* by the inhabitants, always covered with a fresh and delicate herbage. This and another cavity of the same description are supposed on good grounds to have been craters of volcanoes. The rocks consist of three or four different species of lava, some of which have assumed a regular prismatic form, some of the prisms being extremely perfect, and of 30 or 40 feet in length. They also contain olivine, and occasionally carbonate of lime and zeolite; and intermixed with the strata of lava are beds of clay, with layers of pumice and ashes. The soil of the island is clay on the surface, and large masses of it as hard as brick are found underneath.

Many brooks and small rivulets descend from the summits in deep chasms or glens, which separate the various parts of the island. The beds of the brooks are in some places covered with stones of all sizes, carried down from the higher parts by the violence of winter rains or floods of melted snow. The water is conducted by weirs and channels in the vineyards, where each proprietor has the use of it for a certain time; some being allowed to keep a constant supply of it, some to use it thrice, others twice, and others only once a week. As the heat of the climate renders this supply of water to the vineyards absolutely necessary, it is not without great expence that a new vineyard can be planted; for the maintenance of which, the owners must purchase water at a high price, from those who are constantly supplied, and are thus enabled to spare some of it.

Wherever a level piece of ground can be contrived in the higher hills, the natives make plantations of eddoes, enclosed by a kind of dyke to cause a stagnation, as that plant succeeds best in swampy ground. Its leaves serve as food for hogs, and the country people use the roots for their own nourishment.

The sweet potato is planted for the same purpose, and makes a principal article of diet; together with chesnuts, which grow in extensive woods, on the higher parts of the island, where the vine will not thrive. Wheat and barley are likewise sown, especially in spots where the vines are decaying through age, or where they are newly planted. But the crops do not produce above three months provisions; and the inhabitants are therefore obliged to have recourse to other food, besides importing considerable quantities of corn from North America in exchange for wine. The want of manure, and the inactivity of the people, are in some measure the causes of this disadvantage; but supposing husbandry to be carried to its perfection

†

U a

here,

Madeira here, they could not raise corn sufficient for their consumption. They make their threshing-floors of a circular form, in a corner of a field, which is cleared and beaten solid for the purpose. The sheaves are laid round about it; and a square board, stuck full of sharp slints below, is dragged over them by a pair of oxen, the driver getting on it to increase its weight. This machine cuts the straw as if it had been chopped, and frees the grain from the husk, from which it is afterwards separated.

The great produce of Madeira is the wine, from which it has acquired fame and support. Where the soil, exposure, and supply of water, will admit of it, the vine is cultivated. One or more walks, about a yard or two wide, intersect each vineyard, and are included by stone walls two feet high. Along these walks which are arched over with laths about seven feet high, they erect wooden pillars at regular distances, to support a lattice-work of bamboos, which slopes down from both sides of the walk, till it is only a foot and a half or two feet high, in which elevation it extends over the whole vineyard. The vines are in this manner supported from the ground, and the people have room to root out the weeds which spring up between them. In the season of the vintage, they creep under this lattice-work, cut off the grapes, and lay them into baskets: some bunches of these grapes weigh six pounds and upwards. This method of keeping the ground clean and moist, and ripening the grapes in the shade, contributes to give the Madeira wines that excellent flavour and body for which they are remarkable. The owners of vineyards are however obliged to allot a certain spot of ground for the growth of bamboos; for the lattice-work cannot be made without them: and it is said some vineyards lie quite neglected for want of this useful reed.

The wines are not all of equal goodness, and consequently of different prices. The best, made of a vine imported from Candia by order of the Infante of Portugal, Don Henry, is called *Madeira Malmsey*, a pipe of which cannot be bought on the spot for less than 40l. or 42l. sterling. It is an exceeding rich sweet wine, and is only made in a small quantity. The next sort is a dry wine, such as is exported for the London market, at 30l. or 31l. sterling the pipe. Inferior sorts for the East India, West India, and North American markets, sell at 28l. 25l. and 20l. sterling. About 40,000 pipes are annually exported, one half of which goes to the British settlements in the East and West Indies. The best vines grow on the south side of the island, and on the side of the hill which points to the east. The inhabitants import Indian corn and wheat from North America, great quantities of salt fish from Newfoundland, and fresh meat and live sheep and oxen from Barbary. The total amount of imports from England in the 17 years ending in 1809, was 3,278,043l. and of exports to England only 216,167l.

The enclosures of the vineyards consist of walls, and hedges of prickly pear, pomegranates, myrtles, brambles, and wild roses. The gardens produce peaches, apricots, quinces, apples, pears, walnuts, chesnuts, and many other European fruits; together with now and then some tropical plants, such as bananas, goavas, and pine-apples.

All the common domestic animals of Europe are

likewise found at Madeira; and their mutton and beef, though small, is very well tasted. Their horses are small, but sure-footed; and with great agility climb the difficult paths, which are the only means of communication in the country. They have no wheel-carriages of any kind: but in the town they use a sort of drays or sledges, formed of two pieces of plank joined by cross pieces, which make an acute angle before; these are drawn by oxen, and are used to transport casks of wine, and other heavy goods, to and from the warehouses.

The animals of the feathered tribe, which live wild here, are more numerous than the wild quadrupeds; there being only the common gray rabbit here, as a representative of the last-mentioned class. Game birds, such as turkeys, geese, ducks, and hens, are very rare, which is perhaps owing to the scarcity of corn.

There are no snakes whatsoever in Madeira; but all the houses, vineyards, and gardens, swarm with lizards. The friars of one of the convents complained to Mr Forster, that these vermine destroyed the fruit in their garden; they had therefore placed a brass-kettle in the ground to catch them, as they are constantly running about in quest of food. In this manner they daily caught hundreds, which could not get out on account of the smooth sides of the kettle, but were forced to perish.

The shores of Madeira, and of the neighbouring Salvages and Desertas, are not without fish; but as they are not in plenty enough for the rigid observance of Lent, pickled herrings are brought from Gottenburg in English bottoms, and salted cod from New York and other American ports, to supply the deficiency.

MADIAN, in *Ancient Geography*, a town of Arabia Petraea, near the Arnon; so called from one of the sons of Abraham by Ketura; in ruins in Jerome's time. Jerome mentions another **MADIAN**, or **MIDIAN**, beyond Arabia, in the desert, to the south of the Red sea; and hence *Madianæi*, and *Madianitæi*, the people; and *Madianæa Regio*, the country.

MADNESS, a most dreadful kind of delirium, without fever. See *MEDICINE Index*.

MADRAS. See *S^t GEORGE*.

MADRE DE POPA, a town and convent of South America, in Terra Firma, seated on the river Grande. It is almost as much resorted to by pilgrims of America as Loretto is in Europe; and the image of the Virgin Mary is said to have done many miracles in favour of the seafaring people. W. Long. 76. o. N. Lat. 11. o.

MADREPORA, in *Natural History*, the name of a genus of submarine substances; belonging to the order lithophyta. See *HELMINTHOLOGY Index*.

MADRID, a town of New Castile in Spain, and capital of the whole kingdom, though it never had the title of a city, is situated in W. Long. 3. 5. N. Lat. 40. 26. It stands in the centre of a large plain, surrounded with mountains, and in the very heart of Spain, on the banks of the little river Manzanares, which is always very low and shallow, except when it is swelled by the melting of the snow on the mountains. The city is in general well laid out; the streets are very handsome; and the houses are fair and lofty, but built of brick, with lattice-windows, excepting those of the rich,

Madeira
||
Madrid

Madrigal || it to have been originally a kind of pastoral or shepherd's song; whence the Italians formed their *madrigale*, and we *madrigal*. Others rather choose to derive it from the word *madrugar*, which in the Spanish language signifies "to rise in the morning;" the *madrigales* being formerly sung early in the morning by those who had a mind to serenade their mistresses.

MADURA, a province of Asia, in the peninsula on this side the Ganges; bounded on the east by Tanjour and Marava, on the south-east by the sea, on the west by the Balagate mountains, which separate it from Malabar, and on the north by Visiapour and Carnate. The inhabitants are Gentoos, and of a thievish disposition. The commodities are rice, elephants teeth, and cotton cloth; of which last a good deal is made here, and very fine. At this place is a pearl fishery, which brings in a large sum annually.

MÆANDER, in *Ancient Geography*, a celebrated river of Asia Minor, rising near Celæne. It flows through Caria and Ionia into the Ægean sea between Miletus and Priene, after it has been increased by the waters of the Marsyas, Lycus, Eudon, Lethæus, &c. It is celebrated among the poets for its windings, which amount to no less than 600, and from which all obliquities have received the name of *mæanders*. It forms in its course, according to the observation of some travellers, the Greek letters ζ ξ ε & ω; and from its windings Dædalus is said to have had the first idea of his famous labyrinth.

MÆATÆ, anciently a people of Britain, near Severus's wall, inhabiting the district now called *Lauderdale*, in Scotland.

MÆCENAS, CAIUS CILNIUS, the great friend and counsellor of Augustus Cæsar, was himself a very polite scholar, but is chiefly memorable for having been the patron and protector of men of letters. He was descended from a most ancient and illustrious origin, even from the kings of Hetruria, as Horace often tells us; but his immediate forefathers were only of the equestrian order. He is supposed to have been born at Rome, because his family lived there; but in what year antiquity does not tell us. It says as little about his education: but we know it must have been of the most liberal kind, and perfectly agreeable to the dignity and splendour of his birth, since he excelled in every thing that related to arms, politics, and letters. How Mæcenas spent his younger years is also unknown to us, any farther than by effects; there being no mention made of him by any writer before the death of Julius Cæsar, which happened in the year of Rome 709. Then Octavius Cæsar, who was afterwards called Augustus, went to Rome, to take possession of his uncle's inheritance; and then Mæcenas became first publicly known, though he appears to have been Augustus's intimate friend, and as it should seem guardian, from his childhood. From that time he accompanied him through all his fortunes, and was his counsellor and adviser upon all occasions; so that Pædo Albinovanus justly called him *Cæsar's dextram*, "Cæsar's right-hand."

In A. R. 710, the year that Cicero was killed and Ovid born, Mæcenas distinguished himself by his courage and military skill at the battle of Modena, where the consuls Hirtius and Pansa were slain in fighting against Antony; as he did afterwards at Philippi.

After this last battle began the memorable friendship between Mæcenas and Horace. Horace, as Suetonius relates, was a tribune in the army of Brutus and Cassius, and upon the defeat of those generals made a prisoner of war. Mæcenas, finding him an accomplished man, became immediately his friend and protector; and afterwards recommended him to Augustus, who restored him his estate with no small additions. In the mean time, though Mæcenas behaved himself well as a soldier in these and other battles, yet his principal province was that of a minister and counsellor. He was the adviser, the manager, the negociator, in every thing that related to civil affairs. When the league was made at Brundisium between Antony and Augustus, Mæcenas was sent to act on the part of Augustus. This we learn from Horace in his journey to Brundisium:

*Huc venturus erat Mæcenas optimus, atque
Cocceius, missi magnis de rebus uterque
Legati, aversos soliti componere amicos.* Sat. v. lib. i.

And afterwards, when this league was near breaking, through the suspicions of each party, Mæcenas was sent to Antony to ratify it anew.

In the year 717, when Augustus and Agrippa went to Sicily to fight Sextus Pompeius by sea, Mæcenas went with them; but soon after returned to appease some commotions which were rising at Rome: for though he usually attended Augustus in all his military expeditions, yet whenever there was any thing to be done at Rome either with the senate or people, he was always despatched thither for that purpose.

Upon the total defeat of Antony at Actium, Mæcenas returned to Rome, to take the government into his hands, till Augustus could settle some necessary affairs in Greece and Asia. Agrippa soon followed Mæcenas; and when Augustus arrived, he placed these two great men and faithful adherents, the one over his civil, the other over his military concerns. While Augustus was extinguishing the remains of the civil wars in Asia and Egypt, young Lepidus, the son of the triumvir, was forming a scheme to assassinate him at his return to Rome. This conspiracy was discovered at once, by the extraordinary vigilance of Mæcenas; who, as Velleius Paterculus says, "observing the rash councils of the headstrong youth with the same tranquillity and calmness as if nothing at all had been doing, instantly put him to death, without the least noise and tumult; and by that means extinguished another civil war in its very beginning."

The civil wars being now at an end, Augustus returned to Rome; and from this time Mæcenas indulged himself at vacant hours in literary amusements, and the conversation of men of letters. In the year 734 Virgil died, and left Augustus and Mæcenas heirs to what he had. Mæcenas was excessively fond of this poet, who, of all the wits of the Augustan age, stood highest in his esteem; and if the Georgics and the Æneid be owing to the good taste and encouragement of this patron, as there is some reason to think, posterity cannot commemorate him with too much gratitude. Horace may be ranked next to Virgil in Mæcenas's good graces: we have already mentioned how and at what time their friendship commenced. Propertius also acknowledges Mæcenas for his favourer and protector, lib. ii. eleg. 7.

Nor

Mæcenas. Nor must Varius be forgot, though we have nothing of his remaining; since we find him highly praised by both Virgil and Horace. He was a writer of tragedies; and Quintilian thinks he may be compared with any of the ancients. In a word, Mæcenas's house was a place of refuge and welcome to all the learned of his time; not only to Virgil, Horace, Propertius, and Varius, but to Fundarius, whom Horace extols as an admirable writer of comedies; to Fuscus Aristius, a noble grammarian, and Horace's intimate friend; to Plotius Tucea, who assisted Varius in correcting the *Æneid* after the death of Virgil; to Valgius, a poet and very learned man, who, as Pliny tells us, dedicated a book to Augustus, *De usu Herbarum*; to Asinius Pollio, an excellent tragic writer; and to several others, whom it would be tedious to mention. All these dedicated their works, or some part of them at least, to Mæcenas, and celebrated his praises in them over and over: and we may observe farther, what Plutarch tells us, that even Augustus himself inscribed his Commentaries to him and to Agrippa.

Mæcenas continued in Augustus's favour to the end of his life, but not uninterruptedly. Augustus had an intrigue with Mæcenas's wife: and though the minister bore this liberty of his master very patiently, yet there was a coldness on the part of Augustus, which, however, soon went off. Mæcenas died in the year 745; but at what age we cannot precisely determine, though we know he must have been old. He must have been older than Augustus, because he was a kind of tutor to him in his youth: and we find him often called an *old man* by Pædo Albinovanus, a contemporary poet, whose elegy upon his dead patron is still extant. He made Augustus his heir; and recommended his friend Horace to him in those memorable last words, "*Horatii Flacci, ut mei, memor esto,*" &c. Horace, however, did not probably survive him long, as there is no elegy of his upon Mæcenas extant, nor any account of one having ever been written, which there certainly would have been had Horace survived him any time. Nay, Father Sanadon, the French editor of Horace, will have it, that the poet died before his patron; and that these last words were found only in Mæcenas's will, which had not been altered.

Mæcenas is said never to have enjoyed a good state of health in any part of his life: and many singularities are related of his bodily constitution. Thus Pliny tells us, that he was always in a fever; and that, for three years before his death, he had not a moment's sleep. Though he was certainly an extraordinary man, and possessed many admirable virtues and qualities, yet it is agreed on all hands, that he was very luxurious and effeminate. "Mæcenas (says Velleius Paterculus) was of the equestrian order, but sprung from a most illustrious origin. He was a man, who, when business required, was able to undergo any fatigue and watching; who consulted properly upon all occasions, and knew as well how to execute what he had consulted; yet a man who in seasons of leisure was luxurious, soft, and effeminate, almost beyond a woman. He was no less dear to Cæsar than Agrippa, but distinguished by him with fewer honours; for he always continued of the equestrian rank, in which he was born: not that he could not have been advanced upon the least intimation, but he never solicited it."

But let moralists and politicians determine of Mæcenas as they please, the men of letters are under high obligations to celebrate his praises and revere his memory: for he countenanced, protected, and supported, as far as they wanted his support, all the wits and learned men of his time; and that too, out of a pure and disinterested love of letters, when he had no little views of policy to serve by their means: whence it is no wonder, that all the protectors and patrons of learning, ever since, have usually been called *Mæcenas's*.

MAELSTROM, a very dangerous whirlpool on the coast of Norway, in the 68th degree of latitude, in the province of Nordland, and the district of Lofoden and near the island of Moskoe, from whence it also takes the name of *Moskoe-strom*. Its violence and roarings exceed that of a cataract, being heard to a great distance, and without any intermission, except a quarter every sixth hour, that is, at the turn of high and low water, when its impetuosity seems at a stand, which short interval is the only time the fishermen can venture in; but this motion soon returns, and, however calm the sea may be, gradually increases with such a draught and vortex, as absorb whatever comes within their sphere of action, and keep it under water for some hours, when the fragments, shivered by the rocks, appear again. This circumstance, among others, makes strongly against Kircher and others, who imagine that there is here an abyss penetrating the globe, and issuing in some very remote parts, which Kircher is so particular as to assign, for he names the gulf of Bothnia. But after the most exact researches which the circumstances will admit, this is but a conjecture without foundation; for this and three other vortices among the Ferroe islands, but smaller, have no other cause than the collision of waves rising and falling, at the flux and reflux, against a ridge of rocks and shelves, which confine the water so that it precipitates itself like a cataract; and thus the higher the flood rises, the deeper must the fall be; and the natural result of this is a whirlpool or vortex, the prodigious suction whereof is sufficiently known by lesser experiments. But what has been thus absorbed, remains no longer at the bottom than the ebb lasts; for the suction then ceases, and the flood removes all attraction, and permits whatever had been sunk to make its appearance again. Of the situation of this amazing Moskoe-strom we have the following account from Mr Jonas Ramus: "The mountain of Helseggen, in Lofoden, lies a league from the island Ver, and betwixt these two runs that large and dreadful stream called *Moskoe-strom*, from the island Moskoe, which is in the middle of it, together with several circumjacent isles, as Ambaaren, half a quarter of a league northward, Ifesen, Heeholm, Kieldholm, Suarven, and Buckholm. Moskoe lies about half a quarter of a mile south of the island of Ver, and betwixt them these small islands, Otterholm, Flimen, Sanfisen, Stockholm. Betwixt Lofoden and Moskoe, the depth of the water is between 36 and 40 fathoms; but on the other side, towards Ver, the depth decreases, so as not to afford a convenient passage for a vessel, without the risk of splitting on the rocks, which happens even in the calmest weather: when it is flood, the stream runs up the country between Lofoden and Moskoe with a boisterous rapidity; but the roar of its impetuous ebb to.

Mæcenas,
Maelstrom.

Mælstrom || **Mæonides.** to the sea is scarcely equalled by the loudest and most dreadful cataracts; the noise being heard several leagues off, and the vortices or pits are of such an extent and depth, that if a ship comes within its attraction, it is inevitably absorbed and carried down to the bottom, and there beat to pieces against the rocks; and when the water relaxes, the fragments thereof are thrown up again. But these intervals of tranquillity are only at the turn of the ebb and flood, and in calm weather: and last but a quarter of an hour, its violence gradually returning. When the stream is most boisterous, and its fury heightened by a storm, it is dangerous to come within a Norway mile of it: boats, ships, and yachts having been carried away, by not guarding against it before they were within its reach. It likewise happens frequently, that whales come too near the stream and are overpowered by its violence; and then it is impossible to describe their howlings and bellowings in their fruitless struggles to disengage themselves. A bear once attempting to swim from Lofoden to Moskoe, with a design of preying upon the sheep at pasture in the island, afforded the like spectacle to the people; the stream caught him, and bore him down, whilst he roared terribly, so as to be heard on shore. Large stocks of firs and pine trees, after being absorbed by the current, rise again, broken and torn to such a degree as if bristles grew on them. This plainly shows the bottom to consist of craggy rocks, among which they are whirled to and fro. This stream is regulated by the flux and reflux of the sea; it being constantly high and low water every six hours. In the year 1645, early in the morning of Sexagesima Sunday, it raged with such noise and impetuosity, that on the island of Moskoe, the very stones of the houses fell to the ground."

MÆMACTERIA, sacrifices offered to Jupiter at Athens in the winter month Mæmacterion. The god surnamed Mæmactes was entreated to send mild and temperate weather, as he presided over the seasons, and was the god of the air.

MÆMACTERION, was the fourth month of the Athenian year, containing twenty-nine days, and answering to the latter part of our September, and the beginning of October. It received its name from the festival *Mæmacteriu*, which was observed about this time. This month was called by the Æcœtians *Alalcomenius*.

MÆNA. See SPARUS, *ICHTHYOLOGY Index*.

MÆNALUS, in *Ancient Geography*, a mountain of Arcadia sacred to the god Pan, and greatly frequented by shepherds. It received its name from Mænalus a son of Lycaon. It was covered with pine trees, whose echo and shade have been greatly celebrated by all the ancient poets.

MÆONIA, or **MOEONIA**, a country of Asia Minor, and forming part of Lydia; namely the neighbourhood of Mount Tmolus, and the country watered by the Pactolus. The rest on the sea coast was called Lydia. See **LYDIA**.

MÆONIDÆ, a name given to the muses, because Homer, their greatest and worthiest favourite, was supposed to be a native of Mæonia.

MÆONIDES, a surname of Homer, because, according to the opinion of some writers, he was born in Mæonia, or because his father's name was Mæon.

MÆOTIS PALUS or **LACUS**, *Mæotica Palus*, or *Mæoticus Lacus*, in *Ancient Geography*, a large lake or part of the sea between Europe and Asia, at the north of the Euxine, to which it communicates by the Cimmerian Bosphorus. It was worshipped as a deity by the Massagetæ. It extends about 390 miles from south-west to north-east, and is about 600 miles in circumference. Still called *Palus Mæotis*, reaching from Crim Tartary to the mouth of the Don.

Mæotis
Palus
||
Mæoti.

MÆSTLIN, **MICHAEL**, in Latin *Mæstlinus*, a celebrated astronomer of Germany, was born in the duchy of Wittenberg; but spent his youth in Italy, where he made a speech in favour of Copernicus's system, which brought Galilæo over from Aristotle and Ptolemy, to whom he had been hitherto entirely devoted. He afterwards returned to Germany, and became professor of mathematics at Tübingen; where, among his other scholars, he taught the great Kepler, who has praised several of his ingenious inventions, in his *Astronomia Optica*. Though Tycho Brahé did not assent to Mæstlin's opinion, yet he allowed him to be an extraordinary person, deeply skilled in the science of astronomy. Mæstlin published many mathematical and astronomical works; and died in 1590.

MÆSTRICHT, an ancient town of the Netherlands; is about four miles in circumference, and strongly fortified. The inhabitants, the number of whom is estimated at 18,000, are noted for making excellent fire arms. It contains an arsenal, a handsome town-house, and a good library. Both Papists and Protestants are allowed the free exercise of their religion, and the magistrates are composed of both. It is seated on the river Maese, which separates it from Wyck, and with which it communicates by a handsome bridge. Mæstricht revolted from the Spaniards in 1570, but was reduced in 1579. Louis XIV. became master of it in 1673; but it was restored to the states by the treaty of Nimeguen in 1678. It was again taken by the French in 1794, and remained in their possession till 1814. It now belongs to the kingdom of the Netherlands. E. Long. 5. 50. N. Lat. 50. 52.

MAFFÆUS, **VEGIO**, a Latin poet, born in Lombardy in 1407, was greatly admired in his time. He wrote epigrams, and a humorous supplement to Virgil, which he called *The thirteenth book of the Æneid*: this was as humorously translated into English a few years since by Mr Ellis. Maffæus wrote also some prose works. He was chancellor of Rome towards the end of the pontificate of Martin V.; and died in 1458.

MAFFEI, **SCIPIO**, a celebrated Italian poet, born of an illustrious and ancient family at Verona, in 1675. After having finished his studies, he took arms, and distinguished himself by his valour at the battle of Donawert; but he more particularly distinguished himself by his love of learning, which made him undertake several voyages into France, England, and Germany. He conversed with the learned in all those countries, and obtained their friendship and esteem. He was a member of the academy of the Arcadia at Rome, an honorary foreign member of that of Inscriptions at Paris; and died in 1755. He wrote many works in verse and prose, which are esteemed; the most known of which are, 1. The tragedy of Merope, of which there

Maffi
||
Magazine.

there are two French translations in prose. 2. Ceremony, a comedy. 3. A translation, into Italian verse, of the first book of Homer's Iliad. 4. Many other pieces of poetry, in a collection entitled *Rhyme and Prose*, quarto. His principal works in prose are, 1. *Verona illustrata*. 2. *Istoria diplomatica*. 3. *Scienza cavalleresca*; an excellent work, in which he attacks duelling. 4. An edition of *Theatro Italiano*. 5. An edition of Cassiodorus on the Epistles, Acts of the Apostles, and Apocalypse. 6. *Gallix Antiquitates quedam selectæ, atque in plures epistolas distributæ*; and several other works.

MAGADA, in *Mythology*, a title under which Venus was known and worshipped in Lower Saxony; where this goddess had a famous temple, which was treated with respect even by the Huns and Vandals when they ravaged the country. It is said to have been destroyed by Charlemagne.

MAGADOXO, the capital town of a kingdom of the same name, in Africa, and on the coast of Ajan. It is seated near the mouth of a river of the same name, defended by a citadel, and has a good harbour. The inhabitants are Mahometans. E. Long. 45. 15. N. Lat. 3. 0.

MAGAS, MAGADIS, (from *μαγαδίζω*, "to sing, or play in unison or octave,") the name of a musical instrument in use among the ancients.

There were two kinds of *magades*, the one a string instrument, formed of 20 chords arranged in pairs, and tuned to unison or octave, so that they yielded ten sounds: the invention whereof is ascribed by some to Sappho; by others to the Lydians; and by some, to Timotheus of Miletus. The other was a kind of flute, which at the same time yielded very high and very low notes. The former kind was at least much improved by Timotheus of Miletus, who is said to have been impeached of a crime, because by increasing the number of chords he spoiled and discredited the ancient music.

MAGAZINE, a place in which stores are kept, of arms, ammunition, provisions, &c. Every fortified town ought to be furnished with a large magazine, which should contain stores of all kinds, sufficient to enable the garrison and inhabitants to hold out a long siege; and in which smiths, carpenters, wheelwrights, &c. may be employed in making every thing belonging to the artillery, as carriages, wagons, &c.

Powder MAGAZINE, is that place where the powder is kept in very large quantities. Authors differ greatly both with regard to their situation and construction; but all agree that they ought to be arched and bomb-proof. In fortifications, they are frequently placed in the rampart; but of late they have been built in different parts of the town. The first powder magazines were made with Gothic arches: but M. Vauban finding them too weak, constructed them in a semicircular form; whose dimensions are 60 feet long within, and 25 broad; the foundations are eight or nine feet thick, and eight feet high from the foundation to the spring of the arch, the floor is two feet from the ground, which keeps it from dampness.

One of our engineers of great experience some time since had observed, that after the centres of semicircular arches are struck, they settle at the crown and rise

up at the hanches, even with a straight horizontal extrados, and still much more so in powder magazines, whose outside at top is formed like the roof of a house, by two inclined planes joining in an angle over the top of the arch, to give a proper descent to the rain; which effects are exactly what might be expected agreeable to the true theory of arches. Now, as this shrinking of the arches must be attended with very ill consequences, by breaking the texture of the cement after it has been in some degree dried, and also by opening the joints of the voussoirs at one end, so a remedy is provided for this inconvenience with regard to bridges, by the *arch of equilibration* in Mr Hutton's book on bridges; but as the ill effect is much greater in powder magazines, the same ingenious gentleman proposed to find an arch of equilibration for them also, and to construct it when the span is 20 feet, the pitch or height 10 (which are the same dimensions as the semicircle), the inclined exterior walls at top forming an angle of 113 degrees, and the height of their angular point above the top of the arch equal to seven feet. This very curious question was answered in 1775 by the reverend Mr Wildbore, to be found in Mr Hutton's *Miscellanea Mathematica*.

Artillery MAGAZINE. In a siege, the magazine is made about 25 or 30 yards behind the battery, towards the parallels, and at least three feet under ground, to hold the powder, loaded shells, portfires, &c. Its sides and roof must be well secured with boards to prevent the earth from falling in: a door is made to it, and a double trench or passage is sunk from the magazine to the battery, one to go in and the other to come out at, to prevent confusion. Sometimes traverses are made in the passages to prevent ricochet shot from plunging into them.

MAGAZINE, on shipboard, a close room or storehouse, built in the fore or after-part of the hold to contain the gunpowder used in battle. This apartment is strongly secured against fire, and no person is allowed to enter it with a lamp or candle: it is therefore lighted, as occasion requires, by means of the candles or lamps in the *light-room* contiguous to it.

MAGAZINE *Air-Gun*. See *Air-Gun*.

MAGAZINE, *Literary*; a well-known species of periodical publications, of which the first that appeared was *The Gentleman's*, set on foot by the projector Mr Edward Cave in the year 1731: (see the article CAVE). This, as Dr Kippis observes †, "may be considered as something of an epocha in the literary history of this country. The periodical performances before that time were almost wholly confined to political transactions, and to foreign and domestic occurrences; but the monthly magazines have opened a way for every kind of inquiry and information. The intelligence and discussion contained in them are very extensive and various: and they have been the means of diffusing a general habit of reading through the nation, which in a certain degree hath enlarged the public understanding. Many young authors, who have afterwards risen to considerable eminence in the literary world, have here made their first attempts in composition. Here too are preserved a multitude of curious and useful hints, observations, and facts, which otherwise might have never appeared; or if they had appeared in a more evanescent form, would have incurred the danger of being lost. If it

Magde-
burg.

it were not an invidious task, the history of them would be no incurious or unentertaining subject. The magazines that unite utility with entertainment are undoubtedly preferable to those (*if there have been any such*) which have only a view to idle and frivolous amusement. It may be observed, that two of them, *The Gentleman's* and *The London*, which last was begun the year after the former, have, amidst their numerous rivals, preserved their reputation to the present day. They have both of them, in general, joined instruction with pleasure; and this likewise hath been the case with some others of a later origin.—The original London Magazine, it has been believed, has been discontinued for some years past.—The next oldest publication of this kind, is that entitled *The Scots Magazine*: which was commenced at Edinburgh a few years posterior to the appearance of the *Gentleman's* at London; which, like it, has survived many rivals, and has been continued, under different proprietors and editors, with various degrees of merit.

MAGDALEN, MARY. See **MARY.**

Religious of St MAGDALEN, a denomination given to divers communities of nuns, consisting generally of penitent courtézans; sometimes also called *Magdalenettes*. Such are those at Metz, established in 1452; those at Paris, in 1492; those at Naples, first established in 1324, and endowed by Queen Sancha, to serve as a retreat for public courtézans, who should betake themselves to repentance; and those of Rouen and Bourdeaux, which had their original among those of Paris in 1618. In each of these monasteries there are three kinds of persons and congregations; the first consist of those who are admitted to make vows, and these bear the name of *St Magdalen*; the congregation of *St Martha* is the second, and is composed of those whom it is not judged proper to admit to vows; finally, the congregation of *St Lazarus* is composed of such as are detained there by force.

The religions of *St Magdalen* at Rome were established by Pope Leo X. Clement VIII. settled a revenue on them; and farther appointed, that the effects of all public prostitutes, dying intestate, should fall to them; and that the testaments of the rest should be invalid unless they bequeathed a portion of their effects, which was to be at least a fifth part, to them.

MAGDALEN Hospital. See **LONDON**, N^o 115.

MAGDALENA, one of the Marquesas islands, about five leagues in circuit, and supposed to be in S. Lat. 10. 25. W. Long. 138. 50. It was only seen at nine leagues distance by those who discovered it.

MAGDALENE'S CAVE, a cave of Germany, and in Carinthia, 10 miles east of Gortz. It appears like a chasm in a rock, and at the entrance torches are lighted to conduct travellers. It is divided into several apartments, or halls, with a vast number of pillars formed by nature, which give it a beautiful appearance, they being as white as snow, and almost transparent. The bottom is of the same substance, inasmuch that a person may fancy himself to be walking among the ruins of an enchanted castle, surrounded with magnificent pillars, some entire and others broken.

MAGDEBURG, a duchy of Germany, in the circle of Lower Saxony; bounded on the north by the duchy of Mecklenburgh, on the south and south-

west by the principality of Anhalt and Halberstadt, on the east by Upper Saxony with part of Brandenburg, and on the west by the duchy of Wolfenbuttle. The Saale circle, and that of Luxkenwalde, are separated from the rest, and surrounded on all sides by a part of Upper Saxony. This country is for the most part level; but sandy, marshy, or overgrown with woods. There are salt springs in it, so rich that they are sufficient to supply all Germany with that commodity. The Holz circle is the most fruitful part of it. In the Saale circle, where wood is scarce, there is pit-coal: and at Rothenburg is a copper-mine worked. The duchy is well watered, for the Elbe passes through it; and the Saale, Havel, Aller, Ohre, and Elster, either rise in, or wash some part of it in their course. The whole duchy, exclusive of that part of the county of Mansfeldt, which is connected with it, is said to contain 29 cities, six towns, about 430 villages, and 330,000 inhabitants. The states of the country consist of the clergy, the nobility, and deputies of the cities. Before it became subject to the electoral house of Brandenburg, frequent diets were held in it; but at present no diets are held, nor have the states the direction of the finances as formerly. Before the Reformation, it was an archbishopric, subject in spirituals to the pope alone, and its prelate was primate of all Germany; but embracing the Reformation, it chose itself administrators, till the treaty of Munster, in 1648, when it was given, together with the bishopric of Halberstadt, to the elector of Brandenburg, as an equivalent for the Hither Pomerania, granted by that treaty to the king of Sweden. Lutheranism is the predominant religion here; but Calvinists, Jews, and Roman Catholics, are tolerated. Of the last there are five convents, who never embraced the Reformation. All the Lutheran parishes, amounting to 314, are subject to 16 inspectors, under one general superintendent; only the clergy of the old town of Magdeburg are under the direction of their senior. The Jews have a synagogue at Halle. The manufactures of the duchy are cloth, stuffs, stockings, linen, oil-skins, leather, and parchment; of which, and grain of all sorts, large quantities are exported. The arms of it are, Party per pale, ruby, and pearl. The king of Prussia, as duke of Magdeburg, sits and votes between the elector of Bavaria, as duke of Bavaria, and the elector palatine, as palgrave of Lautern. Of the states of the circle of Lower Saxony he is the first. His matricular assessment for the duchy is 43 horse and 196 foot, or 1300 florins monthly; and to the chamber of Wetzlar, 343 florins and 40 kruitzers. For the civil government of the duchy there is a council of regency, with a war and demesne chamber; and for the ecclesiastical a consistory and general superintendent. The revenues of the duchy, arising from the salt-works, demesne, and taxes, some of which are very heavy and oppressive, are said to amount to 800,000 rixdollars annually. With respect to salt, every housekeeper in the Prussian dominion is obliged to buy a certain quantity for himself and wife; and also for every child and servant, horse, cow, calf, and sheep, that he possesses. The principal places are Magdeburg, Halle, and Glauche.

MAGDEBURG, a city of Germany, in a duchy of the same name, of which it is not only the capital, but that

Magde-
burg.

Magde-
burg.

of all Lower Saxony, and formerly of even all Germany. It stands on the Elbe, in E. Long. 11. 38. N. Lat. 52. 16. It is a city of great trade, strongly fortified, and very ancient. Its name signifies the *maiden city*; which, some imagine, took its rise from the temple of Venus, which is said to have stood here anciently, and to have been destroyed by Charlemagne. The founder of the city is supposed to have been Otho I. or his empress Editha, daughter to Edmund the Saxon king of England. The same emperor founded a Benedictine convent here, which he afterwards converted into an archbishopric, of which the archbishop was a count-palatine, and had very great privileges, particularly that of wearing the archiepiscopal pallium, and having the cross borne before him, besides many others. The first tournament in Germany is said to have been appointed near this city, by the emperor Henry the Fowler; but these pastimes were afterwards abolished, because they occasioned such envy and animosity among the nobility, that several of them killed one another upon the spot. The situation of the city is very convenient and pleasant, upon the banks of the Elbe, amidst spacious fruitful plains, and on the road betwixt High and Low Germany. It has been a great sufferer by fires and sieges; but by none so much as that in 1631, when the emperor's general, Count Tilly, took it by storm, plundered and set it on fire, by which it was entirely reduced to ashes, except the cathedral, the convent of our Lady, and a few cottages belonging to fishermen; of 40,000 burghers, not above 400 escaping. The soldiers spared neither age nor sex; but ripped up women with child, murdered sucking infants in sight of their parents, and ravished young women in the streets; to prevent which violation, many of them flung themselves into the Elbe, and others into the fire. The city is now populous, large, and well built, particularly the broad street and cathedral square. The principal buildings are the king's palace, the governor's house, the armoury, guildhall, and cathedral. The last is a superb structure in the antique taste, dedicated to St Maurice, which has a fine organ, the master pipe of which is so big, that a man can scarce clasp it with both arms; it also contains the tombs of the emperor Otho and the empress Editha; a fine marble statue of St Maurice, a porphyry font, an altar in the choir of one stone of divers colours, curiously wrought, and many other curiosities. They show here a bedstead and table which belonged to Martin Luther, when he was an Augustine friar in a cloister of this city before the Reformation. Among the relics, they pretended to have the bason in which Pilate washed his hands after his condemnation of our Saviour; the lantern which Judas made use of when he apprehended him; and the ladder on which the cock crowed after St Peter denied him. The chapter consists of a provost, sixteen major and seven minor canons; besides which, there are four other Lutheran collegiate foundations, and a Lutheran convent dedicated to our Lady, in which is a school or seminary. Here is also a gymnasium, with an academy, in which young gentlemen are instructed in the art of war. The canons of the chapter, which, except the change of religion, is upon the same footing as before the Reformation, must make proof of their nobility. The prebends and dignities are all in the

VOL. XII. Part I.

†

gift of the elector; and the revenue of the provost is computed at 12,000 crowns a-year. Here is a great trade, and a variety of manufactures. The chief are those of woollen cloths and stuffs, silks, cottons, linen, stockings, hats, gloves, tobacco, and snuff. The city was formerly one of the Hanse and Imperial towns. Editha consort to Otho I. on whom it was conferred as a dowry, among many other privileges and advantages, procured it the grant of a yearly fair. The burgrave of this city was anciently an office of great power; having the civil and criminal jurisdiction, the office of hereditary cupbearer being annexed to it, and was long held as a fief of the archbishopric, but afterwards became an imperial fief, which was again conferred on the archbishopric by the elector of Saxony, upon certain conditions.

MAGDOLUM, or MAGDALUM, in *Ancient Geography*, a town of the Lower Egypt, twelve miles to the south of Pelusium (Herodotus, Antonine), which doubtless is the Migdal or Magdol of Jeremiah.—Another MAGDALUM, or MIGDOL, denoting literally “a tower or place of strength,” near the Red sea, (Moses); far to the south of the former.

MAGELLAN, FERDINAND DE, an eminent navigator, was by birth a Portuguese, of a good family. He served in the East Indies with reputation for five years under Albuquerque, and in 1510 he greatly distinguished himself at the battle of Malacca. Deeming his services poorly repaid by his own court, he entered into the employment of Charles V. king of Spain. He has been charged with peculation by some of his countrymen, who have assigned this as the reason why he quitted Portugal. In conjunction with Ruy Foleiro he formed the bold design of discovering a new passage by the west to the Molucca islands, which he offered to prove fell within the division of the globe assigned by the pope to the crown of Castile. It is said that he first proposed this enterprise to Emanuel king of Portugal, who rejected it, as opening a way for other nations to have access to the East Indies, the trade of which was now monopolized by the Portuguese. The proposition was agreed to by the king of Spain, and on the 20th of September 1519 Magellan sailed from San Lucar with five ships and 236 men under his command. His officers soon murmured at this appointment, considering it as a disgrace to be commanded by a renegade Portuguese; and when the fleet was lying at a port in South America which they named San Julian, a conspiracy was formed against him by three of the captains, which he discovered and quelled. He caused the captain of one of the ships to be assassinated, he boarded a second, and secured the mutineers, and the third submitted.

The coast on which they lay was that of Patagonia; and this first voyage contains accounts of the extraordinary stature of the natives. About the end of October they reached a cape, to which they gave the name of Dec las Virgines, forming the entrance of the straits which bear the name of Magellan. He exerted all his authority to induce his men to venture on this unknown passage, with the view of crossing a vast ocean beyond it, at the hazard of running short of provisions, of which a supply for three months was all he had remaining. One of his ships abandoned him, and made the best of her way to Europe. The rest proceeded, and on the

Magellan.

Magellan
||
Maggi

27th of November they discovered the South sea, which made Magellan shed tears of joy. They continued their voyage over this ocean, now visited for the first time by Europeans, and were not long in suffering those evils from famine which they had apprehended. The men were reduced to the necessity of eating the hides with which the rigging was covered. The weather proved so uniformly calm and temperate, that they gave to the ocean the name of *Pacific*. They came in sight of the Ladrões on the 6th of March, so called from the thievish disposition of the inhabitants; and from thence they sailed to the Philippines. At Zebu Magellan obtained with little difficulty the conversion of the king; and on condition of his becoming a vassal of Spain, the Portuguese assisted him in reducing some neighbouring chieftains, and the cross was erected over some burnt villages.

With about 50 men Magellan landed upon Matan, whose chief refused to submit to Zebu, had an engagement between them lasted for the greater part of the day. His troops having spent all their ammunition, found it necessary to retreat, during which Magellan was wounded in the leg by an arrow, beaten down, and at last slain with a lance. This happened in 1521. By this act of imprudence he lost the honour of being the first circumnavigator of the globe, which fell to the lot of Cano, who brought his ship home by the East Indies. Yet Magellan has secured an immortal name among maritime discoveries, by the commencement of this great enterprize, in which he displayed extraordinary skill and resolution, but disregarded justice and humanity, then almost universal among adventurers of this class.

Straits of MAGELLAN, a narrow passage between the island of Terra del Fuego and the southern extremity of the continent of America. This passage was first discovered by Ferdinand Magellan, who sailed through it into the South sea, and from thence to the East Indies. Other navigators have passed the same way; but as these straits are exceedingly difficult, and subject to storms, it has been common to sail by Cape Horn, rather than through the straits of Magellan. See *Straits Le MAIRE*, and *TERRA del Fuego*.

MAGELLANIC CLOUDS, whitish appearances like clouds, seen in the heavens towards the south pole, and having the same apparent motion as the stars. They are three in number, two of them near each other. The largest lies far from the south pole; but the other two are not many degrees more remote from it than the nearest conspicuous star, that is, about 11 degrees. Mr Boyle conjectures, that if these clouds were seen through a good telescope, they would appear to be multitudes of small stars, like the milky-way.

MAGGI, JEROME, in Latin *Magias*, one of the most learned men of the 16th century, was born at Anghiari in Tuscany. He applied himself to all the sciences, and even to the art of war; and distinguished himself so much in this last study, that the Venetians sent him into the island of Cyprus in quality of judge of the admiralty. When the Turks besieged Famagusta, he performed all the services that could be expected from the most excellent engineer: he invented mines and machines for throwing fire, by means of which he destroyed all the works of the besiegers, and in an instant overthrew what had cost the Turks infi-

nite labour. But they had their revenge; for, taking the city in 1571, they plundered his library, carried him loaded with chains to Constantinople, and treated him in the most inhuman and barbarous manner. He nevertheless comforted himself from the example of *Æsop*, *Menippus*, *Epictetus*, and other learned men; and, after passing the whole day in the meanest drudgery, he spent the night in writing. He composed, by the help of his memory alone, treatises filled with quotations, which he dedicated to the Imperial and French ambassadors. These ministers, moved by compassion for this learned man, resolved to purchase him; but while they were treating for his ransom, Maggi found means to make his escape, and to get to the Imperial ambassador's house; when the grand visir being enraged at his flight, and remembering the great mischief he had done the Turks during the siege of Famagusta, sent to have him seized, and caused him to be strangled in prison in 1572. His principal works are, 1. A Treatise on the Bells of the Ancients. 2. On the Destruction of the World by Fire. 3. Commentaries on *Æmilius Probus's* Lives of Illustrious Men. 4. Commentaries on the Institutes. These works are written in elegant Latin. He also wrote a treatise on fortification in Italian; and a book on the situation of ancient Tuscany.

He ought not to be confounded with his brother *Bartholomew Maggi*, a physician at Bologna, who wrote a treatise of gunshot wounds: nor with *Vincent Maggi*, a native of Bresse, and a celebrated professor of humanity, at Ferrara in Padua, who was the author of several works.

MAGGIORE, LAKE OF, a beautiful lake, situated on the confines of Switzerland and Italy, on the south side of the Alps. It is about 50 miles long and 4 or 5 miles broad, and is bent into a very irregular figure. Its height above the level of the sea, according to Count *Moroso*, is 732 feet. Its greatest known depth is 1800 feet. It receives the waters of the *Tesino*, *Magia*, and other rivers from the surrounding mountains. There are several islands in it, and two of these, called the *Borromean islands*, which have been beautified with gardens and buildings at a great expence, are much admired by travellers.

MAGGOT, the common name of the fly-worm bred in flesh, from the egg of the great blue flesh fly. Notwithstanding the distaste for this animal, its figure and structure of parts are greatly worth attending to; and may serve as a general history of the class of worms produced from the eggs of flies.

This animal is white and fleshy; its body is composed of a number of rings, like the bodies of caterpillars and other similar insects; and is capable, at the pleasure of the animal, of assuming different figures; being at times more or less extended in length, and consequently more or less thick.

Notwithstanding that this animal has no legs, it is able to move itself very swiftly; and in its first attempt to move, its body is extended to its greatest length, and assumes something of the figure of a pointed cone. The pointed part of the cone is the head of the animal, and is not separated from the next ring by any deeper furrow than the rest of the rings are from one another. In some states of the animal, one may see two short horns thrust out from the head; but more generally

Maggi.
Maggot.

Maggot

generally two scaly hooks are observable: these are, however, sometimes hid, and have each of them a case or sheath, into which the animal can retract them at pleasure. These hooks are bent into an arch, the concavity of which is towards the plane on which the creature is placed; and they are thickest at their insertion in the head, and thence diminish gradually, till they terminate in a fine sharp point.

These two hooks are placed in a parallel direction, and can never come together, and therefore cannot serve in the place of teeth for grinding the food; but merely to pull and sever it in pieces, that it may be of a proper size for the mouth of the creature. Besides these hooks, the maggot has a kind of dart, which is about a third part of their length, and is placed at an equal distance between them. This is also brown and scaly like them; it is quite straight, and terminates in a fine point. The hooks have as it were two scaly thorns at their points; and this dart seems intended, by reiterated strokes, to divide and break the pieces of flesh these have separated from the rest into smaller parts. Immediately below the apertures for the egress of the hooks, is placed the mouth of the animal; the creature does not show this little opening unless pressed: but if the pressure is properly managed it will sufficiently open it, and there may be discovered within it a small protuberance, which may very naturally be supposed either the tongue or the sucker of the animal. The hooks in these creatures not only supply the place of teeth, but also of legs; since it is by fastening these hooks into the substance it is placed on, and then drawing up its body to it, that it pulls itself along.

The back of this creature lowers itself by degrees as it approaches the extremity of the belly: and near the place where the back begins to lower itself, are placed the creature's two principal organs of respiration. One may perceive there are two small roundish brown spots: they are very easily distinguishable by the naked eye, because the rest of the body of the creature is white; but if we take in the assistance of glasses, each of these spots appears to be a brown circular eminence raised a little above the rest of the body. On each of these spots one may also discover three oblong oval cavities, something of the shape of button holes; these are situated in a parallel direction to one another, and their length nearly in a perpendicular direction to that of the body of the animal. These apertures are so many stigmata or air-holes: openings destined to admit the air necessary to the life of the animal. It has six of these stigmata, three in each side of its body.

The great transparency of the body of this animal gives us an opportunity also to distinguish that it has on each side a large white vessel running the whole length of the body. It is easy to follow the course of these vessels through their whole length, but they are most distinct of all towards its hinder part; and they are always seen to terminate each in the brown spot above mentioned; this leaves us no room to doubt that they are the two principal tracheæ.

The ramifications of the two great tracheæ are very beautifully seen in this creature, especially on its belly; and it is remarkable, that no vessel analogous to the great artery in the caterpillar class can be discovered in these; though, if there were any such, their great

transparency must needs make them very easily distinguishable; nor could its dilatations and contractions, if so considerable as in that class of animals, be less so. See CATERPILLAR, ENTOMOLOGY *Index*.

MAGI, or MAGIANS, an ancient religious sect in Persia, and other eastern countries, who maintained that there were two principles, one the cause of all good, the other the cause of all evil: and, abominating the adoration of images, they worshipped God only by fire; which they looked upon as the brightest and most glorious symbol of Oromasdes, or the good god; as darkness is the truest symbol of Arimanius, or the evil god. This religion was reformed by Zoroaster, who maintained that there was one supreme independent Being; and under him two principles or angels, one the angel of goodness and light, and the other of evil and darkness; that there is a perpetual struggle between them, which shall last to the end of the world; that then the angel of darkness and his disciples shall go into a world of their own, where they shall be punished in everlasting darkness; and the angel of light and his disciples shall also go into a world of their own, where they shall be rewarded in everlasting light.

The priests of the magi were the most skilful mathematicians and philosophers of the ages in which they lived, insomuch that a learned man and a magian became equivalent terms. The vulgar looked on their knowledge as supernatural; and hence those who practised wicked and mischievous arts, taking upon themselves the name of *magians*, drew on it that ill signification which the word magician now bears among us.

This sect still subsists in Persia under the denomination of *gours*, where they watch the sacred fire with the greatest care, and never suffer it to be extinguished.

MAGIC, (MAGIA, *Magia*), in its ancient sense, the science or discipline and doctrine of the magi, or wise men of Persia. See MAGI.

The origin of magic and the magi is ascribed to Zoroaster. Salmasius derives the very name from Zoroaster, who, he says, was surnamed *Mog*, whence *Magus*. Others, instead of making him the author of the Persian philosophy, make him only the restorer and improver thereof; alleging, that many of the Persian rites in use among the Magi were borrowed from the Zabii among the Chaldeans, who agreed in many things with the Magi of the Persians; whence some make the name *magus* common both to the Chaldeans and Persians. Thus Plutarch mentions, that Zoroaster instituted magi among the Chaldeans, in imitation whereof the Persians had theirs too.

MAGIC, in a more modern sense, is a science which teaches to perform wonderful and surprising effects.

The word *magic* originally carried with it a very innocent, nay, laudable meaning; being used purely to signify the study of wisdom, and the more sublime parts of knowledge; but in regard the ancient magi engaged themselves in astrology, divination, sorcery, &c. the term *magic* in time became odious, and was only used to signify an unlawful and diabolical kind of science, depending on the assistance of the devil and departed souls.

If any wonder how so vain and deceitful a science should gain so much credit and authority over men's minds, Pliny gives the reason of it. It is, says he,

X x 2

because

||
Magic.

Magic.

because it has possessed itself of three sciences of the most esteem among men: taking from each all that is great and marvellous in it. Nobody doubts but it had its first origin in medicine; and that it insinuated itself into the minds of the people, under pretence of affording extraordinary remedies. To these fine promises it added every thing in religion that is pompous and splendid, and that appears calculated to blind and captivate mankind. Lastly, It mingled judicial astrology with the rest; persuading people, curious of futurity, that it saw every thing to come in the heavens. Agrippa divides magic into three kinds; natural, celestial, and ceremonial or superstitious.

Natural Magic is no more than the application of natural active causes to passive subjects; by means whereof many surprising, but yet natural, effects are produced.

In this way many of our experiments in natural philosophy, especially those of electricity, optics, and magnetism, have a kind of magical appearance, and among the ignorant and credulous might easily pass for miracles. Such, without doubt, have been some of those miracles wrought by ancient magicians, whose knowledge of the various powers of nature, there is reason to believe, was much greater than modern vanity will sometimes allow*.

Baptista Porta has a treatise of natural magic, or of secrets for performing very extraordinary things by natural causes. The natural magic of the Chaldeans was nothing but the knowledge of the powers of simples and minerals. The magic which they called *theurgia*, consisted wholly in the knowledge of the ceremonies to be observed in the worship of the gods, in order to be acceptable. By virtue of these ceremonies they believed they could converse with spiritual beings, and cure diseases.

Celestial Magic borders nearly on judiciary astrology: it attributes to spirits a kind of rule or dominion over the planets, and to planets a dominion over men; and on these principles builds a ridiculous kind of system. See *ASTROLOGY*.

Superstitious or Goetic Magic consists in the invocation of devils. Its effects are usually evil and wicked, though very strange, and seemingly surpassing the powers of nature; supposed to be produced by virtue of some compact, either tacit or express, with evil spirits: but the truth is, these have not all the power that is usually imagined, nor do they produce those effects ordinarily ascribed to them.

This species of magic, there is every reason to believe, had its origin in Egypt, the native country of paganism. The first magicians mentioned in history were Egyptians; and that people so famed for early wisdom believed not only in the existence of *dæmons*, the great agents in magic (see *DÆMON*), but also that different orders of those spirits presided over the elements of earth, air, fire, and water, as well as over the persons and affairs of men. Hence they ascribed every disease with which they were afflicted to the immediate agency of some evil *dæmon*. When any person was seized with a fever, for instance, they did not think it necessary to search for any natural cause of the disease: it was immediately attributed to some *dæmon* which had taken possession of the body of the patient,

and which could not be ejected but by charms and incantations.

These superstitious notions, which had spread from Egypt over all the east, the Jews imbibed during their captivity in Babylon. Hence we find them in the writings of the New Testament attributing almost every disease to which they were incident to the immediate agency of devils (see *POSSESSION*). Many of the same impious superstitions were brought from Egypt and Chaldea by Pythagoras, and transmitted by him and his followers to the Platonists in Greece. This is apparent from the writers of the life of Pythagoras. Jamblicus, speaking of the followers of that philosopher, says expressly, that they cured certain diseases by incantations; and Porphyry adds, that they cured diseases both of the mind and of the body by songs and incantations. This was exactly the practice of the Egyptian priests, who were all supposed to keep up a constant intercourse with *dæmons*, and to have the power of controlling them by magical charms and sacred songs. Agreeably to this practice of his masters, we are told that Pythagoras directed certain diseases of the mind, doubtless those which he attributed to the agency of *dæmons*, to be cured partly by *incantations*, partly by *magical hymns*, and partly by *music*—*και τας ψυχας δε νοουσις παραμυθιο τους μιν ιπποδαις και μαγικαις τους δε μουσικαις*.

That there are different orders of created spirits, whether called *dæmons* or *angels*, whose powers intellectual and active greatly surpass the powers of man, reason makes probable, and revelation certain. Now it was the universal belief of the ancient nations, says the learned Mosheim †, and especially of the orientals, that certain sounds and words, for the most part barbarous, were highly grateful, and that others were equally disagreeable, to these spirits. Hence, when they wished to render a *dæmon* propitious, and to employ him on any particular office, the magicians composed their sacred songs of the words which were believed to be agreeable to him; and when it was their intention to drive him from themselves or others, they sung in a strain which they fancied a *dæmon* could not hear but with horror. From the same persuasion arose the custom of suspending from the neck of a sick person, whose disease was supposed to be inflicted by a *dæmon*, an amulet, sometimes made of gold and sometimes of parchment, on which was written one or more of those words which *dæmons* could not bear either to hear or to see: and in a didactic poem on the healing art still extant, we are taught by *Serenus Sammonicus*, that the word *ABRACADABRA* is an infallible remedy for a semitertian fever or ague; and to banish grief of heart, *Marcellinus* thinks nothing more effectual than the word *καρτερικον*. In more modern times, as we are informed by Agrippa, the words used by those in compact with the devil, to invoke him, and to succeed in what they undertake, are, *Dies, mies, jesquet, benedoe-fet, douvima, enitemaus*. There are a hundred other formulas of words composed at pleasure, or gathered from several different languages, or patched from the Hebrew or formed in imitation of it. And among the primitive Christians there was a superstitious custom, of which we suspect some remains may yet be found among the illiterate vulgar in different countries,

Magic.

* See *Stillingfleet's Origines Sacrae*, book ii. c. 2.

† See his edition of *Cudworth's Intellectual System*.

Magic. of fastening to the neck of a sick person, or to the bed on which he lay, some text from the New Testament, and especially the first two or three verses of the gospel of St John, as a charm undoubtedly efficacious to banish the disease.

That magicians who could thus cure the sick, were likewise believed to have the power of inflicting diseases, and of working miracles, by means of their subservient dæmons, need not be doubted. Ancient writers of good credit are full of the wonders which they performed. We shall mention a few of those which are best attested, and inquire whether they might not have been effected by other means than the interposition of dæmons.

The first magicians of whom we read are those who in Egypt opposed Moses. And we are told, that, when Aaron cast down his rod, and it became a serpent, they also did the like with their enchantments; "for they cast down every man his rod, and they became serpents." This was a phenomenon which, it must be confessed, had a very miraculous appearance; and yet there seems to have been nothing in it which might not have been effected by slight of hand. The Egyptians, and perhaps the inhabitants of every country where serpents abound, have the art of depriving them of their power to do mischief, so that they may be handled without danger. It was easy for the magicians, who were favoured by the court, to pretend that they changed their rods into serpents, by dexterously substituting one of these animals in place of the rod. In like manner they might pretend to change water into blood, and to produce frogs; for if Moses gave in these instances, as we know he did in others, any previous information of the nature of the miracles which were to be wrought, the magicians might easily provide themselves in a quantity of blood and number of frogs sufficient to answer their purpose of deceiving the people. Beyond this, however, their power could not go. It stopped where that of all workers in legerdemain must have stopt—at the failure of proper materials to work with. Egypt abounds with serpents; blood could be easily procured; and without difficulty they might have frogs from the river: But when Moses produced lice from the dust of the ground, the magicians, who had it not in their power to collect a sufficient quantity of these animals, were compelled to own this to be an effect of divine agency.

The appearance of Samuel to Saul at Endor is the next miracle, seemingly performed by the power of magic, which we shall consider. It was a common pretence of magicians, that they could raise up ghosts from below, or make dead persons appear unto them to declare future events; and the manner of their incantation is thus described by Horace:

—Pallor utrasque

Fecerat horrendas aspectu. Scalpere terram
Unguibus, et pullam divellere mordicus agnam
Cœperunt: cruor in fossam confusus, ut inde
Manes elicerent, animas responsa daturas.

"With yellings dire they fill'd the place,
And hideous pale was either's face.
Soon with their nails they scrap'd the ground,
And fill'd a magic trench profound

With a black lamb's thick-streaming gore,
Whose members with their teeth they tore;
That they might charm the sprights to tell
Some curious anecdotes from hell." FRANCIS.

Magic.

Whether the witch of Endor made use of such infernal charms as these, the sacred historian has not informed us; but Saul addressed her, as if he believed that by some form of incantation she could recal from the state of departed spirits the soul of the prophet who had been for some time dead. In the subsequent apparition, however, which was produced, some have thought there was nothing more than a trick, by which a cunning woman imposed upon Saul's credulity, making him believe that some confidant of her own was the ghost of Samuel. But had that been the case, she would undoubtedly have made the pretended Samuel's answer as pleasing to the king as possible, both to save her own life, which appears from the context to have been in danger, and likewise to have procured the larger reward. She would never have told her sovereign, she durst not have told him, that he himself should be shortly slain, and his sons with him; and that the host of Israel should be delivered into the hands of the Philistines. For this reason many critics, both Jewish and Christian, have supposed that the apparition was really a dæmon or evil angel, by whose assistance the woman was accustomed to work wonders, and to foretel future events. But it is surely very incredible, that one of the apostate spirits of hell should have upbraided Saul for applying to a *sorceress*, or should have accosted him in such words as these: "Why hast thou disquieted me, to bring me up? Wherefore dost thou ask of me, seeing the Lord is departed from thee, and is become thine enemy! For the Lord hath rent the kingdom out of thine hand, and given it to thy neighbour, even to David. Because thou obeyedst not the voice of the Lord, therefore the Lord hath done this thing to thee this day." It is to be observed farther, that what was here denounced against Saul was really prophetic, and that the event answered to the prophecy in every particular. Now, though we do not deny that there are created spirits of penetration vastly superior to that of the most enlarged human understanding; yet we dare maintain, that no finite intelligence could by its own mere capacity have ever found out the precise time of the two armies engaging, the success of the Philistines, the consequences of the victory, and the very names of the persons that were to fall in battle. Saul and his sons were indeed men of tried bravery, and therefore likely to expose themselves to the greatest danger: but after the menaces which he received from the apparition, he would have been impelled, one should think, by common prudence, either to chicanery with the enemy, or to retire from the field without exposing himself, his sons, and the whole army, to certain and inevitable destruction; and his acting differently, with the consequences of his conduct, were events which no limited understanding could either foresee or certainly foretel. If to these circumstances we add the suddenness of Samuel's appearance, with the effect which it had upon the sorceress herself, we shall find reason to believe, that the apparition was that of no evil dæmon. There is not, we believe, upon record, another instance of any person's

Magic.

son's pretending to raise a ghost from below, without previously using some magical rites or some form of incantation. As nothing of that kind is mentioned in the case before us, it is probable that Samuel appeared before he was called. It is likewise evident from the narrative, that the apparition was not what the woman expected; for we are told, that "when she saw Samuel, she cried out for fear." And when the king exhorted her not to be afraid, and asked what she saw, "the woman said, I see gods (*elohim*) ascending out of the earth." Now, had she been accustomed to do such feats, and known that what she saw was only her subservient dæmon, it is not conceivable that she could have been so frightened, or have mistaken her familiar for *elohim* in any sense in which that word can be taken. We are therefore strongly inclined to adopt the opinion of those who hold that it was Samuel himself who appeared and prophesied, not called up by the wretched woman or her dæmons, but, to her utter confusion, and the disgrace of her art, sent by God to rebuke Saul's madness in a most affecting and mortifying way, and to deter all others from ever applying to magicians or dæmons for assistance when refused comfort from heaven. For though this hypothesis may to a superficial thinker seem to transgress the rule of Horace—*Nec deus intersit*, &c.—which is as applicable to the interpretation of scripture, as to the introduction of supernatural agency in human compositions; yet he who has studied the theocratical constitution of Israel, the nature of the office which was there termed regal, and by what means the administration was in emergencies conducted, will have a different opinion; and at once perceive the *dignus vindice nodus*.

The sudden and wonderful destruction of the army of Brennus the Gaul, has likewise been attributed to magic, or, what in this inquiry amounts to the same thing, to the interposition of evil spirits, whom the priests of Apollo invoked as gods. Those barbarians had made an inroad into Greece, and invested the temple of Apollo at Delphi, with a view to plunder it of the sacred treasure. Their numbers and courage overpowered all opposition; and they were just upon the point of making themselves masters of the place, when, Justin informs us, that, to encourage the besieged, the priests and prophetess "advenisse deum clamant; eumque se vidisse desilientem in templum per culminis aperta fastigia. Dum omnes opem dei suppliciter implorant, juvenem supra humanum modum insignis pulchritudinis, comitesque ei duas armatas virgines, ex propinquis duabus Dianæ Minervæque ædibus occurrisset, nec oculis tantum hæc se perspexisset; audisset

etiam stridorem arcus, ac strepitum armorum: proinde ne cunctarentur, diis antesignanis, hostem cedere, et victoriæ deorum socios se adjungere," summis obsecrationibus monebant. Quibus vocibus incensi, omnes certatim in prælium prosiliunt. Præsentiam Dei et ipsi statim sentire: nam et terræ motu portio montis abrupta Gallorum stravit exercitum, et confertissimi cunei non sine vulneribus hostium dissipati ruebant. Insecuta deinde tempestas est, quæ grandine et frigore saucios ex vulneribus absumpsit (A).

This was unquestionably an extraordinary event: and it must be ascribed either to the immediate interposition of the Supreme Being, to natural means, or to the agency of dæmons: there is no other alternative. But it is altogether incredible that the Supreme Being should have miraculously interposed to defend the temple of a pagan divinity. It is very difficult to suppose that an earthquake, produced in the ordinary course of nature, should have been foretold by the priests, or that it could have happened so opportunely for the preservation of their treasure from the hands of fierce barbarians. Nothing, therefore, it has been said, remains, but either to allow the earthquake to have been produced by evil spirits, or to deny the truth of the historian's relation. But the catastrophe of Brennus's army is recorded in the same manner by so many ancient writers of good credit, that we cannot call in question their veracity; and therefore, being unwilling to admit the agency of dæmons into this affair, it will be incumbent on us to show by what human contrivance it might have been effected; for its arrival at so critical a juncture will not easily suffer us to suppose it a mere *natural* event.

"The inclination of a Pagan priest (says Bishop Warburton*) to assist his god in extremity, will hardly be questioned; and the inclination of those at Delphi was not ill seconded by their public management and address. On the first rumour of Brennus's march against them, they issued orders, as from the oracle, to all the region round, forbidding the country people to secret or bear away their wine and provisions. The effects of this order succeeded to their expectations. The half-starved barbarians finding, on their arrival in Phocis, so great a plenty of all things, made short marches, dispersed themselves over the country, and revelled in the abundance that was provided for them. This respite gave time to the friends and allies of the god to come to his assistance. Their advantages of situation likewise supported the measures which they had taken for a vigorous defence. The town and temple of Delphi were seated on a bare and cavernous rock, defended on all sides with precipices instead

(A) "Called aloud that the god had arrived: That they had seen him leap into the temple through the aperture in the roof: That whilst they were all humbly imploring his help, a youth of more than human beauty, accompanied by two virgins in armour, had run to their assistance from the neighbouring temples of Diana and Minerva; and that they had not only beheld these things with their eyes, but had also heard the whizzing of his bow and the clangor of his arms. They therefore earnestly exhorted the besieged not to neglect the heavenly signal, but to sally out upon their enemies, and partake with the divinities of the glory of the victory." With these words the soldiers being animated, eagerly rushed to battle: and were themselves quickly sensible of the presence of the god; for part of the rock being torn away by an earthquake, rolled down upon the Gauls; whose thickest battalions being thus thrown into confusion, fled, exposed to the weapons of their enemies. Soon afterwards a tempest arose, which by cold and the fall of hailstones cut off the wounded.

Magic. instead of walls. A large recess within assumed the form of a theatre; so that the shouts of soldiers, and the sounds of military instruments, re-echoing from rock to rock, and from cavern to cavern, increased the clamour to an immense degree; which, as the historian observes, could not but have great effects on ignorant and barbarous minds. The playing off these panic terrors was not indeed of itself sufficient to repulse and dissipate an host of fierce and hungry invaders, but it enabled the defenders to keep them at bay till a more solid entertainment was provided for them, in the *explosion* and fall of that portion of the rock at the foot of which the greater part of the army lay encamped.

“ Among the caverns in the sacred rock, there was one which, from an intoxicating quality discovered in the steam which issued from it, was rendered very famous by being fitted to the recipient of the priestess of Apollo (B). Now, if we only suppose this, or any other of the vapours emitted from the numerous fissures, to be endowed with that unctuous, or otherwise inflammatory quality, which modern experience shows to be common in mines and subterraneous places, we can easily conceive how the priests of the temple might, without the agency of dæmons, be able to work the wonders which history speaks of as effected in this transaction. For the throwing down a lighted torch or two into a chasm whence such a vapour issued, would set the whole into a flame; which, by suddenly rarefying and dilating the air, would, like fired gunpowder, blow up all before it. That the priests, the guardians of the rock, could be long ignorant of such a quality, or that they would divulge it when discovered, cannot be supposed. Strabo relates, that one *Onomarchus*, with his companions, as they were attempting by night to dig their way through to rob the holy treasury, were frightened from their work by the violent shaking of the rock; and he adds, that the same phenomenon had defeated many other attempts of the like nature. Now, whether the tapers which *Onomarchus* and his companions were obliged to use while they were at work, inflamed the vapour, or whether the priest of Apollo heard them at it, and set fire to a countermine, it is certain a quality of this kind would always stand them in stead. Such then (presumes the learned prelate) was the expedient (C) they employed to dislodge this nest of hornets, which had settled at the foot of their sacred rock; for the storm of thunder, lightning, and hail, which followed, was the natural effect of the violent concussions given to the air by the explosion of the mine.”

Two instances more of the power of ancient magic we shall just mention, not because there is any

thing particular or important in the facts, but because some credit seems to have been given to the narration by the discerning Cudworth. Philostratus, in his life of Apollonius Tyanæus, informs us that a *laughing demoniac* at Athens was cured by that magician, who ejected the evil spirit by threats and menaces; and the biographer adds, that the dæmon, at his departure, is said to have overturned a statue which stood before the porch where the cure was performed. The other instance is of the same magician freeing the city of Ephesus from the *plague*, by stoning to death an old ragged beggar whom Apollonius called the *plague*, and who appeared to be a *dæmon* by his changing himself into the form of a *shagged dog*.

That such tales as these should have been thought worthy of the slightest notice by the incomparable author of the Intellectual System, is indeed a wonderful phenomenon in the history of human nature. The whole story of Apollonius Tyanæus, as is now well known, is nothing better than a collection of the most extravagant fables*: but were the narrative such as that credit could be given to the facts here related, there appears no necessity in either case for calling in the agency of evil spirits by the power of magic.—The Athenians of that age were a superstitious people. Apollonius was a shrewd impostor, long practised in the art of deceiving the multitude. For such a man it was easy to persuade a friend and confidant to act the part of the *laughing demoniac*; and without much difficulty the statue might be so undermined as inevitably to tumble, upon a violent concussion being given to the ground at the time of the departure of the pretended dæmon. If so, this feat of magic dwindles down into a very trifling trick performed by means both simple and natural. The other case of the poor man at Ephesus, who was stoned to death, is exactly similar to that of those innocent women in our own country, whom the vulgar in the last century were instigated to burn for the supposed crime of witchcraft. We have no reason to suppose that an Ephesian mob was less inflammable or credulous than a British mob, or that Apollonius played his part with less skill than a Christian demonologist; and as the spirits of our witches, who were sacrificed to folly and fanaticism, were often supposed to migrate from their dead bodies into the bodies of *hares* or *cats* accidentally passing by, so might this impostor at Ephesus persuade his cruel and credulous instruments, that the spirit of their victim had taken possession of the body of the *shagged dog*.

Still it may be said, that in *magic* and *divination* events have been produced out of the ordinary course of nature; and as we cannot suppose the Supreme Being

Magic.

* See *Prideaux's Connexions*, *Brucker's History of Philosophy*, and *Moshcim's Notes on Cudworth's Intellectual System*.

(B) “ In hoc rupis anfractu, media ferme montis altitudine, planities exigua est, atque in ea profundum terræ foramen, quod in oraculo patet, ex quo frigidus spiritus, vi quadam velut vento in sublimè expulsus, mentes vatum in vecordiam vertit, impletasque deo responsa consulentibus dare cogit.” JUST. lib. xxiv. c. 10.

(C) The learned author, by arguments too tedious to be here enumerated, confirms the reasoning which we have borrowed from him; and likewise shows from history, that the priests, before they came to extremities with the sacred rock, had entered into treaty with those barbarians, and paid them a large tribute to decamp and quit the country. This adds greatly to the probability of his account of the explosion; for nothing but the absolute impossibility of getting quit of their besiegers by any other means, could have induced the priests to hazard an experiment so big with danger to themselves as well as to their enemies.

Magic. Being to have countenanced such abominable practices by the interposition of his power, we must necessarily attribute those effects to the agency of demons, or evil spirits. Thus, when Æneas consulted the Sibyl, the agency of the inspiring god changed her whole appearance :

“ Poscere fata
Tempus,” ait : “ Deus, ecce, Deus.” Cui talia fanti
Ante fores, subito non vultus, non color unus,
Non comptæ mansère comæ : sed pectus anhelum,
Et rabie fera corda tument ; majorque videri,
Nec mortale sonans : afflata est numine quando
Jam propiore Dei.

“ Aloud she cries,
“ This is the time, inquire your destinies.
He comes, behold, a god !” Thus while she said,
And shivering at the sacred entry staid,
Her colour chang’d, her face was not the same ;
And hollow groans from her deep spirit came ;
Her hair stood up ; convulsive rage possess’d
Her trembling limbs, and heav’d her lab’ring breast ;
Greater than human kind she seem’d to look,
And with an accent more than mortal spoke.
Her staring eyes with sparkling fury roll,
When all the god came rushing on her soul.”

DRYDEN.

In answer to this, it is to be observed, that the temple of Apollo at Cumæ was an immense excavation in a solid rock. The rock was probably of the same kind with that on which the temple of Delphi was built, full of fissures, out of which exhaled perpetually a poisonous kind of vapour. Over one of these fissures was the tripod placed, from which the priestess gave the oracle. Now we learn from St Chrysostom, that the priestess was a woman : “ Quæ in tripodibus sedens expansa malignum spiritum per interna immissum, et per genitales partes subeuntem excipiens, furore repletur, ipsaque resolutis crinibus bacharetur, ex ore spumam emittens, et sic furoris verba loquebatur.” By comparing this account with that quoted above from Justin, which is confirmed both by Pausanias and by Strabo, it is evident, that what Chrysostom calls *malignum spiritum* was a particular kind of vapour blown forcibly through the fissure of the rock. But if there be a vapour of such a quality as, if received *per partes genitales*, would make a woman furious, there is surely no necessity for calling into the scene at Cumæ the agency of a demon or evil spirit. Besides, it is to be remembered, that in all mystical and magical rites, such as this was, both the priests, and the persons consulting them, prepared themselves by particular kinds of food, and sometimes, as there is reason to believe, by human sacrifices*, for the approach of the god or demon whose aid they invoked. On the present occasion, we know from the poet himself, that a cake was used which was composed of poppy-seed and honey ; and Plutarch speaks of a shrub called *leucophyllus*, used in the celebration of the mysteries of Hecate, which drives men into a kind of frenzy, and makes them confess all their wickedness which they had done or intended. This being the case, the illusions of fancy occasioned by poppy will sufficiently account for the change of the sibyl’s ap-

pearance, even though the inhaled vapour should not have possessed that efficacy which Chrysostom and Justin attribute to it. Even some sorts of our ordinary food occasion strange dreams, for which onions in particular are remarkable. Excessive drunkenness, as is well known, produces a disorder named by the bacchanalians of this country *the blue devils*, which consists of an immense number of spectres, accompanied with extreme horror to the person who sees them. From these facts, which cannot be denied, there must arise a suspicion, that by using very unnatural food, such as human blood, the vilest of insects, serpents, and medicated cakes, by shutting themselves up in solitude and caves, and by devising every method to excite horrid and dreadful ideas or images in the fancy, the ancient magicians might by natural means produce every phenomenon which they attributed to their gods or demons. Add to this, that in ancient times magic was studied as a science. Now, as we cannot suppose that every one who studied it intended absolutely nothing, or that all who believed in it were *wholly* deceived ; what can we infer, but that the science consisted in the knowledge of those drugs which produced the phantoms in the imagination, and of the method of preparing and properly employing them for that purpose ? The celebrated Friar Bacon indeed, as far back as the 13th century, wrote a book *de Nullitate Magiæ* : but though we should allow that this book proved to demonstration, that in his time no such thing as magic existed, it never could prove that the case had always been so. At that time almost all the sciences were lost ; and why not magic as well as others ? It is likewise an undoubted fact, that magic at all times prevailed among the Asiatics and Africans more than among the Europeans. The reason doubtless was, that the former had the requisites for the art in much greater perfection than we. Human sacrifices were frequent among them ; they had the most poisonous serpents, and the greatest variety of vegetable poisons, together with that powerful narcotic opium ; all which were of essential use in mystical and magic rites. They had, besides, a burning sun, frightful deserts and solitudes ; which, together with extreme fasting, were all called in to their assistance, and were sufficient to produce, by natural means, the most wonderful phenomena which have ever been attributed to magical incantations. Even in our own days, we have the testimony of two travellers, whom we cannot suspect to be either liars or enthusiasts, that both the Indians and Africans perform feats for which neither they nor the most enlightened Europeans can account. The one is Mr Grose, who visited the East Indies about the year 1762 ; and the other is Mr Bruce, who informs us, that the inhabitants of the western coast of Africa pretend to hold a communication with the devil, and verify their assertions in such a manner that neither he nor other travellers know what to make of it : but it does not from this follow, that Mr Bruce believed that communication to be real. We have all seen one of the most illiterate men that ever assumed the title of *Doctor*, perform feats very surprising, and such as even a philosopher would have been puzzled to account for, if he had not been previously let into the secret ; and yet no man supposes that *Katterfelto* holds any communication

* Vide *Lucani Pharsalia*, lib. vi. et *Arnob. C. Gentes*, lib. i.

Magic.

tion with the devil, although he has sometimes pretended it among people whose minds he supposed unenlightened.

* *Manchester Transactions*, vol. iii.

Still it may be objected, that we have a vast number of histories of witches, who in the last century confessed, that they were present with the devil at certain meetings; that they were carried through the air, and saw many strange feats performed, too numerous and too ridiculous to be here mentioned. The best answer to this objection seems to be that given by Dr Ferriar in his essay on Popular Illusions*. "The solemn meeting of witches (says he) is supposed to be put beyond all doubt by the numerous confessions of criminals, who have described their ceremonies, named the times and places of their meetings, with the persons present, and who have agreed in their relations, though separately delivered. But I would observe, first, that the circumstances told of those festivals are in themselves ridiculous and incredible; for they are represented as gloomy and horrible, and yet with a mixture of childish and extravagant fancies, more likely to disgust and alienate than conciliate the minds of their guests. They have every appearance of uneasy dreams. Sometimes the devil and his subjects *say mass*; sometimes he *preaches* to them; more commonly he was seen in the form of a *black goat*, surrounded by imps in a thousand frightful shapes; but none of these forms are *new*, they all resemble known quadrupeds or reptiles. Secondly, I observe, that there is direct proof furnished even by demonologists, that *all* those supposed journeys and entertainments were nothing more than dreams. Persons accused of witchcraft have been repeatedly watched about the time they had fixed for their meeting: they have been seen to anoint themselves with soporific compositions; after which they fell into profound sleep; and on awaking several hours afterwards, they have related their journey through the air, with their amusement at the festival, and have named the persons whom they saw there." This is exactly conformable to the practice of the ancient magicians and diviners, and seems to be the true way of accounting, as well for many of the phenomena of magic, as for that extravagant and shameful superstition which prevailed so much during part of the last century, and by which such numbers of innocent men and women were cruelly put to death (c). We may indeed be assured, that the devil has it not in his power to reverse in a single instance the laws of nature without a divine permission; and we can conceive but one occasion (see POSSESSION) on which such permission could be given consistently with the wisdom and the goodness of God. All the tales, therefore, of diabolical agency in magic and witchcraft must undoubtedly be false; for a power, which the devil is not himself at liberty to exert, he cannot communicate to a human creature. Were the case otherwise; were those powers, "which (according to Johnson) only the controul of Omnipotence restrains from laying creation waste, subservient to the invocations of wicked mortals; were those spirits,—

racles, and either to inflict or to remove diseases at the desire of their capricious votaries, how comfortless and wretched would be the life of man! But the matter has been long ago determined by the failure of Pharaoh's magicians; who, though by legerdemain they imitated some of the miracles of Moses, could not form the vilest insect, or stand before the disease which he inflicted upon them as well as upon others.

The revival of learning, and the success with which the laws of nature have been investigated, have long ago banished this species of magic from all the enlightened nations of Europe. Among ourselves, none but persons grossly illiterate pay the least regard to magical charms; nor are they anywhere abroad more prevalent than among the inhabitants of Lapland and Iceland. These people, indeed, place an absolute confidence in the effects of certain idle words and actions: and ignorant sailors from other parts of the world are deceived by their assertions and their ceremonies. The famous *magical drum* of the Laplanders is still in constant use in that nation; and Scheffer, in his History of Lapland, has given an account of its structure.

This instrument is made of beech, pine, or fir, split in the middle, and hollowed on the flat side where the drum is to be made. The hollow is of an oval figure; and is covered with a skin clean dressed, and painted with figures of various kinds, such as stars, suns and moons, animals and plants, and even countries, lakes, and rivers; and of later days, since the preaching of Christianity among them, the acts and sufferings of our Saviour and his apostles are often added among the rest. All these figures are separated by lines into three regions or clusters.

There is, besides these parts of the drum, an index and a hammer. The index is a bundle of brass or iron rings, the biggest of which has a hole in its middle, and the smaller ones are hung to it. The hammer or drumstick is made of the horn of a rein-deer; and with this they beat the drum so as to make these rings move, they being laid on the top for that purpose. In the motion of these rings about the pictures figured on the drum, they fancy to themselves some prediction in regard to the things they inquire about.

What they principally inquire into by this instrument, are three things. 1. What sacrifices will prove most acceptable to their gods. 2. What success they shall have in their several occupations, as hunting, fishing, curing of diseases, and the like; and, 3. What is doing in places remote from them. On these several occasions they use several peculiar ceremonies, and place themselves in various odd postures as they beat the drum; which influences the rings to the one or the other side, and to come nearer to the one or the other set of figures. And when they have done this, they have a method of calculating a discovery, which they keep as a great secret, but which seems

Y y.

merely

Magic,
Magic
Square.

merely the business of the imagination in the diviner or magician.

Magic Square, a square figure, formed of a series of numbers in mathematical proportion; so disposed in parallel and equal ranks, as that the sums of each row, taken either perpendicularly, horizontally, or diagonally, are equal.

Let the several numbers which compose any square number (for instance, 1, 2, 3, 4, 5, &c. to 25 inclusive, the square number) be disposed, in their natural order, after each other in a square figure of 25 cells, each in its cell; if now you change the order of these numbers, and dispose them in the cells in such manner, as that the five numbers which fill a horizontal rank of cells, being added together, shall make the same sum with the five numbers in any other rank of cells, whether horizontal or vertical, and even the same number with the five in each of the two diagonal ranks: this disposition of numbers is called a *magic square*, in opposition to the former disposition, which is called a *natural square*. See the figures following.

Natural Square.

One would imagine that these magic squares had that name given them, in regard this property of all their ranks, which, taken any way, make always the same sum, appeared extremely surprising, especially in certain ignorant ages, when mathematics passed for magic: but there is a great deal of reason to suspect, that these squares merited their name still farther, by the superstitious operations they were employed in, as the construction of talismans, &c.; for according to the childish philosophy of those days, which attributed virtues to numbers, what virtue might not be expected from numbers so wonderful?

However, what was at first the vain practice of makers of talismans and conjurers, has since become the subject of a serious research among mathematicians; not that they imagine it will lead them to any thing of solid use or advantage (magic squares savour too much of their original to be of much use); but only as it is a kind of play, where the difficulty makes the merit, and it may chance to produce some new views of numbers, which mathematicians will not lose the occasion of.

Eman. Moschopolus, a Greek author of no great antiquity, is the first that appears to have spoken of magic squares: and by the age wherein he lived, there is reason to imagine he did not look on them merely as a mathematician. However, he has left us some rules for their construction. In the treatise of Cor. Agrippa, so much accused of magic, we find the squares of seven numbers, viz. from three to nine inclusive, disposed magically; and it must not be supposed that those seven numbers were preferred to all the other without some very good reason: in effect, it is because their squares, according to the system of Agrippa and his followers, are planetary. The square of 3, for in-

Magic
Square.

stance, belongs to Saturn; that of 4 to Jupiter; that of 5 to Mars; that of 6 to the Sun; that of 7 to Venus; that of 8 to Mercury; and that of 9 to the Moon. M. Bachet applied himself to the study of magic squares, on the hint he had taken from the planetary squares of Agrippa, as being unacquainted with the work of Moschopolus, which is only in manuscript in the French king's library; and, without the assistance of any author, he found out a new method for those squares whose root is uneven, for instance 25, 49, &c. but he could not make any thing of those whose root is even.

After him came M. Frenicle, who took the same subject in hand. A certain great algebraist was of opinion, that whereas the 16 numbers which compose the square might be disposed 20922789888000 different ways in a natural square (as from the rules of combination it is certain they may), they could not be disposed in a magic square above 16 different ways; but M. Frenicle showed, that they might be thus disposed 878 different ways: whence it appears how much his method exceeds the former, which only yielded the 55th part of magic squares of that of M. Frenicle.

To this inquiry he thought fit to add a difficulty that had not yet been considered: the magic square of 7, for instance, being constructed, and its 49 cells filled, if the two horizontal ranks of cells, and, at the same time, the two vertical ones, the most remote from the middle, be retrenched; that is, if the whole border or circumference of the square be taken away, there will remain a square whose root will be 5, and which will only consist of 25 cells. Now it is not at all surprising that the square should be no longer magical, because the ranks of the large ones were not intended to make the same sum, excepting when taken entire with all the seven numbers that fill their seven cells; so that being mutilated each of two cells, and having lost two of their numbers, it may be well expected, that their remainders will not any longer make the same sum. But M. Frenicle would not be satisfied, unless when the circumference or border of the magic square was taken away, and even any circumferences at pleasures, or, in five, several circumferences at once, the remaining square was still magical: which last condition, no doubt, made these squares vastly more magical than ever.

Again, He inverted that condition, and required that any circumference taken at pleasure, or even several circumferences, should be inseparable from the square; that is, that it should cease to be magical when they were removed, and yet continue magical after the removal of any of the rest. M. Frenicle, however, gives no general demonstration of his methods, and frequently seems to have no other guide but chance. It is true, his book was not published by himself, nor did it appear till after his death, viz. in 1693.

In 1703, M. Poignard, canon of Brussels, published a treatise of sublime magic squares. Before him there had been no magic squares made but for serieses of natural numbers that formed a square; but M. Poignard made two very considerable improvements. 1. Instead of taking all the numbers that fill a square, for instance the 36 successive numbers, which would fill all the cells of a natural square whose side is 6, he only takes as many successive numbers as there are units

in

Magic Square.

in the side of the square, which, in this case, are six; and these six numbers alone he disposes in such manner in the 36 cells, that none of them are repeated twice in the same rank, whether it be horizontal, vertical, or diagonal; whence it follows, that all the ranks, taken all the ways possible, must always make the same sum, which M. Poignard calls repeated progression. 2. Instead of being confined to take these numbers according to the series and succession of the natural numbers, that is, in an arithmetical progression, he takes them likewise in a geometrical progression, and even in a harmonical progression. But with these two last progressions the magic must necessarily be different from what it was: in the squares filled with numbers in geometrical progression, it consists in this, that the products of all the ranks are equal; and in the harmonical progression, the numbers of all the ranks continually follow that progression: he makes squares of each of these three progressions repeated.

This book of M. Poignard gave occasion to M. de la Hire to turn his thoughts the same way, which he did with such success, that he seems to have well nigh completed the theory of magic squares. He first considers uneven squares: all his predecessors on the subject having found the construction of even ones by much the most difficult; for which reason M. de la Hire reserves those for the last. This excess of difficulty may arise partly from hence, that the numbers are taken in arithmetical progression. Now in that progression, if the number of terms be uneven, that in the middle has some properties, which may be of service; for instance, being multiplied by the number of terms in the progression, the product is equal to the sum of all the terms.

M. de la Hire proposes a general method for uneven squares, which has some similitude with the theory of compound motions, so useful and fertile in mechanics. As that consists in decomposing motions, and resolving them into others more simple; so does M. de la Hire's method consist in resolving the square that is to be constructed into two simple and primitive squares. It must be owned, however, it is not quite so easy to conceive these two simple and primitive squares in the compound or perfect square, as in an oblique motion to imagine a parallel and perpendicular one.

Suppose a square of cells, whose root is uneven, for instance 7; and that its 49 cells are to be filled magically with numbers, for instance the first 7; M. de la Hire, on the one side, takes the first 7 numbers, beginning with unity, and ending with the root 7; and on the other 7, and all its multiples to 49, exclusively; and as these only make six numbers, he adds 0, which makes this an arithmetical progression of 7 terms as well as the other; 0. 7. 14. 21. 28. 35. 42. This done, with the first progression repeated, he fills the square of the root magically: In order to this, he writes in the first seven cells of the first horizontal rank the seven numbers proposed in what order he pleases, for that is absolutely indifferent; and it is proper to observe here, that these seven numbers may be ranged in 5040 different manners in the same rank. The order in which they are placed in the first horizontal rank, be it what it will, is that which determines their order in all the rest. For the second horizontal rank, he places in its first cell, either the

Magic Square.

third, the fourth, the fifth, or the sixth number, from the first number of the first rank; and after that writes the six others in order as they follow. For the third horizontal rank, he observes the same method with regard to the second that he observed in the second with regard to the first, and so of the rest. For instance, suppose the first horizontal rank filled with the seven numbers in their natural order, 1, 2, 3, 4, 5, 6, 7; the second horizontal rank may either commence with 3, with 4, with 5, or with 6: but in this instance it commences with 3; the third rank therefore must commence with 5, the fourth with 7, the fifth with 2, the sixth with 4, and the seventh with 6. The commencement of the ranks which follow the first being thus determined, the other numbers, as we have already observed, must be written down in the order wherein they stand in the first, going on to 5, 6, and 7, and returning to 1, 2, &c. till every number in the first rank be found in every rank underneath, according to the order arbitrarily pitched upon at first. By this means it is evident, that no number whatever can be repeated twice in the same rank; and by consequence, that the seven numbers 1, 2, 3, 4, 5, 6, 7, being in each rank, must of necessity make the same sum.

It appears, from this example, that the arrangement of the numbers in the first rank being chosen at pleasure, the other ranks may be continued in four different manners; and since the first rank may have 5040 different arrangements, there are no less than 20,160 different manners of constructing the magic square of seven numbers repeated.

1	2	3	4	5	6	7

4	5	6	7	1	2	3
3	4	5	6	7	1	2
2	3	4	5	6	7	1

The order of the numbers in the first rank being determined; if in beginning with the second rank, the second number 2, or the last number 7, should be pitched upon in one of these cases, and repeated; and in the other case, the other diagonal would be false unless the number repeated seven times should happen to be 4; for four times seven is equal to the sum of 1, 2, 3, 4, 5, 6, 7: and in general, in every square consisting of an unequal number of terms, in arithmetical progression, one of the diagonals would be false according to those two constructions, unless the term always repeated in that diagonal were the middle term of the progression. It is not, however, at all necessary to take the terms in an arithmetical progression; for, according to this method, one may construct a magic square of any numbers at pleasure, whether they be according to any certain progression or not. If they be in an arithmetical progression, it will be proper, out of the general method, to except those

Y y 2 two

Magic Square.

two constructions which produce a continual repetition of the same term in one of the two diagonals, and only to take in the case wherein that repetition would prevent the diagonal from being just; which case being absolutely disregarded when we computed that the square of 7 might have 20,160 different constructions, it is evident that by taking that case in, it must have vastly more.

To begin the second rank with any other number besides the second and the last, must not, however, be looked on as an universal rule: it holds good for the square of 7; but if the square of 9, for instance, were to be constructed, and the fourth figure of the first horizontal rank were pitched on for the first of the second, the consequence would be, that the fifth and eighth horizontal ranks would likewise commence with the same number, which would therefore be repeated three times in the same vertical rank, and occasion other repetitions in all the rest. The general rule, therefore, must be conceived thus: Let the number in the first rank pitched on, for the commencement of the second, have such an exponent for its quota; that is, let the order of its place be such, as that if an unit be taken from it, the remainder will not be any just quota part of the root of the square; that is, cannot divide it equally. If, for example, in the square of 7, the third number of the first horizontal rank be pitched on for the first of the second, such construction will be just; because the exponent of the place of that number, viz. 3, subtracting 1, that is, 2 cannot divide 7. Thus also might the fourth number of the same first rank be chosen, because 4—1, viz. 3, cannot divide 7; and, for the same reason, the fifth or sixth number might be taken: but in the square of 9, the fourth number of the first rank must not be taken, because 4—1, viz. 3, does divide 9. The reason of this rule will appear very evidently, by considering in what manner the returns of the same numbers do or do not happen, taking them always in the same manner in any given series. And hence it follows, that the fewer divisions the root of any square to be constructed has, the more different manners of constructing it there are; and that the prime numbers, i. e. those which have no divisions, as 5, 7, 11, 13, &c. are those whose squares will admit of the most variations in proportion to their quantities.

The squares constructed according to this method have some particular properties not required in the problem; for the numbers that compose any rank parallel to one of the two diagonals, are ranged in the same order with the numbers that compose the diagonal to which they are parallel. And as any rank parallel to a diagonal must necessarily be shorter, and have fewer cells than the diagonal itself, by adding

First Primitive.

1	2	3	4	5	6	7
3	4	5	6	7	1	2

6	7	1	2	3	4	5

to it the correspondent parallel, which has the number of cells by which the other falls short of the diagonal, the numbers of those two parallels, placed as it were end to end, still follow the same order with those of the diagonal: besides that their sums are likewise equal; so that they are magical on another account. Instead of the squares which we

have hitherto formed by horizontal ranks, one might also form them by vertical ones; the case is the same in both.

All we have hitherto said regards only the first primitive square, whose numbers, in the proposed example, were, 1, 2, 3, 4, 5, 6, 7; here still remains the second primitive, whose numbers are 0, 7, 14, 21, 28, 35, 42. M. de la Hire proceeds in the same manner here as in the former; and this may likewise be constructed in 20,160 different manners, as containing the same number of terms with the first. Its construction being made, and of consequence all its ranks making the same sum, it is evident, that if we

Second Primitive.

0	7	14	21	28	35	42
21	28	35	42	0	7	14
42	0	7	14	21	28	35

bring the two into one, by adding together the numbers of the two corresponding cells of the two squares, that is, the two numbers of the first of each, the two numbers of the second, of the third, &c. and dispose them in the 49 corresponding cells of a third square, it will likewise be magical in regard to its rank, formed by the addition of equal sums to equal sums, which must of necessity be equal among themselves. All that remains in doubt is, whether or no, by the addition of the corresponding cells of the two first squares, all the cells of the third will be filled in such manner, as that each not only contains one of the numbers of the progression from 1 to 49, but also that this number be different from any of the rest, which is the end and design of the whole operation.

As to this it must be observed, that if in the construction of the second primitive square care has been taken, in the commencement of the second horizontal rank, to observe an order with regard to the first, different from what was observed in the construction of the first square; for instance, if the second rank of the first square began with the third term of the first rank, and the second rank of the second square commence with the fourth of the first rank, as in the example it actually does; each number of the first square may be combined once, and only once, by addition with all the numbers of the second.

Perfect Square.

1	9	17	25	33	41	49
24	32	40	48	7	8	16
47	6	14	15	23	31	39
21	22	30	38	46	5	13
37	45	4	12	20	28	29
11	10	27	35	36	44	3
34	12	43	21	18	18	26

And as the numbers of the first are here 1, 2, 3, 4, 5, 6, 7, and those of the second, 0, 7, 14, 21, 28, 35, 42; by combining them in this manner we have all the numbers in the progression from 1 to 49, without having any of them repeated; which is the perfect magic square proposed.

The necessity of constructing the two primitive squares in a different manner does not at all hinder but that each of the 20,160 constructions of the one may be combined with all the 20,160 constructions of the other: of consequence, therefore, 20,160 multiplied by itself, which makes 406,425,600, is the number of different constructions that may be made of the perfect square, which here consists of the 49 numbers of the natural progression. But as we have already observed, that a primitive square of seven numbers repeated

Magic Square.

Magic
Square.

peated may have above 20,160 several constructions, the number 406,425,600 must come vastly short of expressing all the possible constructions of a perfect magic square of the 49 first numbers.

As to the even squares, he constructs them like the uneven ones, by two primitive squares; but the construction of primitives is different in general, and may be so a great number of ways; and those general differences admit of a great number of particular variations, which give as many different constructions of the same even square. It scarce seems possible to determine exactly, either how many general differences there may be between the construction of the primitive squares of an even square and an uneven one, nor how many particular variations each general difference may admit of; and, of consequence, we are still far from being able to determine the number of different constructions of all those that may be made by the primitive squares.

The ingenious Dr Franklin seems to have carried this curious speculation farther than any of his predecessors in the same way. He has constructed not only a magic square of squares, but likewise a magic circle of circles, of which we shall give some account for the amusement of our readers. The magic square of squares is formed by dividing the great square, as in Plate CCXCVIII. The great square is divided into 256 small squares, in which all the numbers from 1 to 256 are placed in 16 columns, which may be taken either horizontally or vertically. The properties are as follow:

1. The sum of the 16 numbers in each column, vertical and horizontal, is 2056.
2. Every half column, vertical and horizontal, makes 1028, or half of 2056.
3. Half a diagonal ascending added to half a diagonal descending, makes 2056; taking these half diagonals from the ends of any side of the square to the middle thereof; and so reckoning them either upward or downward, or sidewise from left to right hand, or from right to left.
4. The same, with all the parallels to the half diagonals, as many as can be drawn in the great square; for any two of them being directed upward and downward, from the place where they begin to that where they end, their sums will make 2056. The same downward and upward in like manner: or all the same if taken sidewise to the middle, and back to the same side again. *N. B.* One set of these half diagonals and their parallels is drawn in the same square upward and downward. Another such set may be drawn from any of the other three sides.
5. The four corner numbers in the great square, added to the four central numbers therein, make 1028; equal to the half sum of any vertical or horizontal column which contains 16 numbers; and equal to half a diagonal or its parallel.
6. If a square hole (equal in breadth to four of the little squares) be cut in a paper, through which any of the 16 little squares in the great square may be seen, and the paper be laid on the great square, the

sum of all the 16 numbers, seen through the hole, is equal to the sum of the 16 numbers in any horizontal or vertical column, viz. to 2056.

The magic circle of circles, Plate CCXCVIII. is composed of a series of numbers from 12 to 75 inclusive, divided into eight concentric circular spaces, and ranged in eight radii of numbers, with the number 12 in the centre; which number, like the centre, is common to all these circular spaces, and to all the radii.

The numbers are so placed, that the sum of all those in either of the concentric circular spaces above mentioned, together with the central number 12, make 360; equal to the number of degrees in a circle.

The numbers in each radius also, together with the central number 12, make just 360.

The numbers in half of any of the above circular spaces, taken either above or below the double horizontal line, with half the central number 12, make 180; equal to the number of degrees in a semicircle.

If any four adjoining numbers be taken, as if in a square, in the radial divisions of these circular spaces, the sum of these, with half the central number, makes 180.

There are, moreover, included, four sets of other circular spaces, bounded by circles which are eccentric with respect to the common centre; each of these sets containing five spaces. The centres of the circles which bound them are at A, B, C, and D. The set whose centre is at A is bounded by dotted lines; the set whose centre is at C is bounded by lines of short unconnected strokes; and the set round D is bounded by lines of unconnected longer strokes, to distinguish them from one another. In drawing this figure by hand, the set of concentric circles should be drawn with black ink, and the four different sets of eccentric circles with four kinds of ink of different colours; as blue, red, yellow, and green, for distinguishing them readily from one another. These sets of eccentric circular spaces intersect those of the concentric, and each other; and yet the numbers contained in each of the eccentric spaces, taken all around through any of the 20 which are eccentric, make the same sum as those in the concentric, namely 360, when the central number 12 is added. Their halves also, taken above or below the double horizontal line, with half the central number, make 180.

Observe, that there is not one of the numbers but what belongs at least to two of the circular spaces, some to three, some to four, some to five; and yet they are all so placed as never to break the required number 360 in any of the 28 circular spaces within the primitive circle.

To bring these matters in view, all the numbers as above mentioned are taken out, and placed in separate columns as they stand around both the concentric and eccentric circular spaces, always beginning with the outermost and ending with the innermost of each set, and also the numbers as they stand in the eight radii, from the circumference to the centre: the common central number 12 being placed the lowest in each column.

Magic Square.
||
Magliabechi.

If, now, we take any four numbers, in a square form, either from N^o 1. or N^o 2. (we suppose from N^o 1.) as in the margin, and add half the central number 12 to them, the sum will be 180; equal to half the numbers in any circular space taken above or below the double horizontal line, and equal to the number of degrees in a semicircle. Thus, 14, 72, 25, 63, and 6, make 180.

Magic Lantern. See DIOPTRICS, art. x.

MAGICIAN, one who practises magic, or hath the power of doing wonderful feats by the agency of spirits.

Among the eastern nations it seems to have been formerly common for the princes to have magicians about their court to confer with upon extraordinary occasions. And concerning these there hath been much disputation: some supposing that their power was only feigned, and that they were no other than impostors who imposed on the credulity of their sovereigns; while others have thought that they really had some unknown connexion or correspondence with evil spirits, and could by their means accomplish what otherwise would have been impossible for men. See the article MAGIC.

MAGINDANAO, or MINDANAO. See MINDANAO.

MAGISTERY, an old term in chemistry, given to precipitates. Thus, *magistry* and *precipitate* are synonymous; formerly *precipitate* was a general term, and *magistry* applied to particular precipitates, such as the magistry of bismuth, &c. See BISMUTH, CHEMISTRY *Index*.

MAGISTRATE, any public officer to whom the executive power of the law is committed either wholly or in part.

MAGLIABECHI, ANTONY, a person of great learning, and remarkable for an amazing memory, was born at Florence in 1633. His father died when he was only seven years old. His mother had him taught grammar and drawing, and then put him apprentice to one of the best goldsmiths in Florence. When he was about 16 years old, his passion for learning began to appear; and he laid out all his money in buying books. Becoming acquainted with Michael Ermini, librarian to the cardinal de Medicis, he soon perfected himself by his assistance in the Latin tongue, and in a little time became master of the Hebrew. His name soon became famous among the learned. A prodigious memory was his distinguishing talent; and he retained not only the sense of what he had read, but

Magli-
bechi
M
Magnan-
imity.

but frequently all the words and the very manner of spelling. It is said that a gentleman, to make trial of the force of his memory, lent him a manuscript he was going to print. Some time after it was returned, the gentleman, coming to him with a melancholy countenance, pretended it was lost, and requested Magliabechi to recollect what he remembered of it; upon which he wrote the whole, without missing a word. He generally shut himself up the whole day, and opened his doors in the evening to the men of letters who came to converse with him. His attention was so absorbed by his studies, that he often forgot the most urgent wants of nature. Cosmo III. grand duke of Florence, made him his librarian; but he still continued negligent in his dress, and simple in his manners. An old cloak served him for a morning gown in the day and for bed-clothes at night. The duke, however, provided for him a commodious apartment in his palace, which he was with difficulty persuaded to take possession of; but which he quitted four months after, and returned to his house. He was remarkable for his extraordinary modesty, his sincerity, and his beneficence, which his friends often experienced in their wants. He was a patron of men of learning; and had the highest pleasure in assisting them with his advice and information, and in furnishing them with books and manuscripts. He had the utmost aversion at any thing that looked like constraint; and therefore the grand duke always dispensed with his personal attendance, and sent him his orders in writing. Though he lived a very sedentary life, he reached the 81st year of his age; and died in the midst of the public applause, after enjoying, during the latter part of his life, such affluence as few have ever procured by their learning. By his will, he left a very fine library to the public, with a fund for its support.

MAGLOIRE, ST, a native of Wales in Great Britain, and cousin german to St Sampson and St Mallo. He embraced a monastic life, and went into France, where he was made abbot of Dol, and after that a provincial bishop in Brittany. He afterwards founded a monastery in the island of Jersey, where he died on the 14th of October 575, about the age of 80. His remains were transported to the suburb of St Jacques, and deposited in a monastery of Benedictines, which was ceded to the fathers of the oratory in 1628. It is now the seminary of St Magloire, celebrated on account of the learned men whom it has produced.— This saint cultivated poetry with considerable success: the hymn which is sung at the feast of All Saints was composed by him; *Cælo quos eadem gloria consecrat, &c.*

MAGNA ASSISA ELIGENDA, is a writ anciently directed to the sheriff for summoning four lawful knights before the justices of assize, in order to choose 12 knights of the neighbourhood, &c. to pass upon the great assize between such a person plaintiff and such a one defendant.

MAGNA Charta. See CHARTA.

MAGNANIMITY, denotes greatness of mind, particularly in circumstances of trial and adversity.— It has been justly observed of it, that it is the good sense of pride, and the noblest way of acquiring applause. It renders the soul superior to the trouble, disorder, and emotion, which the appearance of great

danger might excite; and it is by this quality that heroes maintain their tranquillity, and preserve the free use of their reason, in the most surprising and dreadful accidents. It admires the same quality in its enemy; and fame, glory, conquests, desire of opportunities to pardon and oblige their opposers, are what glow in the minds of the brave. Magnanimity and courage are inseparable.

1. The inhabitants of Privernum being subdued and taken prisoners after a revolt, one of them being asked by a Roman senator, who was for putting them all to death, what punishment he and his fellow captives deserved? answered with great intrepidity, "We deserve that punishment which is due to men who are jealous of their liberty, and think themselves worthy of it." Plautinus perceiving that his answer exasperated some of the senators, endeavoured to prevent the ill effects of it, by putting a milder question to the prisoner: How would you behave (says he) if Rome should pardon you?" "Our conduct (replied the generous captive) depends upon yours. If the peace you grant be an honourable one, you may depend on a constant fidelity on our parts: if the terms of it be hard and dishonourable, lay no stress on our adherence to you." Some of the judges construed these words as menaces; but the wiser part finding in them a great deal of magnanimity, cried out, that a nation whose only desire was liberty, and their only fear that of losing it, was worthy to become Roman. Accordingly, a decree passed in favour of the prisoners, and Privernum was declared a municipium. Thus the bold sincerity of one man saved his country, and gained it the privilege of being incorporated into the Roman state.

2. Subrius Flavius, the Roman tribune, being impeached for having conspired against the life of the emperor Nero, not only owned the charge, but gloried in it. Upon the emperor's asking him what provocation he had given him to plot his death. Because I abhorred thee (said Flavius), though there was not in the whole army one more zealously attached to thee than I, so long as thou didst merit affection; but I began to hate thee when thou becamest the murderer of thy mother, the murderer of thy brother and wife, a charioteer, a comedian, an incendiary, and a tyrant." Tacitus tells us, that the whole conspiracy afforded nothing which proved so bitter and pungent to Nero as this reproach. He ordered Flavius to be immediately put to death, which he suffered with amazing intrepidity. When the executioner desired him to stretch out his neck valiantly, "I wish (replied he) thou mayest strike as valiantly."

3. When the Scythian ambassadors waited on Alexander the Great, they gazed attentively upon him for a long time without speaking a word, being very probably surprised, as they formed a judgment of men from their air and stature, to find that his did not answer the high idea they entertained of him from his fame. At last, the oldest of the ambassadors (according to Q. Curtius) addressed him thus: "Had the gods given thee a body proportionable to thy ambition, the whole universe would have been too little for thee. With one hand thou wouldst touch the east, and with the other the west; and, not satisfied with this, thou wouldst follow the sun, and know where he hides himself."

Magna-
nimity.

Beauties of
History,
under the
word.

Magnanimity.

himself. But what have we to do with thee? we never set foot in thy country. May not those who inhabit woods be allowed to live, without knowing who thou art, and whence thou comest? We will neither command over, nor submit to, any man. And that thou mayest be sensible what kind of people the Scythians are, know, that we received from heaven as a rich present, a yoke of oxen, a ploughshare, a dart, a javelin, and a cup. These we make use of, both with our friends and against our enemies. To our friends we give corn, which we procure by the labour of our oxen; with them we offer wine to the gods in our cup; and with regard to our enemies, we combat them at a distance with our arrows, and near at hand with our javelins. But thou, who boastest thy coming to extirpate robbers, thou thyself art the greatest robber upon earth. Thou hast plundered all nations thou overcamest; thou hast possessed thyself of Lydia, invaded Syria, Persia, and Bactriana; thou art forming a design to march as far as India; and now thou comest hither to seize upon our herds of cattle. The great possessions thou hast, only make thee covet more eagerly what thou hast not. If thou art good, thou oughtest to do good to mortals, and not deprive them of their possessions. If thou art a mere man, reflect always on what thou art. They whom thou shalt not molest will be thy true friends, the strongest friendships being contracted between equals; and they are esteemed equals who have not tried their strength against each other; but do not imagine that those whom thou conquerest can love thee."

Rapin's
Hist. ann.
1199.

4. Richard I. king of England, having invested the castle of Chalus, was shot in the shoulder with an arrow; an unskilful surgeon endeavouring to extract the weapon, mangled the flesh in such a manner, that a gangrene ensued. The castle being taken, and perceiving he should not live, he ordered Bertram de Gourdon, who had shot the arrow, to be brought into his presence. Bertram being come, "What harm (said the king) did I ever do thee, that thou shouldst kill me?" The other replied with great magnanimity and courage, "You killed with your own hand my father and two of my brothers, and you likewise designed to have killed me. You may now satiate your revenge. I should cheerfully suffer all the torments that can be inflicted, were I sure of having delivered the world of a tyrant who filled it with blood and carnage." This bold and spirited answer struck Richard with remorse. He ordered the prisoner to be presented with one hundred shillings, and set at liberty: but Maccardec, one of the king's friends, like a true ruffian, ordered him to be flayed alive.

5. The following modern instance is extracted from a French work, entitled, *Ecole historique et morale du soldat*, &c. A mine, underneath one of the outworks of a citadel, was intrusted to the charge of a serjeant and a few soldiers of the Piedmontese guards. Several companies of the enemy's troops had made themselves masters of this work; and the loss of the place would probably soon have followed had they maintained their post in it. The mine was charged, and a single spark would blow them all into the air. The serjeant, with the greatest coolness, ordered the soldiers to retire, desiring them to request the king to

take care of his wife and children; struck fire, set a match to the train, and sacrificed himself for his country.

Magnanimity
||
Magnes-

MAGNESA, or MAGNESIA, in *Ancient Geography*, a town or a district of Thessaly, at the foot of Mount Pelius, called by Philip, the son of Demetrius, one of the three keys of Greece, (Pausanias).

MAGNESIA, or MAGNESIA ALBA, in *Chemistry*, a peculiar kind of earth. See *CHEMISTRY Index*.

Black MAGNESIA. See *MANGANESE, CHEMISTRY and MINERALOGY Index*.

MAGNESIA, in *Ancient Geography*, a maritime district of Thessaly, lying between the south part of the Sinus Thermaicus and the Pegasæus to the south, and to the east of the Pelasgiotis. *Magnetes*, the people. *Magnesium* and *Magnessus*, the epithet; (Horace).

MAGNESIA, a town of Asia Minor on the Mæander, about 15 miles from Ephesus. Themistocles died there: it was one of the three towns given him by Artaxerxes, with these words, "to furnish his table with bread." It is also celebrated for a battle which was fought there, 190 years before the Christian era, between the Romans and Antiochus king of Syria. The forces of Antiochus amounted to 70,000 men according to Appian, or 70,000 foot and 12,000 horse according to Livy, which has been exaggerated by Florus to 300,000 men; the Roman army consisted of about 28,000 or 30,000 men, 2000 of whom were employed in guarding the camp. The Syrians lost 50,000 foot and 4000 horse; and the Romans only 300 killed, with 25 horse. It was founded by a colony from Magnesia in Thessaly; and was commonly called *Magnesia ad Mæandrum*, to distinguish it from another called *Magnesia ad Sipylum* in Lydia at the foot of Mount Sipylum.

MAGNESIA ad Sipylum, anciently *Tantalus*, the residence of Tantalus, and capital of Mæonia, where now stands the lake Sale. A town of Lydia, at the foot of Mount Sipylum, to the east of the Hermus; adjudged free under the Romans. It was destroyed by an earthquake in the reign of Tiberius.

MAGNET (*Magnes*) the LOADSTONE; a species of iron ore. See *MAGNETISM, and MINERALOGY Index*.

The magnet is also called *Lapis Heracleus*, from Heraclea, a city of Magnesia, a port of the ancient Lydia, where it is said to have been first found, and from which it is usually supposed to have taken its name. Though others derive the word from a shepherd named *Magnes*, who first discovered it with the iron of his crook on Mount Ida. It is also called *Lapis Nauticus*, from its use in navigation; and *siderites*, from its attracting iron, which the Greeks call *sidēra*.

The ancients reckoned five kinds of magnets, different in colour and virtue; the Ethiopic, Magnesian, Bœotic, Alexandrian, and Natolian. They also took it to be male and female: but the chief use they made of it was in medicine; especially for the cure of burns and defluxions on the eyes.—The moderns, more fortunate in its application, employ it to conduct them in their voyages. See *NAVIGATION*.

The most distinguished properties of the magnet are, That it attracts iron, and that it points to the poles of the world; and in other circumstances also dips or inclines

Magnet. declines to a point beneath the horizon, directly under the pole; and that it communicates these properties, by touch, to iron. On which foundation are built the mariner's needles, both horizontal and inclinatory.

Attractive Power of the MAGNET was known to the ancients; and is mentioned even by Plato and Euripides, who call it the *Herculean stone*, because it commands iron, which subdues every thing else: but the knowledge of its directive power, whereby it disposes its poles along the meridian of every place, and occasions needles, pieces of iron, &c. touched with it, to point nearly north and south, is of a much later date; though the exact time of its discovery, and the discoverer himself, are yet in the dark. The first mention we have of it is in 1260, when Marco Polo the Venetian is said by some to have introduced the mariner's compass; though not as an invention of his own, but as derived from the Chinese, who are said to have had the use of it long before; though some imagine that the Chinese rather borrowed it from the Europeans.

Flavio de Gioia, a Neapolitan, who lived in the 13th

century, is the person usually supposed to have the best title to the discovery; and yet Sir G. Wheeler mentions, that he had seen a book of astronomy much older, which supposed the use of the needle; though not as applied to the uses of navigation, but of astronomy. And in Guyot de Provins, an old French poet, who wrote about the year 1180, there is express mention made of the loadstone and the compass, and their use in navigation obliquely hinted at.

The Variation of the MAGNET, or its declination from the pole, was first discovered by Seb. Cabot, a Venetian, in 1500; and the variation of that variation, by Mr Gellibrand, an Englishman, about the year 1625. See VARIATION.

Lastly, The dip or inclination of the needle, when at liberty to play vertically, to a point beneath the horizon, was first discovered by another of our countrymen, Mr R. Norman, about the year 1576. See the article *DIPPING NEEDLE*.

MAGNETICAL NEEDLE. See *NEEDLE, Magnetical.*

Magnet, Magnetical.

M A G N E T I S M.

INTRODUCTION.

General Principles.

General Idea of magnetism. **I**F the mineral body called *magnet* or *loadstone* (an ore of iron which will be described under MINERALOGY) is brought within a moderate distance from a piece of iron or steel, or other ferruginous body, such as a small key, a sewing needle, or the like, the ferruginous body will approach the magnet; and if no obstacle intervene, will come in contact with it, and the two bodies will adhere together, so as to require an evident force to separate them from each other.

Magnetic polarity or directive power. Again, if a magnet be freely balanced, so that it be left at liberty to assume any direction, as if it be suspended by a thread, or made to float on the surface of water by placing it on a piece of cork, or wood, it will soon settle itself in one particular direction, so as to turn one part of its surface towards the northern point of the horizon, and the opposite part of course towards the southern point. These two parts of the surface of the magnet are called its *north* and *south* poles; this property of the magnet, of assuming this particular direction, is called its *polarity*, or its *directive power*; and when a magnet is placed so as to arrange itself in such a direction, it is said to *traverse*.

Declination of the magnet. The direction in which a suspended magnet finally settles is called the *magnetic meridian*, and it is different in different places, and at different times. It is generally, however, very different from the real meridian line, so that the north pole of a magnet declines a little to the east or west, and the south pole to the west or east. The difference of the magnetic from the astronomical meridian, is called the *declination*, or *variation* of the magnet; and the declination is said to be east or west, according as the north pole of the magnet verges to the one or the other of these points.

If an oblong magnet be suspended on a pivot by its

centre of gravity, it does not settle in a perfectly horizontal position, but one of its poles is depressed below the horizontal line, and the other elevated as far above it, making an angle with the horizon that is also different on different parts of the earth's surface. This depression of one of the poles is called the *dipping* of the magnet.

If two magnets that are each freely suspended, be brought within a moderate distance from each other, so that the north pole of the one is opposed to the south pole of the other, they will attract each other; and if no obstacle intervene, will rush together: but if the two north poles, or the two south poles, be mutually opposed, the magnets will repel each other.

Such are the leading properties of what is called the natural magnet; but what is of more importance, as we shall see hereafter, any piece of iron or steel may, by being rubbed with a natural magnet, or by some other processes to be afterwards explained, be made to acquire the same properties, and thus in every useful respect serve the same purposes as the natural magnet. These pieces of iron or steel, thus magnetised, are called *artificial magnets*; and when they are of a slender oblong form, they are termed *magnetic needles*. When afterwards we speak of the polarity, the declination, or the dipping of the magnetic needle, we would be understood as alluding to these slender, oblong, artificial magnets.

A straight line joining the two poles of a magnet is *Axis* and called its *axis*, and a line drawn transversely on the surface of the magnet, perpendicular to the axis, is called the *equator*.

The properties of natural and artificial magnets above enumerated, are attributed to the agency of some unknown force or power, either inherent in the magnet, or imparted to it by the processes to which it is subjected. This force is sometimes called *magnetism*, but we shall for the present denominate it the *magnetic power*.

†

Z z

power,

General power, restricting the term magnetism to the science that illustrates and attempts to explain the phenomena.

9
Utility of magnetism.

The most important property of the magnet is its polarity, as it is by means of this that the mariner is enabled to find his way along the trackless ocean, where, before the discovery of this important property, he had no other guide but the stars, and could therefore seldom venture far from the coast. It is by this property too, that the miner is enabled to pursue a direct course through the bowels of the earth, or the traveller direct his steps through immense forests, or over sandy deserts. The uses of the magnet are therefore obvious and important, and the science which places these uses in the best point of view, and thus enables us to turn them to the greatest advantage, is well deserving our attention. Many of the facts to be related under this article are highly curious, and form a pleasing addition to those scientific amusements which are so well calculated to excite the attention of beginners in the study of experimental philosophy.

10
Works on magnetism.

It is unnecessary for us to attempt giving here a history of the origin and progress of our knowledge in magnetism. To a general reader, it would be uninteresting, and to such as are better informed, superfluous. We shall only mention the most important works that have appeared on the subject.

Few treatises expressly on magnetism have appeared in this country. In the year 1600, Dr Gilbert, a physician of Colchester, and the friend of Lord Bacon, published an excellent work *De Magnete et Corporibus Magneticis*, which is still perhaps the most valuable that we possess. Mr Cavallo's Treatise on Magnetism, first published in 1787, contains a great variety of facts and experiments; and a neat compendium of it is given in the 3d volume of the same author's *Elements of Natural and Experimental Philosophy*. Mr Cavallo's Treatise, and Mr Adams's Essay on Magnetism, form the substance of most of the compilations on this subject that have lately appeared.

To those who wish to enter minutely on the study of magnetism, the following list of foreign publications recommended by the late Professor Robison of Edinburgh will be acceptable.

Æpini Tentamen Theoriæ Magn. et Electr.

Eberhard's Tentam. Theor. Magnetismi, 1720.

Dissertations sur l'Aimant, par Dufay, 1728.

Anton. Brugmanni Tentamen Phil. de Materia Magnetica. Franquera, 1765.

There is a German translation of this work by Eisenbach, with many valuable additions.

Scarella de Magnete, 2 tom. fol.

Van Swinden sur l'Analogie entre les phenomenes Electriques et Magnetiques, 3 tom. 8vo.

Dissertation sur les Aimants Artificielles, par Nicholas Fuss, 1782.

Essai sur l'Origine des Forces Magnetiques, par M. Prevost. Magnetical Apparatus.

Sur les Aimants artificielles, par Rivoir. Paris, 1752.

Dissertatio de Magnetismo, par Sam. Klingenstein et Jo. Brander. Holm. 1752.

Description des Courants Magnetiques. Strasbourg, 1753.

Traité de l'Aimant, par Dalancé. Amst. 1687.

Besides the above original works, there are several valuable dissertations on magnetism by Des Cartes, Bernoulli, Euler, Du Tour, Coulomb, &c. either published in the miscellaneous works of these authors, or in the journals and transactions of academies.

We shall divide this article into three chapters. In the first we shall briefly describe the principal instruments made use of in magnetical experiments; in the second we shall endeavour to arrange under distinct heads or propositions, the leading principles of magnetism, point out how these may be illustrated by experiment, and explain the construction and uses of the magnetical apparatus, as they are deducible from the principles laid down; and in the third we shall notice the more important theories of magnetism, and exemplify the illustration of some of the preceding facts by that theory which we shall feel most disposed to adopt.

CHAP. I. Of Magnetical Apparatus.

THE principal instruments employed in magnetical experiments and observations, are reducible to three heads: First, *Magnets* of various kinds and forms; Secondly, *Magnetic needles and compasses*; and, Thirdly, the *Dipping needle*. Of compasses we have nothing to say here, having fully treated of them under COM-
PASS.

Magnets, as we have said, are either *natural* or *artificial*. The natural magnet may be cut into various forms, according to the experiments that are to be made with it. The most usual shape is oblong, having the poles at the two most distant extremities. Dr Gilbert, whom we shall mention more at large hereafter, made his magnets of a spherical shape, so as to resemble the terrestrial globe. Magnets of this shape are called *terrella*, or *little earths*, and have usually marked upon their surface the magnetic poles, meridian, and equator.

Natural magnets of an oblong shape have usually a piece of soft iron attached to each pole, called the *conductor*; and another piece of soft iron placed so as to join two of the extremities of the former pieces, and usually furnished with a hook or hole in the middle. The magnet thus fitted up, as represented at fig. 1. is said to be *armed*, and the iron pieces CD, CD, are called the *armature* of the magnet AB. The magnet with its armature is commonly inclosed in a brass box, represented in the figure by the dotted lines DC, CC, CD: and to the upper part of the box is fixed a ring E, for holding the magnet.

One of the most common forms of the artificial magnet is that of an oblong bar, as NS, fig. 2. of which N is the north pole, and S the south, having the north end marked with a transverse notch. These bars are made of hardened steel, and are either sold separately, or, what is more common, in sets of six in a box.

Another very common form of the artificial magnet is

Experimental Illustrations. Fig. 3. is that of a horse shoe, such as fig. 3. having the two poles N, S, brought near each other, and commonly united by a piece of soft iron or conductor. The horse-shoe magnets sometimes consist only of a single crooked bar; but they are frequently composed of several such bars united together by their flat surfaces, and inclosed in a leathern covering that envelopes all but the poles, and thus preserves the bars from rusting.

Instead of the very arched form of which horse-shoe magnets are usually made, they are sometimes constructed so as to form nearly a semicircle, and in this shape they are very convenient for several experiments.

Artificial magnets, like the natural, when of an oblong shape, are sometimes armed at each end, so as to enable them to apply both poles to a ferruginous body at the same time. One material advantage of the horse-shoe magnet is, that in it such an armature is unnecessary, as the poles are brought so near each other as easily to be applied to the object it is proposed to lift, as a key, &c.

14
Magnetic
needle.

A magnetic needle is an oblong piece of steel, tempered so as commonly to assume the blue tinge that is seen in watch-springs, and supported on a brass point, so as, when left at liberty, to arrange itself in the magnetic meridian, but in a horizontal position. These needles are sometimes made pointed at both extremities; sometimes the northern extremity is made in the form of a cross; but perhaps the best form is that of the oblong, with extremities that are nearly obtuse, such as is represented at fig. 4. To balance the needle on its pivot, it is furnished near its middle with a hollow cap, which is formed of some substance that is not attracted by the magnet. The cap is usually of brass; but for nice experiments it is sometimes made of agate, as this latter does not wear so fast as brass, and consequently the needle will longer retain its original suspension.

Fig. 4.

15
Dipping
needle.
Fig. 5.

The dipping needle, fig. 5. consists of an oblong bar of steel, AB, balanced between two horizontal slips of brass, CD, so as when magnetised to form an angle with the horizon, equal to the dipping of the needle at the place where the instrument is made. The two horizontal slips of brass are either fixed to a graduated semicircle that is supported on a stand of wood, or more commonly they form diameters to a brass ring which is graduated on its circumference, and furnished with a ring, H, by which it may be held on the finger.

The construction and uses of these instruments will be fully explained in the next chapter; our only object here being to bring the reader acquainted with the names and general form of the instruments that are made use of in the experiments which we are about to describe, for illustrating the principles of magnetism.

Several smaller articles will be required by the experimentalist; but these are easily procured, and need no particular description. Such are a number of sewing needles of various sizes, soft iron bars, pieces of iron wire, small iron balls, iron filings, &c.

CHAP. II. *Experimental Illustrations of the Principles of Magnetism.*

SECT. I. *Of Magnetical Polarity.*

WE have stated (N^o 3.) that when a magnet is sus-

Experimental Illustrations. depended at perfect freedom, it assumes a certain determinate position with respect to the astronomical meridian. This is but a particular case of a much more general fact, which may be expressed by the following proposition.

If an oblong piece of iron be so adjusted, as to be at liberty to take any position; it will assume a certain determinate direction with respect to the axis of the earth, differing according to the place where the experiment is made.

Experiment 1.—Take a moderately sized straight iron rod, as a piece of iron wire about the thickness of a goose quill, and about eight or ten inches long; pass it through one extremity of a large wine cork, so that it may be at right angles to the axis of the cork, and adjust it in such a manner that it may swim in water in a horizontal position. Now, provide a pretty large earthen vessel, as a hand bason or round deep dish, nearly filled with water; and when the water is free from agitation, cautiously put in the wire, in such a direction as not to be very far from the north and south line. The iron rod will, after some time, be found to have arranged itself so as, in Britain, to form an angle with the meridian of about 25 degrees.

This experiment requires some nicety, and it will sometimes be long before the iron assumes its proper position; but if due attention be paid to all the particulars above mentioned, it will at length arrange itself in the magnetic line. It is necessary that the rod should be placed not too far from the magnetic line, as, if it be laid at right angles to that line, it will never acquire the proper direction. The situation of the rod in this experiment is in the true magnetic line, so far as respects the meridian; but, as it is horizontal, it is not in the position that a magnet would assume, if freely suspended by its centre of gravity. An iron rod may, however, be made to take such a position, as well as a magnet.

Exper. 2.—Instead of passing the iron rod through the extremity of a cylindrical or conical piece of cork, let it be passed through the centre of a spherical piece of cork or wood, so that the centre of gravity may coincide with the centre of the sphere, and let the whole be of such a specific gravity as to remain suspended in any part of the water, without ascending or descending. If the iron rod thus fitted be placed as in the last experiment, it will at length arrange itself in the true magnetic direction, so as to make an angle of about 25 degrees with the meridian, and with one extremity depressed below the horizon at an angle of about 73 degrees.

These experiments were contrived by Dr Gilbert, and fully shew that the property of assuming a determinate direction with respect to the earth's axis is not confined to magnets, or iron rendered magnetical by the usual processes. There is, however, a remarkable difference between the polarity of unmagnetised iron and that of natural and artificial magnets. It is of no consequence in the former which extremity be placed towards the north, or which below the surface of the water, as either will retain the position it first acquired, unless disturbed by agitation, or by the proximity of a magnet; and both extremities may easily be made to change situations. *The effect produced on the iron is therefore temporary.* But if a magnetic needle be

freely suspended, the same extremity always points towards the north, and this northern extremity always dips below the horizon, at least in these northern latitudes; and if the position of the needle be disturbed by mechanical motion, or by the application of a magnet, it will be resumed when the disturbing cause is removed.

The polarity of magnets therefore is permanent.

We have said that the magnetic line varies at different times, and in different places. The declination of the magnet is so uncertain as to impose great impediments to the art of navigation, as it is necessary in the course of a long voyage, frequently to ascertain the degree of variation for any particular time or place. The method of doing this is mentioned under COMPASS. The declination observed in different places at different times, has been laid down in tables; and as such tables are very useful, we shall here subjoin one, given by Mr Cavallo.

 1801 - 22 1
 1802 - 21 45
 1803 - 21 59
 1804 - 22 10
 At Jamaica 1805 - 6 30 E.

Experi-
mental Il-
lustrations.

At Alexandria in Egypt,
 In 1761 - 11° 4' W.
 1798 - 13 6

At Cairo,
 In 1761 - 12° 25' W.
 1798 - 12

The declination of the magnetic needle has been found to be different, even at different hours of the day. The following table contains the result of some observations made by Mr Canton on the daily variation, and on the mean variation of each month.

The declination observed at different hours of the same day. June 27. 1759.

From this last table it appears that when the declination was first observed, the north pole of the magnetic needle declined to the eastward of the meridian of London, that since that time it advanced continually towards the west till 1657, when the needle pointed due north and south, and that ever since it has continually declined more and more towards the west, in which direction it appears to be still advancing.

At Paris, in different years, the declination has been observed as follows :

In 1550 - 8° 0' East.
 1640 - 3 0
 1660 - 0 0
 1681 - 2 2 West.
 1759 - 18 10
 1760 - 18 20

Charts

Experi-
mental Il-
lustrations.

Charts have been constructed for shewing the declination of the needle in various parts of the earth by means of curve lines. Respecting these charts and several other circumstances with regard to this subject, see *VARIATION of the Compass*.

It may not be improper here to point out the general method of applying the polarity of the magnet to the useful purposes of navigation, mining, &c.

A mariner's compass, or magnetic needle in a case, is so placed as to be as little as possible disturbed by the motion of the vessel, person, &c. In a ship, it is placed in the binnacle (see *BINNACLE*), or suspended from the upper deck in the cabin. Then the head of the vessel is kept by the helm in such a direction as to make any required angle with the line of the needle, or the person (in mining or travelling) advances in a similar manner. Thus, supposing that a vessel sets out from a certain part, in order to go to another place that is exactly westward of the former; as for example, from the Land's End in Cornwall to Newfoundland on the coast of North America. The vessel must be directed in such a way, as that its course may be always at right angles with the direction of the magnetic needle, or so that the part of the needle or compass card, which points to the northward, (allowing for the variation) may be always kept to the right hand of the man at the helm, or to the starboard side of the vessel. The reason of this is evident; for, supposing the needle to point duly north and south, the direction of east and west being perpendicular to it, this must be the true course of the vessel. From this example, a little reflection will easily point out how a vessel may be steered in any in other course (A).

The declination of the magnetic needle is disturbed by the near approach of a ferruginous body, especially if this be of considerable size.

On holding the extremity of a pretty large iron rod, such as a poker, near one end of a magnetic needle properly suspended, the needle will be found to turn considerably from its usual direction. This circumstance, though proper to be mentioned here, will be better understood when we have considered the attractive power of the magnet. The fact is useful, as it teaches us to keep magnetic needles in such a situation as not to be acted on by any considerably body of iron.

A magnet, whether natural or artificial, has a great-

er effect in disturbing the polarity of a magnetic needle than is produced by iron.

Magnetic polarity seems also to be affected by changes in the state of the atmosphere; and the following axioms respecting this effect on the declination of the needle, collected by M. la Cotte, are deserving of attention.

1. The greatest declination of the needle from the north towards the west, takes place about two in the afternoon; and the greatest approximation of it towards the north, about eight in the morning; so that from the last-mentioned hour till about two in the afternoon, it endeavours to remove from the north, and between two in the afternoon and the next morning, to approach it.

2. The annual progress of the magnetic needle is as follows:—Between January and March, it removes from the north; between March and May it approaches it; in June it is stationary; in July it removes from it; in August, September, and October it approaches it; its declination in October is the same as in May; in November and December it removes from the north; its greatest western declination is at the vernal equinox, and its greatest approximation to the north, at the autumnal equinox.

3. The declination of the magnetic needle is different, according to the latitude; among us, (i. e. in France) it has always increased since 1657; before that period it was easterly.

4. Before volcanic eruptions and earthquakes, the magnetic needle is often subject to very extraordinary movements.

5. The magnetic needle is agitated before and after the appearance of the northern lights: its declination on these occasions is about noon greater than usual.

So much has already been said respecting the phenomena, &c. of the dipping needle, under the article *DIPPING Needle*, that it is unnecessary here to add much more on the subject. It was there noticed, that at the equator the dipping needle lies quite horizontal, and that one of its extremities inclines more towards the earth, according as the instrument is carried farther from the equator. We may here add, that from some late observations made by experimentalists with balloons, it appears that the higher we ascend above the surface

Experi-
mental Il-
lustrations.

20
Polarity
disturbed
by the ap-
proach of
iron.

(A) In reply to some inquiries respecting the mode of employing the compass in mining, we were favoured by an ingenious friend, who is manager of one of the most extensive coalworks in this island, with the following remarks: "The compass is used in all mines where great accuracy is required. In some coal-mines the *cleats* or *faces* of the coal are the guides to the miners in excavating the mine, and the compass is used to ascertain the situation and extent of the excavations. In other coal-mines the courses of the excavations are at first directed by the compass. In doing this, the compass is placed in a given situation, and is made to point the desired course. Then from the centre of one sight a perpendicular line is conveyed to the roof of the mine, and a small mark is there made with chalk; then a person looks at a candle (placed so as nearly to touch the roof), through the lower part of the sight of the compass nearest to him, and through the upper part of the opposite sight. The candle at the roof is moved in any direction until he sees it through both sights of the compass. It is then in a proper place, and a chalk mark is made in the roof immediately above it. A line struck with a chalked cord, between these two marks upon the roof, marks the proper course, by which the workmen are directed in making the excavation. By applying one part of a chalked cord along part of the course or white line thus begun on the roof, and extending the other part of the cord past it to any required distance, and then striking the cord, the course may be continued from time to time as the excavation advances."

Experimental Illustrations surface of the earth, the less is the angle of inclination which the dipping needle makes with the horizontal line *.

* Nichols. Jour. 8vo. xi. p. 54.

It is worthy of remark that, under the same circumstances, the declination of the needle was not found different from what it would have been on the earth at the same place, and its polarity with respect to iron was unchanged.

Experimental Illustrations. In an aërostatic voyage made at St Petersburg in 1804 by M. M. Sacharof and Robertson, it was observed that the south pole of a magnetic needle, balanced on a pin, dipped below the horizon nearly 10 degrees.

The following table shows the magnetic dip as observed at several different places at various times.

* Phil. Trans. 1806. p. 491.

To

Experi-
mental Il-
lustrations.

To what was said under *DIPPING Needle*, respecting the construction of that instrument, we may add, that notwithstanding the great improvements that have been lately made in the arts, the making of a dipping needle is one of the most delicate and difficult tasks that an instrument-maker can undertake. The needle must be made of tempered steel which we are certain has no magnetism before it is touched; it must be poised so nicely, and with such a perfect coincidence of its centre of gravity and axis of motion, that it will retain any position (before being magnetised) that is given it. A good dipping needle cannot be had below *twenty guineas*.

SECT. II. On Magnetic Attraction and Repulsion.

²²
A magnet
attracts
iron and all
ferruginous
bodies.

A magnet attracts iron, and all bodies, into the position of which iron enters in any considerable degree. This principle is illustrated by very simple experiments, which will readily occur to every reader. It is of consequence here to observe, that the purer and softer the iron to which the magnet is presented, the stronger will be the attraction; thus, a magnet attracts a piece of soft and clean iron much more strongly than it attracts any other ferruginous body of the same shape and weight. Hard steel, or the harder ores of iron, are less forcibly attracted than soft steel, and still less than soft iron; and all pieces of iron are less forcibly attracted in proportion as they are oxygenated.

[22]
Attraction
greatest at
the poles.

The attractive power of a magnet is not equally strong in every part of its surface. It is most powerful at the poles of the magnet, and it is found to diminish in proportion as the part of the surface is more distant from the poles. Thus, in an oblong magnet, the attraction is least at about its middle, where it is often very trifling.

²³
Method of
finding the
poles of a
magnet.

It is by this property of the magnet that we are enabled to discover the poles of a magnet, where they are not yet ascertained; a circumstance which is often necessary with respect to natural magnets, in which, when of an irregular shape, it would otherwise be difficult to discover the poles. The usual method of ascertaining the poles of a magnetic body is, to present various parts of the body to be examined, successively to the poles of a magnetic needle, when it will soon be discovered which parts of the body have most influence on the needle, by the pole of the latter standing perpendicularly to that part of the body. It will presently appear, that in this way it may also be ascertained which of these poles is the north, and which the south, as the south pole of the body under examination will have most influence on the north pole of the needle, and *vice versa*.

A good magnet should have no more than two poles, and these should be situated in the extreme surface of the magnet; but it sometimes happens, especially in natural magnets, and in artificial magnetic bars, if they be very long, that there are more than two poles, or that the poles are very confused. For example, in a very long magnetised bar, there may be a strong north pole at one extremity, a south pole a little farther on, then a weaker north pole, and so on to the extremity, which will be found possessed of a still weaker south polarity. These poles are to be discovered by presenting to several parts of the bar one or other of the poles

of a magnetic needle; for, as we shall immediately mention, each pole of the needle will be attracted towards that part of the rod which is possessed of the contrary polarity. Experi-
mental Il-
lustrations.

The attractive power of the magnet and the iron is most forcible when the two bodies are in contact, and it diminishes as they are made to recede from each other. The exact law according to which this diminution takes place, has not yet been completely ascertained. We shall see in the next chapter, what approximation has been made to it.

A magnet is not capable of lifting above a certain weight of iron; and all magnets of the same form and size are not able to lift the same weight. Among the natural magnets the smallest seem in general to possess a greater attractive power in proportion to their size, than those of larger dimensions. Mr Cavallo mentions a small magnet that weighed not more than 6 or 7 grains, and was capable of lifting about 300 grains; and Sir Isaac Newton possessed a magnet that he wore in a ring, weighing but about 3 grains, which is said to have lifted 746 grains, or nearly 250 times its own weight. The larger natural magnets are very weak in proportion to these. Those of two pounds scarcely lift more than ten times their own weight. It seems extraordinary, that a piece cut off from a large magnet is sometimes much stronger in respect of its attractive power, than the magnet from which it was taken.

It has been said that the attractive power of magnets is greatest at their poles. Both poles, however, are seldom equal in this respect; and it appears, that in these northern parts of the world, the northern pole of magnets is more powerful than the south. In the southern hemisphere the contrary effect is said to take place. The attractive power of the magnet is most forcible when both poles are made to act conjunctly; hence an armed magnet, or one of the horse-shoe form, is best adapted for experiments on the force of magnetic attraction.

It is of little consequence whether the iron that is presented to the magnet be in one piece, or consist of several pieces. The attraction is indeed stronger in the former case; but if several pieces of iron are presented to the magnet, they will either all adhere about the pole of the magnet, or will adhere to each other, so as to form a sort of chain. If a small iron ball be made to adhere to the pole of a magnet, this ball will support a second; and this latter, if the magnet be pretty strong, will support a third. If the magnet be of the horse-shoe form, and have these three balls hanging by one ball, if two others be suspended from the other pole, all the five may be made to adhere, so as to form a curved chain. It will be evident, that pieces of iron which present a greater extent of surface than the above spherical balls, will be more powerfully attracted.

One of the most pleasing experiments on the attraction of the magnet for iron, is shown by means of iron filings. Action of a
magnet on
iron filings.

Exper.—Let a paper be placed above a bar magnet, and let iron filings be shaken on the paper through a gauze sieve. They will arrange themselves round the magnet in a very beautiful manner, forming curves and arches of curves, as represented in fig. 6. At the two ends of the magnet, as *aa*, there are chains of filings standing out nearly perpendicular; and along the sides they

Experi- mental Illustrations they form complete curves, bending outwards away from the magnet towards its middle, and having their extremities bounded by the poles of the magnet; and at the corners there are a number of arches that seem to form imperfect curves.

bring the extremity of a large iron rod, as the point of a new poker, holding it in a position not very different from that of the iron wire, within about a quarter of an inch of the upper extremity of the floating iron, and hold it there for some time, a little towards one side. The floating wire will gradually approach the iron rod with an accelerated motion, will at length touch it, and may be drawn through the water in any direction. A similar attraction will take place between the head of the poker and the extremity of the wire that is below the water.

Experi- mental Illustrations

A similar effect may be produced by strewing iron filings on a piece of paper, so as to leave a vacancy in the middle, capable of receiving a bar magnet. When the magnet is placed on the paper, and the paper gently tapped, so as to agitate the filings, these will arrange themselves about the magnet, in curves, as above described.

The form of these curves will be better defined if the magnet be laid at the bottom of an earthen or glass vessel of water, and the iron filings be sifted over it so as to pass through the water.

The attractive power of the magnet is increased by the near approach of a piece of iron. ³¹ **Magnetic attraction increased by iron.**

²⁷ **Attraction between the magnet and iron mutual.**

The attraction between a magnet and a ferruginous body is mutual.

Exper. 1.—Suppose we have a magnetic bar that is capable of supporting a small key by one of its extremities, but which will not lift a key somewhat larger. If we bring a considerable oblong piece of iron near the opposite extremity of the bar, it will be found capable of supporting the larger key, or at least of lifting a weight somewhat greater than it sustained before.

Exper.—Place a piece of iron or other ferruginous body upon a piece of cork or wood, so that it may float on the surface of water in an earthen or wooden vessel. Bring a magnet within a moderate distance of the floating body, and the latter will approach the former, and may be drawn by it in any direction. Again, place the magnet on cork or wood, so as to float on the water, and present to it a piece of iron or other ferruginous body. The magnet will now approach the iron, and may be drawn by it as the iron was before. Lastly, Place both the magnet and the iron on separate pieces of wood or cork, within a moderate distance of each other, on the surface of the water. They will gradually approach each other, with a velocity that becomes greater in proportion as they approach nearer each other.

²⁸ **Magnetic attraction not sensibly lessened by the interposition of bodies not ferruginous.**

Magnetic attraction is not sensibly impeded by the interposition of bodies of any kind, that do not contain iron in their composition.

Exper. 2.—Let an oblong magnetic bar be supported in a horizontal position, and let a piece of iron wire, about an inch in length, be hung by a short thread, so that its extremity is just opposite one of the poles of the magnetic bar, but so far out of the reach of the bar's attractive power as not to be brought from the perpendicular. Now, if a considerable iron bar be brought with one end within a moderate distance of the opposite pole of the magnet, the suspended wire will be drawn towards the magnet, thus shewing that the power of the latter has been increased by the juxtaposition of the bar of iron. If the bar of iron be brought still nearer the opposite pole of the magnet, the suspended wire will be drawn still nearer its adjacent pole; but if the bar of iron be drawn back from the magnet, the wire will fall into its original position.

Exper.—Suppose that a magnet, placed at the distance of an inch from a piece of iron, exerts a certain degree of attraction, it will be found that the attraction is not sensibly weakened by the interposition of a plate of glass, a sheet of paper, a piece of copper, or any other similar substance. A needle, inclosed in a glass globe, will be still attracted by the magnet.

This fact leads to many important practical conclusions in the management of magnets. As the juxtaposition of iron to the poles of a magnet improves its powers, we may infer, that if we keep a piece of soft iron in contact with the poles, the magnet will be improved by it; and this is in fact the case, and it shews the utility of the armature and conductor mentioned in N^o 13. But of this more hereafter.

²⁹ **Usual mode of measuring the attractive force.**

It is not easy to ascertain correctly the degree of attractive force exerted between a magnet and a ferruginous body. The usual method of observing this is, to fasten a magnet to one arm of a balance, and placing the body to be attracted at different distances below the magnet, to counterpoise the attraction with weights placed in the opposite scale of the balance. Proceeding in this way, then, if we find that it requires the weight of an ounce to counterpoise the attractive power of a magnet, when presented immediately to a piece of iron, it will be found that it requires the same counterpoise, if a plate of any matter that is not ferruginous be interposed.

The attractive power of a magnet may be improved by increasing the weight appended to it. ³² **Power of a magnet increased by hanging weights to it.**

This is best shown by a horse-shoe magnet, having a conductor of soft iron attached to its two poles, and a brass ring at the convex part by which it may be suspended. If a small bag be hung to the conductor, and if the magnet is capable of sustaining a certain weight at any particular time, it will, by adding a little more, suppose a few shot, to the bag, at moderate intervals, be made to support gradually a much greater weight. If the magnet, on a first trial, was able to lift a small key, it will soon be able to lift a larger one, &c. How far this increase of power may be carried, has not, we believe, yet been ascertained.

³⁰ **Iron attracts iron in certain situations.**

Not only is iron attracted by the magnet, but under certain circumstances, one piece of iron exerts an attractive power on another piece of iron.

Exper.—Let an oblong piece of iron be fixed in a spherical piece of wood or cork, so as to float in water in the true magnetic line, as in *Exper. 2.* of N^o 16. When the iron is nearly in the magnetical position,

It sometimes happens that a magnet does not shew any great attractive power, as exemplified in its power of lifting a considerable weight of iron, though it may have a great effect in exciting or in altering magnetic polarity. This was observed by Dr Gilbert, who remarks

Experi-
mental Il-
lustrations.

marks that the *directive power* of a magnet extends farther than its *attractive power*.

The contrary poles of two magnets attract each other; that is, the north the south, and vice versa.

33
Contrary
poles of
magnets at-
tract each
other.

Exper. 1.—Place two oblong magnets on cork or wood, so as to float in water, or suspend each by a pretty long thread, with the north pole of the one opposed to the south pole of the other. They will gradually approach, and will at length rush together.

A similar effect will be produced, if the north pole of a bar magnet be held near the south pole of a magnetic needle; the latter will be attracted, and the same thing will happen if the south pole of the bar is brought near the north pole of the needle.

Exper. 2.—Take two semicircular magnets, and dip their extremities into iron filings. The filings will of course adhere to the extremities of the magnets, and will appear as if radiating from them. Now, present the two magnets with their adhering filings to each other, so that the north and south pole of the one is opposite to the contrary poles of the other, and the iron filings at their extremities will approach each other, and coalesce, as represented in fig. 7.

Fig. 7.

The attraction exerted between two magnets is not so strong in proportion, as between a magnet and a piece of soft iron in contact; but it has been found to commence at a greater distance.

34
Correspond-
ing poles
repel each
other.

The corresponding poles of two magnets repel each other; that is, the north the north, and the south the south.

Exper. 1.—Make the two magnets float on water, or suspend them by threads, so that the north or south pole of the one may be opposite to the north or south pole of the other. They will recede from each other; and the repulsion will evidently be greater, in proportion as they are brought nearer together.

Exper. 2.—Take two semicircular magnets, and dip their ends in iron filings, as mentioned above. Present them to each other, so that their corresponding poles may be mutually opposed. The filings at their extremities will start back, and leave a vacancy between the opposed poles of the magnets, somewhat like what is represented in fig. 8.

Fig. 8.

It sometimes happens that the corresponding poles of two magnets do not repel each other, but either mutually attract, or are quite indifferent. In this case, it will, in general, be found that one of them is stronger than the other; and the reason of the phenomenon will appear hereafter.

The repulsive power of a magnet is generally in a less proportion than its attractive power.

35
Usual mode
of ascer-
taining
whether a
body is
magnetic.

It is by the attractive power of the magnet that we usually ascertain whether any substance be magnetic; that is, whether the magnet possess any attractive power for it. If the body contain any considerable quantity of iron in its composition, its magnetism is easily ascertained, by approaching it with the pole of a pretty strong magnetic bar. If, however, the magnetism is too feeble to be discovered in this way, it may be ascertained by placing the body on a piece of cork or wood, so that it may float on the surface of water or mercury, in an earthen or wooden vessel, and bringing the pole of the magnet within a small distance of the floating body. It will sometimes be necessary to bring

the magnet within one-tenth of an inch of the body, when, if it possesses any magnetism, it will gradually approach the magnet. This experiment is most satisfactory when the body to be examined is made to float on mercury; but in that case the vessel containing the mercury must not be too small, otherwise the natural convexity of the surface of the mercury will cause the floating body perpetually to fall down towards the sides of the vessel. A common soup plate will answer the purpose very well. It is also necessary that the mercury be very pure, and as clean as possible. To insure this, it will be proper, before using the mercury, to pass it through a conical piece of writing paper, rolled up so as to terminate in a very small aperture; or, what is better, to squeeze it through a pretty thick piece of shamois leather. It need scarcely be remarked, that in these delicate experiments, the air of the room should be kept as still as possible.

Experi-
mental Il-
lustrations.

By the above methods, Mr Cavallo and others discovered, that the following substances are in some measure affected by the magnet. Most metallic ores, especially after their having been exposed to a fire; zinc, bismuth, and particularly cobalt, as well as their ores, are almost always attracted. Of the earths, the calcareous is the least, if at all, and the siliceous is the most frequently, attracted. The ruby, the chrysolite, and the tourmalin, are attracted. The emerald, and particularly the garnet, are not only attracted, but frequently acquire a permanent polarity. The opal is weakly attracted, especially after combustion. Most animal and vegetable substances, after combustion, are attracted. Even soot, and the dust which usually falls upon whatever is left exposed to the atmosphere, are sensibly attracted by the magnet.

36
Coulomb's
experiments
on univer-
sal magne-
tism.

“It has long ago been remarked, that platina, nickel, and several other bodies, acquire a sensible degree of magnetism; but some philosophers attribute this property only to a portion of iron not easy to be separated, and conclude, that by obtaining a greater degree of purity, we might succeed in rendering them perfectly indifferent to the action of the magnetic bar.

“The new experiments which Citizen Coulomb has made and repeated before the Institute, lead us on the contrary to think, that the action of magnetism extends through all nature; for none of the bodies he has yet tried was found to resist this power.

“But however real this action may be, it is not alike in all bodies, and in most of them it must be necessarily very small, to have escaped the attention of philosophers to this time. In order therefore to exhibit and to measure these results, we must begin by placing the bodies in a situation which shall allow them to yield to the weakest action.

“For this purpose, Citizen Coulomb fashioned his subjects into the form of a cylinder or small bar; and in this state he suspended them to a silken thread, such as is drawn from the silk-worm's cone, and in this state he placed them between the opposite poles of two magnetic bars of steel. The single thread of silk could hardly bear the weight of a quarter of an ounce without breaking, consequently it became necessary to form small bars very light and thin. Citizen Coulomb made them about seven or eight millimetres in length (or less than half an inch), with three-fourths of a millimetre

(or

Experimental Illustrations. (or about an hundredth part of an inch) in thickness, and he gave the metals about one-third of this thickness.

"In his experiments he placed the steel bars in the same right line, their opposite poles being five or six millimetres farther asunder than the length of the needle intended to oscillate between them. The result of the experiment shewed, that whatever might be the substance of the needle, it always disposed itself according to the direction of the two bars; and that if they were turned from this direction, they always recovered it, after oscillations of which the number was often more than 30 per minute. It was therefore easy in every case to determine, from the weight and figure of the needle, the force which had produced the oscillation.

"These experiments were successfully made with small needles of gold, silver, copper, lead, tin, small cylinders of glass, a piece of chalk, a fragment of bone, and different kinds of wood.

"Citizen Coulomb has proved, that the force of torsion of the silk thread is so slight, that in order to draw it round the entire circle, it would require a force scarcely equal to the one hundred thousandth part of a gramm, (or about one seven hundredth part of a grain). A quantity so minute cannot therefore sensibly derange the measure of magnetic force in the different bodies; and its effect, even if it were admitted to be of perceptible magnitude, may also be urged in proof of the general conclusion of Citizen Coulomb, because the magnetic power must overcome this resistance of the thread in order to manifest itself. Our author gives, in the third volume of the Memoirs of Natural Philosophy and Mathematics of the National Institute, a very simple formula to determine the magnetic force of a body from the time of its oscillations; and he means to shew in another memoir, the method of determining this result in different bodies of the same figure placed between the poles of two bars. He thinks it now proved, that all the elements which enter into the composition of our globe are subjected to the magnetic power, and that the whole mass collectively forms one single magnet.

"In favour of those who might be desirous of repeating his experiments, and rendering them very sensible, the author remarks, that the method of succeeding consists in diminishing the size of the oscillating bodies. From some essays, of which the results terminate this memoir, it seems to follow, that the accelerating forces are inversely as the masses, or very nearly in the direct proportion of the surfaces; but Citizen Coulomb gives this rule only as a first deduction, which requires to be confirmed*."

* Nichol. Journ. 8vo. vol. ii.

The opinion of the general influence of magnetism on all terrestrial bodies was, as we shall see hereafter, maintained by our countryman Dr Gilbert, though Coulomb has certainly the merit of having put it to the test of experiment.

37 Entertaining experiments.

Besides the experiments which we have related, there are some that depend on the attractive power of the magnet, and which are ranked among scientific amusements. We shall here describe a few of these.

Before we relate the manner of making these experiments, it may be proper to describe an instrument that is employed in some of them. This, from its form

and apparent use, is called the magnetic perspective glass, and is thus constructed.

Experimental Illustrations. 38 Construction of the magnetic perspective glass. Fig. 9.

Provide an ivory tube about $2\frac{1}{2}$ inches long, and of such a form as is expressed in fig. 9. The sides of this tube must be so thin as to admit a considerable quantity of light. It is to open at one end with a screw, and at that end must be placed an eye-glass of about two inches focus, and at the other end any glass you please. Have a small magnetic needle like that in a compass. It must be strongly touched, and so placed at the bottom of the tube that it may turn freely round. It is to be fixed on the centre of a small ivory circle C, of the thickness of a counter, placed on the object-glass D, and painted black on the side next it. This circle must be kept fast by a circular rim of pasteboard, that the needle may not rise off its pivot, in the same manner as in the compass. This tube will thus become a kind of compass sufficiently transparent to show the motions of the needle. The eye-glass serves more clearly to distinguish the direction of the needle, and the glass at the other end, merely to give the tube the appearance of a common perspective glass. It will appear, from what has been already stated, that the needle in this tube, when placed over and at a small distance from a magnet, or any machine in which it is contained, will necessarily place itself in a position directed by that magnet, and consequently show where the north and south pole of it is placed; the north end of the needle constantly pointing to the south end of the magnet. This effect will take place, though the magnet be enclosed in a case of wood, or even metal. You must observe, however, that the attracting magnet must not be very far distant from the needle, especially if it be small, as in that case its influence extends but to a short distance. This tube may be differently constructed, by placing the needle in a perpendicular direction, on a small axis of iron, on which it must turn quite freely, between two small plates of brass placed on each side of the tube; the two ends of the needle should be in exact equilibrium. The north and south ends of the needle will, in like manner, be attracted by the south and north ends of the magnetic bar. The former construction, however, appears preferable, as it is more easily excited, and the situation of the needle much more easily distinguished.

Exp. 1. The Communicative Piece of Money.

Take a crown or dollar, and drill a hole in the side of it, in which place a piece of wire, or a large needle well polished, and strongly touched with a magnet. Then close the hole with a small piece of pewter, that it may not be perceived. Now, the needle in the magnetic perspective before described, when it is brought near to this piece of money, will fix itself in a direction corresponding to the wire or needle in that place. Desire any person to lend you a crown piece or dollar, which you dexterously change for one that you have prepared as above. Then give the latter piece to another person, and leave him at liberty either to put it privately in a snuff-box, or not; he is then to place the box on a table, and you are to tell him by means of your glass, whether the crown is or is not in the box. Then bringing your perspective close to the box, you will know, by the motion of the needle, whether it be there or not; for as the needle in the perspective will

39 Communicative piece of money.

Experimental Illustrations

always keep to the north of itself, if you do not perceive it has any motion, you conclude the crown is not in the box. It may happen, however, that the wire in the crown may be placed to the north, in which case you will be deceived. Therefore, to be sure of success, when you find the needle in the perspective remain stationary, you may, on some pretence desire the person to move the box into another position, by which you will certainly know whether the crown-piece be there or not. You must remember that the needle in the perspective must here be very sensible, as the wire in the crown cannot possibly have any great attractive force.

Exp. 2. *The Magnetic Table.*

40
Magnetic table.

Under the top of a common table place a magnet that turns on a pivot, and fix a board under it, that nothing may appear. There may also be a drawer under the table, which you pull out to shew that there is nothing concealed. At one end of the table there must be a pin that communicates with the magnet, and by which it may be placed in different positions; this pin must be so placed as not to be visible to the spectators. Strew some steel filings or very small nails over that part of the table where the magnet is. Then ask any one to lend you a knife or a key, which will then attract part of the nails or filings. Then placing your hand in a careless manner on the pin at the end of the table, you alter the position of the magnet, and giving the key to any person, you desire him to make the experiment, which he will then not be able to perform. You then give the key to another person, at the same time placing the magnet, by means of the pin, in the first position, when that person will immediately perform the experiment.

Exp. 3. *The Mysterious Watch.*

41
Mysterious watch.

You desire any one in company who has a watch with a steel balance (B), to lend it you for a few minutes, asking him whether it will continue to go when laid on the table. He will probably say it will. To prove to him that he is wrong, you lay it on that part of the table below which you have previously placed a strong bar-magnet (as in Exp. 2.), so that the watch may be above one of the poles. It will immediately stop. Now, if you shift the position of the magnet, and give the watch to another person to lay it on the table, it will not stop; but replacing the magnet, and desiring a third person to try the experiment, he will succeed. All this, to those who are not acquainted with the secret, will appear very extraordinary.

Exp. 4. *The Magnetic Dial.*

42
Magnetic dial.
Fig. 10.
and 11.

Provide a circle of wood or ivory, of about five or six inches diameter, as fig. 10: which must turn quite free on the stand B (fig. 11.), in the circular border A: on the circle must be placed the dial of pasteboard C (fig. 10.), whose circumference is to be divided into 12 equal parts, in which must be inscribed the numbers from 1 to 12, as on a common dial. There must be a small groove in the circular frame D, to receive the

pasteboard circle; and observe that the dial must be made to turn so freely that it may go round without moving the circular border in which it is placed. Between the pasteboard circle and the bottom of the frame, place a small artificial magnet E (fig. 12.) that has a hole in its middle, or a small protuberance. On the outside of the frame place a small pin P, which serves to shew where the magnetic needle I, that is placed on a pivot at the centre of the dial, is to stop. This needle must turn quite freely on its pivot, and its two sides should be in exact equilibrium. Then provide a small bag, that has five or six divisions, like a lady's work-bag, but smaller. In one of these divisions put small square pieces of pasteboard on which are written the numbers from 1 to 12, and if you please you may put several of each number. In each of the other divisions you must put 12 or more like pieces, observing, that all the pieces in each division must be marked with the same number. Now the needle being placed upon its pivot, and turned quickly about, it will necessarily stop at that point where the north end of the magnetic bar is placed, and which you previously knew by the situation of the small pin in the circular border. You therefore present to any person that division of the bag which contains the several pieces on which is written the number opposite to the north end of the bar, and tell him to draw any one of them he pleases. Then placing the needle on the pivot, you turn it quickly about, and it will necessarily stop, as we have already said, at that particular number.

Another experiment may be made with the same dial, by desiring two persons to draw each of them one number out of two different divisions of the bag; and if their numbers, when added together, exceed 12, the needle or index will stop at the number they exceed it; but if they do not amount to 12, the index will stop at the sum of those two numbers. In order to perform this experiment, you must place the pin against the number 5, if the two numbers to be drawn from the bag be 10 and 7; or against 9, if they be seven and two. If this experiment be made immediately after the former, as it easily may, by dexterously moving the pin, it will appear the more extraordinary.

Exp. 5. *The Divining Circles.*

On the top of a thin box, as AB fig. 13. paste two circles drawn on paper, as F, G, each of which is divided into compartments. In those of one circle, as G, are written questions, and in those of the other, as F, appropriate answers. Through the centre of the circle G an axle passes, carrying a toothed wheel, and which works into the pinion d, to the axis of which is fixed another pinion, and this receives the teeth of another wheel g, whose axis is passed through the centre of the circle F. On the axis of the wheel c is to be fixed an index a above the paper circle, and to the axis of the wheel g, just below the cover of the box, is fixed a bar magnet qg, turning together with the axis; while on the part of the axis that projects above the circle F a loose needle xx is balanced, so as to move independently of the axis. A carton of strong paper, of the size

(B) The balance of a watch is sometimes, though very seldom, made of brass, when it is scarcely susceptible of magnetic influence.

Experi-
mental Il-
lustrations.

of F should cover the pasted circle, and turn easily on the centre π ; and it should have a triangular piece as F cut out, in order to see the answers. If now the needle be taken off its point, and a person be desired to ask some of the questions on the circle G, the index must be turned to the question, and then the needle placed on its pivot, giving it a whirl round. When it stops, its point will stand over the proper answer, which may be seen by turning the open part of the carton to that place.

lustrations.

SECT. III. *Of the Communication and Production of Magnetism.*

The whole of this important part of the subject may be said to depend on one general fact, which we shall therefore first lay down and illustrate.

44
Iron be-
comes mag-
netical by
proximity
to a mag-
net.

Any piece of iron when in the neighbourhood of a magnet, is itself a magnet, and possesses all the material properties of that body.

Exp. 1.—Let there be a large and strong magnet properly supported in the horizontal direction, at a distance from iron or other similar bodies, and with its poles perfectly free. Take also any small piece of common iron, not more than two or three inches long, such as a common small key, and take another piece of iron, as a smaller key, or short piece of wire about the size of a goose quill.

In the first place hold the key in a horizontal position, with one end opposite one of the poles of the magnet, but so as not to be in contact with it. Then bring the other piece of iron to the other end of the key, and it will hang by the key, and will so continue to hang, though we withdraw the key from the magnet horizontally, till there is a certain interval between the key and the magnet, when the former will be no longer able to support the piece of iron. Even at this distance the key will, however, be found capable of supporting a piece of iron considerably smaller than the former, till its distance from the magnet is increased.

Again, hold the key with one extremity below one of the poles of the magnet, and touch the other extremity with the small piece of iron, the latter will adhere till the key be removed too far below the magnet.

Thirdly, Hold the key with one of its extremities above one of the poles of the magnet, but at such a distance that there is room for the small piece of iron to go between the key and the magnet, without touching the latter. The piece of iron will be supported by the key, as in the two former instances.

Fourthly, Let the magnet be placed in a vertical position, and hold the key with one extremity immediately below or above one of the poles. The piece of iron will be supported in a similar manner, in the former case by the extremity of the key that is most remote from the magnet, and in the latter by that which is adjacent.

If, instead of approaching the magnet with the key, we reverse the circumstances, the effect of the magnet in rendering the key magnetical will be still more evident. Suppose the piece of iron to be lying on the table; let one end of it be touched with the key, and there will be found no attraction between them: but if while we hold the key very near one extremity of the wire, we bring the pole of the magnet near the other

end of the key, we shall see the wire rise from the table, and adhere to the key.

In all these cases the attractive power of the key, that is, its magnetism, is evidently derived from its juxtaposition to the magnet.

Exp. 2.—Let two pieces of iron be suspended by separate ends of a piece of thread, so that they may be hung from a pin in the wall in a situation parallel to each other, or in contact. Now bring one end of a bar magnet a little below the wires, and they will repel each other. If these wires are of soft iron, they will collapse immediately on the magnet being withdrawn; but if they are formed of hard iron or of steel, they will continue apart for a considerable time.

Here the two wires are, by the proximity of the magnet, become magnets, and the extremities next the bar have each acquired a similar polarity, i. e. both contrary to that of the adjacent pole of the bar. They, therefore, repel each other.

Exp. 3.—Let a bar-magnet, such as N, S, fig. 14. Fig. 14. be laid in a horizontal position, and let a small key, as B, C, be held near the north pole of the magnet, in the direction of its axis. Let a very small magnetic needle, supported on a sharp pivot, be brought near that end of the key C, which is most remote from N. The needle will immediately turn its south pole towards C, as is indicated by the feathered part of the arrow c. Hence it appears that the key has acquired a directive power like a magnet, and that its remote extremity performs the office of a north pole, as it attracts the south pole of the needle, and repels its north pole. If it be said that the magnetic needle in this case is affected directly by the directive power of the magnet, as it would take the above position though the key were not present; to shew that the effect is produced through the medium of the key, remove the needle into another situation as b, and it will still arrange itself with the same pole opposite C, and if it be carried to the proximate extremity of the key, as a, it will turn round, and present its north pole to B, thus shewing that it is, at least in some measure, influenced by the key.

In general, when a piece of iron is presented to the pole of a magnet, the extremity next that pole is possessed of the contrary polarity, and the remote extremity has acquired a similar polarity. The situation of the poles, however, depends much on the form of the piece of iron, and on the part of its surface which is presented to the pole of the magnet. If the form be that of an oblong bar, one extremity of which is presented to the pole, which is the most usual case, the circumstances will be as we have just mentioned. If the oblong bar be presented to the pole in a perpendicular direction, with its middle very near the pole of the magnet, this middle point will be possessed of a polarity contrary to that of the adjacent pole, while the two extremities have acquired the same polarity. If the presented iron be in the form of a circular plate, and its centre be held near the pole of the magnet, this centre will have the contrary polarity, and every point of the circumference the same polarity. If the plate have its circumference fashioned into points, each of these points will acquire a very strong polarity, contrary to that of the pole near which the centre of the plate is held.

The communication of magnetic power from the magnet

Experimental Illustrations.

magnet to the key in the foregoing experiments, will be still more strongly illustrated by holding another piece of wire to the wire that is already suspended by the key. The new piece of wire will also be suspended, and so several more may be suspended by one another, like the links of a chain, according to the strength of the magnet. This fact was known to the ancients, who speak of a loadstone causing an iron ring to carry another ring; and that a third, till the whole puts on the appearance of a chain.

46 Induced magnetism.

It will be found that the magnet has lost none of its power by producing magnetism in the iron, and of course, that nothing has been transferred from the magnet to the iron. The magnetism of the iron thus caused by its juxtaposition to a magnet is called *induced magnetism, or magnetism by induction.*

47 Apparent exception.

There is an apparent exception to the universality of the above proposition. If the key be held in such a position as that it shall be perpendicular to the magnet, with one extremity either opposite one of the poles, or a little above the centre of the magnet, the bit of wire will not be attracted by that extremity, and we may hence suppose that the key has acquired no magnetic power by its proximity to the magnet. But if we bring a needle or a piece of iron wire near its remote end, it will be strongly attracted, and shew that end to have the same polarity with the nearest pole of the magnet. Now, the ends both of the key and the wire that are next the magnet, having the same polarity with the pole of the magnet nearest them, cannot attract each other, but on the contrary will repel each other, and therefore the wire cannot adhere to the key, though by the change produced by the other extremity, it is evident that the key has acquired magnetic power.

48 Real exception.

There is, however, one exception. If the key in the first experiment, with the wire hanging to it, be carried from any of the situations there described, towards the middle of the magnet, the wire will fall off as soon as it arrives very near the middle. If we suppose a plane to pass through the centre of the magnet in a direction perpendicular to its axis, so as to form the magnetic equator, a slender piece of iron held any where within this plane can acquire no sensible magnetism, which is demonstrated by its shewing no signs of polarity, and not being attracted by the magnet. Now it is well known that the greatest activity of a magnet resides in its two poles, and that those magnets are the best in which this activity is least diffused. A certain circumference of every magnet is entirely inactive, as we see in the experiment with the iron filings described in N^o 26. where the filings collect themselves principally on two points of the surface, between which there is a space all round, to which no filings are attached. Many circumstances shew that the two poles of a magnet have contrary actions; the north pole producing a strong northern polarity in the remote end of an iron bar brought near it, and a south polarity in the proximate end, while an opposite effect is produced by its south pole. Now, adopting this principle, that the actions of the two poles are opposite, it follows that if these actions are equal, and act in a similar manner, each must counteract and prevent the action of the other, and produce what may be called a *magnetic equilibrium*. Therefore if a slender iron rod or thin plate be placed so that every part of it lies within the magnetic equa-

tor, it will exhibit no magnetism, will not be attracted by the magnet, and will not attract iron. This will be seen more satisfactorily when we have explained the theory of magnetism.

Experimental Illustrations.

The consideration of the above important facts will enable us to explain, especially after what will be stated in the next chapter, the production or communication of magnetism in all the methods by which these are usually effected.

Magnetism may be produced artificially in a piece of iron or steel, by various methods.

1. *By touching the iron or steel either with a natural magnet, or with a steel bar already magnetized.*

The process of communicating magnetism by natural or artificial magnets, or by what has been called *touching*, has undergone various improvements and modifications, which we shall endeavour briefly to trace.

The most simple method of magnetizing a bar of steel is to apply the north pole of a magnet to that extremity of the bar which we wish to acquire a south polarity. In this way, merely by contact, a slight degree of magnetic power will, after some time, be imparted to the bar, and the communication will be expedited by striking the bar so as to make it sound. Only a slight degree of magnetism can, however, be communicated in this way, and unless the steel bar be very short, its poles will be much confused.

Another method of communicating magnetism to a bar of this kind is, to apply the pole of a magnet to one end of the bar, and pass it on to the other end, giving a moderate degree of pressure. This is repeated several times on both sides of the bar, taking care always to begin the stroke at the same end as at first, and instead of drawing the magnet back along the bar, lifting it up every time that we come to the other end. The following description will best explain the mode of communicating magnetism in this way, by one or two magnetic bars.

When only one magnetic bar is to be made use of, one of its poles must be applied as represented fig. 15. where CD represents the needle or steel bar to be impregnated. The magnet AB is then to be drawn all along the surface of it, till it reaches the extremity D. The magnet being then removed, must be applied to the extremity C, and drawn over the needle as before. Thus the needle must be rubbed several times, by which means it will acquire a considerable degree of magnetism. In this method, the other extremity of the needle which the magnet touched last acquires the contrary magnetism; that is, if B be the north pole of the magnet, C will be the north pole and D the south of the needle. This method, however, is never found to be equally effectual with that in which two magnets, or both poles of one magnet, are made use of.

To communicate magnetism by means of two magnetic bars, place the bar or needle AB, fig. 16. upon a table; then set the two magnetic bars CD, EF, straight upright upon it at a little distance, equal on both sides from the middle of the bar AB, and in such a manner that the south pole D of one of the bars may be nearest to that end of the bar AB which is to become the north pole, &c. These two bars must then be slid gradually towards one extremity of the bar, keeping them constantly at the same distance from each other; and when one of them, for instance CD, is arrived

Experimental Illustrations. rived at A, then they must be slid the contrary way, till EF arrives at B; and thus the bar AB must be rubbed a greater or smaller number of times, till it will be found by trial to have acquired a considerable power. When the magnetic bars are powerful, and the bar AB of very good steel, and not very large, a dozen of strokes are fully sufficient; but when the bars are to be removed from the bar AB, care must be taken to bring them to the same situation where they were first placed; viz. a little and equal distance from the middle of the bar AB, from which they may be lifted up.

The mode of employing two bars instead of one was an improvement, and the method was still farther improved by placing them in an inclined position, with their extremities C, E, remote from each other, and sliding them contraryways from the middle towards each extremity of the bar AB, lifting them up when they come to the extremities, and replacing them on the middle of the bar, thus repeating the operation as often as required.

Method of touching curved bars. Horse-shoe bars, or those of a semicircular form, may be magnetized in a similar manner, except that the magnetic bars employed for the purpose must follow the curvature of the bar to be impregnated. The following is the method usually employed for magnetizing bars of this kind. The crooked bar is laid flat upon a table, and to each of its extremities is applied a straight magnetic bar, as DF, FG, fig. 17. and the remote extremities of these bars F, G, are joined by the conductor or piece of soft iron FG. Then to its middle are to be applied two magnetic bars, with their opposite poles at a little distance from each other, H, I, and with these the crooked bar is to be stroked from end to end, following the direction of the crooked bar, so that on one side of it the magnetic bars may stand in the direction represented by the dotted lines at K and L. When in this manner the piece of steel ABC has been rubbed a sufficient number of times on the one side, it is to be turned, and the same operation repeated on the other side, taking care that the adhering magnetic bars, and the conductor of soft iron, be preserved in the same situation as at first. It must be observed that in this process the magnets DF, DG, as well as the magnets H, I, must be placed so that their south poles shall be towards that extremity of the bar which is to be made a north pole.

53 Duhamel's improvement. A material improvement in the process for communicating magnetism from artificial magnets to steel bars, was introduced by Duhamel. He formed a right-angled parallelogram, two of the sides of which were made by two equal bars of steel, that were intended to be magnetized, while the other two were formed by joining the extremities of the steel bars by two pieces of soft iron, also equal to each other in length, but much shorter than the steel bars. Then taking two parcels of bars already magnetized, he brought together their opposite poles towards the middle of one of the steel bars forming the parallelogram, and inclining the parcels as in fig. 18. he made them glide gently, separating them from each other towards the extremities of the bar; and this operation was repeated as often as required, when the inclined parcels of magnetic bars were carried to the opposite bars of the parallelogram, and this was rubbed in a similar manner. After the bars were

rubbed sufficiently on one side, they were, as in former cases, turned on the other.

This method is one of the best that we can employ for magnetizing the needles of compasses, and such steel bars as are of a moderate thinness, especially if we employ magnetic bars strongly impregnated for the purpose of rubbing the steel bars.

54 Improvement by Mitchell and Canton. Much about the time that M. Duhamel contrived the above method, the same object was employing the attention of experimental philosophers in England, where the process of magnetizing bars was much improved by Mr Mitchell and Mr Canton.

Mr Mitchell employed two parcels of bars already strongly magnetized, joined together in a parallel direction, with their opposite poles united at each extremity, but in such a manner, that there remained between the two parcels a small interval. He then placed a number of equal steel bars in a straight line, and made one extremity of the magnetized bars slide over the line formed by the steel bars at right angles; and this he repeated as usual. In this way he found that the intermediate bars in the straight line acquired a great degree of magnetic power.

Mr Canton placed the bar which he wished to magnetize, so as form part of a parallelogram, as in the method of M. Duhamel, and then employed the same means as Mr Mitchell for impregnating the bar; after which he separated the two parcels of magnets, and inclining them to each other in the manner of Duhamel upon the bar, he made them slide from the needle towards the extremities. This last method considerably augmented, according to Mr Canton, the magnetic power of the bar; but by Coulomb it is considered as the only effectual part of the process. These methods of Mitchell and Canton constitute what has been called the double touch, which was still farther improved by the celebrated Æpinus.

55 Method of Æpinus. This philosopher, after having formed a parallelogram with steel bars, and pieces of soft iron, in the manner of Duhamel, placed upon the bar to be magnetized, two parcels of magnetic bars inclined in such a way that each of them formed on its own side an angle of 15° or 20° with the steel bar on which it was placed; their opposite poles being at a very small distance from one another. Keeping the parcels of magnetic bars in the same relative situation with respect to each other, he made both parcels slide along alternately from the middle of the bar towards each extremity, beginning at every renewal of the operation from the middle of the bar. This method has a very great advantage over the former, as by it we may magnetize bars of considerable length and thickness, by means of magnetic bars that have no great magnetic power.

56 Remarks. In all these processes it must be remarked, that, in order to proceed properly, it is necessary to employ a considerable degree of pressure. A parallelogram of steel bars and soft iron should be kept firm by wedges, somewhat in the manner of printers types, and the extremities of the magnetic bars should be perfectly cleaned. Dr Robison supposed, that wetting these extremities considerably aided the process; but he found that the least particle of oil between the bars greatly obstructed it, as did the smallest piece of the thinnest gold leaf. He found that bars which were rough acquired a more powerful

Fig. 18.

Experimental Illustrations.

57
Improvements of
Coulomb.

powerful magnetism than those which were moderately polished; but that, if moderately rough, they acquired the first degrees of magnetism more expeditiously than smooth bars, but did not receive so strong an impregnation as the latter.

The method of making artificial magnets has been greatly improved by M. Coulomb, who in a series of memoirs, printed in the Memoirs of the Academy of Sciences, and of the National Institute of Paris, has communicated a number of valuable observations and experiments, that have contributed, perhaps more than any preceding labours, to the advancement both of the theory and practice of magnetism. Many years ago he published his process for making very powerful artificial magnets.

Fig. 19.

In his operations he uses four very strong magnets previously impregnated. He placed his two strongest magnets, (as NS, NS, fig. 19.) on a horizontal plane in one right line, at such a distance that they might be a few lines nearer to each other than the length of the needle *n s* intended to be magnetized. He afterwards took the two magnets N' S', and inclining them as in the method of Æpinus, he placed them first on the middle of the needle, or with their poles nearly in contact. He then drew each magnet, without changing its inclination, to the extremity of the needle, and repeated this operation 5 or 6 times on each face of the needle. It is clear, that in this operation the poles of the needle *n s* remain fixed and invariable at the extremities of the needle, by means of the two strong magnets NS on which it rests. The effect produced by these can only be augmented by the action of the two superior magnets, which concur in magnetizing all the particles of the needle in the same direction.

He found likewise, that in this method of magnetizing there is a greater certainty of giving to both surfaces of needles intended to determine the magnetic meridian, an equal degree of magnetism; a circumstance deserving of the greatest attention in the construction of compasses, if the needle be suspended with its broadest surface parallel to the horizon.

After these previous processes, he took 30 bars of steel hardened and tempered to the temper of a spring, five or six lines broad, two or three lines thick, and 36 inches long. The blades of fencing foils, such as are found in the shops, make pretty good magnets. English sheet steel cut into pieces one inch wide, hardened and lowered to spring temper, is preferable. When each compound magnet is to contain no more than 15 or 20 pounds of steel, it is sufficient to make the bars 30 or 36 inches long.

Fig. 20.

He magnetized each bar singly, according to the method already described. He then took two rectangular parallelepipeds of very soft iron, well polished, six inches in length, between 20 and 24 lines broad, and 10 or 12 lines thick. With these two parallelepipeds, represented fig. 20. at N and S, he formed the armour of his magnet, by enveloping one extremity of each parallelepipedon with a stratum of his magnetic bars, so that the extremities of the parallelepipeds may project beyond the extremities of the bars 20 or 24 lines, and the other end may be enveloped by the ends of the set of bars. On this first layer of steel bars of three or four lines thick he places a second, three inches shorter than the first, so that the first projects beyond the second

about 18 lines on each side. The whole is secured at the ends by two binding pieces of copper, which press the bars close together, and prevent the armour from escaping. Experimental Illustrations.

Fig. 20. represents two artificial magnets composed according to the method just described. N and S are the extremities of the two iron parallelepipeds. The two other extremities are inclosed by the bars. Each magnet thus compounded is solidly connected together by the copper pieces marked *a, b, a', b'*. The pieces of contact A, R, join the opposite poles of the magnets.

He found by experience, that with an apparatus of this form, each part weighing 15 or 20 lbs. a force of 80 or 100 lb. will be required to separate the pieces of contact; and that when an ordinary needle of the compass is placed on the two extremities of the compound bars fig. 20. they become magnetized to saturation, without its being necessary to rub them with the upper pair. When magnets of greater force are desired, it is necessary, in proportion as the number of bars is increased, to augment their length also, and the dimensions of the parallelepipeds of iron which serve for the armour. It would be easy to ascertain the different dimensions which the magnets ought to have, in a manner sufficiently accurate for practice, from the laws of magnetism, and the position of the centre of action of the bars of steel of different lengths and thickness.

2. *Iron or steel is rendered magnetical by being placed in a position corresponding to the magnetic meridian.* 58
Iron or steel becomes magnetic by position.

It has been often observed, that a bar of iron which has stood for a long time exactly or nearly in the magnetic direction, has acquired a degree of magnetic power, the extremities possessing opposite polarity. In this and other northern parts of Europe, old vanes of turrets, window bars, and even pokers that have stood long inclined in the chimney corner, are often very sensibly magnetic, their lower extremity becoming a north, and the upper a south pole. In the highest part of the steeple of St Giles's church in Edinburgh, on the north side, the upper bar of a hand-rail leading to a stair is very magnetical. It is worthy of remark, that those parts of such old bars which have become foliated and crumbly by exposure to the air are the most magnetical. This magnetic state of perpendicular iron bars was, as we are informed by Dr Gilbert, first observed in the vane spindle of the Augustine church at Mantua.

3. *A bar of steel long hammered or exposed to violent friction, while lying in the magnetic meridian, becomes magnetic.* 59
By hammering or friction.

This fact was well known to Dr Gilbert, who in a plate represents a blacksmith hammering a bar of steel in the magnetic position. Many smiths tools, such as long drills, that receive great pressure while in motion, broaches that are worked with a long lever, so as to act very fast, become very sensibly magnetical; the lower end, in these latitudes, being always a north pole. When a steel punch is driven hard into a piece of iron, the punch has sometimes been rendered magnetical by a single blow. There is scarcely a cutting or boring tool in a smith's shop that does not possess some degree of magnetic power. Even soft steel and iron will acquire it by being violently twisted or exposed to great friction, and the magnetism thus acquired

Experimental Illustrations

quired is commonly permanent. From this circumstance it is difficult to procure for nice experiments pieces of iron that do not possess some degree of magnetism, and hence these experiments do not always succeed. It is therefore convenient to know how to deprive iron and steel of magnetism, and the method of doing this will appear from what will be said in the next section.

The steel balances of watches are often magnetic, sometimes even shewing evident polarity; a circumstance which is found to have some effect in disturbing the proper going of such watches or time-pieces. Hence it is recommended to make the balances of brass. See a paper on this subject by Mr Varley, in the first volume of the Philosophical Magazine.

4. Magnetism may be induced on substances that are susceptible of it, by heat.

60
By heat.

Dr Gilbert remarks that such ores of iron as are in that particular metallic state, which he considers as most susceptible of magnetism, will acquire this power by being kept long in a red heat, while in a magnetic direction; and that their polarity corresponds to their position, that end of the mass which is opposite the north becoming a north pole. By many experiments made both by Dr Gilbert, and since his time by Dr Hooke, on iron and steel bars, it appears that these acquire permanent magnetism by being exposed to a strong heat, and suffered to cool gradually while lying in the magnetic direction; but that the magnetism thus acquired by steel rods is much stronger and more durable, if they are suddenly quenched with cold water, so as to give them a very hard temper. Dr Hooke found that the end of the bar next the north, or the lower end of a vertical bar, always became its permanent north pole, and the upper end, even when quenched, while the rest was suffered to cool gradually, became a very sensible south pole. If these operations were performed on bars placed in a position at right angles to the magnetic direction, no magnetism was acquired. Dr Gilbert makes a remarkable observation respecting the position of a magnetic needle brought near an ignited bar of iron, which was some years ago repeated in the Philosophical Transactions as a new discovery. "*Bacillum ferreum, validè ignitum appone versorio excito: stat versorium, nec ad tale ferrum convertitur: sed statim ut primum de candore aliquantulum remiserit, confluit illico.*" Thus it appears that iron is not susceptible of magnetism when red hot, but that it acquires magnetic power during its cooling. Dr Gilbert ascertained the degree of heat most favourable to the production of magnetism, but from his want of proper thermometers he did not succeed. Dr Robison found that though a bright red or a white heat does not make iron susceptible of magnetism while it is exposed to such a heat, it predisposes it for becoming magnetical. He found, that when a bar of steel was made to acquire magnetism by being tempered in the magnetic direction, the acquired magnetism was much stronger when the bar was first made very hot, even though allowed to acquire its most magnetical state before being quenched, than if it had been heated only to this latter degree. Nay, he always found it stronger if quenched while red hot.

He also found that when he heated a small steel bar red hot, and quenched it while lying between two

magnets, it acquired a much stronger magnetic power than it would acquire in any other way.

Experimental Illustrations

Mr Canton contrived the following method of producing magnetism in steel bars, without the assistance either of natural or artificial magnets.

61
Canton's method of making artificial magnets.

Take twelve bars, six of soft, and six of hard steel, the former three inches long, one-fourth of an inch broad, and one-twentieth of an inch thick; with two pieces of iron, each half the length of one of the bars; but of the same breadth and thickness. The six hard bars should be each five inches and a half long, one-half inch broad, and three twentieths of an inch thick, with two pieces of iron of half the length, but of the same breadth and thickness as one of the hard bars; and let all the bars be marked with a line quite round them at one end; then take an iron poker and tongs, or two bars of iron, the larger they are, and the longer they have been used, the better; and fixing the poker upright, or rather in the magnetical line between the knees, hold to it, near the top, one of the soft bars, having its marked end downwards, by a piece of sewing silk, which must be pulled tight by the left hand, that the bar may not slide; then grasping the tongs with the right hand, a little below the middle, and holding them nearly in a vertical position, let the bar be stroked by the lower end from the bottom to the top about ten times on each side, which will give it a magnetic power sufficient to lift a small key at the marked end; which end, if the bar were suspended on a point, would turn towards the north, and is therefore called the north pole, and the unmarked end, for the same reason, is called the south pole. Four of the soft bars being impregnated after this manner, lay the other two parallel to each other, at a quarter of an inch distant, between the two pieces of iron belonging to them, a north and a south pole against each piece of iron; then take two of the bars already made magnetical, and place them together so as to make a double bar in thickness, the north pole of the one even with the south pole of the other, and the remaining two being put to these, one on each side, so as to have two north and two south poles together, separate the north from the south poles at one end by the interposition of some hard substance (I, fig. 21.), and place them perpendicularly with that end downward on the middle of one of the parallel bars AC, the two north poles towards its south end, and the two south poles towards its north end. Slide them three or four times backward and forward the whole length of the bar; then removing them from the middle of this bar, place them on the middle of the other bar BD as before directed, and go over that in the same manner; then turn both bars the other side upwards, and repeat the former operation: this being done, take the two bars from between the pieces of iron, and placing the two outermost of the touching bars in their stead, let the other two be the outermost of the four to touch these with; and this process being repeated till each pair of bars have been touched three or four times over, will give them a considerable magnetic power.

Fig. 21.

When the small bars have been thus rendered magnetic, in order to communicate the magnetism to the large bars, lay two of them on the table, between their iron conductors as before; then form a compound magnet with the six small bars, placing three of them with

Experi-
mental Il-
lustrations.

the north poles downwards, and the three others with the south poles downwards. Place the two parcels at an angle, as was done with four of them, the north extremity of the one parcel being put contiguous to the south extremity of the other, and with this compound magnet stroke four of the large bars, one after another, about twenty times on each side, by which means they will acquire some magnetic power.

When the four large bars have been so far rendered magnetic, the small bars are laid aside, and the large ones are strengthened by themselves, in the manner followed with the small bars.

To expedite the operation, the bars ought to be fixed in a groove, or between brass pins, otherwise the attraction and friction between the bars will be continually deranging them when placed between the conductors.

This whole process may be gone through in about half an hour, and each of the large bars, if well hardened, will lift about 28 ounces troy, and they are fitted for all the purposes of magnetism in navigation and experimental philosophy. The half dozen being put into a case in such a manner, as that no two poles of the same name may be together, and their irons with them as one bar, they will retain the virtue they have received; but if their power should, by making experiments, be ever so much impaired, it may be restored without any foreign assistance in a few minutes.

These bars must be kept in a wooden box, arranged in such a manner that their opposite poles may lie together, as represented at fig. 22.

There are various methods of communicating a permanent magnetism to ferruginous bodies, by means of a bar rendered magnetic, by position, of which the most simple is that described by Mr Marcel, whose experiments were made in the year 1726. Being employed in making some observations on the magnetic power which he found in great pieces of iron, he took a large vice weighing 90 pounds, in which he fixed a large anvil weighing 12lbs. The steel to which he wished to give the magnetic power was laid upon the anvil in a north and south position, which happened to be the diagonal of the square surface of the latter. He then took a four-cornered piece of iron an inch thick every way, 33 inches long, weighing about 8lbs. having one end rounded and brightly polished, the other being tapered. Holding then the steel fast upon the anvil with the one hand, he took the iron bar in the other, and holding it perpendicularly, he rubbed the steel hard with the rounded part towards him from north to south, always carrying the bar far enough round about to begin at the north. Having thus given 10 or 12 strokes, the steel was turned upside down, and rubbed as much on the other side. Proceeding in this manner till it had been rubbed 400 times, the steel was as strongly magnetic as if it had been touched by a powerful loadstone. The place where he began to rub was always the north pole. In these experiments it sometimes happened that the virtue was imparted by a few strokes; nay, by a single stroke a small needle was made to receive a very considerable power. Thus he imparted to two compass needles such a degree of magnetic power, that one lifted three-fourths, and another a whole ounce of iron, and although these needles were anointed with lintseed oil to keep them from rusting,

Fig. 22.
62
Marcel's
method.

and a hard coat was thus formed upon them, they nevertheless retained their power. Thus also a knife was made so strongly magnetical, that it would take up an ounce and three-fourths of iron. Four small pieces of steel, each an inch long, and one-twelfth of an inch broad, as thin as the spring of a watch, were thus impregnated with the magnetic power, and then joined into a small artificial magnet; which at its first formation took up eight times its own weight of iron; and after being six years kept in the most careless manner, was found to have gained rather than lost any thing of its power. In the course of his experiments, Mr Marcel found, that the end at which he began to rub was always the north pole, whatever position the steel was laid in. On rubbing a piece of steel from one end to the middle, and then from the other end to the middle, it acquired two north poles, one at each end, the middle being a south pole. Beginning to rub from the middle towards each end, he found a north pole in the middle, and a south pole at each extremity.

Magnetism may be communicated to a small piece of soft steel in the following manner: take two iron bars of about an inch square, and upwards of three feet in length; keep them in the magnetical line, or in a perpendicular posture, as represented fig. 23. Let the piece of steel CB be either fastened to the edge of a table, or held by an assistant; and placing the lower extremity of the bar AB, and the upper extremity of the bar CD, on opposite sides, and in the middle of the steel, stroke the latter from the middle towards its extremities, moving both bars at the same time. When both are arrived at the extremities of the steel, remove them from it, and apply them again to the middle. Do so for 40 or 50 times, and the steel will be found to have a considerable degree of magnetic power. Care, however, must be taken, in removing the bars, not to draw them along the surface of the steel, or the experiment will not succeed, because the magnetism is destroyed by the contrary strokes.

The late Dr Gowin Knight possessed a surprising skill in magnetism, being able to communicate an extraordinary degree of attractive or repulsive power, and to alter or reverse the poles at pleasure; but as he refused to discover his methods upon any terms whatever (even as he said, though he should receive in return as many guineas as he could carry), these curious and valuable secrets have died with him. In the 69th volume of the Philosophical Transactions, however, Mr Benjamin Wilson has given a process, which at least discovers one of the leading principles of Dr Knight's art, and may perhaps be a means of discovering the whole to those who shall be less reserved. The doctor's process, according to Mr Wilson, was as follows. Having provided himself with a great quantity of clean iron filings, he put them into a large tub, that was more than one-third filled with clean water; he then, with great labour, worked the tub to and fro for many hours together, that the friction between the grains of iron by this treatment might break off such smaller parts as would remain suspended in the water for a time. The obtaining of these very small particles in sufficient quantity seemed to him to be one of the principal desiderata in the experiment. The water being by this treatment rendered very muddy, he poured the same into a clean iron vessel, leaving the filings behind;

hind; and when the water had stood long enough to be clear, he poured it out carefully, without disturbing such of the sediment as still remained; which now appeared reduced almost to an impalpable powder. This powder was afterwards removed into another vessel in order to dry it; but as he had not obtained a proper quantity thereof by this one step, he was obliged to repeat the process many times. Having at last procured enough of this very fine powder, the next thing was to make a paste of it, and that with some vehicle which would contain a considerable quantity of the inflammable matter; for this purpose he had recourse to lintseed oil in preference to all other fluids. With these two ingredients only he made a stiff paste, and took particular care to knead it well before he moulded it into convenient shapes. Sometimes, while the paste continued in its soft state, he would put the impression of a seal upon the several pieces; one of which is in the British Museum. This paste was then put upon wood, and sometimes on tiles, in order to bake or dry it before a moderate fire, at about the distance of a foot. He found that a moderate fire was most proper, because a greater degree of heat made the composition frequently crack in many places. The time required for the baking or drying of this paste was generally about five or six hours before it attained a sufficient degree of hardness. When that was done, and the several baked pieces were become cold, he gave them their magnetic power in any direction he pleased, by placing them between the extreme ends of his large magazine of artificial magnets for a few seconds or more as he saw occasion. By this method the power they acquired was such, that when any of these pieces were held between two of his best ten guinea bars, with its poles purposely inverted, it immediately of itself turned about to recover its natural direction, which the force of those very powerful bars was not sufficient to counteract.

In the 66th volume of the Philosophical Transactions we have the following account from Dr Fothergill, of Dr Knight's method of imitating natural magnets, but which is by Mr Cavallo supposed to be some mistake or misinformation. "I do not know," says he, "that ever the doctor (Dr Knight) left behind him any description of a composition he had made to form artificial loadstones. I have seen in his possession, and many other of his friends have likewise seen, such a composition, which retained the magnetic virtue in a manner much more fixed than either any real loadstone, or any magnetic bar, however well tempered. In the natural ones he could change the poles in an instant, so likewise in the hardest bars, but in the composition the poles were immovable. He had several small pieces of this composition which had strong magnetic powers. The largest was about half an inch in breadth, very little longer than broad, and near one-fourth of an inch thick. It was not armed, but the ends were powerfully magnetic; nor could the poles be altered, though it was placed between two of his largest bars, and they were very strongly impregnated. The mass was not very heavy, and had much the appearance of a piece of black lead, though not quite so shining. I believe he never divulged the composition, but I think he once told me, the basis of it was filings of iron reduced by long-continued attrition to a perfectly impal-

pable state, and then incorporated with some pliant matter to give it due consistence.

From these accounts it appears that the basis of Dr Knight's artificial loadstones was the black powder to which iron filings are reduced by being shaken with water, or the *black oxide of iron*, formerly called martial aethiops. Hence Mr Cavallo supposes that the following receipt for imitating the natural magnets will answer the purpose.

Take some martial aethiops, reduced into a very fine powder, or, which is more easily procured, *black oxide of iron*, the scales which fall from red-hot iron when hammered, and are found abundantly in smiths shops. Mix this powder with drying lintseed oil, so as to form it into a very stiff paste, and shape it in a mould so as to give it any form you require, whether of a terrella, a human head, or any other. This done, put it into a warm place for some weeks, and it will dry so as to become very hard; then render it magnetic by the application of powerful magnets, and it will acquire a considerable power.

SECT. IV. *Of the Circumstances which tend to impair or destroy the Magnetic Power.*

The magnetic power in all its modifications, whether of attraction, repulsion, or polarity, is in general temporary and perishing. The best magnets, whether natural or artificial, unless carefully preserved, with attention to certain circumstances that will presently appear, are observed to have their magnetic power diminished. Natural magnets, and artificial magnets made of steel tempered as hard as possible, retain their power most obstinately, and seldom entirely lose it except under circumstances which we know to be unfavourable to its durability. Magnets of steel of a spring temper, are much sooner weakened, lose more of their force merely by keeping, and finally retain little or none of it. Soft steel and iron seldom retain magnetic power when removed from the magnet where they acquired it, unless their metallic state undergoes some change.

The following circumstances have been observed to be most powerful in diminishing or destroying the power of magnets.

1. *Improper position.* Nothing has so much effect in impairing the power of a magnet as keeping it in an improper position, that is, too far from the magnetic line. If the axis of the magnet be placed in a direction that is at right angles with the magnetic meridian, that is, in this latitude nearly E. N. E. and W. N. W. it will soonest lose its magnetic power; and if it be placed in the magnetic line, but in a contrary position, or with the north pole where the south pole should be, if permitted to vibrate freely, it will gradually become weaker every day, and unless it be a natural magnet, or an artificial one made of very hard tempered steel, it will, in no very long time, entirely lose its magnetic power.

2. *Heat.* The dissipation of magnetic power is greatly promoted by heating the magnet. The heat of boiling water has a sensible effect in this way; but if the magnet be exposed to a red heat, its power is entirely destroyed, as has been long known. Dr Gilbert observed that the power of magnets was destroyed by a

Experimental Illustrations.

Magnetism lost or destroyed.

66
by improper position;

67
by heat;

Theory.

heat that was not sufficient to make the metal visible in the dark; and Mr Canton found that the heat of boiling water weakened the power of a magnet, but that the greatest part of this was recovered as the magnet cooled. If the heat be applied when the magnet lies in a position most favourable to the dissipation of magnetism, the power is soonest destroyed; hence, the best way to deprive iron or steel of accidental magnetism is, to heat it red hot, and allow it to cool while lying in a direction perpendicular to the magnetic line.

M. Coulomb has ascertained that at 200 degrees of heat, two-fifths of the magnetism of a magnet is dissipated, and that at 500 degrees the whole is lost.

68
by violent
treatment;

3. *By violent treatment.* It is very extraordinary that the power of a magnet is impaired by rough usage. Dr Gilbert observed that a magnet which he had powerfully impregnated was greatly weakened by a single fall on the floor; and since his time it has been observed that when a magnet falls on a stone, or receives any concussion that makes it ring, it is injured much more than by being beaten with any thing soft and yielding. When a natural magnet is ground with coarse powders, in order to bring it to any required form, it is considerably weakened. This shows the propriety of altering the natural form of loadstones as little as possible, and when this is necessary, of doing it as expeditiously as may be, by cutting them briskly in the thin disks of a lapidary's wheel.

69
by similar
poles being
opposite.

4. *Placing them near each other with their similar poles opposite.* Magnets situated in this way always weaken each other, and when a powerful magnet is placed near a weaker, with their similar poles opposed, the polarity of the weaker is frequently reversed, that is, if the pole were north it becomes south, and *vice versa*. When the weaker magnet is a natural loadstone, or has been made of hard tempered steel, its original polarity is restored when the improper position is changed; but if it has been made of spring-tempered steel, the alteration is generally permanent, and often as complete as while the magnets were in the neighbourhood of each other.

CHAP. III. *Theory of Magnetism.*

70
Opinions of
the ancients.

RESPECTING the notions which the ancient philosophers entertained about the cause of magnetic phenomena, we know very little. One curious opinion which they entertained of the reason why a magnet was improved by the contact of iron, is worth noticing. They conceived that the magnet *fed upon the iron*, and hence acquired additional attractive power: and when deprived of this pabulum, it grew weak and languid.

—“*Nam ferro nurunt vitam, ferrique vigore
Vescitur; hoc dulces epulas, hoc pabula novit;
Hinc proprias renovat vires, hinc fusa per artus
Aspera secretum servant alimenta vigorem.
Hoc absente perit, tristi morientia torpent
Membra fame, venasque sitis consumit apertas.*”

CLAUDIAN.

In the 16th century, the philosophers of modern times first began to speculate about the cause of magnetic polarity, a phenomenon which then became interesting on account of the difference of declination observed

Theory.

by navigators. Various trifling opinions were published on the subject. Some said that the needle was directed by a certain point in the heavens, which was little more than saying that it pointed one way. Others ascribed the direction of the needle to vast magnetic rocks situated in the earth; but as to the exact situation of these rocks, they did not give themselves the trouble to inquire, till Fracasteri observed, that, if these rocks are supposed to be situated in any part of the globe yet visited by navigators, and if, as we must suppose, they act like loadstones, they will cause the direction to be very different from what is observed. He therefore placed them somewhere in the inaccessible polar regions, though not immediately at the poles. Norman, who, as we have seen (*DIPPING needle*), discovered the dip of the magnetic needle, and observed that in every part of Europe, the north pole pointed very far below the horizon, was naturally led to ascribe this effect to the influence of the earth, though he does not express himself as if he thought that the needle was attracted by any point within the earth, but only that it was always directed to such a point.

From comparing the different positions of the compass needle, as described by Norman, with the positions which he had himself observed small needles to assume in relation to a magnet, Dr Gilbert was naturally led to consider the earth as a great loadstone, or else containing a great loadstone within it, which arranged the dipping needle, or the needle of the compass, in the same manner as he observed a small needle poised on its pivot, to be arranged by a large magnet. Dr Gilbert has explained his theory at large in his *Physiologia Nova de Magnete, et de Tellure Magno Magnete*. It may be briefly expressed in the following terms. All the appearances of natural magnetism are similar to what would be observed in the earth, were a large magnet with its poles situated near the poles of the equator, viz. the north pole not far from Baffin's bay in North America, and the south pole in about the opposite part of the globe. If a dipping needle were exposed to the influence of such a large magnet, it must arrange itself in a plane passing through the magnetic poles, a position indicated very nearly by the mariners' needle; and the more we recede from the equator of the great magnet, the more must the dipping needle be inclined to the horizon.

71
Gilbert's
theory.

Dr Gilbert's theory was equally ingenious and important, and affords, if firmly established, a complete explanation of all the phenomena of magnetism. At the time it was first published, however, observations were neither sufficiently numerous, nor sufficiently accurate, to enable the author to assign the real position of the great magnet, nor to ascertain its laws of action. The theory was chiefly founded on observations made by the dipping needle, and though those instruments made by Norman were more accurate than might have been expected at so early a period of the science, the observations made with them cannot, from many circumstances, be implicitly relied on. We are still in want of a numerous collection of observations on the dip, in order to perfect our knowledge of the magnetic poles. We can only say that the earth acts on the compass needle in the same manner as a large magnet would act; but the appearances do not seem to resemble the effects of what we should consider as a good loadstone having two vigorous

72

Theory. gorous poles, but rather such as would result from the action of a very irregular loadstone with its poles very much diffused.

73

It is unfortunate that our most numerous observations of the dip have not been made in those places where they would be the most instructive. Dr Robison was of opinion that a series of observations should be obtained, extending from New Zealand northward, across the Pacific ocean to Cape Fairweather on the western coast of North America, whence it should be continued through that part of the continent. A second series might extend from the Cape of Good Hope along the western coast of Africa to the tropic of Capricorn; thence across the interior of the African continent through Sicily, Italy, Dalmatia, the eastern part of Germany, the gulf of Bothnia, Lapland, and the western part of Greenland. This series would be nearly in a plane passing through the probable situations of the poles. A third series might extend at right angles to the last, so as to form a small circle crossing the former, passing near Japan, through the island of Borneo, and the western part of New Holland; near Mexico, and a few degrees west of Easter island. Here and at Borneo there would be a considerable inclination of the magnetic plane to the horizon, though this cannot be found out. There are, however, other points of this circle in which the dip is considerable, where the inclination may be discovered. In short, all circumstances seem to indicate a multiplicity of poles, or, what renders calculation most difficult, an irregular magnetism in which the polarity is very much diffused.

Philosophers are very much divided respecting the situation of the magnetic poles of the earth. We shall here state only a few of their opinions, reserving a fuller account of some of them for the article *VARIATION of the Compass*.

74
Opinions as to the situation of the magnetic poles.

Dr Halley thought that the north magnetic pole was near Baffin's bay in North America.

Professor Krafft (see Petersburg Comment. vol. xvii.) places the north pole in N. Lat. 70° and W. Long. 23° from London; and the south pole in S. Lat. 50° , and E. Long. 92° .

Wilcke of Stockholm places the north pole in N. Lat. 75° near Baffin's bay, and in the longitude of California, while he fixes the south pole in S. Lat. 70° in the Pacific ocean.

Churchman supposes the north pole to be in N. Lat. 59° , and W. Long. 135° , a little inland from Cape Fairweather; and the south in S. Lat. 59° , and E. Long. 165° , directly south of New Zealand. (See *VARIATION*).

Euler (Memoirs of the Acad. of Berlin, vol. xvi.) places the north pole in N. Lat. 75° . Lemounier (*Lois du Magnétisme*) in N. Lat. 73° . Buffon in N. Lat. 71° .

La Lande places it in N. Lat. $77^{\circ} 4'$, and in about W. Long. 98° from Paris. (See *Connaissance des Temps*, an. xii.).

However ingenious this hypothesis of Dr Gilbert was, it appears to have been nothing more than a sagacious conjecture. The hypothesis, however, is confirmed into a rational theory by many observations and experiments which were unknown or unthought of in Dr Gilbert's time.

Mr Hindshaw's beautiful experiment on the effect of

75
Proofs of the truth of the theory.

an upright iron bar on the opposite ends of a compass-needle, according as one end or the other of the bar is next the earth (see *VARIATION of the Compass*) is an abundant proof of the justness of this theory.

Theory.

We can imitate that experiment in a very satisfactory manner by artificial magnetism; thus forming a just comparison between the action of the earth and that of a magnet.

Let a large bar magnet, as SAN (fig. 24.) be supported so as to have its ends detached from surrounding bodies. Then place a small needle nicely poised, as B, about three inches below N, the north pole of the magnet, and so that its directive power for the magnet may be very weak. Now take a small piece of soft iron, and hold it in such a position as is represented at C; its lower end becoming a north pole, will attract the south pole of the needle. Now, while the needle is kept in the same position, turn round the piece of iron into the position D; the south pole of the needle will be seen to avoid it, and the north pole will be attracted. Here the magnet may be compared to the earth, and the small piece of iron to the iron bar in Mr Hindshaw's experiment.

Again, it has been seen that magnetism may be produced in iron or steel by hammering or heating them while in a determinate position with respect to the earth. The same effect will be produced by the same processes while the iron or steel is in the neighbourhood of a powerful magnet.

Lastly, the circumstance of the magnetic inclination of the north pole of the dipping needle being diminished, and the horizontality of the compass needle destroyed, as we ascend above the earth, is an additional and certain evidence of the truth of this theory.

In short, we may consider it as demonstrated, that the earth is a great magnet, or contains a great magnet, by the influence of which the direction of the needle and all the magnetic power acquired by iron, when placed in a proper position, are produced.

A further illustration and application of this theory will be given presently, when we have considered some other hypotheses posterior to that of Dr Gilbert.

It was very early an object with philosophers to assign the immediate cause of magnetic attraction and repulsion, and of that faculty of mutual impregnation which so remarkably distinguishes iron from all other substances. In particular, the curious arrangement of iron filings strewed round a magnet forcibly attracted their attention. It is scarcely possible to observe this arrangement without conceiving the idea of a stream of matter issuing from one of the poles of the magnet, moving round it, entering by the other pole, and again issuing by its former outlet. Accordingly, such an idea was entertained in the earliest times; but very different notions prevailed as to the manner in which such a stream produced the effects observed. One of the simplest methods was, to conceive it acting by impulsion, like any other stream of fluid matter. This idea was entertained by Lucretius, who supposed the surrounding air to be swept out of the way by the impulsion of the fluid, which thus rushing round the magnet carried the iron filings towards it.

In the last century Euler framed an hypothesis of magnetism on this theory of impulsion. He supposes, that the two principal causes which concur in producing the

76

Theories of re-impulsion.

Theory. the wonderful properties of a magnet, are, First, A particular structure of the internal pores of the magnets, and of magnetical bodies; and, Secondly, An external agent or fluid, which acts upon, and passes through these pores. This fluid he supposes to be the solar atmosphere, or that subtle matter called *ether*, which fills our system.

Indeed, most writers on this subject agreed in supposing that there are corpuscles of a peculiar form and energy, which continually circulate around and through a magnet; and that a vortex of the same kind circulates around and through the earth.

“A magnet, besides the pores which it has in common with other bodies, has also other pores considerably smaller, destined only for the passage of the magnetic fluid. These pores are so disposed as to communicate one with the other, forming tubes or channels, by which the magnetic fluid passes from one end to the other. The pores are so formed, that this fluid can only pass through them in one direction, but cannot return back the same way; similar to the veins and lymphatic vessels of the animal body, which are furnished with valves for this purpose: So that the pores of the magnet may be conceived to be formed into several narrow contiguous tubes, parallel to each other, as at A, B, fig. 25. through which the finer part of the ether passes freely from A to B, but cannot return back on account of the resistance it meets with at *a, a, b, b*, nor overcome the resistance of the grosser ether, which occasions and continues the motion. For supposing the pole A of a magnet, filled with several mouths or open ends of similar tubes, the magnetic fluid, pressed by the grosser part of the ether, will pass towards B with an inconceivable rapidity, which is proportionable to the elasticity of the ether itself; this matter which, till it arrives at B, is separated from the tubes by the grosser parts, then meets with it again, and has its velocity retarded, and its direction changed; the stream, reflected by the ether, with which it cannot immediately mix, is bent on both sides towards C and D, and describes, but with less velocity, the curves DE and CF*e*, and approaching by the curves *d* and *c*, falls in with the effluent matter *m m*, and again enters the magnet; and thus forms that remarkable atmosphere, which is visible in the arrangement of steel filings on a piece of paper that is placed over a magnet *.”

* Letters d
une Prin-
cesse d'Al-
lemagne.

73

We have already had occasion (see the article IMPULSION) to make some observations on the general doctrine of impulsion, and these need not be here repeated. Respecting the explanations afforded by the canals and dock-gates in Euler's hypothesis, opening in one direction and shutting in the other, we may observe, that as these constructions are altered in a moment in a bar of soft iron, merely by changing the position of the magnet, it is astonishing that they should ever have been conceived by so acute a philosopher. Even supposing such circumstances to take place, the effects resulting from them should be the reverse of what are actually observed, as the impelling stream should move those bodies least which afford the readiest channels for its passage. If the iron filings were arranged by this impelling stream, they should be carried along with it, and if they are carried towards one pole of the magnet, they should be driven away from the other.

Theory *Theory of Æpinus.* 79
Æpinus, of the academy of Petersburg, whose theory of electricity we have explained and illustrated at considerable length, was led by the analogy observed between the phenomena of electricity and those of magnetism, and in particular from the resemblance between the attractions and repulsions of the tourmalin and those of a magnet, to conceive the idea that both classes of phenomena might be explained in a similar manner, or that the phenomena of magnetism, like those of electricity, were to be attributed to the motions of a certain fluid existing in all bodies susceptible of magnetism. This conjecture was confirmed by observing, that when magnetism was induced on a piece of iron by its proximity to a magnet, the power of the magnet is not sensibly diminished. The following is an abstract of Mr Æpinus's hypothesis.

1. There exists in all magnetic bodies a substance which may be called the magnetic fluid, the particles of which repel each other with a force that decreases as the distance increases.

2. There is a mutual attraction, varying according to the same law, between the particles of the magnetic fluid, and the particles of iron.

3. There is a mutual repulsion among the particles of iron, following the same law.

4. The magnetic fluid is capable of moving through the pores of iron, and soft steel, without any considerable difficulty: but its motion is more and more obstructed as the steel receives a harder degree of temper; and in steel of the hardest temper, and the ores of iron, it moves with the greatest difficulty.

5. From the supposed attraction between the magnetic fluid and iron, the latter may contain a certain determinate quantity of the former, and this quantity will be such that the accumulating attraction of a particle of it for the whole of the iron, balances the repulsion between the particles of the whole fluid contained in the iron; supposing the quantity of fluid competent to a particle of iron to be such, that the repulsion between it and the fluid competent to another particle of iron, is also equal to its attraction for that particle of iron. Therefore the attraction between the fluid in one iron bar A, and the iron of another bar B, is just equal to the repulsion between the iron in A and the iron in B. This determinate quantity of fluid in the iron is called its *natural quantity*.

6. From the mobility of the fluid through the pores of iron, it may, by the agency of a proper external force, be abstracted from one end of an iron bar, and condensed in the other end. This, however, is a violent state, and the mutual repulsion between the particles of condensed fluid, together with the attraction between the fluid and that part of the iron which it has quitted, tend to produce a more uniform distribution. It is evident that something of this tendency must take place in every state of condensation and rarefaction, and that a perfect equilibrium can be produced only when the fluid is diffused with perfect uniformity. This state of uniformity may be called the natural state of the body.

7. The production of such a uniform distribution will depend on the nature of the resistance to the motion of the fluid, opposed by the iron in its various states. If this resistance arises merely from the communication of motion, like that which perfect fluids oppose to the mo-

tion

Theory. tion of solid bodies, such resistance may be overcome by the weakest tendency to uniform diffusion; but if, as seems most likely, the obstruction is like that of a clammy fluid, or of a soft plastic body like clay, after the accumulation arising from the action of an external force, it may remain after that force is removed; and the diffusion will cease when there is a perfect equilibrium between the obstruction and the diffusing force.

As the illustration of this theory in general cases is precisely similar, *mutatis mutandis*, with that of electricity, so fully detailed under the article ELECTRICITY, from N^o 299. to 348. we need not repeat it here, but may refer the reader to that treatise, requesting him to consider the illustration as relating to the *magnetic* fluid.

It is proper, however, to remark here, that the phenomena of magnetism are limited by this circumstance; that magnets always contain their natural quantity of fluid. Of course, their action on iron, and on each other, depends entirely on its unequal distribution.

The most important part of this theory is that which explains the induction of magnetism on iron and steel by juxtaposition to a magnet; but before we can properly enter on that, we must notice some other particulars respecting the theoretical part of our subject.

80
Law of magnetic action.

A very material point in magnetism, as in electricity, is to ascertain the law of action, according to which this power acts on the particles of iron and other matter; and accordingly this has long been an object of attention with philosophers. The difficulty of ascertaining this law is extremely great, as will readily appear by the following consideration.

In the action of two magnets on each other, as A and B, there are four different actions to be considered that act at the same time, though with different degrees of force, and in different directions. Thus the north pole of A repels the north pole of B, and attracts its south pole, while the south pole of A exerts a repulsion on the south pole of B, and an attraction on its north pole. Now the force, which we attempt to measure, is compounded of these four forces; and these we cannot measure separately. The attraction observed is the excess of two attractions that are unequal above two unequal repulsions, and *v. v.* with respect to the observed repulsion. Further, if we reflect that it is possible for a mutual action to exist between every two particles of the different magnets, and that the intensity of this action may vary, not only at different distances, but at the *same* distance, the difficulty will be greatly increased.

81
Experiments of Muschenbroeck,

Numerous experiments have been made with a view of ascertaining this law. Mr Cavallo has detailed many of those made by Muschenbroeck; but their results are so anomalous, that their inaccuracy is apparent. Indeed, the attempt to ascertain this law by observing merely the attractions and repulsions, was very unphilosophical. The method employed by Mr Hawksbee and Dr Brook Taylor, viz. observing how far the action of a magnet made a compass needle deviate from the meridian at different distances, was much more scientific, as this deviation is occasioned by the difference of the two sums of the same forces; and this may be made many times greater than the other, and must of course be

82
of Hawksbee and Dr Brook Taylor,

much more sensible. The shape of the magnets employed by them was, however, very improper. Some experiments made by Mr Lambert of the academy of Berlin, were very judicious. He placed a magnetic needle at various distances from a magnet, but in the direction of its axis, and marked the declination from the magnetic line produced by the action of the magnet, and the obliquity of the magnet to the axis of the needle. Thus the action of the magnet and the natural polarity of the needle were placed in opposition and equilibrium; but the great difficulty was to discover the proportional change of these forces by their obliquity of action on this small lever.

Theory.
83
of Lambert.

Mr Lambert observed, that when the obliquity of the magnet to the axis of the needle was $=30^\circ$, the needle was made to decline 15° ; and when the obliquity was $=75^\circ$, the needle declined 30° . Let us call the obliquity o and the declination d , and let us put f for that function of the angle which is proportional to the action. Also let us call the natural polarity of the needle p , and the force of the magnet m . Then it is evident that $p \times f : 15 = m \times f : 30$; and $p : m = f, 30 : f, 15$; and for the same reason $p : m = f, 75 : f, 30$, and therefore $f, 15 : f, 30 = f, 30 : f, 75$. But since $15 : 30 = \text{sine } 30 : s 75$; hence Mr Lambert concluded, that the *sine* was that function of the angle which was proportional to the action of magnetism on a lever. As this point, however, could not be determined by one experiment, he compared several other obliquities and declinations with the same distances, and with different distances of the magnet, and fully proved that he was right in his conjecture.

The result of Mr Lambert's experiments fully proves the fallacy of the theories of impulsion, which pretend to explain magnetic action by the impelling power of a stream of fluid, or by pressure produced by the motion of such a stream; as in such a case the pressure on the needle must have diminished in the duplicate ratio of the sine; or with the angle 90° the directive power must have been four times as much as with the angle of 30° , whereas it is shewn by observation to be only twice as much.

When Mr Lambert had ascertained the effect of obliquity, he proceeded to examine that of distance; and he found, that if we put f for the force of the magnet, and d for the distance of the nearest pole of the magnet from the centre of the needle, and a for a constant quantity nearly equal to two-thirds of the length of the needle, f will be proportional to $(d - a)$.

Dr Robison endeavoured to investigate this law in a very simple manner. He caused to be made some magnets consisting of two balls connected by a slender rod. By a particular mode of impregnation (which we suppose to be quenching them, after being red hot, between two magnets) he gave them a pretty good magnetism; and the force of each pole appeared to be nearly confined to the centre of the ball, which was his object in making them of such a shape, as it reduced the examination of their attractive and directive power to a very easy computation. The result of his experiments was, that the force of each pole varied inversely as the squares of the distances, or at least the error arising from such an hypothesis was very small, amounting only to one-fiftieth of the whole.

84
Dr Robison's investigations.

Dr Robison made a near approximation to the law of

Theory. of action, by supposing that the function of the distance expressing that law, represented by the ordinates of a curve similar to the hyperbola, referred to its asymptote as an axis, towards which its curve was of course always convex. On this supposition he explained the attractions and repulsions of magnets nearly in the following manner :

85 Picture of the magnetic forces. Fig. 26. Let there be two magnets, A and B (fig. 26.) placed so that their four poles, S, N, s, n, may be in a straight line. Now, in the straight line Oq take Om, Op, On, Oq = Ns, Nn, Ss, Sn; and let MPNQ be a curve line, whose asymptotic axis is the said line Oq. Draw the ordinates mM, pP, Nn, qQ to the curve, and these will represent the intensities of the forces exerted between the poles of the magnets. The distance between m, n, or between p and q = the length of the magnet A, and mp or nq = that of B, and Mm, Pp, Nn, and Qq, are pairs of ordinates that are equally distant. Now, it is easy to see from the figure, that in whatever situation the pairs of equidistant ordinates may be, Mm + Qq will always exceed Pp + Nn, or the sum of the attractions will always be greater than that of the repulsions.

Let the chords MQ, PN, MP, NQ be drawn. Bisect them in B, D, E, F, and join EF. Draw the ordinates Ee, Ff, and BD b (cutting EF in C). Draw Pu parallel to the axis, cutting Ee in s. Draw also Qi parallel to the axis, cutting Ff in φ. Also draw FHL parallel to the axis, and Pot parallel to QN; and draw PLl, and Pex, cutting Mm in l and x. Let each ordinate be represented by the letter at its intersection with the axis. Thus, the ordinates, Mm and Qq may be represented by m and q, &c. Because MP is bisected in E, Mt is double of Ee, Ml is double EL, and Mx double of Ee. Again, Pt being parallel to Qn, and Pu to Qi, tu equals Ni.

86 If these ordinates are supposed to represent the mutual action of the magnetic poles, their tendency to or from each other, that is, their attractions or repulsions, may be expressed by $(m+q) - (n+p)$ which represent the excess of the sum of the actions of the nearest and most remote poles above the sum of the action of the intermediate distant poles. This tendency may often be conveniently represented by $(n-p) - (n-q)$ or the excess of the difference of the actions exerted by the nearest pole of A on the two poles of B, above the difference of the actions of the remote pole of A on the same poles of B. Now, 1. If we suppose the dissimilar poles of A and B to front each other, $m+q$ will represent attractions, and $p+n$, repulsions; but $m+q$ is greater than $p+n$, therefore A and B will attract each other. Again $(m+q) - (p+n)$ equals Mt, = 2 Ee = 2 BD = 4 CD.

The above action will be increased by any one of four circumstances, as, 1. By increasing the strength of either magnet. 2. By lessening the distance between the two magnets. 3. Increasing the length of A, the distance between it and B remaining the same. 4. By increasing the length of B, the distance between it and A remaining the same.

2dly, Let us place the magnets, so that their similar poles front each other. Here it is evident that the ordinates which in the former case represented attractions, will now represent repulsions, and that the repel-

ling forces of the magnet are equal to the former attracting forces at the same distances. As magnets are seldom perfect, the repelling forces are, however, usually weaker than the attracting.

To explain the directive power of magnets, Dr Robison supposed the magnet A not to be at liberty to approach B or recede from it, but to be supported at its centre B, so as to turn round it. Now, its south pole s being more attracted by N than it is repelled by S, B is on the whole attracted by A, and by this attraction would vibrate like a pendulum supported at the centre B. Again, the north pole n being repelled by N more than it is attracted by S, will be on the whole repelled, and B n would also vibrate round B. Thus B would be kept in the position s B n. This will be more evident if we suppose the magnet B arranged at right angles to the line AB, as in the dotted representation s' B n'; for now s' and n' are urged in opposite conspiring directions with equal force, which, if the magnet be very small, will act nearly at right angles to n' s'. If the position were oblique, the forces would be somewhat unequal; and allowances must be made for the obliquity of the action, that we may know the precise rotative momentum. This modification of the action of A on B, we call the directive power of A; and the modification of B, by which it tends to or from A, we call the polarity of B.

Now, the directive power of A and the polarity of B may be increased, 1. By increasing the strength of either A or B, or both; 2. By diminishing the distance between A and B; 3. By increasing the length of A; and, 4. By diminishing the length of B, the distance between them remaining the same.

We may remark, that the directive power of A is always greater than its attractive power, by a certain measure which we may represent by the formula $2(p-q)$ which is thus derived. The difference between them may be expressed by $tl = 2oL$; but $sc = Pp = p$, and $sL = Pp - Ff = Pp - Qq - Fφ = Pp - Qq - os$; therefore $oL = Pp - Qq$, and $tl = 2(Pp - Qq) = 2(p-q)$.

This picture of the forces, attentively examined, will suggest to the reader many interesting and instructive particulars. Dr Robison used to relate a curious and instructive phenomenon that he was long puzzled to explain respecting the mutual action of large magnets. Amusing himself with some experiments on magnetism, with two large strong magnets, as AB, fig. 27. which were placed at about the distance of three inches with their opposite poles fronting each other, he had placed a small needle balanced on a point between them as at D, which arranged itself in the same line with the magnets; but happening to set it off to a considerable distance on the table, as at F, he was surprised to see it instantly turn round on the point, and arrange itself in an opposite direction. When brought back to D, it reassumed its former position, but when he carried it out gradually along the line DF, perpendicular to Ns, he found it grow sensibly more feeble, vibrating more slowly; and when arrived at a certain point E, it shewed no polarity towards either A or B, but retained any position given it: but when carried farther out, it again acquired polarity to the magnets, though in a contrary direction, arranging itself parallel to NS, with its north pole next to N, and south pole next to S. Being interrupted

Theory.
87 Explanation of directive power.

88 Curious phenomenon.

Fig. 27.

Theory.

interrupted in the prosecution of this experiment, but having marked the line DF on the table, he afterwards replaced the magnets and needle, placing the latter at E, where he expected it to be neutral; but it now turned its north pole towards B, and did not become neutral till carried further out. When standing there, something happened to move the magnets A and B, which instantly rushed together, and at the same instant the needle turned itself briskly, and arranged itself as before at F. In short, by gradually withdrawing the magnets from each other, he found that the needle first became weaker, then neutral, and then turned into the opposite position.

Dr Robison explained this curious phenomenon by what he calls primary and secondary magnetic curves, such as NHM, NEL, and SGK, SEI; but our limits do not permit us to enter here on the investigation of these curves.

89
Law of action probably inversely as the squares of the distances.

From all Dr Robison's experiments and calculations, he appears to have been fully convinced, that the true law of magnetic action is in the *inverse duplicate ratio of the distances*, and his opinion is still farther strengthened by the ingenious experiments of M. Coulomb related in the *Memoirs of the Academy of Sciences at Paris* for 1786 and 1787, or the *Jour. de Phy.* vol. xliii.

We are now prepared to examine the induction of magnetism in iron or steel by juxtaposition to a magnet, the general facts of which are mentioned and illustrated in N^o 44.

It was remarked in N^o 46, that the induction of magnetism in the iron by being near a magnet was not produced by a transference of something from the magnet to the iron. It follows that there must be some inherent property in iron, which is only excited, as it were, or roused into action, by the proximity of the magnet.

It has been remarked, that the magnetism of iron is momentary; but this must be understood only of the finest and purest iron, as when this metal is in the state of ore, or has undergone any change, as by exposure to the air, or by cementation, its magnetism becomes permanent, in proportion to the hardness of the metal.

90
Induced magnetism gradual.

It is of great importance to observe that the acquisition of induced magnetism is gradual and progressive, and that this gradation is more perceptible according as the iron is in a harder state. In soft iron the induction appears to be instantaneous throughout, unless the bar be exceedingly long; but when a magnet is brought near a bar of tempered steel, the near end acquires a contrary polarity long before the remote end appears affected, and it is a long time before the remote end acquires the same polarity with the proximate end of the magnet.

91
Iron attracted only because it becomes magnetical.

From what has been said we may infer, that a piece of iron brought near a magnet, is attracted only because it becomes magnetical by induction, and that the attraction of a loadstone for iron, or the tendency of iron to the loadstone, is the consequence of the proper disposition of the magnetism induced in the iron. It has already appeared, that this phenomenon arises from the excess of two attractions above two repulsions, and this is farther proved by the following considerations: 1. That the magnetism of the two poles is evidently of an opposite nature, the one attracting what the other repels, and *vice versa*. If a piece of iron is

Theory.

attracted by one, it ought therefore to be repelled by the other; but each pole, by inducing on the near end of the iron a magnetism opposite to its own, and on the remote end a similar magnetism, and its action diminishing as the distance increases, the attraction must always be in excess, and the iron must on the whole be attracted. 2. When we have two magnets placed in a parallel position, with their opposite poles together, if a piece of common iron be brought near their extremities, the different poles counteracting each other, the piece of iron will not be supported by the two magnets together, unless there is an inequality of action; but it is evident that either of them alone would be capable of supporting the iron. 3. In all the cases where the induction of magnetism is slow, the attraction is proportionally weak, and the attraction increases exactly according to the increase of the progressive induction. 4. An ore of iron that is not capable of acquiring magnetism, is not attracted by the magnet, and on the other hand it is an universal fact, that no substance which is not attracted by the magnet, can be rendered magnetical.

The induction of magnetism by juxtaposition affords a complete explanation of the curious arrangement of iron filings round a magnet. Let us suppose a great many small oblong pieces of iron to be lying near each other on the surface of mercury, and that a strong magnet be brought into the midst of them. They are all immediately rendered magnetical by induction; any one that is nearest the north pole of the magnet acquiring two poles, one a north and the other a south pole, turns the south pole towards the north pole of the magnet, and the north pole away from it; a similar effect is produced on another piece or filing that lies near the first, and so on of the rest. All those that lie near each other must mutually attract, as the magnetism of each is so disposed that both ends of it are in a state of attraction towards one or other of its neighbours. They will therefore arrange themselves by coalescence in a particular manner; if they are near enough, they will unite by their extremities, and if they are at some distance they will point towards each other, forming curved lines.

92
Arrangement of iron filings explained.

It is found that the magnetism of magnets, whether natural or artificial, is continually tending to decay. Now as we find that this magnetism may be induced merely by the approach of a magnet, and as we know that in producing magnetism, magnets may oppose each other, it is reasonable to conclude, that when a slight though permanent magnetism has been acquired by a piece of iron by its vicinity to a magnet, it may be destroyed, and the contrary magnetism induced, by applying a magnet in the opposite direction. Accordingly it is a well-known fact, that the poles of magnets made of soft steel can be reversed at pleasure.

93
Magnetism can be reversed.

This explains why magnetic repulsion is always weaker than attraction at the same distance, as magnets, when placed with their similar poles fronting each other, in order to try their repulsion, are thereby weakened; whereas, on the contrary, magnets applied with their opposite poles, so as to attract each other, are thereby improved, and their attractive powers are made to appear greater than they really are.

It has been observed that a magnet is not weakened by inducing magnetism on iron. In fact, it is rather improved

Theory.

improved by such induction, and this will increase the effect; for as the magnet is improved, the induced magnetism of the iron will be thereby increased, and thus the magnet will be thus farther improved.

After what has been said, we need not enter further into an explanation of the phenomena, or of the processes employed in making artificial magnets. They are all referable to this one fact of the induction of magnetism by juxtaposition, and explanations will readily suggest themselves to readers who carefully consider the preceding facts, and compare them with Dr Gilbert's theory of terrestrial magnetism.

94
Objection to terrestrial magnetism answered.

It is now time for us to return to Dr Gilbert's hypothesis, and consider an objection that has been strongly urged against it.

There is observed no tendency in the magnetic needle towards the great terrestrial magnet, that is, though, when made to float on water, it speedily acquires directive power, it does not in these latitudes approach the north side of the vessel, nor does an iron bar appear heavier when its south pole is uppermost, as ought to be the case on account of the attraction of the great magnet. Dr Gilbert saw this objection, and it appears to have given him some concern. He attempted to get rid of it by observing that the directive power of a magnet is greater than its attractive force; a fact in support of which he brings many experiments. A much more satisfactory answer may be derived from what has been stated respecting the actions of the four poles. We thence find, that the polarity of the needle depends on the difference of the *sums* of the actions of each pole of the magnet on both poles of the needle; whereas its tendency towards the magnet arising from the attraction between them, depends on the difference of the *differences* of the same actions. Hence the former may be very great, while the latter is very small. We find that small iron filings are much less forcibly attracted by magnets than coarse ones, and, if we consider that the largest magnets which we employ do not bear so great a proportion to the earth, as the finest iron filings to an ordinary magnet, we shall not wonder that the attractive power of the earth is not very sensible.

As this objection is one of the strongest that can be brought against the theory, and as we may consider this as done away, we may now receive the theory as just so far as it goes. We must remark, that though we call that pole of a magnet which inclines towards the earth in the northern latitudes, a *north* pole, it is properly speaking a *south* pole; for as we must call that pole of the *great* magnet the north pole which is in the north, and as this pole produces the contrary polarity in the proximate end of a needle, that end must be possessed of *south* polarity. We shall return to this subject in the article VARIATION.

Some valuable observations on terrestrial magnetism have lately been made in France by M. M. Humboldt and Biot, and as they would suffer materially by abridgement, we shall present our readers with the greatest part of the memoir nearly as translated in the Philosophical Magazine, vol. xxii.

95
Observations of Humboldt and Biot.

After explaining the object of the memoir, and giving an account of the share that he had in conducting the observations, M. Biot proceeds as follows.

It is necessary to consider the action of terrestrial

magnetism under different points of view, corresponding to the different classes of the phenomena which it produces. Theory.

If we consider it first in general, we find that it acts on the whole surface of the globe, and that it extends beyond it. This fact, which was doubted, has been lately proved by M. Guy-Lussac, during his two

aërostatic voyages. And if these observations, made with all the care possible, have not shewn the least sensible diminution in the intensity of the magnetic force, at the greatest height to which man can attain, we have a right to conclude that this force extends to an indefinite distance from the earth, where it decreases, perhaps, in a very rapid manner, but which at present is unknown to us.

If we now consider magnetism at the surface even of the earth, we shall find three grand classes of phenomena which it is necessary to study separately, in order to have a complete knowledge of its mode of action. These phenomena are, the declination of the magnetic needle, its inclination, and the intensity of the magnetic force, considered either comparatively in different places or in themselves, paying attention to the variations which they experience. It is thus that, after having discovered the action of gravity as a central force, its variation, resulting from the figure of the earth, was afterwards ascertained in different latitudes.

The declination of the magnetic needle appears to be that phenomenon which hitherto has more particularly fixed the attention of philosophers, on account, no doubt, of the assistance which they hoped to derive from it in determining the longitude; but when it was known that the declination changes in the same place, in the course of time, when its diurnal variations were remarked, and its irregular traversing occasioned by different meteors, in a word, the difficulty of observing it at sea, within one degree nearly, it was necessary to abandon that hope, to consider the cause of these phenomena as much more complex and abstruse than had been at first imagined.

In regard to the intensity of the magnetic power in different parts of the earth, it has never yet been measured in a comparative manner. The observations of M. Humboldt on this subject have discovered a very remarkable phenomenon; it is the variation of the intensity in different latitudes, and its increase proceeding from the equator to the poles.

The compass, indeed, which at the departure of M. Humboldt gave at Paris 245 oscillations in 10 minutes, gave no more in Peru than 211, and it constantly varied in the same direction; that is to say, the number of the oscillations always decreased in approaching the equator, and always increased in advancing towards the north.

These differences cannot be ascribed to a diminution of the force in the magnetism of the compass, nor can we suppose that it is weakened by the effect of time and of heat; for after three years residence in the warmest countries of the earth, the same compass gave again in Mexico oscillations as rapid as at Paris.

There is no reason to doubt the justness of M. Humboldt's observations, for he often observed the oscillations in the vertical plane perpendicular to that meridian; and by decomposing the magnetic force in the

Theory. the latter plane, and comparing it with its total action, which is exercised in the former, we may from these data calculate its direction, and consequently the direction of the needle (c). This inclination, thus calculated, is found always conformable to that which M. Humboldt observed directly. When he made his experiments, however, he could not foresee that they would be subjected to this proof by which M. Laplace verified them.

As the justness of these observations cannot be contested, we must allow also the truth of the result which they indicate, and which is the increase of the magnetic force proceeding from the equator to the poles.

⁹⁸ Humboldt's determination of the magnetic equator. To follow these results with more facility, it will be proper to set out from a fixed term; and it appears natural to make choice for that purpose of the points where the inclination of the magnetic needle is null, because they seem to indicate the places where the opposite action of the two terrestrial hemispheres is equal. The series of these points forms on the surface of the earth a curved line, which differs very sensibly from the terrestrial equator, deviating from it to the south of the Atlantic ocean, and to the north in the south sea. M. Humboldt found this equator in Peru about 7° 1' S. Lat. which for that part of the earth places it nearly in the spot where Wilke and Lemoumier had fixed it.

The places situated to the north of that point may be divided into four zones, the three first of which, being nearer the equator, are about 4° of latitude, while the latter, more extensive and more variable, is 14°. So that the system of these zones extends in America from the magnetic equator to 23° of north latitude, and comprehends in longitude an interval of about 50°.

The first zone extends from 7° 1' of south latitude to 2° 54'. The mean number of the oscillations of the needle in the magnetic meridian in 10' of time is there 211.9: no observation gives less than 211, or more than 214. From M. Humboldt's observations one might form a similar zone on the south side of the magnetic equator, which would give the same results.

The second zone extends from 2° 13' of south la-

titude to 3° 15' of north latitude. The mean term of the oscillations is there 217.9; they are never below 220, nor above 226.

The fourth zone, broader than the other two, extends from 9° 15' to 23° 8' of north latitude. Its mean term is 237: it never presents any observation below 229, nor above 240.

We are unacquainted, in regard to this part of the earth, with the intensity of the magnetic force beyond the latitude of 23° north; and on the other hand, in Europe, where we have observations made in high latitudes, we have none in the neighbourhood of the equator; but we will not venture to compare these two classes of observations, which may belong to different systems of forces, as will be mentioned hereafter.

However, the only comparison of results, collected in America by M. Humboldt, appears to us to establish with certainty the increase of the magnetic force from the equator to the poles; and, without wishing to connect them too closely with the experiments made in Europe, we must remark, that the latter accord so far also with the preceding as to indicate the phenomenon.

If we have thus divided the observations into zones parallel to the equator, it is in order that we may more easily shew the truth of the fact which results from them, and in particular to render the demonstration independent of those small anomalies which are inevitably mixed with these results.

Though these anomalies are very trifling, they are however, so sensible, and so frequently occur, that they cannot be ascribed entirely to errors in the observations. It appears more natural to ascribe them to the influence of local circumstances, and the particular attractions exercised by collections of ferruginous matters, chains of mountains, or by the large masses of the continents.

One of them, indeed, having carried to the Alps the magnetic needle employed in an aerial excursion, he found that its tendency to return to the magnetic meridian was constantly stronger in these mountains than it was at Paris before his departure, and than it has been found since his return. This needle, which made at Paris 83.9° in 10' of time, has varied in the following manner in the different places to which it was carried.

3 C 2 Places

(c) Let HOC (fig. 28.) be the plane of the magnetic meridian passing through the vertical OC; let OL be the direction of the needle situated in that plane, and OH a horizontal. The angle LOH will be the inclination of the needle, which we shall denote by I. If F represent the total magnetic force which acts in the direction OL, the part of this force which acts according to OC, will be F sine of I: but the magnetic forces which determine the oscillations of the needle in any plane, are to each other as the squares of the oscillations made in the same time. If we denote them by M, the number of oscillations made in 10' of time in the magnetic meridian, and by P, the number of oscillations made also in 10', in the perpendicular plane, we shall have the following proportion:

$$\frac{F \sin. I}{F} = \frac{P^2}{M^2}$$

from whence we deduce

$$\sin. I = \frac{P^2}{M^2}$$

The inclination then may be calculated by this formula, when we have oscillations made in the same planes.

In like manner, by making a needle oscillate successively in several vertical planes, we might determine the direction of the magnetic meridian.

99
Terrestrial magnetism modified by local circumstances.

These experiments were made with the greatest care, conjointly with excellent observers, and always employing the same watch verified by small pendulums, and taking the mean terms between several serieses of observations, which always differed very little from each other. It appears thence to result, that the action of the Alps has a sensible influence on the intensity of the magnetic force. M. Humboldt observed analogous effects at the bottom of the Pyrenees; for example, at Perpignan. It is not improbable that they arose from the mass of these mountains, or the ferruginous matters contained in them; but whatever may be the cause, it is seen by these examples that the general action of terrestrial magnetism is sensibly modified by local circumstances, the differences of which may be perceived in places very little distant from each other. This truth will be further confirmed by the following observations.

It is to causes of this kind, no doubt, that we must ascribe the diminution of the magnetic forces observed in some mountains; a diminution which, on the first view, might appear contrary to the results obtained during various aerial voyages. This conjecture is supported by several observations of M. Humboldt. By making his needle to oscillate on the mountain of Guadaloupe, which rises 338 toises above Santa-Fé, he found it in 10' of time give two oscillations less than in the plain. At Silla, near Caracas, at the height of 1316 toises above the coast, the diminution went so far as five oscillations; and on the other hand, on the volcano of Antisana, at the height of 2467 toises, the number of oscillations in 10 minutes was 230; though at Quito it was only 218, which indicates an increase of intensity. A similar effect was observed on the summit of Mount Genève, at the height of 800 or 900 toises, as may be seen from the numbers already given; and on this mountain M. Biot found the greatest intensity of the magnetic force. He saw on the hill of La Superga, in the neighbourhood of Turin, an example of these variations equally striking. Observing, with Vassali, on this hill; at the elevation of 300 toises, they found 87 oscillations in 10 minutes of time. On the side of the hill they had 88,8 oscillations, and at the bottom, on the bank of the Po, they obtained 87.3. Though these results approach very near to each other, their difference is, however, sensible, and fully shows that their small variations must be considered as slight anomalies produced by local circumstances.

This examination leads us to consider the intensity of magnetism on the different points of the surface of the globe, as subject to two sorts of differences. One kind are general; they depend merely on the situation of the places in regard to the magnetic equator, and belong to a general phenomenon, which is the increase of the in-

tensity of the magnetic forces in proportion as we remove from the equator; the other kind of variations, which are much smaller and altogether irregular, seem to depend entirely on local circumstances, and modify either more or less the general results.

If we consider terrestrial magnetism as the effect of an attractive force inherent in all the material particles of the globe, or only in some of these particles, which we are far from determining, the general law will be, the total result of the system of attraction of all the particles, and the small anomalies will be produced by the particular attractions of the partial systems of the magnetic molecule diffused irregularly around each point; attractions rendered more sensible by the diminution of the distance.

It now remains to consider the inclination of the magnetic needle in regard to the horizontal plane. It has been long known that this inclination is not every where the same; in the northern hemisphere the needle inclines towards the north; in the southern towards the south; the places where it becomes horizontal form the magnetic equator; and those where the inclination is equal, but not null, form on each side of that equator curved lines, to which the name of magnetic parallels has been given, from their analogy to the terrestrial parallels. One may see in several works, and particularly in that of Lemoumier, entitled *Lois du Magnétisme*, the figure of these parallels, and their disposition on the face of the earth.

It evidently results from this disposition, that the inclination is in proportion as we recede from the magnetic equator; but the law which it follows in its increase, has not yet, as far as appears to us, been given. To ascertain this law, however, would be of great utility; for the inclination seems to be the most constant of all the magnetic phenomena, and it exhibits much fewer anomalies than the intensity. Besides, if any rule well confirmed could be discovered on this subject, it might be employed with advantage at sea to determine the latitude, when the weather does not admit an observation of the sun; which is the case in various places during the greater part of the year. We have some reason to expect this application, when we see the delicacy of that indication in the observations of M. Humboldt, where we find 35' 6" of difference between two towns so near each other as Nismes and Montpellier. These motives have induced us to study with great interest the series of observations made by M. Humboldt in regard to the inclination; and it appears to us that they may be represented very exactly by a mathematical hypothesis, to which we are far from attaching any reality in itself, but which we offer merely as a commodious and sure mode of connecting the results.

To discover this law, we must first exactly determine the position of the magnetic equator, which is as an intermediate line between the northern and the southern inclinations. For this purpose we have the advantage of being able to compare two direct observations, one of La Perouse, and the other of M. Humboldt. The former found the magnetic equator on the coasts of Brasil at 10° 57' of south latitude, and 25° 25' of west longitude, counted from the meridian of Paris. The latter found the same equator in Peru at 7° 1' of south latitude, and 80° 41' of west longitude, also reckoning from the same meridian. These data are sufficient

Theory. cient to calculate the position of the magnetic equator, supposing it to be a great circle of the terrestrial sphere; an hypothesis which appears to be conformable to observations. The inclination of this plane to the terrestrial equator is thus found to be equal to $10^{\circ} 58' 56''$, and its occidental node on that equator is at $120^{\circ} 2' 5''$ west from Paris, which places it a little beyond the continent of America, near the Gallipagos, in the South sea; the other node is at $59^{\circ} 57' 55''$ to the east of Paris, which places it in the Indian seas (D).

“ We do not give this determination as rigorously exact; some corrections might no doubt be made to it, had we a greater number of observations equally precise; but we are of opinion that these corrections would be very small, and it will be seen afterwards that, independently of the confidence which the two observations we have employed deserve, we have other reasons for entertaining this opinion (E).

“ It is very remarkable that this determination of the magnetic equator agrees almost perfectly with that given long ago by Wilke and Lemounier. The latter in particular, who for want of direct observations had discussed a great number of corresponding observations, indicates the magnetic equator in Peru towards $7^{\circ} 20'$ of south latitude, and M. Humboldt found it in the same place at $7^{\circ} 1'$; besides, Lemounier's chart, as well as that of M. Wilke, indicates for the inclination of the magnetic meridian about 11° , and they place the node about 140° of west longitude, reckoned from the meridian of Paris.

“ Can it be by chance, then, that these elements, found more than 40 years ago, should accord so well with ours founded on recent observations? or does the inclination of the magnetic equator experience only very small variations, while all the other symptoms of terrestrial magnetism change so rapidly? We should

Theory. not be far from admitting the latter opinion, when we consider that the inclination of the magnetic needle has changed at Paris 3° in 60 years since it has been observed; and that at London, according to the observations of Mr Graham, it has not changed 2° in 200 years, while the declination has varied more than 20° in the same interval, and has passed from east to west: but on the other hand the observation of the inclination is so difficult to be made with exactness, and it is so short a time since the art of measuring it with precision was known, that it is perhaps more prudent to abstain from any premature opinion on phenomena, the cause of which is totally unknown to us.”

To employ the other observations of M. Humboldt in regard to the inclination, the terrestrial latitudes and longitudes reckoned from the magnetic equator were first reduced. The latter, being reckoned from the node of that equator in the South sea, M. Biot first perceived by these calculations that the position of that plane determined by preceding researches was pretty exact; for some of the places, such as Santa-Fé and Javita, where M. Humboldt observed inclinations almost equal, were found nearly on the magnetic parallel, though distant from each other more than 60° of longitude.

When these reductions were made, M. Biot endeavoured to represent the signs of the inclinations observed, and to leave as little to chance as possible. He first tried a mathematical hypothesis conformable enough to the idea which has hitherto been entertained in regard to terrestrial magnetism.

He supposed in the axis of the magnetic equator, and at an equal distance from the centre of the earth, two centres of attractive forces, the one austral and the other boreal, in such a manner as to represent the two opposite magnetic poles of the earth. He then calculated the effect which ought to result from the action of

(D) To calculate this position, let NEE' (fig. 29.) be the terrestrial equator; NHL the magnetic equator, supposed also to be a great circle, and HL the two points of that equator, observed by Messrs Humboldt and La Perouse. The latitudes HE, LE', and the arc EE', which is the difference of longitude of these two points, is known; consequently, if we suppose HE=b, LE'=b', EE'=v, EN=x, and the angle ENH=y, we shall have two spherical triangles NEH, NE'L, which will give the two following equations:

$$\sin. x = \frac{\text{tang. } b \text{ cot. } y}{R} \quad \sin. (x+v) = \frac{\text{tang. } b' \text{ cot. } y}{R}$$

from which we deduce

$$\sin. \frac{(x+v)}{\sin. x} = \frac{\text{tang. } b'}{\text{tang. } b}$$

and developing

$$\cot. x = \frac{\text{tang. } b \sin. v}{\text{tang. } b} - \frac{\cos. v}{\sin. v}$$

Let us now take an auxiliary angle ϕ , so that we may have

$$\text{tang. } \phi = \frac{\text{tang. } b \sin. v}{\text{tang. } b}, \text{ and we shall have}$$

$$\text{tang. } x = \frac{\sin. v \sin. \phi}{\sin. (v-\phi)}$$

By these equations we may find x , and then y , by any of the first two.

(E) La Perouse, after having doubled Cape Horn, fell in a second time with the magnetic equator in $18'$ north latitude, and $119^{\circ} 7'$ of longitude west from Paris. He was therefore very near the node of the magnetic equator, such as we have deduced it from observations. This fact establishes in a positive manner two important consequences: First, that the preceding determinations require only very slight corrections; and the second, that the magnetic equator is really a great circle of the earth, if not exactly, at least very nearly.

Theory. of these centres in any point of the surface of the earth, making their attractive force reciprocally vary as the square of the distance; and in this manner he obtained the direction of the result of their forces, which ought to be that also of the magnetic needle in that latitude.

Fig. 30.

He supposes that the point B (fig. 30.) is the north magnetic pole of the earth, and that the point A is the south magnetic pole; he supposes also that there is in the point M, at the surface of the earth, a molecule of the austral fluid which is attracted by B and repelled by A in the inverse ratio of the square of the distance; and he requires what will be the direction of the power resulting from these two forces acting on that molecule. It is evident that this direction will be that also which would be assumed in the point M by the needle of a compass freely suspended; for, in consequence of the smallness of the needle in comparison of the radius of the earth, the lines drawn from its points to one centre, B or A, may be considered as parallel, especially if the points A and B are near the centre of the earth, which is the case with nature, as may be seen.

He first supposes that the earth has a spherical figure, and that the two poles A and B are equal in force, and he then examines how far the latter supposition agrees with the results observed.

Let AM then = D', BM = D, CP = x, PM = y, the angle MCP = u, CA = CB = a. He then makes a = Kr; r being = the radius of the earth, and K a constant but indeterminate quantity.

Let X, Y, also be the forces which attract M in the direction of the axes of the co-ordinates, and β the angle which the resulting force makes with the axis ABC.

$$\text{tang. } \beta = \frac{\sin. u}{\cos. u - K \left(\frac{D'^3 + D^3}{D'^3 - D^3} \right)},$$

$$K \left(\frac{D'^3 + D^3}{D'^3 - D^3} \right) = \frac{(I + 2K \cos. u + K^2)^{\frac{1}{2}} + (I - 2K \cos. u + K^2)^{\frac{1}{2}}}{(I + 2K \cos. u + K^2)^{\frac{1}{2}} - (I - 2K \cos. u + K^2)^{\frac{1}{2}}} K.$$

These equations determine the direction of the magnetic needle in regard to each point M, the distance of which from the magnetic equator is known; but it is seen that this direction depends on the quantity K, which represents the distance of the magnetic centres from the centre of the earth; this distance being expressed in parts of the terrestrial radius, we must therefore first determine this quantity from observations.

To do it in the manner of approximation, and thus acquire a first idea of the value of K, M. Biot chose an observation made by M. Humboldt at Carichana in 6° 34' 5" of north latitude counted from the terrestrial equator, and 70° 18' west longitude reckoned from the meridian of Paris, which gives 14° 52' 25" of longitude counted from the magnetic equator, and 48° 51' 53" of west longitude, proceeding from the node formed by that equator with the equator of the earth. The inclination of the magnetic needle was observed in that place by M. Humboldt in the month of Messidor, year 8, and found to be equal to 33.78° of the centigrade division. A comparison of this result with the other observations of M. Humboldt, shews that it may indeed be considered as agreeing to that latitude.

He then gives the following equations, in which F is the magnetic force, at a distance equal to unity.

Theory.

$$x = \frac{F}{D^2} \cos. \text{MBD} - \frac{F}{D'^2} \cos. \text{MAD};$$

$$D^2 = y^2 + (x+a)^2 = r^2 + 2 \text{axis} \cdot x + a^2,$$

$$Y = \frac{F}{D^2} \sin. \text{MBD} - \frac{F}{D'^2} \sin. \text{MAD};$$

$D^2 = y^2 + (x-a)^2 = r^2 - 2 \text{axis} \cdot x + a^2$, or, by putting for the cosines their values:

$$X = \frac{F(x-a)}{D^2} - \frac{F(x+a)}{D'^2}$$

$$Y = \frac{Fy}{D^2} - \frac{Fy}{D'^2}$$

and as we have

$$\text{tang. } \beta = \frac{Y}{X},$$

we shall have also

$$\frac{Y}{D^2} - \frac{Y}{D'^2}$$

$$\text{tang. } \beta = \frac{x-a}{D^2} - \frac{x+a}{D'^2} = \frac{y(D'^3 - D^3)}{(D'^3 - D^3) - a(D'^2 + D^2)};$$

and by putting for x, y and a, their values, cos. u : r sin. u, Kr;

$$\text{tang. } \beta = \frac{\sin. u}{\cos. u - K \left(\frac{D'^3 + D^3}{D'^3 - D^3} \right)},$$

$$D^2 = r^2(I + 2K \cos. u + K^2);$$

$$D'^2 = r^2(I - 2K \cos. u + K^2);$$

which gives the system of the two equations,

To make use of it, M. Biot successively gave to K different values in the formula; he calculated the inclinations resulting from that latitude; and comparing these results with that which M. Humboldt really observed, the progress of the errors naturally led him to the most proper supposition. The following is a table of these trials.

Values of K.	Inclinations of the Needle.	Errors.
K=1	7.73°	26.04
K=0.6	18.80	14.97
K=0.5	22.04	11.73
K=0.2	29.38	4.39
K=0.1	30.64	3.13
K=0.01	31.04	2.73
K=0.001	31.07	2.7

The first value of K would place the centre of the magnetic forces at the surface of the earth and the poles of the magnetic equator. It is seen that this supposition cannot be admitted, because it would give an increase of inclination much less rapid than that indicated by observations. The case is the same with the following

Theory. following results, which place the centres of action on the terrestrial radius at different distances from the centre of the earth; but it is seen also in general, that they approach more and more to the truth in proportion as this distance becomes less; which evidently shews that the two centres of action of the magnetic forces are situated near the centre of the earth. All the other observations of M. Humboldt would also lead to the same consequence.

The most proper supposition would be to make K null, or so small that it would be needless to pay attention to it; which amounts to the same thing as to consider the two centres of action placed, as we may say, in the same molecula. The result, indeed, obtained in this manner is the most exact of all; it is = 31.0843°; this value is still a little less than that which M. Humboldt observed, and the difference is = 2.69; but it must be considered also that the formula from which we derive these values supposes the position of the magnetic equator is perfectly determined; but it may not be so with the utmost exactness, according to the two only observations of La Perouse and Humboldt, which we have employed. It is therefore by studying the progress of the formula, and comparing it with the observations, that we are able to appreciate it justly; after which we may think of remedying the small errors with which it may be accompanied.

To obtain the result here mentioned, and which is, as it were, the limit of all those which may be obtained by giving to K different values, it is to be remarked that the quantity.

$$K \left(\frac{D^3 + D^3}{D^3 - D^3} \right),$$

or,

$$K \frac{(I + 2K \cos. u + K^2)^{\frac{1}{2}} + (I - 2K \cos. u + K^2)^{\frac{1}{2}}}{(I + 2K \cos. u + K^2)^{\frac{1}{2}} - (I - 2K \cos. u + K^2)^{\frac{1}{2}}}$$

becomes $\frac{0}{0}$ when K is null; but by applying to it the methods of known quantities, it will be found that its value in this supposition is really determinate and = $\frac{I}{3 \cos. u}$. By substituting this in the formula we shall have

$$\text{tang. } \beta = \frac{\sin. u}{\cos. u - \frac{I}{3 \cos. u}}$$

an equation which may be reduced to this form:

$$\text{tang. } \beta = \frac{\sin. u}{\cos. 2u + \frac{I}{3}}$$

which will easily give the value of β ; and when this value is known, we shall have the inclination I, by the following formula:

$$I = 100 + u - \beta,$$

which will serve throughout the whole extent of the two hemispheres.

From the progress thus traced out, it is seen that the preceding formula is not merely an empiric construction of observations; on the contrary, it is totally independent, and only supposes the inclination of the

magnetic needle to be produced by a magnet infinitely small, placed in the centre of the terrestrial surface; but by calculating from this formula the inclination for the different latitudes, M. Biot found precisely the same numbers as M. Humboldt observed either in Europe or America; and it is not his observations only that are represented in this manner; but those which have been made in Russia, and at Kola in Lapland, during the last transit of Venus, are also comprehended under the same law.

It is seen that the results of the formula deviate very little from the observations; but these differences may be rendered still smaller. By examining, indeed, the progress of the errors, it is seen that the numbers given by calculation are a little too small in America for the low latitudes, and a little too great for the high latitudes, which shews that the whole may be allowed, with some slight modifications, either by changing, however little, the node and inclination of the magnetic equator, which two observations cannot determine with the utmost exactness, or by displacing ever so little our small magnet, leaving, however, its centre in the plane of the magnetic equator, and placing it in such a manner that it shall be a little nearer America than Europe. It is by these observations themselves, when we shall have a greater number, that we must be guided in these small corrections.

In a word, it must not be expected that we can represent in a rigorous manner, by a mathematical law, all the inclinations observed; for the phenomenon of the inclination, though more regular than the other magnetic effects, is not free from some anomalies; this may be easily seen on constructing the curve given by the observations themselves. Thus, for example, the inclination observed at Popayan is 0° 10' greater than at St Carlos del Rio Negro, though the magnetic latitude of the latter is 3° 7' greater. The case is the same with observations made at Javita and Santa Fé. Other anomalies are discovered in the comparative progress of the observations and formula. This is the case in regard to Carichana, St Thomas de la Guyane, and Carthagena. The increase of the inclination from the first to the second of these points is by no means in harmony with the increase from the second to the third; and if we compare together the intensities observed in these different places, the anomalies they exhibit announce in some measure those which the inclination ought to experience.

The cause of these anomalies becomes evident from what has been already remarked; they are merely the effect of local circumstances, and arise from the small systems of attraction by which the general phenomena are modified. This must be sensible in particular for that part of America which M. Humboldt travelled over, and which is traversed throughout its whole length by the grand chain of the cordillera of the Andes. It is also in these places that the most considerable differences exist. Popayan, for example, is situated near the volcanoes of Sotara and Pourace; it is joined to basaltic mountains abounding with magnetic iron. Near Sulumito, to the east of Popayan, these basaltic columns have very striking poles: in like manner Mexico is situated at the height of 1160 toises on the ridge of the grand cordillera of Lenschtitlan; the ground there is covered with porous basaltes and amygdaloids,

Theory. daloids, which are almost all charged with magnetic iron. Must not all these causes have a sensible influence on the inclination of the magnetic needle; and must not the different dispositions of the ferruginous masses, or their change of state, in consequence of the action of nature, produce also variations? M. Humboldt made on this point a decisive observation: the earthquake of the 4th November 1799 changed at Cumana the inclination of the needle. On the 1st of November it was $43^{\circ} 65'$; on the 7th it was only $42^{\circ} 75'$, and ten months after it returned to $42^{\circ} 85'$, but it did not regain its former value; the intensity of the magnetic force was not changed by the effect of this earthquake.

It is proved, then, by these observations, that local circumstances may have on the inclination a sensible influence; and this influence is remarked in the countries traversed by M. Humboldt.

It appears, therefore, that the mathematical hypothesis which we have employed really expresses the law of nature, at least to the north of the magnetic equator; for, though the first results observed towards the south seem to bend to it also, the uncertainty under which we are, in regard to the true cause of these phenomena, must stop our conjectures, and prevent us from extending too far the consequences of the laws which we observe (F).

From the preceding results, we may calculate the points where the axis of the magnetic equator pierces the terrestrial surface; for their latitudes are equal to the complements of the obliquity of that equator, and their meridian is at 100° of longitude from its nodes. The north magnetic pole is found also at $79^{\circ} 1' 4''$ of north latitude, and at $30^{\circ} 2' 5''$ of longitude west from Paris, which places it to the north of America. The other magnetic pole, symmetric to the preceding, is situated in the same latitude south, and at $149^{\circ} 67' 55''$ of longitude east from Paris, which places it amidst the eternal ice; indications entirely analogous to those of Wilke and Lemoumier.

If we could reach these poles, the compass would be seen vertical; but if any confidence can be placed in the law which we have discovered, this would be the only difference which would be observed in regard to the inclination, and we should be still as far distant as in Europe from the real centres which produce it. This result might appear to be of such a nature as to diminish the interest one might have in visiting these horrid regions, had we not also the hope of discovering there new phenomena in regard to the intensity of the magnetic force, and the influence of meteors.

These consequences do not entirely accord with the opinion pretty generally received, and which ascribes

Theory. the increase of the magnetic effects towards the north to the great quantity of iron dispersed throughout these regions; but it appears to us that this opinion is not agreeable to the truth. The cordillera of the Andes contains an enormous quantity of magnetic iron; the native iron of Chaco, that problematic mass analogous to that of Pallas, and those of Xacatares in Mexico, is found even under the tropics.

On seeing the inclinations of the compass so exactly represented in the hypothesis, they endeavoured to discover whether it could be applied to the intensities observed by M. Humboldt; but they found that it did not apply. It gives indeed, an increase of the magnetic forces from the equator to the pole; but this increase, which at first is too slow, becomes afterwards too rapid. M. Biot has not yet been able to try whether the small displacement of the terrestrial magnet will contribute towards representing them better; but it must be remarked, that the series of the intensities is extremely whimsical, and contains an infinite number of anomalies, so that local phenomena may have on this phenomenon a much more sensible influence than on the inclination.

On reviewing the results which have been given, it is seen that we have first determined the position of the magnetic equator by direct observations, which had never been done before; we have then proved that the magnetic force increases in proceeding from that equator to the poles; in the last place, we have given a mathematical hypothesis, which, when reduced to a formula, satisfies all the inclinations hitherto observed.

Supposing, as has been done in this formula, the small corrections of which it is susceptible, its utility becomes evident, either for making known, in the course of time, the variations which may take place in the action of the terrestrial magnetism, or to ascertain or even foresee the value of the inclination, which in a great many cases is of the utmost importance.

For example, near the magnetic equator, the increase or diminution of the inclination will indicate to a vessel on a voyage whether she has gained or lost in latitude by currents. This knowledge of the latitude is sometimes as important as that of longitude. On the coasts of Peru, for example, the currents tend from Chiloe to the north and north-east with such force, that one may go from Lima to Guayaquil in three or four days, and two, three, and sometimes five months are necessary to return. It is consequently of the greatest importance for vessels coming from Chili which stretch along the coast of Peru, to know their latitude. If they go beyond the port to which they are bound, they must work to the southward, and every day's progress requires often a month of return. Unfortunately, the fogs which prevail during four or five months on the coast of Peru, prevent

(F) Observations made at the Cape of Good Hope, Cape Horn, and New Holland, by different navigators, are very exactly represented by the above-mentioned formula; and it follows, that it extends also to the austral hemisphere. We hope soon to have numerous and very exact observations on the inclination of the needle in that part of the earth. But we have thought it our duty to add to our table such results as relate to it, and which we have been able to procure. We have inserted also two observations on the intensity, made with great care by M. Rossel, during the expedition of d'Entrecasteaux, which are very important, as they prove that the terrestrial magnetic force increases also in the austral hemisphere in proportion as one removes from the equator.

Theory. prevent navigators from distinguishing the form of the coast; nothing is seen but the summits of the Andes, and that of the peaks which rise above that stratum of vapours; but the figure of it is so uniform that pilots fall into mistakes. They often remain 12 or 15 days without seeing the sun or stars, and during that interval they come to anchor, being afraid of overshooting their port; but if we suppose that the inclination of the magnetic needle in the ports to the south of Lima is known, for example at Chancay, Huaura, and Santa, the dipping needle will show whether it be, in regard to Lima, to the south or to the north. It will show at the same time opposite what point of the coast a vessel is; and this indication will be attended with more exactness than one could hope for, because in these seas the inclination varies with extraordinary rapidity. M. Humboldt, to whom we are indebted for these remarks, observed in these seas the following values.

Places.	South Latitudes.	Inclinations.
Huancey	10° 4'	6.80°
Huaura	11 3	9.00
Chancay	11 33	10.35

These observations prove that the error of three or four degrees in the inclination in these seas would produce but a degree of error in latitude; and, on account of the tranquillity of the Pacific ocean, the inclination may be observed to within a degree nearly. Frequent instances of such results may be seen in books of voyages. In like manner, if one knew exactly the inclination at the mouth of the Rio de la Plata, it would be very useful to navigators, who, when the Pamperos blow, remain 15 or 18 days without seeing the heavenly bodies, and go on different tacks for fear of losing the parallel of the mouth of that river.

In a word, the inclination may indicate also the longitude in these seas; and this method may be employed when others fail. A vessel which sails there in the direction of a parallel could not find its longitude either by a chronometer or the declination of Halley, unless a star could be seen, in order to take a horary angle or the magnetic azimuth. The dipping needle then throws light on the longitude amidst the thickest fogs. We point out this method as one of those which have only a local application; but hitherto little attention has been paid to it. These ideas may be extended and rectified by able navigators.

In general, if the inclination of the needle, and the law we have tried to establish, could be depended on, to observe the inclination and the terrestrial latitude would also be sufficient to determine the longitude; but we have not yet examined the extent of the errors of which this method may be susceptible, and consequently we confine ourselves to a mere indication of it.

The phenomenon of the inclination has in maritime observations a peculiar and very remarkable advantage, namely, that of not being subject to those great progressive variations which affect the declination. Without repeating what we have already said above on the supposed constancy of this phenomenon, it may be remarked that our formula even affords a new proof that it may comprehend in the same law the observations made many years ago in Lapland, those which Lacaille brought back in 1751 from the Cape of Good Hope,

VOL. XII. Part I.

and those which M. Humboldt has lately made in America.

In short, when we tried to represent the inclinations in different latitudes by the supposition of a magnet infinitely small, very near the centre of the earth, and perpendicular to the magnetic equator, we did not pretend to consider that hypothesis as any thing real, but only as a mathematical abstraction useful to connect the results, and proper to ascertain in future whether any changes exist. In regard to the declination and intensity, we freely confess that we are entirely unacquainted with their laws or their causes; and if any philosopher is so fortunate as to bring them to one principle, which explains at the same time the variations of the inclination, it will no doubt be one of the greatest discoveries ever made. But this research, exceedingly difficult, requires, perhaps, before it be attempted, more observations, and in particular more precise observations, than have hitherto been collected. For this reason we have presented the preceding researches, imperfect as they are, hoping our readers will receive them with indulgence*.

We would willingly have entered into a more full illustration of the theory of Æpinus, and compared it with the phenomena noticed in CHAP. II. but the important paper just given has taken up so much room, that this article is already extended to very nearly the utmost limits assigned to it. We must, therefore, content ourselves with giving some idea of the induction of magnetism by juxtaposition according to Æpinus's hypothesis, and must refer for the rest to his *Tentamen Theoriæ Electricitatis et Magnetismi*, or to the abridgement of it in Van Swinden's work *Sur l'Analogie de l'Electricité et du Magnetisme*, tom. ii.

Let NAS (fig. 31). be a magnet, of which the part next the north pole AN is overcharged, and let a bar of iron s B n be brought near the north pole of the magnet, so that their axes are in the same straight line. Now, in this theory, the overcharged pole N acts on the iron only by its redundant fluid, for that part of the fluid which is merely sufficient to saturate the iron will repel the fluid in B as much as the iron in AN attracts it, and of course can produce no change in B. In the same way SA acts on B merely by its redundant iron. Now, were the fluid in s B n immovable, no sensible effect would be produced on it; but as it is supposed to be easily moveable, the redundant fluid in AN will have the effect of repelling it towards n, till the resistance met with there, added to its own tendency to diffuse itself uniformly, just balances the repulsion of AN. In the mean time, however, an attraction exists between the redundant iron in AS, and the fluid in B, by which the latter would be drawn from B n, and condensed in B s, the attraction opposing the repulsion above mentioned; but since AS is more distant from every point of B than AN from the same point, the redundant fluid will prevail, and on the whole the fluid will be condensed towards n, and rarefied towards s. The more diffused we suppose the fluid and iron in the magnet to be, the more removed will be the centres of effort of its poles from their extremities, the smaller will be the action, and the difference of action of AN and AS, and of course the smaller the condensation towards n, and the rarefaction towards s. From this we learn,

3 D

that,

Theory.

* Phil. Mag. vol. xxii.

101

102

by juxtaposition explained. Fig. 31.

Theory. that, according as the poles of a magnet are more counteracted, the greater will be its power of action; and as this is agreeable to observation, it gives additional credit to the hypothesis.

Now, we see that the piece of iron nBs is attracted in consequence of its fluid being repelled towards its remote extremity, and distributed something like the fluid in *NAS*. In this hypothesis magnetism is supposed to depend entirely on the diffusion of magnetic fluid. The iron *B* has become a magnet, and by having magnetism induced on it, is attracted by the magnet *A*. In a similar way we might explain the action of the magnet, if its south or deficient pole were presented opposite to *B*.

103
Coulomb's
theory.

When the notion of a magnetic fluid was once entertained, it is not surprising that philosophers, reasoning from the analogy between electricity and magnetism, and the different effects arising from the south and north pole of a magnet, should be led to the idea of the magnetic fluid being compounded of two fluids. Accordingly the hypothesis of two magnetic fluids has long been a favourite on the continent, where it has been chiefly supported by Coulomb and Haüy. As the experiments and observations of the former philosopher entitle him to the highest respect, we shall here give a sketch of his theory of magnetism.

1. Coulomb admits of two magnetic fluids, one of which may be called the northern, and the other the southern fluid.

2. The particles of each of these two fluids are mutually repulsive of each other; that is, the particles of the fluid *N* mutually repel each other, and the particles of the fluid *S* repel each other.

3. There is a mutual attraction between the particles of one of these fluids and the particles of the other; or the particles of the fluid *N* attract and are attracted by the particles of the fluid *S*.

4. In the ordinary state of iron not magnetized, these two fluids are found mixed together, and hence a piece of ordinary iron under the usual circumstances exhibits no signs of magnetism.

5. In a magnetized body these two fluids are separated, and this separation takes place as soon as we begin to magnetize the body; one of the fluids *N*, retiring towards one extremity, and the other fluid *S* to the other extremity of the magnetized body.

6. The attraction and repulsion of two magnetic bodies, when they approach each other, is the result of the mutual action of the two fluids.

Suppose we have two needles *A* and *B*. If we make them approach each other on the side of the two poles of the same name, *N* or *S*, they will repel each other; but if they are made to approach on the side of different poles, as when the needle *A* presents its north pole to the south pole of the needle *B*, they will attract each other. Here there are four forces in action; 1. the fluid *N* of the needle *A* repels the fluid *N* of the needle *B*. 2. The same fluid *N* of the needle *A* attracts the fluid *S* of the needle *B*. 3. The fluid *S* of the needle *A* repels the fluid *S* of the needle *B*; and, 4. The fluid *S* of the needle *A* attracts the fluid *N* of the needle *B*. Now, if the extremity *N* of the needle *A* be very near the extremity *S* of the needle *B*, the mutual attraction between the two fluids *N* and *S*, will be stronger than the mutual repulsion between the two

fluids *N*, *N*, and the two fluids *S*, *S*, and consequently the two needles will approach each other. **Theory.**

7. The attraction and repulsion of the two magnetic fluids is in the direct ratio of the masses, and in the inverse ratio of the distances.

This important part of the theory Coulomb deduces from a series of very delicate experiments made with his magnetic bars, similar to those by which he proved the same law to take place with respect to the action of the electric fluid. See *ELECTRICITY*, Part IV. chap. ii.

8. The magnetic fluid is entirely in the interior of magnetic bodies, for as the magnetic fluid moves with difficulty in the interior of a magnetic body, it cannot diffuse itself over the surface, which is the reason why filings of iron brought near a magnetic bar, remain attached to it.

9. Consequently magnetic bodies can have no magnetic atmosphere.

10. In a magnetic needle, the centres of magnetic action are near the extremities of the needle.

11. A magnetic needle being broken in any place, each of its parts is found to have two poles.

12. The forces which attract a needle towards one pole, are equal to those which draw it toward the other pole.

13. Magnetic bodies do not act on other bodies susceptible of magnetism, in any other way than by attraction or repulsion; for the magnetic fluid remains entirely within the interior of these bodies.

14. Magnetic attraction ought to be regarded as a particular power, analogous, however, to the power which we call universal gravitation, the only difference being, that gravitation acts very sensibly on all bodies, whereas magnetism acts most powerfully on iron.

15. This magnetic power or attraction is therefore a particular power produced neither by impulsion, nor by the action of any other fluid.

Though the instrument which is usually employed to measure the inclination of the magnetic needle is very simple in its construction, it is nevertheless liable to great errors, which in general arise from the almost absolute impossibility of placing the needle in all the positions it can take in equilibrium with regard to the effect of gravitation, that is to say, so that its centre of gravity may always exactly agree with the point on which it turns. When the dimensions are considerable, a new inconvenience arises from a degree of flexure, which, though scarcely sensible, is nevertheless productive of very great effects, from the slightest displacement of the centre of gravity producing a combination of the power of gravitation with that of magnetism.

To obviate these difficulties, Citizen Coulomb, instead of endeavouring to ascertain immediately, as has been hitherto done, the direction of the magnetic needle in the vertical plane which passes through the magnetical pole, conceives the force of this pole to be decomposed or resolved into two others in the same plane, the one acting in a horizontal, and the other in a vertical direction. He determines separately the intensity of each of these last forces, and the result gives the direction in which the magnetic force acts, and which a needle governed singly by this force would take.

Citizen

Theory.

Citizen Coulomb has proved, in the Memoirs of the Academy of Sciences for the year 1789, that the magnetic needle suspended by its centre of gravity is incessantly brought back to its true direction by a constant force at the same place and time. It thence follows, that by observing the number of oscillations made in a given time by a needle horizontally suspended, the ratio of the horizontal component part of the magnetic power with gravity may be obtained. As to the vertical component part, it is measured by determining with care the weight necessary to be added to the southern part of the magnetic needle, to maintain it in a perfectly horizontal position. That being done, if A and B represent the respective measures of the horizontal and

vertical component parts of the magnetic power, $\frac{B}{A}$ will

be the tangent of the angle made by their result with the horizontal force, and, consequently, it will be the inclination of the magnetic needle.

In the experiments made by Citizen Coulomb, the needle had the form of a right-angled parallelepipedon, very thin in proportion to its breadth, and always suspended so that its breadth was kept in a vertical plane. Let P represent the weight of the needle, l the half of its length, λ the length of a pendulum that performs its oscillations in the same time as the needle when it obeys the magnetic power in a horizontal plane. Cou-

lomb then gives the formula $\frac{P l^2}{3 \lambda}$ to calculate the momentum of the magnetic force referred to the arm of a lever of one millimetre in length. The length of the needle was 427 millimetres, its breadth 13, and its weight 88,753 milligrammes. It was suspended horizontally by a thread of silk in a box well closed, and it made 30 oscillations in 286 seconds, and by applying these data to the preceding formula, Coulomb found that the logarithm of the momentum of the horizontal magnetic force is 4.1740.

Coulomb having placed his needle in a clip, having knife edges, which rested on two cylinders of glass, in the manner of the beam of a balance, endeavoured first to bring it to an equilibrium in a horizontal situation, coinciding with the magnetic meridian, by placing the edges in a proper manner, and when they were sufficiently near the point where the equilibrium took place, he completed it by the addition of small weights. He then reversed the poles of the needle by the magnetic touch, but without altering the position of the clip, and again bringing it to an equilibrium in this new state, the sum of the momenta of the additional weights placed in these two operations gave him the double of the momentum of the vertical component parts of the magnetic force, valued at $\frac{74467}{2}$. The result of this

force, and of the horizontal force, is inclined 68° 9'.

In repeating these operations three times, Coulomb found successively 68° 9', 68° 13', and 68° 11'. Though the differences of these results are very trifling, he thinks they are to be entirely attributed to errors in the observation; for he is assured they do not amount to so much. It is possible that the needle is subject to variations in the vertical similar to those which are known to take place in the horizontal plane.

Daniel Bernoulli contrived an ingenious dipping ^{Theory.} needle that may answer the purpose of an universal instrument for making accurate observations on the dip. It depends on the following principle. If a dipping ¹⁰⁵ needle be made by an ordinary workman, and balanced ^{Bernoulli's dipping needle.} with some care, so that when impregnated with magnetism, it may show nearly the true dip, and if it be touched, and the dip observed, then its magnetism destroyed, and its balance so altered, that without any magnetism it will take nearly the inclination of the true dip; and if it be then touched again, giving it the same polarity as it had before, it is evident that it will now approach very nearly to the true dip, since, by its want of perfect equilibrium, it was deranged only a few degrees from its proper direction. If the second observation of the dip should, from the inaccurate formation of the needle, differ considerably from the first, the operation must be repeated; and in this third observation there will very seldom be an error of more than half a degree.

Bernoulli's instrument is as follows. A very light graduated brass circle EFG (fig. 32.) is fixed on one ^{Fig. 32.} side of the dipping needle, so as to be concentric with its axis, and the whole is balanced with as much nicety as may be, before being impregnated. CD is a very light index fixed to the axis in such a manner as to turn on it with some difficulty. By this the equilibrium of the needle will be destroyed. If great care has been taken in forming the instrument, and if it has been balanced with great accuracy, it will, by the addition of the index, be made to settle so as to have the index perpendicular to the horizon, at whatever degree of the circle the needle may happen to point. As such accuracy, however, is scarcely to be expected, let the index be set to several different degrees of the circle, and note the inclination taken by the needle before being magnetized, corresponding to each position of the index, and let all these be written down. For example, let us suppose that when the index is at 50°, the needle inclines 46° from the horizon; if we observe at any place that the needle, after being magnetized, inclines 46°, when the index is at 50°, we may be sure that the former is the true magnetic dip at that place, as the needle is not deranged by the magnetism that has been given it, from the situation it would assume by gravity alone. We usually know something of the dip that may be expected at any place. If we set the index accordingly, and if the needle does not then point out the expected dip; change the position of the index, and again observe the dip; examine whether this second position of the index and the second dip form a corresponding pair of numbers, such as we have written down; if they do, we have got the true dip, but if not, another position of the index must be tried. Thus, by noticing whether the agreement of this last pair be greater or less than that of the former pair of numbers, we learn whether we are to change the position of the index in the same or in the opposite direction.

A close analogy has long been remarked between the ¹⁰⁶ phenomena of magnetism and those of induced electricity, especially those of attraction and repulsion. The mechanical composition of these actions produces a directive ^{Analogy between electricity and magnetism.} power and polarity, both in electrical and magnetical bodies. It is easy to form an electrical needle that will

Theory. arrange itself with respect to the overcharged and undercharged ends of a body electrified by position, just as a magnetic needle arranges itself with respect to the magnet. A stick of sealing wax may be touched in a manner similar to the double magnetic touch, so as to acquire poles of considerable force, and very durable. Again, melted sealing wax, when cooled in the neighbourhood of a positive and negative electric, acquires permanent poles, just as a red-hot steel bar acquires them by being quenched near a magnet. Lastly, lightning sometimes gives polarity to needles, sometimes destroys it, and sometimes reverses their polarity.

From these various circumstances of resemblance, some have supposed that both phenomena originate from the same cause, but there are several circumstances which show their original causes to be different. Thus, we find that electricity is common to all bodies, and can be excited or induced on all in a degree that is pretty nearly equal. Magnetism, on the contrary, though from Coulomb's experiments, it appears in some degree to affect all terrestrial bodies, acts, however, very imperceptibly on all but iron and its compounds. The action of lightning must not be considered as a proof of their identity, since that is accompanied with a great degree of heat, and we have already seen that this power, under favourable circumstances, is a very active agent, both in producing and destroying magnetism. Again, there is nothing in magnetism like a body being entirely overcharged, or entirely undercharged, as in electricity; but a magnetic body having two poles, must always be overcharged at one extremity, and undercharged at the other. There is nothing in magnetism resembling that inconceivably rapid motion which we see in electricity. In fine, the only perfect resemblance is between the induced magnetism of common iron, and the induced electricity of a conductor. On the arguments that have been employed for and against the identity of magnetism and electricity, our readers may consult Van Swinden, *Sur l'Analogie de l'Electricité et du Magnetisme*, and a tract by Æpinus *De Similitudine Electricitatis et Magnetismi*.

Some late experiments of Ritter tend to show a greater analogy than has yet been supposed, between magnetism and that modification of electricity which we call galvanism.

107
Ritter's experiments.

Mr Ritter's first experiments with the magnet were on frogs. He found that a magnetic iron wire, with another not magnetic, excited a galvanic palpitation in these animals. Presently he observed, that the south pole excited stronger palpitations, and the north pole weaker, than the iron not magnetic. Having constantly noticed, that the metals most susceptible of oxidation excited the strongest palpitations, he inferred, that the south pole possesses a greater affinity for oxygen than simple iron, and the north pole less.

This supposition he confirmed by means of several chemical re-agents. He placed a magnetic iron wire on pieces of glass in a plate of earthen ware, and poured upon it a very weak nitric acid. The south pole was attacked by the acid much more powerfully than the north; and was soon surrounded by a deposition of oxygen, the quantity of which greatly exceeded that of the other pole.

The different oxidability of the magnetic pole is very

well exhibited likewise, by taking three small Lottles of equal size, filled with water, either purely or slightly acidulated, and putting into one the south polar end of a magnetic wire, into a second the north polar end of a similar wire, and into the third the end of an equal wire not magnetic; the south pole will first begin to deposit oxide, the unmagnetic iron a little after, and the north pole last. This experiment requires considerable care. The surface of the water must be covered with very fresh oil of almonds, to exclude all access of air. Care must be taken too, that one of the bottles is not more exposed to the sun than the others, because light accelerates oxidation. Ritter convinced himself of this by direct experiments; exposing two iron wires in water to the sun, but covering one of the phials with black paper, when that in the phial left uncovered was oxidated much more quickly.

If infusion of litmus be substituted instead of the water in the three phials in the preceding experiment, the relative oxidations will be the same, but they will be attended with a change of colour, showing that an acid is produced proportional to each oxidation; so that the south pole not only undergoes the greatest oxidation, but likewise reddens the infusion of litmus most. The action that takes place in this experiment is very feeble, and frequently requires a week to produce a distinct effect; and indeed to accelerate it so much as this, it is necessary to add, previously to the infusion, as much acetic acid as will incline it to red, without completely changing its colour. The infusion reddened in this experiment resumes its blue colour on exposure to the air; but we must not hence conclude, that the acid produced by the action of the magnet is very volatile, for infusion of litmus reddened by phosphoric acid, or any other, exhibits the same phenomenon.

The following experiment exhibits some things peculiar, and therefore we shall give it more at large. It has not been repeated, but the harmony of its results is in favour of its accuracy. Sixteen magnetic wires, of equal size and power, were placed in six vessels, all equally full of a mixture of one part nitric acid, and 36 parts water, in the following manner: in the first glass were placed two wires, one with the north pole immersed in the fluid, the other with the south, and not more than half a line asunder: in the second, the same, but the wires an inch and three-fourths apart: in the third and fourth were each three wires, with the south poles of all immersed, but their distances in the two glasses different, as in the first and second: in the fifth and sixth were wires similarly arranged, but with the north poles immersed. Different quantities of oxide were gradually deposited, and to express the whole in few words, we will call the south pole S, the north pole N, their greater distance g, and their less p, and we will express the order of oxidations as follows: $SNg > SNp > 3Sp > 3Sg > 3Ng > 3Np$. On the nineteenth day it was observed, that the loss of fluid by evaporation had not been equal in all the vessels, but took place in the inverse order of the oxidations. All the magnetic wires were weakened in power; NSg least; NSp more: of the wires 3Sp, two had lost less power than the third; and in like manner 3Sg, 3Np, 3Ng, had each two left more powerful than the third; the strongest were equal to NSg.

Theory. In another experiment, where two little vessels filled with infusion of litmus were employed, one of them containing two magnetic wires, the south poles of which were immersed in the fluid; the other two similar wires, of which the opposite poles were immersed; the oxidation was greatest in the latter vessel.

The analogy between galvanism and magnetism is still farther proved by other experiments of Ritter on *galvanizing* metals, which he does by placing them in a stream of galvanic fluid proceeding from a strong pile. He found that a golden needle thus galvanized and balanced on a pivot, exhibited, like a magnetized iron needle, both directive power and horizontal inclination.

Some late experiments of Ritter, referring still more directly to the analogy between magnetism and galvanism, were communicated to the Royal Academy of Sciences of Munich, and the following are their general results.

1. Every magnet is equivalent to a pair of heterogeneous metals united together; its different poles represent as it were different metals.

2. Like them, it gives electricity; that is to say, one of the two poles, the positive electricity, and the other the negative.

3. By following the same process a certain number of magnets, as well as a certain number of pairs of metals, afforded electricity; and in this manner the electricities afforded by the poles of different magnets, have been successfully indicated by the electrometer.

4. By means of these electricities, one of these batteries of magnets, accordingly as it is more or less strong, produces upon dead and living bodies, all the

phenomena which are produced by a pile of Volta, of the common kind, and of the same force.

5. The experiments which prove this, show, that in magnetized iron, the south pole gives positive electricity, and the north pole negative electricity; but that on the contrary in magnetized steel, the north pole affords the positive, and the south pole the negative.

6. The same inverse disposition is also observed with regard to the polar oxidability of the magnetized body in which this change is produced by magnetism. In magnetized iron the south pole is most oxidable, and the north pole least; whereas in magnetized steel the north pole is most oxidable, and the south least.

7. Mr Ritter thinks, that by considering the earth as an immense magnet, these results might serve to explain various phenomena of nature, such as the physical difference between the two hemispheres, the aurora borealis and aurora australis. In fact, after what has been just stated, the earth considered as a magnet, may be taken as an equivalent to an immense pile of Volta, of which the poles are on one side sufficiently closed by the waters of the ocean. And the action of this pile must produce, and has produced the greatest chemical changes, in the materials of the earth; changes which must have differed according to the poles; and of which pile the poles at the other extremity have always such an abundance of electricity as to cause its splendour to appear by radiations in the vast spaces of the heavens*.

The foregoing experiments appear to prove that magnetism has some effect in producing chemical changes, and thence we may infer that perhaps it would not be altogether inactive in the animal economy.

Animal Magnetism.

Animal MAGNETISM, a sympathy supposed by some persons to exist between the magnet and the human body: by means of which the former, it was thought, possessed the property of curing many diseases.

The notion of animal magnetism appears to have originated in 1774, with a German philosopher named *Father Hehl*, who greatly recommended the use of the magnet in medicine. M. Mesmer, a physician of the

same country, by adopting the principles of Hehl, became the direct founder of the system; but afterwards deviating from the tenets of his instructor, he lost his patronage, as well as that of Dr Ingenhousz, which he had formerly enjoyed. Mesmer had already distinguished himself by "A dissertation on the influence of the Stars upon the human body," which he publicly defended in a thesis before the university of Vienna; but

Animal Magnetism.

Animal
Magnet-
ism.

he was so unable to stand before the opposition of Hebl and Ingenhousz, that his system fell almost instantly into disrepute. Mesmer appealed to the Academy of Sciences at Berlin; but they rejected his principles as destitute of foundation, and unworthy of the smallest attention. He then made a tour through Germany, publishing everywhere the great cures he performed by means of his animal magnetism, while his enemies everywhere pursued him with detections of the falsehood of his assertions.

Mesmer, still undaunted by so many defeats, returned to Vienna; but meeting there with no better success than before, he retired to Paris in the beginning of the year 1778. Here he met with a very different reception. He was first patronized by the author of the *Dictionnaire des Merveilles de la Nature*; in which work a great number of his cures were published, Mesmer himself receiving likewise an ample testimony of his candour and *solid reasoning*. Our physician soon collected some patients; and in the month of April 1778 retired with them to Creteil, from whence he in a short time returned with them perfectly cured. His success was now as great as his former disappointment. Patients increased so rapidly that the doctor was soon obliged to take in pupils to assist him in his operations. These pupils succeeded equally well as Mesmer himself; and so well did they take care of their own emolument, that one of them named M. Deslon realized upwards of 100,000l. sterling. In 1779 Mesmer published a memoir on the subject of Animal Magnetism, promising afterwards a complete work upon the same, which should make as great a revolution in philosophy as it had already done in medicine.

The new system now gained ground daily; and soon became so fashionable, that the jealousy of the faculty was roused, and an application concerning it was made to government. In consequence of this a committee was appointed to inquire into the matter, consisting partly of physicians and partly of members of the Royal Academy of Sciences, with Dr Benjamin Franklin at their head. This was a thunderstroke to the supporters of the new doctrine.—Mesmer himself refused to have any communication with the committee; but his most celebrated pupil Deslon was less scrupulous, and explained the principles of his art in the following manner:

1. Animal magnetism is an universal fluid, constituting an absolute plenum in nature, and the medium of all mutual influence between the celestial bodies, and betwixt the earth and animal bodies.

2. It is the most subtle fluid in nature; capable of a flux and reflux, and of receiving, propagating, and continuing all kinds of motion.

3. The animal body is subjected to the influences of this fluid by means of the nerves, which are immediately affected by it.

4. The human body has poles and other properties analogous to the magnet.

5. The action and virtue of animal magnetism may be communicated from one body to another, whether animate or inanimate.

6. It operates at a great distance without the intervention of any body.

7. It is increased and reflected by mirrors; commu-

nicated, propagated, and increased by sound; and may be accumulated, concentrated, and transported.

8. Notwithstanding the universality of this fluid, all animal bodies are not equally affected by it; on the other hand, there are some, though but few in number, the presence of which destroys all the effects of animal magnetism.

9. By means of this fluid nervous disorders are cured immediately, and others mediately; and its virtues, in short, extend to the universal cure and preservation of mankind.

From this extraordinary theory, Mesmer or M. Deslon, had fabricated a paper, in which he stated that there was in nature but one disease and one cure, and that this cure was animal magnetism: and, lastly, M. Deslon engaged, 1. To prove to the commissioners, that such a thing as animal magnetism existed; 2. To prove the utility of it in the cure of diseases; after which he was to communicate to them all that he knew upon the subject. The commissioners accordingly attended in the room where the patients underwent the magnetical operations. The apparatus consisted of a circular platform made of oak, and raised about a foot and a half from the ground; which platform was called the *baquet*. At the top of it were a number of holes, in which were iron rods with moveable joints for the purpose of applying them to any part of the body. The patients were placed in a circle round, each touching an iron rod, which he could apply to any part of the body at pleasure; they were joined to one another by a cord passing round their bodies, the design being to increase the effect by communication. In the corner of the room was a piano forte, on which some airs were played, occasionally accompanied with a song. Each of the patients held in his hand an iron rod ten or twelve feet long; the intention of which, as Deslon told the commissioners, was to concentrate the magnetism in its point, and thus to render its effects more sensible. Sound is another conductor of this magnetism; and in order to communicate the magnetism to the piano forte, nothing more is necessary than to bring the iron rod near it. Some magnetism is also furnished by the person who plays it; and this magnetism is transmitted to the patients by the sounds. The internal part of the platform was said to be so contrived as to concentrate the magnetism, and was the reservoir whence the virtue diffused itself among the patients. Its structure, however, is not mentioned; but the committee satisfied themselves, by means of a needle and electrometer, that neither common magnetism nor electricity was concerned.

Besides the different ways of receiving the magnetism already mentioned, viz. by the iron, cord, and piano forte, the patients also had it directly from the doctor's finger, and a rod which he held in his hand, and which he carried about the face, head, or such parts of the patient as were diseased; observing always the direction of what he called the poles. The principal application of magnetism, however, was by pressure of the hands or fingers on the hypochondria or lower regions of the stomach.

The effects of these operations upon Deslon's patients were very different. Some felt nothing, neither had the magnetism any effect whatever upon them.

Animal
Magnet-
ism.

Some spit, coughed, sweat, and felt, or pretended to feel, extraordinary heats in different parts of the body. Many women, but very few men, had convulsions, which Deslon called their crisis, &c.—The commissioners at last found that they could come to no satisfactory conclusion while they attended in this public way, and therefore determined to try the experiments themselves privately. As the fluid itself, however, was totally imperceptible by any of the senses, they could only ascertain themselves of its existence by ultimately curing diseases, or by its observable effects upon the human body. Being well assured, however, that though many diseases were cured, it would not amount to any proof of the existence of animal magnetism, they determined to observe its effects on the animal economy. For this purpose they made the following experiments :

1. They tried it upon themselves, and felt nothing.

2. Seven of Deslon's patients were magnetized at Dr Franklin's house, four of whom felt nothing ; three felt, or affected to feel, something.

3. Several persons in a higher sphere of life were magnetized, and felt nothing.

4. The commissioners, now determined to discover what share imagination had in this business, blindfolded several of the common people, and made them sometimes think that they were magnetized, at other times they magnetized them without letting them know that they did so : the consequence was, that when they supposed themselves magnetized, the patients likewise thought they felt something, and *vice versa*.

5. A magnetized tree was said to produce convulsions ; a young man, blindfolded, fell into convulsions when he imagined himself near the tree, though he was really at a considerable distance from it. Deslon accounted for this on the principle of all trees being magnetic : but in this case, every one, susceptible of magnetism, would be seized with convulsions when he approached a tree. The same influence of imagination was observed in a woman accustomed to have convulsions when magnetized. They came on when nothing was done to her, on being told, when blinded, that she was magnetized.

Other instances are given, from which it was evident, either that the patients were impostors, or in such a most wretched state of debility both of mind and body, that the most trifling effects of the former had the most powerful effects on the latter. The commissioners therefore entirely disapproved of the whole. The touch, imitation, and imagination, they concluded, were the great causes of the effects produced by M. Deslon's operations ; and by means of these they supposed, that convulsions, which in themselves are a very violent disorder, might be spread much farther than could be wished, even through a whole city. It was observed that the operator sometimes pressed strongly, and for a length of time, upon different parts of the body, particularly the hypochondria and pit of the stomach ; and it is well known that a strong pressure on these parts will produce disagreeable sensations in those who enjoy perfect health.

It is needless to add more upon this subject, than that Mesmer complained of the report of the commis-

sioners, petitioned parliament, was by them commanded to discover the mysteries of his doctrine ; and that it is now exploded by every man of sense.—The conclusion of the academicians concerning it was, that it is not entirely useless even to philosophy ; as it is one fact more to be consigned to the history of the errors and illusions of the human mind, and a signal instance of the power of imagination.

MAGNIFYING, the making of objects appear larger than they would otherwise do ; whence convex lenses, which have the power of doing this, are called *magnifying glasses*. See OPTICS.

MAGNITUDE, whatever is made up of parts locally extended, or that has several dimensions ; as a line, surface, solid, &c.

MAGNOLIA, the LAUREL-LEAVED TULIP TREE, a genus of plants belonging to the polyandria class ; and in the natural method ranking under the 52d order, *Coadunata*. See BOTANY Index.

MAGNUS CAMPUS, in *Ancient Geography*, a tract lying towards Scythopolis, or Bethsan in Galilee, beyond which it extends into Samaria ; Josephus placing the common boundary between these two districts in the Campus Magnus. Called also *Esdrelon*, (Judith) ; 30 miles long, and 18 broad ; having Samaria with Mount Ephraim to the south, the lake Genesareth to the east, Mount Carmel to the west, and Lebanon to the north.

MAGNUS Portus, in *Ancient Geography*, a port of the Belgæ, in Britain, on the Channcl. Now thought to be Portsmouth in Hampshire.—Another *Portus Magnus* of Bætica in Spain ; a port to the east of Abdera.

MAGO, the name of several Carthaginian generals. See CARTHAGE.

MAGO, in *Ancient Geography*, a citadel and town of the Balearis Minor, or Minorca. Now Maon, or Mahon. E. Long. 4. 6. N. Lat. 39. 5.

MAGONTIACUM, MOGONTIACUM, or *Mogontiacus*, truncated afterwards by the poets to Mogontia, Maguntia, and Moguntia : a town of Gallia Belgica. Now *Mentz*, capital of the electorate of that name ; situated at the confluence of the Rhine and Maine. E. Long. 8°. N. Lat. 50°.

MAGOPHONIA (formed from *μαγος*, "magus," and *φονος*, "slaughter"), the name of a feast among the ancient Persians, held in memory of the expulsion of the Magians. The Magian Smerdis having usurped the throne of Persia, upon the death of Cambyses, 521 years before Jesus Christ, seven of the principal lords of the court conspired to drive him out of it.—Their design was executed with good success. Smerdis and his brother, another Magian, called Patizithes, were killed. Upon which the people also arose, and put all the Magi to the sword, insomuch that there would not one have escaped, had not night come upon them. Darius, son of Hystaspes, was then elected king ; and, in memory of this massacre of the Magi, a feast was instituted, says Herodotus, called *Magophoniu*. See MAGI.

MAGPIE. See CORVUS, ORNITHOLOGY Index.

MAHIE, the name given by the inhabitants of Otaheite, or George's island, to their bread-fruit when made into a kind of sour paste, which, in consequence of having undergone a fermentation, will keep a considerable

Animal
Magnetism
||
Mahie.

Mahomet.

siderable time, and supply them with food when no ripe fruit is to be had. When therefore they see a great show of new fruit on the trees, they strip them all at once of their former crop, of which they make mahic. This *succedaneum* for ripe bread-fruit is thus made. They gather the fruit before it be perfectly ripe, and laying it in heaps, cover it closely with leaves. In this state it ferments, and becomes disagreeably sweet; the core is then taken out entire, and the rest of the fruit thrown into a hole in their houses, dug on purpose, and neatly lined in the bottom and sides with grass. The whole is then covered with leaves, and heavy stones are laid upon it. In this state it undergoes a second fermentation, and becomes sour; after which it will suffer no change for many months. It is taken out of this hole as it is wanted for use, and being made into balls, it is wrapped up in leaves and baked, and thus dressed it will keep for five or six weeks. It is eaten, both cold and hot, and the natives of those countries seldom make a meal without it; but to Captain Cook and his company the taste was as disagreeable as that of a pickled olive generally is the first time it is eaten.

MAHO. See HIBISCUS, BOTANY *Index*.

MAHOGANY. See SWIETENIA, BOTANY *Index*.

MAHOMET, or MOHAMMED, styled the *Impostor*, was born in the reign of Anushirwan the Just, emperor of Persia, about the end of the 6th century of the Christian era. He came into the world under some disadvantages. His father Abd'allah was a younger son of Abd'almotaleb; and dying very young, and in his father's lifetime, left his widow and infant son in very mean circumstances, his whole substance consisting but of five camels and one Ethiopian she-slave. Abd'almotaleb was, therefore, obliged to take care of his grandchild Mahomet; which he not only did during his life, but at his death enjoined his eldest son Abu-Taleb, who was brother to Abd'allah by the same mother to provide for him for the future; which he very affectionately did, and instructed him in the business of a merchant, which he followed; and to that end he took him into Syria when he was but 13. He afterwards recommended him to Khadijah, a noble and rich widow, for her factor; in whose service he behaved himself so well, that by making him her husband she soon raised him to an equality with the richest in Mecca.

After he began by this advantageous match to live at his ease, it was, that he formed the scheme of establishing a new religion, or, as he expressed it, of replanting the only true and ancient one professed by Adam, Noah, Abraham, Moses, Jesus, and all the prophets, by destroying the gross idolatry into which the generality of his countrymen had fallen, and weeding out the corruptions and superstitions which the latter Jews and Christians had, as he thought, introduced into their religion, and reducing it to its original purity, which consisted chiefly in the worship of one only God.

Before he made any attempt abroad, he rightly judged that it was necessary for him to begin with the conversion of his own household. Having therefore retired with his family, as he had done several times before, to a cave in Mount Hara, he there opened the secret of his mission to his wife Khadijah; and ac-

quainted her, that the angel Gabriel had just before appeared to him, and told him that he was appointed the apostle of God: he also repeated to her a passage which he pretended had been revealed to him by the ministry of the angel, with those other circumstances of this first appearance, which are related by the Mahometan writers. Khadijah received the news with great joy; swearing by him in whose hands her soul was, that she trusted he would be the prophet of his nation; and immediately communicated what she had heard to her cousin Warakab Ebn Nawfal, who, being a Christian, could write in the Hebrew character, and was tolerably well versed in the scriptures; and he as readily came into her opinion, assuring her that the same angel who had formerly appeared unto Moses was now sent to Mahomet. The first overture the prophet made was in the month of Ramadan, in the 40th year of his age, which is therefore usually called the year of his mission.

Encouraged by so good a beginning, he resolved to proceed, and try for some time what he could do by private persuasion, not daring to hazard the whole affair by exposing it too suddenly to the public. He soon made proselytes of those under his own roof, viz. his wife Khadijah, his servant Zeid Ebn Haretha, to whom he gave his freedom on that occasion, (which afterwards became a rule to his followers), and his cousin and pupil Ali, the son of Abu Taleb, though then very young: but this last, making no account of the other two, used to style himself the *first of believers*. The next person Mahomet applied to was Abd'allah Ebn Abi Kohafa, surnamed *Abu Becr*, a man of great authority among the Koreish, and one whose interest he well knew would be of great service to him; as it soon appeared: for Abu Becr, being gained over, prevailed also on Othman Ebn Affan, Abd'alraham Ebn Awf, Saad Ebn Abbi Wakkas, Al Zobeir Ebn al Awam, and Telha Ebn Obeid'allah, all principal men of Mecca, to follow his example. These men were the six chief companions, who, with a few more, were converted in the space of three years; at the end of which, Mahomet having, as he hoped, a sufficient interest to support him, made his mission no longer a secret, but gave out that God had commanded him to admonish his near relations; and in order to do it with more convenience and prospect of success, he directed Ali to prepare an entertainment, and invite the sons and descendants of Abd'almotaleb, intending then to open his mind to them. This was done, and about 40 of them came; but Abu Laheb, one of his uncles, making the company break up before Mahomet had an opportunity of speaking, obliged him to give them a second invitation the next day; and when they were come he made them the following speech: 'I know no man in all Arabia who can offer his kindred a more excellent thing than I now do you; I offer you happiness both in this life, and in that which is to come; God Almighty hath commanded me to call you unto him: Who, therefore, among you will be assistant to me herein, and become my brother and my viceregent?' All of them hesitating, and declining the matter, Ali at length rose up, and declared that he would be his assistant; and vehemently threatened those who should oppose him. Mahomet upon this embraced Ali with great demonstrations of affection, and desired all who

Mahomet.

Mahomet. were present to hearken to and obey him as his deputy; at which the company broke out into a great laughter, telling Abu Taleb that he must now pay obedience to his son.

This repulse, however, was so far from discouraging Mahomet, that he began to preach in public to the people; who heard him with some patience, till he came to upbraid them with the idolatry, obstinacy, and perverseness of themselves and their fathers: which so highly provoked them, that they declared themselves his enemies; and would soon have procured his ruin, had he not been protected by Abu Taleb. The chief of the Koreish warmly solicited this person to desert his nephew, making frequent remonstrances against the innovations he was attempting; which proving ineffectual, they at length threatened him with an open rupture, if he did not prevail on Mahomet to desist. At this Abu Taleb was so far moved, that he earnestly dissuaded his nephew from pursuing the affair any farther, representing the great danger he and his friends must otherwise run. But Mahomet was not to be intimidated; telling his uncle plainly, *that if they set the sun against him on his right hand, and the moon on his left, he would not leave his enterprise*: And Abu Taleb, seeing him so firmly resolved to proceed, used no further arguments, but promised to stand by him against all his enemies.

The Koreish, finding they could prevail neither by fair words or menaces, tried what they could do by force and ill treatment; using Mahomet's followers so very injuriously, that it was not safe for them to continue at Mecca any longer: whereupon Mahomet gave leave to such of them as had not friends to protect them to seek for refuge elsewhere. And accordingly in the fifth year of the prophet's mission, 16 of them, four of whom were women, fled into Ethiopia; and among them Othman Ebn Affan and his wife Rakhiah, Mahomet's daughter. This was the first flight; but afterwards several others followed them, retiring one after another, to the number of 83 men and 18 women, besides children. These refugees were kindly received by the Najashi, or king of Ethiopia; who refused to deliver them up to those whom the Koreish sent to demand them, and, as the Arab writers unanimously attest, even professed the Mahometan religion.

In the sixth year of his mission, Mahomet had the pleasure of seeing his party strengthened by the conversion of his uncle Hamza, a man of great valour and merit; and of Omar Ebn al Kattab, a person highly esteemed, and once a violent opposer of the prophet. As persecution generally advances rather than obstructs the spreading of a religion, Islamism made so great a progress among the Arab tribes, that the Koreish, to suppress it effectually if possible, in the seventh year of Mahomet's mission, made a solemn league or covenant against the Hashemites and the family of Abd'almotaleb, engaging themselves to contract no marriages with any of them, and to have no communication with them; and, to give it the greater sanction, reduced it into writing, and laid it up in the Caaba. Upon this the tribe became divided into two factions; and the family of Hashom all repaired to Abu Taleb, as their head: except only Abd'al Uzza, surnamed *Abu Lahab*, who, out of inveterate hatred to his nephew and

his doctrine, went over to the opposite party, whose Mahomet chief was Abu Sosian Ebn Harb, of the family of Ommeya.

The families continued thus at variance for three years; but in the tenth year of his mission, Mahomet told his uncle Abu Taleb, that God had manifestly showed his disapprobation of the league which the Koreish had made against them, by sending a worm to eat out every word of the instrument except the name of God. Of this accident Mahomet had probably some private notice: for Abu Taleb went immediately to the Koreish, and acquainted them with it; offering, if it proved false, to deliver his nephew up to them; but in case it were true, he insisted that they ought to lay aside their animosity, and annul the league they had made against the Hashemites. To this they acquiesced; and going to inspect the writing, to their great astonishment found it to be as Abu Taleb had said; and the league was thereupon declared void.

In the same year Abu Taleb died, at the age of above fourscore, and it is the general opinion that he died an infidel: though others say, that when he was at the point of death he embraced Mahometism; and produce some passages out of his poetical compositions to confirm their assertion. About a month, or, as some write, three days after the death of this great benefactor and patron, Mahomet had the additional mortification to lose his wife Khadijah, who had so generously made his fortune. For which reason this year is called the *year of mourning*.

On the death of these two persons, the Koreish began to be more troublesome than ever to their prophet, and especially some who had formerly been his intimate friends; insomuch that he found himself obliged to seek for shelter elsewhere, and first pitched upon Tayef, about 60 miles east from Mecca, for the place of his retreat. Thither therefore he went, accompanied by his servant Zeid, and applied himself to two of the chief of the tribe of Thakif who were the inhabitants of that place; but they received him very coldly. However, he staid there a month; and some of the more considerate and better sort of men treated him with a little respect: but the slaves and inferior people at length rose against him; and bringing him to the wall of the city, obliged him to depart and return to Mecca, where he put himself under the protection of Al Motaam Ebn Adi.

This repulse greatly discouraged his followers. However, Mahomet was not wanting to himself; but boldly continued to preach to the public assemblies at the pilgrimage, and gained several proselytes; and among them six of the inhabitants of Yathreb of the Jewish tribe of Khazraj; who, on their return home, failed not to speak much in commendation of their new religion, and exhorted their fellow citizens to embrace the same.

In the 12th year of his mission it was that Mahomet gave out that he had made his night-journey from Mecca to Jerusalem, and thence to heaven, so much spoken of by all that write of him. Dr Prideaux thinks he invented it, either to answer the expectations of those who demanded some miracle as a proof of his mission; or else, by pretending to have conversed with God, to establish the authority of whatever he should think fit to leave behind by way of oral tradition, and make

Mahomet. make his sayings to serve the same purpose as the oral law of the Jews. But it does not appear that Mahomet himself ever expected so great a regard should be paid to his sayings, as his followers have since done; and seeing he all along disclaimed any power of performing miracles, it seems rather to have been a fetch of policy to raise his reputation, by pretending to have actually conversed with God in heaven, as Moses had heretofore done in the Mount, and to have received several institutions immediately from him, whereas before he contented himself with persuading them that he had all by the ministry of Gabriel.

However, this story seemed so absurd and incredible, that several of his followers left him upon it; and had probably ruined the whole design, had not Abu Becr vouched for his veracity, and declared, that if Mahomet affirmed it to be true, he verily believed the whole. Which happy incident not only retrieved the prophet's credit, but increased it to such a degree, that he was secure of being able to make his disciples swallow whatever he pleased to impose on them for the future. And this fiction, notwithstanding its extravagance, was one of the most artful contrivances Mahomet ever put in practice, and what chiefly contributed to the raising of his reputation to that great height to which it afterwards arrived.

In this year, called by the Mahometans the *accepted year*, 12 men of Yathreb or Medina, of whom 10 were of the tribe of Khazraj, and the other two of that of Aws, came to Mecca, and took an oath of fidelity to Mahomet at Al Akaba, a hill on the north of that city. This oath was called the *women's bath*; not that any women were present at this time, but because a man was not thereby obliged to take up arms in defence of Mahomet or his religion; it being the same oath that was afterwards exacted of the women, the form of which we have in the Koran, and is to this effect: viz. That they should renounce all idolatry; that they should not steal nor commit fornication, nor kill their children (as the Pagan Arabs used to do when they apprehended they should not be able to maintain them), nor forge calumnies; and that they should obey the prophet in all things that were reasonable. When they had solemnly engaged to all this, Mahomet sent one of his disciples, named *Masab Ebn Omair*, home with them, to instruct them more fully in the grounds and ceremonies of his new religion.

Masab being arrived at Medina, by the assistance of those who had been formerly converted, gained several proselytes, particularly Osaid Ebn Hodeira, a chief man of the city, and Saad Ebn Moadh, prince of the tribe of Aws; Mahometanism spreading so fast, that there was scarce a house wherein there were not some who had embraced it.

The next year being the 13th of Mahomet's mission, Masab returned to Mecca, accompanied by 73 men and two women of Medina who had professed Islamism, besides some others who were as yet unbelievers. On their arrival they immediately sent to Mahomet, and offered him their assistance, of which he was now in great need; for his adversaries were by this time grown so powerful in Mecca, that he could not stay there much longer without imminent danger. Wherefore he accepted their proposal, and met them one night, by appointment, at Al Akaba above mentioned,

attended by his uncle Al Abbas; who, though he was Mahomet. not then a believer, wished his nephew well, and made a speech to those of Medina, wherein he told them that as Mahomet was obliged to quit his native city, and seek an asylum elsewhere, and they had offered him their protection, they would do well not to deceive him; that if they were not firmly resolved to defend, and not betray him, they had better declare their minds, and let him provide for his safety in some other manner. Upon their protesting their sincerity, Mahomet swore to be faithful to them, on condition that they should protect him against all insults as heartily as they would their own wives and families. They then asked him what recompense they were to expect if they should happen to be killed in his quarrel; he answered, Paradise. Whereupon they pledged their faith to him, and so returned home; after Mahomet had chosen 12 out of their number, who were to have the same authority among them as the 12 apostles of Christ had among his disciples.

Hitherto Mahomet had propagated his religion by fair means; so that the whole success of his enterprise, before his flight to Medina, must be attributed to persuasion only, and not to compulsion. For before this second oath of fealty or inauguration at Al Akaba, he had no permission to use any force at all; and in several places of the Koran, which he pretended were revealed during his stay at Mecca, he declares his business was only to preach and admonish; that he had no authority to compel any person to embrace his religion; and that, whether people believe or not, was none of his concern, but belonged solely unto God. And he was so far from allowing his followers to use force, that he exhorted them to bear patiently those injuries which were offered them on account of their faith; and, when persecuted himself, chose rather to quit the place of his birth and retire to Medina, than to make any resistance. But this great passiveness and moderation seem entirely owing to his want of power, and the great superiority of his opposers for the first 12 years of his mission; for no sooner was he enabled, by the assistance of those of Medina, to make head against his enemies, that he gave out, that God had allowed him and his followers to defend themselves against the infidels; and at length, as his forces increased, he pretended to have the divine leave even to attack them, and to destroy idolatry, and set up the true faith by the sword: finding, by experience, that his designs would otherwise proceed very slowly, if they were not utterly overthrown; and, knowing, on the other hand, that innovators, when they depend solely on their own strength, and can compel, seldom run any risk; from whence, says Machiavel, it follows, that all the armed prophets have succeeded, and the unarmed ones have failed. Moses, Cyrus, Theseus, and Romulus, would not have been able to establish the observance of their institutions for any length of time, had they not been armed. The first passage of the Koran, which gave Mahomet the permission of defending himself by arms, is said to have been that in the 22d chapter; after which a great number to the same purpose were revealed.

That Mahomet had a right to take up arms for his own defence against his unjust persecutors, may perhaps be allowed; but whether he ought afterwards to

Mahomet have made use of that means for the establishing of his religion, it is not so easy to determine. How far the secular power may or ought to interpose in affairs of this nature, mankind are not agreed. The method of converting by the sword gives no very favourable idea of the faith which is so propagated, and is disallowed by every body in those of another religion, though the same persons are willing to admit of it for the advancement of their own: supposing that, though a false religion ought not to be established by authority, yet a true one may: and accordingly force is almost as constantly employed in these cases by those who have the power in their hands, as it is constantly complained of by those who suffer the violence. It is certainly one of the most convincing proofs that Mahometanism was no other than a human invention, that it owed its progress and establishment almost entirely to the sword; and it is one of the strongest demonstrations of the divine original of Christianity, that it prevailed against all the force and powers of the world by the mere dint of its own truth, after having stood the assaults of all manner of persecutions, as well as other oppositions, for 300 years together, and at length made the Roman emperors themselves submit thereto; after which time, indeed, this proof seems to fail, Christianity being then established, and Paganism abolished, by public authority, which has had great influence in the propagation of the one and destruction of the other ever since. But to return.

Mahomet having provided for the security of his companions as well as his own, by the league offensive and defensive which he had now concluded with those of Medina, directed them to repair thither, which they accordingly did; but himself with Abu Becr and Ali staid behind, having not yet received the divine permission, as he pretended, to leave Mecca. The Koreish fearing the consequence of this new alliance, began to think it absolutely necessary to prevent Mahomet's escape to Medina; and having held a council thereon, after several milder expedients had been rejected, they came to a resolution that he should be killed; and agreed that a man should be chosen out of every tribe for the execution of this design; and that each man should have a blow at him with his sword, that the guilt of his blood might fall equally on all the tribes, to whose united power the Hashemites were much inferior, and therefore durst not attempt to revenge their kinsman's death.

This conspiracy was scarce formed, when, by some means or other, it came to Mahomet's knowledge; and he gave out that it was revealed to him by the angel Gabriel, who had now ordered him to retire to Medina. Whereupon, to amuse his enemies, he directed Ali to lie down in his place, and wrap himself up in his green cloak, which he did; and Mahomet escaped miraculously, as they pretend, to Abu Becr's house, unperceived by the conspirators, who had already assembled at the prophet's door. They, in the mean time, looking through the crevice, and seeing Ali, whom they took to be Mahomet himself, asleep, continued watching there till morning, when Ali awoke, and they found themselves deceived.

From Abu Becr's house Mahomet and he went to a cave in Mount Thur, to the south-east of Mecca, accompanied only by Amer Ebn Foheirah, Abu Becr's

servant, and Abd'allah Ebn Oreitah, an idolater whom Mahomet they had hired for a guide. In this cave they lay hid three days, to avoid the search of their enemies; which they very narrowly escaped, and not without the assistance of more miracles than one: for some say that the Koreish were struck with blindness, so that they could not find the cave; others, that after Mahomet and his companions were got in, two pigeons laid their eggs at the entrance, and a spider covered the mouth of the cave with her web, which made them look no farther. Abu Becr, seeing the prophet in such imminent danger, became very sorrowful; whereupon Mahomet comforted him with these words recorded in the Koran, *Be not griev'd, for God is with us*. Their enemies being retired, they left the cave, and set out for Medina, by a by-road; and having fortunately, or, as the Mahometans tell us, miraculously, escaped some who were sent to pursue them, arrived safely at that city; whither Ali followed them in three days, after he had settled some affairs at Mecca.

The first thing Mahomet did after his arrival at Medina, was to build a temple for his religious worship, and a house for himself, which he did on a parcel of ground which had before served to put camels in, or, as others tell us, for a burying-ground, and belonged to Sahal and Soheil the sons of Amru, who were orphans. This action Dr Prideaux exclaims against, representing it as a flagrant instance of injustice; for that, says he, he violently dispossessed these poor orphans, the sons of an inferior artificer, (whom the author he quotes calls a *carpenter*), of this ground, and so founded the first fabric of his worship with the like wickedness as he did his religion. But, to say nothing of the improbability that Mahomet should act in so impolitic a manner at his first coming, the Mahometan writers set this affair in a quite different light: one tells us that he treated with the lads about the price of the ground, but they desired he would accept it as a present: however, as historians of good credit assure us, he actually bought it; and the money was paid by Abu Becr. Besides, had Mahomet accepted it as a present, the orphans were in circumstances sufficient to have afforded it: for they were of a very good family, of the tribe of Najjer, one of the most illustrious among the Arabs; and not the sons of a carpenter, as Dr Prideaux's author writes, who took the word *Najjer*, which signifies "a carpenter," for an appellative, whereas it is a proper name.

Mahomet, being securely settled at Medina, and able not only to defend himself against the insults of his enemies, but to attack them, began to send out small parties to make reprisals on the Koreish; the first party consisting of no more than nine men, who intercepted and plundered a caravan belonging to that tribe, and in the action took two prisoners. But what established his affairs very much, and was the foundation on which he built all his succeeding greatness, was the gaining of the battle of Bedr, which was fought in the second year of the Hegira, and is so famous in the Mahometan history. Some reckon no less than 27 expeditions wherein Mahomet was personally present, in nine of which he gave battle, besides several other expeditions in which he was not present.

His

Mahomet. His forces he maintained partly by the contributions of his followers for this purpose, which he called by the name of *zacaat* or *alms*, and the paying of which he very artfully made one main article of his religion; and partly by ordering a fifth part of the plunder to be brought into the public treasury for that purpose, in which matter he likewise pretended to act by the divine direction.

In a few years, by the success of his arms (notwithstanding he sometimes came off by the worst) he considerably raised his credit and power. In the sixth year of the Hegira he set out with 1400 men to visit the temple of Mecca, not with any intent of committing hostilities, but in a peaceable manner. However, when he came to Al Hodeibiya, which is situated partly within and partly without the sacred territory, the Koreish sent to let him know that they would not permit him to enter Mecca, unless he forced his way; whereupon he called his troops about him, and they all took a solemn oath of fealty or homage to him, and he resolved to attack the city; but those of Mecca sending Arwa Ebn Masun, prince of the tribe of Thakif, as their ambassador to desire peace, a truce was concluded between them for ten years, by which any person was allowed to enter into league either with Mahomet, or with the Koreish, as he thought fit.

It may not be improper, in order to show the inconceivable veneration and respect the Mahometans by this time had for their prophet, to mention the account which the above-mentioned ambassador gave the Koreish, at his return, of their behaviour. He said he had been at the courts both of the Roman emperor and of the king of Persia, and never saw any prince so highly respected by his subjects as Mahomet was by his companions; for, whenever he made the ablution, in order to say his prayers, they ran and caught the water that he had used; and, whenever he spit, they immediately licked it up, and gathered every hair that fell from him with great superstition.

In the seventh year of the Hegira, Mahomet began to think of propagating his religion beyond the bounds of Arabia; and sent messengers to the neighbouring princes, with letters to invite them to Mahometanism. Nor was this project without some success. Khosru Parviz, then king of Persia, received his letter with great disdain, and tore it in a passion, sending away the messenger very abruptly; which when Mahomet heard, he said *God shall tear his kingdom*. And soon after a messenger came to Mahomet from Badhan king of Yaman, who was a dependent on the Persians, to acquaint him that he had received orders to send him to Khosru. Mahomet put off his answer till the next morning, and then told the messenger it had been revealed to him that night that Khosru was slain by his son Shiruyeh: adding that he was well assured his new religion and empire should rise to as great a height as that of Khosru; and therefore bid him advise his master to embrace Mahometanism. The messenger being returned, Badhan in a few days received a letter from Shiruyeh, informing him of his father's death, and ordering him to give the prophet no further disturbance. Whereupon Badhan and the Persians with him turned Mahometans.

The emperor Heraclius, as the Arabian historians

assure us, received Mahomet's letter with great respect, **Mahomet.** laying it on his pillow, and dismissed the bearer honourably. And some pretend that he would have professed this new faith, had he not been afraid of losing his crown.

Mahomet wrote to the same effect to the king of Ethiopia, though he had been converted before, according to the Arab writers; and to Mokawkas, governor of Egypt, who gave the messenger a very favourable reception, and sent several valuable presents to Mahomet, and among the rest two girls, one of which, named Mary, became a great favourite with him. He also sent letters of the like purport to several Arab princes; particularly one to Al Hareth Ebu Abi Shamar king of Ghassan, who returning for answer that he would go to Mahomet himself, the prophet said, *May his kingdom perish*; another to Hawdha Ebn Ali, king of Yamama, who was a Christian, and, having some time before professed Islamism, had lately returned to his former faith; this prince sent back a very rough answer, upon which Mahomet cursing him, he died soon after: and a third to Al Monder Ebn Sawa, king of Bahrein, who embraced Mahometanism, and all the Arabs of that country followed his example.

The eighth year of the Hegira was a very fortunate year to Mahomet. In the beginning of it, Khaled Ebn al Walid and Amru Ebn al As, both excellent soldiers, the first of whom afterwards conquered Syria and other countries, and the latter Egypt, became proselytes to Mahometanism. And soon after the prophet sent 3000 men against the Grecian forces, to revenge the death of one of his ambassadors, who, being sent to the governor of Bosra on the same errand as those who went to the above-mentioned princes, was slain by an Arab, of the tribe of Ghassan, at Muta, a town in the territory of Balka in Syria, about three days journey eastward from Jerusalem, near which town they encountered. The Grecians being vastly superior in number (for, including the auxiliary Arabs, they had an army of 100,000 men), the Mahometans were repulsed in the first attack, and lost successively three of their generals, viz. Zcid Ebn Haretha Mahomet's freedman, Jaafar the son of Abu Taleb, and Abdallah Ebn Rawaha: but Khaled Ebn al Walid succeeding to the command, overthrew the Greeks with a great slaughter, and brought away abundance of rich spoil; on occasion of which action Mahomet gave him the title of *Scif min soquf Allah*, "one of the swords of God."

In this year also Mahomet took the city of Mecca, the inhabitants whereof had broken the truce concluded on two years before. For the tribe of Becr who were confederates with the Koreish, attacking those of Khozaah, who were allies of Mahomet, killed several of them, being supported in the action by a party of the Koreish themselves. The consequence of this violation was soon apprehended; and Abu Sossian himself made a journey to Medina on purpose to heal the breach and renew the truce: but in vain; for Mahomet, glad of this opportunity, refused to see him: whereupon he applied to Abu Becr and Ali; but they giving him no answer, he was obliged to return to Mecca as he came.

Mahomet immediately gave orders for preparations

to

Mahomet to be made, that he might surprise the Meccans while they were unprovided to receive him: in a little time he began his march thither; and by that time he came near the city, his forces were increased to 10,000 men. Those of Mecca, being not in a condition to defend themselves against so formidable an army, surrendered at discretion; and Abu Sosian saved his life by turning Mahometan. About 28 of the idolaters were killed by a party under the command of Khaled; but this happened contrary to Mahomet's orders, who, when he entered the town, pardoned all the Koreish on their submission, except only six men and four women, who were more obnoxious than ordinary (some of them having apostatized), and were solemnly proscribed by the prophet himself; but of these no more than three men and one woman were put to death, the rest obtaining pardon on their embracing Mahometanism, and one of the women making her escape.

The remainder of this year Mahomet employed in destroying the idols in and round Mecca, sending several of his generals on expeditions for that purpose, and to invite the Arabs to Islamism: wherein it is no wonder if they now met with success.

The next year, being the ninth of the Hegira, the Mahometans call *the year of embassies*: for the Arabs had been hitherto expecting the issue of the war between Mahomet and the Koreish: but, so soon as that tribe, the principal of the whole nation, and the genuine descendants of Ishmael, whose prerogatives none offered to dispute, had submitted, they were satisfied that it was not in their power to oppose Mahomet; and therefore began to come in to him in great numbers, and to send embassies to make their submissions to him, both to Mecca, while he staid there, and also to Medina, whither he returned this year. Among the rest, five kings of the tribe of Hamyar professed Mahometanism, and sent ambassadors to notify the same.

In the 10th year, Ali was sent into Yaman to propagate the Mahometan faith there; and, as it is said, converted the whole tribe of Hamdan in one day. Their example was quickly followed by all the inhabitants of that province, except only those of Najran, who, being Christians, chose rather to pay tribute.

Thus was Mahometanism established, and idolatry rooted out, even in Mahomet's lifetime (for he died the next year), throughout all Arabia, except only Yamama, where Moseilama, who set up also for a prophet as Mahomet's competitor, had a great party, and was not reduced till the caliphate of Abu Becr: and the Arabs being then united in one faith, and under one prince, found themselves in a condition of making those conquests which extended the Mahometan faith over so great a part of the world.

MAHOMET, the name of several emperors of the Turks; of whom the most celebrated is,

MAHOMET II. surnamed *the Great*, their seventh sultan. See **TURKEY**.

He was born at Adrianople the 24th of March 1430; and is to be remembered chiefly by us for taking Constantinople in 1453, and thereby driving many learned Greeks into the west, which was a great cause of the restoration of learning in Europe, as the

Greek literature was then introduced here. He was one of the greatest men upon record, with regard to the qualities necessary to a conqueror; for he conquered two empires, twelve kingdoms, and two hundred considerable cities. He was very ambitious of the title of Great, and the Turks gave it him; even the Christians have not disputed it with him; for he was the first of the Ottoman emperors whom the Western nations dignified with the title of Grand Seignior or Great Turk, which posterity has preserved to his descendants. Italy had suffered greater calamities, but she had never felt a terror equal to that which this sultan's victories imprinted. The inhabitants seemed already condemned to wear the turban: it is certain, that Pope Sixtus IV. represented to himself Rome as already involved in the dreadful fate of Constantinople; and thought of nothing but escaping into Provence, and once more transferring the holy see to Avignon. Accordingly, the news of Mahomet's death, which happened the 3d of May 1481, was received at Rome with the greatest joy that ever was beheld there. Sixtus caused all the churches to be thrown open, made the trades people leave off their work, ordered a feast of three days, with public prayers and processions, commanded a discharge of the whole artillery of the castle of St Angelo all that time, and put a stop to his journey to Avignon.

He appears to be the first sultan who was a lover of arts and sciences; and even cultivated polite letters. He often read the History of Augustus, and the other Cæsars; and he perused those of Alexander, Constantine, and Theodosius, with more than ordinary pleasure, because these had reigned in the same country with himself. He was fond of painting, music and sculpture; and he applied himself to the study of agriculture. He was much addicted to astrology; and used to encourage his troops by giving out, that the motion and influence of the heavenly bodies promised him the empire of the world. Contrary to the genius of his country, he delighted so much in the knowledge of foreign languages, that he not only spoke the Arabian, to which the Turkish laws, and the religion of their legislator Mahomet, are appropriated, but also the Persian, the Greek, and the French, that is, the corrupted Italian. Landin, a knight of Rhodes, collected several letters which this sultan wrote in the Syriac, Greek, and Turkish languages, and translated them into Latin. Where the originals are, nobody knows; but the translation has been published several times; as at Lyons 1520, in 4to; at Basil 1554, 12mo; in a collection published by Oporinus, at Marburg 1604, in 8vo; and at Leipsic 1690, in 12mo. Melchior Junius, professor of eloquence at Strasburg, published at Montbeliard, 1595, a collection of letters, in which there are three written by Mahomet II. to Scanderberg. One cannot discover the least air of Turkish ferocity in these letters: they are written in as civil terms, and as obliging a manner, as the most polite prince in Christendom could have written.

MAHOMETANISM, or **MAHOMETISM**, the system of religion broached by Mahomet, and still adhered to by his followers. See **MAHOMET**, and **AL-CORAN**.

Mahometanism

Mahome-
taniam.

Mahometanism is professed by the Turks, Persians, and several nations among the Africans, and many among the East Indians.

The Mahometans divide their religion into two general parts, faith and practice: of which the first is divided into six distinct branches: Belief in God, in his angels, in his scriptures, in his prophets, in the resurrection and final judgment, and in God's absolute decrees. The points relating to practice are, prayer, with washings, &c. alms, fasting, pilgrimage to Mecca, and circumcision.

I. Of the Mahometan *Faith*.] 1. That both Mahomet, and those among his followers who are reckoned orthodox, had and continue to have just and true notions of God and his attributes, appears so plain from the Koran itself, and all the Mahometan divines, that it would be loss of time to refute those who suppose the God of Mahomet to be different from the true God, and only a fictitious deity or idol of his own creation.

2. The existence of angels, and their purity, are absolutely required to be believed in the Koran; and he is reckoned an infidel who denies there are such beings, or hates any of them, or asserts any distinction of sexes among them. They believe them to have pure and subtle bodies, created of fire; that they neither eat nor drink, nor propagate their species; that they have various forms and offices, some adoring God in different postures, others singing praises to him, or interceding for mankind. They hold, that some of them are employed in writing down the actions of men; others in carrying the throne of God, and other services.

The four angels, whom they look on as more eminently in God's favour, and often mention on account of the offices assigned them, are, Gabriel, to whom they give several titles, particularly those of the *holy spirit*, and the *angel of revelations*, supposing him to be honoured by God with a greater confidence than any other, and to be employed in writing down the divine decrees; Michael, the friend and protector of the Jews; Azrael, the *angel of death*, who separates men's souls from their bodies; and Israfil, whose office it will be to sound the trumpet at the resurrection. The Mahometans also believe, that two guardian angels attend on every man, to observe and write down his actions, being changed every day, and therefore carried *al Moakkibat*, or "the angels who continually succeed one another."

The devil, whom Mahomet names *Eblis*, from his *despair*, was once one of those angels who are nearest to God's presence, called *Azazil*; and fell, according to the doctrine of the Koran, for refusing to pay homage to Adam at the command of God.

Besides angels and devils, the Mahometans are taught by the Koran to believe an intermediate order of creatures, which they call *jin* or *genii*, created also of fire, but of a grosser fabric than angels, since they eat and drink, and propagate their species, and are subject to death. Some of these are supposed to be good and others bad, and capable of future salvation or damnation, as men are; whence Mahomet pretended to be sent for the conversion of genii as well as men.

3. As to the Scriptures, the Mahometans are taught

by the Koran, that God, in divers ages of the world, gave revelations of his will in writing to several prophets, the whole and every one of which it is absolutely necessary for a good Moslem to believe. The number of these sacred books was, according to them, 104. Of which 10 were given to Adam, 50 to Seth, 30 to Edris or Enoch, 10 to Abraham; and the other four, being the Pentateuch, the Psalms, the Gospel, and the Koran, were successively delivered to Moses, David, Jesus, and Mahomet; which last being the seal of the prophets, those revelations are now closed, and no more are to be expected. All these divine books, except the four last, they agree to be now entirely lost, and their contents unknown; though the Sabians have several books which they attribute to some of the antediluvian prophets. And of those four, the Pentateuch, Psalms, and Gospel, they say, have undergone so many alterations and corruptions, that, though there may possibly be some part of the true word of God therein, yet no credit is to be given to the present copies in the hands of the Jews and Christians. The Mahometans have also a gospel in Arabic, attributed to St Barnabas; wherein the history of Jesus Christ is related in a manner very different from what we find in the true gospels, and correspondent to those traditions which Mahomet has followed in his Koran. Of this gospel the Moriscoes in Africa have a translation in Spanish; and there is, in the library of Prince Eugene of Savoy, a manuscript of some antiquity, containing an Italian translation of the same gospel; made, it is to be supposed, for the use of renegades. This book appears to be no original forgery of the Mahometans; though they have, no doubt, interpolated and altered it since, the better to serve their purpose; and in particular, instead of the *Paraclete*, or *Comforter*, they have in this apocryphal gospel inserted the word *Perichlyte*, that is, the "famous," or "illustrious;" by which they pretend their prophet was foretold by name, that being the signification of *Mohammed* in Arabic: and thus they say to justify that passage of the Koran, where Jesus Christ is formally asserted to have foretold his coming, under his other name of *Ahmed*, which is derived from the same root as *Mohammed*, and of the same import. From these, or some other forgeries of the same stamp, it is that the Mahometans quote several passages, of which there are not the least footsteps in the New Testament.

4. The number of the prophets, which have been from time to time sent by God into the world, amounts to no less than 224,000, according to one Mahometan tradition; or to 124,000, according to another; among whom 313 were apostles, sent with special commissions to reclaim mankind from infidelity and superstition; and six of them brought new laws or dispensations, which successively abrogated the preceding; these were Adam, Noah, Abraham, Moses, Jesus, and Mahomet. All the prophets in general the Mahometans believe to have been free from great sins and errors of consequence, and professors of one and the same religion, that is, Islam, notwithstanding the different laws and institutions which they observed: They allow of degrees among them, and hold some of them to be more excellent and honourable than others. The first place they give to the revealers and

Mahome-
taniam.

Mahometanism. and establishers of new dispensations, and the next to the apostles.

In this great number of prophets, they not only reckon divers patriarchs and persons named in scripture, but not recorded to have been prophets, (wherein the Jewish and Christian writers have sometimes led the way), as Adam, Seth, Lot, Ishmael, Nun, Joshua, &c. and introduce some of them under different names, as *Enoch*, *Heber*, and *Jethro*, who are called, in the Koran, *Edris*, *Hud*, and *Shoaib*: but several others whose very names do not appear in Scripture (though they endeavour to find some persons there to fix them on), as *Salch*, *Khedr*, *Dhu'lkefl*, &c.

5. The belief of a general resurrection and a future judgment.

When a corpse is laid in the grave, they say he is received by an angel, who gives him notice of the coming of the two examiners; who are two black livid angels, of a terrible appearance, named *Mouker* and *Nakir*. These order the dead person to sit upright; and examine him concerning his faith as to the unity of God, and the mission of Mahomet: if he answer rightly, they suffer the body to rest in peace, and it is refreshed by the air of paradise; but, if not, they beat him on the temples with iron maces, till he roars out for anguish so loud, that he is heard by all from east to west, except men and genii. They then press the earth on the corpse, which is gnawed and stung till the resurrection by 99 dragons, with seven heads each; or, as others say, their sins will become venomous beasts, the grievous ones stinging like dragons, the smaller like scorpions, and the others like serpents: circumstances which some understand in a figurative sense.

As to the soul, they hold, that, when it is separated from the body by the angel of death, who performs his office with ease and gentleness towards the good, and with violence towards the wicked, it enters into that which they call *al berzakh*, or *the interval* between death and the resurrection. If the departed person was a believer, they say two angels meet it, who convey it to heaven, that its place there may be assigned, according to its merit and degree. For they distinguish the souls of the faithful into three classes: The first of prophets, whose souls are admitted into paradise immediately; the second of martyrs, whose spirits, according to a tradition of Mahomet, rest in the crops of green birds, which eat of the fruits and drink of the rivers of paradise; and the third of other believers, concerning the state of whose souls before the resurrection there are various opinions.

Though some among the Mahometans have thought that the resurrection will be merely spiritual, and no more than the returning of the soul to the place whence it first came (an opinion defended by Ebn Sina, and called by some the *opinion of the philosophers*); and others, who allow man to consist of body only, that it will be merely corporeal; the received opinion is, that both body and soul will be raised: and their doctors argue strenuously for the possibility of the resurrection of the body, and dispute with great subtilty concerning the manner of it. But Mahomet has taken care to preserve one part of the body, whatever becomes of the rest, to serve for a basis of the future edifice, or rather a leaven for the mass which is to be join-

ed to it. For he taught, that a man's body was entirely consumed by the earth, except only the bone called *al ajb*, which we name the *os coccygis*, or rumpbone; and that, as it was the first formed in the human body, it will also remain uncorrupted till the last day, as a seed from whence the whole is to be renewed; and this, he said, would be effected by a forty years rain, which God should send, and which would cover the earth to the height of 12 cubits, and cause the bodies to sprout forth like plants. Herein, also, is Mahomet beholden to the Jews; who say the same things of the bone Luz, excepting that what he attributes to a great rain, will be effected according to them, by a dew impregnating the dust of the earth.

The time of the resurrection the Mahometans allow to be a perfect secret to all but to God alone; the angel Gabriel himself acknowledging his ignorance in this point, when Mahomet asked him about it. However, they say, the approach of that day may be known from certain signs which are to precede it. These signs they distinguish into two sorts, the lesser and the greater.

The lesser signs are, 1. The decay of faith among men. 2. The advancing of the meanest persons to eminent dignity. 3. That a maid servant shall become the mother of her mistress (or master); by which is meant, either that towards the end of the world men shall be much given to sensuality, or that the Mahometans shall then take many captives. 4. Tumults and seditions. 5. A war with the Turks. 6. Great distress in the world, so that a man, when he passes by another's grave, shall say, Would to God I were in his place! 7. That the provinces of Irac and Syria shall refuse to pay their tribute. And, 8. That the buildings of Medina shall reach to Ahab, or Yabab.

The greater signs are, 1. The sun's rising in the west; which some have imagined it originally did. 2. The appearance of the beast, which shall rise out of the earth, in the temple of Mecca, or on Mount Safa, or in the territory of Tayef, or some other place. This beast, they say, is to be 60 cubits high; though others, not satisfied with so small a size, will have her reach to the clouds and to heaven, when her head only is out; and that she will appear for three days, but show only a third part of her body. They describe this monster, as to her form, to be a compound of various species; having the head of a bull, the eyes of a hog, the ears of an elephant, the horns of a stag, the neck of an ostrich, the breast of a lion, the colour of a tiger, the back of a cat, the tail of a ram, the legs of a camel, and the voice of an ass. Some say this beast is to appear three times in several places, and that she will bring with her the rod of Moses and the seal of Solomon; and being so swift that none can overtake or escape her, will with the first strike all the believers on the face, and mark them with the word *mumcn*, i. e. believer; and with the latter will mark the unbelievers on the face likewise, with the word *Caser*, i. e. infidel, that every person may be known for what he really is. They add, that the same beast is to demonstrate the vanity of all religions except Islam, and to speak Arabic. All this stuff seems to be the result of a confused idea of the beast in the Revelation. 3. War with the Greeks, and the taking Constantinople by 70,000 of the posterity of Isaac, who shall

Mahome-
tanism.

shall not win that city by force of arms, but the walls shall fall down while they cry out, *There is no God but God, God is most great!* As they are dividing the spoil, news will come to them of the appearance of Antichrist; whereupon they shall leave all, and return back. 4. The coming of Antichrist, whom the Mahometans call *Masib al Dajjal*, i. e. the false or lying Christ, and simply *al Dajjal*. He is to be one-eyed, and marked on the forehead with the letters C. F. R. signifying *Cafir*, or infidel. They say that the Jews give him the name of *Messiah Ben David*; and pretend he is to come in the last days, and to be lord both of land and sea, and that he will restore the kingdom to them. 5. The descent of Jesus on earth. They pretend that he is to descend near the white tower to the east of Damascus, when the people are returned from the taking of Constantinople: that he is to embrace the Mahometan religion, marry a wife, get children, kill Antichrist; and at length die after 40 years, or, according to others, 24 years continuance on earth. Under him, they say, there will be great security and plenty in the world, all hatred and malice being laid aside; when lions and camels, bears and sheep, shall live in peace, and a child shall play with serpents unhurt. 6. War with the Jews; of whom the Mahometans are to make a prodigious slaughter, the very trees and stones discovering such of them as hide themselves, except only the tree called *gharkad*, which is the tree of the Jews. 7. The irruption of Gog and Magog, or, as they are called in the east, *Yajuj* and *Majuj*; of whom many things are related in the Koran and the traditions of Mahomet. These barbarians, they tell us, having passed the lake of Tiberias, which the vanguard of their vast army will drink dry, will come to Jerusalem, and there greatly distress Jesus and his companions; till, at his request, God will destroy them, and fill the earth with their carcases, which, after some time, God will send birds to carry away, at the prayers of Jesus and his followers. Their bows, arrows, and quivers, the Moslems will burn for seven years together; and at last God will send a rain to cleanse the earth and to make it fertile. 8. A smoke which shall fill the whole earth. 9. An eclipse of the moon. Mahomet is reported to have said, that there would be three eclipses before the last hour; one to be seen in the east, another in the west, and the third in Arabia. 10. The returning of the Arabs to the worship of Allat and Al Uzza, and the rest of their ancient idols, after the decease of every one in whose heart there was faith equal to a grain of mustard seed, none but the very worst of men being left alive. For God, they say, will send a cold odoriferous wind, blowing from Syria Damascena, which shall sweep away the souls of all the faithful, and the Koran itself, so that men will remain in the grossest ignorance for 100 years. 11. The discovery of a vast heap of gold and silver by the retreating of the Euphrates, which will be the destruction of many. 12. The demolition of the Caaba, or temple of Mecca, by the Ethiopians. 13. The speaking of beasts and inanimate things. 14. The breaking out of fire in the province of Hejaz; or, according to others, in Yaman. 15. The appearance of a man of the descendants of Kahtan, who shall drive men before him with his staff. 16. The coming of the Mohdi, or director; concerning whom Mahomet pro-

VOL. XII. Part II.

+

Mahome-
tanism.

phesied, that the world should not have an end till one of his own family should govern the Arabians, whose name should be the same with his own name, and whose father's name should also be the same with his father's name; and who should fill the earth with righteousness. This person the Shiites believe to be now alive, and concealed in some secret place till the time of his manifestation; for they suppose him no other than the last of the 12 imams, named *Mahomet Abu'lkasem*, as their prophet was; and the son of Hassan al Askeri, the 11th of that succession. He was born at Sermanrai, in the 255th year of the Hegira. From this tradition, it is to be presumed, an opinion pretty current among the Christians took its rise, that the Mahometans are in expectation of their prophet's return. 17. A wind which shall sweep away the souls of all who have but a grain of faith in their hearts, as has been mentioned under the tenth sign.

These are the greater signs, which, according to their doctrine, are to precede the resurrection, but still leave the hour of it uncertain: for the immediate sign of its being come will be the first blast of the trumpet, which they believe will be sounded three times. The first they call the *blast of consternation*; at the hearing of which all creatures in heaven and earth shall be struck with terror, except those whom God shall please to exempt from it. The effects attributed to this first sound of the trumpet are very wonderful: for they say the earth will be shaken, and not only all buildings, but the very mountains levelled; that the heavens shall melt, the sun be darkened, the stars fall, on the death of the angels, who, as some imagine, hold them suspended between heaven and earth; and the sea shall be troubled and dried up, or, according to others, turned into flames, the sun, moon, and stars being thrown into it: the Koran to express the greatness of the terror of that day, adds, that women who give suck shall abandon the care of their infants, and even the she camels which have gone 10 months with young (a most valuable part of the substance of that nation) shall be utterly neglected. A farther effect of this blast will be that concourse of beasts mentioned in the Koran, though some doubt whether it be to precede the resurrection or not. They who suppose it will precede, think that all kinds of animals, forgetting their respective natural fierceness and timidity, will run together into one place, being terrified by the sound of the trumpet and the sudden shock of nature.

The Mahometans believe that this first blast will be followed by a second, which they call the *blast of extermination*; by which all creatures both in heaven and earth shall die or be annihilated, except those which God shall please to exempt from the common fate; and this, they say, shall happen in the twinkling of an eye, nay, in an instant; nothing surviving except God alone, with paradise and hell, and the inhabitants of those two places, and the throne of glory. The last who shall die will be the angel of death.

Forty years after this will be heard the *blast of resurrection*, when the trumpet shall be sounded the third time by Israsil, who, together with Gabriel and Michael, will be previously restored to life, and, standing on the rock of the temple of Jerusalem, shall, at God's command, call together all the dry and rotten bones, and other dispersed parts of the bodies, and the very

3 F

hairs

Mahome-
tanism.

hairs to judgment. This angel having, by the divine order, set the trumpet to his mouth, and called together all the souls from all parts, will throw them into his trumpet, from whence, on his giving the last sound, at the command of God, they will fly forth like bees, and fill the whole space between heaven and earth, and then repair to their respective bodies, which the opening earth will suffer to arise; and the first who shall so arise, according to a tradition of Mahomet, will be himself. For this birth the earth will be prepared by the rain above mentioned, which is to fall continually for 40 years, and will resemble the seed of a man, and be supplied from the water under the throne of God, which is called *living water*; by the efficacy and virtue of which the dead bodies shall spring forth from their graves as they did in their mother's womb, or as corn sprouts forth by common rain, till they become perfect; after which breath will be breathed into them, and they will sleep in their sepulchres till they are raised to life at the last trumpet.

When those who have risen shall have waited the limited time, the Mahometans believe God will at length appear to judge them; Mahomet undertaking the office of intercessor, after it shall have been declined by Adam, Noah, Abraham, and Jesus, who shall beg deliverance only for their own souls. They say, that on this solemn occasion God will come in the clouds surrounded by angels, and will produce the books wherein the actions of every person are recorded by their guardian angels, and will command the prophets to bear witness against those to whom they have been respectively sent. Then every one will be examined concerning all his words and actions uttered and done by him in this life; not as if God needed any information in these respects, but to oblige the person to make public confession and acknowledgment of God's justice. The particulars of which they shall give an account, as Mahomet himself enumerated them, are, of their time, how they spent it; of their wealth, by what means they acquired it, and how they employed it; of their bodies, wherein they exercised them; of their knowledge and learning, what use they made of them. To the questions we have mentioned each person shall answer, and make his defence in the best manner he can, endeavouring to excuse himself by casting the blame of his evil deeds on others; so that a dispute shall arise even between the soul and the body, to which of them their guilt ought to be imputed: The soul saying, *O Lord, my body I received from thee; for thou createdst me without a hand to lay hold with, a foot to walk with, an eye to see with, or an understanding to apprehend with, till I came and entered into this body; therefore punish it eternally, but deliver me.* The body, on the other side, will make this apology: *O Lord, thou createdst me like a stock of wood, having neither hand that I could lay hold with, nor foot that I could walk with, till this soul, like a ray of light, entered into me, and my tongue began to speak, my eye to see, and my foot to walk; therefore punish it eternally, but deliver me.* But God will propound to them the following parable of the blind man and the lame man, which, as well as the preceding dispute, was borrowed by the Mahometans from the Jews. A certain king having a pleasant garden, in which were ripe fruits, set two persons to keep it, one of whom was blind, and the

other lame; the former not being able to see the fruit, nor the latter to gather it: the lame man, however, seeing the fruit, persuaded the blind man to take him upon his shoulders, and by that means he easily gathered the fruit, which they divided between them. The lord of the garden coming some time after, and inquiring after his fruit, each began to excuse himself: the blind man said he had no eyes to see with; and the lame man, that he had no feet to approach the trees. But the king, ordering the lame man to be set on the blind, passed sentence on and punished them both. And in the same manner will God deal with the body and the soul. As these apologies will not avail on that day, so it will be in vain for any one to deny his evil actions; since men and angels, and his own members, nay, the very earth itself, will be ready to bear witness against him.

At this examination, they also believe, that each person will have the book wherein all the actions of his life are written delivered to him: which books the righteous will receive into the right hand, and read with great pleasure and satisfaction; but the ungodly will be obliged to take them, against their wills, in their left, which will be bound behind their backs, their right hand being tied up to their necks.

To show the exact justice which will be observed on this great day of trial, the next thing they describe is the balance, wherein all things shall be weighed. They say it will be held by Gabriel; and that it is of so vast a size, that its two scales, one of which hangs over paradise, and the other over hell, are capacious enough to contain both heaven and hell. Though some are willing to understand what is said in the Koran concerning this balance allegorically, and only as a figurative representation of God's equity; yet the more ancient and orthodox opinion is, that they are to be taken literally; and since words and actions, being mere accidents, are not capable of being themselves weighed, they say that the books wherein they are written will be thrown into the scales, and according as those wherein the good or evil actions are recorded shall preponderate, sentence will be given: those whose balances laden with good works shall be heavy, will be saved; but those whose balances are light, will be condemned. Nor will any one have cause to complain that God suffers any good action to pass unrewarded, because the wicked for the good they do have their reward in this life, and therefore can expect no favour in the next.

This examination being past, and every one's works weighed in a just balance, that mutual retaliation will follow, according to which every creature will take vengeance one of another, or have satisfaction made them for the injuries which they have suffered. And, since there will then be no other way of returning like for like, the manner of giving this satisfaction will be by taking away a proportional part of the good works of him who offered the injury, and adding it to those of him who suffered it. Which being done, if the angels (by whose ministry this is to be performed) say, *Lord, we have given to every one his due, and there remaineth of this person's good works so much as equalleth the weight of an ant,* God will, of his mercy, cause it to be doubled unto him, that he may be admitted into paradise; but if, on the contrary, his good works be exhausted,

Mahome-
tanism.

Mahome-
tanism.

hausted, and there remain evil works only, and there be any who have not yet received satisfaction from him, God will order that an equal weight of their sins be added unto his, that he may be punished for them in their stead, and he will be sent to hell laden with both. This will be the method of God's dealing with mankind. As to brutes, after they shall have likewise taken vengeance of one another, he shall command them to be changed into dust; wicked men being reserved to more grievous punishment, so that they shall cry out, on hearing this sentence passed on the brutes, *Would to God that we were dust also!* As to the genii, many Mahometans are of opinion, that such of them as are true believers, will undergo the same fate as the irrational animals, and have no other reward than the favour of being converted into dust: and for this they quote the authority of their prophet.

The trials being over, and the assembly dissolved, the Mahometans hold, that those who are to be admitted into paradise will take the right-hand way, and those who are destined to hell-fire will take the left; but both of them must first pass the bridge called in Arabic *al Sirat*, which they say is laid over the midst of hell, and describe to be finer than a hair, and sharper than the edge of a sword; so that it seems very difficult to conceive how any one shall be able to stand upon it; for which reason, most of the sect of the Motazalites reject it as a fable; though the orthodox think it a sufficient proof of the truth of this article, that it was seriously affirmed by him who never asserted a falsehood, meaning their prophet: who, to add to the difficulty of the passage, has likewise declared, that this bridge is beset on each side with briars and hooked thorns; which will however be no impediment to the good; for they shall pass with wonderful ease and swiftness, like lightning, or the wind, Mahomet and his Moslems leading the way; whereas the wicked, what with the slipperiness and extreme narrowness of the path, the entangling of the thorns, and the extinction of the light which directed the former to paradise, will soon miss their footing, and fall down headlong into hell, which is gaping beneath them.

As to the punishment of the wicked, the Mahometans are taught, that hell is divided into seven stories or apartments, one below another, designed for the reception of as many distinct classes of the damned.

The first, which they call *Jehennam*, they say, will be the receptacle of those who acknowledge one God, that is, the wicked Mahometans; who, after having there been punished according to their demerits, will at length be released. The second, named *Ladha*, they assign to the Jews; the third named *al Hot-ma*, to the Christians; the fourth, named *al Sair*, to the Sabians; the fifth, named *Sakar*, to the Magians; the sixth, named *al Jahim*, to the idolaters; and the seventh, which is the lowest and worst of all, and is called *al Hawyat*, to the hypocrites, or those who outwardly professed some religion, but in their hearts were of none. Over each of these apartments they believe there will be set a guard of angels, 19 in number; to whom the damned will confess the just judgment of God, and beg them to intercede with him for some alleviation of their pain, or that they may be delivered by being annihilated.

Mahomet has, in his Koran and traditions, been

Mahome-
tanism.

very exact in describing the various torments of hell, which, according to him, the wicked will suffer both from intense heat and excessive cold. We shall, however, enter into no detail of them here; but only observe, that the degrees of these pains will also vary in proportion to the crimes of the sufferer, and the apartment he is condemned to; and that he who is punished the most lightly of all will be shod with shoes of fire, the fervour of which will cause his skull to boil like a cauldron. The condition of these unhappy wretches, as the same prophet teaches, cannot be properly called either *life* or *death*; and their misery will be greatly increased by their despair of being ever delivered from that place, since, according to that frequent expression in the Koran, *they must remain therein for ever*. It must be remarked, however, that the infidels alone will be liable to eternity of damnation; for the Moslems, or those who have embraced the true religion, and have been guilty of heinous sins, will be delivered thence after they shall have expiated their crimes by their sufferings. The time which these believers shall be detained there, according to a tradition handed down from their prophet, will not be less than 900 years, nor more than 7000. And, as to the manner of their delivery, they say that they shall be distinguished by the marks of prostration on those parts of their bodies with which they used to touch the ground in prayer, and over which the fire will therefore have no power; and that, being known by this characteristic, they will be released by the mercy of God, at the intercession of Mahomet and the blessed: whereupon those who shall have been dead, will be restored to life, as has been said; and those whose bodies shall have contracted any sootiness or filth from the flames and smoke of hell, will be immersed in one of the rivers of paradise, called the *river of life*, which will wash them whiter than pearls.

The righteous, as the Mahometans are taught to believe, having surmounted the difficulties, and passed the sharp bridge above mentioned, before they enter paradise, will be refreshed by drinking at the *pond* of their prophet, who describes it to be an exact square of a month's journey in compass; its water, which is supplied by two pipes from Al Cawthar, one of the rivers of paradise, being whiter than milk or silver, and more odoriferous than musk, with as many cups set around it as there are stars in the firmament; of which water whoever drinks will thirst no more for ever. This is the first taste which the blessed will have of their future and now near approaching felicity.

Though paradise be so very frequently mentioned in the Koran, yet it is a dispute among the Mahometans whether it be already created, or to be created hereafter; the Motazalites and some other sectaries asserting, that there is not at present any such place in nature, and that the paradise which the righteous will inhabit in the next life will be different from that from which Adam was expelled. However, the orthodox profess the contrary, maintaining that it was created even before the world, and describe it, from their prophet's traditions, in the following manner:

They say it is situated above the seven heavens (or in the seventh heaven), and next under the throne of God; and, to express the amenity of the place, tell us, that the earth of it is of the finest wheat flour, or

Mahome-
tanism

of the purest musk, or, as others will have it, of saffron: that its stones are pearls and jacinths, the walls of its buildings enriched with gold and silver; and that the trunks of all its trees are of gold, among which the most remarkable is the tree called *Tuba*, or the tree of happiness. Concerning this tree, they fable, that it stands in the palace of Mahomet, though a branch of it will reach to the house of every true believer; that it will be laden with pomegranates, grapes, dates, and other fruits, of surprising bigness, and of tastes unknown to mortals. So that if a man desire to eat of any particular kind of fruit, it will immediately be presented him; or, if he choose flesh, birds ready dressed will be set before him, according to his wish. They add, that the boughs of this tree will spontaneously bend down to the hand of the person who would gather of its fruits, and that it will supply the blessed not only with food, but also with silken garments, and beasts to ride on ready saddled and bridled, and adorned with rich trappings, which will burst forth from its fruits; and that this tree is so large, that a person, mounted on the fleetest horse, would not be able to gallop from one end of its shade to the other in 100 years.

As plenty of water is one of the greatest additions to the pleasantness of any place, the Koran often speaks of the rivers of paradise as a principal ornament thereof: some of these rivers, they say, flow with water, some with milk, some with wine, and others with honey; all taking their rise from the root of the tree *Tuba*.

But all these glories will be eclipsed by the resplendent and ravishing girls of paradise, called from their large black eyes *Hur al oyun*, the enjoyment of whose company will be a principal felicity of the faithful. These, they say, are created, not of clay, as mortal women are, but of pure musk; being, as their prophet often affirms in his Koran, free from all natural impurities, defects, and inconveniences incident to the sex, of the strictest modesty, and secluded from public view in pavilions of hollow pearls, so large, that as some traditions have it, one of them will be no less than four parasangs (or, as others say, 60 miles) long, and as many broad.

The name which the Mahometans usually give to this happy mansion, is *al Jannat*, or "the garden;" and sometimes they call it, with an addition, *Jannat al Ferdaws*, "the garden of paradise;" *Jannat Aden*, "the garden of Eden," (though they generally interpret the word *Eden*, not according to its acceptance in Hebrew, but according to its meaning in their own tongue, wherein it signifies "a settled or perpetual habitation;") *Jannat al Mawa*, "the garden of abode;" *Jannat al Naim*, "the garden of pleasure;" and the like: by which several appellations some understand so many different gardens, or at least places of different degrees of felicity (for they reckon no less than 100 such in all), the very meanest whereof will afford its inhabitants so many pleasures and delights, that one would conclude they must even sink under them, had not Mahomet declared, that, in order to qualify the blessed for a full enjoyment of them, God will give to every one the abilities of 100 men.

6. God's absolute decree and predestination both of

good and evil. The orthodox doctrine is, that whatever hath or shall come to pass in this world, whether it be good, or whether it be bad, proceedeth entirely from the divine will, and is irrevocably fixed and recorded from all eternity in the preserved table: God having secretly predetermined not only the adverse and prosperous fortune of every person in this world, in the most minute particulars, but also his faith or infidelity, his obedience or disobedience, and consequently his everlasting happiness or misery after death; which fate or predestination it is not possible by any foresight or wisdom to avoid.

Of this doctrine Mahomet makes great use in his Koran for the advancement of his designs: encouraging his followers to fight without fear, and even desperately, for the propagation of their faith, by representing to them, that all their caution could not avert their inevitable destiny, or prolong their lives for a moment; and deterring them from disobeying or rejecting him as an impostor, by setting before them the danger they might thereby incur of being, by the just judgment of God, abandoned to seduction, hardness of heart, and a reprobate mind, as a punishment for their obstinacy.

11. *Religious practice.* 1. The first point is *prayer*, under which are also comprehended those legal washings or purifications which are necessary preparations thereto.

Of these purifications there are two degrees, one called *ghost*, being a total immersion or bathing of the body in water; and the other called *woda* (by the Persians, *abdest*), which is the washing of their faces, hands, and feet, after a certain manner. The first is required in some extraordinary cases only, as after having lain with a woman, or being polluted by emission of seed, or by approaching a dead body; women also being obliged to it after their courses or childbirth. The latter is the ordinary ablution in common cases, and before prayer, and must necessarily be used by every person before he can enter upon that duty. It is performed with certain formal ceremonies, which have been described by some writers, but much easier apprehended by seeing them done, than by the best description.

That his followers might be more punctual in this duty, Mahomet is said to have declared, that *the practice of religion is founded on cleanliness*, which is the *one half of the faith*, and the *key of prayer*, without which it will not be heard by God. That these expressions may be the better understood, Al Ghazali reckons four degrees of purification; of which the first is the cleansing of the body from all pollution, filth, and excrements; the second, the cleansing of the members of the body from all wickedness and unjust actions; the third, the cleansing the heart from all blameable inclinations and odious vices; and the fourth, the purging a man's secret thoughts from all affections which may divert their attendance on God; adding, that the body is but as the outward shell, in respect to the heart, which is as the kernel.

Circumcision, though it be not so much as once mentioned in the Koran, is yet held by the Mahometans to be an ancient divine institution, confirmed by the religion of Islam, and though not so absolutely necessary but that it may be dispensed with in some cases,

Mahome-
tanism

Mahome-
tanism.

cases, yet highly proper and expedient. The Arabs used this rite for many ages before Mahomet, having probably learned it from Ishmael, though not only his descendants, but the Hamyarites and other tribes practised the same. The Ishmaelites, we are told, used to circumcise their children, not on the eighth day, as is the custom of the Jews, but when about 12 or 13 years old, at which age their father underwent that operation; and the Mahometans imitate them so far as not to circumcise children before they may be able at least distinctly to pronounce that profession of their faith, *There is no God but GOD, Mahomet is the apostle of GOD*; but pitch on what age they please for the purpose, between 6 and 16 or thereabouts.

Prayer was by Mahomet thought so necessary a duty, that he used to call it *the pillar of religion and the key of paradise*; and when the Thakifites, who dwelt at Tayef, sending, in the ninth year of the Hegira, to make their submission to the prophet, after the keeping of their favourite idol had been denied them, begged at least that they might be dispensed with as to their saying of their appointed prayers, he answered, *That there could be no good in that religion wherein was no prayer.*

That so important a duty, therefore, might not be neglected, Mahomet obliged his followers to pray five times every 24 hours, at certain stated times, viz. 1. In the morning before sunrise: 2. When noon is past, and the sun begins to decline from the meridian: 3. In the afternoon, before sunset: 4. In the evening, after sunset, and before the day be shut in; and, 5. After the day is shut in, and before the first watch of the night. For this institution he pretended to have received the divine command from the throne of God himself, when he took his night-journey to heaven; and the observing of the stated times of prayer is frequently insisted on in the Koran, though they be not particularly prescribed therein. Accordingly, at the aforesaid times, of which public notice is given by the Muedhdhins, or Criers, from the steeples of their mosques (for they use no bells), every conscientious Moslem prepares himself for prayer, which he performs either in the mosque or any other place, provided it be clean, after a prescribed form, and with a certain number of praises or ejaculations (which the more scrupulous count by a string of beads), and using certain postures of worship; all which have been particularly set down and described, though with some few mistakes, by other writers, and ought not to be abridged, unless in some special cases, as on a journey, on preparing for battle, &c.

For the regular performance of the duty of prayer among the Mahometans, besides the particulars above mentioned, it is also requisite that they turn their faces, while they pray, towards the temple of Mecca; the quarter where the same is situated, being, for that reason, pointed out within their mosques by a niche, which they call *al Mehrah*; and without, by the situation of the doors opening into the galleries of the steeples: there are also tables calculated for the ready finding out their Keblah, or part towards which they ought to pray, in places where they have no other direction.

2. *Alms* are of two sorts, *legal* and *voluntary*. The *legal alms* are of indispensable obligation, being com-

Mahome-
tanism.

manded by the law, which directs and determines both the portion which is to be given, and of what things it ought to be given; but the *voluntary alms* are left to every one's liberty, to give more or less as he shall see fit. The former kind of alms some think to be properly called *zacam*, and the latter *sadakat*; though this name be also frequently given to the legal alms. They are called *zacam*, either because they *increase* a man's store by drawing down a blessing thereon, and produce in his soul the virtue of liberality; or because they *purify* the remaining part of one's substance from pollution, and the soul from the filth of avarice; and *sadakat*, because they are a proof of a man's sincerity in the worship of God. Some writers have called the legal alms *tithes*; but improperly, since in some cases they fall short, and in others exceed that proportion.

3. *Fasting* is a duty of so great moment, that Mahomet used to say it was *the gate of religion*, and that the *odour of the mouth of him who fasteth is more grateful to GOD than that of musk*; and Al Ghazali reckons *fasting one-fourth part of the faith*. According to the Mahometan divines there are three degrees of fasting: 1. The restraining the belly and other parts of the body from satisfying their lusts: 2. The restraining the ears, eyes, tongue, hands, feet, and other members, from sin; and, 3. The fasting of the heart from worldly cares, and restraining the thought from every thing besides God.

The Mahometans are obliged, by the express command of the Koran, to fast the whole month of Ramadan from the time the new moon first appears, till the appearance of the next new moon; during which time they must abstain from eating, drinking, and women, from daybreak till night or sunset. And this injunction they observe so strictly, that, while they fast, they suffer nothing to enter their mouths, or other parts of their body, esteeming the fast broken and null, if they smell perfumes, take a clyster or injection, bathe, or even purposely swallow their spittle; some being so cautious, that they will not open their mouths to speak lest they should breathe the air too freely: the fast is also deemed void, if a man kiss or touch a woman, or if he vomit designedly. But after sunset they are allowed to refresh themselves, and to eat and drink, and enjoy the company of their wives till daybreak; though the more rigid begin the fast again at midnight. This fast is extremely rigorous and mortifying when the month of Ramadan happens to fall in summer (for the Arabian year being lunar, each month runs through all the different seasons in the course of 33 years), the length and heat of the days making the observance of it much more difficult and uneasy than in winter.

The reason given why the month of Ramadan was pitched on for this purpose is, that on that month the Koran was sent down from heaven. Some pretend, that Abraham, Moses, and Jesus, received their respective revelations in the same month.

4. The pilgrimage to Mecca is so necessary a point of practice, that according to a tradition of Mahomet, he who dies without performing it may as well die a Jew or a Christian; and the same is expressly commanded in the Koran.

The temple of Mecca stands in the midst of the city, and is honoured with the title of *Masjad al charam*, i. e. *the sacred or inviolable temple*. What is principal-

Mahometanism. ly revered in this place, and gives sanctity to the whole, is a square stone building, called the CAABA; (see that article.)

To this temple every Mahometan, who has health and means sufficient; ought, once at least in his life, to go on pilgrimage; nor are women excused from the performance of this duty. The pilgrims meet at different places near Mecca, according to the different parts from whence they come, during the months of Shawal and Dhu'lkaada; being obliged to be there by the beginning of Dhu'lhajja; which month, as its name imports, is peculiarly set apart for the celebration of this solemnity.

At the place above mentioned the pilgrims properly commence such; when the men put on the Ibram or sacred habit, which consists only of two woollen wrappers, one wrapped about their middle to cover their privities, and the other thrown over their shoulders, having their heads bare, and a kind of slippers which cover neither the heel nor the instep, and so enter the sacred territory in their way to Mecca. While they have this habit on, they must neither hunt nor fowl, (though they are allowed to fish); which precept is so punctually observed, that they will not kill even a louse or flea if they find them on their bodies: there are some noxious animals, however, which they have permission to kill during their pilgrimage, as kites, ravens, scorpions, mice, and dogs given to bite. During the pilgrimage, it behoves a man to have a constant guard over his words and actions; to avoid all quarrelling or ill language, all converse with women, and all obscene discourse; and to apply his whole attention to the good work he is engaged in.

The pilgrims, being arrived at Mecca, immediately visit the temple; and then enter on the performance of the prescribed ceremonies, which consist chiefly in going in procession round the Caaba, in running between the mounts Safa and Merwa, in making the station on Mount Arafat, and slaying the victims, and shaving their heads in the valley of Mina.

In compassing the Caaba, which they do seven times, beginning at the corner where the black stone is fixed, they use a short quick pace the three first times they go round it, and a grave ordinary pace the four last; which, it is said, was ordered by Mahomet, that his followers might show themselves strong and active, to cut off the hopes of the infidels, who gave out that the immoderate heats of Medina had rendered them weak. But the aforesaid quick pace they are not obliged to use every time they perform this piece of devotion, but only at some particular times. So often as they pass by the black stone, they either kiss it, or touch it with their hand, and kiss that.

The running between Safa and Merwa is also performed seven times, partly with a slow pace and partly running: for they walk gravely till they come to a place between two pillars; and there they run, and afterwards walk again; sometimes looking back, and sometimes stooping, like one who had lost something, to represent Hagar seeking water for her son: for the ceremony is said to be as ancient as her time.

On the ninth of Dhu'lhajja, after morning prayer, the pilgrims leave the valley of Mina, whither they come the day before; and proceed in a tumultuous and rushing manner to Mount Arafat, where they stay to

perform their devotions till sunset: then they go to Mozdalifa, an oratory between Arafat and Mina; and there spend the night in prayer and reading the Koran. The next morning by daybreak they visit *al Masher al Karam*, or "the sacred monument;" and, departing thence before sunrise, haste by Batu Mohasser to the valley of Mina, where they throw seven stones at three marks or pillars, in imitation of Abraham, who, meeting the devil in that place, and being by him disturbed in his devotions, or tempted to disobedience when he was going to sacrifice his son, was commanded by God to drive him away by throwing stones at him; though others pretend this rite to be as old as Adam, who also put the devil to flight in the same place, and by the same means.

This ceremony being over, on the same day, the tenth of Dhu'lhajja, the pilgrims slay their victims in the said valley of Mina; of which they and their friends eat part, and the rest is given to the poor. These victims must be either sheep, goats, kine, or camels: males, if of either of the two former kinds; and females if of either of the latter; and of a fit age. The sacrifices being over, they shave their heads and cut their nails, burying them in the same place; after which the pilgrimage is looked on as completed: though they again visit the Caaba, to take their leave of that sacred building.

The rapid success which attended the propagation of this new religion was owing to causes that are plain and evident, and must remove, or rather prevent, our surprise, when they are attentively considered. The terror of Mahomet's arms, and the repeated victories which were gained by him and his successors, were, no doubt, the irresistible arguments that persuaded such multitudes to embrace his religion and submit to his dominion. Besides, his law was artfully and marvellously adapted to the corrupt nature of man; and, in a more particular manner, to the manners and opinions of the eastern nations, and the vices to which they were naturally addicted: for the articles of faith which it proposed were few in number, and extremely simple; and the duties it required were neither many nor difficult, nor such as were incompatible with the empire of appetites and passions. It is to be observed farther, that the gross ignorance, under which the Arabians, Syrians, Persians, and the greatest part of the eastern nations, laboured at this time, rendered many an easy prey to the artifice and eloquence of this bold adventurer. To these causes of the progress of Mahometanism, we may add the bitter dissensions and cruel animosities that reigned among the Christian sects, particularly the Greeks, Nestorians, Eutychians, and Monophysites; dissensions that filled a great part of the east with carnage, assassinations, and such detestable enormities as rendered the very name of Christianity odious to many. We might add here, that the Monophysites and Nestorians, full of resentment against the Greeks, from whom they had suffered the bitterest and most injurious treatment, assisted the Arabians in the conquest of several provinces, into which, of consequence, the religion of Mahomet was afterwards introduced. Other causes of the sudden progress of that religion will naturally occur to such as consider attentively its spirit and genius, and the state of the world at this time.

MAHOMETANS,

Mahometans
||
Mahwah

MAHOMETANS, those who believe in the religion and divine mission of Mahomet. See **MAHOMET**, **MAHOMETANISM**, and **ALCORAN**.

MAHRATTA. See **MARHATTA**.

MAHWAH, or **MAWEE**, in *Botany*; an East Indian tree, so called by the natives of Bahar and the neighbouring countries, but of which the Shanscrit name is *Madhuca*, or *Madhudruma*. According to Lieut. C. Hamilton, by whom a very particular account of this tree is given in the *Asiatic Researches**, it is of the class of the polyandria-monogynia of Linnaeus, but of a genus not described by him.

* Vol. I.
art. xiv.

The tree, when full grown, is about the size of a common mango tree, with a bushy head and oval leaves a little pointed; its roots spreading horizontally, are sunk but little in the earth; the trunk, which is often of a considerable thickness, rises seldom to any great height, without giving off branches; it is, however, not uncommon to see it shoot up clear to the length of eight or ten feet: the wood itself is moderately hard, fine grained, and of a reddish colour. By incision the tree affords a resinous gum from the bark.

The flowers are of a nature very extraordinary, "differing essentially (says Mr Hamilton) from those of any other plant with which I am acquainted, as they have not, in any respect, the usual appearance of such, but rather resemble *berries*; and I, like many others, had long conceived them to be the fruit of the Mahwah." The tree drops its leaves in the month of February, and early in March these flowers begin to come out in clusters of thirty, forty, or fifty, from the extremity of every small branch; and, from this period till the latter end of April, as the flowers come to maturity (for they never open or expand), they continue falling off, with their antheræ, in the mornings, a little after sunrise; when they are gathered; and afterwards dried by an exposure of a few days in the sun: when thus prepared, they very much resemble a dried grape, both in taste and flavour. Immediately after the flowers drop off, fresh shoots are made for the new leaves, which soon make their appearance, coming presently to their full growth.

The fruit (*properly* so called) is of two sorts in shape; the one resembling a small walnut, the other somewhat larger and pointed: it is ripe towards the middle of May; and continues dripping from the tree till the whole fall, which is generally about the beginning or towards the middle of June. The outer covering, or *pericarpium*, which is of a soft texture, commonly bursts in the fall, so that the seeds are very easily squeezed out of it: the seeds are somewhat of the shape, but longer than an olive. These seeds are replete with a thick oil, of the consistence of butter or *ghee*, which is obtained by expression.

From this description it may easily be conceived, that the Mahwah tree and its productions are of singular and general use, especially in those dry and barren countries, which, from the nature of their situation, are not so well calculated for producing in plenty or perfection the other necessaries of life.

The corolla or flowers, after being dried as before described, are eaten by the natives raw or dressed with their *curries*; and, when even simply boiled with rice, they afford a strengthening and wholesome nourish-

ment. They are indeed, our author tells us, often applied to a less laudable purpose; for being fermented, they yield by distillation a strong spirit, which the people here sell so very cheap, that for one *picce* (about a halfpenny) may be purchased no less than a *cutcha-seer* (above a pint English) with which any man may get completely drunk. These flowers make an article of trade; being exported from this country to Patna and elsewhere in no inconsiderable quantities.

Mahwah
||
Maiden.

The oil yielded by the fruit, as before mentioned, resembles ghee so much, that, being cheaper, the natives often mix it with that commodity. They use it the same as ghee in their victuals, and in the composition of some sorts of sweetmeats; and burn it in their lamps. It is also regarded as a salutary remedy, applied exteriorly to wounds and all cutaneous eruptions. It is at first of the consistence of common oil, but soon coagulates: after being kept for some time, it acquires a bitterish taste and rancid smell, which renders it somewhat less agreeable as an article of food: but this is an inconvenience which, by the oil being properly clarified and prepared at first, might be perhaps avoided. This oil is also exported both in its adulterated and original state to Patna and other parts of the low country. The gum has not been applied to any use: but might be collected in large quantities in the months of March and April, about the time the flowers come out.

MAIA, in fabulous history, the daughter of Atlas and Pleione. She was the mother of Mercury by Jupiter. She was one of the Pleiades, the most luminous of the seven sisters; (see **PLEIADES**). Also, a surname of Cybele.

MAIDEN, an instrument for beheading criminals.

Of the use and form of this instrument Mr Pennant gives the following account: "It seems to have been confined to the limits of the forest of Hardwick, or the 18 towns and hamlets within its precincts. The time when this custom took place is unknown; whether Earl Warren, lord of this forest, might have established it among the sanguinary laws then in use against the invaders of the hunting rights, or whether it might not take place after the woollen manufactures at Halifax began to gain strength, is uncertain. The last is very probable; for the wild country around the town was inhabited by a lawless set, whose depredations on the cloth-tenters might soon stifle the efforts of infant industry. For the protection of trade, and for the greater terror of offenders by speedy execution, this custom seems to have been established, so as at last to receive the force of law, which was, 'That if a felon be taken within the liberty of the forest of Hardwick, with goods stolen out, or within the said precincts, either hand-habend, back-berand, or confession'd, to the value of thirteen pence halfpenny, he shall, after three market days or meeting-days within the town of Halifax, next after such his apprehension, and being condemned, be taken to the gibbet, and there have his head cut from his body.'"

"The offender had always a fair trial; for as soon as he was taken, he was brought to the lord's bailiff at Halifax: he was then exposed on the three markets (which here were held thrice in a week), placed in a stocks, with the goods stolen on his back, or, if the theft was of the cattle kind, they were placed by him; and this was done both to strike terror into others, and

Maiden
||
Maiden-
head.

and to produce new informations against him. The bailiff then summoned four freeholders of each town within the forest to form a jury. The felon and prosecutors were brought face to face; and the goods, the cow or horse, or whatsoever was stolen, produced: If he was found guilty, he was remanded to prison, had a week's time allowed for preparation, and then was conveyed to this spot, where his head was struck off by this machine. I should have premised, that if the criminal, either after apprehension, or in the way to execution, should escape out of the limits of the forest (part being close to the town), the bailiff had no farther power over him; but if he should be caught within the precincts at any time after, he was immediately executed on his former sentence.

"This privilege was very freely used during the reign of Elizabeth: the records before that time were lost. Twenty-five suffered in her reign, and at least 12 from 1623 to 1650; after which I believe the privilege was no more exerted.

"This machine of death is now destroyed; but I saw one of the same kind in a room under the parliament house at Edinburgh, where it was introduced by the regent Morton, who took a model of it as he passed through Halifax, and at length suffered by it himself. It is in form of a painter's easel, and about ten feet high: at four feet from the bottom is a cross bar on which the felon lays his head, which is kept down by another placed above. In the inner edges of the frame are grooves; in these is placed a sharp axe, with a vast weight of lead, supported at the very summit with a peg: to that peg is fastened a cord, which the executioner cutting, the axe falls, and does the affair effectually, without suffering the unhappy criminal to undergo a repetition of strokes, as has been the case in the common method. I must add, that if the sufferer is condemned for stealing a horse or a cow, the string is tied to the beast, which, on being whipped, pulls out this peg, and becomes the executioner." This apparatus is now in possession of the Scottish Antiquarian Society.

MAIDEN is also the name of a machine first used in Yorkshire, and since introduced into other places, for washing linen; consisting of a tub 19 inches high, and 27 in diameter at the top, in which the linen is put, with hot water and soap, to which is adapted a cover, fitting it very closely, and fastened to the tub by two wedges; through a hole in the middle of the cover passes an upright piece of wood, kept at a proper height by a peg above, and furnished with two handles, by which it is turned backward and forward: to the lower end of this upright piece is fastened a round piece of wood, in which are fixed several pieces, like cogs of a wheel. The operation of this machine is to make the linen pass and repass quick through the water.

MAIDEN-Rents, in our old writers, a noble paid by the tenants of some manors on their marriage. This was said to be given to the lord for his omitting the custom of marcheta, whereby he was to have the first night's lodging with his tenant's wife; but it seems more probably to have been a fine for a license to marry a daughter.

MAIDENHEAD, a town of Berks, 26 miles from London, with a stone bridge over the Thames. It is

governed by a high steward, a mayor, a steward, and 10 aldermen, out of which last two bridgemasters are chosen every year. Here is a gaol both for debtors and felons. The town stands partly in the parish of Bray and partly in that of Cookham; and here is a chapel peculiar to the corporation, the minister whereof is chosen by the inhabitants, and not obliged to attend the bishop's visitation. Here are several alms-houses and charities. This town, now so considerable, did not begin to flourish till, by the building of its bridge, travellers were brought this way, who before used a ferry at that called *Babham's End*, two miles north of it. The large pier bridge is maintained by the corporation, for which they are allowed the tolls both over and under it. The bridge pier divides Berks from Bucks. There is a great trade here in malt, meal, and timber, which they carry in their barges to London. As this is the great thoroughfare from thence to Bath, Bristol, and other south-west parts of England, the adjacent wood or thicket has been noted for many robberies. The market is on Wednesdays. The population in 1811 was 792.

MAIDSTONE, a town of Kent, in England, 36 miles from London, seated on the river Medway, a branch of which runs through it. It is a corporation, sends two members to parliament, and in 1811 contained 9443 inhabitants. Its chief trade, besides linen-thread, which is made in great perfection, is in hops; of which there are many plantations about the town, as well as orchards of cherries. The tide flows quite up to the town, and brings up barges, &c. of 50 or 60 tons. It has a fine stone bridge. One of the public gaols for the county is kept in this town; and the custody of weights and measures, renewed by the standard of King Henry VII. was committed to it by parliament, as being in the centre of Kent; for which reason the knights of the shire are always elected, and the courts of justice always held here, and generally the assizes. The archbishop of Canterbury is constant parson of this parish, which is his peculiar, and served by his curate. Here are four charity-schools, in which are above 100 boys and girls, who are visited once a-week and catechised by the minister. This is such a plentiful country, and the lands hereabouts are so rich, that London is supplied with more commodities from hence than from any market town in England; particularly with the large bullocks that come from the Weald of Kent, which begins but six miles off; with timber, wheat, and great quantities of hops, apples, and cherries; with a sort of paving stone, eight or ten inches square, that is exceeding durable; and with the fine white sand for glass-houses and stationers. There are so many gentlemen's seats within 10 miles, that it is rare to find a town of so much trade and business, so full of gentry and good company.

MAIENNE, a considerable, handsome, and populous town in France, formerly having the title of a duchy; seated on a river of the same name, in W. Long. o. 35. N. Lat. 48. 18.

MAIGNAN, EMANUEL, a religious Minim, and a philosopher of considerable eminence, was born of an ancient and noble family at Thoulouse in 1601. Like the famous Pascal, he became a complete mathematician without the assistance of a teacher; and filled the professor's chair at Rome in 1636, where, at the

Maiguan
Mail.

expence of Cardinal Spada, he published his book *De Perspectiva Horaria*. He returned to Thoulouse in 1650, and was created provincial: the king, who in 1660 entertained himself with the machines and curiosities in his cell, made him offers by Cardinal Mazarine, to draw him to Paris; but he humbly desired to spend the remainder of his days in a cloister. He published a course of philosophy, 4 vols. 8vo, at Thoulouse; to the second edition of which he added two treatises, one against the vortices of Descartes, and the other on the speaking trumpet invented by Sir Samuel Morland. He is said to have studied even in his sleep, his very dreams being employed in theorems, the demonstrations of which would awaken him with joy. He died in 1676.

MAJESTY, a title given to kings, which frequently serves as a term of distinction. The word seems composed of the two Latin words, *major*, "greater," and *status*, "state." The emperor is called *Sacred Majesty*, *Imperial Majesty*, and *Cæsarean Majesty*: The king of Hungary is styled *His Apostolic Majesty*. The king of Spain is termed *His most Catholic Majesty*: and the king of Portugal, *His most Faithful Majesty*. The king of France used to be called *His most Christian Majesty*; and when he treated with the emperor, the word *Sacred* was added: He was afterwards called simply *King of the French*. Bonaparte assumed the title of *Emperor and King of France*.—With respect to other kings, the name of the kingdom is added; as, *His Britannic Majesty*, *His Prussian Majesty*, &c. Formerly princes were more sparing in giving titles, and more modest in claiming them: before the reign of Charles V. the king of Spain had only the title of *Highness*; and before that of Henry VIII. the kings of England were only addressed under the titles of *Grace* and *Highness*.

Under the Roman republic, the title *Majesty*, (*majestas*) belonged to the whole body of the people, and to the principal magistrates; so that to diminish or wound the majesty of the commonwealth, was to be wanting in respect to the state or to its ministers. But the power afterwards passing into the hands of a single person, the appellation of *Majesty* was transferred to the emperor and the imperial family. Pliny compliments Trajan on his being contented with the title of *Greatness*; and speaks very invidiously of those who affected that of *Majesty*. And yet this last seems to be the most modest and just title that can be attributed to sovereigns, since it signifies no more than the royalty or sovereign power.

MAIL INDUCTIO, an ancient custom for the priest and people of country-villages to go in procession to some adjoining wood on a May-day morning; and return in a kind of triumph, with a May-pole, boughs, flowers, garlands, and other tokens of the spring. This May-game, or rejoicing at the coming of the spring, was for a long time observed, and still is in some parts of England; but there was thought to be so much heathen vanity in it, that it was condemned and prohibited within the diocese of Lincoln by the good old Bishop Grosthead.

MAIL (*maille*), a term primarily applied to the meshes or holes in net-work.

Coat of MAIL. See COAT. It is called also a *haubergeon*. Anciently they also wore shirts of mail un-

der the waistcoat, to serve as a defence against swords and poniards. We also read of gloves of mail.

MAIL, or *Mall*, also signifies a round ring of iron; whence the play of pall-mall, from *palla* "a ball," and *maille*, "the round ring through which it is to pass."

MAIL, or *Maille*, in our old writers, a small kind of money. Silver halfpence were likewise termed *Mailles*, 9 Henry V. By indenture in the mint, a pound weight of old sterling silver was to be coined into 360 sterlings or pennies, or 720 *mails* or half-pennies, or 1440 farthings. Hence the word *mail* was derived, which is now vulgarly used in Scotland to signify an annual rent.

MAIL, or *Mail*, on ship-board, a square machine composed of a number of rings interwoven net-wise, and used for rubbing off the loose hemp which remains on lines or white cordage after it is made.

MAIL is likewise used for the leather bag wherein letters are carried by the post.

MAIL-Coaches. See COACH.

Action of MAILS and Duties, in Scots Law. See LAW, p. 689, § 20.

MAIL, *Black*. See BLACK-Mail.

MAILLA, JOSEPH ANNE MARIE DE MOYRIAC DE, a learned Jesuit, was born in the castle of Maillac in the Bugey, and appointed a missionary to China, whither he went in 1703. At the age of 28 he had acquired so great a skill in the characters, arts, sciences, mythology, and ancient books of the Chinese, as to astonish even the learned. He was greatly beloved and esteemed by the emperor Kham-Hi, who died in 1722. He, together with other missionaries, was employed by that prince to draw a chart of China and Chinese Tartary, which was engraven in France in the year 1732. He drew likewise particular charts of some of the provinces of this vast empire; with which the emperor was so pleased, that he settled the author at his court. The great annals of China were also translated into French by Father Mailla, and his manuscript was transmitted to France in 1737. This work was published in 12 volumes quarto, under the inspection of M. Grosier, and is the first complete history of that extensive empire. The style, which was full of hyperbole and bombast, has been revised by the editor, and the speeches which extended to too great a length, and had too much sameness in them, have been omitted. Father Mailla, after having resided 45 years in China, died at Peking on the 28th of June 1748, in the 79th year of his age. Kien-Lung the reigning emperor paid the expences of his funeral. He was a man of a lively and gentle character, capable of the most persevering labour and the most unremitting activity.

MAILLET, BENOIT DE, descended from a noble family in Lorraine, was born in 1659, and appointed, at the age of 33, consul-general for Egypt. He fulfilled this office for 16 years with great ability, supported the king's authority against the janizaries, and greatly extended the trade of France into that part of Africa. As a recompense for his services, the king bestowed upon him the consulship of Leghorn, which is the first and most considerable consulship in his gift. Being at last appointed in 1715 to visit the

Maillet,
Maim.

sea-ports in the Levant and on the coast of Barbary, he was so successful in the execution of his commission, that he obtained permission to retire with a considerable pension. He settled at Marseilles; where he died in 1738, in the 79th year of his age. He was a man of a lively imagination, and gentle manners; in society he was very amiable, and he possessed the strictest probity. He was fond of praise, and very anxious about the reputation of genius. During the whole of his life he paid particular attention to the study of natural history; and his principal object was to become acquainted with the origin of our globe. On this important subject he left some curious observations, which have been published in octavo under the title of *Telliamed*, which is the name *de Maillet* written backwards. The editor Abbé Mascrier has given to this work the form of dialogue. An Indian philosopher is introduced as explaining to a French missionary his opinion concerning the nature of the globe, and the origin of mankind; and, which is very incredible, he supposes it to have come out of the waters, and makes an abode uninhabitable by man the birthplace of the human race. His great object is to prove, that all the strata of which this globe is composed, even to the tops of the highest mountains, have come from the bosom of the waters; that they are the work of the sea, which continually retires to allow them gradually to appear. Telliamed dedicated his book to the illustrious Cyrano de Bergerac, author of the imaginary "Travels to the sun and moon." In the humorous epistle which is addressed to him, the Indian philosopher informs us that these dialogues are nothing but a collection of dreams and fancies. He cannot be accused of having broken his word; but he may well be reproached with not having written them in the same style with his letter to Cyrano, and with not having displayed equal liveliness and humour. A subject the most extravagant is handled in the gravest manner, and his ridiculous opinion is delivered with all the serious air of a philosopher. Of the six dialogues which compose the work, the four first contain many curious observations truly philosophical and important: in the other two we find nothing but conjectures, fancies, and fables, sometimes amusing, but always absurd. To Maillet we are indebted also for "A Description of Egypt," collected from his memoirs by the editor of *Telliamed*, 1743, 4to, or in 2 vols. 12mo.

MAIM, **MAIHEM**, or *Mayhem*, in Law, a wound by which a person loses the use of a member that might have been a defence to him; as when a bone is broken, a foot, hand, or other member cut off, or an eye put out; though the cutting off an ear or nose, or breaking the hinder-teeth, was formerly held to be no maim. A maim by castration was anciently punished with death, and other maims with loss of member for member; but afterwards they were only punished by fine and imprisonment. It is now enacted by the statute 22 and 23 Car. II. that if any person, from malice aforethought, shall disable any limb or member of any of the king's subjects with an intent to disfigure him, the offender, with his aiders and abettors, shall be guilty of felony without benefit of clergy; though no such attainer shall corrupt the blood, or occasion forfeiture of lands, &c.

MAIMONIDES, **MOSES**, or **MOSES THE SON OF MAIMON**, a celebrated rabbi, called by the Jews *the eagle of the doctors*, was born of an illustrious family at Cordova in Spain, in 1131. The early part of his education was undertaken by his father, who afterwards placed him under the tuition of Rabbi Joseph, the son of Megas, a person on whose profound learning he has bestowed the highest praise; and according to Leo Africanus, he had also among his tutors the learned Arabians Ibn Thophail and Averroes. He is commonly named *Moses Ægyptius*, because he settled in Egypt, where he spent his whole life in quality of physician to the sultan. Here he opened a school, which was soon filled with pupils from all parts, from Alexandria and Damascus especially, whose proficiency under him spread his fame all over the world. He was no less eminent in philosophy, mathematics, and divinity, than in medicine. Casaubon affirms it may be truly said of him, as Pliny of old said of Diodorus Siculus, that "he was the first of his tribe who ceased to be a trifler." It would be tedious to enumerate all the works of Maimonides; some were written originally in Arabic, but are now extant only in Hebrew translations. "Those (says Collier) who desire to learn the doctrine and the canon law contained in the Talmud, may read Maimonides's compendium of it in good Hebrew, in his book entitled *Iad*; wherein they will find great part of the fables and impertinencies in the Talmud entirely discarded. But the *More Nevochim* is the most valued of all his works; designed to explain the obscure words, phrases, metaphors, &c. in scripture, which, when literally interpreted, have either no meaning or appear absurd.

MAIN, an epithet usually applied by sailors to whatever is principal, as opposed to whatever is inferior or secondary. Thus the main land is used in contradistinction to an island or peninsula; and the main mast, the main wale, the main keel, and the main hatchway, are in like manner distinguished from the fore and mizen masts, the channel wales, the false keel, and the fore and after hatchways, &c.

MAINOUR, **MANOUR**, or *Mcinour* (from the French, *manier*, i. e. *manu tractare*), in a legal sense denotes the thing that a thief taketh away or stealeth: As to be taken with the mainour (*Pl. Cor.* fol. 179.), is to be taken with the thing stolen about him: And again (fol. 194.) it was presented, that a thief was delivered to the sheriff or viscount, together with the mainour: And again (fol. 186.), if a man be indicted, that he feloniously stole the goods of another, where, in truth, they are his own goods, and the goods be brought into the court as the mainour; and if it be demanded of him, what he saith to the goods, and he disclaim them; though he be acquitted of the felony, he shall lose the goods: And again (fol. 149.), if the defendant were taken with the mainour, and the mainour be carried to the court, they, in ancient times, would arraign him upon the mainour, without any appeal or indictment. Cowel. See *Blackst. Comment.* vol. iii. p. 71. vol. iv. p. 303.

MAINPRIZE. See *False IMPRISONMENT*.

The writ of mainprize, *mamcaptio*, is a writ directed to the sheriff (either generally, when any man is imprisoned for aailable offence, and bail hath been refused; or specially, when the offence or cause of

Maimo-
nides
||
Mainprize.

Mainprize commitment is not properly bailable below), commanding him to take sureties for the prisoner's appearance, usually called *mainperners*, and to set him at large. Mainperners differ from bail, in that a man's bail may imprison or surrender him up before the stipulated day of appearance; mainperners can do neither, but are barely sureties for his appearance at the day: bail are only sureties that the parties be answerable for the special matter for which they stipulate; mainperners are bound to produce him to answer all charges whatever. See *HABEAS Corpus*.

MAINTENANCE, in *Law*, bears a near relation to BARRETRY; being an officious intermeddling in a suit that no way belongs to one, by maintaining or assisting either party with money or otherwise, to prosecute or defend it: a practice that was greatly encouraged by the first introduction of uses. This is an offence against public justice, as it keeps alive strife and contention, and perverts the remedial process of the law into an engine of oppression. And therefore, by the Roman law, it was a species of the *crimen falsi*, to enter into any confederacy, or do any act to support another's law suit, by money, witnesses, or patronage. A man may, however, maintain the suit of his near kinsman, servant, or poor neighbour, out of charity and compassion, with impunity. Otherwise the punishment by common law is fine and imprisonment; and by the statute 32 Henry VIII. c. 9. a forfeiture of 10*l*.

MAINTENON, MADAME DE, a French lady of extraordinary fortune, descended from an ancient family, and whose proper name was *Frances d'Aubigné*, was born in 1635. Her parents by misfortunes being ill able to support her, she fell to the care of her mother's relations; to escape which state of dependence, she was induced to marry that famous old buffoon the Abbé Scarron, who subsisted himself only on a pension allowed him by the court for his wit and parts. She lived with him many years, which Voltaire makes no scruple to call the happiest years of her life; but when he died in 1660, she found herself as indigent as she had been before her marriage. Her friends indeed endeavoured to get her husband's pension continued to her, and presented so many petitions to the king about it, all beginning with "The widow Scarron most humbly prays your majesty's," &c. that he was quite weary of them, and has been heard to exclaim, "Must I always be pestered with the widow Scarron?" At last, however, through the recommendation of Madame de Montespan, he settled a much larger pension on her, with a genteel apology for making her wait so long; and afterward made choice of her to take care of the education of the young duke of Maine, his son by Madame de Montespan. The letters she wrote on this occasion charmed the king, and were the origin of her advancement; her personal merit effected all the rest. He bought her the lands of Maintenon, the only estate she ever had; and finding her pleased with the acquisition, called her publicly *Madame de Maintenon*; which was of great service to her in her good fortune, by releasing her from the ridicule attending that of Scarron. Her elevation was to her only a retreat; the king came to her apartment every day after dinner, before and after supper, and continued there till midnight: here he did business with his ministers, while

Madame de Maintenon, employed in reading or needle-work, never showed any desire to talk of state affairs, and carefully avoided all appearance of cabal or intrigue; she did not even make use of her power to dignify her own relations. About the latter end of the year 1685, Louis XIV. married her, he being then in his 48th and she in her 50th year; and that piety with which she inspired the king to make her a wife instead of a mistress, became by degrees a settled disposition of mind. She prevailed on Louis to found a religious community at St Cyr, for the education of 300 young ladies of quality; and here she frequently retired from that melancholy of which she complains so pathetically in one of her letters, and which few ladies will suppose she should be liable to in such an elevated situation. But, as M. Voltaire says, if any thing could show the vanity of ambition, it would certainly be this letter. Madame de Maintenon could have no other uneasiness than the uniformity of her manner of living with a great king; and this made her once say to the count D'Aubigné her brother, "I can hold it no longer; I wish I was dead." The answer he made to her was, "You have then a promise to marry the Almighty!" Louis, however, died before her in 1715; when she retired wholly to St Cyr, and spent the rest of her days in acts of devotion; and what is most surprising is, that her husband left no certain provision for her, recommending her only to the duke of Orleans. She would accept no more than a pension of 80,000 livres, which was punctually paid her till she died in 1719. A collection of her letters has been published, and translated into English; from which familiar intercourses her character will be better known than from description.

MAJOR, in the art of war, the name of several officers of very different ranks and functions.

MAJOR-general. See GENERAL.

MAJOR of a Regiment of Foot, the next officer to the lieutenant-colonel, generally promoted from the eldest captain: he is to take care that the regiment be well exercised, to see it march in good order, and to rally it in case of being broken in action: he is the only officer among the infantry that is allowed to be on horseback in time of action, that he may the more readily execute the colonel's orders.

MAJOR of a Regiment of Horse, as well as foot, ought to be a man of honour, integrity, understanding, courage, activity, experience, and address: he should be master of arithmetic, and keep a detail of the regiment in every particular: he should be skilled in horsemanship, and ever attentive to his business: one of his principal functions is, to keep an exact roster of the officers for duty: he should have a perfect knowledge in all the military evolutions, as he is obliged by his post to instruct others, &c.

Town-MAJOR, the third officer in order in a garrison, and next to the deputy-governor. He should understand fortification, and has a particular charge of the guards, rounds, patroles, and centinels.

Brigade-MAJOR, is a particular officer appointed for that purpose only in camp: he goes every day to headquarters to receive orders from the adjutant-general: there he writes exactly whatever is dictated to him: from thence he goes and gives the orders, at the place appointed for that purpose, to the different majors or

Major. adjutants of the regiments which compose that brigade, and regulates with them the number of officers and men which each are to furnish for the duty of the army; taking care to keep an exact roster, that one may not give more than another; and that each march in their tour: in short, the major of brigade is charged with the particular detail in his own brigade, in much the same way as the adjutant-general is charged with the general detail of the duty of the army. He sends every morning to the adjutant-general an exact return, by battalion and company, of the men of his brigade missing at the retreat, or a report expressing that none are absent: he also mentions the officers absent with or without leave.

As all orders pass through the hands of the majors of brigade, they have infinite occasions of making known their talents and exactness.

MAJOR of Artillery, is also the next officer to the lieutenant-colonel. His post is very laborious, as the whole detail of the corps particularly rests with him; and for this reason all the non-commissioned officers are subordinate to him, as his title of *serjeant-major* imports: in this quality they must render him an exact account of every thing which comes to their knowledge, either regarding the duty or wants of the artillery and soldiers. He should possess a perfect knowledge of the power of artillery, together with all its evolutions. In the field he goes daily to receive orders from the brigade-major, and communicates them with the parole to his superiors, and then dictates them to the adjutant. He should be a very good mathematician, and be well acquainted with every thing belonging to the train of artillery, &c.

MAJOR of Engineers, commonly with us called *Sub-director*, should be very well skilled in military architecture, fortification, gunnery, and mining. He should know how to fortify in the field, to attack and defend all sorts of posts, and to conduct the works in a siege, &c. See **ENGINEER**.

Aid-MAJOR, is on sundry occasions appointed to act as major, who has a pre-eminence above others of the same denomination. Our horse and foot guards have their guidons, or second or third majors.

Serjeant-MAJOR, is a non-commissioned officer of great merit and capacity, subordinate to the adjutant, as he is to the major. See **SERJEANT**.

Drum-MAJOR, is not only the first drummer in the regiment, but has the same authority over his drummers as the corporal has over his squad. He instructs them in their different beats; is daily at orders with the serjeants, to know the number of drummers for duty. He marches at their head when they beat in a body. In the day of battle, or at exercise, he must be very attentive to the orders given him, that he may regulate his beats according to the movements ordered.

Fife-MAJOR, is he that plays the best on that instrument, and has the same authority over the fifers as the drum-major has over the drummers. He teaches them their duty, and appoints them for guards, &c.

MAJOR, in *Law*, a person who is of age to manage his own affairs. By the civil law a man is not a major till the age of 25 years; in England, he is a major at 21, as in Normandy at 20.

MAJOR, in *Logic*, is understood of the first proposition of a regular syllogism. It is called *major*, because

it has a more extensive sense than the minor proposition, as containing the principal term. See **LOGIC**.

MAJOR and *Minor*, in *Music*, are applied to concords which differ from each other by a semi-tone. See **CONCORD**.

MAJOR tone is the difference between the fifth and fourth; and major semi-tone the difference between the major fourth and the third. The major tone surpasses the minor by a comma.

MAJOR-Domo, an Italian term frequently used to signify a steward or master of the household. The title of *major-domo* was formerly given in the courts of princes to three different kinds of officers. 1. To him who took care of what related to the prince's table, or eating; otherwise called *cleater*, *praefectus mensae*, *architrachinus*, *dapifer*, and *princeps coquorum*.—2. Major-domo was also applied to the steward of the household.—3. The title of major-domo was also given to the chief minister, or him to whom the prince deputed the administration of his affairs, foreign and domestic, relating to war as well as peace. Instances of major-domos in the first two senses are frequent in the English, French, and Norman affairs.

MAJOR, John, a scholastic divine and historian, was born at Haddington, in the province of East Lothian in Scotland. It appears from some passages in his writings, that he resided a while both at Oxford and Cambridge. He went to Paris in 1493, and studied in the college of St Barbe, under the famous John Boulac. Thence he removed to that of Montacute, where he began to study divinity under the celebrated Standouk. In the year 1498, he was entered of the college of Navarre. In 1505, he was created doctor in divinity; returned to Scotland in 1519, and taught theology during several years in the university of St Andrew's. But, at length, being disgusted with the quarrels of his countrymen, he went back to Paris, and resumed his lectures in the college of Montacute, where he had several pupils who afterwards became men of great eminence. About the year 1530, he returned once more to Scotland, and was chosen professor of theology at St Andrew's, of which he afterwards became provost; and there died in 1547, aged 78. His logical treatises form one immense folio; his commentary on Aristotle's physics makes another; and his theological works amount to several volumes of the same size. These masses of crude and useless disquisition were the admiration of his contemporaries. A work, less prized in his own age, was to make him known to posterity. His book *De Gestis Scotorum*, was first published at Paris by Badius Ascensius, in the year 1521. He rejects in it some of the fictions of former historians; and would have had greater merit if he had rejected more. He intermingles the history of England with that of Scotland; and has incurred the censure of some partial writers, for giving an authority to the authors of the former nation, which he refuses to those of his own. Bede, Caxton, and Froissard, were exceedingly useful to him. What does the greatest honour to this author is, the freedom with which he has censured the rapacity and indolence of ecclesiastics, and the strain of ridicule with which he treats the pope's supremacy. The style in which he wrote does not deserve commendation. Bishop Spotiswood calls it *Sorbonnic* and *barbarous*.

MAJORCA,

Majorca,
Mairan.

MAJORCA, an island of the Mediterranean, lying between Yvica on the west and Minorca on the east. These three islands were anciently called *Baleares*, supposed to be from the skill of their inhabitants in slinging, for which they were very remarkable. Originally they belonged to the Carthaginians; but during the wars of that people with the Romans they seem to have regained their liberty. In 122 B. C. they were subdued by Metellus the Roman consul, who treated the inhabitants with such cruelty, that out of 30,000 he scarce left 1000 alive. He then built two cities on Majorca; one called *Palma*, now *Majorca*, to the east; the other to the west, named *Pollentia*, now no longer in being. The island continued subject to the Romans, and to the nations who overran the western part of the empire, for many ages. At last it was subdued by the Moors about the year 800. By them the island was put in a much better condition than it ever was before or since. The Moors being very industrious, and also populous, surrounded the whole coast with fortifications, that is, with a kind of towers and lines between them; cultivated every spot in the island that was not either rock or sand; and had no fewer than 15 great towns, whereas now there are not above three. Neither was it at all difficult for the Moorish monarch to bring into the field an army much superior in number to the inhabitants that are now upon it, taking in all ranks, sexes, and ages. In 1229, the island was subdued by the king of Arragon, who established in it a new kingdom, feudatory to that of Arragon, which was again destroyed in 1341 by the same monarchs; and ever since, the island hath been subject to Spain, and hath entirely lost its importance. It is about 60 miles long, and 45 broad. The air is clear and temperate; and, by its situation, the heat in summer is so qualified by the breezes, that it is by far the most pleasant of all the islands in the Mediterranean. There are some mountains; but the country is generally flat, and of such an excellent soil, that it produces great quantities of corn as good in its kind as any in Europe. Oil, wine, and salt, are very plentiful, as also black cattle and sheep; but deer, rabbits, and wild-fowl, abound so much, that they alone are sufficient for the subsistence of the inhabitants. There are no rivers, but a great many springs and wells, as well as several good harbours. The inhabitants are robust, active, and good seamen.

MAJORCA, a handsome, large, rich, and strong town in the island of the same name, with a bishop's see. It contains about 6000 houses, and 22 churches, besides the cathedral. The squares, the cathedral, and the royal palace, are magnificent structures. A captain-general resides there, who commands the whole island; and there is a garrison against the incursion of the Moors. It was taken by the English in 1706; but was retaken in 1715, since which time it has been in the hands of the Spaniards. It is seated on the south-west part of the island, where there is a good harbour, 70 miles north-east of Yvica, 120 south-east of Barcelona, 140 east of Valencia, and 300 from Madrid. E. Long. 2. 55. N. Lat. 39. 36.

MAIRAN, JEAN JACQUES D'ORTOUS DE, descended from a noble family at Besiers, was born in that city in 1678, and died at Paris of a defluxion on the lungs on the 20th of February 1771, at the age of 93. He

was one of the most illustrious members of the Academy of Sciences and of the French Academy. Being early connected with the former society, he, in the year 1741, succeeded Fontenelle in the office of secretary. This station he filled with the most distinguished success till the year 1744; and, like his predecessor, possessed the faculty of placing the most abstract subjects in the clearest light; a talent which is very rare, but which appears conspicuous in all his works. The chief of them are. 1. *Dissertation sur la Glace*, the last edition of which was printed in 1749, 12mo. This excellent little tract has been translated into German and Italian. 2. *Dissertation sur la cause de la lumiere des Phosphores*, 1717, 12mo. 3. *Traité historique et physique de l'Aurore Boreale*, first published in 12mo, 1733, and afterwards much enlarged and printed in 4to in 1754. The system embraced by the author is liable to be controverted; but the book displays great taste and erudition. 4. *Lettre au Pere Parenau, contenant diverses questions sur la Chine*, 12mo. This is a very curious work, and is full of that philosophical spirit which characterizes the author's other publications. 5. A great number of papers in the memoirs of the Academy of Sciences (since 1719), of which he published some volumes. 6. Several dissertations on particular subjects, which form only small pamphlets. 7. The *Eloges* of the Academicians of the Academy of Sciences, who died in 1741, 1742, 1743, in 12mo, 1747. Without imitating Fontenelle, the author attained almost equal excellence by his talent of discriminating characters, appreciating their worth, and giving them their due share of praise, without at the same time concealing their defects.

Mairan's reputation extended itself into foreign countries. He was a member of the Imperial Academy at Petersburg, of the Royal Academy of London, of the Institution at Bologna, of the Royal Societies of Edinburgh and Upsal, &c. The gentleness and sweetness of his manners made him be considered as a perfect model of the social virtues. He possessed that amiable politeness, that agreeable gaiety, and that steady firmness, which never fail to procure love and esteem. But we must add, says M. Saverien, that every thing had a reference to himself; self-love and a regard to his own reputation were the motives of all his actions. He was deeply affected with censure or applause, and yet he had many friends. Uniting much gentleness of disposition to an ingenious and agreeable expression of countenance, he possessed the art of insinuating himself into the good graces of others, so as to pave the way to elevation and success. He was honoured with protection and particular marks of regard by the duke of Orleans the regent, who bequeathed to him his watch in his will. The prince of Conti loaded him with favours; and the chancellor Daguesseau, observing in him great originality and ingenuity of thought, appointed him president of the *Journal des Savans*: a station which he filled very much to the satisfaction of the public and of the learned. The private and selfish views imputed to him by M. Saverien never made him deficient in what was due to the strictest probity. An expression of his is remembered, which could have proceeded only from sentiment; "An honest man (said he) is one whose blood is refreshed with the recital of a good action." His

Mairan.

Mairan
Maistre

He was ready at repartee. One day he happened to be in company with a gentleman of the gown, and to differ with him in opinion upon some point which had no more connexion with jurisprudence than with geometry. "Sir (said the magistrate, who supposed that a learned man was a perfect idiot out of his own sphere), we are not now talking of Euclid or Archimedes."—"No, nor of Cujas nor Barthole!" replied the academicien.

MAIRE, STREIGHTS LE, a passage to Cape Horn, situated between Terra del Fuego and Staten island; which, being discovered by Le Maire, obtained his name. It is now, however, less made use of than formerly, ships going round Staten island at well as Terra del Fuego.

MAISTRE, LOUIS ISAAC LE, better known by the name of Sacy, was born at Paris in 1613. His genius very early discovered itself. After an excellent course of study under the direction of the abbot of Saint Cyran, he was raised to the priesthood in 1648, and soon after was chosen, on account of his virtues, to be director of the religious of Port Royal des Champs. As this monastery bore the reputation of Jansenism, their enemies were furnished with a pretence for persecuting them. In 1661 the director was obliged to conceal himself; and in 1666 he was committed to the Bastile. During his confinement he composed the book *Figures de la Bible*; in which, according to the Molinists, allusions are made to the sufferings endured by the Jansenists. If we may believe a Jesuit writer, the gentlemen of Port Royal and those who opposed their errors are represented in the 92d figure, the former by David, the latter by Saul. Rehoboam in the 116th figure, Jezebel in the 130th, Ahasuerus in the 148th and 150th, and Darius in the 160th, in the opinion of this author, represent Louis XIV. The writer of these anecdotes, of which we do not answer for the authenticity, adds, that when Sacy wished to reproach his persecutors, he always did it by means of the holy fathers. If this is the key to those enigmatical portraits and allusions, which it is pretended are to be found in that book, certain we are it is not discovered by the spirit of charity. Besides, it is not certain that Sacy was the author of that book; for it is much more probable that it was composed by Nicolas Fontaine his fellow prisoner.

To Sacy's confinement the public are indebted for a French translation of the Bible. This work was finished in 1668, the evening before the feast of All Saints; on which day he recovered his liberty, after an imprisonment of two years and a half. He was presented to the king and the minister; and all the favour he asked from them was, that they would send several times a year to examine the state of the prisoners in the Bastile. Le Maistre continued at Paris till 1675, when he retired to Port Royal, which he was obliged to leave in 1679. He went to settle at Pomponne, where he died January 4. 1684, at the age of 71. From him we have, 1. *La Traduction de la Bible*, with explanations of the spiritual and literal meaning taken from the fathers, the greater part of which was done by Du Fossé, Huré, and Tourneux. This is the best French translation which has yet appeared, and the most esteemed edition is that of Paris in 32 volumes 8vo, 1682 and following years. The author trans-

lated the New Testament three times, because the first time the style of it appeared too much laboured and too refined, and the second too simple. A counterfeit of the edition in 32 vols. 8vo, was published at Brussels in 40 vols. 12mo. The best editions of this version have been published at Brussels, 1700, in 3 vols. 4to; at Amsterdam, under the name of *Paris*, 1711, 8 vols. 12mo; at Paris 1713, in 2 vols. 4to; and in 1715, with notes and a concordance, 4 vols. folio. 2. *Une Traduction des Pseaumes selon l'Hebreu et la Vulgate*, in 12mo. 3. *Une version des Homelies de St Chrysostome sur St Matthieu*, in 3 vols. 8vo. 4. *La Traduction de l'Imitation de Jesus Christ (sous le nom de Beuil, prieur de Saint-Val)*, Paris 1663, 8vo. 5. *Celle de Phedre*, 12mo, (sous le nom de Saint-Aubin). 6. *De trois Comédies de Térence*, in 12mo. 7. *Des Lettres de Bongars (sous le nom de Brianville)*. 8. *Du Poème de St Prosper sur les ingrates*, 12mo, en vers et en prose. 9. *Les Enluminures de l'Almanach des Jésuites*, 1654, 12mo, reprinted in 1733. In 1653 there appeared a print representing the overthrow of Jansenism anathematized by the two powers, and the confusion of the disciples of the bishop of Ypres, who are going to seek refuge with the Calvinists. The monks of Port-Royal were greatly provoked at this print, and Sacy thought that he would lower its reputation by means of his *Enluminures*, which Racine has ridiculed in one of his letters. It is indeed very strange that men of taste and piety should write satires to the injury of one another. 10. *Heures de Port-Royal*, 12mo. 11. *Lettres de Piété*, Paris 1690, 2 vols. 8vo.

MAITTAIRE, MICHAEL, a learned English writer, was born in 1668. Dr South, canon of Christ-Church, made him a student of that house, where he took the degree of M. A. March 23. 1696. From 1695 till 1699 he was second master of Westminster school; which was afterwards indebted to him for *Græca Linguae Dialecti, in usum Scholæ Westmonasteriensis*, 1706, 8vo; and for the "English Grammar, applied to, and exemplified in, the English Tongue, 1712," 8vo. In 1711, he published "Remarks on Mr Whiston's Account of the Convocation's proceedings with relation to himself, in a Letter to the right reverend Father in God George Lord Bishop of Bath and Wells," 8vo; also "An Essay against Arianism, and some other Heresies; or a Reply to Mr William Whiston's Historical Preface and Appendix to his Primitive Christianity revived," 8vo. In 1709 he gave the first specimen of his great skill in typographical antiquities, by publishing *Stephanorum Historia, vitas ipsorum ac libros complectens*, 8vo; which was followed in 1717 by *Historia Typographorum aliquot Parisiensium, vitas et libros complectens*, 8vo. In 1719, *Annales Typographici ab artis inventæ origine ad annum MD*, 4to. The second volume, divided into two parts, and continued to the year 1536, was published at the Hague in 1702; introduced by a letter of John Toland, under the title of *Conjectura verisimilis de prima Typographiæ Inventione*. The third volume, from the same press, in two parts, continued to 1557, and (by an Appendix) to 1664, in 1725. In 1733 was published at Amsterdam what is usually considered as the fourth volume, under the title of *Annales Typographici ab artis inventæ origine, ad annum MDCLXIV, operâ Mich. Maïttaire, A. M. editio nova, auctior et emendatior*;

tomi

Maittaire. *tomii primi pars posterior* (A). In 1741 the work was closed at London, by *Annalium Typographicorum Tomus quintus et ultimus, indicem in tomos quatuor præcunctes complectens*; divided, like the two preceding volumes, into two parts. In the intermediate years, Mr Maittaire was diligently employed on various works of value. In 1713 he published by subscription *Opera et Fragmenta Veterum Poëtarum*, 1713, two volumes in folio: the title of some copies is dated 1721. In 1714, he was the editor of a Greek Testament, in 2 vols. The Latin writers, which he published separately, most of them with good indexes, came out in the following order: In 1713, *Christus Patiens*; *Justin*; *Lucretius*; *Phædrus*; *Sallust*; *Terence*. In 1715, *Catullus*; *Tibullus*; *Propertius*; *Cornelius Nepos*; *Florus*; *Horace*; *Juvenal*; *Ovid*, 3 vols; *Virgil*. In 1711, *Cæsar's Commentaries*; *Martial*; *Quintus Curtius*. In 1718 and 1725, *Velleius Paterculus*. In 1719, *Lucan*. In 1720, *Bonifontii Carmina*. In 1721, he published, *Batrachomyomachia, Græcè, ad veterum exemplarium fidem recusa*; *glossa Græca, variantibus lectionibus, versionibus Latinis, commentariis et indicibus, illustrata*, 8vo. In 1722, *Miscellanea Græcorum aliquot Scriptorum Carmina, cum versione Latina et notis*, 4to. In 1724 he compiled, at the request of Dr John Freind (at whose expence it was printed), an index to the works of *Aræteus*, to accompany the splendid folio edition of that author in 1723. In 1725 he published an excellent edition of *Anacreon* in 4to, of which no more than 100 copies were printed, and the few errata in each copy corrected by his own hand. A second edition of the like number was printed in 1741, with six copies on fine writing paper. In 1726 he published *Petri Petiti Medici Parisiensis in tres priores Aræti Cappadocis Libros Commentarii, nunc primum editi*, 4to. This learned commentary was found among the papers of Grævius. From 1728 to 1733 he was employed in publishing *Marmorum Arundelianorum, Seldenianorum, aliorumque Academiæ Oronienſis donatorum, una cum Commentariis et Indice, editio secunda*, folio; to which an Appendix was printed in 1733. *Epistola D. Mich. Maittaire ad D. P. Des Maisceaux, in qua Indices in Annales Typographicos methodus explicatur, &c.* printed in "The Present State of the Republic of Letters," August 1733, p. 142. The life of Robert Stephens in Latin, revised and corrected by the author, with a new and complete list of his works, is prefixed to the improved edition of R. Stephens's Thesaurus, 4 vols. in folio, in 1734. In 1736 appeared *Antiquæ Inscriptiones duæ*, folio; being a commentary on two large copper tables discovered near Heraclea, in the bay of Tarentum. In 1738 were printed at the Hague *Græcæ Linguae Dialecti in Scholâ Regiæ Westmonasteriensis usum recogniti, opera Mich. Maittaire*. In 1739 he addressed to the empress of Russia a small Latin poem, under the title of *Carmen Epicinium Augustissimæ Rusorum Imperatrici sacrum*. His name not having been printed

in the title page, it is not so generally known that he was editor of Plutarch's *Apophthegmata*, 1641, 4to. The last publication of Mr Maittaire was a volume of poems in 4to, 1742, under the title of *Scenica, sive Poetica aliquot in argumentis varii generis tentamina*. Mr Maittaire died in 1747, aged 79. His valuable library, which had been 50 years collecting, was sold by auction by Messrs Cock and Langford, at the close of the same year, and the beginning of the following, taking up in all 44 nights. Mr Maittaire, it may be added, was patronized by the first earl of Oxford, both before and after that gentleman's elevation to the peerage, and continued a favourite with his son the second earl. He was also Latin tutor to Mr Stanhope, the earl of Chesterfield's favourite son.

MAIZE, or **INDIAN Corn**. See **ZEA**, **BOTANY**. *Index*.

MAKI. See **LEMUR**, **MAMMALIA** *Index*.

MALABAR, the name given to a great part of the west coast of the peninsula of Hindostan on this side of the Ganges, extending from the kingdom of Baglalat to Cape Comorin, or from the north extremity of the kingdom of Canara as far as Cape Comorin, and lying between 9° and 14° N. Lat. It is bounded by the mountains of Balagate on the east; by Deccan on the north; and on the west and south is washed by the Indian sea.

MALACA, in *Ancient Geography*, surnamed *Fæderatorum* by Pliny; a maritime town of Bætica; a Carthaginian colony according to Strabo; so called from *Malach*, signifying "salt;" a place noted for pickled or salted meat. Now *Malega*, a port town of Granada in Spain. W. Long. 4. 45. N. Lat. 36. 40.

MALACCA, the most southerly part of the great peninsula beyond the Ganges, is about 600 miles in length, and contains a kingdom of the same name. It is bounded by the kingdom of Siam on the north; by the bay of Siam and the Indian ocean on the east; and by the straits of Malacca, which separate it from the island of Sumatra, on the south-west. This country is more to the south than any other in the East Indies; and comprehends the towns and kingdoms of Patan, Pahan, Igohor, Pera, Queda, Borkelon, Ligor; and to the north the town and kingdom of Tanassery, where the Portuguese formerly carried on a great trade. This last either does or did belong to the king of Siam. The people of Malacca are in general subject to the Dutch, who possess all the strong places on the coast, and compel them to trade on their own terms, excluding all other nations of Europe from having any commerce with the natives.

The Malays are governed by feudal laws. A chief, who has the title of *king* or *sultan*, issues his commands to his great vassals, who have other vassals in subjection to them in a similar manner. A small part of the nation live independent, under the title of *oranicai* or *noble*,

(A) The awkwardness of this title has induced many collectors to dispose of their first volume, as thinking it superseded by the second edition: but this is by no means the case; the volume of 1719 being equally necessary to complete the set as that of 1733, which is a revision of all the former volumes. The whole work, when properly bound, consists, *ad libitum*, either of five volumes or of nine.

Malacca. *ble.* and sell their services to those who pay them best; while the body of the nation is composed of slaves, and live in perpetual servitude.

The generality of these people are restless, fond of navigation, war, plunder, emigration, colonies, desperate enterprises, adventures, and gallantry. They talk incessantly of their honour and their bravery; whilst they are universally considered by those with whom they have intercourse, as the most treacherous, ferocious people on earth. This ferocity, which the Malays qualify under the name of *courage*, is so well known to the European companies who have settlements in the Indies, that they have universally agreed in prohibiting the captains of their ships who may put into the Malay islands, from taking on board any seamen from that nation, except in the greatest distress, and then on no account to exceed two or three. It is not in the least uncommon for a handful of these horrid savages suddenly to embark, attack a vessel by surprise, massacre the people, and make themselves masters of her. Malay batteaux, with 24 or 30 men, have been known to board European ships of 30 or 40 guns, in order to take possession of them, and murder with their poniards great part of the crew. Those who are not slaves go always armed: they would think themselves disgraced if they went abroad without their poniards, which they call *crit*. As their lives are a perpetual round of agitation and tumult, they cannot endure the long flowing garments in use among the other Asiatics. Their habits are exactly adapted to their shapes, and loaded with a multitude of buttons, which fasten them close to their bodies.

The country possessed by the Malays is in general very fertile. It abounds with odoriferous woods, such as the aloe, the sandal, and cassia. The ground is covered with flowers of the greatest fragrance, of which there is a perpetual succession throughout the year. There are abundance of mines of the most precious metals, said to be richer even than those of Brazil or Peru, and in some places are mines of diamonds. The sea also abounds with excellent fish, together with ambergris, pearls, and those delicate bird-nests so much in request in China, formed in the rocks with the spawn of fishes and the foam of the sea, by a species of small-sized swallow peculiar to those seas. These are of such an exquisite flavour, that the Chinese for a long time purchased them for their weight in gold, and still buy them at an excessive price. See *BIRDS-NEST*.

Notwithstanding all this plenty, however, the Malays are miserable. The culture of the lands, abandoned to slaves, is fallen into contempt. These wretched labourers, dragged incessantly from their rustic employments by their restless masters, who delight in war and maritime enterprises, have never time or resolution to give the necessary attention to the labouring of their grounds; of consequence the lands for the most part are uncultivated, and produce no kind of grain for the subsistence of the inhabitants. The sago tree indeed supplies in part the defect of grain. It is a species of the palm tree, which grows naturally in the woods to the height of about 20 or 30 feet; its circumference being sometimes from five to six. Its ligneous bark is about an inch in thickness, and covers a multitude of

long fibres, which being interwoven one with another envelope a mass of a gummy kind of meal. As soon as this tree is ripe, a whitish dust, which transpires through the pores of the leaves, and adheres to their extremities, indicates that the trees are in a state of maturity. The Malays then cut them down near the root, and divide them into several sections, which they split into quarters: they then scoop out the mass of mealy substance, which is enveloped by and adheres to the fibres; they dilute it in pure water, and then pass it through a straining bag of fine cloth, in order to separate it from the fibres. When this paste has lost part of its moisture by evaporation, the Malays throw it into a kind of earthen vessel of different shapes, where they allow it to dry and harden. This paste is wholesome nourishing food, and preserves for many years.

MALACCA, the capital of the country of the same name, is situated in a flat country close to the sea. The walls and fortifications are founded on a solid rock, and are carried up to a great height; the lower part of them is washed by the sea at every tide, and on the land side is a wide canal or ditch, cut from the sea to the river, which makes it an inland. In 1641 it was taken from the Portuguese by the Dutch, from which time it continued in their possession till 1795, when it was taken by the British. It was restored after the peace of Amiens, retaken in 1807 by the British, but appears to have been included in the cessions made to the Dutch by the treaty of 13th August 1814. The houses are tolerably well built, and some of them have gardens behind or on one side. The inhabitants consist of a few Dutch, many Malayans, Moors, Chinese, and other Indians. The city is well situated for navigation; but the trade of the place is trifling. E. Long. 102. 2. N. Lat. 2. 12.

MALACHI, or the prophecy of MALACHI, a canonical book of the Old Testament, and the last of the 12 lesser prophets. Malachi prophesied about 300 years before Christ, reproving the Jews for their wickedness after their return from Babylon, charging them with rebellion, sacrilege, adultery, profaneness, and infidelity; and condemning the priests for being scandalously careless in their ministry; at the same time not forgetting to encourage the pious few, who, in that corrupt age, maintained their integrity. This prophet distinctly points at the Messiah, who was suddenly to come to his temple, and to be introduced by Elijah the prophet, that is; John the Baptist, who came in the spirit and power of Elias or Elijah.

MALACIA, in *Medicine*, is a languishing disorder incident to pregnant women, in which they long sometimes for one kind of food and sometimes for another, and eat it with extraordinary greediness.

MALACOPTERYGEUS, in *Ichthyology*, an appellation given to fishes having the rays of their fins bony at the extremities, but not pointed, like those of acanthopterygeous fishes.

MALACOSTOMOUS FISHES, those destitute of teeth in the jaws, called in English *leather-mouthed*, as the tench, carp, bream, &c.

MALAGA, an ancient, rich, and strong town of Spain, in the kingdom of Granada, with two castles, a bishop's see, and a good harbour, which renders it a place of considerable commerce. The advantage

Malacca
||
Malaga

Malaga,
Malagrída.

of this commerce, according to M. Bourgoanne, is entirely in favour of Spain, but almost without any to its navigation; of 842 vessels which arrived at this port in 1782, from almost every commercial nation, scarcely 100 were Spanish, even reckoning the ships of war which anchored there. The English, who are in possession of the greatest part of the trade, carry thither woollens and great quantities of small ware; the Dutch carry spice, cutlery ware, laces, ribbons, thread, &c. These nations, those of the north, and Italy, export to the amount of two millions and a half of piastres in wines, fruits, sumach, pickled anchovies, oil, &c. and all they carry thither amounts only to about a million and a half. The balance would be still more advantageous for Malaga if the silk and wool of Granada were exported from this port; but these are employed in the country where they are produced. Sugar has been cultivated in the vicinity of this town for 700 years. The streets of Malaga are narrow, but there are some good squares; and the cathedral church is a superb building, said to be as large as St Paul's. The bishop's palace is a large edifice, but looks insignificant from its being situated near the other. Its prelate enjoys a revenue of 16,000l. sterling. Malaga is seated on the Mediterranean sea, at the foot of a craggy mountain. W. Long. 4. 10. N. Lat. 36. 51.

MALAGRIDA, GABRIEL, an Italian Jesuit, was chosen by the general of the order to conduct missions into Portugal. To great ease and fluency of speech, for which he was indebted to enthusiasm, he added the most ardent zeal for the interest of the society to which he belonged. He soon became the fashionable director; and every one, small or great, placed himself under his conduct. He was respected as a saint, and consulted as an oracle. When a conspiracy was formed by the duke d'Aveiro against the king of Portugal, it is asserted by the enemies of the society, that three Jesuits, among whom was Malagrída, were consulted concerning the measure. They add (what is very improbable), that it was decided by these casuists, that it was only a venial crime to kill a king who persecuted the saints. At that time the king of Portugal, spurred on by a minister who had no favour for the Jesuits, openly declared himself against them, and soon after banished them from his kingdom. Only three of them were apprehended, Malagrída, Alexander, and Mathos, who were accused of having approved this murder. But either the trial could not be proceeded in without the consent of the pope, which was not granted, or no proof could be got sufficient to condemn Malagrída; and therefore the king was obliged to deliver him to the Inquisition, as being suspected of having formerly advanced some rash propositions which bordered on heresy. Two publications which he acknowledged, and which give the fullest indications of complete insanity, were the foundation of these suspicions. The one was written in Latin, and entitled *Tractatus de vita et imperio Antichristi*; the other in Portuguese, under the title of the "Life of St Anne, composed with the assistance of the blessed Virgin Mary and her most holy Son." They are full of extravagance and absurdity.—This enthusiast pretended to have the gift of miracles. He confessed before the judges of the Inquisition, that God himself

VOL. XII. Part II.

†

had declared him his ambassador, apostle, and prophet; that he was united to God by a perpetual union; and that the Virgin Mary, with the consent of Jesus Christ and of the whole Trinity, had declared him to be her son. In short, he confessed, as is pretended, that he felt in the prison, at the age of 72, some emotions very uncommon at that period of life, which at first gave him great uneasiness, but that it had been revealed to him by God that these emotions were only the natural effect of an involuntary agitation, wherein there was the same merit as in prayer. It was for such extravagancies, that this unfortunate wretch was condemned by the Inquisition; but his death was hastened by a vision which he eagerly revealed. Upon occasion of the death of the marquis de Tancourt, commander in chief of the province of Estremadura, mournful and continued discharges were made in honour of him by the castle of Lisbon, and by all the forts on the banks of the Tagus. These being heard by Malagrída in his dungeon, he instantly supposed, from their extraordinary nature, and from their happening during the night, that the king was dead. The next day he demanded an audience from the members of the Inquisition: which being granted, he told them that he had been ordered by God to show the minister of the holy office that he was not a hypocrite, as was pretended; for the king's death had been revealed to him, and he had seen in a vision the torments to which his majesty was condemned for having persecuted the religious of his order. This was sufficient to accelerate his punishment: he was burnt on the 21st of September 1761; not as the accomplice of a parricide, but as a false prophet, for which he deserved to be confined in bedlam rather than tied to the stake. The acts of impiety whereof he was accused were nothing more than extravagancies proceeding from a mistaken devotion and an overheated brain.

MALDEN, a town of Essex, 37 miles from London, situated on an eminence at the conflux of the Chalmers and Pant or Blackwater, where they enter the sea. It was the first Roman colony in Britain, and the seat of some of the old British kings. It was besieged, plundered, and burnt by Queen Boadicea: but the Romans repaired it. It was again ruined by the Danes, but rebuilt by the Saxons. It has a convenient haven on an arm of the sea for vessels of 400 tons; and a considerable trade in coals, iron, corn, and deals. A little beyond it begins Blackwater bay, famous for the Walfleet oysters. The channel called Malden water is navigable to the town. King Edward the elder (of the Saxon race) resided here whilst he built Witham and Hertford castles. On the west side of the town are the remains of a camp. The population in 1811 was 2679.

MALALEUCA, the **CAYPUTI TREE**, a genus of plants belonging to the polyadelphia class. See **BOTANY Index**. This plant, which is a native of the Moluccas, yields the oil called *Cayputi*.

MALDIVIA ISLANDS, a cluster of small islands in the Indian ocean, 500 miles south-west of the continent of the island of Ceylon. They are about 1000 in number, and are very small; extending from the second degree of south latitude to the seventh degree of north latitude. They are generally black low lands, surrounded by rocks and sands. The natives are of the same complexion with the Arabians, profess the

3 H

||
Male-
branche.

Mahometan religion, and are subject to one sovereign. The channels between the islands are very narrow, and some of them are fordable. They produce neither rice, corn, nor herbage; but the natives live upon coconuts, and other fruits, roots, and fish. They carry on a little trade with the British Indian settlements, exchanging their salt-fish, turtle-shells, and cocoa, for rice, sugar, hardware, cloth, &c. They have also a considerable trade among themselves. Their manners are mild and inoffensive.

MALE, among zoologists, that sex of animals which has the parts of generation situated externally. See SEX and GENERATION.

The term *male* has also from some similitude to that sex in animals, been applied to several inanimate things; thus we say, a male flower, a male screw, &c. See *MAS Planta*, *MASCULUS Flos*, and *SCREW*; also *FE-MALE* and *FLOS*.

MALEBRANCHE, NICHOLAS, an eminent French metaphysician, the son of Nicholas Malebranche, secretary to the French king, was born in 1638, and admitted into the congregation of the oratory in 1660. He at first applied himself to the study of languages and history: but afterwards meeting with Des Cartes's *Treatise of Man*, he gave himself up entirely to the study of philosophy. In 1699, he was admitted an honorary member of the Royal Academy of Sciences at Paris. Notwithstanding he was of a delicate constitution, he enjoyed a pretty good state of health till his death, which happened in 1715, at the age of 77. Father Malebranche read little, but thought a great deal. He despised that kind of philosophy which consists only in knowing the opinions of other men, since a person may know the history of other men's thoughts without thinking himself. He could never read ten verses together without disgust. He meditated with his windows shut, in order to keep out the light, which he found to be a disturbance to him. His conversation turned upon the same subjects as his books; but was mixed with so much modesty and deference to the judgment of others, that it was extremely and universally desired. His books are famous; particularly his *Recherche de la Verité*, i. e. "Search after truth:" his design in which is, to point to us the errors into which we are daily led by our senses, imagination, and passions; and to prescribe a method for discovering the truth, which he does, by starting the notion of seeing all things in God. And hence he is led to think and speak meanly of human knowledge, either as it lies in written books, or in the book of nature, compared with that light which displays itself from the ideal world; and, by attending to which, with pure and defecate minds, he supposes knowledge to be most easily had. The fineness of this author's sentiments, together with his fine manner of expressing them, made every body admire his genius and abilities; but he has generally passed for a visionary philosopher. Mr Locke, in his examination of Malebranche's opinion of seeing all things in God, styles him, "an acute and ingenious author;" and tells us, that there are "a great many very fine thoughts, judicious reasonings, and uncommon reflections in his *Recherches*." But Mr Locke, in that piece, endeavours to refute the chief principles of his system. He wrote many other pieces besides that we have mentioned, all tending to confirm

Male-
branche,
Ma-le-
sherba.

his main system, established in the *Recherche*, and to clear it from the objections which were brought against it, or from the consequences which were deduced from it; and if he has not attained what he aimed at in these several productions, he has certainly shown great abilities and a vast force of genius. See SUPPLEMENT, FIRST DISSERTATION, p. 113.

MALESHERBES, CHRISTIAN-WILLIAM DE LAMOIGNON DE, was born at Paris in 1721. He was son of the chancellor of France, William de Lamoignon, who was descended of an illustrious family. His early education he received at the Jesuits college, applying himself afterwards to the study of the law with great assiduity, as well as history and political economy. He was chosen a counsellor of the parliament of Paris at the age of 24, and succeeded his father as president of the court of aids in the year 1750. With the presidentship of the court of aids he received the superintendance of the press, in whose hands it became the means of promoting liberty to a degree beyond all former example in that country. As he firmly believed that despotism alone had any reason to dread the liberty of the press, he was anxious to give it every extension consistent with sound policy and the state of public opinion. Through his favour the French Encyclopædia, the works of Rousseau, and many other free speculations, issued from the press, in defiance of the terrific anathemas of the Sorbonne. This had its own weight in paving the way to the horrors of the revolution, which Malesherbes did not probably foresee; yet it had also the happy effect of freeing the minds of men from the fetters of ignorance and superstition, and of enlightening them respecting their rights and duties in society.

The superintendance of the press having been taken from him, to confer it on that tool of despotism Maupeou, he was only the more intent on fulfilling the duties of his presidentship, and opposing arbitrary power with all his vigour, being thus freed from a number of other cares. When the proceedings of the court of aids were to be prohibited, on account of the spirited conduct of Malesherbes in the case of one Monnerat, who had been most unjustly treated by the farmers of the revenue, he presented a remonstrance to the king, containing a free protest against the enormous abuses of lettres de cachet, by which every man's liberty was rendered precarious, concluding with these memorable words; "no one is great enough to be secure from the hatred of a minister, nor little enough not to merit that of a clerk." Soon after this he was banished to his country-seat by a lettre de cachet, and the duke de Richelieu at the head of an armed force abolished the tribunal. In this state of retirement he committed to paper a number of observations on the political and judicial state of France, on agriculture and natural history, which all perished in the wreck of the revolution.

On the accession of Louis XVI. to the throne in 1774, he received an order to appear at the place where the court of aids had sat, and resume the presidentship of the tribunal thus restored. He laid before the new sovereign an ample memoir on the calamitous state of the kingdom, with a free exposure of the faults by which it had been produced, from a firm conviction that truth at all times should have access to the throne. His sentiments so fully accorded with those of

the

Male-
sherbes.

the young king, whose mind was not yet corrupted, that he was chosen minister of state in the year 1775, in which elevated rank he was only ambitious to extend the sphere of his usefulness. His first care was to visit the prisons, and restore to liberty the innocent victims of the former reign. His administration was also distinguished by the powerful encouragement of commerce and agriculture, being supported in his laudable endeavours by the able and virtuous Turgot, at that time comptroller-general of the revenue, who having lost his place through the intrigues of financiers, Malesherbes did not long retain his office after him. As he failed in his benevolent endeavours to ameliorate the condition of Protestants respecting the solemnization of marriage and the legitimating of their children, he resigned his office in the month of May 1776.

Being fond of travelling, and resolved to mix freely with people of every description, in order to acquire an accurate knowledge of human nature, he assumed the humble title of M. Guillaume, and commenced his journey in a simple, frugal manner. He travelled through France, Switzerland and Holland, frequently on foot, and lodged in villages, to have a nearer survey of the state of the country. He made memorandums, with the greatest care, of whatever he conceived to be worthy of observation respecting the productions of nature and the operations of industry; and after an absence of some years he returned to his favourite mansion, fully fraught with such a stock of valuable knowledge as his age and experience qualified him to appreciate.

Finding on his return that his native country was far advanced in philosophical principles, he drew up two elaborate memoirs to the king, one of them on the condition of the Protestants, and the other on civil liberty and toleration in general; and the difficulties with which ministers now found themselves surrounded, induced the king to call him to his councils, being a man who stood high in the esteem of the whole nation, but he received no appointment to any particular office. In the critical state in which he clearly saw the king stood, he made one effort for opening his eyes, by means of two spirited and energetic memoirs, "On the calamities of France, and the means of repairing them;" but, as the queen's party carried every thing before it, he was not even permitted to read them, and also denied a private interview with the ill-fated monarch, in consequence of which he took his final leave of the court.

When by a decree of the national convention the unfortunate Louis was to be tried for his life, Malesherbes generously offered to plead his cause, nobly forgetting the manner in which he had been banished from his councils. He was the person who announced to him his cruel doom, and one of the last who took leave of him, when taken out to suffer. After this eventful period, he withdrew to his retreat with a deeply wounded heart, and refused to hear any thing more of what was acting on the bloody theatre of Paris. Walking one morning in his garden, he perceived four men coming towards his house, sent by the convention to arrest his daughter Mad. Lepelletier Rossambo and her husband, once president of the parliament of Paris; and the accusation of Malesherbes was followed, as a matter of course, by the sentence of death. The truth

is, the convention never forgave his defence of the king; an action, however, in which he himself always gloried.

On the fatal day, this great man left the prison with a serene countenance; and, happening to stumble against a stone, he said (with the pleasantry of Sir Thomas More), "a Roman would have thought this an unlucky omen, and walked back again." He conversed with his children in the cart, took an affectionate farewell, and received the stroke in April 1794, in the 73d year of his age. Thus fell, by the insatiable cruelty of a monster, whose hatred to men of virtue and abilities was implacable, one of the most spotless and exemplary characters of the period at which he lived. The government afterwards made some reparation for the injustice done him, by ordering his bust to be placed among those of the great men who have reflected honour upon their country.

MALHERBE, FRANCIS DE, the best French poet of his time, was born at Caen about the year 1556, of a noble and ancient family. He quitted Normandy at 17 years of age; and went into Provence, where he attached himself to the family of Henry Angouleme; the natural son of King Henry II. and was in the service of that prince till he was killed by Altoviti in 1586. At length Cardinal de Perron, being informed of his merit and abilities, introduced him to Henry IV. who took him into his service. After that monarch's death, Queen Mary de Medicis settled a pension of 500 crowns upon our poet, who died at Paris in 1628. The best and most complete edition of his poetical works is that of 1666, with Menage's remarks. Malherbe so far excelled all the French poets who preceded him, that Boileau considers him as the father of French poetry: but he composed with great difficulty, and put his mind on the rack in correcting what he wrote. He was a man of singular humour, and blunt in his behaviour. When the poor used to promise him, that they would pray to God for him, he answered them, that "he did not believe they could have any great interest in heaven, since they were left in such a bad condition upon earth; and that he should be better pleased if the duke de Luyne, or some other favourite, had made him the same promise." He would often say that "the religion of gentlemen was that of their prince." During his last sickness he had much ado to resolve to confess to a priest: for which he gave this facetious reason, that "he never used to confess but at Easter." And some few moments before his death, when he had been in a lethargy two hours, he awaked on a sudden to reprove his landlady, who waited on him, for using a word that was not good French; saying to his confessor, who reprimanded him for it, that "he could not help it, and he would defend the purity of the French language to the last moment of his life."

MALICE, in *Ethics* and *Law*, is a formed design of doing mischief to another; it differs from hatred. In murder, it is malice makes the crime; and if a man, having a malicious intent to kill another, in the execution of his malice kills a person not intended, the malice shall be connected to his person, and he shall be adjudged a murderer. The words *ex malitia præcogitata* are necessary to an indictment of murder, &c. And this *malitia præcogitata*, or *malice prepense*,

Male-
sherbes

Malice
||
Mallet.

may be either express or implied in law. Express malice is, when one, with a sedate, deliberate mind, and formed design, kills another; which formed design is evidenced by external circumstances discovering that intention; as lying in wait, antecedent menaces, formed grudges, and concerted schemes to do him some bodily harm. Besides, where no malice is expressed, the law will imply it; as where a man wilfully poisons another, in such a deliberate act the law presumes malice, though no particular enmity can be proved. And if a man kills another suddenly, without any, or without a considerable provocation, the law implies malice; for no person, unless of an abandoned heart, would be guilty of such an act upon a slight or no apparent cause.

MALIGNANT, among physicians, a term applied to diseases of a very dangerous nature, and generally infectious; such are the dysentery, hospital fever, &c. in their worst stages.

Malignity among physicians signifies much the same with contagion. See **CONTAGION**.

MALL, **SEA-MALL**, or *Sea-mew*. See **LARUS**, **ORNITHOLOGY** *Index*.

MALLARD. See **ANAS**, **ORNITHOLOGY** *Index*.

MALLEABLE, a property of metals, whereby they are capable of being extended under the hammer.

MALLENDERS. See **FARRIERY** *Index*.

MALLEOLI, in the ancient art of war, were bundles of combustible materials, set on fire to give light in the night, or to annoy the enemy: when they were employed for the latter purpose they were shot out of a bow, or fixed to a javelin, and thus thrown into the enemies engines, ships, &c. in order to burn them. Pitch was always a principal ingredient in the composition. The malleoli had also the name of *pyroboli*.

MALLET, or **MALLOCH**, *David*, an English poet, but a Scotsman by birth, was born in that country about 1700. By the penury of his parents, he was compelled to be janitor of the high school at Edinburgh; but he surmounted the disadvantages of his birth and fortune; for when the duke of Montrose applied to the college of Edinburgh for a tutor to educate his sons, Malloch was recommended. When his pupils went abroad, they were intrusted to his care; and having conducted them through their travels, he returned with them to London. Here, residing in their family, he naturally gained admission to persons of high rank and character. His first production was the popular and pathetic ballad of "William and Margaret," which was printed in the *Plain Dealer*, N^o 36. 1724. In the last edition of his works it appears considerably altered. In 1733, he published a poem on verbal Criticism, on purpose to make his court to Pope. In 1740, he wrote a *Life of Lord Bacon*, which was then prefixed to an edition of his works; but with so much more knowledge of history than of science, that, when he afterwards undertook the *Life of Marlborough*, some were apprehensive lest he should forget that Marlborough was a general, as he had forgotten that Bacon was a philosopher. The old duchess of Marlborough assigned in her will this task to Glover and Mallet, with a reward of 1000*l.* and a prohibition to insert any verses. Glover is supposed to have rejected the legacy with disdain, so that the work devolved

upon Mallet; who had also a pension from the duke of Marlborough to promote his industry, and who was continually talking of the discoveries he made, but left not when he died any historical labours behind. When the prince of Wales was driven from the palace, and kept a separate court by way of opposition, to increase his popularity by patronizing literature, he made Mallet his under secretary, with a salary of 200*l.* a-year.—Thomson likewise had a pension; and they were associated in the composition of the *Masque of Alfred*, which, in its original state, was played at Cliefden in 1740. It was afterwards almost wholly changed by Mallet, and brought upon the stage of Drury Lane in 1751, but with no great success. He had before published two tragedies; *Eurydice*, acted at Drury Lane in 1731; and *Mustapha*, acted at the same theatre in 1739. It was dedicated to the prince his master, and was well received, but never was revived. His next work was *Amyntor and Theodora* (1747), a long story in blank verse; in which there is a copiousness and elegance of language, vigour of sentiment, and imagery well adapted to take possession of the fancy. In 1753, his *masque of Britannia* was acted at Drury Lane, and his tragedy of *Elvira* in 1763; in which year he was appointed keeper of the book of entries for ships in the port of London. In the beginning of the war, which ended in 1763, when the nation was exasperated by ill success, he was employed to turn the public vengeance upon Byng, and wrote a letter of accusation under the character of a Plain Man. The paper was with great industry circulated and dispersed; and for his seasonable intervention he had a considerable pension bestowed upon him, which he retained to his death. Towards the end of his life he went with his wife to France; but after a while, finding his health declining, he returned alone to England, and died in April 1765. He was twice married, and by his first wife had several children. One daughter, who married an Italian of rank named Cilezia, wrote a tragedy called *Almida*, which was acted at Drury Lane. His stature was diminutive, but, he was regularly formed; his appearance, till he grew corpulent, was agreeable, and he suffered it to want no recommendation that dress could give it. His conversation was elegant and easy.

MALLET, *Edme*, was born at Melun in 1713, and enjoyed a curacy in the neighbourhood of his native place till 1751, when he went to Paris to be professor of theology in the college of Navarre, of which he was admitted a doctor. Boyer, bishop of Mirepoix, was at first much prejudiced against him; but being afterwards undeceived, he conferred upon him the see of Verdun as a reward for his doctrine and morals. Jansenism had been imputed to him by his enemies with his prelate; and the gazette which went by the name of *Ecclesiastical*, accused him of impiety. Either of these imputations was equally undeserved by the abbé Mallet: as a Christian, he was grieved at the disputes of the French church; and as a philosopher, he was astonished that the government had not, from the very beginning of those dissensions imposed silence on both parties. He died at Paris in 1755, at the age of 42. The principal of his works are, 1. *Principes pour la lecture des Poètes*, 1745, 12mo, 2 vols. 2. *Essai sur l'Etude des Belles Lettres*, 1747, 12mo.

Mallet,
Mallicollo.

12mo. 3. *Essai sur les bienséances oratoires*, 1753, 12mo.
4. *Principes pour la lecture des Orateurs*, 1753, 12mo.
3 vols. 5. *Histoire des Guerres civiles de France sous les regnes de François II. Charles IX. Henri III. et Henri IV.* translated from the Italian of d'Avila.— In Mallet's work on the Poets, Orators, and the Belles Lettres, his object is no more than to explain with accuracy and precision the rules of the great masters, and to support them by examples from authors ancient and modern. The style of his different writings, to which his mind bore a great resemblance, was neat, easy, and unaffected. But what must render his memory estimable, was his attachment to his friends, his candour, moderation, gentleness, and modesty. He was employed to write the theological and belles lettres articles in the *Encyclopédie*; and whatever he wrote in that dictionary was in general well composed. Abbé Mallet was preparing two important works when the world was deprived of him by death. The first was *Une Histoire generale de nos Guerres depuis le commencement de la Monarchie*; the second, *Une Histoire de Concile de Trente*, which he intended to set in opposition to that of Father Paul translated by Father le Courayer.

MALLET, a large kind of hammer made of wood; much used by artificers who work with a chissel, as sculptors, masons, and stone-cutters, whose mallet is ordinarily round; and by carpenters, joiners, &c. who use it square. There are several sorts of mallets used for different purposes on ship-board. The calking mallet is chiefly employed to drive the oakum into the seams of a ship, where the edges of the planks are joined to each other in the sides, deck, or bottom. The head of this mallet is long and cylindrical, being hooped with iron to prevent it from splitting in the exercise of calking. There is also the serving mallet, used in serving the rigging, by binding the spun yarn more firmly about it than it could possibly be done by hand, which is performed in the following manner; the spun-yarn being previously rolled up in a large ball or clue, two or three turns of it are passed about the rope, and about the body of the mallet, which for this purpose is furnished with a round channel in its surface, that conforms to the convexity of the rope intended to be served. The turns of the spun-yarn being strained round the mallet, so as to confine it firmly to the rope, which is extended above the deck, one man passes the ball continually about the rope, whilst the other, at the same time, winds on the spun-yarn by means of the mallet, whose handle acting as a lever strains every turn about the rope as firm as possible.

MALLICOLLO, one of the largest of the New Hebrides, in the Pacific ocean. It extends twenty leagues from north to south. Its inland mountains are very high, and clad with forests. Its vegetable productions are luxuriant, and in great variety; cocoa-nuts, breadfruit, bananas, sugar-canes, yams, eddoes, turmeric, and oranges. Hogs and common poultry are the domestic animals. The inhabitants appear to be of a race totally distinct from those of the Friendly and Society islands. Their form, language, and manners, are widely different. They seem to correspond in many particulars with the natives of New Guinea, particularly in their black colour and woolly hair. They go almost naked, are of a slender make, have lively but

very irregular ugly features, and tie a rope fast round their belly. They use bows and arrows as their principal weapons, and the arrows are said to be sometimes poisoned. They keep their bodies entirely free from punctures, which is one particular that remarkably distinguishes them from the other tribes of the Pacific ocean.

The population, according to Mr Forster, may amount to 50,000, who occupy 600 square miles of ground. The same author informs us that very few women were seen, but that those few were no less ugly than the men, were of small stature, and their heads, faces, and shoulders were painted red. They had bundles on their backs containing their children, and the men seemed to have no kind of regard for them. They appeared in fact to be oppressed, despised, and in a state of servility.

The men use bows and arrows, and a club about 30 inches long, which they hang on their right shoulder, from a thick rope made of a kind of grass. They live chiefly on vegetables, and apply themselves to husbandry. Their music had nothing remarkable in it, either for harmony or variety, but seemed to Mr Forster to be of a more lively turn than that at the Friendly islands. In some of their countenances he thought he could trace a mischievous, ill-natured disposition, but he confesses that he might mistake jealousy for hatred. It is in 16° 28' S. Lat. and 167° 56' E. Long.

MALLOW, a manor, and also a borough town in the county of Cork, and province of Munster, in Ireland, above 118 miles from Dublin, pleasantly situated on the north bank of the Blackwater, over which there is an excellent stone bridge. Not far distant is a fine spring of a moderately tepid water, which bursts out of the bottom of a fine limestone rock, and approaches the nearest in all its qualities to the hot-well waters of Bristol of any that has been yet discovered in this kingdom, which brings a resort of good company there frequently in the summer months, and has caused it to be called the *Irish Bath*.

MALLOW. See MALVA, BOTANY *Index*.

Marsh-MALLOW. See ALTHEA, BOTANY *Index*.

Indian-MALLOW. See SIDA, BOTANY *Index*.

MALMSBURY, a town of Wiltshire in England, 95 miles from London. It stands on a hill, with six bridges over the river Avon at the bottom; with which and a brook that runs into it, it is in a manner encompassed. It formerly had walls and a castle, which was pulled down to enlarge the abbey, which was the largest in Wiltshire, and its abbots sat in parliament. The Saxon king Athelstan granted the town large immunities, and was buried under the high altar of the church, and his monument still remains in the nave of it. The memory of Aldhelm, its first abbot, who was the king's great favourite, and whom he got to be canonized after his death, is still kept up by a meadow near this town, called Aldhelm's Mead. By charter of King William III. the corporation consists of an alderman, who is chosen yearly, 12 capital burgesses, and 4 assistants. Here is an alms-house for 4 men and 4 women, and near the bridge an hospital for lepers, where it is supposed there was formerly a nunnery. This town contained, in 1811, 1152 inhabitants, and has a considerable trade in the woollen manufactory; has

Mallicollo
||

Malsbury, has a market on Saturday, and three fairs. It has sent members to parliament ever since the 26th of Edward I.

William of MALMSBURY. See WILLIAM.

MALO, ST, a sea-port town of France, in the province of Brittany, situated in the latitude of 48 degrees 38 minutes north, and 1 degree 57 minutes to the west. The town stands upon a rock called the island of St Aaron, surrounded by the sea at high water, which is now joined to the continent, by means of a sort of causeway or dike, near a mile long, called the Sillon, which has often been damaged by storms, and was almost quite ruined in the year 1730. At the end of this causeway next the town is a castle, flanked with large towers, a good ditch, and a large bastion. The city nearly covers the whole surface of the island, and is of an oblong form, surrounded with a strong rampart, on which there is a number of cannon.— There is always in it a good garrison. The cathedral church is dedicated to St Vincent, and stands in the square of the same name, as do also the town-house and the episcopal palace. There are some other squares in the place, but less remarkable; and as to the streets, except two or three, they are all very narrow. There being no springs of fresh water in St Malo, the inhabitants are at great pains to convey the rain which falls on the roofs of their houses into cisterns; and of this they have enough for all family uses. There is only one parish church in the town, though it contain between 9000 and 10,000 inhabitants; but there are several convents of monks and nuns, and a general hospital. The two entrances into the harbour are defended by several forts, such as that of the Couchal; of the great and the little bay; the forts of Isle Rebour, Sezembre, Roteneuf; the castle of Latte, and Fort-Royal. These are several little isles near the harbour, the most considerable whereof is that of St Sezembre, which is near a quarter of a league in circumference, and serve as so many outworks to the fortifications of the city, and are useful as bulwarks, by breaking the violence of the waves, which otherwise would beat with great force against the walls of the city. At the end of the causeway next the continent stands the suburb of St Servant, large and well built. Here the merchants have their houses and storehouses. Here is the dockyard; and a secure harbour is formed by the river Rance, where ships of great burden can ride at anchor very near the houses. The harbour is one of the best in the kingdom, and most frequented by merchant ships; but it is of very difficult and dangerous access on account of the rocks which lie round it. The town of St Malo is exceedingly well situated for trade; and accordingly, in this respect, it has succeeded beyond most towns in France. It maintains a trade with England, Holland, and Spain.— The commerce of Spain is of all the most considerable, and most profitable to the inhabitants of St Malo, the ships of the Malouins being frequently employed as register ships by the Spaniards, to carry out the rich cargoes to Peru and Mexico, and bring home treasure and plate from America. The inhabitants of St Malo carry on also a considerable trade in dry and salted cod to Newfoundland. They send to this fishery a good many vessels from 100 to 300 tons burden, with salt for the fish, and provisions for sub-

sisting the crews. They carry their fish to Italy, Spain, and some to Bourdeaux and Bayonne, and bring home the returns in fruits, soap, oil, &c. which are disposed of to great advantage at Nantz. St Malo is the capital of the bishopric of that name, which is of considerable extent; and the soil about it produces most kinds of grain and fruits in great abundance. The most remarkable towns in the district and diocese of St Malo, are St Servand, Cancalle, Chateauf, Dinan, Tintimiac, Combours, Montfort, Breal, Guer, Plocrmel, Josselin, &c.

MALO, *Maclou*, or *Mahout*, Saint, the son of an Englishman, and cousin to St Magloire, was educated in a monastery in Ireland, and afterwards chosen bishop of Gui-Castel, a dignity which his humility prevented him from accepting. The people wishing to compel him, he went to Brittany, and put himself under the direction of a holy anchorite called Aaron, in the neighbourhood of Aleth. Some time after, about the year 541, he was chosen bishop of that city, and there cultivated piety and religion with great success. He afterwards retired to a solitude near Xaintes, where he died November 15. 565. From him the city of St Malo derives its name; his body having been carried thither, after the reduction of Aleth to a small village called *Guidalet* or *Guichalet*, and the transference of the episcopal see to St Malo.

MALOUIN, PAUL-JAQUES, born at Caen in 1701, was professor of medicine in the royal college of Paris, physician in ordinary to the queen, and a member of the Royal Society of London, and of the Academy of Sciences of Paris. These stations were a proper reward for his very extensive information in medicine and chemistry; and his amiable and steady character procured him many friends and protectors. He was very unlike some modern physicians, who put little trust in medicine; and was greatly displeased to hear any ill spoken of his profession. He observed one day to a young man who took this liberty, that all great men had respected medicine: *Ah!* said the young fellow, *you must at least except from the list one Moliere.* *But then,* instantly replied the doctor, *you see he is dead.* He is said to have believed the certainty of his art as firmly as a mathematician does that of geometry. Having prescribed a great many medicines for a celebrated man of letters, who followed his directions exactly, and was cured, Malouin eagerly embraced him, saying, *You deserve to be sick.* As he valued the rules of medicine still more on his own account than on that of others, he observed, especially in the latter part of his life, a very austere regimen. He strictly practised the preservative part of medicine, which is much more certain in its effects than the restorative. To this regimen Malouin was indebted, for what many philosophers have desired in vain, a healthy old age and an easy death. He was a stranger to the infirmities of age; and died at Paris of an apoplexy, the 3d of January 1778, in the 77th year of his age. By his will he left a legacy to the faculty of medicine, upon condition of their holding a public meeting every year for the purpose of giving the public an account of his labours and discoveries. Malouin was economical, but at the same time very disinterested. After two years of very lucrative practice, he left Paris and went to Versailles, where he saw very few patients, observing that

Malouin
|

quet.

that he had *retired to the court*. His principal works are, 1. *Traité de Chimie*, 1734, 12mo. 2. *Chimie Medicinale*, 2 vols. 12mo, 1755; a book full of curious observations, and written in a chaste and well adapted style. He had the character of a laborious chemist; and he was a well-informed and even a distinguished one for the age in which he lived: but his knowledge of chemistry, it must be confessed, was very imperfect, compared with the state of the science in the present age, in which it has assumed a new face, that probably will not be the last. 3. Some of the articles in the Collection published by the Academy of Sciences on the arts and professions. A circumstance which happened at a meeting of the academy does as much honour to his heart, as any of his works do to his understanding. A new treatise on the art of baking, wherein some of Malouin's ideas were combated, was read by M. Parmentier before his fellows, among whom was the old doctor. The young academican, who knew how easily self-love is hurt, was afraid to meet his looks: but no sooner was the reading finished, than Malouin went up to him, and embracing him, "Receive my respects (said he), you have seen farther into the subject than I did." 4. He was likewise the author of the chemical articles in the *Encyclopedie*.

Of the same family was *Charles MALOUI*N, who graduated as a doctor of medicine in the university of Caen, and died in 1718 in the flower of his age. He published a *Treatise on Solids and Fluids*, Paris 1718, 12mo.

MALPAS, a town of Cheshire, 166 miles from London. It stands on a high hill, nor far from the river Dee, on the borders of Shropshire; has a grammar school, and an hospital, and had formerly a castle. It is called in Latin *Mala Platea*, i. e. "Ill Street," and was, for the same reason, by the Normans, called *Mal Pas*; but its three streets, of which it chiefly consists, are now well paved; and here is a benefice rich enough to support two rectors, who officiate alternately in its stately church. The population of this place in 1811 was 938.

MALPIGHI, MARCELLUS, an eminent Italian physician and anatomist in the 17th century. He studied under Massari and Mariano. The duke of Tuscany invited him to Pisa, to be professor of physic there. In this city he contracted an intimate acquaintance with Borelli, to whom he ascribed all the discoveries he had made. He went back to Bologna, the air of Pisa not agreeing with him. Cardinal Antonio Pignatelli, who had known him while he was legate at Bologna, being chosen pope in 1691, under the name of *Innocent XII.* immediately sent for him to Rome, and appointed him his physician. But this did not hinder him from pursuing his studies, and perfecting his works, which have immortalized his memory. He died in 1694; and his works, with his life written by himself, prefixed, were first collected and printed at London, in folio, in 1667.

MALPIGHIA, BARBADOES CHERRY; a genus of plants belonging to the decandria class; and in the natural method ranking under the 23d order, *Trihilitata*. See *BOTANY Index*.

MALPLAQUET, a village of the Netherlands, in Hainault, famous for a most bloody battle fought here

on the 11th of September 1709, between the French under old Marshal Villars, and the allies commanded by Prince Eugene and the duke of Marlborough. The French army amounted to 120,000 men; and were posted behind the woods of La Marte and Teniers, in the neighbourhood of Malplaquet. They had fortified their situation in such a manner with lines, hedges, and trees laid across, that they seemed to be quite inaccessible. In this situation they expected certain victory; and even the common soldiers were so eager to engage, that they flung away the bread which had been just given them, though they had taken no sustenance for a whole day before. The allied army began the attack early in the morning, being favoured by a thick fog. The chief fury of their impression was made upon the left of the enemy; and with such success, that, notwithstanding their lines and barricadoes, the French were in less than an hour driven from their entrenchments. But on the enemy's right the combat was sustained with much greater obstinacy. The Dutch, who carried on the attack, drove them from their first line; but were repulsed from the second with great slaughter. The prince of Orange, who headed that attack, persisted in his efforts with incredible perseverance and intrepidity, though two horses had been killed under him, and the greater part of his officers slain and disabled. At last, however, the French were obliged to yield up the field of battle; but not till after having sold a dear-bought victory. Villars being dangerously wounded, they made an excellent retreat under the conduct of Bouffers, and took post near Guesnoy and Valenciennes. The conquerors took possession of the field of battle, on which above 20,000 of their best troops lay dead. The loss of the French, it is said, did not exceed 8000; and Marshal Villars confidently asserted, that, if he had not been disabled, he would have gained an undoubted victory.

MALT, denotes barley cured, or prepared to fit it for making a potable liquor, under the denomination *beer* or *ale*. See *BREWING* in this work, and the same article in the *SUPPLEMENT*.

MALT-Liquors have different names as well as different virtues, properties, and uses, both from the different manners of preparing the malt, whence they are distinguished into *pale* and *brown*; and from the different manners of preparing or brewing the liquors themselves; whence they are divided into *beer* and *ale*, *strong* and *small*, *new* and *old*.

Malt drinks are either pale or brown, as the malt is more or less dried on the kiln: that which is the slenderest dried tinging the liquor least in brewing, and therefore being called *pale*; whereas that higher dried, and as it were roasted, makes it of a higher colour. A mixture of both makes an amber colour; whence several of these liquors take their name.

Now, it is certain, the pale malt has most of the natural grain in it, and is therefore the most nourishing; but, for the same reason, it requires a stronger constitution to digest it. Those who drink much of it, are usually fat and sleek in the bloom, but are often cut off by sudden fevers; or, if they avoid this, they fall early into a distempered old age.

The brown malt makes a drink much less viscid, and fitter to pass the several strainers of the body; but, if very strong, it may lead on to the same inconveni-

Malpla-
quet,
Malt.

Malt ces with the pale: though a single debauch wears off much more easily in the brown.

Dr Quincy observes, that the best pale malt-liquors are those brewed with hard waters, as those of springs and wells, because the mineral particles, wherewith these waters are impregnated, help to prevent the cohesions of those drawn from the grain, and enable them to pass the proper secretions the better; as the viscid particles of the grain do likewise defend these from doing the mischief they might otherwise occasion. But softer waters seem best suited to draw out the substance of high dried malts, which retain many fiery particles in their contexture, and are therefore best lost in a smooth vehicle.

For the differences in the preparation of malt liquors, they chiefly consist in the use of hops, as in beer; or in the more sparing use of them, as in ale.

The difference made by hops is best discovered from the nature and quality of the hops themselves: these are known to be a subtle grateful bitter; in their composition, therefore, with this liquor, they add somewhat of an alkaline nature, i. e. particles that are sublime, active, and rigid. By which means, the ropy viscid parts of the malt are more divided and subtilized: and are therefore not only rendered more easy of digestion and secretion in the body, but also, while in the liquor, they prevent it from running into such cohesions as would make it ropy, vapid, and sour.

For want of this, in unhopped drinks, that clammy sweetness, which they retain after working, soon turns them acid and unfit for use; which happens sooner or later in proportion to the strength they receive from the malt, and the comminution that it has undergone by fermentation.

The different strengths of malt liquors also make their effects different. The stronger they are, the more viscid parts they carry into the blood; and though the spirituous parts make these imperceptible at first, yet when those are evaporated, which will be in a few hours, the other will be sensibly felt by pains in the head, nausea at the stomach, and lassitude or listlessness to motion. This those are the most sensible of who have experienced the extremes of drinking these liquors and wines; for a debauch of wine they find much sooner worn off, and they are much more lively and brisk afterwards, than after fuddling malt liquors, whose viscid remains will be long before they be shaken off.

Malt liquors, therefore, are, in general, the more wholesome for being small; i. e. of such a strength as is liable to carry a small degree of warmth into the stomach, but not so great as to prevent their being proper diluters of the necessary food. Indeed, in robust people, or those who labour hard, the viscidities of the drink may be broken into convenient nourishment; but in persons of another habit and way of living, they serve rather to promote obstructions and ill humours.

The age of malt liquors is the last thing by which they are rendered more or less wholesome. Age seems to do nearly the same thing as hops; for those liquors which are longest kept are certainly the least viscid; age breaking the viscid parts, and by degrees rendering them smaller, and fitter for secretion.

But this is always determined according to their

strength; in proportion to which, they will sooner or later come to their full perfection as well as decay; for, when ale or beer is kept till its particles are broken and comminuted as far as they are capable, then it is that they are best; and, beyond this, they will be continually on the decay, till the finer spirits are entirely escaped, and the remainder becomes vapid and sour.

MALT-Distillery. This is an extensive article of trade; and by which very large fortunes are made. The art is to convert fermented malt liquors into a clear inflammable spirit, which may be either sold for use in the common state of a proof strength, that is, the same strength with French brandy; or is rectified into that purer spirit usually sold under the name of *spirit of wine*; or made into compound cordial waters, by being distilled again from herbs and other ingredients. See BREWING and WASH.

To brew with malt in the most advantageous manner, it is necessary, 1. That the subject be well prepared; 2. That the water be suitable and duly applied; and, 3. That some certain additions be used, or alterations made, according to the season of the year, and the intention of the operator: and by a proper regulation in these respects, all the fermentable parts of the subject will thus be brought into the tincture, and become fit for fermentation.

The due preparation of the subject consists in its being justly malted and well ground. When the grain is not sufficiently malted, it is apt to prove hard, so that the water can have but very little power to dissolve its substance; and if it be too much malted, a part of the fermentable matter is lost in that operation. The harder and more stinty the malt is, the finer it ought to be ground; and in all cases, when intended for distillation, it is advisable to reduce it to a kind of finer or coarser meal. When the malt is thus ground, it is found by experience that great part of the time, trouble, and expence of the brewing is saved by it, and yet as large a quantity of spirit will be produced; for thus the whole substance of the malt may remain mixed among the tincture, and be fermented and distilled among it. This is a particular that very well deserves the attention of the malt distiller as that trade is at present carried on; for the despatch of the business, and the quantity of spirit procured, is more attended to than the purity or perfection of it.

The secret of this matter depends upon the thoroughly mixing or briskly agitating and throwing the meal about, first in cold and then in hot water; and repeating this agitation after the fermentation is over, when the thick turbid wash being immediately committed to the still already hot and dewy with working, there is no danger of burning, unless by accident, even without the farther trouble of stirring, which in this case is found needless, though the quantity be ever so large, provided that requisite care and cleanliness be used; and thus the business of brewing and fermenting may very commodiously be performed together, and reduced to one single operation. Whatever water is made choice of, it must stand in a hot state upon the prepared malt, especially if a clear tincture be desired; but a known and very great inconvenience attends its being applied too hot, or too near

Malt

Malt

to a state of boiling, or even scalding with regard to the hand. To save time in this case, and to prevent the malt running into lumps and clods, the best way is to put a certain measured quantity of cold water to the malt first; the malt is then to be stirred very well with this, so as to form a sort of thin uniform paste or pudding; after which the remaining quantity of water required may be added in a state of boiling, without the least danger of making what, in the distiller's language, is called a *pudden*.

In this manner the due and necessary degree of heat in the water, for the extracting all the virtues of the malt, may be hit upon very expeditiously, and with a great deal of exactness, as the heat of boiling water is a fixed standard which may be let down to any degree by a proportionate mixture of cold water, due allowances being made for the season of the year, and for the temperature of the air.

This little obvious improvement, added to the method just above hinted for the reducing brewing and fermentation to one operation, will render it practicable to very considerable advantage, and the spirit improved in quality as well as quantity.

A much more profitable method than that usually practised for the fermenting malt for distillation, in order to get its spirit, is the following: Take ten pounds of malt reduced to a fine meal, and three pounds of common wheat meal: add to these two gallons of cold water, and stir them well together; then add five gallons of water, boiling hot, and stir altogether again. Let the whole stand two hours, and then stir it again; and when grown cold, add to it two ounces of solid yeast, and set it by loosely covered in a warmish place to ferment.

This is the Dutch method of preparing what they call the *wash for malt spirit*, whereby they save much trouble and procure a large quantity of spirit: thus commodiously reducing the two businesses of brewing and fermenting to one single operation. In England the method is to draw and mash for spirit as they ordinarily do for beer, only instead of boiling the wort, they pump it into large coolers, and afterwards run it into their fermenting backs, to be there fermented with yeast. Thus they bestow twice as much labour as is necessary, and lose a large quantity of their spirit by leaving the gross bottoms out of the still for fear of burning.

All simple spirits may be considered in the three different states of low wines, proof spirit, and alcohol, the intermediate degrees of strength being of less general use; and they are to be judged of only according as they approach to or recede from these. Low wines at a medium contain a sixth part of pure inflammable spirit, five times as much water as spirit necessarily arising in the operation with a boiling heat. Proof goods contain about one half of the same totally inflammable spirit; and alcohol entirely consists of it.

Malt low wines, prepared in the common way, are exceeding nauseous; they have, however, a natural vinosity or pungent agreeable acidity, which would render the spirit agreeable to the palate, were it not for the large quantity of the gross oil of the malt that abounds in it. When this oil is detained in some measure from mixing itself among the low wines, by

VEL. XII. Part II.

the stretching a coarse flannel over the neck of the still or at the orifice of the worm, the spirit becomes much purer in all respects; it is less fulsome to the taste, less offensive to the smell, and less milky to the eye. When these low wines, in the rectification into proof spirits, are distilled gently, they leave a considerable quantity of this gross fetid oil behind them in the still along with the phlegm; but if the fire be made fierce, this oil is again raised and brought over with the spirit; and being now broken somewhat more fine, it impregnates it in a more nauseous manner than at first. This is the common fault both of the malt distiller and of the rectifier: the latter, instead of separating the spirit from this nasty oil, which is the principal intent of his process, attends only to the leaving the phlegm in such quantity behind, that the spirit may be of a due strength as proof or marketable goods, and brings over the oil in a worse state than before. To this inattention to the proper business of the process, it is owing, that the spirit, after its several rectifications, as they are miscalled, is often found more stinking than when delivered out of the hands of the malt distiller. All this may be prevented by the taking more time in the subsequent distillations, and keeping the fire low and regular; the sudden stirring of the fire, and the hasty way of throwing on the fresh fuel, being the general occasion of throwing up the oil by spurts, where the fire in general, during the process, has not been so large as to do that mischief.

The use of a *balneum mariae*, instead of the common still, would effectually prevent all this mischief, and give a purer spirit in one rectification than can otherwise be procured in ten, or indeed according to the common methods at all.

Malt low wine, when brought to the standard of proof spirit, loses its milky colour, and is perfectly clear and bright, no more oil being contained in it than is perfectly dissolved by the alcohol, and rendered miscible with that proportion of phlegm, which is about one half the liquor: its taste also is cleaner, though not more pleasant; there being less of the thick oil to hang on the tongue in its own form; which is not the case in the low wines, where the oil being undissolved, adheres to the mouth in its own form, and does not pass lightly over it.

When proof spirit of malt is distilled over again, in order to be rectified into alcohol, or, as we usually call it, spirits of wine, if the fire be raised at the time when the fumes begin to fall off, a very considerable quantity of oil will be raised by it, and will run in the visible form of oil from the nose of the worm. This is not peculiar to malt spirit; but the French brandy shows the same phenomenon, and that in so great a degree, that half an ounce of this oil may be obtained from a single piece of brandy.

Malt spirit, more than any other kind, requires to be brought into the form of alcohol, before it can be used internally, especially as it is now commonly made up in the proof state, with as much of this nauseous and viscous oil as will give it a good crown of bubbles. For this reason it ought to be reduced to an alcohol, or totally inflammable spirit, before it is admitted into any of the medicinal compositions. If it be used without this previous caution, the taste of the malt oil will

Malt.

be distinguished among all the other flavours of the ingredients.

A pure spirit being this procured, should be kept carefully in vessels of glass or stone, well stopped, to prevent the evaporation of any of its volatile parts. If preserved in casks, it is apt to impregnate itself very strongly with the wood. The quantity of pure alcohol obtainable from a certain quantity of malt, differs according to the goodness of the subject, the manner of the operation, the season of the year, and the skilfulness of the workmen; according to which variations, a quarter of malt will afford from eight or nine to 13 or 14 gallons of alcohol. This should encourage the malt distiller to be careful and diligent in his business, as so very large a part of his profit depends wholly on the well conducting his processes.

After every operation in this business, there remains a quantity of faints, which in their own coarse state ought never to be admitted into the pure spirit; these are to be saved together, and large quantities of them at once wrought into alcohol. It is easy to reduce these to such a state that they will serve for lamp-spirits. Their disagreeable flavour being corrected by the adding of aromatics during the distillations, the reducing them into a perfect and pure alcohol is practicable, but not without such difficulties as render it scarcely worth the trader's while. One way of doing it is by distilling them from water into water, and that with a very slow fire. By this means a pure alcohol may be made out of the foulest faints.

The malt distiller always gives his spirit a single rectification *per se*, in order to purify it a little, and make it up proof; but in this state it is not to be reckoned fit for internal uses, but serves to be distilled into geneva and other ordinary compound strong waters for the vulgar.

The Dutch, who carry on a great trade with malt spirit, never give it any farther rectification than this; and it is on this account that the malt spirit of England is in general so much more in esteem. The Dutch method is only to distil the wash into low wines, and then to full proof spirit; they then directly make it into geneva, or else send it as it is to Germany, Guinea, and the East Indies, for the Dutch have little notion of our rectification. Their spirit is by this means rendered very foul and coarse, and is rendered yet more nauseous by the immoderate use they make of rye meal. Malt spirit, in its unrectified state, is usually found to have the common bubble proof, as the malt distiller knows that it will not be marketable without it.

The whole matter requisite to this is, that it have a considerable portion of the gross oil of the malt well broke and mixed along with it; this gives the rectifier a great deal of trouble if he will have the spirit fine; but in the general run of the business, the rectifier does not take out this oil, but breaks it finer, and mixes it faster in by alkaline salts, and disguises its taste by the addition of certain flavouring ingredients. The spirit loses in these processes the vinosity it had when it came out of the hands of the malt distiller, and is in all respects worse, except in the disguise of a mixed flavour.

The alkaline salts used by the rectifier destroying the natural vinosity of the spirit, it is necessary to add

an extraneous acid in order to give it a new one. The acid they generally use is the *spiritus nitri dulcis*; and the common way of using it is the mixing it to the taste with the rectified spirit: this gives our malt spirit, when well rectified, a flavour somewhat like that of French brandy, but this soon flies off; and the better method is to add a proper quantity of Glauber's strong spirit of nitre to the spirit in the still. The liquor in this case comes over impregnated with it, and the acid being more intimately mixed, the flavour is retained. See BREWING and DISTILLING, SUPPLEMENT.

MALT-bruiser, or Bruising-mill. It has been found by repeated experiments, that bruising malt is a more advantageous method than the old one of grinding and flouring. By bruising, there is not only less waste, but the malt is also better fitted for giving out all its virtues. It has therefore become a practice to squeeze malt between rollers, by means of a proper apparatus, of which various constructions have been invented. One of the best contrivances of this sort is said to be the bruising-mill of Mr Winlaw, which consists of a frame, a large cylinder or roller, a small roller, a hopper, a shoe, a frame to support the hopper, a fly wheel, and a windlass. To use this engine, it is directed to screw the large roller up to the small one, and not to feed too fast from the shoe, which is regulated by pins that have strings fixed to them. It is evident, that when two smooth surfaces are opposed to each other at a distance which can be regulated at pleasure, neither grain nor any other similar substance can pass between them without being bruised. This being the principle on which the bruising-mill acts, the mealy substance, which is the essential part of malt, is entirely removed from the skin or husk which contains it, and all the virtues of the malt are with ease extracted by the water in a manner superior to what is effected when the grain is only cut by grinding. The operation is at the same time so expeditiously performed, that two men can with ease bruise a bushel of malt in a minute. By the same engine may also be bruised oats and beans for horses. A great part of the corn given these animals, it is well known, is swallowed whole, and often passes through them in the same state; in which case, they cannot receive any nourishment from the grains that are unbroken; but when bruised in this engine, it eases mastication; and every grain being prepared for nutrition, a much less quantity will of course be found to be sufficient. For bruising beans, the two regulating screws must be unscrewed a little; and the fly-wheel requires to be then set in motion with the hand, on account that the rollers are then a little space apart, and will not turn each other before the beans come between them.

MALT-Tax, is the sum of 750,000*l.* raised every year by parliament since 1697, by a duty of 6*d.* on the bushel of malt, and a proportionable sum on certain liquors, such as cyder and perry, which might otherwise prevent the consumption of malt. This is under the management of the commissioners of the excise; and is indeed itself no other than the annual excise. In 1760, an additional perpetual excise of 3*d.* per bushel was laid upon malt; and in 1763, a proportional excise was laid upon cyder and perry, but new-modelled in 1766. See EXCISE.

MALTA, a celebrated island of the Mediterranean, situated

Malt.

Malta.

Malta situated between the 15th and 16th degrees of east longitude, and between the 35th and 36th degrees of north latitude. It is about 19 or 20 miles in length, nine or ten in breadth, and 60 in circumference. Anciently it was called *Melita*; and is supposed by Cluverius, from its situation and other particulars, to be the *Hyperia* mentioned by Homer, whence the Phœaces were afterwards driven by the Phenicians, and retired into Scheria and the island of Corfu; which is the more probable, as the ancient poet places the mountain *Melita* in that island. He has likewise brought some probable arguments to prove, that *Melita* or *Malta* is the ancient *Ogygia*; in which the famed nymph *Calypso*, daughter of the Ocean and *Thetis*, received the shipwrecked *Ulysses*, and detained him seven years.

1
Ancient history of the island.

The most ancient possessors of *Malta*, of whom we have any certain account, were the *Carthaginians*; from whom it was taken by the *Romans*: and yet during the whole time that it continued under the power of these polite nations it was almost entirely barren. The soil was partly sandy and partly rocky, having scarcely any depth of earth; and withal so stony, that it was hardly capable of producing corn or any other grain except cummin, and some seeds of a similar nature. Its chief products were figs, melons, honey, cotton, and some few other fruits and commodities, which the inhabitants exchanged for corn; and in this barren state it seems to have continued till it came into the possession of the *Maltese knights*. It laboured also under great scarcity of water and fuel: upon all which accounts it was till that time but thinly inhabited, there being only about 30 or 40 boroughs or other villages scattered about, and no city except the capital, called also *Malta*, and the town and fort of *St Angelo*, which defended the harbour: so that the whole number of its inhabitants did not exceed 12,000, including women and children; the greatest part of whom were very indigent.

According to an ancient tradition, *Malta* was first possessed by an African prince named *Battus*; an enemy to *Queen Dido*; from whom it was taken by the *Carthaginians*; from the *Carthaginians* it passed to the *Romans*, who made themselves masters of it when they subdued the island of *Sicily*. These were driven out by the *Arabs* in the year 828; who were driven out in their turn by *Roger the Norman*, earl of *Sicily*, who took possession of it in 1190: from which time it continued under the dominion of the *Sicilian princes* till the time of *Charles V.* when it fell under his power, along with *Naples* and *Sicily*. To cover the island of *Sicily* from the *Turks*, *Charles* gave the island to the *knights of Rhodes*; since that time called *knights of Malta*, whose origin and history is given under the article *Knights of MALTA and RHODES*.

2
Malta given to the knights of Rhodes.

At the first landing of the *Maltese knights*, they found themselves obliged to lodge in a very poor town at the foot of the hill on which stands the castle of *St Angelo*, and where their only habitations were fishermen's huts. The grand master, with the principal knights, took possession of the castle, where the accommodations were somewhat better; though these too were very mean, and out of repair. Three days after, he took possession of the city, which was formerly called *Malta*, but since that time hath taken the name of

the *Notable City*; and after that, of the whole island of *Malta*, and the neighbouring one of *Gosa*.

Malta.

The first care of the knights, after having settled their authority through the two islands, was to provide some better accommodation for the present, and to choose a proper place where to fix their habitation. But as the island had no other defence than the old castle of *St Angelo*, and was so much exposed on all sides, that it would have required greater sums than their exhausted treasury could spare to put it in a proper state of defence; the grand master was obliged to content himself with surrounding the borough above mentioned, wherein he had ordered new buildings to be reared for the present habitation of his knights, with a stout wall, to prevent its being surprised by the *Turkish* and *Barbary corsairs*. His design, indeed, at this time, was not to have fixed the abode of the knights in the bare and defenceless island of *Malta*, but to stay in it only till he had got a sufficient force to attempt the conquest of *Modon*, a town of the *Morea*, and which was not only a populous and opulent place, but lay very convenient for making an attempt on the island of *Rhodes*, their ancient habitation, and to which they were naturally attached. This, however, did not hinder his taking all proper measures for securing *Malta* as well as *Gosa*, and laying out a proper plan for securing them from attacks, in case the design on *Modon* should fail.

3
They attempt the conquest of Modon without success.

In the mean time, as superstition was then universally prevalent, the grand master, among other precious relics which they had brought from *Rhodes*, caused the arm of *St Catharine* to be carried in procession to the cathedral. Whilst they were on their march, one of the centinels gave them notice, that a large *Turkish merchantman* was wrecked on their coast. The grand master immediately despatched some of his knights and soldiers thither; who finding *Isaac the patron of the ship*, a native of *Modon*, and one *Maurithisala Nocher*, an excellent engineer, they were retained in the service of the order, and the latter was immediately employed in fortifying the island.

The knights were hardly settled in *Malta*, when the emperor, and other European potentates, endeavoured to engage them in a war with the inhabitants of *Barbary*, as the city of *Tripoli*, then held by *Charles*, was in great danger of falling into the hands of the infidels. The attempt on *Modon*, however, was first made; but it proved unsuccessful, through the base avarice of the *Maltese forces*: for they having been admitted into the city, during the night began to murder and plunder the inhabitants, without waiting for the arrival of the galleys which were coming to their assistance. The consequence was, that the inhabitants armed, and a desperate battle began; in which the *Maltese*, notwithstanding the utmost efforts, were obliged to retire, but not till they had loaded themselves with plunder, and carried away 800 women captive.

The grand master, looking upon this disappointment as a sign that Providence had ordained *Malta* to be the residence of the knights, did not renew his attempts upon *Modon*; but, in 1532, joined with the emperor against the *Turks*, and sent a great number of his galleys to join the confederate fleet under the celebrated *Andrew Doria*. In consequence of this aid, the undertaking proved successful; and in all probability the

4
Join the emperor against the Turks.

Malta. conquest of Modon would have been accomplished, had not the soldiery, discouraged by the bad success of the last attempt, openly refused to proceed, and obliged the emperor to proceed to Coron, another town belonging to the Turks. Through the valour of the Maltese knights, this place was soon obliged to capitulate; and in a second expedition in 1533, the knights again distinguished themselves in a most eminent manner. They were quickly recalled, however, by the grand master to the defence of the island, which was now threatened with an invasion by Barbarossa the celebrated Turkish corsair, who scoured those seas at the head of above fourscore galleys. This invasion, however, did not take place; and in 1534 the grand master Villiers de l'Isle Adam died, and was succeeded by Perino de Ponte, a native of the town of Ast in Italy.

The new grand master, who received intelligence of his election at St Euphemia in Calabria, very soon after received another express, giving an account of the wars which at that time reigned in Tunis, and the danger that Tripoli as well as Malta was in from Barbarossa, who was by this time become master both of Algiers and Tunis; upon which he made all the haste he could to his new government. His first care was to send a strong reinforcement to Italy; after which, he despatched an embassy to the emperor, intreating him to equip a powerful fleet against Barbarossa, without which it would be impossible for Tripoli to hold out much longer.

5
Africa invaded by Charles.

By this embassy from De Ponte, and another to the same purpose from Muley Hassen, the deposed king of Tunis, Charles was easily prevailed on to carry his arms into Africa; in which he was assisted by a great number of the bravest knights, together with 18 brigantines of different sizes, four of the best Maltese galleys, and their vessel called the *great carrack*, of itself almost equivalent to a squadron. In this expedition the knights distinguished themselves in a most eminent manner. At the siege of Goletta, one of the knights named *Conversa*, an excellent engineer, by means of a *barca longa*, got almost close to the great tower, which he furiously battered with large cannon, while the great carrack, which was behind all the rest of the vessels, and by reason of its height could fire over them, did prodigious execution. A breach was soon made; and hardly was it wide enough to be scaled, when the Maltese knights jumped out of the galleys into their long-boats, and thence into the sea, with their swords in their hands, and waded through the water above their girdles, it being too shallow for boats to approach the shore. The standard-bearer of the order was the first that jumped into the water, and led the rest to the attack; they claiming everywhere the post of honour. They marched with the greatest resolution through the most terrible firing and showers of all kinds of missile weapons; and, having gained the shore, quickly ascended the breach, on the top of which they planted their great standard. A great number lost their lives, and scarcely one came off unwounded; but the emperor did them the justice to own, that the taking the place was chiefly owing to the valour of the Maltese knights.

6
Desperate valour of the Maltese knights.

The city of Tunis was soon taken after the fortress of Goletta; on the surrender of which, the emperor,

designing to return into Europe, took his last dinner on board the great carrack; where he was magnificently entertained, and bestowed on the surviving knights the greatest encomiums, and marks of his esteem and gratitude to the owner. These he accompanied with considerable presents and with two new grants. By the first, they were allowed to import corn and other provisions from Sicily, without paying duty; and by the second, the emperor engaged, that none of the order should enjoy any of the estates or revenues, due to Maltese knights, throughout all his dominions, unless they were lawfully authorised by the grand master and his council; or till the originals had been examined and registered by himself, or such ministers as he should appoint for that purpose. The fleet then set sail for Malta; where, on their arrival, they received the news of the grand master's death, who was succeeded by Didier de Tolon de St Jalle, a native of Provence, and then grand prior of Thoulouse, where he resided at the time of his election.

Malta. 7
Privileges conferred upon them by the emperor.

The present grand master was a man of great conduct and bravery, which he had formerly shown at the siege of Rhodes; and the situation of affairs at this time required a person of experience. The Turkish corsairs, quite tired out with the dreadful havoc made among them by Botigella, grand prior of Pisa, who seldom quitted the sea, and never sailed out without sinking some of them, or making considerable prizes, had agreed to enter into a strong confederacy, either to surprise the city of Tripoli where his retreat was, or, if that failed, to lay siege to it by sea and land; in either of which attempts, they were sure of all the assistance of Barbarossa and Hayradin, then lord of Tangiers. This last had undertaken the command and conduct of the whole enterprise; but the governor being informed of the design, prepared to give him a warm reception. Hayradin came thither with his whole force in the dead of the night, and began to scale the walls in those places where he reckoned them to be most defenceless. They no sooner appeared at the foot of them, than the garrison, which had been kept up in arms, poured down such streams of wild-fire, boiling oil, melted lead, &c. and threw such volleys of stones, while the great and small guns so annoyed those that stood farthest off, that great numbers of them were destroyed. They persisted in the attack, however, with great fury and vigour, till Hayradin, who was foremost in one of the scalades, was knocked down by a musket-shot from the top of his ladder. He fell into the ditch, and was taken up almost dead; upon which his troops instantly dispersed themselves, and abandoned the enterprise. The governor of Tripoli, however, judging that this would not be the last visit of the kind which in all probability he would receive, immediately despatched an express to Malta, with proposals for fortifying the city, and demolishing a strong tower on that coast named *Alcaid*, which was held by a Turkish corsair. His advice being approved of, the commander Botigella, now general of the galleys, was immediately despatched with a sufficient force; who, having landed his men at Tripoli, immediately marched with them and a body of Arab mercenaries towards Alcaid; and without staying to open the trenches, or any other covering than his gabions, levelled his artillery against it. Hayradin being informed of this,

8
The Turks make an unsuccessful attempt on Tripoli.

came

Malta. came with his Turks to its defence; but was intercepted by a strong detachment of Maltese knights at the head of the hired Arabs, and repulsed with loss; so that all he could do was to convey about 50 or 60 Turks into the place, and to annoy the Christians with some slight skirmishes. Botigella, perceiving that his cannon did not make such quick despatch as he wished, sent some of his galleys; under the shelter of which he quickly sprung a mine, which brought down part of the wall, and buried most of the corsairs under it; upon which the rest, seeing the Maltese knights mount the breach sword-in-hand, immediately threw down their arms. The tower was then razed to the ground; after which Botigella marched to a town called *Adabus*, whence he drove Hayradin, who had intrenched himself in it, and gave the plunder to the Arabs. In his return he attacked and took a large Turkish galley, the cargo of which was valued at 160,000 crowns, and had on board 200 persons; so that he landed in triumph, and was received with the loud acclamations of the whole order, who came to meet him on his arrival. Soon after the grand master fell sick and died, and was succeeded by John de Homedes.

Fresh complaints having in 1564 been made to Soliman, he proposed, in a grand council where most of his officers attended, to extirpate the knights altogether. This design was strenuously opposed by Hali, one of Dragut's most experienced captains, who offered the most solid reasons against it; but being overruled by the rest, an expedition against Malta was resolved upon. One of the sultan's first cares was to send some spies, in the disguise of fishermen, to take a full view of the island, who found means to bring him an exact plan of it, with all its fortifications, havens, strength, the number of its inhabitants, &c. whilst he was hastening his armaments against it. By this time, as the Maltese had very little reason to doubt that the Turkish armaments were designed against their island, the viceroy of Sicily, Don Garcia, was ordered by his master to take it in his way to the castle of Goletta, in order to consult with the grand master about the necessary means for opposing such a formidable power. The grand master acquainted him, that, in case of an attack upon Malta, he should want both men and corn: upon which the viceroy engaged to supply him with both on his return to Sicily; in pledge of which he left one of his sons with him, who was afterwards admitted into the order. He was no sooner departed, than the grand master summoned all the knights of the order, dispersed through several parts of Europe, to repair to him. Those that were in Italy raised a body of 2000 foot, to which the vicerny of Sicily added two companies of Spanish forces. All the galleys of the order were employed in transporting these troops, together with all manner of provisions and ammunition, into the island; and the knights that were in it, in distributing, disciplining, and exercising their new levies, as well as the Maltese militia, against the siege. Thus the grand master saw himself strengthened by the arrival of 600 knights, all of whom brought with them retinues of stout good-servants, fit to assist in the defence of the island; whilst those, who by reason of age, sickness, or other impediments, could not repair to him, sold their most valuable effects in order to assist him with their purses. The pope, on his

part, contented himself with sending a supply of 10,000 crowns; and the king of Spain ordered his viceroy Don Garcia to raise an army of 20,000 men, to be ready to sail thither as soon as called for. The grand master employed the remainder of his time in visiting all the forts, magazines, arsenals, &c. and assigning to each tongue their several posts, and making all necessary preparations, till the Ottoman fleet appeared in sight on the 18th of May 1565. It consisted of 159⁹ The siege large galleys and galleons, carrying on board 30,000 commences forces, janizaries and spahis, besides the slaves at the oar, accompanied by a considerable number of other vessels, laden with artillery, ammunition, and other necessaries for a siege. The whole armament was commanded by Mustapha Basba, an old experienced officer, aged about 85 years, and an old favourite and confidant of the sultan; of a haughty cruel temper, who made it a merit to violate his word, and to use all manner of violence against the Christians, especially against the Maltese. This formidable army landed at some distance from Il Borgo, and soon afterwards spread themselves over the country; setting fire to the villages, putting the peasants to the sword, and carrying off such of the cattle as, notwithstanding the orders of the grand master, had not been secured within the forts and towns.

While the Turks were thus employed, La Valette (the grand master) sent out De Copier, marshal of the order, with 200 horse and 600 foot, to watch their motions. De Copier, an officer of great experience, executed his commission with so much prudence and vigour, that, by falling unexpectedly on detached parties, he cut off 1500 Turks, with the loss only of 80 men.

The Turkish general held a council of war as soon as all his troops were landed, to assist him in resolving where he should begin his attack. Piali, the Turkish admiral, agreeably to what he understood to have been the sultan's instruction, was of opinion that they ought not to enter upon action till Dragut should arrive. But Mustapha having received information of the king of Spain's preparations, thought something ought to be done instantly for the safety of the fleet; which lay at present in a creek, where it was exposed to the violence of the east wind, and might be attacked with great advantage by the Spaniards. On this account he was of opinion, that they should immediately lay siege to a fort called *St Elmo*, which stood on a neck of land near Il Borgo, having the principal harbour on one side of it, and on the other another harbour large enough to contain the whole fleet in safety. This proposal was approved by a majority of the council, and Mustapha proceeded without delay to carry it into execution.

La Valette did not expect that a place which was ¹⁰ Desperate neither strong nor large enough to admit a numerous defence of garrison, could be defended long against so great a force as was employed to reduce it; but he thought ¹⁰ it necessary that the siege of this fort should be prolonged as much as possible, in order to give the viceroy of Sicily time to come to his relief. With this view, he resolved to throw himself into *St Elmo*, with a select body of troops; and he was preparing to set out, when the whole body of knights remonstrated with such earnest importunity against his leaving the town,

Malta town, that he at last consented to suffer the reinforcement, which he had prepared, to be conducted to the fort by a knight called *De Medran*, upon whose conduct and intrepidity he could rely with the most assured confidence.

Not long after *De Medran's* arrival in the fort, the garrison made a vigorous sally, in which they drove the enemy from their entrenchments, and put a number of them to the sword. But the rest soon recovered from their surprise; and having returned to the charge, they compelled the Christians to retire. In this rencounter, the vigorous efforts of the janizaries were favoured by the wind, which blew the smoke of the guns upon the fort, and covered the besieged with a thick cloud, through which it was impossible to discern the operations of the enemy. This incident the Turks had the presence of mind to improve to very great advantage. They seized, unperceived, upon the counterscarp; made a lodgement there with beams, woolsacks, and gabions; and raised a battery upon it with incredible expedition. After the smoke was dispersed, the besieged beheld what had been done with much astonishment: and they were the more disquieted, as the fortification which the Turks had raised upon their counterscarp overtopped a ravelin which lay near it, in which the besieged could no longer appear with safety. They resolved, however, to defend this ravelin as long as possible, whatever it should cost them.

In the mean time *Dragut*, and another noted corsair named *Uluchiali*, arrived with 20 galleys; having, besides slaves and seamen, 2500 troops on board. This reinforcement, and the presence of *Dragut*, added fresh vigour to the operations of the siege. This gallant corsair exposed himself, on all occasions, with the utmost intrepidity; spent whole days in the trenches; and as, besides his other extraordinary talents, he was particularly skilful in the management of artillery, he caused some new batteries to be raised in more advantageous situations than had hitherto been made choice of; and kept up a continual fire both on the ravelin above mentioned, and a cavalier that covered the fort and was one of its principal defences.

This cavalier soon became the only defence which could prevent the besiegers from coming up to the very foot of the wall. Some Turkish engineers having approached the ravelin at daybreak, to observe the effects of their artillery, they perceived a gun-port so low, that one of them, when mounted on the shoulders of another, looked into it, and saw the Christian soldiers lying on the ground asleep. Of this they gave immediate information to the troops; who, advancing as quickly and silently as possible, and clapping ladders to the gun-hole, got up into the ravelin, and cut most of the Christians to pieces.

Between this ravelin and the cavalier lay the ditch, over which the besieged had thrown a temporary bridge of planks leading up to the cavalier. The Turks, perceiving this, leaped instantly upon the bridge, and attempted to make themselves masters of the cavalier, as they already were of the ravelin. But the garrison was now alarmed; the bravest of the knights hastened from different quarters to the post of danger; and after an obstinate engagement, they compelled the Turks to retire into the ravelin. There, observing

another way of reaching the cavalier by a path from the bottom of the ditch, they threw themselves down without dread or hesitation; and having ascended by this path to the other side, they renewed their attack with greater fury than ever. The combat lasted from sunrise till noon, when the knights at last proved victorious. About 20 knights and 100 soldiers were killed; and near 3000 of the enemy.

As the ravelin was open on the side towards the fort, the besieged pointed some cannon against it, and made great havock among the infidels. But *Mustapha*, sensible of the value of the acquisition he had made, poured in fresh soldiers without number, and the pioneers coming forward with woolsacks, planks, and gabions, put the troops at length in safety, and made a lodgment in the ravelin, of which the garrison were never afterwards able to dispossess them.

The grand master's concern on account of this disaster was greatly augmented, by considering that it could not have happened so soon without some negligence on the part of the garrison. He sent them, however, an immediate reinforcement; and both the siege and the defence were carried on with the same vigour as before.

But the situation of the besieged was now become much more dangerous than formerly. The Turks applied with unremitting diligence to heighten the ravelin till it overtopped the wall of the fort; and after this the garrison could no longer appear upon the parapet with safety. Many were killed by the enemy's artillery, several breaches were made in the wall, and the hearts of the bravest knights began to fail within them.

They agreed therefore, though with much reluctance, ¹¹ to apply to the grand master for liberty to quit the fort; and they made choice of the Chevalier de *Medran* for their messenger. He represented that the fort was in reality no longer tenable; and that, to continue in it, though only for a few days, would infallibly occasion the destruction of the garrison. The knights desire permission to leave the fort, but are refused.

Most of the knights in council thought that this request of the garrison ought to be immediately granted. But *La Valette* was of a contrary opinion.— This he represented to the Chevalier de *Medran*; and sent him back with instructions to remind the knights of the vows which they took at their entrance into the order, of sacrificing their lives for its defence. He likewise bade him assure them, in his name, that he would not fail to send them such reinforcements as they should stand in need of; and was determined, as soon as it should be necessary, to come himself to their assistance, with a fixed unalterable purpose to lay down his life sooner than deliver the fort into the hands of the infidels.

This answer had the desired effect on several of the knights, and particularly on those whose principles of honour and attachment to the order were confirmed by years. But the greater part of them were much dissatisfied. They thought the grand master's treatment of them harsh and cruel; and wrote him a letter, subscribed by 53; in which they informed him, that, if he did not, on the next night, send boats to carry them to the town, they were determined to sally out into the Turkish camp, where they might fall honourably by the sword, instead of suffering such an ignominious death

Malta. death as they had reason to expect if the fort was taken by storm.

To this letter La Valette replied, "That they were much mistaken if they expected to satisfy their honour by throwing away their lives; since it was no less their duty to submit to his authority than to sacrifice their lives in defence of the order: that the preservation of the whole depended on their present obedience to his commands: that no aid was to be expected from Spain if the fort were given up. And that if he should yield to their request, and bring them to the town, the town itself would then be immediately invested; and they, as well as the rest, soon afterwards reduced to a situation more desperate than that from which they were so solicitous to escape, by deserting an important post which they had undertaken to defend." Besides this letter, he sent three commissioners to examine the state of the fortifications; intending by this measure either to gain time or to prevent the garrison from sinking into despair.

These commissioners differed very widely in the accounts which they delivered at their return. Two of them thought it impossible to defend the fort much longer. But the third, named Constantine Castriot, a Greek prince, descended from the famous Albanian hero Scanderbeg, whether from ignorance or a consciousness of greater resources in his native courage than the other two possessed, maintained that the garrison was far from being reduced to the last extremity; and to give a proof how firmly he was persuaded of the truth of what he said, he offered to enter the fort himself, and to undertake the defence of it with such troops as should be willing to accompany him.

The grand master, strongly impressed with a sense of the necessity of protracting the siege, immediately accepted this offer, and bestowed the highest encomiums on Castriot's zeal and resolution. Nor did Castriot find any difficulty in persuading a sufficient number to attend him, who were no less zealous and resolute than himself. The soldiers crowded to his standard, and were emulous to have their names enrolled for that dangerous service in which he had engaged.

When La Valette saw the spirit by which these men were animated, and had no longer any doubt of being able by their means to prolong the siege of the fort; he sent a letter to the knights, acquainting them, that he was now willing to give them their discharge; and would immediately send another garrison, into whose hands he desired they should be ready to deliver up the fort, and come themselves to the town in the boats in which their successors were to be transported.

The contents and style of this letter affected the knights in the most sensible manner, and roused within them that delicate sense of honour by which the order had been so long and so eminently distinguished. — They resolved without hesitation to remain in the fort till every man should perish, rather than either deliver it to the new garrison or abandon it to the enemy. And they went in a body to the governor, and intreated him to inform the grand master of their repentance, and to join with them in praying that they might be suffered to wipe out the remembrance of their fault by their future conduct.

Malta. The grand master suffered himself at last to be overcome; and henceforth the garrison were intent on nothing but how to prolong the defence.

The grand master sent them every night fresh troops to supply the place of the killed and wounded; and kept them well furnished with provisions, ammunition, and fireworks. Of these last he had invented a particular kind, which consisted of hoops of wood, covered with wool, and steeped in boiling oil and other inflammable liquors, mixed with nitre and gunpowder. To these machines they set fire, and threw them flaming in the midst of the enemy when they were crowded together at an assault. It happened often that two or three of the Turks were hooked together and scorched to death; and the utmost confusion was produced wherever they were thrown.

Malta. 12
Invention
of burning
hoops.

The besieged stood much in need of this, and every other instrument of mischief that could be devised, for their defence. In spite of the most vigorous opposition, the Turks had cast a bridge over the ditch, and begun to sap and undermine the wall. From the 17th of June to the 14th of July, not a single day passed without some rencounter; and Mustapha had frequently attempted to scale the wall of the fort, but had been as often repulsed with the loss of some of the bravest of his troops.

Ashamed at having been detained so long before a place of such inconsiderable strength, he resolved to make one great decisive effort; and to bring to the assault as many of his forces as the situation of the place would permit him to employ. He had already made several breaches; but in order to secure the success of the assault which he now intended, he kept his batteries playing all the 15th without intermission, till the wall on that side where he designed his attack was almost level with the rock. On the 16th, the fleet was drawn up before sunrise, as near the fort as the depth of the water would allow. Four thousand musketeers and archers were stationed in the trenches; and the rest of the troops, upon a signal given, advanced to the breach. The garrison was prepared to receive them; the breach was lined with several ranks of soldiers, having the knights interspersed among them at certain distances. The Turks attempted often to break through this determined band, and to overpower them with their numbers; but their numbers served only to augment the loss which they sustained. Every shot from the fort did execution. The artillery made dreadful havock among them: and the burning hoops were employed with astonishing success. The novelty of these machines, and the shrieks of those who were caught in them, added greatly to the terror which they inspired; and made it impossible for the Turkish officers to keep their men firm and steady in pursuing the advantages, which, had they preserved their ranks, their numbers must have infallibly acquired.

At length Mustapha, after a fruitless assault of more than six hours, gave orders for sounding a retreat. In this attack the garrison lost about 20 knights and 300 soldiers; but this loss was immediately supplied by a reinforcement from the town; and Mustapha was at last convinced, that, unless the communication between the fort and the town were cut off, it would be impossible to bring the siege of the former to a period, while

any

Malta.

any troops remained in the other parts of the island. By the advice of Dragut, he resolved to extend his trenches and batteries on the side next the town, till they should reach to that part of the sea, or great harbour, where those supplies were landed which the grand master daily sent to the garrison. This undertaking he knew must be attended with the utmost difficulty, because all the space between his intrenchments, and the point to which it was necessary to extend them, lay exposed to the artillery both of Fort St Elmo and St Angelo. In viewing the ground, a Sangiac, in whom he put confidence, was killed by his side; and, which was still a more irreparable loss, Dragut received a mortal wound, of which he died in a few days. This did not, however, discourage Mustapha from pursuing his design. By employing his troops and pioneers at the work day and night, without intermission, he at length carried it into execution. Then having planted batteries along the shore, and filled his trenches with musketeers, it was impossible for any boat to pass from the town to the fort without the most imminent danger of either being sunk or intercepted.

After this precaution, he resumed with fresh vigour his attempts to take the fort by storm. On the 21st he made four different assaults: all of which the garrison withstood; and, in repulsing so many thousand brave and well disciplined troops, displayed a degree of prowess and fortitude which almost exceeds belief, and is beyond the power of description. But this heroic garrison was now exceedingly reduced in number; and there was the strongest reason to apprehend, that, in one assault more, they must inevitably be overpowered, unless a reinforcement were sent them from the town. Of their desperate situation they gave intelligence to the grand master by one who swam across the harbour in the night. The boats were instantly filled with knights and other soldiers, who generously resolved to devote themselves to certain destruction for the general safety, and the preservation of the fort. They set off from the town with as much alacrity as if they had entertained the most sanguine hopes of victory; but they found the Turks everywhere so much upon their guard, and the lines so strongly defended, that, after several fruitless attempts to land, they were at last obliged to return, depressed with sorrow for the fate of their brave companions.

The garrison now gave themselves up for lost; but instead of either capitulating or attempting to escape, they prepared for death, and passed the night in prayer and in receiving the sacrament; after which they embraced one another tenderly, and then repaired to their respective posts; while such of the wounded as had been disabled from walking, were, at their own earnest desire, carried to the side of the breach, where they waited, without dismay, for the approach of the Turkish army.

Early in the morning of the 23d of July, the Turks advanced to the assault with loud shouts, as to certain victory, which they believed so a small handful of men as now remained in the fort would not dare to dispute with them. In this expectation they were disappointed. The garrison being resolved on death, and despising danger were more than men, and exerted a degree of prowess and valour that filled their enemies with amazement. The combat lasted upwards of four

hours, till not only every knight but every soldier had fallen, except two or three who had saved themselves by swimming. The Turkish colours were then planted on the ramparts; and the fleet entered the harbour, which the fort commanded, in a kind of triumph. When Mustapha took a view of the fort, and examined its size and fortifications, he could not refrain from saying, "What will not the father cost us (meaning the town), when the son, who is so small, has cost so many thousands of our bravest troops?" But this reflection, far from exciting his admiration of that heroic fortitude which he had found so difficult to overcome, served only to inspire him with a brutal fury. He ordered all such of the garrison as were found lying on the breach alive to be ripped open, and their hearts torn out; and, as an insult on the knights and their religion, he caused their dead bodies to be searched for, and large gashes to be made in them, in the form of a cross; after which he tied them on planks, and threw them into the sea, to be carried by the wind and tide to the town or Fort St Angelo.

The grand master was at first melted into tears at this shocking spectacle; but his grief was soon converted into indignation and revenge: and these passions betrayed him into an action unworthy of the exalted character which he bore. In order to teach the basha, as he pretended, to make war with less barbarity, he caused all the Turks whom he had taken prisoners to be massacred; and then putting their heads into his largest cannon, he shot them into the Turkish camp.

In the siege which has been related, the order lost about 1500 men, including 130 of the bravest knights.

Mustapha vainly imagined, that, being intimidated by the fate of their companions, they would be now inclined to listen to terms of capitulation: and in this hope, he sent an officer with a white flag to one of the gates, attended by a Christian slave designed to serve for his interpreter. The Turk was not allowed to enter within the town; but the Christian was admitted, and was led through several ranks of soldiers under arms, by an officer, who, after showing him all the fortifications of the place, desired him to take particular notice of the depth and breadth of the ditch, and said to him, "See there, the only spot we can afford your general; and there we hope soon to bury him and all his janizaries."

This insulting speech being reported by the slave, excited in the fiery mind of the basha the highest degree of wrath and indignation, and made him resolve to exert himself to the utmost in the prosecution of the siege. His troops, though greatly diminished, were still sufficient to invest at once both the town and the fort of St Michael. He kept a constant fire on both; but he intended first to apply to the reduction of the latter, which he proposed to attack both by land and water, at the extremity of the peninsula on which it stands. In order to accomplish this design, it was necessary he should have some shipping introduced into the harbour for transporting his forces. But the mouth of the harbour having been rendered inaccessible by a great iron chain and the cannon of St Angelo, his design must have been relinquished, if Piali had not suggested an expedient against which the grand master had not provided. This was, to make

Malta.

Cruelty of Mustapha.

¹⁵
And of the grand master.

Malta. make the Christian slaves and the crews of the ships draw a number of boats, by the strength of their arms, over the neck of land on which stood Fort St Elmo. Of this proposal, which Mustapha immediately adopted, information was carried to the grand master by a Turkish officer; who, being by birth a Greek, was touched suddenly with remorse, and deserted to the Christians. In consequence of this intelligence, La Valette set a great number of hands to work in framing a stacado along that part of the promontory where the Turks intended their attack; and at another part, where the depth of the water or the hardness of the bottom would not admit the stacado, he caused strong intrenchments to be made upon the beach. Mustapha, in the mean time, fired incessantly upon the fort, while the slaves and crews were employed in transporting the boats over land into the harbour. At length the basha, judging that the number of boats which he had transported would be sufficient, and that the breaches which his artillery had made were practicable, resolved, without further delay, to make an attack both by sea and land. He was the more confident of success, as since the taking of St Elmo, he had received a considerable reinforcement, by the arrival of Hascem, son of Barbarossa, with 2500 select soldiers, commonly called *the Bravoes of Algiers*. Hascem, who possessed a considerable share of his father's fire, and was ambitious to distinguish himself in the sultan's service, begged of Mustapha to intrust him with the assault of Fort St Michael; and vaunted, with his natural arrogance, that he would soon make himself master of it sword-in-hand. The basha, whether from an opinion of his valour, or an intention to make him learn at his own expence the folly of his presumption, readily complied with his request; and, having added 6000 men to his Algerines, he promised to support him with the rest of his army.

Hascem divided his forces with Candelissa, an old corsair, his lieutenant; to whom he committed the attack by sea, whilst he reserved that on the land-side to himself.

Candelissa having put his troops on board the boats, set out with drums beating, and hautboys and other musical instruments playing, preceded by a boat filled with Mahometan priests, some of whom were employed in offering prayers to heaven for his success, or in singing hymns; while others had books in their hands, out of which they read imprecations against the Christians. Candelissa attempted first to break down the stacado which had been formed to obstruct his landing; but finding it much stronger than he expected, and that, while he was employed in demolishing it, his troops must suffer greatly from the enemy's fire, he thought it would be easier to make a descent on that part of the shore which the grand master had strengthened with intrenchments. At this important post, the Christian troops were commanded by an ancient knight of the name of *Guimeran*. This experienced officer reserved his fire till the Turks had advanced within a little distance of the shore, when, by a single discharge, he killed about 400 men. This did not prevent the rest from approaching. Candelissa pushed forwards while the Christians were loading their cannon, and landed at the head of his Algerines. But

VOL. XII. Part II.

Guimeran having reserved some cannon charged with grape-shot, did dreadful execution among them after they had landed, and many of them began to fly to their boats: which Candelissa observing, he commanded the boats to be put off to a little distance from the shore. His troops, perceiving then that they must either die or conquer, took courage from despair, and advanced boldly to the intrenchment, with ladders for scaling it in one hand and their sabres in the other. The combatants on both sides displayed the most intrepid valour. Great numbers fell, and the ditch was choked with blood, and with the bodies of the dead and wounded. The Turks at last, after an engagement, of five hours, reached the top of the intrenchment and there planted their ensigns. The knights, stung with shame on account of their retreat, returned with redoubled ardour. But they would probably have been overpowered by the superior number of the enemy, had not the grand master sent them a seasonable reinforcement, under the admiral de Giou and the Chavalier de Quiney; who fell upon the Algerines and Turks with a degree of fury that struck terror into Candelissa himself, who was noted for his intrepidity. Having ordered the boats to be brought nearer the shore, he was among the first who fled. His bravoes fought desperately for some time after he had left them; but they were at length thrown down from the intrenchments, and compelled to fly to their boats with the utmost precipitation. The Christians pursued them, and the batteries continued firing on them without intermission. Many of the boats were sunk; the water was covered with dead bodies, mangled limbs, shields, and helmets. Of the 4000 who had been sent on this enterprise, scarcely 500 remained, and many of these were dangerously wounded.

Hascem was not more fortunate in his assault by land than Candelissa was by sea. After having been repulsed at one breach with great slaughter, he rallied his troops, and led them on to another, where he fought long and desperately, till, most of the bravoes having fallen by his side, he was obliged, with much reluctance and sorrow, to sound a retreat.

Mustapha, not unmindful of his promise to support him, no sooner perceived him beginning to retire, than he ordered the janizaries, whom he kept under arms, to advance. The garrison had maintained an engage-¹⁷ment with Hascem for five hours, in the middle of the valour of day, and in the hottest season of the year; yet, as if^{the Mal-} they had not been subject to the wants and weaknesses^{tesc.} of humanity, they advanced beyond the breach to meet the janizaries, and fought apparently with as much vigour and fortitude as before. By the power of superior numbers, they were compelled to fall back within the breach. But there they made the most desperate resistance; and, being reinforced by De Giou and De Quiney, with the troops which had triumphed over Candelissa, they at last repulsed the janizaries with dreadful slaughter; after having lost more than 40 knights, and 200 of the bravest of the common men.

Mustapha, enraged by this invincible obstinacy which the Christians displayed in their defence, and dreading that the Spanish succours, which had been already delayed much longer than he expected, might soon arrive, resolved now to employ his whole force at once;

repulsed
with great
slaughter.

Malta.

and while he himself prosecuted the siege of Fort St Michael with one half of his troops, to employ the other, under Piali, against the town. More batteries were raised; the trenches were advanced still nearer than before; bridges of sail-yards and masts were thrown over the ditches; mines, notwithstanding the hard and rocky soil, were sprung; assaults were repeated without number; and the two bashas, emulous of one another, and each of them agitated with continual anxiety lest victory should declare first for his competitor, exhibited the most shining proofs of personal courage, and exhausted all the art of war then known in the world. Yet, through the determined bravery of the knights, conducted by the grand master with consummate prudence and indefatigable vigilance, the Turks were baffled in every attempt, and repulsed with slaughter. Mustapha flattered himself once with the most sanguine hopes of success on his part, from a machine invented by his principal engineer, in the form of a huge cask bound strongly with iron hoops, and filled with gunpowder, nails, chains, bullets, and such other instruments of death. After setting fire to a train which was fastened to this machine, it was thrown, by the force of an engine, upon a ravelin that was the principal defence of the fort. But the garrison, undismayed, found means, before it caught fire, to cast it out again into the midst of the assailants. In a moment afterwards it burst with dreadful fury, and filled the Turks with consternation. The knights then sallied out upon them sword in hand; and, taking advantage of their confusion, killed many of them, and put the rest to flight.

18
A great number of Turks destroyed by a contrivance of their own.

Piali had, on some occasions, still more reason than Mustapha to entertain the hopes of victory, although the town was much stronger than the fort, and La Vallette commanded there in person. By his batteries he had demolished all the outworks of the place, and had made an immense breach in the wall. While his troops were engaged in a furious assault, that engrossed the whole attention of the besieged from morning till night, he employed a great number of pioneers in raising a cavalier or platform of earth and stones, close by the breach, and so high as to overlook the parapet. Night, in the mean time, came on, and prevented him from carrying any further this great advantage; but he doubted not that next day he should be able to make himself master of the place.

19
The grand master prevents the knights from abandoning the town.

As soon as he had drawn off his forces, a council of the order was convened, and most of the knights were of opinion that the town was no longer tenable; that the fortifications which still remained should be blown up; and that the garrison and inhabitants should retire into the castle of St Angelo. But the grand master received this proposal with horror and indignation. "This would be in effect (said he), to deliver the whole island into the hands of the infidels. Fort St Michael, which has been so gallantly defended, and which is preserved by its communication with the town, would thus be soon reduced to the necessity of surrendering. There is no room in the castle of St Angelo for the inhabitants and troops; nor, if there were room, is there water in that fort for so great a number." It was then proposed, that at least the relics of the saints and the ornaments of the churches should be carried into the castle; and the knights earnestly en-

Malta.

treated the grand master to retire into it himself, assuring him that they would conduct the defence with the utmost vigour and vigilance. "No, my brethren (he replied), what you propose as to the sacred things would serve only to intimidate the soldiers. We must conceal our apprehensions. It is here we must either die or conquer. And is it possible that I, at the age of 71, can end my life so honourably as in fighting, together with my friends and brethren, against the implacable enemies of our holy faith?" He then told them what he thought proper to be done, and proceeded instantly to put it into execution. Having called all the soldiers from Fort St Angelo, except a few who were necessary for managing the artillery, he employed them and the inhabitants all night in throwing up intrenchments within the breach; after which he sent out some of the bravest knights, with a select body of troops, to make an attempt on the cavalier. These men stole softly along the foot of the wall till they arrived at the place appointed; when they set up a loud shout, and attacked the guards whom Piali had left there with so much fury, that the Turks, believing the whole garrison had fallen upon them, abandoned their post, and fled precipitately to their camp.

The cavalier was immediately fortified, a battery of cannon planted on it, and a parapet raised on the side towards the enemy. And thus the breach was rendered impracticable; the town put in greater security than before; and a work, which had been devised for its destruction, converted into a bulwark for its defence.

The grand master had now greater confidence than ever of being able to hold out till the Spaniards should come to his relief. In consequence of the assurances given by Philip and the Sicilian viceroy, he had, long before this time, entertained the hopes of their arrival; and had often earnestly solicited the viceroy to hasten his departure from Messina. The conduct of this nobleman was long exceedingly mysterious. The patience of the knights was worn out by his delays; and they, and many others, suspected that the real motives of his conduct was the dread of encountering with an admiral of so considerable reputation as Piali. But it afterwards appeared that the viceroy had acted agreeably to his instructions from the court of Spain. For although Philip was, for the reasons above mentioned, sincerely interested in the preservation of the knights, and had amused them with the most flattering promises of assistance; yet he seems from the first to have resolved not to expose himself to danger on that account, and to avoid, if possible, a general engagement.

Philip was affected by their danger only so far as it threatened the tranquillity of his own dominions. He had resolved to interpose in their behalf, rather than suffer them to be overpowered; but he appears to have been very little touched with their calamities, and to have intended to leave them to themselves, as long as there was any prospect of their being able to make resistance; by doing which he considered, that he would not only preserve his own strength entire, but might afterwards engage with the Turks, when they were exhausted by the operations of the siege.

Philip adhered inflexibly to this plan, notwithstanding the grand master's repeated importunities, much longer than was consistent with his own selfish views. For,

without

Malta. without a degree of fortitude and prowess on the part of the garrison, and a degree of wisdom, vigilance, and magnanimity on that of the grand master, infinitely higher than there could be reason to expect, it must have been impossible for such a handful of men to have withstood, for so long a time, so great a force, and such mighty efforts, as were employed to reduce them. Even the death of the grand master alone, whose person was exposed to perpetual danger, would have proved fatal to the knights, long before Philip sent orders to his viceroy to give them any effectual support; and in this case, as his own dominions or his fleet would have been immediately attacked, he would probably have had little reason to be satisfied with the timid ungenerous counsels which he pursued.

Whatever judgment may be formed on this head, the viceroy did not think himself at liberty to yield to the repeated applications of the grand master, till the operations of the siege began to relax, and the Turkish forces were reduced from 45,000 to 15,000 or 16,000; of whom many were worn out with the fatigues which they had undergone, and others rendered unfit for action by a bloody flux, which for several weeks had raged amongst them.

In this situation of affairs, when it was probable that the knights would, without assistance, have compelled the Turks to raise the siege, the viceroy let the grand master know, that he had now received such instructions from the king, as put it in his power to show his attachment to the order: that he was not indeed permitted to attack the Turkish fleet; but that he would immediately bring him a strong body of troops, whose commanders (as he himself must return to Sicily) were to be entirely subject to the grand master's authority till the enemy should be expelled.

²⁰ The knights receive a reinforcement. The viceroy, although still suspected of interposing unnecessary delays, at length fulfilled his promise; and on the 7th of September landed 6000 men, under Don Alvaro de Sandé and Ascanio della Corna, in that part of the island which lay at the greatest distance from the Turks; after which, he immediately carried back the fleet to Sicily.

In the mean time, intelligence being brought to Mustapha that the Spaniards were landed, and marching towards him, he was thrown into the most dreadful consternation. Sensible that his soldiers were much disheartened by their ill success, he imagined that he was about to be attacked by a superior army, consisting of the bravest and best disciplined troops in Spain. Without waiting for information of their number, he forthwith raised the siege, drew his garrison out of St Elmo, and, leaving all his heavy cannon behind him, embarked his troops with as much precipitation as if the Spaniards with superior forces had been in sight. He had scarcely got on board when a deserter arrived from the Spanish camp, and informed him, that with 15,000 or 16,000 men, he had fled before an army that did not exceed 6000, having no general at their head, and commanded by officers who were independent of one another. The basha was overwhelmed with shame and vexation by this intelligence, and would have immediately disembarked; but this, he knew, he durst not attempt without consulting Piali, Hascem, and his other principal officers.

While he was deliberating upon it, the grand ma-

ster improved to the best advantage the leisure that was afforded him. He employed all the inhabitants, men, women, and children, as well as the soldiers, in filling up the enemy's trenches, and demolishing their works; and put a garrison without delay into Fort St Elmo; in which the Turks now beheld from their ships the standard of St John erected, where that of Mahomet had lately stood.

This demonstrated to Mustapha how much new labour awaited him in case he should return to the siege; but being enraged against himself on account of the precipitancy of his retreat, and disquieted at the thoughts of the reception which he had reason to expect from Solymán, he wished to atone for his imprudence, and to wipe off the reproach in which it had involved him, by victory or death. Piali, who, from his jealousy of the basha's credit with the sultan, was not sorry for the failure of his enterprise, represented in a council of war convened on this occasion, That as the troops were much dispirited and worn out, it would be exposing them to certain destruction, either to lead them against the enemy, or to resume the operations of the siege. But the majority of the council were of a different opinion; and it was resolved to land the forces again without delay.

The Turkish soldiers complained bitterly of this unexpected resolution, and obeyed the orders to disembark with the greatest reluctance. Their officers were obliged to employ threats with some, and force with others. At length the number intended was put on shore, and Mustapha set out at their head in search of the enemy.

The grand master had not neglected to give early notice of their march to the Spanish commanders, who had intrenched their little army on a steep hill, which the Turks would have found almost inaccessible; and it was the opinion of some of the principal officers, that they should avail themselves of the advantage of their situation, and stand on their defence. But this proposal was rejected with disdain by the bold adventurous De Sandé, and the greatest part of the Spanish officers; and the troops were led out of their encampment, to meet the enemy in the open field. This conduct, more fortunate perhaps than prudent, contributed to increase the dejection of the Turkish soldiers, and to facilitate their defeat. Having been dragged against their inclination to the field of battle, and being attacked by the Spaniards with great fury, both in front and flank, they scarcely fought, but, being struck with a sudden panic, fled with the utmost precipitation.

Mustapha, confounded and enraged by this pusillanimous behaviour of his troops, was hurried along by the violent tide of the fugitives. He fell twice from his horse, and would have been taken prisoner if his officers had not rescued him. The Spaniards pursued briskly till they came to the sea shore. There Piali had his boats ready to receive the Turks, and a number of shallops filled with musketeers drawn up to favour their escape. Without this precaution, they must all have perished; and, even notwithstanding the protection which it afforded them, the number of their killed amounted to 2000 men, while the victors lost only 13 or 14 at most.

Such, after four months continuance, was the conclusion

Malta. clusion of the siege of Malta, which will be for ever memorable on account of that extraordinary display of the most generous and heroic valour, by which the knights, so few in number, were enabled to baffle the most vigorous efforts which could be made to subdue them by the most powerful monarch in the world. The news of their deliverance gave universal joy to the Christian powers; and the name of the grand master excited everywhere the highest admiration and applause. Congratulations were sent him from every quarter; and in many states public rejoicings were celebrated on account of his success.

With this siege is concluded every thing of importance in the history of Malta. The power of the Turks began about this time to be so much circumscribed, that they ceased to be formidable to the Christian nations, and the knights of Malta had no longer an opportunity of exerting their valour as formerly. The best description of Malta we have met with is that given by Mr Brydone.

23
Description
of the
island, &c.

“The approach of the island (says he), is very fine, although the shore is rather low and rocky. It is everywhere made inaccessible to an enemy by an infinite number of fortifications. The rock, in many places, has been sloped into the form of a glacis, with strong parapets and intrenchments running behind it.—On getting ashore we found ourselves in a new world indeed—the streets (of Valetta) crowded with well-dressed people, who have all the appearance of health and affluence; and we were conducted by the English consul to an inn, which had more the appearance of a palace.

“After dinner we went to visit the principal villas of the island; particularly those of the grand master and the general of the galleys, which lie contiguous to one another. These are nothing great or magnificent; but they are admirably contrived for a hot climate, where, of all things, shade is the most desirable. The orange groves are indeed very fine, and the fruit they bear superior to any thing of the kind in Spain or Portugal.

“The aspect of the country is far from being pleasing: the whole island is a great rock of very white freestone; and the soil that covers this rock is, in most places, not more than five or six inches deep; yet, what is singular, we found their crop in general was exceedingly abundant. They account for it from the copious dews that fall during the spring and summer months: and pretend likewise that there is a moisture in the rock below the soil, that is of great advantage to the corn and cotton, keeping its roots perpetually moist and cool; without which singular quality, they say, they could have no crop at all, the heat of the sun being so exceedingly violent.—The whole island produces corn only sufficient to supply its inhabitants for five months or little more; but the crop they most depend upon is the cotton. They begin to sow it about the middle of May, and continue till the middle of June; and the time of reaping is in the month of October and beginning of November.

“They pretend that the cotton produced from this plant, which is sown and reaped in four months, is of a much superior quality to that of the cotton-tree. I compared them; but I cannot say I found it so: this is indeed the finest; but that of the cotton-tree is

by much the strongest texture. The plant rises to the height of a foot and a half; and is covered with a number of nuts or pods full of cotton: These, when ripe, they are at great pains to cut off every morning before sunrise; for the heat of the sun immediately turns the cotton yellow: which indeed we saw from those pods they save for seed.

“They manufacture their cotton into a great variety of stuffs. Their stockings are exceedingly fine. Some of them, they assured us, had been sold for ten sequins a pair. Their coverlets and blankets are esteemed all over Europe. Of these the principal manufactures are established in the little island of Gozzo, where the people are said to be more industrious than those of Malta, as they are more excluded from the world, and have fewer inducements to idleness. Here the sugar cane is still cultivated with success, though not in any considerable quantity.

“The Maltese oranges certainly deserve the character they have of being the finest in the world. The season continues for upwards of seven months, from November till the middle of June; during which time those beautiful trees are always covered with abundance of delicious fruit. Many of them are of the red kind, much superior, in my opinion, to the others, which are rather too luscious. They are produced, I am told, from the common orange bud, ingrafted on the pomegranate stock. The juice of this fruit is as red as blood, and of a fine flavour. The greatest part of their crop is sent in presents to the different courts of Europe, and to the relations of the chevaliers.

“The industry of the Maltese in cultivating their little island is inconceivable. There is not an inch of ground lost in any part of it; and where there was not soil enough, they have brought over ships and boats loaded with it from Sicily, where there is plenty, and to spare. The whole island is full of enclosures of freestone, which give the country a very uncouth and barren aspect; and in summer reflect such a light and heat, that it is exceedingly disagreeable and offensive to the eyes. The enclosures are very small and irregular, according to the inclination of the ground. This, they say, they are obliged to observe, notwithstanding the deformity it occasions; otherwise the floods, to which they are subject, would soon carry off their soil.

“The island is covered over with country houses and villages, besides seven cities, for so they term them; but there are only two, the Valetta, and Citta Vecchia, that by any means deserve that appellation. Every little village has a noble church, elegantly finished, and adorned with statues of marble, rich tapestry, and a large quantity of silver plate.

“The city of Valetta has certainly the happiest situation that can be imagined. It stands upon a peninsula between two of the finest ports in the world, which are defended by almost impregnable fortifications. That on the south side of the city is the largest. It runs about two miles into the heart of the island; and is so very deep, and surrounded by such high grounds and fortifications, that they assured us the largest ships of war might ride here in the most stormy weather, almost without a cable.

“This beautiful bason is divided into five distinct harbours,

Malta. harbours, all equally safe, and each capable of containing an immense number of shipping. The mouth of the harbour is scarcely a quarter of a mile broad, and is commanded on each side by batteries that would tear the strongest ship to pieces before she could enter. Besides this, it is fronted by a quadruple battery, one above the other, the largest of which is a *fleur d'eau*, or on a level with the water. These are mounted with about 80 of their heaviest artillery: so that this harbour, I think, may really be considered as impregnable; and indeed the Turks have ever found it so, and I believe ever will.

"The harbour on the north side of the city, although they only use it for fishing, and as a place of quarantine, would, in any other part of the world, be considered as inestimable. It is likewise defended by very strong works; and in the centre of the bason is an island on which they have built a castle and a lazaret.

"The fortifications of Malta are indeed a most stupendous work. All the boasted catacombs of Rome and Naples are a trifle to the immense excavations that have been made in this little island. The ditches, of a vast size, are all cut out of the solid rock. These extend for a great many miles, and raise our astonishment to think that so small a state has ever been able to make them.

"One side of the island is so completely fortified by nature, that there was nothing left for art. The rock is of a great height, and absolutely perpendicular from the sea for several miles. It is very singular, that on this side there are still the vestiges of several ancient roads, with the tracks of carriages worn deep in the rocks. These roads are now terminated by the precipice, with the sea beneath; and show, to a demonstration, that this island has formerly been of a much larger size than it is at present; but the convulsion that occasioned its diminution is probably much beyond the reach of any history or tradition. It has been often observed, notwithstanding the very great distance of Mount Ætna, that this island has generally been more or less affected by its eruptions; and they think it probable, that on some of these occasions a great part of it may have been shaken into the sea.

"One half of Mount Ætna is clearly discovered from Malta. They reckon the distance near 200 Italian miles. And the people of Malta affirm, that, in great eruptions of the mountain, their whole island is illuminated, and from the reflection in the water there appears a great track of fire all the way from Malta to Sicily. The thundering of the mountain is likewise distinctly heard.

"We made an expedition through the island in coaches drawn by one mule each; the only kind of vehicle the island affords. The catacombs, not far from the ancient city of Melita, are a great work; they are said to extend for 15 miles under ground. Many people, they assure us, have been lost in them by advancing too far; the prodigious number of branches making it next to impossible to find the way out again. The great source of water that supplies the city of Valletta takes its rise near to this place; and there is an aqueduct, composed of some thousand arches, that conveys it from thence to the city. The whole of this

immense work was finished at the private expence of one of the grand masters.

"Not far from the old city there is a small church dedicated to St Paul; and just by the church a miraculous statue of the saint, with a viper on his hand; supposed to be placed on the very spot where the house stood in which he was received after his shipwreck on the island, and where he shook the viper off his hand into the fire without being hurt by it: at which time the Maltese assure us, the saint cursed all the venomous animals of the island, and banished them for ever. Whether this be the cause of it or not, the fact is certain that there are no venomous animals in Malta. They assured us that vipers had been brought from Sicily, and died almost immediately on their arrival.

"Adjoining to the church is the celebrated grotto in which the saint was imprisoned. It is looked upon with the utmost reverence and veneration; and if the stories they tell of it be true, it is well entitled to it all. It is exceedingly damp, and produces (I believe by a kind of petrification from the water (a whitish kind of stone, which, they assure us, when reduced to powder, is a sovereign remedy in many diseases, and saves the lives of thousands every year. There is not a house in the island that is not provided with it: and they tell us there are many boxes of it sent annually, not only to Sicily and Italy, but likewise to the Levant, and to the East Indies; and (what is considered as a daily standing miracle) notwithstanding this perpetual consumption, it has never been exhausted, nor even sensibly diminished; the saint always taking care to supply them with a fresh quantity the day following. I tasted some of it, and believe it is a very harmless thing. It tastes like exceeding bad magnesia, and, I believe, has pretty much the same effects. They give about a teaspoonful of it to children in the smallpox and in fevers. It produces a copious sweat about an hour after; and, they say, never fails to be of service. It is likewise esteemed a certain remedy against the bite of all venomous animals. There is a very fine statue of St Paul, in the middle of this grotto, to which they ascribe great powers.

"The grand master of the knights of Malta is more absolute, and possesses more power, than most sovereign princes. His titles are, *serene highness* and *eminence*; and his household attendance and court are all very princely. As he has the disposal of all lucrative offices, he makes of his councils what he pleases; besides, in all the councils that compose the jurisdiction of this little nation, he himself presides, and has two votes. He has the disposal of 21 commanderies, and one priory, every five years; and as there is always a number of expectants, he is very much courted. He is chosen by a committee of 21; which committee is nominated by the seven nations, three out of each nation. The election must be over within three days of the death of the former grand master; and, during these three days, there is scarce a soul that sleeps at Malta: all is cabal and intrigue; and most of the knights are masked, to prevent their particular attachments and connections from being known: the moment the election is over, every thing returns to its former channel.

"The land force of Malta is equal to the number of

Malta.

of men in the island fit to bear arms. They have about 500 regulars belonging to the ships of war; and 150 compose the guard of the prince. The two islands of Malta and Gozzo contain about 150,000 inhabitants. The men are exceedingly robust and hardy. I have seen them row for 10 or 12 hours without intermission, and without even appearing to be fatigued. Their sea force consists of 4 galleys, 3 galliots, 4 ships of 60 guns, and a frigate of 36, besides a number of the quick-sailing little vessels called *scampovias* (literally *runaways*). Their ships, galleys, and fortifications, are not only well supplied with excellent artillery, but they have likewise invented a kind of ordnance of their own, unknown to all the world besides. For we found, to our no small amazement, that the rocks were not only cut into fortifications, but likewise into artillery, to defend these fortifications, being hollowed out, in many places, into the form of immense mortars. The charge is said to be about a barrel of gunpowder, over which they place a large piece of wood, made exactly to fit the mouth of the chamber. On this they heap a great quantity of cannon-balls, shells, or other deadly materials; and when an enemy's ship approaches the harbour, they fire the whole into the air: and they pretend it produces a very great effect; making a shower for 200 or 300 yards round, that would sink any vessel.

"Notwithstanding the supposed bigotry of the Maltese, the spirit of toleration is so strong, that a mosque has been lately built for their sworn enemies the Turks. Here the poor slaves are allowed to enjoy their religion in peace. It happened lately that some idle boys disturbed them during their service; they were immediately sent to prison, and severely punished. The police indeed is much better regulated than in the neighbouring countries, and assassinations and robberies are very uncommon; the last of which crimes the grand master punishes with the utmost severity. He is said to be much more relaxed with regard to the first.

"Perhaps Malta is the only country in the world where duelling is permitted by law. As their whole establishment is originally founded on the wild and romantic principles of chivalry, they have ever found it too inconsistent with those principles to abolish duelling; but they have laid it under such restrictions as greatly to lessen its danger. These are curious enough. The duellists are obliged to decide their quarrel in one particular street of the city; and if they presume to fight anywhere else, they are liable to the rigour of the law. But, what is not less singular, but much more in their favour, they are obliged, under the most severe penalties, to put up their swords, when ordered to do so by a *woman*, a *priest*, or a *knight*. Under these limitations, in the midst of a great city, one would imagine it almost impossible that a duel could ever end in blood; however, this is not the case: a cross is always painted opposite to the spot where a knight has been killed, in commemoration of his fall. We counted about 20 of these crosses.

"About three months ago (Mr Brydone's letter is dated June 7. 1770), two knights had a dispute at a billiard table. One of them, after giving a great deal of abusive language, added a blow; but to the astonishment of all Malta (in whose annals there is not a

similar instance), after so great a provocation he absolutely refused to fight his antagonist. The challenge was repeated, and he had time to reflect on the consequences; but still he refused to enter the lists. He was condemned to make the *amende honorable* in the great church of St John for 45 days successively; then to be confined in a dungeon, without light, for five years; after which, he is to remain a prisoner in the castle for life. The unfortunate young man who received this blow is likewise in disgrace, as he has not had an opportunity of wiping it out in the blood of his adversary.

"The horse-races of Malta are of a very uncommon kind. They are performed without either saddle, bridle, whip, or spur; and yet the horses are said to run full speed, and to afford a great deal of diversion. They are accustomed to the ground for some weeks before; and although it is entirely over rock and pavement, there are very seldom any accidents. They have races of asses and mules performed in the same manner four times every year. The rider is only furnished with a machine like a shoemaker's awl, to prick on his courser if he is lazy.

"As Malta is an epitome of all Europe, and an assemblage of the younger brothers, who are commonly the best, of its first families, it is probably one of the best academies for politeness in this part of the globe; besides, where every one is entitled by law as well as custom to demand satisfaction for the least breach of it, people are under a necessity of being very exact and circumspect, both with regard to their words and actions."

Malta was taken by the French army under General Bonaparte, destined to invade Egypt, in the year 1799, but soon after retaken by the British, and agreed to be given up to the knights of St John of Jerusalem, by the treaty of Amiens, in 1802. The British however insisted on retaining it for 10 years; and this formed one cause of the recommencement of hostilities in June 1803. The possession and full sovereignty of this island, was confirmed to Britain by the treaty of Paris in May 1814.

Knights of MALTA, otherwise called *Hospitalers of St John of Jerusalem*, a religious military order, whose residence is in the island of Malta, situated in the Mediterranean sea, upon the coast of Africa. The Knights of Malta, so famous for defending Christendom, had their rise as follows:

Some time before the journey of Godfrey of Bouillon into the Holy Land, some Neapolitan merchants, who traded in the Levant, obtained leave of the caliph of Egypt to build a house for those of their nation who came thither on pilgrimage, upon paying an annual tribute. Afterwards they built two churches, and received the pilgrims with great zeal and charity. This example being followed by others, they founded a church in honour of St John, and an hospital for the sick; whence they took the name of *Hospitalers*. A little after Godfrey of Bouillon had taken Jerusalem, in 1099, they began to be distinguished by black habits and a cross with eight points; and, besides the ordinary vows, they made another, which was to defend the pilgrims against the insults of the infidels. This foundation was completed in 1104, in the reign of Baldwin; and so their order became military, into which

Malta.

Malta which many persons of quality entered, and changed the name of *hospitalers* into that of *knights*.

When Jerusalem was taken, and the Christians lost their power in the East, the knights retired to Acre or Ptolemais, which they defended valiantly in 1290. Then they followed the king of Cyprus, who gave them Limisson in his dominions, where they staid till 1310. That same year they took Rhodes, under the grand master Foulques de Villaret, a Frenchman; and next year defended it against an army of Saracens: since which the grand masters have used these four letters, F. E. R. T. i. e. *Fortitudo ejus Rhodum tenuit*; and the order was from thence called *knights of Rhodes*.

In 1522, Solyman having taken Rhodes, the knights retired into Candia, and thence into Sicily. In 1530, Charles V. gave them the island of Malta, to cover his kingdom of Sicily from the Turks. In 1566, Solyman besieged Malta; but it was gallantly defended by the grand master John de Valette Parisot, and the Turks obliged to quit the island with great loss.

The knights consisted of eight different languages or nations, of which the English were formerly the sixth; but at present they are but seven, the English having withdrawn themselves. The first is that of Provence, whose chief is grand commendator of religion; the second of Auvergne, whose chief is mareschal of the order; the third of France, whose chief is grand hospitaler; the fourth of Italy, and their chief, admiral; the fifth of Arragon, and their chief, grand conservator; the sixth of Germany, and their chief, grand bailiff of the order; the seventh of Castile, and their chief, grand chancellor. The chief of the English was grand commander of the cavalry.

None are admitted into this order but such as are of noble birth both by father and mother's side for four generations, excepting the natural sons of kings and princes. The knights are of two sorts; those who have a right to be candidates for the dignity of grand master, called *grand crosses*; and those who are only *knights assistants*, who are taken from good families. They never marry; yet have continued from 1090 to the present time.

The order consists of three estates; the knights, chaplains, and servants at arms. There are also priests who officiate in the churches; friar-servants, who assist at the offices; and *donnes* or *dcmi-crosses*; but these are not reckoned as constituent parts of the body. This division was made in 1130, by the grand master Raymond du Puy.

The government of the order is mixed, being partly monarchical, and partly aristocratical. The grand master is sovereign, coins money, pardons criminals, and gives the places of grand priors, bailiffs, knights, &c. The ordinary council is composed of the grand master and the grand crosses. Every language has several grand priors, and every priory a certain number of commanderies.

The knights are received into this order, either by undergoing the trials prescribed by the statutes, or by dispensations. The dispensations are obtained either by the pope's brief, or by a general chapter of the order, and are granted in case of some defect as to the nobility of their pedigree, especially on the mother's side. The knights are received, either as of age, under mi-

nority, or pages to the grand master. They must be 16 years old complete before they are received: they enter into the noviciate at 17, and are professed at 18. They sometimes admit infants of one year old; but the expence is about 4000 livres. The grand master has 16 pages who serve him, from 12 to 16 years of age. The knights wear on the left side of their cloak or waistcoat a cross of white waxed cloth, with eight points, which is their true badge; that of gold being only for ornament. When they go to war against the Turks, they wear a red cassock, with a great white cross before and behind, without points, which are the arms of the religion. The ordinary habit of the grand master is a sort of cassock of tabby-cloth, tied about with a girdle, at which hangs a great purse, to denote the charitable institution of the order. Over this he wears a velvet gown; and on the left side a white cross with eight points. His yearly revenue is 10,000 ducats. He acknowledges the kings of Spain and both the Sicilies, as his protectors; and is obliged by his agreement with the emperor Charles V. to suppress pirates.

The knights of Malta were deprived of their privileges and had their estates sequestered by order of Maximilian Joseph, elector of Bavaria; but after Paul emperor of Russia took them under his protection, they were all restored. A treaty to this effect was signed in July 1799; but their political existence may now be considered at an end.

MALTON, a town of the north riding of Yorkshire in England, seated on the river Derwent, over which there is a good stone bridge. It is composed of two towns, the New and the Old, and contained 3713 inhabitants in 1811. It is well accommodated with good inns, and sends two members to parliament. W. Long. O. 40. N. Lat. 54. 8.

MALVA, the MALLOW, a genus of plants belonging to the monadelphia class; and in the natural method ranking under the 37th order, *Columniferae*. See BOTANY *Index*.

MALVERN, GREAT and LITTLE, (with the Chase and the Hills); two towns of Worcestershire, in which were formerly two abbeys, about three miles asunder. Since the dissolution nothing remains of the abbey of *Great Malvern* but the gateway of the abbey and church, now parochial. Part of it was a religious cell for hermits before the Conquest; and the greatest part, with the tower, built in the reign of William the Conqueror. Its outward appearance is very striking. It is 171 feet in length, 63 in breadth, and 63 in height. In it are ten stalls; and it is supposed to have been rebuilt in the year 1171. The nave only remains in part, the side aisles being in ruins. The windows have been beautifully enriched with painted glass, and in it are remains of some very ancient monuments. *Little Malvern* stands in a cavity of the hills, which are great lofty mountains, rising like stairs, one higher than another, for about seven miles, and divide this county from Herefordshire. There is a ditch here very much admired. On the hills are two medicinal springs, called *holy wells*, one good for the eyes, and the other for cancers. Henry VII. his queen, and his two sons, Prince Arthur and Prince Henry, were so delighted with this place, that they beautified the church and windows, part of which remain, though mutilated. In the lofty south windows

Malta
||
Malvern.

Malvern
||
Mambrun.

windows of the church are the historical passages of the Old Testament; and in the north windows the pictures of the holy family, the nativity and circumcision of our Saviour, the adoration of the shepherds and the kings, his presentation in the temple, his baptism, fasting, and temptation, his miracles, his last supper with his disciples, his prayer in the garden, his passion, death, and burial, his descent into hell, his resurrection and ascension, and the coming of the Holy Ghost. The history of our Saviour's passion is painted differently in the east window of the choir, at the expence of Henry VII. whose figure is therefore often represented, as is that of his queen. In the west window is a noble piece of the day of judgment, not inferior to the paintings of Michael Angelo. *Malvern Chase* contains 7115 acres in Worcestershire (besides 241 acres called the Prior's Land), 619 in Herefordshire, and 103 in Gloucestershire. *Malvern Hills* run from north to south, the highest point 1313 feet above the surface of the Severn at Hanley, and appear to be of limestone and quartz. On the summit of these hills is a camp with a triple ditch, imagined to be Roman, and situated on the Herefordshire side of the hills.

MALUS. See PYRUS, BOTANY *Index*.

MAMALUKES, the name of a dynasty that reigned in Egypt. See EGYPT.

MAMBRUN, PETER, an ingenious and learned French Jesuit, born in the diocese of Clermont, in

the year 1581. He was one of the most perfect imitators of Virgil in Latin poetry, and his poems are of the same species: Thus he wrote *Eclogues*, *Georgics*, or four books on the culture of the soul and the understanding; together with a heroic poem, entitled *Constantine, or Idolatry overthrown*. He showed also great critical abilities in a Latin *Peripatetical Dissertation on Epic Poetry*. He died in 1661.

MAMERTINI, a mercenary band of soldiers which passed from Campania into Sicily at the request of Agathocles. When they were in the service of Agathocles, they claimed the privilege of voting at the election of magistrates at Syracuse, and had recourse to arms to support their unlawful demands. The sedition was appeased by the authority of some leading men, and the Campanians were ordered to leave Sicily. In their way to the coast they were received with great kindness by the people of Messina, and soon returned perfidy for hospitality. They conspired against the inhabitants, murdered all the males in the city, married their wives and daughters, and rendered themselves masters of the place. After this violence they assumed the name of Mamertini, and called their city Mamertum, or Mamertium, from a provincial word which in their language signified *martial* or *warlike*. The Mamertines were afterwards defeated by Hiero, and totally disabled to repair their ruined affairs.

MAMMÆ, in *Anatomy*. See there, N° 227.

Manumæ.

M A M M A L I A,

¹ Definition. THE first class of the animal kingdom in the system of Linnæus, containing those animals which have *breasts or paps (mamæ)*, at which they suckle their young. In this class are included, not only what are called the *viviparous quadrupeds*, but the BAT tribe, and several marine animals, as SEALS and WHALES. In the present article, we are to give an account of all but the whales, or CETACEA, which have been already fully treated of under the article CETOLOGY.

INTRODUCTION.

² Utility of this part of natural history.

The relations that subsist between man and many of the animals arranged in this class, either from their utility as domestic servants, or from the warfare that they carry on against him, his property or his dependants, render the study of this part of natural history peculiarly important; while the extraordinary actions and faculties of some of these animals must make the history of them highly interesting to every one who examines nature with a curious or discerning eye.

³ Our knowledge of it imperfect.

Quadrupeds have, accordingly, engaged the particular attention of naturalists in every country and in every age, and as our acquaintance with them is less difficult than with most other classes of animated nature, it is not surprising that their form, habits, and manners, are most familiar to us. Still, indeed, much remains in doubt respecting some of the foreign and rarer quadrupeds, and of some we know little more than the name. Even with regard to those which have been longest

known and described, as the *lion*, the *elephant*, the *porcupine*, &c. the observations of modern naturalists and travellers have corrected several erroneous notions that had been generally received as certain. Long as this part of natural history has occupied the attention of mankind, there yet probably remain many gleanings to repay the industry of future inquirers. It is probable that the unexplored regions of Africa, America, and New Holland, may contain many quadrupeds either entirely unknown to us at present, or known only by the fossil remains that have been discovered in the bowels of the earth. There can, we think, be little doubt that the unicorn exists in Africa, not far north of the Cape of Good Hope, and perhaps, at some distant period it may be as well known as the elephant or the hippopotamus is at present*.

To attempt any thing like a critical examination of even the most celebrated writers on the natural history of the mammalia would far exceed the limits which we are obliged to prescribe to this article. We shall, however, briefly notice some of the more important and more interesting works, to which our readers may refer for information which the nature of this work precludes us from affording them.

Among the ancients, the most celebrated writers on natural history in general, and on quadrupeds in particular, are Aristotle and Pliny, and of these the former has been much more circumstantial, and probably much less credulous than the latter. Aristotle wrote more from observation, and the opportunities of obtaining a knowledge

* See Barrow's Travels in Southern Africa.

⁴ Writers on mammalia.

Classification. knowledge of animals that were afforded him by the liberality of his pupil give him a greater claim to our attention and assent, than is perhaps due to Pliny, who drew his accounts almost entirely from preceding writers. Pliny, however, is a more graceful, more animated, and consequently a more pleasing writer, and everywhere displays great marks of taste and erudition.

6 Gesner, Aldrovandus, and Johnston. Between the subversion of literature and the beginning of the 17th century, there is scarcely a writer on quadrupeds that deserves particular mention. Even during the 17th century, the labourers in this department were few; and the names of Gesner, Aldrovandus, and Johnston, alone have been deemed worthy of commemoration in Linnæus's introduction to the mammalia, and of these it is by no means certain that the writings on quadrupeds attributed to Aldrovandus are genuine.

7 Pennant. The 18th century produced a great many valuable works, both systematic and descriptive, on this part of natural history. As systematic writers, Ray and Pennant, and on the continent, Klein, Stort, Brisson, Linné, Daubenton, and Cuvier, are the most celebrated, and we shall presently notice some of these more at large. As a descriptive writer, Pennant is also conspicuous; and the histories of quadrupeds contained in his "British Zoology" and "Arctic Zoology," are at once accurate and interesting, amusing and instructive. But of all these naturalists who have professed to give a detailed account of the history of quadrupeds, none have acquired such celebrity as the Count de Buffon, whose work is in every one's hands, and has been translated into most of the modern languages.

8 Buffon. For animated and lively descriptions, and acute and brilliant remarks, Buffon is perhaps unrivalled: method he seems to have despised; and it is to be regretted that his judgment is not always equal to his taste, and that his accuracy is sometimes less conspicuous than his genius and fancy. There are also a certain freedom of expression, and luxuriance of description, in treating of certain subjects, which render Buffon's work less proper for young people than for those who are more advanced both in years and in the study of nature. Dr Goldsmith's "History of the Earth and Animated Nature" is chiefly an abridgement of Buffon.

Classification. Mr Bewick's "General History of Quadrupeds," with wooden cuts, deserves much praise. In his descriptions, he has selected with much skill and taste, and has added many original and judicious observations, especially respecting the domestic and indigenous animals of this country. His figures are in general excellent, and his vignettes both useful and entertaining.

10 Among the latest systematic works written on this subject is the elegant and splendid "General Zoology" of Dr Shaw. As a museum for acquiring a knowledge of the form and external structure of animals, this work has been surpassed by none, and equalled by very few. Description of the habits or manners of the animals seems to have been a secondary object with Dr Shaw, as of this his work contains very little. It is chiefly valuable as a *systematic arrangement* and general *muscum*.

11 We have seen few works more entertaining than Mr Bingley's "Animal Biography." It is professedly a compilation, but the extracts are well chosen, and in general highly interesting. We cannot say, however, that they are always happily arranged. As Mr Bingley uniformly quotes his authorities, and has given a list of many valuable works from which he has drawn his information, his work is very useful, and forms an admirable companion to Dr Shaw's Zoology.

In the following account of the mammalia, we shall endeavour to combine amusement with utility; but, as our limits are exceedingly confined, we can give a detailed account of very few species. We shall therefore select the most interesting individuals, referring here generally to Buffon, Pennant, Bewick, Shaw, and Bingley for the rest.

With respect to the general divisions of quadrupeds and the terms employed in describing them, we need say nothing here; the former will be seen from the several classifications to be immediately mentioned, and the latter explained under their proper heads in the general alphabet of this dictionary. Respecting the general anatomical structure of the mammalia, we could add little to what has been already given under *Comparative ANATOMY*. When there occurs any striking peculiarity of conformation in particular individuals, it will be noticed in its proper place.

PART I. CLASSIFICATION OF THE MAMMALIA.

12 Classification of Linnæus. QUADRUPEDS have been very differently classified by different naturalists. Our limits will permit us only to give a brief sketch of some of the more important arrangements, and we shall select those of Linnæus, Pennant, and Cuvier.

Linnæus divides the mammalia into seven orders, the distinctive characters of which are chiefly derived from the number, situation, and structure of the teeth.

ORDER I. PRIMATES.

This order is intended to contain man and those animals which are most nearly allied to him in their structure. VOL. XII. Part II.

They have usually four cutting teeth in the fore part of each jaw, and in the upper jaw these are parallel; and they have one canine tooth on each side of these in each jaw. They have also two breasts or teats, from which this class derives its name. The two fore feet in many of the individuals resemble the hands of the human species, and are employed for the same purposes, having fingers, furnished for the most part with oval flattened nails. They chiefly live on vegetable food. Under this order Linnæus ranks four genera, viz. man, the ape tribe, the lemur tribe, and the bats.

ORDER II. BRUTA.

These have no front teeth in either jaw; their feet are armed with strong blunt nails like hoofs; they are generally of a clumsy form, and slow in their movements; they feed chiefly upon vegetables. This order contains nine genera, of which the principal are the rhinoceros, the elephant, the sloths, and ant-eaters.

ORDER III. FERÆ.

These have commonly six front teeth in the upper and under jaw, which are somewhat of a conical shape, and next to these strong and sharp canine teeth, with grinders that terminate in conical pointed eminences; their feet are divided into toes which are armed with sharp crooked claws. Almost all the animals of this order are beasts of prey, living chiefly on the flesh of other animals. The order comprehends ten genera, the most remarkable of which are, the seal, dog, cat, weazel, and bear tribes.

ORDER IV. GLIRES.

These have two front teeth in each jaw, and these are remarkably long and large, but they have no canine teeth; their feet are furnished with claws, and appear formed both for running and leaping. Their food consists of vegetables. This order also contains ten genera, the principal of which are the porcupines, beavers, rats, squirrels, and hares.

ORDER V. PECORA.

These have several front teeth that are blunt, and have a wedge-like form, in the lower jaw, but no front teeth in the upper; their feet are armed with cloven hoofs; they have four stomachs, feed entirely on vegetables, and ruminant or chew the cud. There are in this order eight genera, comprehending the camel, the musk animal, the giraffe, and the deer, antelope, goat, sheep, and ox tribes.

ORDER VI. BELLUÆ.

These have front teeth in both jaws that are obtuse; their feet are armed with hoofs that are in some species entire, and in others subdivided. Most of them live entirely on vegetable food. There are four genera, comprising those of the horse, hippopotamus, tapir, and hog.

ORDER VII. The last order is that of the CETÆ, or *Whales*; for which, see CETOLOGY.

¹³
Objections
to Lin-
næus's ar-
rangement.

Several objections have been made to the above arrangement of Linnæus, and some of them appear to be sufficiently valid. It has been objected with great reason, that man, the lord of the creation, is degraded by being placed under the same division with apes, monkeys, macaocs and bats, the companions which Linnæus has thought proper to allot to him. However nearly the apes may resemble man in their general appearance, and the macaocs in the use of their fore extremities, they should surely have been considered apart from

man; and nothing, it is said, can be more absurd than to arrange the insignificant fly-bat with any of the former animals, because it agrees with them in the number and situation of its teeth. To the second order it is objected, that the most intelligent of quadrupeds, the half-reasoning elephant, is made to associate with the most discordant and stupid of the creation, with sloths, ant eaters, and armadillos, or with creatures of a quite different element, walruses and morses. In the third order, again, which from its name should comprehend only the wild beasts or beasts of prey, it will be impossible (says Mr Pennant) to allow the mole, the shrew, and the harmless hedgehog, to be the companions of lions, wolves, and bears. We may err in our arrangement.

*Sed non ut placidis locant inimitia, non ut
Serpentes avibus gementur, tigribus agni*.*

¹⁴
* Pennant's Syn-
opsis, Pref.

To the sixth order it has been objected that the hoofed animals arranged under it are so dissimilar in their nature, that they ought not to be placed together without some intermediate gradations.

To many of the above objections it may be replied, that all artificial arrangements have their disadvantages, and that if we follow nature in placing together only those animals that resemble each other in their external appearance, or in their habits of life, we shall often be obliged to arrange the individuals of what most naturalists consider as the same genus under very different parts of our system. The great object of a systematic arrangement is to facilitate the discovery of objects that are unknown; and for this purpose, in respect to quadrupeds, there is perhaps no method preferable to that which is founded on the diversity of their teeth and feet. We shall in the following article, as we have done in most of the preceding departments of natural history, adopt the arrangements of Linnæus, modifying according to the latest improvements of Gmelin and Shaw.

Our celebrated British naturalist, Mr Pennant, published the first edition of his *Synopsis of Quadrupeds* in 8vo, in 1771; and ten years after he published a third edition under the new title of *History of Quadrupeds*, in 2 vols. 4to. This work has gone through some other editions, and is justly admired for the quantity of information which the author has contrived to give in a very condensed form.

Mr Pennant distributes quadrupeds into four general divisions, containing such as are hoofed, digitated, pinnated, and winged.

The first division is subdivided into two sections: the first containing those animals whose hoofs are entire or of one piece, of which there is only one genus, viz. HORSE. The second section those which are cloven-hoofed; of which there are 13 genera, comprising the OX, SHEEP, GOAT, GIRAFFE, ANTELOPE, MUSK, CAMEL, HOG, RHINOCEROS, HIPPOPOTAME, TAPIR, and ELEPHANT.

The second division consists of digitated animals, or those whose feet are divided into toes. It is subdivided into five sections; the first of which consists of those animals that are anthropomorphous, or which, in some measure, resemble man in their external form. Of these there are two genera, viz. APE and MACAUOC. The second section consists of rapacious carnivorous ani-
mals,

Classification. Mals, having six or more cutting teeth in each jaw, and large canine teeth separated from the cutting teeth. Of these there are eight genera, comprehending those of the DOG, HYÆNA, CAT, BEAR, BADGER, OPOSSUM, WEAZEL, and OTTER. The third section contains animals that have no canine teeth, and only two cutting teeth in each jaw, being generally herbivorous or frugivorous. Of these there are 11 genera, viz. CAVY, HARE, BEAVER, PORCUPINE, MARMOT, SQUIRREL, JERBOA, RAT, SHREW, MOLE, and HEDGEHOG. The fourth section comprehends those animals which are without cutting teeth, and which, like those of the last section, live on herbs and fruits. This section contains only two genera, viz. those of the SLOTH and ARMADILLO. The fifth section contains animals that are destitute of teeth, and live on insects. Of these there are two genera, viz. MANIS and ANT-EATER.

The third division consists of those animals that are pinnated or furnished with fins, and chiefly live in the water, feeding partly on fish and partly on herbage. Of these there are three genera, viz. the WALRUS, SEAL, and MANATI.

The fourth division, or that of the winged quadrupeds, contains the single genus of the BAT, which being placed last in the order of quadrupeds, is thus made to form the connecting link between them and the class of birds.

16
Of Cuvier.

According to Cuvier's arrangement, the mammalia are divided into three general orders: 1. Those having claws or nails; 2. Those having hoofs; and, 3. Those having feet like fins: a division very similar to that of Mr Pennant. The first of these orders is subdivided into those mammalia that have three sorts of teeth, and those that want at least one kind of teeth.

The first subdivision of the first order contains three families, viz.

I. BIMANUM, having thumbs separate on the atlantal * extremities, comprehending MAN alone.

* See Bar-
clay on
Anatomical
Nomenclature.

II. QUADRUMANA, having the thumbs or great toes separate on each of the fore feet. This family contains two genera, viz. SIMIA or Apes, comprehending the subgenera pithecus or *oran-otans*, callitrix or *sapajous*, cercopithecus or *guenons*, cynocephalus or *macaques*, papio or *baboons*, cubes or *alouates*; and LEMUR or *Makis*, comprehending the subgenera of lemur, indri, lori, galago, and tardipus.

III. SARCOPHAGA; having no separate thumbs or great toes on the atlantal extremity. This family is subdivided into four sections, viz. CHEIROPTERA, or those that have elongated hands and membranes, extending between the feet from the neck to the anus; PLANTIGRADA, or those that have no separate thumbs or great toes, and who, in walking, apply the whole sole of the foot to the ground; CARNIVORA, or such as have no separate thumbs or great toes, and whose feet, in walking, rest only on the toes; and PEDIMANA, or such as have separate great toes on the sacral extremities or hind feet. The CHEIROPTERA comprise two genera, viz. VESPERTILIO or *Bats*, comprehending the subgenera of pteropus or *roussets*, vesperilio or *common bats*, rinolaphus, phyllostoma, and noctilio; and GALEOPITHECUS, or *Flying Lemurs*. The PLANTIGRADA contain four genera, viz. ERINACEUS or *Hedgehogs*, comprehending the subgenera of erinaceus or *hedgehogs*, and setiger or *tenrecs*; SOREX or *Shrews*,

comprehending the subgenera of sorex or *shrew mice*, mygali or *musk shrew*; CHRYSO-CHLORIS, *Scalops*; talpa or *moles*; and URSUS or *Bears*, comprehending the subgenera of ursus or *bears*, taxus or *badgers*, nassua or *coatis*, procyon or *racoons*; potos or *kincajous*, ichneumon or *mangoustes*. The CARNIVORA comprise four genera, viz. MUSTELA, or *Weazels*, comprehending the subgenera of mustela, or *weazels* and *martins*, lutra or *otters*, mephites or *mouffetes*, viverra or *ci-vets*; FELIS, or *Cat tribe*; and CANIS, or the *Dog tribe*, comprehending the subgenera of canis and hyæna. The PEDIMANA contains only one genus, viz. DIDELPHIS or *Opossum*, comprehending the subgenera of didelphis or *sariques*, dasyurus, phalangista or *phalang-ers*.

Classification.

IV. RODENTIA, or such quadrupeds as want only the canine teeth. This family comprises eight genera, viz. KANGURUS, *Kanguroos*; HYSTRIX or *Porcupines*; LEPUS, or *Hares* and *Rabbits*, comprehending the subgenera of lepus and lagomys; CAVIA, comprehending the subgenera of cavia and hydrochærus; CASTOR or *Beavers*; SCIURUS or *Squirrels*, comprehending the subgenera of sciurus, and pteromys or *flying squirrels*; CHEIROMYS, or *Aye-aye*; and MUS, or *Rats* and *Mice*, comprehending the subgenera of arctomys or *marmots*, lemmus or *field mice*, fiber or *ondatra*, mus or *rats*, cricetus or *hamsters*, sphalax or *mole rat*, dipus or *jer-boas*, myoxus or *dormice*.

V. EDENTATA, or those mammalia which have neither cutting nor canine teeth. This family comprises three genera, viz. MYRMECOPHAGA, or *Ant-Eaters*, comprehending the subgenera of myrmecophaga, echidna or *porcupine ant-eaters*, and manis or *scaly lizards*; ORYCTEROPUS, or *Cape Ant-Eaters*; and DASYPUS, or *Armadillos*.

VI. TARDIGRADA, or such as are deficient only in cutting teeth. Of this family there is only one genus, viz. BRADYPUS, or *Slots*; under which Cuvier arranges as a subgenus, the unknown animal which he calls *megatherium*.

The second order, or those quadrupeds that are furnished with hoofs, comprises three families, with the following distinctions and subdivisions.

VII. PACHYDERMATA, or those animals that have more than two toes and more than two hoofs. In this family there are six genera, viz. ELEPHAS or *Elephants*; TAPIR or *Tupirs*; SUS or *Swine*; HIPPOPOTAMUS or *River horse*; HYRAX or *Daman*; and RHINOCEROS.

VIII. RUMINANTIA, having two toes and two hoofs. Of this there are eight genera, viz. CAMELUS or *Camels*, divided into the subgenera of camelus and lama; MOSCHUS or *Musks*; CERVUS or *Deer*; CAMELOPARDALIS or *Giraffe*; ANTELOPE or *Antelopes*; CAPRA or *Goats*; OVIS or *Sheep*; and BOS or *Oxen*.

IX. SOLIPEDA, having one toe and one hoof, and comprising only one genus, viz. EQUUS or *Horse*.

The third order, or the mammalia with fin-like feet, contains two families, viz. AMPHIBIA and CETACEA.

X. AMPHIBIA, having four feet, and comprising two genera, viz. PHOCA or *Seals*; and TRICHECUS or *Morses*.

XI. CETACEA, containing five genera, viz. MANATUS or *Lamantins*; DELPHINUS or *Dolphins*; PHYSETER or *Cachalots*; BALÆNA or *Common Whales*; and MONODON or *Narwhal* *.

* *Lecons

mie Compa-
rat. vol. i.*

GENERIC CHARACTERS.

ORDO I. PRIMATES.

HOMO. Situs erectus. Hymen et menstrua femina-
rum.

MAN. Posture erect. Female furnished with a hy-
men, and menstruating.

1. **SIMIA.** Dentes laniarii, hinc remoti.
2. **LEMUR.** Dentes primores superiores 4; inferi-
ores 6.
3. **GALOPITHECUS.** Dentes primores superiores
nulli; inferiores 6.
* 4. **VESPERTILIO.** Manus palmato-volatilis (A).

- S. Tusks distant from each other.
L. Fore teeth upper 4; lower 6 in number.
G. Front teeth in the upper jaw wanting; in the
lower 6.
V. Fore feet palmate, formed for flying.

ORDO II. BRUTA.

5. **BRADYPUS.** Dentes molares primo longiore, abs-
que laniariis primoribusve. Corpus pilosum.
6. **MYRMECOPHAGA.** Dentes nulli. Corpus pilo-
sum.
7. **MANIS.** Dentis nulli. Corpus squamatum.
8. **DASYPUS.** Molares absque laniariis primoribus-
ve. Corpus cataphractum.
9. **RHINOCEROS.** Cornu in fronte positum.
10. **ELEPHAS.** Dentes laniarii et molares. Nasus
proboscide elongatus.
11. **SUKOTYRO.** Cornu ad utrumque latus prope
oculos.
12. **PLATYPUS.** Os anatinum. Pedes palmati.
13. **TRICHECUS.** Dentes laniarii superiores, molares
ex osse rugoso. Pedes compedes.

- B. Grinders longer in front, without tusks. Body
hairy.
M. No teeth. Body hairy.
N. No teeth. Body scaly.
D. Grinders, without tusks or cutting teeth. Body
crustaceous.
R. Horn seated in front.
E. Tusks and grinders. Nose elongated into a pro-
boscis.
S. A horn on each side near the eyes.
P. Mouth like a duck's bill. Feet webbed.
T. Upper tusks. Grinders rough and bony. Hin-
der feet uniting into a fin.

ORDO III. FERÆ.

Glires.

ORDO IV. GLIRES.

26. HYSTRIX. Corpus spinis tectum.
27. CAVIA. Dentes primores cuneati. Molares 4 ad utrumque latus. Claviculae nulli.
28. CASTOR. Dentes primores superiores cuneati. Molares ad utrumque latus. Claviculae perfectae.
* 29. MUS. Dentes primores superiores cuneati. Molares 3 ad utrumque latus. Claviculae perfectae.
30. HYDROMYS. Pedes posteriores palmatae. Cauda cylindrica.
31. ARCTOMYS. Dentes primores cuneati. Molares superiores 5, inferiores 4, ad utrumque latus. Claviculae perfectae.
* 32. SCIURUS. Dentes primores superiores cuneati; inferiores acuti. Molares superiores 5, inferiores 4, ad utrumque latus. Claviculae perfectae. Cauda disticha. Mystaces longae.
* 33. MYOXUS. Mystaces longae. Cauda rotunda, apice crassior.
34. DIPUS. Pedes anteriores perbreves; posteriores praelongi.
* 35. LEPUS. Dentes primores superiores duplicati.
36. HYRAX. Dentes primores superiores lati. Cauda nulla.

- H. Body covered with spines.
C. Cutting teeth wedge-shaped. Grinders 4 on each side. Clavicles wanting.
C. Upper cutting teeth wedge-shaped. Grinders 4 on each side. Clavicles complete.
* M. Upper cutting teeth wedge-shaped. Grinders 3 on each side. Clavicles complete.
H. Hind feet webbed. Tail round.
A. Cutting teeth wedge-shaped. Grinders 5 in the upper jaw, 4 in the lower, on each side. Clavicles complete.
* S. Upper cutting teeth wedge-shaped; lower acute. Grinders 5 in the upper jaw, 5 in the lower, on each side. Clavicles complete. Tail spreading towards each side. Whiskers long.
* M. Whiskers long. Tail round, thicker at the tip.
D. Fore feet short; hind feet very long.
* L. Upper cutting teeth double.
H. Upper cutting teeth broad. Tail wanting.

²²
Pecora.

ORDO V. PECORA.

37. CAMELUS. Ecornis. Dentes lanarii plures.
38. MOSCHUS. Ecornis. Dentes lanarii solitarii; superioribus exsertis.
* 39. CERVUS. Cornua solida, ramosa, decidua. Dentes lanarii nulli.
40. CAMELOPARDALIS. Cornua brevissima. Pedes anteriores posterioribus multo longiores.
41. ANTILOPE. Cornua solida, simplicia, persistentia. Dentes lanarii nulli.
* 42. CAPRA. Cornua tubulosa, erecta. Dentes lanarii nulli.
* 43. OVIS. Cornua tubulosa reclinata. Dentes lanarii nulli.
* 44. BOS. Cornua tubulosa porrecta. Dentes lanarii nulli.

- C. Without horns. Tusks many.
M. Without horns. Tusks single; upper projecting.
* C. Horns solid, branching, deciduous. Tusks wanting.
C. Horns very short. Fore feet much longer than the hind.
A. Horns solid, unbranched, persistent. Tusks wanting.
* C. Horns hollow, erect. Tusks wanting.
* O. Horns hollow, reclined. Tusks wanting.
* B. Horns hollow, turned outwards. Tusks wanting.

ORDO VII. CETÆ.—See CETOLOGY.

PART II. ARRANGEMENT AND HISTORY OF THE SPECIES.

CHAP. I. PRIMATES.

OF this order we shall here give an account only of the four genera, SIMIA, LEMUR, GALEOPITHECUS, and VESPERTILIO, reserving MAN for a separate article.

²⁴
Simia.

Genus I. SIMIA. APES.

Front teeth four in each jaw, near together; canine solitary, longer than the others, and at a distance from the grinders. Grinders obtuse.

The animals of this genus, which are best known by the familiar name of apes or monkeys, form a very interesting part of the animal creation; not so much for their importance and utility in relation to man, as on account of the near resemblance that they bear to the human species. They are a very lively tribe of animals, full of frolic, chatter, and grimace. From the structure of their limbs, they are capable of performing many actions in common with man; and we shall presently relate some diverting instances of their imitative powers. Most of them are fierce and untameable, though some are of a more gentle nature, and even seem capable of an attachment to man. In general, however, they are prone to mischief, and are filthy, obscene, lascivious, and thievish. When offended, they use threatening gestures; and when pleased, they appear to laugh. Many of them have cheek pouches, in which they keep for a while such food as they have not immediate use for. They are commonly gregarious, going together in vast companies, the different species never mixing with each other, but keeping apart, and in different quarters. They inhabit woods, and live on trees, leaping with vast activity from one tree to another, even though loaded with their young, which cling to them. They are not carnivorous, but chiefly feed on fruits and leaves, sometimes on insects, though, for mischief's sake, they will often rob the nests of birds of their eggs and young. They are themselves the prey of serpents, which pursue them to the trees and swallow them entire. They are also devoured by leopards and similar beasts of prey. Some species are eaten by the natives of the countries where they are found.

These animals are almost confined to the torrid zone; and, in particular, the woods of Africa, from Senegal to the Cape, and from thence to Ethiopia, are crowded with them. They are found in all parts of India, and its islands, in the south of China, in Cochinchina and Japan; and they swarm in the forests of South America, from the isthmus of Darien to Paraguay.

In some parts of India monkeys are objects of worship to the natives, and magnificent temples are erected in honour of them (B). In these countries they frequently come in vast numbers into the cities, and enter the houses without molestation. In Amadabad, the capital of Guzarud, there are three hospitals for animals, where lame and sick monkeys, and such as, though well, choose to dwell there, are fed and cherished. Twice a-week the monkeys of the neighbourhood assemble spontaneously in the streets of this city, mount on the houses which are flat-roofed, and lie here during the great heats. On these days the inhabitants take care to leave for them rice, millet, or fruit; and if by any accident they omit to do this, the disappointed animals become furious, break the tiles, and do other mischief.

From the great number of species, it has been found convenient to distribute them into three subdivisions, viz. those of apes, baboons, and monkeys. We shall enumerate the species under each of these subdivisions, with their specific characters, and shall then give a brief account of some of the most remarkable individuals.

A. APES, destitute of tails. In this subdivision are ²⁵ reckoned 4 species, viz.

1. *S. Satyrus*, Oran Otan, or Wild Man of the Wood. Tailless, either chesnut colour or black, without callosities behind, and with the hair on the lower parts of the arms reversed.—2. *S. Lar*, Great Gibbon or long-armed A. Tailless, usually black, without callosities behind, and with arms as long as the body.—3. *S. Inuus*, Magot or Barbary A. Tailless; pale brown, with callosities behind and an oblong head.—4. *S. Sylvanus*, Pigmy. Tailless; pale brown, with callosities behind, and a roundish head.

B. BABOONS. Tails commonly short; bodies muscular. In this there are 16 species, viz. ²⁶ Baboons.

5. *S. Sphinx*, Common B. Short tailed; brown, with callosities behind, with dull flesh-coloured face and pointed nails.—6. *S. Mormon*, Mantegar, or Great B. Short-tailed; tawney brown, with callosities behind; naked, tumid, violet blue cheeks, obliquely furrowed, and the middle of the nose blood-red.—7. *S. Maimon*, Mandril or Ribbed-nose B. Short-tailed; olive brown, with callosities behind; naked, violet-blue furrowed cheeks, and the middle of the nose flesh-coloured.—8. *S. Porcaria*, or Hog-faced B. Short-tailed; brown, covered behind, with black naked hog-like face and pointed nails.—9. *S. Sylvicola*, Wood B. Short-tailed; fleshy brown, with callosities behind, and with black naked face, hands, and feet.—10. *S. Sublutea*, Yellow:

(B) When the Portuguese got possession of the island of Ceylon, they found in one of the temples dedicated to these animals, a golden casket containing the tooth of an ape; a relick which the natives held in such veneration, that they offered to redeem it at no less a price than 700,000 ducats. The viceroy, however, ordered it to be burned; but, some years afterwards, a fellow, who was in the Portuguese ambassador's train, having procured a similar tooth, pretended that it was the old one, and offered it to the priests, who were so much rejoiced at the recovery of their lost treasure, that they purchased it of the fellow for above 10,000l. of our money.

Primates. low B. Short-tailed; yellow, freckled with black, with naked black face and hands, hairy on the upper surface.—11. *S. Cinerea*, Cinereous B. Short-tailed; cinereous, with the crown spotted with yellow; brown face and pale beard.—12. *S. Dentata*, Broad-toothed B. Short-tailed, ash brown, with bluish face, and very large fore teeth.—13. *S. Fusca*, Brown B. Short-tailed; brown, with callosities behind, a whitish face, and a very broad nose.—14. *S. Nemestrina*, Pig-tailed B. Olive brown, with a short naked tail.—15. *S. Cristata*, Crested B. Short-tailed; black, with very long hair on the crown and cheeks; whitish breast, and bare face and hands.—16. *S. Apedia*, Little B. Short-tailed; yellowish, without callosities behind, with thumbs standing close to the fingers, and furnished with rounded nails; the fingers with narrow ones.—17. *S. Hamadryas*, Dog-faced B. Tail gray, with callosities behind; sharpish claws, and the hairs on each side of the head very long.—18. *S. Ferox*, Lion-tailed B. Tailed; black, with very large whitish spreading beard.—19. *S. Cynosuros*, Pale brown, beardless, with callosities behind, and with longish flesh-coloured face; a whitish band across the forehead, and a longish sharp-pointed tail.—20. *S. Rugata*, Wrinkled B. Short-tailed, yellowish brown; whitish beneath, with flesh-coloured face, and large blood-red wrinkled callosities behind.

27
Monkeys.

C. MONKEYS. Tails generally long. This subdivision contains 42 species, viz.

21. *S. Leomina*, Leonine Monkey. Black, with callosities behind, very large whitish beard, and very long tufted tail.—22. *S. Cynomolgus*, Hare-lipped M. Long-tailed, beardless, with callosities behind, rising bifid nostrils, and arched tail.—23. *S. Veter*, Purple-faced M. Long-tailed; white, with black beard.—24. *S. Roloway*, Roloway or Raloure M. Short-tailed, blackish; white beneath, with triangular face, surrounded by a white divided beard.—25. *S. Diana*, Diana or Spotted M. Long-tailed, blackish, freckled with white; the hair of the forehead and beard growing in a pointed form, with a lunated band across the forehead.—26. *S. Nasuta*, Long-nosed M. Long-tailed, blackish-rusty; pale ash-coloured beneath, with long naked flesh-coloured face.—27. *S. Flavescens*, Yellowish M. Long-tailed, bearded, cinereous; yellow, with black face and ears.—28. *S. Sabaea*, Green M. Long-tailed, yellowish gray, with black face and callosities behind.—29. *S. Ethiops*, Mangabey or White-eyed M. Long-tailed, beardless, with black face; white eyelids, white frontal band, and the hair on the forehead upright.—30. *S. Cephas*, Mustache M. Long-tailed, blackish rusty, whitish beneath, with bearded cheeks and yellowish crown; red eye-lids and whitish muzzle.—31. *S. Nictitans*, White-nosed M. Long-tailed, beardless, black, freckled with white; the thumb of the hands very short, and no callosities behind.—32. *S. Talapoin*, Long-tailed, olive-coloured; bearded cheeks, and black ears, nose, and soles.—33. *S. Maura*, Negro M. Long-tailed, blackish, with swarthy flesh-coloured face and breast, and blackish beard.—34. *S. Aygula*, Egret M. Long-tailed, beardless; gray, with a rising longitudinal tuft on the crown.—35. *S. Rubra*, Red M. Long-tailed, red pale ash-coloured beneath, with bearded cheeks, and a black or white band across the forehead.—36. *S. Sinica*, Chi-

nese M. Beardless, pale brown, with the hair of the crown spreading round horizontally.—37. *S. Petaurista*, Vaulting M. Olive black; white beneath, with a triangular white spot on the nose.—38. *S. Pileata*, Bonneted M. Rusty brown, whitish; yellow beneath, with black limbs, and the hair at the head rising circularly upwards.—39. *S. Mona*, Varied M. Olive rusty; white beneath, with the cheeks bearded, and a lunated whitish band across the forehead.—40. *S. Nasalis*, Proboscis M. Long-tailed, bearded, chesnut colour, with pale limbs and tail, and a very long nose.—41. *S. Neomus*, Cochin China M. Long-tailed, with bearded cheeks and white tail.—42. *S. Fulva*, Tawney M. Sub-ferruginous, with the lower part of the back orange, white beneath, with flesh-coloured face and ears.—43. *S. Hircina*, Goat M. Long-tailed, brown, with blue furrowed nose, and long-pointed beard.—44. *S. Comosa*, Full-bottom M. Long-tailed, black, with very long spreading whitish hair on the head, and white tail.—45. *S. Ferruginea*, Bay M. Long-tailed, rusty, with black limbs and tail.—46. *S. Annulata*, Annulated M. Rusty brown, whitish beneath, with annulated tail, shorter than the body.—47. *S. Pithecia*, Fox-tailed M. Blackish brown, with the tips of the hair whitish, and very bushy tail.—48. *S. Iacchus*, Striated M. Long-tailed, with spreading hairy ears; crooked hairy tail and sharp claws, those on the thumb being rounded.—49. *S. Oedipus*, Red-tailed M. Long, red-tailed, beardless, with the hair of the head spreading downwards, and sharp nails.—50. *S. Rosalia*, Silky M. Long-tailed, silky hair, with long hair on the head; yellow body, reddish round the face, and pointed claws.—51. *S. Nudus*, Great-eared M. Long-tailed, black, with large naked square ears, orange-coloured feet, and pointed nails.—52. *S. Argentata*, Fair M. Long-tailed, beardless, white, with red face and brown tail.—53. *S. Beelzebub*, Preacher M. Bearded, black, the feet and tip of the tail brown; tail prehensile.—54. *S. Senniculus*, Royal M. Long-tailed, bearded, red; tail prehensile.—55. *S. Paniscus*, Four-fingered M. Long-tailed, bearded, black, with four-fingered feet; tail prehensile.—56. *S. Fatuellus*, Horned M. Long-tailed, beardless, with two horns like tufts on the head; tail prehensile.—57. *S. Trepida*, Fearful M. Long-tailed, beardless, with upright hair on the head, and bluish feet; tail prehensile.—58. *S. Apella*, Weeper M. Long-tailed, beardless; brown body, black feet, and without callosities; tail prehensile.—59. *S. Capucina*, Capuchin M. Long-tailed, beardless, without callosities, with black crown and limbs, and hirsute prehensile tail.—60. *S. Sciurea*, Squirrel M. Long-tailed, yellowish gray, beardless, with orange-coloured hands and feet; four of the claws, and the hind feet pointed.—61. *S. Antiguensis*, Antigua M. Blackish brown, white beneath, with black limbs and face, bearded cheeks, and brown prehensile tail.—62. *S. Morta*, Naked-tailed M. Long-tailed, beardless, brown, with dusky muzzle, and naked scaly tail.

Species 1. *S. Satyrus*. ²⁸Oran Otan, Wild Man of the Woods. *Chimpansee*, *Jocko*. Tailless Ape.—It is generally believed by naturalists, that the animals which have been described under the names given above, are only varieties of the same species, differing from each other in size, colour, sex, and some other trifling shades of discrimination. Four remarkable specimens have

History of
the Species.

have been described by authors of repute; one by our countryman Tyson; another by Professor Allamand; a third by Vosmaer; and a fourth by Edwards.

The oran otan is said sometimes to have attained the height of six feet: the specimens brought into Europe have seldom exceeded the half of that stature. His strength, however, is very great; and, in his native forests, it is said that the most muscular man is by no means a match for him. His colour is usually a dusky brown; almost the whole body, except the feet and palms of the hands, is covered with hair: but in some varieties the face is said to be nearly as bare as the human. Indeed there is no animal which bears so strong a resemblance to man as this species. His hands, feet, and ears are almost exactly human; and, to a superficial observer, many others of its features so nearly resemble those of a man, that he has been considered, by some writers, as man in his rudest and most uncultivated state. On a closer examination, however, it has been found, that there are marks of distinction sufficiently strong to overturn an opinion so humiliating to the lords of the creation, and to demonstrate, that even in anatomical structure this animal differs as much from the most savage of the human species, as the latter does in point of sagacity and reasoning powers from the most cultivated European. The nose of the oran-otan is flatter, and his mouth wider, than that of the Negro; his forehead is more oblique; his chin has no elevation at the base, his eyes are much nearer each other, and the distance betwixt the nose and the mouth is much greater than in man. He has also no calves to his legs, and, though he sometimes walks on two, it is pretty certain that this attitude is not natural to him. Buffon has asserted that these animals always walk upright, and has made this circumstance one of the distinguishing characters of his division of apes. It is now, however, generally understood, that this assertion is too hasty: and it is the opinion of those most capable of judging, that the oran otan, like all other animals except man, was intended by nature to walk on all fours. See MAN.

On the whole it appears that there are two principal varieties of this species; one of which has been distinguished by the name of pongo, or great oran otan, and the other has been called jocko. The following account is given of the pongo by Battel. "This pongo is all proportioned like a man, but that he is more like a giant in stature than a man; for he is very tall, and hath a man's face, hollow-eyed, with long hair upon his brows. His face and ears are without hair, and his hands also. He differeth not from man but in his legs, for they have no calf. He goes always upon his legs, and carrieth his hands clasped on the nape of his neck when he goeth upon the ground. They sleep in the trees and build shelters from the rain. They feed upon fruit that they find in the woods and upon nuts, for they eat no kind of flesh. They cannot speak, and have no understanding more than a beast. The people of the country when they travel in the woods, make fires where they sleep in the night; and in the morning when they are gone, the pongo will come and sit about the fire till it goeth out; for they have no understanding to lay the wood together. They go many together, and kill many negroes that travel in the woods. Many times they fall upon the elephants,

which come to feed where they be, and so beat them with their clubbed fists, and pieces of wood, that they will run roaring away from them. Those pongoes are never taken alive, because they are so strong that ten men cannot hold one of them, but yet they take many of their young ones with poisoned arrows. The young pongo hangeth on his mother's belly, with his hands clasped about her, so that when any of the country people kill any of the females, they take the young one, which hangeth fast upon his mother *."

This is almost the only account which we have of the oran otan in its native state. The other relations of its habits and manners are descriptive of it in a state of captivity, and of these we shall present our readers with some of the most remarkable.

Mr Buffon gives us the following account of a jocko, which he saw in France. "The oran otan which I saw walked always on two feet, even when carrying things of considerable weight. His air was melancholy, his gait grave, his movements measured, his disposition gentle, and very different from those of other apes. He had neither the impatience of the Barbary ape, the maliciousness of the baboon, nor the extravagance of the monkeys. It may be alleged (says our author) that he had the benefit of instruction; but the other apes, which I shall compare with him, were educated in the same manner. Signs and words were alone sufficient to make our oran otan act; but the baboon required a cudgel, and the other apes a whip; for none of them would obey without blows. I have seen this animal present his hand to conduct the people who came to visit him, and walk as gravely along with them as if he had formed a part of the company. I have seen him sit down at table, unfold his towel, wipe his lips, use a spoon or a fork to carry the victuals to his mouth, pour his liquor into a glass, and make it touch that of the person who drank along with him. When invited to tea, he brought out a cup and saucer, placed them on the table, poured out the tea, and allowed it to cool before he drank it. All these actions he performed without any other instigation than the signs or verbal orders of his master, and often of his own accord. He did no injury to any person; he even approached company with circumspection, and presented himself as if he wanted to be caressed. He was very fond of dainties, which every body gave him: and as his breast was diseased, and he was affected with a teasing cough, this quantity of sweet-meats undoubtedly contributed to shorten his life. He lived one summer in Paris, and died in London the following winter. He ate almost every thing, but preferred ripe and dried fruits to all other kinds of food. He drank a little wine, but spontaneously left it for milk, tea, or other mild liquors †."

Doctor Tyson describes the oran otan which exhibited in London about the end of the seventeenth century as the most gentle and loving creature that could be. Those that he knew on board the ship in which he was brought to England, he would come and embrace with the greatest tenderness, and though there were other monkeys on board, it was observed that he would never associate with any of them, but always avoided their company as of nothing akin to them. He was sometimes drest in clothes, of which he at length became very fond, would put on part of them without help, and carry the rest in his hands to some of the

* Buffon
by Smellie,
vol. viii.

† Buffon,
ubi supra.

Primates. the company for their assistance. He would lie in bed, lay his head on the pillow, and pull up the bed clothes to keep himself warm*.

* **Anatomy of a Pigmy.** Peré Carbasson brought up an oran otan, which became so fond of him, that wherever he went it was always desirous of accompanying him: whenever, therefore, he had to perform the service of his church, he was obliged to shut it up in a room. Once, however, the animal escaped and followed the father to the church, where, mounting on the sounding board above the pulpit, he lay perfectly still till the sermon commenced. He then crept to the edge of the board, and overlooking the preacher, imitated all his gestures in so grotesque a manner, that the congregation was unavoidably caused to laugh. The father, surprised and confounded at this ill-timed levity, reproved his audience for their inattention. The reproof failed in its effect; the congregation still laughed, and the preacher in the warmth of his zeal redoubled his vociferations and his actions; these the ape so exactly imitated, that the congregation could no longer restrain themselves, but burst into a loud and continued laughter. A friend of the preacher at length stepped up to him, and pointed out the cause of this improper conduct; and such was the arch demeanour of the animal, that it was with the utmost difficulty he could command his countenance and keep himself apparently serious, while he ordered the servant of the church to take the ape away.

Perhaps one of the most interesting accounts of the oran otan is that given by Vosmaer, and with this we shall close our history of this species.

Plat. CCCL. fig. 1. "This animal (says M. Vosmaer) was a female; its height was about two Rhenish feet and a half. It shewed no symptoms of fierceness or malignity, and was even of a somewhat melancholy appearance. It was fond of being in company, and showed a preference of those who took daily care of it, of which it seemed to be sensible. Often when they retired, it would throw itself on the ground, uttering lamentable cries, and tearing in pieces the linen within its reach. Its keeper having sometimes been accustomed to sit near it on the ground, it took the hay of its bed, and laid it by its side, and seemed by every demonstration to invite him to be seated near. Its usual manner of walking was on all fours, like other apes, but it could also walk on its two hind feet only. One morning it got unchained, and we beheld it with wonderful agility ascend the beams and rafters of the building; it was not without some pains that it was retaken, and we then remarked an extraordinary muscular power in the animal, the assistance of four men being necessary to hold it in such a manner as to be properly secured. During its state of liberty it had among other things taken a cork from a bottle of Malaga wine, which it drank to the last drop, and had set the bottle in its place again. It ate almost every thing which was given to it; but its chief food was bread, roots, and especially carrots, all sorts of fruits, especially strawberries; and it appeared extremely fond of aromatic plants, and of the leaves and roots of parsley. It also ate meat, both boiled and roasted, as well as fish. It was not observed to hunt for insects like other monkeys; was fond of eggs, which it broke with its teeth, and sucked completely; but fish and roasted meat seemed its favourite food. It had been taught to eat with a spoon and a fork. When

presented with strawberries on a plate, it was extremely pleasant to see the animal take them up one by one with a fork, and put them into its mouth, holding at the same time the plate in the other hand. Its common drink was water, but it also very willingly drank all sorts of wine, and particularly Malaga. After drinking, it wiped its lips; and after eating, if presented with a toothpick, would use it in a proper manner. I was assured (continues our writer), that on shipboard it ran freely about the vessel, played with the sailors, and would go like them into the kitchen for its mess. At the approach of night, it lay down to sleep, and prepared its bed by shaking well the hay on which it slept, and putting it in proper order, and lastly covering itself with the coverlet. One day seeing the padlock of its chain opened with a key, and shut again, it seized a little bit of stick, and put it into the key-hole, turning it about in all directions, endeavouring to see whether the padlock would open or not. This animal lived seven months in Holland. On its first arrival it had but very little hair except on its back and arms; but on the approach of winter it became extremely well covered; the hair on the back being three inches in length. The whole animal then appeared of a chestnut colour; the skin of the face, &c. was of a mouse colour, but about the eyes and round the mouth, of a dull flesh colour." It came from the island of Borneo, and was after its death deposited in the museum of the prince of Orange.

29
3. *S. Inuus.* Magot, Barbary Ape.—This species is *Inuus*, considered by some naturalists as forming the connecting line between the ape, properly so called, and the baboon. Like the latter it has posterior callosities, and though it properly has no tail, it is furnished with an appendage of skin in the place where the tail is situated in other species. The hair on the greatest part of its body is of a greenish brown, the belly being paler than the rest; the face is of a swarthy flesh-colour, and the fingers and toes are furnished with nails resembling those of the human species.

Barbary Ape. Fig. 2.
It is found most commonly in Barbary and some other parts of Africa as far as the Cape of Good Hope, and it is also occasionally met with in Tartary, in Arabia, and in some parts of the Indian peninsula.

It is probable that Tavernier alludes to this species, in the account he gives of a custom amongst some of the inhabitants of India of amusing themselves at the expence of the ape. These people place five or six baskets of rice, forty or fifty yards asunder, in an open ground near their retreat, and by every basket put a number of stout cudgels, each about two feet long; they then retire to some hiding place not far distant, to wait the event. When the apes observe no person near the baskets, they soon descend in great numbers from the trees, and run towards them: they grin at each other for some time before they dare approach; sometimes they advance, then retreat, seeming much disinclined to encounter. At length the females, which are more courageous than the males, especially those that have young ones (which they carry in their arms as women do their children), venture to approach the baskets, and as they are about to thrust their heads in to eat, the males on the one side advance to hinder them. Immediately the other party comes forward; and the feud being kindled on both sides, the combatants seize the

History of
the Species.

cudgels, and commence a most severe fight, which always ends with the weakest being driven into the woods, with broken heads and limbs. The victors, he tells us, then fall to in peace, and devour the reward of their labour.

Of all the apes this agrees best with the temperature of an European climate, and may easily be kept in a state of domestication. Buffon had one which he kept for several years. In summer he delighted to be in the open air, and in winter he appeared sufficiently comfortable in a room without a fire, which shewed he was by no means delicate. He was always of a grave deportment, and sometimes dirty in his manner. His movements were brisk, and his countenance rather ugly than ridiculous. When agitated with passion, he exhibited and grinded his teeth. He filled the pouches of his cheeks with the food which was given him, and generally ate every thing except raw flesh, cheese, and whatever had undergone a kind of fermentation. When about to sleep, he loved to perch upon an iron or wooden bar. He was always chained, because though he had been long in a domestic state he was not civilized, and had no attachment to his masters. He seems to have been ill educated, for Buffon had seen others of the same species more intelligent, more obedient, more gay, and so docile as to learn to dance and make gesticulations in cadence, and to allow themselves peaceably to be clothed.

The flesh of this species is used as food by the wild Arabs.

4. *S. Sylvanus. Pitheque. Pigmy.*—This species greatly resembles the last, except that its head is rounder, and that it is much inferior in size, being seldom larger than a cat. It is thought by Mr Pennant to be the pigmy of the ancients; or one of that nation which was by them supposed to carry on periodical wars with the cranes. It is a native of Africa, and is also found in the East Indies and in Ceylon. They associate in troops, and live chiefly on vegetable food. They are often found walking erect. They are said to be very malicious and spiteful.

We are told by Marmol that they go in troops into the gardens or fields; but before they leave the thickets, one of them ascends an eminence from which he views the country; and when he sees no person, he gives the signal by a cry for the rest to proceed, and removes not from his station as long as they continue abroad: but whenever he perceives any person approaching, he screams with a loud voice, and by leaping from tree to tree they all fly to the mountains. Their flight is worthy of admiration; for the females, though they carry four or five young ones on their backs, make great springs from branch to branch. Though extremely cunning, vast numbers of them are taken by different arts. When wild they bite desperately, but by caresses they are easily tamed. They do much mischief to the fruits and corn; for they gather it together in heaps, cut it, and throw it on the ground whether it be ripe or not, and destroy more than they eat or carry off. Those who are tamed perform things incredible, and imitate every human action.

They chiefly reside in caverns, which gives the natives an easy opportunity of taking them alive. For this purpose the natives place vessels containing intoxicating liquors in the caverns frequented by the apes,

and these animals assemble together to drink these liquors. After having become intoxicated, they fall asleep, and are easily taken by the hunters.

5. *S. Sphinz. Great baboon. Papion. Mottled baboon.*—This is a very large species, measuring when sitting on its posteriors, three or four feet high. It is very strong and muscular, especially towards the fore parts of the body; but its waist, as is common to all the baboons, is slender. All the nails are not pointed, those on the thumbs and great toes being rounded. The tail is short and thick, and rounded; the posteriors are perfectly bare and callous, and of a red colour.

The baboon is a native of Borneo, and of the hottest parts of the African continent. It lives chiefly on vegetables, but is said to be very fond of eggs. The female brings forth one young at a time, and carries it in her arms.

From the great size and strength of these animals they are not a little formidable; and as their natural disposition is very ferocious, it is dangerous to encounter any number of them in their native wilds.

The baboons are passionately fond of raisins, apples, and in general of all fruits which grow in gardens. Their teeth and paws render them formidable to dogs, who overcome them with difficulty, unless when eating has made them heavy and inactive. Buffon has remarked that they neither eat fish nor flesh, except when boiled or roasted, and then they devour both with avidity. In their expeditions to rob orchards, gardens, or vineyards, they generally go in troops. Some of them enter the inclosure, while others remain on the walls as sentinels to give notice of any approaching danger. The rest of the troop are stationed without the garden, at convenient distances from each other, and thus form a line, which extends from the place of pillage to that of their rendezvous. Matters being disposed in this manner, the baboons begin the operation, and throw to those on the wall melons, gourds, apples, pears, &c. Those on the walls throw these fruits to their neighbours below; and thus the spoils are handed along the whole line, which generally terminates on some mountain. They are so dexterous and quick-sighted, that they seldom allow the fruit to fall in throwing it from one to another. All this is performed with profound silence and great despatch. When the sentinels perceive any person, they cry, and at this signal the whole troop fly off with astonishing rapidity.

In confinement the great baboon loses nothing of his native ferocity. He is indeed one of the most unmanageable of his tribe, grinding his teeth, putting on a threatening aspect, and shaking the bars of his cage so as often to make the spectators tremble. Mr Smellie speaks of one that he saw at Edinburgh in 1779, that was remarkable for its size, strength, and beautiful colours. He was nearly five feet high, and was excessively fierce, presenting uniformly to the spectators a most threatening aspect, and attempting to seize every person that came within the length of his chain. On such occasions he made a deep grunting noise, and was perpetually tossing up his head. This seems to have been the same animal that is described by Mr Pennant as having been seen by him at Chester about two months after the time mentioned by Mr Smellie. He was particularly fond of cheese; his voice was a kind of roar not unlike that of a lion, but low and somewhat inward.

Primates. It went on all-fours, and never stood on its hind legs unless forced to do so by its keeper. He would frequently sit on his rump in a crouching posture, and drop his hands before his belly*.

* *Smellie's Buffon*, vol. viii.

It is not a little extraordinary that an animal of this disposition should be kept in private houses as a pet, especially when we consider the mischiefs that they often commit. Dr Goldsmith says that he has seen one of them demolish a whole service of china, without appearing in the least conscious of having done amiss, though the mischief was evidently intentional.

14. *S. Nemestrina*. Pig-tailed baboon.—Olive brown, with short naked tail.

This is but a small species, seldom exceeding the size of a cat. The tail exactly resembles that of a pig. It is a native of Sumatra, and is very lively and active. He is sometimes seen in an exhibition in this country, but seldom lives long in a climate so much colder than his own.

Mr Edwards had a male of this species: it lived with him for a year, and was about the size of a common house cat. Another of the same species being at that time exhibited at Bartholomew fair in London, Mr Edwards carried his to compare with it; and he remarks that they seemed highly pleased with each others company, though this was the first time of their meeting.

53. *S. Beelzebub*. Preacher monkey.—This species is found in great numbers in the woods of South America, especially in Guiana and Brasil. It is the largest of the American monkeys, being about the size of a fox, and of a glossy black colour. There is in the throat of this animal a hollow bony substance, which is supposed to produce that peculiar dreadful howl for which this animal and the next species are so remarkable. They are exceedingly mischievous and spiteful, and if attacked they bite cruelly. They usually keep together in parties of from 20 to 30, rambling over the tops of the trees, and leaping with great agility from one tree to another. If they see any one approach alone, they always tease and threaten him.

Marcgrave informs us that they assemble every morning and evening in the woods of Brasil, and make a most dreadful howling. Sometimes one of them mounts on a higher branch, and the rest seat themselves beneath: the first begins, as it were to harangue, and sets up a howl so loud and sharp as to be heard to a great distance: after a while, he gives a signal with his hand, when the whole assembly joins in chorus; but on another signal they are again silent, and the orator finishes his address. Their clamour is the most disagreeable and tremendous that can be conceived.

They are extremely sagacious; and when hunted, not only distinguish particularly those who are active against them, but defend themselves vigorously when attacked. When the hunters approach, the monkeys assemble together, uttering loud and fearful cries, and throwing at their assailants dried branches which they wrench from the trees. It is said that they never abandon each other, and that in passing from tree to tree they fling themselves headlong from one branch to another without ever falling to the ground, always catching hold either with their hands or tail. If they are not at once shot dead it is scarcely possible to take them, as, though mortally wounded, they cling so

firmly to the trees as to maintain their hold even after death.

History of the Species.

Gen. 3. LEMUR. *MACAUCOS*.

34 Lemur.

Four front teeth in the upper jaw, the intermediate being remote; six in the lower jaw, longer, stretched forwards, compressed, parallel, and approximated. Canine teeth solitary and approximated. Grinders sublobated, the foremost of them being rather longer and sharper than the rest.

The animals of this genus resemble the monkey tribe in the use of their hands, but they are much less mischievous and ferocious than that tribe. None of them, except the *indri*, bears any resemblance to man; but in this species the arms, hands, body, and feet, are very similar to the human. A few of them are tailless, but most of them have long tails.

They are harmless inoffensive creatures, live chiefly in woods, and feed on fruits, vegetables, or insects. At least one species, viz. the 12th, serves for food to the natives of the countries where it is found.

There are 13 species which are distinguished by the following names and characters:

1. *Lemur Tardigradus*. Slow Lemur. Tailless; of a rusty ash colour, with a brown dorsal line; very small ears.—2. *L. Loris*. Loris. Tailless; of a rusty ash colour, with extremely slender limbs, and large ears.—3. *L. Indri*. Indri. Tailless; black, grayish beneath, with the face and space round the anus whitish.—4. *L. Potto*. Potto. Tailed; subferruginous.—5. *L. Mongoz*. Mongoz or Woolly L. Long-tailed; gray brown.—6. *L. Macaco*. Ruffed L. Tailed; black, with the neck bearded like a ruff.—7. *L. Laniger*, Flocky L. Tailed; pale tawney, white beneath, with rusty tail.—8. *L. Catta*. Ring-tailed L. Tail long, and annulated with black and white.—9. *L. Bicolor*. Heart-marked L. Long-tailed; blackish white beneath, with a white heart-shaped spot on the forehead.—10. *L. Tarsier*. Tarsier. Long-tailed; ash-coloured; with slender almost naked tufted tail; and very long hinder feet.—11. *L. Murinus*. Tail long, and rusty; body ash coloured.—12. *L. Calago*. Whitish L. Tail long and rusty; body whitish, gray beneath.—13. *L. Psilodactylus*. Long-fingered K. Ash-ferruginous, with extremely villose tail, and the middle finger of the hands very long and naked.

1. *L. Tardigradus*. Slow Lemur.—This animal is ³⁵about the size of a small cat, with the body of an elephant pale brown or mouse-colour; a flattish face, extremely prominent eyes, that are surrounded with a circle of dark brown, and a sharpish nose. Of its manners in its native state we know almost nothing, but in a state of domestication it has been accurately observed.

35 *Lemur*, Slow Lemur. Fig. 7.

The late Sir William Jones had one of these animals in his possession for some time, and has given a very interesting account of its form and manners. This was published in the Asiatic Researches, from which we shall extract the most interesting particulars.

“In his manner he was for the most part gentle, except in the cold season, when his temper seemed wholly changed; and his Creator who made him so sensible to cold, to which he must often have been exposed even in his native forests, gave him probably for that reason;

32 *Nemestrina*. Pig-tailed Baboon.

33 *Beelzebub*, Preacher Monkey. Fig. 5.

his thick fur, which we rarely see in animals in these tropical climates: to me, who not only constantly fed him, but bathed him twice a-week in water accommodated to the seasons, and whom he clearly distinguished from others, he was at all times grateful; but when I disturbed him in winter, he was usually indignant, and seemed to reproach me with the uneasiness which he felt, though no possible precaution had been omitted to keep him in a proper degree of warmth. At all times he was pleased with being stroked on the head and throat, and frequently suffered me to touch his extremely sharp teeth; but his temper was always quick, and when he was unseasonably disturbed, he expressed a little resentment, by an obscure murmur, like that of a squirrel, or a greater degree of displeasure by a peevish cry, especially in winter, when he was often as fierce, on being much importuned, as any beast of the woods.

“From half an hour after sunrise to half an hour before sunset, he slept without intermission, rolled up like a hedgehog; and, as soon as he awoke, he began to prepare himself for the labours of his approaching day, licking and dressing himself like a cat; an operation which the flexibility of his neck and limbs enabled him to perform very completely: he was then ready for a slight breakfast, after which he commonly took a short nap; but when the sun was quite set he recovered all his vivacity.

“His ordinary food was the sweet fruit of this country; plantains always, and mangoes during the season; but he refused peaches, and was not fond of mulberries, or even of guavas: milk he lapped eagerly, but was content with plain water. In general he was not voracious, but never appeared satisfied with grasshoppers; and passed the whole night, while the hot season lasted, in prowling for them: when a grasshopper, or any insect, alighted with his reach, his eyes, which he fixed on his prey, glowed with uncommon fire; and having drawn himself back to spring on it with greater force, he seized the prey with both his fore paws, but held it in one of them while he devoured it. For other purposes, and sometimes even for that of holding his food, he used all his paws indifferently as hands, and frequently grasped with one of them the higher parts of his ample cage, while his three others were severally engaged at the bottom of it; but the posture of which he seemed fondest was to cling with all four of them to the upper wires, his body being inverted; and in the evening he usually stood erect for many minutes, playing on the wires with his fingers, and rapidly moving his body from side to side, as if he had found the utility of exercise in his unnatural state of confinement.

“A little before daybreak, when my early hours gave me frequent opportunities of observing him, he seemed to solicit my attention; and if I presented my finger to him, he licked or nibbled it with great gentleness, but eagerly took fruit when I offered it, though he seldom ate much at his morning repast; when the day brought back his night, his eyes lost their lustre and strength, and he composed himself for a slumber of ten or eleven hours.

“My little friend was, on the whole, very engaging: and when he was found lifeless in the same posture in which he would naturally have slept, I consoled myself with believing that he died without much

pain, and lived with as much pleasure as he could have enjoyed in a state of captivity.” Primates.

Its pace is exceedingly slow, scarcely moving above six or eight yards in a minute; whence its name.

It is of considerable importance in a physiological point of view, to investigate the structure of these slow moving animals, such as the species just described, and the sloth to be afterwards mentioned. An anatomical examination of the blood-vessels in the limbs of this species by Mr Carlisle has thrown considerable light on the connection of slow motion with a particular distribution of the arteries in the slow-moving limbs; this distribution is thus described by Mr Carlisle. “Immediately after the subclavian has penetrated the axilla it is divided into 23 equal-sized cylinders, which surround the principal trunk of the artery, now diminished in size to an inconsiderable vessel. These cylindrical arteries accompany each other, and divide with the ulnar and radial branches, being distributed in their route upon the muscles, each of which has one of these cylinders. The other branches, for example the radial and ulnar, proceed like the arteries in general, dispersing themselves upon the skin, the membranes, joints, bones, &c. in an arborescent form. The iliac artery divides upon the margin of the pelvis into upwards of twenty equal-sized cylinders, surrounding the main trunk as described in the axillary artery. These vessels are also finally distributed, as in the upper extremity; the cylinders wholly upon the muscles, and the arborescent branches on all the other parts. The carotid arteries do not divide the equal-sized cylinders, but are distributed as in the generality of animals*.”

* Shaw's
Zoology,
vol. i.

36
Galeopithecus.

Gen. 3. GALEOPITHECUS. CALUGO.

Front teeth in the upper jaw wanting; in the lower six, short, broad and pectinated. Canine teeth very short, triangular, broad, sharp and serrated. Grinders four, truncated, and muricated with conical protuberances. Flying skin surrounding the body, limbs, and tail.

There is only one species, viz.

G. Volans. Flying Calugo, or Flying Lemur.—This ³⁷ *Volans*, Flying Lemur, is one of those extraordinary quadrupeds whom nature has raised above their usual element, and enabled them to transport themselves through the air in a manner which, though it cannot strictly be denominated *flying*, is at least very similar to it. The body of the flying lemur is about three feet long; but, except when the membrane is expanded, it is very slender. It has a slender tail, about a span long. The membrane, which extends from the neck to the fore legs, hind legs, and tail, is covered with fur, but appears membranaceous on the inner side. The upper side of the animal is of a deep ash colour, inclining to black when young, and the back is crossed transversely with blackish lines. Its head is long, its mouth small, and its teeth differ from those of every other quadruped hitherto examined. The cutting teeth in the lower jaw are deeply cut like a comb; the canine teeth, as Pallas calls them, (though Geoffroy thinks they are more properly cutting teeth), are triangular, very broad at the base, and very short. The cæcum or large intestine is very voluminous.

It is a native of the Molucca and Philippine islands, frequents woody places, and feeds on fruits, and probably

Primates. bably on insects. It almost constantly resides on trees; in descending from which it spreads its membranes, and balances itself in a gentle manner towards the place at which it aims, but in ascending it uses a leaping pace. It brings forth two young, which are said to adhere to the breasts of the parent by their teeth and claws.

Geoffroy and Cuvier make two varieties or species of this genus, viz. *G. Rufus*, Red Calugo; and *G. Variiegatus*, Varied Calugo:—but these are probably no more than sexual differences.

History of the Species. licate, enables those animals when blinded, to avoid those objects which would impede their flight. This gentleman collected several specimens of the *Vespertilio auritus* or large-eared bat, and observed, that when the external ears of the blinded ones were closed, they hit against the sides of the room, without being at all aware of their situation. They refused every species of food four days, as did a larger number which were afterwards caught and preserved in a dark box for above a week. During the day time they were extremely desirous of retirement and darkness; and, while confined to the box, never moved or endeavoured to get out during the whole day; and, when spread on the carpet, they commonly rested some minutes, and then beginning to look about, crawled slowly to a dark corner or crevice. At sunset the scene was quite changed: every one then endeavoured to scratch its way out of the box; a continued chirping was kept up; and no sooner was the lid of their prison opened, than each was active to escape, either flying away immediately, or running nimbly to a convenient place for taking wing. When the bats were first collected, several of the females had young ones clinging to their breasts, in the act of sucking. One of them flew with perfect ease, though two little ones were thus attached to her, which weighed nearly as much as their parent. All the young were devoid of down, and of a black colour*.

Many of the larger species of bats attack men and other animals when asleep, make a slight wound with their sharp teeth so dexterously as not to awaken their victim, and then suck the blood. This property is attributed chiefly to one species, which we shall particularly notice presently; but it is probably possessed by most of the larger bats that inhabit the warm climates.

Some of the species may be employed as food.

There are described about 24 species of Bats; and as they are so numerous, they may be distributed into two sections, as the *tailed*, and the *tailless*.

A. TAILED BATS, of which there are 18; viz.

1. **Vespertilio murinus*, Common B. Nose inappended; ears shorter than the head.—2. **V. Auritus*, Long-eared B. Nose inappended; ears larger than the head, and double.—3. *V. Noctula*, Noctule B. Nose and mouth simple; oval ears and very small valves.—4. *V. Ferrum equinum* Horse-shoe B. Nose horse-shoe shape; ears, valve lesser; tail half as long as the body.—5. *V. Serotinus*, Serotine B. Yellowish, with short emarginate ears.—6. *Pipistrellus*, Pipistrelle. Blackish brown, with convex front, and ovate emarginated ears, scarcely longer than the head.—7. *V. Barbastellus*, Barbastelle. Cheeks elevated, hairy; ears large, angulated below.—8. *Lasipterus*, Lasiopter B. Membrane connecting the feet extremely broad, covered above with hair.—9. *V. Lasiurus*, Rough-tailed B. Lips tumid; tail broad and hairy.—10. *V. Cephalotes*, Molucca B. Yellowish gray, with large head; spiral nostrils, small valveless ears.—11. *V. Pictus*, Striped B. Nose simple; ears funnel-shaped, appended.—12. *Novboracensis*, New-York B. Tail long, rusty; nose short and sharp; ears short and round, with a white spot at the base of each wing.—13. *Hispidus*, Bearded B. Hairy, with channelled nostrils, and long narrow ears.—14. *V. Auripendulus*, Slouch-eared B. Nose blunt;

* Shaw's
Zoology;
vol. i.

38
Vespertilio.

Genus 4. VESPERTILIO. BATS.

Teeth erect, sharp-pointed, and approximated; hands palmated; with a membrane surrounding the body, and enabling the animal to fly.

The animals of this genus have their atlantal extremities exceedingly long, especially what may be termed the fingers: and the delicate membrane that is stretched over them is so contrived, as to form a wing when the animals wish to fly, and to fold up into a small space when they are at rest. All the species have two breasts, more or less conspicuous, to which the young adhere. They have no cæcum.

The Bats are natives of very different regions; three of them are found in Britain, and several in the warmer regions of Asia and Africa; one in the West Indies, and a few in America. Those of warm climates are usually very large. Those which inhabit the colder regions lie all winter in a torpid state, without tasting nourishment. The smaller species live chiefly on insects which they seize in their flight; but the larger attack birds, or even the lesser quadrupeds.

From some experiments made by the abbé Spallanzani, on three species of this genus, it appears that these animals possess some additional sense, by which they are enabled, when deprived of sight, to avoid obstacles as readily as when they retained the power of vision. When the eyes of these bats were covered, or even entirely destroyed, they would fly about in a darkened room, without striking against the walls, and would constantly suspend their flight, when they came near a place where they could conveniently perch. In the middle of a dark sewer that turned at right angles, they would, though at a considerable distance from the walls, regularly alter the direction of their flight with the greatest nicety, when they came to the angles. When branches of trees were suspended in the room in which they were flying, they always avoided them, and even flew betwixt threads hung perpendicularly from the ceiling, though these were so near each other that they were obliged to contract their wings in order to pass through them.

These experiments were repeated by Vassali at Turin, by Rossi at Pisa, Spadon at Bologna, and Jurin at Geneva. M. Jurin conceives that no other of the five senses could, in these instances, supply the place of sight: and as, from some anatomical observations that he made on these animals, he found a prodigious number of nerves expanded on the upper jaws, the muzzle, and the organ of hearing, he conceived that those nervous productions would account for the extraordinary faculty above described. From some observations made by Mr Carlisle on this subject, it appears probable that the sense of hearing, which in the bat is uncommonly de-

History of
the Species.

blunt; ears large and pendent, with pointed tips.—
15. *V. Lepturus*, Slender-tailed B. Nostrils tubular;
tail slender, with a purse-shaped cavity on the inside of
each wing.—16. *V. Nigrita*, Senegal B. Yellowish
brown, with the forepart of the head, feet and tail
black.—17. *V. Molossus*, Bull-dog B. Upper lip pendu-
lous; tail stretching beyond the connecting membrane.
18. *V. Leporinus*, Peruvian B. Upper lip bifid.

B. TAILLESS BATS; of which there are 6; viz.

19. *V. Spasma*, Cordated B. A double heart-shaped
leaf-like membrane on the nose.—20. *V. Sorcinus*, Leaf
B. Snout lengthened, furnished with a heart-shaped
leaf-like membrane.—21. *V. Hastatus*, Javelin B. Nose
furnished with a trefoil-shaped upright membrane.—
22. *V. Nasutus*, Great Scrotine B. Rusty, with long
sloping nose, and long upright rounded ears.—23. *V.*
Spectrum, Spectre B. Nose furnished with a funnel-
shaped pointed membrane.—24. *Vampyrus*, Vampyre
B. Nose without appendage; flying membrane divid-
ed between the thighs.

After having said so much on the general structure
and habits of this genus, we shall briefly notice only
two of the species.

Species 2. *V. Auritus*, Long-eared B.—This is
one of the most common species of Britain, and may
be seen flying through the air in the evenings of sum-
mer and autumn, in search of insects. It is about two
inches long, and seven from the tip of one wing to
that of the other. Its ears are half as long as its body,
very thin, and almost transparent, and within each
there is a membrane which probably serves as a valve
to defend the organ of hearing during the inactive state
of the animal. These bats are sometimes taken by
throwing up at them the heads of burdock whitened
with flour. The animals either mistaking these for
prey, or accidentally striking against them, are entang-
led by the hooked prickles, and brought to the ground.
This is one of the species that remains in a torpid state
during winter. At the end of summer they retire to
their hiding places in old buildings, walls, or caverns,
where they remain, generally in great numbers, sus-
pended by the hind legs, and enveloped in their wings,
till the genial warmth of summer again calls them
forth. These animals are said to drink on the wing
like swallows, and they love to frequent waters, partly
for the sake of drinking, and partly to prey on the in-
sects which hover over them. As Mr White was go-
ing pretty late on a warm summer's evening, in a boat
on the Thames, from Richmond to Sunbury, he saw
prodigious multitudes of bats between the two places;
and he says, that the air swarmed with them all round
the Thames, so that hundreds were in sight at a time.
Bats are supposed to produce two young at a birth, and
these they suckle for a considerable time. The young,
when recently born, adhere most tenaciously to the nip-
ple of the parent, so as not to be removed without great
difficulty.

This animal is capable of being to a certain degree
domesticated; and we are told by Mr White, that
he was once much amused with the sight of a tame
bat. "It would, says he, take flies out of a person's
hand. If you gave it any thing to eat, it brought
its wings round before the mouth; hovering and hid-
ing its head in the manner of birds of prey when

they feed. The adroitness it shewed in shearing off
the wings of flies (which were always rejected) was
worthy of observation, and pleased me much. Insects
seemed to be most acceptable, though it did not re-
fuse raw flesh when offered; so that the notion that
bats go down chimneys, and gnaw people's bacon, seems
no improbable story. While I amused myself with this
wonderful quadruped, I saw it several times confute the
vulgar opinion, that bats, when down on a flat surface,
cannot get on the wing again, by rising with great ease
from the floor. It ran, I observed, with more dispatch
than I was aware of, but in a most ridiculous and gro-
tesque manner *."

Species 24. *V. Vampyrus*. Vampyre Bat.—This is
one of the largest species, being about a foot long,
and nearly four feet in the extent of its wings; it is
sometimes found even larger, and of the extent of six
feet between the wings. Its colour is generally a
deep reddish brown; its head is shaped like that of a
fox, the nose being sharp and black, and the tongue
pointed, and terminated by sharp prickles. The ears
are naked, flattish, and pointed; and in colour re-
sembling those of the common bat. These animals
are said not to be carnivorous, but live principally up-
on fruit; and are so fond of the juice of the palm tree,
that they will suck it till they are intoxicated, and fall
motionless to the ground. They often hang together
in vast clusters in hollow trees, or from the boughs of
trees, and make a horrid noise. They are found in
the Friendly islands, New-Holland, in South America,
and in the East Indies.

Linnaeus has given to this species the name *Vampyrus*,
from the idea that this is the principal species that
sucks the blood of people when asleep. It is not cer-
tain whether the bat by which Captain Stedman was
attacked, while in Surinam, be this species; but his ac-
count of the accident is so diverting, that we shall give
it in his own words. "I cannot here (says he) forbear
relating a singular circumstance respecting myself, viz.
that on waking about four o'clock one morning in my
hammock, I was extremely alarmed at finding my-
self weltering in congealed blood, and without feeling
any pain whatever. Having started up, and rung for
the surgeon, with a fire-brand in one hand, and all
over besmeared with gore; to which, if added, my pale
face, short hair, and tattered apparel, he might well ask
the question,

'Be thou a spirit of health, or goblin damn'd,
Bring with thee airs from heaven, or blasts from hell?'

"The mystery, however, was, that I had been bitten
by the *vampire* or *spectre* of Guiana, which is called
the *flying-dog* of New Spain, and by the Spaniards,
perro volador: this is no other than a bat of a mon-
strous size, that sucks the blood from men and cattle
while they are fast asleep, even sometimes till they
die; and as the manner in which they proceed is truly
wonderful, I shall endeavour to give a distinct account
of it.—Knowing by instinct, that the person they in-
tend to attack is in a sound slumber, they generally
alight near the feet, where, while the creature conti-
nues fanning with his enormous wings, which keeps
one cool, he bites a piece out of the tip of the great
toe, so very small indeed, that the head of a pin could
scarcely

He then begins again, and thus continues sucking and disgorging till he is scarcely able to fly, and the sufferer has often been known to sleep from time into eternity. Cattle they generally bite in the ear, but always on places where the blood flows spontaneously. Having applied tobacco ashes as the best remedy, and washed the gore from myself and hammock, I observed several heaps of congealed blood all round the place where I had lain, upon the ground; on examining which, the surgeon judged that I had lost at least 12 or 14 ounces of blood during the night *."

* *Stedman's Narrative.*

The flesh of this species is considered by the Indians as excellent food, and it is said that the French residents sometimes boil them in their bouillon to give it a *relish*.

From the general appearance and usual time of flight of bats, they have always been looked on with a sort of superstitious terror, and are commonly introduced as principal objects in those awful scenes of haunted castles, and mysterious caverns, that have exercised the fancy of poets and romantic writers. The bat has been represented by the ancient epic poets as one of the inhabitants of that dreary vault that forms the entrance to the infernal regions; and it has from time immemorial lent its wings to decorate the shoulders of those terrific figures under which the ingenious fancy of painters has represented imps and demons. Probably the fabulous harpies of the ancient poets may be traced to a similar origin, as some of the larger bats may with a little poetical exaggeration, easily be converted into those rapacious and filthy beings.

This first order contains four genera, and about 100 species.

CHAP. II. BRUTA.

Genus 5. BRADYPUS. SLOTHS.

⁴¹ *Bradypus.* Cutting teeth wanting in both jaws; canine teeth single, obtuse, longer than the grinders, and placed opposite; grinders five on each side, obtuse; fore legs by much the longer; claws very long.

The animals of this genus are called *sloths*, as their movements, more especially those of one species, are very slow and sluggish. There are but three species, two of which are natives of South America, and the third of India. They all live chiefly on vegetable food, and are mild harmless creatures. They are thus distinguished.

1. *B. Tridactylus*, Three-toed S. Feet three-toed; tail short.—2. *B. Didactylus*, Two-toed S. Tailless; fore feet two-toed.—3. *B. Ursinus*, Ursine S. Black, with very long shaggy hair; long snout, and five-toed feet.

We shall here give an account only of the first species, or the Three-toed S.

⁴² *Bradypus Tridactylus.* This animal is remarkable for its slow movements, affording almost a singular example of languid motion and habitual inactivity. The following account of it is given us by Kircher. "Its figure is (he says) extraordinary: it is about the size of a cat, has a very ugly countenance, and claws ex-

tended like fingers. It sweeps the ground with its belly, and moves so slowly that it would scarcely go the length of a bow-shot in 15 days, though constantly in motion; hence it obtained the name of sloth. It lives generally on the tops of trees, and employs two days in crawling up, and as many in getting down again. Nature has doubly guarded it against its enemies, first, by giving it such strength in its feet, that wherever it seizes, it holds so fast, that it can never be freed, but must there die of hunger. 2dly, In having given it such an affecting countenance, that when it looks at any one who might be tempted to injure it, it is almost impossible not to be moved with compassion; it also sheds tears, and upon the whole persuades one that a creature so defenceless and so abject ought not to be tormented.

"To try an experiment with this animal, the provincial had one of them brought to the Jesuit's college at Carthagena. He put a long pole under its feet, which it seized very firmly, and would not let go again. The animal, therefore, thus voluntarily suspended, was placed between two beams, where it remained without food for 40 days, the eyes being always fixed on those who looked at it, who were so affected that they could not forbear pitying its dejected state. At length, being taken down, a dog was let loose on it: this, after a while the sloth seized in its claws, and held till he died of hunger."

The slowness of its motions is, in the above account greatly exaggerated, as we are informed by later writers that it will move fifty or sixty paces in a day, and one that was on board ship climbed to the mast head in about an hour.

In ascending a tree, this animal first carelessly stretches out one of its fore paws, and fixes its claws in the bark of the tree, as high as it can reach, then heavily raises its body, and gradually fixes its other paw, thus ascending with the greatest slowness and apparent difficulty. When got up into the tree, he continues there till he has despoiled it of every thing that can serve him for food, and then to save himself the trouble of a tedious and difficult descent, it is said he suffers himself to drop from the tree upon the ground, being safe from any injury in the fall by his very tough and hairy skin. Here he remains till the calls of hunger again incite him to the arduous task of climbing another tree, when he proceeds in the same manner.

The female produces only one young, which she frequently carries on her back. This animal is a native of the hotter parts of South America.

In Dr Shaw's description of this species, it is remarked, that "the fore legs are short, the hinder ones far longer." As this contradicts the generic character, and is different from the other descriptions that we have read of the three-toed sloth, we suppose it to be an inadvertency, though Mr Bingley has copied the passage without remarking its incongruity.

The third species, or *ursine sloth*, is the same animal that is figured in Mr Bewick's *History of Quadrupeds*, p. 266, (2d edit.) and which was by him considered as a species of bear.

MEGATHERIUM. Some years ago, there was discovered below the surface of the earth in South America, an entire fossil skeleton of an animal at present unknown; but which M. Cuvier found to resemble the present

History of the Species.

History of present genus more than any other. From its vast size, Cuvier gave it the name of *megatherium*, (*mys megas*, great wild beast), and he has given the following description of it in the "*Annales de Muséum National*," accompanied with a figure.

"This skeleton is twelve feet (French) long, by six feet in height. The spine is composed of seven cervical, 16 dorsal, and four lumbar vertebræ; it has consequently sixteen ribs. The sacrum is short; the ossa ilia very broad, and their plane being almost perpendicular to the spine, they form a very open pelvis. There is no pubis or ischium, at least they are wanting in this skeleton, and there is no mark of their having existed when the animal was alive.

"The thigh bones are excessively thick, and the leg bones still more so in proportion; the entire sole of the foot bore on the ground in walking; the shoulder blade is much broader than long; the clavicles are perfect, and the two bones of the fore arm are distinct and moveable upon each other; the fore limbs are longer than the hind. To judge by the form of the last phalanges, there must have been very large pointed claws, enclosed at their origin in a long sheath. There appears to have been only three of these claws on the fore feet, and a single one on the hind; the other toes seem to have been deprived of them, and perhaps, entirely concealed beneath the skin.

"The head is the greatest singularity of this skeleton; the occiput is elongated and flattened, but is pretty convex above the eyes; the two jaws form a considerable projection, but without teeth, there being only four on each side above and below, all grinders, with a flat crown, and grooved across; the breadth of the branches of the lower jaw, and the great apophysis placed on the base of the zygomatic arch, deserve particular notice.

This quadruped, in its characters, taken together, differs from all known animals, and each of its bones, considered apart, also differs from the corresponding bones of all known animals. This results from a detailed comparison of the skeleton with that of other animals, and will readily appear to those who are conversant in such researches; for none of the animals which approach it in bulk have either pointed claws, or similarly formed head, shoulder blades, clavicles, pelvis, or limbs*."

* Vid. *Annales de Muséum National*.

44
Myrmecophaga.

Genus 6. MYRMECOPHAGA. ANT-EATERS.

Teeth wanting; tongue cylindrical and extensile; mouth lengthened out so as to be somewhat of a tubular form; body covered with hair.

The *ant-eaters*, as their name imports, live chiefly on ants and similar insects, and for this purpose they are furnished with a very remarkable tongue, it being of great length and of a roundish or worm-like form, and covered with a very glutinous saliva. This tongue the animals thrust into the nests of the ants, &c. and when a sufficient number of the insects has adhered to it, they withdraw the tongue and swallow the prey. Though the want of teeth makes part of the generic character, it appears from the observations of M. Bronsonet, that in most of the species there are certain bones or processes not unlike teeth, situated at the entrance of the gullet, or rather, according to Camper, at the

lower end of the jaws. The ant-eaters are confined to warm climates, and most of them have hitherto been found only in South America. Bruta.

There are seven species described by Shaw, though Gmelin admits only five.

1. *M. Jubata* Great A. Gray brown; with four toes on the fore feet, five on the hind; long snout, and very long bushy tail.—2. *M. Tetradactyla*, Middle A. Four toes on the fore, and five on the hind feet, and half naked, prehensile tail.—3. *M. Tridactyla*, Three-toed A. Three toes on the fore, and four on the hind feet, and villose tail.—4. *M. Didactyla*, Little A. Two toes on the fore, and four on the hind feet, and prehensile tail.—5. *M. Capensis*. Cape A. Four toes on the fore feet; long snout; large pendant ears; tail shorter than the body, and attenuated towards the tip.—6. *M. Aculeata*, Spiny A. Tail very short.—7. *M. Striata*, Striped A. Yellowish, with transverse dusky bands, and the upper jaw longer than the lower.

Of the above seven species, it is probable that the third is only a variety of the second; and M. M. Cuvier and Geoffroy have placed the fifth in a new genus, *oryctropus*, (see p. 451.) as it differs so considerably from the rest. Most naturalists agree that the spines on the body of the sixth entitle it, equally with the genus *MANIS*, to a separate place in systematic arrangement. On the whole, from an extensive consideration of this tribe, M. La Cèpede is of opinion that only three species should be admitted into it, viz. the first, second, and fourth. Of these the first and fourth are best known; the second, or what Cèpede calls *tamandua-i*, or *little tamandua*, has been well described by this naturalist in a memoir on the genus *MYRMECOPHAGA*, printed in the sixth volume of "*Memoires de l'Institut*."

Genus 7. MANIS.

45
Manis.

Teeth wanting; tongue cylindrical and extensile: mouth lengthened into a narrow snout; body covered with scales.

This genus is nearly allied to the last, differing in little more than in the nature of the covering of the body, which in this is composed of large scales that are of a horny consistence, and extremely strong, constituting a suit of armour that is capable of defending the animals, when rolled up, against the attacks of the most ferocious enemies. The animals have the power of raising these scales; thus presenting to the assailants a most formidable front. From some distant resemblance to the lizard tribe (see *ERPETOLOGY*), the animals of this genus have been called *scaly lizards*, but they are more commonly known by the name of *pangolins*. They are harmless creatures, and feed on similar food with the ant-eaters, taking it in the same manner. They are found in India and the Indian islands.

There are only two, or at most three species, viz. 1. *M. Tetradactyla*, Long-tailed M, or Phatagin. Feet four-toed, and tail very long.—2. *M. Pentadactyla*, Short-tailed M, or *Pangolin*. Feet five-toed, and tail about as long as the body.—3. *M. Platurus*, Broad-tailed M. Tail extremely broad.

It is doubtful whether the last be a distinct species, or only a variety, the effect perhaps of advanced age.

So

Bruta. So little is known of the habits and manners of these animals that we shall not dwell longer on them.

divided into three bands, and five-toed feet.—2. *D. Sexcinctus*, Six-banded A. Six bands, and five-toed feet.—3. *D. Septemcinctus*, Seven-banded A. Seven bands, and fore feet four-toed, hind feet five-toed.—4. *D. Novemcinctus*, Nine-banded A. Nine bands; fore feet four-toed, hind feet five-toed.—5. *D. 12-cinctus*, 12-banded A. Twelve bands.—6. *D. 18-cinctus*, Eighteen-banded A. Eighteen bands.

Genus 8. *DASYPUS*. *ARMADILLOS*.

⁴⁶
Dasypus or *Armadillo*. Cutting and canine teeth wanting; grinders several; body covered with a shelly armour, divided into zones or bands.

The animals of this tribe are called *armadillos*, from the very singular *armour*, by which the upper part of their bodies is defended. This is composed partly of large irregular pieces covering the shoulders and rump, and partly of regular bands lying between these, and folding one over another, like the parts of a lobster's tail, so as to accommodate themselves to all the motions of the animal. The number of these bands varies in the several species; and though this circumstance makes part of the specific characters, it is doubtful whether it is sufficiently constant or exact, as various authors have numbered them very differently. The armadillos resemble each other so much in their habits and way of life, that a general account of them may suffice.

They are very harmless animals, and live retired in subterraneous retreats, which they burrow for themselves by means of the large strong claws with which their feet are furnished. They wander about chiefly by night, in search of roots, grain, worms, insects, and other small animals; when attacked, they coil themselves up in a ball like the pangolins, and are then invulnerable. They are said to drink much, and often grow very fat. They are very prolific, breeding three or four times in a year, and producing several young at a birth. They are all natives of South America, and are considered as excellent food. The Indians hunt them with small dogs trained for that purpose. When surprised, they run to their holes, or attempt to make a new one, which they do with great expedition, having strong claws on their fore feet, with which they adhere so firmly to the ground, that if they should be caught by the tail whilst making their way into the earth, their resistance is so great, that they will sometimes leave their tails in the hand of their pursuers: to avoid this, the hunter has recourse to artifice; and, by tickling the animal with a stick, it gives up its hold, and suffers itself to be taken alive. If no other means of escape be left, it rolls itself up within its covering, by drawing in its head and legs, and bringing its tail round them, as a band to connect them more forcibly together: in this situation it sometimes escapes by rolling itself over the edge of a precipice, and generally falls to the bottom unhurt.

The most successful method of catching armadillos is by snares laid for them by the sides of rivers or other places which they frequent.

There are six species of armadillos, that are, as we have said, chiefly distinguished by the number of shelly bands that envelope the middle part of their body.

1. *Dasypus Tricinctus*. Three-banded A. Armour

VOL. XII. Part II. †

Genus 9. *RHINOCEROS*.

Horn solid, perennial, conical, seated on the nose.

⁴⁷
Rhino-
ceros.

There are at least two species, viz. *R. Unicornis*, Single-horned R. with a single horn, and, 2. *R. Bicornis*, Two-horned R. with two horns.

As both species are remarkable, both for their form and habits, we shall describe both pretty much at large.

1. *R. Unicornis*, Single-horned rhinoceros. This ⁴⁸ animal, if we except the elephant, is the largest of all Single-terrestrial animals, and in strength and power it is exceeded by none. It is generally about 12 feet long, and nearly as many in the circumference of its body. Its whole form is very awkward and clumsy; its head is large and long; its back sinks in considerably, and its skin is puckered up into several folds, giving the animal the appearance as if it were invested with a coat of mail. The upper lip hangs over the lower in the form of a lengthened tip, which seems to answer the purpose of a small proboscis, and, being extremely pliable, is useful to the animal in taking hold of the shoots of vegetables, and delivering them into the mouth. The horn is situated on the nose, and is slightly curved, sharp pointed, and very strong, and is sometimes three feet long, and 18 inches round at the base. This horn the rhinoceros uses both as an offensive and defensive weapon, by which it is completely armed against the attacks of the most ferocious animals, who cannot face it without danger of having their bowels torn out. The Roman epigrammatist, Martial, long ago remarked, that with this horn the rhinoceros could lift up a bull as easily as a foot-ball. The ears are pretty large, upright and pointed; the eyes small. The skin is naked, very rough, and marked with numerous large callous granulations; it is destitute of hair, except a few straggling coarse bristles on some parts of the head. The folds of the skin are very remarkable, and are disposed in various parts of the body in a singular manner. There is one large plait about the neck, another passing through the shoulders to the fore legs, and a third from the hind part of the back to the thighs. The belly is pendulous like that of a hog; the legs are very short, strong and thick; and the feet marked with three large hoofs all standing forwards. The tail is slender, flattened at the end, and covered on the sides with very stiff, thick, black hairs (c).

This animal is a native both of the continent of Asia, and of several of the islands in the Indian ocean, especially Ceylon, Java, and Sumatra; and is sometimes found in Ethiopia. It usually resides in cool sequestered

3 N

(c) For an accurate osteological account of this species, with a figure of his skeleton by Cuvier, see *Annales des Muséum National*, N^o 13, or *Philosophical Magazine*, vol. xix.

History of the Species. questered spots near waters and in shady woods, and delights to roll itself in the mud. It seems to live entirely on vegetables.

The sight of this animal is but indifferent; but he is said to possess an acute and most attentive ear, and to listen with a deep, long-continued attention to any kind of noise. It is generally of a quiet inoffensive disposition, but when provoked or attacked, he becomes furious and implacable. He is even said to be subject to paroxysms of rage which nothing can allay. One that was sent as a present to the pope by Emmanuel king of Portugal in 1513, destroyed the vessel in which they were transporting it. He runs with great swiftness, and from his prodigious strength rushes with resistless violence through woods, and over every obstacle, bending the small trees as he passes like so many twigs.

The female produces but one young at a birth, but its time of gestation is not certainly known.

The flesh of this animal is eaten by the natives, who often engage in hunting parties against it. It is a difficult matter to kill the rhinoceros, its skin being so hard that an ordinary leaden bullet will not pierce it, and they are obliged to use iron bullets for that purpose. The horn is employed for many useful purposes, especially for making drinking cups, which are used by the Indian princes, under an idea that if any poisonous liquor is poured into them, it will ferment and boil over the top. Professor Thunberg tried several of these horns, both of old and young animals, wrought into goblets and unwrought, with several poisonous liquors, both weak and strong, without observing any effervescence; but on pouring a solution of corrosive sublimate into one of them, there arose a few bubbles, which he supposes to have been inclosed in the pores of the horn, and disengaged from them by the liquor. The skin is also employed by the Javanese for making shields, and in some parts of India almost every part of the animal is used medicinally.

Several of these animals have been brought into Europe. Buffon gives an account of one, and Dr Parsons has given a particular description of one that was brought to England from Bengal. This animal was only two years old, and yet consumed so much food, that his voyage cost 1000l. He had every day at three meals seven pounds of rice mixed with three pounds of sugar, besides hay and green plants, and he drank large quantities of water. He was in general, very quiet and peaceable, readily suffering people to touch every part of his body; but when hungry, or when struck, he became very mischievous, and nothing would appease him but food. At this time he was about the size of a young cow.

In the year 1748, there was exhibited at Paris a rhinoceros brought from the kingdom of Ava. It was very tame, gentle, and even caressing; was fed principally on hay and corn; and was much delighted with sharp or prickly plants, and the thorny branches of trees. The attendants frequently gave him branches that had very sharp and strong thorns on them; but he bent and broke them in his mouth without seeming in the least incommoded. It is true they sometimes drew blood from the mouth and tongue, but that, says Father Le Comte, who gives us the description, might even render them more palatable, and those little wounds

might serve only to cause a sensation similar to that excited by salt, pepper, or mustard on ours.

The rhinoceros is even sometimes domesticated, and brought into the field of battle by the Asiatics, in order to terrify their enemies; but he is so unmanageable, that his use seems to be attended with more disadvantage than benefit, and when wounded, they are as likely to turn on their masters as on the enemy.

R. Bicornis, Two-horned rhinoceros. In size, and in many of its general habits, this species greatly resembles the former, but differs much in its external appearance, as the skin, instead of the regularly marked folds in that, has only a slight wrinkle across the shoulders, and on the hind parts, so as, in comparison with the other species, to appear almost smooth, though its surface is rough and tuberculated, especially in the larger specimens. It is chiefly distinguished, however, by the two horns, one smaller than the other, and situated higher up on the front. These horns are said to be loose when the animal is quiet, but to become fixed and immoveable when he is in an enraged state. Dr Sparrman has observed that these horns are fixed to the nose by a strong apparatus of muscles or tendons, so as to enable the animal to fix or relax them at pleasure, and on inspecting the horns and skin on which they are seated, it does not appear that the horns are firmly attached to the skull bone, or closely connected with it.

This species is found in various parts of Africa, and appears to have been that which was introduced by the Romans into their public shows.

Mr Bruce has given us an account of this animal, which is highly interesting. He says, that besides the trees capable of most resistance, there are in the vast forests within the rains, trees of a softer consistence, and of a very succulent quality, which seem to be destined for his principal food. For the purpose of gaining the highest branches of these, his upper lip is capable of being lengthened out so as to increase his power of laying hold with it, in the same manner as the elephant does with his trunk. With this lip, and the assistance of his tongue, he pulls down the upper branches, which have most leaves, and these he devours first; having stripped the tree of its branches, he does not therefore abandon it, but placing his snout as low in the trunk as he finds his horns will enter, he rips up the body of the tree, and reduces it to thin pieces like so many laths; and when he has thus prepared it, he embraces as much of it as he can in his monstrous jaws, and twists it round with as much ease as an ox would do a root of celery, or any such pot herb or garden stuff.

When pursued, and in fear, he possesses an astonishing degree of swiftness, considering his size, the apparent unwieldiness of his body, his great weight before, and the shortness of his legs. He is long, and has a kind of trot, which after a few minutes increases in a great proportion, and takes in a great distance; but this is to be understood with a degree of moderation. It is not true, that in a plain he beats the horse in swiftness. Mr Bruce has passed him with ease, and seen many worse mounted do the same; and though it is certainly true that a horse can seldom come up with him, this is owing to his cunning, and not to his swiftness. He makes constantly from wood to wood, and forces himself into

Bruta
49
Bicornis.
Two-horned Rhinoceros.

Bruta. the thickest parts of them. The trees that are dead or dry, are broken down, as with a cannon shot, and fall behind him and on his side in all directions. Others that are more pliable, greener, or fuller of sap, are bent back by his weight and the velocity of his motions: and after he has passed, restoring themselves like a green branch to their natural position, they often sweep the incautious pursuer and his horse from the ground, and dash them in pieces against the surrounding trees.

The eyes of the rhinoceros are very small; he seldom turns his head, and therefore sees nothing but what is before him. To this he owes his death, and never escapes if there be so much plain as to enable the horse to get before him. His pride and fury then make him lay aside all thoughts of escaping but by victory over his enemy. He stands for a moment at bay; then at a start runs forward at the horse like a wild boar, which in his manner of action he very much resembles. The horse easily avoids him by turning to one side, and this is the fatal instant; the naked man with the sword drops from behind the principal horseman, and unseen by the rhinoceros, who is seeking his enemy the horse, he gives him a stroke across the tendon of the heel, which renders him incapable of further flight or resistance.

In speaking of the great quantity of food necessary to support this enormous mass, we must likewise consider the vast quantity of water which he needs. No country but that of the Shangalla, which he possesses, deluged with six months rain, and full of large deep basons made in the living rock, and shaded by dark woods from evaporation, or watered by large and deep rivers, which never fall low or to a state of dryness, can supply the vast draughts of this moustrous creature: but it is not for drinking alone, that he frequents wet and marshy places; large, fierce, and strong as he is, he must submit to prepare himself against the weakest of all his adversaries. The great consumption he makes of food and water necessarily confine him to certain limited spaces; for it is not every place that can maintain him; he cannot emigrate or seek his defence among the sands of Athara.

This adversary is a fly (probably of the genus *OESTRUS*) which is bred in the black earth of the marshes: it persecutes him so unremittingly, that it would in a short time entirely subdue him, but for a stratagem which he practises for his preservation. In the night when the fly is at rest, the rhinoceros chooses a convenient place, and there rolling in the mud, clothes himself with a kind of case, which defends him against his enemy for the following day. The wrinkles and folds of his skin serve to keep this muddy plaister firm upon him, except about his hips, legs, and shoulders, where by motion it cracks and falls off, leaving him exposed to the attacks of the fly. The itching and pain which follow, occasion him to rub himself in those parts against the roughest trees, and this is supposed to be one cause of the numerous pustules or tubercles which we see upon him.

He seems to enjoy the rubbing of himself very much, and groans and grunts so loud during this action that he is heard at a considerable distance. The pleasure he receives from this enjoyment, added to the darkness of the night, deprives him of his usual vi-

gilance and attention. The hunters guided by his noise, steal secretly on him; and while lying on the ground, wound him with their javelins, mostly in the belly, where the wound is mortal.

It is by no means true that the skin of the rhinoceros, as it has been often represented, is hard and impenetrable like a board. In his wild state he is easily killed by javelins thrown from different hands, some of which enter many feet into his body. A musket shot will go through him, if it meet not with the intervention of a bone; and the Shangalla, an Abyssinian tribe, kill him by the worst and most inartificial arrows that ever were used by any people practising that weapon, and cut him to pieces afterwards with the very worst of knives.

To shew the amazing strength of the rhinoceros, even after being severely wounded, we shall quote Mr Bruce's account of the hunting of this animal in Abyssinia. "We were on horseback (says this gentleman) by the dawn of day in search of the rhinoceros, many of which we had heard making a very deep groan and cry as the morning approached. Several of the agageers (hunters) then joined us, and after we had searched about an hour in the very thickest part of the wood, one of them rushed out with great violence, crossing the plain towards a wood of canes that was about two miles distance. But though he ran, or rather trotted, with surprising speed considering his bulk, he was in a very little time transfixed with 30 or 40 javelins, which so confounded him that he left his purpose of going to the wood, and ran into a deep hole or ravine, a *cul de sac*, without outlet, breaking above a dozen javelins as he entered. Here we thought he was caught as in a trap, for he had scarce room to turn, when a servant who had a gun standing directly over him, fired at his head, and the animal fell immediately to all appearance dead. All those on foot now jumped in with their knives to cut him up; and they had scarce begun, when the animal recovered so far as to rise upon his knees: happy then was the man that escaped first; and had not one of the agageers who was himself engaged in the ravine, cut the sinews of the hind leg as he was retreating, there would have been a very sorrowful account of the foot hunters that day.

"After having dispatched him, I was curious to see what wound the shot had given which had operated so violently upon so huge an animal, and I doubted not it was in the brain; but it had struck him no where but upon one of the horns, of which it had carried off above an inch, and this occasioned a concussion, that had stunned him for a minute till the bleeding had recovered him."

It has been often asserted that the tongue of the rhinoceros is so hard and rough as to take away the skin and flesh wherever it licks any person that has unfortunately fallen a victim to its fury. Dr Sparrman says, however, that he thrust his hand into the mouth of one that had just been shot, and found the tongue perfectly smooth and soft.

Fossil bones have been found below the earth in Siberia that seem to belong to a third species of rhinoceros, differing from the two above mentioned in having a longer head, and in the partition between the nostrils being otherwise shaped. It seems also to have had two horns. In 1772 a specimen was dug up almost

History of almost entire, with the flesh and skin not yet quite the Species corrupted.

⁵⁰
Elephas.

Genus 10. ELEPHAS.

No cutting teeth in either jaw, very long tusks in the upper jaw; nose ending in a very long prehensile proboscis; body nearly naked.

⁵¹
Maximus.
Elephant.
Fig. 17.

We know of only one species, which has been called *elephas maximus*. Of all the animals that have engaged the attention of mankind from the earliest times, none has been so much, or perhaps so deservedly celebrated as the elephant. Possessed of magnitude and strength superior to all other quadrupeds, he is more gentle and tractable than almost any of them, and in sagacity and obedience to the commands of man, he is not excelled by any, except perhaps the dog.

The usual height of the elephant is nine or ten feet, though he is said to be sometimes found at least twelve feet high (D). His body is of a very clumsy and awkward form; his head very large; his back very much arched, and his legs very short, and extremely thick. His eyes are very small; but his ears large, pendulous, and irregularly waved about the edges. His trunk may be considered as one of the most wonderful instruments with which nature has gifted her most favoured animals, being little inferior in flexibility and utility, even to the hand of man. This organ appears to be composed of a great number of flexible rings, forming a double tube, ending in a circular tip that is somewhat flattened, and furnished with a projecting point, or fleshy moveable hook, of exquisite sensibility, and so pliable, that by means of it the animal can pick up from the ground almost the smallest object. Its lower surface is somewhat flattened, and it is circularly formed on the upper. The trunk is the principal organ of breathing to the elephant, being terminated by two orifices that are the nostrils. By means of this tube he supplies himself with food, taking hold of it with the trunk, and conveying it into his mouth. He drinks by sucking up the water into his trunk, and then pouring it into his mouth. The skull of the elephant is extremely thick, but not solid, there being a number of cavernous cells between the outer and inner laminæ. The feet of this animal are edged with five rounded hoofs; the tail is of a moderate length, and is terminated by a few scattered hairs, very thick, and of a black colour. The general colour of the skin is a dusky or blackish brown, but in some parts of India they are found of a white colour, though this is a rare occurrence.

The teeth of the elephant deserve particular notice, as, till lately, our information respecting them was very imperfect. It has long been known that the females either seldom have tusks, or that in them these are very short. The tusks of the male are sometimes of an immense length, those brought from the Mosambique and Cochin China having been seen 10 feet long.

Mr Scot has given us the best account of the elephant's teeth; and we shall extract some of the most interesting particulars from his paper, which appeared in the Philosophical Transactions for 1799.

Bruta.

The tusks in some female elephants are so small as not to appear beyond the lip, whilst in others they are almost as large and long as in one variety of the male, called mooknah. The grinders are so much alike in both sexes, that one description may serve for both. The largest tusks, and from which the best ivory is supplied, are taken from that kind of male elephant, called dauntelah from this circumstance, in opposition to the mooknah, whose tusks are not larger than those of some females. In one variety of the elephant the tusks point downwards, projecting only a little way beyond the trunk. The tusks in elephants are fixed very deep in the upper jaw; and the root or upper part, which is hollow, and filled with a core, goes as high as the insertion of the trunk, round the margin of the nasal opening to the throat; which opening is just below the protuberance of the forehead. Through this opening the elephant breathes, and by its means he sucks up water into his trunk: between it and the roots of the tusks there is only a thin bony plate. The first or milk-tusks of an elephant never grow to any considerable size, but are shed between the first and second year, when not two inches in length. The time at which the tusks cut the gum varies considerably: sometimes a young elephant has his tusks at five months old, and sometimes not till seven. Even in a fœtus which has arrived at its full time, these deciduous tusks are formed. A young elephant shed one of his milk-tusks on the 6th of November, 1790, when about 13 months old, and the other on the 7th of December, when above fourteen months old. Two months afterwards the permanent ones cut the gums, and on the 19th of April, 1791, they were an inch long. Another young elephant did not shed his milk-tusks till he was 16 months old, which proves that the time of this process varies considerably. The permanent tusks of the female are very small compared with those of the male, and do not take their rise so deep in the jaw. The largest elephant tusks Mr Scot ever saw in Bengal did not exceed the weight of 72 pounds avoirdupois; and at Tiperah they seldom exceed 50 pounds each. Both these weights are very inferior to that of the tusks brought from other parts to the India house, where some have weighed 150 pounds each. These, Mr Scot suspects, were from Pegu. The African elephant is said to be smaller than the Asiatic; yet the ivory dealers in London affirm that the largest tusks come from Africa, and are of a better texture, and less liable to turn yellow, than the Indian ones. The increase of the tusks arises from circular layers of ivory, applied internally, from the core on which they are formed, similar to what happens in the horns of some animals.

The grinders of elephants may be considered as composed of several distinct laminæ or teeth, each covered

(D) There is little doubt that the accounts generally given of the great height of the elephant have been much exaggerated. To John Corse Scot, Esq. F. R. S. naturalists are greatly indebted for clearing up many circumstances relating to this animal. That gentleman declares that he never saw an elephant above ten feet high, and that the highest of which he could procure any authentic account did not exceed ten feet six inches.

Bruta. vered with its proper enamel; and these teeth are merely joined to each other by an intermediate softer substance, acting as a cement. This structure, even at the first glance, must appear very curious, being composed of a number of perpendicular laminæ, which may be considered as so many teeth, each covered with a strong enamel, and joined to one another by the common osseous matter: this, being much softer than the enamel, wears away faster by the mastication of the food; and in a few months after these teeth cut the gum, the enamel rises considerably higher, so that the surface of each grinder soon acquires a ribbed appearance, as if originally formed of ridges. The number of these teeth or portions, of which an elephant's grinder is composed, varies from four to 23, according as the animal advances in age; so that a grinder or case of teeth in a full grown elephant is more than sufficient to fill one side of the mouth. The shape of the grinders of the lower jaw differs from those of the upper, which are very convex on the back part; whereas the lower has a bent or curved direction, adapting itself to the shape of the jaw, and is concave on the surface. The grinders, like the tusks, are already formed, even in the very young animal. The first set of grinders, or milk-teeth, begin to cut the gum eight or ten days after birth; they are not shed or cast, as the milk-tusks are, but are gradually worn away during the time the second set are coming forward. Mr Scot could not ascertain the exact time at which the second set of grinders make their appearance; but when the elephant is two years old, the second set are then completely in use. At about this period the third set begins to cut the gum; and from the end of the second to the beginning of the sixth year, the third set comes gradually forward as the jaw lengthens, not only to fill up this additional space, but also to supply the place of the second set, which are during the same period gradually worn away, and their fangs or roots absorbed. From the beginning of the sixth to the end of the ninth year, the fourth set of grinders comes forward, to supply the gradual waste of the third set. After this period other sets are produced, but in what time, and in what proportion, is not yet ascertained; but it is reasonable to conclude, that every succeeding grinder takes a year longer than its predecessor to be completed; and consequently, that the fifth, sixth, seventh, and eighth set of grinders will take from five to eight years (and probably much longer) each set, before the posterior lamina has cut the gum.

The time of gestation of the female elephant has been much disputed. Aristotle stated it at two years, and Buffon was at one time led to fix the same period. Afterwards, however, this naturalist was induced to consider nine months as the most likely time, and in this he was followed by Mr Pennant. We are indebted to Mr Scot for setting us right in this particular also; that gentleman having ascertained by actual experiment, that the female goes with young nearly twenty-one months.

It is now fully proved that the elephant will readily breed in captivity, and that neither male nor female shew those signs of modesty and shyness which have been attributed to them. Mr Scot has repeatedly witnessed the ceremony.

M. Buffon was led to conceive that elephants could

not copulate in the situation that is customary to other quadrupeds, but this Mr Scot has also found to be an error. The young when first born is about three feet high, and continues growing for 16 or 18 years. The female has two teats a little behind the fore legs. It was supposed by Buffon, that the young elephant suckled by means of its trunk, but later observations have shewn, that they suck in the usual way with their mouth, using the trunk for grasping the dug of the mother to press out the milk.

Mr Scot corrects another mistake, respecting the fondness of the female for her young. It was supposed that this was most exemplary, and that she would defend her young with her life; but Mr Scot relates an instance where females suffered their young to be gored to death by a male elephant, without attempting to protect or rescue them.

It has not yet been ascertained how long an elephant usually lives in its native forests. In captivity they are said to live above 100 years.

The elephant is found on the continent of Asia, in several of the Asiatic islands, especially Ceylon, and in the southern part of Africa. The Ceylonese elephants are, in general, larger than those of Africa. Captain Beaver informs us, that the little island of Bulama (on the western coast of Africa) abounds with them. He says "the number of these animals on this little island almost exceeds belief; it was nearly impossible for us to proceed fifty yards inland without meeting recent and palpable vestiges of them, and the skeletons of old ones that had died in the woods are frequently found." They often pass over the arm of the sea from the continent to this island; but, what is very extraordinary, they have never been observed to return to the continent*.

* Beaver's African Memoranda, p. 353.

The ordinary food of the elephant consists of herbage, roots, leaves, and the tender branches of trees, which he breaks off with his trunk. As he is not a ruminating animal, he has only one stomach; but the extent of his bowels is very considerable, the colon alone being 15 or 20 feet long, and two or three in diameter. When an elephant discovers a plentiful pasture, he calls his neighbours together, to partake with him of the feast. They feed together in considerable herds, and as they require a large quantity of fodder, frequently shift their situation. They usually march in troops, the oldest keeping foremost, and the middle-aged bringing up the rear. The females are placed in the centre, carrying their young firmly held in their trunks. This order they observe when they forage near the haunts of men; but when at liberty to range in extensive desert plains, they are less guarded. They often make great havoc in the cultivated fields, destroying even more with the weight of their enormous feet than they consume as food. They are fond of cool sequestered places, where they may be sheltered from the mid-day sun, and love to bathe themselves with water, which they do by pouring it over their bodies with their trunks. They are said frequently to roll themselves in mud, probably like the rhinoceros, for the purpose of sheathing their skin from the attacks of insects. The elephant uses many other artifices to rid himself of these winged enemies; he strikes them with his tail, his ears, or his trunk; he contracts his skin, and crushes them between its wrinkles; he gathers boughs from the trees with his trunk, and brushes them away; and when all these

History of
the Species

of these arts are unsuccessful, he collects dust with his trunk, and strews it over the most sensible parts of his body. He has been seen to dust himself in this manner several times a-day, especially after bathing. He swims with great ease, and in this way whole troops of them sometimes pass over rivers and narrow straits. The largest tusk elephants lead the way, and pass first. When they arrive at the opposite shore, they try whether the landing place is good, and if so, they make a signal with their trunk, and some more of the old elephants swim over, the young following with their trunks locked together, and the rest of the old ones bring up the rear.

This is nearly all we know of the manners of the elephant in the wild state. Still more interesting observations remain to be noticed respecting this animal when domesticated. We shall first give an account of the manner in which elephants are taken; and this differs according as the object is to capture single elephants, or a whole troop. Of the mode of taking elephants in Ceylon, Captain Percival has given us an interesting description in his account of Ceylon, to which we refer the reader.

The following is the method usually employed at Tiperah in the East Indies, for securing a single male elephant. As the hunters know the places whither the elephants come to feed, they advance towards them in the evening, bringing with them four *koomkees*, or female elephants trained for the purpose. In the dark nights it is easy to discover the male elephants by the noise they make in cleaning their food, by whisking it against their fore legs, and by moon light they may be distinctly seen at some distance. Having determined on the animal they wish to secure, they silently and slowly conduct three of the *koomkees* at a little distance from each other, near the place where the male is feeding. The females advance very cautiously, feeding as they approach, and appear like wild elephants that have strayed from the forest. When the male perceives them, he sometimes takes the alarm, and if viciously inclined, he makes a noise, and beats the ground with his trunk, shewing evident marks of displeasure, and of his unwillingness for them to come near him. If they persist, he will immediately attack and gore them with his tusks; they therefore take care to retreat in time. He generally, however, allows them to approach, and sometimes even advances to meet them.

When the drivers find him thus gentle, they conduct two of the females close to him, one on each side, and make them press gently against his neck and shoulders; the third then comes up, and is placed directly across his tail. In this situation he is so far from suspecting any design against his liberty, that he begins to toy with the females, and caresses them with his trunk. The fourth female is now brought near, and proper assistants furnished with ropes get under his belly at the tail, and fasten a slight cord round his hind legs. If he takes no notice of this, they proceed to tie his legs with a stronger cord, passed alternately from one leg to the other, so as to form a figure of 8. Six or eight such cords are usually employed, one above another, and fastened at their intersections, by another cord made to pass perpendicularly up and down. A strong cable about 60 cubits long, with a running noose, is

next put round each hind leg, above the other cords, and over these six or eight more cords are crossed as before from one leg to the other, all which takes up about 20 minutes, a strict silence being observed all the time.

When thus properly secured, he is left to himself, the *koomkees* retiring to a little distance; in attempting to follow them, he finds his legs tied, and becoming sensible of the danger of his situation, immediately retreats towards the jungle. The drivers on the tame elephants, accompanied by a number of people who till this time had been kept out of sight, follow him at a little distance, and as soon as he passes near a tree sufficiently stout to hold him, they make a few turns of the long cables which trailed behind him round its trunk. His progress being thus stopped, he becomes furious, and exerts his utmost efforts to disengage himself. The *koomkees* dare not now come near him, and in his fury he falls down on the earth and tears it up with his tusks. In these exertions he sometimes breaks the cables, and escapes into the thick jungle: here the drivers dare not advance for fear of the other wild elephants, and are therefore obliged to leave him to his fate; and in this hampered situation, it is said, he is even ungenerously attacked by his former companions. But as the cables are strong, and very seldom give way, when he has exhausted himself by his exertions, the *koomkees* are again brought near him, and take their former positions, one on each side, and the other behind. After getting him nearer the tree, the people carry the ends of the long cables two or three times round it, so as to prevent even the possibility of his escape. His fore legs are now tied exactly in the same manner as his hind legs were, and the cables are made fast, one on each side, to trees or stakes driven deep into the earth.

When he has become more settled, and will eat a little food, with which he is supplied as soon as he is taken, the *koomkees* are again brought near, and a strong rope is put twice round his body, close to his fore legs, like a girth, and tied behind his shoulder; then the long end is carried back close to his rump, and there fastened, after a couple of turns more have been made round his body. Another cord is next fastened to this, and from thence carried under his tail like a crupper, and brought forward and fastened to each of the girths. A strong rope is now put round his buttocks, and made fast to each side of the crupper, so as to confine the motion of his thighs, and prevent his taking a full step. A couple of large cables, with running nooses, are put about his neck, there secured, and then tied to the ropes on each side. Thus completely hampered, the cables round his neck are made fast to two *koomkees*, one on each side.

Every thing being now ready, all the ropes are taken from his legs, except the strong one round his buttocks to confine the motion of his hind legs, which is still left. The *koomkees* pull him forward, sometimes, however, not without much struggling and violence on his part. When brought to his proper station, and made fast, he is treated with a mixture of severity and gentleness, and generally in a few months becomes tractable, and appears perfectly reconciled to his fate.

Bruta.

It

Bruta.

It has happened that an elephant which escaped from captivity, suffered itself to be taken again by the hunters. This is not the only fact, as we shall see hereafter, that contradicts the observation of Horace, that no beast once escaped from slavery, suffers himself again to be entrapped (E).

The elephant when tamed, is gentle, obedient, and tractable, patient of labour, and submits to the most toilsome drudgery. He is so attentive to the commands of his governor, that a word or look is sufficient to stimulate him to the greatest exertions. His attachment to his keeper is remarkable: he caresses him with his trunk, and frequently will obey no other master. He knows his voice, and can distinguish between the tones of command, of approbation, and of anger. He receives his orders with attention, and executes them with eagerness, but without precipitation. All his motions are grave, majestic, regular and cautious, and seem to correspond with the dignity of his appearance. He kneels down for the accommodation of those who would mount upon his back, and even helps them to ascend with his trunk. He suffers himself to be harnessed, and seems proud of the splendour of his trappings; he will easily perform the work of several horses, being able to carry from 3000 to 4000 weight. His conductor or *cornac* is usually mounted on the neck of the elephant, and uses a rod of iron sharp at the end and hooked, with which he urges the animal forward, by pricking his head, ears, or muzzle, though this is seldom necessary, a word being usually sufficient.

In India, Mr Scot tells us, elephants are divided into two casts, viz. the koomareah and the merghce. The first consists of the large or full-bodied kind; the second of the more slender, with longer legs and thinner trunk in proportion; it is also a taller animal, but not so strong as the former. A large trunk is always considered as a great beauty in an elephant, so that the koomareah is preferred not only on this account, but for his superior strength in carrying burthens, &c. Many indistinct varieties are again produced from the intermixture of these two breeds. The torrid zone seems to be the natural clime of the elephant, and the most favourable for the production of the largest and hardiest race; and when this animal migrates beyond the tropics, the species degenerates.

The following marks are laid down by Mr Scot as descriptive of a perfect elephant. His ears should be large and rounded, not ragged nor indented at the margin: his eyes of a dark hazel colour, free from specks: the roof of his mouth and his tongue without dark or blackish spots of any considerable size: his trunk large: his tail long, with a tuft of hair reaching nearly to the ground. There must be five nails on each of his fore feet, and four on each of his hind ones; his head well set on, and carried rather high; the arch or curve of his back rising gradually from the shoulder to the middle, and thence descending to the insertion of the tail; and all his joints firm and strong.

The value of an elephant varies much, according to

his cast, and as he has more or less of the above marks. History of The usual price at Ceylon is 50 guineas, but they some- the Species. times fetch considerably more.

Elephants are kept by the princes and grandes of India, chiefly for shew and magnificence. In their travels the Indian princes are attended by hundreds of these animals. Some are employed to carry the ladies which compose the seraglio, who are placed in latticed cages covered with branches of trees; while others transport the immense quantities of baggage which the sovereigns of the east usually carry with them in their journeys. Great care is taken in the management and decoration of these elephants. They are daily fed, bathed, oiled, and rubbed, and frequently painted about the ears and head with various colours, and their tusks surrounded with rings of gold and silver. When employed in processions, they are covered with the most gaudy and sumptuous trappings.

Elephants are now seldom employed in war, as in the present state of warfare they can be of little advantage. The ancients, as is well known, used numbers of them in their armies, and we are told that Porus opposed the passage of Alexander over the Hydaspes with 85 elephants. The accounts related of those brought by Pyrrhus against the Romans, are familiar to most of our readers, and Buffon supposes that some of these were among the number that Alexander took and sent into Greece. In the later periods of the Roman republic, elephants were frequently exhibited to the people, for the cruel purpose of being put to death in conflicts with armed men. It is said that Pompey, in the space of five days, destroyed 18 elephants in this way, with a view of entertaining the populace, among whom the cries of the elephants are said to have excited much commiseration.

In the east, elephants are sometimes employed as the executioners of public justice, and they will trample a criminal to death, break his limbs with their trunk, or impale him on their enormous tusks, according to the orders given them. In some parts of India they were formerly employed in launching ships, which they effect by pushing the vessel with their heads. We are told that one of them being directed to force a large vessel into the water, and this proving too much for his strength, the master in an angry tone cried out, Take away that lazy beast, and bring another in his place. The poor animal repeated his efforts, fractured his skull, and died upon the spot.

A great many instances have been recorded of the sagacity, and almost reasoning power of this wonderful animal. We shall mention a few of these. "I was, says M. Philippe, an eye witness to the following facts:—At Goa, there are always some elephants employed in the building of ships. I one day went to the side of the river, near which a great ship was building, where there is a large area filled with beams for that purpose. Some men tie the ends of the heaviest beams with a rope, which is handed to an elephant, who carries it to his mouth, and after twisting it round his trunk,

(E) ————— Quæ bellua ruptis,
Cum semel effugit, reddit se prava catenis.

History of trunk, draws it, without any conductor, to the place where the ship is building, though it may have been only once pointed out to him. One of these sometimes drew beams so large, that more than 20 men would have been unable to move them. But what surprised me still more, when other beams obstructed the road, he elevated the ends of his own beams that they might run easily over those which lay in his way. Could the most enlightened man do more?

He well knows when he is mocked, or otherwise ill treated. The story of the tailors of Delhi, who were drenched with puddle water by an elephant for having pricked his trunk with a needle, is well known. The following instance of retaliation is not less worthy of notice. An elephant driver at Macasa having a cocoa nut given him, he out of wantonness struck it twice against his elephant's head, to break it. The next day when the animal was passing through the street, he saw some cocoa nuts exposed to sale, and taking up one of them with his trunk, he beat it about the driver's head till he completely killed the man. This comes, says the relater, of jesting with an elephant.

When much provoked, he has been known to take the most dreadful vengeance. He is extremely fond of wine and spirits, and by shewing him a vessel of arack, he is induced to use the greatest efforts, and take the utmost pains in hopes of gaining it as the reward of his labour. An elephant disappointed of his reward in this way, out of revenge killed his cornac or governor. The poor man's wife, who beheld the dreadful scene, took her two infants, and threw them at the feet of the enraged animal, saying, "since you have slain my husband, take my life also, as well as that of my children." The elephant instantly stopped, relented, and as if stung with remorse, took the eldest boy in his trunk, placed him on his neck, adopted him for his cornac, and would never allow any other person to mount it.

The elephant is sometimes seized with periodical fits of rage, and during these he will destroy the first person he meets with; but what is very remarkable, when he has sacrificed one victim, he becomes instantly appeased, and may be then led and governed as usual.

The following instance of mutual affection between a male and female elephant, who had before been much together, and were brought to Paris in separate conveyances is very interesting.

The place for their reception had been long prepared. It was a spacious hall in the museum of natural history, well aired and lighted. A stove was placed in it to warm it during the winter; and it was divided into two apartments, which had a communication with each other by means of a large door resembling a portcullis. The inclosure round these apartments, consisted of rails made of strong thick beams, and a second inclosure, breast high, ran round them, to keep the spectators at some distance, and preserve them from accidents.

The morning after their arrival, these animals were put in possession of their new habitation. The first conducted to it was the male, who issued from his cage with precaution, and seemed to enter his apartment with a degree of suspicion. His first care was to reconnoitre the place. He examined each bar with his trunk, and tried their solidity by shaking them. Care had been taken to place on the outside the large screws

by which they were held together. These he sought out, and, having found them, tried to turn them, but was not able. When he arrived at the portcullis which separates the two apartments, he observed that it was fixed only by an iron bar, which rose in a perpendicular direction. He raised it with his trunk, pushed up the door, and entered into the second apartment, where he received his breakfast. He ate quietly, and appeared to be perfectly easy.

During this time people were endeavouring to make the female enter. We still recollect the mutual attachment of these two animals, and with what difficulty they were parted and induced to travel separately. From the time of their departure they had not seen each other, not even at Cambray, where they passed the winter. They had only been sensible that they were near neighbours. The male never lay down, but always stood upright or leaned against the bars of his cage, and kept watch for his female, who lay down and slept every night. On the least noise, or the smallest alarm, he sent forth a cry to give notice to his companion.

The joy which they expressed on seeing each other, after so long a separation, may be readily imagined. When the female entered, she sent forth a cry expressive only of the pleasure which she felt at finding herself at liberty. She did not at first observe the male, who was busy feeding in the second apartment. The latter did not immediately discover that his companion was so near him; but the keeper having called him, he turned round, and immediately the two animals rushed towards each other, and sent forth cries of joy so animated and loud, that they shook the whole hall. They breathed also through their trunks with such violence, that the blast resembled an impetuous gust of wind. The joy of the female was the most lively: She expressed it by quickly flapping her ears, which she made to move with astonishing velocity, and drew her trunk over the body of the male with the utmost tenderness. She in particular applied it to his ear, where she kept it a long time; and after having drawn it over the whole body of the male, would often move it affectionately towards her own mouth. The male did the same thing over the body of the female; but his joy was more concentrated: He seemed to express it by his tears, which fell from his eyes in abundance.

Besides the use made of the elephant, when living, he is sometimes hunted for the sake of his tusks and flesh. Mr Bruce has given us an interesting account of the mode of hunting elephants in Abyssinia, and with this we shall conclude our history of this animal.

The men who make the hunting of elephants their business, dwell constantly in the woods, and live entirely upon the flesh of the animals they kill, which is chiefly that of the elephant or rhinoceros. They are exceedingly thin, light, and agile, both on horseback and on foot. They are called *agageer*, a name derived from the word *agar*, which signifies to hamstring with a sharp weapon. More properly it means, indeed, the cutting of the tendon of the heel, and is a characteristic of the manner in which they kill the elephant, which is thus:—Two men, quite naked, to prevent their being laid hold of by the trees or bushes in making their escape from this very watchful enemy, get on horseback. One of these riders sits on the back of the horse, some-

Bruta.

Bruta. times with a saddle, and sometimes without one, with only a short stick in one hand, carefully managing the bridle with the other? behind him sits his companion, armed only with a broadsword. His left hand is employed in grasping the sword by the handle; about 14 inches of the blade of which are covered with whip cord. This part he takes in his right hand, without any danger of being hurt by it; and though the edges of the lower part of the sword are as sharp as a razor, he carries it without a scabbard.

"As soon as an elephant is found feeding, the horseman rides before him, as near his face as possible; or if he flies, crosses him in all directions, calling out, 'I am such a man and such a man, this is my horse, that has such a name; I killed your father in such a place, and I am now come to kill you; you are but an ass in comparison with them.' This nonsense he believes the elephant perfectly understands, who, chafed and angry at hearing the noise immediately before him, attempts to seize him with his trunk; and, intent upon this, follows the horse everywhere, turning round and round with him, neglectful of making his escape by running straight forward, in which consists his only safety. After having made him turn a few times in pursuit of the horse, the horseman rides up alongside of him, and drops his companion just behind on the off-side; and while he engages the elephant's attention upon the horse, the footman behind gives him a drawn stroke just above the heel, into what in man is called the *tendon of Achilles*. This is the critical moment; the horseman immediately wheels round, again takes his companion up behind him, and rides off after the rest of the herd, if they have started more than one; and sometimes an expert agageer will kill three out of one herd. If the sword is good, and the man not afraid, the tendon is commonly entirely separated; and if it is not cut through, is generally so far divided, that the animal, with the stress he puts upon it, breaks the remaining part asunder. In either case, he remains incapable of advancing a step, till the horseman returning, or his companions coming up, pierce him through with javelins and lances; he then falls to the ground, and expires from loss of blood.

"The elephant once slain, they cut the whole flesh off his bones into thongs, like the reins of a bridle, and hang these, like festoons, upon the branches of trees, till they become perfectly dry, without salt, and they then lay them by for their provision in the season of the rains*."

Bosman and Labat give us terrible ideas of the courage of the elephant, and his fury when wounded; but either their accounts are much exaggerated, or the modern elephant is a much more timid animal than that of their time. Captain Beaver assures us, that when an elephant is attacked, it will endeavour to escape by any opening it can perceive; that whenever they fired at it on shore, it never turned on its enemies, but made for the openings that led into the woods. The Bijugas and Biaforas use a very long gun, loaded with a piece of an iron rod nearly equal to its caliber, for attacking the elephant, and always aim at the flank, or behind the ear, these being the most dangerous parts in which the animal can be wounded. The elephant is scarcely ever killed by a single shot †.

For many years past a number of large bones and

extraordinary teeth, have been discovered in the northern parts both of Asia and America, which at first were generally attributed to the elephant, though in Siberia they were considered as belonging to a monstrous animal called *mammoth*, whose fabulous existence they supposed to be under ground. In North America these large bones and carnivorous grinders have been found in great abundance on the Ohio and its tributary streams, washed from their banks, or discovered by digging in salt morasses in the neighbourhood of Cincinnati, where they are found intermixed with the bones of buffaloes and deer, which a tradition of the Indians states to have been destroyed by a herd of these animals which came upon them from the north. This event happened, the Indians believe, as a punishment for their sins; but they say that the good spirit at length interposed to save them, and seating himself on a neighbouring rock, where they shew you the print of his seat and of one foot, hurled his thunderbolts against them. All were killed except one male, who, presenting his forehead to the shafts, shook them off, until at length wounded, he sprang over the Wabash, the Illinois, and the Great Lake, where he still lives.

These bones were forwarded with eagerness to all parts of Europe, and deposited in museums, where they attracted the curiosity of all naturalists, whose conjectures and theories on them were very various, until Dr Hunter, by a more accurate comparison between them and the bones of other animals, determined that they must have belonged to a large non-descript animal of the carnivorous kind, somewhat resembling the hippopotamus and the elephant, yet essentially different from both.

The subject is now completely elucidated. Not long since some farmers in the state of New York, in America, digging marl from their morasses in the neighbourhood of New Windsor, accidentally discovered several of these bones, which were preserved by physicians in the neighbourhood. In the autumn of 1801, Mr Charles Peale, and his son Mr Rembrandt Peale, having obtained possession of these bones, persevered for near three months, with much labour and expence, in searching for the remainder of this animal, and were at length so fortunate as to obtain two skeletons found in two distinct situations, and unmixed with the bones of any other individual. One of these is preserved in the museum at Philadelphia, and the other was exhibited a few years ago in London, previously to its being taken to Paris.

The length of this skeleton, from the chin to the rump, was 15 feet, and its height over the shoulders 11 feet; and from the point of the tusks to the end of the tail, in a straight line, it was 17 feet long. The whole skeleton weighed about 1000lb.

The following differences between the skull of the mammoth, and that of the elephant, are given by Mr R. Peale.

On examining the head of the elephant, it will appear, that the sockets of the tusks are situated, with respect to the condyle of the neck, nearly in an angle of 45°, so that the tusks, which have but little curve, are directed downwards and forwards, and may be with ease employed offensively and defensively. On the other hand it will be observed, that, in the mammoth, the socket is nearly in a horizontal line with the condyle;

* Bruce's Travels.

† Beaver's African Memoranda, p. 350.

History of dyle; and therefore the tusks, which are semicircular, the Species could never have been elevated in the air, pointing backwards, but must have had their points thrown out by the spiral twist on each side.

In the elephant, the orbit of the eye is situated where, in the mammoth, there is a large mass of bone. The cheek of the elephant is formed of two bones; but in the mammoth, besides other variations, there is but one bone. The whole figure of the under jaw differs considerably, in the length of the condyles or arms, which in the mammoth is short and angular, but in the elephant forms a semicircular line*.

* Ph^l o-
soph. Mag.
xiv.

Mr R. Peale seems to have no doubt that the mammoth was a carnivorous animal, feeding chiefly on shell fish; but if the animal, whose stomach was lately found in digging a well near a salt lake in Wythe county, Virginia, were really a mammoth, it is clear that this animal was at least capable of living on herbage. The contents of this stomach, which were in a state of perfect preservation, consisted of half masticated reeds, † Nichol. Journ. 8vo. twigs, and grass or leaves †.

p. 358.

Genus 11. SUKOTYKO.

53
Sukotyru.
Fig. 18.

Of this genus there is only one species, of which we know little or nothing, and are not even certain that it exists: the little information that has been given of it being confined to a single traveller, Nieuhoff. He describes it as a quadruped of a very singular shape, about the size of a large ox, with a snout-like that of a hog, long and rough ears, and a thick and bushy tail. He says that the eyes are placed upright in the head, and that on each side of the head, next to the eyes, stand two horns or rather tusks, not quite so large as those of the elephant, that it feeds on herbage, and is a native of Java.

Genus 12. PLATYPUS.

54
Platypus.
Fig. 19.

Mouth shaped like the bill of a duck, with two grinders on each side in each jaw; feet webbed.

There is only one species, which has been called *P. Anatinus*, or Duck-billed Platypus. It was brought from New Holland, and presented to Sir Joseph Banks. An account of it was first published by Dr Shaw in the Naturalists Miscellany, and afterwards in the General Zoology of the same author, from which the following account is taken.

“Of all the mammalia yet known, this seems the most extraordinary in its conformation, exhibiting the perfect resemblance of the beak of a duck engrafted on the head of a quadruped. So accurate is the similitude, that, at first view, it naturally excites the idea of some deceptive preparation by artificial means; the very epidermis, proportion, serratures, manner of opening, and other particulars of the beak of a shoveler, or other broad-billed species of duck, presenting themselves to the view; nor is it without the most minute and rigid examination that we can persuade ourselves of its being the real beak or snout of a quadruped.

“The body is depressed, and has some resemblance to that of an otter in miniature. It is covered with a very thick, soft, and beaver-like fur, and is of a moderately dark brown above, and of a subferruginous white beneath. The head is flattish, and rather small than large. The mouth or snout, as before observed, so ex-

actly resembles that of some broad-billed species of duck, that it might be mistaken for such. Round the base is a flat circular membrane, somewhat deeper or wider below than above, viz. below, near the fifth of an inch, and above, about an eighth. The tail is flat, furry like the body, rather short, and obtuse, with an almost bifid termination; it is broader at the base, and gradually lessens to the tip, and is about three inches in length; its colour is similar to that of the body. The length of the whole animal, from the tip of the beak to that of the tail, is 13 inches; of the beak an inch and a half. The legs are very short, terminating in a broad web, which on the fore feet extends to a considerable distance beyond the claws; but on the hind feet reaches no farther than the roots of the claws. On the fore feet are five claws, straight, strong, and sharp-pointed; the two exterior ones somewhat shorter than the three middle ones. On the hind feet are six claws, longer and more inclining to a curved form than those on the fore feet: the exterior toe and claw are considerably shorter than the four middle ones: the interior, or sixth, is seated much higher up than the rest, and resembles a strong sharp spur. All the legs are hairy above: the fore feet are naked, both above and below. The internal edges of the under mandible (which is narrower than the upper) are serrated or channelled with numerous striæ, as in a duck's bill. The nostrils are small and round, and are situated about a quarter of an inch from the tip of the bill, and are about one-eighth of an inch distant from each other. There is no appearance of teeth: the palate is removed; but it seems to have resembled that of a duck: the tongue also is wanting in the specimen here described. The ears or auditory orifices, are placed about an inch beyond the eyes; they appear like a pair of oval holes of the eighth of an inch in diameter, there being no external ear. On the upper part of the head, on each side, a little beyond the beak, are situated two smallish oval white spots, in the lower part of each of which are imbedded the eyes, or at least the parts allotted to the animal for some kind of vision; for, from the thickness of the fur, and the smallness of the organs, they seem to have been but obscurely calculated for distinct vision, and are probably like those of moles, and some other animals of that tribe; or perhaps even subcutaneous, the whole apparent diameter of the cavity in which they are placed not exceeding the tenth of an inch.

“When we consider the general form of this animal, and particularly its bill and webbed feet, we shall readily perceive, that it must be a resident in watery situations; that it has the habits of digging or burrowing in the banks of rivers, or under ground, and that its food consists of aquatic plants and animals. This is all that can at present be reasonably guessed at; future observations, made in its native regions, will, it is hoped, afford us ample information, and will make us fully acquainted with the natural history of an animal which differs so widely from all other quadrupeds, and which verifies in a most striking manner the observation of Buffon, viz. that whatever was possible for nature to produce, has actually been produced*.

This animal was first called *Ornithorynchus Para-doxus*, and it has been described under this name by *Zoology*, Blumenbach of Gottingen, and by Mr Home of London. See Phil. Trans. for 1800.

Mr

Bruta.

Brut

Mr Home found on dissection, that the beak of the platypus differs materially from the bill of a bird; that it was independent of the cavity of the mouth, which was similar to that of other quadrupeds, having two grinders on each side in both jaws, but without fangs.

History of the Species. bers under them with the intention of oversetting them, at the same time shewing all the marks of rage, by roaring in a dreadful manner, and gnashing their teeth with great violence. They are strongly attached to each other, and will make every effort in their power, even to death, to set at liberty their harpooned companions. A wounded walrus has been known to sink to the bottom, rise suddenly again, and bring up with it multitudes of others, who have united in an attack on the boat from which the insult came.

55
Trichecus.

Genus 13. TRICHECUS. WALRUSSES.

No fore teeth in the full-grown animal in either jaw. Tusks in the upper jaw solitary; grinders with wrinkled surfaces. Lips double. Hind feet uniting at the extremity of the body into a fin.

The following picture of a herd of walruses on a mass of floating ice, is given by Captain Cook. "They lie in herds of many hundreds upon the ice, huddling over one another like swine, and roar or bray very loud, so that in the night, or in foggy weather, they gave us notice of the vicinity of the ice, before we could see it. We never found the whole herd asleep, some being always upon the watch. These, on the approach of the boat, would wake those next to them; and the alarm being thus gradually communicated, the whole herd would be awake presently. But they were seldom in a hurry to get away, till after they had been once fired at. They then would tumble over one another into the sea in the utmost confusion. And if we did not, at the first discharge, kill those we fired at, we generally lost them, though mortally wounded. They did not appear to us to be that dangerous animal which some authors have described, not even when attacked. They are rather more so in appearance than in reality. Vast numbers of them would follow and come close up to the boats. But the flash of a musket in the pan, or even the bare pointing of one at them, would send them down in an instant. The female will defend the young to the very last, and at the expence of her own life, whether in the water or upon the ice. Nor will the young one quit the dam, though she be dead; so that if one is killed, the other is certain prey. The dam, when in the water, holds the young one between her fore fins."

This genus constitutes one of the links that connect the quadrupeds with the fishes; the walruses and manatis being marine animals, who, though they sometimes come on shore, pass most of their time in the water. They feed on sea weeds and shell fish, and do not appear to be carnivorous. There are about seven species, which are distinguished by the following names and characters.

1. *T. Rosmarus*, Morse or Arctic Walrus. Tusks distant and exerted.—2. *T. Dugon*, Dugon or Indian W. Tusks exerted and approximate.—3. *T. Borealis*, Whale-tailed W. Hairless, with a horizontal tail in place of hind feet.—4. *T. Australis*, Round-tailed W. Hairy, with a horizontal tail in place of feet.—5. *T. Manatis*, Guiana W. Slightly hairy, without tusks, and with a horizontal tail in place of hind feet. The following are named, but not characterized, by Dr Shaw, viz. 6. *T. Amazonius*, and, 7. *T. Hydropithecus*.

56
Rosmarus.
Arctic
Walrus
Fig. 20.

1. *T. Rosmarus*, Arctic Walrus.—This is a very large animal, growing sometimes to the length of 18 feet, and so thick as to measure 12 feet about the middle of the body. Its form is clumsy and inelegant, having a small head, short neck, thick body, and short legs. The lips are very thick, and the upper lip is indented or cleft into two large rounded lobes: over the whole surface of this part are scattered numerous semitransparent bristles, of a yellowish tinge, and of such a thickness as almost to equal a straw in diameter; they are about three inches long, and are slightly pointed at their extremities. The eyes are small. Instead of external ears, there are only two small round orifices. The skin, on the whole, is thick, and more or less wrinkled, and is scattered over with short brownish hair. On each foot are five toes, all connected by webs, and on each toe is a small nail; the hind feet are considerably broader than the fore feet. The tail is extremely short. In the upper jaw are two large and long tusks bending downwards.

The tusks of this animal are used as ivory; but authors seem to differ with respect to its quality, some taking it as superior, and others far inferior to that of the elephant. The walrus is taken chiefly for the sake of its oil and its skin, from which latter is prepared a very strong and elastic leather.

This order contains nine genera, and about 30 species.

CHAP. III. FERÆ.

Genus 14. PHOCA. SEALS.

57
Phoca.

Six fore teeth in the upper jaw, pointed, parallel, outer the larger; four in the lower jaw, bluntish, parallel, equal and distinct. One canine tooth on each side in both jaws, large and pointed; the upper distinct from the cutting teeth; the lower from the grinders. Five grinders on each side in the upper, and six in the lower jaw; obtusely tricuspidated. Hind feet growing together.

The arctic walrus inhabits the northern seas, and is chiefly found within the arctic circle. Great numbers are often met with in the Magdalen isles in the gulf of St Lawrence. They are gregarious, and are sometimes seen in vast multitudes on the masses of floating ice that are found in those high latitudes. They are harmless, unless when attacked or provoked, in which case they become furious, and extremely vindictive. When surprised on the ice, the females first provide for the safety of their young, by flinging them into the sea, and themselves after them. Having carried these to a secure distance, they will return to the place again with great rage to revenge any injury they have received. They will sometimes attempt to fasten their teeth on the boats, in order to sink them, or rise in great num-

This constitutes another tribe of marine animals; but these are much better fitted for living on land than the walruses, and indeed they pass much of their time either on the sea shores, on insulated rocks, or on the ice in the frozen seas, assembling in these places in vast numbers, especially at the time when the females bring forth

History of
the Species.

forth their young. Here they lie basking in the sun or sporting with each other, and here they take their repose. They are found in all seas, and some of them are said to inhabit large inland lakes. They feed chiefly on fish and sea weeds.

The species are numerous, at least 19 being described by naturalists, viz.

1. * *P. Vitulina*, Common Seal. Earless, brown, with smooth head and neck.—2. *Bicolor*, Pied S. Earless, black, variegated with white, with elongated nose and lunated hind feet.—3. *P. Monachus*, Mediterranean S. Earless, with four cutting teeth in each jaw, undivided fore feet, and the hinder pinniform and without claws.—4. *P. Longicollis*, Long-necked S. Earless, long-necked, with the fore feet pinniform.—5. *P. Falklandica*, Falkland-isle S. Cinereous, with small-pointed ears, and furrowed cutting teeth.—6. *P. Testudinea*, Tortoise-headed S. Tortoise-shaped head and slender neck.—7. *P. Fasciata*, Ribbon S. Blackish, with a squarish dorsal yellow band.—8. *P. Leporina*, Leporine S. with white, soft, suberect fur.—9. * *P. Barbatata*, Great S. Earless, blackish, with smooth head.—10. *P. Hispidata*, Rough S. Pale brown, subauriculated, with smooth head, and the body covered with rising bristly hair.—11. *P. Porcina*, Porcine S. Eared, with hog-like snout and five-toed feet.—12. *P. Flavescens*, Yellow S. Yellowish, with pointed ears.—13. *P. Cristata*, Hooded S. Gray, with a folding skinny crest on the forehead.—14. *P. Groenlandica*, Harp. S. Earless, gray, with a black dorsal crescent; the horns pointing downwards along the sides.—15. *P. Pusilla*, Little S. Subauriculated, dusky, with smooth head.—16. *P. Ursina*, Ursine S. Eared, blackish, with flattish nose, and fin-like fore feet.—17. *P. Leonina*, Bottle-nosed S. Brown, male having a projecting crest or inflated membrane on the snout.—18. *P. Jubata*, Leonine S. Reddish brown, male furnished with a large mane round the neck.—19. *P. Lupiara*, U-rigne S. Earless, with dog-like head, and fin-like fore feet.

1. *P. Vitulina*, Common Seal, or Sea-Calf.—The usual length of this species is from five to six feet. It has a large round head, a small short neck, and several strong bristles on each side of its mouth; large eyes, no external ears, and a forked tongue. The body tapers from the shoulders to the tail. The legs are very short, and the feet all webbed. The hind legs are placed so far back as to be of but little use, except in swimming. The tail is very short. They vary in colour, being sometimes gray, sometimes brown or blackish, and now and then spotted with white and yellow. They inhabit all the European seas, and are found round all the coasts of the northern hemisphere. They are also seen in vast quantities about the southern polar regions; and Mr Pennant informs us that they even inhabit some fresh-water lakes, especially that of Baikal. Their dens or habitations are formed in hollow rocks or caverns out of the reach of the tide.

They are excellent swimmers and ready divers, and are very bold when in the sea. In the summer they will come out of the water, to bask or sleep in the sun, on the top of large stones, or shivers of rocks; and that is the opportunity our countrymen take of shooting them: if they chance to escape, they hasten towards

their proper element, flinging stones and dirt behind them as they scramble along; at the same time expressing their fears by piteous moans; but if they happen to be overtaken, they will make a vigorous defence with their feet and teeth, till they are killed. They are taken for the sake of their skins, and for the oil their fat yields; the former sell for 4s. or 4s. 6d. a piece, and, when dressed, are very useful in covering trunks, making waistcoats, shot pouches and several other conveniences. The flesh of these animals, and even of porpoises, formerly found a place at the tables of the great, as appears from the bill of fare of that vast feast that Archbishop Nevill gave in the reign of Edward IV. in which is seen, that several seals were provided on the occasion. They couple about April, on large rocks, or small islands, not remote from the shore; and bring forth in those vast caverns that are frequent on our coasts. They commonly bring forth two at a time, which, in their infant state, are covered with a whitish down, or woolly substance.

They suckle their young for about a fortnight, in the place where they were born, and then take them out to sea, and instruct them in swimming, and seeking for their prey, which consists chiefly of sea weed. When the young are fatigued, the parents are said to carry them on their backs. The growth of the young seals is said to be so rapid, that, in about nine tides after their birth, they become as active as their parents.

Seals are very swift in their proper depth of water; dive like a shot, and in a trice rise at 50 yards distance; so that weaker fishes cannot avoid their tyranny, except in shallow water; a person of the parish of *Sennon*, saw, not long since, a seal in pursuit of a mullet (that strong and swift fish): the seal turned it to and fro in deep water, as a greyhound does a hare. The mullet at last found it had no way to escape, but by running into shoal water: the seal pursued, and the mullet, to get more securely out of danger, threw itself on its side, by which means it darted into shoaler water than it could have swam in with the depth of its haunch and fins, and so escaped.

They sleep on rocks surrounded by the sea, or on the less accessible parts of our cliffs, left dry by the ebb of the tide; and if disturbed by any thing, take care to tumble over the rocks into the sea. They are extremely watchful, and never sleep long without moving; seldom longer than a minute: then raise their heads, and if they hear or see nothing more than ordinary, lie down again, and so on, raising their heads a little, and reclining them alternately, in about a minute's time. Nature seems to have given them this precaution, as being unprovided with auricles, or external ears; and consequently not hearing very quick, nor from any great distance.

When taken young, these animals may be domesticated, will follow their master like a dog, and come to him when called by name. Some years ago a young seal was thus domesticated that had been taken at a little distance from the sea. It was usually kept in a vessel full of salt water, but was allowed to crawl about the house, and would sometimes come near the fire; its natural food was regularly brought to it, and it was every day taken to the sea, and thrown in from a boat, but would swim after the boat, and always allowed it-

Linnaeus's characters, marking with a star those that are generally found in this country. **History of the Species.**

59
Canis.

Gen. 15. CANIS. DOGS.

Six cutting teeth in each jaw; the lateral of the upper jaw longer and distant, the intermediate lobated; the lateral of the lower jaw lobated. Canine teeth solitary and curved. Grinders six or seven, or more than in the other genera of this order.

The individuals of this genus, like those of the next, have so little in common with respect to their habits and manners, and are otherwise so important in themselves, as to call for a separate account. Without making any general remarks here, we shall merely give the specific differences, and then proceed to such of the species as are most worthy of notice.

There are about 23 species; viz.

1. **Canis Familiaris*, Common Dog. Recurved tail, turned towards the left.—2. *C. Lupus*, Wolf. Tail incurvated.—3. *C. Mexicanus*, Mexican wolf. Tail deflected; body ash-coloured, and variegated with dusky bands and fulvous spots.—4. *C. Lycaon*, Black wolf. Tail straight.—5. *C. Hyæna*, Hyæna. Pale brown, striped with black, with upright mane, naked ears, straight tail, and four-toed feet.—6. *C. Crocata*, Spotted hyæna. Reddish brown, spotted with black; with straight tail, and four-toed feet.—7. *C. Aureus*, Jackall. Pale fulvous, with straight tail.—8. *C. Mesomelos*, Cape jackall. Ferruginous, with straight tail, and black dorsal band.—9. *C. Barbarus*, Barbary jackall. Pale brown with straight tail; a black descending forked band behind each ear, and three dusky bands on the tail.—10. *C. Ceylonicus*, Ceylonese dog. Yellowish gray, with lengthened snout, long sharp pointed tail, and crooked claws.—11. **C. Vulpes*, Fox. Tail straight, tipped with white.—12. *C. Alopex*, Brant fox. Tail straight, tipped with black.—13. *C. Corsac*, Corsac fox. Tail straight, fulvous, with the base and tip white.—14. *C. Karagan*, Karagan fox. Tail straight; body gray, and ears black.—15. *C. Cinereo-argenteus*, Fulvous-necked fox. Ash gray, with straight tail; and the sides of the neck fulvous.—16. *C. Virginianus*, Virginian fox. Whitish gray, with straight tail.—17. *C. Argentatus*, Silvery fox. Deep brown, with longer hairs of a silvery white.—18. *C. Lagopus*, Arctic fox. Tail straight, feet covered with thick fur.—19. *C. Thous*, Surinam dog. Grayish, white beneath, with deflected tail.—20. *C. Bengalensis*, Bengal fox. Light brown, with a longitudinal black stripe down the face, white orbits, fulvous legs, and tail tipped with black.—21. *C. Fuliginosus*, Sooty fox. Of a sooty colour, with straight tail.—22. *C. Antarcticus*, Antarctic fox. Cinereous brown, villous; tail tipped with white.—23. *C. Zerda*, Fennec. Whitish, with straight tail, and very large upright ears, that are internally of a rose colour.

60
Domestic
dog.

1. *C. Familiaris*. Domestic dog.—The varieties of the common dog are so numerous, that it is scarcely possible to give any general description of the species that would apply to all. We shall here, therefore, only give Linnaeus's characteristic picture, as modified by Mr Daniel, and then enumerate the several varieties with

Linnaeus's characters, marking with a star those that are generally found in this country.

The dog eats flesh and farinaceous vegetables, but not greens (*this is a mistake, for they will eat greens when boiled*); its stomach digests bones; it uses the tops of grass as a vomit; is fond of rolling in carrion; voids its excrements on a stone; its dung (*the album græcum*) is one of the greatest encouragers of putrefaction; it laps up its drink with its tongue; makes water sideways, by lifting up one of its hind legs; is most diuretic in the company of a strange dog, and very apt to repeat it where another dog has done the same: *Odorat anum alterius; menstruans catulit cum varis; mordet illa illos; cohæret copula junctus*. Its scent is most exquisite when its nose is moist; it treads lightly on its toes, scarcely ever sweats, but when hot lolls out its tongue; generally walks frequently round the place it intends to lie down on; its sense of hearing is very quick; when asleep, it dreams. It goes with young 63 days, and commonly brings from four to ten; the male puppies resemble the dog, the female the bitch (*an assertion by no means accurate, any more than the tail always bending to the left is a common character of the species*). It is the most faithful of animals, is very docile, fawns at its master's approach; runs before him on a journey; often passes over the same ground; on coming to cross ways stops, and looks back; drives cattle home from the field; keeps herds and flocks within bounds, protects them from wild beasts; points out to the sportsman the game, brings the birds that are shot to its master; will turn a spit; at Brussels, and in Holland, draws little carts to the herb market; in more northern regions, draws sledges with provisions, travellers, &c.; will find out what is dropt; watchful by night, and when the charge of a house or garden is at such times committed to him, his boldness increases, and he sometimes becomes perfectly ferocious; when he has been guilty of a theft, slinks away with his tail between his legs; eats voraciously with oblique eyes; enemy to beggars; attacks strangers without provocation; hates strange dogs; howls at certain notes in music, and often urines on hearing them; will snap at a stone thrown at it; is sick at the approach of bad weather (*a remark vague and uncertain*); is afflicted with worms; spreads its madness; grows blind with age; *sæpe gonorrhœa infectus*; driven as unclean from the houses of the Mahometans; yet the same people establish hospitals for, and allow them daily food.

1. **Shepherd's dog*; ears erect, tail woolly under-
neath. 61
Varieties.

2. *Wolf-dog*; hair on the head long, ears erect, tail very much curved on the rump.

3. *Siberian dog*; ears erect, hair all long.

4. *Iceland dog*; ears erect, tips pendulous, hair long, except on the snout.

5. *Water-dog*; hair long, curled like a sheep.

6. **Little water-dog*; less; hair long, curled, round; the ears long, and hanging down.

7. *King Charles's dog*; head less, rounded; snout short, tail curved back.

8. **Spaniel*; ears long, woolly, pendulous.

9. *Multese dog*; hair soft, silky, very long.

10. *Lion-dog*; very small; hair on the belly and tail shorter.

11. *Danish*

History of
the Species.

11. *Danish dog*; ears small, subpendulous; snout small, acute; legs slender.
12. *Bastard pug-dog*; ears small, subpendulous; nose thick, flattish.
13. * *Pug-dog*; nose crooked upwards; ears pendulous; body square.
14. * *Bull-dog*; sides of the lips pendulous; body robust; size of a wolf.
15. * *Mastiff*; very large; sides of the lips pendulous; body robust.
16. *German hound*; ears pendulous; a spurious claw on the hind feet.
17. * *Hound*; ears pendulous; a spurious claw on the hind feet; whitish.
18. * *Bloodhound*; very sagacious.
19. * *Pointer*; tail truncate; spotted.
20. *Barbet*; tail truncate; hair long, coarse.
21. * *Greyhound*; head long; snout robust; ears small, subpendulous; legs long, stout; body long, slender.
22. *Irish greyhound*; body curved; snout narrowing; size of 15.
23. *Turkish greyhound*; body curved; snout tapering; hair a little curled; size of 25.
24. *Common greyhound*; body curved; snout tapering; size of a wolf.
25. *Rough greyhound*; body curved; snout tapering; hair longer, curled; size of a wolf.
26. *Italian greyhound*; less; body curved; snout tapering.
27. *Naked dog*; body naked.
28. *Oriental dog*; tall, slender; ears pendulous; hair on the tail very long, hanging down.
29. * *Lurcher*; body narrow; legs stout; tail strong, straight; hair short, thick set.
30. *Rough lurcher*; body narrow; legs stout; tail thick, straight; hair long, rough.
31. *Boar lurcher*; head and snout thick; body narrow behind; feet long; hair long, rough.
32. * *Turnspit*; legs short; body long, often spotted.
33. *Aleo*; head small; ears pendulous; back curved; tail short; size of 9.
34. *New Holland dog*; tail bushy, pendulous; ears short, erect; snout pointed.

Of these, the *shepherd's dog*, the *Siberian dog*, the *bull dog*, the *mastiff*, the *hound*, the *bloodhound*, the *greyhound*, the *Irish greyhound*, and the *terrier*, are the most deserving of our attention. We shall make a very few remarks on each, and shall take occasion to intersperse a few anecdotes characteristic of the sagacity, cunning, strength, or courage, of this most valuable species.

Dog.
Fig. 22.

The *Shepherd's dog* is supposed by many to be the original stock, whence most of the other varieties are derived. This is one of the most useful of the species, and is ever faithful to his charge. This sagacious animal is of the greatest importance in those large tracts of land which in many parts of our island are appropriated to the feeding of sheep and cattle, and where vast flocks may be seen ranging without controul, their only guides being the shepherd and his dog. This animal is strictly attentive to the commands of his master, and always prompt in the execution of them. He is the watchful guardian of the flock, keeps them to-

gether, and often drives them by himself from one pasture to another. We have heard of one of these dogs who was employed by a farmer in the south of Scotland to steal other people's sheep. His master had only to point out to him beforehand the sheep which he wished to appropriate to himself, and to send the dog at a convenient time to fetch them home. This charge he was sure to execute with the utmost punctuality and address. The proprietors of the stolen sheep were surprised at their loss, when they could not discover the person who had robbed them. The master of the dog was at length detected and hanged.

Mr Bewick speaks of a remarkable singularity in the feet of the shepherd's dogs in the northern parts of this island, viz. their having one or two toes more than other dogs, which appear to be destitute of muscles, and hang dangling behind like an unnatural excrescence. This, however, is not peculiar to the shepherd's dog, but is found in the spaniel, pointer, and hound.

The *Siberian* or *Greenland dog* is a most useful animal to the inhabitants of the dreary regions of North America, and the north-east of Asia, especially Greenland and Kamtschatka. It bears a considerable resemblance to the shepherd's dog, but is much larger, and has more shaggy hair, and a more bushy tail. It is ferocious and savage, and rather howls than barks. It is principally employed in drawing sledges across the frozen snow; several of these animals being fastened to the sledge, which they draw with so much speed, that they have been known to perform a journey of 270 miles in less than four days.

The sledges are usually drawn by five dogs, four of them yoked two and two abreast: the foremost acting as a leader to the rest. The reins are fastened to a collar round the leading dog's neck, but are of little use in directing the pack, the driver depending chiefly upon their obedience to his voice, with which he animates them to proceed. Great care and attention are consequently used in training up those intended for leaders, which are more valuable according to their steadiness and docility; the sum of 40 rubles or 10l. being no unusual price for one of them. The rider has a crooked stick, answering the purpose both of whip and reins, with which, by striking on the snow, he regulates the speed of the dogs, or stops them at his pleasure. When they are inattentive to their duty, he often chastises them by throwing it at them. He discovers great dexterity in regaining his stick, which is the greatest difficulty attending his situation; for if he should happen to lose it, the dogs immediately discover the circumstance, and seldom fail to set off at full speed, and continue to run till their strength is exhausted, or till the carriage is overturned and dashed to pieces, or hurried down a precipice.

The *Bull-dog* is the fiercest of the species, and in courage is scarcely excelled by any creature in the world. It is of a low stature, but very strong and muscular; has a short nose, and its under jaw projects forward, so as to render its aspect fierce and unpleasing. The cruel purpose for which these animals were formerly much employed, viz. bull-baiting, is now, much to the credit of the present times, going fast out of fashion, and we should hope, in the course of another century, will be entirely abolished. The uncommon ardour, and obstinacy displayed by those dogs in attacking the bull,

64
Bull-Dog.

Fern. bull, even under the greatest pain, are well illustrated by the following fact, related by Mr Bewick. Some years ago at a bull-baiting in the north of England, a young man, confident of the courage of his dog, laid some trifling wager, that he would, at separate times, cut off all the four feet of his dog, and that it would, after each amputation, still attack the bull. The inhuman experiment was tried; and the dog continued to seize the bull as eagerly as at first.

65
Mastiff.
Fig. 23.

The *Mastiff* is one of the largest and strongest dogs, and one of those for which this country is particularly famous. His principal office is that of guarding and securing houses, gardens, and other property, and for this he is admirably calculated, both from his strength and courage. The power of this dog was put to a severe trial in the reign of James I. when three of them were made to attack a lion. The result of the engagement is thus related by Stow. "One of the dogs being put into the den, was soon disabled by the lion, which took it by the head and neck, and dragged it about; another dog was then let loose, and served in the same manner; but the third being put in, immediately seized the lion by the lip, and held him for a considerable time, till being severely torn by his claws, the dog was obliged to quit his hold, and the lion, greatly exhausted in the conflict, refused to renew the engagement; but taking a sudden leap over the dogs, fled into the interior part of his den. Two of the dogs soon died of their wounds; the last survived, and was taken great care of by the king's son, who said, he that had fought with the king of beasts, should never after fight with any inferior creature.

M. D'Obsonville relates an instance of memory in a mastiff, which exceeds any thing of which even the human race seems capable. This dog, which had been brought up by him in India from a puppy, accompanied himself and a friend from Pondicherry to Benglour, a distance of above 300 leagues. The journey occupied nearly three weeks, and they had to traverse plains and mountains, to ford rivers, and go through several bye-paths. The dog, which had certainly never before been in that country, lost his master at Benglour, and immediately returned to Pondicherry. He went directly to the house of a friend of M. D'Obsonville's, with whom that gentleman had generally resided. Now the difficulty is, not so much to know how the dog subsisted on the road (for he was very strong, and able to procure himself food), but how he should so well have found his way, after an interval of more than a month.

An anecdote related by Mr Bewick shews that the mastiff possesses forbearance equal to his courage, and that he disdains to attack an inferior foe, while he knows how to chastise his impertinence. A large dog of this kind belonging to the late M. Ridley, Esq. of Heatton, near Newcastle, being frequently molested by a mongrel, and teased by its continual barking, at last took it up in his mouth by the back, and with great composure dropped it over the quay into the river, without doing any farther injury to an enemy so much his inferior.

66
Fox-hound.
Fig. 24.

There are several varieties of hounds, as the fox-hound, the beagle, and the harrier. Of these the fox-hound most merits our attention.

The *Fox-hounds* of Britain are considered as superior

in swiftness, strength, and activity, to those of every other country in Europe. As fox-hunting forms one of the most favourite diversions among our country gentlemen, the greatest attention is paid to the breeding, education, and maintenance of the fox hounds; and this climate seems so congenial to their nature, that they will thrive nowhere else. It is asserted that when our fox-hounds are carried over to the continent, they always degenerate.

The proper shape of a fox-hound is of considerable consequence, for if he is not of a perfect symmetry he will neither run fast nor bear hard work, and in a fox-chase, both great speed and strength are required. According to Mr Daniel, his legs should be as straight as arrows, his feet round and not too large; his shoulders should lie back; his breast should be rather wide than narrow; his chest deep, his back broad, his neck thin, his head moderately small, his tail thick and bushy.

Fox-hounds are sometimes employed to hunt the stag, and there is on record a remarkable instance of the stoutness displayed by these dogs in such a chase. Many years since a stag was hunted from Whinfield park, in the county of Westmoreland, until by fatigue or accident the whole pack was thrown out except two fox-hounds, bred by Lord Thanet, who continued the chase the greatest part of the day. The stag returned to the park from whence he had been driven, and as his last effort leapt the wall, and died as soon as he had accomplished it. One of the hounds ran to the wall, but being unable to get over it, lay down, and almost immediately expired: the other hound was found dead about half a mile from the park. The length of this chase is uncertain, but as they were seen at Red-kirks, near Annan, in Scotland, distant by the post-road about 46 miles, it is conjectured that the circuitous course they took, could not make the distance run, less than 120 miles.

The following anecdote is an admirable proof of the sagacity of the fox-hound. Two gentlemen had their hounds at Whinneck, Northamptonshire, and used sometimes to go to Lutterworth in Leicestershire for a fortnight's hunting. A favourite hound was left in Northamptonshire, on account of not being quite sound. The first day's hunting from Lutterworth produced an extraordinary chase, in which the hounds and horses were so tired, that it was deemed necessary to stop that night at Leicester. Upon their arrival next day at Lutterworth, they were told that a hound (which answered the description of that left in Northamptonshire), came there soon after their going out the preceding morning, and waited quietly until towards the evening; he had then shown signs of uneasiness, and in the morning had disappeared. It was concluded that, disappointed of finding his companions where he expected, the hound, whose name was *Dancer*, had returned to Whinneck; but to the surprise and concern of his masters, upon their returning home, they were informed that the hound had come back from Leicestershire, staid one day at the kennel, and then left it. Every possible inquiry was made, at length it was discovered that *Dancer*, upon not finding the pack either at Lutterworth, or Whinneck, had proceeded into Warwickshire, to a Mr Newsome's where the hounds had been for a week some months before*.

The *Blood-hound* was held in great esteem by our ancestors,

Daniel's Rural Sports, vol. i.

History of the Species. 67
Blood-hound.

ancestors, and was so remarkable for the fineness of its scent, that they employed it for recovering game that had escaped wounded from the hunters. It would also follow with considerable certainty the footsteps of a man to a great distance. In barbarous and uncivilized times, when a thief or murderer had fled, the blood-hound would trace him through the thickest and most secret coverts, and ceased not the pursuit till it had seized the felon. This is finely described by Somerville in his poem of *The Chase*.

Mr Boyle relates a story that shews the extreme acuteness of this dog's smell, as well as his surprising sagacity. A person of quality, to make a trial whether a young blood hound was well instructed, caused one of his servants to walk to a town four miles off, and then to a market town three miles from thence. The dog, without seeing the man he was to pursue, followed him by the scent to the above-mentioned places, notwithstanding the multitude of market-people that went along the same way, and of travellers that had occasion to cross it; and when the blood-hound came to the chief market-town, he passed through the streets without taking notice of any of the people there, and left it not till he had gone to the house where the man he sought rested himself, and he found him in an upper room, to the wonder of those that followed him.

Blood-hounds are still employed in the southern part of the kingdom, either for recovering wounded deer, or for pursuing deer-stealers, whom they infallibly trace by the blood that issues from the wounds of their victims.

68
Greyhound. Fig. 26.

The *Greyhound* is the fleetest of all dogs, and can out-run every animal of the chase; but it has not the fine scent of other hounds, it can pursue only by the eye, and must be indebted for success to its astonishing speed. The swiftness of this dog is so great, that a swift horse can do little more than keep up with him, and his ardour in pursuit of game is such as not infrequently to occasion his death.

Greyhounds were formerly held in such repute as to be considered a most valuable present even from or to princes.

69
Irish Greyhound. Fig. 27.

The *Irish greyhound* is supposed to be the largest of the species, as well as the most beautiful and majestic. One described by Mr Lambert, in the third volume of the *Linnaean Transactions*, measured above five feet from the nose to the tip of the tail, and they are said formerly to have been of a much larger size. They are found only in Ireland, and even in that country are now become extremely rare. The earl of Altamont is said to be the only person who possesses them, and his lordship has not more than eight. They were formerly employed in clearing the country of wolves, and are hence sometimes called *Irish wolf-dog*.

70
Terrier. Fig. 28.

The *Terrier* is of two kinds, one with smooth glossy hair, commonly of a black colour, or black marked with reddish spots; and the other rough and shaggy, usually of a reddish brown mixed with gray. This dog is generally an attendant on every pack of fox-hounds, being employed to force the fox from his kennel, in which he is very expert. He is also the determined enemy of rats, weazels, and other vermin, and no dog is better calculated for the useless and cruel sport of hunting the badger. He is also a good water-dog.

Mr Hope has related an anecdote respecting the terrier, which shews that this animal is both capable of resentment when injured, and of great contrivance in order to accomplish his revenge; it indeed shews that he is possessed of a certain power of combining ideas, and communicating his thoughts to other dogs.

A gentleman of Whitmore in Staffordshire, used to come twice a-year to town, and being fond of exercise, generally performed the journey on horseback, accompanied most part of the way by a faithful little terrier dog, which, lest he might lose it in town, he always left to the care of Mrs Langford, the landlady at St Alban's; and on his return he was sure to find his little companion well taken care of. The gentleman calling one time, as usual, for his dog, Mrs Langford appeared before him with a woeful countenance:—Alas! sir, your terrier is lost! Our great house-dog and he had a quarrel, and the poor terrier was so worried and bit before we could part them, that I thought he could never have got the better of it. He, however, crawled out of the yard, and no one saw him for almost a week: he then returned, and brought with him another dog, bigger by far than ours, and they both together fell on our great dog, and bit him so unmercifully, that he has scarcely since been able to go about the yard, or to eat his meat. Your dog and his companion then disappeared, and have never since been seen at St Alban's. The gentleman heard the story with patience, and endeavoured to reconcile himself to his loss. On his arrival at Whitmore, he found his little terrier; and on inquiring into circumstances, was informed that he had been at Whitmore, and had coaxed away the great dog, who it seems had, in consequence, followed him to St Alban's, and completely avenged his injury.

The above anecdote, with others which we have before given, are abundantly sufficient to shew the great sagacity of the dog; but of all the qualifications that have been attributed to him, that of learning to speak must appear the most extraordinary. The French academicians, however, have given us an account of a dog in Germany which would call for tea, coffee, chocolate, &c. The account was communicated to the Royal Academy by the celebrated Leibnitz, and in substance is as follows: "This dog was of a middling size, and was the property of a peasant in Saxony. A little boy, the peasant's son, imagined that he perceived in the dog's voice an indistinct resemblance to certain words, and therefore took it into his head to teach him to speak. For this purpose he spared neither time nor pains with his pupil, who was about three years old when this his learned education commenced; and at length he made such a progress in language as to be able to articulate so many as thirty words. It appears, however, that he was somewhat of a truant, and did not very willingly exert his talents, being rather pressed into the service of literature, and it was necessary that the words should be first pronounced to him each time, which he, as it were, echoed from his preceptor. Leibnitz, however, attests that he himself heard him speak; and the French academicians add, that unless they had received the testimony of so great a man as Leibnitz, they should scarcely have dared to report the circumstance. This wonderful dog was born at Zeitz in Misnia, in Saxony*."

* *Shaw's Zoology*, vol. 1. and part 1.

Fern. and we have heard of some epicures in this country who fatten young puppies for their table. The skin of this animal is made into leather for gloves, &c.

For the construction and management of dog kennels, see FARRIERY, Part iv. chap. i. sect 3. For the best method of feeding hounds, see chap. ii. of the same part; and for the diseases of dogs and their treatment, especially the distemper and canine madness, see FARRIERY, Part vi.

72
Wolf.
Fig. 28.

2. *C. Lupus.* The Wolf.—The wolf is much larger, stronger, and more muscular than the dog; the upper part of his face is broader, and his whole form longer; the tail too has an inward direction, and is rather long and bushy; the opening of his mouth appears a little shorter in proportion than that of the dog, but his jaws are much stronger, his teeth larger, and his eyes placed more obliquely. His general colour is a pale gray with a cast of yellow; but it varies much in shade in different parts of the world.

He is found in almost all the temperate and cold regions of the globe, even as high as the arctic circle. He was formerly very common in Britain and Ireland, insomuch that King Edgar commuted the punishment of certain crimes into the acceptance of a number of wolves tongues, and in Wales converted the tax of gold and silver into an annual tribute of 300 wolves heads. Notwithstanding these endeavours to extirpate the race of wolves, we find that in the reign of Edward I. these animals had so much increased in number, as to require a mandate from that monarch to Peter Corbet to assist in their destruction. In the county of Derby certain persons held their lands by the suit of hunting, and destroying the wolves that infested the country; whence they were called *wolve-hunt*. They infested Ireland many centuries after their extinction in England; for we are told that they were found there so lately as the year 1710. In Scotland the last wolf was killed in the latter end of the 17th century, by Sir Ewen Cameron of Lochiel. In the parts of America possessed by the United States, wolves are nearly extirpated; but very lately a reward of 20 or 30 shillings was offered for killing a wolf.

Wolves prey on all kinds of animals: but in case of necessity will feed upon carrion; in hard weather assemble in vast troops, and join in dreadful howlings. Horses generally defend themselves against their attacks, but all weaker animals fall a prey to them. Throughout France the peasants are obliged nightly to house their flocks. The wolf is naturally a suspicious animal, and though so ravenous as to devour his own species when pressed by hunger, yet he is so mistrustful as to imagine every thing he sees to be a snare laid to entrap him. If he finds a rein-deer tied to a post for the purpose of being milked, he dares not approach it for fear it should be placed there only to betray him; but when once the deer is let loose, he will pursue and seize him. He is, however, so cowardly, that if the animal stands on the defensive, he will scarcely venture to attack it. They sally forth with great caution in quest of their prey; have a fine scent; hunt by nose; they are capable of bearing long abstinence; to allay their hunger will fill their bellies with mud; a mutual enmity subsists between the dogs and them: the female is in heat in winter, followed by several males, which occasions

VOL. XII. Part II. †

great combats; goes with young ten weeks; near her time prepares a soft bed of moss, in some retired place; brings from five to nine at a birth; the young born blind. Their bite is terrible, as their strength is great; the hunters therefore clothe their dogs, and guard their necks with spiked collars. Wolves are proscribed animals; destroyed by pitfalls, traps, or poison; a peasant in France who kills a wolf, carries its head through the villages, and collects some small reward from the inhabitants. The Khaissocks take the wolves by the help of a large sort of hawk called beskat, which is trained for the diversion, and will fasten on them and tear out their eyes*.

History of
the Species.

These animals abound in the immense forests of Germany, where the following methods are taken to destroy them. In some very sequestered part of the forest they hang up a large piece of carrion to the branch of a tree, having previously made a train of some miles long, leaving small pieces of putrid flesh here and there to allure the wolves to the spot; they then wait till it is dark, and approach the place with great circumspection. Here they sometimes find two or three wolves assembled, leaping up, and straining themselves to catch the bait, which is placed just within their reach; while the animals are busily employed in this way, the hunters being provided with fire-arms, seldom fail to dispatch them. Again, in a convenient place, at the foot of a declivity, they make a small enclosure of strong poles, so high, that the wolf having once entered, cannot return again. An opening is left at the top of the bank; and a sheep that has been long dead, is the bait; to which he is allured by long trains, made from different places where he is known to haunt. As soon as he arrives at the spot, he examines every part of the enclosure, and finding no other way to come at the booty, he precipitates himself to the bottom; and having made a plentiful meal, endeavours in vain to re-ascend. His disappointment at not being able to get back, is productive of the most direful howlings, which alarm his enemies, and they either take him alive, or dispatch him with bludgeons. It is remarkable that when this animal finds there is no possibility of escaping, his courage entirely forsakes him; and he is for some time so stupified with fear, that he may be killed without offering to resist, or taken alive without much danger.

* Pennant's
Quadrupeds.

Notwithstanding the savage ferocity of the wolf, more than one instance has occurred of his being tamed. Buffon brought up one which remained very quiet and docile till he was 18 or 19 months old, when he broke his fetters, and ran off, after destroying a number of fowls, and killing a dog with whom he had lived in the greatest familiarity. It is said that Sir Ashton Lever had a tame wolf, which by proper education, was entirely divested of the ferocious character of its species.

The wolf is valuable for nothing but his skin, which makes a warm and durable fur.

It is now fully ascertained that the wolf and dog will breed together, and that the breed may be continued between the mules themselves, or between them and other dogs.

It has hence been conjectured that the wolf is the original stock whence the dog is derived, but the differences

History of ferences between the two animals are so striking, that the Species this supposition must be abandoned in favour of some other animal.

73
Hyæna.
Fig. 29.

5. *C. Hyæna*. Hyæna.—This animal is about the size of a large dog, though it is sometimes found nearly six feet long from the root to the base of the tail. It is chiefly distinguished by its great strength of limbs, and a remarkable fullness of the snout, which is black; the ears are long, sharp pointed, and nearly naked, and from the neck there runs a strong bristly mane along the upper part of the back. The tail is rather short, but extremely thick and bristly with hair. All the feet have four toes. Its usual colour is a pale grayish brown, with a tawney cast, and the whole body is marked with several blackish transverse bands, running from the back downwards, those on the legs being most numerous, and of the deepest colour.

The hyæna is found in Asiatic Turkey, Syria, Persia, and in some parts of Africa, especially Barbary and Abyssinia.

It is one of the most ferocious animals of which we have any account; will prey on cattle, and frequently commits great devastation among the flocks, and prowls about in the night to feed on the remains of dead animals, or on whatever living prey it can seize. Troops of hyænas sometimes assemble, and follow the movements of an army, in order to feast on the bodies of the slain. They will even violate the repositories of the dead, and greedily devour the putrid contents of the grave. The courage of this animal is equal to its rapacity, and on occasion he will obstinately defend himself against much larger animals. He will sometimes attack the ounce and the panther, and Kæmpfer speaks of one that he saw put two lions to flight. This character, however, seems not to apply to the hyænas of Barbary; for we are told by Mr Bruce, that he has seen the Moors in the day time take this animal by the ears, and drag him along without his offering any other resistance than drawing back. The Abyssinian hyænas on the contrary, are extremely bold, and infest the towns so much in the night, that it is dangerous to stir out after dark. Mr Bruce tells us, that they were a plague in Abyssinia in every situation, both in the city and in the field, and he thinks surpassed even the sheep in number. "Gondar was full of them, from the time it became dark till the dawn of day, seeking the different pieces of slaughtered carcasses, which this cruel and unclean people expose in the streets without burial, and who firmly believe that these animals are Falasha from the neighbouring mountains, transformed by magic, and come down to eat human flesh in the dark in safety. Many a time in the night, when the king had kept me late in the palace, and it was not my duty to lie there, in going across the square from the king's house, not many hundred yards distant, I have been apprehensive lest they should bite me in the leg. They grunted in great numbers about me, although I was surrounded with several armed men, who seldom passed a night without wounding or slaughtering some of them.

"One night in Maitsha, being very intent on an observation, I heard something pass behind me towards the bed; but upon looking round, could perceive nothing. Having finished what I was then about, I went out of my tent, resolving directly to return, which I immedi-

ately did, when I perceived two large blue eyes glaring at me in the dark. I called upon my servant with a light, and there was the hyæna standing near the head of the bed, with two or three large bunches of candles in his mouth. To have fired at him, I was in danger of breaking my quadrant or other furniture; and he seemed, by keeping the candles steadily in his mouth, to wish for no other prey at that time. As his mouth was full, and he had no claws to tear with, I was not afraid of him, but with a pike struck him as near the heart as I could judge. It was not till then that he shewed any sign of fierceness; but upon feeling his wound, he let drop the candles, and endeavoured to run up the shaft of the spear to arrive at me; so that, in self defence, I was obliged to draw my pistol from my girdle and shoot him; and nearly at the same time my servant cleft his skull with a battle-axe. In a word, the hyæna was the plague of our lives, the terror of our night walks, and the destruction of our mules and asses; which above all others, is his favourite food."

The voice of this animal is singular, beginning somewhat like the moaning of a human voice, and ending like a person making a violent effort to vomit.

Hyænas generally inhabit caverns and rocky places, where they keep themselves retired during the day.

There is said to be a remarkable particularity in this animal, viz. that when it is first dislodged from cover, and obliged to run, it always appears lame for a considerable space, sometimes to such a degree as would lead people to suppose one of his hind legs to be broken, though after running for some time this affection goes entirely off.

There is something peculiarly savage and gloomy in the aspect of the hyæna, which seems to indicate an extreme malignity of disposition, and his manners while in captivity seem to correspond with this appearance, being in general fierce and untractable. The opinion so decidedly maintained by most keepers of wild beasts, that the hyæna cannot be tamed, appears, however, to be erroneous, as there are at least two instances of the contrary on record, one by Mr Pennant, who declares that he saw a hyæna that had been rendered as tame as a dog, and the other by Buffon, who assures us, that in an exhibition of animals at Paris, in the year 1773, there was a hyæna which had been tamed very early, and was apparently divested of all its natural malevolence of disposition.

7. *C. Aureus*, Jackal.—In external figure the jack-Jackal⁷⁴ resembles the wolf more than the fox. It is also Fig. 30- larger, and stands higher on its legs than the fox. The head is of a fox-red above, mixed with ash gray hairs, which have each a blackish ring and tip; the upper lip is white on each side of the nose, and the throat is of the same colour; the whiskers, the long hairs on the chin, and those above the eyes, which are five in number, are black; the ears are fox-red externally, and white internally; the neck and back are all over gray yellow, and both, but especially the latter, are dashed with a shade of dusky, owing to the tips of the long hairs on those parts; the under parts of the body and the legs are of a light reddish yellow, but the shoulders and thighs are externally of a fox-red; the claws are black; the thumb claw stands higher than in the dog, and is crooked; the tail is straight, somewhat longer, and

Ferra. and more hairy than in the wolf, and is of a grayish yellow, more inclining to fox-red towards the end; the long hairs have black tips, and consequently the tip of the tail appears black; the hair of the jackal is stronger and coarser than that of the wolf, and is longest on the shoulders and tail, where it measures four inches; on the neck and back it is shorter by an inch; between the hairs is situated a woolly fur of a gray colour. The four middle front teeth are of a truncated form, or if cut off, flat, not perceptibly notched or indented; the two exterior larger ones in the upper jaw are somewhat varinated, in the lower rounded; the side or canine teeth in the upper jaw are somewhat larger than in the under; the grinders are six on each side, the first being the smallest, and of a conical shape; the next grinders, to the number of two in the upper and three in the lower, are gradually larger, and divided into three points; the fourth of the upper jaw and the fifth of the under are the largest, and have two points: the remaining ones stand deeper in the jaw, or more inwards, and are smaller than the preceding; the tongue has on each side a border or row of small verrucæ or warts.

The female breeds only once a year, goes with young about four weeks, and brings forth from six to eight at a time.

Jackals go in packs of 40, 50, or even 200 at a time, and hunt like hounds in full cry, from evening to morning. They are less destructive to poultry than the wolf; they ravage the streets and villages, and gardens, and will even destroy children, if they are left unprotected. They will enter stables and out-houses, and eat any materials made of leather; they will familiarly come into a tent, and carry off whatever they can take from the sleeping traveller. For want of living prey, they will devour putrid carcases, eat the most infected carrion, and even disinter the dead, for which reason the graves in many countries are made of a great depth. Like the hyæna they will follow armies, in hopes of feasting on the slain. When they cannot get animal food, they will even feed on fruits and roots. They burrow in the earth, and lie there all the day, coming out at night to hunt. They hunt by the nose, and are very quick in scent, filling the air with the most horrid howlings when they begin the chase. The lion, panther, and other beasts of prey, take advantage of the general consternation, and follow the jackals in silence till they have hunted down their prey, when they come up and devour the fruits of the jackal's labours, leaving them only the remains of the spoil. Hence the jackal has been vulgarly termed the *lion's provider*.

There is great reason to believe that the jackal forms the primeval stock from which the domestic dog has originated. The external form, internal structure, and manners of both are very similar. According to Mr Goldenstadt, the jackal has a natural propensity to follow mankind, instead of flying from him like the wolf or the fox; the whelp of the jackal is readily tamed, and when grown up, assumes all the habits of the domestic dog; fawns on his master, expresses his joy by wagging his tail, throws himself on his back, murmurs gently, distinguishes his name, jumps on the table, &c. The jackal and dog also readily breed together, as appears from various testimonies.

11. C. Vulpes. Fox. The fox is found in all the temperate regions of the globe; throughout Europe, and great part of Asia; he abounds in North America, but is scarcely met with in Africa, except in Barbary. It is very common in this island. There are several varieties of the common fox; and three of these, viz. the *greyhound*, the *mastiff*, and the *cur fox*, are met with in Britain. Of these the greyhound is the largest, and is chiefly found in the mountainous parts of this island; the cur is the smallest, but the most common.

Foxes differ very much in point of colour, according to the climate which they inhabit. In Britain they are usually of a yellowish brown colour, with white or ash-coloured marks on the forehead, shoulders, hind part of the neck, and outside of the hind legs; the lips, throat, and cheeks are white, and there is usually a white stripe running along the under side of the legs; the breast and belly whitish gray, mixed with ash colour; the tips of the ears and feet are black, and the tail is of a reddish yellow, with the tip white. In general form the fox much resembles the dog, except that his head is larger in proportion to his body, his snout more pointed, his ears shorter, and his tail more long and bushy. His eyes are prominent and piercing, of a lively hazel colour, and very expressive of the several passions by which the animal is agitated.

The smell of this animal is proverbially strong and offensive; and is said to resemble so exactly that of the root of crown imperial (*fritillaria imperialis* Lin.), as scarcely to be distinguished from it. It has however been remarked, that from a spot at the base of the tail, there proceeds an odour which has been compared to that of violets. He possesses the faculty of smelling in a degree equal to the dog, and can scent his food or his foe at the distance of some hundred yards. He has a yelping kind of bark, consisting of a quick succession of similar tones, concluding in an elevation of the voice, something like the cry of a peacock. He yelps much when in heat, and during winter, especially in frost and snow; but in summer he is almost entirely silent. In summer he casts his hair.

The fox chooses his habitation in brakes, woods, or coppices; and here he prepares his bed below hard ground, the roots of trees, or similar situations, where he can make proper outlets to escape danger. The fox's bed, in the language of hunters, is called his *kenel*; when he retires to it, he is said to *go to earth*, and when forced from it by his pursuers, he is said to be *unkenned*. Foxes have been known to form their beds in hollow trees, that they may the better secure their young. This animal does not always take the trouble to construct a hole for himself, but often procures one by dispossessing the badger, which he does, as is said, by depositing his urine in the badger's hole, and thus obliging that cleanly animal to abandon his contaminated dwelling. He usually fixes his habitation not far from the dwellings of man, especially in the neighbourhood of farm yards. He generally keeps retired during the day, though sometimes he may be seen in clear warm weather basking in the sunshine in some dry place, and sometimes amusing himself with running round after his tail. He is so much attached to his usual abode, that it is not easy to induce him to leave

History of
the Species.

it for another, and the same fox has been caught in the same place four successive times, having repeatedly after his escape made for his old cover*.

The food of the fox consists chiefly of birds, especially game and poultry, and of the lesser quadrupeds, as of young hares, rabbits, and even field mice, rats, lizards, toads, and serpents. The greyhound fox is said to attack sheep, and carry off young lambs. When pressed by hunger he will eat carrion, roots, and insects, and near the sea coast will feed on crabs, shrimps, or shell fish. He is very fond of grapes, and in France and Italy often does great mischief among the vines. He is said also to be fond of honey, for which he will attack the bee-hives, and though obliged repeatedly to make off by the fury of the enraged bees, after ridding himself of his enemies by rolling on the ground and killing them, he successively returns to the charge, and seldom fails to make himself master of the booty.

In his attack upon the neighbouring poultry, he chooses his time with judgment; and concealing his road, glides forward with caution. If he can leap the fence, or get in below it, he ravages the yard, puts all the poultry to death, and then takes measures for securing what he has killed. He retires softly with his prey, which he either hides in holes that he digs for that purpose, carefully covering it with earth, or carries it to his kennel if this be near; in a few minutes he returns for more, which he conceals in a similar manner, but in a different place, and he will thus carry off a whole flock of poultry, one by one, to his hiding places, thrusting them in with his nose, and leaving them till hunger calls for a supply. In this way he proceeds till the rising of the sun, or some noise about the farm house, gives him notice that it is time to retire.

In procuring young rabbits from their burrows, he exhibits a great degree of cunning. He does not enter the hole, for as this is very narrow, he would be obliged to dig several feet along the ground below the surface; but he follows the scent of the rabbits above, till he comes to the end where they lie, and then scratching up the earth, descends upon them and devours them.

When foxes are in heat they are said by sportsmen to go to *clicket*; this takes place in winter: the females produce but once a-year, and have from three to six young ones at a birth. While breeding, the bitch seldom lies far from the earth, and after littering, if she perceives her retreat to be discovered, she removes her cubs one by one to some more secure situation. The cubs are usually first found in the latter end of March; when brought forth, they are blind like puppies, and of a very dark brown colour; they grow for 18 months, and live about 13 or 14 years. The fox is exceedingly careful of her young, and a remarkable instance of her parental affection is recorded by Goldsmith. A she fox that had, as it should seem, but one cub, was unkenneled by a gentleman's hounds, and hotly pursued. The poor animal braving every danger, rather than leave her cub behind to be worried by the dogs, took it up in her mouth, and ran with it in this manner for some miles; at last, passing through a farmer's yard, she was assaulted by a mastiff, and obliged to drop her cub, which was taken up by the far-

mer. It is pleasing to add that the affectionate creature got off in safety.

The fox and the dog readily breed together, and the produce is a very useful animal as a dog.

Foxes are sometimes domesticated, but are scarcely ever fully tamed.

The hunting of this animal is one of the greatest diversions of our country gentlemen. For an account of fox-hunting, see HUNTING. The skins are valuable for muffs, tippets, &c.

The arctic fox, *C. lagopus*, is well described by Steller, for whose entertaining account of their manners, we must refer to Mr Bingley's Animal Biography, vol. i.

23. *C. Zerda. Fennec.*—This beautiful little animal is about 10 inches long, and of a yellowish white colour; its eyes are large, and of a bright black; its ears of an uncommon size, internally of a bright rose colour, and edged with a broad margin of white hair, with an orifice so small as to be scarcely visible; its legs and feet are shaped like those of a dog; its tail long, tapering, and tipped with black. 76
Zerda,
Fennec.
Fig. 31.

It inhabits the vast deserts of Saara, that extend beyond Mount Atlas, and is said to be called by the Moors, *zerda*, though Mr Bruce, who saw it often, and kept two or three specimens of it, says that its proper name is *fennec*. It feeds on insects, especially locusts, sits on its rump, barks like a dog, only with a shriller voice; is very vigilant, and so swift that it is very rarely taken alive.

The following interesting account of its manners and appearance is given by Mr Bruce.

"Though his favourite food seemed to be dates, or any sweet fruit, yet I observed he was very fond of eggs; and small birds eggs were first brought him, which he devoured with great avidity; but he did not seem to know how to manage that of a hen; but when broke for him, he ate it with the same avidity as the others. When he was hungry he would eat bread, especially with honey or sugar. It was very observable that a bird, whether confined in a cage near him, or flying across the room, engrossed his whole attention. He followed it with his eyes wherever it went, nor was he, at this time, to be diverted by placing biscuit before him; and it was obvious, by the great interest he seemed to take in its motions, that he was accustomed to watch for victories over it, either for his pleasure or his food. He seemed very much alarmed at the approach of a cat, and endeavoured to hide himself, but shewed no symptom of preparing for a defence. I never heard he had any voice; he suffered himself, not without some difficulty, to be handled in the day, when he seemed rather inclined to sleep, but was exceedingly unquiet and restless so soon as night came, and always endeavouring his escape, and though he did not attempt the wire, yet with his sharp teeth he very soon mastered the wood of any common bird cage. From the snout to the anus he was about 10 inches long, his tail five and a quarter, near an inch on the tip of it was black. From the point of his fore shoulder to the point of his fore toe, was two inches and seven-eighths. He was two inches and a half from his occiput to the point of his nose; the length of his ears three inches and three-eighths. These were doubled or had a plait on the bottom on the outside; the borders

Form. borders of his ears on the inside were thick covered with soft white hair, but the middle part was bare, and of a pink or rose colour. They were about an inch and a half broad, and the cavities within were very large. It was very difficult to measure these; for he was very impatient at having his ears touched, and always kept them erect, unless when terrified by a cat. The pupil of the eye was large and black, surrounded by a deep blue iris. He had strong, thick mustachoes; the tip of his nose very sharp, black, and polished. His upper jaw reached beyond the lower, and had four grinders on each side of the mouth. It had six fore teeth in each jaw; those in the under jaw are smaller than the upper; the canine teeth are long, large, and exceedingly pointed; his legs are small and his feet very broad; he has four toes armed with crooked, black, sharp claws; those on his fore feet more crooked and sharp than behind. All his body is nearly of a dirty white, bordering on cream colour; the hair of his belly rather whiter, softer, and longer than the rest; and on it a number of paps, but he was so impatient it was impossible to count them. He very seldom extended or stiffened his tail, the hair of which was harder. He had a very sly and wily appearance. But as he is a solitary animal, and not gregarious, as he has no particular mark of feelings about him, no shift or particular cunning which might occasion Solomon to qualify him as wise, as he builds his nest upon trees, and not on the rock, he cannot be the Saphan (or *coney*) of the scripture, as some, both Jews and Arabians, not sufficiently attentive to the qualities attributed to that animal, have nevertheless erroneously imagined."

body black above, whitish below.—12. *F. Tigrina*, Mar-gay. Tail long; body fulvous, striped and spotted with black, whitish beneath.—13. *F. Capensis*, Cape Cat. Fulvous, with long tail annulated with black; body marked with black stripes above, with rounded and lunated black spots on the other parts, and a lunated white bar on the ears.—14. *F. Bengalensis*.—15. *F. Manul*, Manul. Tail elongated, and annulated with black; head marked with spots, and two lateral bands of black.—16. *F. Catus*, Common Cat. Yellowish gray, with dusky bands, three on the back longitudinal; those on the sides spiral; tail barred with dusky rings.—17. *F. Japanensis*, Japan Cat.—18. *F. Guigna*, Guigna Cat.—19. *F. Corololo*, Corololo.—20. *F. Serval*, Serval. Tail shortish; body tawney brown, whitish beneath, marked with roundish dusky spots; orbits of the eyes white.—21. *F. Montana*, Mountain Lynx.—22. *F. Chaus*, Chaus. Tail moderately short, annulated towards the tip, with the tip black; body brownish yellow; ears brown, bearded with black at the tips.—23. *F. Rufa*, Bay Lynx. Tail short; body bay, obscurely spotted with black; tail white beneath and at the tip; ears bearded at the tip.—24. *F. Caracal*, Caracal. Tail shortish; body reddish-brown; ears black externally, and tipped with long black hairs.—25. *F. Lynx*, Common Lynx. Tail short; body rufous gray, slightly spotted with black, white beneath; tail black at the tip; ears terminated by long black hairs.

History of
the Species.

1. *F. Leo*, The Lion.—The Lion has usually been considered as the most dignified and majestic inhabitant of the forest. His vast size and prodigious strength well entitle him to the rank of lord over most other beasts; though from the observations of modern travellers and naturalists, we are obliged to consider him in a light less formidable and less amiable than that in which he is displayed by earlier writers.

This animal seldom exceeds eight feet in length from nose to tail, and the tail itself usually measures about four feet; his head is very large; his ears rounded; his face covered with short or close hair, while the upper part of the head, the neck and shoulders, are coated with long and shaggy hair, hanging down below the breast and fore part of the belly, like a mane; the hair on the body is short and smooth; and the tail is terminated by a blackish tuft. The usual colour of the lion is a pale tawney, inclining to white on the lower part of the body.

The lioness is smaller than the lion, of a whiter colour beneath, and destitute of mane.

The lion is principally found in Africa, and is also met with, though by far less plentifully, in the hotter parts of Asia; but it is in the interior of Africa that he exerts his greatest ravages, and reigns superior among the weaker quadrupeds. His habitation is in the thickest parts of the forest, and he is seldom seen by day; but, when night approaches, he quits his retreat, and prowls about for prey. The roaring of this animal, when in quest of prey, is generally said to resemble the sound of thunder; and being re-echoed by the rocks and mountains, it appals the whole race of animals. Frequently, however, he varies his voice into a sort of a scream or yell. His strength is so great, that it is affirmed a single stroke of his paw is sufficient to break the back of a horse; and he has been seen to carry off

78

Fig. 32.

Genus 16. FELIS.

Six front teeth, of which the intermediate are equal; three grinders on each side; tongue beset with reversed prickles; claws retractile.

In this as in the last genus, the individuals would require a particular examination, though they agree more together in their form and habits than those of the dog tribe. We shall here, as in the last genus, first discriminate the species, and then give an account of some of the most remarkable individuals.

Dr Shaw distinguishes 25 species by the following names and characters.

Species 1. *Felis Leo*, Lion. Colour pale tawney, or dun; tail long, and floppy at the tip.—2. *F. Tigris*, Tiger. Tail elongated; body marked with long transverse streaks.—3. *F. Pardus*, Panther. Tail elongated; body yellow, marked with orbicular spots above, and lengthened ones below.—4. *F. Leopardus*, Leopard. Body yellow, marked with black spots, nearly contiguous, disposed in circles.—5. *F. Jubeta*, Hunting Leopard. Colour pale fulvous, with round black spots; tail of moderate length; neck slightly maned.—6. —*F. Uncia*, Ounce. Tail long; body whitish, with irregular black marks.—7. *F. Onca*, Jaguar. Tail of moderate length; body yellowish, with black ocellated roundish cornered spots, with yellow central spaces.—8. *F. Pardalis*, Ocelot. Tail longish, long stripe-shaped spots on the upper parts, and round ones on the lower.—9. *Cinerea*, Cinereous Cat.—10. *F. Puma*, Puma. Tail long; body reddish brown, whitish beneath.—11. *F. Discolor*, Black Tiger. Tail long;

History of the Species. with apparent ease a middle-sized ox, or even a buffalo. We are told by Kolben, that he usually knocks down his prey with his paw, and seldom bites it till he has given the mortal blow. His teeth are so strong that he breaks the largest bones with ease, and swallows them with the flesh; and the prickles on his tongue are so large and strong, as to be capable of lacerating the skin. He usually conceals himself in a thicket, from which he darts upon his prey; and, it is said, that if he chances to miss his aim, he will not follow his prey any farther; but, as though ashamed, he turns back to the place from which he sprung on it, slowly, and step by step, as it were, measuring the distance between the two points, as if to find out how much too short, or how much beyond the mark, he had taken his leap.

Dr Sparman says, that from all the most credible accounts he could collect concerning lions, as well as from what he himself saw, he thinks he may safely conclude, that this wild beast is frequently a great coward, or, at least, deficient in point of courage comparatively to his strength; on the other hand, however, he sometimes shews an unusual degree of intrepidity, of which he mentions the following instance as it was related to him.

A lion had broken into a walled inclosure for cattle through the latticed gate, and done considerable damage. The people belonging to the farm were assured of his coming again by the same way: in consequence of which they stretched a rope directly across the entrance, to which several loaded guns were fastened in such a manner, that they must necessarily discharge themselves into the lion's body, as soon as ever he should push against the cord, as it was expected he would, with his breast. But the lion, who came before it was dark, having probably some suspicions respecting the cord, struck it away with his foot, and without betraying the least fear, in consequence of the report made by the loaded pieces, went on steadily, and careless of every thing, and devoured the prey he had left untouched before.

The lion is said to prefer the flesh of a Hottentot to that of any other animal; and in order to procure it, will sometimes depart from his usual method of quitting his prey when he misses his aim. It is surprising with what obstinacy he will follow one of these unfortunate savages. We are informed by Mr Barrow, that one of the Namaqua Hottentots, endeavouring to drive his master's cattle into a pool of water, inclosed between two ridges of rocks, espied a huge lion couching in the midst of the pool. Terrified at the unexpected sight of such a beast, that seemed to have its eyes fixed upon him, he instantly took to his heels. In doing this he had presence of mind enough to run through the herd, concluding that, if the lion should pursue, he would take up with the first beast that presented itself. In this, however, he was mistaken. The lion broke through the herd, making directly after the Hottentot, who, on turning round, and perceiving that the monster had singled him out, breathless and half dead with fear, scrambled up one of the tree-aloës, in the trunk of which a few steps had luckily been cut out, to come at some birds nests that the branches contained. At the same moment the lion made a spring at him, but missing his aim, fell upon the ground. In surly silence he

walked round the tree, casting at times a dreadful look towards the poor Hottentot, who had crept behind the nests. We should here remark, that these nests belong to a small bird of the genus *Loxia*, that lives in a state of society with the rest of its species, constructing a whole republic of nests in one clump, and under one cover. One of these clumps of nests will sometimes extend a space of 10 feet in diameter, and contain a population of several hundred individuals. It was under the cover of one of these edifices that the Hottentot screened himself from the sight of the lion. Having remained silent and motionless for a length of time, he ventured to peep over the side of the nest, hoping that the lion had taken his departure; when to his great terror and astonishment, his eyes met those of the animal, which, as the poor fellow afterwards expressed himself, flashed fire at him. In short, the lion laid himself down at the foot of the tree, and did not remove from the place for 24 hours. At the end of this time becoming parched with thirst, he went to a spring at some distance in order to drink. The Hottentot now, with trepidation ventured to descend, and scampered off home, which was not more than a mile distant, as fast as his feet could carry him, where he arrived in safety. The perseverance of the lion was such, that it afterwards appeared, he returned to the tree, and finding the man had descended, hunted him by the scent to within 300 paces of the house*.

An elderly Hottentot observed a lion following him at a great distance for two hours together. He thence naturally concluded, that the lion only waited the approach of darkness, in order to make him his prey; and in the meantime expected nothing else than to serve for this fierce animal's supper, as he had no other weapon of defence than a staff. But as he was well acquainted with the nature of the lion, and the manner of its seizing upon its prey, and at the same time had leisure at intervals to ponder on the ways and means in which it was most probable that his existence would be put an end to, he at length bethought of a method of saving his life. For this end, in place of making his way home, he looked out for a *klipkrans*, or a rocky place level at top, and having a perpendicular precipice on one side of it; and sitting down on the edge of one of these precipices, he found to his great satisfaction, that the lion also made a halt, and kept the same distance as before. As soon as it grew dark, the Hottentot sliding a little forwards, let himself down below the upper edge of the precipice upon a projecting part of the rock, where he could barely keep himself from falling. But in order to deceive the lion still more, he set his hat and cloak on the stick, making with it at the same time a gentle motion just over his head, and a little way from the edge of the mountain. This crafty expedient had the desired effect. He did not remain long in that situation, before the lion came creeping softly towards him like a cat, and mistaking the skin cloak for the Hottentot himself, took his leap with such exactness and precision, as to fall headlong down the precipice, directly close to the snare which had been placed for him; when the Hottentot is said, in great joy, exultingly to have called out, *é'katsi*; an interjection which is of very extensive import and significance †.

Next to Hottentot's flesh he is said to prefer that of man's horses † Sparrow's Voyage.

Fenn.

* Barrow's Travels in Africa, vol. i.

† Sparrow's Voyage.

Fero.

horses and buffaloes, but on the sheep he seldom deigns to fix his paw, perhaps from his woolly covering, which he is too indolent to be at the labour of uncasing. It is commonly said that a lion will devour as much at once as will serve him for two or three days, and when satiated with food, he returns to his den, where he remains in a state of inactivity till hunger again compels him to seek for food.

Though this animal has generally been represented as extremely brave as well as ferocious, it has not unfrequently happened, that he has been frightened or driven away by the opposition of a much inferior enemy. It is said, that a traveller once had an opportunity of seeing a female buffalo with her calf, defended by a river at her back, keep at bay for a long time five lions which had partly surrounded her, but did not, as long as the traveller looked on, dare to attack her; and we are informed, that Mr Brew, commander of the Senegal company on the African coast, had once near him a large full-grown tame lion, about four years old, when a flock of goats passed. All the goats except one, ran off with terror at the sight of the lion; but this one looking stedfastly at the lion, stamped with his foot on the ground in a menacing manner, then retreated three steps, and instantly returning, struck the lion's forehead so violently with his horns, that the animal was stunned by the blow, and having repeated this several times before the lion could recover himself, the monstrous animal was thrown into such confusion, that he went behind his master for protection.

The lion does not always destroy the object that he attacks, but seems sometimes to spring on an animal through wantonness. Dr Sparrman was told of several who had escaped from the paw of lions. At St Catharine Cru's church, Leadenhall-street, London, provision is made, under the will of Sir John Gager, who was lord mayor in the year 1646, for a sermon to be annually preached, with a charitable donation, on the 16th of November, in commemoration of his happy deliverance from a lion, which he met in a desert as he was travelling in the Turkish dominions, and which suffered him to pass unmolested.

There seems no doubt, that in those places where mankind have made the greatest advances towards civilization, the lion has lost much of his native boldness and ferocity. Experience seems to have taught him, that in cunning and resources he is inferior to man, and he therefore seldom attacks the human race, except forced to it by the imperious calls of hunger.

The lioness is said to breed only once a-year, and to produce four or five at a birth, which she nurses with great assiduity, and attends in their first excursions for plunder. These animals readily breed in captivity.

Buffon, reasoning from the size and constitution of the lion, and the time required for his arrival at full growth, concluded, that he ought to live about 25 years; but if we may depend upon the accounts that have been given of some lions kept in the Tower of London, the period of his life may be considerably extended. One of these, called Pompey, is said to have lived at least 70 years, and another 63.

The lion has been often brought from his native forests into Europe; and, when taken young, is capa-

ble of being made very gentle and tractable. Many of our readers will have seen the keepers of wild beasts play tricks with this monstrous animal, which he appears to bear without shewing any marks of anger. He seems to bear all with the greatest composure, and we seldom hear of his revenging these unprovoked sallies of impertinent curiosity. It is, however, not always safe to play with, and still less so to mingle blows with caresses, as is done by some injudicious keepers.

Numerous instances are on record of the lion's gentleness, sagacity, and gratitude, while in a state of domestication. He has been known to spare the lives of animals that were thrown to be devoured by him; to live peaceably with them; to afford them part of his food, and even to want food himself, rather than deprive them of that life which his generosity had once spared. A dog was put into the cage of a lion in the menagerie at the Tower, some years ago, for food; the stately animal, however, spared his life, and they lived together for a considerable time in the same den, in the most perfect harmony, and appeared to have a great affection for each other. The dog had sometimes the impudence to growl at the lion, and even dispute with him the food which was thrown to them; so true is the old proverb, *familiarity breeds contempt*: but the noble animal was never known to chastise the impertinent conduct of his little companion, but usually suffered him to eat quietly till he was satisfied, before he began his own repast.

Mr Hope relates an anecdote of a lion in the possession of the duchess of Hamilton some years ago, which affords a striking instance both of the retentive memory of this animal, and of his attachment to those who have been kind to him. "One day (says Mr Hope) I had the honour of dining with the duchess of Hamilton: after dinner the company attended her grace to see a lion, that she had in the court, fed. While we were admiring his fierceness, and teasing him with sticks to make him abandon his prey and fly at us, the porter came and informed the duchess, that a serjeant with some recruits at the gate, begged permission to see the lion. Her grace, with great condescension and good nature, asked permission of the company for the travellers to come in, as they would then have the satisfaction of seeing the animal fed. They were accordingly admitted at the moment the lion was growling over his prey. The serjeant, advancing to the cage, called out, "Nero, Nero, poor Nero, don't you know me?" The animal instantly turned his head to look at him, then rose up, left his prey, and came wagging his tail, to the side of the cage. The man then put his hands upon him, and patted him: telling us, at the same time, that it was three years since they had seen each other, but that the care of the lion on his passage from Gibraltar, had been committed to him, and he was happy to see the poor beast show so much gratitude for his attention. The lion indeed seemed perfectly pleased; he went to and fro, rubbing himself against the place where his benefactor stood, and licked the serjeant's hand as he held it out to him. The man wanted to go into the cage to him, but was prevented by the company, who were not altogether convinced of the safety of the act."

The lion is frequently hunted at the Cape of Good Hope,

* Thoughts in Prose and Verse.

History of the Species.

History of Hope, for the sake of his skin and flesh, which latter is the Species. esteemed by some an excellent food, and is often eaten by the negroes. The colonists of the Cape hunt him with dogs, and it is said that 12 or 16 are sufficient to overcome one lion. The lion runs for some time after being roused, then stops and shakes his mane, as if in defiance of the dogs, who, as soon as they have an opportunity, rush all at once upon him, and soon overpower him. Three or four of the dogs, however, are commonly killed in the conflict, being struck dead by the first strokes of his paw.

79
Tiger.
Fig. 33.

2. *F. Tigris*, the Tiger.—This most beautiful, but most destructive of quadrupeds, is nearly equal in size to the lion, and has even been seen larger, viz. 15 feet long from the nose to the tip of the tail. The prevailing colour of the body is a deep tawney, or orange yellow; the face, throat, and lower part of the belly being nearly white, and the whole is traversed by numerous long black stripes, forming a bold and striking contrast with the ground colour. These stripes are proportionally smaller on the face and breast, than on the other parts of the body. The tail is shorter than the body, and is surrounded with black rings. Dr Shaw observes, that when seen in perfection, and before its health has been impaired by confinement, it is scarcely possible to conceive a more elegantly variegated animal than the tiger: the bright and intense orange yellow which constitutes the ground colour; the deep and well-defined stripes of black, in some parts double, in others single; the pure white of the cheeks and lower parts of the sides, over which a part of the black striping is continued, form, altogether, an appearance far superior in beauty to the skin of the zebra, or that of any other regularly marked quadruped, not excepting even the panther itself.

This animal is confined to the warmer parts of Asia, and is principally found in the peninsula of India, and the Indian islands. The species extends, however, as far as China and Chinese Tartary, to the lake Ural and the Altaic mountains.

The tiger is of a disposition so fierce and sanguinary, as to surpass in rapacity every other wild beast; indeed there is no animal that he will not venture to attack. Dreadful combats sometimes take place between him and the lion, and they are carried on with such fury and obstinacy, that both parties are often found dead together. He commits horrid ravages among the flocks and herds, and neither the sight nor opposition of man have power to make him desist. It is said that when undisturbed, he plunges his head into the body of the animal he has slaughtered, and greedily sucks its blood. His strength is astonishing. We are told that a peasant in the East Indies, had a buffalo fallen into a quagmire, and while he went to call for assistance, an immense tiger came, that immediately drew out the animal, on which the united efforts of several men had no effect. When the people returned, the first object they beheld was the tiger, with the buffalo thrown over his shoulder, as a goose is by a fox: he was carrying him away with his feet upward, towards his den. As soon however, as he saw the men, he let fall his prey, and instantly fled to the woods; but he had previously killed the buffalo, and sucked its blood. If we consider that a buffalo is often twice the size of our ordinary cattle, we may form some idea of the immense strength

of an animal that could thus run off with a carcass as large again as himself.

The tiger's method of seizing his prey is similar to that of the lion, rushing on it at once from his concealment, with a horrid roar. His voice when springing on his victim, is said to be hideous beyond conception. Like the lion, if he misses his aim, he makes off without repeating the attack for that time.

The tiger seems to prefer the flesh of man to that of any other prey, as he takes all opportunities of seizing a man where he thinks there is any chance of success. Many of our readers will perhaps remember to have read an account of the melancholy fate of Mr Munro, who was killed by a tiger in the East Indies in the year 1792. "We went (says the narrator) on shore on Sangar island, to shoot deer, of which we saw innumerable tracks, as well as of tigers; notwithstanding which, we continued our diversion till near three o'clock, when, sitting down by the side of a jungle to refresh ourselves, a roar like thunder was heard, and an immense tiger seized on our unfortunate friend, and rushed again into the jungle, dragging him through the thickest bushes and trees, every thing giving way to his monstrous strength; a tigress accompanied his progress. The united agonies of horror, regret, and fear, rushed at once upon us. I fired on the tiger; he seemed agitated; my companion fired also; and in a few moments after this, our unfortunate friend came up to us bathed in blood. Every medical assistance was vain, and he expired in 24 hours, having received such deep wounds from the teeth and claws of the animal, as rendered his recovery hopeless. A large fire, consisting of 10 or 12 whole trees, was blazing by us at the time this accident took place, and ten or more of the natives were with us. The human mind can scarcely form an idea of this scene of horror. We had hardly pushed our boat from that accursed shore, when the tigress made her appearance, almost raging mad, and remained on the sand all the while we continued in sight."

In the beginning of the last century, as Mr Pennant was informed, some gentlemen and ladies being on a party of pleasure, under a shade of trees, on the banks of a river in Bengal, observed a tiger preparing for its fatal spring. One of the ladies, with amazing presence of mind, laid hold of an umbrella, and furlled it full in the animal's face, which instantly retired, and gave the company opportunity of removing from so terrible a neighbour.

The tigress, like the lioness, produces four or five young at a litter, and though at all times furious, her rage rises to the greatest extremity in defence of her young. If robbed of them, she pursues her plunderers with the greatest fury and obstinacy, and they are often obliged to drop some of the young tigers, to prevent her from attacking them.

We are told by keepers of *wild beasts*, that the tiger when full grown, is incapable of being tamed; but it appears that when young, they are gentle, and as playful as a kitten.

The skin of this animal is much esteemed throughout the east, especially in China, where the seats of justice, on which the mandarins sit, are covered with it.

3. and 4. *F. Pardus* and *F. Leopardus*, the Panther and Leopard.

Fern.

80
Panther
and Leo-
pard.

Ferae. and the Leopard.—These species have frequently been confounded, and we mention them together for the sake of marking their distinguishing characters. They are usually distinguished by the form of the spots; those on the panther, having commonly a central spot in each circle, while in those of the leopard this is usually wanting. This distinction, however, by no means holds universally, and the animals are better distinguished by the general shade of colour, and by their size. The panther is of a darker colour, and larger than the leopard. After all, the distinction is by no means so strongly marked that we can always discriminate between them, and perhaps they should rather be considered as varieties of the same species. In manners and disposition they nearly resemble the tiger, yet the leopard is generally considered as less fierce than the panther. Both are found in Africa, especially about the river Senegal. It was supposed that they were to be met with in America, but this appears to be a mistake.

81
Cat.
Fig. 34.

16. *F. Catus*, Common Cat.—This animal is found wild in several parts of the north of Europe, and is so formidable, that it may be called the *European tiger*. It is three or four times as large as the house cat; the head larger, and the face flatter. The teeth and claws tremendous; its muscles very strong, as being formed for rapine; the tail is of a moderate length, but very thick and flat, marked with alternate bars of black and white, the end always black; the hips and hind part of the lower joints of the leg, are always black; the fur is very soft and fine. The general colour of these animals is a yellowish white, mixed with a deep gray. These colours, though they appear at first sight confusedly blended together, yet on a close inspection will be found to be disposed like the streaks on the skin of the tiger, pointing from the back downwards, rising from a black list that runs from the head along the middle of the back to the tail.

It is the fiercest and most destructive beast we have, making dreadful havock among our poultry, lambs, and kids. It inhabits the most mountainous and woody parts of these islands, living mostly in trees, and feeding only by night. It multiplies as fast as our common cats; and often the females of the latter will quit their domestic mates, and return home pregnant by the former.

Mr Bingley informs us, that at Barnborough, a village between Doncaster and Barnsby, in Yorkshire, there is a tradition extant of a serious contest that once took place between a man and a wild cat. The inhabitants say that the fight commenced in an adjacent wood, and that it was continued from thence into the porch of the church. We do not recollect in what manner it is reported to have begun; they, however, tell us, that it ended fatally to both combatants, for each died of the wounds he received. A rude painting in the church commemorates the event; and, as in many similar traditions, the accidentally natural red tinge of some of the stones has been construed into bloody stains, which all the properties of soap and wa-

* Bingley's

p. 281.

ter have not been able to efface.* They are taken either in traps, or by shooting: in the latter case it is very dangerous only to wound them; for they attack the person who injured them, and have strength enough to be no despicable enemy.

VOL. XII. Part II.

Wild cats were formerly reckoned among the beasts of chase, as appears by a charter of Richard II. to the abbot of Peterborough, giving him leave to hunt the hare, fox, and wild cat; and in much earlier times it was also the object of the sportsman's diversion.

The domestic cat is so well known as to render a description of it unnecessary. It is an useful but generally a deceitful domestic; active, neat, sedate, intent on its prey. When pleased, purrs and moves its tail. When angry, spits, hisses, and strikes with its foot. When walking, it draws in its claws; it drinks little; is fond of fish; its urine is corrosive; it buries its dung; it washes its face with its fore foot (Linnaeus says at the approach of a storm); the female is remarkably salacious; a piteous, squalling, jarring lover. Its eyes shine in the night; its hair when rubbed in the dark emits electric sparks; it is even proverbially tenacious of life; always lights on its feet, is fond of perfumes, as *marum*, *cat-mint*, *valerian*, &c.

The cat usually lives from 6 to 10 years. A friend of ours had a cat that lived 18 years.

The female brings forth twice, and sometimes thrice, a-year. The period of her gestation is fifty-five or fifty-six days, and she generally produces 5 or 6 at one litter. She conceals her kittens from the male, lest he should devour them, as he is sometimes inclined; and, if apprehensive of being disturbed, will take them up in her mouth, and remove them one by one to a more secure retreat. Even the female herself, contrary to the established law of nature, which binds the parent to its offspring by an almost indissoluble tie, is sometimes known to eat her own young the moment she has produced them.

Instances of such conduct in the female cat are, however very rare, and few mothers exhibit more tenderness or greater attachment to their young. The assiduity with which she attends them, and the pleasure she seems to take in witnessing their playful tricks, are extremely amusing. She has also been known, not only to suckle kittens belonging to other cats, but even the young of such animals as are generally objects of prey to her kind. A very extraordinary example of this is recorded by Mr White, in his *Natural History of Selborne*, in a cat belonging to a friend of his.

"My friend (says Mr White) had a little helpless *leveret* brought to him, which the servants fed with milk from a spoon, and about the same time his cat kitten, and the young were dispatched and buried. The hare was soon lost, and was supposed, as with most foundlings, to have been killed by some dog or cat. However, in about a fortnight, as the master was sitting in his garden, in the dusk of the evening, he observed his cat, with tail erect, trotting towards him, and calling with little short inward notes of complacency, such as they use towards their kittens, and something gamboling after, which proved to be the *leveret*, that the cat had supported with her milk, and continued to support with great affection.—Thus was a granivorous animal nurtured by a carnivorous and predaceous one!

"This strange affection was probably occasioned by that desiderium, those tender maternal feelings which the loss of her kittens had awakened in her breast; and by the complacency and ease she derived to herself from the procuring of her teats to be drawn; which were

History of too much distended with milk; from habit, she became as much delighted with this foundling as if it had been her offspring.

"A boy (says this same gentleman) had taken three young squirrels in their nest. These small creatures he put under a cat who had lately lost her kittens, and finds that she nurses and suckles them with the same assiduity and affection, as if they were her own offspring.

"So many people went to see the little squirrels suckled by a cat, that the foster-mother became jealous of her charge, and in pain for their safety, and therefore hid them over the ceiling, where one died. This circumstance shewed her affection for these foundlings, and that she supposed the squirrels to be her own young."

The cat is usually stigmatized as an ungrateful animal, incapable of attachment to her master. There are, however, not wanting instances that shew this character to be unmerited. Mr Pennant, in his history of London, tells us that Henry Wriothsley earl of Southampton, the friend and companion of the earl of Essex in his fatal insurrection, having been some time confined in the Tower, was one day surprised by a visit from his favourite cat, which, says tradition, reached its master by descending the chimney of his apartment.

The following anecdote affords a striking example, both of the sagacity of this animal, and of its grateful remembrance of those with whom it had been accustomed to live. A physician of Lyons was, in July 1800, requested to inquire into a murder that had been committed on a woman of that city. In consequence of this request he went to the habitation of the deceased, where he found her extended lifeless on the floor and weltering in her blood. A large white cat was mounted on the cornice of a cupboard, at the far end of the apartment, where he seemed to have taken refuge. He sat motionless, with his eyes fixed on the corpse, and his attitude and looks expressing horror and affright. The following morning he was found in the same station and attitude; and when the room was filled with officers of justice, neither the clattering of the soldiers arms, nor the loud conversation of the company, could in the least degree divert his attention. As soon, however, as the suspected persons were brought in, his eyes glared with increased fury, his hair bristled, he darted into the middle of the apartment, where he gazed for a moment at them, and then retreated precipitately under the bed. The countenances of the assassins were disconcerted, and they were now, for the first time during the whole course of the horrid business, abandoned by their atrocious audacity.

Our ancestors seem to have had a high sense of the utility of this animal. That excellent prince Howel the Good, did not think it beneath him to include that of the cat, and to describe the qualities it ought to have. The price of a kitten before it could see, was to be a penny; till it caught a mouse, 2d.; when it commenced mouser, 4d. It was required besides, that it should be perfect in its senses of hearing and seeing, be a good mouser, have the claws whole, and be a good nurse; but if it failed in any of these qualities, the seller was to forfeit to the buyer the third part of its value. If any one stole or killed the cat that guarded the prince's granary, he was to forfeit a milch ewe, its

fleece and lamb, or as much wheat as, when poured on the cat suspended by its tail, would form a heap high enough to cover the tip of the former. This is an evidence of the simplicity of ancient manners; and it almost proves to a demonstration that cats are not aborigines of these islands, or known to the earliest inhabitants. The large price set on them, and the great care taken of the improvement and breed of an animal that multiplies so fast, are almost certain proofs of their being little known at that period.

A beautiful variety of the cat, the *Cat of Angora*, is described in an interesting manner by M. Sonnini in his Travels in Egypt, vol. 1.

Genus 17. VIVERRA. WEASELS.

82
Viverra.

Six sharp cutting teeth; canine teeth longer than the former. Tongue smooth in some species; in others furnished with reversed prickles. Body of a lengthened form.

The last circumstance mentioned in the generic character is one of the principal characteristics of this tribe, most of the species being remarkable for the length and slenderness of their form. The visage is usually sharp, the feet short, and the tail in most species long. Many of the species are notorious for a most abominable odour, with which they are capable of annoying their enemies, when attacked or disturbed. If the accounts given of this odious vapour are not aggravated by the abhorrent recollection of those who have experienced its effects, every other ill smell which nature can produce, is surpassed by the overpowering factor of these extraordinary quadrupeds. In consequence of this dreadful emanation, the dogs are said to relinquish the pursuit, and the men to fly with precipitation from the tainted spot; but if unfortunately the least particle of the fluid, which the animal commonly discharges at this juncture, should happen to light on the clothes of the hunter, he becomes a general nuisance wherever he appears, and is obliged to divest himself of his dress, and practise all the arts of ablution, in order to be restored to the society of mankind. They are generally harmless animals, live on rabbits, birds, and vermin, and many of them are extremely useful in destroying rats and mice, and catching rabbits. The skins of many of the species form a valuable article of the fur trade.

There are about 43 species that have been distinguished by specific characters.

1. *V. Ichneumon*, Ichneumon. Gray, with distant thumbs, and tail tapering gradually from a thick base, and tufted at the end.—2. *V. Cafra*, Caffarian W. Yellowish brown, with tail gradually tapering from a thick base, and black at the tip.—3. *V. Zenik*, Zenik. Gray, four-toed, with 10 transverse black bands, and deep chesnut-coloured tail, black at the tip.—4. *V. Surikatta*, Surikate. Gray brown, with long moveable snout, four-toed feet, and rusty black-tipped tail.—5. *V. Nasua*, Coatimondi. Reddish, tail marked with white rings, and a lengthened moveable snout.—6. *V. Vulpecula*, Coesse. Dark chesnut, with lengthened snout.—7. *V. Striata*, Striated W. Blackish, with five parallel white stripes on the back.—8. *V. Conepati*, Conepati. Blackish, with two white lines on the back extending to the tail.—9. *V. Mephistica*, Mephitic W. or Chinche. Brown, with white back,

back, marked with a longitudinal black stripe.—10. *V. Chinge*, Chinge. Black with a changeable cast of blue, and a row of white spots from head to tail.—11. *V. Zorilla*, Zorilla. Variegated black and white.—12. *V. Mapurito*, Mapurito. Black, with white band from the forehead to the middle of the back, and no external ears.—13. *V. Vittata*, Grison. Blackish, with a broad white band from the forehead to each shoulder. 14. *V. Quasge*, Quasge. Chesnut, yellowish beneath, with lengthened moveable snout, and ring-marked tail.—15. *V. Zeylanica*, Ceylonese W. Ash, mixed with gray, whitish beneath.—16. *V. Capensis*, Cape W. Black, with gray back, edged with white.—17. *V. Mellivora*, Honey W. Back ash, with a black lateral band; belly black; claws long.—18. *V. Civetta*, Civet. Ash-coloured, spotted with black, with chesnut-coloured mane, and dusky spotted tail.—19. *V. Zibetha*, Zibet. Ash gray, waved with black and ring-marked tail.—20. *V. Hermaphrodita*, Three-striped W. Dark gray, with long black-tipped tail, and three black stripes on the back.—21. *V. Genetta*, Genet. Fulvous gray; body spotted with black, and ring-marked tail.—22. *V. Fossa*, Fossane. Ash-coloured, spotted with black, and ring-marked tail.—23. *V. Caudivolula*, Prehensile W. Yellow, shaded with dusky, and prehensile tail.—24. *V. Fasciata*, Fasciated W. Gray, with six longitudinal black bands.—25. *V. Malaccensis*, Malacca W. Gray, with longitudinal black stripes on the neck and rump, and round black spots on the sides. 26. *V. Tigrina*, Tigerine W. Yellowish gray, with brown variegations, ring-marked black-tipped tail, and a black stripe along the back.—27. **V. Foina*, Marten. Blackish fulvous, with white throat.—28. **V. Martes*, Pine Marten. Blackish fulvous, with yellow throat.—29. *V. Zibellina*, Sable. Blackish fulvous, with gray throat.—30. *V. Piscator*, Fisher W. Back, belly, feet, and tail black; sides brown, and face subcinereous, with black nose.—31. **V. Putorius*, Pole cat. Blackish tawney, with whitish muzzle and ears.—32. *V. Furo*, Ferret. Yellow, with red eyes.—33. **V. Vulgaris*, Common W. Pale-reddish brown, white beneath.—34. **V. Erminia*, Stoat. Tip of the tail black.—35. *V. Galera*, Galera. Entirely brown.—36. *V. Barbara*, Guiana W. Black, with a white trilobate spot below the throat.—37. *V. Quadricolor*, White-cheeked W. Yellow, cinereous, with black head, legs, and tail, bright-yellow throat, and white cheeks and chin.—38. *V. Canadensis*, Pezan. Blackish fulvous, with white pectoral spot.—39. *V. Sarmatia*, Sarmatian W. Variegated above with brown and yellow.—40. *V. Sibirica*, Siberian W. Fulvous, with extremely hairy feet.—41. *V. Touan*, Touan. Ferruginous, white beneath, with the tail naked towards the tip.—42. *Quiqui*, Quiqui. Brown, with wedge-shaped snout.—43. *V. Cuya*, Cuya. Black, with turned-up snout.—The following are enumerated by Dr Shaw, without character, viz. 44. Gray-headed W.—45. South American W.—46. Woody W.—47. Musky W. and, 48. Slender-toed W.

83
Ichneumon.
Fig. 35.

1. *V. Ichneumon*, the Ichneumon.—Of this species there are two distinct varieties found in different countries, varying chiefly as to size, the larger being commonly about 40 inches from the nose to the tip of the tail, while the lesser scarcely exceeds two-thirds of that length,

The greater variety has also the tail slightly tufted at the end. In other respects they bear a near resemblance to each other. They are commonly of a pale reddish gray colour, each hair being mottled with brown, so as to make the whole body appear speckled. The eyes are of a bright red or flame colour; the ears rounded and almost naked; the nose long and slender, and the body rather thicker than in most other species of this genus. The tail is very thick at the base, and the hair on the whole animal is hard and coarse.

The larger ichneumon is found chiefly in Egypt, and in some other parts of Africa; the smaller seems confined to the East Indies. In their wild state these animals frequent the banks of rivers, and, during floods, approach the highest grounds and inhabited places in quest of prey. They are said to swim and dive occasionally, and are able to continue under water for a considerable time. The voice of the ichneumon is very soft, resembling a murmur; but it is said never to exert it unless struck or irritated. When going to sleep, it rolls itself up like a ball, and is not easily awakened.

Both varieties, but especially the Egyptian, are great enemies to serpents, rats, and other noxious animals; and the Indian variety attacks with great eagerness that dreadful snake, the *cobra-di-capello*. Hence they are held in great esteem both by the Egyptians and the natives of India, and are kept like our dogs and cats as domestic animals. It is easily tamed, is very active, and springs with great agility on its prey. It will glide along the ground like a serpent, and seem as if without feet. It sits up like a squirrel, and eats with its fore feet; catches any thing that is flung to it. It is a great enemy to poultry, and will feign itself dead till they come within its reach. It is said to be extremely skilful in seizing the serpents by the throat, in such a manner as to avoid receiving any injury. Lucan has beautifully described the same address of this animal in conquering the Egyptian asp.

M. d'Obsonville had an ichneumon very young, which he brought up; he fed it at first with milk, and afterwards with baked meat mixed with rice. It soon became tamer even than a cat; for it came when called, and followed him, though at liberty, into the country. One day he brought to the animal a small water serpent alive, being desirous to know how far his instinct would carry him against a being with which he had been hitherto unacquainted. His first emotion seemed to be astonishment mixed with anger, for his hair became erect; but an instant after, he slipped behind the reptile, and with a remarkable swiftness and agility leaped upon its head, seized it, and crushed it between his teeth. This essay, and new aliment, seemed to have awakened in him his innate and destructive voracity, which till then had given way to the gentleness he had acquired from his education. M. d'Obsonville had about the house several curious kinds of fowls, among which the ichneumon had been brought up, and which before the above adventure he had suffered to go and come unmolested and unregarded; but in a few days after, when he found himself alone, he strangled every one of them, ate a little, and, as appeared, had drunk the blood of two.

The ichneumon is said to be short-lived, but grows very rapidly. They have been brought into our climates;

History of
the Species.

84
Civet.
Fig. 36.

mates; but cannot, without great difficulty, be either reared or preserved. They appear much incommoded by frosty weather, and soon fall victims to the change of climate.

18. *V. Civetta*, Civet, or Civet Cat.—This animal is about two feet long from nose to tail, and the tail measures about 14 inches. The ground colour of the body is a yellowish gray, marked with large blackish or dusky spots, disposed in longitudinal rows on each side, and sometimes intermixed with a tinge of rusty colour. The hair is coarse, and stands up along the top of the back like a sort of mane; the ears are short and rounded; the eyes of a bright sky blue; the tip of the nose, sides of the face, chin, breast, lips, and feet, are black; the remainder of the face and part of the sides of the neck of a yellowish white; and from each ear there are three black stripes terminating at the throat and shoulders. The tail is generally black, but is sometimes marked with pale spots near its base. At a little distance below the tail there is a large, double, glandular receptacle, which contains the secretion called *civet*, employed as a perfume. See *CIVET*.

This animal is found in several parts of Africa and India. It is of a wild disposition, living, like most of its kind, on birds and the smaller quadrupeds. It is said to be very voracious, and will sometimes roll itself for some time on its food before it eats it. It is very destructive to poultry, which it seizes whenever it can steal into a farm yard. It is very prolific, active, and nimble, jumping like a cat, and running very nimbly. Its voice is stronger than that of a cat, and somewhat resembles the cry of an enraged dog. It is capable of being tamed, and is usually kept by perfumers at Amsterdam and some other places for the sake of the *civet*.

These animals, in a state of confinement, are placed, from time to time, in strong wooden cages or receptacles, so constructed as to prevent the creature from turning round, and biting the person employed in collecting the *civet*: this operation is said to be performed twice a week, and is done by scraping out the civet with a small spoon. The quantity usually collected at each time amounts to about a dram.

85
Foina,
Marten.
Fig. 37.

27. *V. Foina*, the Marten.—This is an animal of a very elegant appearance. It is about 18 inches long from nose to tail, and its tail is about 10 inches. It is of a blackish tawney colour, with a white throat, and a dusky brown belly. The tail is bushy, and darker than the rest of the body; the ears are pretty large and rounded, and the eyes are very lively.

It is found in most parts of Europe, and is not uncommon in Britain. It inhabits woods and fields, and preys on birds and other small animals. It breeds in the hollows of trees, and brings forth from three to five young at a birth.

The marten attacks pheasants when at roost, and makes great havoc among them. For this reason game-keepers are careful to set traps for them, which are baited with a piece of pheasant or wood-pigeon. Mr Daniel recommends the following mode of catching them, in parks or places that are pales in. As they constantly run to the pales and posts to dry themselves in the morning, have a groove cut in some of the posts or gate-posts where they run, sufficient to contain a

strong hawk or rat trap; the trap must be set in this groove without a bait; in leaping upon the place they are sure to be taken; a small chain should be fixed to the trap and fastened to the post. The skin of the marten affords a valuable fur.

Fern.

29. *V. Zibellina*, the Sable.—This animal is very similar in its general appearance to the marten, but its fur is finer, and of a deep glossy brown; the hair being ash-coloured at the root, and black at the tips. The tail is also much shorter than in the marten.

86

Zibellina,
Sable.

It inhabits the northern parts of Asia, where it lives in holes under ground, especially below the roots of trees. In manners and disposition it greatly resembles the marten.

The skins of sables form one of the most valuable articles of the fur trade; and for these the animals are hunted with great eagerness.

The hunting is usually carried on by criminals confined to the desert regions of Siberia, or by soldiers sent thither for that purpose, who generally remain there for several years. Both are obliged to furnish a certain quantity of furs. They shoot with a single ball, to injure the skin as little as possible. They frequently take them in traps, or kill them with blunt arrows. As an encouragement to the hunters, they are allowed to share among themselves whatever skins they take above the allotted number; and this, in a few years, amounts to a considerable premium.—The hunters form themselves into small troops, each of which is directed by a leader of their own choosing.

The season of hunting is from November to February; for at that time the sables are in the highest perfection. Those caught at any other time of the year are full of short hairs, and are sold at inferior prices. The best skins are such as have only long hair, which is always black, and of a glossy brightness. Old furs do not retain their gloss.—Both the Russians and Chinese have a method of dyeing their furs; but the dyed sables are easily discovered, having neither the smoothness nor the brightness of the natural hair.

31. *V. Putorius*, the Polecat, Fitchet, or Fomart.—The length of this animal is about 17 inches, exclusive of the tail; that of the tail six. Its shape is long and slender; the nose sharp-pointed, and the legs short; in fine, admirably formed for insinuating itself into the smallest holes and passages, in search of prey. It is very nimble and active, runs very fast, will creep up the sides of walls with great agility, and spring with vast force. In running, the belly seems to touch the ground; in preparing to jump, it arches its back, which assists it greatly in that action. The ears are short, rounded, and tipped with white; the circumference of the mouth is wholly of a chocolate colour, almost black. The sides are covered with hairs of two colours, the ends of which are of a blackish hue, like the other parts; the middle of a full tawney colour.

87

Putorius,
Polecat,
or Fomart.

The toes are long, and separated to the very origin; the tail is covered with pretty long hair.

The polecat is very destructive to young game of all kinds, and to poultry: it generally resides in woods, or thick brakes, burrowing under ground, forming a shallow retreat, about two yards in length, which commonly ends for its security, among the roots of some large trees. It will sometimes lodge under hay ricks,

and

Ferra. and in barns; in the winter it frequents houses, and makes a common practice of robbing the dairy of the milk. It also makes great havoc in warrens.

Though the smell of the polecat, when alive, is rank and disagreeable, even to a proverb, yet the skin is dressed with the hair on, and used as other furs for tip-pets, &c. and is also sent abroad to line clothes.

Mr Bewick mentions an extraordinary method which this animal sometimes practises to procure itself subsistence. During a severe storm, one of these animals was traced in the snow from the side of a rivulet to its hole, at some distance from it. As it was observed to have made frequent trips, and as other marks were to be seen in the snow which could not be easily accounted for, it was thought a matter worthy of greater attention. Its hole was accordingly examined, the founart taken, and 11 fine eels were discovered to be the fruits of its nocturnal excursions. The marks in the snow were found to have been made by the motion of the eels in the creature's mouth.

83
Furo. Ferret. 32. *F. Furo*, the Ferret.—This animal is about 14 inches long, and its tail about five. Its nose is sharper than that of the polecat; its ears are round, eyes red and fiery, and the colour of its whole body a very pale yellow. It breeds twice in the year, unless it devours its offspring, as it sometimes does as soon as brought forth; it then has three litters. The ferret goes with young six weeks and has generally six or seven young, which are blind for a month.

It is a native of Africa, and was originally brought into Spain, to free that country from the multitudes of rabbits with which it was overrun.

After two months the young are fit for service in catching rabbits; they should be kept in tubs, or small boxes, where they can be supplied with plenty of clean straw, as they are offensive and smell strong; before you use, do not feed them, for with their bellies full they will not hunt, but sleep in the burrows for hours. The ferret is the natural enemy to the rabbit, inasmuch, that if a dead rabbit be laid before a ferret, it instantly seizes upon it, although it has never seen one before; if shewn a living rabbit, the ferret is still more eager, fastens on the neck, winds itself round and sucks the blood until satiated. The ferret, however, is apt to lose its savage nature, unless the breed is crossed with the polecat, which the warreners frequently do, and the produce is of a much darker colour, partaking of that of the fire.

89
Vulgaris. 33. *V. Vulgaris*, Common Weasel.—This is one of the smallest of the tribe; its general length being about seven inches, with a tail little more than two inches long. It is usually of a reddish brown on the back, sides, and legs, white on the throat and belly, and below the corners of the mouth on each jaw is a spot of brown. The ears are small and rounded; the mouth furnished with whiskers, and the eyes are black.

The female brings forth in the spring, and produces four or five at a birth. Of these she is very careful, and, as we are told by Aldrovandus, will carry them about from place to place, when she suspects that they will be stolen from her.

The food of this animal is similar to that of the other species, and it is very destructive to young birds, poultry, and rabbits. Its favourite food seems to be the field mouse. It is also very fond of eggs. It is exceed-

ingly active, and will run up the sides of walls with such facility, that scarcely any place is secure from it; and its body is so small, that there are few holes through which it cannot creep.

It is found in most of the temperate parts of Europe, is very common in this island, and is also occasionally met with in Barbary. It inhabits the cavities below the roots of trees, and the banks of rivulets, from which it sallies out in quest of its prey.

The weasel was supposed by Buffon to be untamable; but it appears from a communication made to him by a lady, and published in his 7th supplemental volume, that it may be rendered very gentle and domestic. The account is very amusing, but we have not room for it here. It is given by Dr Shaw, vol. i. p. 521. and Mr Bingley, vol. i. p. 314.

Genus 18. LUTRA. OTTERS.

90
Lutra.

Teeth as in the former genus. Feet webbed.

Linnaeus formed two genera of the animals which are usually called weasels, viz. *viverra* and *mustela*, in the latter of which he comprised the otters. Mr Pennant and Dr Shaw have united the *mustelæ* to the *viverræ*, and have made a new genus of the otters, to which Dr Shaw gives the name of *lutra*.

There are eight species, viz.

1, * *L. Vulgaris*, Common O. Brown, with naked feet, and tail half as long as the body.—2. *L. Lutreola*, Smaller O. Blackish tawney, with hairy feet, equal toes, and white muzzle.—3. *L. Marina*, Sea O. Black, with hairy feet, and very short tail.—4. *L. Brasiliana*, Brazilian O. Black, with yellow throat.—5. *L. Saricovienna*, Saricovienne O. Gray, spotted with black.—6. *L. Gracilis*, Slender O. Brown, with extremely slender body.—7. *L. Vison*, Vison O. Body entirely of a deep chesnut colour.—7. *L. Felina*, Chinchemin O. Of the shape and appearance of a cat.

1. *L. Vulgaris*, Common O. The usual length of this animal is about two feet from nose to tail, and the tail is about 16 inches long. The head and nose are broad and flat; the eyes are small, but very brilliant, and are placed nearer to each other than in most quadrupeds, which gives the otter a singular appearance, not unlike an eel. The ears are extremely short; the opening of the mouth small; the lips very muscular, capable of being brought very close together; and the nose and corners of the mouth are furnished with long whiskers. The legs are remarkably short, but very muscular; and the joints are articulated so loosely, that the animal can bring its legs on a line with its body, and use them as fins for swimming. Its fur is of a deep brown colour.

Otters are found in most parts of Europe, and are met with occasionally in Britain. They inhabit the banks of rivers, and their principal food consists of fish, though they will sometimes attack poultry and the smaller quadrupeds. They are said to be as destructive in a fishpond as a polecat is in a henhouse.

The otter makes its nest in some retired spot, where it can have an easy and secure access to the water, to which it immediately flies on the least alarm; and as it is very active, and swims with great rapidity, it is not easily taken. This animal is very nice, and will eat no fish but such as are perfectly fresh. As soon as he catches

91
Common Otter.
Fig. 39.

History of
the Species.

catches a fish, he drags it on shore, and devours it as far as the vent; but unless extremely pressed with hunger, he always leaves the rest. It swims against the stream in rivers, and may sometimes be seen in concert with a companion hunting the salmon. It has been supposed that the otter never goes out to sea, but this appears to be a mistake, for they have been seen about the Orkneys, hunting sea fish, especially cod.

When taken young, the otter is easily tamed, and may be made to catch fish for its master's use. The usual way of teaching them is, first to make them fetch and carry like a dog; they have then given them a truss stuffed with wool, in the shape of a fish, which they are accustomed to take in their mouths, and drop at command. From this they proceed to real fish, which are thrown dead into the water, whence they are taught to fetch it; and thus by degrees they are made to catch living fish. Mr Bewick informs us that a man near Wooler had a tame otter, which followed him wherever he went. He frequently carried it to fish in the river, and, when satiated, it never failed returning to its master. One day, in the absence of his master, being taken out by his son to fish, instead of returning as usual, it refused to come at the accustomed call, and was lost. The father tried every means to recover it; and after several days search, being near the place where his son had lost it, and calling it by its name, to his inexpressible joy it came creeping to his feet, and shewed many marks of affection and firm attachment. Its food, exclusive of fish, consisted chiefly of milk and hasty pudding.

Some years ago, one James Campbell, near Inverness, had a young otter, which he brought up and tamed. It would follow him wherever he chose, and if called on by its name, would immediately obey. When apprehensive of danger from dogs, it sought the protection of its master, and would endeavour to fly into his arms for greater security. It was frequently employed in catching fish, and would sometimes take eight or ten salmon in a day. If not prevented, it always made an attempt to break the fish behind the fin next to the tail; and as soon as one was taken away, it immediately dived in pursuit of more. When tired, it would refuse to fish any longer, and was then rewarded with as much fish as it could devour. Being satisfied with eating, it always curled itself round, and fell asleep, in which state it was carried home. The same otter fished as well in the sea as in the river, and took great numbers of codlings and other fish. Its food was generally fresh fish, and sometimes milk. What is still more extraordinary, the otter has been made to hunt fish along with dogs, who never gave him the smallest molestation, though accustomed to hunt other otters.

The flesh of the otter is rank and disagreeable, and partakes so much of the nature of fish, that by the Roman Catholic religion it is allowed to be eaten on fast days; and Mr Pennant tells us, that he saw in the kitchen of the Carthusian convent, near Dijon, an otter preparing for the dinner of that religious order, who by their rules are prohibited during their whole lives the eating of flesh.

The sea otter is chiefly valuable on account of its fur, which is thick and long, generally of a shining black colour, but sometimes of a silvery hue. It is hunted

for its fur in Kamtschatka, and the opposite coasts of America.

Ferae.

Genus 19. URSUS. BEARS.

91
Ursus.

Six front teeth in both jaws; the two lateral of the lower jaw longer than the rest, and lobed, with smaller or secondary teeth at their inner bases. Canine teeth solitary. Grinders five or six on each side, the first very near the canine teeth. Tongue smooth. Snout prominent. Eyes furnished with a nictitating membrane.

The individuals of this species have not many circumstances in common, except those mentioned in the generic character. The soles of their feet are long, and extend to the heel, from which circumstance they tread very firmly. Their claws are long and sharp, and they are thus enabled to climb trees with great dexterity, either in search of prey, or to escape from their enemies. Some of the species use their fore paws as hands.

There are about nine species, which are thus distinguished.

1. *U. Arctos*, Brown Bear. Blackish brown, with abrupt tail.—2. *U. Americanus*, American B. Black, with rusty cheeks and throat.—3. *U. Maritimus*, White or Polar Bear. White, with elongated neck and head, and abrupt tail.—4. *U. Gulo*, Glutton. Reddish brown, with tail of the same colour, and the middle of the back black.—5. *U. Luscus*, Wolverine. Rusty, with dusky snout, and forehead and lateral band of the body whitish.—6. *U. Lotor*, Raccoon. Tail ring-marked, and a black band across the eyes.—7. *U. Meles*, Badger. Tail unmarked; body gray above, black below, and a longitudinal black band through the eyes and head.—8. *U. Labradorius*, American Badger. Pale yellowish gray, with the throat and belly white, and head striped with black.—9. *U. Indicus*, Indian Badger. White above, black beneath.

1. *Ursus Arctos*, Common or Brown Bear.—There is a considerable variety of colour in different individuals of this species, according to the climate it inhabits. The prevailing colour is a blackish brown, but they are sometimes seen gray, or even quite white. His general appearance is very clumsy; his body thick, legs very strong, head round, neck short, and he is covered with a very long thick fur.

He is a native of almost all the northern parts of Europe and Asia, and is said to be found in some of the Indian islands, especially Ceylon. He inhabits woods and unfrequented forests, where he passes the greatest part of winter in a state of repose and abstinence, coming out only at distant intervals, and again concealing himself till the approach of spring. He lives chiefly on vegetables, such as roots and fruits; but when pressed by hunger, he becomes fierce and ravenous, and will attack animals of almost every description. He is said to be particularly fond of honey, in search of which he climbs trees, in order to get at the nests of wild bees. He will catch and devour fish, and occasionally frequents the banks of rivers for that purpose. It is observed that the brown and black varieties differ somewhat in their choice of food, the former living almost entirely on vegetables, while the latter frequently attack cattle, lambs, and kids, the blood of which they suck, like many of the cat and weasel tribe.

The

Fera.

The females bring forth two young at a birth. It was formerly supposed that these cubs were nearly shapeless masses, that were gradually licked and fashioned into shape by the parent, whence the expression of an *unlicked cub*, for an awkward ill-manner'd booby. This has long been proved to be a vulgar error. Though not shapeless, the cubs are, however, usually blind for about a month. The bear is an animal that is extremely useful to the inhabitants of the north of Europe; his flesh is nearly as good as pork, and makes excellent bacon. His skin is used for muffs, tippetts, and other articles of dress, and the fat is held in great estimation by the inhabitants of Kamtschatka as a very savoury and wholesome nourishment.

When tamed, it appears mild and obedient to its master, but is not to be trusted without the utmost caution.—It may be taught to walk upright, to dance, to lay hold of a pole with its paws, and perform various tricks to entertain the multitude, who are highly pleased to see the awkward measures of this rugged creature, which it seems to suit to the sound of an instrument, or to the voice of its leader. But to give the bear this kind of education, it must be taken when young, and early accustomed to restraint and discipline. An old bear will suffer neither, without discovering the most furious resentment; neither the voice nor menace of his keeper has any effect upon him; he equally grows at the hand that is held out to feed, as at that which is raised to correct him.

The excessive cruelties practised upon this poor animal, in teaching it to walk erect, and regulate its motions to the sound of the flageolet, are such as make sensibility shudder. Its eyes are put out, and an iron ring being put through the cartilage of the nose, to lead it by, it is kept from food, and beaten, till it yield obedience to the will of its savage leaders. Some of them are taught to perform by setting their feet upon hot iron plates, and then playing to them whilst in this uneasy situation. It is truly shocking to every feeling mind, to reflect that such cruelties should be exercised upon any part of the brute creation by our fellow men. That they should be rewarded by numbers of unthinking people, who crowd around them to see the animal's rude attempts to imitate human actions, is not to be wondered at; but it is much to be wished, that the timely interference of the magistrate would prevent every exhibition of this kind, that, in Britain at least, we might not be reproached with tolerating practices so disgraceful to humanity.

One of these animals, presented to the prince of Wales a few years ago, was kept in the Tower. By the carelessness of the servant, the door of his den was left open, and the keeper's wife happening to go across the court at the same time, the animal flew out, seized the woman, threw her down, and fastened upon her neck, which he bit, and without offering any farther violence, lay upon her, sucking the blood out of the wound. Resistance was in vain, as it only served to irritate the brute, and she must inevitably have perished, had not her husband luckily discovered her situation. By a sudden blow he obliged the bear to quit his hold, and retire to his den, which he did with great reluctance, and not without making a second attempt to come at the woman, who was almost dead through fear and loss of blood. It is somewhat remarkable, that when-

ever it happened to see her afterwards, it always growled, and made most violent struggles to get out to her. The prince, upon hearing of the circumstance, ordered the bear to be killed.

A few years ago, a man exhibited at Edinburgh a bear, which it was discovered he chiefly fed with dead bodies taken from the burying-grounds. On complaint being made to the magistrates, they ordered the bear to be shot. What punishment was inflicted on the man we do not recollect.

3. *U. Maritimus*, the White or Polar Bear.—This species is considerably larger and longer than the common bear, having been sometimes found 12 feet in length. It is exceedingly strong and fierce, and its body is covered with a very long, thick, white fur. It inhabits the coldest regions of the north, and is sometimes carried on floating ice as far to the southward as Newfoundland. In winter it buries itself in the snow, where it lies in a torpid state; but in summer it takes up its residence in the cliffs and caverns of the numerous ice islands that are found in those high latitudes. Here it brings forth its young, usually one or two at a birth. The parent is exceedingly tender and affectionate to her young, of which the following anecdote affords a striking and interesting example.

While the *Carcase* frigate, which went out some years ago to make discoveries towards the north pole, was locked in the ice, early one morning the man at the mast-head gave notice that three bears were making their way very fast over the frozen ocean, and were directing their course towards the ship. They had, no doubt, been invited by the scent of some blubber of a sea-horse that the crew had killed a few days before, which had been set on fire, and drew out of the flames a part of the flesh of the sea-horse that remained unconsumed, and ate it voraciously. The crew from the ship threw great lumps of the flesh of the sea-horse, which they had still left, upon the ice, which the old bear fetched singly, laid every lump before her cubs as she brought it, and dividing it, gave to each a share, reserving but a small portion to herself. As she was fetching away the last piece, they levelled their muskets at the cubs, and shot them both dead, and in her retreat they wounded the dam, but not mortally. It would have drawn tears of pity from any but unfeeling minds, to have marked the affectionate concern expressed by this poor beast in the dying moments of her expiring young. Though she was herself dreadfully wounded, and could but just crawl to the place where they lay, she carried the lump of flesh she had fetched away, as she had done others before; tore it in pieces, and laid it before them; and when she saw that they refused to eat, she laid her paws first upon one, and then upon the other, and endeavoured to raise them up: all this while it was pitiful to hear her moan. When she found she could not stir them, she went off, and when she had got at some distance, looked back and moaned; and that not availing her to entice them away, she returned, and smelling round them, began to lick their wounds. She went off a second time as before, and having crawled a few paces, looked again behind her, and for some time stood moaning. But still, her cubs not rising to follow her, she returned to them again, and with signs of inexpressible fondness went round one, and round the other, pawing them, and moaning. Finding at last that they were cold

History of the Species.

Maritimus,
Polar Bear.
Fig. 41.

History of
the Species.

cold and lifeless, she raised her head towards the ship, and uttered a growl of despair, which the murderers returned with a volley of musket-balls. She fell between her cubs, and died licking their wounds.

The polar bear lives chiefly on fish, but sometimes attacks the seals. He in his turn becomes a prey to the inhabitants of the arctic regions, who eat the flesh, though it is very coarse, and use the skin for coverings of various kinds.

⁹⁵
Luscus,
Wolverine.

5. *U. Luscus*, Wolverine.—This, by most naturalists, is considered only as a variety of the glutton. It is a large animal, almost equalling the wolf in size. It is pretty common in the northern parts of North America, where it burrows under ground. It is a beast of prey, living on deer and similar animals. Though its pace is very slow, it has a very acute scent, is extremely strong, and possessed of great sagacity. It is said to be so fierce, as to be a terror even to the wolves and bears; and its strength is so great, that it has been known to pull down a pile of immense logs of wood, in order to get at some provisions that had been hidden there, though some of the logs were as much as two men could carry. It is a great enemy to badgers and foxes.

It is hunted in North America for the sake of its skin.

⁹⁶
Meles,
Badger.
Fig. 42.

7. *U. Meles*, The Badger.—This is an animal of a very clumsy make, being thick-necked and thick-bodied, with very short legs. His usual length from nose to tail is about two feet and a half, and the tail itself seldom exceeds six inches. His eyes are very small, ears short and rounded. The body is covered with long coarse hairs like bristles, that are of a dirty yellowish white next the root, black in the middle, and gray at the tips. The badger differs from most other animals in having his back of a lighter colour than his belly. He is exceedingly strong, especially about the legs and feet, which are formed for burrowing in the earth.

This animal is found in all the temperate parts of Europe and of Asia. It makes its habitation below ground, and is a very cleanly animal, so that when his retreat is defiled by any other animal, as the fox, he quits it for another. It seldom leaves its hole during the day, feeding only by night. Its principal food appears to consist of the smaller quadrupeds, as rabbits, birds, &c. though Mr Pennant will scarcely allow it to be a carnivorous animal. It is also said to be very fond of honey. It sleeps much during winter, confining itself like the bear, in a half torpid state.

The female brings forth three or four young in the early part of summer.

Badgers were formerly distinguished into sow badgers and dog badgers, from the supposed resemblance of their heads to those animals, though we do not know of any with a head like that of swine, its usual appearance being that of the dog.

No animal has suffered more from vulgar prejudices than the badger: harmless in his nature, he seems to have had the character of ferocity given him, merely because he is a beast of great strength, and is furnished with strong teeth, as if formed to live by rapine; he is, however, found to be an animal perfectly inoffensive. Nature has denied the badger the speed requisite to escape its enemies, but has supplied it with such weapons of offence that scarcely any creature will attack;

few animals defend themselves better, or bite harder; when pursued, it soon comes to bay, and fights with great obstinacy. The badger is very tenacious of life, yet a small blow on the snout is mortal both to him and the otter. It is hunted with terriers, and its obstinate defence affords great diversion to those human brutes who are capable of finding pleasure in the torments of a harmless, inoffensive creature.

Its skin is used for pistol furniture, when dressed with the hair on; the hairs are made into brushes that are used by painters to soften their shades, and the flesh is said to make excellent bacon.

Genus 20. DIDELPHIS. OPOSSUMS.

⁹⁷
Didelphis.

Front teeth small and rounded; superior 10, the two middle ones longer; inferior eight, the two middle ones broader and very short; canine teeth long; grinders denticulated; tongue ciliated with papillæ; abdominal pouch (in most species) containing the teats.

This curious tribe of animals first became known to naturalists on the discovery of America, where only most of the species are met with. They are principally distinguished by the extraordinary contrivance which nature has adopted for enabling most of the genus to secure their young, and which consists of a pouch or bag formed by a fold of the skin of the belly. Into this the young are received soon after birth, and are there suckled at teats within the bag, till they are able to shift for themselves. In some of these there are two or three distinct cavities that can be opened or shut at pleasure, by means of bones with which they are provided for that purpose. Some of the species carry their young on their backs, covering them with their tail.

This is a numerous genus, comprehending about 19 species.

1. *D. Virginiana*, Virginian O. Yellowish gray, with naked tail, and black, naked, rounded ears, edged with white.—2. *D. Marsupialis*, Molucca O. Brown, with naked tail.—3. *D. Cayopolin*, Mexican O. Brown, with tail longer than the body, and the eyes surrounded with a blackish border.—4. *D. Brachyura*, Short-tailed O. With hairy tail; very short, naked ears, reddish body, and no pouch.—5. *D. Brunii*, Javan O. Short naked tail, and long three-toed hind feet.—6. *D. Orientalis*, Phalanger. Rusty white beneath, with blackish dorsal line; tail of the length of the body, and hairy almost to the middle, and the two middle toes of the hind feet united.—7. *D. Canerivora*, Cayenne O. Nearly naked; scaly tail almost the length of the body, and the nails of the thumbs flat.—8. *D. Philander*, Philander. The tail hairy at the base, and with four teats in the abdominal pouch.—9. *D. Murina*, Murine O. Tail half naked, and six teats.—10. *D. Dorsigera*, Merian O. Tail naked, hairy at the base, and the fore feet without claws.—11. *D. Lemurina*, Lemurine O. Ash-coloured, tawney beneath, with cylindric, black, furry, prehensile tail.—12. *D. Obesula*, Porcupine O. Subferruginous, whitish beneath, with longish tail; the fore feet five-toed, with small exterior claws; the hind feet four-toed, with two interior toes united.—13. *D. Petaurus*, Petaurine O. Blackish gray, tinged with ferruginous; whitish beneath

Fern. beneath, with lateral flying membrane, and long, sub-cylindric, very villose tail.—15. *D. Sciurca*, Squirrel O. Pale gray, snow-white beneath, with lateral flying membrane, and very villose prehensile tail.—15. *D. Macroura*, Long-tailed O. Ash coloured, whitish beneath, with lateral flying membrane, and very long black tail.—16. *D. Pygmaea*, Pygmy O. With lateral flying membrane, and flatly pinnated linear tail.—17. *D. Vulpina*, Vulpine O. Ferruginous, with black villous tail.—18. *D. Australasiaticus*, New Holland O.—19. *D. Ursina*, Ursine O. Yellowish, with cleft upper lip.

⁹⁸
Virginiana.
Virginian
Opossum.
Fig. 43.

1. *D. Virginiana*, Virginian Opossum.—This animal is about the size of a cat, but appears of a thicker form, from the length and erect position of the hair. It has an inelegant aspect, having a long sharp face, and very wide mouth, armed with numerous sharp teeth. The legs are short; and all the toes, except the thumbs of the hind feet, are furnished with sharp claws. The tail is strongly prehensile, enabling the animal to suspend itself thereby.

This is one of those species in which the abdominal pouch is most strongly marked, and into this receptacle the female receives her young when they are in danger, or when fatigued.

The Virginian opossum, like all the other American species, is a carnivorous animal, and preys on poultry, small birds, &c. in the manner of the European polecat; it is also frugivorous, eating several kinds of fruits, roots, &c. It is of a gentle disposition, and may easily be tamed; but, like some other species, it has a disagreeable smell. Its voice is a sort of grunting squeak; its pace in running is not swift, but it is very expert in climbing trees, and readily passes, by means of its clinging tail, from bough to bough, in the manner of a monkey. The female produces four or five at a birth, and has the power of closing the pouch so strongly as to make it extremely difficult to open it by the hand, nor will any torture compel the animal to loosen it. The female, when ready to bring forth her young, is said to make herself a nest of dry grass, in some bush near the root of a tree.

⁹⁹
Dorsigera.
Merian
Opossum.
Fig. 44.

10. *D. Dorsigera*, Merian O.—Almost the only account we have of this animal is given by Madame Merian, in her work on the insects of Surinam. Her account is as follows. "By way of filling up a plate, I have represented a kind of wood-rat, which always carries her young ones upon her back; she is of a yellowish brown colour, and white beneath. When these rats come out of their hole, either to play or to seek their food, they run about with their mother; but when they are satisfied with food, or are apprehensive of danger, they climb up again on the back of the mother, and twist their tails round that of the parent, who runs with them into her hole again."

¹⁰⁰
Dasyurus.

Genus 21. *DASYURUS*.

The organs of generation and abdominal pouch in the female, as in the last genus. Front teeth in the upper jaw eight, in the lower six. Canine teeth, two in each jaw. Grinders 14, of which six are sharp. Head conical; snout furnished with large whiskers. Tail furnished with long hair. Five toes on each foot, all separate; the thumb of the hind feet extremely short.

VOL. XII. Part II.

This is a new genus, formed by Geoffroy, to comprehend several species which are placed by Dr Shaw under *Viverra* and *Didelphis*, but which Geoffroy thinks have sufficiently distinguishing characters to be separated from both. They are all found in New Holland, and are herbivorous animals.

History of
the Species

Geoffroy enumerates six species, to which he gives the following names and characters.

1. *D. Macrourus*, Long-tailed D. Chestnut colour spotted with white. Tail equally speckled.—2. *D. Maugei*, Maugei D. Olive coloured, spotted with white; tail without spots.—3. *D. Viverrinus*, Viverrine D. Black, spotted with white; tail without spots.—4. *D. Tafa*, Tafa D. Entirely brown; tail of the same colour.—5. *D. Penicillatus*, Brush-tailed D. Ash-coloured, without spots.—6. *D. Minimus*, Least D. Entirely red; tail of the same colour.

M. Geoffroy has also formed a new genus, which he calls *Perameles*, in which he includes the *didelphis obe-sula* of Shaw, and another species that had not before been described. As we are not very certain of the necessity of this new genus, we have not included it in the arrangement of the generic characters; and for a description of the genus, we must refer to Geoffroy's Memoir, in the fourth volume of *Annales de Museum National*, p. 56.

¹⁰¹
Perameles.

Geoffroy calls the species *Perameles nasuta*, and *P. obe-sula*. The latter has been thus described by Dr Shaw. It is about the size of a half-grown domestic rat, and is remarkable for a thicker or more corpulent habit than most others of the genus. The hind legs are considerably longer than the fore legs, and have in miniature the form of those of the kangaroo, and some other Australasian quadrupeds; though the middle claws are far less in proportion; the interior ones are double, or both covered by a common skin. The colour of this species is a pale yellow brown, paler and inclining to whitish below; and its hair is of a coarser or harsher appearance than the rest of the small opossums; the ears are rounded, the tail rather long. When viewed in a cursory manner, the animal bears a distant resemblance to a pig in miniature.

¹⁰²
Obe-sula.

In Collins's account of New South Wales, there is described a very curious animal under the name of *wombat*, which seems nearly allied to the opossums, and the other animals which we have just mentioned. The teeth, however, differ so much from those of the three last genera, that it can scarcely be ranked as a species of any of them, and perhaps it may hereafter constitute a new genus. The account given in the work referred to is as follows.

¹⁰³
Wombat.
Fig. 46.

Its length, from the tip of the tail to the tip of the nose, is two feet seven inches, of which its body takes up one foot eleven inches. The head is seven inches, and the tail five-tenths of an inch. Its circumference behind the fore legs, 27 inches; across the thickest part of the belly, 31 inches. Its weight by hand is between 25 and 30 pounds. The hair is coarse, and is about one inch, or one and five-tenths in length, thinly set upon the belly, thicker on the back and head, and thickest upon the loins and rump; the colour of it a light sandy brown, of varying shades, but darkest along the back.

The head is large and flattish, and when looking the animal full in the face, seems, excluding the ears,

3 R 10

Ferae.

to form nearly an equilateral triangle, any side of which is about seven inches and five-tenths in length; but the upper side, or that which constitutes the breadth of the head, is rather the shortest. The hair upon the face lies in regular order, as if it were combed, but its ends point upwards in a kind of radii, from the nose their centre.

The ears are sharp and erect, of two inches and three-tenths in length, stand well asunder, and are in nowise disproportionate. The eyes are small, and rather sunk than prominent, but quick and lively. They are placed about two inches and five-tenths asunder, a little below the centre of the imaginary triangle towards the nose. The nice co-adaptation of their ciliary processes, which are covered with a fine hair, seems to afford the animal an extraordinary power of excluding whatever might be hurtful.

The nose is large or spreading, the nostrils large, long, and capable of being closed. They stand angularly with each other, and a channel is continued from them towards the upper lip, which is divided like the hare's. The whiskers are rather thick and strong, and are in length from two to three inches and a half.

The opening of its mouth is small; it contains five long grass-cutting teeth in the front of each jaw, like those of the kangaroo; within them is a vacancy for an inch or more, then appear two small canine teeth of equal height with, and so much similar to, eight molars situated behind, as scarcely to be distinguishable from them. The whole number in both jaws amount to 24.

The neck is thick and short, and greatly restrains the motions of the head, which, according to the common expression, looks as if it were stuck upon the shoulders.

From the neck the back arches a little as far as the loins, whence it goes off at a flat slope to the hindermost parts, where not any tail is visible. A tail, however, may be found by carefully pressing the finger over the flat slope in a line with the back bone. After separating the hairs, it is seen of some half an inch in length, and from three-tenths to one-tenth of an inch in diameter, naked, except a few fine short hairs near its end. This curious tail seemed to hold a much bolder proportion in the young than in the full grown animal.

The fore legs are very strong and muscular: their length, to the sole of the paw, is five inches and a half, and the distance between them is five inches and a half. The paws are fleshy, round, and large, being one inch and nine-tenths in diameter. Their claws are five in number, attached to as many short digitations. The three middle claws are strong, and about nine-tenths of an inch in length; the thumb and little finger claws are also strong, but shorter than the others, being only seven-tenths of an inch long. The fleshy root of the thumb claw is stronger and more flexible than the others. The sole of the paw is hard, and the upper part is covered with the common hair, down to the roots of the claws which it overhangs. The hind legs are less strong and muscular than the fore; their length, to the sole, is five inches and a half; the distance between, about seven inches and a half. The hind paw is longer than the fore, but not less fleshy; its length is two inches

and seven-tenths, in breadth two inches and three-fifths. The claws are four in number; the three inner ones are less strong, but about one-fifth of an inch longer than the longest of the fore claws, and there is a fleshy spur in the place of the thumb claw. The whole paw has a curve, which throws its fore part rather inward.

In size the two sexes are nearly the same, but the female is perhaps rather the heaviest.

In the opinion of Mr Bass, this wombat seemed to be very economically made; but he thought it unnecessary to give an account of its internal structure in his journal.

This animal has no claim to swiftness, as most men could run it down. Its pace is hobbling, like the awkward gait of a bear. It is mild and gentle, as becomes a grass-eater; but it bites hard, and is furious, when provoked. Mr Bass never heard its voice but then; it was a low cry, between a hissing and a whizzing, which could not be heard at a distance of above 40 yards. He chased one, and suddenly lifted it off the ground with his hands, and laid him along his arm like a child. It made no noise, nor any effort to escape. Its countenance was placid, and seemed as content as if Mr Bass had nursed it from its infancy. He carried it more than a mile, on his arm or his shoulder, which it took in good part; but when he secured his legs, in order to go into a bush to cut a specimen of new wood, its anger rose, and it snapped a piece from the elbow of Mr Bass's jacket with its grass-cutting teeth. Here their friendship ended, and the creature remained implacable all the way to the boat, and kicked till he was exhausted.

This circumstance seemed to prove, that with kind treatment the wombat might soon be rendered docile and affectionate; but let his tutor beware of giving him provocation, at least if he should be full grown.

Besides Furneaux island, the wombat inhabits the mountains to the west of Port Jackson. It lives below ground, being admirably formed for burrowing; but to what depth it descends, does not seem to be ascertained. According to the account given of it by the natives, the wombat of the mountains is never seen during the day, but lives retired in his hole, feeding only in the night; but that of the islands seems to feed in all parts of the day. His food is not well known, but it is probably varied according to the situation in which he may be placed. The stomachs of such as Mr Bass examined were distended by the coarse wiry grass; and he, as well as others, had seen the animal scratching among the dry ricks of sea-weed thrown upon the shores, though he could never discover what the animal was in search of.

Genus 22. MACROFUS. KANGUROO.

104
Macropus.

Front teeth in the upper jaw six, emarginated; in the lower jaw two, very large, long, sharp, and pointing forwards; grinders five on each side, both in the upper and lower jaw, distant from the other teeth; fore legs very short; hind legs very long; abdominal pouch in the female.

There are only two species at present known, viz.
1. *M. Major*, Great K. Brownish, with sharpish ears,

4.

and.

Fern. and five-toed fore feet.—2. *M. Minor*, Rat K. or Kangaroo rat. Brown, ash-coloured below, with rounded ears, and four-toed fore feet.

These were ranked by Linnæus under the genus DIDELPHIS, but differ so much in many circumstances, that they have been very properly formed into a separate genus.

105
Major,
Kangaroo.
Fig. 47.

1. *M. Major*, Great K.—This animal was first discovered by Captain Cook's people, while at Botany Bay in New Holland, in 1770; and an interesting, though not strictly accurate account of it, is given in Captain Cook's first voyage. It is thus described by Shaw. The general size of the kangaroo is, at least, equal to that of a full grown sheep; the upper parts of the animal are small, while the lower are remarkably large in proportion; yet such is the elegance of gradation in this respect, that the kangaroo may justly be considered as one of the most picturesque of quadrupeds. The head bears some resemblance to that of a deer, and the visage is mild and placid; the ears are moderately large, of a slightly sharpened form, and upright; the eyes large, and the mouth rather small; the neck thin and finely proportioned, the fore legs extremely short, with the feet divided into five toes, each furnished with a sharp and somewhat crooked claw. From the breast downwards the body gradually enlarges, and again decreases a little towards the tail; the thighs and hind legs are extremely stout and long, and the feet are so constructed as to appear, at first sight, to consist but of three toes, of which the middle is by far the largest, and is furnished with a claw of great size and strength; the exterior toe is also furnished with a very strong claw, but far smaller than that of the middle one; and the interior consists of two very small toes united under a common skin, with their respective claws placed so close to each other as to appear like a split or double claw; the whole appearance of the foot bears a distant resemblance to that of a bird. The kangaroo rests on the whole length of the foot, which is callous, blackish, and granulated beneath. The colour of the animal is an elegant pale brown, lighter or more inclining to whiteness on the abdomen; the ventral pouch, or receptacle for the young, is situated in the same manner as in the opossums, and is extremely large and deep.

The dimensions of a full grown kangaroo are given as follows, in Governor Phillip's Voyage to Botany Bay, viz. eight feet from the tip of the nose to that of the tail: length of the tail three feet and an inch; of the head eleven inches; of the fore legs two feet; of the hind, three feet seven inches: circumference of the fore part of the animal near the legs, three feet nine inches; of the lower part near the legs, four feet five inches; round the thickest end of the tail 13 inches. The weight of the largest specimens is said to have been about 150 pounds; but it is imagined that this animal attains a much larger size.

Though the general position of the kangaroo, when at rest, is standing on its hind feet, yet it frequently places its fore feet on the ground also, and thus feeds in the manner of other quadrupeds. It drinks by lapping. In its natural state it is extremely timid, and springs from the sight of mankind by vast bounds of many feet in height, and to a surprising distance. When in a state of captivity, it has sometimes a way of

springing forwards and kicking with its hind feet in a very forcible and violent manner; during which action it rests or props itself on the base of the tail. In a natural state it sometimes uses its tail as a weapon of defence, and will give such severe blows with it to dogs as to oblige them to desist from their attack. The female kangaroo has two mammæ situated in the abdominal pouch, and in each are seated two teats; yet so far as has hitherto been observed, the animal produces but one young at a birth; and so exceedingly diminutive is the young, when first found in the pouch, as scarcely to exceed an inch in length. The young continues in the pouch till it is grown to a large size, and takes occasional refuge in it long after it has been accustomed to come abroad.

The kangaroo feeds entirely on vegetable substances, and chiefly on grass. In their native state these animals are said to feed in herds of 30 or 40 together, and one is generally observed to be stationed, as if apparently on the watch, at a distance from the rest.

The flesh of the kangaroo is said to be rather coarse; and such as to be eaten rather in defect of other food than as an article of luxury.

Genus 23. TALPA. MOLES.

106
Talpa.

Front teeth in the upper jaw six, unequal; in the lower eight. Canine teeth one on each side, the upper larger. Grinders in the upper jaw seven, in the lower six.

The moles are furnished by nature for perforating the earth in the most expeditious manner. Their head is long, and provided with very strong muscles for enabling it to raise up the earth; their snout is much lengthened, and is moveable; their hands are large, broad, and flat, and armed with strong, flat, pointed claws, directed backwards for throwing the earth behind them, and the fore legs are very short and strong, and nearly hidden below the skin. They have no external ears, and their eyes are very small, and hidden in the fur. They mostly feed on worms and insects, and in this way would be of service, were it not that in seeking for these, they make much havoc among young plants by turning up the earth. This circumstance renders them very troublesome to gardeners and farmers, who take every method to destroy them.

Naturalists have described about 7 species, viz. 1. * *T. Europæa*, Common M. Black (usually) with short tail and five-toed feet.—2. *T. Purpurascens*, Purple M. Black, with a gloss of purple, with white tail and five-toed feet.—3. *T. Capensis*, Cape M. Gold-green, with a gloss of copper colour, with three-toed fore feet.—4. *T. Rufa*, Red M. Red, with short tail; three-toed fore feet, and four-toed hind feet.—5. *T. Longicaudata*, Long-tailed M. Brown, with tail moderately long, and five-toed feet, hinder scaly.—6. *T. Radiata*, Radiated M. Black, with white feet, and nose radiated with papillæ.—7. *T. Fusca*, Brown M. Brown, with white feet and tail, and very broad fore feet.

Species 1. *T. Europæa*, Common M. Moldwarp, or *Moudeiwarp*.

The figure of this animal is well known. Its eyes are so small that it was long doubted whether it really

History of had any. It has, however, been proved by dissections the Species- assisted by the microscope, that this animal not only has eyes, but that its eyes are every way calculated for distinct vision. It possesses the senses of hearing and smelling in a very acute degree, and according to Ray and Buffon is peculiarly gifted in another faculty, on which it would be improper here to enlarge. It is sometimes found white.

Moles are found in every part of Europe, and are extremely common in Britain.

These animals, as is well known, live below the earth, where they make subterranean passages leading from one hillock to another. They live in pairs, and are said to be the most domestic of all quadrupeds. They seldom quit their holes except when compelled to do so by heavy rains, or when the earth is so much parched by constant drought, that they are unable to continue their work of burrowing. In winter they retire to elevated places, where they may be best secured from inundations; but in summer descend to the low and flat lands, especially meadows, which they prefer on account of the earth there being fresher and softer.

They generally breed in the spring, being found big with young in January and February, and in April a great many of their young may be seen.

It appears that moles are capable of swimming to a considerable distance; and a remarkable instance of one having been seen swimming towards a small island in the middle of a lake 180 yards from land, is given by Mr Bruce in the third volume of the Linnæan Transactions.

People in general are not aware of the great mischief occasioned in fields and gardens by these animals. We are however informed by Buffon, that in the year 1740, he planted 15 or 16 acres of land with acorns, and that the greater part of them was in a little time carried away by the moles to their subterranean retreats. In many of these there were found half a bushel, and in others a bushel. Buffon, after this circumstance, caused a great number of iron traps to be constructed, by which in less than three weeks he caught 1300. To this instance of the devastation occasioned by these animals, we may add the following: In the year 1742 they were so numerous in some parts of Holland, that one farmer alone caught between 5000 and 6000 of them. The destruction occasioned by these animals is however no new phenomenon. We are informed by history, that the inhabitants of the island of Tenedos, the Trojans, and the Æolians, were infested by them in the earliest ages. For this reason a temple was erected to Apollo Smynthius, the destroyer of moles.

The catching of moles constitutes a profession which is well understood in this country. For the particular modes of taking them, we must refer our readers to Dr Darwin's *Phytologia*, p. 370, and to the second volume of the *Philosophical Magazine*, p. 34. According to Mortimer, as quoted by Pennant, the roots of white hellebore made into a paste and laid into their holes, will destroy them. They seem to have few enemies among other animals, but we are told by Sir Robert Sibbald, that there is a kind of mouse with a beak that destroys moles. We are assured that these animals are not found in Ireland.

The skin of the mole is extremely tough; its fur close set, and softer than the finest velvet, or perhaps than the fur of any other animal; it is usually black, but moles have been found spotted with white, and sometimes, though rarely, they have been seen altogether white.

Genus 24. SOREX. *SHREWS.*

108
Sorex.

Front teeth in the upper jaw two, long, bifid. In the lower two or four; the intermediate ones shorter; canine teeth several on each side; grinders cuspidated.

This genus is nearly allied to the last, and indeed a few of its species are scarcely to be distinguished from some of the moles. It is therefore not surprising that Linnæus, in the twelfth edition of his *Systema Naturæ*, ranked two species under *Sorex*, which should more properly have been placed under *Talpa*.

There are 16 species, which are thus distinguished.

1. * *S. Araneus*, Common S. or Shrew mouse. Rusty brown, whitish below, with tail rather shorter than the body.—2. *S. Moschatus*, Musk S. Web-footed, with naked compressed tail.—3. *S. Radiatus*, Canada S. Blackish, with lengthened snout, radiated at the tip with tentacula.—4. *S. Carrulescens*, Perfuming S. Blue-gray, with flesh-coloured snout, feet, and tail.—5. *S. Fodiens*, Water S. Black, and white below.—6. *S. Brasiliensis*, Brazilian S. Brown, with three black stripes on the back.—7. *S. Surinamensis*, Surinam S. Bay, yellowish ash colour below, with tail shorter than the body.—8. *S. Proboscideus*, Elephant S. Brown, with very long cylindrical snout.—9. *S. Leucodon*, White-toothed S. Dusky, white below, with tail of middling length.—10. *S. Tetragonurus*, Square-tailed S. Quadrangular tail.—11. *S. Leucurus*, White-tailed S. Brownish, whitish beneath, with short tail, whitish towards the tip.—12. *S. Unicolor*, Cinereous S. Dusky ash-coloured, with tail narrowed at the base.—13. *S. Murinus*, Murine S. Brown, with ash-coloured feet and tail, the latter of middling length.—14. *S. Pusillus*, Persian S. With rounded ears and short subdistichious tail.—15. *S. Minutus*, Minute S. With very long snout.—16. *S. Exilis*, Pygmy S. Extremely small, with very thick cylindrical tail.

1. *S. Araneus*, Shrew Mouse, or Hardy S. The length of this little animal, from the end of the nose to the origin of the tail, is two inches and a half; that of the tail, near one inch and a half; the nose is very long and slender, and the upper mandible is much longer than the lower; the ears are short and rounded; the eyes very small, and like those of the mole, almost concealed in the hair. The colour of the head, and upper part of the body, is of a brownish dark red, the belly of a dirty white; the tail is covered with short dark hairs; the legs are very short; the hind legs are placed very far back; the feet are divided into five distinct toes.

The teeth are 28 in number, and of so singular a form as to engage the attention of most naturalists. Gesner is of opinion, that nature seems to have formed in this animal teeth of mixed shape, between those of mice and serpents; the two upper fore teeth are very sharp, and on each side of them grows a minute process,

Fera. cess, scarcely visible, except on a near inspection; the other teeth are placed close together, are very small, and seem scarcely separated.

The shrew mouse inhabits old walls, heaps of stones, or holes in the earth; is frequently found near out-buildings, hay ricks, dunghills, and necessary houses; it lives on insects, corn, and any filth, and has been observed rooting like a hog in the last-named places. Either from its food or its nature, it has a very disagreeable smell, insomuch that the cat will kill it, yet refuses to eat it. It is said to bring four or five young at a time. It is a very common animal in this country.

110
Echinaceus.

Genus 25. ERINACEUS. HEDGEHOGS.

Front teeth, two both above and below; those of the upper jaw distant, of the lower approximated. Canine teeth on each side, in the upper jaw five, in the lower three. Grinders on each side, both above and below, four. Body covered on the upper parts with spines.

There are five species, viz. 1. * *Erinaceus Europæus*, European or Common H. With rounded ears and crested nostrils.—2. *E. Inauris*, Earless H. Without external ears.—3. *E. Auritus*, Long-eared H. With long oval ears, and crested nostrils.—4. *E. Madagascariensis*, Striped H. With spines and long bristles; the body longitudinally banded with black and white, with long, sharp-pointed snout.—5. *E. Malaccensis*, Malacca H. With long spines and pendulous ears.

111
Europæus,
Common
Hedgehog.
Fig. 50.

1. *Erinaceus Europæus*, Common Hedgehog, or Urchin.

The usual length of this animal, exclusive of the tail, is about ten inches; the tail is little more than an inch long, but so concealed by the spines as scarcely to be visible. The snout is like that of the hog; the upper jaw being much longer than the lower, and the end flat; the nostrils are narrow, terminated on each side by a loose thin flap; the colour of the snout is dusky; it is covered with a few scattered hairs; the upper part of the head, the sides, and the rump, are clothed with strong stiff hair, approaching the nature of bristles, of a yellowish and ash hue.

The legs are short, of a dusky colour, and almost bare; the toes on each foot are five in number, long, and separated the whole way; the thumb or interior toe is much shorter than the others; the claws long but weak; the whole upper part of the body and sides are strongly covered with close spines of an inch in length, and very sharp pointed; their lower part is white, the middle black, the points white. The mouth is small, but full of teeth. The barbarity of anatomists furnishes us with an amazing instance of its patience; one that was dissected alive, and whose feet were nailed down to the table, endured that, and every stroke of the operator's knife, without even one groan.

It is found in most parts of Europe, and is not uncommon in this island.

It produces four or five young at a birth, which are soon covered with prickles like those of the parent, but shorter and weaker.

It is a nocturnal animal, keeping retired in the day, but is in motion the whole night in search of food. It generally resides in small thickets, in hedges, or in

ditches covered with bushes, lying well wrapped up in moss, grass, or leaves; its food is roots, fruits, worms, and insects. It lies under the undeserved reproach of sucking cattle, and hurting their udders; but the shortness of its mouth renders that impossible. It is a mild, helpless, and patient animal; and would be liable to injury from every enemy, had not providence guarded it with a strong covering, and the power of rolling itself into a ball, by that means securing the defenceless parts. It is hunted with dogs; but few of them will venture to attack it while rolled up, so that its persecutors throw it into water, to oblige it to unroll itself. Its flesh is esteemed good food.

The hedgehog may be tamed; and we are told of one that lived at the Angel inn at Felton in Northumberland in 1799, which performed the duty of a turnspit, as well in every respect as the dog of that name; ran about the house as familiarly as any other domestic quadruped; displayed a facility till then unknown in this species of animals; and used to answer to the name of Tom.

This order contains 12 genera, and about 184 species.

CHAP. IV. GLIRES.

Gen. 26. HYSTRIX. PORCUPINE.

112
Hystrix.

Front teeth two, both in the upper and under jaw, obliquely cut; grinders eight. Body covered with spines intermixed with hairs. Four toes on the fore feet, five on the hind.

There are six species; viz.

1. *H. Cristata*, Long-spined Porcupine; with four-toed fore feet, and five-toed hind feet; crested head, and short tail.—2. *H. Prehensilis*, Prehensile P. Short-spined, with four-toed feet; and long half-naked prehensile tail.—3. *H. Mexicana*, Mexican P. Short-spined, with four-toed feet, and tail of moderate length.—4. *H. Macroura*, Long-tailed P. Short-spined, with five-toed feet, and very long tail, tufted at the end with club-shaped bristles.—5. *H. Fasciculata*, Brush-tailed P. Four-toed fore feet, five-toed hind feet, and tail terminated by a tuft of flattened bristles.—6. *H. Dorsata*, Canada P. Short-spined, with very long fur; four-toed fore feet, five-toed hind feet; spiny back, and shortish tail.

1. *H. Cristata*, Common Porcupine.—The figure which we have given of this animal will convey a better idea of it than any description. We may remark only that it is about two feet long from head to tail; and that the tail is about four inches long, being almost entirely hidden by the quills and long hair.

113
Cristata,
Common
Porcupine.
Fig. 51.

It is a native of Africa, India, and the Indian islands; and is found in some of the warmer parts of Europe, particularly in Sicily and Malta.

It was long believed that the porcupine had the power of darting its quills to a considerable distance, at any enemy that assaulted it. This is proved to have been a vulgar error, arising probably from the manner in which the quills are detached when the animal is moulting, at which time they are often thrown with a jerk to a little distance. The quills seem intended merely as weapons of defence, and when attacked, the animal has the power of raising them, as was remarked with respect to the scales of the manis.

The

History of the Species. The flesh of the porcupine is eaten in some places; and we are told by Mr Brydone, that when in Sicily, he dined on it, and found it extremely luscious, soon palling on the appetite.

This animal feeds chiefly on fruits, roots, and vegetable substances. It commonly lives under ground, sleeps much by day, and goes in search of food only during the night. The female produces two young at a birth, and these, when taken early, are easily tamed.

114
Cavia.

Gen. 27. *CAVIA, CAVY.*

Front teeth two, wedge-shaped; grinders eight. Toes on the fore feet, four or five; on the hind feet, from three to five. Tail very short, or wanting. No clavicles.

The animals of this genus are chiefly found in America; they live on vegetable substances, and inhabit holes in the ground, or beneath the roots of trees. There are seven species; viz.

1. *Cavia Cobaya*, Variegated Cavy, or Guinea Pig. Tailless; generally variegated either with black and white, or rufous, &c.—2. *C. Paca*, Spotted C. Tailed; with five-toed feet, and sides marked by rows of yellowish white spots.—3. *C. Capybara*, Capybara. Tailless; with three-toed palmated hind feet.—4. *C. Aguti*, Aguti. Tailed; with the body reddish brown, and the belly yellowish.—5. *C. Acouchy*, Acouchy. Tailed; with olive-coloured body.—6. *C. Aperia*, Rock C. Tailless; with reddish ash-coloured body.—7. *C. Patagonica*, Patagonian C. Rusty gray, whitish below, with extremely short naked tail; large white patch on each thigh, and black rump.

115
Cobaya.
Guinea Pig

1. *C. Cobaya*, Restless Cavy, or Guinea Pig.—This animal is pretty well known among us, being frequently kept as a kind of pet. It is a native of South America, and naturally of a chilly tender constitution; yet it lives and breeds in our climates when kept in the house, and properly fed. Few animals breed so early as the Guinea pig. Though it does not attain its full growth till eight or nine months old, it has been known to bring forth at two months. The female goes with young about three weeks, and at her first litter produces four or five young; but her subsequent litters often consist of ten or twelve. As these animals are thus prolific, and will breed five or six times in a year, it is computed that a thousand of them may be produced in one year from a single pair. They seem capable of no sentiment but the lowest sensuality, and pass their whole time in eating, sleeping, &c. They live entirely on vegetable food, and are very fond of parsley, apples, and other fruits. They eat often, but little at a time.

They are very neat and cleanly, and are often seen dressing each other's fur. They are easily tamed, but seem to feel no attachment to man. They grunt like a pig, make a chirping noise when pleased, and utter a sharp cry when hurt.

The flesh may be eaten, but is very indifferent.

116
Castor.

Gen. 28. *CASTOR. BEAVER.*

Front teeth in the upper jaw truncated, and hollowed with a transverse angle; in the lower jaw transverse

at the tips. Grinders on each side four. Tail long, depressed and scaly. Collar bones in the skeleton. Giresa.

There are two species; viz.

1. *C. Fiber*, Common Beaver. Chesnut-coloured, with flat ovate naked tail.—2. *C. Huidobrius*, Chili B. With long, compressed, lance-shaped, hairy tail; lobed fore feet, and webbed hind feet. 117
Common
Beaver.
Fig. 52.

1. *C. Fiber*, Common Beaver.—This animal is easily distinguished from all quadrupeds by the peculiar appearance of its tail, which is of an oval form, nearly flat, except on its upper surface, where it is slightly convex, entirely destitute of hair, except at the base, and marked with scaly divisions like the skin of a fish. The body is about three feet long, and the tail about a foot in length. The general colour of the fur is a deep chesnut, but it is sometimes found perfectly black, white, cream-coloured, or spotted.

The beaver is found in most of the northern parts of Europe and Asia, and is very abundant in North America. It was once met with in Britain, but the species has long been there extinct. It delights in shady watery situations.

Many accounts have been given of the manners and labours of this extraordinary animal, but we believe none are in general more correct than the following by Buffon.

The beavers begin to assemble in the month of June or July, for the purpose of uniting into society. They arrive in numbers from all corners, and soon form a troop of 200 or 300. The place of rendezvous is generally the place fixed for their establishment, and is always on the banks of waters. If the waters be flat, and never rise above their ordinary level, as in lakes, the beavers make no bank or dam; but in rivers or brooks, where the waters are subject to risings and fallings, they build a bank, and by this artifice they form a pond or piece of water which remains always at the same height. The bank traverses the river from one side to the other, like a sluice, and it is often from 80 to 100 feet long, by 10 or 12 broad at the base. This pile, for animals of a size so small, appears to be enormous, and supposes an incredible labour. But the solidity with which the work is constructed is still more astonishing than its magnitude. The part of the river where they erect this bank is generally shallow. If they find on the margin a large tree, which can be made to fall into the water, they begin with cutting it down, to form the principal part of their work. This tree is often thicker than the body of a man. By gnawing the foot of the tree with their four cutting teeth, they accomplish their purpose in a very short time, and always make the tree fall across the river. They next cut the branches from the trunk to make it lie level. These operations are performed by the whole community. Several beavers are employed in gnawing the foot of the tree, and others in lopping off the branches after it has fallen. Others at the same time traverse the banks of the river, and cut down smaller trees, from the size of a man's leg to that of his thigh. These they dress, and cut to a certain length to make stakes of them, and first drag them by land to the margin of the river, and then by water to the place where the building is carrying on. These piles they sink down, and

Glires and interweave the branches with the larger stakes. This operation implies the vanquishing of many difficulties; for to dress these stakes, and to put them in a situation nearly perpendicular, some of the beavers must elevate, with their teeth, the thick ends against the margin of the river, or against the cross tree, while others plunge to the bottom, and dig holes with their fore feet, to receive the points that they may stand on end. While some are labouring in this manner, others bring earth, which they plash with their feet, and beat firm with their tails. They carry the earth in their mouths, and with their fore feet, and transport it in such quantities that they fill with it all the intervals between the piles. These piles consist of several rows of stakes of equal height, all placed opposite to each other, and extend from one bank of the river to the other. The stakes facing the under part of the river, are placed perpendicularly; but the rest of the work slopes upwards, to sustain the pressure of the fluid, so that the bank, which is 10 or 12 feet wide at the base, is reduced to two or three at the top. It has, therefore, not only all the necessary thickness and solidity, but the most advantageous form for supporting the weight of the water, for preventing its issue, and to repel its efforts. Near the top, or thinnest part of the bank, they make two or three sloping holes, to allow the surface water to escape, and these they enlarge or contract, according as the river rises or falls; and when any breaches are made in the bank by sudden or violent inundations, they know how to repair them as soon as the water sub-sides.

It would be superfluous, after this account of their public work, to give a detail of their particular operations, were it not necessary, in a history of these animals, to mention every fact, and were not the first great structure made with a view to render their smaller habitations more commodious. These cabins or houses are built upon piles near the margin of the pond, and have two openings, the one for going to the land, and the other for throwing themselves into the water. The form of the edifices is either oval or round, some of them larger and some less, varying from four or five, to eight or ten feet diameter. Some of them consist of three or four stories, and their walls are about two feet thick, raised perpendicularly upon planks, or plain stakes, which serve both for foundations and floors to their houses. When they consist but of one story, the walls rise perpendicularly only a few feet, afterwards assume a curved form, and terminate in a dome or vault, which serves them for a roof. They are built with amazing solidity, and neatly plastered both without and within. They are impenetrable to rain, and resist the most impetuous winds. The partitions are covered with a kind of stucco, as nicely plastered as if it had been executed by the hand of man. In the application of this mortar, their tails serve for trowels, and their feet for plashing. They employ different materials, as wood, stone, and a kind of sandy earth, which is not subject to dissolution in water. The wood they use is almost all of the light and tender kinds, as alders, poplars, and willows, which generally grow on the banks of rivers, and are more easily barked out, and transported, than the heavier and more solid species of timber. When they once attack a tree, they never abandon it till they cut it down, and carry it off.

They always begin the operation of cutting at a foot, or a foot and a half above ground; they labour in a sitting posture; and, beside the convenience of this situation, they enjoy the pleasure of gnawing perpetually the bark and wood, which are most palatable to their taste; for they prefer fresh bark and tender wood to most of their ordinary aliment. Of these provisions they lay up ample stores, to support them during the winter; but they are not fond of dry wood. It is in the water, and near their habitations, that they establish their magazines. Each cabin has its own magazine, proportioned to the number of its inhabitants, who have all a common right to the store, and never pillage their neighbours. Some villages are composed of 20 or 25 cabins. But these large establishments are rare, and the common republic seldom exceeds 10 or 12 families, of which each has his own quarter of the village, his own magazine, and his separate habitation. They allow no strangers to sit down in their neighbourhood. The smallest cabins contain 2, 4, or 6, and the largest 18; 20, and, it is alleged, sometimes 30 beavers. They are almost always equally paired, being the same number of females as of males. Thus, upon a moderate computation, the society is often composed of 150 or 200, who all, at first, laboured jointly, in raising the great public building, and afterwards in select tribes or companies, in making particular habitations. In this society, however numerous, an universal peace is maintained. Their union is cemented by common labours, and it is rendered perpetual by mutual convenience, and the abundance of provisions which they amass, and consume together. Moderate appetites, a simple taste, and an aversion against blood and carnage, deprive them of the idea of rapine and war. They enjoy every possible good, while man only knows how to pant after it. Friends to each other, if they have some foreign enemies, they know how to avoid them. When danger approaches, they advertise one another by striking their tail on the surface of the water, the noise of which is heard at a great distance, and resounds through all the vaults of their habitations. Each takes his post; some plunge into the lake, others conceal themselves within their walls, which can only be penetrated by the fire of heaven or the steel of man, and which no animal will attempt either to open or to overturn. These retreats are not only very safe, but neat and commodious. The floors are spread over with verdure; the branches of the box and the fir serve them for carpets, upon which they permit not the least dirtiness. The window that faces the water answers for a balcony to receive the fresh air, and to bathe. During the greatest part of the day, they sit on end, with their heads and anterior parts of the body elevated, and their posterior parts sunk in the water. This window is made with caution, the aperture of which is sufficiently raised to prevent its being stopped up with ice, which, in the beaver climates, is often two or three feet thick. When this happens, they slope the sole of the window, cut obliquely the stakes which support it, and thus open a communication with the unfrozen water. This element is so necessary, or rather so agreeable to them, that they can seldom dispense with it. They often swim a long way under the ice; it is then that they are most easily taken, by attacking the cabin on one hand, and, at the same time, watching at a hole made at some distance,

History of the Species. distance, where they are obliged to repair for the purpose of respiration. The continual habit of keeping their tail and posterior parts in the water, appears to have changed the nature of their flesh. That of their anterior parts, as far as the reins, has the taste and consistence of the flesh of land or air animals; but that of the tail and posteriors has the odour and all the other qualities of fish. The tail, which is a foot long, an inch thick, and five or six inches broad, is just like an extremity or genuine portion of a fish attached to the body of a quadruped. It is entirely covered with scales, and with skin perfectly similar to those of large fishes. They may be scraped off with a knife, and, after falling, they leave an impression on the skin, as is the case with all fishes.

It is in the beginning of summer that the beavers assemble. They employ the months of July and August in the construction of their bank and cabins. They collect, in September, their provisions of bark and wood; afterwards they enjoy the fruits of their labours, and taste the sweets of domestic happiness. This is the time of repose and the season of love. Knowing and loving one another from habit, from the pleasures and fatigues of a common labour, each couple join not by chance, nor by the pressing necessities of nature, but unite from choice and from taste. They pass together the autumn and the winter, and perfectly satisfied with each other, they never separate. At ease in their cabins, they go not out but upon agreeable or useful excursions, to bring in supplies of fresh bark, which they prefer to what is too dry, or too much moistened with water. The females are said to go pregnant for four months: they bring forth in the end of winter, and generally produce two or three young ones. About this time, they are left by the males, who retire to the country to enjoy the pleasures and the fruits of the spring. They return occasionally to their cabins, and are occupied in nursing, protecting, and rearing their young, who at the end of a few weeks, are in a condition to follow their dams. The females, in their turn, make little excursions to recruit themselves by the air, by eating fresh bark and herbage; and in this manner pass the summer upon the waters, and in the woods. They assemble not again till autumn, unless their banks or cabins be overturned by inundations; for when accidents of this kind happen, they suddenly collect their forces, in order to repair the breaches which have been made.

Some places they prefer to others for their habitations; and they have been observed, after having their labours frequently destroyed, to return every summer to repair them, till being fatigued with this persecution, and weakened by the loss of several of their numbers, they took the resolution of changing their abode, and of retiring to solitudes still more profound. It is in winter that they are chiefly sought by the hunters, because their fur is not perfectly sound in any other season: and, after their village is ruined, and numbers of them are taken, the society is sometimes too much reduced to admit of a fresh establishment; but those which escape death or captivity, disperse and become vagabond. Their genius, withered by fear, never again expands. They hide themselves and their talents in holes; or, sunk to the condition of other animals, they lead a timid and solitary life. Occupied only by pressing wants, and exerting solely their individual powers, they lose

for ever those social qualities which we have been so justly admiring.

The beaver is hunted for the sake of its fur, which, as is well known, forms a considerable article in the manufacture of fine hats, as well as for the drug called *Castor*, for an account of which see *MATERIA MEDICA*. Its flesh is eaten in some places, and is said to have a fishy taste.

Genus 29. MUS. RATS AND MICE.

118
Mus.

Upper front teeth wedge-shaped. Grinders on each side three, sometimes only two. Clavicles or collar-bones in the skeleton.

These animals generally live in holes in the ground, are very swift, and able to climb trees. Their food is chiefly vegetable, which most of them seek in the night, keeping in their retreats during the day. They feed in a somewhat upright position, carrying the food to their mouth with their paws. They are very prolific, the females breeding many times a year and bringing numerous litters. The females have usually eight teats. The ears of these animals are usually short and rounded; their fore feet are commonly four-toed, with a warty excrescence in place of a fifth. Many of them are almost amphibious, living much in the water and swimming very well. A few of them are furnished with cheek pouches for carrying food to their holes. They are found in almost all parts of the world, and many of them are natives of Britain.

The species are very numerous, and are therefore by Dr Shaw distributed into the following sections.

A. With flattened tails.

1. *M. Zibethicus*, Musk Rat. Rusty brown, with long compressed lanceolate tail, and unwebbed feet.

B. With round naked tails.

2. *M. Pilorides*, Piloris. Whitish, with longish, scaly, obtuse truncated tail.—3. *M. Caraco*, American rat. Gray, with long, scaly, somewhat obtuse tail, and slightly semi-palmated hind feet.—4. * *M. Decumanus*, Norway R. Gray, stiff-haired, with very long scaly tail, and body whitish below.—5. * *M. Rattus*, Black R. Blackish, ash-coloured beneath, with very long scaly tail.—6. *M. Malaboricus*, Bandicot R. Gray, with naked round ears, and the two exterior toes of the hind feet shorter than the rest.—7. *M. Perchal*, Perchal R. Rusty brown, with the hind legs larger than the fore.—8. *M. Musculus*, Common M. Brown, ash-coloured beneath, with four-toed fore-feet, five-toed hind feet, and long nearly naked tail.—9. * *M. Sylvaticus*, Wood M. Yellowish brown, with long naked tail, and body white beneath, the colours being abruptly separated on the sides.—10. *M. Agrarius*, Rustic M. Yellowish brown, with long scaly tail and black dorsal streak.—11. *M. Messorius*, Harvest M. Rusty, white beneath, with long slightly hairy tail, and ears longer than the fur of the head.—12. *M. Minutus*, Minute M. Rusty, whitish beneath, with long scaly tail.—13. *M. Soricinus*, Soricine M. Yellowish gray, with long snout, round furred ears, and hairy tail of moderate length.—14. *M. Vagus*, Wandering M. Ash-coloured, with black dorsal band, very long naked tail, and plaited ears.—15. *M. Beulinius*,

Glirea. tulinus, Birch M. Fulvous, with black dorsal band, plaited ears, and very long naked tail.—16. *M. Striatus*, Streaked M. Rufous brown, with longish naked tail, and the body marked by several longitudinal rows of white spots.—17. *M. Barbarus*, Barbary M. Brown, marked with ten pale streaks; with tail of middling length, three-toed fore feet, and five-toed hind feet.

C. *With hairy tails, in general either of a middling length or short.*

18. *M. Cyanus*, Blue R. Blue, whitish beneath, with four-toed fore feet, five-toed hind feet, and slightly hairy tail of middling length.—19. *M. Saxatilis*, Rock R. Grayish brown, with longish tail; ears longer than the fur, and feet about four-toed.—20. *M. Amphibius*, Water R. Blackish brown, ash-coloured below, with ears scarcely projecting from the fur; fore feet about four-toed, and tail about half as long as the body.—21. *M. Scherman*, Scherman R. Deep brown, ash-coloured below, with slightly hairy tail of moderate length, small feet, and ears shorter than the fur.—22. *M. Lemmus*, Lemming R. Short-tailed, with ears shorter than the fur, five-toed fore feet, and body white below, variegated above with black, white and fulvous.—23. *M. Arvalis*, Meadow M. Dusky rusty, short-tailed, deep ash-coloured beneath, with ears longer than the fur, and about four-toed fore feet.—24. *M. Torquatus*, Collared M. Short-tailed, rusty, with dusky variegations; ears shorter than the fur; five-toed fore feet, interrupted white collar, and black spinal stripe.—25. *M. Lagurus*, Hare-tailed M. Short-tailed, ash-coloured, white below; ears shorter than the fur; about four-toed fore feet, and black dorsal line.—26. *M. Economicus*, Economic R. Short-tailed, tawney whitish below, with naked ears concealed by the fur, and about four-toed fore feet.—27. *M. Alliarius*, Garlic M. Ash-coloured, whitish below, with rather large ears slightly hairy, and tail about an inch long.—28. *M. Rutilus*, Red M. Fulvous ash-coloured beneath, with tail about an inch long; ears longer than the fur, and about four-toed feet.—29. *M. Laniger*, Woolly M. Ash-coloured, with four-toed fore feet, five-toed hind feet, and tail of middling length.—30. *M. Gregalis*, Baikal M. Gray, with ears shorter than the fur, about four-toed fore feet, and tail about one inch and a half long.—31. *M. Socialis*, Social M. Pale gray, white beneath, with very short rounded ears, about four-toed fore feet, and tail of half an inch long.—32. *M. Hudsonius*, Hudson's Bay M. Short-tailed, earless, ash-coloured, white beneath, with yellowish brown dorsal stripe, and five-toed hind feet.

D. *With cheek pouches for the temporary reception of their food.*

33. *M. Cricetus*, Hamster R. Reddish brown, pouched, with three white spots on each side, and deep black belly.—34. *M. Bursarius*, Canada R. Ash-coloured, with short nearly naked tail, pouched cheeks, and the claws of the fore feet very large, and formed for burrowing in the ground.—35. *M. Accedula*, Yaik R. Yellowish gray, whitish beneath, with pouched cheeks and sinuated ears.—36. *M. Arenarius*, Sand R. Ash-coloured, pouched; with the feet, sides of the body, belly and tail white.—37. *M. Phœus*, Astracan M.

Ash-brown, pouched, white beneath.—38. *M. Songarus*. History of the Species. Ash-coloured, pouched, white beneath, with black spinal line, and the sides spotted with white.—39. *M. Furuncululus*, Baraba R. Yellowish gray, pouched, whitish beneath, with black dorsal streak.

E. *Subterranean or Ground Rats, resembling Moles in habit and manner of life.*

40. *M. Maritimus*, Coast R. Pale yellowish brown, whitish beneath, with very large and long naked teeth, five-toed feet, no external ears, and short tail.—41. *M. Typhlus*, Blind R. Short-tailed, rufous brown, dusky beneath, with five-toed fore feet, broad front teeth, and without eyes or external ears.—42. *M. Aspalax*, Daurian R. Short-tailed, earless, yellowish ash-coloured, with large wedged fore teeth, and long claws on the fore feet.—43. *M. Capensis*, Cape R. Short-tailed, reddish ash, paler below, with very large naked fore teeth, five-toed feet, and white muzzle.—44. *M. Talpinus*, Mole R. Short-tailed, brown, with large wedged front teeth, no external ears, and five-toed fore feet formed for burrowing.

4. * *M. Decumanus*, Common brown or Norway rat. ¹¹⁰ *Decumanus*, Norway Rat. —This is one of the most common species of rat, by which our houses and granaries are infested, and is too well known to require any description. It was originally, it is said, brought to this country from Norway, and has multiplied so prodigiously, and is so strong and voracious, as to form one of our most unpleasant inmates. St Pierre informs us, that in the Isle of France these rats are found in such prodigious swarms, that 30,000 of them have been killed in some of the houses in a single year. It is even said that the Dutch entirely abandoned that post from the number of rats by which it was infested. They will in a single night entirely destroy a whole crop of corn. They frequently infest ships in such numbers as to destroy large quantities of provisions, and even endanger the vessel, by gnawing its timbers. When the Valiant came from the Havannah, in the year 1766, the rats had increased on board her so much as to destroy nearly one hundred weight of biscuit in a day; and on the ship being smoked between decks, to suffocate the rats, six hampers were for some time filled every day with those that had been thus killed.

In summer it frequents the banks of rivers, ponds, and ditches; where it lives on frogs, fishes, and small animals. But its rapacity is not confined entirely to these: It destroys rabbits, poultry, young pigeons, &c. It infests the granary, the barn, and the store-house; does infinite mischief among corn and fruit of all kinds; and, not content with satisfying its hunger, frequently carries off large quantities to its hiding place. It is a bold and fierce little animal; and when closely pursued, will turn and fasten on its assailant. Its bite is keen, and the wound it inflicts is painful, and difficult to heal, owing to the form of its teeth, which are long, sharp, and irregular.

Their produce is enormous, as the female brings forth from 12 to 18 at a litter, and usually breeds thrice a year, so that from a single pair, provided food were sufficiently plentiful, and they had no enemies to diminish their numbers, there might be propagated above 1,000,000 in the space of two years! Their enemies are, however, numerous. They are destroyed by dogs,

History of dogs, cats, and especially weasels; and it is said that the Species. a strong rat is as much dreaded by its own species, as the whole race is by those animals that are their prey. They are commonly taken by traps, or destroyed by poison, which latter is the surest method. Mr Bewick recommends for the purpose a composition of *nus vomica* mixed with oatmeal, and a small proportion of musk and oil of rhodium.

120.
Hamster.
Fig. 54.

33. *M. Cricetus*, Hamster, or Hamster Rat.—This is one of the fiercest of the rat tribe, being rather larger and much stronger than the Norway rat. It is of a pale reddish brown colour above, and blackish below, with a whitish muzzle, reddish cheeks, pretty large rounded ears, and a short tail almost bare. The male is always larger than the female.

The hamster is the only European species of rat that is furnished with pouches. It is found in Austria, Silesia, and many parts of Germany. It lives under ground, burrowing down obliquely. At the end of its passage, the male sinks one perpendicular hole, and the female several, sometimes seven or eight. At the end of these are formed various vaults, either as lodges for themselves and young, or as store-houses for food. Each young has its different apartment, and each sort of grain its different vault; the former is lined with straw or grass. The vaults are of different depths, according to the age of the animals: a young hamster makes them scarcely a foot deep; an old one sinks them to the depth of four or five. The whole diameter of the habitation, with all its communications, is sometimes eight or 10 feet. The female breeds twice or three times a-year, and produces from six to 18 at a litter. The young grow very rapidly, and are soon able to shift for themselves. The male and female have always separate burrows; for, except in their short season of courtship, they have no intercourse. The whole race is so malevolent, as constantly to reject all society with one another. They will fight, kill, and devour each other. The female shows little affection even for her young; for if any person digs into the hole, she attempts to save herself by burrowing deeper into the earth, leaving them a prey to the intruder. They would willingly follow her, but she is deaf to their cries, and even shuts up against them the hole which she has made. They feed on grain and fruits, which they collect in large quantities in their granaries; and in some countries they do so much damage among the corn, that a considerable reward is offered for destroying them. According to Mr Sultzor, they abound to such a degree in Gotha, that in one year, 17,564, in another 54,429, and in a third, 80,136 of their skins were delivered in at the hotel de ville of that capital.

The life of a hamster (says Buffon) is divided between eating and fighting. He seems to have no other passion than that of rage, which induces him to attack every animal that comes in his way, without in the least attending to the superior strength of the enemy. Ignorant of the art of saving himself by flight, rather than yield, he will allow himself to be beaten to pieces with a stick. If he seizes a man's hand, he must be

killed before he quits his hold. The magnitude of the horse terrifies him as little as the address of the dog, which last is fond of hunting him. When the hamster perceives a dog at a distance, he begins by emptying his cheek pouches, if they happen to be filled with grain. He then blows them up so prodigiously, that the size of the head and neck greatly exceeds that of the rest of the body. He raises himself on his hind legs, and thus darts upon the enemy. If he catches hold, he never quits it, but with the loss of life. But the dog generally seizes him behind, and strangles him. This ferocious disposition prevents the hamster from being at peace with any animal whatever. He even makes war against his own species, not excepting the females. When two hamsters meet, they never fail to attack each other, and the stronger always devours the weaker. A combat between a male and a female commonly lasts longer than between two males. They begin by pursuing and biting each other; then each of them retires to a side, as if to take breath; a little after they renew the combat, and continue to fly and to fight till one of them falls. The vanquished uniformly serves for a repast to the conqueror.

Glibres.

Genus 30. HYDROMYS (F).

121
Hydromys

Cutting teeth two in each jaw; canine; grinders two in each row, furrowed on the side, and having a double excavation on the crown. Feet five-toed; toes on the fore feet three; those on the hind webbed. Tail round and covered with short hair.

This is a new genus, constituted by Geoffroy to comprehend the coypou, which is commonly ranked as a species of *mus*, and two other species that had not been described.

His account of the genus is contained in the sixth volume of the *Annales de Museum National*, and a translation of his memoir is given in the 22d volume of the *Philosophical Magazine*.

The three species are thus distinguished by Geoffroy.

1. *H. Coypus*, Coypou H. Hair chestnut brown on the back, red on the flanks, and bright brown below the belly.—2. *H. Chrysogaster*, Yellow-bellied H. Hair chestnut brown above, orange below.—3. *H. Leucogaster*, White-bellied H. Hair brown above, white below.

122
Coypus
Coupon
Rat.
Fig. 55.

1. *H. Coypus*, Coypou, or Coypou Rat.—This curious animal was first described by Molina, who speaks of it as a species of water rat, of the size and colour of an otter. According to Geoffroy, it is a large animal, being about 14 inches from nose to tail, with a tail about two inches long. The general tint of the hair on the back is a chestnut brown. This colour becomes brighter on the flanks, and passes to bright red; under the belly it is only a dirty and almost dark russet. Yet this colour is sufficiently changeable according to the manner in which the coypou raises or lowers its hair. This mobility in the tone of its fur arises from each hair being of an ash-coloured brown at the root, and bright red at the point. The felt concealed under the

(F) Geoffroy chooses to spell this word *hydromis*; but we have thought the orthography that we adopt more conformable to the Greek origin of the name, viz. *ιδρυμυς*, or *water-rat*.

Glres. the long hair is an ash brown, of a brighter tint under the belly. The long hair on the back has the points only reddish, and that on the flanks is of the latter colour throughout the half of its length.

As in all animals which go frequently into the water, the hair of the tail is thin, short, stiff, and of a dirty red colour: in its naked parts it is scaly. The contour of the mouth and extremity of the muzzle are white. The whiskers, which are long and stiff, are also white, some black hairs excepted. Among the great number of skins which form part of the collection of M. Bechem, M. Geoffroy saw some belonging to animals which had no doubt been afflicted with the alpine disease; in one of these the silky hairs were entirely russet, so that the back appeared of the same tint as the sides and the belly; in another, the dorsal stripe, instead of being chestnut, had passed entirely to a red colour, the flanks being of a very pale red. He could not believe that these varieties on the one hand, were the character of youth or of the female, because these accidents were rare, considering the great number of skins which he examined; and, on the other, because M. d'Azzara has expressly told us that the female is entirely similar to the male.

Molina and d'Azzara agree in regard to the mild qualities by which the coypou is distinguished. It eats every thing given to it. It may be easily tamed, and soon becomes accustomed to the state of domesticity. It is never heard to cry but when harshly used; it then emits a piercing cry. The female produces five young, which she always carries with her.

The coypou is very common in the provinces of Chili, Buenos Ayres, and Tucuman. On the other hand, it is rarely found in Paraguay.

123
Arctomyx.

Genus 31. ARCTOMYS. MARMOTS.

Front teeth two in each jaw, strong, sharp, and wedged. Grinders in the upper jaw five on each side; in the lower jaw four. Clavicles or collar bones in the skeleton.

This genus differs in very few particulars from that of *mus*. The marmots are of a thick form, with large, roundish, and somewhat flattened heads, small mouths, the fissure having somewhat of a perpendicular appearance; ears very short, and sometimes none; a short villous tail, and five toed hind feet: the skeleton is furnished with clavicles or collar-bones, and the cœcum or appendicular intestine is very large. They are diurnal animals; feed on roots and grain, reside in subterraneous holes or burrows, and sleep during the winter.

There are eight species, viz.

1. *A. Marmota*, Alpine M. Brown, reddish beneath.—2. *A. Monax*, Maryland M. Rusty brown, with bluish gray snout, and longish villous tail.—3. *A. Empetra*, Quebec M. Gray, waved with darker and lighter shades, reddish below, with dusky tail.—4. *A. Bobac*, Bobac. Gray, reddish below, with a thumb claw on the fore feet.—5. *A. Pruinosa*, Hoary M. Hoary, with black legs and tail.—6. *A. Maulina*, Mauline M. Tail of middling length; ears sharp-pointed, and feet five-toed.—7. *A. Gundi*, Gundi M. Reddish, with abruptly terminated ears.—8. *A. Citillus*, Variegated M. Earless, with villous tail.

1. *A. Marmota*, Alpine M.—This animal is rather

larger than a rabbit, being about 16 inches long, exclusive of the tail, which measures about 6 inches. Its head is rather large and flattish; the ears short and hidden in the fur, and the tail thick and bushy.

It is a native of the Alps and Pyrenees, being most frequently found in Savoy and Switzerland, where it inhabits the higher regions, and feeds on various roots, plants, insects, &c. It climbs readily, and ascends with ease the rocky eminences and fissures.

It is an animal which delights in the regions of high mountains. In such situations several individuals unite in forming a place of retreat, which is contrived with great art, and consists of an oval cavity or general receptacle, large enough to contain several of the animals, and having a large canal or passage, which divaricates in such a manner as to present two outlets to the surface of the ground. These recesses are prepared on the declivity of elevated spots; and the cavern or receptacle is well lined with moss and hay, which they prepare during summer, as if conscious of the necessity of providing for their long hybernal sleep. In fine weather they are seen sporting about the neighbourhood of their burrows, and delight in basking in the sunshine, frequently assuming an upright posture, sitting on their hind feet. When assembled in this manner, it is observed, that one of the exterior number seems to act as a sentinel; and on the approach of any danger, alarms the fraternity by a loud shrill whistle, on which they instantly retire to their cavern. These animals make no provision for winter; but as soon as the autumnal frosts commence, they carefully stop up the entrances to their mansions, and gradually fall into a state of torpidity, in which they continue till the arrival of spring, when they again awake, and recommence their excursions. Before they retire to their winter quarters they are observed to grow excessively fat; and, on the contrary, appear greatly emaciated on first emerging from them. If carefully dug up during the winter, from their holes, they may be conveyed away in their sleeping state; and when brought into a warm chamber, gradually awaken, nearly in the same manner as the hamster. If kept in a warm situation, they do not become torpid in winter. They breed early in summer, and the litter commonly consists of three or four, the growth of which is observed to be very rapid.

When taken young, the marmot may be easily tamed, and is often taught to perform various gesticulations. In a domestic state it will also eat almost any kind of animal or vegetable food, and is extremely fond of milk. In feeding it generally sits in an upright position, making use of its paws in the manner of a squirrel.

Genus 32. SCIURUS. SQUIRRELS.

125
Sciurus.

Upper front teeth wedged; lower sharp. Upper grinders five on each side, lower four. Clavicles. Tail in most species spreading towards each side.

The beautiful animals which compose this genus are remarkable for the liveliness of their disposition, the rapidity of their movements, and the general neatness and elegance of their appearance. A few of the species are furnished with an expansile lateral skin, similar to that in the calugo, by means of which they are enabled to spring to a great distance, and to transport themselves occasionally from tree to tree. Like the calugo, they cannot,

History of not, however, continue this motion, and are therefore improperly called *flying squirrels*. The squirrels inhabit woods, and prepare their nests in hollow trees. They live entirely on vegetable food.

There are 26 species, viz.

A. *Not striped.*

1. *S. Maximus*, Great S. Rusty, yellowish below, with the outsides of the limbs and tail black.—2. *S. Madagascariensis*, Madagascar S. Black, with the nose, ears, and under parts yellowish white, and very long tapering tail.—3. *S. Macrourus*, Long-tailed S. Dark brown, yellowish white below, with the tail twice the length of the body.—4. *S. Bicolor*, Javan S. Blackish, fulvous below, with pointed beardless ears, and large rounded thumb claw.—5. *S. Anomalus*, Georgian S. Dusky rusty, with tail and lower parts fulvous, and rounded beardless ears.—6. *S. Erythræus*, Ruddy S. Yellowish brown, with the under parts and tail red rusty, and ciliated ears.—7. *S. Indicus*, Bombay S. Purple brown; yellow below; tip of the tail orange-coloured.—8. * *S. Vulgaris*, Common S. Reddish brown, white below, with pencilled ears.—9. *S. Cinereus*, Gray S. Ash-coloured, white below, with beardless ears.—10. *S. Niger*, Black S. Black, with beardless ears.—11. *S. Hudsonius*, Hudson's Bay S. Iron gray, dashed with rusty, whitish below, with dusky side-stripe, and lance-shaped tail edged with black.—12. *S. Persicus*, Persian S. Dusky, yellow below, with white sides, beardless ears, and blackish gray tail, with a white band.—13. *S. Flavus*, Fair S. Yellow, with roundish ears and five-toed feet.—14. *S. Æstivans*, Brazilian S. Dusky; yellow below, with longitudinal white stripe in the middle.

B. *Striped or variegated.*

15. *S. Variiegatus*, Coquallin S. Rustyish, orange-tawney below, with the upper parts varied crosswise with black, brown, and whitish.—16. *S. Mexicanus*, Mexican S. Ash brown, with five or seven longitudinal white stripes.—17. *S. Getulus*, Barbary S. Brown, with four longitudinal white stripes.—18. *S. Palmarum*, Palm S. Brown, pale below, marked above with three longitudinal yellowish stripes, and the tail with blackish ones.—19. *S. Ginginianus*, Gingi S. Gray brown, with a longitudinal white stripe on each side, and blackish tail.—20. *S. Degus*, Chilian S. Yellowish brown, with a black stripe on each shoulder.—21. *S. Striatus*, Striped S. Yellowish brown, with five longitudinal blackish stripes.

C. *Flying Squirrels.*

22. *S. Volans*, Common flying S. Pale gray, white below, with the side skin dilated into a flying membrane.—23. *S. Volucella*, Virginian flying S. Brown, yellowish white below, with a flying membrane.—24. *S. Sabrinus*, Severn flying S. Rusty brown, yellowish white below, with flattish villous tail.—25. *S. Sagitta* ? Hooded flying S. Rusty brown, pale rusty below, with the flying membrane commencing on each side of the head.—26. *S. Petaurista*, Taguan S. Chesnut-coloured; pale rusty beneath, with very long, round, tapering, villous tail.

8. *S. Vulgaris*, Common Squirrel.—The tail of this species is long enough to cover the whole body, and is

covered with long hairs, disposed on each side horizontally, which gives it a great breadth. These serve a double purpose. When erected, they prove a secure protection from the injuries of heat or cold: When extended, they are very instrumental in promoting those vast leaps the squirrel takes from tree to tree. On the authority of Klein and Linnæus, we may add a third application of the form of the tail. These naturalists tell us, that when the squirrel is disposed to cross a river, a piece of bark is the boat, the tail the sail.

This animal is remarkably neat, lively, active, and provident, never leaves its food to chance, but secures in some hollow tree a vast magazine of nuts for winter provision. In the summer it feeds on the buds and young shoots, and is particularly fond of those of the fir and pine, and also of the young cones. It makes its nest of moss or dry leaves, between the fork of two branches, and brings forth four or five young at a time. Squirrels are in heat early in the spring, when it is very diverting to see the female feigning an escape from the pursuit of two or three males, to observe the various proofs they give of their agility, which is then exerted in full force.

The colour of the whole head, body, tail, and legs of this animal, is a bright reddish brown: the belly and breast white. In some parts of Wales there is a variety of the squirrel kind, with a cream-coloured tail. The ears are very beautifully ornamented with long tufts of hair, of a deeper colour than those of the body. The eyes are large, black, and lively. The fore teeth strong, sharp, and well adapted to its food. The legs are short and muscular; the toes long and divided to their origin: the nails strong and sharp; in short, in all respects fitted for climbing, or clinging to the smallest boughs. On the fore feet it has only four toes, with a claw in the place of the thumb or interior toe: on the hind feet there are five toes. When it eats or dresses itself, it sits erect, covering the body with its tail, and making use of the fore legs as hands. It is observed that the gullet of this animal is very narrow, to prevent it from disgorging its food, in descending of trees, or in down leaps.

In northern climates these animals change their colour to gray on the approach of winter; and it is singular that this change will take place, even though they are kept in the warmth of a stove.

Genus 33. MYOXUS. DORMICE.

127
Myoxus.

Front teeth two; upper wedged, lower compressed. Grinders four in each jaw. Whiskers long. Tail cylindrical, villous, thicker towards the end. Legs of equal length; fore feet four-toed.

There are seven species, viz.

1. *M. Glis*, Fat D. Gray, whitish below.—2. *M. Nitela*, Garden D. Rufous, grayish white below, with a black mark above the eyes and behind the ears.—3. *M. Dryas*, Wood D. Grayish rufous, whitish below, with a straight black stripe across the eyes to the ears.—4. * *M. Muscardinus*, Common D. Rufous, with whitish throat, and the thumbs of the hind feet without claws.—5. *M. Chrysurus*, Gilt-tailed D. Purplish brown, with the hind part of the tail and longitudinal stripe on the head gold yellow.—6. *M. Guerlinguet*, Guerlinguet D. Rusty, yellowish rufous beneath, with

126
Vulgaris,
Common
Squirrel.
Fig. 57.

Glirea. with long rather depressed tapering tail.—7. *M. Africanus*, African D. Rusty gray, whitish below, with a white superciliary and lateral line; tail black in the middle, and claws on the fore feet very long.

123
Muscardinus, Common Dormouse.
Fig. 58.

4. *M. Muscardinus*, Common D.—The size of the dormouse is equal to that of a mouse, but has a plumper appearance, and the nose is blunter; the eyes are large, black, and prominent; the ears broad, rounded, thin, and semitransparent. The fore feet are furnished with four toes, the hind feet with five; but the interior toes of the hind feet are destitute of nails. The tail is about two inches and a half long, covered on every side with hair; the head, back, sides, belly, and tail, are of a tawny red colour; the throat white.

These animals seldom appear far from their retreats, or in any open place, for which reason they seem less common in England than they really are. They make their nests of grass, moss, and dead leaves, and usually bring forth three or four young at a time.

This animal agrees with the squirrel with respect to its food, residence, and in many of its actions; but it wants much of the sprightliness of that animal, never aspiring to the tops of trees, nor, like it, attempting to bound from spray to spray. Like the squirrel, it forms little magazines of nuts for winter provisions, takes its food in the same manner, and same upright posture. The consumption during the rigour of the season is but small, for it sleeps most part of the time, retiring into its hole at the first approach of the winter, where it lies torpid for the greatest part of that gloomy season. In that space it sometimes experiences a short revival, in a warm sunny day, when it takes a little food, and then relapses into its former state.

Genus 34. *DIPUS*. *JERBOA*.

129
Dipus.

Front teeth two both above and below. Fore legs very short; hind legs very long. Clavicles.

There are six species, viz.

1. *D. Sagitta*, Common Jerboa.—Pale brown, white beneath, with extremely long three-toed hind feet, and very long tail, with subpinnated black and white tip.—2. *D. Jaculus*, Alagtaga J. Pale brown; white below, with extremely long five-toed hind feet, and very long tail, with subpinnated black and white tip.—3. *D. Caffer*, Cape J. Rusty, pale ash-coloured below, with five-toed fore feet, four-toed hind feet, and very villous tail, tipped with black.—4. *D. Meridianus*, Torrid J. Yellowish brown, white below, with about four toes on the fore feet and five-toed hind feet, and tapering tail.—5. *D. Tamaricinus*, Tamarisk J. Yellowish brown; white below, with about four toes on the fore feet, five-toed hind feet, and tapering tail obscurely ringed with brown.—6. *D. Canadensis*, Canadian J. Yellowish brown, whitish below, with four-toed fore feet, five-toed hind feet, the tail long and mouse-like.

130
Sagitta, Common Jerboa
Fig. 59.

1. *D. Sagitta*, Common J.—This animal appears to have been known to the ancients, under the name of *μῦς δίπους*, or two-footed mouse, and is represented, though not very correctly, on some coins of Cyrene, where it is found in great abundance. By some it is supposed to be the *saphan* of the sacred writings (in our translation rendered *coney*), though this is denied by Mr Bruce. It is found in Egypt, Barbary, Palestine, in

the deserts between Bassora and Aleppo; the sandy tracts between the Don and Volga, and some other parts of Asia. M. Sonnini has given a long account of it, as he found it in Egypt, and from this we shall extract the following description.

History of the Species.

“ Its size is nearly equal to that of a large rat. Its head is broad, large in proportion to the body, the upper part flat, and of a light fawn colour, striped with black; the upper jaw projects beyond the lower: they are both provided with two cutting teeth; the upper ones broad, square, flat, and divided lengthwise by a groove in the middle: the lower ones longer, convex externally, pointed at the extremity, and bent inwards. The muzzle is short, wide, and obtuse; a number of stiff hairs grow out on each side, and form long whiskers. The nose is white, bare, and cartilaginous. The iris of its large and projecting eye is brown; the ears long, large, and covered with hair, so short that they appear naked except on very close inspection; externally they are white in the lower part, and gray upwards: their middle, as well as the sides of the head, is of a very light fawn colour, mixed with gray and black: they entirely surround the meatus auditorius for about one-third of their length, so that they exactly resemble the larger end of a cone. This conformation must increase the animal’s faculty of hearing, and is particularly well calculated to defend the inner part of the organ from the extraneous substances that might lodge there. The body is short, well provided with long, soft, silky hair; that which covers the back and sides is of an ash colour throughout almost the whole of its length, and of a light fawn colour where it approaches the points, which are black; but as the ash-coloured part is not visible, it may be said that the fur is fawn-coloured, with blackish zigzag stripes. These tints, which are somewhat dusky, form an agreeable contrast with the fine white of the belly. The fore legs are so short that they scarcely extend beyond the hair: they are white, and have five toes, the inner of which is short, rounded at the end, and has no nail. The four other toes, the second outer one of which is the longest, are long, and armed with great hooked nails; the heel is very high, and the middle of the foot is naked and of a flesh colour. These fore feet are of no use to the animal in walking, but serve him only to lay hold of his food, and to carry it to his mouth, as also to dig his subterraneous abode. The hind legs are covered with long hair, fawn-coloured and white; its long feet are almost entirely bare, especially on the outside, which must necessarily be the case, since the animal, whether in motion or at rest, constantly leans on that part. Those feet, so exceedingly long, have each three toes; the middle one something longer than the other two; they are all provided with nails, which are short, but broad and obtuse; they have also at the heel a kind of spur, or rather a very small rudiment of a fourth toe, which gives the jerboa of Egypt some resemblance to the alagtaga of Tartary, described by Gmelin in the Petersburg Transactions, and which part probably escaped Hasselquist, as well as many others. The toes and the heel are furnished below with long gray hairs tinged with yellow, except that at the origin of the toes, which is of a blackish cast; the nails, both of the fore and hind feet, are of a dirty white. According to Hasselquist the tail of the jerboa is three times the

History of
the Species.

the length of the body. I never, says Sonnini, found it much more than half that length. It scarcely exceeds the circumference of a goose quill, but is of a quadrangular and not a round shape. It is of a deeper gray above than below, and is furnished with short hairs as far as the extremity, which ends in a tuft of long silky hair, half black and half gray*."

* Sonnini's
Travels in
Egypt.

This animal is as singular in its motions as in its form. It always stands erect on its hind feet, the fore feet performing the office of hands. It runs fast, and, when pursued, jumps five or six feet from the ground; burrows like rabbits; keeps close in the day; sleeps rolled up; is lively during night; when taken, emits a plaintive feeble note; feeds on vegetables, and has great strength in its fore feet. Two which Mr Pennant saw living in London, burrowed almost through the brick wall of the room they were in, came out of their hole at night for food, and, when caught, were much fatter and sleeker than when confined to their box.

The jerboa is easily tamed. M. Sonnini kept six of them for some time in a large iron cage, but found it was very difficult to preserve them, owing to their great tenderness.

131
Lepus.

Genus 35. LEPUS. HARES and RABBITS.

Front teeth two in each jaw, the upper pair duplicate; two small inner teeth standing behind the outer.

This genus approaches very nearly to the order of Pecora, and it has even been supposed that the common hare actually ruminates; an opinion which is owing not merely to the peculiar motions of its mouth, similar to those in ruminating animals, but to the structure of the stomach, which appears to be divided into two regions by a particular fold. All the species are herbivorous.

There 12 species, viz.

1. * *L. Timidus*, Common H. Rustyish brown, short-tailed, with ears longer than the head and tipped with black.—2. * *L. Variabilis*, Varying H. Tawney-gray, short-tailed, (white in winter) with ears shorter than the head, and tipped with black.—3. *L. Americanus*, American H. Tawney-gray, short-tailed, white below, with the hind legs longer than the body, and the ears and tail tipped with gray.—4. *L. Tolai*, Baikal H. Pale brown, short-tailed, with the upper edges of the ears black.—5. * *L. Cuniculus*, Rabbit. Short-tailed, brown, with the tips of the ears black, and the hind legs shorter than the body.—6. *L. Brasiliensis*, Brazilian H. Tailless, brown, white below, with a white collar round the neck.—7. *L. Capensis*, Cape H. Brown, with reddish legs, and tail the length of the head.—8. *L. Visaccia*, Visaccia. Brownish, with long bristly tail.—9. *L. Alpinus*, Alpine H. Tailless, rusty, with rounded ears and brownish feet.—10. *L. Ogotana*, Ogotana H. Tailless, pale brown, with oval sharpish ears of the same colour.—11. *L. Pusillus*, Calling H. Tailless, gray-brown, with nearly triangular ears edged with white.—12. *L. Minimus*, Minute H. Short-tailed, brown, long-nosed, with small hairy pointed ears.

1. *L. Timidus*, Common H.—To describe an animal so well known would be superfluous; we may only remark, that nature, ever kind and provident, in pity to its defenceless state against its numerous enemies, has

bestowed on it many faculties, by which it is frequently enabled to evade their pursuit. Fearful of every danger, and attentive to every alarm, the hare is continually upon the watch, and being provided with very long ears, moveable at pleasure, and easily directed to every quarter, is warned of the most distant approaches of danger. Its eyes are large and prominent, adapted to receive the rays of light on every side, and give notice of more immediate alarms. To these may be added its great swiftness, by which it soon leaves most of its pursuers far behind.—The hind are much longer than the fore legs, and are furnished with strong muscles, which give the hare a singular advantage in running up a hill; and, as if sensible of its powers in this respect, it is always observed to fly towards rising ground when first started.

Thus formed for escape, the hare might be supposed to enjoy a state of tolerable security; but as every rapacious creature is its enemy, it is seldom permitted to live out its natural term. Dogs and foxes pursue it by instinct; wild cats and weasels of all kinds, catch and devour it; birds of prey are still more dangerous enemies, whilst man, far more powerful than all, makes use of every artifice to obtain an animal which constitutes one of the numerous delicacies of his table. If we were to enumerate the various stratagems which ingenuity has suggested to circumvent this persecuted creature, we would willingly omit the notable achievements and gallant exploits of the chase, which to a cool and dispassionate observer, seem to demand a nobler game. This animal has also another means of safety from her colour very much resembling that of the ground where she sits. In the colder regions she is said to become white during the winter, when the ground is covered with snow.

The hare is very prolific, breeds four or five times in the year, goes with young 30 days, and generally produces three or four at a litter. They are first in heat about February. Hares generally keep within their seats during the day, going out only at night in search of food, and they always return to their forms by the same paths by which they left them.

The following instances of the sagacity of the hare, in endeavouring to escape from its enemies, are quoted by Mr Bewick. Touilloux says, he has seen a hare start from its form at the sound of the hunter's horn, run towards a pool of water at a considerable distance, plunge itself in, and swim to some rushes in the middle, where it lay down, and concealed itself from the pursuit of the dogs. He mentions another, which, after running two hours before the dogs, pushed a hare from its seat, and took possession of it. Others he has seen run into a sheepfold, and lie down among the sheep; and some have effected their escape by mounting an old wall, and clapping themselves down in the midst of the ivy which covered it.

The hare has been sometimes tamed, and rendered very familiar. When Dr Townson was at Gottingen, he had a young hare that became so frolicsome in the evenings, as to run about upon the sofa and bed, sit upon its hind legs, and pat him with its fore feet; and while he was reading, it would even knock the book out of his hand. Mr Borlase saw a hare that was so familiar as to feed from the hand, lay under a chair in a common sitting room, and appeared, in every other respect,

Glirea.

132
Timidus,
Common
Hare.
Fig. 6c.

Gires. spect, as easy and comfortable in its situation as a lap-dog. It now and then went out into the garden; but after regaling itself, always returned to the house as its proper habitation. Its usual companions were a greyhound and a spaniel, both so fond of hare-hunting, that they often went out together without any person accompanying them. With these two dogs this tame hare spent its evenings; they always slept on the same hearth, and very frequently it would rest itself upon them.

The fur of the hare is used for hats; and for this purpose many thousands of their skins are imported into this country from Russia, besides what are collected here.

133
Cuniculus,
Rabbit.

5. *L. Cuniculus*, the Rabbit.—Respecting an animal so well known as the rabbit, we shall remark only, that its fecundity is truly astonishing. It breeds seven times in the year, and generally produces eight young at a time. Hence it is calculated, that the produce of a single pair may, in the course of four years, amount to the amazing number of 1,274,840, so that if frequent reductions were not made by various ways, there is reason to apprehend that they would soon exceed the means of their support, and overrun the face of the country. They are, however, exposed to numerous enemies. Besides the havock made among them by man for their flesh and skins, which latter are also used in the manufacture of hats, they are the prey of foxes, weasels, polecats, and other beasts of prey.

The rabbit is often kept in a domestic state; but the flesh of the domestic rabbit is far inferior to that of the wild animal.

135
Hyrax.

Genus 36. *HYRAX*. *HYRAX*, or *DAMAN*.

Front teeth in the upper jaw two, broad, and rather distant; in the lower four, broad, flat, twice notched. Grinders four on each side in both jaws, large. Fore feet four-toed; hind feet three-toed. No tail or clavicles.

There are three species, viz.

1. *H. Capensis*, Cape H. Gray brown, paler below, with flat nails on the fore feet, and a single sharp crooked claw on the hind feet.—2. *H. Syriacus*, Syrian H. Reddish gray, white below, with three-toed feet, and nearly equal claws.—3. *H. Hudsonius*, Hudson's bay H. Ash brown, with the hair whitish at the tips, and all the feet four-toed.

A long account is given of the second species in Mr Bruce's Travels to Abyssinia. Mr Bruce calls it *askoka*, and supposes it to be the saphan or coney of the sacred writings. For his description we must refer to the work itself.

This order contains 11 genera and 124 species.

(G) It was formerly supposed that, besides the four stomachs common to all ruminating animals, the camel had a sort of fifth stomach or appendage to the second stomach, calculated for receiving a large quantity of water to supply the animal in his long journeys over the deserts. There is no such receptacle: but in the first, and more especially the second stomach, there are several rows of cells, furnished round their edges with strong muscular fibres, by which they can be closed at pleasure. Into these cells part of the water which the camel drinks, is, by a peculiar mechanism, received, and retained, in a pure state, till the animal has occasion for it. In an interesting paper on this subject in the Philosophical Transactions for 1806, Mr Home has given a comparative view of the structure of the stomachs in the ox and the camel, illustrated by plates.

CHAP. V. PECORA.

Genus 37. *CAMELUS*, *CAMELS*.

Horns wanting. Front teeth in the lower jaw six; rather thin and broad. Canine teeth distant, three in the upper jaw, two in the lower. Upper lip divided.

There are usually enumerated seven species, viz.

1. *C. Dromedarius*, Arabian C. With a single bunch on the back.—2. *C. Bactrianus*, Bactrian C. With two bunches on the back.—3. *C. Glama*, Glama. Pale rusty, whitish below, with level back and pectoral bunch.—4. *C. Vicugna*, Vicuna. Purplish brown, whitish below, with level woolly back, blunt snout, and upright tail.—5. *C. Paco*, Paco. Purplish brown, woolly, white below, with oblong snout.—6. *C. Huanaco*, Guanaco. Tawney, white below, with gibbous back, and upright tail.—7. *C. Arcuramus*, Chilihuque. With smooth woolly body, curved snout, and pendulous ears and tail.

1. *C. Dromedarius*, Arabian Camel. Dromedary. A single bunch on the back.—This species is thus described by Dr Shaw.

136
Dromedary,
or Arabian
Camel.
Fig. 62.

The general height of the Arabian camel, measured from the top of the dorsal bunch to the ground, is about six feet and a half; but from the top of the head, when the animal elevates it, not less than nine feet. The head, however, is generally so carried as to be nearly on a level with the bunch, or rather below it, the animal bending the neck extremely in its general posture. The head is small; the neck very long; the body of a long and meagre shape; the legs rather slender, and the tail, which is slightly tufted at the end, reaches to the joint of the hind legs. The feet are very large, and are hoofed in a peculiar style, being divided into two lobes not reaching through the whole length of the foot; and the extremity of each lobe is guarded by a small hoof. The under part of the foot is covered with an extremely strong, tough, and pliable skin, which, by yielding in all directions, enables the animal to travel with peculiar ease and security, over dry, stony, and sandy regions. On each leg are six callosities, viz. one on each knee, one on the inside of each fore leg on the upper joint, and one on the inside of each hind leg at the bottom of the thigh. On the lower part of the breast is also a large callus or tough tubercle (G).

The camel is generally of a dusky-brown colour, with a rusty tinge.

Its hair is very fine and soft, and is employed in making pencils for painters, and in the manufacture of various stuffs.

This

History of
the Species.

This animal attains its full strength at about the age of six years, and lives about 40 years, or sometimes 50. Only the males are usually employed for labour; the females being kept for breeding, and suffered to range at liberty. These go with young about 12 months, and usually bring forth one at a time.

The camel is found wild in the deserts of Arabia, in Africa, and in most of the temperate parts of Asia. It is domesticated chiefly among the Arabs, of whom it forms the principal riches.

We are chiefly acquainted with this animal in a state of domestication; and to this state only the accounts that have been given of him are applicable. A few days after birth the legs of the young camels are folded up below their belly, and they are constrained to remain in this position on the ground, and are loaded with a pretty heavy weight, which is never taken off but to replace it by a greater. Instead of allowing them to feed and drink at pleasure, they begin by regulating their repasts, and increasing the intervals between them, and diminishing the quantity of their nourishment. When they have acquired a little more strength they are exercised in running, in which they are excited to emulation by the example of horses; and thus in time they become both robust and active.

Thus instructed, the camels traverse with great rapidity the immense deserts of Arabia, marching night and day almost without stopping, and almost without taking food or drink. They are often made with apparent ease to travel 300 leagues in eight days; and during the whole of this time they are allowed but one hour of the day for repose, and for nourishment: often they will run for even nine or ten days without finding water; but when they happen to find water at some distance in their route, if permitted, they eagerly make towards it, and are said to scent it at more than half a league's distance.

The march of camels across the sandy plains of Arabia has been elegantly described by Buffon. "Figure to yourself (says this animated writer) a country without verdure and without water, a burning sun, an air always parched, sandy plains, mountains still more arid, which the eye runs over without perceiving an animated being; a dead earth perpetually tossed with the wind, and presenting nothing but bones, scattered flints, rocks perpendicular or overturned; a desert totally void, where the traveller never breathes under a shade, where nothing accompanies him, nothing recalls the idea of animated nature; absolute solitude, more dreadful than that of the deepest forests: more solitary and naked, more lost in an unlimited wild, he every where beholds space surrounding him like a tomb; the light of day, more dismal than the darkness of night, serves only to give him a clear idea of his own wretchedness and impotence, and to conceal from his view the boundaries of the void, by extending around him that immense abyss, which separates him from the habitable parts of the earth.

"The Arab, however, by the assistance of his camel, has learned to surmount, and even to appropriate these frightful intervals of nature. They serve him for an assylum, they secure his repose, and maintain his independence; but man never uses any thing without abuse. This same free, independent, tranquil, and even rich Arab, instead of regarding his deserts as

the ramparts of his liberty, pollutes them with his crimes; he traverses them to carry off goods and slaves from the adjacent nations; he employs them for perpetrating his robberies, which unluckily he enjoys more than his liberty, for his enterprises are almost always successful; notwithstanding the vigilance of his neighbours and the superiority of their strength, he carries off with impunity all that he ravishes from them. An Arab who gives himself up to this kind of land piracy, is early accustomed to the fatigues of travelling, to want of sleep, and to hunger, thirst, and heat, and with the same view he uses and instructs his camels. After he is certain of the strength, fleetness, and sobriety of his camels, he loads them both with his own and their food, sets off with them, arrives unperceived at the confines of the desert, robs the first passenger he meets, pillages the solitary houses, loads his camels with the booty; and, if pursued, he is obliged to accelerate his retreat. It is on these occasions, that he unfolds his own talents and those of the camels; he mounts one of the fleetest, and conducts the troop, and makes them travel night and day, without almost either stopping, eating, or drinking; and in this manner he easily performs a journey of 300 leagues in eight days. During this period of motion and fatigue his camels are perpetually loaded."

In Turkey, Persia, Arabia, Egypt, and Barbary, the only means of transporting merchandise is by camels, as this is of all others the cheapest and most expeditious method. The merchants and other travellers unite in a caravan, in order to avoid the insults, piracies, and robberies of the Arabs. These caravans always consist of a greater number of camels than of men; each of these animals is loaded according to his strength, and he so well knows the proper extent of his load, that when he is overloaded, he utters the most lamentable cries, and continues lying down till his burden is lightened. The large camels usually carry 10 or even 12 hundred weight, and the smaller 6 or 7 hundred weight.

In these commercial journeys they never hurry the camels in their march, but regulate their days work; they generally go a certain space, and travel about 10 or 12 leagues every day; every evening their load is taken off, and they are suffered to feed at liberty. If they are in a country abounding with herbage, they usually eat as much in an hour as is sufficient to serve them for the next twenty-four hours; and, during the remainder of the night, they continue to ruminate: but they seldom find such good pasturage; and indeed this delicate nourishment does not appear to be necessary for them; they even seem to prefer wormwood, thistles, nettles, broom, cassia, and other prickly plants, to more pleasant herbage. So long as they find plants to browse, they easily go without drink.

Nothing is more admirable than their docility. At the first sign they bow their knees, and crouch to the earth to suffer themselves to be loaded in this situation, and, when loaded, they rise of their own accord without assistance. They follow exactly the motions of their conductor, and require neither whip nor spur to urge them forward; but, when they begin to be fatigued, their masters support their spirit, or rather beguile their fatigue, by singing or by the sound of musical instruments. When they wish to prolong their journey, they give them

Pecora.

Pecora.

them only an hour for repose; and then resuming their song, they continue the march for several hours longer, and give over singing only when they intend to stop; then the camels crouch again with their burdens, from which they are freed by loosening the cords and fastenings on each side, while the poor animals remain kneeling on the earth, and sleep in this posture in the midst of their baggage. Mr Pennant and some other writers tell us, that camels are made to go more expeditiously by being whistled to by the drivers; but this is at least not an universal practice, as we are told by Sonnini, that the Bedouin Arabs, who possess great numbers of camels, not only never use whistling themselves, but express much uneasiness when they hear others whistle.

When the caravan on these long journeys across the deserts find themselves in want of water, and have no other means of procuring it, it is not uncommon for them to kill a camel for the sake of the water contained in his stomach, which is said to be always sweet and pleasant.

This animal, so patient, and so obedient to the voice of man, has, however, his periodical fits of rage, at which he becomes wholly unmanageable. These fits take place at the rutting season, which happens every year about spring, and continues about 40 days. At these times they are quite outrageous, eat little, foam at the mouth, and bite at other animals, and even their masters; and they have been known to take up a man in their teeth, throw him on the ground, and trample him under their feet. Though so remarkably docile, except during the rutting season, they are, however, abundantly sensible of injustice and ill treatment: and, when they experience these, they seldom fail to shew their resentment, and endeavour to wreak their vengeance on their unfeeling driver, who will not find it easy to escape their vengeance, as they are said to retain for a long time the remembrance of an injury. Though eager to express their resentment, they seem incapable of harbouring any rancour, when they are once satisfied; and it is sufficient to make them believe that they have taken their desired vengeance on their persecutor. Whenever the Arab finds that he has excited the rage of his camel, as he well knows that the animal will take the first opportunity of seeking revenge, he lays down his clothes in a situation which the animal is to pass, and arranges them in such a manner as to seem as if he himself were lying there. The camel recognises the clothes, seizes them in his teeth, shakes them violently, and tramples them under his feet; but when his rage has been thus satisfied, he leaves them, and after this his owner may approach, load, and guide him as usual. M. Sonnini says, that he has sometimes seen them, when weary with the impatience of their riders, stop short, turn round their long necks to bite them, and utter cries of rage. Under these circumstances the rider must be careful not to dismount, or he would infallibly be torn in pieces; and he must also beware of striking the beast, as that would only increase his fury. Nothing can be done but to wait with patience, and endeavour to appease the animal by patting him with the hand. When once appeased, which sometimes is not speedily effected, he can proceed on his journey at his usual pace.

VOL. XII. Part II.

†

Genus 38. MOSCHUS, Musk.

Horns wanting; front teeth eight in the lower jaw; tusks solitary in the upper jaw, exerted.

There are 7 species, viz. 1. *Moschus Moschiferus*, Tibetan Musk. Gray-brown, with umbilical follicle.—2. *M. Indicus*, Indian M. Rufous, whitish below, with spurious hoofs, and somewhat lengthened tail.—3. *M. Pygmaeus*, Pygmy M. Reddish-brown, white below, without false hoofs.—4. *M. Meminna*, Meminna. Olive ash, white below, with the sides spotted with white, and no false hoofs.—5. *M. Javanicus*, Java M. Rusty, longitudinally white beneath, with villous tail, white below and at the tip, and small appendicular hoofs.—6. *M. Americanus*, American M. Rufous brown, with black muzzle and white throat.—7. *M. Delicatulus*, Leverian M. Rusty brown, spotted above with white.

Species 1. *Moschus Moschiferus*, Tibetan Musk.—This is an animal of considerable importance, as it is from it that the article musk, so useful as a medicine and perfume, is derived.

138
Mosciferus, Tibetan Musk.
Fig. 63.

The size and general appearance of this animal not ill resemble those of a small roebuck. It measures about three feet three inches in length, about two feet three inches in height from the tip of the shoulders to the bottom of the fore feet, and two feet nine inches from the top of the haunches to the bottom of the hind feet. The upper jaw is considerably longer than the lower, and is furnished on each side with a curved tusk about two inches long, and consequently exposed to view when the mouth is closed. These tusks are of a different form from those of any other quadruped, being sharp-edged on their inner or lower side, so as to resemble in some degree, a pair of small crooked knives; their substance is a kind of ivory, as in the tusks of the babyrussa and some other animals. The ears are long and narrow, of a pale yellow on the inside, and deep brown on the outside; the chin is of a yellowish cast; the general colour of the whole body a kind of deep iron-gray, the tips of the hairs being of a rusty cast, the remainder blackish, growing much paler or whitish towards the roots. Each hair is somewhat waved throughout its whole length; and is of a strong elastic nature, growing somewhat upright on the animal, and very thick. In some specimens the cheeks are whitish, and the sides of the neck marked by a longitudinal whitish band, descending to the breast, while the flank and sides are obscurely striped by a few waved whitish streaks; in others the colour is uniform, or as at first described; the hoofs are long and black, the tail extremely short, and so concealed by the fur as to be scarcely, if at all, visible on a general view.

The female is smaller than the male, and wants the tusks; it has also two small teats.

The musk animal is principally found in the kingdom of Tibet, in the province of Mohang Meng, Tonquin, and Boutan; and it is also found about the lake Baikal, and near the rivers Jenisea and Argun. Its favourite haunts are the tops of mountains covered with pines, where it delights to wander in places of the most difficult access, bounding with great celerity, and, when pursued, taking refuge among the most inaccessible summits.

3 T

It

History of
the Species.

It is hunted for the sake of the musk contained in its umbilical follicle, which is an oval receptacle, peculiar to the male, about the size of a small egg, hanging from the middle of the belly. As soon as the animal is killed, the hunters cut off the bag and tie it up for sale. Tavernier informs us, that in one of his eastern journeys, he purchased no fewer than 7673 of these bags; a proof how numerous these animals must be in the east. For the appearance and uses of musk, with the method of detecting its adulteration, see MUSK, MATERIA MEDICA Index. Besides the musk that they produce, the skins of these animals are useful as clothing. The Russians scrape off the hair, and prepare the leather, so as to render it as soft and bright as silk.

139
Cervus.

Gen. 39. CERVUS. DEER.

Horns solid, covered while young with a hairy skin, growing from the top, naked, annual, branched. Front teeth in the lower jaw eight. Canine teeth none (sometimes single in the upper jaw).

There are 12 species, viz.—1. *C. Alces*, Elk. With stemless palmated horns, and guttural caruncle.—2. *C. Tarandus*, Rein D. Branched, recurvate, round horns, with palmated extremities.—3. * *C. Elaphus*, Stag. Reddish brown, with cylindric, recurvate, branching horns.—4. * *C. Dama*, Fallow D. Yellowish brown, with slightly recurvate, compressed, branching horns, palmated at the top.—5. *C. Virginianus*, Virginian D. Pale brown, with slender round branched horns, bending forward, and slightly palmated at the tip.—6. *C. Axis*, Spotted Axis. Pale reddish brown, spotted with white, with slender three-forked horns.—7. *C. Pygargus*, Tailless Roe. Tailless, brown, yellowish below, white behind, with three-forked horns and nose surrounded with black.—8. *C. Mexicanus*, Mexican Roe. Red, with rough three-forked horns, bending forward.—9. *C. Porcinus*, Porcine D. Brown, ash-coloured below, with slender three-forked horns.—10. * *C. Capreolus*, Common Roe. Reddish brown, with branching, upright cylindric horns, bifid at the top.—11. *C. Muntjac*, Rib-faced D. With three-forked horns rising from a cylindric hairy base, with the upper fork hooked.—12. *C. Guineensis*, Gray D. Gray, blackish below.

140
Alces, Elk.
Fig. 64.

1. *C. Alces*, Elk, or Moose Deer.—In conformity with the opinion of most naturalists, we have given the two English names of Elk and Moose Deer as synonymous, though it is not yet clearly ascertained whether they are not really distinct species. The elk is by far the largest of the deer tribe, and if we may believe the accounts of some travellers, a full grown moose is many times bigger than an ox, the tips of its horns being sometimes nearly 12 feet asunder. Its shape is represented as very inelegant, having a short thick neck, large head, horns spreading out immediately from the base into a broad palmated form; a thick, broad, heavy upper lip, hanging considerably over the lower; high shoulders and long legs. Its colour is a dark grayish brown, much paler, or inclining to whiteness, on the legs, and beneath the tail. The hair, which is of a strong, coarse, and elastic nature, is much longer on the top of the shoulders and on the ridge of the neck than on the other parts, forming a kind of stiffish mane; beneath the neck the hair is also of considerable length, and in some specimens of the animal, a sort of caruncle or

pendent excrescence, covered with long hair, is seen hanging from beneath the throat; the eyes and ears are large, the hoofs broad, and the tail extremely short. It is usually bigger than a horse, and Mr Pennant estimates its greatest height at 17 hands, and its greatest weight at 1230 pounds. Its horns sometimes weigh 56 pounds; and on a moderate calculation, measure each about 32 inches in length. The female is smaller than the male, and is destitute of horns.

This animal inhabits both the Old and New Continent; but it is commonly called elk on the former, and moose deer on the latter. In Europe it is found chiefly in Sweden, Norway, and in some parts of Russia; in Asia it is met with most frequently in Siberia, where it is of a prodigious size; and in America it is most common in Canada, especially about the great lakes. It usually resides in the midst of forests, where it lives by browsing on the branches of the trees, as from its long legs and short neck it cannot easily graze from the ground. It feeds chiefly by night. Its usual pace is a high, shambling, but very swift trot, the feet being lifted very high; and, according to most writers, the hoofs during its running separate as they approach the ground in order to give the animal a better purchase, and come together again when they rise, producing a clattering noise that is heard at a considerable distance.

Its faculty of hearing is supposed to be more acute than either its sight or scent, which renders it very difficult to kill it in the summer time, as the Indians have then no other method of doing it but by creeping after it among the trees and bushes, till they get within gunshot. In winter, when the snow is so hard frozen that the natives can go upon it in their snow shoes, they are able frequently to run it down; for its slender legs break through the snow at every step, and plunge them up to the belly. It is so tender-footed, and so short-winded, that a good runner will generally tire it in less than a day; there have been some, however, that have kept the hunters in chase for two days. On these occasions the Indians, in general, take with them nothing more than a knife or bayonet, and a little bag containing implements for lighting a fire. When the poor animal is incapable of further speed, it stands, and keeps its pursuers at bay with its head and fore feet, in the use of the latter of which it is so dexterous, that the Indians are generally obliged to lash their knives or bayonets to the end of a long stick, and stab the elk at a distance. Some who have neglected this necessary precaution, and rashly attempted to rush in upon it, have received very serious blows from its fore feet. When wounded, it sometimes becomes furious, rushes boldly on the hunters, and endeavours to tread them down: in this case the men are frequently compelled to leave their outer garments, and escape into the trees.

When suddenly roused, and endeavouring to make its escape, the elk is observed at times to fall down, as if deprived for some moments of motion. Whether this be owing, as has been frequently imagined, to an epileptic fit, or whether it merely arises from fear, is not perhaps easy to determine. The fact, however, is too well authenticated to admit of our doubting it. This has given rise to the popular superstition of attributing to the hoofs the virtue of an antiepileptic medicine; and the Indians even still imagine that the elk has the power of curing itself of its own disorder, or of preventing an approaching

Pecora.

History of approaching fit, by scratching its ear with the hoof till it draws blood.

The female produces from one to three young at a time, generally about the end of April or beginning of May.

The elk is an animal of great utility. Its flesh is eaten, and is reckoned very good, but coarser and tougher than any other kind of venison; its tongue is excellent, and the fat of its nose is so much like marrow, as to be esteemed a great delicacy; its skin makes excellent tent covers and shoe leather, and the hair of its hams, which is of great length, is employed in stuffing saddles.

141
Tarandus.
Rein Deer.

2. *C. Tarandus*, Rein Deer.—This, in a domestic point of view, is the most useful animal to the natives of the countries where it resides, serving there most of the purposes of our horses. The height of this species, when full grown, is about four feet and a half. The body is rather of a thick and square form, and the legs shorter in proportion than those of the stag. Its general colour is brown above, and white below; but as it advances in age, it often becomes of a grayish white, and sometimes almost entirely white; the space about the eyes is always black. The hair on the under part of the neck is of much greater length than the rest, and forms a kind of hanging beard in that part. Both sexes are furnished with horns, but those of the male are much larger and longer than those of the female. The hoofs are long, large, and black, as are also the false or secondary hoofs behind; and these latter, while the animal is running, as was remarked of the elk, make a remarkable clattering sound, which may be heard at a considerable distance.

The female begins to breed at the age of two years, in season the latter end of September, goes with young eight months, and generally brings forth two at a time. The fondness of the dam for her young is very remarkable. They follow her for two or three years, but do not acquire their full strength until four. It is at this age that they are trained to labour, and they continue serviceable four or five years. They seldom live above 15 or 16 years.

The rein deer is found in all the northern regions of Europe, Asia, and America, particularly in Lapland, Siberia, and Greenland, where it is employed to draw the sledges of the inhabitants over the frozen snow. To this exercise the animals are accustomed from an early age. They are yoked to the sledge by a collar, from which a trace is brought under the belly between the legs, and fastened to the fore part of the sledge. These carriages are extremely light, and covered at the bottom with the skin of the rein deer. The person who sits in it guides the animal with a cord fastened to its horns; he drives it with a goad, and encourages it with his voice. Those of the wild breed, though by far the strongest, often prove refractory, and not only refuse to obey their master, but turn against him, and strike so furiously with their feet, that his only resource is to cover himself with his sledge, upon which the enraged creature vents his fury. The tame deer, on the contrary, is pliant, active, and willing. When hard pushed, the rein deer will trot the distance of 60 miles without stopping; but in such exertions, the poor obedient creature fatigues itself so exceedingly, that its master is obliged to kill it immediately, to prevent a lingering death that would

ensue. In general, they go about 30 miles without stopping, and that without any dangerous effort. This mode of travelling can be performed only in the winter season, when the face of the country is covered with snow; and although the conveyance is speedy, it is inconvenient, dangerous, and troublesome.

As the rein-deer constitutes the sole riches of the Laplander, it may well be supposed that a constant attention to preserve and secure it, forms the chief employment of his life. It is no uncommon thing for one person to possess above 500 in a single herd.

These animals are much tormented by gnats, and a species of gadfly, called by Linnæus *æstrus tarandi*. The havoc made among them by the latter is so great, that their skins are often found pierced almost full of holes.

The rein-deer has sometimes been brought into Europe, and Sir H. G. Liddle, Bart. had several of them in his possession, which he brought over from Lapland. They do not, however, seem to agree with the more temperate climates.

Gen. 40. CAMELOPARDALIS, GIRAFFE.

Horns permanent, bony, covered with a bristly skin. Front teeth in the lower jaw eight; the exterior one on each side deeply bilobate.

This genus was formed to include a single species that Linnæus and other naturalists had classed under *cervus*; but as the form and connection of its horns differ very materially from those of the deers and antelopes, it was judged better to constitute of it a new genus. This animal, with respect to its height, exceeds all other known quadrupeds, as it measures, when full grown, nearly 17 feet from the top of the head to the fore feet. The female is lower than the male. Notwithstanding the unusual proportions of this animal, its general form is in the highest degree elegant and picturesque; the head being small, the aspect mild, the neck extremely long and tapering, the fore parts much higher than the hinder, and the disposition of the colours singular and pleasing. At first view, the fore legs seem nearly twice the length of the hind; but this difference, on accurate examination, appears to result chiefly from the extraordinary height of the shoulders, compared with that of the thighs; accordingly, among the old writers who have described this animal, Petrus Gyllius perhaps approaches nearest to the truth, when he affirms, that all the legs or tibiae of the camelopardi are of nearly equal length, but that the fore thighs are so long in comparison with the hind, that the back appears inclined like the roof of a house.

The horns of the camelopardalis differ in texture from those of all other horned quadrupeds, forming, as it were, a part of the skull, and consisting of a porous bony substance covered externally with short, coarse, bristly hair; they terminate abruptly, on a flattish or slightly convex head, but little wider than the other part of the horn, and edged with bristles all around the outline. On the middle of the forehead is a considerable protuberance, owing to an elevation or bony rising on that part of the skull. From the head to the middle of the back runs a short stiffish mane. The tail is of moderate length, of a cylindrical form, gradually tapering towards the end, and terminating in a tuft of long hair. The hoofs are moderately large and black.

The fore part of the body is very thick and muscular, and the hind part thin and meagre. The ground colour of the animal is whitish, variegated on all parts with numerous, moderately large, and somewhat squarish spots, which in the male are brown, and in the female rusty. In the younger animals they are sometimes of a bright reddish-yellow. These marks or spots are of a somewhat less regular shape on the sides, than on the neck and shoulders.

This animal is an inhabitant of Africa, where it is found chiefly in Ethiopia, and other internal parts of the country, being rarely met with near the coasts. It resides in the forests, where it lives by browsing on the branches of trees. It is of a mild and timid disposition. When pursued, it trots so fast, that even a good horse is scarcely able to keep pace with it, and it continues its course for a long time without requiring rest. When it leaps, it lifts first the fore legs, and then the hinder ones, in the manner of a horse whose fore legs are tied together. Its general position, except when grazing, is, with the head and neck erect. It feeds principally on the leaves of trees, and particularly on those of a peculiar species of *mimosa*, common in the country where it is found, to which the extreme length of its legs and neck admirably adapt it. When it feeds from the ground, it is under the necessity of dividing its fore legs to a considerable distance. In preparing to lie down, it kneels like the camel.

It has been generally supposed that the giraffe possessed neither the power nor the strength to defend itself against the attacks of other animals; this, however, seems to be unfounded, for M. le Vaillant has asserted, that by its kicks it frequently wearies, discourages, and distances even the lion. The utility of the horns appears to be hitherto unknown; this writer says that they are not used as weapons of defence.

The giraffe is hunted by the Hottentots for the sake of its flesh, and its marrow, which latter they esteem as a great delicacy.

Gen. 41. ANTILOPE. ANTELOPES.

Horns hollow, seated on a bony core, growing upwards, ringed or wreathed, permanent. Front teeth in the lower jaw eight. Canine teeth none.

The individuals of this genus, with the exception of two or three species, inhabit the hottest parts of the globe, or at least those parts of the temperate zones that lie so near the tropics as to form a doubtful climate. None, therefore, except the *saiga* and the *chamois*, are to be met with in Europe; and notwithstanding the warmth of South America is suited to their nature, not a single species has yet been discovered in any part of the new world. Their proper climates seem, therefore, to be those of Asia and Africa, where the species are very numerous.

As there appears a general agreement in the nature of the species that form this great genus, it will prevent needless repetition to observe, that the antelopes are animals generally of a most elegant and active make; of a restless and timid disposition; extremely watchful; of great vivacity; remarkably swift and agile, and most of their boundings so light, so elastic, as to strike the spectator with astonishment. What is very singular is, that they will stop in the midst of their course, gaze

for a moment at their pursuers, and then resume their flight. Pecora.

As the chase of these animals is a favourite amusement with the eastern nations, from that may be collected proofs of the rapid speed of the antelope tribe. The greyhound, the fleetest of dogs, is usually unequal in the course, and the sportsman is obliged to call in the aid of the falcon, trained for the purpose, to seize on the animal, and impede its motions, in order to give the dogs an opportunity of overtaking it. In India and Persia a species of leopard is made use of in the chase. This is an animal that takes its prey not by swiftness of foot, but by the greatness of its springs, by motions similar to those of the antelope; but should the leopard fail in its first essay, the game escapes.

The fleetness of the antelope was proverbial in the country it inhabited, even in the earliest times: the speed of Asahel is beautifully compared to that of the tzebi, and the Gadites were said to be as swift as the antelopes upon the mountains. To this day the greatest compliment that can be paid to female beauty in the eastern regions is *Aine el czazel*, You have the eyes of an antelope.

Some species of antelopes form herds of 2000 or 3000, while others keep in troops of only five or six. They generally reside in hilly countries, though some inhabit plains. They often browse like the goat, and feed on the tender shoots of trees, from which their flesh acquires an excellent flavour. The flesh of most of the species is eaten, but that of some of them is said to taste of musk.

This is a very numerous genus, and most of the species are comparatively new, only six having been known to Linnæus, who ranked them under the genus *Capra*. The following are enumerated by Dr Shaw, though he confesses himself not certain that they are all distinct species.

A. With straight or nearly straight horns.

1. *Antelope Oryx*, Egyptian A. Gray, with black and white face, dusky dorsal stripe, and very long, tapering, sharply ringed horns.—2. *A. Leucoryx*, White A. Milk white, with very long, tapering, slightly ringed horns.—3. *A. Gazella*, Gazel. Bay, with slightly bowed, tapering, wrinkled horns.—4. *A. Orcas*, Indian A. Slate coloured, with reddish head, black mane on the neck and breast, and tapering wreathed horns.—5. *A. Ourebi*, Ourebi. Rusty brown, with the breast, belly, hind part of the thighs, and insides of the limbs, white; and small horns.—6. *A. Orcotragus*, Klipspringer. Yellowish tawney; whitish below, with very straight upright tapering horns, slightly wrinkled at their base.—7. *A. Scriptus*, Harnessed A. Chestnut-coloured, with white crossed stripes on the sides; and tapering wreathed horns.—8. *A. Grinnia*, Guinea A. Yellowish bay, with short horns, and black bristly tuft on the forehead.—9. *A. Pygmaea*, Pigmy A. With short convex horns, wrinkled at the base.

B. With curved, bent, or twisted horns.

10. *A. Picta*, Nyl-ghau. Slate-coloured, with the back of the neck and breast maned, the feet barred with black and white, and somewhat triangular horns bending forwards.—11. *A. Trajocamelus*, Indostan A. Gray, with maned neck and breast, dorsal protuberance, long

Pecora. long flocky tail, and tapering horns bending forwards.—12. *A. Bubalis*, Cervine A. Reddish brown, with large elongated head, thick, strongly wrinkled, lyrated horns, and longish tail.—13. *A. Strepsiceros*, Striped A. Reddish gray, with compressed spirally ridged horns, white longitudinal dorsal, and transverse lateral stripes. 14. *A. Cervicapra*, Common A. Tawney brown, white below, with round, lyrated, ringed horns.—15. *A. Lerwii*, Gambian A. Reddish, with the nape of the neck bearded, and recurved wrinkled horns.—16. *A. Saiga*, Saiga. Yellowish gray, with distant, semitransparent, lyrated, and ringed horns.—17. *A. Gutturosa*, Chinese A. Tawney, whitish below, with lyrated yellowish ringed horns, and prominent throat.—18. *A. Subgutturosa* Guldensted's A. Gray-brown, white below, with lyrated horns, and tumid throat.—19. *A. Euchore*, Springer. Yellowish brown, white below, with dark lateral stripe, lyrated horns, and expansile white patch above the tail.—20. *A. Arundinacea*, Ritbock. Ash-coloured, white below, with ringed horns, bending forwards.—21. *A. Sylvatica*, Bosbock. Brown-white below, the hind part of the body spotted with white, the horns spirally, and ringed.—22. *A. Eleotragus*, Cinereous. A. Gray, snow-white below, with spirally ringed horns.—23. *A. Dorcas*, Barbary A. Fulvous brown, white below, with lateral-brown band, and lyrated horns.—24. *A. Kevella*, Flat-horned A. Tawney-brown, white below, with brown lateral band, and compressed lyrated horns.—25. *A. Pygarga*, White-faced A. Rusty brown, white below, with brown lateral band, white rump, and lyrated horns.—26. *A. Corinna*, Corine. Fulvous brown, white below, with dark lateral band, and sublyrated, rather erect, smoothish horns.—27. *A. Sumatrensis*, Sumatran A. Black, with recurved horns, and whitish bristly mane between the shoulders.—28. *A. Leucophaea*, Blue A. Blue gray, with roundish arcuated, recurved, ringed horns.

C. With hooked horns.

29. *A. Gnu*, Gnu. Rusty brown, with maned neck, whitish tail, and horns directed forwards, and then suddenly backwards.—30. *A. Dama*, Nanguer. White, with fulvous back, and round horns, incurvated forwards.—31. *A. Ridunca*, Red A. Red brown, with round slightly ringed horns, recurved forwards at the tips.—32. *A. Rupicapra*, Chamois. Brown, with smooth upright horns, with the tips hooked forwards.

10. *A. Picta*, the Nyl-ghau. This curious animal was first described by Dr W. Hunter, in the Philosophical Transactions, vol. lxi. Its height is about four feet to the top of the shoulders, and it measures nearly about the same in length from the bottom of the neck to the base of the tail. It is of a fine slate colour, with a large white spot below the throat, and two white bands above each foot. Its ears are large, edged with white, white within, where they are marked with two black stripes. Along the top of the neck there is a slight black mane, continued to some distance down the back, and on the breast there is a much thicker mane, or tuft of the same colour. The tail is moderately long, and tufted at the end; the horns are short, pointed, smooth, and three-cornered at the base. The female resembles the male in general appearance, but

is considerably smaller. This animal is a native of the interior parts of India, and was a favourite object of the chase with the emperor Aurengzebe. Some years ago two of them were brought into England, and were kept some time by Dr Hunter, who has given the following account of its manners.

Although the nyl-ghau is usually reported to be exceedingly vicious, yet the one he had the care of was very gentle. It seemed pleased with every kind of familiarity, always licked the hand which either stroked it or gave it bread, and never once attempted to use its horns offensively. It seemed to have much dependence on the organs of smell, and snuffed keenly, and with considerable noise, whenever any person came within sight. It did the same when any food or drink was brought to it, and was so offended with an uncommon smell, or was so cautious, that it would not taste bread that was offered with a hand that had touched oil of turpentine or spirits.

Its manner of fighting was very particular; this was observed at Lord Clive's, where two males were put into a little inclosure, and it was thus related by his lordship. While they were at a considerable distance from each other, they prepared for the attack by falling down upon their fore knees, and when they were come within some yards, they made a spring, and darted against each other.

At the time that two of them were in his stable, Dr Hunter observed this particularity, that whenever any attempt was made on them, they immediately fell down upon their fore knees; and sometimes they would do so when he came before them; but as they never darted, he so little supposed this to be a hostile posture, that he rather supposed it to be expressive of a timid humility.

The intrepidity and force with which they dart against any object may be conceived, from an anecdote that has been related of the finest and largest of these animals that has ever been seen in England. A poor labouring man, without knowing that the animal was near him, and therefore neither meaning to offend, nor suspecting the danger, came up to the outside of the poles of the inclosure where it was kept; the nyl-ghau, with the swiftness of lightning, darted against the wood-work with such violence that he shattered it to pieces, and broke off one of his horns close to the root. This violence was supposed to occasion his death, which happened not long after. From this it appears, that at certain seasons the animal is vicious and fierce, however gentle it may be at other times.

Gen. 42. CAPRA, GOATS.

145
Capra.

Horns hollow, turning upwards and backwards, rough, almost close at their base. Front teeth in the lower jaw eight. No tusks. Chin bearded in the male.

There are eight species; viz.:

1. *C. Iber*, Ibex. Gray-brown, whitish below, with large horns, bending over the back; and bearded throat.—2. *C. Aegagrus*, Caucasian I. Gray brown, white below, with large, keeled, slightly wrinkled, bowed horns, and bearded throat.—3. **C. Hircus*, Common G. With bowed keeled horns, commonly turning outwards towards the end.—4. *C. Mambrica*, Syrian G.

With

History of
the Species.

With pendulous ears and horns reclined backwards.—
5. *C. Augorensis*, Angora G. With very long, pendent, spirally-curved hair.—6. *C. Depressa*, African G. With very small depressed horns, closely incumbent on the head.—7. *C. Reversa*, Whidaw G. With upright horns, recurved at the tips.—*C. Capricornus*, Capricorn G. With short horns, turning forwards at the tips, and ringed on the sides.

146
Ibex.
Fig. 67.

1. *Ibex*, Ibex.—As this is supposed to have been the original stock from which the common goat has been derived, we shall here give a short account of it.

This is an animal of great strength and activity, and is considerably larger than the common goat. It is of a deep hoary, or grayish brown colour, with a whiter shade below, and on the insides of the limbs. The body is thick and strong, the head rather small; eyes large, and the horns very large and long, so as sometimes to extend the whole length of the body. These are of a deep brown colour, and are marked above with transverse semicircular protuberances or knots. The legs are strong, with short hoofs; the tail is short, and the chin is furnished with a brown or dusky beard. The female is less than the male, and has smaller horns.

The ibex is found in several parts of Europe and Asia, chiefly in the mountainous parts of the country, especially the Carpathian and Pyrenean mountains, the Rhaetian Alps, Mount Taurus, the high lands between Eastern Tartary and Siberia, and on the mountainous parts of the island of Candia.

The flesh of the young ibex is said to be in good esteem as an article of food. Its period of gestation is said to be the same as in the common goat; viz. five months.

In its general habits or manners the ibex resembles the common goat, but possesses every attribute of strength and activity in a degree proportioned to its natural state of wildness. It delights to climb mountains, and hang upon the brinks of precipices; and its chase is in consequence considered, like that of the *chamois*, as in the highest degree difficult and laborious. It is even said, that when hard pressed, this animal will fling itself down a steep precipice, and falling on his horns escape unhurt from its pursuers; nor will this appear in the least incredible, if we may rely on the truth of *Monardes*, who assures us that he saw a *Caucasian ibex* leap from the top of a high tower, and, falling on its horns, immediately spring up on its limbs, and leap about without having received the least apparent injury.

Two or three hunters usually associate in this perilous occupation; they are armed with rifle-barreled guns, and furnished with small bags of provisions; they erect a miserable hut of turf among the heights, where, without fire or covering, they pass the night; and on awaking in the morning, they not unfrequently find the entrance blocked up with snow three or four feet deep. Sometimes, in pursuit of this animal, being overtaken by darkness, amid crags and precipices, they are obliged to pass the whole night standing, and embraced together, in order to support each other, and to prevent themselves from sleeping.

For an account of the common goat, we refer our readers to Buffon and Mr Pennant's *British Zoology*, where they will meet with every thing of consequence respecting that useful animal.

Gen. 43. OVIS, SHEEP.

Pecora.

147

Horns hollowed, wrinkled, turning backwards, and spirally twisted inwards. Front teeth eight in the lower jaw. Canine teeth none.

There are usually enumerated about eight species.

1. *Ovis Ammon*, Argali. With arched semicircular horns, flat below, and loose hairy dewlaps.—2. * *O. Aries*, Common S. With compressed lunated horns.—3. *O. Strepsiceros*, Cretan S. With upright, keeled, spirally twisted horns.—4. *O. Polycerata*. Many-horned S.—5. *O. Guineensis*, African S. With pendulous ears, loose hairy dewlaps, and head prominent at the back.—6. *O. Laticaudata*, Broad-tailed S.—7. *O. Steatopygia*, Fat-rumped S.—8. *O. Pudu*, Pudu. With smooth round diverging horns, and beardless throat.

148

2. *Ovis Aries*, Common Sheep.—In its present state of domestication, the sheep seems so far removed from a state of nature as to make it a difficult matter to point out its origin. But naturalists are now generally of opinion, that it has proceeded from the argali or wild sheep, (the *mouflon* of Buffon).

Climate, food, and, above all, the unwearied arts of cultivation, contribute to render this animal in a peculiar manner, the creature of man, to whom it is obliged to trust entirely for its protection, and to whose necessities it largely contributes. Though singularly inoffensive, and harmless even to a proverb, it does not appear to be that stupid, inanimate creature described by Buffon: "devoid of every necessary art of self-preservation, without courage, and even deprived of every instinctive faculty, we are led to conclude that the sheep, of all other animals, is the most contemptible and stupid." But amidst those numerous flocks which range without controul on extensive mountains, where they seldom depend upon the aid of the shepherd, it will be found to assume a very different character. In those situations, a ram or wedder will boldly attack a single dog, and often come off victorious; but when the danger is more alarming, they have recourse to the collected strength of the whole flock. On such occasions they draw up into a compact body, placing the young and the females in the centre, while the males take the foremost rank, keeping close to each other. Thus an armed front is presented to all quarters, and cannot be easily attacked without danger of destruction to the assailant. In this manner they wait with firmness the approach of the enemy; nor does their courage fail them in the moment of attack; for when the aggressor advances within a few yards of the line, the rams dart upon him with such impetuosity, as lays him dead at their feet, unless he save himself by flight. Against the attacks of single dogs or foxes, when in this situation, they are perfectly secure. A ram, regardless of danger, will sometimes engage a bull, and his forehead being much harder than that of any other animal, he seldom fails to conquer. The bull, by lowering his head, receives the stroke of the ram between his eyes, which usually brings him to the ground.

In the selection of their food, few animals discover greater sagacity than the sheep, nor does any domestic animal shew more dexterity and cunning in its attempts to elude the vigilance of the shepherd, in order to steal such delicacies as are agreeable to its palate.

Besides

Pecora.

Besides its hardness in enduring great severities of weather, the natural instinct of the sheep, in foreseeing the approach of a storm, is no less remarkable. In their endeavours to secure themselves under the shelter of some hill, whole flocks have frequently been buried for many days under a covering of snow, and have afterwards been taken out without any material injury.

There have been instances, where sheep, at the approach of a storm, have fled for shelter to a neighbouring cottage, and taken refuge under the same roof with their shepherd.

The variety in this creature is so great, that scarcely any two countries produce sheep of the same kind. There is found a manifest difference in all, either in the size, the covering, the shape or the horns. The woolly sheep is found only in Europe, and the temperate provinces of Asia. When transported into warmer climates, it loses its wool, and becomes rough and hairy, is less fertile, and its flesh no longer retains the same flavour.

No country produces finer sheep than Great Britain; their fleeces are large, and well adapted to the purposes of clothing. The Spanish fleeces are indeed finer, but for utility cannot be compared with those of Lincolnshire or Warwickshire. In Edward III.'s time, when wool was allowed to be exported, it brought into the kingdom 150,000*l.* per annum, at the rate of 2*l.* 10*s.* a pack. At this time, when our woollen manufactory stands unrivalled by any nation of the world, and when every method is taken to prevent this valuable commodity from being sent out of the kingdom, the annual value of wool shorn in England is supposed to be about 5,000,000*l.* sterling, and when manufactured together with the Spanish wool imported, amounting to about 600,000*l.* the total value must be above 20,000,000*l.*

Two of the front teeth in the sheep drop out before they are two years old, at which time they are replaced by others; at three years old, four of them are renewed, and the remainder at the age of four.

The ewe produces one or two lambs at a time, and sometimes, though rarely, three or four. She bears her young five months, and brings forth in the spring. The ram lives to the age of about 15 years, and begins to procreate at one. When castrated, they are called wethers. They then grow sooner fat, and the flesh becomes finer and better flavoured.

There is hardly any part of this animal that is not serviceable to man: of the fleece we make our clothes; the skin produces leather, of which are made gloves, parchment, and covers for books; the entrails are formed into strings for fiddles, and other musical instruments, likewise coverings for whips; its milk affords both butter and cheese, and its flesh is a delicate and wholesome food.

To the foregoing account of the sheep, for which we are indebted to Mr Bewick, we shall add a few remarks from Mr Cully's observations on live stock, on the most remarkable breeds of sheep at present cultivated in this country.

Mr Cully begins with those of Lincolnshire, which are of a large size, big-boned, and afford a greater quantity of wool than any other kind, owing to the rich fat marshes on which they feed, but their flesh is coarse, leaner, and not so finely flavoured as that of smaller sheep. The same breed extends, with some va-

riations, through most of the midland counties of England. But the largest breed of sheep in this island, is to be met with on the banks of the Tees, which runs through a rich and fertile country, dividing the two counties of Yorkshire and Durham. This kind differs from the preceding, in their wool not being so long and heavy; their legs are longer, but finer boned, and support a thicker, firmer carcass. Their flesh is likewise much fatter, and finer grained. These sheep weigh from 25 to 45 lbs. per quarter; some have been fed to 50 lbs. and one in particular was killed which weighed 62 lbs. 10 oz. per quarter, avoirdupois; a circumstance never before heard of in this island. The ewes of this breed generally bring forth two lambs each season; sometimes 3, 4, and even 5. As an instance of extraordinary fecundity, it deserves to be mentioned, that one of these ewes at the age of two years, brought forth six lambs at one time, the next season five, both within 11 months.

The Dorsetshire breed is likewise remarkably prolific, the ewes being capable of bringing forth twice a year. It is from these, that the tables of our nobility and gentry are supplied with early lamb at Christmas, or sooner if required. Great numbers of those early victims to luxury are yearly sent to the London markets, where they are sold at the enormous price of 1*s.* 6*d.* or perhaps 1*5s.* per quarter. The manner of rearing the lamb is curious. They are imprisoned in little dark cabins; the ewes are fed with oil-cakes, hay, corn, turnips, cabbages, or any other food which the season of the year affords; these are given them in a field, contiguous to the apartments where the lambs are kept; and at proper intervals, the nurses are brought in to give suck to their young ones, while the attendants, at the same time make their lodgings perfectly clean, and litter them with fresh straw. Great attention is paid to this, as much of the success of rearing these unseasonable productions depends upon warmth and cleanliness.

The Dorsetshire sheep are mostly white-faced, their legs are long and small, and great numbers of them have no wool upon their bellies, which gives them an uncouth appearance. They produce a small quantity of wool, but of a good quality, from which our fine Wiltshire cloths are made. The mutton of these sheep is very sweet and well flavoured. The variations of this breed are spread through most of the southern counties; but the true kind is only to be found in Dorsetshire and Wiltshire. There is a breed, not unlike this, in Norfolk and Suffolk, but they are all gray or black-faced.

For some observations on feeding sheep, see AGRICULTURE, N^o 600; for the best method of providing them with shelter against the weather, see FARRIERY, N^o 109; and for some account of their diseases, with the most approved methods of treatment, see the same article, Part vi. *passim*.

Gen. 44. Bos, Ox.

149
Bos.

Horns concave, turned outwards, lunated, smooth. Front teeth eight in the lower jaw. Canine teeth none.

There are numerous varieties, but naturalists have not distinguished more than about six species; viz.

1. * *Bos Taurus*, Common O. With round horns curving outwards, and loose dewlap.—2. *B. Arnee*, Arnee. With

History of
the Species

With upright luted horns, flat and wrinkled in their upper surface.—3. *B. Bubalus*, Buffalo. With horns lying backwards, turning inwards, and flat on the fore part.—4. *B. Moschatus*, Musk O. With very long pendent hair, and horns approximated at the base, bending inwards and downwards, and outwards at the tips.—5. *B. Grunniens*, Yak. With cylindric horns curving outwards, very long pendent hair, and extremely villous horse-like tail.—6. *B. Caffer*, Cape O. With the horns very broad at the base, then spreading downwards, next upwards, and at the tips curving inwards.

150
Common
Ox.

1. *Bos Taurus*, Common Ox.—Few animals are more widely diffused over the globe than the common ox. Under different names, distinguishing several varieties, it is found in a wild or domestic state throughout almost the whole of the old continent, in most of the European and Asiatic islands, and is very abundant in several parts of America. It seems capable of enduring equally the rigours of heat and cold, and inhabits the frozen as well as the most scorching climates. Most animals preserve nature in their form with inflexible perseverance, but the ox appears to suit himself in every respect to the wants and conveniences of mankind. In no animal is there to be found a greater variety of kinds, and in none a more humble and tractable disposition. Though in many countries these animals are larger than those of Britain, yet on the whole our cattle are to be preferred, both for beauty of form, excellence of flesh, and general utility, to those of most other countries.

The climate of the British isles is, above most others, productive of the greatest variety and abundance of wholesome vegetables, which are most equally diffused throughout every part of them. Hence the number, variety, and excellence of our cattle, the richness of our dairies, and innumerable other advantages. Cæsar speaks of the numbers of our cattle, and adds that we neglected tillage, but lived on milk and flesh. Strabo takes notice of our plenty of milk, but says we were ignorant of the art of making cheese. Mela informs us that the wealth of the Britons consisted in cattle; and in his account of Ireland reports that such was the richness of the pastures in that kingdom, that the cattle would even burst if they were suffered to feed in them long at a time.

This preference of pasturage to tillage was delivered down from our British ancestors to much latter times; and continued equally prevalent during the whole period of our feudal government: the chieftain whose power and safety depended on the promptness of his vassals to execute his commands, found it his interest to encourage those employments that favoured that disposition; the vassal, who made it his glory to fly at the first call to the standard of his chieftain, was sure to prefer that employment which might be transacted by his family with equal success during his absence. Tillage would require an attendance incompatible with the services he owed the ba-

ron: while the former occupation not only gave leisure for those duties, but furnished the hospitable board of his lord with ample provision, of which the vassal was equally partaker. The relics of the larder of the elder Spencer are evident proofs of the plenty of cattle in his days; for after his winter provisions may have been supposed to be mostly consumed, there were found, so late as the month of May, in salt, the carcasses of no fewer than 80 beeves, 600 bacons, and 600 muttons. The accounts of the several great feasts in after times, afford amazing instances of the quantity of cattle that were consumed in them. This was owing partly to the continued attachment of the people to grazing; partly to the preference that the English at all times gave to animal food. The quantity of cattle that appear from the latest calculation to have been consumed in London, is a sufficient argument of the vast plenty of these times; particularly when we consider the great advancement of tillage, and the numberless variety of provisions, unknown to past ages, that are now introduced into these kingdoms from all parts of the world.

This animal seems to have originated from a large wild variety called the bison, distinguished by its general largeness, particular strength of its fore parts, and a thick shaggy mane and beard about its neck and chin. This variety is found both in Europe and America, and from all this the varieties at present met with are descended. Besides the bison, and what may strictly be called the common ox, writers enumerate under this species the varieties called *zebu*, distinguished by a small single bunch over the shoulders; the *Indian ox*, having a very large double or treble protuberance over the shoulders; the *loose-horned ox*, whose horns seem attached only by the skin; the *boury*, having a protuberance on the back; the *Tinian ox*, of a white colour with black ears; and several other less important varieties. In Britain we distinguish chiefly the *Holstein* breed, the *Lancashire* and *Lincolnshire* breeds, the *Kyloe* or Highland cattle, the *Alderney* cow, and a particular species of wild cattle.

In most points of view, the female of this species is of more importance than the male. The cow goes with young nine months, and seldom produces more than one at a time. She has, as is well known, four teats, which, in proportion to her young, is a peculiarity scarcely to be found in any other animal, the females of which seldom have more teats than are sufficient to suckle the number of young which they produce.

The age of a cow is known by its horns. At the age of four years, a ring is formed at their roots, and every succeeding year another ring is added. Thus, by allowing three years before their appearance, and then reckoning the number of rings, the creature's age may be exactly known (H).

The quantity of milk given by cows is very various; some will yield only about six quarts in one day, while others give from 10 to 15, and sometimes even 20.
The

(H) In the earlier editions of his natural history, Buffon asserted that the bull and cow shed their horns at the age of three years, and at this time had them replaced by others that were permanent. As this mistake was corrected in one of his supplemental volumes, we should not now have thought it necessary to notice it, had we not seen it copied into a late work of considerable merit, and seemingly the result of much experience, Mr John Lawrence's Treatise on Cattle, p. 17.

Pecora.

The richness of the pasture contributes not a little to its increase. There have been instances of cows giving upwards of 30 quarts of milk in one day. In such cases there is a necessity for milking them thrice. From the milk of some cows, 12lbs. or 14lbs. of butter are made in a week.

It is a curious fact, that, in some instances, cows are naturally barren; and this is said to happen when a cow brings forth two calves, one of them a male, the other a female: the former is a perfect animal, but the latter is incapable of propagation, and is well known to farmers under the denomination of a *free-martin*. It resembles the ox, or spayed heifer, in figure, and is considerably larger than the cow. It is sometimes preserved by the farmer, for the purpose of yoking with the oxen, or fattening for the table. Mr Hunter observes, that the flesh of the free-martin, like that of the ox, is in common much finer in the fibre than either the bull or cow. It is supposed to exceed that of the heifer in delicacy of flavour, and bears a higher price at market*.

* See Hunter on the animal economy.

It is unnecessary to enlarge further on the ox in a domestic state. We shall therefore only give a short account of a very singular species of wild cattle that were formerly found in this country, but which are now nearly extinct.

Numerous herds of them were kept in several parts of England and Scotland, but they have been destroyed by various means. The only breeds now remaining in the kingdom are in the park at Chillingham-castle in Northumberland; at Wollaton in Nottinghamshire, the seat of Lord Middleton; at Gisburne, in Craven, Yorkshire; at Limehall in Cheshire, and at Chartley in Staffordshire.

The principal external appearances which distinguish this breed of cattle from all others are the following. Their colour is invariably white, muzzles black; the whole of the inside of the ear; and about one-third of the outside, from the tip downwards, red; horns white, with black tips, very fine, and bent upwards. Some of the bulls have a thin upright mane, about one inch and a half or two inches long.

At the first appearance of any person, they set off in full gallop, and at the distance of 200 or 300 yards, make a wheel round, and come boldly up again, tossing their heads in a menacing manner. On a sudden they make a full stop, at the distance of 40 or 50 yards, looking wildly at the object of their surprise; but upon the least motion being made, they all again turn round, and fly off with equal speed, but not to the same distance. Forming a short circle, and again returning with a bolder and more threatening aspect than before, they approach much nearer, probably within 30 yards, when they make another stand, and again fly off. This they do several times, shortening their distance, and advancing nearer, till they come within ten yards, when most people think it prudent to leave them, not choosing to provoke them further, for there is little doubt but in two or three turns more they would make an attack.

The mode of killing them was, perhaps, the only modern remains of the grandeur of ancient hunting. On notice being given, that a wild bull would be killed on a certain day, the inhabitants of the neighbourhood came mounted, and armed with guns, &c. sometimes to the amount of 100 horse and 500 foot, who

VOL. XII. Part II.

stood upon walls, or got into trees, while the horsemen rode off the bull from the rest of the herd, until he stood at bay, when a marksman dismounted and shot. At some of these huntings, 20 or 30 shots have been fired before he was subdued. On such occasions the bleeding victim grew desperately furious, from the smarting of his wounds, and the shouts of savage joy that were echoing from every side. But, from the number of accidents that happened, this dangerous mode has been little practised of late years; the park-keeper alone generally shooting them with a rifled gun at one shot.

When the cows calve, they hide their calves for a week or ten days in some sequestered situation, and go and suckle them two or three times a-day. If any person come near the calves, they clap their heads close to the ground, and lie like a hare in form, to hide themselves. This is a proof of their native wildness, and is corroborated by the following circumstance that happened to the writer of this narrative, who found a hidden calf, two days old, very lean, and very weak. On stroking its head, it got up, pawed two or three times like an old bull, bellowed very loud, stepped back a few steps, and butted at his legs with all its force: it then began to paw again, bellowed, stepped back, and butted as before; but knowing its intention, and stepping aside, it missed him, fell, and was so very weak that it could not rise, though it made several efforts. But it had done enough. The whole herd were alarmed, and coming to its rescue, obliged him to retire; for the dams will allow no person to touch their calves without attacking them with impetuous ferocity. When any one happens to be wounded, or is grown weak and feeble through age or weakness, the rest of the herd set upon it, and gore it to death.

The weight of the oxen is generally from 30 to 50 stones the four hind quarters, the cows about 30. The beef is finely marbled, and of excellent flavour*.

There is scarcely any part of the ox that is not some use to mankind. Boxes, combs, knife-handles, and drinking vessels, are made of the horns. These, when softened with boiling water, become so pliable, as to be formed into transparent plates for lanterns; an invention ascribed to King Alfred, who is said to have first used them to preserve his candle time-measures from the wind. Their dung is useful for manure. Glue is made of the cartilages, gristles, and the finer pieces of cuttings and parings of the hides, boiled in water till they become gelatinous, and the parts sufficiently dissolved, and then dried. The bone is a cheap substitute, in many instances, for ivory. The thinnest of the calves-skins are manufactured into vellum. The blood is used as the basis of Prussian blue. Saddlers and others use a fine sort of thread, prepared from the sinews, which is much stronger than any other equally fine. The hair is valuable in various manufactures, and the suet, fat, and tallow, for candles. The utility of the milk and cream is well known.

From the circumstance of these animals furnishing the Gentoos with milk, butter and cheese, their favourite food, they bear for them a superstitious veneration, founded thus principally in gratitude. There is

3 U

scarcely

History of the Species.

* Bewick's Quadrupeds.

History of scarcely a Gentoo to be found that would not, were he under a forced option, prefer sacrificing his parents or children to the slaying of a bull or cow.

For the application of oxen to the purposes of agriculture, and for the best methods of rearing, breeding, and feeding of cows and cattle, see AGRICULTURE; for an account of the internal structure of this genus, see ANATOMY, Part IV. Chap. IV. Sect. III.; for the construction of byres or cow-houses, with some observations on the feeding of cows and calves, see FARRIERY, Part IV.; and for the diseases incident to cattle, with their treatment, see the same article, Part VI.

151
Grunniens,
Yak of Tar-
tary.
Fig. 71.

3. *B. Grunniens*, Yak, or Grunting Ox.—The best account of this singular species is that given by Captain Turner, in his account of an embassy to Tibet. It is as follows.

The yak of Tartary, called *soora goy* in Hindostan, and which Captain Turner terms the *bushy-tailed bull of Tibet*, is about the height of an English bull, which it resembles in the general figure of the body, head, and legs. He could discover between them no essential difference, except that the yak is covered all over with a thick coat of long hair. The head is rather short, crowned with two smooth round horns, which, tapering from the root upwards, terminate in sharp points; they are arched inwards, bending towards each other, but near the extremities are a little turned back. The ears are small; the forehead appears prominent, being adorned with much curling hair; the eyes are full and large; the nose small and convex; the nostrils small; the neck short, describing a curvature nearly equal both above and below; the withers are high and arched. The rump is low; over the shoulder rises a thick muscle, which seems to be the same kind of protuberance peculiar to the cattle of Hindostan, covered with a profusion of soft hair, which in general, is longer and more copious than that along the ridge of the back to the setting on of the tail. The tail is composed of a prodigious quantity of long, flowing, glossy hair, and is so abundantly furnished, that not a joint of it is perceptible; but it has much the appearance of a large cluster of hair artificially set on; the shoulders, rump, and upper part of the body, are clothed with a sort of thick soft wool, but the inferior parts with straight pendent hair that descends below the knee; and Captain Turner has seen it so long in some cattle, which were in high health and condition, as to trail upon the ground. From the chest between the legs, issues a large pointed tuft of straight hair, growing somewhat longer than the rest; the legs are very short; in every other respect he resembles the ordinary bull.

These cattle, though not large-boned, seem, from the profuse quantity of hair with which they are provided, to be of great bulk. They have a downcast heavy look, and appear, what indeed they are, sullen and suspicious, discovering much impatience at the near approach of strangers. They do not low loud like the cattle of Britain, any more than those of Hindostan, but make a low grunting noise, scarcely audible, and that but seldom, when under some impression of uneasiness. These cattle are pastured in the coldest parts of Tibet, upon the short herbage peculiar to the tops of mountains and bleak plains. The chain of mountains situ-

ated between the latitudes of 27° and 28°, which divides Tibet from Boutan, and whose summits are most commonly clothed with snow, is their favourite haunt. In this vicinity the southern glens afford them food and shelter during the severity of winter; in milder seasons, the northern aspect is more congenial to their nature, and admits a wider range. They are a very valuable property to the tribes of itinerant Tartars, called *Duck-ba*, who live in tents, and tend them from place to place; they at the same time afford their herdsmen an easy mode of conveyance, a good covering, and wholesome subsistence. They are never employed in agriculture, but are extremely useful as beasts of burden, for they are strong, sure-footed, and carry a great weight. Tents and ropes are manufactured of their hair; and among the humbler ranks of herdsmen, he has seen caps and jackets made of their skins. Their tails are esteemed throughout the east, as far as luxury and parade have any influence on the manners of the people; and on the continent of India they are found, under the denomination of *chauries*, in the hands of the meanest grooms, as well as occasionally in those of the first minister of state. They are in universal use for driving away winged insects, flies, and musketoos, and are employed as ornamental furniture upon horses and elephants; yet the best requital with which the care of their keepers is at length rewarded, for selecting them good pastures, is in the abundant quantity of rich milk which they give, and the butter produced from it, which is most excellent. It is their custom to preserve this in skins or bladders, and the air being thus excluded from it, it will keep in this cold climate throughout the year; so that, after some time tending their herds, when a sufficient store is accumulated, it remains only to load their cattle, and drive them to a proper market with their own produce, which constitutes, to the utmost verge of Tartary, a most material article of commerce.

Dr Pallas informs us, that the calves of this species, when first born, are covered with a strong woolly hair, resembling that of a water spaniel, and that in about three months they begin to acquire the long hair of the throat, lower parts, and tail.

This animal was described by Ælian, under the name of *Poephagus*.

This order contains eight genera and about 82 species.

CHAP. VI. BELLUÆ.

Genus 45. EQUUS. HORSE.

152
Equus

Front teeth in the upper jaw six, parallel. In the lower jaw, six, somewhat projecting. Canine teeth, one on each side, in both jaws, remote from the rest. Feet with undivided hoofs.

Dr Shaw enumerates six species, viz. 1. * *Equus Caballus*, The Horse.—Tail uniformly covered with long hair.—2. *E. Hemionus*, Jickta. Of an uniform colour, without a distinct humeral cross, with naked tail haired at the tip.—3. * *E. Asinus*, Ass. Blackish cross over the shoulders, and tail tipped with long hair.—4. *E. Zebra*, Zebra. Variegated with numerous dark brown stripes.—5. *E. Quagga*, Quagga. Rather rusty,

ty, whitish below, striped above with brown. Spotted towards the hind parts.—6. *E. Bisuleus*, Cloven-footed H. With cloven hoofs.

1. *Equus Caballus*, Common H.—Though it is in a state of domestication that we are chiefly to consider this most noble animal, we must first, however, mention a few circumstances respecting him in his native state of liberty.

Horses are found wild in several parts of the globe. Large herds of them are occasionally seen in the southern parts of Siberia, and in the great Mongolian deserts, and among the Kalkas to the north-west of China. They are also found in the deserts on each side the river Don; but it is supposed that these are descended from the Russian horses employed in the siege of Asoph, in the year 1697, who being turned loose for want of forage, escaped into the deserts, and their descendants have gradually acquired the appearance of native wildness.

The horse in its wild state is considerably smaller than most of our domestic horses, and possesses much less symmetry of form. He is extremely swift, active and vigilant, and like some other tribes of animals, these horses have always a centinel, who by a loud neigh gives notice to the herd of approaching danger, when they all gallop off with astonishing rapidity.

In South America there are also found large herds of wild horses; but these are of Spanish origin, derived from those that were carried over by the first conquerors of America. They are now become so numerous as to live in herds, some of which are said to consist of 20,000. As soon as they perceive domestic horses in the fields, they gallop to them, caress, and by a kind of grave and prolonged neighing, invite them to run off. The domestic horses are soon seduced, unite themselves to the independent herd, and depart along with them. It happens not unfrequently that travellers are stopped on the road by the effect of this desertion. To prevent this, they halt as soon as they perceive these wanderers, watch their own horses, and endeavour to frighten away the others. In this case the wild horses resort to stratagem; some are detached before, and the rest advance in a close column, which nothing can interrupt. If they are so alarmed as to be obliged to retire, they change their direction, but without suffering themselves to be dispersed. Sometimes they make several turns round those they wish to seduce, in order to frighten them, but they often retire after making one turn. When the inhabitants wish to convert some of these wild horses into domestic ones, which they find not very difficult to be done, persons mounted on horseback attack a troop of them, and when they approach them, they throw ropes with great care round their legs, which prevent them from running away. When brought home they are tied with a halter to a stake or tree, without food or drink for two or three days. After this they are cut, and then broke in the same manner as the domestic horses. They soon become docile; but if not carefully watched, will again join their wild friends.

The attention with which the wild horses of Siberia protect their young, is finely exemplified in a communication by a gentleman in that country to the editor of the Bee. The wild horse, he says, though a grega-

rious animal, does not go in promiscuous flocks like cattle or sheep; but each male chooses for himself a certain number of females, with whom alone he associates during the whole year, beating off every other male which offers to approach them. The strongest of course has the best harem, and the weaker are obliged to go without any. But when he has once fixed himself, he defends his own property, never attempting to encroach on that of another. The battles that are fought for the females at the beginning of the season are furious, and often prove fatal to one of the parties; but when the victory is once decided, the weakest never afterwards for that season dispute for superiority.

The horse, when he has once obtained his females, governs them with despotic authority. Whenever he calls upon them they must obey, otherwise they are punished severely; and the mares are so sensible of this, that they discover every symptom of the most perfect obedience to their lord and master.

His government, however, is founded on love, and his authority is exercised, rather for the protection of his subjects, than their injury. The great enemy they have there to dread is the wolf; and if the horse did not take care to keep them close together, so as to receive the benefit of his protection, they would be soon exterminated. It is the foals only that the wolf ever attacks, and against his attacks they are much upon their guard. When they see any appearance of danger, the horse gives the call, and they all instantly gallop up to him. The foals are then put all together, and the mares laying their heads together above the foals, form a circle all round with their heels outward, ready to strike their enemy if he approaches. The horse in the mean time remains without the circle to be ready to attack wherever the danger shall be greatest. One wolf dares never make the attack by himself. When they come up, the horse gallops round his family, trampling to death every one he can reach, or tearing them with his teeth; and so strong is his bite when thus enraged, that they frequently have been known with a single gnash of their teeth, to break the back of a wolf, and to kill him entirely. It seldom happens that the wolves prevail in this contest; and they so much dread the power of this noble animal, that they seldom make the attack unless when they are much pinched with hunger.

This breed of horses, though nimble and active, are not of a very large size. The hunting of these horses, which is only attempted by the natives for catching them alive, especially the young ones, is attended with difficulty and danger, and must not be attempted without due precautions*.

In a domestic or improved state, the horse is found in almost every country of the world, except within the Arctic circle; but he is found in his highest perfection in Arabia, where he seems as little degenerated in his race and powers as the lion or tiger of the African forests. To the Arabian hordes the horses are as dear as their children; and the constant intercourse arising from living in the same tent with their owner and his family, creates a familiarity that could not otherwise be effected, and a tractability that arises only from the kindest usage. They are the fleetest animals of the desert, and are so well trained as to stop in their

* Bee, vol. xvii. p. 98.

History of the Species. most rapid course, by the slightest check of the rider. Unaccustomed to the spur, the least touch with the foot sets them again in motion, and so obedient are they to the rider's will, as to be directed in their course merely by the motion of a switch. They form the principal riches of many of the Arab tribes, who use them both in the chase and in their plundering expeditions. In the day time they are generally kept saddled at the door of the tent, prepared for any excursion their master may take. They never carry any heavy burdens, or are employed on long journeys. Their constant food, except in spring, when they get a little grass, is barley, which they are suffered to eat only during the night. The Arab, his wife, and children, always lie in the same apartment with the mare and foal, who, instead of injuring them, suffer the children to rest on their necks and bodies without incommoding them in the least. The poor gentle animals even seem afraid to move lest they should hurt them. The Arabs never beat or correct their horses, but always treat them with the utmost kindness. They talk to and reason with them.

The whole stock of a poor Arabian of the desert, consisted of a beautiful mare; this the French consul at Saïd offered to purchase, with an intention to send her to Louis XIV. The Arab, pressed by want, hesitated for a long time, but at length consented, on condition of receiving a very considerable sum of money, which he named. The consul wrote to France for permission to close the bargain, and having obtained it, sent immediately to the Arab the information. The man, so poor as to possess only a miserable rag, a covering for his body, arrived with his magnificent courser, and looking first at the gold, and then stedfastly at his mare, heaved a deep sigh. "To whom is it (he exclaimed) that I am going to yield thee up? To Europeans! who will tie thee close, who will beat thee, who will render thee miserable. Return with me, my beauty, my jewel! and rejoice the hearts of my children!" As he pronounced the last words, he sprang upon her back, and was out of sight almost in a moment.

The horses of France are thus characterized by Buffon. Those of Bretagne are pretty strongly made, and have generally black hair, or brown bay; and they have good legs and feet, with a hardy mouth, and a head short and fleshy, but in general they are rather clumsy. The horses of Franche Comté are said to have the legs of tigers, and belly of a hind; but they are short and thick, and of a middle size, being much more proper for drawing than riding. The horses of Gascony are not unlike those of Spain; but they are not so handsome nor so active, and therefore they are more proper to draw carriages. The Limosin horses are very vicious, and are good for little till they are six years old. Their colour is generally bay, or a bay brown. The horses of Normandy are much like those of Bretagne; and those of Poitou have good bodies, legs, feet and eyes, but they are far from being handsome.

The horses of Germany are much better and handsomer than those of the Low Countries. They are of great use for carriages, but much more for the army, and for drawing the artillery. They have a great deal of hair, especially about the legs. They are not large,

but they are well set, and yet they have tender feet. The Hungarian horses are excellent for the coach, as well as for riding; but they are large, though well proportioned; and they are of all colours, and in general very swift.

The Danish horses are low, short, and square; but they have a fine head, and short hair. The horses of the Low Countries are very fit for the coach, and they are best known by the name of *Flanders mares*. The Polish horses are like the Danish, only they have not so fine a forehead; their colour is generally a bright bay, and that of the outward peel of an onion, and they are fiery and vicious. The horses of Switzerland are pretty much like those of Germany, which is not surprising, since the Germans purchase a great number of them. The horses of Piedmont are fiery, of a middle size, and of all sorts of colours; their legs are good and handsome, their eyes fine, their ears small, and their mouths good; but they do not carry their heads well.

The horses of Naples and Italy are generally ill made and lean, and yet they are good and useful, for they are light and proper for racing, though not for a long course; they never do well in a colder climate. The Spanish horses are very well made and handsome, as well as very active and nimble; they have good eyes, handsome legs and heads, and are easily managed; they are also good for racing, if they are well kept; however, they are not so good in northern climates as in their own country. The Turkish horses are of different shapes, but they are generally swift, though their mouths are bad. Most of them are white, though there are other colours, and they are large, hardy, strong, and fit for the road.

The horses of Barbary, commonly called *barbs*, have strong hoofs, and are more proper for racing than any others whatever; some have said they never grow old, because they preserve their vigour to the last. They are excellent stallions, and some of them are used as such in Britain; however, the Arabian horses are not quite so good as the Barbary, though some think they are both of the same kind; only those that are used to the deserts of Arabia are always in action. The horses of the Gold coast of Guinea are very few in number, and in other parts of that coast there are none at all; for many of the negroes, when they have been first brought over to our American plantations, have expressed great admiration at the sight of the horse, and even been afraid to come near one.

The horses of the Cape were originally brought from Persia, and they are small, of a chestnut colour, as the natives of that country are all wild, and could never be tamed. The horses of China are good, and more particularly those in the province of Yun Nan, for they are vigorous, though rather low. The horses of the Eluth Tartars are good and full of fire, and their size is much the same as that of the Polish horses; they are afraid of nothing, not even of lions and tigers, but this perhaps may be owing to use. In the country of the Moguls they are very numerous, and of all colours; they are generally of the middle size, though some are as large and handsome as those of Europe.

The breed of horses in Great Britain is as mixed as that of its inhabitants. The frequent introduction of foreign horses has given us a variety, that no single country

Bellum.

country can boast of; most other countries produce only one kind, while ours, by a judicious mixture of the several species, by the happy difference of our soils, and by our superior skill in management, may triumph over the rest of *Europe*, in having brought each quality of this noble animal to the highest perfection.

In the annals of *Newmarket*, may be found instances of horses that have literally outstripped the wind. *Childers* is an amazing instance of rapidity, his speed having been more than once exerted equal to 82½ feet in a second, or nearly a mile in a minute. The same horse has also run the round course at *Newmarket* (which is about 400 yards less than four miles) in six minutes and 40 seconds, in which case his fleetness is to that of the swiftest *Barb* as four to three. This horse was allowed to be the fleetest that was ever bred in the world; he started repeatedly at *Newmarket* against the best horses of his time, and was never beaten. He won in different prizes to the amount of nearly 2000*l.* and was afterwards reserved as a stallion. His sire was an Arabian, sent by a gentleman as a present to his brother in England. Next to *Childers* was the famous *Eclipse*, who won prizes to a great amount. *High-flter* was accounted the best horse of his time in England. Though he never started after he was five years old, he won to the amount of nearly 9000*l.* He was never beaten, nor ever paid a forfeit. *Bay Malton*, the property of the late marquis of Rockingham, won, in seven prizes, nearly 6000*l.* At York he ran four miles in less than eight minutes.

One of the most remarkable instances of the work done by post-horses, in a short time, is that mentioned by *Buffon*, of the post-master of *Stretton*, who in the year 1745, rode on different horses along the London road no less than 215 miles in 11 hours and a half; a rate of above 18 miles an hour. In July 1788, a horse belonging to a gentleman of *Billeter square*, London, was, for a wager, trotted 30 miles in an hour and 25 minutes, which is above 21 miles in an hour.

No country can be compared with ours with respect to the strength and size of draught horses, and for the activity and strength of those that form our cavalry. In London there have been instances of a single horse drawing, for a short space, the weight of three tons; and some of the pack horses of the north usually carry burdens weighing upwards of 400*lb.* But the most remarkable proof of the strength of the British horses is in our mill horses, some of which have been known to carry, at one load, 13 measures of corn, that in the whole would amount to more than 900*lb.* in weight. Our cavalry in the late campaigns, showed over those of our allies, as well as the French, a great superiority both of strength and activity: the enemy was broken through by the impetuous charge of our squadrons, while the German horses, from their great weight, and inactive make, were unable to second our efforts, though those troops were actuated by the noblest ardour. The present cavalry of this island only supports its ancient glory; it was eminent in the earliest times; our scythed chariots, and the activity and good discipline of our horses, even struck terror into *Cæsar's* legions. It is now impossible to trace out this species, for those which exist among the indigenæ of *Great Britain*, such as the little horses of *Wales* and *Cornwall*, the hobbies of *Ireland*, and the shelties of *Scotland*, though admirably well

adapted to the uses of those countries, could never have been equal to the work of war. Those we employ for that purpose, or for the draught, are an offspring of the German or *Flemish* breed, meliorated by our soil, and a judicious culture.

The English were ever attentive to an exact culture of these animals, and in very early times set a high value on their breed. The esteem that our horses were held in by foreigners so long ago as the reign of *Athelstan*, may be collected from a law of that monarch prohibiting their exportation, except they were designed as presents. These must have been the native kind, or the prohibition would have been needless, for our commerce was at that time too limited to receive improvement from any but the German kind, to which country their own breed could be of no value.

But when our intercourse with the other parts of *Europe* was enlarged, we soon laid hold of the advantages this gave of improving our breed. *Roger de Bellesme*, earl of *Shrewsbury*, is the first that is upon record. He introduced the Spanish stallions into his estate in *Powisland*, from which that part of *Wales* was for many ages celebrated for a swift and generous race of horses. *Giraldus Cambrensis*, who lived in the reign of *Henry II.* takes notice of it, and *Michael Drayton*, cotemporary with *Shakespeare*, sings their excellence in the 6th part of his *Polybion*. This kind was probably destined to mount our gallant nobility, our courteous knights for feats of chivalry, in the generous contests of the tilt-yard. From these sprung, to speak the language of the times, the flower of coursers, whose elegant form added charms to the rider, and whose activity and managed dexterity gained him the palm in that field of gallantry and romantic honour. That this was the chief object of cultivating the mixed breed, is very probable, for racing in its present form was not introduced into England till the reign of *James I.* the earliest notice of the diversion being in that reign. *Croyden* in the south, and *Garterly* in *Yorkshire*, were then famous horse courses. That it was not in vogue in the preceding reign, is reasonable to imagine, for among the numerous entertainments exhibited at *Kenelworth* by *Elizabeth's* favourite on her visit there, and where no amusement then practised was omitted, we do not find horse-racing among them.

Not that we deny this diversion to be known in these kingdoms in earlier times; we only assert a different mode of it, gentlemen being then their own jockeys, and riding their own horses. *Lord Herbert of Chisbury* enumerates it among the sports that gallant philosopher thought unworthy of a man of honour. "The exercise (says he) I do not approve of, is running of horses, there being much cheating in that kind; neither do I see why a brave man should delight in a creature whose chief use is to help him to run away."

As no kingdom can boast of parallel circumstances, so none can vie with us in the number of these noble quadrupeds. It would be extremely difficult to guess at the exact number of them, or to form a periodical account of their increase; the number seems very fluctuating. *Mr William Fitz-Stephen* relates, that in the reign of *King Stephen*, London alone poured out 20,000 horsemen in the wars of those times; yet we find that in the beginning of *Queen Elizabeth's* reign, the whole kingdom could not supply 2000 horses to form

History of the Species.

History of
the Species.

form our cavalry; and even in the year 1588, when the nation was in the most imminent danger from the Spanish invasion, all the cavalry which the nation could then furnish amounted only to 3000. To account for this difference we must imagine, that the number of horses which took the field in Stephen's reign was no more than an undisciplined rabble; the few that appeared under the banners of Elizabeth, a corps well formed, and such as might be opposed to such a formidable enemy as was then expected. But such is their present increase, that in a late war, the number employed was 13,375; and such is our improvement in the breed of horses, that most of those which are used in our waggons and carriages of different kinds, might be applied to the same purpose. Of those our capital alone employs near 22,000.

Of all quadrupeds, says Buffon, the horse, together with grandeur of stature, possesses the greatest elegance and proportion of parts. If we compare him with the animals immediately above and below him, we shall find that the ass is ill-made; that the head of the lion is too large; the limbs of the ox too short and slender; that the camel is deformed, and the elephant a shapeless mass. The regularity and proportion of the parts of his head, give him a light and sprightly aspect, which is well supported by the beauty of his chest. He elevates his head as if anxious to exalt himself above the condition of quadrupeds, and in this noble attitude he beholds man face to face.

We shall here give Buffon's description of what he considers as a perfect horse; but that this and similar descriptions may be better understood, we shall premise an explanation of the technical terms commonly employed in describing a horse. The figures prefixed to the terms refer to fig. 72. Plate CCCXIII. *The fore part.* 1. The forehead. 2. The temples. 3. Cavity above the eye. 4. The jaw. 5. The lips. 6. The nostrils. 7. The tip of the nose. 8. The chin. 9. The beard. 10. The neck. 11. The mane. 12. The fore-top. 13. The throat. 14. The withers. 15. The shoulders. 16. The chest. 17. The elbow. 18. The arm. 19. The plate vein. 20. The chesnut. 21. The knee. 22. The shank. 23. The main tendons. 24. The fetlock joint. 25. The fetlock. 26. The pastern. 27. The coronet. 28. The hoof. 29. The quarters. 30. The toe. 31. The heel.—*The body.* 32. The reins. 33. The fillets. 34. The ribs. 35. The belly. 36. The flanks.—*The hind part.* 37. The rump. 38. The tail. 39. The buttocks. 40. The haunches. 41. The stifle. 42. The thighs. 43. The hock. 44. The kerb. 45. The point of the hock.

When the horse is without blemish, says Buffon, the legs and thighs are clean, the knees straight, the shin and shank thin, and the back sinew strong and well braced. The sinews and the bones should be so distinct, as to make the legs appear thin and lathy, not full and round. The pastern joints should never be large and round; nor must there be any swelling near the coronet. The hock should be lean and dry, not puffed up with wind. With regard to the hoof, the coronet should be equally thick, and the horn shining and grayish. A white horn is a sign of a bad hoof, for it will wear out in a short time; and likewise when the horn is thin, it is liable to be spoiled in shoeing, and by travelling hard

on stony grounds. This is best known when the shoe is taken off, for then the verge all round the sole will appear thin, and the horse will wince at the least touch of the pincers.

Bellum.

A strong foot has the fibres of the hoof very distinct, running in a direct line from the coronet to the toe, like the grain of wood. In this case, care must be taken to keep the foot moist and pliable. The greatest inconvenience attending a hard strong foot, is its being subject to rifts and fissures, which cleave the hoof quite through sometimes from the coronet down to the bottom.

A narrow heel is likewise a defect; and when it is not above two fingers in breadth, the foot is bad. A high heel causes a horse to trip and stumble often; and the low one, with long yielding pasterns, is very apt to be worn quite away on a journey. Too large a foot in proportion to the rest of the body, renders a horse weak and heavy.

The head of a horse should be small, and rather lean than fleshy. The ears should be small, erect, thin, sprightly, and pointed. The forehead, or brow, should have a star or snip thereon. The nose should rise a little, and the nostrils should be wide that he may breathe more freely. The muzzle should be small, and the mouth neither too deep nor too shallow. The jaws should be thin, and not approach too near together at the throat, nor too high upwards towards the onset, that the horse may have sufficient room to carry his head in an easy graceful posture. The eyes should be of a middle size, bright, lively, and full of fire. The tongue should be small, that it may not be too much pressed on by the bit; and it is a good sign when his mouth is full of white froth, as it shows that he will not soon be overheated.

The neck should be arched towards the middle, growing smaller by degrees from the breast and shoulders to the head. The hair of the mane should be long, small, and fine, and it will not be amiss if it be a little frizzled. The shoulders should be pretty long, the withers thin, and should gradually enlarge downwards, but so as to render the breast neither too narrow nor too thick. A thick shouldered horse soon tires, and trips and stumbles every minute, especially if he has at the same time a thick, large neck. When the breast is so narrow that the fore thighs almost touch, the horse is never good for much. A horse of a middle size should have the distance of five or six inches between his fore thighs, and there should be less distance between his feet than his thighs near the shoulders when he stands upright.

The body or carcase of a horse should be of a middling size in proportion to his bulk, and the back should sink a little below the withers; but the other parts should be straight, and no higher behind than before. He should also be home-ribbed, but the short ribs should not approach too near the haunches, and then he will have room to fetch his breath. When a horse's back is short in proportion to his bulk, and yet otherwise well limbed, he will hold out a journey, though he will travel slow. When he is tall, with very long legs, he is but of little value.

The wind should never be overlooked in the choice of a horse, and it may easily be known by his flanks, whether he is broken-winded, when he stands quiet in the stable;

Bellua.

ble; because then he always pinches them in with a very slow motion, and drops them suddenly. A thick-winded horse fetches his breath often, and sometimes rattles and wheezes. This may be always discovered when he is put to brisk exercises.

The temper of a horse should always be observed; a vicious horse generally lays his ears close to his pole, shows the whites of his eyes, and looks sullen and dogged. An angry horse may be known by his frowning looks; and he generally seems to stand in a posture of defence. When he is very vicious, he pays no regard to the groom that feeds him, though some horses that are ticklish will lay back their ears, without being of a bad disposition. A fearful horse is apt to start, and never leaves off till he is old and useless. A fretful horse is very unfit for a journey, and you may discover his temper as soon as he gets out of the stable. A dull, heavy, sluggish horse, may be easily known, whatever tricks are used to rouse his spirits. With regard to the colour of a horse, the bright bay, and indeed all bays in general, are accounted good colours. The chesnut horse is generally to be preferred to the sorrel, unless the former happens to be party-coloured with white legs. Brown horses have generally black manes and tails, and their joints are of a rusty black. Those of this colour that are dapple are much handsomer than the rest. Horses of a shining black, and well marked, without too much white, are in high esteem for their beauty. A star, or blaze, or white muzzle, or one or more feet tipped with white, are generally thought to be rather better than those that are quite black.

Of grays, the dappled are accounted best, though the silver gray make a more beautiful appearance, and often prove good. The iron gray with white manes and tails, are thought not to be so hardy. Grays of every kind will turn white sooner or later; but the nutmeg gray, when the dappled parts incline to bay or chesnut, are said to be good hardy horses. Roan horses have a diversity of colours mixed together; but the white is more predominant than the rest. They are all generally hardy, and fit for the road; and some are exceeding good. Those of a strawberry colour most resemble the sorrel, and they are often marked with white on the legs and face. When the bay is blended with it, he seems to be tintured with claret, and some of these prove to be very good. Dun, sallow, and cream-coloured horses have a list down their backs, and their manes and tails are black. Dun horses are seldom chosen by gentlemen, and yet they may be very useful to the country farmer. The swallow and cream-coloured are more esteemed, both for beauty and use. Those horses that are finely spotted with gray colours like leopards are a great rarity, and for that reason they are only in the hands of great men.

As in this country the form of the race-horse is more particularly attended to, we shall give the following rules for the best proportions of race-horses, as laid down by Mr Ferron.

“It has been observed by several authors, with good authority, that the head of a horse, divided into 22 equal parts, is the common measure for every part of the body; but if the head should appear too long or too short, that measure must be abandoned, to take the height of the body from the top of the withers to the

ground. The third part of this measure will give you a just length for every other part of the body, and will shew you likewise how much the head was defective. History of the Species.

“A horse well made and beautiful in his fore hand, should measure 3 heads and 16 parts from the top of the head to the ground, the head standing in its natural position—the neck should measure one head and 13 parts from the withers to the top of the head,—the same measure gives the length of the neck from the top of the head to its termination in the chest—the height of the body should measure three heads from the withers to the ground—we observe the same measure from the rump to the ground,—the length of the body should measure three heads and four parts, from the point of the shoulder to the posterior part of the buttock.

“The line which falls from the articulation of the shoulder with the arm, should measure two heads and seven parts. This line must directly touch the hoof in front of the toe. If the foot should stand before this line, the leg will be in an oblique direction forward, which structure will confine the horse in all his actions, because the fore legs are obliged to come upon the ground nearly the same way as those of a horse going down hill; that is to say, the heels will touch the ground first, instead of the toes; but if the legs stand obliquely backwards from above, which is the opposite defect, the case is a great deal worse, because the animal is continually stumbling or even falling, on account of his feet being drawn too much under the belly, which situation obliges him to support too great a weight of the body. When this defect originates from the knees only, it bends the legs more or less, in which case the horse is called bow-legged. In either case such an animal must be rejected, and considered as unfit for a racer.

“The line which falls from the top of the fore leg to the point of the heel, should measure one head and 20 parts. This line is extended to show the perfect perpendicular position of the whole limb. The distance from the top of the withers to the stifle should measure one head and 20 parts; the same measure gives the distance from the rump to the elbow, or *vice versa*. The width of the neck should measure one head, taken from the top of the withers to the point of the shoulder.

“The narrowest part of the neck, and the breadth of the head taken a little below the eyes, measures 12 parts of a head each. The thickness of the body, from the middle of the back to the middle of the belly, should be one head and two parts. The same line continued to the ground, shews the centre of gravity of the horse's body. The distance from the root of the tail to the stifle, should measure one head and four parts. The same measure gives the length from the stifle to the hock. The same measure gives the distance from the hock to the ground. The breadth of the fore-arm, taken from the anterior parts of the elbow, should measure 11 parts of a head. The same measure gives the breadth of one of the hind-legs, taken just under the fold of the buttocks. The breadth of the hock, taken from its anterior part to the top of the os calcis, should measure seven parts of a head. The same measure gives the breadth of the head above the nostrils, measured sideways.

“The breadth of the head, taken from one eye to the other,

History of other, should measure seven parts of a head. The same measure should give the distance between the fore legs.

The thickness of the knees should measure five parts of a head. The same measure gives the breadth of the fore legs, just above the knees. The breadth of the hind fetlock joints should measure four parts of a head. The breadth of the fore pasterns should measure $2\frac{1}{2}$ parts of a head. The breadth of the coronet should measure $4\frac{1}{2}$ parts of a head. The breadth of the hinder legs or shank bones, should measure three parts of a head. The breadth of the fore legs should measure $2\frac{1}{2}$ parts of a head. The perpendicular line which falls from the articulation of the stifle, should touch the ground at the distance of half a head from the toe. Too far or too near this direction, proves the hock defective. If the hind feet advance too much under the belly, the hocks must be proportionably bent, and the weight of the body overcharging them, will of course increase the deformity. The feet being too much under the belly, will render it impossible for them to cover much ground; therefore their steps will be very much confined. The extension of the hocks terminating almost in an upright direction, will rather serve to raise the body than to push it forward. If, on the contrary, the hind feet stand too far behind this line, the hocks will be too strait, and their flexion too confined. The extension of the hinder parts taking place, only in a perpendicular direction backward, will produce a defect capable of retarding their speed*.”

* Ferron's
Farriery,
p. 28.

The flesh of the horse is dark and coarse; but it has appeared from the accounts we have of long sieges, that it may be employed for food, and we are assured that it is by no means unpalatable. In fact, in some countries it is employed as food for choice. In the medical dictionary of the *Encyclopédie Methodique*, art. *Cheval*, tom. iv. p. 696. is a curious account of the mode of preparing an extraordinary part of this animal, that forms an ingredient in ragouts, with which some of the Mogul Tartars regale themselves in their most splendid entertainments.

The chief use to which the remains of the horse can be applied, is for collars, traces, and other parts of the harness; and thus, even after death, he preserves some analogy with his former employment. The hair of the mane is sometimes used in making wigs; that of the tail in making the bottoms of chairs, floor cloths, and cords, and to the angler in making lines.

For several other particulars respecting the horse, especially on the use of that animal among the Jews, on the management of horses upon and after a journey, and on the breeding of horses, see the article HORSE. On the use of horses in husbandry, with a comparative view of the profits arising from them and oxen, see the article AGRICULTURE, Part III.; for a short account of the anatomical structure of the horse, see FARRIERY, Part II.; for various methods of shoeing horses, and several other operations, see the same article, Part III.; for the best method of constructing stables, and the most proper food of horses, see Part IV.; and for the description and treatment of the diseases incident to horses, with the remedies employed, see Parts V. and VI. of the same article; and for the art of riding, training, and managing horses, see HORSEMANSHIP.

3. *E. Asinus*, the Ass.—It is unnecessary to describe the appearance of the domestic ass; but as this animal

in his native state of wildness differs considerably from him who is the slave of man, we shall give a short description of the wild ass. Bellus.

Its usual colour is said to be white, or a pale silvery gray, with a slight shade of straw colour on the sides of the neck and body. Along the back runs a deep brown stripe of thickish wavy hair, to the beginning of the tail; this stripe is crossed over the shoulders, as in the tame animal, by another of similar colour; but it is said that this is peculiar to the male. The neck is furnished with a brown mane three or four inches long, consisting of soft woolly hair; the tail is tufted at the end by dusky hairs of about six inches in length; the forehead is arched, and the ears erect, pointed, and lined internally with white curling hairs. It stands higher on its limbs than the domesticated animal, and its legs are more slender in proportion. The hair on the whole body is very fine, bright, soft, and silky; and on some parts is marked by a few obscure undulations of a darker shade than the rest. Those which are found in Africa are said to be of a pale ash colour, rather than of the cast above described.

The food of the wild ass consists chiefly of saline, or bitter and lactescent plants. It is also fond of salt or brackish water. The manners of these animals very much resemble those of the wild horse. They assemble in troops under the conduct of a leader, and are extremely shy and vigilant, and, like the former animals, dart off with the utmost rapidity on the sight of mankind. They have been at all times celebrated for their swiftness. Their voice resembles that of the common ass, but is somewhat shriller.

Wild asses are found in several parts of Asia, especially in the dry and mountainous deserts of Tartary, and in the southern parts of India and Persia. Large herds of them are also found in South America, where they were originally introduced by the Spaniards, and as the climate seems peculiarly favourable to them, they have multiplied to so great a number, as in some places to have become quite a nuisance. In the kingdom of Quito they are hunted for the purpose of domestication, and the hunting is conducted in the following manner.

A number of persons go on horseback, and are attended by Indians on foot. When arrived at the proper places, they form a circle in order to drive them into some valley, where, at full speed, they throw the noose and endeavour to halter them. The creatures, finding themselves inclosed, make very furious efforts to escape; and if only one forces his way through, they all follow with an irresistible impetuosity. However, when noosed, the hunters throw them down and secure them with fetters, and thus leave them till the chace is over. Then, in order to bring them away with greater facility, they pair them with tame asses; but this is not easily performed, for they are so remarkably fierce, that they often wound the persons who undertake to manage them.

They have all the swiftness of horses, and neither declivities nor precipices can retard their career. When attacked, they defend themselves with their heels and mouth with such address, that without slackening their pace, they often maim their pursuers. But the most remarkable property in these creatures is, that, after carrying their first load, their celerity leaves them, their dangerous

154
Asinus.
The Ass.
Fig. 37.

Bellm. dangerous ferocity is lost, and they soon contract the stupid look and the dulness peculiar to their species. It is also observable that these creatures will not permit a horse to live among them. They always feed together, and if a horse happens to stray into the place where they graze, they all fall upon him, and without even giving him the choice of flying, bite and kick him till they leave him dead on the spot.

Though the ass is at present naturalized in this country, his introduction into Britain seems to have been very late, as he was entirely lost among us during the reign of Queen Elizabeth, when, as Hollinshed informs us, "our lande did yeelde no asses." There is, however, no reason to suppose that the ass was unknown among us some hundred years before, as we find mention made of him so early as the time of Athelred, and again in the reign of Henry III. so that the loss of them during the reign of Queen Elizabeth must have been owing to some accident. They were probably introduced again under the succeeding reign, when we renewed our intercourse with Spain, in which country this animal is much used, and where it has been brought to great perfection.

The qualities of this animal are so well known as to need no description. His gentleness, patience, and perseverance, are without example. He is temperate with regard to food, and eats contentedly the coarsest and most neglected herbage. If he give the preference to any vegetable, it is to the plantain, for which he will neglect every other herb in the pasture. In his water he is singularly nice, drinking only from the clearest brooks. He is so much afraid of wetting his feet, that, even when laden, he will turn aside to avoid the dirty parts of the road.

He is stronger, in proportion to his size, than the horse, but more sluggish, stubborn, and untractable. He is healthier than the horse, and of all other quadrupeds is least infested with lice or other vermin; probably owing to the extreme hardness and dryness of his skin. For the same reason, perhaps, he is less sensible of the goads of the whip, or the stinging of flies.

He is three or four years in coming to perfection, and lives to the age of 20, or sometimes 25 years. He sleeps much less than the horse, and never lies down for that purpose but when he is much fatigued. The she-ass goes 11 months with young, and seldom produces more than one at a time.

In pleading the cause of this injured and neglected animal, we cannot do better than copy the eulogy of the abbé la Pluche.

"I confess (says he) that the ass is not master of very shining qualities, but then he enjoys those that are very solid. If we resort to other animals for distinguished services, this at least furnishes us with such as are most necessary. His voice is not altogether melodious, nor his air majestic, nor his manners very lively; but then a fine voice has very little merit with people of solidity. With him the want of a noble air has its compensation in a mild and modest countenance; and instead of the boisterous and irregular qualities of the horse, which are frequently more incommodious than agreeable, the behaviour of the ass is entirely simple and unaffected; no supercilious and self-sufficient airs. He marches with a very uniform pace, and though he is not extraordinarily swift, he pursues his journey for a

VOL. XII. Part II.

long time, and without intermission. He finishes his work in silence, serves you with a steady perseverance, and discovers no ostentation in his proceedings, which is certainly a considerable accomplishment in a domestic. His meat requires no preparation, for he is perfectly well contented with the first thistle that presents itself in his way. He does not pretend that any thing is due to him, and never appears squeamish or dissatisfied: he thankfully accepts whatever is offered to him; he has an elegant relish for the best things, and very civilly contents himself with the most indifferent. If he happens to be forgotten, or is fastened a little too far from his fodder, he entreats his master, in the most pathetic language he can utter, to be so good as to supply his necessities. It is very just that he should live, and he employs all his rhetoric with that view. When he has finished his expostulation, he patiently waits the arrival of a little bran, or a few withered leaves; and the moment he has dispatched his meal, he returns to his business, and marches on without a murmur or reply. His occupations have a tinge of the meanness of those who set him to work: but the judgments that are formed, both of the ass and his master, are equally partial. The employments of a judge, a man of consequence, and an officer of the revenue, have an important air, and their habit imposes on the spectators. On the contrary, the labour of the peasant has a mean and contemptible appearance, because his dress is poor and his condition despised. But we really make a false estimation of these particulars. It is the labour of the peasant which is most valuable, and alone truly necessary. Of what importance is it to us when a manager of the revenue glitters from head to foot with gold? We have no advantage from his labours. I confess, judges and advocates are, in some measure, necessary, but they are made so by our folly and misbehaviour; for they would no longer be wanted, could we conduct ourselves in a rational manner. But, on the other hand, we could on no account, and in no season or condition of life, be without the peasant and the artizan. These people may be considered as the souls and sinews of the community, and the support of our life. It is from them we are constantly deriving some accommodations for our wants. Our houses, our habits, our furniture, and our sustenance rise from their labours. Now, what would become of your vine dressers, gardeners, masons, and the generality of country people, that is to say, of two-thirds of all mankind, if they were destitute of men and horses to convey the commodities and materials which they employ and manufacture? The ass is perpetually at their service; he carries fruit, herbs, coal, wood, bricks, tiles, plaster, lime, and straw. The most abject offices are his ordinary lot, and it is as singular an advantage to this multitude of workmen, as well as to ourselves, to find a gentle, strong, and indefatigable animal, who, without expence or pride, furnishes our cities and villages with all sorts of commodities. A short comparison will complete the illustration of his services, and in some measure raise them from their obscurity. The horse very much resembles those nations who are fond of glitter and burry; who are perpetually singing and dancing, and extremely studious to set off their exterior, and mix gaiety in all their actions. They are admirable on some distinguished and decisive occasions, but their fire frequently degenerates into ro-

History of the Species.

3 X

mantic

History of mantic enthusiasm; they fall into wild transports; they exhaust themselves, and lose the most favourable conjunctures for want of management and moderation.

The ass, on the contrary, resembles those people who are naturally heavy and pacific, whose understanding and capacity are limited to husbandry or commerce, and who proceed in the same track without discomposure, and complete, with a positive air, whatever they have once undertaken."

The skin of this animal is very hard and elastic, and may be used for drums, shoes, and many other purposes. It is, we believe, seldom employed, except for the leaves of pocket memorandum books. The flesh of the wild ass is said to be good food, and easy of digestion.

¹⁵⁵
Mule.
Fig. 74.

The he-ass and the mare readily breed together, but the commerce between the stallion and the she-ass is said to be difficult. The produce of either connexion is the common mule, an animal superior both to the horse and ass for travelling over wild and mountainous tracts of country.

The common mule is very healthy, and will live above 30 years. It is found very serviceable in carrying burthens, particularly in mountainous places, where horses are not so sure-footed: The size and strength of our breed have lately been much improved by the importation of Spanish male asses; and it were much to be wished, that the useful qualities of this animal were more attended to; for, by proper care in its breaking, its natural obstinacy would in a great measure be corrected; and it might be formed with success, for the saddle, the draught, or the burthen.

People of the first quality in Spain are drawn by mules, where 50 or 60 guineas is no uncommon price for one of them; nor is it surprising, when we consider how far they excel the horse in travelling in a mountainous country, the mule being able to tread securely where the former can hardly stand: Their manner of going down the Alps, Andes, &c. is very extraordinary. In these passages, on one side, are steep eminences, and on the other frightful abysses; and as they generally follow the direction of the mountain, the road instead of lying in a level, forms at every little distance steep declivities of several hundred yards downward. These can only be descended by mules; and the animal itself seems sensible of the danger, and the caution to be used in such descents. When they come to the edge of one of these precipices, they stop without being checked by the rider, and if he inadvertently attempt to spur them on, they continue immovable. They seem all this time ruminating on the danger that lies before them, and preparing themselves for the encounter. They not only attentively view the road, but tremble and snort at the danger. Having prepared for the descent, they place their fore feet in a posture as if they were stopping themselves; they then also put their hind feet together, but a little forward, as if they were going to lie down. In this attitude, having as it were taken a survey of the road, they slide down with the swiftness of a meteor. At this time all the rider has to do is to keep-himself fast on the saddle without checking the reins, for the least motion is sufficient to destroy the equilibrium of the mule, in which case both he and his rider would perish. The address of these animals in this rapid descent is truly wonderful, for in their swiftest motion, when they seem to have lost all government of themselves, they follow ex-

actly the different windings of the road, as if they had previously settled in their minds the route they were to follow, and had taken every precaution for their safety. On these occasions the natives place themselves along the sides of the mountains, and holding by the roots of trees, they animate the beasts with shouts, and encourage them to persevere. Some mules after having been long used in such journeys, acquire a sort of reputation for their safety and skill, and their value rises in proportion to their celebrity*.

Bellin.

Mules very rarely breed among each other, or with horses or asses, but a few instances of this kind have occurred.

* Bewick's
Quadrupeds.

4. *E. Zebra*, the Zebra.—This may be considered as the most beautiful animal of the horse tribe, but it is that species with which we are least acquainted. It is wild in its nature, and so swift in its motions, that it can seldom be taken.

¹⁵⁶
Zebra.
Fig. 75.

In size the zebra commonly equals the ass, and it is often considerably larger. Its form is much more elegant than that of the ass; its head and ears being well shaped, and of a moderate size. What, however, chiefly distinguishes this animal, is the beauty and symmetry of its colours. The ground of the skin is either a pure white or cream colour, sometimes with a slight shade of buff, or a pale rusty tinge, and the skin is ornamented on every part with numerous stripes of a black or blackish brown colour, disposed with the greatest regularity, so as to produce an appearance as if the animal were decorated with dark ribbands. These stripes run transversely on the body and limbs, and in a longitudinal direction down the face. The tail is moderately long, round, rather slender, marked with small blackish bars, and terminated by a pretty thick tuft of a blackish or brown colour.

The zebra is chiefly confined to the hotter parts of Africa, from Ethiopia to the Cape of Good Hope, where there are large herds. In manners they resemble the wild horse and ass, and are excessively swift and vigilant.

All attempts to tame this animal, so as to render it serviceable, have been hitherto fruitless. Wild and independent by nature, it seems ill adapted to servitude and restraint. If, however, it were taken young, and much care was bestowed on its education, it might very probably be in a great measure domesticated. A beautiful male zebra, at Exeter change, London, which was afterwards burnt to death by the mischievous act of a monkey setting fire to the straw on which he lay, appeared to have entirely lost his native wildness, and was so gentle as to suffer a child of six years old to sit quietly on his back, without exhibiting the least sign of displeasure. He was familiar even with strangers, and received those kind of caresses that are usually given to the horse with evident satisfaction.

One that was, some years ago, kept at Kew, seemed of a savage and fierce nature; no one dared venture to approach it, except the person who was accustomed to feed it, and who alone could mount on its back. Mr Edwards saw this animal eat a large paper of tobacco, paper and all; and was told it would eat flesh, and any kind of food whatever that was given it. This, however, might proceed from habit or necessity in its long voyage to this country; for in a native state these

Bellus. these animals all feed, like horses and asses, on vegetables.

History of the Species.

In some parts about the Cape, where there are many zebras, there is a penalty of fifty rix-dollars inflicted on any person who shoots one of them; and wherever any of them happen to be caught alive, they are ordered to be sent to the governor.

It has been found that the zebra and the ass will breed together. For the purpose of ascertaining this, an experiment was made in the year 1773 with a zebra that belonged to Lord Clive. No account of this experiment appeared till Mr Nicholson published the substance of some answers made by Mr Parker to a set of questions proposed by Sir Joseph Banks.

The zebra was first covered by an Arabian horse. For this purpose it was found necessary to bind her, and she shewed great disgust. As she did not conceive, an English ass was procured, to which she showed a degree of aversion, scarcely if at all less than to the horse, and was subjected to him by the same means. The result of this trial not being more favourable than the other, recourse was had to the extraordinary expedient of painting another ass so as to resemble the zebra. Complete success attended this deception. When the animals were put together, the zebra at first appeared shy, but she received the embraces of the painted ass, and conceived. The offspring was a fine large male foal, which was just turned of six months old at the time of inquiry, namely, December 1773. It resembled both parents; the father as to make, and the mother as to colour; but the colour was not so strong, and the stripes on the shoulders were more conspicuous than on any other part. In answer to a question directed to that object, the relater states it as his opinion, that it would very probably propagate its species, as it did not appear at all to be like a mule.

In the course of the year after this information was received, his lordship died suddenly, and the collection of animals was disposed of. Sir Joseph Banks was then absent from town; and upon his return he was prevented by this circumstance, either from purchasing the animals, or acquiring any further information respecting the foal*.

* Nichol. Journ. 4to. vol. ii.

Genus 46. HIPPOPOTAMUS.

¹⁵¹ Hippopotamus. Four front teeth in each jaw, the upper standing distant in pairs, lower prominent, the two middle longest; canine teeth solitary, lower extremity large, long curved, and obliquely truncated; feet armed at the margin with four hoofs.

There is only one species, viz. *H. Amphibius*, the Hippopotamus, Hippopotame, or River Horse.—The head of this animal is of an enormous size, and the mouth extremely wide. The ears are small and pointed, and very thickly lined within with short fine hairs. The eyes and nostrils are small in proportion to the bulk of the animal; on the lips are some strong hairs scattered in patches here and there. The hair on the body is very thin, of a whitish colour, and scarcely discernible at first sight. There is no mane on the neck, as some writers affirm, but the hairs on that part are rather thicker. The skin is very thick and strong, and of a dusky colour. The tail is about a foot long, tapering, compressed, and naked; the hoofs

are divided into four parts. The legs are short and thick. In bulk it is second only to the elephant, and by some writers, is said even to be superior to him. The length of a male has been found to be 17 feet, the circumference of the body 15, the height nearly seven, the legs nearly three, the head three and a half, and the girth nearly nine. The mouth, when open, is above two feet wide, and furnished with 44 teeth of different figures. The cutting, and particularly the canine teeth of the lower jaw, are very long, and exceedingly hard and strong. The substance of the canine teeth is so white, fine, and hard, that it is preferred to ivory for making artificial teeth. The cutting teeth, especially those of the under jaw, are very long, cylindrical, and chamfered. The canine teeth are also long, crooked, prismatic, and sharp, like the tusks of the wild boar. The grinders are square, or oblong, like those of man, and so large that one of these teeth sometimes weighs three pounds. The tusks, according to Dr Sparrman, are 27 inches long. With such powerful arms, and such a prodigious strength of body, the hippopotamus might render himself formidable to every animal. But he is naturally of a mild disposition, and is formidable only when provoked. His bulk is so great that 12 oxen have been found necessary to draw ashore one that had been shot; and it is said that the hide is a load for a camel. Though he delights in the water, and appears to live in it as easily as on land, he has not, like the beaver, or otter, membranes between his toes. The great size of his belly renders his specific gravity nearly equal to that of water, and enables him to swim with ease.

These animals inhabit the rivers of Africa, from the Niger to Berg river, many miles north of the Cape of Good Hope. They formerly abounded in the rivers nearer the Cape, but are now almost extirpated; and to preserve the few which are left in Berg river, the governor absolutely prohibited the shooting of them without particular permission. They are not found in any of the African rivers that run into the Mediterranean, except in the Nile, and even there only in Upper Egypt, and in the fens and lakes of Ethiopia, through which the Nile passes. From the unwieldiness of his body and the shortness of his legs, the hippopotamus is not able to move fast upon land, and is there extremely timid. When pursued, he takes to the water, plunges in, sinks to the bottom, and is seen walking there at ease; he cannot, however, continue there long, without rising towards the surface; and in the day-time is so fearful of being discovered, that when he takes in fresh air the place is hardly perceptible, as he scarcely ventures to put his nose out of the water. In rivers not frequented by mankind, he is, however, less cautious, and there puts his whole head out of the water. If wounded, he will rise and attack boats or canoes with great fury; and is said frequently to sink them by biting large pieces out of the sides; for he is as bold in the water as he is timid on the land. In shallow rivers the hippopotamus makes deep holes in the bottom for the purpose of concealing his great bulk. When he quits the water, he usually puts out half his body at once, smells and looks around, but sometimes he rushes out with great impetuosity, and tramples down every thing in his way. During the night he leaves the rivers to graze upon the land, where he eats sugar canes, rushes,

History of the Species rushes, millet, rice, &c. consuming great quantities, and doing much damage in the cultivated fields. As he is so timid on land, it is however, not difficult to drive him off. The Egyptians (as Mr Hasselquist informs us) have a curious method of freeing themselves in some measure from this destructive animal. They remark the places he frequents most, and there lay a large quantity of pease; when the animal comes on shore hungry and voracious, he falls to eating what is nearest him, and, filling his belly with pease, they occasion an insupportable thirst; he then returns immediately into the river, and drinks large draughts of water, which by swelling the pease, cause his sudden death; for not long after the Egyptians find him dead on the shore, blown up as if killed with strong poison. He also feeds on the roots of trees, which he loosens with his great tusks; but he never feeds on fish. These animals sleep on the reedy islands in the middle of the stream, and here they bring forth their young. There is but one male to a herd of females: these bring forth one young at a time on the land, but they suckle them in the water.

They are generally taken in pit-falls, and the poor people eat their flesh. Indeed the flesh of the young animals or calves, as they are called, is esteemed a dainty by the natives. In some parts they place in their corn grounds boards full of sharp irons, which these beasts strike into their feet, and thus become an easy prey. Sometimes they are taken in the water by striking them with harpoons fastened to cords, and 10 or 12 canoes are employed in the chase. The hippopotamus was known to the Romans. Scaurus treated the people with the sight of five crocodiles and one hippopotamus during his edileship, and exhibited them in a temporary lake. Augustus produced one at his triumph over Cleopatra.

This animal is the behemoth of Job, who admirably describes its manners, food, and haunts. *Vid.* chap. xl. ver. 15.

For an anatomical account of the skeleton of the hippopotamus by Cuvier, see *Ann. de Mus. Nat.* tom. iv. p. 299.

Genus 47. TAPIR. *TAPIR.*

Front teeth in both jaws 10. Canine teeth in both jaws single, incurvated. Grinders in both jaws five on each side, very broad. Feet with three hoofs and a false hoof on the fore feet.

There is only one species, viz.

T. Americanus, American Tapir, which is thus described by M. Bajon.

The figure of the tapir bears some general resemblance to that of a hog; but he is of the height of a small mule, having an extremely thick body and short legs. He is covered with hair of a longer kind than the horse or ass; but not so long nor thick as that of a hog. His mane, which is straight, is but little longer than the rest of the hair, and reaches from the top of the head to the shoulders; the head is large and long, the eyes very small and black: the ears black, and somewhat like those of a hog. He is provided with a trunk on the upper lip of nearly a foot long, the movements of which are extremely supple, and in which resides the organ of smell, as in the elephant, and which he extends in order to grasp fruits, &c. The two nostrils part the end of the trunk. The tail is only two

inches long, and is nearly naked. The hair of the body is of a somewhat deep brown; the limbs short and thick; the feet very large, and rather rounded; the fore feet have four toes, and the hind three: all the toes are covered with a hard thick hoof or horn. Though the head is very large, it contains but a very small brain; the jaws are much elongated, and furnished, in general, with 40 teeth; but sometimes there are more, and sometimes fewer. The cutting teeth are sharp-edged, and are the teeth which vary as to number. After the cutting teeth, we find a canine tooth on each side, both above and below, which have a good deal of resemblance to those of a boar; we then find a small space or interval without teeth, and then follow the grinders, which are very large, with very broad surfaces.

M. Bajon imagined, that, on dissection, he discovered three stomachs within this animal; and therefore he considered it to be a ruminating animal; but this was afterwards found to be a mistake. It appeared, on dissecting a tapir brought alive to Paris, that the stomach was very large, and was contracted in two places, but was still a single uniform stomach.

The female tapir is larger than the male, and has a weaker voice.

The tapir was once considered as an amphibious animal; but this opinion seems to be erroneous.

For an anatomical account of the skeleton of the tapir, by Cuvier, see *Annales de Mus. Nat.* tom. iii. 132.

Genus 48. SUS. *HOG.*

Front teeth in the upper jaw four, converging. In the lower jaw six, projecting. Canine teeth or tusks, in the upper jaw two, long, exerted. Snout truncated, prominent, moveable. Feet cloven.

In their manners the whole of this tribe nearly resemble each other, being in general filthy and disgusting, and very fond of wallowing in the mire. They feed indifferently on animal and vegetable food, but seem to prefer the latter when they can obtain it. They are particularly fond of acorns, beech mast, and similar fruits, and with their strong tendinous snout they dig up the earth in search of roots. They are exceedingly prolific.

There are about five species, viz.

1. * *S. Scrofa*, Common H. Body bristled in front; tail hairy.—2. *S. Ethiopicus*, Ethiopian H. Wattles beneath the eyes.—3. *S. Africanus*, Cape Verd H. Only two front teeth.—4. *S. Babyrussa*, Babyroussa, or Horned H. The two upper tusks growing from the upper part of the front.—5. *S. Tajassu*, Pacary. Tailless, with a glandular orifice on the back.

1. *S. Scrofa*, Common H.—The common hog is found either in a wild or domestic state, in almost all the temperate parts of Europe and Asia; but it is not met with in the most northern parts of these continents. It is also found in the upper parts of Africa. Dr Shaw remarks, that it is not indigenous to the British isles; but Mr Pennant asserts, that the wild boar was formerly a native of this country, as appears from the laws of Hoeldda, who permitted his grand huntsman to chase that animal from the middle of November to the beginning of December. William the Conqueror punished, with the loss of their eyes, any that were convicted of killing

Bellus. killing the wild boar, the stag, or the roe-buck; and Fitz-Stephens tells us, that the vast forest that in his time grew on the north side of London, was the retreat of stags, fallow-deer, wild boars, and bulls.

The wild boar inhabits woods, living on various kinds of vegetables, viz. roots, mast, acorns, &c. &c. It also occasionally devours animal food. It is, in general considerably smaller than the domestic hog, and is of a dark brindled gray colour, sometimes blackish; but, when only a year or two old, is of a pale red or dull yellowish brown cast; and, when quite young, is marked by alternate dusky and pale stripes disposed longitudinally on each side the body. Between the bristles, next the skin, is a finer or softer hair, of a woolly or curling nature. The snout is somewhat longer in proportion than that of the domestic animal; but the principal difference is in the superior length and size of the tusks, which are often several inches long, and capable of inflicting the most severe and fatal wounds.

The hunting of the wild boar forms one of the amusements of the great in some parts of Germany, Poland, &c. and is a chase of some difficulty and danger, not on account of the swiftness, but the ferocity of the animal.

Wild boars, says Buffon, which have not passed their third year, are called by the hunters *beasts of company*, because previous to this age they do not separate, but follow their common parent. They never wander alone till they have acquired sufficient strength to resist the attacks of the wolf. These animals, when they have young, form a kind of flocks; and it is upon this alone that their safety depends. When attacked, the largest and strongest front the enemy, and by pressing all round against the weaker, force them into the centre. Domestic hogs are also observed to defend themselves in a similar manner. The wild boar is hunted with dogs, or killed by surprise, during the night, when the moon shines. As he flies slowly, leaves a strong odour behind him, and defends himself against the dogs, and often wounds them dangerously, fine hunting dogs are unnecessary, and would have their nose spoiled, and acquire a habit of moving slowly by hunting him. Mastiffs, with very little training, are sufficient. The oldest boars, which are known by the track of their feet, should alone be hunted; a young boar of three years old is difficult to be attacked, because he runs very far without stopping; but the old boars do not run far, allow the dogs to come near, and often stop to repel them. During the day the boar commonly keeps in his soil, which is in the most sequestered parts of the woods, and comes out by night in quest of food; and in summer, when the grain is ripe, it is easy to surprise him among the cultivated fields, which he frequents every night.

As the wild boar advances in age, after the period of three or four years, he becomes less dangerous, on account of the growth of his tusks, which turn up, or make so large a curve, as often rather to impede than assist his intentions of wounding with them.

According to the French newspapers for the year 1787, a wild boar, of most extraordinary size, was killed in the neighbourhood of Cognac in Angoumois, which had often escaped from the hunters, had received many gun-shot wounds, and had cost the lives of several dogs and men each time of attacking him. When

this animal was at length slain, several bullets were said to have been found between his skin and flesh. M. Son-^{History of the Species.} nini, who details this anecdote from the public papers, observes, that if the relation had not been given by hunters of distinguished order, and too well acquainted with these animals to have made any mistake, we might imagine that this formidable creature, which had long committed its ravages in the park of Cognac, belonged to a totally different species. It was of enormous size, with a very long head, a very sharp or pointed snout; and its mouth was armed with teeth of a very singular form. The hairs of the body were white, those of the head yellowish, the neck marked with a black band in form of a cravat, and the ears large and straight; and what appears surprising, considering its size, it was of uncommon swiftness.

In a domestic state the sow brings forth twice a year, and produces from 10 to 20 at a litter. She goes rather more than four months with young. At the time of bringing forth she must be carefully watched, as she sometimes devours her young, and it is still more necessary to keep off the boar, who may destroy the whole litter.

There are several varieties of the hog bred in this country; but those in greatest request are generally known by the name of *Berkshire pigs*. These are usually of a reddish-brown colour, with black spots; they have large ears hanging over their eyes, are short-legged, small-boned, and very easily fattened. Mr Culley mentions one of these that was killed at Congleton in Cheshire, which measured from the nose to the end of the tail nine feet eight inches, was four feet and a half high, and weighed, when killed, 86 stones 11 lbs. avoirdupois.

The Chinese, or black breed, are now very common in England. They are smaller, have shorter legs, and their flesh is whiter and sweeter than the common kind. Of this sort were those found in New Guinea, which proved so seasonable a relief to our circumnavigators, when that country was first visited by them. There are likewise great numbers of them in the Friendly and Society islands, the Marquesas, and many other of the lately discovered islands in the South seas. These are fed with plantains, bread-fruit, and yams; and are exceedingly fat. They are frequently seen by the natives in their canoes, swimming from one island to another, and killed by them with lances and arrows.

The hog species, though very numerous, and diffused over Europe, Asia, and Africa, did not exist in America, till transported thither by the Spaniards. In many places they have multiplied exceedingly, and become wild. They resemble the domestic hog, but their bodies are shorter, and their snout and skin thicker.

This animal has been compared to a miser, who is useless and rapacious in his life; but on his death becomes of public use, by the very effects of his sordid manners. The hog, during life, does not render the least service to mankind, except in removing that filth which other animals reject. His more than common brutality urges him to devour even his own offspring. All other domestic quadrupeds shew some degree of respect to mankind, and even a sort of tenderness for us in our helpless years; but this animal will devour infants, whenever it has opportunity.

The parts of this animal are finely adapted to its way of life. As its method of feeding is by turning up the earth,

History of earth for roots of different kinds, so nature has given it a more prone form than other animals; a strong brawny neck, eyes small, and placed high in the head, a long snout, nose callous and tough, and a quick sense of smelling to trace out its food. Its intestines have a strong resemblance to those of the human species; a circumstance that should mortify our pride. The external form of its body is very unwieldy, yet, by the strength of its tendons, the wild boar is enabled to fly from the hunters with amazing agility. The back toe on the feet of this animal prevents it from slipping while it descends declivities, and must be of singular use when pursued; yet, notwithstanding its powers of motion, it is by nature stupid, inactive, and drowsy; much inclined to increase in fat, which is disposed in a different manner from other animals, and forms a regular coat over the whole body. It is restless at a change of weather, and in certain high winds is so agitated as to run violently, screaming horribly at the same time: it is fond of wallowing in the dirt, either to cool its surfeited body, or to destroy the lice, ticks, and other insects with which it is infested. Its diseases generally arise from intemperance: measles, imposthumes, and scrophulous complaints, are reckoned among them.

Linnæus observes that its flesh is a wholesome food for athletic constitutions, or those that use much exercise, but bad for such as lead a sedentary life. It is of most universal use, and furnishes numberless materials for epicurism, among which brawn is a kind peculiar to England. The flesh of the hog is an article of the first importance to a naval and commercial nation, for it takes salt better than any other kind, and consequently is capable of being preserved longer. The lard is of great use in medicine, being an ingredient in several sorts of plasters, either pure, or in the form of pomatum; and the bristles are formed into brushes of several kinds.

162
Babyrussa.
 Fig. 80.

4. *S. Babyrussa*, the Babyroussa.—This animal nearly resembles the common hog in size; but his body is rather longer, his limbs more slender, and, instead of bristles, he is covered with fine short, rather woolly hair, of a deep brown or blackish colour, with only a few bristles on the upper and hinder parts of the back. It is principally distinguished from other species by the very extraordinary position and form of the upper tusks. These, instead of being situated internally on the edge of the jaw, as in other animals, are placed without, through the skin of the snout, turning upwards towards the forehead. As the animal advances in age, those tusks become so extremely long and curved, as to touch the forehead, and then bend downwards, when they must lose their power as offensive weapons, for which they were probably intended in the younger animal. These upper tusks are of a fine hard grain, and may be used as ivory. The tusks of the lower jaw resemble those of the other species, and are very long, sharp, and curved; but not nearly so large as those of the upper jaw. The eyes are small; the ears erect and pointed; the tail pretty long, slender, and terminated by a tuft of long hairs.

This species is gregarious, and found in large herds in several parts of Java, Amboyna, and other Indian islands. It feeds entirely on vegetables, and often eats the leaves of trees. When sleeping or resting itself in a standing posture, it is said to hook its tusks across the lower branches of the trees by way of support. When

pursued, these animals will often plunge into a river, or even into the sea, and they can swim with great ease, and to a vast distance. Their voice is said to resemble that of the common hog; but it is sometimes a strong, loud, growling note. It is occasionally domesticated by the natives of the Indian islands, and its flesh is considered as wholesome food.

This order contains four genera and 13 species.

In the class MAMMALIA, we have enumerated or described about 537 species; of which the following table shews the number in each genus.

SIMIA contains	62 species
LEMUR,	13
GALEOPITHECUS,	1
VESPERTILIO,	24
BRADYPUS,	3
MYRMECOPHAGA, about	6
MANIS,	3
DASYPUS, about	6
RHINOCEROS, perhaps	3
ELEPHAS,	1
PLATYPUS,	1
TRICHECUS, about	7
PHOCA,	19
CANIS, about	23
FELIS, about	25
VIVERRA, about	48
LUTRA,	8
URSUS, about	9
DIDELPHIS, about	18
DASYURUS,	6
PERAMELES,	2
WOMBAT,	1
MACROPUS,	2
TALPA,	7
SOREX,	16
ERINACEUS,	5
HYSTRIX,	6
CAVIA,	7
CASTOR,	2
MUS, about	44
HYDROMYS,	3
ARCTOMYS,	8
SCIURUS,	26
MYOXUS,	7
DIPUS,	6
LEPUS,	12
HYRAX,	3
CAMELUS,	7
MOSCHUS,	7
CERVUS,	12
CAMELOPARDALIS,	1
ANTILOPE,	32
CAPRA,	8
OVIS,	8
BOS,	6
EQUUS,	6
HIPPOPOTAMUS,	1
TAPIR,	1
Sus,	5

Total 537
 Of these about 36 are found in Britain.

The

Explan-
ation of the
Plates.

The compiler of this article is conscious that it labours under many deficiencies; that many animals, which ought to have been described, are merely enumerated; and that the accounts of several, which are usually considered as important objects of natural history, are much less complete than might have been expected. For many of these defects he does not hold himself accountable. From the very limited space within which he was obliged to confine the article, it was necessary, either that he should treat of every species in a very concise manner, so as to make the treatise

merely a tabular sketch, or that he should content himself with a systematic arrangement of all the mammalia at present known, and enlarge only on a few of the more important species. He has chosen the latter alternative, which, by making the article more interesting to the generality of readers, seems best adapted to the nature of this work; while the systematic arrangement, with the specific characters will assist the naturalist who knows where to refer for a particular account of the individuals.

Explan-
ation of the
Plates.

EXPLANATION OF THE PLATES.

Plate CCCI.

- Fig. 1. *Simia Satyrus*, Oran Otan.
Fig. 2. *Simia Inuus*, Magot or Barbary Ape.
Fig. 3. *Simia Sylvanus*, Pygmy.
Fig. 4. *Simia Sphinx*, Great Baboon.
Fig. 5. *Simia Beelzebub*, Alouatte, or Preacher Monkey.
Fig. 6. *Simia Argentata*, Mico or Fair Monkey.

Plate CCCII.

- Fig. 7. *Lemur Tardigradus*, Slow Lemur.
Fig. 8. *Galeopithecus Volans*, Flying Calugo.
Fig. 9. *Vespertilio Auritus*, Long-eared Bat.
Fig. 10. *Vespertilio Vampyrus*, Vampire Bat.
Fig. 11. *Bradypus Tridactylus*, Three-toed Sloth.
Fig. 12. *Myrmecophaga Jubata*, Great Ant-Eater.

Plate CCCIII.

- Fig. 13. *Manis Pentadactyla*, Pangolin, or Short-tailed Manis.
Fig. 14. *Manis Tetradactyla*, Long-tailed Manis.
Fig. 15. *Dasyus Sexcinctus*, Six-banded Armadillo.
Fig. 16. *Rhinoceros Unicornis*, Single-horned Rhinoceros.

Plate CCCIV.

- Fig. 17. *Elephas Maximus*, Elephant.
Fig. 18. *Sukotyra*.
Fig. 19. *Platypus Anatinus*, Duck-billed Platypus.
Fig. 20. *Trichecus Rosmarus*, Arctic Walrus.

Fig. 23. Mastiff.
Fig. 24. Foxhound.
Fig. 25. Terrier.
Fig. 26. Greyhound.
Fig. 27. Irish Greyhound.

Plate CCCVI.

- Fig. 28. *Canis Lupus*, Wolf.
Fig. 29. *Canis Hyæna*, Hyæna.
Fig. 30. *Canis Aureus*, Jackal.
Fig. 31. *Canis Zerda*, Fennec.

- Fig. 32. *Felis Leo*, Lion.
Fig. 33. *Felis Tigris*, Tiger.

Plate CCCVII.

- Fig. 34. *Felis Catus*, Wild Cat.
Fig. 35. *Viverra Ichneumon*, Ichneumon.
Fig. 36. *Viverra Civetta*, Civet Cat.
Fig. 37. *Viverra Foina*, Marten.
Fig. 38. *Viverra Furo*, Ferret.
Fig. 39. *Lutra Vulgaris*, Common Otter.

Plate CCCVIII.

- Fig. 40. *Ursus Arctos*, Brown Bear.
Fig. 41. *Ursus Maritimus*, White or Polar Bear.
Fig. 42. *Ursus Meles*, Badger.
Fig. 43. *Didelphis Virginiana*, Virginian Opossum.
Fig. 44. *Didelphis Dorsigera*, Merian Opossum.
Fig. 45. *Dasyurus Viverrinus*, Viverrine Dasyurus.

Plate CCCIX.

- Fig. 46. The Wombat.
Fig. 47. *Macropus Major*, Kangaroo.
Fig. 48. *Talpa Radiata*, Radiated Mole.
Fig. 49. *Sorex Araneus*, Common Shrew.
Fig. 50. *Erinaceus Europæus*, Common Hedgehog.
Fig. 51. *Hystrix Cristata*, Porcupine.
Fig. 52. *Castor Fiber*, Common Beaver.

Plate CCCX.

- Fig. 53. *Cavia Cobaya*, Restless Cavy, or Guinea-Pig.
Fig. 54. *Mus Cricetus*, Hamster Rat.
Fig. 55. *Hydromys Coypus*, Coypou Rat.
Fig. 56. *Arctomys Marmota*, Alpine Marmot.
Fig. 57. *Sciurus Vulgaris*, Common Squirrel.
Fig. 58. *Myoxus Muscardinus*, Common Dormouse.
Fig. 59. *Dipus Jaculus*, Common Jerboa.

Plate CCCXI.

- Fig. 60. *Lepus Timidus*, Hare sitting.
Fig. 61. *Hyrax Syriacus*, Syrian Hyrax.
Fig. 62. *Camelus Dromedarius*, Arabian Camel or Dromedary.
Fig. 63. *Moschus Moschiferus*, Tibetan Musk.
Fig. 64. *Cervus Alces*, Elk.
Fig. 65. *Camelopardalis Giraffa*, Camelopardalis or Giraffe.

M A M

MAMMEA, *MAMMEE-TREE*; a genus of plants belonging to the polyandria class; and in the natural method ranking with those of which the order is doubtful. See *BOTANY Index*.

MAMMON, the god of riches, according to some authors; though others deny that the word stands for such a deity, and understand by it only *riches* themselves. Our Saviour says, *We cannot serve God and Mammon*; that is, be religious and worldly-minded at the same time. Our poet Milton, by poetic license, makes Mammon to be one of the fallen angels, and gives us his character in the following lines:

Mammon, the least erected spirit that fell
From heav'n; for ev'n in heav'n his looks and
thoughts
Were always downward bent; admiring more
The riches of heav'n's pavement, trodden gold,
Than ought divine or holy else enjoy'd
In beatific vision: by him first
Man also, and by his suggestion taught,
Ransack'd the centre, and with impious hands
Rifled the bowels of their mother earth,
For treasures better hid. Soon had his crew
Open'd into the hill a spacious wound,
And digg'd out ribs of gold. Let none admire
That riches grow in hell; that soil may best
Deserve the precious bane.

MAMMOTH, or **MAMMUTH**, the name of a huge animal, now unknown, to which are said to have belonged those tusks, bones, and skeletons, of vast magnitude, which have been frequently found in different parts of Siberia, as well in the mountains as the valleys; likewise in Russia, Germany, and North America. Many specimens of them may be seen in the Imperial cabinet at Petersburg; in the British, Dr Hunter's, and the late Sir Ashton Lever's museums, and in that of the Royal Society. A description of the mammoth is given by Muller in the *Recueil des Voyages au Nord*: "This animal, he says, is four or five yards high, and about 30 feet long. His colour is grayish. His head is very long, and his front very broad. On each side, precisely under the eyes, there are two horns, which he can move and cross at pleasure. In walking he has the power of extending and contracting his body to a great degree." Isbraudes Ides gives a similar account; but

M A M

he is candid enough to acknowledge, that he never knew any person who had seen the mammoth alive. Mr Pennant, however, thinks it "more than probable that it still exists in some of those remote parts of the vast new continent, impenetrated yet by Europeans. The name of Mastodon has been given by Cuvier to this fossil species. It is about the size of the elephant, and more nearly allied to that than to any other animal of the present creation. It appears to have been herbivorous. The Ohio Indians have a tradition handed down from their fathers respecting these animals, "That in ancient times a herd of them came to the Big-bone Licks, and began an universal destruction of the bears, deer, elks, buffaloes, and other animals which had been created for the use of the Indians: that the Great Man above, looking down and seeing this, was so enraged that he seized his lightning, descended to the earth, seated himself upon a neighbouring mountain on a rock, on which his seat and the print of his feet are still to be seen, and hurled his bolts among them till the whole were slaughtered, except the big bull, who, presenting his forehead to the shafts, shook them off as they fell; but at length missing one, it wounded him in the side; whereon, springing round, he bounded over the Ohio, the Wabash, the Illinois, and finally over the great lakes, where he is living at this day." See *MAMMALIA Index*.

MAMRE, an Amorite, brother of Aner and Eshcol, and friend of Abraham (Gen. xiv. 13.). It was with these three persons, together with his own and their domestics, that Abraham pursued and overcame the kings after their conquest of Sodom and Gomorrah. This Mamre, who dwelt near Hebron, communicated his name to great part of the country round about. Hence we read (chap. xiii. 18. xxiii. 17, &c.), that Abraham dwelt in Mamre and in the plain of Mamre. But it is observed, that what we translate the *plain* should be rendered the *oak*, of Mamre, because the word *elon* signifies an oak or tree of a long duration. Sozomen tells us, that this tree was still extant, and famous for pilgrimages and annual feasts, even in Constantine's time; that it was about six miles distant from Hebron; that some of the cottages which Abraham built were still standing near it; and that there was a well likewise of his digging, whereunto both Jews, Christians, and Heathens, did at certain seasons resort, either out
of

¹ **Manre, Man.** of devotion or for trade, because there was held a great mart. To these superstitions Constantine the Great put a stop.

¹ **Importance of the study of man.** **MAN.** Of all the objects which the universe presents to our observation, there is none that so powerfully calls for our attention, there is none with which it so much concerns us to be intimately acquainted, as the human species. If we admit, what mankind, in that pride of heart, which is so natural to those who style themselves the *lords of the creation*, have assumed, that man is the only being possessed of reason; there is no *created thing* that can in the least stand in competition with him. But, without examining into the validity of this exclusive claim, without inquiring whether some of our inferior *fellow mortals* may not be admitted to some small share of this faculty; it must be allowed that, whether we consider him as a solitary being, possessed of beauty and intelligence superior to the other classes of animated nature, or in the more amiable character of a social being, capable of the sentiments of affection, friendship, gratitude, and benevolence, man is a most distinguished personage; and, to his fellow men, certainly the most interesting object to which they can direct their attention; that in short,

“The proper study of mankind is man.”

A full examination of every thing relating to the human species would include almost all that is interesting, useful, or curious in nature. Indeed this whole work is little more than a collection of facts and reasonings, that either mediately or immediately relate to MAN. It may not be improper here to refer to a few of the principal articles alluded to, before we enter on the proper business of this article, which is to state a few general circumstances relating to the *natural history* of man, considering him as the *first animal* in the creation.

² **Outline of the study of man.** *First*, Man may be considered *generically*; as constituting a *tribe* of animals differing from all others, in his *structure, functions, diseases*, and in possessing the *faculty of reason*.

The *structure* of man has been detailed under ANATOMY; his *functions* will be treated of under PHYSIOLOGY; the *diseases and accidents* to which he is exposed, with their treatment and remedies, will form the subjects of MEDICINE, MIDWIFERY, SURGERY, and MATERIA MEDICA; and the nature and exercise of his *reasoning powers* are discussed under LOGIC, METAPHYSICS, LANGUAGE, GRAMMAR, ORATORY, ARITHMETIC, ALGEBRA, GEOMETRY, &c.

Secondly, Man may be considered *specifically*, as differing from others of the same tribe in *height, features, colour, disposition, and manners*; resulting from climate and other local circumstances. In a general point of view, the varieties of the human species fall to be noticed *here*; but for a particular account of the inhabitants of different regions of the globe, we refer the reader to the geographical articles AFRICA, ASIA, AMERICA, ABYSSINIA, CEYLON, HINDOSTAN, *New HOLLAND*, &c.

Thirdly, Man may be considered as a *dependent and an accountable being*, in relation to his *Creator*, his *neighbour, or himself*. The *religious and moral duties* of man are explained under THEOLOGY, CHRISTIANITY, MORAL PHILOSOPHY, and LAW; and to these may be added, as connected with man in this third view, Po-

LITICAL Economy, AGRICULTURE, GARDENING, ARCHITECTURE, CHEMISTRY, DYNAMICS, MECHANICS, HYDRODYNAMICS, and a number of other branches of science, that teach man how to employ to the best advantage those powers and faculties with which Heaven has endowed him, for his individual and common benefit.

Lastly, We may consider man with respect to the relations that subsist between him and the inferior classes of the creation, as they minister to his necessities, supply his wants, abridge his comforts, or oppose his progress. This consideration naturally leads us to the article NATURAL HISTORY, and its subdivisions, MAMMALIA, CETOLOGY, ERPETOLOGY, OPHIOLOGY, ORNITHOLOGY, ICHTHYOLOGY, HELMINTHOLOGY, CONCHOLOGY, BOTANY, MINERALOGY, GEOLOGY, and METEOROLOGY.

Of those writers who directly treat of man, the *philosopher* and the *moralist* consider him in the abstract; the *geographer* describes him as he exists in communities; the *historian* traces the origin of society, the progress of man in arts, civilization, and refinement, and the changes that have taken place among the human species, from the natural operation of physical causes, or from the folly, villany, and ambition of princes and heroes; the *biographer* treats of man as an individual, and shews the effects of exalted virtue, eminent abilities, or striking vices, both on their possessor and on the community at large. It is the business of the *naturalist* to describe the external form of man, as it differs from that of other animals; to consider the usual varieties of it in different nations, and the more striking peculiarities that are occasionally found in individuals; to describe the habits and manners of the human species; the progress of life from infancy to death; the duration of life and its causes; and the effects produced on the body by death.

Of the writers who have treated on some part of the natural history of man, we might give a most copious list, even without including the almost innumerable catalogue of medical works. For the generality of readers, it may be sufficient to refer to Buffon's Natural History, or the Abridgement of it by Goldsmith; to Virey's *Histoire Naturelle du Genre Humain*; Cuvier's *Tableau Elementaire de l'Histoire Naturelle des Animaux*; Herder's Outlines of the Philosophy of the History of Man; and the works of Daubenton, Vicq d'Azyr, Camper, Blumenbach, &c. &c.

We had proposed giving here a short popular view of the *structure and economy* of man; but as even this would lead us into details for which we cannot afford room, we must refer our readers to Kerr's Translation of the System of Linnæus, and Dr Hunter's Introductory Lectures to his course of Anatomy.

It is of more consequence to our present purpose to mention the particular circumstances that distinguish man from those animals to which he seems nearest allied. These distinctive marks are well described by Blumenbach, in his work *De Generis Humani Varietate Nativa*, and by M. Daubenton, in his introduction to the Dictionary of Natural History in the *Encyclopédie Methodique*; with the latter we shall present our readers.

The only animals that bear any striking resemblance to man, in point of structure, are the apes, especially the oran otan, and the gibbon; but according to M. Daubenton, apes.

Man. Daubenton, there are two principal circumstances that particularly distinguish man from these animals; the first is the strength of the muscles of the legs, by which the body is supported in a vertical position above them; the second consists in the articulation of the head with the neck by the middle of its base.

We stand upright, bend our body, and walk, without thinking on the power by which we are supported in these several positions. This power resides chiefly in the muscles which constitute the principal part of the calf of the leg. Their exertion is felt, and their motion is visible externally, when we stand upright and bend our body backwards and forwards. This power is no less great when we walk even on a horizontal plane. In ascending a height, the weight of the body is more sensibly felt than in descending. All these motions are natural to man. Other animals, on the contrary, when placed on their hind legs, are either incapable of performing them at all, or do it partially, with great difficulty, and for a very short time. The *gibbon*, and the *oran otan*, can stand upright with much less difficulty than other brutes; but the restraint they are under in this attitude, plainly shews that it is not natural to them. The reason is, that the muscles in the back part of the leg in the *gibbon*, &c. are not, as in man, sufficiently large to form a calf, and consequently not sufficiently strong to support the thighs and body in a vertical line, and to preserve them in that posture. See MAMMALIA, N° 28.

M. Daubenton has discovered, that the attitudes proper to man and to other animals, are pointed out by the different ways in which the head is articulated with the neck. The two points by which the osseous part of the head is connected with the first joint of the neck, and on which every movement of the head is made with the greatest facility, are placed at the edge of the great hole of the occipital bone, which in man is situated near the centre of the base of the skull (affording a passage for the medullary substance into the vertebral canal,) as upon a pivot or point of support. The face is on a vertical line, almost parallel to that of the body and neck. The jaws, which are very short when compared with those of most other animals, extend very little farther forwards than the forehead. No animal has, like man, its hind legs as long as the body, neck, and head, taken together, measuring from the top of head to the os pubis.

5
Difference between man and quadrupeds in general.

In the frame of the human body the principal parts are nearly the same with those of other animals; but in the connection and form of the bones there is as great a difference as in the attitudes proper to each. Were a man to assume the natural posture of quadrupeds, and try to walk by the help of his hands and feet, he would find himself in a very unnatural situation; he could not move his feet and hands but with the greatest difficulty and pain; and let him make what exertions he pleased, he would find it impossible to attain a steady and continued pace. The principal obstacles he would meet with would arise from the structure of the pelvis, the hands, the feet, and the head.

The plane of the great occipital hole, which in man is almost horizontal, puts the head in a kind of equilibrium upon the neck when we stand erect in our natural attitude; but when we are in the attitude of quadrupeds, it prevents us from raising our head so as to

look forwards, because the movement of the head is stopt by the protuberance of the occiput, which then approaches too near the vertebræ of the neck.

Man.

In most animals, the great hole of the occipital bone is situated at the back part of the head; the jaws are very long; the occiput has no protuberance beyond the aperture, the plane of which is in a vertical direction, or inclined a little forwards or backwards; so that the head is pendent, and joined to the neck by its posterior part. This position of the head enables quadrupeds, though their bodies are in a horizontal direction, to present their muzzle forwards, and to raise it so as to reach above them, or to touch the earth with the extremity of their jaws when they bring their neck and head down to their feet. In the attitude of quadrupeds, man could touch the earth only with the fore part or the top of the head.

To these differences of structure, we may add, that when man is standing, his heel rests upon the earth as well as the other parts of his foot; when he walks it is the first part that touches the ground; man can stand on one foot: these are peculiarities in structure and in the manner of moving which are not to be found in other animals. We may therefore conclude that man cannot be ranked in the class of quadrupeds. We may add, that in man the brain is much larger, and the jaws much shorter, than in any other animal. The brain, by its great extent, forms the protuberance of the occipital bone, the fore head, and all that part of the head which is above the ears. In the inferior animals, the brain is so small, that most of them have no occiput, and the front is either wanting or little raised. In animals which have large foreheads, such as the horse, the ox, the elephant, &c. they are placed as low as the ears, and even lower. These animals likewise want the occiput, and the top of the head is of very small extent. The jaws, which form the greatest portion of the muzzle, are large in proportion to the smallness of the brain. The length of the muzzle varies in different animals; in solipede animals it is very long; it is short in the *oran otan*, and in man it does not exist at all; no beard grows on the muzzle; this part is wanting in every animal*.

6
Man could never be a quadruped.

Man then alone, of all the animals with which we are acquainted, can constantly and uniformly support himself in the erect posture; and whatever the ingenious and learned writer of Ancient Metaphysics has advanced in favour of so strange a hypothesis, we cannot believe that even in his earliest and rudest state of civilization man could ever have been a quadruped. We are aware that Kotzebue, in the entertaining work in which he relates his exile to Siberia, speaks of an idiot he saw on his return, that went on all fours, with as much ease as if it were his natural attitude, but we do not consider this single instance as affording a proof that such would be the attitude of man in a state of nature.

* Daubenton.

“There are (says Cuvier) several circumstances in the anatomical structure of man, which sufficiently prove that nature never intended him to walk on all fours. In this situation his eyes would be directed towards the earth; but not being possessed of the cervical ligament that is found in quadrupeds, he would not be able to support his head. His inferior extremities would be too much elevated in proportion to his arms, and his feet too short.

Man.

short to enable him conveniently to bend them like other animals who tread only on their toes. His chest is so large that it would impede the free motion of his arms. He could not even climb with so much facility as apes, because he has not, like them, the great toe separated from the rest; nor could he climb like the cats, on account of the weakness of his nails *."

* *Tableau Elementaire.*

The body of a well-shaped man ought to be square, the muscles ought to be strongly marked, the contour of the members boldly delineated, and the features of the face well defined. In women, all the parts are more rounded and softer, the features are more delicate, and the complexion brighter. To man belong strength and majesty: gracefulness and beauty are the portions of the other sex. The structure essential to each will be found in the description of the human skeleton, under the article ANATOMY. See also ANATOMY, ANIMAL, SUPPLEMENT.

7 Nobleness of the form and attitude of man.

Every thing in both sexes points them out as the sovereigns of the earth; even the external appearance of man declares his superiority to other creatures. His body is erect; his attitude is that of command; his august countenance, which is turned towards heaven, bears the impressions of his dignity. The image of his soul is painted in his face; the excellence of his nature pierces through the material organs, and gives a fire and animation to the features of his countenance. His majestic deportment, his firm and emboldened gait, announce the nobleness of his rank. He touches the earth only with his extremity, he views it only at a distance, and seems to despise it. It has been justly observed, that the countenance of man is the mirror of his mind. In the looks of no animal are the expressions of passions painted with such energy and rapidity, and with such gentle gradations and shades, as in those of man. We know, that in certain emotions of the mind, the blood rises to the face, and produces blushing; and that in others the countenance turns pale. These two symptoms, the appearance of which depends on the structure and the transparency of the reticulum, especially redness, constitute a peculiar beauty. In our climates, the natural colour of the face of a man in good health is white, with a livel red suffused upon the cheeks. Paleness of the countenance is always a suspicious symptom. That colour which is shaded with black is a sign of melancholy; and constant and universal redness is a proof that the blood is carried with too much impetuosity to the brain. A livid colour is a morbid and dangerous symptom; and that which has a tint of yellow is a sign of jaundice or repletion of bile. The colour of the skin is frequently altered by want of sleep or of nourishment, or by looseness and diarrhoea †.

† *Buffon.*

8 Diversity of the human features.

Notwithstanding the general similitude of countenance in nations and families, there is a wonderful diversity of features. No one, however, is at a loss to recollect the person to whom he intends to speak, provided he has once fully seen him. One man has liveliness and gaiety painted in his countenance, and announces beforehand, by the cheerfulness of his appearance, the character which he is to support in society. The tears which bedew the cheeks of another man would excite compassion in the most unfeeling heart. Thus the face of man is the rendezvous of the symptoms both of his moral and physical affections; tranquillity,

Man.

anger, threatening, joy, smiles, laughter, malice, love, envy, jealousy, pride, contempt, disdain or indignation, irony, arrogance, tears, terror, astonishment, horror, fear, shame or humiliation, sorrow and affliction, compassion, meditation, particular convulsions, sleep, death, &c. &c. The difference of these characters appears to us of sufficient importance to form a principal article in the natural history of man.

When the mind is at ease, all the features of the face are in a state of profound tranquillity. Their proportion, harmony, and union, point out the serenity of the thoughts. But when the soul is agitated, the human face becomes a living canvas, whereon the passions are represented with equal delicacy and energy; where every emotion of the soul is expressed by some feature, and every action by some mark; the lively impression of which anticipates the will, and reveals by pathetic signs our secret agitation, and those intentions which we are anxious to conceal. It is in the eyes that the soul is painted in the strongest colours, and with the nicest shades. The different colours of the eyes are, dark hazel, light hazel, green, blue, gray, and whitish gray. The most common of these colours are hazel and blue, both of which are often found in the same eye. Eyes which are commonly called black, are only dark hazel; they appear black in consequence of being contrasted with the white of the eye. Wherever there is a tint of blue, however slight, it becomes the prevailing colour, and outshines the hazel, with which it is intermixed, to such a degree, that the mixture cannot be perceived without a very narrow examination. The most beautiful eyes are those which appear black or blue. In the former there is more expression and vivacity; in the latter more sweetness, and perhaps delicacy.

9 General analysis of the features.

10 The eyes.

Next to the eyes, the parts of the face by which the physiognomy is most strongly marked, are the eyebrows. Being of a different nature from the other parts, their effect is increased by contrast. They are like shade in a picture, which gives relief to the other colours and forms.

11 The eye-brows.

The forehead is one of the largest parts of the face, and one that contributes most to its beauty. Every body knows of how great importance the hair is in the physiognomy, and that baldness is a very great defect. When old age begins to make its approaches, the hair which first falls off is that which covers the crown of the head and the parts above the temples. We seldom see the hair of the lower part of the temples, or of the back of the head, completely fall off. Baldness is peculiar to men; women do not naturally lose their hair, though it becomes white as well as that of men at the approach of old age.

12 The forehead.

The nose is the most prominent feature of the face; but as it has very little motion, and that only in the most violent passions, it contributes less to the expression than to the beauty of the countenance. The nose is seldom perpendicular to the middle of the face, but for the most part is turned toward the one side or the other. The cause of this irregularity, which, according to painters, is perfectly consistent with beauty, and of which even the want would be a deformity, appears to be frequent pressure on one side of the cartilage of the child's nose against the breast of the mother when

13 The nose.

it

^{Man.} it receives suck. At the early period of life the cartilages and bones have acquired very little solidity, and are easily bent.

¹⁴ Mouth and lips. Next to the eyes, the mouth and lips have the greatest motion and expression. The motions of these parts are under the influence of the passions. The mouth, set off by the vermilion of the lips, and the enamel of the teeth, marks, by the various forms it assumes, their different characters; and this feature receives animation from the organ of the voice, which communicates to it more life and expression than is possessed by any other feature. The cheeks are uniform features, and have no motion, and little expression, except what arises from that involuntary redness or paleness with which they are covered in different passions, such as shame, anger, pride, and joy, producing redness; and fear, terror, and sorrow, producing paleness.

¹⁵ Changes on the features by the passions. In different passions, the whole head assumes different positions, and is affected with different motions. It hangs forward during shame, humility, and sorrow; it inclines to one side in languor and compassion; it is elevated in pride, erect and fixed in obstinacy and self-conceit. In astonishment, it is thrown backwards; and it moves from side to side in contempt, ridicule, anger, and indignation. In grief, joy, love, shame, and compassion, the eyes swell and the tears flow. The effusion of tears is always accompanied with an extension of the muscles of the face, which opens the mouth. In sorrow, the corners of the mouth are depressed, the under-lip rises, the eyelids fall down, the pupil of the eye is round and half concealed by the eyelid. The other muscles of the face are relaxed, so that the distance between the eyes and the mouth is greater than ordinary; and consequently the countenance appears to be lengthened. In fear, terror, consternation, and horror, the forehead is wrinkled, the eyebrows are raised, the eyelids are opened as wide as possible, the upper lid uncovers a part of the white above the pupil, which is depressed and partly concealed by the under lid. At the same time the mouth opens wide, the lips recede from each other, and discover the teeth both above and below. In contempt and derision, the upper lip is raised to one side and exposes the teeth, while the other side of the lip moves a little, and wears the appearance of a smile. The nostril on the elevated side of the lip shrivels up, and the corner of the mouth falls down. The eye on the same side is almost shut, while the other is open as usual; but the pupils of both are depressed, as when one looks down from a height. In jealousy, envy, and malice, the eyebrows fall down and are depressed. The upper lip is elevated on both sides, while the corners of the mouth are a little depressed, and the under lip rises to join the middle of the upper. In laughter the corners of the mouth are drawn back, and a little elevated; the upper parts of the cheeks rise; the eyes are more or less closed; the upper lip rises, and the under one falls down; the mouth opens, and in cases of immoderate laughter, the skin of the nose wrinkles. That gentler and more gracious kind of laughter which is called *smiling*, is seated wholly in the parts of the mouth. The under lip rises; the angles of the mouth are drawn back, the cheeks are puffed up, the eyelids approach one another, and a small twinkling is observed in the eyes. It is very extraordinary, that laughter may be excited either by a

moral cause without the immediate action of external objects, or by a particular irritation of the nerves without any feeling of joy. Thus an involuntary laugh is excited by a slight tickling of the lips, of the palm of the hand, of the sole of the foot, of the armpits, and in short, below the middle of the ribs. We laugh when two dissimilar ideas, the union of which was unexpected, are represented to the mind at the same time, and when one or both of these ideas, or their union, includes some absurdity which excites an emotion of disdain mingled with joy. In general, striking contrasts never fail to produce laughter.

A change is produced in the features of the countenance by weeping as well as by laughing. In weeping, the under lip is separated from the teeth; the forehead is wrinkled; the eyebrows are depressed; the dimple which gives a gracefulness to laughter, forsakes the cheek; the eyes are unusually compressed, and bathed in tears. In laughter, tears not unfrequently appear, but they flow more seldom and less copiously.

The arms, hands, and every part of the body, contribute to the expression of the passions. In joy, for instance, all the members of the body are agitated with quick and varied motions. In languor and sorrow, the arms hang down, and the whole body remains fixed and immoveable. In admiration and surprise, a similar suspension of motion is likewise observed. In love and hope, the head and eyes are raised to heaven, as if to solicit the wished-for good; the body bears forward as if to approach it; the arms are stretched out, and seem to seize before hand the desired object. On the contrary, in fear, hatred, and horror, the arms seem to push backward, and repel the object of aversion. We turn away our head and eyes, as if to avoid the sight of it; we start back as if to shun it*.

For the *beauty* of the human form, see BEAUTY and DRAWING.

¹⁶ At his birth, man is the most feeble of all animals; he cannot subsist but by the care of his parents, for which he has occasion for a much longer time than other animals. Hence the natural continuance of conjugal affection, and the intimate ties that bind together the parents with each other and with their children. As the father partakes with his companion in the care of educating their children, man ought more than any other animal, to live in a state of monogamy, the propriety of which is demonstrated by the nearly equal number of male and female children that on an average come into the world.

¹⁷ Man is formed for society, which is rendered essentially necessary to him from his natural weakness, and without which he would not be able to resist the wild beasts of the forest, nor procure for himself the necessaries of life: for he has no arms offensive or defensive, such as horns, claws, scales; nor any thing that resembles that faculty which we call instinct, which many species of animals derive from nature herself, and by which they construct themselves habitations, or change their climate, according to the diversity of the seasons.

¹⁸ All gregarious animals have a certain language by which they can in some measure communicate their thoughts to each other; but man enjoys in this respect two remarkable prerogatives. 1. The faculty of articulating sounds, which no quadruped enjoys in common with him, and which must give to his language an infinite

Man.

* Buffon.

¹⁶ Origin of family affection;¹⁷ and of social intercourse.¹⁸ Of language and arts.

Man.

finite variety and precision. 2. An unlimited power of generalizing his ideas, and of fixing and retaining abstract notions by means of words. On this depend memory and judgment, which latter is the foundation of reason, or of that faculty of reflecting and combining ideas, which is considered as peculiar to man.

It is by means of language than man communicates to the rest of his species the observations and discoveries made by each individual, and this communication is the great source of the infinite perfectibility of the human race. The arts are the offspring of science, produced by the combination of these observations and discoveries, and by that address which results from the peculiar conformation of our hands and fingers.

By means of the arts man has learned to procure for himself subsistence, and to provide against the inclemencies of the weather in every climate of the earth. Thus, he has established himself every where; while the rest of the animal creation have each a determinate space, beyond which they cannot pass without the protection of man, who has transported with him the domestic kinds, and has been followed in spite of himself by the parasitical tribes.

¹⁹
Progress of
civilization.

The nations who established themselves in the icy regions of the north, not finding there enough of vegetable nourishment, nor pasture sufficiently abundant for cattle, derived all their subsistence from the chase or fishing. Obligated to devote all their time to the procuring of this subsistence, and multiplying but slowly, from the destruction of the game which surrounded them, it is not surprising that among them man has made least progress in arts and civilization. Their arts were confined to the construction of huts, to the preparing of skins for their covering, and to the manufacture of spears and arrows. The inhabitants of the northern and eastern parts of Siberia, and the savages of North America, are almost the only people who are in this low state of civilization.

Other nations learned to secure for themselves in the possession of numerous herds, certain subsistence, and to find sufficient leisure to increase their knowledge; but their wandering life, in search of new pastures and more agreeable climates, kept them still within very narrow limits with respect to civilization. They, however, acquired more industry in the construction of their habitations, and learned the value of property; the natural consequences of which were riches, and an inequality of condition. The Laplanders in the north of Europe, the Tartars who inhabit the vast extent of country in the interior of Asia; the Bedouin Arabs who occupy the sands of Arabia and the north of Africa, the Caffres and Hottentots in the south of Africa, are the principal wandering tribes with which we are acquainted.

Man did not multiply to any great extent, nor rise to any great perfection in the arts and sciences, till landed property allowed him to pay attention to agriculture, by means of which the labour of one part of the community could procure subsistence for the rest, and leave them sufficient leisure to employ themselves in arts less necessary than ornamental. Lastly, The invention of money, by facilitating the transfer of commodities, brought to the highest pitch industry, luxury, and inequality of fortune, and by a necessary conse-

quence, the vices of effeminacy, and the rage of ambition.

Man living in every climate, fearing no other animal, but having even destroyed or confined to the deserts all those who could molest him, became incomparably more numerous than any other tribe of large animals. Hence, having few other animals to combat, he soon began to make war on his own species, and he may be considered as almost the only animal that is perpetually at war with those of the same tribe. Savages dispute the forests in which they follow the chase; Nomads, the pastures where they feed their cattle; more civilized people combat for the monopoly of commerce or the prerogatives of pride and ambition. Hence the necessity of government, to regulate national disputes, and to reduce to certain rules the quarrels of individuals*.

Man.

It is chiefly the features of the countenance, and the colour of the skin, that serve to distinguish the varieties of the human species. Independently of particular and individual differences, the human race may be distinguished into five principal varieties, the distinctive characters of which are deeply stamped, and appear to resist even the powerful influence of climate. In fact we see, under the same parallel of latitude, and in the same country, existing together for a number of ages, the dark Hungarian or gypsy, and the fairest people of Europe; the copper-coloured Peruvian, the brown Malay, and the almost white Abyssinian, in the same zone that is inhabited by the blackest people in the universe.

The inhabitants of Van Diemen's land are black, while the Europeans of the same degree of north latitude are white; and the inhabitants of the Malabar coast, though placed beneath a sky much hotter than the inhabitants of Siberia, are not browner than these latter. The Dutch who colonized the Cape of Good Hope, have not, during two centuries, acquired the same colour with the Hottentots who people that country; and the Parsi remain white in the midst of the olive-coloured Hindoos.

The colouring matter seated in the mucous membrane below the skin, is not the only distinctive character that marks the varieties of the human species, as in each of them there is a peculiar form, distinguished by general and constant marks, depending on the conformation of the bones. The muzzle of the Negro; the very prominent cheek-bones of the Calmuck; the flattened skull and nose of the Caribbee Indian; the oblique eyes of the Japanese and Chinese, do not appear owing to art, like the lengthened ears or the tattooed skin of the natives of the South sea islands. The fair or red colour of the hair in Europeans; the blue or gray eyes of the north, are almost never seen, except in a few morbid cases, in any other varieties. The hair of all the rest is very black, even from infancy; sleek and thick in all the Mogul nations, the Malays, and the Americans, both of the south and north, but woolly in Negroes and Hottentots; the beard which is late and thin in all the Monguls, exists naturally throughout the American tribes, though, as among most other savage people, all the Caribs eradicate it from their youth, which has induced a supposition that all these savage people are naturally beardless †.

Mankind with respect to their varieties, have been very

* Cuvier.

20

Marks that distinguish varieties of the human species.

† Ferri.

Man. very differently divided by naturalists. Linnæus makes five varieties, viz. 1. *Americans*, of copper-coloured complexion, choleric constitution, and remarkably erect. 2. *Europeans*; of fair complexion, sanguine temperament, and brawny form. 3. *Asiatics*; of sooty complexion, melancholic temperament, and rigid fibre. 4. *Africans*; of black complexion, phlegmatic temperament, and relaxed fibre; and, 5. *Monsters*; comprehending, 1. *Alpini*; the inhabitants of the northern mountains: they are small in stature, active, and timid in their disposition. 2. *Patagonici*; the Patagonians of South America, of vast size, and indolent in their manners. 3. *Monorchides*; the Hottentots, having one testicle extirpated. 4. *Imberbes*; most of the American nations, who eradicate their beards and the hair from every part of the body except the scalp. 5. *Macrocephali*. 6. *Plagiocephali*; the Canadian Indians, who have the fore part of their heads flattened, when young, by compression.

21 Varieties of man as stated by Linnæus.
22 By Gmelin. The following arrangement of the varieties in the human species, is offered by Gmelin as more convenient than that of Linnæus. 1. White, (*Hom. Albus*.) Formed by the rules of symmetrical elegance and beauty: or at least what we consider as such.—This division includes almost all the inhabitants of Europe; those of Asia on this side of the Oby, the Caspian, Mount Imaus, and the Ganges; likewise the natives of the north of Africa, of Greenland, and the Esquimaux.

2. Brown: (*Hom. Badius*.) Of a yellowish brown colour; has scanty hairs, flat features, and small eyes.—This variety takes in the whole inhabitants of Asia not included in the preceding division.

3. Black: (*Hom. Niger*.) Of black complexion; has frizzly hair, a flat nose, and thick lips.—The whole inhabitants of Africa, excepting those of its more northern parts.

4. Copper-coloured: (*Hom. Cupreus*.) The complexion of the skin resembles the colour of copper not burnished.—The whole inhabitants of America, except the Greenlanders and Esquimaux.

5. Tawney: (*Hom. Fuscus*.) Chiefly of a dark blackish-brown colour; having a broad nose, and harsh coarse straight hair.—The inhabitants of the southern islands, and of most of the Indian islands.

23 By Buffon. Buffon enumerates six varieties, 1. The polar or Lapland race; 2. The Tartar or Mongul; 3. The southern Asiatic; 4. The European; 5. The Ethiopian; and, 6. The American. For an account of these varieties see Buffon's Natural History by Smellie, and Herder's Outlines of the Philosophy of the History of Man.

24 By Virey. Virey the disciple of Buffon, distributes man into five varieties, 1. The Celtic race, containing most of the Europeans. 2. The Mongul and Lapland. 3. Malay. 4. The Negro and Hottentot; and, 5. The Carrib. For his description of these varieties, with portraits illustrating them, see his *Histoire Naturelle du Genre Humain*, tom. i. p. 129.

25 By Cuvier. Of all the divisions which we have seen, we consider that given by Cuvier, in his *Tableau Elementaire de l'Histoire Naturelle des Animaux*, as the least exceptionable; and as it is very concise, we shall here give a translation of it. Cuvier's enumeration is as follows:

26 White race. 1. The *white race*, with oval visage, long hair, pointed

nose; to which belong the polished natives of Europe; which appears to us the most comely of all the varieties, is also far superior to the rest in strength of genius, in courage, and activity. The Tartars, properly so called, from whom the Turks are descended; the Circassians, and other people about Mount Caucasus, who are the fairest of the human race: the Persians, the native inhabitants of Hindostan, the Arabians, the Moors who inhabit the north of Africa, and the Abyssinians, who appear, as well as the Jews, to be derived from the Arabians. belong to the same race with the Europeans. These nations are larger and fairer in the north, their hair is there fair, their eyes blue; whereas in the south they are dark, and often very brown, and their hair and eyes are black. There are intermixtures of these colours in the more temperate regions.

27 2. All the north of the two continents is peopled with Lapland men that are very dark, with flat visage, black hair race. and eyes; with a body thick and extremely short. To this belong the Laplanders in Europe, the Samoiedes, Ostiaks, Tschutski in Asia, the Greenlanders and Esquimaux in America. The inhabitants of Finland resemble these almost in every circumstance, except that their height equals that of the European. The Hungarians and several wandering tribes of Asia, have a similar form, and similar language and manners with the Fins.

28 3. The *Mongul* race, to which belong most of the Mongul people we call Tartars, as the Monguls, the Mantcheoux, the Calmucs, &c. and who have extended their conquests from China to Hindostan, and are even advanced as far as the frontiers of Europe, is characterized by a flat forehead, a small nose, prominent cheek-bones, black hair, very thin beard, small oblique eyes, thick lips, and a colour more or less yellow.

The Chinese and Japanese, and the Indians beyond the Ganges, to whom we give the name of Malays, appear to hold a near resemblance to the Monguls. The islands of the South sea, and the great continent of New Holland, are inhabited by original Malays. Those who live nearest the equator have the skin almost as black as the Negroes. Such are, among others, the Papons.

29 4. The *Negroes* inhabit all the coasts on the south of Africa from the river Senegal to the Red sea. Besides the blackness of their skin, they are distinguished by their flat nose and forehead, their long muzzle, prominent cheek bones, and frizzled hair. They are blacker than the inhabitants of Guinea, and have the nose excessively long. Those of Congo are the most comely. Towards the tropic of Capricorn they become a little paler, and take the name of Caffres. Almost all the inhabitants of the eastern coast of Africa are of this subvariety. The Hottentots form another subdivision, which is found in the most southern point, and they have cheek-bones so prominent, that their visage appears triangular. Their colour is a brown olive.

It is supposed that the interior parts of Africa, which are very hilly, are inhabited by a race of white men like Abyssinia.

30 5. America was peopled with men of a copper colour, with long and coarse hair, who, according to most travellers, generally want the beard, and even the hair on the body. Others assure us that they eradicate these. It is also said, that the fanciful form of their heads

Man. heads arise from the compression they undergo in infancy. This race comprehends the savage nations of America, and the remaining inhabitants of Mexico and Peru. It is towards the southern point of this continent that we find the tallest race of men in the universe; but their height, which the earlier travellers represented as gigantic, scarcely exceeds six feet. These are the people so celebrated under the name of Patagonians.

All these different varieties of men can intermix and produce children, who hold a mean between the forms and colours of their parents. These intermixtures can again mix with the original races, and the produce approaches to these races according to the degree of mixture. All these progenies are prolific as well as their fathers and mothers.

It appears that there are sometimes born in the different races of our variety, subjects of a milky whiteness, which is the effect of disease, and this colour is accompanied with feebleness of body and weakness of sight. Some travellers have believed that these men form entire nations, which they have called Dariens in America, Dondos or Albinos, in Africa, and Chackleras in India. See ALBINOS.

The different colours which distinguish the varieties of the human species, reside not in the cuticle, but in the mucus and reticular membrane which is immediately below it*.

* Cuvier.

31
Varieties
of man not
distinct
species.

Blumenbach remarks, that some late writers seem doubtful whether the numerous distinct races of men ought to be considered as mere varieties, which have arisen from degeneration, or as so many species altogether different. The cause of this seems chiefly to be, that they took too narrow a view in their researches, selected, perhaps, two races the most different from each other possible, and, overlooking the intermediate races that formed the connecting links between them, compared these two together; or, they fixed their attention too much on man, without examining other species of animals, and comparing their varieties and degeneration with those of the human species. The first fault is, when one, for example, places together a Senegal negro and an European Adonis, and at the same time forgets that there is not one of the bodily differences of these two beings, whether hair, colour, features, &c. which does not gradually run into the same thing of the other, by such a variety of shades, that no physiologist or naturalist is able to establish a certain boundary between these gradations, and consequently between the extremes themselves.

The second fault is, when people reason as if man were the only organized being in nature, and consider the varieties in his species to be strange and problematical, without reflecting that all these varieties are not more striking or more uncommon than those with which so many thousands of other species of organized beings degenerate, as it were, before our eyes.

We cannot here enter into the merits of the question, whether, considering the varieties of the human species which we have described, all these could have originated from one pair, as related in the Mosaic history. To those who affect to disbelieve the Mosaic account, it may be sufficient to reply, that to the almighty power of the Divine Being it was not more difficult to change and modify the descendants of one man and one wo-

Vol. XII. Part II. †

Man. man, in order to adapt them to the different regions of the earth which they were destined to occupy, than to create at the first five or six pairs placed in different situations, to be the progenitors of the nations that we now see inhabiting the globe.

On the nature and causes of the different colour of the skin, that characterizes the varieties of the human species, see the article COMPLEXION. On this subject we shall here add a curious comparison between the human race and swine, by Professor Blumenbach, intended to refute the second error into which he considers writers have fallen, in treating of the varieties of man.

More reasons, says he, than one have induced me to make choice of swine for this comparison; but, in particular, because they have a great similarity, in many respects, to man; not, however, in the form of their entrails, as people formerly believed, and therefore studied the anatomy of the human body purposely in swine; so that even, in the 17th century, a celebrated dispute, which arose between the physicians of Heidelberg and those of Durlach, respecting the position of the heart in man, was determined, in consequence of orders from government, by inspecting a sow, to the great triumph of the party which really was in the wrong. Nor is it because in the time of Galen, according to repeated assertions, human flesh was said to have a taste perfectly similar to that of swine; nor because the fat, and the tanned hides of both, are very like to each other; but because both, in general, in regard to the economy of their bodily structure, taken on the whole, shew unexpectedly, on the first view, as well as on closer examination, a very striking similitude.

Both, for example, are domestic animals; both omnivora; both are dispersed throughout all the four quarters of the world; and both consequently are exposed, in numerous ways, to the principal causes of degeneration arising from climate, mode of life, nourishment, &c.: both, for the same reason, are subject to many diseases rarely found among other animals than men and swine, such as the stone in the bladder; or to diseases exclusively peculiar to these two, such as the worms found in measles swine.

Another reason, continues he, why I have made choice of swine for the present comparison is, because the degeneration and descent from the original race are far more certain in these animals, and can be better traced, than in the varieties of other domestic animals: For no naturalist, I believe, has carried his scepticism so far as to doubt the descent of the domestic swine from the wild boar; which is much the more evident, as it is well known that wild pigs, when caught, may be easily rendered as tame and familiar as domestic swine: and the contrary also is the case; for if the latter, by any accident get into the woods, they as readily become wild again; so that there are instances of such animals being shot for wild swine, and it has not been till they were opened, and found castrated, that people were led to a discovery of their origin, and how, and at what time, they ran away. It is well ascertained, that, before the discovery of America by the Spaniards, swine were unknown in that quarter of the world, and that they were afterwards carried thither from Europe. All the varieties, therefore, through which this animal has since degenerated, belong, with the original European race,

3 Z

to

Man.

to one and the same species; and since no bodily difference is found in the human race, either in regard to stature, colour, the form of the skull, &c. as will presently appear, which is not observed in the same proportion in the swine race, this comparison, it is to be hoped, will silence those sceptics who have thought proper, on account of those varieties of the human species, to admit more than one species.

With regard to stature, the Patagonians, as is well known, have afforded the greatest employment to anthropologists. The romantic tales, however, of the old travellers, and even the more modest relations of English navigators, have been doubted by other travellers, who on the same coast sought in vain for such children of Anak. But even admitting every thing said of the size of these Patagonians, there is not among them nearly such an excess of stature as that observed in many parts of America among the swine originally carried thither from Europe; and of these we shall mention particularly those of Cuba, which are more than double the size of the original Europeans.

The natives of Guinea, Madagascar, New Holland, New Guinea, &c. are black; many American tribes are reddish brown, and the Europeans are white. An equal difference is observed among swine in different countries. In Piedmont, for example, they are black. When I passed, says our author, through that country, during the great fair for swine at Salenge, I did not see a single one of any other colour. In Bavaria, they are reddish brown; in Normandy they are all white. Human hair is, indeed, somewhat different from swine's bristles, yet, in the present point of view, they may be compared with each other. Fair hair is soft, and of a silky texture; black hair is coarser, and among several tribes, such as the Abyssinians, Negroes, and the inhabitants of New Holland, it is woolly, and most so among the Hottentots. In like manner, among the white swine in Normandy, as I was assured by an incomparable observer, Sulzer of Bonneburg, the hair on the whole body is longer and softer than among other swine; and even the bristles on the back are very little different, but lie flat, and are only longer than the hair on the other parts of the body. They cannot, therefore, be employed by the brush-makers. The difference between the hair of the wild boar and the domestic swine, particularly in regard to the softer part between the strong bristles, is, as is well known, still greater.

The whole difference between the cranium of a negro and that of an European, is not in the least degree greater than that equally striking difference which exists between the cranium of the wild boar and that of the domestic swine. Those who have not observed this in the animals themselves, need only to cast their eye on the figure which Daubenton has given of both.

I shall pass over, says Blumenbach, less national varieties which may be found among swine as well as among men, and only mention, that I have been assured by Mr Sulzer, that the peculiarity of having the bone of the leg remarkably long, as is the case among the Hindoos, has been remarked with regard to the swine in Normandy. They stand very long on their hind legs; their back, therefore, is highest at the rump, forming a kind of inclined plane, and the head proceeds in the same direction, so that the snout is not far from the ground. I shall here add, that the swine in some

countries have degenerated into races which in singularity far exceed every thing that has been found strange in bodily variety among the human race. Swine with solid hoofs were known to the ancients, and large herds of them are found in Hungary, Sweden, &c. In like manner the European swine, first carried by the Spaniards, in 1509, to the island of Cuba, at that time celebrated for its pearl fishery, degenerated into a monstrous race, with hoofs which were half a span in length.

From these facts our ingenious author concludes, that it is absurd to allow the vast variety of swine to have descended from one original pair, and to contend that the varieties of men are so many distinct species.

No part of the natural history of man can be more interesting than that which describes the progressive improvement and decay of human life, from the cradle to the grave. This subject has been treated of in a most animated manner by Buffon, and we shall here give an abridgement of this part of his work.

Nothing (says M. Buffon) exhibits such a striking picture of our weakness, as the condition of an infant immediately after birth. Incapable of employing its organs, it requires assistance of every kind. In the first moments of our existence, we present an image of pain and misery, and are more weak and helpless than the young of any other animal. At birth, the infant passes from one element to another; when it leaves the gentle warmth of the tranquil fluid by which it was completely surrounded in the womb of the mother, it becomes exposed to the impressions of the air, and instantly feels the effects of that active element. The air acting upon the olfactory nerves, and upon the organs of respiration, produces a shock something like that of sneezing, by which the breast is expanded, and the air admitted into the lungs. In the mean time, the agitation of the diaphragm presses upon the bowels, and the excrements are thus for the first time discharged from the intestines, and the urine from the bladder. The air dilates the vesicles of the lungs, and after being rarefied to a certain degree, is expelled by the spring of the dilated fibres reacting upon this rarefied fluid. The infant now respires, and articulates sounds or cries.

Most animals are blind for some days after birth. Infants open their eyes to the light the moment they come into the world; but they are dull, fixed, and commonly blue. The new-born child cannot distinguish objects, because he is incapable of fixing his eyes upon them. The organ of vision is yet imperfect; the cornea is wrinkled; and perhaps the retina is too soft for receiving the images of external objects, and for communicating the sensation of distinct vision. At the end of 40 days, the infant begins to hear and to smile. About the same time it begins to look at bright objects, and frequently to turn its eyes towards the window, a candle, or any light. Now likewise it begins to weep; for its former cries and groans were not accompanied with tears. Smiles and tears are the effect of two internal sensations, both of which depend on the action of the mind. Thus they are peculiar to the human race, and serve to express mental pain or pleasure, while the cries, motions, and other marks of bodily pain and pleasure, are common to man and most of the other animals. Considering the subject as metaphysicians, we shall find that pain and pleasure form the universal

Man.

33

Progress of human life.

34

Infancy.

Man. universal power, which sets all our passions in motion.

The size of an infant born at the full time is commonly 21 inches; and that *fœtus*, which nine months before was an imperceptible bubble, now weighs ten or twelve pounds, and sometimes more. The head is large in proportion to the body; and this disproportion, which is still greater in the first stage of the fœtus, continues during the period of infancy. The skin of a new-born child is of a reddish colour, because it is so fine and transparent as to allow a slight tint of the colour of the blood to shine through. The form of the body and members is by no means perfect in a child soon after birth; all the parts appear to be swollen. At the end of three days, a kind of jaundice generally comes on, and at the same time milk is to be found in the breasts of the infant, which may be squeezed out by the fingers. The swelling decreases as the child grows up.

The liquor contained in the amnios leaves a viscid whitish matter upon the body of the child. In this country we have the precaution to wash the new-born infant only with warm water; but it is the custom with whole nations inhabiting the coldest climates, to plunge their infants into cold water as soon as they are born, without their receiving the smallest injury. It is even said that the Laplanders leave their children in the snow till the cold has almost stopped their respiration, and then plunge them into a warm bath. Among these people, the children are also washed thrice a day during the first year of their life. The inhabitants of northern countries are persuaded that the cold bath tends to make men stronger and more robust, and on that account accustom their children to the use of it from their infancy. The truth is, that we are totally ignorant of the power of habit, or how far it can make our bodies capable of suffering, of acquiring, or of losing.

The child is not allowed to suck as soon as it is born; but time is given for discharging the liquor and slime from the stomach, and the *meconium* or excrement, which is of a black colour, from the intestines. As these substances might sour the milk, a little diluted wine mixed with sugar is first given to the infant, and the breast is not presented to it before 10 or 12 hours have elapsed.

The young of quadrupeds can of themselves find the way to the teat of the mother: it is not so with man. The mother, in order to suckle her child, must raise it to her breasts; and, at this feeble period of life, the infant can express its wants only by cries.

New-born children have need of frequent nourishment. During the day, the breast ought to be given them every two hours, and during the night as often as they awake. At first they sleep almost continually; and they seem never to awake but when pressed by hunger and pain. Sleep is useful and refreshing to them; and it is sometimes considered as necessary to employ narcotic doses, proportioned to the age and constitution of the child, for the purpose of procuring them repose. The common way of appeasing the cries of children is by rocking them in a cradle; but this agitation must be very gentle, otherwise a great risk is run of confusing the infant's brain, and of producing a total derangement. It is necessary to their being in

good health, that their sleep be long and natural. It is possible, however, that they may sleep too much, and thereby endanger their constitution. In that case, it would be proper to take them out of the cradle, and awaken them by a gentle motion, or by presenting some bright object to their eyes. At this age we receive the first impressions from the senses, which, without doubt, are more important during the rest of life than is generally imagined. Great care ought to be taken to place the cradle in such a manner that the child shall be directly opposite to the light, for the eyes are always directed towards that part of the room where the light is strongest; and if the cradle be placed sideways, one of them, by turning towards the light, will acquire greater strength than the other, and the child will squint. For the first two months, no other food should be given to the child but the milk of the nurse; and when it is of a weak and delicate constitution, this nourishment alone should be continued during the third or fourth month. A child, however robust and healthy, may be exposed to great danger and inconvenience, if any other aliment is administered before the end of the first month. In Holland, Italy, Turkey, and the whole Levant, the food of children is limited to the milk of the nurse for a whole year. The savages of Canada give their children suck for four, five, six, and sometimes even seven years. In this country, as nurses generally have not a sufficient quantity of milk to satisfy the appetite of their children, they commonly supply the want of it by panada, or other light preparations.

The teeth usually begin to appear about the age of ³⁵ Dentition. seven months. The cutting of these, although a natural operation, does not follow the common laws of nature, which acts continually on the human body without occasioning the smallest pain, or even producing any sensation. Here a violent and painful effort is made, accompanied with cries and tears. Children at first lose their sprightliness and gaiety; they become sad, restless, and fretful. The gums are red, and swelled; but they afterwards become white, when the pressure of the teeth is so great as to stop the circulation of the blood. Children apply their fingers to their mouth, that they may remove the irritation which they feel there. Some relief is given, by putting into their hands a bit of ivory or coral, or of some other hard and smooth body, with which they rub the gums at the affected part. This pressure, being opposed to that of the teeth, calms the pain for a moment, contributes to make the membrane of the gum thinner, and facilitates its rupture. Nature here acts in opposition to herself; and an incision of the gum must sometimes take place, to allow a passage to the tooth. For the period of dentition, number of teeth, &c. see ANATOMY, N^o 27.

When children are allowed to cry too long, and too ³⁶ Diseases of infancy. often, ruptures are sometimes occasioned by the efforts they make. These may easily be cured by the speedy application of bandages; but if this remedy has been too long delayed, the disease may continue through life. Children are very much subject to worms. Some of the bad effects occasioned by these animals might, according to Buffon, be prevented by giving them a little wine now and then, for fermented liquors have a tendency to prevent their generation.

Man.

Though the body is very delicate in the state of infancy, it is then less sensible of cold than at any other period of life. The internal heat appears to be greater. The pulse in children is much quicker than in adults, from which we are certainly entitled to infer, that the internal heat is greater in the same proportion.

37
Mortality
of infants.

Till three years of age, the life of a child is very precarious. In the second or third following years it becomes more certain, and at six or seven years of age a child has a better chance of living than at any other period of life. From the bills of mortality published at London, it appears, that of a certain number of children born at the same time, one half of them dies the three first years; according to which, one-half of the human race would be cut off before they are three years of age. But the mortality among children is not everywhere so great as in London. *M. Dupre du Saint-Maur*, from a great number of observations made in France, has shewn that half of the children born at the same time are not extinct till seven or eight years have elapsed.

Among the causes which have occasioned so great a mortality among children, and even among adults, the smallpox may be ranked as the chief. But luckily the means of alleviating the effects of this terrible scourge are now universally known by inoculation, and still more by the introduction of the cowpox.

38
Speech.

Children begin learning to speak about the age of 12 or 15 months. In all languages, and among every people, the first syllables they utter are *ba, ba, ma, ma, pa, pa, taba, abada*; nor ought this to excite any surprise, when we consider that these syllables are the sounds most natural to man, because they consist of that vowel, and those consonants, the pronunciation of which require the smallest exertion in the organs of speech. Some children at two years of age articulate distinctly, and repeat whatever is said to them; but most children do not speak till the age of two years and a half, or three years, and often later.

The life of man and of other animals is measured only from the moment of birth; they enjoy existence, however, previous to that period, and begin to live in the state of a foetus. This state is described and explained under the article ANATOMY, N^o 113. The period of infancy, which extends from the moment of birth to about 12 years of age, has already been considered.

39
Adolescence and
puberty.

The period of infancy is followed by that of adolescence. This begins, together with puberty, at the age of 12 or 14, and commonly ends in girls at 15, and in boys at 18, but sometimes not till 21, 23, and 25 years of age. According to its etymology (being derived from the Latin *adolescencia*), it is completed when the body has attained its full height. Thus, puberty becomes adolescence, and precedes youth. This is the spring of life; this is the season of pleasures, of loves, and of graces; but this smiling season is of short duration. Hitherto nature seems to have had nothing in view but the preservation and increase of her work; she has made no provision for the infant except what is necessary for life and growth. It has enjoyed a kind

of vegetable existence which was shut up within itself, and which it was incapable of communicating. In this first stage of life, reason is still asleep; but the principles of life soon multiply, and man has not only what is necessary to his own existence, but what enables him to give existence to others. This redundancy of life can no longer be confined, but endeavours to expand and diffuse itself*.

Man.

* Buffon.

Thus far we have followed Buffon in his animated sketch of the progress of human life; but here we must leave him for a while, as we consider the picture he has given of the approach of puberty and its corresponding circumstances to be less calculated to serve the purposes of scientific information, than to gratify idle and vicious curiosity, and rouse those passions which seldom require much excitement. The subjects of the procreation of the human species, of pregnancy and parturition, are strictly medical, and are treated of in sufficient detail under their proper heads in this work. Perhaps we shall be accused, by some of the philosophers of the present age, of being too fastidious in omitting so important and interesting a part of the natural history of man; but we had rather incur the imputation of negligence, than introduce into an article that is intended for general readers any thing that may offend the nicest delicacy.

Soon after the age of puberty the body of man attains its full stature. Some young people cease to grow after 15 or 16; while others continue to increase in height till 20, or even 23. During this interval they are usually very slender, but by degrees the limbs swell, and assume their proper shape; and before the age of 30, the body has generally attained its greatest perfection with regard to strength, consistence, and symmetry. Adolescence is considered as terminating at the age of 20 or 25, and at this period (according to the usual division of man's life into ages), youth begins. This continues till the age of 30 or 35.

The stature of man varies considerably in different climates, and under different circumstances. Authors are by no means agreed as to what should be considered the medium height of the human body. Buffon states it at from five feet or five feet and an inch, to five feet four inches, making the medium height about five feet two inches. Haller, on the contrary, reckons the true medium height of men in the temperate climates of Europe to be about five feet five or six inches. In general, women are several inches shorter than men. It has been remarked by Haller, that in mountainous countries, such as Switzerland, the inhabitants of the plains are commonly much taller than those of the higher situations. It is difficult to ascertain with precision the actual limits of the human stature; but we may remark that in surveying the inhabited parts of the earth, we find more remarkable differences in the stature of different individuals of the same nation, than in the general height of different nations. In the same climate, among the same people, and often even in the same family, we find some individuals that are far above the medium standard, and others as far below it. The former we call giants, and the latter dwarfs. See GIANT and DWARF (A).

The

(A) In addition to the relations of gigantic men given under GIANT, we shall here present our readers with Blair's

Man
41
Manhood.

The body having acquired its full height during the period of adolescence, and its full dimensions in youth, remains for some years in the same state before it begins to decay. This is the period of manhood, which extends from the age of 30 or 35 to that of 40 or 45 years. During this stage the powers of the body continue in full vigour, and the principal change which takes place in the human figure arises from the formation of fat in different parts. Excessive fatness disfigures the body, and becomes a very cumbersome and inconvenient load.

42
Declining
age.

Physiologists give the name of old age to that period of life which commences immediately after the age of manhood and ends at death, and they distinguish green old age from the age of decrepitude. But in our opinion such an extensive signification of the word ought not to be admitted. We are not old men at the age of 40 or 45, and though the body then gives signs of decay, it has not yet arrived at the period of old age. M. Daubenton observes, that it would be more proper to call it the *declining age*, because nature then becomes retrograde, the fatness and good plight of the body diminish, and certain parts of it do not perform their functions with equal vigour.

The age of decline is from 40 or 45, to 60 or 65 years of age. At this time of life, the diminution of the fat is the cause of those wrinkles which begin to appear in the face and some other parts of the body. The skin, not being supported by the same quantity of fat, and being incapable, for want of elasticity, of contracting, sinks down and forms folds. In the decline of life, a remarkable change takes place also in vision. In the vigour of our days, the crystalline lens, being thicker and more diaphanous than the humours of the eye, enables us to read letters of a very small character at the distance of eight or ten inches. But when the age of decline comes on, the quantity of the humours of the eye diminishes,

Man.

they lose their clearness, and the transparent cornea becomes less convex. To remedy this inconvenience, we place what we wish to read at a greater distance from the eye; but vision is thereby very little improved, because the image of the object becomes smaller and more obscure. Another mark of the decline of life is a weakness of the stomach, and indigestion, in most people who do not take sufficient exercise in proportion to the quantity and quality of their food.

At 60, 63, or 65 years of age, the signs of decline⁴³ become more and more visible, and indicate old age. This period commonly extends to the age of 70, sometimes to 75, but seldom to 80. When the body is emaciated and bent by old age, man then becomes crazy. Crazyness, therefore, is nothing but an infirm old age. The eyes and stomach then become weaker and weaker; leanness increases the number of the wrinkles, the beard and the hair become white; the strength and the memory begin to fail.

After 70, or at most 80 years of age, the life of man is nothing but labour and sorrow; such was the language of David near 3000 years ago. Some men of strong constitutions, and in good health, enjoy old age for a long time without decrepitude; but such instances are not very common. The infirmities of decrepitude continually increase, and at length death concludes the whole. This fatal term is uncertain. The only conclusions which we can form concerning the duration of life, must be derived from observations made on a great number of men who were born at the same time, and who died at different ages.

The signs of decrepitude form a striking picture of weakness, and announce the approaching dissolution of the body. The memory fails, the fibres become hard, the nerves blunted; deafness and blindness take place; the senses of smell, of touch, and of taste, are destroyed; the appetite fails; the necessity of eating, and more frequently

Blair's account of O'Brien, the Irish giant, who exhibited himself at London and Edinburgh a few years ago, and died very lately. He pretended to be nearly nine feet high. We insert this account the more readily, as it exactly agrees with what we ourselves observed when O'Brien was in Edinburgh.

"I visited this Irishman (says Mr Blair), on the 5th of May 1804, at N^o 11. Haymarket. He was of a very extraordinary stature, but not well formed. As he would not suffer a minute examination to be made of his person, it is impossible to give any other than a short description of him. He declined the proposal of walking across the room, and I believe was afraid of discovering his extreme imbecility. He had the general aspect of a weak and unreflecting person, with an uncommonly low forehead; for as near as I could ascertain, the space above his eye-brows, in a perpendicular line to the top of his head, did not exceed two inches. He told me his age was 38 years, and that most of his ancestors, by his mother's side, were very large persons. The disproportionate size of his hands struck me with surprise, and in this he seemed to make his principal boast. He refused to allow a cast to be made of his hand, and said it had been done many years ago; but as I have seen that cast at Mr Bacon's, I am convinced the size is much too small to represent his present state of growth. All his joints were large, and perhaps rickety; his legs appeared swollen, mishapen, and I thought dropsical; however, he did not like my touching them. The feet were clumsy, and concealed as much as possible by high shoes. His limbs were not very stout, especially his arms, and I judged that he had scarcely got the use of them; for, in order to lift up his hand, he seemed obliged to swing the whole arm, as if he had no power of raising it by the action of the deltoid muscle. He certainly had a greater redundancy of bone than of muscle, and gave me the impression of a huge, overgrown, sickly boy; his voice being rather feeble as well as his bodily energies, and his age appearing under that which he affirmed. Indeed I find he gave a different account of himself to different visitors. The state of his pulse agreed with the general appearance of his person, viz. feeble, languid, and slow in its motions. With regard to his actual height, I felt anxious to detect the fallacy he held out of his being *nine feet*! Upon extending my arm to the utmost, I reached his eye-brow with my little finger: allowing his height to have been two inches and one-fourth above this, it could not be more in the whole than seven feet ten inches; so that I am persuaded the common opinion, founded on the giant's own tale, is greatly exaggerated." *Philosophical Magazine*, vol. xviii. p. 356.

Man. frequently that of drinking, are alone felt; after the teeth fall out, mastication is imperfectly performed, and digestion is very bad; the lips fall inwards; the edges of the jaws can no longer approach each other; the muscles of the lower jaw become so weak, that they are unable to raise and support it. The body sinks down; the spine is bent outward, and the vertebræ grow together at the interior part; the body becomes extremely lean; the strength fails; the decrepid wretch is unable to support himself; he is obliged to remain on a seat, or stretched in his bed; the bladder becomes paralytic; the intestines lose their spring; the circulation of the blood becomes slower; the strokes of the pulse no longer amount to the number of 80 in a minute as in the vigour of life, but are reduced to 24 and sometimes fewer; respiration is slower; the body loses its heat; the circulation of the blood ceases; death follows; and the dream of life is at an end.

44
Death.

Nothing can be more humiliating to the pride and vanity of man than a comparison of the state to which his body is reduced by death, with that which it exhibits in the prime and vigour of youth. Let us contemplate a female in the prime of youth and beauty. That elegant voluptuous form, that graceful flexibility of motion, that gentle warmth, those cheeks crimsoned with the roses of delight, those brilliant eyes darting rays of love, or sparkling with the fire of genius; that countenance enlivened by sallies of wit, or animated by the glow of passion, appear, united, to form a most fascinating being. A moment is sufficient to destroy the illusion. Sense and motion cease without any apparent cause; the body loses its heat; the muscles become flat, and the angular prominences of the bones appear; the lustre of the eye is gone; the cheeks and lips are livid. These, however, are but preludes of changes still more horrible. The flesh becomes successively blue, green, and black. It attracts humidity, and while one portion evaporates in infectious emana-

tions, another dissolves into a putrid sanies, which is also dissipated. In a word, after a few short days there remains only a small number of earthy and saline principles. The other elements are dispersed in air, and in water, to enter again into new combinations*.

Man.
* Cuvier's
Comp.
Anat. i. 2.

Man has no right to complain of the shortness of life. Throughout the whole of living beings, there are few who unite in a greater degree all the internal causes which tend to prolong its different periods. The term of gestation is very considerable; the rudiments of the teeth are very late in unfolding; his growth is slow, and is not completed before about 20 years have elapsed.—The age of puberty, also, is much later in man than in any other animal. In short, the parts of his body being composed of a softer and more flexible substance, are not so soon hardened as those of inferior animals. Man, therefore, seems to receive at his birth the seeds of a long life; if he reaches not the distant period which nature seemed to promise him, it must be owing to accidental causes foreign to himself. Instead of saying that he has finished his life, we ought rather to say that he has not completed it.

The natural and total duration of life is in some measure⁴⁵ proportioned to the period of growth. A tree of human or an animal which soon acquires its full size, decays⁴⁵ life. much sooner than another which continues to grow for a longer time. If it is true that the life of animals is eight times longer than the period of their growth, we might conclude that the boundaries of human life may be extended to a century and a half.

On the subject of longevity, and the general circumstances on which it depends, we have already treated under the article LONGEVITY, and have there given a list of a great number of persons who have been celebrated for the length of their lives. To this list we shall add a few more names in the note below (B); but on the general subject of longevity, we shall

(B) William Lecomte, a shepherd, died suddenly in 1776, in the county of Caux in Normandy, at the age of 110. Cramers, physician to the emperor, saw at Temeswar two brothers, the one aged 110, and the other 112, both of whom were fathers at that age. St Paul the hermit was 113 at his death. The Sieur Iswan-Horwaths, knight of the order of St Louis, died at Saar-Albe in Lorraine in 1775, aged almost 111. He was a great hunter. He undertook a long journey a short time before his death, and performed it on horseback. Rosine Iwiwarouska died at Minsk in Lithuania at the age of 113. Fockjel Jonas died in the year 1775, aged 113. Marsk Jonas died at Vilejac in Hungary, aged 119. John Niethen of Bakler in Zealand lived to the age of 120. Eleonora Spicer died in 1773, in Virginia, aged 121. John Argus was born in the village of Lastua in Turkey, and died in 1779, at the age of 123, having six sons and three daughters, by whom he had posterity to the fifth generation. They amounted to the number of 160 souls, and all lived in the same village. His father died at the age of 120. In December 1777, there lived in Devonshire a farmer named John Brookey, who was 134 years of age, and had been fifteen times married. The Philosophical Transactions mention an Englishman called Eccleston, who lived to the age of 143. Another Englishman, named Effingham, died in 1757 at the age of 144. Niels Jukens of Hamerset in Denmark died in 1764, aged 146. Christian Jacob Drakemberg died in 1770 at Archusen, in the 146th year of his age. This old man of the north was born at Stavangar in Norway in 1624, and at the age of 130 married a widow of 60. In Norway some men have lived to the age of 150. John Rovin, who was born at Szatlova-Carantz-Batcher, in the bannat of Temeswar, lived to the age of 172, and his wife to that of 164, having been married to him for 147 years. When Rovin died, their youngest son was 99 years of age. Peter Zorten a peasant, and a countryman of John Rovin, died in 1724, at the age of 185. His youngest son was then 97 years of age. The history and whole length pictures of John Rovin, Henry Jenkins, and Peter Zorten, are to be seen in the library of S. A. R. Prince Charles at Brussels; and engravings of Rovin and Zorten, with a short account of them, are given in Sir John Sinclair's "Code of Health and Longevity." Professor Hanovius at Dantzic, mentions in his nomenclature an old man who died at the age of 184; and another, then alive, had attained the extraordinary age of 186. For other instances, see Sir J. Sinclair's work above mentioned.

Man. shall add nothing to what has been said under that head, except the portrait of a man destined for longevity, drawn by the celebrated Hufeland.

46
Portrait of a man formed for longevity.

He has a proper and well proportioned stature, without being too tall. He is rather of the middle size, and somewhat thick set. His complexion is not too florid; at any rate, too much ruddiness in youth is seldom a sign of longevity. His hair approaches rather to the fair than the black; his skin is strong, but not rough. His head is not too big; he has large veins at the extremities, and his shoulders are rather round than flat. His neck is not too long; his belly does not project, and his hands are large, but not too deeply cleft. His foot is rather thick than long, and his legs are firm and round. He has also a broad arched chest, a strong voice, and the faculty of retaining his breath for a long time without difficulty. In general, there is a complete harmony in all his parts. His senses are good, but not too delicate; his pulse is clear and regular. His stomach is excellent, his appetite good, and digestion easy. He eats slowly, and has not too much thirst, which is always a sign of a rapid consumption. He is serene, active, susceptible of joy, love, and hope, but insensible to the impressions of hatred, anger, and avarice. His passions never become too violent. If he gives way to anger, he experiences an unusual flow of warmth, a kind of gentle fever, without any overflowing of the gall. He is fond of employment, particularly calm meditation, and agreeable speculations; is an optimist; a friend to natural affections, and domestic felicity; has no thirst after

* Hufeland honours or riches, but is satisfied with his lot *.
on prolonging Life, i. 423.
M. Daubenton has given a table of the probabilities of the duration of life, of which the following is an abridgement. Of 23,994 children born at the same time, there will probably die,

In one year	-	-	7998
Remaining $\frac{3}{4}$ or 15,996.			
In eight years	-	-	11,997
Remaining $\frac{3}{4}$ or 11,997.			
In 38 years	-	-	15,996
Remaining $\frac{3}{4}$ or 7998.			
In 50 years	-	-	17,994
Remaining $\frac{3}{4}$ or 5998.			
In 61 years	-	-	19,995
Remaining $\frac{3}{4}$ or 3999.			
In 70 years	-	-	21,595
Remaining $\frac{3}{4}$ or 2399.			
In 80 years	-	-	22,395
Remaining $\frac{3}{4}$ or 599.			
In 90 years	-	-	23,914
Remaining $\frac{3}{4}$ or 79.			
In 100 years	-	-	23,992
Remaining $\frac{3}{4}$ or 2.			

47
Recapitulation.

It thus appears, that a very small number of men indeed pass through all the periods of life, and arrive at the goal marked out by nature. Innumerable causes accelerate our dissolution. The life of man consists in the activity and exercise of his organs, which grow up and acquire strength during infancy, adolescence, and youth. No sooner has the body attained its utmost perfection, than it begins to decline. Its decay is at first imperceptible, but in progress of time the membranes become cartilaginous, and the cartilages acquire

the consistence of bone; the bones become more solid, and all the fibres are hardened. Almost all the fat wastes away; the skin becomes withered and scaly; wrinkles are gradually formed; the hair grows white; the teeth fall out; the face loses its shape; the body is bent, and the colour and consistence of the crystalline humour become more perceptible. The first traces of this decay begin to be perceived at the age of 40, and sometimes sooner; this is the *age of decline*. They increase by slow degrees till 60, which is the period of old age. They increase more rapidly till the age of 70 or 75. At this period craziness begins, and continues always to increase. Next succeeds decrepitude, when the memory is gone, the use of the senses lost, the strength totally annihilated, the organs worn out, and the functions of the body almost destroyed. Little now remains to be lost, and before the age of 90 or 100, death terminates at once decrepitude and life.

The body then dies by little and little; its motion gradually diminishes; life is extinguished by successive gradations, and death is only the last term in the succession. When the motion of the heart, which continues longest, ceases, man has then breathed his last; he has passed from the state of life to the state of death; and as at his birth a breath opened to him the career of life, so with a breath he finishes his course.

This natural cause of death is common to all animals, and even to vegetables. We may observe that the centre of an oak first perishes and falls into dust, because these parts having become harder and more compact, can receive no further nourishment. The causes of our dissolution, therefore, are as necessary as death is inevitable; and it is no more in our power to retard this fatal term than to alter the established laws of the universe. In whatever manner death happens, the time thereof is unknown. It is considered, however, as at all times terrible, and the very thoughts of it fill the mind with fear and trouble. It is, notwithstanding our duty frequently to direct our thoughts to that event, which must inevitably happen, and by a life of virtue and innocence to prepare against those consequences which we so much dread.

As in women the bones, the cartilages, the muscles, and every other part of the body, are softer and less solid than those of men, they must require more time in hardening to that degree which occasions death. Women of course ought to live longer than men. This reasoning is confirmed by experience; for by consulting the bills of mortality, it appears, that after women have passed a certain age, they live much longer than men who have arrived at the same age. In like manner, it is found by experience, that in women the age of youth is shorter and happier than in men, but that the period of old age is longer, and attended with more trouble.

It is not our business here to consider those circumstances which are calculated to preserve health and prolong life. Many of these are mentioned in the medical articles; and those who wish to make this subject their particular study, have now ample materials provided for them, in Sir John Sinclair's "Code of Health and Longevity."

Isle of MAN, an island in the Irish sea, lying about seven leagues north from Anglesey, about the same distance west from Lancashire, nearly the like distance

Man.

Man.

distance south-east from Galloway, and nine leagues east from Ireland. Its form is long and narrow, stretching, from the north-east of Ayre point to the Calf of Man, which lies south-west, at least 30 English miles. Its breadth in some places is more than nine miles, in most places eight, and in some not above five; and it contains about 160 square miles.

The first author who mentions this island is Cæsar; for there can be as little doubt, that, by the *Mona* of which he speaks in his Commentaries, placing it in the midst between Britain and Ireland, we are to understand Man; as that the *Mona* of Tacitus, which he acquaints us had a fordable strait between it and the continent, can be applied only to Anglesey. Pliny has set down both islands; *Mona*, by which he intends Anglesey, and *Monubia*, which is Man. In Ptolemy we find *Monaæda*, or *Monaida*, that is, the farther or more remote Môn. Orosius styles it *Menavia*; tells us, that it was not extremely fertile; and that this, as well as Ireland, was then possessed by the Scots. Beda, who distinguishes clearly two Menavian islands, names this the *northern Menavia*, bestowing the epithet of *southern* upon Anglesey. In some copies of Nennius, this isle is denominated *Eubonia*; in others, *Menavia*; but both are explained to mean *Man*. Alured of Beverley also speaks of it as one of the Menavian islands. The Britons, in their own language, called it *Manaw*, more properly *Main au*, i. e. "a little island," which seems to be Latinized in the word *Menavia*. All which clearly proves, that this small isle was early inhabited, and as well known to the rest of the world as either Britain or Ireland.

In the close of the first century, the Druids, who were the priests, prophets, and philosophers of the old Britons, were finally expelled by Julius Agricola from the southern *Mona*; and we are told, that they then took shelter in the northern. This island they found well planted with firs; so that they had, in some measure, what they delighted in most, the shelter of trees; but, however, not the shelter of those trees in which they most delighted, viz. the oaks: and therefore these they introduced. No histories tell us this; but we learn it from more certain authority, great woods of fir having been discovered interred in the bowels of the earth, and here and there small groves of oaks: but as these trees are never met with intermixed, so it is plain they never grew together; and as the former are by far the most numerous, we may presume them the natural produce of the country, and that the latter were planted and preserved by the Druids. They gave the people, with whom they lived, and over whom they ruled, a gentle government, wise laws, but withal a very superstitious religion. It is also very likely that they hindered them, as much as they could, from having any correspondence with their neighbours; which is the reason that though the island is mentioned by so many writers, not one of them, before Orosius, says a word about the inhabitants. A little before this time, that is, in the beginning of the fifth century, the Scots had transported themselves thither, it is said, from Ireland. The tradition of the natives of Man (for they have a traditionary history) begins at this period. They style this first discoverer *Mannâ Mac Lear*; and they say that he was a magician, who kept this coun-

try covered with mists, so that the inhabitants of other places could never find it. But the ancient chronicles of Ireland inform us, that the true name of this adventurer was *Orboemius*, the son of Alladius, a prince in their island; and that he was surnamed *Miannanan*, from his having first entered the island of Man, and *Mac Lir*, i. e. "the offspring of the sea," from his great skill in navigation. He promoted commerce; and is said to have given a good reception to St Patrick, by whom the natives were converted to Christianity.

The princes who ruled after him seem to have been of the same line with the kings of Scotland, with which country they had a great intercourse, assisting its monarchs in their wars, and having the education of their princes confided to them in time of peace.

In the beginning of the seventh century, Edwin king of Northumberland invaded the Menavian islands, ravaged Man, and kept it for some time, when, Beda assures us, there were in it about 300 families; which was less than a third part of the people in Anglesey, though Man wants but a third of the size of that island.

The second line of their princes they derive from Orri, who, they say, was the son of the king of Norway; and that there were 12 princes of this house who governed Man. The old constitution, settled by the Druids, while they swayed the sceptre, was perfectly restored; the country was well cultivated and well peopled; their subjects were equally versed in the exercise of arms and in the knowledge of the arts of peace: in a word, they had a considerable naval force, an extensive commerce, and were a great nation, though inhabiting only a little isle. Guttred the son of Orri built the castle of Russyn, A. D. 960, which is a strong place, a large palace, and has subsisted now above 800 years. Macao was the ninth of these kings, and maintained an unsuccessful struggle against Edgar, who reduced all the little sovereigns of the different parts of Britain to own him for their lord; and who, upon the submission of Macao, made him his high-admiral, by which title (*archipirata*, in the Latin of those times) he subscribes that monarch's charter to the abbey of Glastonbury.

After the death of Edward the Confessor, when Harold, who possessed the crown of England, had defeated the Norwegians at the battle of Stamford, there was amongst the fugitives one Goddard Crownan, the son of Harold the Black, of Iceland, who took shelter in the isle of Man. This isle was then governed by another Goddard, who was a descendant from Macao, and he gave him a very kind and friendly reception. Goddard Crownan, during the short stay he made in the island, perceived that his namesake was universally hated by his subjects; which inspired him with hopes that he might expel the king, and become master of the island. This he at last accomplished, after having defeated and killed Fingal the son of Goddard, who had succeeded his father. Upon this he assigned the north part of the island to the natives, and gave the south to his own people; becoming, in virtue of his conquest, the founder of their third race of princes. However he might acquire his kingdom, he governed it with spirit and prudence,

Man.

Man.

prudence, made war with success in Ireland; gained several victories over the Scots in the Isles; and, making a tour through his new-obtained dominions, deceased in the island of Islay. He left behind him three sons. A civil war breaking out between the two eldest, and both of them deceasing in a few years, Magnus king of Norway coming with a powerful fleet, possessed himself of Man and the Isles, and held them as long as he lived; but, being slain in Ireland, the people invited home Olave, the youngest son of Goddard Crownau, who had fled to the court of England, and been very honourably treated by Henry the Second. There were in the whole nine princes of this race, who were all of them feudatories to the kings of England; and often resorted to their court, were very kindly received, and had pensions bestowed upon them. Henry III. in particular, charged Olave, king of Man, with the defence of the coasts of England and Ireland; and granted him annually for that service 40 marks, 100 measures of wheat, and five pieces of wine. Upon the demise of Magnus the last king of this isle, without heirs male, Alexander III. king of Scots, who had conquered the other isles, seized likewise upon this; which, as parcel of that kingdom, came into the hands of Edward I. who directed William Huntercumbe, guardian or warden of that isle for him, to restore it to John Baliol, who had done homage to him for the kingdom of Scotland.

But it seems there was still remaining a lady named *Austica*, who claimed this sovereignty, as cousin and nearest of kin to the deceased Magnus. This claimant being able to obtain nothing from John Baliol, applied herself next to King Edward, as the superior lord. He, upon this application, by his writ which is yet extant, commanded both parties, in order to determine their right, to appear in the king's bench. The progress of this suit does not appear; but we know farther, that this lady, by a deed of gift, conveyed her claim to Sir Simon de Montacute; and, after many disputes, invasions by the Scots, and other accidents, the title was examined in parliament, in the seventh of Edward III. and solemnly adjudged to William de Montacute; to whom, by letters-patent, dated the same year, that monarch released all claim whatsoever.

In the succeeding reign, William Montacute, earl of Salisbury, sold it to Sir William Scroop, afterwards earl of Wiltshire; and, upon his losing his head, it was granted by Henry IV. to Henry Percy, earl of Northumberland; who, being attainted, had, by the grace of that king, all his lands restored, except the isle of Man, which the same monarch granted to Sir John Stanley, to be held by him of the king, his heirs and successors, by homage, and a cast of falcons to be presented at every coronation. Thus it was possessed by this noble family, who were created earls of Derby, till the reign of Queen Elizabeth; when, upon the demise of Earl Ferdinand, who left three daughters, it was, as Lord Coke tells us, adjudged to these ladies, and from them purchased by William earl of Derby, the brother of Ferdinand, from whom it was claimed by descent, and adjudged to the duke of Athol.

This island, from its situation directly in the mouth
VOL. XII. Part II.

of the channel, is very beneficial to Britain, by lessening the force of the tides, which would otherwise break with far greater violence than they do at present. It is frequently exposed to very high winds; and at other times to mists, which, however, are not at all unwholesome. The soil towards the north is dry and sandy, of consequence unfertile, but not unimprovable; the mountains, which may include near two-thirds of the island, are bleak and barren; yet afford excellent peat, and contain several kinds of metals. They maintain also a kind of small swine, called *purrs*, which are esteemed excellent pork. In the valleys there is as good pasture, hay, and corn, as in any of the northern counties; and the southern part of the island is as fine soil as can be wished. They have marl and limestone sufficient to render even their poorest lands fertile; excellent slate, ragstone, black marble, and some other kinds for building. They have vegetables of all sorts, and in the utmost perfection; potatoes in immense quantities; and, where proper pains have been taken, they have tolerable fruit. They have also hemp, flax, large crops of oats and barley, and some wheat. Hogs, sheep, goats, black cattle, and horses, they have in plenty; and though small in size, yet if the country was thoroughly and skilfully cultivated, they might improve the breed of all animals, as experience has shown. They have rabbits and hares very fat and fine; tame and wild fowl in great plenty; and in their high mountains they have one airy of eagles, and two of excellent hawks. Their rivulets furnish them with salmon, trout, eels, and other kinds of fresh-water fish; on their coasts are caught cod, turbot, ling, holibut, all sorts of shell-fish (oysters only are scarce, but large and good), and herrings, of which they made anciently a great profit, though this fishery is of late much declined.

The inhabitants of Man, though far from being unmixed, were perhaps, till within the course of the 18th century, more so than any other under the dominion of the crown of Great Britain; to which they are very proud of being subjects, though, like the inhabitants of Jersey and Guernsey, they have a constitution of their own, and a peculiarity of manners naturally resulting from a long enjoyment of it.—The Manks tongue is the only one spoken by the common people. It is the Old British, mingled with Norse, or the Norwegian language, and the modern language. The clergy preach and read the common prayer in it. In ancient times they were distinguished by their stature, courage, and great skill in maritime affairs. They are at this day a brisk, lively, hardy, industrious, and well-meaning people. Their frugality defends them from want: and though there are few that abound, there are as few in distress; and those that are, meet with a cheerful unconstrained relief. On the other hand, they are choleric, loquacious, and as the law till lately was cheap, and unencumbered with solicitors and attorneys, not a little litigious. The revenue, in the earl of Derby's time, amounted to about 2500l. a-year; from which, deducting his civil list, which was about 700l. the clear income amounted to 1800l. At the same time time, the number of his subjects was computed at 20,000.—The sovereign of Man, though he has long ago waved the title of *king*, was still in-

Man.

Man.

vested with regal rights and prerogatives: but the distinct jurisdiction of this little subordinate royalty, being found inconvenient for the purposes of public justice and for the revenue (it affording a commodious asylum for debtors, outlaws, and smugglers), authority was given to the treasury, by stat. 12 Geo. I. c. 28. to purchase the interest of the then proprietors for the use of the crown: which purchase was at length completed in the year 1765, and confirmed by stat. 5 Geo. III. c. 26. and 39.; whereby the whole island and all its dependencies (except the landed property of the Athol family), their manorial rights and emoluments, and the patronage of the bishopric and other ecclesiastical benefices, are unalienably vested in the crown.

The most general division of this island is into north and south; and it contains 17 parishes, of which five are market towns, the rest villages. Its division with regard to its civil government, is into six shreeplings, every one having its proper coroner, who is in the nature of a sheriff, is intrusted with the peace of his district, secures criminals, brings them to justice, &c. The lord chief justice Coke says, "their laws were such as scarce to be found anywhere else." In July 1786, a copper coinage for the use of the island was issued from the Tower of London.—There is a ridge of mountains runs almost the length of the isle, from whence they have abundance of good water from the rivulets and springs; and Snafield, the highest, rises about 580 yards. The air is sharp and cold in winter, the frosts short, and the snow, especially near the sea, lies not long on the ground. The prevailing rocks are clay slate, which occupies the highest parts of the island, and lower down grey-wacke, with old red sandstone and limestone, with some mines of lead, copper, and iron. The trade of this island was very great before the year 1726; but the late Lord Derby farming out his customs to foreigners, the insolence of these farmers drew on them the resentment of the government of England, who, by an act of parliament, deprived the inhabitants of an open trade with this kingdom. This naturally introduced a clandestine commerce, which they carried on with England and Ireland with prodigious success, and an immense quantity of foreign goods was run into both kingdoms, till the government in 1765 thought proper to put an entire stop to it, by purchasing the island of the duke of Athol, as already mentioned, and permitting a free trade with England. On the little isle of Peele, on the west side of Man, is a town of the same name, with a fortified castle. Before the south promontory of Man, is a little island called the *Calf of Man*: it is about three miles in circuit, and separated from Man by a channel about two furlongs broad. At one time of the year it abounds with puffins, and also with a species of ducks and drakes, by the English called *barnacles*, and by the Scots *clakes* and *solan geese*.

The principal manufactures are coarse hats, cotton goods, and linen cloth. About 500 boats are employed in the herring fishery; and previous to the late war, the salmon fishery was in a very flourishing condition, but has now declined. Great quantities of cattle, sheep, pork, butter, and eggs, are shipped to England. The imports are manufactured goods, coal, &c.

The women in the isle of Man are not remarkable

for elegance of form or delicacy of features. The practice of her domestic duties, and the regulation of her domestic affairs, constitute the employment of the Manks wife; and if not so refined as the dames of more polished nations, she is perhaps as happy.

Landed property is very much divided in the island, there being scarcely six men who have estates above 500l. a year.

The internal scenery of the isle of Man is far from being beautiful, of which the chief cause is the want of wood; and the rivers are so small as to add little to the richness of the views. The Manks are fond of dancing, and dance well. Two balls in the year are given at Castletown; one on the king's birth day, the other on the queen's, and there are frequent private dances. At Ramsay, during the winter of 1801, a society of ladies and gentlemen was formed, which met three evenings in the week for the purpose of reading Shakespeare; and such a number of copies were procured, that each character of the drama was supported by a separate individual.

The inhabitants of this isle (estimated at 30,000 by Mr Colquhoun) are of the church of England; and the bishop is styled *Bishop of Sodor and Man*. He has no vote in the British house of peers. This bishoprick was first erected by Pope Gregory IV. and for its diocese had this isle and all the Hebrides or Western islands of Scotland; but which were called *Sodoroe* by the Danes, who went to them by the north, from the Swedish Sodor, Saib or Oar islands, from which the title of the bishop of Sodor is supposed to originate. The bishop's seat was at Rushin, or Castletown, in the isle of Man, and in Latin is entitled *Sodorensis*. But when this island became dependent upon the kingdom of England, the Western islands withdrew themselves from the obedience of their bishop, and had a bishop of their own, whom they entitled also *Sodorensis*, but commonly *Bishop of the Isles*. The patronage of the bishopric was given, together with the island, to the Stanleys by King Edward IV. and came by an heir-female to the family of Athol; and, on a vacancy thereof, they nominated their designed bishop to the king, who dismissed him to the archbishop of York for consecration.—By an act of parliament, the 33d of King Henry VIII. this bishopric is declared in the province of York.

MAN-of-war Bird. See PELICANUS, ORNITHOLOGY Index.

MANAGE. See MANEGE.

MANASSEH, in Scripture history, the eldest son of Joseph, and grandson of the patriarch Jacob (Gen. xli. 50. 51.) was born in the year of the world 2290, before Jesus Christ 1714.

The tribe descended from him came out of Egypt, in number 32,200 men fit for battle, upwards of 20 years old, under the conduct of Gamaliel son of Pedabzur (Numb. ii. 20. 21.). This tribe was divided at their entrance into the land of Promise. One half had its portion beyond the river Jordan, and the other half on this side the river. The half tribe of Manasseh which settled beyond the river possessed the country of Bashan, from the river Jabbok to Mount Libanus, (Numb. xxii. 33. 34. &c.); and the other half tribe of Manasseh on this side Jordan, obtained for its inheritance the country between the tribe of Ephraim to the south

Manchester.

MANASSEH, the 15th king of Judah, being the son and successor of Hezekiah. His acts are recorded in 2 Kings, xx. xxi. and 2 Chr. xxxiii.

MANATI. See TRICHECUS, MAMMALIA *Index*.

MANCA, was a square piece of gold coin, commonly valued at 30 pence; and *mancusa* was as much as a mark of silver, having its name from *manu cusa*, being coined with the hand: (*Leg. Cant.*) But the *manca* and *mancusa* were not always of that value; for sometimes the former was valued at six shillings, and the latter, as used by the English Saxons, was equal in value to our half crown. *Manca sex solidis aestimatur*, (*Leg. H. I. c. 69.*) Thorn in his chronicle, tells us, that *mancusa est pondus duorum solidorum et sex denariorum*; and with him agrees Du Cange, who says, that 20 *manca* make 50 shillings. *Manca* and *mancusa* are promiscuously used in the old books for the same money.

MANCHA, a territory of Spain in the province of New Castile, lying between the river Guadiana and Andalusia. It is a mountainous country; and it was here that the famous Don Quixote was supposed to perform his exploits.

MANCHESTER, a town of Lancashire in England, situated in W. Long. 2. 42 N. Lat. 53. 27. Mr Whitaker conjectures, that the station was first occupied by the Britons about 500 years B. C. but that it did not receive any thing like the form of a town till 450 years after, or 50 years B. C. when the Britons of Cheshire made an irruption into the territories of their southern neighbours, and of consequence alarmed the Sestuntii, or inhabitants of Lancashire, so much, that they began to build fortresses, in order to defend their country. Its British name was *Mancenion*, that is, "a place of tents:" it was changed, however, into *Mancunium* by the Romans, who conquered it under Agricola in the memorable year of the Christian era 79. It appears also to have been called *Manduesudum*, *Manduessedum*, *Manucium*, and *Mancestre*; from which last it seems most evident that the present name has been derived. It is distant from London 182 miles, and from Edinburgh 214; standing near the conflux of the Irk and the Irwell, about three miles from the Mersey.

This account was drawn up about 1792.

Manchester was accounted a large and populous town even 50 years ago; but since that time it is supposed to have increased in more than triple proportion, both in respect to buildings and inhabitants. The houses amount to a number not far short of 12,000; and perhaps it may not be an overrate to reckon seven persons to each, when it is considered, that, of the houses occupied by working people of various descriptions, many have two, three, and sometimes more, families in each. For though many hundred houses have been built in the course of a few late years, yet are they constantly engaged as soon as possible; the avidity for building increasing with every new accession of inhabitants, and rents rising to a degree scarcely known in other places. The progress of this *circumstantia* may be partly estimated by the price of building, land, and materials: a guinea per square yard, chief rent, having been refused for some central plots; and bricks selling at 24s. per 1000,

which about four years since were not more than half the price. Such, however, has been the happy concurrence of ingenuity and industry, and such the astonishing improvements daily making in its numerous manufactures, together with the encouragement these afford to skilful artists in various branches, that streets must extend in proportion: yet population appears to have increased more rapidly than buildings; hence competitions naturally arise, and hence a *temporary* advance of rents. The manufactures of this town and neighbourhood, from humble domestic beginnings about two centuries ago, have now, after progressive improvements, acquired such celebrity, both in the scale of ornament and utility, as to spread in ten thousand forms and colours, not only in these kingdoms, but over all Europe, and even into the distant continents; being at once most precious mines of well-earned private wealth, and important contributors to the necessary public treasure of the state. Its post-office alone may afford an evidence of its extensive commerce. The population of the town may be further calculated from the great number of cotton factories within the boundaries of the town, wherein it is thought that 20,000 men, women, and children, are employed in the mere branches of preparing *warp* and *weft*. If to these be added the many hands applied to weaving, &c. &c. &c. beside all the more general mechanics, as well as householders, domestic servants, &c. Manchester may be ranked as the most populous market-town in Great Britain. The marriages in Manchester and Salford, from January 1791 to January 1792, were 1302, the christenings 2060, and the burials 2286. In 1801 the population of Manchester, including Salford, exceeded 84,000, and in 1811 it had increased to 98,573. The number of inhabited houses at the latter period, was 17,245. The streets are spacious and airy, great part of the old buildings being removed, and the new streets allowed a convenient breadth. The town is lighted every night by 2700 lamps, a number of which are lighted with gas.

Manchester.

The college was founded in 1422 by *Thomas West*, Lord Delaware; and consisted of a warden, eight fellows, four clerks, and six choristers. About the same time the present collegiate church was built (timber only having been used for the former church). This church is a fine structure of what is termed the Gothic system, and is much enriched with sculpture. The collegiate body consists of a warden, four fellows, two chaplains, two clerks (one of whom by a very late regulation, is to be at least bachelor of arts and in priest's orders), four choristers, and four singing men.

Besides the collegiate church, there are also the following. St Anne's, a handsome church begun in 1709 and finished in 1723; it is in the gift of the bishop of Chester. St Mary's, built by the clergy of the collegiate church, and consecrated upwards of 30 years ago, is a neat and indeed an elegant edifice; as is St John's, which was built about 20 years since by the late Edward Byrom, Esq. The next presentation thereof is, by act of parliament, vested in his heirs, afterwards devolving to the warden and fellows of the collegiate church. St Paul's church was erected upwards of 12 years ago, and is a handsome spacious building, chiefly brick; to which has been added, within the last two years, a lofty and substantial stone tower. St James's church

Manchester.

church has been finished within the last ten years: it is a large well-lighted building of brick and stone, with a small stone steeple. St Michael's is also of brick and stone, with a square tower. It was built by the late Rev. Humphrey Owen (one of the chaplains of the collegiate church, and rector of St Mary's), in whose heirs the presentation is vested for a term of 60 years, and thenceforward in the warden and fellows of the college. To these may be added, St Thomas's, Ardwick Green, and Trinity church, Salford: for though the Irwell intervenes between Manchester and Salford, and each is governed by its respective constables; yet, being connected by three bridges, by mutual friendship, and by the common pursuit of universally useful manufactures and commerce, the two places are generally considered under the name of *Manchester*, as the borough of Southwark is not improperly deemed a part of the metropolis. In Salford there is likewise a Methodist chapel nearly finished. A new church is also about to be built and dedicated to St Stephen.—In Manchester a new church is lately finished, and called *St George's*; but divine service has not yet been performed therein. St Peter's church, at the end of Mosley-street, was begun about three years since: when finished, it will be a strong and elegant stone structure with a high spire; at present the body only is completed, and lighted, in a manner not very common, by six semicircular windows. The foundation of another church, to be called *St Clement's*, has also been laid, within the present year 1792, in Stephenson's square lately planned; and also one called the *New Jerusalem Church*, nearly finished. Besides the 14 churches above enumerated, there are, a Catholic chapel, a large Methodist chapel, a chapel for the people called *Quakers*, and 5 chapels for dissenters of other denominations.

Cheetham's Hospital, commonly called the College, because it was originally the place of residence of the warden and fellows, is deserving of particular notice. Humphrey Cheetham of Clayton near Manchester, Esq. having been remarkably successful in trade in the middle of the last century, bought the college, and liberally endowed it for the maintenance and education of 40 poor boys, admissible between the age of 6 and 10 years. By an improvement of the funds of the charity, the number of boys was increased to 60; and continued such till the Easter meeting of the feoffees in 1780, when another augmentation took place, and the number has since been constantly 80. The townships, pointed out by the founder for objects of his charity, are the following, together with the respective numbers admitted from each: Manchester, original number 14, now 28; Salford 6, now 12; Droylsden 3, now 6; Crumpsall 2, now 4; Bolton-le-moors 10, now 20; Turton 5, now 10. So that 89 persons are now annually provided for by this liberal benefactor; including for the hospital a governor, one man and five women servants, a school-master; and, on the library establishment, a librarian. (See an authentic letter in the *Gent. Mag.* for June 1792, p. 521.). The boys of this hospital are comfortably provided for till the age of 14, when they are further clothed, and with a premium placed apprentices to useful trades; and, in order to incite

early habits of industry, to make them good servants, and at length good masters, it has been suggested to furnish some kind of easy employment for a small part of their time not engaged at school. The Library, which occupies an extensive gallery of the same building, owes its foundation and increasing importance to the same benevolent source. The annual value of the fund originally bequeathed for the purchase of books and for a librarian's salary was 116l.; but by recent improvements of the estate, the income is more than thrice that sum. The books at this time amount to 10,000 volumes, of which a catalogue handsomely printed in 2 volumes 8vo has been published by the present librarian, the Rev. John Radcliffe, A. M. At stated hours on all days, except Sundays and other holidays, the studious may have free access to read, *in the library*, any book it contains; and in order to render it comfortable during the cold season of the year, several stoves are kept heated at the reading hours. This college and a large inclosed area are situated upon a high perpendicular rock, bounded by the Irk close to its confluence with the Irwell; and is thought by Mr Whitaker to be included, as well as the collegiate church, within the boundaries of the ancient Roman prætorium; the whole of which site towards the Irwell, as on the side of the Irk, is considerably elevated above the water and the opposite land of Salford. The free-school, higher up on the same side of the Irk, almost joining to the college, is supported by the rents of three mills; one of which is for grinding malt, another for corn, and the third is employed as a snuff mill. These rents are now increased to 700l. *per annum*, from which salaries are paid to three masters and two assistants. The scholars educated here have certain exhibitions allowed at the university; and such of them as are entered at Brazenose college Oxford have a chance of obtaining some valuable exhibitions arising from lands in Manchester bequeathed by Mr Hulme. The deserved reputation of this school is a powerful recommendation of its scholars entering at the universities. The Academy is a large and commodious building, raised by the subscriptions of several respectable dissenters, and placed under the care of able tutors. Here youth above 14 years of age are admitted, and instructed in the various branches of liberal knowledge, preparatory to trade or the professions. The Literary and Philosophical Society of Manchester was instituted in the beginning of the year 1781, and is well known by its Memoirs, of which several volumes 8vo, containing several excellent papers on various literary and scientific subjects, have been published; these have been translated into the German language. A society was established here in November 1789, under the name of the *Lancashire Humane Society*, for the encouragement of all who may attempt the recovery of persons apparently drowned. The Infirmary, Dispensary, Lunatic Asylum, and public Baths, are all situated on one large airy plot of land, in the most elevated and agreeable part of the town; a pleasant grass-plot and gravel-walk extending the whole length of the buildings; a canal intervening between them and the public street, next to which it is guarded by iron palisades. The Lying-in hospital is situated in Salford, at the end of the

Manchester.

Manches-
ter.

the old bridge. A new Work-house is nearly completed; and for such a purpose a happier spot could not be found in any town than that whereon it is erected, being on an equal eminence with the college on the opposite side of the Irk, and promising the greatest possible comforts to such as may be necessitated to become its inhabitants. The Exchange, a fine and spacious building, was erected in 1808 by subscription. The Theatre is a neat building, wherein the boxes are placed in a semicircle opposite to the stage. The Gentlemen's Concert-room is an elegant building, capacious enough to accommodate 1200 persons. The concerts are supported by annual subscriptions: but strangers and military gentlemen have free admission to the private concerts; as also to the public concerts, with a subscriber's ticket. The new Assembly-rooms are large and commodious. A Circus is almost finished. Here are two Market-places, the old and the new; which are well supplied with every thing in season, though at high rates. There are several charity-schools belonging to different churches and chapels, where children are furnished with clothes and taught to read. The Sunday-schools are numerous, and afford instruction to upwards of 5000 children. A Lancasterian school was founded in 1809, and two schools on the principles of Dr Bell in 1812.

Over the Irwell are three bridges, uniting the town with Salford: the old bridge is very high at the Manchester end, whence it slopes into Salford. The middle bridge, four feet wide, raised upon timber and flagged, is only for the accommodation of foot-passengers, who from the Manchester side must descend to it by nearly forty steps. The lower bridge is a handsome stone building of two arches; this bridge affords a level road for two or three carriages abreast. It was undertaken and finished by the private subscription of a few gentlemen; and a small toll is taken for all passing, which toll is now annually let by auction, and pays the proprietors remarkably well.—From Manchester there are likewise the same number of bridges over the Irk; only one, however, is adapted for the passage of carriages. The Irwell, having at a great expence been rendered navigable for vessels of 20 or 30 tons burden, there is a constant communication between Liverpool, Manchester, and the intermediate places on the Irwell and Mersey, to the great advantage of the proprietors of the country at large. This navigation, and more especially the duke of Bridgewater's canal, opening a passage from Manchester to the Mersey at 30 miles distance, have, together, greatly contributed to the present highly flourishing state of the town. Advantages still greater, because more widely diffusive, may result from the intended union of the Hamber and the Mersey by means of canals. Indeed, every mile of canal would benefit many miles of land; and such would be the reciprocity of interest, that it would undoubtedly extend and be felt far beyond the visible measurement of the navigation."

The News Room and Library in Manchester is an elegant building, and an ornament to the town; and as it comprehends in it a news room, circulating library, and reading room, must be productive of general utility. The proposal of this institution met with

much opposition at first; but it was finally carried by the unwearied exertions of a Mr Robinsen, a man whose character was universally loved and admired.

We must not omit to notice the new penitentiary house, called the *New Bailey*, for separate confinement of various criminals. Over the entrance is a large session room, with adjoining rooms for the magistrates, council, jurors, &c. Beyond this, in the centre of a very large area inclosed by very high walls, stands the Prison, an extensive building, forming a cross three stories high; and the four wards of each story may in an instant be seen by any person in its centre. This prison is kept surprisingly neat and healthy; and such as can work at any trade, and are not confined for crimes of the greatest magnitude, are employed in a variety of branches; so that one may be seen beating and cleansing cotton, another carding it, another roving, and a fourth spinning. In the next place may be observed a man or a woman busy at the loom; and in another, one or more engaged in cutting and raising the velvet pile. Hence industry is not suffered to slumber in the solitary cell, nor to quit it under the acquired impressions of that torpor which formerly accompanied the emancipated prisoner from his dungeon; rendering him, perhaps, totally unfit for the duties of honest society, though well qualified, in all probability, to hord with gamblers, and be then, if not before, initiated into their pernicious mysteries.—At Kersal-moor, three miles distant, horse-races are annually permitted. The banks of the rivers and various brooks about the town afford excellent situations for the numerous dye-houses employed for a multitude of fabrics. Among other things the manufacture and finishing of hats is carried on to an extent of great importance.—The general market is here on Saturdays. Tuesday's market is chiefly for transacting business between the traders and manufacturers of the town and circumjacent country. The fairs are on Whit-Monday, October 1st, and November 17th.

Manchester is a manor with courts leet and baron. It sends no members to parliament, but gives title to a duke. The annual fall of rain is here about 42 inches; though from January 1791 to January 1792 it was 44 inches. The sun's greatest heat in 1791 was 76°, July 17.

MANCHINEEL. See HIPFOMANE, BOTANY Index.

MANCIPATIO, was a term made use of in the Roman law, and may be thus explained; every father had such a regal authority over his son, that before the son could be released from his subjection and made free, he must be three times over sold and bought, his natural father being the vender. The vendee was called *pater fiduciarius*. After this fictitious bargain, the *pater fiduciarius* sold him again to the natural father, who could then, but not till then, *manumit* or make him free. The imaginary sale was called *mancipatio*; and the act of giving liberty or setting him free after this was called *emancipatio*.

MANCIPATIO also signifies the selling or alienating of certain lands by the balance, or money paid by weight, and five witnesses. This mode of alienation took place only amongst Roman citizens, and that only in respect to certain estates situated in Italy, which were called *mancipia*.

MANCIPLE,

Manches-
ter
||
Mancipa-
tio.

Manciple
Mandarins

MANCIPLE (*manceps*), a clerk of the kitchen, or caterer. An officer in the inner temple was anciently so called, who is now the steward there; of whom Chaucer, the ancient English poet, some time a student of that house, thus writes:

A manciple there was within the temple,
Of which all caterers might take ensample.

This officer still remains in colleges in the universities.

MANCUNIUM, in *Ancient Geography*, a town of the Brigantes in Britain. Now *Manchester* in Lancashire. See **MANCHESTER**.

MANCUS (formed of *manu cusus*), in antiquity, an Anglo-Saxon gold coin, equal in value to $2\frac{1}{2}$ solidi, or 30 pence; and in weight to 55 Troy grains. The first account of this coin that occurs in the history of our country, is about the close of the 8th century, in an embassy of Cenwulf king of Mercia to Leo III. requesting the restoration of the jurisdiction of the see of Canterbury: this embassy was enforced by a present of 120 mancuses. Ethelwolf also sent yearly to Rome 300 mancuses: and these coins are said to have continued in some form or other till towards the conclusion of the Saxon government. The heriots of the nobility are chiefly estimated by this standard in Canute's laws. It came originally from Italy, where it was called *ducat*: and is supposed to have been the same with the drachma or miliarensis current in the Byzantine empire.

MANDAMUS, in *Law*, a writ that issues out of the court of king's bench, sent to a corporation, commanding them to admit or restore a person to his office. This writ also lies where justices of the peace refuse to admit a person to take the oaths in order to qualify himself for enjoying any post or office; or where a bishop or archdeacon refuses to grant a probate of a will, to admit an executor to prove it, or to swear a church-warden, &c.

MANDANES, an Indian prince and philosopher, who for the renown of his wisdom was invited by the ambassadors of Alexander the Great to the banquet of the son of Jupiter. A reward was promised him if he obeyed, but he was threatened with punishment in case of a refusal. Unmoved by promises and threatenings, the philosopher dismissed them with observing, that though Alexander ruled over a great part of the universe, he was not the son of Jupiter; and that he gave himself no trouble about the presents of a man who possessed not wherewithal to content himself. "I despise his threats (added he): if I live, India is sufficient for my subsistence; and to me death has no terrors, for it will only be an exchange of old age and infirmity for the happiness of a better life."

MANDARINS, a name given to the magistrates and governors of provinces in China, who are chosen out of the most learned men, and whose government is always at a great distance from the place of their birth. *Mandarin* is also a name given by the Chinese to the learned language of the country; for besides the language peculiar to every province, there is one common to all the learned in the empire, which is in China what Latin is in Europe: this is called the *mandarin tongue*, or the *language of the court*.

MANDATE, in *Law*, a judicial commandment to do something. See the article **MANDAMUS**.

MANDATE, in the canon law, a rescript of the pope commanding an ordinary collator to put the person therein named in possession of the first vacant benefice in his collation.

MANDATUM, was a fee or retainer given by the Romans to the *procuratores* and *advocati*. The *mandatum* was a necessary condition, without which they had not the liberty of pleading. Thus the legal eloquence of Rome, like that of our own country, could not be unlocked without a golden key.

MANDERSCHÉIT, a town of Germany in the circle of the Lower Rhine, and in the electorate of Triers, capital of a county of the same name, between the diocese of Triers and the duchy of Juliers. E. Long. 6. 32. N. Lat. 50. 20.

MANDEVILLE, SIR JOHN, a physician, celebrated on account of his travels, was born at St Alban's, about the beginning of the 14th century. He had a liberal education, and applied himself to the study of physic; but being at length seized with an invincible desire of seeing distant parts of the globe, he left England in 1332, and did not return till 34 years after. His friends, who had long supposed him dead, did not know him when he appeared. He had travelled through almost all the east, and made himself master of a great variety of languages. He particularly visited Scythia, Armenia the Greater and Less, Egypt, Arabia, Syria, Media, Mesopotamia, Persia, Chaldea, Greece, Dalmatia, &c. His rambling disposition did not suffer him to rest; for he left his own country a second time, and died at Liege in the Netherlands in 1372. He wrote *An Itinerary*, or *An Account of his Travels*, in English, French, and Latin.

MANDEVILLE, *Bernard de*, an eminent writer in the 18th century, was born in Holland, where he studied physic, and took the degree of doctor in that faculty. He afterwards came over into England, and in 1714 published a poem, entitled "The Grumbling Hive, or Knaves turned Honest;" upon which he afterwards wrote remarks, and published the whole at London, 1723, in 8vo, under the title of "The Fable of the Bees, or private Vices made public Benefits; with an Essay on Charity and Charity-schools, and a Search into the Nature of Society." This book was presented by the jury of Middlesex in July the same year, and severely animadverted upon in "A Letter to the Right Honourable Lord C." printed in the London Journal of Saturday July 27. 1723. Our author published a *Vindication*. His book was attacked by several writers. He published other pieces, and died in 1724.

MANDING, a large state in the interior of Africa, situated in N. Lat. 12. 40. and W. Long. 6. 40. The government, according to Mr. Park, seems to be a kind of republic, or rather an oligarchy. Many species of edible roots are found here; but the sugar cane, coffee, and the cocoa tree, appear to be unknown to the inhabitants. The Mandingoes are reputed a very gentle race of people, cheerful in their dispositions, inquisitive, credulous, simple, and fond of flattery. The men, in general, are about the middle size, well-shaped, strong, and capable of enduring great labour; the women are good-

Mandate
Manding-

Manding. good-natured, sprightly, and agreeable. Both sexes dress in cotton cloth of their own manufacture, and both seem irresistibly inclined to commit depredations on the property of unprotected strangers; yet, strange as it may appear, they will contribute to the personal safety of the very people whom they are bent upon plundering.

Parental and filial affection is very strong between the mother and her child, but not so between the father and his children, which must originate from that divided love which never fails to be an attendant on polygamy. The care of the mother extends to the cultivation of the mind; and one of the first lessons in which they instruct their offspring, is the *practice of truth*. To suckle their children three years is an ordinary occurrence, during which time the husband devotes all his attention to his other wives. When a young man intends to marry a young girl, he first addresses the parents, as her consent is not deemed necessary. If the parents are agreeable, she must either accept of the hand of her lover, or continue unmarried all her life long. The Mandingoes practise circumcision both on males and females, which is a very painful operation, but not performed by them from any religious motive, for they have a superstitious notion that it contributes to render the married state prolific. Mr Park assures us, that the belief of one God, and a future state of rewards and punishments, is universal among them, but that the management of all sublunary concerns is committed to certain subordinate or tutelary agents, whose wrath they deprecate by every mean in their power. These people seldom arrive at old age, being gray-headed and covered with wrinkles about 40, and few reach the age of 60, although their diseases are few, being confined almost to fevers, fluxes, elephantiasis, and a leprosy of the worst kind, together with the *Guinea worm*. Their feelings, on the death of a relation, are manifested by loud and dismal howlings; and the body is interred, when rolled up in white cotton with a mat above it, on the day of its decease. The men cultivate the ground, and the women manufacture cotton cloth, viz. the spinning and dyeing of it, for it is wove by the men in looms of about four inches broad. Here also there are manufactories of leather and iron. They tan and dress leather with great expedition, and are said to be acquainted with the smelting of gold, which they convert into a great variety of ornaments, executed with much taste and ingenuity.

Their notions of geography are rather puerile, as they conceive the earth to be an extended plane, the termination of which no eye has as yet discovered, it being, according to them, overhung with clouds and darkness. They suppose the sea to be a large river of salt water, on the farther shore of which is situated a country called *Tobabodoo*, or the land of the white people; at a distance from which they describe another country, which they believe to be inhabited by cannibals of a gigantic size, called *Koomi*.

As to their ideas of property, they consider the lands in native woods to belong to government. When any individual of free condition has the means of cultivating more land than he actually possesses, he applies to the chief man of the district, who allows him an extension of territory, on condition of forfeiture, if the lands are

not brought into cultivation by a given period. The condition being fulfilled, the soil becomes vested in the possessor, and in all probability descends to his heirs.

MANDRAGORA. See *ATROPA*, *BOTANY Index*.

MANDRAKE. See *ATROPA* and *MUSA*, *BOTANY Index*.

MANDREL, a kind of wooden pulley, making a member of the turner's lathe. Of these there are several kinds; as *Flat Mandrels*, which have three or more little pegs or points near the verge, and are used for turning flat boards on. *Pin Mandrels*, which have a long wooden shank to fit into a round hole made in the work to be turned. *Hollow Mandrels*, which are hollow of themselves, and used for turning hollow work. *Screw Mandrels*, for turning screws, &c.

MANE, the hair hanging down from a horse's neck; which should be long, thin, and fine: and if frizzled, so much the better.

MANEGE, or **MANAGE**, the exercise of riding the great horse; or the ground set apart for that purpose; which is sometimes covered, for continuing the exercise in bad weather; and sometimes open, in order to give more liberty and freedom both to the horseman and horse. See *HORSEMANSHIP*.

The word is borrowed from the French *manage*, and that from the Italian *maneggio*; or, as some will have it, *à manu agendo*, "acting with the hand."

MANES, a poetical term, signifying the shades or souls of the deceased. The heathens used a variety of ceremonies and sacrifices to appease the manes of those who were deprived of burial. See *LEMURES* and *LEMURIA*.

Dii MANES, were the same with *inferi*, or the infernal gods, who tormented men; and to these the heathens offered sacrifices to assuage their indignation.

The heathen theology is a little obscure with regard to these gods manes. Some hold, that they were the souls of the dead; others, that they were the genii of men; which last opinion suits best with the etymology of the word.

The heathens, it is pretty evident, used the word *manes* in several senses; so that it sometimes signified the ghosts of the departed, and sometimes the infernal or subterraneous deities, and in general all divinities that presided over tombs.

The invocation of the manes of the dead seems to have been very frequent among the Thessalians; but it was expressly prohibited by the Romans. See *LARES*.

MANES, the founder of the Manichean system. See *MANICHEES*.

MANETHO, an ancient Egyptian historian, who pretended to take all his accounts from the sacred inscriptions on the pillars of *Hermes Trismegistus*. He was high priest of *Heliopolis* in the time of *Ptolemy Philadelphus*, at whose request he wrote his history in Greek; beginning from their gods, and continuing it down to near the time of *Darius Codomanus* who was conquered by *Alexander the Great*. His history of Egypt is a celebrated work, that is often quoted by *Josephus* and other ancient authors. *Julius Africanus* gave an abridgement of it in his *Chronology*. *Manetho's* work is however lost; and there only

Manding
||

Manetio
||
Mangeart.

only remain some fragments extracted from Julius Africanus, which are to be found in Eusebius's *Chronica*.

MANFREDONIA, a port town of Naples, on the gulf of Venice, which arose on the ruins of the ancient Sipontum; (see the article *SIPONTUM*). It received its name from its founder *Manfred*; who transplanted hither the few inhabitants that remained at Sipontum, and attracted other settlers to it by various privileges and exemptions. In order to found it under the most favourable auspices, he called together all the famous professors of astrology (a science in which both he and his father placed great confidence), and caused them to calculate the happiest hour and minute for laying the first stone. He himself drew the plans, traced the walls and streets, superintended the works, and by his presence and largesses animated the workmen to finish them in a very short space of time. The port was secured from storms by a pier; the ramparts were built of the most solid materials; and in the great tower was placed a bell of so considerable a volume as to be heard over all the plain of Capitanata, in order to alarm the country in case of an invasion. Charles of Anjou afterwards removed the bell to Barri, and offered it at the shrine of St Nicholas, as a thanksgiving for the recovery of one of his children. In spite of all the precautions taken by Manfred to secure a brilliant destiny to his new city, neither his pains, nor the horoscopes of his wizards, have been able to render it opulent or powerful. At present, Mr Swinburne informs us, it scarce musters 6000 inhabitants, though most of the corn exported from the province is shipped off here, and a direct trade carried on with Venice and Greece, for which reason there is a lazaretto established; but from some late instances we may gather, that if the kingdom of Naples has for many years past remained free from the plague, it is more owing to good luck, and the very trifling communication with Turkey, than to the vigilance or incorruptibility of the officers of this port. In 1620, the Turks landed and pillaged Manfredonia. All sorts of vegetables abound here, for flavour and succulency infinitely superior to those raised by continual waterings in the cineritious soil of Naples. Lettuce in particular is delicious, and fish plentiful and cheap. E. Long. 15. 56. N. Lat. 41. 42.

MANGANESE, or **MAGNESIA NIGRA**, a metallic substance, the oxide of which has been long known by the name of glass-makers soap, from its property of rendering glass colourless. See *CHEMISTRY* and *MINERALOGY Index*.

MANGE, in dogs. See *FARRIERY Index*.

MANGE. See *FARRIERY*, N^o 333.

MANGAERT, DOM THOMAS, a Benedictine of the congregation of St Vanne and St Hidulphe, whose knowledge was an ornament to his order. It gained him also the titles of antiquarian, librarian, and counsellor to Charles duke of Lorraine. He was preparing a very considerable work when he died, A. D. 1763, before he had put his last hand to his book, which was published by Abbé Jacquin. This production appeared in 1763, in folio, with this title: *Introduction à la science des Medailles, pour servir à la connoissance des Dieux, de la Religion, des Sciences, des Arts, et de tout ce qui appartient à l'Histoire ancienne, avec les preuves tirées des Medailles*. The elementary

treatises on the numismatic science were not sufficiently extensive, and the particular dissertations were by far too tedious and prolix. This learned Benedictine has collected into a single volume all the principles contained in the former, and all the ideas of any consequence which are to be found scattered through the latter. His work may serve as a supplement to Montfaucon's *Antiquity explained*. From Mangeart we likewise have a volume of sermons; and a treatise on Purgatory; Nancy, 1739, 2 vols. 12mo.

MANGËL-WURZEL. See *BETA*, *BOTANY Index*; and *AGRICULTURE Index*.

MANGER, is a raised trough under the rack in the stall, made for receiving the grain or corn that a horse eats.

MANGER, a small apartment, extending athwart the lower deck of a ship of war, immediately within the hause-holes, and fenced on the after part by a partition, which separates it from the other part of the deck behind it. This partition serves as a fence to interrupt the passage of the water, which occasionally gushes in at the hause-holes, or falls from the wet cable whilst it is heaved in by the capstern. The water, thus prevented from running aft, is immediately returned into the sea by several small channels, called *scuppers*, cut through the ship's side within the manger. The manger is therefore particularly useful in giving a contrary direction to the water that enters at the hause-holes, which would otherwise run aft in great streams upon the lower deck, and render it extremely wet and uncomfortable, particularly in tempestuous weather, to the men who mess and sleep in different parts thereof.

MANGËT, JOHN-JAMES, an eminent physician, born at Geneva in 1652. The elector of Brandenburg made him his first physician in 1699; in which post he continued till his death, which happened at Geneva in 1742. He wrote many works; the most known of which are, 1. A collection of several Pharmacopœias, in folio. 2. *Bibliotheca Pharmacœutico-medica*. 3. *Bibliotheca Anatomica*. 4. *Bibliotheca Chemica*. 5. *Bibliotheca Chirurgica*. 6. A *Bibliotheca* of all the authors who have written on medicine, in 4 vols folio. All these works are in Latin. Daniel le Clerc, the author of a History of Physic, assisted him in writing them.

MANGIFERA, the **MANGO-TREE**; a genus of plants belonging to the pentandria class; and in the natural method ranking with those of which the order is doubtful. See *BOTANY Index*.

MANGLE, a machine for smoothing linen. See *MECHANICS Index*.

MANGOSTAN, or **MANGOSTEEN**. See *GARCINIA*, *BOTANY Index*.

MANGROVE. See *RHIZOPHORA*, *BOTANY Index*.

MANHEIM, a town of Germany, in the Lower Palatinate, with a very strong citadel, and a palace, where the elector Palatine often resides. It is seated at the confluence of the rivers Neckar and Rhine, in E. Long. 8. 33. N. Lat. 49. 25. It surrendered to the French in September 1795; but it was retaken by the Austrians in September following.

MANHOOD, that stage of life which succeeds puberty or adolescence. See *MAN*.

MANIA, or **MADNESS**. See *MEDICINE Index*.

MANICHEES,

Mangeart
||
Mania.

Manichees. MANICHEES, or MANICHEANS (*Manichæi*), a sect of ancient heretics, who asserted two principles; so called from their author *Manes* or *Manichæus*, a Persian by nation, and educated among the Magi, being himself one of that number before he embraced Christianity.

This heresy had its first rise about the year 277, and spread itself principally in Arabia, Egypt, and Africa. St Epiphanius, who treats of it at large, observes that the true name of this heresiarch was Cubricus; and that he changed it for *Manes*, which in the Persian or Babylonish language signifies *vesse*. A rich widow, whose servant he had been, dying without issue, left him store of wealth; after which he assumed the title of the *apostle* or *envoy of Jesus Christ*.

Manes was not contented with the quality of apostle of Jesus Christ, but he also assumed that of the Paraclete, whom Christ had promised to send: which Augustine explains, by saying that Manes endeavoured to persuade men, that the Holy Ghost did personally dwell in him with full authority. He left several disciples, and among others, Addas, Thomas, and Hermas. These he sent in his lifetime into several provinces to preach his doctrine. Manes, having undertaken to cure the king of Persia's son, and not succeeding, was put in prison upon the young prince's death, whence he made his escape; but he was apprehended soon after, and flayed alive.

However, the oriental writers, cited by D'Herbelot and Hyde, tell us, that Manes, after having been protected in a singular manner by Hormizdas, who succeeded Sapor in the Persian throne, but who was not able to defend him, at length, against the united hatred of the Christians, the Magi, the Jews, and the Pagans, was shut up in a strong castle, to serve him as a refuge against those who persecuted him on account of his doctrine. They add, that after the death of Hormizdas, Varanes I. his successor, first protected Manes, but afterwards gave him up to the fury of the Magi, whose resentment against him was due to his having adopted the Sadducean principles, as some say; while others attribute it to his having mingled the tenets of the Magi with the doctrines of Christianity. However, it is certain that the Manicheans celebrated the day of their master's death. It has been a subject of much controversy whether Manes was an impostor. The learned Dr Lardner has examined the arguments on both sides; and though he does not choose to deny that he was an impostor, he does not discern evident proofs of it. He acknowledges, that he was an arrogant philosopher and a great schemist; but whether he was an impostor, he cannot certainly say. He was much too fond of philosophical notions, which he endeavoured to bring into religion, for which he is to be blamed: nevertheless, he observes, that every bold dogmatizer is not an impostor.

The doctrine of Manes was a motley mixture of the tenets of Christianity with the ancient philosophy of the Persians, in which he had been instructed during his youth. He combined these two systems, and applied and accommodated to Jesus Christ the characters and actions which the Persians attributed to the god Mithras.

He established two principles, viz. a good and an evil one; the first a most pure and subtle matter,

which he called *light*, did nothing but good; and the second, a gross and corrupt substance, which he called *darkness*, nothing but evil. This philosophy is very ancient; and Plutarch treats of it at large in his *Isis* and *Osiris*.

Manes borrowed many things from the ancient Gnostics; on which account many authors consider the Manicheans as a branch of the Gnostics.

In truth, the Manichean doctrine was a system of philosophy rather than of religion. They made use of amulets, in imitation of the Basilidians; and are said to have made profession of astronomy and astrology. They denied that Jesus Christ, who was only God, assumed a true human body, and maintained it was only imaginary; and therefore, they denied his incarnation, death, &c. They pretended that the law of Moses did not come from God, or the good principle, but from the evil one; and that for this reason it was abrogated. They rejected almost all the sacred books in which Christians look for the sublime truths of their holy religion. They affirmed, that the Old Testament was not the work of God; but of the prince of darkness, who was substituted by the Jews in the place of the true God. They abstained entirely from eating the flesh of any animal; following herein the doctrine of the ancient Pythagoreans; they also condemned marriage. The rest of their errors may be seen in St Epiphanius and St Augustine, which last, having been of their sect, may be presumed to have been thoroughly acquainted with them.

Though the Manichees professed to receive the books of the New Testament, yet in effect they only took so much of them as suited with their own opinions. They first formed to themselves a certain idea or scheme of Christianity; and to this adjusted the writings of the apostles, pretending that whatever was inconsistent with this had been foisted into the New Testament by later writers, who were half Jews. On the other hand, they made fables and apocryphal books pass for apostolical writings; and even are suspected to have forged several others, the better to maintain their errors. St Epiphanius gives a catalogue of several pieces published by Manes, and adds extracts out of some of them. These are the *Mysteries*, *Chapters*, *Gospel*, and *Treasury*.

The rule of life and manners which Manes prescribed to his followers was most extravagantly rigorous and severe. However, he divided his disciples into two classes; one of which comprehended the perfect Christians, under the name of the *elect*; and the other the imperfect and feeble, under the title of *auditors* or *hearers*. The elect were obliged to a rigorous and entire abstinence from flesh, eggs, milk, fish, wine, all intoxicating drink, wedlock, and all amorous gratifications; and to live in a state of the severest penury, nourishing their emaciated bodies with bread, herbs, pulse, and melons, and depriving themselves of all the comforts that arise from the moderate indulgence of natural passions, and also from a variety of innocent and agreeable pursuits. The auditors were allowed to possess houses, land, and wealth, to feed on flesh, to enter into the bonds of conjugal tenderness; but this liberty was granted them with many limitations, and under the strictest conditions of moderation and temperance. The general assembly of the Manicheans was headed by a

Manichees president, who represented Jesus Christ. There were joined to him 12 rulers or masters, who were designed to represent the 12 apostles, and these were followed by 72 bishops, the images of the 72 disciples of our Lord. These bishops had presbyters or deacons under them, and all the members of these religious orders were chosen out of the class of the elect. Their worship was simple and plain; and consisted of prayers, reading the scriptures, and hearing public discourses, at which both the auditors and elect were allowed to be present. They also observed the Christian appointment of baptism and the eucharist. They kept the Lord's day, observing it as a fast; and they likewise kept Easter and Pentecost.

||
Manilla.

Towards the 4th century, the Manicheans concealed themselves under various names, which they successively adopted, and changed in proportion as they were discovered by them. Thus they assumed the names of Encratites, Apotactics, Saccophori, Hydroparastates, Solitaries, and several others, under which they lay concealed for a certain time, but could not however long escape the vigilance of their enemies. About the close of the 6th century, this sect gained a very considerable influence, particularly among the Persians.

Toward the middle of the 12th century, the sect of Manichees took a new face, on occasion of one Constantine, an Armenian, and an adherer to it; who took upon him to suppress the reading of all other books besides the Evangelists and the epistles of St Paul, which he explained in such a manner as to make them contain a new system of Manicheism. He entirely discarded all the writings of his predecessors; rejecting the chimeras of the Valentinians, and their 30 æons; the fable of Manes, with regard to the origin of rain, and other dreams; but still retained the impurities of Basilides. In this manner he reformed Manicheism, inasmuch that his followers made no scruple of anathematizing Scythian, Buddas, called also *Addas* and *Terebinth*, the contemporaries and disciples, as some say, and, according to others, the predecessors and masters of Manes, and even Manes himself; Constantine being now their great apostle. After he had seduced an infinite number of people, he was at last stoned by order of the emperor.

This sect prevailed in Bosnia and the adjacent provinces about the close of the 15th century; propagated their doctrines with confidence, and held their religious assemblies with impunity.

MANICORDON, or **MANICHORD**, a musical instrument in form of a spinet; the strings of which, like those of the clarichord, are covered with little pieces of cloth, to deaden as well as to soften their sound, whence it is also called the *dumb spinet*.

MANIFESTO; a public declaration made by a prince in writing, showing his intentions to begin a war or other enterprise, with the motives that induce him to it, and the reasons on which he founds his rights and pretensions.

MANIHOT, or **MANIOC**. See **JATROPHA**, **BOTANY Index**.

MANILLA, **LUCONIA**, or *Luzon*, the name of the largest of the Philippine islands in the East Indies, subject to Spain. It had the name of *Luzon* from a custom that prevailed among the natives of beating or bruising their rice in wooden mortars, before they ei-

ther boiled or baked it; *luzon* in their language signifying "a mortar."

As to situation, it is remarkably happy, lying between the eastern and western continents, and having China on the north, at the distance of about 60 leagues; the islands of Japan on the north-east, at the distance of about 250 leagues from the nearest of them; the ocean on the east; the other islands on the south; and on the west Malacca, Patana, Siam, Cambodia, Cochin-China, and other provinces of India, the nearest at the distance of 300 leagues.

The middle of this island is in latitude 15° north; the east point in 13° 38', and the most northern point in 19°. The shape of it is said to resemble that of an arm bent; the whole length being about 160 Spanish leagues, the greatest breadth between 30 and 40, and the circumference about 350. As to the longitude the charts differ, some making the middle of the island to lie 113° east from London, and others 106°. The climate is hot and moist. One thing is held very extraordinary, that in stormy weather there is much lightning and rain, and that thunder is seldom heard till this is over. During the months of June, July, August, and part of September, the west and south winds blow, which they call *vendavales*, bringing such rains and storms, that the fields are all overflowed, and they are forced to have little boats to go from one place to another. From October till the middle of December, the north wind prevails; and from that time till May, the east and south-east; which winds are there called *brcezes*. Thus there are two seasons in those seas, by the Portuguese called *monscens*; whence our word *monsoons*, that is, the brcezes half the year, with a serene dry air; and the *vendavales* the other half, wet and stormy. It is further to be observed, that in this climate no vermin breed upon Europeans, though they wear dirty shirts, whereas it is otherwise with the Indians. The days here being always of an equal length, and the weather never cold, neither their clothes, nor the hour of dining, supping, doing business, studying, or praying, are ever changed; nor is cloth worn, but only against the rain.

The air here being, as has been observed, very hot and moist, is not wholesome, but is worse for young men that come from Europe than for the old. As for the natives, without using many precautions, they live very commonly to fourscore or 100. The soil is so rich, that rice grows even on the tops of the mountains without being watered; and this makes it so plentiful, that the Indians value gold so little as not to pick it up, though it lies almost everywhere under their feet.

Among the disadvantages of the island, besides frequent and terrible earthquakes, here are several burning mountains. The face of the island, however, is far from being disfigured by them, or by the consequences of their explosions.

The mountaineers, called *Tingiani*, have no particular place of abode, but always live under the shelter of trees, which serve them instead of houses, and furnish them with food; and when the fruit is eaten up, they remove where there is a fresh sort.

Here are 40 different sorts of palm-trees, the most excellent cocoas, wild cinnamon, wild nutmegs, and some say wild cloves also; ebony; sandal wood; the

best

Manilla best cassia, and in such plenty, that they feed their hogs with its fruit; all kinds of cattle, and prodigious quantities of gold, amber, and ambergris.

There are several sorts of people in this island besides the Spaniards, as the Tagalians or Tagaleze, the Pintadoes or painted negroes, the Ilayas or Tinglianos, and the Negrellos. The Tagalians, who are thought to be Malaysians by descent, are a modest, tractable, and well-disposed people. The Pintadoes, or painted negroes, are tall, straight, strong, active, and of an excellent disposition. The Tinglianos, whom some suppose to be descended from the Japanese, are very brave, yet very courteous and humane. They live entirely on the gifts of nature; and never sleep under any other shade than that of the trees or a cave. The Negrellos, who are held to be the aborigines of the island, are barbarous and brutal to the last degree. When they kill a Spaniard, they make a cup of his skull and drink out of it.

This island is divided into several provinces, containing divers towns, the chief of which are Manilla, Caceres, New Segovia, Bondo, Passacao, Ibalon, Bulaw, Sersocon, or Bagatao, Lampon, Fernandina, Bolinao, Playahonda, Cavite, Mindora, Caleleya, and Balayan.

MANILLA, the capital of an island of the same name in the East Indies, on the south-east side of the island, where a large river falls into the sea, and forms a noble bay 30 leagues in compass, to which the Spaniards have given the name of *Bahia*, because the river runs out of the great lake Bahi, which lies at the distance of six leagues behind it. In compass it is two miles, in length one-third of a mile; the shape irregular, being narrow at both ends, and wide in the middle. On the south it is washed by the sea, and on the north and east by the river; being also strongly fortified with walls, bastions, forts, and batteries.—Manilla contains about 30,000 souls, who are a very motely race, distinguished by several strange names, and produced by the conjunction of Spaniards, Chinese, Malabars, Blacks, and others inhabiting the city and islands depending on it. Without the walls are large suburbs, particularly that inhabited by the Chinese merchants, called *Sangleys*. In proportion to the size of the place, the number of churches and religious houses is very great. Only small vessels can come up to Manilla; but three leagues south of it is the town and port of Cavite, defended by the castle of St Philip, and capable of receiving the largest ships. Here stands the arsenal where the galleons are built, for which there are from 300 to 600 or 800 men constantly employed, who are relieved every month, and while upon duty are maintained at the king's expence. By an earthquake which happened here in 1645, a third part of the city of Manilla was destroyed, and no less than 3000 people perished in the ruins.

Spain having entered into engagements with France, in consequence of the family-compact of the house of Bourbon, it was found expedient by Britain to declare war also against Spain. Whereupon a force was sent out from our East India settlements particularly Madras, for the conquest of the Philippine islands, under General Draper and Admiral Cornish: who, after a siege of 12 days, took Manilla on the 6th of October

1762 by storm; but to save so fine a city from destruction, agreed to accept a ransom, amounting to a million sterling, a part of which, it is said, was never paid. The Spanish viceroy resides in this city, and lives like a sovereign prince. The government is said to be one of the best in the gift of the king of Spain. When the city was taken, as above, the archbishop, who is a kind of pope in this part of the world, was also viceroy. Five large ships, loaded with the riches of the East, as diamonds from Golconda, cinnamon from Ceylon, pepper from Sumatra and Java, cloves and nutmegs from the Moluccas and Banda islands, camphire from Borneo, benjamin and ivory from Cambodia, silks, tea, and china-ware from Chiou, &c. sail yearly from hence to Acapulco in Mexico, and return freighted with silver, making 400 per cent. profit.

The city of Manilla is governed by two alcaldes: the rest of the cities and great towns have each an alcaide; and in every village there is a corregidore. Appeals from their sentences are made to the royal court at Manilla, in which there are four judges, and a fiscal or attorney-general; each of these judges has a salary of 3300 pieces of eight per annum. The viceroy is president; and in that quality has an income of 4000 pieces of eight, but he has no vote; yet if the judges are equally divided, the president names a doctor of the civil law, who, in virtue of his appointment, has a decisive vote. The attorney-general, in right of his office, is protector of the Chinese, in consideration of which he receives 600 pieces of eight every year. As for the Indians that are in subjection, they pay tribute in the following proportions: Young men from 18, and from thence, if they continue single, to the age of 60, pay five rials of plate by way of capitation; as single women likewise do from 24 to 50: married men pay ten rials. It is computed that there are within the compass of this government 250,000 Indians subject to his Catholic majesty, of whom two-fifths hold immediately from the king, and the rest from lords or proprietors, who pay two rials each for maintenance of the forces, and the like sum for the parish-priest. The royal revenue is computed at about half a million of pieces of eight, exclusive of casualties. In regard to the military establishment, the garrison of Manilla consists of about 800 or 1000 men, and there are about 3000 more in the Philippines. The viceroy is by his office captain-general, with a salary of about 4000 pieces of eight.

MANILIUS, MARCUS, a Latin poet, whose poem had the ill luck to lie buried in some German libraries, and was not heard of in the world, until Poggius, about two centuries ago, published him from some old manuscripts he found there. There is no account to be found of him but what can be drawn from his poem, which is called *Astronomicon*; and contains a system of the ancient astronomy and astrology, together with the philosophy of the Stoics. It consists of five books; though there was a sixth, which has not been recovered. From the style, and no mention of the author being found in ancient writers, it is probable he died young. It is collected, however, that he was a Roman of illustrious extraction, and lived under the reign of Augustus, whom he invokes, though not by name, yet by circumstances and character that suit no other

Manis.

emperor. The best editions of Manilius are, that of Joseph Scaliger, in 1600, and that of Bentley at London in 1738.

MANILLE, in commerce, a large brass ring in the form of a bracelet, either plain or engraven, flat or round.

Manilles are the principal commodities which the Europeans carry to the coast of Africa, and exchange with the natives for slaves. These people wear them as ornaments on the small of the leg, and on the thick part of the arm above the elbow. The great men wear manilles of gold and silver; but these are made in the country by the natives themselves.

MANIOC, or **MANIHOT**. See **JATROPHA**, **BOTANY Index**.

MANIPULUS, **MANIPULE**, among the Romans, was a little body of infantry, which in the time of Romulus consisted of 100 men; and in the time of the consuls, and first Cæsars, of 200.

The word properly signifies "a handful;" and, according to some authors, was first given to the handful of hay which they bore at the end of a pole, to distinguish themselves by, before the custom was introduced of bearing an eagle for their ensign; and hence also the phrase, *a handful of men*. But Vegetius, Modestus, and Varro, give other etymologies of the word: the last derives it from *manus*, a little body of men following the same standard. According to the former, this corps was called *manipulus*, because they fought hand in hand or all together: *Contubernium autem manipulus vocabatur ab eo, quod conjunctis manibus pariter dimicabant*.

Each manipule had two centurions, or captains, called *manipularii*, to command it; one whereof was lieutenant to the other. Each cohort was divided into three manipules, and each manipule into two centuries.

Aulus Gellius quotes an old author, one Cincius, who lived in the time of Hannibal (whose prisoner he was), and who, writing on the art of war, observes, that then each legion consisted of 60 centuries, of 30 manipules, and of ten cohorts. And again, Varro and Vegetius mention it as the least division in the army, only consisting of the tenth part of a century; and Spartian adds, that it contained no more than ten men. This shows that the manipulus was not always the same thing.

MANIPULUS is also an ecclesiastical ornament, worn by the priests, deacons, and subdeacons in the Romish church. It consists of a little fillet in form of a stole, three or four inches broad, and made of the same stuff with the chasuble; signifying and representing an handkerchief which the priests in the primitive church wore on the arm to wipe off the tears they were continually shedding for the sins of the people. There still remains a mark of this usage in a prayer rehearsed by those who wear it; *Merear, Domine, portare manipulum fletus et doloris*.—The Greeks and Maronites wear two manipules, one on each arm.

MANIPULUS, among physicians, is used to signify a handful of herbs or leaves, or so much as a man can grasp in his hand at once; which quantity is frequently denoted by the abbreviation, *M*, or *m*.

MANIS, the **SCALY LIZARD**, a genus of quadrupeds

belonging to the order of bruta. See **MAMMALIA Index**.

MANLEY, Mrs, the celebrated writer of the *Atalantis*, was the daughter of Sir Roger Manley, the reputed author of the first volume of the Turkish Spy. She lost her parents very early; and after having been deluded into a false marriage by her guardian, who was her cousin, and afterwards deserted her, she was patronized by the duchess of Cleveland, mistress of Charles II. But the duchess, being a woman of a very fickle temper, grew tired of Mrs Manley in six months time; and discharged her upon a pretence, whether groundless or not is uncertain, that she intrigued with her son. After this she wrote her first tragedy, called *Royal Mischiefs*, which was acted with great applause in 1696; and her apartment being frequented by men of wit and gaiety, she soon engaged in amours, and was taken into keeping. Her pen now grew as licentious as her conduct; for, in her retired hours, she wrote four volumes, called *Memoirs of the New Atalantis*; in which she was not only very free in her wanton tales of love adventures, but satirized the characters of many distinguished personages, especially those who had a principal concern in the Revolution. A prosecution was commenced against her for this work; but whether those in power were ashamed to bring a woman to trial for a few amorous trifles, or whether the laws could not reach her disguised satire, she was discharged; and a total change of the ministry ensuing, Mrs Manley lived in high reputation and gaiety, amusing herself with the conversation of wits, and writing plays, poems, and letters. She died in 1724.

MANLIUS CAPITOLINUS, the renowned Roman consul and general, who saved the capitol when it was attacked by the Gauls in the night: he was alarmed by the cries of geese, which were ever after held sacred. But being afterwards accused of aspiring at the sovereignty, he was thrown from the Tarpeian rock. See **GAUL** and **ROME**.

MANLIUS Torquatus, a celebrated consul and Roman captain; had great wit, but a difficulty in expressing himself, which induced Manlius Imperiosus, his father, to keep him almost by force in the country. Pompey, tribune of the people, enraged at this instance of severity, formed a design of accusing Manlius the father before the judges; but Torquatus being informed of it, went to that tribune, and, with a poniard in his hand, made him swear, that he would not proceed in that accusation against him to whom he owed his life. At length Torquatus was made military tribune, and killed a soldier of the Gauls in single combat, from whom he took a gold chain that he wore about his neck. From this action he obtained the name of *Torquatus*. He was consul in the war against the Latins; when he ordered his own son to be beheaded for fighting contrary to his orders, though he had gained the victory. He conquered the enemies of the republic, and was several times made consul; but at last refused the consulship, saying, That it was no more possible for him to bear with the vices of the people, than it was for the people to bear with his severity.

MANNA, in the *Materia Medica*, the juice of certain

Manis
||

Manna

tain trees of the ash kind, either naturally concreted on the plants, or exsiccated and purified by art. See *MATERIA MEDICA Index*.

MANNA, is also a Scripture term, signifying a miraculous kind of food which fell from heaven for the support of the Israelites in their passage through the wilderness, being in form of coriander seeds, its colour like that of bdellium, and its taste like honey.

The Scripture gives to manna the name of the *bread of heaven*, and the *food of angels*, Psalm lxxviii. 25. whether it would insinuate to us, that the angels sent and prepared this food, or that angels themselves, if they had need of any food, could not have any that was more agreeable than manna was. The author of the Book of Wisdom says, xvi. 20, 21. that manna so accommodated itself to every one's taste, that every one found it pleasing to him; and that it included every thing that was agreeable to the palate and fit for good nourishment; which expressions some have taken in the literal sense, though others understand them figuratively.

The critics are divided about the original of the word *manna*. Some think that *man* is put instead of the Hebrew word *mah*, which signifies "What is this?" and that the Hebrews, then first seeing that new food which God had sent them, cried to one another, מַה־זֶּה, *man-hu*, instead of *mah-hu*, "What is this?" Others maintain, that the Hebrews very well knew before what manna was; and that, seeing it in great abundance about their camp, they said one to another, *Man-hu*, "This is manna." Mr Saumaise and some other moderns are of this last opinion. They imagine, that the manna which God sent the Israelites was nothing else but that fat and thick dew which still falls in Arabia, which presently condensed, and served for food to the people; that this is the same thing as the wild honey, mentioned Matth. iii. 4. wherewith John the Baptist was fed; and that the miracle of Moses did not consist in the production of any new substance, but in the exact and uniform manner in which the manna was dispensed by Providence for the maintenance of such a great multitude.

On the contrary, the Hebrews and Orientals believe, that the fall of the manna was wholly miraculous. The Arabians call it the *sugar plums of the Almighty*; and the Jews are so jealous of this miracle, that they pronounce a curse against all such as presume to deny the interposition of a miraculous power.

Our translation, and some others, make Moses fall into a plain contradiction in relating this story of the manna, which they render thus: "And when the children of Israel saw it, they said one to another, It is manna; for they wist not what it was." Exodus xvi. 15. Whereas the Septuagint and several authors both ancient and modern have translated the text according to the original, "The Israelites seeing this, said one to another, What is this? for they knew not what it was." For we must observe, that the word by which they asked, *what is this?* was in their language *man*, which signifies likewise meat, ready provided; and therefore it was always afterwards called *man* or *manna*.

Whether this manna had those extraordinary qualities in it or not, which some imagine, it must be allowed to be truly miraculous, upon the following ac-

counts. 1. That it fell but six days in the week. 2. That it fell in such a prodigious quantity, as sustained almost three millions of souls. 3. That there fell a double quantity every Friday, to serve them for the next day, which was their Sabbath. 4. That what was gathered on the first five days stunk and bred worms if kept above one day: but that which was gathered on Friday kept sweet for two days. And, lastly, That it continued falling while the Israelites abode in the wilderness, but ceased as soon as they came out of it and had got corn to eat in the land of Canaan.

MANNA-Tree, is a species of the ash, and a native of Calabria in Italy. See *FRAXINUS*, *BOTANY Index*, and *MATERIA MEDICA Index*.

MANNER, in painting, a habitude that a man acquires in the three principal parts of painting, the management of colours, lights, and shadows; which is either good or bad according as the painter has practised more or less after the truth, with judgment and study. But the best painter is he who has no manner at all. The good or bad choice he makes is called *goute*.

MANNERS, the plural noun, has various significations; as the general way of life, the morals, or the habits, of any person or people; also ceremonious behaviour, or studied civility. See the next article.

Good MANNERS, according to Swift, is the art of making those people easy with whom we converse.

Whoever makes the fewest persons uneasy, is the best bred in the company.

As the best law is founded upon reason, so are the best manners. And as some lawyers have introduced unreasonable things into common law; so likewise many teachers have introduced absurd things into common good manners.

One principal point of this art is to suit our behaviour to the three several degrees of men; our superiors, our equals, and those below us.

For instance, to press either of the two former to eat or drink is a breach of manners; but a tradesman or a farmer must be thus treated, or else it will be difficult to persuade them that they are welcome.

Pride, ill nature, and want of sense, are the three great sources of ill manners; without some one of these defects, no man will behave himself ill for want of experience; or of what, in the language of fools, is called *knowing the world*.

"I defy (proceeds our author), any one to assign an incident wherein reason will not direct us what we are to say or to do in company, if we are not misled by pride or ill nature. Therefore, I insist that good sense is the principal foundation of good manners; but because the former is a gift which very few among mankind are possessed of, therefore all the civilized nations of the world have agreed upon fixing some rules for common behaviour, best suited to their general customs, or fancies, as a kind of artificial good sense to supply the defects of reason. Without which the gentlemanly part of dunces would be perpetually at cuffs, as they seldom fail when they happen to be drunk, or engaged in squabbles about women or play. And, God be thanked, there hardly happeneth a duel in a year, which may not be imputed to one of those three motives. Upon which account, I should be exceedingly sorry to find the legislature make any new laws against

Manna
||
Manners

Manners. against the practice of duelling; because the methods are easy, and many, for a wise man to avoid a quarrel with honour, or engage in it with innocence. And I can discover no political evil, in suffering bullies, sharpers, and rakes, to rid the world of each other by a method of their own, where the law hath not been able to find an expedient.

“As the common forms of good manners were intended for regulating the conduct of those who have weak understandings; so they have been corrupted by the persons for whose use they were contrived. For these people have fallen into a needless and endless way of multiplying ceremonies, which have been extremely troublesome to those who practise them, and insupportable to every body else; insomuch that wise men are often more uneasy at the over civility of these refinements, than they could possibly be in the conversations of peasants or mechanics.

“The impertinences of this ceremonial behaviour, are nowhere better seen than at those tables, where ladies preside who value themselves upon account of their good breeding; where a man must reckon upon passing an hour without doing any one thing he hath a mind to, unless he will be so hardy as to break through all the settled decorum of the family. She determines what he loveth best, and how much he shall eat; and if the master of the house happeneth to be of the same disposition, he proceedeth in the same tyrannical manner to prescribe in the drinking part: at the same time you are under the necessity of answering a thousand apologies for your entertainment. And although a good deal of this humour is pretty well worn off among many people of the best fashion, yet too much of it still remaineth, especially in the country; where an honest gentleman assured me, that having been kept four days against his will at a friend's house, with all the circumstances of hiding his boots, locking up the stable, and other contrivances of the like nature, he could not remember, from the moment he came into the house to the moment he left it, any one thing wherein his inclination was not directly contradicted; as if the whole family had entered into a combination to torment him.

“But, besides all this, it would be endless to recount the many foolish and ridiculous accidents I have observed among these unfortunate proselytes to ceremony. I have seen a duchess fairly knocked down by the precipitancy of an officious coxcomb running to save her the trouble of opening the door. I remember, upon a birth-day at court, a great lady was rendered utterly disconsolate, by a dish of sauce let fall by a page directly upon her head-dress and brocade, while she gave a sudden turn to her elbow upon some point of ceremony with the person who sat next her. Monsieur Buys, the Dutch envoy, whose politics and manners were much of a size, brought a son with him about 13 years old to a great table at court. The boy and his father, whatever they put on their plates, they first offered round in order, to every person in the company; so that we could not get a minute's quiet during the whole dinner. At last their two plates happened to encounter, and with so much violence, that, being china, they broke in twenty pieces, and stained half the company with wet sweatmeats and cream.

“There is a pedantry in manners as in all arts and

sciences, and sometimes in trades. Pedantry is properly the overrating any kind of knowledge we pretend to. And if that kind of knowledge be a trifle in itself, the pedantry is the greater. For which reason I look upon fiddlers, dancing-masters, heralds, masters of the ceremony, &c. to be greater pedants than Lipsius, or the elder Scaliger. With these kinds of pedants the court, while I knew it, was always plentifully stocked: I mean from the gentleman-usher (at least) inclusive, downward to the gentleman-porter; who are, generally speaking, the most insignificant race of people that this island can afford, and with the smallest tincture of good manners, which is the only trade they profess. For being wholly illiterate, conversing chiefly with each other, they reduce the whole system of breeding within the forms and circles of their several offices: and as they are below the notice of ministers, they live and die in court under all revolutions, with great obsequiousness to those who are in any degree of credit or favour, and with rudeness and insolence to every body else. From whence I have long concluded, that good manners are not a plant of the court growth: for if they were, those people who have understandings directly of a level for such acquirements, and who have served such long apprenticeships to nothing else, would certainly have picked them up. For as to the great officers who attend the prince's person or councils, or preside in his family, they are a transient body, who have no better a title to good manners than their neighbours, nor will probably have recourse to gentlemen-ushers for instruction. So that I know little to be learned at court on this head, except in the material circumstance of dress; wherein the authority of the maids of honour must indeed be allowed to be almost equal to that of a favourite actress.

“I remember a passage my Lord Bolingbroke told me: That going to receive Prince Eugene of Savoy at his landing, in order to conduct him immediately to the queen, the prince said he was much concerned that he could not see her majesty that night; for Monsieur Hoffman (who was then by) had assured his highness, that he could not be admitted into her presence with a tied-up periwig; that his equipage was not arrived; and that he had endeavoured in vain to borrow a long one among all his valets and pages. My lord turned the matter to a jest, and brought the prince to her majesty: for which he was highly censured by the whole tribe of gentlemen ushers; among whom Monsieur Hoffman, an old dull resident of the emperor's, had picked up this material point of ceremony; and which, I believe, was the best lesson he had learned in 25 years residence.

“I make a difference between *good manners* and *good breeding*; although, in order to vary my expression, I am sometimes forced to confound them. By the first, I only understand the art of remembering, and applying, certain settled forms of general behaviour. But *good breeding* is of a much larger extent: for besides an uncommon degree of literature sufficient to qualify a gentleman for reading a play, or a political pamphlet, it taketh in a great compass of knowledge; no less than that of dancing, fighting, gaming, making the circle of Italy, riding the great horse, and speaking French; not to mention some other secondary or subaltern accomplishments, which are more easily

Manners

Manners,
Mannory.

sily acquired. So that the difference between good breeding and good manners lieth in this, That the former cannot be attained to by the best understandings without study and labour; whereas a tolerable degree of reason will instruct us in every part of good manners without other assistance.

"I can think of nothing more useful upon this subject, than to point out some particulars wherein the very essentials of good manners are concerned, the neglect or perverting of which doth very much disturb the good commerce of the world, by introducing a traffic of a mutual uneasiness in most companies.

"First, A necessary part of good manners is a punctual observance of time at our own dwellings or those of others, or at third places; whether upon matters of civility, business, or diversion; which rule, though it be a plain dictate of common reason, yet the greatest minister* I ever knew, was the greatest trespasser against it; by which all his business doubled upon him, and placed him in a continual arrear. Upon which I often used to rally him as deficient in point of good manners. I have known more than one ambassador, and secretary of state, with a very moderate portion of intellectuals, execute their offices with great success and applause, by the mere force of exactness and regularity. If you duly observe time for the service of another, it doubles the obligation; if upon your own account, it would be manifest folly, as well as ingratitude, to neglect it; if both are concerned, to make your equal or inferior attend on you to his own disadvantage, is pride and injustice.

"Ignorance of forms cannot properly be styled *ill manners*: because forms are subject to frequent changes; and consequently, being not founded upon reason, are beneath a wise man's regard. Besides, they vary in every country; and after a short period of time vary frequently in the same: so that a man who travelleth must needs be at first a stranger to them in every court through which he passeth; and, perhaps, at his return, as much a stranger in his own; and, after all, they are easier to be remembered or forgotten than faces or names.

"Indeed, among the many impertinencies that superficial young men bring with them from abroad, this bigotry of forms is one of the principal, and more predominant than the rest: who look upon them not only as if they were matters capable of admitting of choice, but even as points of importance; and therefore are zealous upon all occasions to introduce and propagate the new forms and fashions they have brought back with them: so that, usually speaking, the worst bred person in the company is a young traveller just arrived from abroad."

MANNORY, LEWIS, advocate of the parliament of Paris, where he was born in 1696, and died in 1777. From him we have 18 vols. 12mo. of *Pladings* and *Memoirs*. A great number of singular cases occur in this collection: and the author has the talent of rendering them more striking by the agreeable manner in which they are stated. He was Travenol's counsel in his process against Voltaire, and was very satirical against that poet. The latter took revenge by describing him as a mercenary babbler, who sold his pen and his abuse to the highest bidder. Whatever may be the case, Mannory would certainly have been more esteem-

ed, both as an advocate and as a writer, if he had paid more attention to his style, and had been less prolix; if he had thought more deeply, and been more sparing of his pleasantries in cases where nothing was required but knowledge and sound reasoning. He published also a translation into French of Father Parée's funeral Oration on Louis XIV. and very judicious Observations on the Semiramis of Voltaire.

MANOEUVRE, in a military sense, consists solely in distributing equal motion to every part of a body of troops, to enable the whole to form, or change their position, in the most expeditious and best method, to answer the purposes required of a battalion, brigade, or line of cavalry, artillery, or infantry. It has always been lamented, that men have been brought on service without being informed of the uses of the different manœuvres they have been practising; and having no ideas of any thing but the uniformity of the parade, instantly fall into disorder and confusion when they lose the step, or see a deviation from the straight lines they have been accustomed to at exercise. It is a pity to see so much attention given to show, and so little to instruct the troops in what may be of use to them in real service. No manœuvre should be executed in presence of the enemy, unless protected by some division of the troops.

MANOMETER, or MANOSCOPE, an instrument to show or measure the alterations in the rarity or density of the air. The manometer differs from the barometer in this, That the latter only serves to measure the *weight* of the atmosphere, or of the column of air over it; but the former, the density of the air in which it is found; which density depends not only on the weight of the atmosphere, but also on the action of heat and cold, &c. Authors, however, generally confound the two together; and Mr Boyle himself gives us a very good manometer of his contrivance, under the name of a *statical barometer*, consisting of a bubble of thin glass, about the size of an orange, which, being counterpoised when the air was in a mean state of density, by means of a nice pair of scales, sunk when the atmosphere became lighter, and rose as it grew heavier.

Other kinds of manometers were made use of by Colonel Roy, in his attempts to correct the errors of the barometer. "They were (says he) of various lengths, from four to upwards of eight feet: they consisted of straight tubes, whose bores were commonly from $\frac{1}{2}$ th to $\frac{1}{3}$ th of an inch in diameter. The capacity of the tube was carefully measured, by making a column of quicksilver, about three or four inches in length, move along it from one end to the other. These spaces were severally marked with a fine edged file, on the tubes; and transferred from them to long slips of pasteboard, for the subsequent construction of the scales respectively belonging to each. The bulb, attached to one end of the manometer at the glass-house, was of the form of a pear, whose point being occasionally opened, dry or moist air could be readily admitted, and the bulb sealed again, without any sensible alteration in its capacity.

"The air was confined by means of a column of quicksilver, long or short, and with the bulb downward or upwards, according to the nature of the proposed experiment. Here it must be observed, that,

Anne.

Manometer.

from the adhesion of the quicksilver to the tube, the instrument will not act truly, except it be in a vertical position; and even then it is necessary to give it a small degree of motion, to bring the quicksilver into its true place; where it will remain in equilibrio, between the exterior pressure of the atmosphere on one side, and the interior elastic force of the confined air on the other.

"Pounded ice and water were used to fix a freezing point on the tube; and by means of salt and ice, the air was farther condensed, generally four, and sometimes five or six degrees below zero. The thermometer and manometer were then placed in a tin vessel among water, which was brought into violent ebullition; where, having remained a sufficient time, and motion being given to the manometer, a boiling point was marked thereon. After this the fire was removed, and the gradual descents of the piece of quicksilver, corresponding to every 20 degrees of temperature in the thermometer, were successively marked on a deal rod applied to the manometer. It is to be observed, that both instruments, while in the water, were in circumstances perfectly similar; that is to say, the ball and bulb were at the bottom of the vessel.

"In order to be certain that no air had escaped by the side of the quicksilver during the operation, the manometer was frequently placed a second time in melting ice. If the barometer had not altered between the beginning and end of the experiment, the quicksilver always became stationary at or near the first mark. If any sudden change had taken place in the weight of the atmosphere during that interval, the same was noted, and allowance made for it in afterwards proportioning the spaces.

"Long tubes, with bores truly cylindrical, or of any uniform figure, are scarcely ever met with. Such however as were used in these experiments, generally tapered in a pretty regular manner from one end to the other. When the bulb was downwards, and the tube narrowed that way, the column of quicksilver confining the air lengthened in the lower half of the scale, and augmented the pressure above the mean. In the upper half, the column being shortened, the pressure was diminished below the mean. In this case, the observed spaces both ways from the centre were diminished in the inverse ratio of the heights of the barometer at each space, compared with its mean height. If the bore widened towards the bulb when downwards, the observed spaces, each way from the centre, were augmented in the same inverse ratio; but in the experiments on air less dense than the atmosphere, the bulb being upwards, the same equation was applied with contrary signs: and if any extraordinary irregularity took place in the tube, the corresponding spaces were proportioned both ways from that point, whether high or low, that answered to the mean.

"The observed and equated manometrical spaces being thus laid down on the pasteboard containing the measures of the tube; the 212° of the thermometer, in exact proportion to the sections of the bore, were constructed alongside of them: hence the coincidences with each other were easily seen; and the number of thermometrical degrees answering to each

manometrical space readily transferred into a table prepared for the purpose*."

MANOMETER, for the air pump. This is a small glass tube about two or three inches high, hermetically sealed at one end, and open at the other, being divided regularly into inches and lines. It is used for ascertaining the rarefaction of the air produced by working an air pump. The tube previously filled with mercury, is placed in the receiver of an air pump. As the piston is worked, the mercury gradually sinks in the tube, and the expansion is estimated by its height; for the smaller the height at which the mercury in the tube stands above the mercury in the bason, the greater is the expansion.

MANOR, MANERIUM (*à manendo*, because the usual residence of the owner), seems to have been a district of ground held by lords or great personages; who kept in their own hands so much land as was necessary for the use of their families, which were called *terre dominicales*, or *demesne lands*; being occupied by the lord, as *dominus manerii*, and his servants. The other, or *tenemental lands*, they distributed among their tenants; which, from the different modes of tenure, were called and distinguished by two different names.—First, *book-land*, or charter land, which was held by deed under certain rents and free services, and in effect differed nothing from free socage lands: and from hence have arisen most of the freehold tenants who hold of particular manors, and owe suit and service to the same. The other species was called *folk-land*, which was held by no assurance in writing, but distributed among the common folk, or people, at the pleasure of the lord, and resumed at his discretion; being indeed land held in villenage. See VILLENAGE.

The residue of the manor, being uncultivated, was termed the *lord's waste*, and served for public roads, and for common of pasture to the lord and his tenants. Manors were formerly called *baronies*, as they still are *lordships*; and each lord or baron was empowered to hold a domestic court, called the *court baron*, for redressing misdemeanors and usances within the manor, and for settling disputes of property among the tenants. This court is an inseparable ingredient of every manor; and if the number of suitors should so fail, as not to leave sufficient to make a jury or homage, that is, two tenants at the least, the manor itself is lost.

In the early times of our legal constitution, the king's greater barons, who had a large extent of territory held under the crown, granted out frequently smaller manors to inferior persons to be held of themselves; which do therefore now continue to be held under a superior lord, who is called in such cases the *lord paramount* over all these manors; and his seignory is frequently termed an *honour*, not a *manor*; especially if it hath belonged to an ancient feudal baron, or hath been at any time in the hands of the crown. In imitation whereof, these inferior lords began to carve out and grant to others still more minute estates to be held as of themselves, and were so proceeding downwards in *infinitum*, till the superior lords observed, that, by this method of subinfeudation, they lost all their feudal profits of wardships, marriages, and escheats,

Manor cheats, which fell into the hands of these mesne or middle lords, who were the immediate superiors of the *terre tenant*, or him who occupied the land; and also that the mesne lords themselves were so impoverished thereby, that they were disabled from performing their services to their own superiors. This occasioned, first, that provision in the 33d chapter of *magna charta*, 9 Hen. III. (which is not to be found in the first chapter granted by that prince, nor in the great charter of King John), that no man should either give or sell his land without reserving sufficient to answer the demands of his lord; and, afterwards, the statute of Westm. 3. or *quia emptores*, 18 Edw. I. c. 1. which directs, that, upon all sales, or feoffments of land, the feoffee shall hold the same, not of his immediate feoffor, but of the chief lord of the fee, of whom such feoffor himself held it. But these provisions not extending to the king's own tenants *in capite*, the like law concerning them is declared by the statutes of *prærogativa regis*, 17 Edward II. c. 6. and of 34 Edw. III. c. 15. by which last all subinfeudations, previous to the reign of King Edward I. were confirmed; but all subsequent to that period were left open to the king's prerogative. And from hence it is clear, that all manors existing at this day, must have existed as early as King Edward the First: for it is essential to a manor, that there be tenants who hold of the lord; and, by the operation of these statutes, no tenant *in capite* since the accession of that prince, and no tenant of a common lord since the statute of *quia emptores*, could create any new tenant to hold of himself. See **VILLENAGE**.

MANS, a town of France, formerly capital of the county of Maine, with a bishop's see, and 17,000 inhabitants. Its wax and stuffs are famous. It is seated on a high hill near the river Sarte, in E. Long. α . 17. N. Lat. 48.

MANSE, **MANSUS**, *Mansa*, or *Mansum*; in ancient law-books, denotes a *house*, or habitation, either with or without land. See **HOUSE** and **MANSION**. The word is formed *à manendo*, "abiding;" as being the place of dwelling or residence.

Capital MANSE, (*Mansum Capitale*), denotes the *manor-house*, or lord's court. See **MANOR**.

MANSUS Presbyteri, is a parsonage or vicarage house for the incumbent to reside in. This was originally, and still remains, an essential part of the endowment of a parish church, together with the glebe and tythes. It is sometimes called *Presbyterium*. See **PRESBYTERY**.

MANSFELD, a city of Germany, and capital of a county of the same name, in the circle of Upper Saxony. E. Long. 11. 41. N. Lat. 51. 38.

MANSFELD, *Peter Ernest*, Count of, was descended from one of the most illustrious families in Germany, and which has produced the greatest number of distinguished characters. In 1552, he was taken prisoner at Ivry, where he commanded; and he was afterwards of great service to the Catholics at the battle of Montcontour. In consequence of his great talents, he was employed in affairs of the utmost delicacy and importance. Being made governor of Luxemburg, he maintained tranquillity in that province, while the rest of the Low Countries was a prey to the horrors of civil war. In testimony of their

VOL. XII. Part II.

gratitude, the States caused the following inscription to be placed on the gate of the hotel de ville: *In Belgio omnia dum vastat civile bellum, MANSFELDUS bello et pace fidus, hanc provinciam in fide continet servatque illæsam, cum summo populi consensu et hilarum jucunditate.* He was afterwards appointed to the command of the Low Countries; and died at Luxemburg, March 21. 1604, at the age of 87, with the title of *Prince of the Holy Empire*. His mausoleum, in bronze, which is to be seen in the chapel bearing his name, and adjoining to the church of the Recollects at Luxemburg, is an admirable work. Four highly finished weepers, with which this monument was ornamented, were carried off by Louis XIV. when he took this city in 1684. To a love of war, Mansfeld united a taste for the sciences; and he was a lover and encourager of the arts: he possessed a great and elevated mind; but, like many heroes ancient and modern, he was greedy of gain and lavish of blood. Abbé Schannat has written the history of the count of Mansfeld in Latin; printed at Luxemburg, 1707. Charles prince of Mansfeld, his lawful son, signalized himself in the wars of Flanders and Hungary; and died without issue in 1595, after having beaten the Turks who attempted to relieve the city of Gran (Strigonia), which he was besieging.

MANSFELD, *Ernest de*, the illegitimate son of Peter Ernest by a lady of Malines, was educated at Brussels, in the principles of the Roman Catholic religion, by his godfather Ernest archduke of Austria. He was employed in the service of the king of Spain in the Low Countries, and in that of the emperor in Hungary, together with his brother Charles, count of Mansfeld. He was legitimated on account of his bravery by the emperor Rodolphus II.; but his father's posts and possessions in the Spanish Netherlands having been refused him, contrary to promises which he had received, he, in 1610, joined the party of the Protestant princes. Being now become one of the most dangerous enemies of the house of Austria, who called him the *Attila of Christianity*, he set himself, in 1618, at the head of the rebels in Bohemia, and got possession of Pilsen in 1619. Though his troops were defeated in several battles, he was able to penetrate into the palatinate. He there took several places, ravaged Alsace, made himself master of Haguenau, and defeated the Bavarians. At length he was totally defeated by Walstein, at the battle of Dassou, which happened in the month of April 1626. He gave over his remaining troops to the duke of Weimar, and intended to pass into the Venetian states; but fell sick in a village between Zaro and Spalatro, and there expired, A. D. 1626, aged 46. The procurator Nani thus describes him: "He was bold, intrepid in danger, and the most skilful negotiator of the age in which he lived. He possessed a natural eloquence, and well knew how to insinuate himself into the hearts of those whom he wished to gain. He was greedy of others wealth, and prodigal of his own.— He was full of vast projects and great hopes, and yet possessed neither lands nor money at his death." He did not wish to die in his bed; but dressed himself in his finest robes, put on his sword, sat up, leaning upon two domestics, and in this position, highly becoming a warrior, breathed his last. But of all the actions

Mansfield
||
Manslaughter.

actions of this great captain and singular man, the following is without doubt the most extraordinary: Having got the most certain information that Cazel, in whom of all his officers he placed the greatest confidence, had communicated his plans to the Austrian chief, he showed neither passion nor resentment at his treachery, but gave him 300 rix-dollars, and sent him to Count Buquoy, with a letter expressed in these words: "Cazel being attached to you and not to me, I send him to you, that you may have the benefit of his services." The opinions of men were divided about this action, and it was as much censured as applauded. Be this as it may, Ernest is deservedly esteemed one of the greatest generals of his age. There never was a leader more patient, more indefatigable, more inured to toil and hardship, to watchings, to colds and to hunger. He raised armies, and ravaged the enemy's territories with an incredible celerity. The Hollanders said of him, that he was *bonus in auxilio, carus in pretio*; that is, that he rendered great services to those who employed him, but that he made them pay well for it.

MANSFIELD, a town of Nottinghamshire, in England, seated in the forest of Sherwood, 140 miles from London. It was anciently a royal demesne. It has a market on Thursdays, and two fairs. By an ancient custom of this manor, the heirs were declared of age as soon as born. It is a well-built town, and has a great trade in malt. Its market is well stocked with corn, cattle, &c. Here is a charity school for 36 boys. The population in 1811 was 6816.

MANSIO, a term often mentioned in itineraries, denoting *inns* on the public roads to lodge in, at the distance of eighteen miles from each other; (Lactantius). Also, in the lower ages, it came to denote "an encampment for one night," (Lamprius).

MANSIO, or *Mansius*, was sometimes also used in the same sense with *hide*; that is, for as much land as one plough could till in a year. See *HIDE*.

MANSION, MANSIO, a dwelling house, or habitation, especially in the country. See *MANSE*.

MANSION is more particularly used for the lord's chief dwelling house within his fee; otherwise called the *capital messuage* or *manse*, or chief manor-place. See *MANOR*.

MANSLAUGHTER, the unlawful killing of another, without malice either express or implied: Which may be either voluntary, upon a sudden heat; or involuntary, but in the commission of some unlawful act. These were called, in the Gothic constitutions, *homicidia vulgaria; quæ aut casu, aut etiam sponte committuntur, sed in subitaneo quodam iracundie calore et impetu*. And hence it follows, that in manslaughter there can be no accessories before the fact; because it must be done without premeditation.

1. As to the first, or voluntary branch: If upon a sudden quarrel two persons fight, and one of them kills the other, this is manslaughter: and so it is, if they upon such an occasion go out and fight in a field; for this is one continued act of passion; and the law pays that regard to human frailty, as not to put a hasty and deliberate act upon the same footing with regard to guilt. So also if a man be greatly provoked, as by pulling his nose, or other great indignity, and imme-

diately kills the aggressor; though this is not excusable *se defendendo*, since there is no absolute necessity for doing it to preserve himself; yet neither is it murder, for there is no previous malice; but it is manslaughter. But in this, and in every other case of homicide upon provocation; if there be a sufficient cooling-time for passion to subside and reason to interpose, and the person so provoked afterwards kills the other, this is deliberate revenge, and not heat of blood; and accordingly amounts to murder. So if a man takes another in the act of adultery with his wife, and kills him directly upon the spot; though this was allowed by the law of Solon, as likewise by the Roman civil law (if the adulterer was found in the husband's own house), and also among the ancient Goths; yet in England it is not absolutely ranked in the class of justifiable homicide, as in case of a forcible rape, but it is manslaughter. It is, however, the lowest degree of it; and therefore in such a case the court directed the burning in the hand to be gently inflicted, because there could not be a greater provocation. Manslaughter, therefore, on a sudden provocation, differs from excusable homicide *se defendendo* in this: That in the one case there is apparent necessity, for self-preservation, to kill the aggressor; in the other no necessity at all, being only a sudden act of revenge.

2. The second branch, or involuntary manslaughter, differs also from homicide excusable by misadventure, in this: That misadventure always happens in consequence of a lawful act, but this species of manslaughter in consequence of an unlawful one. As if two persons play at sword and buckler, unless by the king's command, and one of them kills the other; this is manslaughter, because the original act was unlawful; but it is not murder, for the one had no intent to do the other any personal mischief. So where a person does an act, lawful in itself, but in an unlawful manner, and without due caution and circumspection; as when a workman flings down a stone or piece of timber into the street, and kills a man; this may be either misadventure, manslaughter, or murder according to the circumstances under which the original act was done. If it were in a country village, where few passengers are, and he calls out to all people to have a care, it is misadventure only; but if it were in London, or other populous towns, where people are continually passing, it is manslaughter, though he gives loud warning; and murder, if he knows of their passing and gives no warning at all, for then it is malice against all mankind. And, in general, when an involuntary killing happens in consequence of an unlawful act, it will be either murder or manslaughter according to the nature of the act which occasioned it. If it be in prosecution of a felonious intent, or in its consequences naturally tending to bloodshed, it will be murder; but if no more was intended than a mere civil trespass, it will only amount to manslaughter.

3. As to the punishment of this degree of homicide: The crime of manslaughter amounts to felony, but within the benefit of clergy; and the offender shall be burnt in the hand, and forfeit all his goods and chattels.

But there is one species of manslaughter, which is punished as murder, the benefit of clergy being taken away from it by statute; namely, the offence of mortally

Manslaughter.

Man-
slaughter

ra.

tally stabbing another, though done upon sudden provocation. See STABBING.

MANTA, in *Ichthyology*; a flat fish mentioned by Ulloa and others, as exceedingly hurtful to the pearl-fishers, and which seems to be the same with that which Pliny has described under the name of *nubes* or *nebula*: *Ipsi ferunt (Urinatores) et nubem quandam crassescere super capita, planorum piscium similem, prementem eos, arcentemque à reciprocando, et ob stilos præacutos lineis annexos habere sese; quia nisi perfossæ ita, non resedant caliginis et pavoris, ut arbitror, opere. Nubem enim sive nebulam (cujus nomine id malum appellant) inter animalia haud ullam reperit quisquam.* (Plin. Hist. lib. ix. cap. 46.). The account given of this cloud by those divers is much the same with that which the divers in the American seas give of the manta; and the name of the cloud is perfectly applicable to it, as it really seems to be a cloud to those who are in the water below it: the swimmers likewise carry long knives, or sharp sticks, for the purpose of dispersing this animal. It is not improbable, that this fish has made its way into those seas from those of the old world, in the same manner as some others appear to have done. The strength of this fish is so great, that it will not only strangle a man whom it embraces or winds itself about, but it has even been seen to take the cable of an anchor and move it from the place where it had been cast. It has been called *manta*, because, when it lies stretched upon the sea, as it frequently does, it seems like a fleece of wool floating upon the water.

MANTE, a considerable town of France, capital of the Mantois, seated on the river Seine, in E. Long. 1. 45. N. Lat. 48. 58.

MANTEGAR, or **MAN-TIGER**, as it is sometimes written, is the tufted ape, a species of simia. See **MAMMALIA Index**.

MANTEGNA, **ANDREW**, was born in a village near Padua in 1451, and at first employed in keeping sheep. It was observed, that instead of watching over his flock, he amused himself with drawing; and he was placed with a painter who, being delighted with his ease and taste in work, and with his gentle and agreeable conduct in society, adopted him for his son, and made him his heir. At the age of 17, Mantegna was employed to paint the altar of St Sophia in Padua, and the four evangelists. James Bellini, who admired his talents, gave him his daughter in marriage. Mantegna painted, for the duke of Mantua, the *Triumph of Caesar*, which is the chief d'oeuvre of this painter, and has been engraved in claro-obsuro, in nine plates. From respect to his extraordinary merit, the duke made him knight of his order. The invention of engraving prints with the graver is commonly ascribed to Mantegna, who died at Mantua in 1517.

MANTELETS, in the art of war, a kind of moveable parapets, made of planks about three inches thick, nailed one over another, to the height of almost six feet, generally cased with tin, and set upon little wheels, so that in a siege they may be driven before the pioneers, and serve as blinds to shelter them from the enemy's small shot.

MANTICHORA, a name given by the Roman authors to a fierce and terrible creature, which they describe from the Greeks, who call it sometimes also *mantichora*, *martichora*, and *martiora*. We have form-

ed the name *man-tiger* on the sound of the Roman name, though expressing a very different sense; and our authors of the histories of animals, figure to us under this name a terrible creature, partly from the accounts of Pliny exaggerated, and partly from their own imagination, with three rows of teeth, and with such a shape as no animal ever possessed. See **MAN-TEGAR**.

MANTINEA, in *Ancient Geography*, a town situated in the south of Arcadia, on the confines of Laconia (Ptolemy); called afterwards *Antigonea*, in honour of King Antigonus. It is memorable for a battle fought in its neighbourhood between the Thebans and Spartans, in which fell the celebrated commander Epaminondas. See **THEBES**.

MANTIS, a genus of insects belonging to the order of hemiptera. See **ENTOMOLOGY Index**.

MANTLE, or *MANTLE Tree*, in *Architecture*, the lower part of the chimney, or that piece of timber which is laid across the jambs, and sustains the compartments of the chimney-piece.

MANTLE, or *Mantling*, in *Heraldry*, that appearance of folding of cloth, flourishing, or drapery, which in any achievement is drawn about a coat of arms. See **HERALDRY**, sect. v.

MANTO, in poetic history, the daughter of Tiresias, and like her father strongly inspired with prophecy. She was in so great esteem, that when the Argives pillaged Thebes, they thought they could not acquit their vow to Apollo, of consecrating to him the most precious thing in their plunder, without offering him this young woman. She was therefore sent to the temple of Delphi. But this did not engage her in any vow of continency; or, if it did, she observed it very ill: for she bore a son called *Amphilochus* to Alcmeon, who had been generalissimo of the army which took Thebes; and a daughter to the same, named *Tisiphone*. These children were the fruits of an amour carried on during the madness which had seized Alcmeon, after he had put his mother to death. Virgil transports her into Italy, not for the sake of securing her virginity, but to produce a son of her who built Mantua.

MANTUA, anciently a town of the Transpadana in Italy, situated on the Mincio, a river running from the Lacus Benacus. It is said to have been founded about 300 years before Rome by Bianor or Ocnus, the son of Manto; and was the ancient capital of Etruria. When Cremona, which had followed the interest of Brutus, was given to the soldiers of Octavius, Mantua also, which was in the neighbourhood, shared the common calamity, and many of the inhabitants were tyrannically deprived of their possessions. Virgil, who was among them, and a native of the town, applied for redress to Augustus, and obtained it by means of his poetical talents.

It is still called **MANTUA**, and is the capital of the duchy of that name. It is now a large place, having eight gates and about 16,000 inhabitants. The streets are broad and straight, and the houses well built. It is very strong by situation as well as by art; lying in the middle of a lake, or rather morass, formed by the river Mincio. There is no access to the city but by two causeways which cross this morass, and which are strongly fortified: so that the city is looked upon to

Manti-
chora
||
Mantua.

Mantua
||
Manual.

be one of the most considerable fortresses of Europe; and the allies in 1745, though their army was in the duchy, durst not undertake the siege. It was greatly noted for its silk manufactures, which are now much decayed. The air in the summer time is very unwholesome. The celebrated poet Virgil was born at a village near this city. It was besieged by the French for above six months, in 1796, and surrendered to them on February 2. 1797. On the recommencement of the war, it was attacked by the Austrian and Russian army, to which it surrendered on the 30th of July, 1799, after a short siege. It again fell into the hands of the French after the battle of Marengo, and formed a part of the kingdom of Italy, till it was restored to Austria in 1814 with the rest of Lombardy. E. Long. 10. 46. N. Lat. 45. 8.

MANTUA, the duchy of, a country of Italy, lying along the river Po, which divides it into two parts. It is bounded on the north by the Veronese; on the south by the duchies of Reggio, Modena, and Mirandola; on the east by the Ferrarese; and on the west by the Cremonese. It is about 50 miles in length, and 25 in breadth; is fruitful in corn, pastures, flax, fruits, and excellent wine. Charles IV. the last duke of Mantua, being a vassal of the empire, took part with the French in the dispute relating to the succession of Spain; for which reason he was put under the ban of the empire, and died at Venice in 1708. He having no heirs, the emperor kept the Mantuan in his own hands, and the duke of Savoy had Montserrat; which were confirmed to them by subsequent treaties. After the death of the emperor in 1740, his eldest daughter, the empress queen, kept possession of the Mantuan; and the governor of the Milanese had the administration of affairs. The Mantuan comprehends the duchies of Mantua, Guastalla, and Sabioneta; the principalities of Castiglione, Solforino, and Bosolo; likewise the county of Novellara. The principal rivers are the Po, the Oglio, and the Mincio; and the principal town is Mantua.

MANUAL, a word signifying any thing performed by the hand.

MANUAL (*manualis*) in *Law*, signifies what is employed or used by the hand, and whereof a present profit may be made; as such a thing in the manual occupation of one, is where it is actually used or employed by him.

MANUAL is the name of a service book used in the church of Rome, containing the rites, directions to the priests, and prayers used in the administration of baptism and other sacraments; the form of blessing holy water, and the whole service used in processions.

MANUAL Exercise, in the army, consists in the observance of certain words of command appointed for this purpose. When a regiment is drawn up, or paraded for exercise, the men are placed three deep, either by companies, or divided into platoons, with the grenadiers on the right. When soldiers are drawn up for exercise, the ranks and files should be exactly even; and each soldier should be instructed to carry his arms well, to keep his firelock steady and even upon his shoulder, with the right hand hanging down, and the whole body without constraint. The distances between the files must be equal, and the ranks eight feet distant from each other. Every motion should be performed with

life, and the greatest exactness observed in all firings, wheelings, and marching; and therefore a regiment should never be under arms longer than two hours.

The following is an abstract of the words of command at the manual exercise, with their explanations.

1. *Poise your firelock*: i. e. Seize the firelock with your right hand, and turn the lock outwards, keeping the firelock perpendicular; then bring up the firelock with a quick motion from the shoulder, and seize it with the left hand, just above the lock, so that the fingers may lie upon the stock, with the elbows down, and the thumb upon the stock; the firelock must not be held too far from the body, and the left hand must be of an equal height with the eyes.
2. *Cock your firelock*: i. e. Turn the barrel opposite to your face, and place your thumb upon the cock, raising your elbow square at this motion; then cock your firelock, by drawing your elbow down, placing your right thumb on the breech-pin, and the fingers under the guard.
3. *Present*: i. e. Step back about six inches to the rear with the right foot, bringing the left toe to the front; at the same time the butt-end of the firelock must be brought to an equal height with the shoulder, placing the left hand on the swell, and the fore finger of the right hand before the trigger, sinking the muzzle a little.
4. *Fire*: i. e. Pull the trigger briskly, and immediately after, bringing up the right foot to the inside of the left, come to the priming position, with the lock opposite to the right breast, the muzzle to the height of the hat, keeping it firm and steady, and at the same time seize the cock with the fore finger and thumb of the right hand, the back of the hand being turned up.
5. *Half-cock your firelock*: i. e. Half-bend the cock briskly with a draw-back of the right elbow, bringing it close to the butt of the firelock.
6. *Handle your cartridge*: i. e. Bring your right hand with a short round to your pouch, slapping it hard; seize the cartridge, and bring it with a quick motion to your mouth; bite the top well off, and bring the hand as low as the chin, with the elbow down.
7. *Prime*: i. e. Shake the powder into the pan, placing the three last fingers behind the rammer, with the elbow up.
8. *Shut your pan*: i. e. Shut your pan briskly, drawing your right arm at this motion towards your body, holding the cartridge fast in your hand as before; then turn the piece nimbly round to the loading position, with the lock to the front, and the muzzle to the height of the chin, bringing the right hand behind the muzzle, with both feet kept fast in this motion.
9. *Charge with cartridge*: i. e. Turn up your hand, and put the cartridge into the muzzle, shaking the powder into the barrel; place your hand, closed, with a quick and strong motion, upon the rammer.
10. *Draw your rammer*: i. e. Draw the rammer with a quick motion half out, seizing it at the muzzle back-handed; draw it quite out, turn it, and enter it into the muzzle.
11. *Ram down your charge*: i. e. Ram the cartridge well down in the barrel, instantly recovering and seizing the rammer back-handed at the centre, turning it, and entering it as far as the lower pipe, placing at the same time the edge of the hand on the butt end of the rammer, with fingers extended.
12. *Return your rammer*: i. e. Return the rammer, bringing up the piece with the left hand to the shoulder, seizing it with the right hand under

Manual.

under the cock, keeping the left hand fast at the swell, turning the body square to the front. 13. *Shoulder your firelock*: i. e. Quit the left hand, and place it strong upon the butt; quit the right hand, and throw it down the right side. 14. *Rest your firelock*: i. e. Seize the firelock with the right hand, turning the lock outwards; raise the firelock from the shoulder, and place your left hand with a quick motion above the lock, holding the piece right up and down in both hands before you, and your left hand even with your eyes; step briskly back with your right foot, placing it a hand's breadth distance from your left heel, and at the same time bring down your firelock as quick as possible to the rest, sinking it as far down before your left hand as your right hand will permit without constraint; your left hand being at the feather spring, and your right, with fingers extended, held under the guard, taking care to draw in the muzzle well towards your body, and to dress in a line with the butt-end. 15. *Order your firelock*: i. e. Place your firelock nimbly with your left hand against your right shoulder; quit the firelock with the right hand, sinking it at the same time with your left; seize it at the muzzle, which must be of an equal height with your chin, and hold it close against your right side; lift up your right foot, and place it by your left; at the same time throw back your left hand by your left side, and with your right bring down the butt-end strong upon the ground, placing it even with the toe of your right foot; the thumb of your right hand lying along the barrel, and the muzzle kept at a little distance from your body. 16. *Ground your firelock*: i. e. Half face to the right upon your heels, and at the same time turn the firelock, so that the lock may point to the rear, and the flat of the butt-end lie against the inside of your foot; at the same time slipping the right foot behind the butt of the firelock, the right toe pointing to the right, and the left to the front: step directly forward with your left foot, about as far as the swell of the firelock, and lay it upon the ground, your left hand banging down by your left leg, and your right kept fast, with the butt end against it; raise yourself up again nimbly, bringing back your left foot to its former position, keeping your body faced to the right; face again to the left upon your heels, and come to your proper front, letting your hands hang down without motion. 17. *Take up your firelock*: i. e. Face to the right upon both heels; sink your body down, and come to the position described in the second motion of grounding; raise yourself and firelock, bringing it close to your right side; come to your proper front, seizing your firelock at the muzzle, as in explanation 15. 18. *Rest your firelock*: i. e. Bring your right hand as far as the swell; raise the firelock high up in a perpendicular line from the ground with your right hand, and seize it with your left above the spring, the cock being at the height of the waist-belt; step back with your right foot, placing it behind your left heel, and come to the rest. 19. *Shoulder your firelock*: i. e. Lift up your right foot, and place it by your left; bring the firelock at the same time to your left shoulder, and seize the butt-end with the left hand, keeping it in the same position as above described; throw your right hand briskly back. 20. *Secure your firelock*: i. e. Bring the right hand briskly up, and place it under the cock,

Manual.

keeping the firelock steady in the same position; quit the butt with the left hand, and seize the firelock with it at the swell, bringing the elbow close down upon the lock; the right hand being kept fast in this motion, and the piece still upright; quit the right hand, and bring it down your right side, bringing the firelock nimbly down to the secure; the left hand in a line with the waist-belt. 21. *Shoulder your firelock*: i. e. Bring the firelock up to a perpendicular line, seizing it with the right hand under the cock: quit the left hand, and place it strong upon the butt, quit the right hand, and bring it smartly down the right side. 22. *Fix your bayonet*: i. e. First and second motions, as in the two first of the secure; quit the right hand, and bring the firelock smartly down to the left side with the left hand, as far as it will admit without constraint, seizing the bayonet at the same time with the right hand, and fixing it, placing that hand just below the brass, with the piece kept close to the hollow of the shoulder. 23. *Shoulder your firelock*: i. e. Quit the right hand, and bring up the firelock with the left; seize it again under the cock with your right, as in the second motion of the secure; quit the left hand, and place it strong upon the butt; quit the right hand, and bring it down the right side. 24. *Present your arms*: i. e. as explained in the three motions of the 14th word of command. 25. *To the right face*: i. e. Bring up the firelock with a quick motion high before you, till your left hand comes even with your eyes, both the fingers of that hand extended along the stock, just above the feather-spring, the right foot to be brought close up to the left heel in this motion; face to the right, taking care in facing to hold the firelock right up and down, and steady in your hands; step back with your right foot, and come down to your present, as in the foregoing explanation. 26. *To the right face*: i. e. as in the foregoing explanation, facing to the right. 27. *To the right about face*: i. e. as in the 25th explanation, only coming to the right about instead of to the right. 28. *To the left face*: i. e. Bring the right foot briskly to the hollow of your left, with the firelock in the same position as in the first motion of facing to the right: face to the left; come down to the present, as before. 29. *To the left face*: i. e. as in the foregoing explanation. 30. *To the left about face*: i. e. as before, coming to the left-about instead of to the left. 31. *Shoulder your firelock*: i. e. as in the two motions of the 19th explanation. 32. *Charge your bayonets*: i. e. as in the first explanation: bring the swell of the firelock down strong upon the palm of the hand, grasping the piece at the small, behind the lock, and as high as the waist-belt; the firelock upon a level with the barrel upwards. 33. *Shoulder your firelock*: i. e. Bring up the firelock to the shoulder, place the left hand upon the butt, bringing the feet square to the front; quit the right hand, and throw it down the right side. 34. *Advance your arms*: i. e. first and second motions, as in the first explanation; bring the firelock down the right side, with the right hand as low as it will admit without constraint, slipping up the left hand at the same time to the swell, the guard between the thumb and forefinger of the right hand, the three last fingers under the cock, with the barrel to the rear; quit the left hand. 35. *Shoulder your firelock*: i. e. Bring up the left hand, and seize it

it

Manual. it at the swell; come smartly up to the poise; shoulder. 36. *Prime and load*: i. e. Come smartly to the *recover*: by springing the firelock straight up with the left hand, turning the barrel inwards to the proper height of the *recover*: at the same time that the left hand springs the firelock, the right hand is raised briskly from the right side, and seizes the firelock across the breast: as it rises below the cock, the left hand comes with a quick motion from the butt, and seizes the firelock strong above the lock, the little finger of the left hand at the spring of the lock, the left hand at an equal height with the face, the butt close to the body, but not pressed, the firelock perpendicular opposite the left side of the face: bring the firelock down with a brisk motion to the priming position, the left hand holding the firelock, as in priming; the thumb of the right hand placed against the face of the steel, the fingers clenched, and the elbow a little turned out, that the wrist may be clear of the cock: open the pan, by throwing up the steel with a strong motion of the right arm, turning the elbow in, and keeping the firelock steady in the left hand; handle your cartridge, prime, shut your pan, cast about, load, draw rammers, ram down the cartridge, return the rammers, shoulder. *N. B.* The motion of *recover*, and coming down to the priming position and opening pans, are to be done in the usual time. The motions of handling cartridge to shutting the pans, are to be done as quick as possible: when the pans are shut, a small pause is to be made, and then cast about together; then the loading motions are to be done as quick as possible; but before the rammer is returned, another small pause is to be made, counting 1, 2, between each motion, till the firelock is shouldered.—*Front rank make ready*: i. e. Spring the firelock briskly to the *recover*, keeping the left foot fast in this motion: as soon as the firelock is at the *recover*, without any stop, sink the body briskly without stooping forward, with a quick motion down upon the right knee; the butt-end of the firelock at the same time falls upon the ground, the front part of the butt being in a line with the heel of the left foot. As soon as the butt comes to the ground, the firelock is to be cocked, immediately seizing the cock and steel in the right hand; the firelock to be held firm in the left hand, about the middle of that part of the firelock between the lock and the swell of the stock; the point of the left thumb to be close to the swell, pointing upwards. As the body is sinking, the right knee is to be thrown as far back as the left leg may be right up and down; the right foot to be thrown a little to the right; the body to be kept straight; the head up, looking to the right along the rank, the same as if shouldered; the firelock to be upright, and the butt about four inches to the right of the inside of the left foot. *Present*: i. e. Bring the firelock briskly down to the *present*, by extending the left arm to the full length with a strong motion; at the same time spring up the butt by the cock with the right hand, and raise the butt so high

upon the right shoulder, that you may not be obliged to stoop too much with the head; the right cheek to be close to the butt, and the left eye shut, and look along the barrel with the right eye from the breech-pin to the muzzle; keep the left elbow down in an easy position, and stand as steady as possible; the thumb of the right hand to remain in the position as described in the third explanation of the manual. *Fire*: i. e. Pull the trigger as directed in the manual; and as soon as the piece is fired, give yourself a strong spring upon your left leg, raising your body briskly, and straight up, keeping your left foot fast, and bringing the right heel to the inside of the left; at the same time the firelock is to be brought up to the priming position, and half-cocked immediately: a short pause is to be made; then handle cartridge, and go on with the loading motions described in the explanation of *prime and load*.—*Centre rank make ready*: i. e. Spring the firelock briskly to the *recover*; so soon as the left hand seizes the firelock above the lock, the right elbow is to be nimbly raised a little, placing the thumb of that hand upon the cock; the fingers open by the plate of the lock, and as quick as possible force the piece to the cock, by dropping the elbow, and forcing down the cock with the thumb, stepping at the same time a moderate pace to the right, keeping the left foot fast; as the firelock is cocked, the thumb is to fall below the cock, the right hand seizing the firelock close under the cock firmly, the fore finger not to be before the trigger; the piece to be held in this position perpendicular, opposite the left side of the face, the butt close to the left breast, but not pressed; the body to be straight, and as full to the front as possible: the head kept up, looking to the right of the rank, that the body and the firelock may not stoop forward, nor lean much out of the rank. *Present*: i. e. Spring the firelock from the body to the arm's length with a quick motion, pressing down the muzzle with the left hand, and springing up the butt with the right hand, as in the foregoing explanation of the *front rank*. *Fire*: As in explanation 4, in the manual, with this difference, that the left foot is to be brought up to the right, at the same time that the firelock is brought down to the priming position. The loading motions as in the explanations of priming and loading; and at the last motion of shouldering, to spring to the left again, and cover the file-leaders.—*Rear rank, make ready*: i. e. Recover the firelock, and cock as before directed for the centre rank; as the firelock is recovered and cocked, step briskly straight to the right, with the right foot, a full pace; bring the left heel about six inches before the right foot; the body straight, and as square to the front as possible, as in the explanation of the *centre rank*. *Present*: As in explanation *present*, before. *Fire*: As in explanation of the *centre rank*; and as the firelock is coming down to the priming position, the left is to be brought back to the right; and at the last motion of shouldering, to spring to the left again, and cover the file-leader (A).

There

(A) The manual exercise now described is not precisely the same that it is at present (1807). The difference indeed is not great; but depending partly on the peculiar views of commanding officers, it is so subject to change that it would be useless to detail it in its present form.

Manual
||
Manumission.

There are some peculiar words of command at the manual exercise of the grenadiers, when apart from the battalion; and also for the cavalry and artillery.

MANUDUCTOR, a name given to an ancient officer in the church; who, from the middle of the choir, where he was placed, gave the signal for the choristers to sing, and marked the measure, beat time, and regulated the music. The Greeks called him *mesachoros*, because seated in the middle of the choir: but in the Latin church he was called *manuductor*; from *manus* and *duco*, "I lead;" because he led and guided the choir by the motions and gesture of the hand.

MANUFACTURE, a commodity produced from raw or natural materials, either by the work of the hand or by machinery.

MANUFACTURER, one who works up a natural product into an artificial commodity.

MANUMISSION, an act whereby a slave or villain is set at liberty, or let out of bondage. The word comes from the Latin *manus*, "hand;" and *mittere*, "to send;" *quia servus mittebatur extra manum seu potestatem domini sui*. Some authors define manumission an act by which a lord enfranchises his tenants, who till that time had been his vassals, and in a state of slavery inconsistent with the sanctity of the Christian faith.

Among the Romans, the manumission of slaves was performed three several ways. 1. When, with his master's consent, a slave had his name entered in the census or public register of the citizens. 2. When the slave was led before the prætor, and that magistrate laid his wand called *vindicta* on his head. 3. When the master gave the slave his freedom by his testament. Servius Tullius is said to have set on foot the first manner; and P. Valerius Publicola the second. A particular account is given of the third in the Institutes of Justinian. It was not necessary that the prætor should be on his tribunal to perform the ceremony of manumission: he did it anywhere indifferently, in his house, in the street, in going to bathe, &c. He laid the rod on the slave's head, pronouncing these words, *Dico cum liberum esse more Quiritum*, "I declare him a freeman, after the manner of the Romans." This done, he gave the rod to the lictor, who struck the slave with it on the head, and afterwards with his hand on his face and back; and the notary or scribe entered the name of the new freeman in the register, with the reasons of his manumission. The slave had likewise his head shaved, and a cap given him by his master as a token of freedom. Tertullian adds, that he had then also a third name given him: if this were so, three names were not a token of nobility, but of freedom. The emperor Constantine ordered the manumissions at Rome to be performed in the churches.

Of manumission there have also been various forms in England. In the time of the Conqueror, villains were manumitted, by the master's delivering them by the right hand to the viscount, in full court, showing them the door, giving them a lance and a sword, and proclaiming them free. Others were manumitted by charter. There was also an implicit manumission: as when the lord made an obligation for payment of

money to the bondman at a certain day, or sued him where he might enter without suit, and the like.

MANURÉ, any thing used for fattening and improving land. See *AGRICULTURE Index*.

MANUSCRIPT, a book or paper written with the hand; by which it stands opposed to a printed book or paper. A manuscript is usually denoted by the two letters MS. and in the plural by MSS. What makes public libraries valuable, is the number of ancient manuscripts repositied in them; see *ALEXANDRIAN*, *CAMBRIDGE*, *CLERMONT*, *COTTONIAN*, *HARLEIAN*, *VATICAN*, &c.

MANUTIUS, **ALDUS**, the first of those celebrated Venetian printers who were as illustrious for their learning as for uncommon skill in their profession. He was born at Bassano in Italy about the middle of the 15th century; and hence is sometimes called *Bassianus*, though generally better known by the name of *Aldus*. He was the first who printed Greek neatly and correctly; and acquired so much reputation by it, that whatever was finely printed was proverbially said to have come from the press of Aldus. We have a kind of Greek grammar of his; with notes upon Homer, Horace, &c. He died at Venice, where he exercised his profession, in 1516.

MANUTIUS, *Paulus*, son of the former, was brought up to his father's profession. He was more learned than he; and he acquired, by continual reading of Tully, such a purity in writing Latin, as even Scalliger allows a Roman could not exceed. Pope Pius IV. placed him at the head of the apostolical press, and gave him the charge of the Vatican library. His Epistles are infinitely laboured, and very correct; but, as may be said of most of the Ciceronians, they contain scarcely any thing but mere words. This constant reading of Tully, however, together with his profound knowledge of antiquity, qualified him extremely well for an editor of Tully; whose works he accordingly published, with Commentaries on them, in 4 vols. folio, at Venice in 1523. He died in 1574.

MANUTIUS, *Aldus*, the Younger, the son of Paulus, and the grandson of Aldus, was esteemed one of the greatest geniuses and most learned men of his time. Clement VIII. gave him the direction of the Vatican printing house: but probably the profits of that place were very small, since Manutius was obliged, for his subsistence, to accept of a professor of rhetoric's chair, and to sell the excellent library that was in his family, which his father, his uncle, and his great uncle, had collected with extraordinary care, and which it is said contained 80,000 volumes. He died at Rome in 1597, without any other recompense than the praises due to his merit. He wrote, 1. Commentaries on Cicero. 2. A Treatise on Orthography. 3. Three books of Epistles; and other works in Latin and Italian, which are esteemed.

MAON, in *Ancient Geography*, a town of the tribe of Judah, to the south east, towards the Dead Sea. It gave name to the *wilderness of Maon*, 1 Sam. xxii.

MAOUNA, one of the Navigator's islands in the south Pacific ocean. Here M. de la Perouse, commander of the French ships the *Boussole* and *Astrolabe*, met with his first fatal accident in 1787; M. de Langle,

Manumission
||
Maouna

Maouna || **Marana.** Langle, captain of the Astrolabe, with 11 officers and sailors, were massacred by the natives. W. Long. 169. S. Lat. 14. 19.

MAP, a plane figure, representing the surface of the earth, or a part thereof, according to the laws of perspective. See *GEOGRAPHY Index*.

MAPLE. See *ACER, BOTANY Index*.

MAPLE-Sugar. See *SUGAR, CHEMISTRY Index*.

MAPPA, in the public games of the Roman circus, was a napkin hung out at the prætor's or other great magistrate's seat, as a signal for the race or other diversions to begin. The mappa was received by the mapparius, or person who held it, from the consul, prætor, or other great officer. Notice was anciently given by sound of trumpet; but Nero is said to have introduced the mappa, by throwing his napkin out of the window to satisfy the people, who grew noisy at the delay of the sports while he was at dinner.

MAPPARIUS, in Roman antiquity, the officer who gave the signal to the gladiators to begin fighting.

MARACANDA, in *Ancient Geography*, capital of the Sogdiana. Now thought to be *Samarcand*, a city of Usbec Tartary in Asia, the country and royal residence of Tamerlane. See *SAMARCAND*.

MARACAYBO, a province of South America, surrounding the lake of the same name, bounded on the north by the Caribbean sea, and containing 100,000 inhabitants. See *CARACCAS, SUPPLEMENT*.

MARACAYBO, a town of South America, capital of a province, and seated near a lake of the same name. It carries on a great trade in skins and chocolate, and they have likewise very fine tobacco. The population is estimated at 8400. It was taken by the French bucaniers in 1666 and 1678. W. Long. 70. 56. N. Lat. 10. 10.

MARACAYBO, a lake in South America, 150 miles long and 90 broad, which communicates with the North sea. It is well defended by strong forts; which, however, did not hinder Sir Henry Morgan, a bucanier, from plundering several towns on the coast. See *CARACCAS, SUPPLEMENT*.

MARAGNAN, a province of Brazil in South America, which comprehends a fertile populous island, 112 miles in circumference. The French settled here in 1612, and built a small town; but they were driven from it by the Portuguese, who have possessed it ever since. The climate is pleasant, and the soil fertile. W. Long. 54. 35. S. Lat. 2. 0.

MARALDI, JAMES-PHILIP, a learned mathematician and astronomer, of the Academy of Sciences at Paris, was born in 1665. He was the son of Francis Maraldi and Angela Catharine Cassini, the sister of the famous astronomer of that name. His uncle sent him to France in 1687, where he acquired great reputation on account of his learning and observations. He made a catalogue of the fixed stars, which is more particular and exact than Bayer's; and has given a great number of curious and interesting observations in the memoirs of the academy. He died in 1729.

MARANA, JOHN PAUL, an ingenious writer of the 17th century, was of a distinguished family, and born at Genoa; where he received an education suit-

able to his birth, and made great progress in the study of polite literature and the sciences, Having been engaged in the conspiracy of Raphael della Terra, to deliver up Genoa to the duke of Savoy, he was in 1670, when 28 years of age, imprisoned in the tower of that city, and remained there four years. Being at length set at liberty, he was ordered to write the history of that conspiracy; but, when finished, it was seized and prevented from being published. When the republic of Genoa was at variance with the court of France, Marana, who had always an inclination for that court, was afraid of being imprisoned a second time; and retired to Monaco, where he again wrote the history of the conspiracy in Italian; and, in 1682, went to Lyons to get it printed. From Lyons he went to Paris, where his merit soon acquired him powerful protectors. He spent the rest of his life in a happy and tranquil mediocrity, devoted to study and the society of men of learning; and died in 1693. His history of the conspiracy contains many curious and interesting anecdotes. He also wrote several other works; the most known of which is the *Turkish Spy*, in six volumes 12mo, which was in 1742 augmented to seven. Of this ingenious work we have an excellent English translation.

MARANO, a town of Friuli in Italy, with a strong citadel; seated in a marsh at the bottom of the gulf of Venice. It contains about 1000 inhabitants.

MARANS, a rich town of France, in the territory of Aunis and diocese of Rochelle, seated among salt marshes, near the river Sevre, three miles from the sea. It carries on a very great trade in corn; and is seated in W. Long. 0. 54. N. Lat. 46. 18.

MARANTA, INDIAN ARROW ROOT, a genus of plants belonging to the monandria class; and in the natural method ranking under the eighth order *Scitamineæ*. See *BOTANY Index*.

MARASMUS, among physicians, denotes an atrophy or consumption in its last and most deplorable stage.

MARATHON, in *Ancient Geography*, one of the demi or hamlets of Attica; about 10 miles to the north-east of Athens, towards Bœotia, near the sea. It still retains its ancient name (Dr Chandler informs us); but is very inconsiderable, consisting only of a few houses and gardens. The plain of Marathon, famous for Miltiades's victory over the Persians, by which the liberties of Athens and other cities of Greece were saved, is long and narrow, but consisting chiefly of level ground, and therefore admitting the operations of cavalry, which formed the main strength of the barbarian army, and with which the Greeks were very poorly provided. Here the Persians, under the command of Datis, pitched their camp, by the advice of Hippias, the banished king of Athens, whose solicitations and intrigues had promoted the expedition, and whose perfect knowledge of the country, and intimate acquaintance with the affairs of Greece, rendered his opinion on all occasions respectable. The Persian army is said to have consisted of 100,000 infantry, and 10,000 horse.—Athens was in the utmost consternation and dismay. She had, upon the first

Marathon. first appearance of the Persian fleet, sent to implore assistance from the other nations of Greece: but some had submitted to Darius, and others trembled at the very name of the Medes and Persians. The Lacedæmonians alone promised troops; but various obstacles did not allow them immediately to form a junction with those of Athens. This city therefore could only rely on its own strength; and happily at this moment there appeared three men destined to give new energy to the state. These were Miltiades, Aristides, and Themistocles; whose example and harangues kindled the flame of the noblest heroism in the minds of the Athenians. Levies were immediately made. Each of the ten tribes furnished 1000 foot soldiers with a commander at their head. To complete this number it was necessary to enrol the slaves (A). No sooner were the troops assembled than they marched out of the city into the plain of Marathon, where the inhabitants of Platæa in Bœotia sent them a reinforcement of 1000 infantry.

Scarcely were the two armies in sight of each other, before Miltiades proposed to attack the enemy. Aristides and several of the commanders warmly supported this measure: but the rest, terrified at the excessive disproportion of the armies, were desirous of waiting for the succours from Lacedæmon. Opinions being divided, they had recourse to that of the polemarch, or chief of the militia, who was consulted on such occasions, to put an end to the equality of suffrages. Miltiades addressed himself to him, with the ardour of a man deeply impressed with the importance of present circumstances: "Athens (said he to him) is on the point of experiencing the greatest of vicissitudes. Ready to become the first power of Greece, or the theatre of the tyranny and fury of Hippias, from you alone, Callimachus, she now awaits her destiny. If we suffer the ardour of the troops to cool, they will shamefully bow beneath the Persian yoke; but if we lead them on to battle, the gods and victory will favour us. A word from your mouth must now precipitate your country into slavery or preserve her liberty." Callimachus gave his suffrage, and the battle was resolved. To ensure success, Aristides, and the other generals after his example, yielded to Miltiades the honour of the command which belonged to them in rotation: but, to secure them from every hazard, he preferred waiting for the day which of right placed him at the head of the army.

When that day arrived, Miltiades drew up his troops at the foot of a mountain, on a spot of ground scattered over with trees to impede the Persian cavalry. The Platæans were placed on the left wing; Callimachus commanded the right; Aristides and Themistocles were in the centre of the battle, and Miltiades everywhere. An interval of nearly a mile separated the Grecian army from that of the Persians. At the first signal the Greeks advanced over this space running. The Persians, astonished at a mode of attack so novel to both nations, for a moment remained

VOL. XII. Part II.

motionless; but to the impetuous fury of the enemy **Marathon.** they soon opposed a more sedate and not less formidable fury. After an obstinate conflict of some hours, victory began to declare herself in the two wings of the Grecian army. The right dispersed the enemy in the plain, while the left drove them back on a morass that had the appearance of a meadow, in which they stuck fast and were lost. Both these bodies of troops now flew to the succour of Aristides and Themistocles, ready to give way before the flower of the Persian troops placed by Datis in the centre of his battle. From this moment the rout became general. The Persians, repulsed on all sides, found their only asylum in the fleet which had approached the shore. The conquerors pursued them with fire and sword, and took, burnt, or sunk the greater part of their vessels: the rest escaped by dint of rowing.

The Persian army lost about 6400 men: that of the Athenians 192. Miltiades was wounded; Hippias was left dead on the field, as were Stesileus and Callimachus, two of the Athenian generals. Scarcely was the battle over, when a soldier, worn out with fatigue, forms the project of carrying the first news of so signal a success to the magistrates of Athens, and without quitting his arms, he runs, flies, arrives, announces the victory, and falls dead at their feet.

This battle was fought on the 6th of Boedromion, in the third year of the 72d Olympiad (or 29th September anno 490 B. C.). The next day 2000 Spartans arrived. In three days and nights they had marched 1200 stadia. Though informed of the defeat of the Persians, they continued their march to Marathon, nor did they enviously shun to behold those fields where a rival nation had signalized itself by so heroic an action: they there beheld the tents of the Persians still standing, the plain strewed over with dead, and covered with costly spoils: they there found Aristides, who with his tribe was guarding the prisoners and booty; and did not retire until they had bestowed just applauses on the victors.

The Athenians neglected nothing to eternize the memory of those who fell in the battle. It had been usual to inter the citizens who perished in war at the public expence, in the Ceramicus without the city; but the death of these was deemed uncommonly meritorious. They were buried, and a barrow was made for them, where their bravery had been manifested. Their names were engraven on half columns erected on the plain of Marathon. These monuments, not excepting those of the generals Callimachus and Stesileus, were in a style of the greatest simplicity. In the intervals between them were erected trophies bearing the arms of the Persians. An artist of eminence had painted all the circumstances of the battle in one of the most frequented porticoes of the city: Miltiades was there represented at the head of the generals, and in the act of exhorting the troops to fight for their country.

Pausanias examined the field of battle about 600
† 4 D years

(A) *Travels of Anacharsis*; authority, *Pausan.* i. 79. But Dr Gillies seems to think that the armed slaves were not included in the 10,000; but amounted of themselves to a greater number, and which formed the centre of the battle.

Marathon
||
Maratti.

years after this event. His account of it is as follows: "The barrow of the Athenians is in the plain, and on it are pillars containing the names of the dead under those of the tribes to which they belonged; and there is another for the Plataeans and slaves; and a distinct monument of Miltiades the commander, who survived this exploit. There may be perceived nightly the neighing of horses and the clashing of arms. No person has derived any good from waiting on purpose to behold the spectres; but their anger does not fall on any one who happens to see them without design. The Marathonians worship those who were slain in the battle, styling them *heroes*.—A trophy also of white marble has been erected. The Athenians say the Medes were buried, religion requiring that the corpse of a man be covered with earth; though I was not able to find any place of sepulture, for there is no barrow or other sign visible; but they threw them promiscuously into a pit.—Above the lake are the marble mangers of the horses of Artaphernes, with marks of a tent on the rocks."

Many centuries have elapsed since the age of Pausanias; but the principal barrow, it is likely that of the gallant Athenians, still towers above the level of the plain. It is of light fine earth, and has a bush or two growing on it. Dr Chandler informs us, that he enjoyed a pleasant and satisfactory view from the summit; and looked, but in vain, for the pillars on which the names were recorded, lamenting that such memorials should ever be removed. Marathon has since been visited by Dr Clarke, who has given an interesting account of the topography of the field of battle in the 4th vol. of his Travels.

MARATTA. See MARHATTAS.

MARATTI, CARLO, a celebrated painter, was born at Camorano, near Ancona, in 1625. He came a poor boy to Rome, when only 11 years old; and at 12 recommended himself so effectually to Andrea Sacchi, by his drawings after Raphael in the Vatican, that he took him into his school, where he continued 25 years till his master's death. His graceful and beautiful ideas occasioned his being generally employed in painting *madonas* and female saints. No man ever performed in a better style, or with a greater elegance. From the finest statues and pictures, he made himself master of the most perfect forms, and the most charming airs of heads, which he sketched with equal ease and grace. He has produced a noble variety of draperies, more artfully managed, more richly ornamented, and with greater propriety, than even the best of the moderns. He was inimitable in adorning the heads, in the disposal of the hair, and the elegance of his hands and feet, which are equal to those of Raphael; and he particularly excelled in gracefulness. In his younger days he etched a few prints, as well of his own invention as after others, with equal spirit and correctness. It would be endless to recount the celebrated paintings done by this great man. Yet he executed nothing slightly, often changed his designs, and almost always for the better, whence his pictures were long in hand. By the example of his master, he made several admirable portraits of popes, cardinals, and other people of distinction, from whom he received the highest testimonies of esteem, as he likewise did from almost all the monarchs and princes of Europe. Inno-

cent XI. appointed him keeper of the paintings in his chapel and the Vatican. Maratti erected two noble monuments for Raphael and A. Caracci, at his own expense, in the Pantheon. How well he maintained the dignity of his profession, appears by his answer to a Roman prince, who complaining of the excessive price of his pictures, he told him there was a vast debt due from the world to the famous artists his predecessors, and that he, as their rightful successor, was come to claim those arrears. His abilities in painting were accompanied with many virtues, and particularly with an extensive charity. This great painter died at Rome in 1713, in the 88th year of his age.

MARAUDING, in a military sense, means a party of soldiers, who, without any order, go into the neighbouring houses and villages, when the army is either in camp or garrison, to plunder and destroy, &c. Marauders are a disgrace to the camp, to the military profession, and deserve no better quarter from their officers than they give to poor peasants, &c.

MARAVEDI, a little Spanish copper coin, worth somewhat more than a French denier, or half a farthing English.

The Spaniards always count by maravedis, both in commerce and in their finances, though the coin itself is no longer current among them. Sixty-three maravedis are equivalent to a rial of silver; so that the piaster, or piece of eight rials, contains 504; and the pistole of four pieces of eight, 2016 maravedis.

This smallness of the coin produces vast numbers in the Spanish accounts and calculations; insomuch that a stranger correspondent would think himself indebted several millions for a commodity that cost but a few pounds.

In the laws of Spain, we meet with several kinds of maravedis; Alphonsine maravedis, white maravedis, maravedis of good money, maravedis Combrenos, black maravedis, and old maravedis. When we find maravedis alone, and without any addition, it is to be understood of those mentioned above. The rest are different in value, fineness of metal, time, &c. Mariana asserts, that this coin is older than the Moors; that it came from the Goths; that it was anciently equal to a third part of the rial, and consequently of 12 times the value of the present maravedi. Under Alphonsus XI. the maravedi was 17 times, under Henry II. ten times, under Henry III. five times, and under John II. two times and a half, the value of the present maravedi.

MARBELLA, a town of Grenada in Spain, situated at the mouth of the Rio Verde, 30 miles north-east of Gibraltar, and 28 south-west of Malaga. W. Long. 4. 59. N. Lat. 36. 31.

MARBLE, a calcareous stone, of which there are many beautiful varieties. The word comes from the French *marbre*, and from the Latin *marmor*, of the Greek *μαρμαριον*, to "shine or glitter." See MINERALOGY *Index*.

Elastic MARBLE, an extraordinary species of fossil which has surprised all the naturalists who have seen it. There are several tables of it preserved in the house of Prince Borghese at Rome, and shown to the curious. F. Jacquier, a celebrated mathematician, has given a description in the Literary Gazette of Paris, but the naturalists cannot be contented with it. If permission was given to make the requisite experiments,

Maratti
||
Marble.

Marble. ments, this curious phenomenon might be better illustrated. There are five or six tables of that marble; their length is about two feet and a half, the breadth about ten inches, and the thickness a little less than three. They were dug up, as the Abbé Fortis was told, in the food of Mondragone; the grain is of Carrarese marble, or perhaps of the finest Greek. They seem to have suffered some attack of fire; though the first degree of pulverization observable in the angles, can, perhaps, scarcely be called that of imperfect calcination. They are very dry, do not yield to external impression, resound to the hammer, like other congenerous marble, and are perhaps susceptible of a polish. Being set on end, they bend oscillating backward and forward; when laid horizontally, and raised at one end, they form a curve, beginning towards the middle; if placed on a table, and a piece of wood or any thing else is laid under them, they make a salient curve, and touch the table with both ends. Notwithstanding this flexibility, they are liable to be broken if indiscreetly handled; and therefore one table only, and that not the best, is shown to the curious. Formerly they were altogether in the prince's apartment on the ground floor.

Colouring of MARBLE. This is a nice art; and in order to succeed in it, the pieces of marble on which the experiments are tried, must be well polished, and free from the least spot or vein. The harder the marble is, the better will it bear the heat necessary in the operation; therefore alabaster and the common soft white marble are very improper for performing these operations upon.

Heat is always necessary for opening the pores of marble, so as to render it fit to receive the colours; but the marble must never be made red hot; for then the texture of it is injured, and the colours are burnt, and lose their beauty. Too small a degree of heat is as bad as one too great; for, in this case, though the marble receives the colour, it will not be fixed in it, nor strike deep enough. Some colours will strike even cold; but they are never so well sunk in as when a just degree of heat is used. The proper degree is that which, without making the marble red, will make the liquor boil upon its surface. The menstruums used to strike in the colours must be varied according to the nature of the colour to be used. A lixivium made with horses or dogs urine, with four parts of quicklime and one of potashea, is excellent for some colours; common ley of wood-ashes is very good for others; for some, spirit of wine is best; and lastly, for others, oily liquors, or common white wine.

The colours which have been found to succeed best with the peculiar menstruums, are these: Stone-blue dissolved in six times the quantity of spirit of wine, or of the urinous lixivium, and that colour which the painters call *litmus*, dissolved in common ley of wood-ashes. An extract of saffron, and that colour made of buckthorn berries, and called by painters *sap-green*, both succeed well when dissolved in urine and quicklime; and tolerably well when dissolved in spirit of wine. Vermilion, and a very fine powder of cochineal, also succeed very well in the same liquors. Dragon's blood succeeds in spirit of wine, as does also a tincture of logwood in the same spirit. Alkanet-root gives a fine colour: but the only menstruum to be used

for it is oil of turpentine; for neither spirit of wine, nor any lixivium, will do with it. There is another kind of *sanguis draconis*, commonly called *dragon's blood in tears*, which, mixed with urine, gives a very elegant colour.

Besides these mixtures of colours and menstruums, there are other colours which must be laid on dry and unmixed. These are, dragon's blood of the purest kind, for a red; gamboge, for a yellow; green wax, for a green; common brimstone, pitch, and turpentine, for a brown colour. The marble for these experiments must be made considerably hot, and then the colours are to be rubbed on dry in the lump. Some of these colours, when once given, remain immutable, others are easily changed or destroyed. Thus, the red colour given by dragon's blood, or by a decoction of logwood, will be wholly taken away by oil of tartar, and the polish of the marble not hurt by it.

A fine gold colour is given in the following manner: Take crude sal ammoniac, vitriol, and verdigris, of each equal quantities. White vitriol succeeds best: and all must be thoroughly mixed in fine powder.

The staining of marble to all the degrees of red or yellow, by solutions of dragon's blood or gamboge, may be done by reducing these gums to powder, and grinding them with the spirit of wine in a glass mortar. But, for smaller attempts, no method is so good as the mixing a little of either of those powders with spirit of wine in a silver spoon, and holding it over burning charcoal. By this means a fine tincture will be extracted; and with a pencil dipt in this, the finest traces may be made on the marble while cold; which, on the heating of it afterwards, either on sand, or in a baker's oven, will all sink very deep, and remain perfectly distinct on the stone. It is very easy to make the ground colour of the marble red or yellow by this means, and leave white veins in it. This is to be done by covering the places where the whiteness is to remain with some white paint, or even with two or three doubles only of paper; either of which will prevent the colour from penetrating. All the degrees of red are to be given to marble by this gum alone; a slight tincture of it, without the assistance of heat to the marble, gives only a pale flesh colour: but the stronger tinctures give it yet deeper; to this the assistance of heat adds greatly; and finally, the addition of a little pitch to the tincture, gives it a tendency to blackness, or any degree of deep red that may be desired.

A blue colour may be given also to marble by dissolving turnsole in lixivium, in lime and urine, or in the volatile spirit of urine; but this has always a tendency to purple, whether made by the one or the other of these ways. A better blue, and used in an easier manner, is furnished by the Canary turnsole, a substance well known among the dyers. This needs only to be dissolved in water, and drawn on the place with a pencil: it penetrates very deeply into the marble; and the colour may be increased, by drawing the pencil wetted afresh several times over the same lines. This colour is subject to spread and diffuse itself irregularly: but it may be kept in regular bounds, by circumscribing its lines with beds of wax, or any such substance. It is also to be observed, that this

Marble
||
Marbles.

colour should always be laid on cold, and no heat given even afterwards to the marble; and one great advantage of this colour is, that it is therefore easily added to marbles already stained with other colours, is a very beautiful tinge, and lasts a long time.

MARBLED, something veined or clouded, resembling marble. See **MARBLING**.

MARBLED China-ware, a name given by many to a species of porcelain or china-ware, which seems to be full of cemented flaws. It is called by the Chinese, who are very fond of it, *tsou tchi*. It is generally plain white, sometimes blue, and has exactly the appearance of a piece of china which had been first broken, and then had all the pieces cemented in their places again, and covered with the original varnish. The manner of preparing it is easy, and might be imitated with us. Instead of the common varnish of the china-ware, which is made of what they call *oil of stone* and *oil of fern* mixed together, they cover this with a simple thing made only of a sort of coarse agates, calcined to a white powder, and separated from the grosser parts by means of water, after long grinding in mortars. When the powder has been thus prepared, it is left moist, or in form of a sort of cream, with the last water that is suffered to remain in it, and this is used as the varnish. Our crystal would serve full as well as those coarse agates, and the method of preparation is perfectly easy. The occasion of the singular appearance of this sort of porcelain is, that the varnish never spreads evenly, but runs into ridges and veins. These often run naturally into a sort of mosaic work, which can scarce be taken for the effect of chance. If the marbled china be desired blue, they first give it a general coat of this colour, by dipping the vessel into a blue varnish; and when this is thoroughly dry, they add another coat of this agate oil.

Artificial MARBLES. The stucco, of which statues, busts, basso-relievos, and other ornaments of architecture are made, ought to be marble pulverized, mixed in a certain proportion with plaster; the whole well sifted, worked up with water, and used like common plaster. See **STUCCO**.

There is also a kind of artificial marble made of the flaky selenites, or a transparent stone resembling plaster; which becomes very hard, receives a tolerable polish, and may deceive a good eye. This kind of selenite resembles Muscovy talc.

There is another sort of artificial marble formed by corrosive tinctures, which, penetrating into white marble to the depth of a line or more, imitate the various colours of other dearer marbles.

There is also a preparation of brimstone in imitation of marble.

To do this, you must provide yourself with a flat and smooth piece of marble: on this make a border or wall, to encompass either a square or oval table, which may be done either with wax or clay. Then having several sorts of colours, as white lead, vermilion, lake, orpiment, masticot, smalt, Prussian blue, &c.; melt on a slow fire some brimstone in several glazed pipkins; put one particular sort of colour into each, and stir it well together; then having before oiled the marble all over within the wall, with one colour quickly drop spots upon it of larger and less size; after this, take another colour and do as before, and

so on till the stone is covered with spots of all the colours you design to use. When this is done, you are next to consider what colour the mass or ground of your table is to be; if of a gray colour, then take fine sifted ashes, and mix it up with melted brimstone; or if red, with English red ochre; if white, with white lead; if black, with lamp or ivory black. Your brimstone for the ground must be pretty hot, that the colour dropt on the stone may unite and incorporate with it. When the ground is poured even all over, you are next, if judged necessary, to put a thin wainscoat board upon it: this must be done while the brimstone is hot, making also the board hot, which ought to be thoroughly dry, in order to cause the brimstone to stick the better to it. When the whole is cold, take it up, and polish it with a cloth and oil, and it will look very beautiful.

Arundel MARBLES, marbles, with a chronicle of the city of Athens, inscribed on them (as was supposed) many years before our Saviour's birth; presented to the university of Oxford by Thomas earl of Arundel, whence the name. See **ARUNDELIAN Marbles**.

Playing MARBLES, are mostly imported from Holland; where it is said they are made by breaking the stone alabaster, or other substance, into pieces or chips, of a suitable size; these are put into an iron mill which turns by water: there are several partitions with rasps within, cut float-wise, not with teeth, which turn constantly round with great swiftness; the friction against the rasps makes them round, and as they are formed, they fall out of different holes, into which size or chance throws them. They are brought from Nuremberg to Rotterdam, down the Rhine, and from thence dispersed over Europe.

MARBLING, the method of preparing and colouring the marbled paper.

There are several kinds of marbled paper; but the principal difference of them lies in the forms in which the colours are laid on the ground: some being disposed in whirls or circumvolutions; some in jagged lengths; and others only in spots of a roundish or oval figure. The general manner of managing each kind is, nevertheless, the same; being the dipping the paper, in a solution of gum-tragacanth, or, as it is commonly called, *gum-dragon*; over which the colours, previously prepared with ox-gall and spirit of wine, are first spread.

The peculiar apparatus necessary for this purpose, is a trough for containing the gum-tragacanth and the colours; a comb for disposing them in the figure usually chosen; and a burnishing stone for polishing the paper. The trough may be of any kind of wood; and must be somewhat larger than the sheets of paper, for marbling which it is to be employed; but the sides of it need only rise about two inches above the bottom; for by making it thus shallow, the less quantity of the solution of the gum will serve to fill it. The comb may be also of wood, and five inches in length; but should have brass teeth, which may be about two inches long, and placed at about a quarter of an inch distance from each other. The burnishing stone may be of jasper or agate; but as those stones are very dear when of sufficient largeness, marble or glass may be used, provided their surface be polished to a greater degree of smoothness.

Marbles,
Marbling.

These

Marbling.

These implements being prepared, the solution of gum-tragacanth must be made, by putting a sufficient proportion of the gum, which should be white and clear from all foulness, into clean water, and letting it remain there a day or two, frequently breaking the lumps, and stirring it till the whole shall appear dissolved and equally mixed with the water. The consistence of the solution should be nearly that of strong gum-water used in miniature painting; and if it appear thicker, water must be added; or if thinner, more of the gum. When the solution is thus brought to a due state, it must be passed through a linen cloth; and being then put into the trough, it will be ready to receive the colours.

The colours employed for red are carmine, lake, rose-pink, and vermilion; but the two last are too hard and glaring, unless they be mixed with rose-pink or lake, to bring them to a softer cast; and with respect to the carmine and lake, they are too dear for common purposes. For yellow, Dutch pink and yellow ochre may be employed:—for blue, Prussian blue and verditer may be used:—for green, verdigris, a mixture of Dutch pink and Prussian blue or verditer, in different proportions:—for orange, the orange lake, or a mixture of vermilion, or red lead, with Dutch pink:—for purple, rose pink and Prussian blue.

These several colours should be ground with spirit of wine till they be of a proper fineness; and then, at the time of using them, a little fish-gall, or in default of it the gall of a beast, should be added, by grinding them over again with it. The proper proportion of the gall must be found by trying them: for there must be just so much as will suffer the spots of colour, when sprinkled on the solution of the gum-tragacanth, to join together, without intermixing or running into each other.

When every thing is thus prepared, the solution of the gum-tragacanth must be poured into the trough; and the colours, being in a separate pot, with a pencil appropriated to each, must be sprinkled on the surface of the solution, by shaking the pencil, charged with its proper colour, over it; and this must be done with the several kinds of colour desired, till the surface be wholly covered.

When the marbling is proposed to be in spots of a simple form, nothing more is necessary; but where the whirls or snail-shell figures are wanted, they must be made by means of a quill; which must be put among the spots to turn them about, till the effect be produced. The jagged lengths must be made by means of the comb above described, which must be passed through the colours from one end of the trough to the other; and will give them that appearance: but if they be desired to be pointed both ways, the comb must be again passed through the trough in a contrary direction; or if some of the whirls or snail-shell figures be required to be added, they may be yet made by the means before directed.

The paper should be previously prepared for receiving the colours, by dipping it over-night in water; and laying the sheets on each other with a weight over them. The whole being thus ready, the paper must be held by two corners, and laid in the most gentle and even manner on the solution covered with

the colours; and there softly pressed with the hand, that it may bear everywhere on the solution. After which it must be raised and taken off with the same care, and then hung to dry across a proper cord, suspended near at hand for that purpose; and in that state it must continue till it be perfectly dry. It then remains only to give the paper a proper polish: in order to which, it is first rubbed with a little soap; and then must be thoroughly smoothed by the glass polishers, such as are used for linen, and called the *calendar glasses*. After which it should be again rubbed by a burnisher of jasper or agate; or, in default of them, of glass ground to the highest polish; for on the perfect polish of the paper depends in a great measure its beauty and value.

Gold or silver powders may be used, where desired, along with the colour; and require only the same treatment as them, except that they must be first tempered with gum-water.

Marbling of books or paper is performed thus: Dissolve four ounces of gum arabic into two quarts of fair water; then provide several colours mixed with water in pots or shells; and, with pencils peculiar to each colour, sprinkle them by way of intermixture upon the gum-water, which must be put into a trough or some broad vessel; then with a stick curl them, or draw them out in streaks, to as much variety as may be done. Having done this, hold your book or books close together, and only dip the edges in, on the top of the water and colours, very lightly; which done, take them off, and the plain impression of the colours in mixture will be upon the leaves; doing as well the ends as the front of the book in the like manner.

Marbling a book on the covers is performed by forming clouds with aquafortis or spirit of vitriol mixed with ink, and afterwards glazing the covers. See BOOK BINDING.

MARC ANTONIO. See RAIMONDI.

MARCASITE, an old term in mineralogy, given indifferently to ores, pyrites, and to semimetals. But more lately confined to pyrites, and to such pyrites as are regularly formed. See PYRITES, MINERALOGY *Index*.

MARCELLIANISM, the doctrines and opinions of the Marcellians, a sect of ancient heretics, towards the close of the second century, so called from Marcellus of Ancyra, their leader, who was accused of reviving the errors of Sabellius. Some, however, are of opinion that Marcellus was orthodox, and that they were his enemies the Arians, who fathered their errors upon him. St Epiphanius observes, that there was a great deal of dispute with regard to the real tenets of Marcellus; but that, as to his followers, it is evident they did not own the three hypostases: for Marcellus considered the Son and Holy Ghost as two emanations from the divine nature, which, after performing their respective offices, were to return again into the substance of the Father; and this opinion is altogether incompatible with the belief of three distinct persons in the Godhead.

MARCELLINUS, AMMIANUS. See AMMIANUS.

MARCELLUS, MARCUS CLAUDIUS, a famous Roman general, who, after the first Punic war, had the management of an expedition against the Gauls. Here

Marbling
||
Marcellus.

Marcellus he obtained the *spolia opima*, by killing with his own hand Viridomarus the king of the enemy. Such success rendered him popular, and soon after he was intrusted to oppose Hannibal in Italy. He was the first Roman who obtained some advantage over this celebrated Carthaginian, and showed his countrymen that Hannibal was not invincible. The troubles which were raised in Sicily by the Carthaginians at the death of Hieronymus, alarmed the Romans; and Marcellus, in his third consulship, was sent with a powerful force against Syracuse. He attacked it by sea and land; but his operations proved long ineffectual, and the invention and industry of Archimedes were able to baffle all the efforts, and to destroy all the great and stupendous machines and military engines of the Romans, during three successive years. The perseverance of Marcellus at last obtained the victory. After this conquest, Marcellus was called upon by his country a second time to oppose Hannibal. In this campaign he behaved with greater vigour than before; the greatest part of the towns of the Samnites, which had revolted, were recovered by force of arms, and 3000 of the soldiers of Hannibal made prisoners. Some time after, in an engagement with the Carthaginian general, Marcellus had the disadvantage: but on the morrow a more successful skirmish vindicated his military character and the honour of the Roman soldiers. Marcellus, however, was not sufficiently vigilant against the snares of his adversary. He imprudently separated himself from his camp, and was killed in an ambuscade in the 60th year of his age, in his 5th consulship, A. U. C. 544. His body was honoured by the conqueror with a magnificent funeral, and his ashes were conveyed in a silver urn to his son. Marcellus claims our commendation for his private as well as public virtues; and the humanity of a general will ever be remembered, who, at the surrender of Syracuse, wept on the thought that many were going to be exposed to the avarice and rapaciousness of an incensed soldiery, which the policy of Rome and the laws of war rendered inevitable.

MARCGRAVE, or MARGRAVE, a kind of dignity in Germany, answering to our marquis; (see MARQUIS). The word is derived from the German *Marche*, or *Marcke*, which signifies "a frontier;" and *Graffe*, "count, governor;" *Maregraves* being originally governors of cities lying on the frontiers of a country or state.

MARCH, (*Martius*), the third month of the year, according to the common way of computing. See MONTH and YEAR.

Among the Romans, March was the first month; and in some ecclesiastical computations, that order is still preserved; as particularly reckoning the number of years from the incarnation of our Saviour; that is, from the 25th of March.

It was Romulus who divided the year into months; to the first of which he gave the name of his supposed father *Mars*. Ovid, however, observes, that the people of Italy had the month of March before Romulus's time; but that they placed it very differently, some making it the third, some the fourth, some the fifth, and others the tenth month of the year.

In this month it was that the Romans sacrificed to *Anna Perenna*; that they began their comitia; that

they adjudged the public farms and leases; that the mistresses served the slaves and servants at table, as the masters did in the Saturnalia; and that the vestals renewed the sacred fire. March.

The month of March was always under the protection of Minerva, and always consisted of 31 days.—The ancients held it an unhappy month for marriage, as well as the month of May.

MARCH, in the military art, is the moving of a body of men from one place to another. Nothing is laid down particularly concerning the marches of the Jewish armies; only this much we may collect, that they made use of trumpets, to the different sounds of which they prepared themselves by packing up their baggage, putting themselves in readiness, and attending at the standards, to wait the signal for marching. We are told that the army of the Israelites marched in general no more than one league in a day and a half; but this appears to hold good only of their progress through difficult roads: For Follard says they might, in an open country, march four leagues in a day or more. The Rabbins suppose that the Israelites marched in the same order: they were placed in their camp. The Greeks, let the posture of their affairs be what it would, never marched against their enemies till favourable omens encouraged the enterprise. An eclipse of the moon, or any untoward accident, or the intervening of what they esteemed an unlucky day, entirely prevented their march. But of all the Greeks the Lacedæmonians were the most nice and scrupulous. The heavenly bodies directed all their motions; and it was an invariable maxim with them never to march before the full moon. The Greeks are particularly remarked by Homer for marching in good order and profound silence; whereas the Barbarian forces were all noise, clamour, and confusion. It is needless to say any thing concerning the marches of the Roman armies, more than that they were performed with the greatest order and despatch, insomuch that their unexpected presence frequently damped the spirits of their enemies. The Roman soldiers were inured to the military pace, that is, to walk 20 miles in five hours, though at the same time they carried burdens of 60 pounds weight.

Of all the mechanical parts of war, in modern times, none is more essential than that of marching. It may be justly called the *key* which leads to all sublime motions and manœuvres of an army; for they depend entirely on this point. A man can be attacked in four different ways; in the front, on both flanks, and in the rear: but he can defend himself, and annoy the enemy, only when placed with his face towards him. Hence it follows, that the general object of marching is reduced to three points only; to march forwards, and on both sides, because it is impossible to do it for any time backwards, and by that means face the enemy wherever he presents himself.—The different steps to be made use of are three: slow, fast, and oblique. The first is proper in advancing, when at a considerable distance from the enemy, and when the ground is unequal, that the line may not be broke, and a regular fire kept up without intermission. The second is chiefly necessary when you want to anticipate the enemy in occupying some post, in passing a defile, and, above all, in attacking an intrenchment,

March.
Marchand. to avoid being a long while exposed to the fire of the artillery and small arms, &c. The third step is of infinite consequence, both in the infantry and cavalry; columns may be opened and formed into lines, and *vice versa*, lines into columns, by this kind of step, in a lesser space, and consequently in less time, than by any other method whatsoever. In coming out of a defile, you may instantly form the line without presenting the flank to the enemy. The line may be formed, though ever so near to the enemy, with safety; because you face him, and can with ease and safety protect and cover the motion of the troops, while they are coming out of the defiles, and forming. The same thing may be equally executed, when a column is to be formed in order to advance or retreat; which is a point of infinite consequence, and should be established as an axiom.

The order of march of the troops must be so disposed, that each should arrive at their rendezvous, if possible, on the same day. The quarter-master-general or his deputy, with an able engineer, should sufficiently reconnoitre the country, to obtain a perfect knowledge of it and the enemy, before he forms his routes.

Before a march, the army generally receives several days bread. The quarter-masters, camp-colour-men, and pioneers, parade according to orders, and march immediately after, commanded by the quarter-master-general or his deputy. They are to clear the roads, level the ways, make preparation for the march of the army, &c. The *general*, for instance, beats at two, the *assembly* at three, and the army to march in 20 minutes after. Upon beating the *general*, the village, and general officer's guards, quarter and rear guards, join their respective corps; and the army pack up their baggage. Upon beating the *assembly*, the tents are to be struck, and sent with the baggage to the place appointed, &c.

The companies draw up in their several streets, and the rolls are called. At the time appointed, the drummers are to beat a march, and fifers play at the head of the line, upon which the companies march out from their several streets, form battalions, as they advance to the head of the line, and then halt.

The several battalions will be formed into columns by the adjutant-general, and the order of march, &c. be given to the general officers who lead the columns.

The cavalry generally march by regiments or squadrons. The heavy artillery always keeps the great roads in the centre of the columns, escorted by a strong party of infantry and cavalry. The field pieces march with the columns.

Each soldier generally marches with 36 rounds of powder and ball, and two good flints; one of which is to be fixed in the cock of his firelock. The routes must be formed so that no columns cross one another on the march.

MARCHAND, PROFESSOR, was from his youth brought up at Paris in the profession of a bookseller, and in the knowledge of books. He kept a regular correspondence with several learned men, among whom was Bernard the continuator of the *Nouvelles de la Republique des Lettres*, and furnished this writer with the literary anecdotes of France. Marchand, having embraced the Protestant religion, went to join Bernard

in Holland, where he might be at liberty to profess his religious opinions. He continued the trade of bookseller for some time; but afterwards quitted it, that he might dedicate himself wholly to the pursuits of literature. The history of France, together with a knowledge of books and authors, was always his favourite study. In the latter he was so eminently distinguished, that he was consulted from all parts of Europe. He was also one of the principal authors of the *Journal Litteraire*, one of the best periodical works which have appeared in Hollaud; and he furnished excellent extracts for the other journals. This valuable and learned man died at an advanced age, the 14th of June 1756; and left the little fortune which he had to a society instituted at the Hague, for the education and instruction of a certain number of poor people. His library, which was excellently chosen for literary history, together with his manuscripts, was left by his will to the university of Leyden. From him we have, 1. The History of Printing, a new edition of which has been promised by one of his friends. This work, which is full of notes and critical discussions, appeared in 1740 at the Hague, in 4to. There is such a prodigious display of erudition, and remarks and quotations are heaped together in such confusion, that when you get to the end of the chaos, you know not what conclusion to form concerning the points which have been discussed. Abbé Mercier, abbot of Saint Leger de Soissons, gave in 1775, 4to, a supplement to this history, which is equally curious and accurate. 2. An Historical Dictionary, or Memoirs Critical and Literary, printed at the Hague in 1758, in two small volumes, folio. In this work we meet with historical singularities, literary anecdotes, and a discussion of points of bibliography; but too great minuteness prevails in it, the style is deficient in point of purity, and the author is too much carried away by the heat and eagerness of his character. More erudition could not well be collected; especially upon subjects which, at least to the generality of readers, are so uninteresting. 3. A new edition of Bayle's Dictionary, and Letters of the *Cymbalum mundi*, &c.

MARCHANTIA, a genus of the natural order of algæ, belonging to the cryptogamia class of plants. See *BOTANY Index*.

MARCHE, before the revolution, a province of France, bounded on the north by Berry, on the east by Auvergne, on the west by Angoumois, and on the south by Limosin; about 55 miles in length, and 25 in breadth, and fertile in corn and wine.

MARCHENA, a handsome, ancient, and considerable town of Spain, in Andalusia, with the title of a duchy, and a suburb as large as the town, seated in the middle of a plain, particularly fertile in olives, though very destitute of water. W. Long. 5. 20. N. Lat. 37. 20.

MARCHERS, or **LORDS-MARCHERS**, were those noblemen that lived on the marches of Wales or Scotland; who, in times past, according to Camden, had their laws, and *potestatem vitæ*, &c. like petty kings, which are abolished by the stat. 27 Hen. VIII. c. 26. and 1 Edw. VI. c. 10. In old records the lords marchers of Wales were styled *Marchianes de Marchia Wallia*. See 1 et 2 P. et M. c. 15.

MARCHES (*marchia*), from the German *march*,
i. c.

Marches
||
Marcianus

i. e. *limes*, or from the French *marque*, viz. *signum* (being the notorious distinction between two countries or territories), are the limits between England and Wales, or between England and Scotland, which last are divided into west and middle marches, 4 Hen. V. c. 7. 22 Ed. IV. c. 8. 24 Hen. VIII. c. 9. And there was formerly a court called the *court of the marches of Wales*, where pleas of debt or damages, not above the value of 50 pounds, were tried and determined; and if the council of the marches held plea for debts above that sum, &c. a prohibition might be awarded. Hill. 14 Car. I. Cro. Car. 38.

MARCHET, or MARCHETTA, a pecuniary fine anciently paid by the tenant to his lord, for the marriage of one of the tenant's daughters. This custom obtained, with some difference, throughout all England and Wales, as also in Scotland; and it still continues to obtain in some places. According to the custom of the manor of Dinover in Caermarthenshire, every tenant at the marriage of his daughter pays ten shillings to the lord; which, in the British language, is called *gwabr-merched*, i. e. *maid's fee*.

In Scotland, and the north parts of England, the custom was, for the lord to lie the first night with the bride of his tenant; but this usage was abrogated by King Malcolm III. at the instance of his queen; and, instead thereof, a mark was paid by the bridegroom to the lord: whence it was called *merchetta mulieris*. See *Borough English*.

MARCIANA SILVA, in *Ancient Geography*, a forest situated between the Rauraci and the Danube, before it comes to be navigable; a part of the Hercynia. Now Schwartzwald, or *Black Forest*, in the south-west of Suabia, near the rise of the Danube and Neckar.

MARCIANUS, a native of Thrace, born of an obscure family. After he had for some time served in the army as a common soldier, he was made private secretary to one of the officers of Theodosius. His winning address and uncommon talents raised him to high stations; and on the death of Theodosius II. A. D. 450, he was invested with the imperial purple in the east. The subjects of the Roman empire had reason to be satisfied with their choice. Marcianus showed himself active and resolute; and when Attila, the barbarous king of the Huns, asked of the emperor the annual tribute, which the indolence and cowardice of his predecessors had regularly paid, the successor of Theodosius firmly said, that he kept his gold for his friends, but that iron was the metal which he had prepared for his enemies. In the midst of universal popularity, Marcianus died, after a reign of six years, in the 69th year of his age, as he was making warlike preparations against the barbarians that had invaded Africa. His death was long lamented; and indeed his merit was great, since his reign has been distinguished by the appellation of the Golden Age. Marcianus married Pulcheria the sister of his predecessor. It is said, that in the years of his obscurity he found a man who had been murdered, and that he had the humanity to give him a private burial; for which circumstance he was accused of the homicide, and imprisoned. He was condemned to lose his life; and the sentence would have been executed, had not the real murderer been discovered, and convinced the world of the

innocence of Marcianus.—Another emperor of the east, A. D. 479, &c.

MARCIONITES, or MARCIONISTS, *Marcionista*, a very ancient and popular sect of heretics, who, in the time of St Epiphanius, were spread over Italy, Egypt, Palestine, Syria, Arabia, Persia, and other countries: they were thus denominated from their author Marcion. Marcion was of Pontus, the son of a bishop, and at first made profession of the monastical life; but he was excommunicated by his own father, who would never admit him again into the communion of the church, not even on his repentance. On this he abandoned his own country, and retired to Rome, where he began to broach his doctrines.

He laid down two principles, the one good, the other evil: between these he imagined an intermediate kind of deity of a mixed nature, who was the creator of this inferior world, and the god and legislator of the Jewish nation: the other nations, who worshipped a variety of gods, were supposed to be under the empire of the evil principle. These two conflicting powers exercise oppressions upon rational and immortal souls; and therefore the supreme God, to deliver them from bondage, sent to the Jews a being more like unto himself, even his son Jesus Christ, clothed with a certain shadowy resemblance of a body; this celestial messenger was attacked by the prince of darkness, and by the god of the Jews, but without effect. Those who follow the directions of this celestial conductor, mortify the body by fastings and austerities, and renounce the precepts of the god of the Jews and of the prince of darkness, shall after death ascend to the mansions of felicity and perfection. The rule of manners which Marcion prescribed to his followers was excessively austere, containing an express prohibition of wedlock, wine, flesh, and all the external comforts of life.

Marcion denied the real birth, incarnation, and passion of Jesus Christ, and held them to be all apparent only. He denied the resurrection of the body; and allowed none to be baptized but those who preserved their continence; but these, he granted, might be baptized three times. In many things he followed the sentiments of the heretic Cerdon, and rejected the law and the prophets. He pretended the gospel had been corrupted by false prophets, and allowed none of the evangelists but St Luke, whom also he altered in many places, as well as the epistles of St Paul, a great many things in which he threw out. In his own copy of St Luke he threw out the two first chapters entire.

MARCITES, MARCITÆ, a sect of heretics in the second century, who also called themselves the *perfecti*, and made profession of doing every thing with a great deal of liberty and without any fear. This doctrine they borrowed from Simon Magus, who however was not their chief; for they were called *Marcites* from one Marcus, who conferred the priesthood, and the administration of the sacraments, on women.

MARCO POLO, PAOLO, or *Paulo*. See PAULO.

MARCOMANNI, an ancient people of Germany, who seem to have taken their name from their situation on the limits or marches, to the east of the Higher Rhine, and the north of the Danube. Cluverius allots to them the duchy of Wurtemberg, a part of the

Marcianus
||

manni
||
Mareta.

the palatinate between the Rhine and the Necker, the Brisgau, and a part of Suabia, lying between the springs of the Danube and the river Bregentz: they afterwards removed to the country of the Boii, whom they expelled and forced to withdraw more to the east, occupying what is now called *Bohemia*. (Strabo, Velleius).

MARCOSIANS, or COLOBARSIANS, an ancient sect in the church, making a branch of the VALENTINIANS.

St Irenaeus speaks at large of the leaders of this sect, Marcus, who it seems was reputed a great magician. The Marcosians had many apocryphal books which they held for canonical, and out of which they picked several idle fables touching the infancy of Jesus Christ. Many of these fables are still in use and credit among the Greek monks.

MARCULUS, among the Romans, a knocker or instrument of iron to knock at doors with.

MARCUS AURELIUS ANTONINUS. See ANTONINUS.

MARDIKERS, or TOPASSES, a mixed breed of Dutch, Portuguese, Indians, and other nations, incorporated with the Dutch at Batavia, in the East Indies.

MARE, the female of the horse kind. See EQUUS, MAMMALIA *Index*, and HORSE.

MARENCO, a village of Italy which has risen to distinction in consequence of a bloody battle between the Austrians and French, which was fought on the 14th June 1800, in which the French say, 15,000 of the former were killed, wounded, and made prisoners.—Marenco lies 3 miles S. E. of Alessandria, in the kingdom of Sardinia.

MAREOTIS, a lake in Egypt near Alexandria. Its neighbourhood was famous for wine; though according to some the *Marcoticum vinum* is the produce of Epirus, or of a certain part of Libya, called also *Marcotis*, near Egypt.

MARETS, JEAN DE, a Parisian, one of the finest geniuses of the 17th century, became at last a visionary and a fanatic. He was a great favourite of Cardinal Richelieu, who was greatly delighted with his facetious conversation. He was a member of the French academy from its first erection. He wrote several dramatic pieces, which were well received. He attempted an epic poem; but after spending several years about it, dropped the design to write books of devotion. He likewise wrote romances, which are not very rigid for their morality. He was a declared enemy of the Jansenists. His visions are well described by the Messieurs de Port Royal. He promised the king of France, by the explication of prophecies, the honour of overthrowing the Mahometan empire, and every species of what he was pleased to denominate heresy, bringing the whole world to the profession of the true faith. This he said Louis XIV. was to accomplish at the head of 144,000 elect. Extravagant and absurd as these declarations were, he was, notwithstanding, admired and patronised by some of the bishops; and though a layman, he was permitted to vent his reveries in religious houses, and assume the direction of devotees of both sexes. He maintained his credit with the great to the very last, and died in 1676, at the age of 81. In his last years he wrote something against Boileau's Satires.

MARETS, *Samuel de*, one of the most celebrated divines of the reformed church, was born in Picardy, VOL. XII. Part II. †

in 1599. In 1620, he was settled in the church of Laon; but, in 1624, accepted a call to that of Sedan, to succeed James Cappel in the office of pastor and professor of divinity. Having soon after obtained leave of absence from his flock, he visited Holland, where he was admitted to the degree of doctor of divinity at Leyden, in 1625. From Holland he took a voyage to England, and after a short stay in that country he returned to Sedan, where he commenced his labours in the divinity chair. These he continued for about seven years with reputation to himself, but not without being sometimes involved in troubles, which he bore with a commendable resolution.

In 1631 he was made chaplain to the army of the duke de Bouillon in Holland; but that nobleman having married a Roman Catholic lady, M. de Murets, advised him to adhere steadily to the Protestant faith, on which account he incurred the displeasure of the duchess. Thus circumstanced, he received in 1636, an invitation to become pastor to the church of Boisleduc, with which he complied, and in the following year he was appointed professor of the *schola illustris* of the same city. The duties of this office he discharged with such diligence and success, that in 1640, the curators of the university of Franeker sent him the offer of a professorship, which he declined; but two years after he accepted a similar offer from the university of Groningen, to which his services were devoted for upwards of thirty years. In 1652 he was made sole minister of the Walloon church at Groningen, where till that time he had gratuitously preached once every Sunday to assist the pastor. Influenced by the fame of his extraordinary merits, the magistrates of Berne in 1661 offered him the chair of professor of divinity at Lausanne, with considerable emoluments, but he declined this offer; and his death happened before he took possession of a similar charge at Leyden, of which he had accepted. His System of Divinity was found to be so methodical, that it was made use of at other academies; and at the end of it may be found a chronological table of all his works. Their number is prodigious; and their variety shows the extent of his genius. He was moreover engaged in many disputes and controversies, and died in 1673.

MARGARET, ST, a celebrated virgin, who, as is supposed, received the crown of martyrdom at Antioch in the year 275: the manner of her death is not known. The ancient martyrologists make no mention of her name, and she did not become famous till the 11th century. There is no more foundation for what is said concerning her relics and girdles than for the stories which are told of her life. A festival, however, is still held in honour of her memory on the 20th of July: See *Baillet's Lives of the Saints*, for that day. "Her actions (says this authority) have been so falsified and altered, in the opinion even of Metaphrastus, that the Romish church have not thought proper to insert any of them into their breviary." The Orientals pay reverence to her by the name of *Saint Pelagia* or *Saint Marina*, and the western church by that of *Saint Geruma* or *Saint Margaret*.

MARGARET, the daughter and heiress of Florent count of Holland, who is famous on account of a story repeated by a hundred compilers even of the 18th century. Having refused charity to a woman whom she at the same time accused of adultery, she was, as

Mareta,
Margaret.

Margaret, a punishment from God, brought to bed (A. D. 1276), of 365 children, partly boys and partly girls. The boys, it is added, were all named *John*, and the girls *Elizabeth*. This story is represented in a large painting in a village not far from the Hague; and by the side of the painting are seen two large basons of brass, on which it is pretended the 365 children were presented to be baptized. But if a picture is a sufficient authority for the truth of any thing, it is impossible to tell how many fables would be fully attested. It has been remarked, that the most ancient annals are altogether silent concerning this fact; and that it is related only by modern writers, who besides do not agree with one another concerning either the date of time, or the life of the countess, or the number of the children; and, in short, that Nassau, who was at that time bishop of Utrecht, was called *John*, and not *Gui*, as the chronicles declare. Several learned men have endeavoured to trace the cause which could have given rise to a relation so extraordinary. M. Struik fixed upon the epitaphs of the mother and son, which appeared to him worthy of some attention; and, in conformity to the dates which they bear, he supposed that the countess was brought to bed on Good Friday 1276, which was the 26th of March. Now, as the year then began on the 25th of the same month, there were only two days of the year elapsed when the countess was brought to bed, which circumstance caused it to be said *that she had brought into the world as many children as there were days in the year*. In fact only two children are mentioned in history, John and Elizabeth. The fable thus explained is only a common event, wherein there is nothing of the marvellous, but in consequence of a double meaning in the expression. Later writers, who have not examined this circumstance, have ascribed 365 children to the countess. *Journal des Savans*, February, 1758, on the General History of the United Provinces.

MARGARET, *Countess of Richmond and Derby*, the learned and pious mother of Henry VII. was born at Betsheo in Bedfordshire, in 1441; and was the sole heiress of John Beaufort duke of Somerset, grandson to John of Gaunt. Her mother was the heiress of Lord Beauchamp of Powick. Whilst yet very young, the great duke of Suffolk, minister to Henry VI. or rather to Queen Margaret, sought her in marriage to his son; and she was at the same time solicited by the king for his half brother Edmund earl of Richmond. To the latter she gave her hand. Henry VII. was the sole fruit of this marriage, his father dying when he was but 15 weeks old. Her second husband was Sir Henry Stafford, knight, second son to the duke of Buckingham; by whom she had no issue. Soon after his death, which happened in the year 1482, she sought consolation in a third husband, Thomas Lord Stanley, who, in the first year of her son's reign, was created earl of Derby. He died in the year 1504, without issue, being then high constable of England. She survived her lord not quite five years, dying at Westminster in June 1509, in the 69th year of her age. She was buried in Henry VII.'s chapel; on the south side of which was erected to her memory an altar-tomb of black marble, with her statue of brass.

From her funeral sermon preached by her confessor Bishop Fisher, who, says Ballard, knew the very secrets of her soul, we learn, "that she possessed almost all things that were commendable in a woman, either in mind or body." She understood the French language perfectly, and had some knowledge of the Latin. She was devout even to austerity, in humility romantic, profuse in the encouragement of learning, and singularly chaste; but this last virtue became conspicuous only towards the latter end of a third marriage. "In her last husband's days (says Baker), she obtained a licence of him to live chaste, whereupon she took upon her the vow of celibacy." "A boon (says Mr Walpole), as seldom requested, I believe of a third husband, as it probably would be easily granted." Her life, from the turbulence of the times, and vicissitudes of her son's fortune, must necessarily have been subject to infinite disquiet, which however she is said to have supported with singular fortitude. She wrote, 1. *The Mirroure of Golde for the sinful soul*, translated from a French translation of a book called *Speculum aureum peccatorum*. Emprynted at London, in Flete-strete, at the signe of St George, by Richard Pynson, quarto, with cuts on vellum. 2. Translation of the fourth book of Dr Gersen's Treatise of the Imitation and following the blessed Life of our most merciful Saviour Christ. Printed at the end of Dr William Atkinson's English translation of the three first books, 1504. 3. A letter to the king: in Howard's collection. 4. By her son's order and authority, she also made the orders for great estates of ladies and noble women, for their precedence, and wearing of barbes at funerals, over the chin and under the same.

MARGARET, the daughter of Woldemar III. king of Denmark, styled the *Semiramis of the North*; she succeeded her father in the throne of Denmark, her husband in that of Norway; and the crown of Sweden was given her as a recompense for delivering the Swedes from the tyranny of Albert their king. Thus possessed of the three kingdoms, she formed the grand political design of a perpetual union, which she accomplished, *pro tempore* only, by the famous treaty styled the *union of Calmar*. She died in 1412, aged 59.

MARGARET of Anjou, daughter of René d'Anjou, king of Naples, and wife of Henry VI. king of England: an ambitious, enterprising, courageous woman. Intrepid in the field, she signalized herself by heading her troops in several battles against the house of York; and if she had not been the authoress of her husband's misfortunes, by putting to death the duke of Gloucester his uncle, her name would have been immortalized for the fortitude, activity, and policy, with which she supported the rights of her husband and son, till the fatal defeat at Tewksbury; which put an end to all her enterprises, the king being taken prisoner, and Prince Edward their only son basely murdered by Richard duke of York. Margaret was ransomed by her father, and died in Anjou in 1482. See ENGLAND, N° 201.—226.

MARGARET, *Duchess of Newcastle*. See CAVENDISH.

MARGARITA, or PEARL-ISLAND, an island of South America, the middle of which is situated in W. Long.

Margarita
||
Marhattas

Long. 64. 2. N. Lat. 11. 30. It was discovered by Columbus, and is about 35 leagues in compass. The soil is very fertile in maize and fruits, and abounds in pasture and verdant groves; yet is totally destitute of fresh water, which the inhabitants are obliged to bring from the continent. When the Spaniards first landed here, they found the natives busy in fishing for oysters. Columbus ordered some of the savages aboard his ship, who were so far from being terrified, that they very soon became familiar with the Spaniards. The latter at first imagined that the oysters served them for food; but on opening the shells, they found they contained valuable pearls. Upon this discovery they immediately landed, and found the natives ready to part with their pearls for the merest trifles. In process of time the Spaniards built a castle, called *Monpadre*, and employed prodigious numbers of Guinea and Angola negroes in the pearl fishery; cruelly forcing them to tear up the oysters from the rocks to which they stuck, during which time many of them were destroyed by the sharks and other voracious fishes. The present population is about 14,000; of whom 5500 are whites, 2000 Indians, and 6500 slaves and free persons of colour. It has for some time been in the hands of the party who are endeavouring to overturn the Spanish authority in Caraccas.

MARGARITA, the *Pearl*, in *Natural History*. See PEARL and MYA.

MARGARITINI, are glass ornaments, made at Venice, of small glass tubes of different colours, which are blown at Murano, and which the women of the lower class wear about their arms and necks. The largest sort are used for making rosaries. This work is performed with great dispatch, the artisan taking a whole handful of these tubes at once, and breaking them off one after another with an iron tool. These short cylinders are mixed with a kind of ashes, and put over the fire in an iron pan; and when the two ends begin to melt, by stirring them about with an iron wire, they are brought to a round figure; but care is taken not to leave them too long over the fire, lest the hole through which they are to be strung should be entirely closed by the melting of the glass. There are several streets at Francesco de Vigna entirely inhabited by people whose sole occupation is to make and string these margaritini.

MARGATE, a sea-port town of Kent, on the north side of the isle of Thanet, near the North Foreland. It is noted for shipping vast quantities of corn (most, if not all, the product of that island) for London; and has a salt-water bath at the post-house, which has performed great cures in nervous and paralytic cases, and numbness of the limbs. It lies in St John's parish, which is a member of the port of Dover, at the distance of 14 miles, 12 from Canterbury, and 72 from London. It has become one of the principal watering places for the idle, the opulent, and the invalid, where they meet with every requisite accommodation; and the adjacent country abounds with most extensive prospects and pleasant rides. The population in 1811 was 6126. E. Long. 1. 30. N. Lat. 51. 24.

MARHATTAS, MERHATTAHS, MARATTAS, or MAHRATTAS; a people of India, and by far the most considerable of all the Hindoo powers. The Marhat-

tas boast a very high antiquity; they profess the religion of Brama; speak a dialect of the Sanscrit language, in which they have introduced all the technical terms of Mogul administration; use a character of their own in writing, though not very different from some of the other tribes around them; and are divided into four casts or classes of people, with the various subdivisions of professional distinction found over the rest of Hindostan; but with this remarkable difference, that among the Marhattas every individual may, as in fact he occasionally does, follow the life of a soldier.

As a nation inhabiting immemorably the country properly denominated *Marhat* or *Merhat*, and comprehending the greater part of the Paishwa's present dominions in the Decan, they were completely subjugated, and afterwards for many centuries depressed, first by the Patans, then by the Mogul conquerors of Delhi. At length, towards the end of Alemgeer's reign, they united, rebelled, and under the famous *Sewajee* or *Seeva-jee*, a leader of their own tribe, laid the foundations of their present vast empire, which has risen gradually on the ruins of the Mohamedan power, as related under the article HINDOSTAN.

Seeva-jee was succeeded by his son Rajah Sahou, who considerably extended the Marhatta dominions. When Rajah Sahou grew old and infirm, and the fatigues of government began to press heavy upon him, he appointed Bissonat Balajee, a Brahman born at Gokum, and leader of about 25,000 horse, to the office of Paishwa or vicegerent.

Rajah Sahou died without issue, but left nephews by his brother. The courage and wisdom of Balajee had gained him, during the latter years of the old rajah, the affection and esteem of all the nation. But, under an appearance of modesty and self-denial, his prevailing passion was ambition; and the sentiments of gratitude and loyalty were absorbed in the desire to command. He made use of the influence he had acquired under his benefactor so firmly to establish his own power, that he not only retained the high office of Paishwa during his life, but transmitted it to his posterity. The Marhattas, gradually forgetting a prince they knew nothing of, became accustomed to obey his vicegerent only: yet a certain respect for the royal race, or the dread of the consequences of violating the strong prejudice which the nation still retains in favour of the family of its founder, have scrupled perhaps to preserve it; and the descendants of Rajah Sahou's nephews yet exist, but are kept in captivity in the palace at Sattarah. The eldest is styled Ram Rajah, or sovereign; his name is on the seal and coin of the Marhatta state; but his person is unknown, except to those who immediately surround him. He resides in his splendid prison, encompassed with the appendages of eastern grandeur, but debarred of all power, and kept totally ignorant of business. The seat of government was transferred from the ancient royal residence of Sattarah to Poonah; and the usurper, as well as his successors, seem still to have acted under the supposed authority of the deposed prince, by their assuming no other title or character than that of Paishwa or prime minister. From this change, the empire of the Ram Rajah has been distinguished only

Marhattas. by the appellation of the *Paishwaship*, or otherwise the *Government of Poonah*, from the name of its present capital.

Bissonat Balajee was succeeded as Paishwa by his eldest son Balajee Row (called also *Nana Saheb*, or *Nanah Row*), who left three sons, the eldest of whom, Balajee Pundit, sometimes called Nanah Pundit, succeeded him. The two others were Rogobah or Ragonat Row, and Shamsheer Row.

Balajee Pundit left two sons; Mahadava Row, who was Paishwa twelve years; and Narrain Row, who succeeded him.

During the latter part of the life of Mahadava Row, his uncle Rogobah was confined to the palace at Poonah, for reasons with which we are not acquainted. Mahadava Row died without issue; and upon the accession of Narrain his brother, a youth of about 19 years of age, Rogobah in vain applied to be released from his confinement. He is therefore suspected of having entered into a conspiracy with two officers in his nephew's service, Somair Jing and Yusuph Gardie, in order to procure that by force which he could not obtain by entreaty. The correspondence between the conspirators was carried on with so much secrecy, that the court had not the least intimation or suspicion of their design, till every avenue leading to the palace had been secured, and the whole building surrounded by the troops under the command of those two officers. It is said, that on the first alarm, Narrain Row, suspecting his uncle, ran to his apartment, threw himself at his feet, and implored his protection: "You are my uncle (said he), spare the blood of your own family, and take possession of a government which I am willing to resign to you."

Somair and Yusuph entered the room whilst the young Paishwa was in this suppliant posture. Rogobah, with apparent surprise and anger, ordered them to withdraw; but as they either knew him not to be sincere, or thought they had proceeded too far to retreat, they stabbed Narrain with their poniards whilst he clung to his uncle's knees.

The office of Paishwa being now vacant, the chiefs of the nation then at Poonah were assembled, and Rogobah being the only survivor of the family of Bissonat Balajee, to whose memory the Marhattas in those parts are enthusiastically attached, he was named to fill it. Being naturally of a warlike temper, he resolved to undertake some foreign expedition; for besides gratifying his passion for the field, he probably hoped, by the splendour of his exploits, to draw off the attention of the public from inquiring into the late catastrophe.

A pretence for war was not difficult to be found. He renewed the claim of his nation to the *chout*, and marched his army towards Hyderabad, the capital of the Nizam. The vigour of his measures procured him an accommodation of his demand; and he was proceeding to enforce a similar one upon the Carnatic, when he received intelligence which obliged him to return hastily to Poonah.

Although the Marhatta chiefs had acknowledged Rogobah as Paishwa, yet they and the people in general were much dissatisfied with his conduct. The murderers of Narrain Row had not only escaped pu-

nishment, but, as was reported, had been rewarded. The crime was unexampled, and the perpetrators were beheld with uncommon horror and detestation. The Paishwa had hitherto so fully possessed the love of the people, that, till then, guards were considered as unnecessary about the person of a man whose character rendered him inviolable. Every one therefore had free access to his palace, and he relied with confidence for his safety upon the affections of those who approached him.

These reflections operated powerfully upon the minds of the Marhattas; but perhaps no violent consequences would have ensued, had it not been discovered, soon after the departure of Rogobah from Poonah, that the widow of Narrain Row, Ganga Bacc, was pregnant. This determined their wavering resolutions. Frequent consultations were held among the principal men then in the capital; and it was finally resolved to abjure the allegiance they had sworn to Rogobah, and declare the child, yet unborn, to be the legal successor of the late paishwa.

A council of regency was immediately appointed to govern the country until the child should become of age; and it was agreed to reserve their deliberations, in case it should prove a female or die, till the event should render them necessary. They who principally conducted these measures, and whose names will on that account be remembered, were Sackharam Babou and Balajee Pundit, called also Nanah Pher Nevees from his having been long the principal secretary of the Marhatta state. Nine other Marhatta leaders approved of these measures, and swore to maintain them.

As the first step towards the execution of their plan, the widow of Narrain Row was conveyed to Poorender, a fort of great strength, situated on a high mountain, about 25 miles from Poonah. As soon as Rogobah received intimation of this revolution, he marched back towards the capital. But discontent had already infected his troops; some of the chiefs retired to their estates, and others joined the standard of the regents. He however risked a battle with an army of the revolters commanded by Trimbec Row, in which the latter was slain; but though he obtained a victory, the strength of the confederates daily increased, while his own troops were diminished by continual desertions. He therefore found it necessary to retire to Ugein, and to solicit the assistance of the Marhatta chiefs Scindia and Holkar; but meeting with a refusal, he went to Surat, and applied for succour to the English.

Rogobah's success in this application was the cause of two wars with the Marhatta state; which, after much waste of blood and treasure, we were obliged to conclude by relinquishing his claim, and acknowledging as legal paishwa the son of Narrain Row, who was born about seven months after the death of his father. See INDIA and HINDOSTAN.

The Marhatta dominions, as already observed, are governed by a number of separate chiefs, all of whom acknowledge the Ram Rajah as their sovereign; and all except Moodajee Boonsalah, own the paishwa as his vicegerent. The country immediately subject to the paishwa, including all the hereditary territories that were left by the Rajah Sahou to the Ram Rajah, and

Marhattas. and those that have been acquired and added to them since in his name, extends along the coast nearly from Goa to Cambay; on the south it borders on the possessions of Tippoo Saib, eastward on those of the Nizam and of the Marhatta rajah of Berar, and towards the north on those of the Marhatta chiefs Scindia and Holkar.

Moodajee Boonsalah, rajah of Berar, possessed, besides Berar, the greatest part of Orixa. This prince being descended from the line of the Ram Rajah, eyes the power of the paishwa, by whom a branch of his family is kept in ignominious confinement, with ill will; has often refused to support his measures; and, on some occasions, has even seemed inclined to act against him.

Next to Moodajee, in point of importance, must be ranked Madajee Scindia, a bold and aspiring chief, who possesses the greatest part of the extensive soubadary or government of Malva, together with part of the province of Candeish. The remainder is under the dominion of Holkar. Both he and Scindia pretend to be descended from the ancient kings of Malva. Scindia resides chiefly at Ugein, near the city of Mundu, once the capital of these kings; and Holkar at Indoor, a town little more than 30 miles west of it. The dominions of these, and of some chiefs of less consequence, extend as far as the river Jumna.

The measures pursued by the Marhattas for some years left little room to doubt that they aspired at the sovereignty of all Hindostan, or at least at the expulsion of the Mohamedan princes: And in this last design they appear to have succeeded*, and to have gained a great accession of territory, through the arms of Scindia, both by the capture of the cities of Agra and Delhi, with their territorial dependences, and the consequent captivity of the unfortunate monarch who ruled there as the last imperial representative of the great Mogul race of Timur. "The whole of the dominion thus newly established is of vast extent, stretching near 1200 miles along the frontiers of Tippoo and the Nizam in a north-east direction, from Goa on the Malabar coast to Balasore in Orissa adjoining to Bengal; and from thence north-westerly 1000 miles more, touching the confines of the British and allied states, on the borders of the Ganges and Jumna, to the territory of the Seiks at Paniput, rendered famous in 1761 for the last memorable defeat sustained by the Marhattas in their ambitious contest for empire with the united declining power of the Mohamedans. From this place in a southerly course, with great encroachment on the old eastern boundary of the Rajepoot country of Ajmere, it runs about 260 miles to the little Hindoo principality of Kotta, and thence south-westerly 540 miles further to the extreme point of the soubah of Gujerat at Duarka, including the whole of that fertile province; from whence, along the sea-coasts of Cambay and Malabar to Goa, the distance may be reckoned 800 miles. Thus the overgrown empire of the Marhattas may be said to extend east 19 degrees of longitude, near the parallel of 22 degrees north latitude, from the mouths of the Indus to those of the Ganges; and about 13 degrees of latitude north, from the Kistnah to Paniput; comprehending at least an area of 400,000 square geographical miles, being considerably more than a third part

of Hindostan, including the Decan, and equal perhaps in dimensions to all the British and allied states in India, with those of Golconda and Mysore, taken together.

Such was the state of affairs in India so far as the Marhattas were concerned a few years ago. By consulting the history of India, the reader will observe, that the power and dominion of these enterprising chiefs have been since greatly abridged by the successful progress of the British arms. See INDIA.

MARIA, or SANCTA MARIA, an island of the Indian ocean, lying about five miles east from Madagascar. It is about 27 miles long and five broad; well watered, and surrounded by rocks. The air is extremely moist, for it rains almost every day. It is inhabited by 500 or 600 negroes, but seldom visited by ships.

MARIA, *St*, a considerable town of South America, in the audience of Panama, built by the Spaniards after they had discovered the gold mines near it, and soon after taken by the English. It is seated at the bottom of the gulf of St Michael, at the mouth of a river of the same name; which is navigable, and the largest that falls into the gulf. The Spaniards come here every year in the dry season, which continues three months, to gather the gold dust out of the sands of the neighbouring streams; and carry away great quantities. W. Long. 148. 30. N. Lat. 7. 0.

MARIA, *St*, a handsome and considerable town of Spain, in Andalusia, with a small castle. It was taken by the English and Dutch in 1702, for the archduke of Austria. It is seated on the Guadaleta, at the mouth of which is a tower and a close battery. W. Long. 5. 33. N. Lat. 36. 35.

MARIAN ISLANDS. See *LADRONE Islands*.

MARIANA, JOHN, a learned Spanish historian, born at Talavera in the diocese of Toledo. He entered among the Jesuits in 1554, at 17 years of age; and became one of the most learned men of his time. He was a great divine, a good humanist, and profoundly versed in ecclesiastical as well as profane history. He taught at Rome, in Sicily, at Paris, and in Spain; and died at Toledo in 1624. His principal works are, 1. An excellent history of Spain in 30 books: which he himself translated from the Latin into Spanish, without servilely following his own Latin edition. 2. *Scholæ*, or short notes on the Bible. 3. A treatise on the changes the specie has undergone in Spain; for which he was thrown into prison by the duke of Lerma, the Spanish minister. 4. A famous treatise *De rege et regis institutione*, which made much noise, and was condemned by the parliament of Paris to be burnt by the hands of the common hangman, for his asserting in that work, that it is lawful to murder tyrants. 5. A work on the faults of the government of the society of Jesuits, which has been translated into Spanish, Latin, Italian, French, &c.

MARIANUS SCOTUS, an Irish monk, was related to the venerable Bede, and wrote a chronicle which is esteemed. He died in the abbey of Fuld in 1086, aged 58.

MARIBONE, or ST MARY LE BONE, or rather *Borne*, from the neighbouring brook, a parish of Middlesex, on the north-west side of London. The manor appears to have belonged anciently to the bishop of London.

* An Historical and Political View of the Decan.

London. The houses in this parish are very numerous, comprising several extensive streets and squares, which are every year increasing. The Paddington road from Islington passes through this parish, which gives it communication with the eastern part of London without passing through the streets. Here were three conduits erected about the year 1238, for supplying the city of London with water; but anno 1703, when it was plentifully served by the New River, the citizens let them out at 700l. a-year for 43 years. There were two for receiving its water at the north-east corner of the bridge on the river Tyburn, and over them stood the lord's mayor's banqueting house, to which (the use of coaches being not then known) his lordship and the aldermen use to ride on horseback, as their ladies did in waggons. This banqueting house, after being many years neglected, was taken down in 1737, and the cisterns arched over.

MARIDUNUM, in *Ancient Geography*, a town of the Demetæ in Britain. Now *Caer Mardin*, or *Caermarthen*, the capital of Caermarthenshire.

MARIETTA, a town in the United States of America, situated in the state of Ohio, at the junction of the Ohio river with the Muskingum. The town and township contained 1463 inhabitants in 1810. Sea-rigged vessels are built here, though it is 2000 miles inland.

MARIGALANTE, an island of North America, and one of the least of the Caribbees, lies in N. Lat. 16. 32. and W. Long. 61. 5. from London, at the distance of four leagues from Guadaloupe, to the south. The soil, produce, and climate, are pretty much the same as the other Caribbees. Columbus discovered it in his second American voyage in 1483, and called it by the name of his ship Maria Galanta, or Gallant Mary. It is about six leagues long, and between three and four broad. Viewed at a distance from on board a ship, it appears like a floating island, because, as it is for the most part flat, the trees seem to swim; but a nearer prospect shows it to be intersected by some rising grounds, which give a fine variety to the landscape. The French settled here in 1648. It was taken by the British in 1759, but afterwards restored at the peace in 1763. It was taken again in 1808, and restored to France by the peace of Paris in 1814. —This island was thought, on its first discovery, to want water; but a charming running stream has in time been discovered, no less convenient than refreshing and wholesome, on the banks of which are some wealthy planters, and excellent plantations of sugar. A little village in a small bay is the capital of the island, and here the commandant resides. The whole island is very capable of improvement; the soil being almost equally good, and the land rising nowhere too high. The coast affords many little bays, and safe anchorage and shelter to ships.

MARINE, a general name for the navy of a kingdom or state; as also the whole economy of naval affairs; or whatever respects the building, rigging, arming, equipping, navigating, and fighting ships. It comprehends also the government of naval armaments, and the state of all the persons employed therein, whether civil or military.

The history of the marine affairs of any one state is a very comprehensive subject, much more that of all

nations. Those who would be informed of the maritime affairs of Great Britain, and the figure it has made at sea in all ages, may find abundance of curious matter in Selden's *Mare Clausum*; and from his time to ours, we may trace a series of facts in Lediard's and Burchet's *Naval History*; but above all in the *Lives of the Admirals*, by the accurate and judicious Dr Campbell

MARINES, or *MARINE Forces*, a body of soldiers raised for the sea service, and trained to fight either in a naval engagement or in an action ashore.

The great service of this useful corps was manifested frequently in the course of the war before last, particularly at the siege of Belleisle, where they acquired a great character, although lately raised and hardly exercised in military discipline. At sea they are incorporated with the ship's crew, of which they make a part: and many of them learn in a short time to be excellent seamen, to which their officers are ordered by the admiralty to encourage them, although no sea officer is to order them to go aloft against their inclination. In a sea fight their small arms are of very great advantage in scouring the decks of the enemy; and when they have been long enough at sea to stand firm when the ship rocks, they must be infinitely preferable to seamen if the enemy attempts to board, by raising a battalion with their fixed bayonets to oppose him.

The sole direction of the corps of marines is vested in the lords commissioners of the admiralty; and in the admiralty is a distinct apartment for this purpose. The secretary to the admiralty is likewise secretary to the marines, for which he has a salary of 300l. a-year; and he has under him several clerks for the management of this department.

The marine forces of Great Britain in the time of peace are stationed in three divisions; one of which is quartered at Chatham, one at Portsmouth, and another at Plymouth. By a late regulation, they are ordered to do duty at the several dock-yards of those ports, to prevent embezzlement of the king's stores, for which a captain's guard mounts every day; which certainly requires great vigilance, as so many abuses of this kind have been committed, that many of the inhabitants, who have been long used to an infamous traffic of this kind, expect these conveyances at certain periods as their due, and of course resent this regulation in the highest degree as an infringement of their liberties as British subjects.

The marine corps are under the command of their own field officers, who discipline them, and regulate their different duties. His late majesty in 1760 formed a new establishment of marine officers, entitled, the *general*, *lieutenant-general*, and *three colonels* of marines (one for each division), to be taken from officers in the royal navy. The two first are always enjoyed by flag officers, the last by post captains only. This establishment was formed to reward such officers who distinguished themselves in the service of their country.

MARINE Discipline, is the training up soldiers for sea service, in such exercise as the various positions of the firelock and body, and teaching them every manœuvre that can be performed on board ships of war at sea. See EXERCISE.

MARINE Chair, a machine invented by Mr Irwin for viewing the satellites of Jupiter at sea, and of course

Marine,
Marine.

Marine
||
Marino.

course determining the longitude by their eclipses. An account of it is given in the *Journal Estranger* for March 1760. An account of its accuracy was published in the year following by M. de l'Isle astronomer in the Imperial academy of Petersburg: but notwithstanding the encomiums bestowed upon it by this gentleman, it hath never come into general use; and therefore we may conclude, that it is much inferior to the inventions of Mr Harrison for the same purpose. See **HARRISON** and **LONGITUDE**.

MARINE Surveyor, is the name of a machine contrived by Mr H. de Saumarez for measuring the way of a ship in the sea. This machine is in the form of the letter Y, and is made of iron, or any other metal. At each end of the lines which constitute the angle or upper part of that letter, are two pallets, not much unlike the figure of the log; one of which falls in the same proportion as the other rises. The falling or pendent pallet meeting a resistance from the water, as the ship moves, has by that means a circular motion under water, which is faster or slower according as the vessel moves. This motion is communicated to a dial within the ship, by means of a rope fastened to the tail of the Y, and carried to the dial. The motion being thus communicated to the dial, which has a bell in it, it strikes exactly the number of geometrical paces, miles, or leagues, which the ship has run. Thus the ship's distance is ascertained; and the forces of tides and currents may also be discovered by this instrument: which, however, has been very little used.

MARINE Acid, an old name given to muriatic acid, which see in **CHEMISTRY Index**.

MARINER, the same with a sailor or seaman. See these articles.

Method of preserving the health of MARINERS. See **SEAMEN**.

MARINER's Compass. See **COMPASS**.

ST MARINO, a small town and republic of Italy, situated in E. Long. 13. 44. N. Lat. 44. 21. This small republic consists only of a mountain, and a few hillocks, that lie scattered about the bottom of it. The number of the inhabitants is about 5000. The mountain yields good wine, but they have no other than rain or snow water. The founder of the republic was a Dalmatian, and a mason, who upwards of 1300 years ago turned hermit, and retired to this mountain. Here his devotion and austerity, and, in consequence of that, his reputation for sanctity, were such, that the princes of the country made him a present of the mountain; on which many, out of veneration for the saint, soon after took up their abode. Thus was the foundation laid of the town and republic, which still bears the name of the saint. The town stands on the top of the mountain, and there is only one way by which it can be come at. In the whole territory are only three castles, three convents, and five churches. The largest of the churches is dedicated to the saint, and contains his ashes and his statue. He is looked upon as the greatest saint, next to the blessed Virgin; and to speak disrespectfully of him is accounted blasphemy, and punished as such. The republic is under the protection of the pope. All that are capable of bearing arms are exercised, and ready at a minute's call. In the ordinary course of government, the administration is in the

hands of the council of 60, which, notwithstanding its name, consists only of 40; one-half of the members of which are of the noble families, and the other of the plebeian: on extraordinary occasions, however, the arengo, in which every house has its representative, is called together. The two principal officers are the capitaneos, who are chosen every half year; and next to them is the commissary, who judges in civil and criminal matters, and is joined in commission with the capitaneos; both he and the physician must be foreigners, and both have their salaries out of the public stock. When any person, after due summons, neglects to assist at the council according to their statute book, he is to be fined in about a penny English; and when an ambassador is to be sent to any foreign state, he is to be allowed about 1s. a-day.

MARINO, John Baptist, a celebrated Italian poet, born at Naples in 1569. His father, who was an able civilian, obliged him to study the law; at which being disgusted, he left his parents, and retired to the house of the Sieur Manzi, who was a friend to all persons of wit. He at length became secretary to Matthew of Capua, great admiral of the kingdom of Naples, and contracted a friendship with Tasso. A short time after, he went to Rome, and entered into the service of Cardinal Aldobrandini, nephew to Pope Clement VIII. who took him with him to Savoy. Marino was in great favour with the court of Turin; but afterwards created himself many enemies there, the most furious of whom was the poet Gaspard Murtola, who, attempting to shoot him with a pistol, wounded one of the duke of Savoy's favourites. Marino being obliged to leave Turin, went to Paris at the desire of Queen Mary de Medicis, and published there his poem on Adonis. He afterwards went to Rome, where he was made prince of the academy of the humoristi; from thence to Naples, where he died while he was preparing to return home. He had a very lively imagination, but little judgment; and, giving way to the points and conceits then in vogue, his authority, far from correcting the false taste of the Italians, served rather to keep it farther from reformation. His works, which are numerous, have been often printed.

MARINUS, an engraver, who flourished about the year 1630, and resided principally at Antwerp. His plates, Mr Strutt observes, are executed in a very singular style, with the graver only: The strokes are very fine and delicate, and crossed over each other in a lozenge-like form, which he filled up with thin long dots. His prints, though generally very neat, want the style of the master in the determination of the folds of the draperies and the outline of the human figure; the extremities of which are heavy, and not marked with precision. Fine impressions from his best plates are, however, much sought after by collectors; those especially after Rubens and Jordaeus are held in high estimation.

MARIONIS, in *Ancient Geography*, a town of Germany: now Hamburg, a famous trading city on the Elbe, in Lower Saxony, in the duchy of Holstein. Another Marionis (Ptolemy), thought to be Wismar, a town of Lower Saxony, in the duchy of Mecklenburgh.

MARJORAM. See **ORIGANUM**, **BOTANY Index**.

MARITAGIUM. In the feudal customs, *maritagium*

Marino
||
Maritagium.

Marit-
gium.
Maritime.

gium (as contradistinguished from *matrimonium*) signifies the power which the lord or guardian in chivalry had of disposing of his infant ward in matrimony. For while the infant was in ward, the guardian had the power of tendering him or her a suitable match without disparagement or inequality: which if the infants refused, they forfeited the value of the marriage, *valorem maritagii*, to their guardian; that is, so much as a jury would assess, or any one would *bona fide* give to the guardian for such an alliance: and if the infants married themselves without the guardian's consent, they forfeited double the value, *duplicem valorem maritagii*.

MARITIME, something relating to, or bounded by the sea. Thus a maritime province or country is one bounded by the sea; and a maritime kingdom is one that makes a considerable figure, or that is very powerful at sea. Hence, by *maritime* powers among the European states, are understood Great Britain and formerly Holland.

MARITIME State, in British policy, one of the three general divisions of the laity: (See *LAITY*). This state is nearly connected with the military; though much more agreeable to the principles of our free constitution. The royal navy of England hath ever been its greatest defence and ornament; it is its ancient and natural strength; the floating bulwark of the island; an army from which, however strong and powerful, no danger can ever be apprehended to liberty; and accordingly it has been assiduously cultivated from earliest ages. To so much perfection was our naval reputation arrived in the 12th century, that the code of maritime laws, which are called the *laws of Oleron*, and are received by all nations in Europe as the ground and substruction of all their marine constitutions, was confessedly compiled by our king Richard I. at the isle of Oleron on the coast of France, then part of the possessions of the crown of England. And yet so vastly inferior were our ancestors in this point to the present age, that even in the maritime reign of Queen Elizabeth, Sir Edward Coke thinks it matter of boast, that the royal navy of England then consisted of *three and thirty ships*. The present condition of our marine is in great measure owing to the salutary provisions of the statutes called the *navigation acts*; whereby the constant increase of English shipping and seamen was not only encouraged, but rendered unavoidably necessary. By the statute 5 Richard II. c. 3. in order to augment the navy of England, then greatly diminished, it was ordained, that none of the king's liege people should ship any merchandise out of or into the realm, but only in ships of the king's ligeance, on pain of forfeiture. In the next year, by statute 6 Rich. II. c. 8. this wise provision was enervated, by only obliging the merchants to give English ships (if able and sufficient) the preference. But the most beneficial statute for the trade and commerce of these kingdoms is that navigation act, the rudiments of which were first framed in 1650, with a narrow partial view; being intended to mortify our own sugar islands, which were disaffected to the parliament, and still held out for Charles II. by stopping the gainful trade which they then carried on with the Dutch, and at the same time to clip the wings of those our opulent and aspiring neighbours.

1

Maritima

This prohibited all ships of foreign nations from trading with any English plantations, without license from the council of state. In 1651, the prohibition was extended also to the mother country: and no goods were suffered to be imported into England, or any of its dependencies, in any other than English bottoms; or in the ships of that European nation of which the merchandise imported was the genuine growth or manufacture. At the Restoration, the former provisions were continued, by stat. 12 Car. II. c. 18. with this very material improvement, that the master and three-fourths of the mariners shall also be English subjects.

Many laws have been made for the supply of the royal navy with seamen; for their regulation when on board; and to confer privileges and rewards on them during and after their service.

1. For their supply. The principal, but the most odious, though often necessary method for this purpose, is by impressing; see *IMPRESSING*. But there are other ways that tend to the increase of seamen, and manning the royal navy. Parishes may bind out poor boys apprentices to the masters of merchantmen, who shall be protected from impressing for the first three years; and if they are impressed afterwards, the masters shall be allowed their wages: great advantages in point of wages are given to volunteer seamen, in order to induce them to enter into his majesty's service: and every foreign seaman, who, during a war, shall serve two years in any man of war, merchantmen, or privateer, is naturalized *ipso facto*. About the middle of King William's reign, a scheme was set on foot for a register of seamen to the number of 30,000, for a constant and regular supply of the king's fleet; with great privileges to the registered men; and, on the other hand, heavy penalties in case of their non-appearance when called for; but this registry, being judged to be rather a badge of slavery, was abolished by stat. 9 Ann. c. 21.

2. The method of ordering seamen in the royal fleet, and keeping up a regular discipline there, is directed by certain express rules, articles, and orders, first enacted by the authority of parliament soon after the Restoration; but since new modelled and altered, after the peace of Aix-la-Chapelle, to remedy some defects which were of fatal consequences in conducting the preceding war. In these articles of the navy almost every possible offence is set down, and the punishment thereof annexed: in which respect the seamen have much the advantage over their brethren in the land service; whose articles of war are not enacted by parliament, but framed from time to time at the pleasure of the crown. Yet from whence this distinction arose, and why the executive power, which is limited so properly with regard to the navy, should be so extensive with regard to the army, it is hard to assign a reason: unless it proceeded from the perpetual establishment of the navy, which rendered a permanent law for their regulation expedient, and the temporary duration of the army, which subsisted only from year to year, and might therefore with less danger be subjected to discretionary government. But, whatever was apprehended at the first formation of the mutiny act, the regular renewal of our standing force at the entrance of every year has made this distinction idle.

For,

Maritime,
Marius.

For, if from experience past, we may judge of future events, the army is now lastingly ingrafted into the British constitution; with this singularly fortunate circumstance, that any branch of the legislature may annually put an end to its legal existence, by refusing to concur in its continuance.

3. The privileges conferred on sailors, are pretty much the same with those conferred on soldiers, with regard to relief, when maimed, or wounded, or superannuated, either by county-rates, or the royal hospital at Greenwich; with regard also to the exercise of trades, and the power of making nuncupative testaments; and farther, no seaman on board his majesty's ships can be arrested for any debt, unless the same be sworn to amount at least to twenty pounds; though, by the annual mutiny acts, a soldier may be arrested for a debt which extends to half that value, but not to a less amount.

MARIUS, the famous Roman general, and seven times consul, who sullied his great military reputation by savage barbarities. He was born at Arpinum, of obscure and illiterate parents. He forsook the meaner occupations of the country for the camp; and signaled himself under Scipio, at the siege of Numantia. The Roman general saw the courage and intrepidity of young Marius, and foretold the era of his future greatness. By his seditions and intrigues at Rome, while he exercised the inferior offices of the state, he rendered himself known; and his marriage with Julia, who was of the family of the Cæsars, contributed in some manner to raise him to consequence. He passed into Africa as lieutenant to the consul Metellus against Jugurtha; and after he had there ingratiated himself with the soldiers, and raised enemies to his friend and benefactor, he returned to Rome and canvassed for the consulship. The extravagant promises he made to the people, and his malevolent insinuations about the conduct of Metellus, proved successful. He was elected and appointed to finish the war against Jugurtha. He showed himself capable in every degree to succeed to Metellus. Jugurtha was defeated, and afterwards betrayed into the hands of the Romans by the perfidy of Bocchus. No sooner was Jugurtha conquered, than new honours and fresh trophies awaited Marius. The provinces of Rome were suddenly invaded by an army of 300,000 barbarians, and Marius was the only man whose activity and boldness could resist so powerful an enemy. He was elected consul, and sent against the Teutones. The war was prolonged, and Marius was a third and fourth time invested with the consulship. At last two engagements were fought, and not less than 200,000 of the barbarian forces of the Ambrones and Teutones were slain in the field of battle, and 90,000 made prisoners. The following year, A. U. C. 651, was also marked by a total overthrow of the Cimbri, another horde of barbarians; in which 140,000 were slaughtered by the Romans, and 60,000 taken prisoners. After such honourable victories, Marius with his colleague Catullus entered Rome in triumph; and for his eminent services he received the appellation of the *third founder of Rome*. He was elected consul a sixth time; and as his intrepidity had delivered his country from its foreign enemies, he sought employment at home, and his restless ambition began to raise seditions, and to oppose the

VOL. XII. Part II.

power of Sylla. This was the foundation of a civil war. Sylla refused to deliver up the command of his forces, with which he was empowered to prosecute the Mithridatic war; and he resolved to oppose in person the authors of a demand which he considered as arbitrary and improper. He advanced to Rome, and Marius was obliged to save his life by flight. The unfavourable winds prevented him from seeking a safer retreat in Africa, and he was left on the coast of Campania, where the emissaries of his enemy soon discovered him in a marsh, where he had plunged himself in the mud, and left only his mouth above the surface for respiration. He was violently dragged to the neighbouring town of Minturnæ; and the magistrates, all devoted to the interest of Sylla, passed sentence of immediate death on their magnanimous prisoner. A Gaul was commanded to cut off his head in the dungeon; but the stern countenance of Marius disarmed the courage of the executioner: and when he heard the exclamation of *Tunc, homo, aude occidere Caium Marium?* the dagger dropped from his hand. Such an uncommon adventure moved the compassion of the inhabitants of Minturnæ. They released Marius from prison; and favoured his escape to Africa, where he joined his son Marius, who had been arming the princes of that country in his cause. Marius landed near the walls of Carthage, and he received no small consolation at the sight of the venerable ruins of a once powerful city, which like himself had been exposed to calamity, and felt the cruel vicissitude of fortune. This place of his retreat was soon known; and the governor of Africa, to conciliate the favour of Sylla, compelled Marius to fly to a neighbouring island. He soon after learned that Cinna had embraced his cause at Rome, when the Roman senate had stripped him of his consular dignity, and bestowed it upon one of his enemies. This intelligence animated Marius; he set sail to assist his friend only at the head of 1000 men. His army, however, was soon increased, and he entered Rome like a conqueror. His enemies were inhumanly sacrificed to his fury; Rome was filled with blood; and he, who once had been called the father of his country, marched through the streets of the city, attended by a number of assassins, who immediately slaughtered all those whose salutations were not answered by their leader. Such were the signals for bloodshed. When Marius and Cinna had sufficiently gratified their resentment, they made themselves consuls; but Marius, already worn out with old age and infirmities, died sixteen days after he had been honoured with the consular dignity for the seventh time, A. U. C. 666. Such was the end of Marius, who rendered himself conspicuous by his victories and by his cruelty. As he was brought up in poverty and among peasants, it will not appear wonderful that he always betrayed rusticity in his behaviour, and despised in others those polished manners and that studied address, which education had denied him. He hated the conversation of the learned only because he was illiterate; and if he appeared an example of sobriety and temperance, he owed these advantages to the years of obscurity which he passed at Arpinum. His countenance was stern, his voice firm and imperious, and his disposition untractable. He was in the 70th year of his age when he died; and Rome seemed to rejoice at

Marius

†

4 F

the

Marius
||
Mark.

the fall of a man whose ambition had proved so fatal to many of her citizens. His only qualifications were those of a great general; and with these he rendered himself the most illustrious and powerful of the Romans, because he was the only one whose ferocity seemed capable to oppose the barbarians of the north.

MARIUS, C. the son of the great Marius, was as cruel as his father, and shared his good and his adverse fortune. He made himself consul in the 25th year of his age, and murdered all the senators who opposed his ambitious views. He was defeated by Sylla, and fled to Præneste, where he killed himself.

MARIUS, *M. Aurelius*, a native of Gaul; who, from the mean employment of a blacksmith, became one of the generals of Gallienus, and at last caused himself to be saluted emperor. Three days after this elevation, a man who had shared his poverty without partaking of his more prosperous fortune, publicly assassinated him, and he was killed by a sword which he himself had made in the time of his obscurity. Marius has been often celebrated for his great strength; and it is confidently reported, that he could stop, with one of his fingers only, the wheel of a chariot in its most rapid course.

MARIUS, *Maximus*, a Latin writer, who published an account of the Roman emperors from Trajan to Alexander, now lost. His compositions were entertaining, and executed with great exactness and fidelity. Some have accused him of inattention, and complain that his writings abounded with many fabulous and insignificant stories.

MARIVAUX, PETER CARLET DE, a French writer in the dramatic way and in romance, was born of a good family at Paris in 1688. A fine understanding, well improved by education, distinguished him early. His first object was the theatre, where he met with the highest success in comic productions; and these, with the merit of his other works, procured him a place in the French academy. The great characteristic of both his comedies and romance was, to convey an useful moral under the veil of wit and sentiment: "My only object (says he) is to make men more just and more humane;" and he was as amiable in his life and conversation as he was in his writings. He died at Paris in 1763, aged 75. His works consist of, 1. *Pièces de Theatre*, 4 vols. 12mo. 2. *Homere travesti*, 12mo; which is not supposed to have done much honour to his taste. 3. *Le Spectateur François*, 2 vols. 12mo. 4. *Le Philosophe Indigent*, 12mo. 5. *Vie de Marianne*, 2 vols. 12mo; one of the best romances in the French language. 6. *Le Paysan Parvenu*, 12mo. 7. *Pharsamon*; inferior to the former.

MARK, ST, was by birth a Jew, and descended of the tribe of Levi. He was converted by some of the apostles, probably by St Peter; to whom he was a constant companion in all his travels, supplying the place of an amanuensis and interpreter. He was by St Peter sent into Egypt, fixing his chief residence at Alexandria, and the places thereabout; where he was so successful in his ministry, that he converted multitudes both of men and women. He afterwards removed westwards, towards the parts of Libya, going through the countries of Marmorica, Pentapolis, and others thereabouts; where, notwithstanding the bar-

barity and idolatry of the inhabitants, he planted the gospel. Upon his return to Alexandria, he ordered the affairs of that church, and there suffered martyrdom in the following manner. About Easter, at the time the solemnities of Serapis were celebrated, the idolatrous people, being excited to vindicate the honour of their deity, broke in upon St Mark, while he was performing divine service, and binding him with cords, dragged him through the streets, and thrust him into prison, where in the night he had the comfort of a divine vision. Next day the enraged multitude used him in the same manner, till, his spirits failing, he expired under their hands. Some add, that they burnt his body, and that the Christians decently interred his bones and ashes near the place where he used to preach. This happened in the year of Christ 68. Some writers assert, that the remains of St Mark were afterwards, with great pomp, translated from Alexandria to Venice. However, he is the tutelar saint and patron of that republic, and has a very rich and stately church erected to his memory. This apostle is author of one of the four gospels inscribed with his name. See the following article.

St Mark's Gospel, a canonical book of the New Testament, being one of the four gospels.

St Mark wrote his gospel at Rome, where he accompanied St Peter in the year of Christ 44. Tertullian and others pretend, that St Mark was no more than an amanuensis to St Peter, who dictated this gospel to him; others affirm, that he wrote it after St Peter's death. Nor are the learned less divided as to the language it was written in; some affirming that it was composed in Greek, others in Latin. Several of the ancient heretics received only the gospel of St Mark: others, among the Catholics, rejected the 12 last verses of this gospel. The gospel of St Mark is properly an abridgement of that of St Matthew.

St MARK the Evangelist's Day, a festival of the Christian church, observed April 25.

Canons of St MARK, a congregation of regular canons founded at Mantua, by Albert Spinola, a priest, towards the end of the 12th century. Spinola made a rule for them, which was approved, corrected, and confirmed by several succeeding popes. About the year 1450 they were reformed, and followed only the rule of St Augustine. This congregation having flourished for the space of 400 years, declined by little and little, and is now become extinct.

Knights of St MARK, an order of knighthood in the republic of Venice, under the protection of St Mark the evangelist. The arms of the order are, gules, a lion winged or; with this device, PAX TIBI MARCE EVANGELISTA. This order is never conferred but on those who have done signal service to the commonwealth.

MARK, or *Marc*, in commerce, denotes a weight used in several states of Europe, and for several commodities, especially gold and silver. In France, the mark is divided into eight ounces, 64 drachms, 192 deniers or penny-weights, 160 esterlins, 300 mails, 640 felins, or 4608 grains. In Holland, the mark weight is also called *Troy-weight*, and is equal to that of France. When gold and silver are sold by the mark, it is divided into 25 carats.

Marlboro-
rough.

MARK is also used among us for a money of account, and in some other countries for a coin. See *MONEY-Table*.

The English mark is two-thirds of a pound sterling, or 13s. 4d.; and the Scotch mark is of equal value in Scots money of account, viz. 13½d.

MARKET, a public place in a city or town, in which live cattle, provisions, or other goods, are set to sale; and also a privilege, either by grant or prescription, by which a town is enabled to keep a market.

Court of the Clerk of the MARKET, is incident to every fair and market in the kingdom, to punish misdemeanors therein; and a court of *pie poudre* is to determine all disputes relating to private or civil property. The object of this jurisdiction (see stat. 17 Car. II. cap. 10. 22 Car. II. cap. 8. 23 Car. II. cap. 12). is principally the cognizance of weights and measures to try whether they be according to the true standard thereof or not; which standard was anciently committed to the custody of the bishop, who appointed some clerk under him to inspect the abuse of them more narrowly; and hence this officer, though now usually a layman, is called the clerk of the market.— If they be not according to the standard, then, beside the punishment of the party by fine, the weights and measures themselves ought to be burnt. This is the lowest court of criminal jurisdiction in the kingdom.

MARKLAND, JEREMIAH, one of the most learned scholars and acute critics of the age, was born in 1692, and received his education in Christ's hospital. He became first publicly known by his *Epistola Critica*, addressed to Bishop Hare. In this he gave many proofs of extensive erudition and critical sagacity. He afterwards published an edition of Statius, and some plays of Euripides; and assisted Dr Taylor in his editions of Lysias and Demosthenes, by the notes which he communicated to him. He has also very happily elucidated some passages in the New Testament, which may be found in Mr Boyer's edition of it; and was author of a very valuable volume of remarks on the epistles of Cicero to Brutus, and of an excellent little treatise under the title of *Questio Grammatica*. He died in 1775, at Milton near Dorking in Surry; and was a man not more valued for his universal reading, than beloved for the excellency of his heart and primitive simplicity of his manners.

MARLBOROUGH, a town of Wiltshire in England, situated near the source of the Kennet, at the foot of a chalky hill, 75 miles from London. It has its name from the chalky soil, which was formerly called *marl*. It was a Romish station. In the year 1627 a parliament was held in the castle here, which made those laws called *Marlborough statutes*. There are still some small remains of its walls and ditch. The town, which is an ancient borough by prescription, sends two members to parliament. It contained, in 1811, 2579 inhabitants; and is governed by a mayor, two justices, twelve aldermen, &c. It consists chiefly of one broad street, with piazzas all along one side of it, two parish churches, and several commodious inns, it being the grand thoroughfare from London to Bath and Bristol. To the south are some relics of a priory, particularly the Gatehouse; and

the site of a Roman castrum, the foundations of which have been discovered there, with Roman coins. The ditch is still in some parts 20 feet wide; and towards the river, without the garden walls, one angle of the castrum is very visible with the rampart and ditch entire. The mount at the west end of the town, which was the keep or main guard of the castle, is converted into a pretty spiral walk; at the top of which is an octagon summer house. This town has often suffered by fire, particularly in 1690, whereupon the parliament passed an act to prevent its houses from being thatched.

MARLBOROUGH, *Duke of*. See CHURCHILL.

MARLBOROUGH-FORT, an English factory on the west coast of the island of Sumatra in Asia; seated three miles west of the town of Bencoolen. E. Long. 101. 12. S. Lat. 4. 21.

MARLE, a mixture of calcareous with siliceous and argillaceous earth, very much used in agriculture as a manure. See AGRICULTURE and MINERALOGY *In-der*.

MARLINE, in sea affairs, are tarred white skains, or long wreaths or lines of untwisted hemp, dipped in pitch or tar, with which cables or other ropes are wrapped round, to prevent their fretting or rubbing in the blocks or pulleys through which they pass. The same serves in artillery upon ropes used for rigging gins, usually put up in small parcels called *skains*.

MARLOE, CHRISTOPHER, an English dramatic author, was a student in the university of Cambridge; but afterwards turning player, he trode the same stage with the inimitable Shakspeare. He was accounted an excellent poet even by Ben Johnson himself. He wrote six tragedies, one of which called *Lust's Dominion*, or the *Lascivious Queen*, has been altered by Mrs Behn, and acted under the title of *Abdelazar*, or the *Moor's Revenge*. Some time before his death, he had made a considerable progress in an excellent poem entitled *Hero and Leander*: which was afterwards finished by George Chapman, who is said to have fallen short of the spirit and invention discovered by Marloe. Mr Anthony Wood represents him as a freethinker, in the worst sense of the word; and gives the following account of his death. Falling deeply in love with a low girl, and having for his rival a fellow in livery, Marloe, imagining that his mistress granted him favours, was fired with jealousy, and rushed upon him in order to stab him with his dagger: but the footman avoided the stroke, and, seizing his wrist, stabbed him with his own weapon; of which wound he died, in the year 1593.

MARLOW, a town of Buckinghamshire, in England, 31 miles from London, lies under the Chiltern hills, in a marly soil. It is a pretty large borough, though not incorporated, with a bridge over the Thames, not far from its conflux with Wycomb, and has a handsome church and town-hall. It first sent members to parliament in the reign of Edward II. Bone lace is its chief manufacture. The Thames brings goods hither from the neighbouring towns, especially great quantities of meal and malt from High Wycomb, and beech from several parts of the county, which abounds with this wood more than any in England. In the neighbourhood are frequent horse races; and here are several corn and paper-mills, particularly

Marlboro-
rough
||
Marlow.

Marlow,
Marly.

on the river Loddon, between this town and High Wycomb. There are, besides, the Temple-mills for making thimbles, and another for pressing oil from rape and flax seeds. The population in 1811 was 2799.

At Great Marlow there is an institution supported by government for the education of young men destined for the army. The pupils are entirely under military discipline, and are instructed by able professors in the various branches of education connected with military tactics.

MARLY, a palace belonging to the king of France, between Versailles and St Germain; seated in a valley, near a village and forest of the same name. It is noted for its fine gardens and water-works, there being a curious machine on the river Seine, which not only supplies them with water, but also those of Versailles. It is 10 miles north-west of Paris. E. Long. 2. 11. N. Lat. 48. 52.

MARLY, Machine at. When Lewis the Great had fixed upon a favourite situation in the forest of Marly, where he intended to erect a splendid castle, he found that it wanted nothing either in point of beauty or convenience but a fountain of water; and he immediately determined to supply by the assistance of art what nature had denied it. An ingenious and self-taught carpenter from Liege, named Rannequin, undertook to conduct from the Seine a copious supply of water, and for this purpose contrived and erected the celebrated and complicated machine which we are now to describe.

The machinery is driven by 14 undershot water wheels of 36 feet diameter, reckoning from the ends of the floatboards, disposed in three rows. In the first row there are seven wheels, in the second six, and in the third only one. By these wheels the water is raised through pumps into the first reservoir about 160 feet above the level of the river, then to a second reservoir 346 feet high, and from this to the summit of a tower about 533 feet above the Seine.

The two extremities of the axle of each wheel extend beyond the gudgeons on which they rest, and are bent into a crank so as to form a lever two feet long. The crank which is towards the mountain drives the water of the river into the first reservoir, and the other crank gives motion to the balances.

An engine of eight pumps is wrought by one of the cranks of each of the six wheels in the first row. These engines consist of a balance, at each end of which hangs a square piece of wood that supports and directs four pistons. This balance is moved by a beam in the form of a T, the horizontal part of which is connected at one end with the balance by the intervention of a vertical regulator or beam, and at the other with the crank of the wheel by means of a horizontal iron rod.

One of the cranks of each of the *six wheels* of the first row, (excepting that which is next the mountain), and two of the cranks of the 14th wheel, or that in the last row, give motion to the pumps in the river, and carry the water into the first reservoir. This motion is communicated from the cranks by means of an iron rod which is fixed to the lower end of a vertical balance. A horizontal regulator or beam is fixed to each end of this balance, and to these regulators are fastened chains which follow the declivity of the mountain till they reach the superior reservoirs. When the

wheel is revolving, therefore, one of these chains will be dragged towards the river, and the other towards the mountain. In order to produce this alternate motion, the chains are supported and kept at equal distances by a number of vertical balances, placed along the mountain at every three toises, and moving upon a centre supported by a frame lying between the two chains and equidistant from them. When these chains reach the first reservoir they are fixed to vertical regulators, which carry frames, to which are adapted the pistons of the sucking pumps. These regulators therefore will be drawn one after another by their corresponding chains; and when one regulator is drawn by its chain, the piston of the pumps which it carries will be raised, and the water will follow them: At the same time the pistons of the other regulator are descending to form a vacuum; and these in their turn ascend with their load of water when the others are in the act of descending. In the pumps formerly mentioned which work in the river, an effect is produced upon the pistons both when they ascend and descend, because they are moved by stiff iron rods; but in the present case the pistons descend merely by their own weight, as the motion is transmitted only by a chain. By these pumps the water is conveyed to the upper reservoir by two conduit pipes of eight inches, and three others of six inches diameter.

The *sixth wheel* of the first row, which is the first towards the dam, moves a long chain which works the pumps of one of the wells of the upper reservoir. The seventh wheel gives motion to a chain which goes to the first cistern.

By means similar to these already described, the six wheels of the second row move by each of their cranks a chain that goes to the second reservoir, and eight of these chains work 16 pumps behind it, to bring back into the reservoir the water which is lost out of the six pipes that go to the tower. These chains go over one of the first cisterns, and five of them at the same time give motion to the pistons of thirty pumps, whilst the other chains go on straight to the great reservoir. These 30 pumps convey their water through two pipes of 8 inches diameter into the upper reservoir. The five chains, after working these 30 pumps, give motion to the pistons of 82 pumps in the second reservoir which raise the water from it to the tower.

The basis of the tower which receives the water raised from the river is 610 fathoms distant from it; and the water runs from this bason along an aqueduct of 36 arches by its own weight. From this aqueduct the water is distributed into great reservoirs, from which it is conveyed to the gardens and shrubberies around the castle.

The quantity of water raised by this machine amounts at a mean rate to 30,000 or 40,000 gallons per hour; though in favourable circumstances it raises more than 60,000 gallons per hour. But while the Seine either overflows its banks, or is frozen, or when the water is very low, the machine is scarcely capable of performing any work.

The yearly expence of the machine at Marly including the salaries of the superintendants and the expences of repairs, amounts to about 3300l. sterling, or 9l. per day, which makes the expence of 90 gallons of water one farthing. But if we take into the account the interest

Marly.

Marly
||
Marobu-
dun.

interest of 333,000*l.* the original expence of the machine, 90 gallons will cost three halfpence, or 15 gallons one farthing.

Notwithstanding the magnificence of this great machine, and the ingenuity which is displayed in its construction, every person who examines it with care, will perceive innumerable defects, whether he examines it as a whole, or attends to the parts of which it is composed. In several positions the moving forces act with great obliquity, and therefore occasion an immense waste of power; and in order to give an alternate motion to a number of chains of balances extending to a distance of 3804 feet, more than nine-tenths of the impelling power are destroyed.

By a few changes upon the construction of the machine, the water might have been raised from the river to the tower without any intermediate reservoirs. This appears from two experiments made upon the machine in 1738 and 1775. In 1738 M. Camus attempted to raise the water to the tower at once. He was able, however, only to bring it to the bottom of the tower which was considerably higher than the second reservoir. By this experiment the machine was so much strained that several parts required chains to secure it. In 1775 the water was elevated to the second reservoir at one jet at different times, but from the age and infirmity of the pipes several of them burst during the experiment. Hence it is obvious that if the pipes had been made stronger, the first reservoir and the machinery connected with it might have been dispensed with; and it is very probable that if the machine had been constructed with more judgment, the water might have been conducted at once from the river to the tower.

MARMALADE, a confection of plums, apricots, quinces, &c. boiled up to a consistence with sugar. In Scotland, it is made of Seville oranges and sugar only.

MARMANDE, a town of France, in the department of Lot and Garonne, containing about 4000 inhabitants. It carries on a great trade in corn and wine, and is seated on the river Garonne, in E. Long. 0. 15. N. Lat. 44. 30.

MARMONTEL, a French writer. See SUPPLEMENT.

MARMORA, the name of four islands of Asia, in the sea of the same name. The largest is about 30 miles in circumference; and the soil of them all produces corn, wine, and fruits. The sea of Marmora is a large gulf, which communicates both with the Archipelago and the Black sea by that of Constantinople, being 120 miles in length and 50 in breadth; and all ships must pass through it that sail to Constantinople from the Mediterranean. It was anciently the *Propontis*.

MARMORICA, a country of Africa anciently inhabited by the Libyans. It was bounded on the east by Egypt, on the west by Cyrenaica, on the south by Sahara, or the desert of Libya Interior, and on the north by the Mediterranean; and was reckoned a part of Egypt.

MARNE, the name of two departments in France, and also of a river which has its origin in one of them.

MAROBUDUN, in *Ancient Geography*, the royal residence of Marobudus, king of the Marcomanni. Now thought to be *Prague*, the capital of Bohemia.

MAROLLES, MICHEL DE, born in 1600, was the son of Claude de Marolles; whom French memoirs make a military hero. Michel, however, was of a different composition. He entered early into the ecclesiastical state, and by the interest of his father obtained two abbeyes. He was formed with an extreme ardour for study, which never abated all his life long: for, from 1619 when he published a translation of Lucan, to 1681, the year of his death, he was constantly employed in writing and printing. He attached himself unfortunately to the translating of ancient Latin writers: but, being devoid of all classical taste and spirit, they sunk miserably under his hands, the poets especially. He was certainly, however, a man of great learning, and discovered all his life a love for the arts. He was one of the first who paid any attention to prints; and collected about 100,000, which make at this day one of the ornaments of the French king's cabinet. He composed memoirs of his own life, which were published by the abbé Goujet, 1755, in 3 vols.

MARONITES, in ecclesiastical history, a sect of eastern Christians, who follow the Syrian rite, and are subject to the pope; their principal habitation being on Mount Libanus.

Mosheim informs us, that the doctrine of the Monothelites, condemned and exploded by the council of Constantinople, found a place of refuge among the Mardaites, a people who inhabited the mounts Libanus and Antilibanus, and who, about the conclusion of the seventh century, were called *Maronites*, after *Maro* their first bishop; a name which they still retain. None (he says) of the ancient writers give any certain account of the first person who instructed these mountaineers in the doctrine of the Monothelites: it is probable, however, from several circumstances, that it was John Maro, whose name they had adopted; and that this ecclesiastic received the name of Maro from his having lived in the character of a monk in the famous convent of St Maro, upon the borders of the Orontes, before his settlement among the Mardaites of Mount Libanus. One thing is certain, from the testimony of Tyrius and other unexceptionable witnesses, as also from the most authentic records, viz. that the Maronites retained the opinions of the Monothelites until the 12th century, when, abandoning and renouncing the doctrine of one will in Christ, they were readmitted in the year 1182 to the communion of the Roman church. The most learned of the modern Maronites have left no method unemployed to defend their church against this accusation; they have laboured to prove, by a variety of testimonies, that their ancestors always persevered in the Catholic faith, in their attachment to the Roman pontiff, without ever adopting the doctrine of the Monophysites, or Monothelites. But all their efforts are insufficient to prove the truth of these assertions to such as have any acquaintance with the history of the church and the records of ancient times; for to all such the testimonies they allege will appear absolutely fictitious and destitute of authority.

Faustus Nairon, a Maronite settled at Rome, has published an apology for Maro and the rest of his nation. His tenet is, that they really took their name from the Maro who lived about the year 400, and of whom mention is made in Chrysostom, Theodoret, and

Maronites, and the Menologium of the Greeks. He adds, that the disciples of this Maro spread themselves throughout all Syria; that they built several monasteries, and among others, one that bore the name of their leader; that all the Syrians who were not tainted with heresy took refuge among them; and that for this reason the heretics of those times called them Maronites.

Mosheim observes, that the subjection of the Maronites to the spiritual jurisdiction of the Roman pontiff was agreed to with this express condition, that neither the popes nor their emissaries should pretend to change or abolish any thing that related to the ancient rites, moral precepts, or religious opinions, of this people, so that in reality there is nothing to be found among the Maronites that savours of popery, if we except their attachment to the Roman pontiff, who is obliged to pay very dear for their friendship. For, as the Maronites live in the utmost distress of poverty, under the tyrannical yoke of the Mahometans, the bishop of Rome is under the necessity of furnishing them with such subsidies as may appease their oppressors, procure a subsistence for their bishop and clergy, provide all things requisite for the support of their churches, and the uninterrupted exercise of public worship, and contribute in general to lessen their misery. It is certain that there are Maronites in Syria who still behold the church of Rome with the greatest aversion and abhorrence; nay, what is still more remarkable, great numbers of that nation residing in Italy, even under the eye of the pontiff, opposed his authority during the last century, and threw the court of Rome into great perplexity. One body of these nonconforming Maronites retired into the valleys of Piedmont, where they joined the Waldenses; another, above 600 in number, with a bishop and several ecclesiastics at their head, fled into Corsica, and implored the protection of the republic of Genoa against the violence of the inquisitors.

The Maronites have a patriarch, who resides in the monastery of Cannubin, on Mount Libanus, and assumes the title of patriarch of Antioch, and the name of Peter, as if he seemed desirous of being considered as the successor of that apostle. He is elected by the clergy and the people, according to the ancient custom; but, since their reunion with the church of Rome, he is obliged to have a bull of confirmation from the pope. He keeps a perpetual celibacy, as well as the rest of the bishops his suffragans: as to the rest of the ecclesiastics, they are allowed to marry before ordination; and yet the monastic life is in great esteem among them. Their monks are of the order of St Anthony, and live in the most obscure places in the mountains, far from the commerce of the world.

As to their faith, they agree in the main with the rest of the eastern church. Their priests do not say mass singly; but all say it together, standing round the altar. They communicate in unleavened bread; and the laity have hitherto partaken in both kinds, though the practice of communicating in one has of late been getting footing, having been introduced by little and little. In Lent they eat nothing, unless it be two or three hours before sunrise: their other fastings are very numerous.

To MAROON, to put one or more sailors ashore upon a desolate island, under pretence of their having

committed some great crime. This detestable expedient has been too often practised by some inhuman commanders of ships.

MAROT, CLEMENT, the best French poet of his time, was born at Cahors in 1495; and was the son of John Marot, valet de chambre to Francis I. and poet to Queen Anne of Brittany. He enjoyed his father's place as valet de chambre to Francis I. and was page to Margaret of France wife to the duke of Alençon. In 1521 he followed that prince into Italy, and was wounded and taken prisoner at the battle of Pavia; but at his return to Paris was accused of heresy, and thrown into prison, from whence he was delivered by the protection of King Francis I. He at length retired to the queen of Navarre, then to the duchess of Ferrara, and in 1536 returned to Paris: but declaring openly for the Calvinists, he was obliged to fly to Geneva; which he at length left, and retiring to Piedmont, died at Turin in 1544, aged 50. His verses are agreeably filled with natural beauties. La Fontaine acknowledged himself his disciple, and contributed greatly to restore to vogue the works of this ancient poet. Marot, besides his other works, has translated part of the Psalms into verse, which was continued by Beza, and are still sung in the Protestant churches abroad.—*Michael Marot*, his son, was also the author of some verses; but they are not comparable to those of John, and much less to those of *Clement Marot*.—The works of the three *Marots* were collected and printed together at the Hague in 1731, in 3 vols. 4to, and in 6 vols. 12mo.

MARPURG, a strong and considerable town of Germany, in the Upper Rhine, and in the landgrate of Hesse Cassel, with an university, a castle, a palace, a handsome square, and a magnificent townhouse. It is seated on the river Lahn, in a pleasant country, 15 miles south of Waldeck, and 47 south-east of Cassel. E. Long. 8. 53. N. Lat. 50. 42.

MARPURG, a town of Germany, in Lower Styria, seated on the river Drave, 25 miles south-west of Gratz, and 60 north-east of Laubach. E. Long. 16. 10. N. Lat. 46. 42.

MARQUARD, FREHER, an eminent German civilian, born at Augsburg in 1565. He studied at Bourges, under the learned Curjas; and acquired great skill in polite literature, and in the laws. At his return to Germany, he became counsellor to the elector Palatine, and professor of law at Heidelberg; and was afterwards sent by the elector Frederic IV. as his minister, into Poland, to Mentz, and several other courts. He died at Heidelberg in 1614. He wrote many works which are esteemed; the principal of which are, 1. *De re monetaria veterum Romanorum, et hodierni apud Germanos imperii*. 2. *Rerum Bohemicarum scriptores*. 3. *Rerum Germanicarum scriptores*. 4. *Corpus historiae Franciae, &c.*

MARQUE, or Letters of MARQUE, in military affairs, are letters of reprisal, granting the subjects of one prince or state liberty to make reprisals on those of another.—They are so called from the German *marcke* "limit, frontier;" as being *jus concessum in alterius principis marchas seu limites transeundi, sibi que jus faciendi*; as being a right of passing the limits or frontiers of another prince, and doing one's self justice.

Letters of marque among us are extraordinary commissions

Maronites,
Maroon.

Marquesas

* See Pre-
negative.

missions granted by authority for reparation to merchants taken and despoiled by strangers at sea; and reprisals is only the retaking, or taking of one thing for another*. The form in these cases is, the sufferer must first apply to the lord privy seal, and he shall make out letters of request under the privy-seal; and if, after such request of satisfaction made, the party required do not, within convenient time, make due satisfaction or restitution to the party grieved, the lord chancellor shall make him out letters of marque under the great seal; and by virtue of these he may attack and seize the property of the aggressor nation, without hazard of being condemned as a robber or pirate.

MARQUESAS ISLANDS, the name of certain islands in the South sea, lying between 8 and 10 degrees of south latitude, and between 139 and 140 degrees of west longitude. They are five in number, viz. La Magdalena, St Pedro, La Dominica, Santa Christina, and Hood island. All the natives of these islands may be supposed to be of the same tribe. Those spots that are fit for culture are very populous; but every island is very mountainous, and has many inaccessible and barren rocks; and the whole population is believed not to exceed 6000. The Spaniards, who first visited here, found the manners of this people gentle and inoffensive; but these qualities did not prevent those who landed from wantonly butchering several of the natives at Magdalena.

The inhabitants of these islands collectively, says Captain Cook, are without exception, the finest race of people in the South sea. For symmetry of shape, and regular features, they perhaps surpass all other nations. Not a single deformed or ill-proportioned person was seen on the island; all were strong, tall, well-limbed, and remarkably active. The men are about five feet ten or six feet high; their teeth are not so good, nor are their eyes so full and lively, as those of many other nations: their hair is of many colours, but none red; some have it long, but the most general custom is to wear it short, except a bunch on each side of the crown, which they tie in a knot: their countenances are pleasing, open, and full of vivacity; they are of a tawny complexion, which is rendered almost black by punctures over the whole body. They were entirely naked, except a small piece of cloth round their waist and loins. The punctures were disposed with the utmost regularity, so that the marks on each leg, arm, and cheek, were exactly similar. The women, in two days time, began to appear in considerable numbers, and the sailors found them not less kind than those of the other islands which they had visited: they were inferior to the men in stature, but well proportioned: their general colour was brown; no punctures were observed upon them; they wore a single piece of cloth made of the mulberry bark, which covered them from the shoulders to the knees.

The principal head dress used in the islands, and what appears to be their chief ornament, is a sort of broad fillet, curiously made of the fibres of the husks of cocoa nuts; in the front is fixed a mother-of-pearl shell, wrought round to the size of a tea saucer; before that another smaller, of very fine tortoiseshell, perforated into curious figures; also before, and in the centre of that, is another round piece of mother-of-pearl, about the size

of half a crown; and before this another piece of perforated tortoiseshell, the size of a shilling. Besides this decoration in front, some have it also on each side, but in small pieces; and all have fixed to them the tail feathers of cocks, or tropic birds, which, when the fillet is tied on, stand upright, so that the whole together makes a very sprightly ornament. They wear round the neck a kind of ruff or necklace made of light wood, the outward and upper sides covered with small pease, which are fixed on with gum; they also wear some bunches of human hair fastened to a string, and tied round the legs and arms. But all the above ornaments are seldom seen on the same person. All these ornaments, except the last, they freely parted with for a trifling consideration; but the human hair they valued very highly, though these bunches were the usual residence of many vermine. It is probable, that these were worn in remembrance of their deceased relations, and therefore were looked upon with some veneration; or they may be the spoils of their enemies, worn as the honourable testimonies of victory. However, a large nail, or something which struck their eyes, commonly got the better of their scruples. The king, or chief of the island, came to visit Captain Cook: he was the only one seen completely dressed in this manner. Their ordinary ornaments are necklaces, and amulets made of shells, &c. All of them had their ears pierced, though none were seen with ear-rings. The king had not much respect paid him by his attendants; he presented Captain Cook with some fruit and hogs; and acquainted him that his name was *Honoo*, and that he was *he-ka-at*, which title seems to correspond with the *aree* of Otaheite, and *areke* of the Friendly isles. Their dwellings are in the valleys, and on the sides of the hills near their plantations. They are built in the same manner as those at Otaheite, which will be particularly described when we speak of that island; but they are much meaner, and are only covered with the leaves of the bread-fruit tree; in general, they are built on a square or oblong pavement of stone, raised some height above the level of the ground; they likewise have such pavement near their houses, on which they sit to eat and amuse themselves. Along the uppermost edge of the mountain a row of stakes or palisadoes, closely connected together, were seen like a fortification, in which, by the help of glasses, appeared something like huts, which seemed to bear a great resemblance to the hupas of New Zealand, which will be described in speaking of that country. Their canoes resemble those of Otaheite, but not so large; their heads had commonly some flat upright piece, on which the human face was coarsely carved; and their sails were made of mats, triangular in shape, and very broad at the top: the paddles which they used were of heavy hard wood; short, but sharp-pointed, and with a knob at the upper end; they were from 10 to 22 feet long, and about 15 inches broad.

Their weapons were all made of the club wood, or casuarina; and were either plain spears about 8 or 10 feet long, or clubs which commonly had a knob at one end. They have also slings with which they throw stones with great velocity, and to a great distance, but not with a good aim.

The

Marquesas,

Marquesas. The language of these people is much nearer to that of Otaheite than any other dialect in the South sea, except that they could not pronounce the letter *r*.

The only quadrupeds seen here were hogs, except rats; here were fowls, and several small birds in the woods, whose notes were very melodious. The chief difference between the inhabitants of the Marquesas and those of the Society islands seems to consist in their different degrees of cleanliness: the former do not bathe two or three times a-day, nor wash their hands and face before and after every meal, as the latter do; and they are besides very slovenly in the manner of preparing their meals. Their diet is chiefly vegetable; though they have hogs and fowls, and catch abundance of fish at certain times. Their drink is pure water, cocoa nuts being scarce here.

It was not long before the propensity of the natives was discovered to be rather to receive than give; for when they had taken a nail as the price of a bread-fruit, the article so purchased could not be obtained from them. To remove this dishonest disposition, Captain Cook ordered a musket to be fired over their heads, which terrified them into fair dealing.

Soon after the natives had gathered courage enough to venture on board the ship, one of them unfortunately stole an iron stanchion from the gangway, with which he sprang into the sea, and, notwithstanding its weight, swam with it to his canoe, and was making to the shore with all speed. A musket was fired over his head to frighten him back, but to no effect, he still continued to make off with his booty; the whistling of another ball over his head was as ineffectual; an officer, less patient of such an injury than reason and humanity should have taught him to be, levelled a musket at the poor fellow, and shot him through the head. Captain Cook had given orders to fire *over* the canoe, but not to kill any one; he was in a boat, and came up with the canoe soon after. There were two men in her: one sat bailing out the blood and water in a kind of hysteric laugh; the other, a youth of about 14 or 15 years of age, who afterwards proved to be the son of the deceased, fixed his eyes on the dead body with a serious and dejected countenance. This act of severity, however, did not estrange the islanders to the ship, and a traffic was carried on to the satisfaction of both parties; bread-fruit, bananas, plantains, and some hogs, were given in exchange for small nails, knives, and pieces of Amsterdam cloth; red feathers of the Amsterdam island were greatly esteemed here. Captain Cook, accompanied by the gentlemen of the ship, in their walks about the country, lighted on the house which had been the habitation of the man who had been shot; there they found his son, who fled at their approach; they inquired for his female relations, and were told that they remained at the top of the mountain to weep and mourn for the dead. Notwithstanding they were then among the relations of a man who had been killed by them, not the least tokens of animosity or revenge were discernible among the natives.

The weather being extremely hot, the inhabitants made use of large fans to cool themselves, of which great numbers were purchased: the fans were formed of a kind of tough bark, or grass, very firmly and curiously plaited, and frequently whitened with

shell-lime. Some had large feathered leaves of a Marquesa kind of palm, which answered the purpose of an um- Marquet brella.

The natives at length became so familiar as to mount the sides of the ship in great numbers. They frequently danced upon the decks for the diversion of the sailors: their dances very much resembled those of Otaheite; their music too was very much the same.

A sailor having been inattentive to his duty, received several blows from Captain Cook; on seeing which, the natives exclaimed *tape-a-hei-te-tina*, "he beats his brother." From other instances that had occurred, it was clear that they knew the difference between the commander and his people, but at the same time they conceived them all brethren; and, says Mr Forster, "to me the most natural inference is, that they only applied an idea to us in this case, which really existed with regard to themselves; they probably look on themselves as one family, of which the eldest born is the chief or king."

MARQUETRY, INLAID WORK; a curious kind of work, composed of pieces of hard fine wood of different colours, fastened, in thin slices, on a ground, and sometimes enriched with other matters, as tortoise-shell, ivory, tin, and brass.

There is another kind of marquetry made, instead of wood, of glasses of various colours; and a third, where nothing but precious stones and the richest marbles are used: but these are more properly called *mosaic work*. See **MOSAIC**.

The art of inlaying is very ancient; and is supposed to have passed from the east to the west, as one of the spoils brought to the Romans from Asia. Indeed it was then but a simple thing; nor did it arrive at any tolerable perfection till the 15th century among the Italians: it seems, however, to have arrived at its height in the 17th century among the French.

Till John of Verona, a cotemporary with Raphael, the finest works of this kind were only black and white, which are what we now call *Morescos*; but that religious, who had a genius for painting, stained his woods with dyes or boiled oils, which penetrated them. But he went no farther than the representing buildings and perspectives, which requires no great variety of colours. Those who succeeded him, not only improved on the invention of dyeing the woods, by a secret which they found of burning them without consuming, which served exceedingly well for the shadows; but had also the advantage of a number of fine new woods of naturally bright colours, by the discovery of America. With these assistances the art is now capable of imitating any thing; whence some call it the *art of painting in wood*.

The ground whereon the pieces are to be ranged and glued, is ordinarily of oak or fir well dried; and to prevent warping, is composed of several pieces glued together. The wood to be used, being reduced into leaves, of the thickness of a line, is either stained with some colour or made black for shadow; which some effect by putting it in sand, extremely heated over the fire, others by steeping it in lime-water and sublimate, and others in oil of sulphur.—Thus coloured, the contours of the piece are formed according to the parts of the design they are to represent.

This

Marquetry,
Marquis.

This last is the most difficult part of marquetry, and that wherein most patience and attention are required. The two chief instruments used herein are the saw and the vice; the one to hold the matters to be formed; the other, to take off from the extremes, according to occasion. The vice is of wood, having one of its chaps fixed; the other moveable, and is opened and shut by the foot, by means of a cord fastened to a treadle. Its structure is very ingenious, yet simple enough.

The leaves to be formed (for there are frequently three or four of the same kind formed together) are put within the chaps of the vice, after being glued on the outermost part of the design whose profile they are to follow; then the workman pressing the treadle, and thus holding fast the piece, with his saw runs over all the outlines of the design.—By thus joining and forming three or four pieces together, they not only gain time, but the matter is likewise the better enabled to sustain the efforts of the saw; which, how delicate soever it may be, and how lightly soever the workman may conduct it, without such a precaution would be apt to raise splinters, to the ruin of the beauty of the work.

When the work is to consist of one single kind of wood, or of tortoise-shell, on a copper or tin ground, or *vice versa*, they only form two leaves on one another, i. e. a leaf of metal, and a leaf of wood or shell: this they call *sawing in counter parts*; for by filling the vacancies of one of the leaves by the pieces coming out of the other, the metal may serve as a ground to the wood, and the wood to the metal.

All the pieces thus formed by the saw, and marked to know them again, and the shadow given in the manner already mentioned; they veneer or fasten each in its place on the common ground; using for that purpose the best English glue.

The whole is put in a press to dry, planed over, and polished with the skin of the sea-dog, wax, and shave-grass, as in simple veneering; with this difference, however, that in marquetry the fine branches, and several of the more delicate parts of the figures, are touched up and finished with the graver.

It is the cabinetmakers, joiners, and toymen, among us, who work in marquetry; it is the enamellers and stone-cutters who deal in mosaic works: the instruments used in the former are mostly the same with those used by the ebonists.

MARQUIS, a title of honour, next in dignity to that of duke. His office is to guard the frontiers and limits of the kingdom, which were called the *marches*, from the Teutonic word *marche*, a "limit:" as, in particular, were the marches of Wales and Scotland while they continued hostile to England. The persons who had command there, were called *lords marchers*, or *marquesses*; whose authority was abolished by statute 27 Hen. VIII. c. 27. though the title had long before been made a mere design of honour. Robert Vere, earl of Oxford, being created marquis of Dublin by Richard II. in the eighth year of his reign. A marquis is created by patent; his mantle is double ermine, three doublings and a half; his title is *most honourable*; and his coronet has pearls and strawberry leaves intermixed round, of equal height.

VOL. XII. Part II.

MARR, that part of Aberdeenshire situated between the rivers Dee and Don.

MARRACCI, LEWIS, a learned Italian, was born at Lucca in Tuscany in 1612. After having finished his juvenile studies, he entered into the congregation of regular clerks of the mother of God, and distinguished himself early by his learning and merit. He taught rhetoric seven years, and passed through several offices of his order. He applied himself principally to the study of languages, and attained of himself the knowledge of the Greek, the Hebrew, the Syriac, the Chaldee, and Arabic; which last he taught some time at Rome, by the order of Pope Alexander VII. Pope Innocent XI. chose him for his confessor, and placed great confidence in him. He would have advanced him to ecclesiastical dignities, if Marracci had not opposed him.—Marracci died at Rome in 1700, aged 87.—He was the author of several pieces in Italian; but the grand work, which has made him deservedly famous all over Europe, is his edition of the Alkoran, in the original Arabic, with a Latin version, notes, and confutation of his own. It was beautifully printed in two vols. folio at Padua in 1698. The Latin version of the Alkoran, by Marracci, with notes and observations from him and others, and a synopsis of the Mahometan religion, by way of introduction, was published by Heineccius at Leipsic, 1721, in 8vo. Marracci had also a hand in the "Biblia sacra Arabica, sacrae congregationis de propaganda fide jussu edita, ad usum ecclesiarum orientalium," Rome, 1671, in 3 vols. folio.

MARRIAGE, a contract, both civil and religious, between a man and a woman, by which they engage to live together in mutual love and friendship for the ends of procreation, &c. See *MORAL Philosophy*.

Marriage is part of the law of nations, and is in use among all people. The Romanists account it a sacrament.—The woman, with all her moveable goods, immediately upon marriage, passes wholly *in potestatem viri*, into the power and disposal of the husband."

The first inhabitants of Greece lived together without marriage. Cecrops, king of Athens, is said to have been the first author of this honourable institution among that people. After the commonwealths of Greece were settled, marriage was very much encouraged by their laws, and the abstaining from it was discountenanced and in many places punished. The Lacedæmonians were very remarkable for their severity towards those who deferred marriage beyond a limited time, as well as to those who wholly abstained from it. The Athenians had an express law, that all commanders, orators, and persons intrusted with any public affair, should be married men. Polygamy was not commonly tolerated in Greece. The time of marriage was not the same in all places. The Spartans were not permitted to marry till they arrived at their full strength; the reason assigned for which custom by Lycurgus was, that the Spartan children might be strong and vigorous: and the Athenian laws are said to have once ordered, that men should not marry till 35 years of age. The season of the year which they preferred for this purpose was the winter, and particularly the month of January, called *Gamelion*. The Greeks thought

Marr
||
Marriage.

Marriage.

thought it scandalous to contract marriage within certain degrees of consanguinity; whilst most of the barbarous nations allowed incestuous mixtures.

Most of the Grecian states, especially such as made any figure, required their citizens should match with none but citizens, and the children were not allowed to marry without the consent of their parents. The usual ceremony in promising fidelity was kissing each other, or giving their right hands, which was a general form of ratifying all agreements. Before the marriage could be solemnized, the gods were to be consulted, and their assistance implored by prayers and sacrifices, which were offered to some of the deities that superintended these affairs, by the parents or nearest relations of the persons to be married. When the victim was opened, the gail was taken out and thrown behind the altar, as being the seat of anger and malice, and therefore the aversion of all the deities who had the care of love, as well as those who became their votaries. For the particularities relating to the bride and bridegroom, see BRIDE and BRIDE-GROOM.

The Romans as well as the Greeks, disallowed of polygamy. A Roman might not marry any woman who was not a Roman. Among the Romans, the kalends, nones, and ides of every month were deemed unlucky for the celebration of marriage, as was also the feast of the *parentalia*, and the whole month of May. The most happy season in every respect was that which followed the ides of June.

The Roman laws speak of second marriages in very hard and odious terms: *Matre jam secundis nuptiis fœnestata*, L. iii. C. de sec. nuptiis. By these laws it was enacted, that the effects of the husband or wife deceased should pass over to the children, if the survivor should marry a second time. By the law *Hæc edictali* (Cod. de sec. nupt.), the survivor, upon marrying a second time, could not give the person he married a portion more than equal to that of each of the children. In the primitive church the respect to chastity was carried so high, that a second marriage was accounted no other than a lawful whoredom, or a species of bigamy; and there are some ancient canons which forbid the ecclesiastics from being present at second marriages.

Marriage, by the Mosaic law, was subject to several restrictions: thus by Levit. chap. xviii. ver. 16. a man was forbid to marry his brother's widow unless he died without issue; in which case it became enjoined as a duty. So it was forbid to marry his wife's sister, while she was living, ver. 18.; which was not forbidden before the law, as appears from the instance of Jacob.

The ancient Roman law is silent on this head; and Papinian is the first who mentions it, on occasion of the marriage of Caracalla. The lawyers who came after him stretched the bonds of affinity so far, that they placed adoption on the same foot with nature.

Affinity, according to the modern canonists, renders marriage unlawful to the fourth generation, inclusive; but this is to be understood of direct affinity, and not of that which is secondary or collateral. *Affinis mei affinis, non est affinis meus*. It is farther to be observed, that this impediment of marriage does not only follow an affinity contracted by lawful matrimony, but also that

contracted by a criminal commerce; with the difference, that this last does not extend beyond the second generation; whereas the other, as has been observed, reaches to the fourth.

In Germany they have a kind of marriage called *morganatic*, wherein a man of quality contracting with a woman of inferior rank, he gives her the left hand in lieu of the right; and stipulates in the contract that the wife shall continue in her former rank or condition; and that the children born of them shall be of the same, so that they become bastards as to matters of inheritance, though they are legitimate in effect. They cannot bear the name or arms of the family. None but princes and great lords of Germany are allowed this kind of marriage. The universities of Leipsic and Jena have declared against the validity of such contracts; maintaining that they cannot prejudice the children, especially when the emperor's consent intervenes in the marriage.

The Turks have three kinds of marriages, and three sorts of wives; *legitimate*, *wives in kebisa*, and *slaves*. They marry the first, hire the second, and buy the third.

Among all the savage nations, whether in Asia, Africa, or America, the wife is commonly bought by the husband from her father or those other relations who have an authority over her; and the conclusion of a bargain for this purpose, together with the payment of the price, has therefore become the usual form or solemnity in the celebration of their marriages. The Hebrews also purchased their wives by paying down a competent dowry for them; and Aristotle makes it one argument to prove that the ancient Grecians were an uncivilized people, because they used to buy their wives; and in proportion as they laid aside their barbarous manners they left off this practice.

The English law considers marriage in no other light than as a civil contract; the holiness of the matrimonial state being left entirely to the ecclesiastical law, to which it pertains, to punish or annul incestuous or other unscriptural marriages. The law allows marriage to be good and valid, where the parties at the time of making it were willing and able to contract, and actually did contract, in the proper forms and solemnities required by law. The disabilities for contracting are of two sorts: first, such as are canonical, and therefore sufficient by the ecclesiastical laws to void the marriage in the spiritual court; such as pre-contract, consanguinity or relation by blood; and affinity, or relation by marriage, and some particular corporal infirmities. But these disabilities in our law do not make the marriage *ipso facto* void, but voidable only by sentence of separation; and marriages are esteemed valid to all civil purposes, unless such separation is actually made during the life of the parties. Thus when a man had married his first wife's sister, and after her death the bishop's court was proceeding to annul the marriage and bastardise the issue, the court of king's bench granted a prohibition *quoad hoc*; but permitted them to proceed to punish the husband for incest.

By 32 Hen. VIII. c. 38. it is declared, that all persons may lawfully marry but such as are prohibited by God's law, &c. And that nothing (God's law excepted) shall impeach any marriage but within the Levitical degrees: these are enumerated in the 18th. chapter.

Marriage.

chapter of Leviticus, and are illustrated by Lord Coke in this manner: a man may not marry his mother, father's sister, mother's sister, sister, daughter, daughter of his son or daughter, father's wife, uncle's wife, father's wife's daughter, brother's wife, wife's sister, son's wife, or wife's daughter, and daughter of his wife's son or daughter. And a woman may not marry her father, father's brother, mother's brother, brother, son, son of her husband's son or daughter, mother's husband, aunt's husband, sister's husband, husband's brother, and son of her husband's son or daughter. By the civil law first cousins are allowed to marry; but by the canon law both first and second cousins are prohibited. Therefore when it is vulgarly said that first cousins may marry but second cousins cannot, this probably arose by confounding these two laws; for first cousins may marry by the civil law, and second cousins cannot by the canon law. But by the fore-said stat. 32 Hen. VIII. c. 38. it is clear, that both first and second cousins may marry. By the same statute all impediments arising from precontracts to other persons were abolished, and declared of none effect unless they had been consummated with bodily knowledge; in which case the canon law holds such contract to be a marriage *de facto*. But this branch of the statute was repealed by 2 and 3 Ed. VI. c. 23. How far the act of 26 Geo. II. c. 33. (which prohibits all suits in ecclesiastical courts to compel a marriage in consequence of any contract) may collaterally extend to revive this clause of Henry VIII.'s statute, and abolish the impediment of precontract, Judge Blackstone leaves to be considered by the canonists. We shall here observe, that on a promise of marriage, if it be mutual on both sides, damages may be recovered in case either party refuses to marry; and though no time for the marriage is agreed on, if the plaintiff avers that he offered to marry the defendant who refused it, an action is maintainable for the damages; but no action shall be brought upon any agreement except it is in writing, and signed by the party to be charged. The canonical hours for celebrating marriage are from 8 to 12 in the forenoon.

The other sort of disabilities are those which are created, or at least enforced, by the municipal laws. These civil disabilities make the contract void *ab initio*, by rendering the parties incapable of forming any contract at all. The first legal disability is a prior marriage, or having another husband or wife living; in which case, besides the penalties consequent upon it as a felony, the second marriage is to all intents and purposes void. See BIGAMY and POLYGAMY.

The next legal disability is want of age: therefore if a boy under 14, or a girl under 12 years of age, marries, when either of them comes to the age of consent, they may disagree and declare the marriage void, without any divorce or sentence in the spiritual court. However, in our law it is so far a marriage, that if at the age of consent they agree to continue together, they need not be married again. Another incapacity arises from want of consent of parents or guardians. By several statutes, viz. 6 and 7 W. III. c. 6, 7, 8. W. III. c. 35. 10 Ann. c. 19. penalties of 100l. are laid on every clergyman who marries a couple either without publication of banns, which may give notice to parents or guardians, or without a license, to ob-

tain which the consent of parents or guardians must be sworn to. And by 4 and 5 Ph. and M. c. 8. who-soever marries any woman-child under the age of 16 years, without consent of parents or guardians, shall be subject to fine or five years imprisonment; and her estate during her husband's life shall be enjoyed by the next heir. Thus also in France the sons cannot marry without consent of parents till 30 years of age, nor the daughters till 25; and in Holland the sons are at their own disposal at 25, and the daughters at 20. And by the marriage act, viz. 26 Geo. II. c. 33. it is enacted, that all marriages celebrated by license (for banns suppose notice), where either of the parties is under 21, not being a widow or widower, without the consent of the father, or if he be not living, of the mother or guardians, shall be absolutely void. However, provision is made where the mother or guardian is *non compos*, beyond sea, or unreasonably froward, to dispense with such consent at the discretion of the lord chancellor; but no provision is made in case the father should labour under any mental or other incapacity. A fourth incapacity is want of reason. It is provided by 15 Geo. II. c. 30. that the marriage of lunatics and sons under phrensies (if found lunatics under a commission or committed to the care of trustees by any act of parliament) before they are declared of sound mind by the lord chancellor or the majority of such trustees, shall be totally void. Lastly, The parties must not only be willing and able to contract, but must actually contract themselves in due form of law, to make it a good civil marriage. Any contract made *per verba de presenti*, or in words of the present tense, and in case of cohabitation *per verba de futuro* also between persons able to contract, was before the late act deemed a valid marriage to many purposes, and the parties might be compelled in the spiritual courts to celebrate it *in facie ecclesie*. But these verbal contracts are now of no force to compel a future marriage. Nor is any marriage at present valid that is not celebrated in some parish church or public chapel, unless by dispensation from the archbishop of Canterbury. It must also be preceded by publication of banns or by license from the spiritual judge. A marriage in pursuance of banns must be solemnized in one of the churches or chapels where the banns were published. No parson, vicar, &c. shall be obliged to publish banns of matrimony, unless the persons to be married shall, seven days before the time required for the first publication, deliver to him a notice in writing of their true names, and of the house or houses of their respective abode within such parish, &c. and of the time that they have dwelt in such house or houses. And the said banns shall be published upon three Sundays preceding the solemnization of marriage during the time of public service: in case the parents or guardians, or either of the parties who shall be under the age of 21 years, shall openly and publicly declare, or cause to be declared, in the church or chapel where the banns shall be so published, at the time of such publication, their dissent to such marriage, such publication of banns shall be void. And when the parties dwell in divers parishes, the curate of the one parish shall not solemnize matrimony betwixt them without a certificate of the banns being thrice asked from the curate

Marriage.

Marriage. of the other parish. A marriage in pursuance of a license (except a special license), must be solemnized in such church or chapel where the license is granted; and no license of marriage shall be granted by any archbishop, bishop, &c. to solemnize any marriage in any other church, &c. than in the parish church, &c. within which the usual place of abode of one of the parties shall have been for four weeks immediately before the granting such license. By the same statute all marriages shall be solemnized in the presence of two credible witnesses at the least, besides the minister, who shall sign their attestation thereof; and immediately after the celebration of every marriage, an entry thereof shall be made in the parish register, expressing that the said marriage was celebrated by banns or license; and if both or either of the parties be under age, with consent of the parents or guardians, as the case shall be, signed by the minister, and also by the parties married, and attested by the two witnesses present. It is held to be also essential to a marriage, that it be performed by a person in orders; though the intervention of a priest to solemnize this contract is merely *juris positivi* and not *juris naturalis aut divini*; it being said that Pope Innocent III. was the first who ordained the celebration of marriage in the church, before which it was totally a civil contract. And in the times of the grand rebellion, all marriages were performed by the justices of the peace; and these marriages were declared valid without any fresh solemnization, by 12 Car. II. c. 33. But as the law now stands, we may upon the whole collect, that no marriage by the temporal law is *ipso facto* void, that is celebrated by a person in orders; in a parish church, a public chapel, or elsewhere, by a special dispensation; in pursuing of banns or a license; between single persons; consenting; of sound mind; and of the age of 21 years; or of the age of 14 in males and 12 in females, with consent of parents or guardians, or without it, in case

of widowhood. And no marriage is voidable by the ecclesiastical law after the death of either of the parties; nor during their lives, unless for the canonical impediments of precontract, if that indeed still exists; of consanguinity; and of affinity or corporeal imbecility subsisting previous to the marriage.

By 26 Geo. II. c. 33. the substance of which has been already recited, if any person shall solemnize matrimony in any other place than a church, &c. where banns have been usually published, unless by special license, or without publication of banns, unless license of marriage be first obtained from some person having authority to grant the same, every such person knowingly so offending shall be guilty of felony, and transported for 14 years; the prosecution to be within three years. By the same statute, to make a false entry into a marriage register; to alter it when made; to forge or counterfeit such entry, or a marriage license, or aid and abet such forgery; to utter the same as true, knowing it to be counterfeit; or to destroy or procure the destruction of any register in order to vacate any marriage, or subject any person to the penalties of this act; all these offences, knowingly and wilfully committed, subject the party to the guilt of felony without benefit of clergy. But this act doth not extend to the marriages of the royal family; nor to Scotland; nor to any marriages among the people called *Quakers*, or among persons professing the Jewish religion, where both the parties are Quakers or Jews respectively; nor to any marriages beyond the seas.

In Scotland, the parties living together as husband and wife, or declaring themselves so before witnesses, makes a valid though informal marriage. See LAW, Part III. N^o 160.

For the proportions which marriages bear to births, and births to burials, in several parts of Europe, Mr Derham gives us the following table.

Names of Places.	Marriages to Births, as	Births to Burials, as
England in general	1 to 4.63	1.12 to 1
London	1 to 4	1. to 1.1
Hantsire, from 1569 to 1658	1 to 4	1.2 to 1
Tiverton in Devonshire from 1656 to 1664	1 to 3.7	1.26 to 1
Cranbrook in Kent, from 1560 to 1649	1 to 3.9	1.6 to 1
Aynho, in Northamptonshire, for 118 years	1 to 6	1.6 to 1
Upminster in Essex, for 100 years	1 to 4.6	1.8 to 1
Franckfort on the Main, in 1695	1 to 3.7	1.2 to 1
Old, Middle, and Lower Marck, in 1698	1 to 3.7	1.9 to 1
Dominions of the elector of Brandenburg, in 1698	1 to 3.7	1.5 to 1
Breslaw in Silesia, from 1687 to 1691	— — —	1.6 to 1
Paris, in 1670, 1671, 1672	1 to 4.7	1.6 to 1

Marriage.

The following TABLE, similar to the preceding, is formed from the observations collected and referred to by Dr Price.

Marriage.

Names of Places.	Marriages to Births, as	Births to Burials, as
London, annual medium from 1716 to 1736 -	— — —	18,000 to 26,529, or 1 to 1.4, &c.
— from 1759 to 1768 -	— — —	15,710 to 22,956, or 1 to 1.4, &c.
Northampton, ditto, from 1741 to 1770 -	— — —	155 to 191, or 1 to 1.2, &c.
Norwich, ditto, from 1740 to 1769 -	— — —	1057 to 1206, or 1 to 1.1, &c.
Shrewsbury, ditto, from 1762 to 1768 -	— — —	301 to 329, or 1 to 1.09, &c.
Manchester and Salford, exclusive of dissenters -	— — —	— — —
Ditto, from 1755 to 1759 -	— — —	756 to 743, — — —
Ditto, ditto, including dissenters, from 1768 to 1772 -	— — —	1098 to 958, or 1.14, &c. to 1.
Gainsborough in Lincolnshire, ditto, from 1752 to 1771 -	1 to 3.7	126 to 105, or 1.2 to 1.
Madeira, ditto, from 1759 to 1766 -	1 to 4.68	2201 to 1293, or 1.7 to 1.
Boston in New England, from 1731 to 1752 -	— — —	538 to 608, or 1 to 1.13, &c.
Christiana in Norway, in 1761 -	— — —	11,024 to 6929, or 1.5 to 1.
Paris, mean of some of the last years -	1 to 4.3	19,100 to 19,400, or 1 to 1.01, &c.
Vienna, annual medium from 1757 to 1769 -	— — —	5800 to 6600, or 1 to 1.1, &c.
Amsterdam, ditto, for some of the last years -	1 to 1.9, &c.	4600 to 8000, or 1 to 1.1, &c.
Copenhagen, ditto -	1 to 3.04, &c.	2700 to 3300, or 1 to 1.2, &c.
Berlin, ditto, for five years, ending at 1759 -	1 to 3.9, &c.	3855 to 5054, or 1 to 1.3, &c.
Breslaw, ditto, from 1633 to 1734 -	— — —	1089 to 1256, or 1 to 1.15, &c.
—, ditto, from 1717 to 1725 -	— — —	1252 to 1507, or 1 to 1.2, &c.
Rome, ditto, from 1759 to 1761 -	— — —	5167 to 7153, or 1 to 1.3, &c.
Vaud in Switzerland, ditto, for 10 years before 1766 -	1 to 3.9	3155 to 2504, or 1.2, &c. to 1.

For an account of the numbers of male and female stillborn children and chrysons, and of boys and girls under ten, of married men and married women, and of widows and widowers, who died for a course of years at Vienna, Breslaw, Dresden, Leipzig, Ratisbon, and some other towns in Germany, see Phil. Trans. Abr. vol. vii. part iv. p. 46, &c.

The reader may find many curious calculations and remarks relating to this subject in Dr Price's excellent work, entitled, *Observations on Reversionary Payments*. From the preceding table it appears, that marriages, one with another, do each produce about four births, both in England and other parts of Europe. Dr Price observes, that the births at Paris, as may be seen in the table, are above four times the weddings; and therefore it may seem, that in the most healthy country situations, every wedding produces above four children; and though this be the case in Paris, for reasons which he has given, he has observed nothing like it in any other great town. He adds, that from comparing the births and weddings in countries and towns where registers of them have been kept, it appears, that in the former, marriages one with another seldom produce less than four children each; generally between four and five, and sometimes above five; but in towns seldom above four, generally between three and four, and sometimes under three. It is necessary to be observed here, that though the proportion of annual births to weddings has been considered as giving the true number of children derived from each marriage, taking all marriages one with another: yet this is only true, when, for many years, the births and burials have kept nearly equal. Where there is an excess of the births occasioning an increase, the proportion of annual births to weddings must be

less than the proportion of children derived from each marriage; and the contrary must take place where there is a decrease: and by Mr King's computation, about one in a hundred and four persons marry; the number of people in England being estimated at five millions and a half, whereof about forty-one thousand annually marry.

In the district of Vaud in Switzerland, the married are very nearly a third part of the inhabitants.

Major Graunt and Mr King disagree in the proportions between males and females, the latter making 10 males to 13 females in London; in other cities and towns, and in the villages and hamlets, 100 males to 99 females: but Major Graunt, both from the London and country bills, computes, that there are in England 14 males to 13 females; whence he justly infers, that the Christian religion, prohibiting polygamy, is more agreeable to the law of nature than Mahometanism and others that allow it.

This proportion of males to females Mr Derham thinks pretty just, being agreeable to what he had observed himself. In the hundred years, for instance, of his own parish register of Upminster, though the burials of males and females were nearly equal, being 633 males and 623 females in all that time; yet there were baptized 709 males and but 675 females, which is 13 females to 13.7 males.

From a register kept at Northampton for 28 years, from 1741 to 1770, it appears, that the proportion of males to females that were born in that period is 2361 to 2288, or nearly 13.4 to 13. However, though more males are born than females, Dr Price has sufficiently shown, that there is a considerable difference between the probabilities of life among males and females in favour of the latter; so that males are more shortlived

Marriage. shortlived than females; and as the greater mortality of males takes place among children, as well as among males at all ages, the fact cannot be accounted for merely by their being more subject to untimely deaths by various accidents, and by their being addicted to the excesses and irregularities which shorten life. Mr Kersseboom informs us, that, during the course of 125 years in Holland, females have in all accidents of age lived about three or four years longer than the same number of males. In several towns of Germany, &c. it appears that of 7270 married persons who had died, the proportion of married men who died to the married women was 3 to 2; and in Breslaw for eight years, as 5 to 3. In all Pomerania, during nine years from 1748 to 1756, this proportion was nearly 15 to 11. Among the ministers and professors in Scotland, 20 married men die to 12 married women at a medium of 27 years, or in the proportion of 5 to 3; so that there is the chance of 3 to 2, and in some circumstances even a greater chance, that the woman shall be the survivor of a marriage, and not the man; and this difference cannot be accounted for merely by the difference of age between husbands and their wives, without admitting the greater mortality of males. In the district of Vaud in Switzerland, it appears, that half the females do not die till the age of 46 and upwards, though half the males die under 36. It is likewise an indisputable fact, that in the beginning of life, the rate of mortality among males is much greater than among females.

From a table formed by Dr Price, from a register kept for 20 years at Gainsborough, it appears, that of those who lived to 80, the major part, in the proportion of 49 to 32, are females. Mr Deparcieux at Paris, and Mr Wargentin in Sweden, have farther observed, that not only women live longer than men, but that married women live longer than single women. From some registers examined by Mr Muret in Switzerland, it appears, that of equal numbers of single and married women between 15 and 25, more of the former died than of the latter, in the proportion of 2 to 1.

With respect to the difference between the mortality of males and females, it is found to be much less in country parishes and villages than in towns; and hence it is inferred, that human life in males is more brittle than in females, only in consequence of adventitious causes, or of some particular debility, that takes place in polished and luxurious societies, and especially in great towns.

From the inequality above stated between the males and females that are born, it is reasonable to infer, that one man ought to have but one wife; and yet that every woman without polygamy may have a husband: this surplusage of males above females being spent in the supplies of war, the seas, &c. from which the women are exempt.

Perhaps, says Dr Price, it might have been observed with more reason, that this provision had in view that particular weakness or delicacy in the constitution of males, which makes them more subject to mortality; and which consequently renders it necessary that more of them should be produced, in order to preserve in the world a due proportion between the two sexes.

That this is a work of Providence, and not of chance, is well made out by the very laws of chance

by Dr Arbuthnot; who supposes Thomas to lay against **Marriage.** John, that for 82 years running more males shall be born than females; and giving all allowances in the computation to Thomas's side, he makes the odds against Thomas, that it does not so happen, to be near five millions of millions of millions of millions to one; but for ages of ages, according to the world's age, to be near an infinite number to one.

According to Mr Kersseboom's observations, there are about 325 children born from 100 marriages.

Mr Kersseboom, from his observations, estimates the duration of marriages one with another, as in the following table.

Those whose ages, taken together, make

40, live together between 24 and 25 years.		
50	22	23
60	23	21
70	19	20
80	17	18
90	14	15
100	12	13

Phil. Trans. N^o 468. sect. iii. p. 319.

Dr Price has shown, that on De Moivre's hypothesis, or that the probabilities of life decrease uniformly (see *COMPLEMENT of Life*;) the duration of survivorship is equal to the duration of marriage, when the ages are equal; or, in other words, that the expectation of two joint lives, the ages being equal, is the same with the expectation of survivorship; and, consequently, the number of survivors, or (which is the same, supposing no second marriages) of widows and widowers, alive together, which will arise from any given set of such marriages constantly kept up, will be equal to the whole number of marriages, or half of them (the number of widows in particular) equal to half the number of marriages. Thus, the expectation of two joint lives, both 40, is the third of 46 years, or their complement, i. e. 15 years and 4 months; and this is also the expectation of the survivor. That is, supposing a set of marriages between persons all 40, they will one with another last just this time, and the survivors will last the same time. In adding together the years which any great number of such marriages, and their survivorships, have lasted, the sums would be found to be equal. It is observed farther, that if the number expressing the expectation of single or joint lives, multiplied by the number of single or joint lives whose expectation it is, be added annually to a society or town, the sum gives the whole number living together, to which such an annual addition would in time grow: thus, since 19, or the third of 57, is the expectation of two joint lives whose common age is 29, or common complement 57, 20 marriages every year between persons of this age would in 57 years grow to 20 times 19, or 380 marriages always existing together. The number of survivors also arising from these marriages, and always living together, would in twice 57 years increase to the same number. Moreover, the particular proportion that becomes extinct every year, out of the whole number constantly existing together of single or joint lives, must, wherever this number undergoes no variation, be exactly the same with the expectation of those lives at the time when their existence commenced. Thus, if it were found

Marriage. found that a 19th part of all the marriages among any body of men whose numbers do not vary, are dissolved every year by the death of either the husband or wife, it would appear, that 19 was at the time they were contracted, the expectation of these marriages. Dr Price observes, that the annual average of weddings among the ministers and professors in Scotland for the last 27 years has been 31; and the average of married persons for 17 years ending in 1767, had been 667. This number, divided by 31, gives 21½, the expectation of marriage among them; which, he says, is above 2½ years more than the expectation of marriage would be, by Dr Halley's table, on the supposition, that all first, second, and third marriages, may be justly considered as commencing one with another so early as the age of 30; and he has proved, that the expectation of two equal joint lives is to the expectation of a single life of the same age as 2 to 3: consequently, the expectation of a single life at 30, among the ministers in Scotland, cannot be less than 32.25. If we suppose the mean ages of all who marry annually to be 33 and 25, the expectation of every marriage would be 19 years; or one with another they would be all extinct in 19 years: the marriages which continue beyond this term, though fewer in number, enjoying among them just as much more duration as those that fall short of it enjoy less. But it appears from the observations and tables of Mr Muret, that, in the district of Vaud (dividing half the number of married persons, viz. 38,328, by the annual medium of weddings, viz. 808), the expectation of marriage is only 23½ years: so much higher are the probabilities of life in the country than in towns, or than they ought to be, according to De Moivre's hypothesis.

MARRIAGE (*Maritajium*), in *Law*, signifies not only the lawful joining of man and wife, but also the right of bestowing a ward or a widow in marriage, as well as the land given in marriage.

Dissolution of MARRIAGE. See **DIVORCE**.

Forcible MARRIAGE. See **FORCIBLE Marriage**.

Frank MARRIAGE. See **FRANK**.

Jactitation of MARRIAGE, in *Law*, is one of the first and principal matrimonial causes, when one of the parties boasts or gives out, that he or she is married to the other, whereby a common reputation of their matrimony may ensue. On this ground the party injured may libel the other in the spiritual court; and unless the defendant undertakes and makes out a proof of the actual marriage, he or she is enjoined perpetual silence on that head; which is the only remedy the ecclesiastical courts can give for this injury.

MARRIAGE Settlement is a legal act, previous to marriage, whereby a jointure is secured to the wife after the death of the husband. These settlements seem to have been in use among the ancient Germans, and their kindred nation the Gauls. Of the former Tacitus give us this account: *Dotem non uxor marito, sed uxori maritus affert: intersunt parentes et propinqui, et munera probant* (De Mor. Germ. c. 18.) And Cæsar (De Bell. Gallic. lib. vi. c. 18.) has given us the terms of a marriage settlement among the Gauls, as nicely calculated as any modern jointure: *Viri, quantas pecunias ab uxoribus dotis nomine acceperunt, tantas ex suis bonis, æstimatione facta, cum dotibus communicant.*

Hujus omnis pecuniæ conjunctim ratio habetur, fructusque servatur. Uter eorum vita superavit, ad eum pars utriusque cum fructibus superiorum temporum pervenit. The dauphin's commentator supposes that this Gaulish custom was the ground of the new regulations made by Justinian, Nov. 97. with regard to the provision for widows among the Romans; but surely there is as much reason to suppose, says Judge Blackstone, that it gave the hint for our statutable jointures. Comment. vol. ii. p. 138.

See an excellent marriage settlement by Blackstone in the appendix to the second volume of his Commentaries.

Duty of MARRIAGE, is a term used in some ancient customs, signifying an obligation on women to marry. To understand this, it must be observed, that old maids and widows about sixty, who held fees in body, or were charged with any personal or military services, were anciently obliged to marry, to render those services to the lord by their husbands, or to indemnify the lord for what they could not do in person. And this was called *duty or service of marriage*.

Policy of encouraging MARRIAGE.—Till the principles of population were explained by Malthus, it was generally held to be the interest of governments to encourage marriage, and to discourage celibacy. Dr Halley has enlarged on this subject, and has shown by computation, that were it not for the backwardness of people to marry, from the prospect of the necessary trouble and charge in providing for a family, there might be four times as many births as there are. It has been a favourite object, too, with most of the governments of Europe at one time or another, to encourage marriage with the view of increasing the population. But we know now that all such attempts are not merely idle, but mischievous. The motives that lead men to marry are at all times sufficiently powerful, and the most common error of individuals has been, not in resisting, but in yielding to these motives, without a due regard to prudence. Population, so far from requiring any artificial stimulus, has a constant tendency to exceed the means of subsistence; and it is only kept down to the proper level, partly by the prudence of those who live in celibacy, and partly by the pressure of misery from the want or the insufficiency of food. To increase the number of marriages, therefore, without regard to the ability of the parents to bring up their offspring, would have the effect of bringing human beings into the world to be destroyed by want or disease.

MARROW, in *Anatomy*, a soft oleaginous substance contained in the cavity of the bones. See **ANATOMY**, N^o 5.

MARRUBIUM, WHITE HOREHOUND; a genus of plants belonging to the didynamia class; and in the natural method ranking under the 42d order, *Verticillata*. See **BOTANY Index**.

MARS, in *Astronomy*, one of the eleven planets, situated without the earth's orbit, and remarkable for the extent of its atmosphere and the redness of its light. See **ASTRONOMY Index**.

The red colour of this planet, according to Dr* *Supplement* Brewster*, is owing to the same cause as the redness of the morning and evening clouds. When a beam of white light passes through any medium, its colour in-
mentary

 Marra.

Mars,
Marsais.

clines to red, in proportion to the space through which it has travelled, and the density of the medium. The momentum of the red or least refrangible rays being greater than that of the violet or most refrangible rays, the former will make their way through the resisting medium, while the latter are either reflected or absorbed. The colour of the beam, therefore, when it reaches the eye, must partake of the colour of the least refrangible ray; and the redness of this colour must increase with the number of the violet rays that have been obstructed. Hence we see, that the sun, moon, and stars appear red, when in the horizon; and that every luminous object seen through a mist is of a ruddy hue. Now, the planet Mars is allowed to have an atmosphere of great density and extent, as is manifest from the dim appearance of the fixed stars that are placed at a considerable distance from his disk. The sun's light, therefore, by which this planet is illuminated, having to pass twice through the atmosphere of Mars before it reaches the earth, must be deprived of a great proportion of the violet rays; and consequently the colour of the resulting light by which Mars is visible, must be red.—As there is a considerable difference of colour among the other planets, and likewise among the fixed stars, are we not entitled to conclude, that those in which the red colour predominates, have the greatest or the densest atmospheres? According to this principle, Saturn must have the next greatest atmosphere to that of Mars.

MARS, in Pagan worship, the god of war. He was, according to some, the son of Jupiter and Juno; while others say that he was the son of Juno alone, who being displeased at Jupiter's having produced Minerva from his brain, without female aid, in revenge conceived without the assistance of the other sex, by touching a flower shown to her by Flora in the plains of Oléus, and became the mother of this formidable deity. The amours of Mars and Venus, and the manner in which Vulcan caught and exposed them to the laughter of the other gods, have been described by several of the ancient poets. He is represented as having several wives and mistresses, and a considerable number of children. He was held in the highest veneration by the Romans, both from his being the father of Romulus their founder, and from their inclination to conquest; and had magnificent temples erected to him at Rome.

Mars is usually represented in a chariot, drawn by furious horses. He is completely armed; and extends his spear with the one hand, and grasps a sword, imbrued in blood, with the other. He has a fierce and savage aspect. Discord is represented preceding his car; and Clamour, Fear, and Terror, appear in his train. The victims sacrificed to him were the wolf, the horse, the woodpecker, the vulture, and the cock.

MARS, among the older chemists, denotes *iron*; that metal being supposed to be under the influence of the planet Mars.

MARSAIS, CESAR CHESNEAU DU, an eminent literary character, was born at Marseilles 1676. He attached himself at an early period of life to the order of the congregation of the oratory; but the situation was too narrow for his genius, and he soon left it. At Paris he married, became advocate, and entered on this

new profession with great success and approbation. Disappointed, however, in his expectations of making a speedy fortune, he abandoned the law also. About this time the peevish humour of his wife occasioned a separation. We next find him as governor to the son of the president de Maisons; and when the premature death of the father deprived him of the fruits of his industry, he engaged with the famous Law in the same capacity. After the fall of this extraordinary projector, he completed the education of the marquis de Beaufremont's children, and reared pupils worthy of his genius and industry. Although he was accused of a tendency to Deism, and though there was good reason for the accusation, yet he never infused into the minds of his scholars any principle inconsistent with sound morality, or with the Christian religion. When he left M. de Beaufremont's family, he took a boarding house, in which, after a method of his own, he educated a certain number of young men. Unexpected circumstances obliged him to abandon this useful undertaking. He was even constrained to give some occasional lessons for the bare necessaries of life. Without fortune, without hope, and almost without resource, he was reduced to extreme indigence. In this situation he was found by the authors of the *Encyclopédie*, and made a partner in conducting that great work. Among many other excellent pieces, the article *Grammar* breathes the spirit of sound philosophy. His principles are clear and solid. He discovers an extreme knowledge of the subject, great accuracy in the rules, and great propriety in the application. M. le Comte de Lauraguais was so much affected with the distresses, and so much convinced of the merit of *Du Marsais*, that he procured him a pension of 1000 livres. Du Marsais died at Paris on the 11th of June 1756, in his eightieth year, after having received the sacrament. The compliment which he paid to the priest on this occasion has been considered by some as rather equivocal. But there is no necessity to deprive religion of this triumph, or philosophy of that honour which conviction and penitence must confer on it. "The faith of a great genius (says Bayle, who is entitled to credit on this subject), is not totally extinguished: It is like a spark under the ashes. Reflection and the prospect of danger call forth its exertions. There are certain situations in which philosophers are as full of anxiety and remorse as other men." Whatever were the last sentiments of Du Marsais, it cannot be denied that in the vigour of health he furnished several examples of irreligion, and to these have been added many absurd stories. The superiority of Du Marsais's talents consisted in exactness and perspicuity. His ignorance of the world, and of the customs of mankind, together with the greatest latitude in expressing whatever he thought, gave him that frank and unguarded simplicity which is often the chief ingredient of genuine humour. Fontenelle used to say of him, "that he was the most lively simpleton, and as a man of wit the most simple he ever knew." He was the Fontaine of philosophers. In consequence of this character, he was a nice judge of what was natural in every production, and a great enemy to all kind of affectation. His principal works are, 1. *Exposition de la doctrine de l'Eglise Gallicane par rapport aux pretensions de la Cour de Rome*, 12mo. This accurate work was begun at the desire of the president

Marsais

Marsais
||
Marseilles.

sident de Maisons, and did not appear till after the death of the author. 2. *Exposition d'une methode raisonnée pour apprendre la langue Latine*, 12mo, 1722, rare. This method appears conformable to the natural unfolding of the powers of the mind, and on that account renders the acquisition of the language less difficult; but it was liable to two great objections to vulgar and unenlightened understandings, namely, its novelty, and the censure which it conveyed against the former method. 3. *Traité des tropes*, 1730, 8vo; again printed in 1771, 12mo. This work is intended to explain the different significations of the same word. It is a masterpiece of logic, of accuracy, of perspicuity, and precision. The observations and the rules are illustrated by striking examples calculated to show both the use and the abuse of the rhetorical figures. It is wonderful at the same time that this excellent book had very little sale, and is scarcely known. A gentleman who wanted to compliment the author on this extraordinary performance, told him that he had heard a great deal of his *Histoire des Tropes*, and begged to know in what particular part of the world the nation flourished. 4. *Les veritables Principes de la Grammaire raisonnée pour apprendre la langue Latine*, 1729, 4to. There was only the preface of this work published, in which he introduced the greatest part of his *methode raisonnée*. 5. *Labiege de la fable du Pere Jouvenci*, arranged after the manner of the original plan, 1731, 12mo. 6. *Une reponse manuscrite à la Critique de l'Histoire des Oracles par le Pere Baltus*. There are only imperfect fragments of these papers to be found. 7. *Logique, ou reflexions sur les operations de l'Esprit*. This is a short tract, which nevertheless contains every thing necessary to be known in the art of reasoning. It was reprinted at Paris in two parts, together with the articles which he had furnished for the *Encyclopédie*, 1762.

MARSAL, a town of France, in Lorrain, remarkable for its salt works; seated in a marsh on the river Selle, of difficult access, which, together with the fortifications, render it an important place. E. Long. 6. 43. N. Lat. 48. 46.

MARSALA, an ancient and strong town of Sicily, in the valley of Mazara. It is well peopled, and built on the ruins of the ancient Lilybœum. E. Long. 12. 27. N. Lat. 37. 52.

MARSAN, or MOUNT MARSAN, a town of France, in Gascony, and capital of a small territory of the same name, fertile in wine; seated on the river Miduse, in W. Long. 0. 39. N. Lat. 44. 0.

MARSAQUIVER, or MARSALQUIVER, a strong and ancient town of Africa, on the coast of Barbary, and in the province of Beni Arax, in the kingdom of Tremesen, with one of the best harbours in Africa. It was taken by the Spaniards in 1732. It is seated on a rock near a bay of the sea, in W. Long. 0. 10. N. Lat. 35. 40.

MARSEILLES, a strong sea port, and the richest town of Provence, in France. Here is a good harbour, where the French galleys are stationed; for it will not admit large men of war. Before the revolution 4500 vessels entered the harbour every year. The entrance, which is extremely narrow and surrounded by lofty mountains, protects and shelters vessels during the most violent storms. The port itself forms a delightful walk, even in the middle of winter, as it is

VOL. XII. Part II.

open to the southern sun, and crowded with vast numbers of people, not only of all the European nations, but of Turks, Greeks, and natives of the coast of Barbary. The whole scene is one of the most agreeable that can be imagined, if the chains of the galley slaves heard among the hum of business did not tincture it with the hateful idea of slavery. The galleys themselves rot in their respective stations: and it is said that no others will ever be constructed to supply their place, as they have long ceased to be of any utility to the state. Marseilles pretends to the most remote antiquity; a colony of Phocians, in ages unknown, having given it birth. It is divided into the Old Town and the New; which are separated by a street, bordered with trees on each side. The Old Town is one of the worst built of any in Europe. The New has sprung up since the commencement of the 18th century, and has all that regularity, elegance, and convenience, which distinguish the present times. It is said to contain 100,000 inhabitants, and is one of the most trading towns in France. Without the walls is the castle of Notre-Dame, which is very well fortified. It is a bishop's see, and there is a French academy; it having been noted at all times for men of learning. There is also a cabinet of natural history. In 1660, Louis XIV. built the citadel and Fort St John to keep the inhabitants in awe, because they pretended to be free. The Jesuits had a very fine observatory here; and in the arsenal, built not long ago, there are arms for 40,000 men. In the House of Discipline they weave gold, silver, and silk brocades. The drugs are brought thither from all parts of the world. It is seated on the north shore of the Mediterranean, in E. Long. 5. 22. N. Lat. 43. 18. The surrounding country is rocky and barren, but covered for several miles on all sides with villas and summer houses, which commerce has erected.

MARSH, NARCISSUS, a learned Irish prelate, was born at Hannington in Wiltshire in 1638. He was made principal of St Alban's hall, Oxford, in 1673, but removed to the provostship of Dublin college in 1678, promoted to the bishopric of Leighlin and Ferns in 1682, translated to the archbishopric of Cashel in 1690, to Dublin in 1694, and to Armagh in 1703. While he held the see of Dublin, he built a noble library for the use of the public, filled it with choice books, and settled a provision for two librarians. He repaired, at his own expence, several decayed churches, besides buying in and restoring many impropriations, and presenting a great number of oriental MSS. to the Bodleian library. He was a very learned and accomplished man; was well versed in sacred and profane literature, in mathematics, natural philosophy, the learned languages, especially the oriental, and in both the theory and practice of music. He published, 1. *Institutiones logicæ. Manuductio ad logicam*, written by Philip de Trieu; to which he added the Greek text of Aristotle and some tables and schemes. 3. An introductory essay on the doctrine of sounds, &c. He died in 1713.

MARSH, signifies a piece of ground flowed with water, yet so that the grass and other vegetables rise above the surface of the water, and, by their decaying, give rise to putrid effluvia, which are very pernicious to the human body.

MARSHAL, or MARESCHAL, (*marescallus*), primarily

Marseilles
||
Marshal.

†

4 H

Marshal.

marily denotes an officer who has the care or the command of horses. Nicod derives the word from *polemarchus*, "master of the camp;" Matthew Paris from *Martis senescallus*. In the old Gaulish language, *marsh* signified "horse;" whence *mareschal* might signify "him who commanded the cavalry." Other derivations have been given by different authors; and the name itself has been applied to officers of very different employments.

MARSHAL of France, the highest dignity of preference in the French armies under the old government. The dignity of marshal came to be for life, though at its first institution it was otherwise. They were then only the king's first ecuyers under the constable; but in time they became the constable's lieutenants in the command of the army, the constable himself being then become captain general. At first they were but two in number; and their allowance was but 500 livres per annum in time of war, and nothing in time of peace; but in the reign of Francis I. a third was added; Henry II. created a fourth. Since it has been various; Louis XIV. increased it to 20. Their office at first was, to marshal the army under the constable, and to command in his absence. They did then what the *marshals de camp* do now; to which last they have given their title, and the least considerable part of their authority.

Earl MARSHAL of Scotland. His office was to command the cavalry, whereas the CONSTABLE commanded the whole army. They seem, however, to have had a sort of joint command, as of old all orders were addressed "to our constable and marischal." The office of earl marischal has never been out of the noble family of Keith. It was reserved at the Union; and when the heritable jurisdictions were bought, it was in the crown, being forfeited by the rebellion of Geo. Keith, earl marischal, in 1715.

Earl MARSHAL of England, is the eighth great officer of state. This office, until it was made hereditary, always passed by grant from the king, and never was held by tenure or serjeantry (by any subject), as the offices of lord high steward and lord high constable were sometimes held. The title is personal, the office honorary and officary. They were formerly styled *lord marshal* only, until King Richard II. June 20. 1397, granted letters patent to Thomas Mowbray, earl of Nottingham, and to the heirs male of his body lawfully begotten, by the name and style of *earl marshal*; and further, gave them power to bear in their hand a gold truncheon, enamelled with black at each end; having at the upper end of it the king's arms engraven thereon, and at the lower end his own arms.

King James I. was pleased, by letters patent, dated August 29th 1622, to constitute Thomas Howard, earl of Arundel and Surrey, earl marshal for life; and the next year, the same king granted (with the advice of the privy-council) letters patent, wherein it was declared, that during the vacancy of the office of lord high constable of England, the earl marshal had the like jurisdiction in the court of chivalry, as both constable and marshal jointly ever exercised. See *CHIVALRY, Court of*.

On the 19th of October 1672, King Charles II. was pleased to grant to Henry Lord Howard, and the

heirs male of his body lawfully begotten, the office and dignity of earl marshal of England, with power to execute the same by deputy or deputies, in as full and ample a manner as the same was heretofore executed by Henry Howard, Lord Maltravers, late earl of Arundel, Surrey, and Norfolk, grandfather to the said Henry Lord Howard; or by Thomas Howard late duke of Norfolk, grandfather to the said Thomas Howard, late earl of Arundel, Surrey, and Norfolk; or by Thomas Howard duke of Norfolk, grandfather of the said Thomas Howard duke of Norfolk; or by John Mowbray duke of Norfolk, or any other earl marshal of England; with a pension of 20l. each year, payable out of the hanaper office in chancery; and on default of the issue-male of the said Henry Lord Howard, with limitation to the heirs male lawfully begotten of the body of the said Thomas Howard earl of Arundel, &c.; and, on the default of such issue male, to descend in like manner to the heirs male of Thomas late earl of Suffolk; and, on default of his issue male, to the heirs male of Lord William Howard, late of Naworth in the county of Cumberland, youngest son to Henry Howard late duke of Norfolk; and, on default of his issue-male, to Charles Howard earl of Nottingham, and the heirs male of his body lawfully begotten.

Field-MARSHAL, an officer of high rank in the European armies. It is now, however, disused in the British army; Lord Tyrawley was the last, appointed in 1763.

Knight-MARSHAL, or *MARSHAL of the King's House*, an English officer, whose business, according to Fleta, is to execute the commands and decrees of the lord steward, and to have the custody of prisoners committed by the court of verge. Under him are six marshals men, who are properly the king's bailiffs, and arrest in the verge of the court, when a warrant is backed by the board of green-cloth. The court where causes of this kind, between man and man, are tried, is called the *Marshalsea*, and is under the knight-marshal. See *MARSHALSEA*.

This is also the name of the prison in Southwark; the reason of which may probably be, that the marshal of the king's house was wont to sit there in judgment, or keep his prison.

MARSHAL of the King's Bench, an officer who has custody of the prison called the *King's Bench* in Southwark. He gives attendance upon the court, and takes into his custody all prisoners committed by the court; he is finable for his absence, and non-attendance incurs a forfeiture of his office. The power of appointing the marshal of the king's bench is in the crown.

In Fleta, mention is also made of a *marshal of the exchequer*, to whom the court commits the custody of the king's debtors, &c.

MARSHALLING a COAT, in *Heraldry*, is the disposal of several coats of arms belonging to distinct families in one and the same escutcheon or shield, together with their ornaments, parts, and appurtenances. See *HERALDRY*, chap. vi. p. 466.

MARSHALSEA, the *Court of*, and the *Palace Court* at Westminster, though two distinct courts, are frequently confounded together. The former was originally holden before the steward and marshal of the king's

Marshal
||
Marshal-
sea

Marshalsea king's house, and was instituted to administer justice between the king's domestic servants, that they might not be drawn into other courts, and thereby the king lose their service. It was formerly held in, though not a part of, the *aula regis*; and, when that was subdivided, remained a distinct jurisdiction: holding plea of all trespasses committed within the verge of the court, where only one of the parties is in the king's domestic service (in which case the inquest shall be taken by a jury of the country); and of all debts, contracts, and covenants, where both of the contracting parties belong to the royal household; and then the inquest shall be composed of men of the household only. By the statute of 13 Rich. II. stat. 1. c. 3. (in affirmance of the common law), the verge of the court in this respect extends for 12 miles round the king's place of residence. And, as this tribunal was never subject to the jurisdiction of the chief justiciary, no writ of error lay from it (though a court of record) to the king's bench, but only to parliament, till the statutes of 5 Edw. III. c. 2. and 10 Edw. III. stat. 2. c. 3. which allowed such writ of error before the king in his place. But this court being ambulatory, and obliged to follow the king in all his progresses, so that by the removal of the household actions were frequently discontinued, and doubts having arisen as to the extent of its jurisdiction, King Charles I. in the sixth year of his reign, by his letters patent, erected a new court of record, called the *curia palatii*, or *palace court*, to be held before the steward of the household and knight-marshal, and the steward of the court, or his deputy; with jurisdiction to hold plea of all manner of personal actions whatsoever, which shall arise between any parties within 12 miles of his majesty's palace at Whitehall. The court is now held once a week, together with the ancient court of marshalsea, in the borough of Southwark: and a writ of error lies from thence to the court of king's bench. But if the cause is of any considerable consequence, it is usually removed on its first commencement, together with the custody of the defendant, either into the king's bench or common pleas, by a writ of *habeas corpus cum causa*: and the inferior business of the court hath of late years been much reduced, by the new courts of conscience erected in the environs of London; in consideration of which the four counsel belonging to these courts had salaries granted them for their lives by the stat. 23 Geo. II. c. 27.

MARSHFIELD, a town of Gloucestershire, seven miles from Bath, and 104 from London, on the road to Bristol, and on the very borders of Wilts. It is a considerable clothing town, derives a good trade in malt, and is famous for cakes. It consists chiefly of one street of old buildings near a mile long; and is governed by a bailiff. The number of inhabitants in 1801 amounted to 1246. It has a large church, with a well endowed alms house, and a charity school; and it has a weekly market and two fairs.

MARSHLAND, a marshy peninsula in the county of Norfolk, opposite to King's Lynn, almost surrounded with the Ouse and other navigable rivers, and an arm of the sea. It seems formerly to have been recovered out of the ocean, from whose inundations it could never be altogether defended; and in Sir Henry Spelman's time it suffered two general ones, viz. one from

the salt water, the other from the freshes; by the last of which the inhabitants suffered 42,000l. damage. It contains about 30,000 acres, which turn to more profit by grazing than ploughing. It is about 10 miles in the widest place, and has no less than 111 brick bridges. The commonage of it belongs to seven villages that surround it. The air is so unhealthy, that an ague is commonly called *the Marshland bailiff*.

MARSHMALLOW. See *ALTHEA*, *BOTANY Index*.
MARSI, a nation of Germany, who afterwards came to settle in Italy, where they occupied the territory in the environs of the Fucine lake. They at first proved very inimical to Rome, but in process of time they became its firmest supporters. They were allowed by the Romans to be the most intrepid soldiers of their legions when in friendship, and the most formidable of their enemies when at variance; and it was a common saying, that Rome could neither triumph over the Marsi nor without them. They are particularly celebrated for the civil war in which they were engaged, and which from them has received the name of the *Marsian war*. The large contributions they made to support the interest of Rome, and the number of men which they continually supplied to the republic, rendered them bold and aspiring; and they claimed, with the rest of the Italian states, a share of the honour and privileges which were enjoyed by the citizens of Rome. This petition, though supported by the interest, the eloquence, and the integrity of the tribune Drusus, was received with contempt by the Roman senate; upon which, in the 662d year of Rome, the Marsi put themselves at the head of the Social war, one of the most obstinate and dangerous oppositions ever made to the progress of the Roman power. They obtained several victories: but they were at last defeated; though the war was not terminated but by a grant of those privileges for which they contended.

MARSICO NUOVO, a small, rich, and handsome town of Italy, in the kingdom of Naples, and in the Hither Principato, with a bishop's see. It is seated at the foot of the Apennines, near the river Agri, in E. Long. 15. 49. N. Lat. 20. 42.

MARSIGLI, **LEWIS FERDINAND**, COUNT, an Italian, famous for letters as well as arms, was descended from an ancient and noble family, and born at Bologna in 1658. He acquired a great knowledge in the art of war and fortification; served under the emperor Leopold II. against the Turks, by whom he was taken prisoner in 1683, but redeemed, after a year's captivity. In the Spanish succession war, Marsigli, then advanced to the rank of marshal, being in the fortress of Brisac, which surrendered to the duke of Burgundy in 1703, when the place was deemed capable of holding out much longer, was stripped of all his commissions, and had his sword broke over him; and the count d'Arco who commanded was beheaded. Marsigli now sought for consolation in the sciences; and amidst all the hurry and fatigue of war, he had made all the advantages the most philosophic man could do, who had travelled purely in quest of knowledge. He had a rich collection of every thing proper to the advancement of natural knowledge, instruments astronomical and chemical, plans of fortifications, models of

Marnigli
||
Mart.

machines, &c. all which he presented to the senate of Bologna by an authentic act in 1712, forming at the same time out of them what he called *the Institute of the arts and sciences at Bologna*. He also founded a printing house, and furnished it with the best types for Latin, Greek, Hebrew, and Arabic, which he presented in 1728 to the Dominicans at Bologna, on condition of their printing all the writings of the *Institute* at prime cost: this was called the *printing house of St Thomas Aquinas*. His writings on philosophical subjects are numerous and valuable, in Latin, Italian, and French. He died in 1730.

MARSTON, JOHN, an English dramatic writer, who lived in the time of James I. Wood says he was a student in Corpus Christi college, Oxford; but neither his family nor the time of his birth is known. He produced eight plays for the stage, which were all acted at Blackfriars with applause: and one of them, called the *Dutch Courtesan*, was once revived since the Restoration, under the title of the *Revenge*, or a *Match in Newgate*. There is no account when he died; but we find his works were published after his death by Shakespeare, and may thence reasonably conclude that it happened about the year 1614. He was a chaste and pure writer; avoiding all that obscenity, ribaldry, and scurrility, which too many of the playwrights of that time, and indeed much more so in some periods since, have made the basis of their wit, to the great disgrace and scandal of the stage.

MARSYAS, in fabulous history, a celebrated musician of Celæne, in Phrygia, son of Olympus, or of Hyagnis, or Oeagrus. He was so skilful in playing on the flute, that he is generally deemed the inventor of it. According to the opinion of some, he found it when Minerva had thrown it aside on account of the distortion of her face when she played upon it. Marsyas was enamoured of Cybele, and he travelled with her as far as Nysa, where he had the imprudence to challenge Apollo to a trial of his skill as a musician. The god accepted the challenge, and it was mutually agreed that he who was defeated should be flayed alive by the conqueror. The Muses, or (according to Diodorus) the inhabitants of Nysa, were appointed umpires. Each exerted his utmost skill, and the victory, with much difficulty, was adjudged to Apollo. The god upon this tied his antagonist to a tree, and flayed him alive: (See APOLLO). The death of Marsyas was universally lamented; the Fauns, Satyrs, and Dryads, wept at his fate; and from their abundant tears arose a river of Phrygia, well known by the name of *Marsyas*. The unfortunate Marsyas is often represented on monuments, as tied with his hands behind his back to a tree, while Apollo stands before him with his lyre in his hands. In independent cities, among the ancients, the statue of Marsyas was generally erected in the forum, to represent the intimacy which subsisted between Bacchus and Marsyas as the emblems of liberty. At Celæne, the skin of Marsyas was shown to travellers for some time. It was suspended in the public place, in the form of a bladder or a foot ball.

The sources of the Marsyas were near those of the Meander, and those two rivers had their confluence a little below the town of Celæne.

MART, a great fair held every year for buying

and selling goods. Public marts, or places of buying and selling, such as markets and fairs, with the tolls thereunto belonging, can only be set up by virtue of the king's grant, or by long and immemorial usage and prescription, which presupposes such a grant. The limitation of these public resorts, to such time and place as may be most convenient for the neighbourhood, forms a part of economics, or domestic polity; which, considering the kingdom as a large family, and the king as the master of it, he has clearly a right to dispose and order as he pleases.

MARTABAN, a province of Asia, in the kingdom of Pegu, lying on the gulf of Bengal. It is a country that produces rice and all kinds of fruits proper to the climate. It has mines of several sorts of metals, and carries on a great trade. The chief town, which is of the same name, is rich, handsome, and very populous, with a good harbour. E. Long. 97. 50. N. Lat. 15. 35.

MARTEAU, the name given by French naturalists to a peculiar species of oysters, called also *malhus* by others, the figure of which is that of a hammer, or rather of a pickaxe. See OSTREA, CONCHOLOGY *Index*.

MARTHA, ST, a province, of South America, on the coast of Terra Firma, bounded on the north by the North sea, on the east by Rio de la Hache, on the south by New Granada, and on the west by Carthage-na. It is 300 miles in length and 200 in breadth, is a mountainous country, and the land very high. Here begins the famous ridge of mountains called the *Cordilleras des los Andes*, which run from north to south the whole length of the continent of South America. It is extremely hot on the sea coast; but cold in the internal parts, on account of the mountains. It abounds with the fruits proper to the climate; and there are mines of gold and precious stones, as also salt works. The Spaniards possess but one part of this province, in which they have built St Martha the capital. The air about the town is wholesome; and it is seated near the sea, having a harbour surrounded with high mountains. It was formerly very considerable when the galleons were sent thither, but is now come almost to nothing. W. Long. 74. 11. N. Lat. 11. 20.

MARTHA'S Vineyard, an island of North America, near the coast of New England, 80 miles south of Boston. It is sixteen miles in length and eight in breadth, and has a light soil, which in some places is fertile. In conjunction with neighbouring islands of smaller size, it forms Duke's county, containing about 3200 inhabitants. The climate is temperate and healthy; the winter is generally mild, and in summer the temperature seldom exceeds 80 of Fahrenheit. The inhabitants apply themselves chiefly to the fisheries, in which they have great success. W. Lon. 70. 35. N. Lat. 41. 0.

MARTIAL, is sometimes used to express preparations of iron, or such as are impregnated therewith; as the martial regulus of antimony, &c.

MARTIAL Court. See COURT Martial.

MARTIAL Law, is the law of war that depends upon the just but arbitrary will and pleasure of the king, or his lieutenant: for though the king doth not make any laws but by common consent in parliament, yet, in time of war, by reason of the necessity of it to guard against

Mart
||
Martial
Law.

Martial
Law
||
Martin.

against dangers that often arise, he useth absolute power, so that his word is a law. *Smith de Repub. Ang. lib. ii. c. 4.*

But the martial law (according to Chief Justice Hale), is in reality not a law, but something indulged rather than allowed as a law; and it relates only to members of the army, being never intended to be executed on others, who ought to be ordered and governed by the laws to which they are subject, though it be a time of war. And the exercise of martial law, whereby any person might lose his life, or member, or liberty, may not be permitted in time of peace, when the king's courts are open for all persons to receive justice.

MARTIALIS, MARCUS VALERIUS, a famous Latin poet, born at Bilbilis, now called *Bubiera*, in the kingdom of Arragon in Spain, was of the order of knights. He went to Rome at the age of 21, and staid there 35 years, under the reign of Galba and the succeeding emperors, till that of Trajan; and having acquired the esteem of Titus and Domitian, he was created tribune. At length, finding that he was neglected by Trajan, he returned to his own country Bilbilis, where he married a wife, and had the happiness to live with her several years. He admires and commends her much, telling her that she alone was sufficient to supply the want of every thing he enjoyed at Rome. "*Romam tu mihi sola facis,*" says he, in the 21st epigram of the 12th book. She appears likewise to have been a lady of a very large fortune; for, in the 31st epigram of the same book, he extols the magnificence of the house and gardens he had received from her, and says that she had made him a little kind of monarch.

*Munera sunt domino: post septima lustra reverso,
Has Marcella domos, parvaque regna dedit.*

There are still extant 14 books of his epigrams, filled with points, a play upon words, and obscenities. The style is affected. However, some of his epigrams are excellent; many of them are of the middling kind; but the greatest part of them are bad: so that Martial never spoke a greater truth, than when he said of his own works,

Sunt bona, sunt quædam mediocria, sunt mala plura.

There is also attributed to him a book on the spectacles of the amphitheatre; but the most learned critics think that this last work was not written by Martial. The best editions of Martial are, that in *Usum Delphini*, 4to, Paris, 1617, and that *cum Notis Variorum*.

MARTIGUES, a sea-port town of France, in Provence, with the title of a principality; seated near a lake 12 miles long and five broad, which is navigable throughout, and from whence they get excellent salt. E. Long. 4. 20. N. Lat. 43. 38.

MARTIN ST, was born at Sabaria in Pannonia, (at present *Stain* in Lower Hungary), in the beginning of the fourth century. His father was a military tribune; and he himself was obliged to carry arms, although peace and solitude were much more agreeable to his inclination. He was remarkable for every virtue, in a profession which is generally considered to give a sanction to vice. He divided his coat with a

naked wretch whom he met at the gate of Amiens; and it is reported, that Jesus Christ appeared to him on the night following, clothed in this half of his coat. Martin was then a catechumen; but he soon afterwards received baptism, and renounced the military profession for the ecclesiastical. After passing many years in solitude, St Hilary bishop of Poitiers gave him the power to cast out devils. On his return to Pannonia, he persuaded his mother to embrace Christianity; and with great zeal and activity opposed the Arians, who governed the church in Illyria. When he was publicly whipt for giving testimony to the divinity of Christ, he bore the punishment with the constancy and patience of the first martyrs. This illustrious champion for Christianity, when he heard that St Hilary was returned from banishment, went and settled in the neighbourhood of Poitiers. In this retirement, a great number of monks placed themselves under his direction. His virtues became every day more splendid and remarkable, till he was drawn from his solitude, and with the general approbation of the clergy and people elected bishop of Tours in the year 374. To the zeal and charity of a bishop, he joined the humility and poverty of an anchorite. That he might detach himself more from the world, he built the celebrated monastery of Marmoutier, which still remains, and which is believed to be the oldest abbey in France. It is situated near the city of Tours, betwixt the Loire and a steep rock. In this situation, together with 80 monks, St Martin displayed the most exemplary sanctity and mortification; nor were there any monks better disciplined than those of Marmoutier. After he had converted his diocese to the Christian faith, he became the apostle of all Gaul. He diffused the doctrines of Christianity among the heathens, destroyed their temples, and (according to the writers of his life), confirmed the truth by an infinite number of miracles. The emperor Valentinian, at that time in Gaul, received him with every mark of respect and honour. The tyrant Maximus, who had revolted against the emperor Gratian, and seized on Spain, England, and Gaul, received him in a manner no less distinguished. The holy bishop attended him at Treves in the year 383, to solicit some favours. Maximus made him sit at his table with the most illustrious persons of his court, and placed him at his right hand. In drinking, the usurper commanded his servants to give him a cup, that he might again receive it from him; but this extraordinary prelate gave it to the priest who accompanied him on his journey. This holy boldness, far from displeasing them, gained him the favour of the emperor and of his court. Martin, who was an enemy to heresy, but a friend of mankind, employed his influence with this prince to preserve the Priscillianists, who were prosecuted by Ithace and by Idace, bishops of Spain. The bishop of Tours would hold no communion with men whose principles of religion inclined them to shed the blood of mankind; and he obtained the life of those whose death they had solicited. On his return to Tours, he prepared himself for the reward of his labours in another world. He died at Candes the 8th of November 397, but according to others on the 11th of November 400. His name is given to a particular opinion concerning the mystery

Martin.

mystery of the holy Trinity. St Martin is the first of the saints confessors to whom the Latin church offered public prayers. His life is written in elegant Latin by Fortunatus, and Sulpicius Severus one of his disciples. Paul of Perigueux and Fortunatus of Poitiers have given us Sulpicius's life of Martin in verse; but they have debased the admirable prose of the author by a wretched poetical imitation. Nicolas Gervais wrote also the life of St Martin, full of many curious and entertaining facts, published at Tours in 1699, in 4to. The tradition at Amiens is, that St Martin performed the act of charity which rendered him so famous, near an ancient gate of the city, of which the ruins are still visible. The following Latin verses, which do more honour to the saint than to the poet, are inscribed on one of the stones:

*Hic quoniam vestem Martinus demidiavit;
Ut faceremus idem, nobis exemplificavit.*

MARTIN, Benjamin, one of the most eminent artists and mathematicians of the age, was born in 1704. After publishing a variety of ingenious treatises, and particularly a Scientific Magazine under his own name, and carrying on for many years a very extensive trade as an optician and globe-maker in Fleet-street, the growing infirmities of age compelled him to withdraw from the active part of business. Trusting too fatally to what he thought the integrity of others, he unfortunately, though with a capital more than sufficient to pay all his debts, became a bankrupt. The unhappy old man, in a moment of desperation from this unexpected stroke, attempted to destroy himself; and the wound, though not immediately mortal, hastened his death, which happened February 9. 1782, in his 78th year. He had a valuable collection of fossils and curiosities of almost every species; which, after his death, were almost given away by public auction. His principal publications, as far as they have occurred to recollection, are, *The Philosophic Grammar*; being a view of the present state of experimental physiology, or natural philosophy, 1735, 8vo. A new, complete, and universal System or Body of Decimal Arithmetic, 1735, 8vo. *The young Students Memorial Book, or Patent Library*, 1735, 8vo. *Description and Use of both the Globes, the Armillary Sphere and Orrery*, 1736, 2 vols, 8vo. *Memoirs of the Academy of Paris*, 1740, 5 vols. *System of the Newtonian Philosophy* 1759, 3 vols. *New Elements of Optics*, 1759. *Mathematical Institutions, viz. Arithmetic, Algebra, Geometry, Trigonometry, and Fluxions*, 1759. *Natural History of England*, with a Map of each County, 1759, 2 vols. *Philology, and Philosophical Geography*, 1759. *Mathematical Institutions*, 1764, 2 vols. *Lives of Philosophers, their Inventions, &c.* 1764. *Introduction to the Newtonian Philosophy*, 1765. *Institutions of Astronomical Calculations*, 2 parts, 1765. *Description and Use of the Air Pump*, 1766. *Description of the Torricellian Barometer*, 1766. *Appendix to the Description and Use of the Globes*, 1766. *Philosophia Britannica*, 1778, 3 vols. *Gentleman and Lady's Philosophy*, 3 vols. *Miscellaneous Correspondence*, 4 vols. *System of Philology. Philosophical Geography. Magazine complete*, 14 vols. *Principles of Pump-work.*

Theory of the Hydrometer. Doctrine of Logarithms.

MARTIN, St, a small but strong town of France in the isle of Rhée, with a harbour and a strong citadel, fortified after the manner of Vauban. The island lies near the coast of Poitou. W. Long. 1. o. N. Lat. 45. 40.

Cape MARTIN, a promontory of Valencia in Spain, near a town called *Demia*, separating the gulf of Valencia from that of Alicant.

MARTIN, St, an island of America, and one of the Caribbees, lying on the gulf of Mexico, to the north-west of St Bartholomew, and to the south-west of Anguilla. It is 42 miles in circumference; has neither harbour nor river, but several salt pits. After various revolutions, it is at length in possession of the French and Dutch, who possess it conjointly. W. Long. 62. 35. N. Lat. 18. 15.

MARTIN. See HIRUNDO, ORNITHOLOGY Index, and MUSTELA, MAMMALIA Index.

Free MARTIN, in Zoology, is a name given in this country to a cow calf cast at the same time with a bull calf, which is a kind of hermaphrodite that is never known to breed nor to discover the least inclination for the bull, nor does the bull ever take the least notice of it. See HERMAPHRODITE.

MARTINGALE, in the manege, a thong of leather, fastened to one end of the girths under a horse's belly, and at the other end to the muss-roll, to keep him from rearing.

MARTINICO, the chief of the French Caribbee islands, the middle of which is situated in W. Long. 61. o. N. Lat. 14. 30.

This island was first settled by M. Desnambuc a Frenchman, in the year 1635, with only 100 men from St Christopher's. He chose rather to have it peopled from thence than from Europe; as he foresaw, that men, tired with the fatigue of such a long voyage, would mostly perish soon after their arrival, either from the climate, or from the hardships incident to most emigrations. They completed their first settlement without any difficulty. The natives, intimidated by their fire-arms, or seduced by promises, gave up the western and southern parts of the island to the new comers. In a short time, however, perceiving the number of these enterprising strangers daily increasing, they resolved to extirpate them, and therefore called in the savages of the neighbouring islands to assist them. They fell jointly upon a little fort that had been hastily erected; but were repulsed, with the loss of 700 or 800 of their best warriors, who were left dead on the spot.

After this check, the savages for a long time disappeared entirely; but at last they returned, bringing with them presents to the French, and making excuses for what had happened. They were received in a friendly manner, and the reconciliation sealed with pots of brandy. This peaceable state of affairs, however, was of no long continuance; the French took such undue advantage of their superiority over the savages, that they soon rekindled in the others that hatred which had never been entirely subdued. The savages, whose manner of life requires a vast extent of land, finding themselves daily more and more straitened, had recourse to stratagem, in order to destroy their

Martin

Martinica

Martinico. their enemies. They separated into small bands, and way-laid the French as they came singly out into the woods to hunt, and waiting till the sportsman had discharged his piece, rushed upon and killed him before he could charge it again. Twenty men had been thus assassinated before any reason could be given for their sudden disappearance: but as soon as the matter was known, the French took a severe and fatal revenge; the savages were pursued and massacred, with their wives and children, and the few that escaped were driven out of Martinico, to which they never returned.

The French being thus left sole masters of the island, lived quietly on those spots which best suited their inclinations. At this time they were divided into two classes. The first consisted of those who had paid their passage to the island, and these were called *inhabitants*; and to these the government distributed lands, which became their own, upon paying a yearly tribute. These inhabitants had under their command a multitude of disorderly people, brought over from Europe at their expence, whom they called *engagés*, or bondsmen. This engagement was a kind of slavery for the term of three years: on the expiration of which they were at liberty, and became the equals of those whom they had served. They all confined themselves at first to the culture of tobacco and cotton; to which was soon added that of arnotto and indigo. The culture of sugar also was begun about the year 1650. Ten years after, one Benjamin d'Acosta, a Jew, planted some cocoa trees; but his example was not followed till 1684, when chocolate was more commonly used in France. Cocoa then became the principal support of the colonists, who had not a sufficient fund to undertake sugar plantations; but by the inclemency of the season in 1718, all the cocoa trees were destroyed at once.—Coffee was then proposed as a proper object of culture. The French ministry had received, as a present from the Dutch, two of these trees, which were carefully preserved in the king's botanical garden. Two young shoots were taken from these, put on board a ship for Martinico, and intrusted to the care of one Mr. Desclieux. The ship happened to be straitened for want of fresh water; and the trees would have perished, had not that gentleman shared with them that quantity of water which was allowed for his own drinking. The culture of coffee was then begun, and attended with the greatest and most rapid success. About the end of last century, however, the colony had made but small advances. In 1700, it had only 6597 white inhabitants. The savages, mulattoes, and free negroes, men, women, and children, amounted to no more than 507. The number of slaves was but 14,566. All these together made a population of 21,645 persons. The whole of the cattle amounted to 3668 horses or mules, and 9217 head of horned cattle. The island produced a great quantity of cocoa, tobacco, and cotton; had nine indigo houses, and, 183 small sugar plantations.

After the peace of Utrecht, Martinico began to emerge from that feeble state in which it had so long continued. The island then became the mart for all the windward French settlements. In the ports of it the neighbouring islands sold their produce, and bought the commodities of the mother country; and, in short,

Martinico became famous all over Europe. In 1736, Martinico. there were on the island 447 sugar works; 11,953,232 coffee trees, 103,870 of cocoa: 2,068,480 plants of cotton, 39,400 of tobacco, 6750 of arnotto. The supplies for provisions consisted of 4,806,142 banana trees, 34,483,000 trenches of cassava; and 247 plots of potatoes and yams. The number of blacks amounted to 72,000 men, women, and children. Their labour had improved the plantations as far as was consistent with the consumption then made in Europe of American productions; and the annual exports from the island amounted to about 700,000l.

The connexions of Martinico with the other islands entitled her to the profits of commission, and the charges of transport; as she alone was in the possession of carriages. This profit might be rated at the tenth of the produce; and the sum total must have amounted to near 765,000l. This standing debt was seldom called in, and left for the improvement of their plantations. It was increased by advances in money, slaves, and other necessary articles; so that Martinico became daily more and more a creditor to the other islands, and thus kept them in constant dependence; while they all enriched themselves by her assistance.

The connexions of this island with Cape Breton, Canada, and Louisiana, procured a market for the ordinary sugars, the inferior coffee, the molasses, and rum, which would not sell in France. In exchange the inhabitants received salt fish, dried vegetables, deals, and some flour. In the clandestine trade on the coasts of Spanish America, consisting wholly of goods manufactured by the nation, she commonly made a profit of 90 per cent. on the value of about 175,000l. sent yearly to the Caraccas, or neighbouring colonies.

So many prosperous engagements brought immense sums into Martinico. Upwards of 787,000l. were constantly circulated in that island with great rapidity; and this is perhaps the only country in the world where the specie has been so considerable as to make it a matter of indifference to them whether they dealt in gold, silver, or commodities. This extensive trade brought into the ports of Martinico annually 200 ships from France; 14 or 15 fitted out by the mother country for the coast of Guinea, 60 from Canada, 10 or 12 from the islands of Margarett and Trinidad; besides the English and Dutch ships that came to carry on a smuggling trade. The private navigation from the island to the northern colonies, to the Spanish continent, and to the windward islands, employed 120 vessels from 20 to 30 tons burden.

The war of 1744 put a stop to this prosperity. Not that the fault was in Martinico itself; its navy, constantly exercised, and accustomed to frequent engagements, which the carrying on a contraband trade required, was prepared for action. In less than six months, 40 privateers, fitted out at St Peter's, spread themselves about the latitude of the Caribbee islands. They signalized themselves in a manner worthy of the ancient freebooters; returning constantly in triumph, and laden with an immense booty. Yet, in the midst of these successes, an entire stop was put to the navigation of the colony, both to the Spanish coast and to Canada, and they were constantly disturbed even on their own coasts. The few ships that came from France,

Martinico. France, in order to compensate the hazards they were exposed to by the loss of their commodities, sold them at a very advanced price, and bought them at a very low one. By this means the produce decreased in value, the lands were ill cultivated, the works neglected, and the slaves perishing for want.

When every thing thus seemed tending to decay, the peace at last restored the freedom of trade, and with it the hopes of recovering the ancient prosperity of the island. The event, however, did not answer the pains that were taken to attain it. Two years had not elapsed after the cessation of hostilities, when the colony lost the contraband trade she carried on with the American Spaniards. This was owing to the substitution of register ships to the fleets; and thus were the attempts of the smugglers confined within very narrow bounds. In the new system, the number of ships was undetermined, and the time of their arrival uncertain: which occasioned a variation in the price of commodities unknown before; and from that time the smuggler, who only engaged in this trade from the certainty of a fixed and constant profit, would no longer pursue it, when it did not secure him an equivalent to the risks he ran. But this loss was not so sensibly felt by the colony, as the hardships brought upon them by the mother country. An unskilful administration clogged the reciprocal and necessary connection between the islands and North America with so many formalities, that in 1755 Martinico sent but four vessels to Canada. The direction of the colonies, now committed to the care of ignorant and avaricious clerks, soon lost its importance, sunk into contempt, and was prostituted to venality. The debts which had been contracted, during a series of calamities, had not yet been paid off, when the war broke out afresh. After a series of misfortunes and defeats, the island fell into the hands of the British. It was restored, however, in July 1763, 16 months after it had been conquered; but deprived of all the necessary means of prosperity, that had made it of so much importance. For some years past, the contraband trade carried on to the Spanish coasts was almost entirely lost. The cession of Canada had precluded all hopes of opening again a communication, which had only been interrupted by temporary mistakes. The productions of the Grenades, St Vincent, and Dominica, which were now become British dominions, could no longer be brought into their harbours; and a new regulation of the mother country, which forbade her having any intercourse with Guadaloupe, left her no hopes from that quarter.

The colony, thus deprived of every thing as it were, and destitute, nevertheless contained, at the last survey, which was taken on the 1st of January 1770, in the compass of 28 parishes, 12,450 white people of all ages and of both sexes; 1814 free blacks or mulattoes; 70,553 slaves, and 443 fugitive negroes. The number of births in 1766, was in the proportion of one in 30 among the white people, and of one in 25 among the blacks. From this observation, if it were constant, it should seem that the climate of America is much more favourable to the propagation of the Africans than of the Europeans: since the former multiply still more in the labours and hardships of slavery, than the latter in the midst of plenty and freedom.

The consequence must be, that in process of time the increase of blacks in America will surpass that of the white men; and, perhaps, at last avenge this race of victims on the descendants of the oppressors.

The cattle of the colony consists of 8283 horses or mules; 12,376 head of horned cattle; 975 hogs; and 13,544 sheep or goats.

Their provisions are, 17,930,596 trenches of cassava; 3,509,048 banana trees, and 406 squares and a hal fof yams and potatoes.

Their plantations contain 11,444 squares of land, planted with sugar; 6,638,957 coffee trees; 871,043 cocoa trees; 1,764,807 cotton plants; 59,966 trees of cassia, and 61 of arnotto.

The meadows or savannahs take up 10,072 squares of land; there are 11,966 in wood, and 8448 uncultivated or forsaken.

The plantations which produce coffee, cotton, cocoa, and other things of less importance, are 1515 in number. There are but 286 for sugar. They employ 116 water-mills, 12 wind-mills, and 184 turned by oxen. Before the hurricane of the 13th of August 1766, there were 302 small habitations and 15 sugar-works more.

In 1760, France imported from Martinico, upon 202 trading vessels, 177,116 quintals of fine sugar, and 12,579 quintals of raw sugar; 68,518 quintals of coffee; 11,731 quintals of cocoa; 6048 quintals of cotton; 2518 quintals of cassia; 783 casks of rum; 307 hogsheads of molasses; 150 pounds of indigo; 2147 pounds of preserved fruits; 47 pounds of chocolate; 282 pounds of rasped tobacco; 494 pounds of rope-yarn; 334 chests of liqueurs; 234 hogsheads of molasses, &c. 451 quintals of wood for dyeing; and 12,108 hides in the hair. All these productions together have been bought in the colony itself, for 536,631l. 9s. 10d. It is true, that the colony has received from the mother country to the amount of 588,412l. 16s. 6d. of merchandise; but part of this has been sent away to the Spanish coasts, and another part has been conveyed to the English settlements.

The island is 16 leagues in length and 45 in circumference, leaving out the capes, some of which extend two or three leagues to the sea. It is very uneven, and intersected in all parts by a number of hills; which are mostly of a conical form. Three mountains rise above these smaller eminences. The highest bears the indelible marks of a volcano. The woods with which it is covered continually attract the clouds, which occasions noxious damps, and contributes to make it horrid and inaccessible; while the two others are in most parts cultivated. From these mountains issue the many springs that water the island. These waters, which flow in gentle streams, are changed into torrents on the slightest storm. Their qualities are derived from the soil over which they flow. In some places they are excellent; in others so bad, that the inhabitants are obliged to drink the water they have collected during the rainy season.

Of all the French settlements in the West Indies, Martinico is the most happily situated with regard to the winds which prevail in those seas. Its harbours possess the inestimable advantage of affording a certain shelter from the hurricanes which annoy these latitudes. The harbour of Fort Royal is one of the best in all the

Martinico ||
Martyr.

the windward islands ; and so celebrated for its safety, that, when it was open to the Dutch, their shipmasters had orders from the republic to take shelter there in June, July, and August, the three months in which the hurricanes are most frequent. The lands of the Lamentin which are but a league distant, are the richest and most fertile in the whole island. The numerous streams which water this fruitful country, convey load- ed canoes to a considerable distance from the sea. The protection of the fortifications secured the peaceable enjoyment of so many advantages ; which, however, were balanced by a swampy and unwholesome soil. This capital of Martinico was also the rendezvous of the men of war ; which branch of the navy has always oppressed the merchantmen. On this account, Fort Royal was an improper place to become the centre of trade, which was therefore removed to St Peter's. This little town, notwithstanding the fires that have four times reduced it to ashes, still contains 1700 houses. It is situated on the western coast of the island, on a bay, or inlet, which is almost circular. One part of it is built on the strand along the sea side, which is called the anchorage ; and is the place destined for ships and warehouses. The other part of the town stands upon a low hill ; it is called the Fort, from a small fortification that was built there in 1665, to check the seditious of the inhabitants against the tyranny of monopoly ; but it now serves to protect the road from foreign enemies. These two parts of the town are separated by a rivulet.

The anchorage is at the back of a pretty high and steep hill. Shut up as it were by this hill, which intercepts the easterly winds, the most constant and most salubrious in these parts ; exposed without any refreshing breezes, to the scorching beams of the sun, reflected from the hill, from the sea, and the black sand on the beach ; this place is extremely hot, and always unwholesome. Besides, there is no harbour ; and the ships which cannot winter safely upon this coast are obliged to take shelter at Fort Royal. But these disadvantages are compensated by the conveniency of the road of St Peter's, for loading and unloading of goods ; and by its situation, which is such that ships can freely go in and out at all times, and with all winds.

Martinico again fell into the hands of the British in 1794 ; was given up to France in 1801 ; retaken in 1809, and finally restored to France by the treaty of Paris in 1814.

MARTLETS, in *Heraldry*, little birds represented without feet ; and used as a difference or mark of distinction for younger brothers, to put them in mind that they are to trust to the wings of virtue and merit, in order to raise themselves, and not to their feet, they having little land to set their foot on. See *HERALDRY*.

MARTYNIA, a genus of plants belonging to the didynamia class ; and in the natural method ranking under the 10th order, *Personata*. See *BOTANY Index*.

MARTYR, is one who lays down his life, or suffers death, for the sake of his religion. The word is Greek, *μαρτυρ*, and properly signifies "a witness." It is applied, by way of eminence, to those who suffer in witness of the truth of the gospel.

The Christian church has abounded in martyrs, and history is filled with surprising accounts of their singular constancy and fortitude under the cruellest torments human nature was capable of suffering. The primitive

Christians were accused by their enemies of paying a sort of divine worship to the martyrs. Of this we have an instance in the answer of the church of Smyrna to the suggestion of the Jews, who at the martyrdom of Polycarp, desired the heathen judge not to suffer the Christians to carry off his body, lest they should leave their crucified master, and worship him in his stead. To which they answered, " We can neither forsake Christ, nor worship any other : for we worship him as the Son of God ; but love the martyrs as the disciples and followers of the Lord, for the great affection they have shown to their King and Master." A like answer was given at the martyrdom of Fructuosus in Spain. For when the judge asked Eulogius, his deacon, Whether he would not worship Fructuosus ? as thinking, that, though he refused to worship the heathen idols, he might yet be inclined to worship a Christian martyr ; Eulogius replied, " I do not worship Fructuosus, but him whom Fructuosus worships." The primitive Christians believed, that the martyrs enjoyed very singular privileges ; that upon their death they were immediately admitted to the beatific vision, while other souls waited for the completion of their happiness till the day of judgment ; and that God would grant chiefly to their prayers the hastening of his kingdom, and shortening the times of persecution.

The churches built over the graves of the martyrs, and called by their names, in order to preserve the memory of their sufferings, were distinguished by the title *martyrium confessio*, or *memoria*.

The festivals of the martyrs are of very ancient date in the Christian church, and may be carried back at least till the time of Polycarp, who suffered martyrdom about the year of Christ 168. On these days the Christians met at the graves of the martyrs, and offered prayers and thanksgivings to God for the examples they had afforded them : they celebrated the eucharist, and gave alms to the poor ; which, together with a panegyric oration or sermon, and reading the acts of the martyrs, were the spiritual exercises of these anniversaries.

Of the sayings, sufferings, and deaths of the martyrs, though preserved with great care for the above purpose, and to serve as models to future ages, we have but very little left, the greatest part of them having been destroyed during that dreadful persecution which Dioclesian carried on for 10 years with fresh fury against the Christians ; for a most diligent search was then made after all their books and papers ; and all of them that were found were committed to the flames. Eusebius, indeed, composed a martyrology, but it never reached down to us ; and those since compiled are extremely suspected. From the eighth century downwards, several Greek and Latin writers endeavoured to make up the loss, by compiling, with vast labour, accounts of the lives and actions of the ancient martyrs, but which consist of little else than a series of fables : Nor are those records that pass under the name of Martyrology worthy of superior credit, since they bear the most evident marks both of ignorance and falsehood.

MARTYR, *Peter*, a famous divine, born at Florence in 1500. He studied philosophy and the languages at Padua and Bononia, was a regular Augustine in the monastery of Fiscoli, and was counted one of the

Martyr,
Martyro-
logy.

best preachers in Italy. Zuinglius and Bucer's writings gave him a good opinion of the Protestants, and his conversation with Valdes confirmed it. He preached that doctrine at Rome in private; but, being impeached, fled to Naples, and thence to Lucca, where he brought over to the Protestant interest Emanuel Tremellius, Celsus, Martinengas, Paul Lasicius, and Jeremiah Zanchy. He was sent for to England by King Edward VI. and made professor of divinity at Oxford in 1549. In Queen Mary's reign he returned to Strasburg, and was present at the conference of Poissy. His sentiments were not the same with Calvin's about Christ's presence in the eucharist. He wrote a great number of works, and died in 1562.

MARTYROLOGY, a catalogue or list of martyrs, including the history of their lives and sufferings for the sake of religion. The term comes from *μαρτυρ*, "witness," and *λογος*, "discourse."

The martyrologies draw their materials from the calendars of particular churches, in which the several festivals dedicated to them are marked; and which seem to be derived from the practice of the ancient Romans who inserted the names of heroes and great men in their fasti or public registers.

The martyrologies are very numerous, and contain many ridiculous and even contradictory narratives: which is easily accounted for, if we consider how many forged and spurious accounts of the lives of saints and martyrs appeared in the first ages of the church, which the legendary writers afterwards adopted without examining into the truth of them. However, some good critics, of late years, have gone a great way towards clearing the lives of the saints and martyrs from the monstrous heap of fiction they laboured under. See the article **LEGEND**.

The Martyrology of Eusebius of Cæsarea was the most celebrated in the ancient church. It was translated into Latin by St Jerome; but the learned agree that it is not now extant. That attributed to Beda, in the eighth century, is of very doubtful authority: the names of several saints being there found who did not live till after the time of Beda. The ninth century was very fertile in martyrologies; then appeared that of Florus, subdeacon of the church at Lyons; who however, only filled up the chasms in Beda. This was published about the year 830, and was followed by that of Waldenburtus, monk of the diocese of Treves, written in verse about the year 844, and this by that of Usuard, a French monk, and written by the command of Charles the Bald in 875, which last is the martyrology now ordinarily used in the Roman church. That of Rabanus Maurus is an improvement on Beda and Florus, written about the year 845; that of Notker, monk of St Gal, was written about the year 894. The martyrology of Addo, monk of Ferrieres, in the diocese of Treves, afterwards archbishop of Vienne, is a descendant of the Roman, if we may so call it; for Du Sollier gives its genealogy thus: The martyrology of St Jerome is the great Roman martyrology; from this was made the little Roman one printed by Rosweyd; of this little Roman martyrology was formed that of Beda, augmented by Florus. Ado compiled his in the year 858. The martyrology of Nevelon, monk of Corbie, written about the year 1080, is little more than an abridgement of that of Ado; Father Kir-

cher also makes mention of a Coptic martyrology preserved by the Maronites at Rome.

We have also several Protestant martyrologists, containing the sufferings of the reformed under the Papists, viz. an English martyrology, by J. Fox; with others by Clark, Bray, &c.

MARTYROLOGY is also used, in the Romish church, for a roll or register kept in the vestry of each church, containing the *names* of all the saints and martyrs, both of the universal church and of the particular ones of that city or monastery.

MARTYROLOGY is also applied to the painted or written catalogues in the Romish churches, containing the foundations, obits, prayers, and masses, to be said each day.

MARVELL, ANDREW, an ingenious writer in the 17th century, was bred at Cambridge. He travelled through the most polite parts of Europe, and was secretary to the embassy at Constantinople. His first appearance in public business at home was as assistant to Dr John Milton, Latin secretary to the protector. A little before the restoration, he was chosen by his native town, Kingston upon Hull, to sit in that parliament, which began at Westminster April 25th 1660; and is recorded as the last member of parliament who received the wages or allowance anciently paid to representatives by their constituents. He seldom spoke in parliament, but he had great influence without doors upon the members of both houses; and Prince Rupert had always the greatest regard for his advice. He made himself very obnoxious to the government by his actions and writings; notwithstanding which, King Charles II. took great delight in his conversation, and tried all means to win him over to his side, but in vain, nothing being ever able to shake his resolution. There were many instances of his firmness in resisting the offers of the court; but he was proof against all temptations. The king having one night entertained him, sent the lord treasurer Danby the next morning to find out his lodgings: which were then up two pair of stairs in one of the little courts in the Strand. He was busy writing when the treasurer opened the door abruptly upon him. Surprised at the sight of so unexpected a visitor, Mr Marvell told his Lordship, "That he believed he had mistaken his way." Lord Danby replied, "Not, now I have found Mr Marvell;" telling him he came from his majesty, to know what he could do to serve him. Coming to a serious explanation, he told the lord treasurer, that he knew the nature of courts full well; that whoever is distinguished by a prince's favour, is certainly expected to vote in his interest. The Lord Danby told him, that his majesty had only a just sense of his merits, in regard to which he only desired to know if there was any place at court he could be pleased with. These offers, though urged with the greatest earnestness, had no effect upon him. He told the lord treasurer, that he could not accept of them with honour; for he must be either ungrateful to the king in voting against him, or false to his country in giving into the measures of the court. The only favour therefore, he had to request of his majesty was, that he would esteem him as dutiful a subject as any he had, and more in his proper interest by refusing his offers than if he had embraced them. The Lord Danby finding no arguments

Martyro-
logy,
Marvell.

Marvel,
Mary.

ments could prevail, told him, that the king had ordered a thousand pounds for him, which he hoped he would receive till he could think what farther to ask of his majesty. The last offer was rejected with the same stedfastness of mind as the first; though, as soon as the lord treasurer was gone, he was forced to send to a friend to borrow a guinea. He died, not without strong suspicions of his being poisoned, in 1678, in the 58th year of his age. In 1688, the town of Kingston upon Hull contributed a sum of money to erect a monument over him in the church of St Giles in the Fields, where he was interred, and an epitaph composed by an able hand; but the ministry of that church forbade both the inscription and monument to be placed there. He wrote many ingenious pieces; as, *The Rehearsal transposed*; *A short Historical Essay concerning General Councils, Creeds, and Impositions in matters of Religion, &c.*; also *Poems and Letters*.

MARVEL of Peru. See *MIRABILIS, BOTANY Index*.

MARY, the mother of our Saviour Jesus Christ, and a virgin at the time that she conceived him; daughter of Joachim and of Anna, of the tribe of Judah, and married to Joseph of the same tribe. The Scripture tells us nothing of her parents, not so much as their names, unless Heli mentioned by St Luke iii. 23. be the same with Joachim. All that is said concerning the birth of Mary and of her parents is only to be found in some apocryphal writings; which, however, are very ancient.

Mary was of the royal race of David, as was also her husband; 'A virgin, espoused to a man whose name was *Joseph*, of the house of David,' says our translation of St Luke i. 27. which translation Mr Whitby thinks might be better rendered thus: A virgin of the house of David, espoused to a man whose name was *Joseph*, and the virgin's name was *Mary*; because this agrees better with the words of the angel, "The Lord shall give him the throne of his father David," ver. 32. For since the angel had plainly told the virgin, that she should have this son without the knowledge of any man, it was not Joseph's but Mary's being of the house of David, that made David his father.

Mary was akin to the race of Aaron, since Elizabeth the wife of Zacharias was her cousin (ver. 36.) Mary very early made a vow of chastity, and engaged herself to perpetual virginity. The *Proto-evangelium* of St James tells us, that she was consecrated to the Lord, and offered in the temple from her earliest youth; and that the priests gave her Joseph for a spouse, who was a holy and venerable old man, whom Providence appointed for his purpose by a miracle, the rod which he commonly carried having grown green and flourished as Aaron's did formerly. He espoused Mary, not to live with her in the ordinary use of marriage, and to have children by her, but only that he might be the guardian of her virginity. Though these circumstances are not to be relied on as certain, yet Mary's resolution of continency, even in a married state, cannot be called in question, since her virginity is attested by the gospel, and that herself speaking to the angel, who declared to her that she should become the mother of a son, told him that "she knew not a man," (ver. 34.), or that she lived in continency with her husband: for which reason,

when Joseph perceived her pregnancy, he was extremely surprised at it, knowing the mutual resolution they had agreed to of living in continency though in a state of marriage.

When Mary was ready to lie in, an edict was published by Cæsar Augustus, which decreed, that all the subjects of the empire should go to their own cities, there to have their names registered according to their families. Thus Joseph and Mary, who were both of the lineage of David, betook themselves to the city of Bethlehem, from whence was the original of their family. But while they were in this place, the time being fulfilled in which Mary was to be delivered, she brought forth her first-born son. She wrapped him in swaddling-clothes, and laid him in the manger of the stable or cavern whither they had retired: for they could find no place in the public inn, because of the great concourse of people that were then at Bethlehem on the same occasion; or they were forced to withdraw into the stable of the inn, not being able to get a more convenient lodging, because of the multitude of people then at Bethlehem.

At the same time the angels made it known to the shepherds who were in the fields near Bethlehem, and who came in the night to see Mary and Joseph and the child lying in the manger, and to pay him their tribute of adoration. Mary took notice of all these things, and laid them up in her heart, (Luke ii. 19. Matth. ii. 8, 9, 10, 11, &c.). A few days after, the magi or wise men came from the east, and brought to Jesus the mysterious presents of gold, frankincense, and myrrh; after which, being warned by an angel that appeared to them in a dream, they returned into their own country by a way different from that by which they came. But the time of Mary's purification being come, that is forty days after the birth of Jesus, Mary went to Jerusalem (Luke ii. 21.), there to present her son in the temple, and there to offer the sacrifice appointed by the law for the purification of women after childbirth. There was then at Jerusalem an old man named *Simeon*, who was full of the Holy Ghost, and who had received a secret assurance that he should not die before he had seen Christ the Lord. He came then into the temple by the influence of the spirit of God, and taking the little Jesus with in his arms, he blessed the Lord: and afterwards addressing himself to Mary, he told her, 'That this child should be for the rising and falling of many in Israel, and for a sign which should be spoken against; even so far as that her own soul should be pierced as with a sword, that the secret thoughts in the hearts of many might be discovered.' Afterwards when Joseph and Mary were preparing to return to their own country of Nazareth (Matth. ii. 13, 14.), Joseph was warned in a dream to retire into Egypt with Mary and the child, because Herod had a design to destroy Jesus. Joseph obeys the admonition, and they continued in Egypt till after the death of Herod; upon which he and Mary returned to Nazareth, not daring to go to Bethlehem because it was in the jurisdiction of Archelaus the son and successor of Herod the Great. Here the holy family took up their residence, and remained till Jesus began his public ministry. We read of Mary being present at the marriage of Cana in Galilee, with her son Jesus and his disciples (John ii.

Mary.

Mary.

1, 2, &c.). On which occasion Jesus having turned water into wine, being the first public miracle that he performed, he went from thence to Capernaum with his mother and his brethren, or his parents and disciples: and this seems to be the place where the holy virgin afterwards chiefly resided. However, St Epiphanius thinks that she followed him everywhere during the whole time of his preaching; though we do not find the evangelists make any mention of her among the holy women that followed him and ministered to his necessities. The Virgin Mary was at Jerusalem at the last passover that our Saviour celebrated there; she saw all that was transacted against him, followed him to Calvary, and stood at the foot of his cross with a constancy worthy of the mother of God. There Jesus seeing his mother and his beloved disciple near her, he said to his mother, "Woman, behold thy son;" and to the disciple, "Behold thy mother." And from that hour the disciple took her home to his own house. It is not to be doubted, but that our Saviour appeared to his mother immediately after his resurrection; and that she was the first, or at least one of the first, to whom he vouchsafed this great consolation. She was with the apostles at his ascension, and continued with them at Jerusalem, expecting the coming of the Holy Ghost (Acts i. 14.). After this, she dwelt in the house of St John the Evangelist, who took care of her as of his own mother. It is thought that he took her along with him to Ephesus, where she died in an extreme old age. There is a letter of the œcumenical council of Ephesus, importing, that in the fifth century it was believed she was buried there. Yet this opinion was not so universal, but that there are authors of the same age who think she died and was buried at Jerusalem.

MARY Magdalen, who has been generally confounded with Mary the sister of Martha and Lazarus, but very improperly, was probably that sinner mentioned by St Luke, chap. vii. 36, 37, &c. whose name he does not tell us. There are some circumstances sufficient to convince us, that she is the same whom he calls *Mary Magdalen* in chap. viii. 2. and from whom he says Jesus drove out seven devils. Jesus having healed the widow's son of Nain, entered into the city, and there was invited to eat by a Pharisee named *Simon*. While he was at table, a woman of a scandalous life came into the house, having an alabaster box full of perfumed oil, and standing upright behind Jesus, and at his feet, for he was lying at table on a couch after the manner of the ancients, she poured her perfume on his feet, kissed them, watered them with her tears, and wiped them with her hair. The Pharisee observing this, said within himself, If this man were a prophet, he would know who this woman is that touches him, that she is one of a wicked life. Then Jesus, who knew the bottom of his heart, illustrated her case by a parable; and concluded with answering the woman, that her sins were forgiven her. In the following chapter, St Luke tells us, that Jesus, in company with his apostles, preached the gospel from city to city: and that there were several women whom he had delivered from evil spirits, and had cured of their infirmities, among whom was Mary called *Magdalen*, out of whom went seven devils. This,

it must be owned, is no positive proof that the sinner mentioned before was Mary Magdalen; however, it is all that we have in support of this opinion: An opinion which has been ably controverted by others. Mary Magdalen had her surname, it is thought, from the town of Magdalia in Galilee. Lightfoot believes that this Mary is the same with Mary the sister of Lazarus. Magdalen is mentioned by the evangelists among the women that followed our Saviour, to minister to him according to the custom of the Jews. St Luke viii. 2. and St Mark xvi. 9. observe, that this woman had been delivered by Jesus Christ from seven devils. This some understand in the literal sense; but others take it figuratively, for the crimes and wickedness of her past life (supposing her to be the sinner first above mentioned), from which Christ had rescued her. Others maintain, that she had always lived in virginity; and consequently they make her a different person from the sinner mentioned by St Luke: and by the seven devils of which she was possessed, they understand no other than a real possession, which is not inconsistent with a holy life. This indeed is the most probable opinion, and that which has been best supported. In particular, the author of a "Letter to Jonas Hanway" on the subject of Magdalen House, published in 1758, has shown by a variety of learned remarks and quotations both from the Scriptures and from the best commentators, that Mary Magdalen was not the sinner spoken of by St Luke, but on the contrary that she "was a woman of distinction, and very easy in her worldly circumstances. For a while, she had laboured under some bodily indisposition, which our Lord miraculously healed, and for which benefit she was ever after very thankful. So far as we know, her conduct was always regular and free from censure; and we may reasonably believe, that after her acquaintance with our Saviour it was edifying and exemplary. I conceive of her (continues our author) as a woman of a fine understanding, and known virtue and discretion, with a dignity of behaviour becoming her age, her wisdom, and her high station: by all which, she was a credit to him whom she followed as her master and benefactor. She showed our Lord great respect in his life, at his death, and after it; and she was one of those to whom he first showed himself after his resurrection."

Mary Magdalen followed Christ in the last journey that he made from Galilee to Jerusalem, and was at the foot of the cross with the holy virgin (John xix. 25. Mark xv. 47.). After which she returned to Jerusalem to buy and prepare the perfumes, that she might embalm him after the sabbath was over, which was then about to begin. All the sabbath day she remained in the city; and the next day early in the morning she went to the sepulchre, along with Mary the mother of James and Salome (Mark xvi. 1, 2. Luke xxiv. 1, 2.). On the way, they inquired of one another, who should take away the stone from the mouth of the sepulchre, and were sensible of a great earthquake. This was the token of our Saviour's resurrection. Being come to his tomb, they saw two angels, who informed them that Jesus was risen. Upon this Mary Magdalen runs immediately to Jerusalem, and acquaints the apostles with this good news, returning herself

Mary.

Mary herself to the sepulchre. Peter and John came also, and were witnesses that the body was no longer there. They returned: but Mary stayed, and stooping forward to examine the inside of the tomb, she there saw two angels sitting, one at the head and the other at the foot of the tomb; and immediately afterwards, upon turning about, she beheld the Lord himself. She would have cast herself at his feet to kiss them. But Jesus said to her, "Touch me not, for I am not yet ascended to my Father." As if he had said, "You shall have leisure to see me hereafter; go now to my brethren, my apostles, and tell them I am going to ascend to my God and to their God, to my Father and to their Father." Thus had Mary the happiness of first seeing our Saviour after his resurrection. (See Matth. xxxviii. 5. &c. Mark xvi. 6. &c. John xx. 11, 17.)

She returned then to Jerusalem, and told the apostles that she had seen the Lord, that she had spoken to him, and told them what he had said to her. But at first they did not believe her, till her report was confirmed by many other testimonies.—This is what the gospel informs us concerning Mary Magdalen, different from Mary the sister of Martha, though she has been often called by this name. For, as to the pretended History of Mary Magdalen, which is said to have been written in Hebrew by Marcella servant of Martha; this can only relate to Mary sister of Martha, and besides is a mere piece of imposture.

MARY, queen and tyrant of England, was eldest daughter of Henry VIII. by his first wife Catharine of Spain, and born at Greenwich in February 1517. Her mother was very careful of her education, and provided her with tutors to teach her what was fitting. Her first preceptor was the famous Linacre, who drew up for her use the Rudiments of Gram-

mar, and afterwards *De emendata structura Latini sermonis libri sex.* Linacre dying when she was but six years old, Ludovicus Vives, a very learned man of Valenza in Spain, was her next tutor; and he composed for her *De ratione studii puerilis.* Under the direction of these excellent men, she became so great a mistress of Latin, that Erasmus commends her for her epistles in that language. Towards the end of her father's reign, at the earnest solicitation of Queen Catharine Parr, she undertook to translate Erasmus's Paraphrase on the gospel of St John; but falling into ill health, as Udall relates, partly by excessive study in this work, after she had made some progress therein, she left the rest to be done by Dr Mallet her chaplain. This translation is printed in the first volume of Erasmus's Paraphrase upon the New Testament, London, 1548, folio; and with it is a Preface, written by Udall, the famous master of Eton school, and addressed to the queen dowager (A).—Had she been educated in Spain, however, and an inquisitor had been her preceptor, she could not have imbibed more strongly the bloody principles of Romish persecution; and to the eternal disgrace of the English prelacy, though the reformation had taken root in both universities, she found English bishops ready to carry her cruel designs to subvert it into effectual execution. King Edward her brother dying the 6th of July 1553, she was proclaimed queen the same month, and crowned in October by Stephen Gardiner bishop of Winchester. Upon her accession to the throne, she declared, in her speech to the council, that she would not persecute her Protestant subjects: but in the following month, she prohibited preaching without a special license; and before the expiration of three months, the Protestant bishops were

(A) As this preface contains many reflections which may very much edify the females of this age, we shall for their sakes here transcribe a part of it. Mr Udall takes occasion in it to observe to her majesty, "The great number of noble women at that time in England, not only given to the study of human sciences and strange tongues, but also so thoroughly expert in the Holy Scriptures, that they were able to compare with the best writers, as well in enditing and penning of godly and fruitful treatises, to the instruction and edifying of realms in the knowledge of God, as also in translating good books out of Latin or Greek into English, for the use and commodity of such as are rude and ignorant of the said tongues. It was now (he said) no news in England to see young damsels in noble houses, and in the courts of princes, instead of cards and other instruments of idle trifling, to have continually in their hands either psalms, homilies, and other devout meditations, or else Paul's epistles, or some book of holy scripture matters, and as familiarly both to read or reason thereof in Greek, Latin, French, or Italian, as in English. It was now a common thing to see young virgins so trained in the study of good letters, that they willingly set all other vain pastimes at nought for learning's sake. It was now no news at all to see queens and ladies of most high estate and progeny, instead of courtly dalliance, to embrace virtuous exercises of reading and writing, and with most earnest study, both early and late, to apply themselves to the acquiring of knowledge, as well in all other liberal arts and disciplines, as also most especially of God and his holy word. And in this behalf (says he), like as to your highness, as well as for composing and setting forth many godly psalms, and divers other contemplative meditations, as also for causing these paraphrases to be translated into our vulgar tongue, England can never be able to render thanks sufficient; so may it never be able, as her deserts require, enough to praise and magnify the most noble the most virtuous, the most witty, and the most studious Lady Mary's grace, for taking such pain and travail in translating this Paraphrase of Erasmus upon the gospel of St John.—What could be a more plain declaration of her most constant purpose to promote God's word, and the free grace of his gospel?" &c. Mr Udall was mistaken; she never meant any such thing; for soon after her accession to the throne, a proclamation was issued for calling in and suppressing this very book, and all others that had the least tendency towards furthering the reformation. And Mr Walpole is of opinion, that the sickness which came upon her while she was translating St John, was all affected; "for (says he) she would not so easily have been cast into sickness, had she been employed on the Legends of St Teresa or St Catharine of Sienna."

Mary.

were excluded the house of lords, and all the statutes of Edward VI. respecting the Protestant religion were repealed. In July 1544 she was married to Philip prince of Spain, eldest son of the emperor Charles V.; and now began that persecution against the Protestants for which her reign is so justly infamous. Some have supposed, that the queen was herself of a compassionate and humane disposition; and that most of those barbarities were transacted by her bishops without her knowledge or privy. Without her knowledge and privy they could not be: it would be a better defence of her to say, that a strict adherence to a false religion, and a conscientious observance of its pernicious and cruel dictates, overruled and got the better of that goodness of temper which was natural to her. But neither can this plea be reasonably admitted by any one who considers her unkind and inhuman treatment of her sister the Lady Elizabeth; her admitting a council for the taking up and burning of her father's body; her most ungrateful and perfidious breach of promise with the Suffolk men; her ungenerous and barbarous treatment of Judge Hales, who had strenuously defended her right of succession to the crown; and of Archbishop Cranmer, who in reality had saved her life. Shall we excuse all this by saying, *Tantum religio potuit suadere malorum*? Her obligations to Cranmer deserve to be more particularly set forth. Burnet says, "that her firm adherence to her mother's cause and interest, and her backwardness in submitting to the king her father, were thought crimes of such a nature by his majesty, that he came to the resolution to put her openly to death: and that when all others were unwilling to run any risk in saving her, Cranmer alone ventured upon it. In his gentle way he told the king "that she was young and indiscreet, and therefore it was no wonder if she obstinately adhered to that which her mother and all about her had been infusing into her for many years; but that it would appear strange, if he should for this cause so far forget the father, as to proceed to extremities with his own child; that if she was separated from her mother and her people, in a little time there might be ground gained on her; but that to take away her life, would raise horror through all Europe against him;" by which means he preserved her.—Along with Archbishop Cranmer, who had thus saved her life, the bishops Ridley and Latimer were also condemned for heresy at Oxford, and afterwards burnt. In 1556, the persecution became general; and Protestants of all ranks and ages, and of both sexes, fell victims to papal fury. It is observable, likewise, that the same perfidious violation of promises and treaties prevailed in the queen's council, with respect to public affairs. By the treaty of marriage concluded between the queen and Philip, it was expressly stipulated that England should not be engaged in any wars with France on account of Spain; yet in 1557, Philip, who had brought immense sums of money into England, procured an offensive and defensive alliance against France, from the English administration, and 8000 of the queen's choicest troops were sent over to the assistance of the Spaniards in the Low Countries; the loss of Calais to the French was the first fruit of this war; and some assert, that upon this single occasion the queen showed a strong attachment to her na-
